8. Start the Cisco IOS CNS agent on the device.

---

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
**Example:**  
Device> enable  
* Enter your password if prompted. |
### Enabling the Cisco IOS CNS Agent

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2** configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 3** cns config initial \{hostname | ip-address\} [port-number]  
Example:  
Device(config)# cns config initial 10.180.1.27 10 | Enables the Cisco IOS CNS agent, and enters the configuration server parameters.  
- For \{hostname | ip-address\}, enter either the hostname or the IP address of the configuration server.  
- (Optional) For \textit{port number}, enter the port number for the configuration server. |
| **Step 4** cns config partial \{hostname | ip-address\} [port-number]  
Example:  
Device(config)# cns config partial 10.180.1.27 10 | Enables the Cisco IOS CNS agent, and enters the configuration server parameters.  
- For \{hostname | ip-address\}, enter either the hostname or the IP address of the configuration server.  
- (Optional) For \textit{port number}, enter the port number for the configuration server. |
| **Step 5** end  
Example:  
Device(config)# end | Returns to privileged EXEC mode. |
| **Step 6** show running-config  
Example:  
Device# show running-config | Verifies your entries. |
| **Step 7** copy running-config startup-config  
Example:  
Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| **Step 8** Start the Cisco IOS CNS agent on the device. | |
What to do next
You can now use the Cisco Configuration Engine to remotely send incremental configurations to the device.

Enabling an Initial Configuration for Cisco IOS CNS Agent

Follow these steps to enable the CNS configuration agent and initiate an initial configuration on the device.

SUMMARY STEPS

1. enable
2. configure terminal
3. cns template connect name
4. cli config-text
5. Repeat Steps 3 to 4 to configure another CNS connect template.
6. exit
7. cns connect name [retries number] [retry-interval seconds] [sleep seconds] [timeout seconds]
8. discover {controller controller-type | dlci [subinterface subinterface-number] | interface [interface-type] | line line-type}
9. template name [... name]
10. Repeat Steps 8 to 9 to specify more interface parameters and CNS connect templates in the CNS connect profile.
11. exit
12. hostname name
13. ip route network-number
14. cns id interface num {dns-reverse | ipaddress | mac-address} [event] [image]
15. cns id {hardware-serial | hostname | string string | udi} [event] [image]
16. cns config initial {hostname | ip-address} [port-number] [event] [no-persist] [page page] [source ip-address] [syntax-check]
17. end
18. show running-config
19. copy running-config startup-config

DETAILED STEPS

</tbody>
</table>

**Note:**
- For `controller controller-type`, enter the controller type.
- For `dci`, enter the active data-link connection identifiers (DLCIs).
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| (Optional) For **subinterface** `subinterface-number`, specify the point-to-point subinterface number that is used to search for active DLCIs.  
- For **interface** `[interface-type]`, enter the type of interface.  
- For **line** `line-type`, enter the line type. | |
| **Step 9** | **template** `name [... name]`  
**Example:**  
Device(config-cns-conn)\# **template** template-dhcp | Specifies the list of CNS connect templates in the CNS connect profile to be applied to the device configuration. You can specify more than one template. |
| **Step 10** | Repeat Steps 8 to 9 to specify more interface parameters and CNS connect templates in the CNS connect profile. |
| **Step 11** | **exit**  
**Example:**  
Device(config-cns-conn)\# **exit** | Returns to global configuration mode. |
| **Step 12** | **hostname** `name`  
**Example:**  
Device(config)\# **hostname** device1 | Enters the hostname for the device. |
| **Step 13** | **ip route** `network-number`  
**Example:**  
RemoteDevice(config)\# **ip route** 172.28.129.22 255.255.255.255 11.11.11.1 | (Optional) Establishes a static route to the Configuration Engine whose IP address is `network-number`. |
| **Step 14** | **cns id** `interface num {dns-reverse | ipaddress | mac-address} [event] [image]`  
**Example:**  
RemoteDevice(config)\# **cns id** GigabitEthernet0/1 ipaddress | (Optional) Sets the unique EventID or ConfigID used by the Configuration Engine. If you enter this command, do not enter the **cns id {hardware-serial | hostname | string string | udi} [event] [image]** command.  
- For **interface num**, enter the type of interface. For example, ethernet, group-async, loopback, or virtual-template. This setting specifies from which interface the IP or MAC address should be retrieved to define the unique ID.  
- For `{dns-reverse | ipaddress | mac-address}`, enter **dns-reverse** to retrieve the hostname and assign it as the unique ID, enter **ipaddress** to use the IP address, or enter **mac-address** to use the MAC address as the unique ID. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| cns id \{hardware-serial | hostname | string string | udi\} [event] [image] | (Optional) Sets the unique EventID or ConfigID used by the Configuration Engine. If you enter this command, do not enter the `cns id interface num \{dns-reverse | ipaddress | mac-address\} [event] [image]` command.  
- For \{hardware-serial | hostname | string string | udi\}, enter `hardware-serial` to set the device serial number as the unique ID, enter `hostname` (the default) to select the device hostname as the unique ID, enter an arbitrary text string for `string string` as the unique ID, or enter `udi` to set the unique device identifier (UDI) as the unique ID. |
| `cns config initial \{hostname | ip-address\} [port-number] [event] [no-persist] [page page] [source ip-address] [syntax-check]` | Enables the Cisco IOS agent, and initiates an initial configuration.  
- For \{hostname | ip-address\}, enter the hostname or the IP address of the configuration server.  
- (Optional) For `port-number`, enter the port number of the configuration server. The default port number is 80.  
- (Optional) Enable `event` for configuration success, failure, or warning messages when the configuration is finished.  
- (Optional) Enable `no-persist` to suppress the automatic writing to NVRAM of the configuration pulled as a result of entering the `cns config initial` global configuration command. If the `no-persist` keyword is not entered, using the `cns config initial` command causes the resultant configuration to be automatically written to NVRAM.  
- (Optional) Enable `no-persist` to suppress the automatic writing to NVRAM of the configuration pulled as a result of entering the `cns config initial` global configuration command. If the `no-persist` keyword is not entered, using the `cns config initial` command causes the resultant configuration to be automatically written to NVRAM.  
- (Optional) For `page page`, enter the web page of the initial configuration. The default is `/Config/config/asp`.  
- (Optional) Enter `source ip-address` to use for source IP address.  

**Step 15**  
- (Optional) Enter `event` to set the ID to be the event-id value used to identify the device.  
- (Optional) Enter `image` to set the ID to be the image-id value used to identify the device.  

**Note**  
If both the `event` and `image` keywords are omitted, the image-id value is used to identify the device.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) Enable <code>syntax-check</code> to check the syntax when this parameter is entered.</td>
<td></td>
</tr>
<tr>
<td><em>Note</em> Though visible in the command-line help string, the <code>encrypt</code>, <code>status url</code>, and <code>inventory</code> keywords are not supported.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 17

**Example:**

Device(config)# end

Returns to privileged EXEC mode.

### Step 18

**Example:**

Device# show running-config

Verifies your entries.

### Step 19

**Example:**

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

### What to do next

To verify information about the configuration agent, use the `show cns config connections` command in privileged EXEC mode.

To disable the CNS Cisco IOS agent, use the `no cns config initial { ip-address | hostname }` global configuration command.

### Refreshing DeviceIDs

Follow these steps to refresh a DeviceID when changing the hostname on the device.

### SUMMARY STEPS

1. enable
2. `show cns config connections`
3. Make sure that the CNS event agent is properly connected to the event gateway.
4. `show cns event connections`
5. Record from the output of Step 4 the information for the currently connected connection listed below. You will be using the IP address and port number in subsequent steps of these instructions.
6. `configure terminal`
7. `no cns event ip-address port-number`
8. `cns event ip-address port-number`
9. end
10. Make sure that you have reestablished the connection between the device and the event connection by examining the output from `show cns event connections`.
11. `show running-config`
12. `copy running-config startup-config`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
**Example:**  
Device> enable |
| **Step 2** | `show cns config connections` | Displays whether the CNS event agent is connecting to the gateway, connected, or active, and the gateway used by the event agent, its IP address and port number.  
**Example:**  
Device# show cns config connections |
| **Step 3** | Make sure that the CNS event agent is properly connected to the event gateway. | Examine the output of `show cns config connections` for the following:  
- Connection is active.  
- Connection is using the currently configured device hostname. The DeviceID will be refreshed to correspond to the new hostname configuration using these instructions. |
| **Step 4** | `show cns event connections` | Displays the event connection information for your device.  
**Example:**  
Device# show cns event connections |
| **Step 5** | Record from the output of Step 4 the information for the currently connected connection listed below. You will be using the IP address and port number in subsequent steps of these instructions. | |
| **Step 6** | `configure terminal` | Enters global configuration mode.  
**Example:**  
Device# configure terminal |
| **Step 7** | `no cns event ip-address port-number` | Specifies the IP address and port number that you recorded in Step 5 in this command.  
**Example:**  
Device(config)# no cns event 172.28.129.22 2012  
This command breaks the connection between the device and the event gateway. It is necessary to first break, then reestablish, this connection to refresh the DeviceID.  
|
## Enabling a Partial Configuration for Cisco IOS CNS Agent

Follow these steps to enable the Cisco IOS CNS agent and to initiate a partial configuration on the device.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `cns config partial {ip-address | hostname} [port-number] [source ip-address]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
## Enabling a Partial Configuration for Cisco IOS CNS Agent

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**configure terminal**

*Example:*

Device# configure terminal

**Purpose:** Enters global configuration mode.

**Step 3**

**cns config partial** `{ip-address | hostname} [port-number] [source ip-address]`

*Example:*

Device(config)# cns config partial 172.28.129.22 2013

**Purpose:** Enables the configuration agent, and initiates a partial configuration.

- For `{ip-address | hostname}`, enter the IP address or the hostname of the configuration server.
- (Optional) For `port-number`, enter the port number of the configuration server. The default port number is 80.
- (Optional) Enter `source ip-address` to use for the source IP address.

**Note:** Though visible in the command-line help string, the `encrypt` keyword is not supported.

**Step 4**

**end**

*Example:*

Device(config)# end

**Purpose:** Returns to privileged EXEC mode.

**Step 5**

**show running-config**

*Example:*

Device# show running-config

**Purpose:** Verifies your entries.

**Step 6**

**copy running-config startup-config**

*Example:*

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

**What to do next**

To verify information about the configuration agent, use either the `show cns config stats` or the `show cns config outstanding` command in privileged EXEC mode.

To disable the Cisco IOS agent, use the `no cns config partial` `{ip-address | hostname}` global configuration command. To cancel a partial configuration, use the `cns config cancel` global configuration command.
Monitoring CNS Configurations

Table 72: CNS show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>

Configuring the Cisco Discovery Protocol

Cisco Discovery Protocol is a Layer 2, media-independent, and network-independent protocol that runs on Cisco devices and enables networking applications to learn about directly connected devices nearby. This protocol facilitates the management of Cisco devices by discovering these devices, determining how they are configured, and allowing systems using different network-layer protocols to learn about each other.

This module describes Cisco Discovery Protocol Version 2 and how it functions with SNMP.

- Information About CDP, on page 1041
- How to Configure CDP, on page 1042
- Monitoring and Maintaining Cisco Discovery Protocol, on page 1049
- Additional References, on page 1050

Information About CDP

Cisco Discovery Protocol Overview

Cisco Discovery Protocol is a device discovery protocol that runs over Layer 2 (the data-link layer) on all Cisco-manufactured devices (routers, bridges, access servers, controllers, and switches) and allows network management applications to discover Cisco devices that are neighbors of already known devices. With Cisco Discovery Protocol, network management applications can learn the device type and the SNMP agent address of neighboring devices running lower-layer, transparent protocols. This feature enables applications to send SNMP queries to neighboring devices.

Cisco Discovery Protocol runs on all media that support Subnetwork Access Protocol (SNAP). Because Cisco Discovery Protocol runs over the data-link layer only, two systems that support different network-layer protocols can learn about each other.

Each Cisco Discovery Protocol-configured device sends periodic messages to a multicast address, advertising at least one address at which it can receive SNMP messages. The advertisements also contain time-to-live, or holdtime information, which is the length of time a receiving device holds Cisco Discovery Protocol information before discarding it. Each device also listens to the messages sent by other devices to learn about neighboring devices.

On the device, Cisco Discovery Protocol enables Network Assistant to display a graphical view of the network. The device uses Cisco Discovery Protocol to find cluster candidates and maintain information about cluster members and other devices up to three cluster-enabled devices away from the command device by default.

- Cisco Discovery Protocol identifies connected endpoints that communicate directly with the device.
• To prevent duplicate reports of neighboring devices, only one wired device reports the location information.
• The wired device and the endpoints both send and receive location information.

Default Cisco Discovery Protocol Configuration

This table shows the default Cisco Discovery Protocol configuration.

<table>
<thead>
<tr>
<th>Feature</th>

How to Configure CDP

Configuring Cisco Discovery Protocol Characteristics

You can configure these Cisco Discovery Protocol characteristics:
• Frequency of Cisco Discovery Protocol updates
• Amount of time to hold the information before discarding it
• Whether or not to send Version 2 advertisements

Note

Steps 3 through 5 are all optional and can be performed in any order.

Follow these steps to configure the Cisco Discovery Protocol characteristics.

SUMMARY STEPS

1. enable
2. configure terminal
3. cdp timer seconds
4. cdp holdtime seconds
5. cdp advertise-v2
6. end
7. show running-config
8. copy running-config startup-config
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Enters global configuration mode. |
| configure terminal | |
| Example: | |
| Device# configure terminal | |

| **Step 3** | (Optional) Sets the transmission frequency of Cisco Discovery Protocol updates in seconds. |
| cdp timer seconds | The range is 5 to 254; the default is 60 seconds. |
| Example: | |
| Device(config)# cdp timer 20 | |

| **Step 4** | (Optional) Specifies the amount of time a receiving device should hold the information sent by your device before discarding it. |
| cdp holdtime seconds | The range is 10 to 255 seconds; the default is 180 seconds. |
| Example: | |
| Device(config)# cdp holdtime 60 | |

| **Step 5** | (Optional) Configures Cisco Discovery Protocol to send Version 2 advertisements. |
| cdp advertise-v2 | This is the default state. |
| Example: | |
| Device(config)# cdp advertise-v2 | |

| **Step 6** | Returns to privileged EXEC mode. |
| end | |
| Example: | |
| Device(config)# end | |

| **Step 7** | Verifies your entries. |
| show running-config | |
| Example: | |
| Device# show running-config | |

| **Step 8** | (Optional) Saves your entries in the configuration file. |
| copy running-config startup-config | |
| Example: | |
| Device# copy running-config startup-config | |
What to do next

Use the no form of the Cisco Discovery Protocol commands to return to the default settings.

Disabling Cisco Discovery Protocol

Cisco Discovery Protocol is enabled by default.

---

**Note**

Device clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.

Follow these steps to disable the Cisco Discovery Protocol device discovery capability.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no cdp run`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; <code>enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure terminal | Enters global configuration mode.              |
| Example: `configure terminal`|                                              |
| Device# `configure terminal` |                                              |

| **Step 3** no cdp run       | Disables Cisco Discovery Protocol.            |
| Example: `no cdp run`       |                                              |
| Device(config)# `no cdp run`|                                              |

| **Step 4** end              | Returns to privileged EXEC mode.              |
| Example: `end`              |                                              |
| Device(config)# `end`       |                                              |
Enabling Cisco Discovery Protocol

Cisco Discovery Protocol is enabled by default.

Note

Device clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.

Follow these steps to enable Cisco Discovery Protocol when it has been disabled.

Before you begin
Cisco Discovery Protocol must be disabled, or it cannot be enabled.

SUMMARY STEPS

1. enable
2. configure terminal
3. cdp run
4. end
5. show running-config
6. copy running-config startup-config

**What to do next**

Use the `show run all` command to show that Cisco Discovery Protocol has been enabled. If you enter only `show run`, the enabling of Cisco Discovery Protocol may not be displayed.

**Disabling Cisco Discovery Protocol on an Interface**

Cisco Discovery Protocol is enabled by default on all supported interfaces to send and to receive Cisco Discovery Protocol information.

**Note**

Device clusters and other Cisco devices (such as Cisco IP Phones) regularly exchange Cisco Discovery Protocol messages. Disabling Cisco Discovery Protocol can interrupt cluster discovery and device connectivity.
Cisco Discovery Protocol bypass is not supported and may cause a port go into err-disabled state.

Follow these steps to disable Cisco Discovery Protocol on a port.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `no cdp enable`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

Prerequisites for SNMP

Supported SNMP Versions

This software release supports the following SNMP versions:

- SNMPv1—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.
- SNMPv2C replaces the Party-based Administrative and Security Framework of SNMPv2Classic with the community-string-based Administrative Framework of SNMPv2C while retaining the bulk retrieval and improved error handling of SNMPv2Classic. It has these features:
  - SNMPv2C—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.
- SNMPv3—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:
  - Message integrity—Ensures that a packet was not tampered with in transit.
  - Authentication—Determines that the message is from a valid source.
• Encryption—Mixes the contents of a package to prevent it from being read by an unauthorized source.

To select encryption, enter the **priv** keyword.

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent’s MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval function and more detailed error message reporting to management stations. The bulk retrieval function retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which the user resides. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security method is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.

The following table identifies characteristics and compares different combinations of security models and levels:

**Table 74: SNMP Security Models and Levels**

</tbody>
</table>

You must configure the SNMP agent to use the SNMP version supported by the management station. Because an agent can communicate with multiple managers, you can configure the software to support communications using SNMPv1, SNMPv2C, or SNMPv3.

## Restrictions for SNMP

**Version Restrictions**

- SNMPv1 does not support informs.

## Information About SNMP

### SNMP Overview

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a management information...
SNMP Manager Functions

The SNMP manager uses information in the MIB to perform the operations described in the following table:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get-request</td>
<td>Retrieves a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieves a value from a variable within a table.</td>
</tr>
<tr>
<td>get-bulk-request</td>
<td>Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.</td>
</tr>
<tr>
<td>get-response</td>
<td>Replies to a get-request, get-next-request, and set-request sent by an NMS.</td>
</tr>
<tr>
<td>set-request</td>
<td>Stores a value in a specific variable.</td>
</tr>
<tr>
<td>trap</td>
<td>An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.</td>
</tr>
</tbody>
</table>

3 With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.

4 The get-bulk command only works with SNMPv2 or later.

SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- Get a MIB variable—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.
- Set a MIB variable—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.

The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.
SNMP Community Strings

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the device, the community string definitions on the NMS must match at least one of the three community string definitions on the device.

A community string can have one of the following attributes:

- Read-only (RO)—Gives all objects in the MIB except the community strings read access to authorized management stations, but does not allow write access.
- Read-write (RW)—Gives all objects in the MIB read and write access to authorized management stations, but does not allow access to the community strings.
- When a cluster is created, the command device manages the exchange of messages among member devices and the SNMP application. The Network Assistant software appends the member device number (@esN, where N is the device number) to the first configured RW and RO community strings on the command device and propagates them to the member devices.

SNMP MIB Variables Access

An example of an NMS is the Cisco Prime Infrastructure network management software. Cisco Prime Infrastructure 2.0 software uses the device MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in the figure, the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in get-request, get-next-request, and set-request format.

Figure 75: SNMP Network

SNMP Notifications

SNMP allows the device to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword traps refers to either traps or informs, or both. Use the `snmp-server host` command to specify whether to send SNMP notifications as traps or informs.

Note

SNMPv1 does not support informs.
Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be resent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the device and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be resent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Therefore, traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the device is a concern and notification is not required, use traps.

**SNMP ifIndex MIB Object Values**

The SNMP agent’s IF-MIB module comes up shortly after reboot. As various physical interface drivers are initialized they register with the IF-MIB module, essentially saying “Give me an ifIndex number”. The IF-MIB module assigns the next available ifIndex number on a first-come-first-served basis. That is, minor differences in driver initialization order from one reboot to another can result in the same physical interface getting a different ifIndex number than it had before the reboot (unless ifIndex persistency is enabled of course).

### Default SNMP Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNMP agent</td>
<td>Disabled(^5).</td>
</tr>
<tr>
<td>SNMP trap receiver</td>
<td>None configured.</td>
</tr>
<tr>
<td>SNMP traps</td>
<td>None enabled except the trap for TCP connections (tty).</td>
</tr>
<tr>
<td>SNMP version</td>
<td>If no version keyword is present, the default is Version 1.</td>
</tr>
<tr>
<td>SNMPv3 authentication</td>
<td>If no keyword is entered, the default is the noauth (noAuthNoPriv) security level.</td>
</tr>
<tr>
<td>SNMP notification type</td>
<td>If no type is specified, all notifications are sent.</td>
</tr>
</tbody>
</table>

\(^5\) This is the default when the device starts and the startup configuration does not have any `snmp-server` global configuration commands.

### SNMP Configuration Guidelines

If the device starts and the device startup configuration has at least one `snmp-server` global configuration command, the SNMP agent is enabled.

An SNMP group is a table that maps SNMP users to SNMP views. An SNMP user is a member of an SNMP group. An SNMP host is the recipient of an SNMP trap operation. An SNMP engine ID is a name for the local or remote SNMP engine.

When configuring SNMP, follow these guidelines:
How to Configure SNMP

Disabling the SNMP Agent

The `no snmp-server` global configuration command disables all running versions (Version 1, Version 2C, and Version 3) of the SNMP agent on the device. You reenable all versions of the SNMP agent by the first `snmp-server` global configuration command that you enter. There is no Cisco IOS command specifically designated for enabling SNMP.

Follow these steps to disable the SNMP agent.

**Before you begin**

The SNMP Agent must be enabled before it can be disabled. The SNMP agent is enabled by the first `snmp-server` global configuration command entered on the device.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. no snmp-server
4. end
5. show running-config
6. copy running-config startup-config

• When configuring an SNMP group, do not specify a notify view. The `snmp-server host` global configuration command auto-generates a notify view for the user and then adds it to the group associated with that user. Modifying the group's notify view affects all users associated with that group.

• To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides.

• Before you configure remote users for a particular agent, configure the SNMP engine ID, using the `snmp-server engineID` global configuration command with the remote option. The remote agent's SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.

• When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.

• If a local user is not associated with a remote host, the device does not send informs for the auth (authNoPriv) and the priv (authPriv) authentication levels.

• Changing the value of the SNMP engine ID has significant results. A user's password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of the engine ID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the `snmp-server user` global configuration command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.
<table>

<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Configuring Community Strings**

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the device. Optionally, you can specify one or more of these characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent
- A MIB view, which defines the subset of all MIB objects accessible to the given community
- Read and write or read-only permission for the MIB objects accessible to the community
Follow these steps to configure a community string on the device.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `snmp-server community string [view view-name] [ro | rw] [access-list-number]`
4. `access-list access-list-number {deny | permit} source [source-wildcard]`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; <strong>enable</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# <strong>configure terminal</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> `snmp-server community string [view view-name] [ro</td>
<td>rw] [access-list-number]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Note: The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.</td>
</tr>
<tr>
<td>Device(config)# <strong>snmp-server community comaccess ro</strong></td>
<td>• For string, specify a string that acts like a password and permits access to the SNMP protocol. You can configure one or more community strings of any length.</td>
</tr>
<tr>
<td>4</td>
<td>• (Optional) For view, specify the view record accessible to the community.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Specify either read-only (ro) if you want authorized management stations to retrieve MIB objects, or specify read-write (rw) if you want authorized management stations to retrieve and modify MIB objects. By default, the community string permits read-only access to all objects.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For access-list-number, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.</td>
</tr>
</tbody>
</table>
### Purpose

**Step 4**

`access-list access-list-number {deny | permit} source [source-wildcard]`

**Example:**

```
Device(config)# access-list 4 deny any
```

(Optional) If you specified an IP standard access list number in Step 3, then create the list, repeating the command as many times as necessary.

- For `access-list-number`, enter the access list number specified in Step 3.
- The `deny` keyword denies access if the conditions are matched. The `permit` keyword permits access if the conditions are matched.
- For `source`, enter the IP address of the SNMP managers that are permitted to use the community string to gain access to the agent.
- (Optional) For `source-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.

Recall that the access list is always terminated by an implicit deny statement for everything.

**Step 5**

`end`

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 6**

`show running-config`

**Example:**

```
Device# show running-config
```

Verifies your entries.

**Step 7**

`copy running-config startup-config`

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

### What to do next

To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).

To remove a specific community string, use the `no snmp-server community-string` global configuration command.

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the device. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.
Configuring SNMP Groups and Users

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the device. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

Follow these steps to configure SNMP groups and users on the device.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. snmp-server engineID {local engineid-string | remote ip-address [udp-port port-number] engineid-string}
4. snmp-server group group-name {v1 | v2c | v3 {auth | noauth | priv}} {read readview} {write writeview} {notify notifyview} {access access-list}
5. snmp-server user username group-name {remote host [udp-port port]} {v1 [access access-list] | v2c [access access-list] | v3 [encrypted] [access access-list] [auth {md5 | sha} auth-password] | priv {des | 3des | aes {128 | 192 | 256} priv-password}
6. end
7. show running-config
8. copy running-config startup-config

</tr>
</thead>
</table>
| **Step 4** snmp-server group group-name {v1 | v2c | v3 {auth | noauth | priv} } [read readview] [write writeview] [notify notifyview] [access access-list] | optional User Datagram Protocol (UDP) port on the remote device. The default is 162. Configures a new SNMP group on the remote device. For group-name, specify the name of the group. Specify one of the following security models:  
  - v1 is the least secure of the possible security models.  
  - v2c is the second least secure model. It allows transmission of informs and integers twice the normal width.  
  - v3, the most secure, requires you to select one of the following authentication levels:  
    - auth—Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication.  
    - noauth—Enables the noAuthNoPriv security level. This is the default if no keyword is specified.  
    - priv—Enables Data Encryption Standard (DES) packet encryption (also called privacy).  
  (Optional) Enter read readview with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent.  
  (Optional) Enter write writeview with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent.  
  (Optional) Enter notify notifyview with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap.  
  (Optional) Enter access access-list with a string (not to exceed 64 characters) that is the name of the access list. |
| **Step 5** snmp-server user username group-name {remote host [udp-port port]} {v1 [access access-list] | v2c [access access-list] | v3 [encrypted] [access access-list] [auth {md5 | sha} auth-password] } [priv {des | 3des | aes {128 | 192 | 256} } priv-password] | Adds a new user for an SNMP group. The username is the name of the user on the host that connects to the agent. The group-name is the name of the group to which the user is associated. Enter remote to specify a remote SNMP entity to which the user belongs and the hostname or IP address of that entity with the optional UDP port number. The default is 162. Enter the SNMP version number (v1, v2c, or v3). If you enter v3, you have these additional options: |
• **encrypted** specifies that the password appears in encrypted format. This keyword is available only when the v3 keyword is specified.

• **auth** is an authentication level setting session that can be either the HMAC-MD5-96 (md5) or the HMAC-SHA-96 (sha) authentication level and requires a password string auth-password (not to exceed 64 characters).

If you enter v3 you can also configure a private (priv) encryption algorithm and password string priv-password using the following keywords (not to exceed 64 characters):

• **priv** specifies the User-based Security Model (USM).

• **des** specifies the use of the 56-bit DES algorithm.

• **3des** specifies the use of the 168-bit DES algorithm.

• **aes** specifies the use of the DES algorithm. You must select either 128-bit, 192-bit, or 256-bit encryption.

(Optional) Enter **access access-list** with a string (not to exceed 64 characters) that is the name of the access list.

### Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the device generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Devices running this Cisco IOS release can have an unlimited number of trap managers.
Many commands use the word **traps** in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword **traps** refers to traps, informs, or both. Use the **snmp-server host** global configuration command to specify whether to send SNMP notifications as traps or informs.

You can use the **snmp-server enable traps** global configuration command combined with the **snmp-server host** global configuration command for a specific host to receive the notification types listed in the following table. You can enable any or all of these traps and configure a trap manager to receive them.

---

**Note**

The **snmp-server enable traps** command does not support traps for local-authentication on your device.

---

**Table 76: Device Notification Types**

<table>
<thead>
<tr>
<th>Notification Type Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bridge</td>
<td>Generates STP bridge MIB traps.</td>
</tr>
<tr>
<td>cluster</td>
<td>Generates a trap when the cluster configuration changes.</td>
</tr>
<tr>
<td>config</td>
<td>Generates a trap for SNMP configuration changes.</td>
</tr>
<tr>
<td>copy-config</td>
<td>Generates a trap for SNMP copy configuration changes.</td>
</tr>
<tr>
<td>cpu threshold</td>
<td>Allow CPU-related traps.</td>
</tr>
<tr>
<td>entity</td>
<td>Generates a trap for SNMP entity changes.</td>
</tr>
<tr>
<td>envmon</td>
<td>Generates environmental monitor traps. You can enable any or all of these environmental traps: fan, shutdown, status, supply, temperature.</td>
</tr>
<tr>
<td>flash</td>
<td>Generates SNMP FLASH notifications. In a device stack, you can optionally enable notification for flash insertion or removal, which would cause a trap to be issued whenever a device in the stack is removed or inserted (physical removal, power cycle, or reload).</td>
</tr>
<tr>
<td>fru-ctrl</td>
<td>Generates entity field-replaceable unit (FRU) control traps. In the device stack, this trap refers to the insertion or removal of a device in the stack.</td>
</tr>
<tr>
<td>hsrp</td>
<td>Generates a trap for Hot Standby Router Protocol (HSRP) changes.</td>
</tr>
<tr>
<td>ipmulticast</td>
<td>Generates a trap for IP multicast routing changes.</td>
</tr>
<tr>
<td>mac-notification</td>
<td>Generates a trap for MAC address notifications.</td>
</tr>
<tr>
<td>ospf</td>
<td>Generates a trap for Open Shortest Path First (OSPF) changes. You can enable any or all of these traps: Cisco specific, errors, link-state advertisement, rate limit, retransmit, and state changes.</td>
</tr>
<tr>
<td>pim</td>
<td>Generates a trap for Protocol-Independent Multicast (PIM) changes. You can enable any or all of these traps: invalid PIM messages, neighbor changes, and rendezvous point (RP)-mapping changes.</td>
</tr>
<tr>
<td>Notification Type Keyword</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>port-security</td>
<td>Generates SNMP port security traps. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0, which means that there is no rate limit.</td>
</tr>
</tbody>
</table>

**Note**
When you configure a trap by using the notification type `port-security`, configure the port security trap first, and then configure the port security trap rate:

1. `snmp-server enable traps port-security`
2. `snmp-server enable traps port-security trap-rate rate`

### snmp
Generates a trap for SNMP-type notifications for authentication, cold start, warm start, link up or link down.

### storm-control
Generates a trap for SNMP storm-control. You can also set a maximum trap rate per minute. The range is from 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence).

### stpx
Generates SNMP STP Extended MIB traps.

### syslog
Generates SNMP syslog traps.

### tty
Generates a trap for TCP connections. This trap is enabled by default.

### vlan-membership
Generates a trap for SNMP VLAN membership changes.

### vlancreate
Generates SNMP VLAN created traps.

### vlandelete
Generates SNMP VLAN deleted traps.

### vtp
Generates a trap for VLAN Trunking Protocol (VTP) changes.

Follow these steps to configure the device to send traps or informs to a host.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `snmp-server engineID remote ip-address engineid-string`
4. `snmp-server user username group-name { remote host [ udp-port port ] } { v1 [ access access-list ] | v2c [ access access-list ] | v3 [ encrypted ] [ access access-list ] [ auth ( md5 | sha ) auth-password ] }`
5. `snmp-server group group-name { v1 | v2c | v3 { auth | noauth | priv } } [ read readview ] [ write writeview ] [ notify notifyview ] [ access access-list ]`
6. `snmp-server host host-addr [ informs | traps ] [ version { 1 | 2c | 3 { auth | noauth | priv } } ] community-string [ notification-type ]`
7. `snmp-server enable traps notification-types`
8. `snmp-server trap-source interface-id`
9. `snmp-server queue-length length`
10. `snmp-server trap-timeout seconds`
11. `end`
12. `show running-config`
13. copy running-config startup-config

<td></td>
<td><strong>Step 10</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>snmp-server trap-timeout seconds</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>(Optional) Defines how often to resend trap messages. The range is 1 to 1000; the default is 30 seconds.</td>
<td></td>
</tr>
</tbody>
</table>

(Optional) For Version 3, select authentication level **auth, noauth, or priv**.

**Note** The **priv** keyword is available only when the cryptographic software image is installed.

For **community-string**, when **version 1** or **version 2c** is specified, enter the password-like community string sent with the notification operation. When **version 3** is specified, enter the SNMPv3 username.

The @ symbol is used for delimiting the context information. Avoid using the @ symbol as part of the SNMP community string when configuring this command.

(Optional) For **notification-type**, use the keywords listed in the table above. If no type is specified, all notifications are sent.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 11</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>

<td>(Optional) Saves your entries in</td>
</tr>
<tr>
<td>Example:</td>
<td>the configuration file.</td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

The `snmp-server host` command specifies which hosts receive the notifications. The `snmp-server enable traps` command globally enables the method for the specified notification (for traps and informs). To enable a host to receive an inform, you must configure an `snmp-server host informs` command for the host and globally enable informs by using the `snmp-server enable traps` command.

To remove the specified host from receiving traps, use the `no snmp-server host host` global configuration command. The `no snmp-server host` command with no keywords disables traps, but not informs, to the host. To disable informs, use the `no snmp-server host informs` global configuration command. To disable a specific trap type, use the `no snmp-server enable traps notification-types` global configuration command.

**Setting the Agent Contact and Location Information**

Follow these steps to set the system contact and location of the SNMP agent so that these descriptions can be accessed through the configuration file.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. snmp-server contact `text`
4. snmp-server location `text`
5. end
6. show running-config
7. copy running-config startup-config
## DETAILED STEPS

## Limiting TFTP Servers Used Through SNMP

Follow these steps to limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list.
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `snmp-server tftp-server-list access-list-number`
4. `access-list access-list-number {deny | permit} source [source-wildcard]`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>snmp-server tftp-server-list access-list-number</code></td>
<td>Limits the TFTP servers used for configuration file copies through SNMP to the servers in the access list. For <code>access-list-number</code>, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config)# snmp-server tftp-server-list 44</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> `access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]`</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config)# access-list 44 permit 10.1.1.2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Trap Flags for SNMP

**SUMMARY STEPS**

1. `configure terminal`
2. `trapflags ap {interfaceup | register}`
3. `trapflags client {dot11 | excluded}`
4. `trapflags dot11-security {ids-sig-attack | wep-decrypt-error}`
5. `trapflags mesh`
6. `trapflags rogueap`
7. `trapflags rrm-params {channels | tx-power}`
8. `trapflags rrm-profile {coverage | interference | load | noise}`
9. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device# configure terminal
```

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>`trapflags ap {interfaceup</td>
<td>register}`</td>
</tr>
</tbody>
</table>

**Example:**

```
Device(config)# trapflags ap interfaceup
```

- **interfaceup**— Enables trap when a Cisco AP interface (A or B) comes up.
- **register**— Enables trap when a Cisco AP registers with a Cisco device.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 3** trapflags client {dot11 | excluded} | Enables sending client-related dot11 traps. Use the no form of the command to disable the trap flags.  
  • **dot11** – Enables Dot11 traps for clients.  
  • **excluded** – Enables excluded traps for clients. |
| **Example:** Device(config)# trapflags client excluded | |
| **Step 4** trapflags dot11-security {ids-sig-attack | wep-decrypt-error} | Enables sending 802.11 security-related traps. Use the no form of the command to disable the trap flags.  
  • **ids-sig-attack** – Enables IDS signature attack traps.  
  • **wep-decrypt-error** – Enables traps for WEP decrypt error for clients. |
| **Example:** Device(config)# trapflags dot11-security wep-decrypt-error | |
| **Step 5** trapflags mesh | Enables trap for the mesh. Use the no form of the command to disable the trap flags. |
| **Example:** Device(config)# trapflags mesh | |
| **Step 6** trapflags rogueap | Enables trap for rogue AP detection. Use the no form of the command to disable the trap flags. |
| **Example:** Device(config)# trapflags rogueap | |
| **Step 7** trapflags rrm-params {channels | tx-power} | Enables sending RRM-parameter update-related traps. Use the no form of the command to disable the trap flags.  
  • **channels** – Enables trap when RF Manager automatically changes a channel number for the Cisco AP interface.  
  • **tx-power** – Enables the trap when RF Manager automatically changes Tx-Power level for the Cisco AP interface. |
| **Example:** Device(config)# trapflags rrm-params tx-power | |
| **Step 8** trapflags rrm-profile {coverage | interference | load | noise} | Enables sending RRM-profile-related traps. Use the no form of the command to disable the trap flags.  
  • **coverage** – Enables the trap when the coverage profile maintained by RF Manager fails.  
  • **interference** – Enables the trap when the interference profile maintained by RF Manager fails.  
  • **load** – Enables trap when the load profile maintained by RF Manager fails.  
  • **noise** – Enables trap when the noise profile maintained by RF Manager fails. |
| **Example:** Device(config)# trapflags rrm-profile interference | |
### Enabling SNMP Wireless Trap Notification

**SUMMARY STEPS**

1. configure terminal
2. `snmp-server enable traps wireless [AP | RRM | bsn80211SecurityTrap | bsnAPParamUpdate | bsnAPProfile | bsnAccessPoint | bsnMobileStation | bsnRogue | client | mfp | rogue]`
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# snmp-server enable traps wireless AP</code></td>
<td></td>
</tr>
</tbody>
</table>

- **AP**—Enables access point traps.
- **RRM**—Enables RRM traps.
- **bsn80211SecurityTrap**—Enables the security-related trap.
- **bsnAPParamUpdate**—Enables the trap for AP parameters that get updated.
- **bsnAPProfile**—Enables BSN AP profile traps.
- **bsnAccessPoint**—Enables BSN access point traps.
- **bsnMobileStation**—Controls wireless client traps.
- **bsnRogue**—Enables BSN rogue-related traps.
- **client**—Enables client traps.
- **mfp**—Enables MFP traps.
- **rogue**—Enables rogue-related traps.
Monitoring SNMP Status

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the `show snmp` privileged EXEC command. You also can use the other privileged EXEC commands listed in the table to display SNMP information.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show snmp</code></td>
<td>Displays SNMP statistics.</td>
</tr>
<tr>
<td><code>show snmp group</code></td>
<td>Displays information on each SNMP group on the network.</td>
</tr>
<tr>
<td><code>show snmp pending</code></td>
<td>Displays information on pending SNMP requests.</td>
</tr>
<tr>
<td><code>show snmp sessions</code></td>
<td>Displays information on the current SNMP sessions.</td>
</tr>
<tr>
<td><code>show snmp user</code></td>
<td>Displays information on each SNMP user name in the SNMP users table. <strong>Note</strong> You must use this command to display SNMPv3 configuration information for <code>auth</code>, <code>noauth</code>, <code>priv</code> mode. This information is not displayed in the <code>show running-config</code> output.</td>
</tr>
</tbody>
</table>

SNMP Examples

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string `public`. This configuration does not cause the device to send any traps.

```
Device(config)# snmp-server community public
```

This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string `public`. The device also sends VTP traps to the hosts 192.180.1.111 and 192.180.1.33.
using SNMPv1 and to the host 192.180.1.27 using SNMPv2C. The community string public is sent with the traps.

    Device(config)# snmp-server community public
    Device(config)# snmp-server enable traps vtp
    Device(config)# snmp-server host 192.180.1.27 version 2c public
    Device(config)# snmp-server host 192.180.1.33 version 1 public

This example shows how to allow read-only access for all objects to members of access list 4 that use the comaccess community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2C to the host cisco.com using the community string public.

    Device(config)# snmp-server community comaccess ro 4
    Device(config)# snmp-server enable traps snmp authentication
    Device(config)# snmp-server host cisco.com version 2c public

This example shows how to send Entity MIB traps to the host cisco.com. The community string is restricted. The first line enables the device to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous snmp-server host commands for the host cisco.com.

    Device(config)# snmp-server enable traps entity
    Device(config)# snmp-server host cisco.com restricted entity

This example shows how to enable the device to send all traps to the host myhost.cisco.com using the community string public:

    Device(config)# snmp-server enable traps
    Device(config)# snmp-server host myhost.cisco.com public

This example shows how to associate a user with a remote host and to send auth (authNoPriv) authentication-level informs when the user enters global configuration mode:

    Device(config)# snmp-server engineID remote 192.180.1.27 00000063000100a1c0b4011b
    Device(config)# snmp-server group authgroup v3 auth
    Device(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5 mypassword
    Device(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
    Device(config)# snmp-server enable traps
    Device(config)# snmp-server inform retries 0

Configuring Service Level Agreements

This chapter describes how to use Cisco IOS IP Service Level Agreements (SLAs) on the switch. Unless otherwise noted, the term switch refers to a standalone switch or a switch stack.

- Restrictions on SLAs, on page 1079
- Information About SLAs, on page 1079
- How to Configure IP SLAs Operations, on page 1084
- Monitoring IP SLA Operations, on page 1097
- Monitoring IP SLA Operation Examples, on page 1098
- Additional References, on page 1099

Restrictions on SLAs

This section lists the restrictions on SLAs.

The following are restrictions on IP SLAs network performance measurement:

- The device does not support VoIP service levels using the gatekeeper registration delay operations measurements.
- Only a Cisco IOS device can be a source for a destination IP SLAs responder.
- You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

Information About SLAs

Cisco IOS IP Service Level Agreements (SLAs)

Cisco IOS IP SLAs send data across the network to measure performance between multiple network locations or across multiple network paths. They simulate network data and IP services and collect network performance information in real time. Cisco IOS IP SLAs generate and analyze traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLA operations can be used for troubleshooting, for problem analysis, and for designing network topologies.
Depending on the specific Cisco IOS IP SLA operations, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLA packets have configurable IP and application layer options such as source and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs are Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs collect and analyze the following performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)
- Path (per hop)
- Connectivity (directional)
- Server or website download time

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like Cisco Prime Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products.

Using IP SLAs can provide the following benefits:

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
  - Measurement of jitter, latency, or packet loss in the network.
  - Continuous, reliable, and predictable measurements.
- IP service network health assessment to verify that the existing QoS is sufficient for new IP services.
- Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).
- Network operation troubleshooting by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.
- Multiprotocol Label Switching (MPLS) performance monitoring and network verification (if the device supports MPLS).

**Network Performance Measurement with Cisco IOS IP SLAs**

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices.
The following figure shows how IP SLAs begin when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation, it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

The IP SLA responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLA request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLA Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond.

Note

The IP SLA responder can be a Cisco IOS Layer 2, responder-configurable device. The responder does not need to support full IP SLA functionality.

The following figure shows where the Cisco IOS IP SLA responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLA operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLA packet, or when the specified time expires. MD5 authentication for control messages is available for added security.
You do not need to enable the responder on the destination device for all IP SLA operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP).

### Response Time Computation for IP SLAs

Switches, controllers, and routers can take tens of milliseconds to process incoming packets due to other high-priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimize these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLA test packets use time stamping to minimize the processing delays.

When the IP SLA responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

The following figure demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt level to allow for greater accuracy. RTT (Round-trip time) = T4 (Time stamp 4) - T1 (Time stamp 1) - Δ

An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.
IP SLAs Operation Scheduling

When you configure an IP SLAs operation, you must schedule the operation to begin capturing statistics and collecting error information. You can schedule an operation to start immediately or to start at a certain month, day, and hour. You can use the pending option to set the operation to start at a later time. The pending option is an internal state of the operation that is visible through SNMP. The pending state is also used when an operation is a reaction (threshold) operation waiting to be triggered. You can schedule a single IP SLAs operation or a group of operations at one time.

You can schedule several IP SLAs operations by using a single command through the Cisco IOS CLI or the CISCO RTTMON-MIB. Scheduling the operations to run at evenly distributed times allows you to control the amount of IP SLAs monitoring traffic. This distribution of IP SLA operations helps minimize the CPU utilization and thus improves network scalability.

For more details about the IP SLA multi-operations scheduling functionality, see the “IP SLAs—Multiple Operation Scheduling” chapter of the Cisco IOS IP SLAs Configuration Guide.

IP SLA Operation Threshold Monitoring

To support successful service level agreement monitoring, you must have mechanisms that notify you immediately of any possible violation. IP SLAs can send SNMP traps that are triggered by events such as the following:

- Connection loss
- Timeout
- Round-trip time threshold
- Average jitter threshold
- One-way packet loss
- One-way jitter
- One-way mean opinion score (MOS)
- One-way latency

An IP SLA threshold violation can also trigger another IP SLA operation for further analysis. For example, the frequency could be increased or an Internet Control Message Protocol (ICMP) path echo or ICMP path jitter operation could be initiated for troubleshooting.

ICMP Echo

The ICMP echo operation measures the end-to-end response time between a Cisco device and any other device that uses IP. The response time is computed by measuring the time it takes to send an ICMP echo request message to a destination and receive an ICMP echo reply. Many customers use IP SLA ICMP-based operations, in-house ping testing, or ping-based dedicated probes to measure this response time. The IP SLA ICMP echo operation conforms to the same specifications as ICMP ping testing, and both methods result in the same response times.
UDP Jitter

Jitter is a simple term that describes interpacket delay variance. When multiple packets are sent consecutively at an interval of 10 ms from source to destination, the destination should receive them 10 ms apart (if the network is behaving correctly). However, if there are delays in the network (such as queuing, arriving through alternate routes, and so on), the time interval between packet arrivals might be more or less than 10 ms. A positive jitter value indicates that the packets arrived more than 10 ms apart. A negative jitter value indicates that the packets arrived less than 10 ms apart. If the packets arrive 12 ms apart, the positive jitter is 2 ms; if the packets arrive 8 ms apart, the negative jitter is 2 ms. For delay-sensitive networks, positive jitter values are undesirable, and a jitter value of 0 is ideal.

In addition to monitoring jitter, the IP SLA UDP jitter operation can be used as a multipurpose data gathering operation. The packets generated by IP SLAs carry sequence information and time stamps from the source and operational target that include packet sending and receiving data. Based on this data, UDP jitter operations measure the following:

- Per-direction jitter (source to destination and destination to source)
- Per-direction packet-loss
- Per-direction delay (one-way delay)
- Round-trip delay (average round-trip time)

Because the paths for the sending and receiving of data can be different (asymmetric), you can use the per-direction data to more readily identify where congestion or other problems are occurring in the network.

The UDP jitter operation generates synthetic (simulated) UDP traffic and sends a number of UDP packets, each of a specified size, sent a specified number of milliseconds apart, from a source router to a target router, at a given frequency. By default, ten packet-frames, each with a payload size of 10 bytes are generated every 10 ms, and the operation is repeated every 60 seconds. You can configure each of these parameters to best simulate the IP service you want to provide.

To provide accurate one-way delay (latency) measurements, time synchronization (as provided by NTP) is required between the source and the target device. Time synchronization is not required for the one-way jitter and packet loss measurements. If the time is not synchronized between the source and target devices, one-way jitter and packet loss data is returned, but values of 0 are returned for the one-way delay measurements provided by the UDP jitter operation.

How to Configure IP SLAs Operations

This section does not include configuration information for all available operations as the configuration information details are included in the Cisco IOS IP SLAs Configuration Guide. It does include several operations as examples, including configuring the responder, configuring a UDP jitter operation, which requires a responder, and configuring an ICMP echo operation, which does not require a responder. For details about configuring other operations, see the Cisco IOS IP SLAs Configuration Guide.

Default Configuration

No IP SLAs operations are configured.
Configuration Guidelines

For information on the IP SLA commands, see the *Cisco IOS IP SLAs Command Reference, Release 12.4T* command reference.

For detailed descriptions and configuration procedures, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4T*.

Not all of the IP SLA commands or operations described in the referenced guide are supported on the device. The device supports IP service level analysis by using UDP jitter, UDP echo, HTTP, TCP connect, ICMP echo, ICMP path echo, ICMP path jitter, FTP, DNS, and DHCP, as well as multiple operation scheduling and proactive threshold monitoring. It does not support VoIP service levels using the gatekeeper registration delay operations measurements.

Before configuring any IP SLAs application, you can use the `show ip sla application` privileged EXEC command to verify that the operation type is supported on your software image. This is an example of the output from the command:

```
Device# show ip sla application

IP Service Level Agreements
Version: Round Trip Time MIB 2.2.0, Infrastructure Engine-III

Supported Operation Types:
icmpEcho, path-echo, path-jitter, udpEcho, tcpConnect, http
dns, udpJitter, dhcp, ftp, udpApp, wspApp

Supported Features:
IPSLAs Event Publisher

IP SLAs low memory water mark: 33299323
Estimated system max number of entries: 24389

Estimated number of configurable operations: 24389
Number of Entries configured : 0
Number of active Entries   : 0
Number of pending Entries  : 0
Number of inactive Entries : 0
Time of last change in whole IP SLAs: *13:04:37.668 UTC Wed Dec 19 2012
```

Configuring the IP SLA Responder

The IP SLA responder is available only on Cisco IOS software-based devices, including some Layer 2 devices that do not support full IP SLA functionality.

Follow these steps to configure the IP SLA responder on the target device (the operational target):

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip sla responder {tcp-connect | udp-echo} ipaddress ip-address port port-number`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`
## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Enable            | Enables privileged EXEC mode.  
  Example:  
  `Device> enable`  
  <br>Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| Configure terminal| Enters global configuration mode.  
  Example:  
  `Device# configure terminal`  
  <br>Enters global configuration mode. |
| Ip sla responder   | Configures the device as an IP SLA responder.  
  Example:  
  `Device(config)# ip sla responder udp-echo 172.29.139.134 5000`  
  <br>Configures the device as an IP SLA responder.  
  The keywords have these meanings:  
  • tcp-connect—Enables the responder for TCP connect operations.  
  • udp-echo—Enables the responder for User Datagram Protocol (UDP) echo or jitter operations.  
  • ipaddress ip-address—Enter the destination IP address.  
  • port port-number—Enter the destination port number.  
  Note The IP address and port number must match those configured on the source device for the IP SLA operation. |
| End                | Returns to privileged EXEC mode.  
  Example:  
  `Device(config)# end`  
  <br>Returns to privileged EXEC mode. |
| Show running-config | Verifies your entries.  
  Example:  
  `Device# show running-config`  
  <br>Verifies your entries. |
| Copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
  Example:  
  `Device# copy running-config startup-config`  
  <br>(Optional) Saves your entries in the configuration file. |
Implementing IP SLA Network Performance Measurement

Follow these steps to implement IP SLA network performance measurement on your device:

Before you begin

Use the `show ip sla application` privileged EXEC command to verify that the desired operation type is supported on your software image.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip sla operation-number
4. `udp-jitter` `destination-ip-address | destination-hostname` `destination-port` `[source-ip` `{ip-address | hostname}` `] [source-port` `port-number] [control` `{enable | disable}` `] [num-packets` `number-of-packets]` `[interval` `interpacket-interval]`
5. frequency `seconds`
6. threshold `milliseconds`
7. exit
8. `ip sla schedule` `operation-number [life` `{forever | seconds}] [start-time` `{hh:mm [ss] [month day | day month] | pending | now | after` `hh:mm:ss] [ageout` `seconds] [recurring]`
9. end
10. show running-config
11. copy running-config startup-config

**UDP Jitter Configuration**

This example shows how to configure a UDP jitter IP SLA operation:

```
Device(config)# ip sla 10
Device(config-ip-sla)# udp-jitter 172.29.139.134 5000
Device(config-ip-sla-jitter)# frequency 30
Device(config-ip-sla-jitter)# exit
Device(config)# ip sla schedule 5 start-time now life forever
Device(config)# end
Device# show ip sla configuration 10
```

IP SLAs, Infrastructure Engine-II.

**Analyzing IP Service Levels by Using the UDP Jitter Operation**

Follow these steps to configure a UDP jitter operation on the source device:

**Before you begin**

You must enable the IP SLA responder on the target device (the operational target) to configure a UDP jitter operation on the source device.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip sla operation-number
4. **udp-jitter** \{destination-ip-address | destination-hostname\} destination-port [source-ip \{ip-address | hostname\}] [source-port port-number] [control \{enable | disable\}] [num-packets number-of-packets] [interval interpacket-interval]

5. **frequency** seconds

6. **exit**

7. **ip sla schedule** operation-number [life \{forever | seconds\}] [start-time \{hh:mm [s] | month day | day month\} | pending | now | after hh:mm:ss [ageout seconds] [recurring]

8. **end**

9. **show running-config**

10. **copy running-config startup-config**

### DETAILED STEPS

<table>
<thead>
<tr>

<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

**Step 2** configure terminal

**Example:**

Device# configure terminal

**Step 3** ip sla operation-number

**Example:**

Device(config)# ip sla 10

**Step 4** udp-jitter \{destination-ip-address | destination-hostname\} destination-port [source-ip \{ip-address | hostname\}] [source-port port-number] [control \{enable | disable\}] [num-packets number-of-packets] [interval interpacket-interval]

**Example:**

Device(config-ip-sla)# udp-jitter 172.29.139.134 5000

**Step 4** Configures the IP SLA operation as a UDP jitter operation, and enters UDP jitter configuration mode.

- **destination-ip-address | destination-hostname**—Specifies the destination IP address or hostname.

- **destination-port**—Specifies the destination port number in the range from 1 to 65535.

- (Optional) **source-ip \{ip-address | hostname\}**—Specifies the source IP address or hostname. When a source IP address or hostname is not specified, IP SLA chooses the IP address nearest to the destination.

- (Optional) **source-port port-number**—Specifies the source port number in the range from 1 to 65535.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>When a port number is not specified, IP SLA chooses an available port.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) <strong>control</strong>—Enables or disables sending of IP SLA control messages to the IP SLA responder. By default, IP SLA control messages are sent to the destination device to establish a connection with the IP SLA responder.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) <strong>num-packets number-of-packets</strong>—Enters the number of packets to be generated. The range is 1 to 6000; the default is 10.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) <strong>interval inter-packet-interval</strong>—Enters the interval between sending packets in milliseconds. The range is 1 to 6000; the default value is 20 ms.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**  
**Example:**  
Device(config-ip-sla-jitter)# frequency 45  

**Step 6**  
**Example:**  
Device(config-ip-sla-jitter)# exit  

**Step 7**  
**Example:**  
Device(config)# ip sla schedule 10 start-time now life forever  

(Optional) Sets the rate at which a specified IP SLA operation repeats. The range is from 1 to 604800 seconds; the default is 60 seconds.

Exits UDP jitter configuration mode, and returns to global configuration mode.

Configures the scheduling parameters for an individual IP SLA operation.

• **operation-number**—Enter the RTR entry number.

• (Optional) **life**—Sets the operation to run indefinitely (forever) or for a specific number of seconds. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour).

• (Optional) **start-time**—Enters the time for the operation to begin collecting information:

  - To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. If no month is entered, the default is the current month.
  - Enter **pending** to select no information collection until a start time is selected.
  - Enter **now** to start the operation immediately.
  - Enter **after hh:mm:ss** to show that the operation should start after the entered time has elapsed.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• (Optional) ageout seconds</td>
<td>— Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds, the default is 0 seconds (never ages out).</td>
</tr>
<tr>
<td>• (Optional) recurring</td>
<td>— Set the operation to automatically run every day.</td>
</tr>
</tbody>
</table>

### Step 8

**Example:**

Device(config)# end

Returns to privileged EXEC mode.

### Step 9

**Example:**

Device# show running-config

Verifies your entries.

### Step 10

**Example:**

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

**Configuring a UDP Jitter IP SLA Operation**

This example shows how to configure a UDP jitter IP SLA operation:

Device(config)# ip sla 10
Device(config-ip-sla)# udp-jitter 172.29.139.134 5000
Device(config-ip-sla-jitter)# frequency 30
Device(config-ip-sla-jitter)# exit
Device(config)# ip sla schedule 5 start-time now life forever
Device(config)# end
Device# show ip sla configuration 10

IP SLAs, Infrastructure Engine-II.

Analyzing IP Service Levels by Using the ICMP Echo Operation

Follow these steps to configure an ICMP echo operation on the source device:

**Before you begin**

This operation does not require the IP SLA responder to be enabled.

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip sla operation-number**
4. **icmp-echo** `{destination-ip-address | destination-hostname} [source-ip {ip-address | hostname} | source-interface interface-id]`
5. **frequency seconds**
6. **exit**
7. **ip sla schedule operation-number [life {forever | seconds}] [start-time {hh:mm [:ss] [month day | day month] | pending | now | after hh:mm:ss] [ageout seconds] [recurring]**
8. **end**
9. **show running-config**
10. **copy running-config startup-config**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; <strong>enable</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>
**Command or Action** | **Purpose**
---|---
**Step 2** configure terminal  
*Example:*
Device# configure terminal  

**Step 3** ip sla operation-number  
*Example:*
Device(config)# ip sla 10  

**Step 4** icmp-echo {destination-ip-address | destination-hostname} [source-ip {ip-address | hostname} | source-interface interface-id]  
*Example:*
Device(config-ip-sla)# icmp-echo 172.29.139.134  

**Step 5** frequency seconds  
*Example:*
Device(config-ip-sla-echo)# frequency 30  

**Step 6** exit  
*Example:*
Device(config-ip-sla-echo)# exit  

**Step 7** ip sla schedule operation-number [life {forever | seconds}] [start-time {hh:mm:ss} [month day] | pending | now | after hh:mm:ss] [ageout seconds] [recurring]  
*Example:*
Device(config)# ip sla schedule 5 start-time now life forever
### Configuring an ICMP Echo IP SLA Operation

This example shows how to configure an ICMP echo IP SLA operation:

```
Device(config)# ip sla 12
Device(config-ip-sla)# icmp-echo 172.29.139.134
Device(config-ip-sla-echo)# frequency 30
Device(config-ip-sla-echo)# exit
```
Device(config)# ip sla schedule 5 start-time now life forever
Device(config)# end
Device# show ip sla configuration 22
IP SLAs, Infrastructure Engine-II.

CHAPTER 70

Configuring Local Policies

• Restrictions for Configuring Local Policies, on page 1101
• Information About Configuring Local Policies, on page 1101
• How to Configure Local Policies, on page 1103
• Monitoring Local Policies, on page 1107
• Examples: Local Policies Configuration, on page 1108
• Additional References for Configuring Local Policies, on page 1108
• Feature History for Performing Local Policies Configuration, on page 1109

Restrictions for Configuring Local Policies

• The policy map attributes supported on the device are QoS, VLAN, session timeout, and ACL.
• Apple iphone 6s will get classified as "workstation" after HTTP profiling.

Information About Configuring Local Policies

Local policies can profile devices based on HTTP and DHCP to identify the end devices on the network. Users can configure device-based policies and enforce the policies per user or per device policy on the network. Local policies allow profiling of mobile devices and basic onboarding of the profiled devices to a specific VLAN. They also assign ACL and QoS or configure session timeouts. You can configure local policies as two separate components:

• Defining policy attributes as service templates specific to clients joining the network and applying policy match criteria.

• Applying match criteria to the policy.

The following policy match attributes are used for configuring local policies:

• Device—Defines the type of device. Windows-based computer, Smartphone, Apple devices such as iPad and iPhone.

• Username—Defines the username of the user.

• User role—Defines the user type or the user group the user belongs to, such as a student or employee.
• MAC— Defines the mac-address of the endpoint.
• MAC OUI— Defines the mac-address OUI.

Once the device has a match corresponding to these parameters per endpoint, the policy can be added. Policy enforcement allows basic device on-boarding of mobile devices based on the following session attributes:

• VLAN
• QoS
• ACL
• Session timeout

You can configure these policies and enforce end points with specified policies. The wireless clients are profiled based on . The device uses these attributes and predefined classification profiles to identify devices.

Replacing Default Profile Text File

If a new device is not classified, contact the Cisco support team with the device MAC address. The Cisco support team will provide a new `dc_default_profile.txt` file with the MAC address included in the file. You need to replace the `dc_default_profile.txt` file with the earlier file. Follow these steps to change the `dc_default_profile.txt` file:

1. Stop device classifier by entering this command:
   ```
   device(config)# no device classifier
   ```
2. Copy the file by entering this command:
   ```
   device# device classifier profile location filepath
   ```
3. Start the device classifier by entering this command:
   ```
   device(config)# device classifier
   ```

Disabling session monitor on trunk ports

On uplink trunk ports, you should not create any session monitoring. By default, session monitoring is enabled. You should disable session monitoring.

1. Enter into global configuration mode by entering this command:
   ```
   device# configure terminal
   ```
2. Enter into interface configuration mode by entering this command:
   ```
   device(config)# interface interface-id
   ```
3. Disable session monitoring by entering this command:
   ```
   device(config-if)# no access-session monitor
   ```
How to Configure Local Policies

Configuring Local Policies (CLI)

To configure local policies, complete these procedures:

1. Create a service template.
2. Create an interface template.
3. Create a parameter map.
4. Create a policy map.
5. Apply a local policy on a WLAN.

Creating an Interface Template (CLI)

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>template interface-template-name</td>
<td>Enters interface template configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# template cisco-phone-template</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>switchport mode access</td>
<td>Sets the interface as a nontrunking nontagged single-VLAN Ethernet interface. An access port can carry traffic in one VLAN only. By default, an access port carries traffic for VLAN 1.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-template)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>switchport voice vlan vlan_id</td>
<td>Specifies to forward all voice traffic through the specified VLAN. You can specify a value from 1 to 4094.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-template)# switchport voice vlan 20</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Creating a Parameter Map (CLI)

Parameter map is preferred to use than class map.
### Creating a Class Map (CLI)

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>parameter-map type subscriber attribute-to-service parameter-map-name</code></td>
<td>Specifies the parameter map type and name.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>parameter-map type subscriber attribute-to-service Aironet-Policy-para</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`map-index map { device-type</td>
<td>mac-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-parameter-map-filter)# <code>10 map device-type eq &quot;WindowsXP-Workstation&quot;</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>interface-template interface-template-name</code></td>
<td>Enters service template configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-parameter-map-filter-submode)# <code>interface-template cisco-phone-template</code> Device(config-parameter-map-filter-submode)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press <strong>Ctrl-Z</strong> to exit global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <code>end</code></td>
<td></td>
</tr>
</tbody>
</table>
## Creating a Policy Map (CLI)

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Purpose</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>policy-map type control subscriber <em>policy-map-name</em></td>
<td>Specifies the policy map type.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# policy-map type control subscriber Aironet-Policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>event identity-update {match-all</td>
<td>match-first}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-policy-map)# event identity-update match-all</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>class_number class {class_map_name</td>
<td>always } {do-all</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-class-control-policymap)# 1 class local_policy1_class do-until-success</td>
<td></td>
</tr>
</tbody>
</table>

### Purpose

- **Purpose**: Configures the local profiling policy class map number and specifies how to perform the action. The class map configuration mode includes the following command options:
  - **always**—Executes without doing any matching but return success.
  - **do-all**—Executes all the actions.
  - **do-until-failure**—Execute all the actions until any match failure is encountered. This is the default value.
  - **do-until-success**—Execute all the actions until any match success happens.
Applying a Local Policy for a Device on a WLAN (CLI)

Before you begin
If the service policy contains any device type-based rules in the parameter map, ensure that the device classifier is already enabled.

Note
You should use the device classification command to classify the device for it to be displayed correctly on the show command output.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> wlan wlan-name</td>
<td>Enters WLAN configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# wlan wlan1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> service-policy type control subscriber policymapname</td>
<td>Applies local policy to WLAN.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-wlan)# service-policy type control subscriber Aironet-Policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> profiling local http (optional)</td>
<td>Enables only profiling of devices based on HTTP protocol (optional).</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-wlan)# profiling local http</td>
<td></td>
</tr>
</tbody>
</table>
### Monitoring Local Policies

The following commands can be used to monitor local policies configured on the device.

**Table 79: Monitoring Local Policies Command**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show access-session</code></td>
<td>Displays the summary of access session with authorization status, method and domain for each client or MAC address displayed.</td>
</tr>
<tr>
<td><code>show access-session cache</code></td>
<td>Displays the latest classification for the client.</td>
</tr>
<tr>
<td><code>show device classifier attached detail</code></td>
<td>Displays the latest classification for the client based on parameters such as Mac, DHCP, or HTTP.</td>
</tr>
<tr>
<td><code>show access-session mac mac-address details</code></td>
<td>Displays the policy mapped, service template used, and attributes for the client. <strong>Note</strong> If the <code>show access-session detail</code> command output is not displaying session timeout details, you should enable client profiling with session timeout in client access session and then run the <code>show access-session mac mac-address details</code> command to see the session timeout details.</td>
</tr>
<tr>
<td><code>show access-session mac mac-address policy</code></td>
<td>Displays the policy mapped, service template used, and attributes for the client. In addition, you can view the Resultant Policy that displays the following information: • The final attributes applied to the session when the session has locally configured attributes. • Attributes applied from the server.</td>
</tr>
</tbody>
</table>
Examples: Local Policies Configuration

At the end of each configuration command line, enter CTRL Z to execute the command and proceed to the next line.

This example shows how to create interface template:

```
Device# configure terminal
Device(config)#template cisco-phone-template
Device(config-template)#switchport mode access
Device(config-template)#switchport voice vlan 20
Device(config-template)# end
```

This example shows how to create parameter map:

```
Device# configure terminal
Device(config)#parameter-map type subscriber attribute-to-service param-wired
Device(config-parameter-map-filter)#10 map device-type regex Cisco-IP-Phone
Device(config-parameter-map-filter-submode)#10 interface-template cisco-phone-template
Device(config-parameter-map-filter-submode)# end
```

This example shows how to create policy map:

```
Device(config)# policy-map type control subscriber apple-tsim
Device(config-policy-map)# event identity-update match-all
Device(config-policy-map)# 1 class always do-until-failure
Device(config-policy-map)# 1 map attribute-to-service table apple-tsim-param
Device(config-policy-map)# end
```

This example shows how to apply policy to a device on a WLAN:

```
Device(config)# wlan wlan1
Device(config-wlan)# client vlan VLAN0054
Device(config-wlan)# profiling local http
Device(config-wlan)# service-policy type control subscriber apple-tsim
Device(config-wlan)# no shutdown
Device# end
```

Configuring SPAN and RSPAN

• Finding Feature Information, on page 1111
• Prerequisites for SPAN and RSPAN, on page 1111
• Restrictions for SPAN and RSPAN, on page 1112
• Information About SPAN and RSPAN, on page 1113
• How to Configure SPAN and RSPAN, on page 1124
• Monitoring SPAN and RSPAN Operations, on page 1147
• SPAN and RSPAN Configuration Examples, on page 1147
• Additional References, on page 1150
• Feature History and Information for SPAN and RSPAN, on page 1151

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Prerequisites for SPAN and RSPAN

SPAN

• You can limit SPAN traffic to specific VLANs by using the `filter vlan` keyword. If a trunk port is being monitored, only traffic on the VLANs specified with this keyword is monitored. By default, all VLANs are monitored on a trunk port.

RSPAN

• We recommend that you configure an RSPAN VLAN before you configure an RSPAN source or a destination session.
Restrictions for SPAN and RSPAN

SPAN

The restrictions for SPAN are as follows:

- On each device, you can configure 66 sessions. A maximum of 8 source sessions can be configured and the remaining sessions can be configured as RSPAN destinations sessions. A source session is either a local SPAN session or an RSPAN source session.

- For SPAN sources, you can monitor traffic for a single port or VLAN or a series or range of ports or VLANs for each session. You cannot mix source ports and source VLANs within a single SPAN session.

- The destination port cannot be a source port; a source port cannot be a destination port.

- You cannot have two SPAN sessions using the same destination port.

- When you configure a device port as a SPAN destination port, it is no longer a normal device port; only monitored traffic passes through the SPAN destination port.

- Entering SPAN configuration commands does not remove previously configured SPAN parameters. You must enter the `no monitor session {session_number | all | local | remote}` global configuration command to delete configured SPAN parameters.

- For local SPAN, outgoing packets through the SPAN destination port carry the original encapsulation headers—untagged, ISL, or IEEE 802.1Q—if the `encapsulation replicate` keywords are specified. If the keywords are not specified, the packets are sent in native form.

- You can configure a disabled port to be a source or destination port, but the SPAN function does not start until the destination port and at least one source port or source VLAN are enabled.

- You cannot mix source VLANs and filter VLANs within a single SPAN session.

Traffic monitoring in a SPAN session has the following restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.

- Wireshark does not capture egress packets when egress span is active.

- You can run both a local SPAN and an RSPAN source session in the same device or device stack. The device or device stack supports a total of 66 source and RSPAN destination sessions.

- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.

- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per device stack.

- SPAN sessions do not interfere with the normal operation of the device. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.

- When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.
• You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.

• The device does not support a combination of local SPAN and RSPAN in a single session.
  - An RSPAN source session cannot have a local destination port.
  - An RSPAN destination session cannot have a local source port.
  - An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same device or device stack.

RSPAN

The restrictions for RSPAN are as follows:

• RSPAN does not support BPDU packet monitoring or other Layer 2 device protocols.

• The RSPAN VLAN is configured only on trunk ports and not on access ports. To avoid unwanted traffic in RSPAN VLANs, make sure that the VLAN remote-span feature is supported in all the participating devices.

• RSPAN VLANs are included as sources for port-based RSPAN sessions when source trunk ports have active RSPAN VLANs. RSPAN VLANs can also be sources in SPAN sessions. However, since the device does not monitor spanned traffic, it does not support egress spanning of packets on any RSPAN VLAN identified as the destination of an RSPAN source session on the device.

• If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network for VLAN IDs that are lower than 1005.

• To use RSPAN, the switch must be running the LAN Base image.

Information About SPAN and RSPAN

SPAN and RSPAN

You can analyze network traffic passing through ports or VLANs by using SPAN or RSPAN to send a copy of the traffic to another port on the device or on another device that has been connected to a network analyzer or other monitoring or security device. SPAN copies (or mirrors) traffic received or sent (or both) on source ports or source VLANs to a destination port for analysis. SPAN does not affect the switching of network traffic on the source ports or VLANs. You must dedicate the destination port for SPAN use. Except for traffic that is required for the SPAN or RSPAN session, destination ports do not receive or forward traffic.

Only traffic that enters or leaves source ports or traffic that enters or leaves source VLANs can be monitored by using SPAN; traffic routed to a source VLAN cannot be monitored. For example, if incoming traffic is being monitored, traffic that gets routed from another VLAN to the source VLAN cannot be monitored; however, traffic that is received on the source VLAN and routed to another VLAN can be monitored.

You can use the SPAN or RSPAN destination port to inject traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) sensor appliance to a destination port, the IDS device can send TCP reset packets to close down the TCP session of a suspected attacker.
Local SPAN

Local SPAN supports a SPAN session entirely within one device; all source ports or source VLANs and destination ports are in the same device or device stack. Local SPAN copies traffic from one or more source ports in any VLAN or from one or more VLANs to a destination port for analysis.

*Figure 79: Example of Local SPAN Configuration on a Single Device*

All traffic on port 5 (the source port) is mirrored to port 10 (the destination port). A network analyzer on port 10 receives all network traffic from port 5 without being physically attached to port 5.

*Figure 80: Example of Local SPAN Configuration on a Device Stack*

This is an example of a local SPAN in a device stack, where the source and destination ports reside on different stack members.

**Related Topics**

Creating a Local SPAN Session, on page 1124
Remote SPAN

RSPAN supports source ports, source VLANs, and destination ports on different devices (or different device stacks), enabling remote monitoring of multiple devices across your network.

Figure 81: Example of RSPAN Configuration

The figure below shows source ports on Device A and Device B. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating devices. The RSPAN traffic from the source ports or VLANs is copied into the RSPAN VLAN and forwarded over trunk ports carrying the RSPAN VLAN to a destination session monitoring the RSPAN VLAN. Each RSPAN source device must have either ports or VLANs as RSPAN sources. The destination is always a physical port, as shown on Device C in the figure.

SPAN and RSPAN Concepts and Terminology

SPAN Sessions

SPAN sessions (local or remote) allow you to monitor traffic on one or more ports, or one or more VLANs, and send the monitored traffic to one or more destination ports.

A local SPAN session is an association of a destination port with source ports or source VLANs, all on a single network device. Local SPAN does not have separate source and destination sessions. Local SPAN sessions gather a set of ingress and egress packets specified by the user and form them into a stream of SPAN data, which is directed to the destination port.

RSPAN consists of at least one RSPAN source session, an RSPAN VLAN, and at least one RSPAN destination session. You separately configure RSPAN source sessions and RSPAN destination sessions on different network devices. To configure an RSPAN source session on a device, you associate a set of source ports or source VLANs with an RSPAN VLAN. The output of this session is the stream of SPAN packets that are sent to the RSPAN VLAN. To configure an RSPAN destination session on another device, you associate the destination port with the RSPAN VLAN. The destination session collects all RSPAN VLAN traffic and sends it out the RSPAN destination port.

An RSPAN source session is very similar to a local SPAN session, except for where the packet stream is directed. In an RSPAN source session, SPAN packets are relabeled with the RSPAN VLAN ID and directed over normal trunk ports to the destination device.

An RSPAN destination session takes all packets received on the RSPAN VLAN, strips off the VLAN tagging, and presents them on the destination port. The session presents a copy of all RSPAN VLAN packets (except Layer 2 control packets) to the user for analysis.

A single RSPAN session with multiple source and destination ports can be in the same session but more than one source session with the source being the same remote VLAN is not allowed.

Traffic monitoring in a SPAN session has these restrictions:

- Sources can be ports or VLANs, but you cannot mix source ports and source VLANs in the same session.
- You can run both a local SPAN and an RSPAN source session in the same device or device stack. The device or device stack supports a total of 66 source and RSPAN destination sessions.
- You can configure two separate SPAN or RSPAN source sessions with separate or overlapping sets of SPAN source ports and VLANs. Both switched and routed ports can be configured as SPAN sources and destinations.
- You can have multiple destination ports in a SPAN session, but no more than 64 destination ports per device stack.
- SPAN sessions do not interfere with the normal operation of the device. However, an oversubscribed SPAN destination, for example, a 10-Mb/s port monitoring a 100-Mb/s port, can result in dropped or lost packets.
- When SPAN or RSPAN is enabled, each packet being monitored is sent twice, once as normal traffic and once as a monitored packet. Therefore monitoring a large number of ports or VLANs could potentially generate large amounts of network traffic.
- You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.
- The device does not support a combination of local SPAN and RSPAN in a single session.
• An RSPAN source session cannot have a local destination port.
• An RSPAN destination session cannot have a local source port.
• An RSPAN destination session and an RSPAN source session that are using the same RSPAN VLAN cannot run on the same device or device stack.

Example: Configuring Local SPAN, on page 1147

Monitored Traffic

SPAN sessions can monitor these traffic types:

• Receive (Rx) SPAN—Receive (or ingress) SPAN monitors as much as possible all of the packets received by the source interface or VLAN before any modification or processing is performed by the device. A copy of each packet received by the source is sent to the destination port for that SPAN session. Packets that are modified because of routing or Quality of Service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied before modification. Features that can cause a packet to be dropped during receive processing have no effect on ingress SPAN; the destination port receives a copy of the packet even if the actual incoming packet is dropped. These features include IP standard and extended input Access Control Lists (ACLs), ingress QoS policing, VLAN ACLs, and egress QoS policing.

• Transmit (Tx) SPAN—Transmit (or egress) SPAN monitors as much as possible all of the packets sent by the source interface after all modification and processing is performed by the device. A copy of each packet sent by the source is sent to the destination port for that SPAN session. The copy is provided after the packet is modified. Packets that are modified because of routing (for example, with modified time-to-live (TTL), MAC address, or QoS values) are duplicated (with the modifications) at the destination port. Features that can cause a packet to be dropped during transmit processing also affect the duplicated copy for SPAN. These features include IP standard and extended output ACLs and egress QoS policing.

• Both—In a SPAN session, you can also monitor a port or VLAN for both received and sent packets. This is the default.

The default configuration for local SPAN session ports is to send all packets untagged. However, when you enter the encapsulation replicate keywords while configuring a destination port, these changes occur:

• Packets are sent on the destination port with the same encapsulation (untagged or IEEE 802.1Q) that they had on the source port.

• Packets of all types, including BPDU and Layer 2 protocol packets, are monitored.

Therefore, a local SPAN session with encapsulation replicate enabled can have a mixture of untagged and IEEE 802.1Q tagged packets appear on the destination port.

Device congestion can cause packets to be dropped at ingress source ports, egress source ports, or SPAN destination ports. In general, these characteristics are independent of one another. For example:
A packet might be forwarded normally but dropped from monitoring due to an oversubscribed SPAN destination port.

An ingress packet might be dropped from normal forwarding, but still appear on the SPAN destination port.

An egress packet dropped because of device congestion is also dropped from egress SPAN.

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the Rx monitor on port A and Tx monitor on port B. If a packet enters the device through port A and is switched to port B, both incoming and outgoing packets are sent to the destination port. Both packets are the same unless a Layer 3 rewrite occurs, in which case the packets are different because of the packet modification.

Source Ports

A source port (also called a monitored port) is a switched or routed port that you monitor for network traffic analysis.

In a local SPAN session or RSPAN source session, you can monitor source ports or VLANs for traffic in one or both directions.

The device supports any number of source ports (up to the maximum number of available ports on the device) and any number of source VLANs (up to the maximum number of VLANs supported).

You cannot mix ports and VLANs in a single session.

A source port has these characteristics:

• It can be monitored in multiple SPAN sessions.
• Each source port can be configured with a direction (ingress, egress, or both) to monitor.
• It can be any port type (for example, EtherChannel, Gigabit Ethernet, and so forth).
• For EtherChannel sources, you can monitor traffic for the entire EtherChannel or individually on a physical port as it participates in the port channel.
• It can be an access port, trunk port, routed port, or voice VLAN port.
• It cannot be a destination port.
• Source ports can be in the same or different VLANs.
• You can monitor multiple source ports in a single session.

Source VLANs

VLAN-based SPAN (VSPAN) is the monitoring of the network traffic in one or more VLANs. The SPAN or RSPAN source interface in VSPAN is a VLAN ID, and traffic is monitored on all the ports for that VLAN.

VSPAN has these characteristics:

• All active ports in the source VLAN are included as source ports and can be monitored in either or both directions.
• On a given port, only traffic on the monitored VLAN is sent to the destination port.
• If a destination port belongs to a source VLAN, it is excluded from the source list and is not monitored.
• If ports are added to or removed from the source VLANs, the traffic on the source VLAN received by those ports is added to or removed from the sources being monitored.
• You cannot use filter VLANs in the same session with VLAN sources.
• You can monitor only Ethernet VLANs.

VLAN Filtering

When you monitor a trunk port as a source port, by default, all VLANs active on the trunk are monitored. You can limit SPAN traffic monitoring on trunk source ports to specific VLANs by using VLAN filtering.

• VLAN filtering applies only to trunk ports or to voice VLAN ports.
• VLAN filtering applies only to port-based sessions and is not allowed in sessions with VLAN sources.
• When a VLAN filter list is specified, only those VLANs in the list are monitored on trunk ports or on voice VLAN access ports.
• SPAN traffic coming from other port types is not affected by VLAN filtering; that is, all VLANs are allowed on other ports.
• VLAN filtering affects only traffic forwarded to the destination SPAN port and does not affect the switching of normal traffic.

Destination Port

Each local SPAN session or RSPAN destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports or VLANs and sends the SPAN packets to the user, usually a network analyzer.

A destination port has these characteristics:

• For a local SPAN session, the destination port must reside on the same device or device stack as the source port. For an RSPAN session, it is located on the device containing the RSPAN destination session. There is no destination port on a device or device stack running only an RSPAN source session.
• When a port is configured as a SPAN destination port, the configuration overwrites the original port configuration. When the SPAN destination configuration is removed, the port reverts to its previous configuration. If a configuration change is made to the port while it is acting as a SPAN destination port, the change does not take effect until the SPAN destination configuration had been removed.

Note

When QoS is configured on the SPAN destination port, QoS takes effect immediately.

• If the port was in an EtherChannel group, it is removed from the group while it is a destination port. If it was a routed port, it is no longer a routed port.
• It can be any Ethernet physical port.
• It cannot be a secure port.
• It cannot be a source port.
• It can be an EtherChannel group (ON mode only).
• It cannot be a VLAN.

• It can participate in only one SPAN session at a time (a destination port in one SPAN session cannot be a destination port for a second SPAN session).

• When it is active, incoming traffic is disabled. The port does not transmit any traffic except that required for the SPAN session. Incoming traffic is never learned or forwarded on a destination port.

• If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

• It does not participate in any of the Layer 2 protocols (STP, VTP, CDP, DTP, PagP).

• A destination port that belongs to a source VLAN of any SPAN session is excluded from the source list and is not monitored.

• The maximum number of destination ports in a device or device stack is 64.

Local SPAN and RSPAN destination ports function differently with VLAN tagging and encapsulation:

• For local SPAN, if the encapsulation replicate keywords are specified for the destination port, these packets appear with the original encapsulation (untagged, ISL, or IEEE 802.1Q). If these keywords are not specified, packets appear in the untagged format. Therefore, the output of a local SPAN session with encapsulation replicate enabled can contain a mixture of untagged, ISL, or IEEE 802.1Q-tagged packets.

• For RSPAN, the original VLAN ID is lost because it is overwritten by the RSPAN VLAN identification. Therefore, all packets appear on the destination port as untagged.

RSPAN VLAN

The RSPAN VLAN carries SPAN traffic between RSPAN source and destination sessions. RSPAN VLAN has these special characteristics:

• All traffic in the RSPAN VLAN is always flooded.

• No MAC address learning occurs on the RSPAN VLAN.

• RSPAN VLAN traffic only flows on trunk ports.

• RSPAN VLANs must be configured in VLAN configuration mode by using the remote-span VLAN configuration mode command.

• STP can run on RSPAN VLAN trunks but not on SPAN destination ports.

• An RSPAN VLAN cannot be a private-VLAN primary or secondary VLAN.

For VLANs 1 to 1005 that are visible to VLAN Trunking Protocol (VTP), the VLAN ID and its associated RSPAN characteristic are propagated by VTP. If you assign an RSPAN VLAN ID in the extended VLAN range (1006 to 4094), you must manually configure all intermediate devices.

It is normal to have multiple RSPAN VLANs in a network at the same time with each RSPAN VLAN defining a network-wide RSPAN session. That is, multiple RSPAN source sessions anywhere in the network can contribute packets to the RSPAN session. It is also possible to have multiple RSPAN destination sessions throughout the network, monitoring the same RSPAN VLAN and presenting traffic to the user. The RSPAN VLAN ID separates the sessions.

Related Topics

Creating an RSPAN Source Session, on page 1133
SPAN and RSPAN Interaction with Other Features

SPAN interacts with these features:

- **Routing**—SPAN does not monitor routed traffic. VSPAN only monitors traffic that enters or exits the device, not traffic that is routed between VLANs. For example, if a VLAN is being Rx-monitored and the device routes traffic from another VLAN to the monitored VLAN, that traffic is not monitored and not received on the SPAN destination port.

- **STP**—A destination port does not participate in STP while its SPAN or RSPAN session is active. The destination port can participate in STP after the SPAN or RSPAN session is disabled. On a source port, SPAN does not affect the STP status. STP can be active on trunk ports carrying an RSPAN VLAN.

- **CDP**—A SPAN destination port does not participate in CDP while the SPAN session is active. After the SPAN session is disabled, the port again participates in CDP.

- **VTP**—You can use VTP to prune an RSPAN VLAN between devices.

- **VLAN and trunking**—You can modify VLAN membership or trunk settings for source or destination ports at any time. However, changes in VLAN membership or trunk settings for a destination port do not take effect until you remove the SPAN destination configuration. Changes in VLAN membership or trunk settings for a source port immediately take effect, and the respective SPAN sessions automatically adjust accordingly.

- **EtherChannel**—You can configure an EtherChannel group as a source port or a SPAN destination port. When a group is configured as a SPAN source, the entire group is monitored.

  If a physical port is added to a monitored EtherChannel group, the new port is added to the SPAN source port list. If a port is removed from a monitored EtherChannel group, it is automatically removed from the source port list.

  A physical port that belongs to an EtherChannel group can be configured as a SPAN source port and still be a part of the EtherChannel. In this case, data from the physical port is monitored as it participates in the EtherChannel. However, if a physical port that belongs to an EtherChannel group is configured as a SPAN destination, it is removed from the group. After the port is removed from the SPAN session, it rejoins the EtherChannel group. Ports removed from an EtherChannel group remain members of the group, but they are in the inactive or suspended state.

  If a physical port that belongs to an EtherChannel group is a destination port and the EtherChannel group is a source, the port is removed from the EtherChannel group and from the list of monitored ports.

- **Multicast traffic** can be monitored. For egress and ingress port monitoring, only a single unedited packet is sent to the SPAN destination port. It does not reflect the number of times the multicast packet is sent.

- **A private-VLAN port** cannot be a SPAN destination port.

- **A secure port** cannot be a SPAN destination port.

For SPAN sessions, do not enable port security on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable port security on any ports with monitored egress.
• An IEEE 802.1x port can be a SPAN source port. You can enable IEEE 802.1x on a port that is a SPAN destination port; however, IEEE 802.1x is disabled until the port is removed as a SPAN destination.

For SPAN sessions, do not enable IEEE 802.1x on ports with monitored egress when ingress forwarding is enabled on the destination port. For RSPAN source sessions, do not enable IEEE 802.1x on any ports that are egress monitored.

**SPAN and RSPAN and Device Stacks**

Because the stack of devices represents one logical device, local SPAN source ports and destination ports can be in different devices in the stack. Therefore, the addition or deletion of devices in the stack can affect a local SPAN session, as well as an RSPAN source or destination session. An active session can become inactive when a device is removed from the stack or an inactive session can become active when a device is added to the stack.

**Flow-Based SPAN**

You can control the type of network traffic to be monitored in SPAN or RSPAN sessions by using flow-based SPAN (FSPAN) or flow-based RSPAN (FRSPAN), which apply access control lists (ACLs) to the monitored traffic on the source ports. The FSPAN ACLs can be configured to filter IPv4, IPv6, and non-IP monitored traffic.

You apply an ACL to a SPAN session through the interface. It is applied to all the traffic that is monitored on all interfaces in the SPAN session. The packets that are permitted by this ACL are copied to the SPAN destination port. No other packets are copied to the SPAN destination port.

The original traffic continues to be forwarded, and any port, VLAN, and router ACLs attached are applied. The FSPAN ACL does not have any effect on the forwarding decisions. Similarly, the port, VLAN, and router ACLs do not have any effect on the traffic monitoring. If a security input ACL denies a packet and it is not forwarded, the packet is still copied to the SPAN destination ports if the FSPAN ACL permits it. But if the security output ACL denies a packet and it is not sent, it is not copied to the SPAN destination ports. However, if the security output ACL permits the packet to go out, it is only copied to the SPAN destination ports if the FSPAN ACL permits it. This is also true for an RSPAN session.

You can attach three types of FSPAN ACLs to the SPAN session:

• IPv4 FSPAN ACL—Filters only IPv4 packets.
• IPv6 FSPAN ACL—Filters only IPv6 packets.
• MAC FSPAN ACL—Filters only non-IP packets.

If a VLAN-based FSPAN session configured on a stack cannot fit in the hardware memory on one or more devices, it is treated as unloaded on those devices, and traffic meant for the FSPAN ACL and sourcing on that device is not copied to the SPAN destination ports. The FSPAN ACL continues to be correctly applied, and traffic is copied to the SPAN destination ports on the devices where the FSPAN ACL fits in the hardware memory.

When an empty FSPAN ACL is attached, some hardware functions copy all traffic to the SPAN destination ports for that ACL. If sufficient hardware resources are not available, even an empty FSPAN ACL can be unloaded.

IPv4 and MAC FSPAN ACLs are supported on all feature sets. IPv6 FSPAN ACLs are supported only in the advanced IP Services feature set.

Configuration Guidelines

SPAN Configuration Guidelines

- To remove a source or destination port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command or the `no monitor session session_number destination interface interface-id` global configuration command. For destination interfaces, the `encapsulation` options are ignored with the `no` form of the command.

- To monitor all VLANs on the trunk port, use the `no monitor session session_number filter` global configuration command.

Related Topics

Creating a Local SPAN Session, on page 1124
Creating a Local SPAN Session and Configuring Incoming Traffic, on page 1127
Example: Configuring Local SPAN, on page 1147

RSPAN Configuration Guidelines

- All the SPAN configuration guidelines apply to RSPAN.

- As RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.

- You can apply an output ACL to RSPAN traffic to selectively filter or monitor specific packets. Specify these ACLs on the RSPAN VLAN in the RSPAN source devices.
• For RSPAN configuration, you can distribute the source ports and the destination ports across multiple devices in your network.

• Access ports (including voice VLAN ports) on the RSPAN VLAN are put in the inactive state.

• You can configure any VLAN as an RSPAN VLAN as long as these conditions are met:
  • The same RSPAN VLAN is used for an RSPAN session in all the devices.
  • All participating devices support RSPAN.

  Examples: Creating an RSPAN VLAN, on page 1149

FSPAN and FRSPAN Configuration Guidelines

• FSPAN is not supported on LAN base.

• When at least one FSPAN ACL is attached, FSPAN is enabled.

• When you attach at least one FSPAN ACL that is not empty to a SPAN session, and you have not attached one or more of the other FSPAN ACLs (for instance, you have attached an IPv4 ACL that is not empty, and have not attached IPv6 and MAC ACLs), FSPAN blocks the traffic that would have been filtered by the unattached ACLs. Therefore, this traffic is not monitored.

</tbody>
</table>
### Creating a Local SPAN Session

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• rx—Monitors received traffic.</td>
<td></td>
</tr>
<tr>
<td>• tx—Monitors sent traffic.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> You can use the <code>monitor session session_number source</code> command multiple times to configure multiple source ports.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

**monitor session session_number destination {interface interface-id [, | -] [encapsulation replicate]}

**Example:**

```
Device(config)# monitor session 1 destination interface gigabitethernet1/0/2 encapsulation replicate
```

Specifies the SPAN session and the destination port (monitoring port). The port LED changes to amber when the configuration changes take effect. The LED returns to its original state (green) only after removing the SPAN destination configuration.

**Note** For local SPAN, you must use the same session number for the source and destination interfaces.

- For `session_number`, specify the session number entered in step 4.
- For `interface-id`, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.
- (Optional) `[, | -]` Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.

(Optional) `encapsulation replicate` specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).

**Note** You can use `monitor session session_number destination` command multiple times to configure multiple destination ports.

### Step 6

**end**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

### Step 7

**show running-config**

**Example:**

```
Device# show running-config
```

Verifies your entries.
Creating a Local SPAN Session and Configuring Incoming Traffic

Follow these steps to create a SPAN session, to specify the source ports or VLANs and the destination ports, and to enable incoming traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

**SUMMARY STEPS**

1. enable
2. configure terminal
3. no monitor session \{session_number | all | local | remote\}
4. monitor session session_number source \{interface interface-id | vlan vlan-id\} [, | -] \{both | rx | tx\}
5. monitor session session_number destination \{interface interface-id [, | -] \{encapsulation replicate\{ingress \{dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id\}\}}
6. end
7. show running-config
8. copy running-config startup-config

**DETAILED STEPS**

<td>---------</td>
</tr>
</tbody>
</table>
| Device(config)# no monitor session all | • all—Removes all SPAN sessions.  
• local—Removes all local sessions.  
• remote—Removes all remote SPAN sessions. |

### Step 4
monitor session session_number source {interface interface-id | vlan vlan-id} [ , | - ] [ both | rx | tx ]

**Example:**
Device(config)# monitor session 2 source gigabitethernet0/1 rx

Specifies the SPAN session and the source port (monitored port).

### Step 5
monitor session session_number destination {interface interface-id [ , | - ] [ encapsulation replicate [ ingress { dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id } ] ]}

**Example:**
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 encapsulation replicate ingress dot1q vlan 6

Specifies the SPAN session, the destination port, the packet encapsulation, and the ingress VLAN and encapsulation.

- For session_number, specify the session number entered in Step 4.
- For interface-id, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.
- (Optional) [ , | - ]—Specifies a series or range of interfaces. Enter a space before and after the comma or hyphen.
- (Optional) encapsulation replicate—Specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged).
- ingress—Enables forwarding of incoming traffic on the destination port and to specify the encapsulation type.
  - dot1q vlan vlan-id—Accepts incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
  - untagged vlan vlan-id or vlan vlan-id—Accepts incoming packets with untagged encapsulation type with the specified VLAN as the default VLAN.

### Step 6
end

**Example:**
Device(config)# end

Returns to privileged EXEC mode.
Specifying VLANs to Filter

Follow these steps to limit SPAN source traffic to specific VLANs.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source interface interface-id`
5. `monitor session session_number filter vlan vlan-id [, |-]`
6. `monitor session session_number destination {interface interface-id [, |-] [encapsulation replicate]}
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# <code>copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

### What to do next

You must create the RSPAN VLAN in all devices that will participate in RSPAN. If the RSPAN VLAN-ID is in the normal range (lower than 1005) and VTP is enabled in the network, you can create the RSPAN VLAN in one device, and VTP propagates it to the other devices in the VTP domain. For extended-range VLANs (greater than 1005), you must configure RSPAN VLAN on both source and destination devices and any intermediate devices.

Use VTP pruning to get an efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

To remove the remote SPAN characteristic from a VLAN and convert it back to a normal VLAN, use the `no remote-span` VLAN configuration command.

To remove a source port or VLAN from the SPAN session, use the `no monitor session session_number source {interface interface-id | vlan vlan-id}` global configuration command. To remove the RSPAN VLAN from the session, use the `no monitor session session_number destination remote vlan vlan-id`. 
Creating an RSPAN Source Session

Follow these steps to create and start an RSPAN source session and to specify the monitored source and the destination RSPAN VLAN.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source {interface interface-id | vlan vlan-id} [ , | - ] [both | rx | tx]`
5. `monitor session session_number destination remote vlan vlan-id`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | **enable**  
Example:  
Device> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| Step 2 | **configure terminal**  
Example:  
Device# configure terminal | Enters global configuration mode. |
| Step 3 | **no monitor session {session_number | all | local | remote}**  
Example:  
Device(config)# no monitor session 1 | Removes any existing SPAN configuration for the session.  
• For `session_number`, the range is 1 to 66.  
• `all`—Removes all SPAN sessions.  
• `local`—Removes all local sessions.  
• `remote`—Removes all remote SPAN sessions. |
| Step 4 | **monitor session session_number source {interface interface-id | vlan vlan-id} [ , | - ] [both | rx | tx]**  
Example:  
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 tx | Specifies the RSPAN session and the source port (monitored port).  
• For `session_number`, the range is 1 to 66.  
• Enter a source port or source VLAN for the RSPAN session:  
  • For `interface-id`, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces |
### Creating an RSPAN Source Session

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>(port-channel port-channel-number). Valid port-channel numbers are 1 to 48.</td>
<td></td>
</tr>
<tr>
<td>• For vlan-id, specifies the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).</td>
<td></td>
</tr>
<tr>
<td>A single session can include multiple sources (ports or VLANs), defined in a series of commands, but you cannot combine source ports and source VLANs in one session.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) [a-zA-Z0-9]+—Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.</td>
<td></td>
</tr>
<tr>
<td>• (Optional) both</td>
<td>rx</td>
</tr>
<tr>
<td>• both—Monitors both received and sent traffic.</td>
<td></td>
</tr>
<tr>
<td>• rx—Monitors received traffic.</td>
<td></td>
</tr>
<tr>
<td>• tx—Monitors sent traffic.</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 5

**monitor session session_number destination remote vlan vlan-id**

**Example:**

```bash
Device(config)# monitor session 1 destination remote vlan 100
```

Specifies the RSPAN session, the destination RSPAN VLAN, and the destination-port group.

• For session_number, enter the number defined in Step 4.

• For vlan-id, specify the source RSPAN VLAN to monitor.

#### Step 6

**end**

**Example:**

```bash
Device(config)# end
```

Returns to privileged EXEC mode.

#### Step 7

**show running-config**

**Example:**

```bash
Device# show running-config
```

Verifies your entries.

#### Step 8

**copy running-config startup-config**

**Example:**

(Optional) Saves your entries in the configuration file.
Specifying VLANs to Filter

Follow these steps to configure the RSPAN source session to limit RSPAN source traffic to specific VLANs.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. no monitor session \{session_number | all | local | remote\}
4. monitor session session_number source interface interface-id
5. monitor session session_number filter vlan vlan-id [ , ]
6. monitor session session_number destination remote vlan vlan-id
7. end
8. show running-config
9. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>no monitor session {session_number</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# no monitor session 2</td>
<td>Removes any existing SPAN configuration for the session.</td>
</tr>
<tr>
<td></td>
<td>• For session_number, the range is 1 to 66.</td>
</tr>
<tr>
<td></td>
<td>• all—Removes all SPAN sessions.</td>
</tr>
<tr>
<td></td>
<td>• local—Removes all local sessions.</td>
</tr>
<tr>
<td></td>
<td>• remote—Removes all remote SPAN sessions.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 4</strong> monitor session session_number source interface interface-id</td>
<td>Specifies the characteristics of the source port (monitored port) and SPAN session.</td>
</tr>
</tbody>
</table>
| Example: Device(config)# monitor session 2 source interface gigabitethernet1/0/2 rx | - For session_number, the range is 1 to 66.  
- For interface-id, specify the source port to monitor. The interface specified must already be configured as a trunk port. |
| **Step 5** monitor session session_number filter vlan vlan-id [, -] | Limits the SPAN source traffic to specific VLANs. |
| Example: Device(config)# monitor session 2 filter vlan 1 - 5 , 9 | - For session_number, enter the session number specified in step 4.  
- For vlan-id, the range is 1 to 4094.  
- (Optional) , - Use a comma (,) to specify a series of VLANs or use a hyphen (-) to specify a range of VLANs. Enter a space before and after the comma; enter a space before and after the hyphen. |
| **Step 6** monitor session session_number destination remote vlan vlan-id | Specifies the RSPAN session and the destination remote VLAN (RSPAN VLAN). |
| Example: Device(config)# monitor session 2 destination remote vlan 902 | - For session_number, enter the session number specified in Step 4.  
- For vlan-id, specify the RSPAN VLAN to carry the monitored traffic to the destination port. |
| **Step 7** end | Returns to privileged EXEC mode. |
| Example: Device(config)# end | |
| **Step 8** show running-config | Verifies your entries. |
| Example: Device# show running-config | |
| **Step 9** copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: Device# copy running-config startup-config | |
Creating an RSPAN Destination Session

You configure an RSPAN destination session on a different device or device stack; that is, not the device or device stack on which the source session was configured.

Follow these steps to define the RSPAN VLAN on that device, to create an RSPAN destination session, and to specify the source RSPAN VLAN and the destination port.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `vlan vlan-id`
4. `remote-span`
5. `exit`
6. `no monitor session {session_number | all | local | remote}`
7. `monitor session session_number source remote vlan vlan-id`
8. `monitor session session_number destination interface interface-id`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
* Enter your password if prompted. |
| **Example:** | |
| `Device> enable` | |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Example:** | |
| `Device# configure terminal` | |
| **Step 3** `vlan vlan-id` | Specifies the VLAN ID of the RSPAN VLAN created from the source device, and enters VLAN configuration mode.  
If both devices are participating in VTP and the RSPAN VLAN ID is from 2 to 1005, Steps 3 through 5 are not required because the RSPAN VLAN ID is propagated through the VTP network. |
| **Example:** | |
| `Device(config)# vlan 901` | |
| **Step 4** `remote-span` | Identifies the VLAN as the RSPAN VLAN. |
| **Example:** | |
| `Device(config-vlan)# remote-span` | |
### Creating an RSPAN Destination Session

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>exit</td>
<td></td>

<td></td>
</tr>
</tbody>
</table>

| **Step 6** | Removes any existing SPAN configuration for the session. |
| no monitor session {session_number | all | local | remote} |  |
| **Example:** |  |
| Device(config)# no monitor session 1 |  |

| **Step 7** | Specifies the RSPAN session and the source RSPAN VLAN. |
| monitor session session_number source remote vlan vlan-id |  |
| **Example:** |  |
| Device(config)# monitor session 1 source remote vlan 901 |  |

| **Step 8** | Specifies the RSPAN session and the destination interface. |
| monitor session session_number destination interface interface-id |  |
| **Example:** |  |
| Device(config)# monitor session 1 destination interface gigabitethernet2/0/1 |  |

| **Step 9** | Returns to privileged EXEC mode. |
| end |  |
| **Example:** |  |
| Device(config)# end |  |

| **Step 10** | Verifies your entries. |
| show running-config |  |
| **Example:** |  |
| Device# show running-config |  |
Creating an RSPAN Destination Session and Configuring Incoming Traffic

Follow these steps to create an RSPAN destination session, to specify the source RSPAN VLAN and the destination port, and to enable incoming traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance).

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source remote vlan vlan-id`
5. `monitor session session_number destination {interface interface-id [, | -] [ingress {dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id}]}
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

</table>
| **Device(config)# no monitor session 2** | • all—Removes all SPAN sessions.  
• local—Removes all local sessions.  
• remote—Removes all remote SPAN sessions. |

**Step 4**

**monitor session session_number source remote vlan vlan-id**

*Example:*

Device(config)# monitor session 2 source remote vlan 901

**Step 5**

**monitor session session_number destination {interface interface-id [, | -] [ingress | dot1q vlan vlan-id | untagged vlan vlan-id | vlan vlan-id]}**

*Example:*

Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress vlan 6

**Step 6**

**end**

*Example:*

Returns to privileged EXEC mode.
Configuring an FSPAN Session

Follow these steps to create a SPAN session, specify the source (monitored) ports or VLANs and the destination (monitoring) ports, and configure FSPAN for the session.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. no monitor session \{session_number | all | local | remote\}
4. monitor session session_number source \{interface interface-id | vlan vlan-id\} [, | -] [both | rx | tx]
5. monitor session session_number destination \{interface interface-id [, | -] [encapsulation replicate]\}
6. monitor session session_number filter \{ip | ipv6 | mac\} access-group \{access-list-number | name\}
7. end
8. show running-config
9. copy running-config startup-config

**DETAILED STEPS**

<table>

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 2**
  configure terminal
  
  **Example:**
  
  Device# configure terminal |
  |
  Enters global configuration mode. |
| **Step 3**
  no monitor session {session_number | all | local | remote; |
  
  **Example:**
  
  Device(config)# no monitor session 2 |
  |
  Removes any existing SPAN configuration for the session.
  - For `session_number`, the range is 1 to 66.
  - `all`—Removes all SPAN sessions.
  - `local`—Removes all local sessions.
  - `remote`—Removes all remote SPAN sessions. |
| **Step 4**
  monitor session session_number source {interface interface-id | vlan vlan-id} [, | -] [both | rx | tx; |
  
  **Example:**
  
  Device(config)# monitor session 2 source interface gigabitethernet1/0/1 |
  |
  Specifies the SPAN session and the source port (monitored port).
  - For `session_number`, the range is 1 to 66.
  - For `interface-id`, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel `port-channel-number`). Valid port-channel numbers are 1 to 48.
  - For `vlan-id`, specify the source VLAN to monitor. The range is 1 to 4094 (excluding the RSPAN VLAN).
  
  **Note** A single session can include multiple sources (ports or VLANs) defined in a series of commands, but you cannot combine source ports and source VLANs in one session.
  - (Optional) [, | -]—Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.
  - (Optional) [both | rx | tx]—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the SPAN monitors both sent and received traffic.
    - **both**—Monitors both sent and received traffic. This is the default.
    - **rx**—Monitors received traffic.
    - **tx**—Monitors sent traffic.
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **monitor session session_number destination {interface interface-id [, | ] [encapsulation replicate]}** | Specifies the SPAN session and the destination port (monitoring port).  
  
- For `session_number`, specify the session number entered in Step 4.  
- For `destination`, specify the following parameters:  
  - For `interface-id`, specify the destination port. The destination interface must be a physical port; it cannot be an EtherChannel, and it cannot be a VLAN.  
  - (Optional) `[, | ]` Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen.  
  - (Optional) `encapsulation replicate` specifies that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged). |
| **monitor session session_number filter {ip | ipv6 | mac} access-group {access-list-number | name}** | Specifies the SPAN session, the types of packets to filter, and the ACLs to use in an FSPAN session.  
  
- For `session_number`, specify the session number entered in Step 4.  
- For `access-list-number`, specify the ACL number that you want to use to filter traffic.  
- For `name`, specify the ACL name that you want to use to filter traffic. |
| end | Returns to privileged EXEC mode. |

**Step 5**

```
Device(config)# monitor session 2 destination
interface gigabitethernet1/0/2 encapsulation replicate
```

**Step 6**

```
Device(config)# monitor session 2 filter ipv6
access-group 4
```

**Step 7**

```
Device(config)# end
```
## Configuring an FRSPAN Session

Follow these steps to start an RSPAN source session, specify the monitored source and the destination RSPAN VLAN, and configure FRSPAN for the session.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `no monitor session {session_number | all | local | remote}`
4. `monitor session session_number source {interface interface-id | vlan vlan-id} [, -] [both | rx | tx]`
5. `monitor session session_number destination remote vlan vlan-id`
6. `vlan vlan-id`
7. `remote-span`
8. `exit`
9. `monitor session session_number filter {ip | ipv6 | mac} access-group {access-list-number | name}`
10. `end`
11. `show running-config`
12. `copy running-config startup-config`

</thead>
</table>
|       | no monitor session {session_number | all | local | remote} | Removes any existing SPAN configuration for the session.
| Example: | Device(config)# no monitor session 2 | - For session_number, the range is 1 to 66.
|             |                                      | - all—Removes all SPAN sessions. |
|             |                                      | - local—Removes all local sessions. |
|             |                                      | - remote—Removes all remote SPAN sessions. |

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
|       | monitor session session_number source {interface interface-id | vlan vlan-id} [, | -] [both | rx | tx] | Specifies the SPAN session and the source port (monitored port).
<p>| Example: | Device(config)# monitor session 2 source interface gigabitethernet1/0/1 | - For session_number, the range is 1 to 66. |
|             |                                      | - For interface-id, specifies the source port to monitor. |
|             |                                      | Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel port-channel-number). Valid port-channel numbers are 1 to 48. |
|             |                                      | - For vlan-id, specify the source VLAN to monitor. |
|             |                                      | The range is 1 to 4094 (excluding the RSPAN VLAN). |
| Note       | A single session can include multiple sources (ports or VLANs) defined in a series of commands, but you cannot combine source ports and source VLANs in one session. |
|             | (Optional) [, | -]—Specifies a series or range of interfaces. Enter a space before and after the comma; enter a space before and after the hyphen. |
|             | (Optional) [both | rx | tx]—Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the SPAN monitors both sent and received traffic. |
|             | both—Monitors both sent and received traffic. This is the default. |
|             | rx—Monitors received traffic. |
|             | tx—Monitors sent traffic. |</p>

</tr>
</thead>
<tbody>
<tr>
<td>show monitor</td>
<td>Displays the current SPAN, RSPAN, FSPAN, or FRSPAN configuration.</td>
</tr>
</tbody>
</table>

## SPAN and RSPAN Configuration Examples

### Example: Configuring Local SPAN

This example shows how to set up SPAN session 1 for monitoring source port traffic to a destination port. First, any existing SPAN configuration for session 1 is deleted, and then bidirectional traffic is mirrored from source Gigabit Ethernet port 1 to destination Gigabit Ethernet port 2, retaining the encapsulation method.

```
Device> enable
Device# configure terminal
Device(config)# no monitor session 1
Device(config)# monitor session 1 source interface gigabitethernet1/0/1
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 encapsulation replicate
Device(config)# destination interface gigabitethernet1/0/2
Device(config)# end
```

This example shows how to remove port 1 as a SPAN source for SPAN session 1:

```
Device> enable
Device# configure terminal
```
Device(config)# no monitor session 1 source interface gigabitethernet1/0/1
Device(config)# end

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

Device> enable
Device# configure terminal
Device(config)# no monitor session 1 source interface gigabitethernet1/0/1 rx

The monitoring of traffic received on port 1 is disabled, but traffic sent from this port continues to be monitored.

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to destination Gigabit Ethernet port 2. The configuration is then modified to also monitor all traffic on all ports belonging to VLAN 10.

Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source vlan 1 - 3 rx
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2
Device(config)# monitor session 2 source vlan 10
Device(config)# end

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor received traffic on Gigabit Ethernet source port 1, and send it to destination Gigabit Ethernet port 2 with the same egress encapsulation type as the source port, and to enable ingress forwarding with VLAN 6 as the default ingress VLAN:

Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source gigabitethernet0/1 rx
Device(config)# monitor session 2 destination interface gigabitethernet0/2 encapsulation replicate ingress vlan 6
Device(config)# end

This example shows how to remove any existing configuration on SPAN session 2, configure SPAN session 2 to monitor traffic received on Gigabit Ethernet trunk port 2, and send traffic for only VLANs 1 through 5 and VLAN 9 to destination Gigabit Ethernet port 1:

Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source interface gigabitethernet1/0/2 rx
Device(config)# monitor session 2 filter vlan 1 - 5 , 9
Device(config)# monitor session 2 destination interface gigabitethernet1/0/1
Device(config)# end

Examples: Creating an RSPAN VLAN

This example shows how to create the RSPAN VLAN 901:

```
Device> enable
Device# configure terminal
Device(config)# vlan 901
Device(config-vlan)# remote span
Device(config-vlan)# end
```

This example shows how to remove any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination as RSPAN VLAN 901:

```
Device> enable
Device# configure terminal
Device(config)# no monitor session 1
Device(config)# monitor session 1 source interface gigabitethernet1/0/1 tx
Device(config)# monitor session 1 source interface gigabitethernet1/0/2 rx
Device(config)# monitor session 1 source interface port-channel 2
Device(config)# monitor session 1 destination remote vlan 901
Device(config)# end
```

This example shows how to remove any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor traffic received on trunk port 2, and send traffic for only VLANs 1 through 5 and 9 to destination RSPAN VLAN 902:

```
Device> enable
Device# configure terminal
Device(config)# no monitor session 2
Device(config)# monitor session 2 source interface gigabitethernet1/0/2 rx
Device(config)# monitor session 2 filter vlan 1 - 5, 9
Device(config)# monitor session 2 destination remote vlan 902
Device(config)# end
```

This example shows how to configure VLAN 901 as the source remote VLAN and port 1 as the destination interface:

```
Device> enable
Device# configure terminal
Device(config)# monitor session 1 source remote vlan 901
Device(config)# monitor session 1 destination interface gigabitethernet2/0/1
Device(config)# end
```

This example shows how to configure VLAN 901 as the source remote VLAN in RSPAN session 2, to configure Gigabit Ethernet source port 2 as the destination interface, and to enable forwarding of incoming traffic on the interface with VLAN 6 as the default receiving VLAN:

```
Device> enable
Device# configure terminal
Device(config)# monitor session 2 source remote vlan 901
Device(config)# monitor session 2 destination interface gigabitethernet1/0/2 ingress vlan 6
Device(config)# end
```

Configuring ERSPAN

This module describes how to configure Encapsulated Remote Switched Port Analyzer (ERSPAN). The Cisco ERSPAN feature allows you to monitor traffic on ports or VLANs and send the monitored traffic to destination ports.

• Prerequisites for Configuring ERSPAN, on page 1153
• Restrictions for Configuring ERSPAN, on page 1153
• Information for Configuring ERSPAN, on page 1154
• How to Configure ERSPAN, on page 1155
• Configuration Examples for ERSPAN, on page 1157
• Verifying ERSPAN, on page 1158
• Additional References, on page 1159
• Feature Information for Configuring ERSPAN, on page 1160

Prerequisites for Configuring ERSPAN

• The ERSPAN feature requires IP routing to be enabled in the Global Configuration Mode.
• Only IPv4 delivery/transport header is supported.
• Access control list (ACL) filter is applied before sending the monitored traffic on to the tunnel.
• Only supports Type-II ERSPAN header.

Restrictions for Configuring ERSPAN

The following restrictions apply for this feature:

• Destination sessions are not supported.

• A device supports up to 66 sessions. A maximum of 8 source sessions can be configured and the remaining sessions can be configured as RSPAN destinations sessions. A source session can be a local SPAN source session or an RSPAN source session or an ERSPAN source session.

• You can configure either a list of ports or a list of VLANs as a source, but cannot configure both for a given session.
When a session is configured through the ERSPAN CLI, the session ID and the session type cannot be changed. To change them, you must use the no form of the configuration commands to remove the session and then reconfigure the session.

- ERSPAN source sessions do not copy locally-sourced Remote SPAN (RSPAN) VLAN traffic from source trunk ports that carry RSPAN VLANs.
- ERSPAN source sessions do not copy locally-sourced ERSPAN GRE-encapsulated traffic from source ports.

Information for Configuring ERSPAN

ERSPAN Overview

The Cisco ERSPAN feature allows you to monitor traffic on ports or VLANs, and send the monitored traffic to destination ports. ERSPAN sends traffic to a network analyzer, such as a Switch Probe device or a Remote Monitoring (RMON) probe. ERSPAN supports source ports, source VLANs, and destination ports on different devices, which helps remote monitoring of multiple devices across a network.

ERSPAN supports encapsulated packets of up to 9180 bytes. ERSPAN consists of an ERSPAN source session, routable ERSPAN GRE-encapsulated traffic, and an ERSPAN destination session.

ERSPAN consists of an ERSPAN source session, routable ERSPAN GRE-encapsulated traffic, and an ERSPAN destination session. You can configure an ERSPAN source session, an ERSPAN destination session, or both on a device. A device on which only an ERSPAN source session is configured is called an ERSPAN source device, and a device on which only an ERSPAN destination session is configured is called an ERSPAN termination device. A device can act as both; an ERSPAN source device and a termination device.

For a source port or a source VLAN, the ERSPAN can monitor the ingress, egress, or both ingress and egress traffic. By default, ERSPAN monitors all traffic, including multicast, and Bridge Protocol Data Unit (BPDU) frames.

An ERSPAN source session is defined by the following parameters:

- A session ID
- List of source ports or source VLANs to be monitored by the session
- The destination and origin IP addresses, which are used as the destination and source IP addresses of the generic routing encapsulation (GRE) envelope for the captured traffic, respectively
- ERSPAN flow ID
- Optional attributes, such as, IP Time to Live (TTL), related to the GRE envelope

Note

ERSPAN source sessions do not copy ERSPAN GRE-encapsulated traffic from source ports. Each ERSPAN source session can have either ports or VLANs as sources, but not both.
Because encapsulation is performed in the hardware, the CPU performance is not impacted.

Figure 82: ERSPAN Configuration

ERSPAN Sources

The Cisco ERSPAN feature supports the following sources:

- Source ports—A source port that is monitored for traffic analysis. Source ports in any VLAN can be configured and trunk ports can be configured as source ports along with nontrunk source ports.
- Source VLANs—A VLAN that is monitored for traffic analysis.

The following interfaces are supported as source ports:

- GigabitEthernet
- PortChannel
- TenGigabitEthernet

How to Configure ERSPAN

Configuring an ERSPAN Source Session

The ERSPAN source session defines the session configuration parameters and the ports or VLANs to be monitored.

SUMMARY STEPS

1. enable
2. configure terminal
3. monitor session span-session-number type erspan-source
4. description description
### Detailed Steps

**Configuration Examples for ERSPAN**

**Example: Configuring an ERSPAN Source Session**

```
Switch> enable
Switch# configure terminal
```
Switch(config)# monitor session 1 type erspan-source
Switch(config-mon-erspan-src)# description source1
Switch(config-mon-erspan-src)# source interface fastethernet 0/1 rx
Switch(config-mon-erspan-src)# filter vlan 3
Switch(config-mon-erspan-src)# no shutdown
Switch(config-mon-erspan-src)# destination
Switch(config-mon-erspan-src-dst)# ip address 192.0.2.9
Switch(config-mon-erspan-src-dst)# erspan-id 2
Switch(config-mon-erspan-src-dst)# origin ip-address 203.0.113.2
Switch(config-mon-erspan-src-dst)# ip ttl 32
Switch(config-mon-erspan-src-dst)# end

Verifying ERSPAN

To verify the ERSPAN configuration, use the following commands:

The following is sample output from the show monitor session erspan-source command:

Switch# show monitor session erspan-source session

Type : ERSPAN Source Session
Status : Admin Enabled
Source Ports :
RX Only : Gi1/4/33
Destination IP Address : 192.0.2.1
Destination ERSPAN ID : 110
Origin IP Address : 10.10.10.216
IPv6 Flow Label : None

The following is sample output from the show monitor session erspan-source detail command:

Switch# show monitor session erspan-source detail

Type : ERSPAN Source Session
Status : Admin Enabled
Description : -
Source Ports :
RX Only : Gi1/4/33
TX Only : None
Both : None
Source VLANs :
RX Only : None
TX Only : None
Both : None
Source RSPAN VLAN : None
Destination Ports : None
Filter VLANs : None
Filter Addr Type :
RX Only : None
TX Only : None
Both : None
Filter Pkt Type :
RX Only : None
Dest RSPAN VLAN : None
IP Access-group : None
IPv6 Access-group : None
Destination IP Address : 192.0.2.1
Destination IPv6 Address : None
Destination IP VRF : None
Destination ERSPAN ID : 110
Origin IP Address : 10.10.10.216
IP QOS PREC : 0
IP TTL : 255

The following output from the `show capability feature monitor erspan-source` command displays information about the configured ERSPAN source sessions:

```
Switch# show capability feature monitor erspan-source
ERSPAN Source Session Supported: true
No of Rx ERSPAN source session: 8
No of Tx ERSPAN source session: 8
ERSPAN Header Type supported: II
ACL filter Supported: true
Fragmentation Supported: true
Truncation Supported: false
Sequence number Supported: false
QOS Supported: true
```

The following output from the `show capability feature monitor erspan-destination` command displays all the configured global built-in templates:

```
Switch# show capability feature monitor erspan-destination
ERSPAN Destination Session Supported: false
```

Feature Information for Configuring ERSPAN

The following table provides release information about the feature or features described in this module. This table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to www.cisco.com/go/cfn. An account on Cisco.com is not required.

Table 82: Feature Information for Configuring ERSPAN

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Releases</th>
<th>Feature Information</th>
</tr>
</thead>
</table>
| ERSPAN       | Cisco IOS XE Denali 16.3.1 | This module describes how to configure Encapsulated Remote Switched Port Analyzer (ERSPAN). The Cisco ERSPAN feature allows you to monitor traffic on ports or VLANs and send the monitored traffic to destination ports over a generic routing encapsulation (GRE) tunnel in any VRF.
In Cisco IOS XE Denali 16.3.1, this feature was introduced on Cisco Catalyst 3650 Series Switches and Cisco Catalyst 3850 Series Switches.
The following commands were introduced or modified: destination (ERSPAN), erspan, filter (ERSPAN), and show capability feature monitor.
The following commands were introduced or modified: destination (ERSPAN), filter (ERSPAN), and show capability feature monitor. |
Prerequisites for Packet Capture

Packet capture is supported on Catalyst 3850 and Catalyst 3650.
Wireshark is supported only on switches running IP Base image or IP Services image.
Embedded Packet Capture is supported only on switches running Lan Base image.

The Embedded Packet Capture (EPC) software subsystem consumes CPU and memory resources during its operation. You must have adequate system resources for different types of operations. Some guidelines for using the system resources are provided in the table below.

<table>
<thead>
<tr>
<th>System Resources</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardware</td>
<td>CPU utilization requirements are platform dependent.</td>
</tr>
<tr>
<td>Memory</td>
<td>The packet buffer is stored in DRAM. The size of the packet buffer is user specified.</td>
</tr>
<tr>
<td>Diskspace</td>
<td>Packets can be exported to external devices. No intermediate storage on flash disk is required.</td>
</tr>
</tbody>
</table>
Restrictions for Packet Capture

Restrictions for Packet Capture

- Starting in Cisco IOS Release XE 3.3.0(SE), global packet capture on Wireshark is not supported.
- Display filters are supported on Wireshark.
- The CLI for configuring Wireshark requires that the feature be executed only from EXEC mode. Actions that usually occur in configuration submode (such as defining capture points), are handled at the EXEC mode instead. All key commands are not NVGEN’d and are not synchronized to the standby supervisor in NSF and SSO scenarios.
- Packets captured in the output direction of an interface might not reflect the changes made by rewrite (includes TTL, VLAN tag, CoS, checksum, MAC addresses, DSCP, precedent, UP, etc.).
- The Rewrite information of both ingress and egress packets are not captured.
- Limiting circular file storage by file size is not supported.
- File limit is limited to the size of the flash in IP Base and IP Services.
- Decoding of protocols such as Control and Provisioning of Wireless Access Points (CAPWAP) is supported in IP Base and IP Services.
- In IP Base and IP Services, in file mode, the packets will be written to the files without export.
- The LAN Base image supports Embedded Wireshark with the following limitations:
  - Capture filters and display filters are not supported.
  - Active capture decoding is not available.
  - The output format is different from previous releases.
- Embedded Packet Capture (EPC) captures multicast packets only on ingress and does not capture the replicated packets on egress.

Wireless Packet Capture

- The only form of wireless capture is a CAPWAP tunnel capture.
- When capturing CAPWAP tunnels, no other interface types can be used as attachment points on the same capture point.
- Capturing multiple CAPWAP tunnels is supported.
- Core filters are not applied and should be omitted when capturing a CAPWAP tunnel.
- To capture a CAPWAP data tunnel, each CAPWAP tunnel is mapped to a physical port and an appropriate ACL will be applied to filter the traffic.
- To capture a CAPWAP non-data tunnel, the switch is set to capture traffic on all ports and apply an appropriate ACL to filter the traffic.
Configuration Limitations

- Up to 8 capture points can be defined, but only one can be active at a time. You need to stop one before you can start the other.
- Neither VRFs, management ports, nor private VLANs can be used as attachment points.
- Only one ACL (IPv4, IPv6 or MAC) is allowed in a Wireshark class map.
- Wireshark cannot capture packets on a destination SPAN port.
- Wireshark stops capturing when one of the attachment points (interfaces) attached to a capture point stops working. For example, if the device that is associated with an attachment point is unplugged from the switch. To resume capturing, the capture must be restarted manually.
- CPU-injected packets are considered control plane packets. Therefore, these types of packets will not be captured on an interface egress capture.
- MAC ACL is only used for non-IP packets such as ARP. It will not be supported on a Layer 3 port or SVI.
- MAC filter will not capture IP packets even if it matches the MAC address. This applies to all interfaces (L2 Switchport, L3 Routed Port)
- MAC filter cannot capture L2 packets (ARP) on L3 interfaces.
- IPv6-based ACLs are not supported in VAACL.
- Layer 2 EtherChannels are not supported.
- Starting from Cisco IOS release 16.1, Layer 3 PortChannel Support is available.
- It is not possible to modify a capture point parameter when a capture is already active or has started.
- ACL logging and Wireshark are incompatible. Once Wireshark is activated, it takes priority. All traffic, including that being captured by ACL logging on any ports, will be redirected to Wireshark. We recommend that you deactivate ACL logging before starting Wireshark. Otherwise, Wireshark traffic will be contaminated by ACL logging traffic.
- Wireshark does not capture packets dropped by floodblock.
- If you capture both PACL and RACL on the same port, only one copy is sent to the CPU. If you capture a DTLS-encrypted CAPWAP interface, two copies are sent to Wireshark, one encrypted and the other decrypted. The same behavior will occur if we capture a Layer 2 interface carrying DTLS-encrypted CAPWAP traffic. The core filter is based on the outer CAPWAP header.
- Starting from Cisco IOS release 16.1:
  - L3 port channel support is added.
  - Minor changes have been made in the display format.
  - Ability to display the number of packets in a cap file
  - Clearing the captured buffer deletes the buffer along with its contents. It cannot be run when the packet capture is active.
  - Additional warning message is displayed for control plane capturing.
  - In buffer mode, the packet display is allowed only after stop.
• Packet statistics displayed at stop, in IP Services and IP Base.

• Ability to query the number of packets captured in a pcap file.

• When the display is from a cap file, display details of the selected packet can be viewed using packet-number.

• Display filter can be used in file mode.

• Statistics of packet capture (packets and bytes received, dropped) can be displayed either during the capture or after capture stop.

• The system can query statistics on a pcap cap file's contents, as supported by Wireshark.

• The packet capture session is always in streaming mode irrespective of the size of the buffer. There is no lock-step mode anymore.

• Clearing buffer on an active capture point is supported only on Lan Base as this only clears the content. On all other licenses, it deletes the buffer itself, hence cannot be run during active capture.

---

**Warning**

Control plane packets are not rate limited and performance impacting. Please use filters to limit control plane packet capture.

---

• If the user changes interface from Switch port to routed port (L2 -> L3) or vice versa, they must delete the capture point and create a new one, once the interface comes back up. Stop/start the capture point will not work.

• If the user deletes the file used by an active capture session, the capture session cannot create a new file, and all further packets captured are lost. The user will then need to restart the capture point.

---

**Introduction to Packet Capture**

**Overview of Packet Capture Tool**

The Packet Capture feature is an onboard packet capture facility that allows network administrators to capture packets flowing to, through, and from the device and to analyze them locally or save and export them for offline analysis by using tools such as Wireshark and Embedded Packet Capture (EPC). This feature simplifies network operations by allowing devices to become active participants in the management and operation of the network. This feature facilitates troubleshooting by gathering information about the packet format. This feature also facilitates application analysis and security.

The Embedded Packet Capture is supported on Lan Base. Embedded Packet Capture with Wireshark is supported on IP Base and IP Services.
Information about Wireshark

Wireshark Overview

Wireshark is a packet analyzer program, formerly known as Ethereal, that supports multiple protocols and presents information in a text-based user interface.

The ability to capture and analyze traffic provides data on network activity. Prior to Cisco IOS Release XE 3.3.0(SE), only two features addressed this need: SPAN and debug platform packet. Both have limitations. SPAN is ideal for capturing packets, but can only deliver them by forwarding them to some specified local or remote destination; it provides no local display or analysis support.

So the need exists for a traffic capture and analysis mechanism that is applicable to both hardware and software forwarded traffic and that provides strong packet capture, display, and analysis support, preferably using a well known interface.

Wireshark dumps packets to a file using a well known format called .pcap, and is applied or enabled on individual interfaces. You specify an interface in EXEC mode along with the filter and other parameters. The Wireshark application is applied only when you enter a start command, and is removed only when Wireshark stops capturing packets either automatically or manually.

---

Note

The current version of Wireshark installed on the switch is 1.10.8.

Capture Points

A capture point is the central policy definition of the Wireshark feature. The capture point describes all of the characteristics associated with a given instance of Wireshark: which packets to capture, where to capture them from, what to do with the captured packets, and when to stop. Capture points can be modified after creation, and do not become active until explicitly activated with a start command. This process is termed activating the capture point or starting the capture point. Capture points are identified by name and can also be manually or automatically deactivated or stopped.

Multiple capture points can be defined, but only one can be active at a time. You need to stop one before you can start the other.

In case of stacked systems, the capture point is activated on the active member. A switchover will terminate any active packet capture session and it will have to be restarted.

Attachment Points

An attachment point is a point in the logical packet process path associated with a capture point. An attachment point is an attribute of the capture point. Packets that impact an attachment point are tested against capture point filters; packets that match are copied and sent to the associated Wireshark instance of the capture point. A specific capture point can be associated with multiple attachment points, with limits on mixing attachment points of different types. Some restrictions apply when you specify attachment points of different types. Attachment points are directional (input or output or both) with the exception of the Layer 2 VLAN attachment point, which is always bidirectional.

In case of stacked systems, the attachment points on all stack members are valid. EPC captures the packets from all the defined attachment points. However these packets are processed only on the active member.
Filters

Filters are attributes of a capture point that identify and limit the subset of traffic traveling through the attachment point of a capture point, which is copied and passed to Wireshark. To be displayed by Wireshark, a packet must pass through an attachment point, as well as all of the filters associated with the capture point.

A capture point has the following types of filters:

- Core system filter—The core system filter is applied by hardware, and its match criteria is limited by hardware. This filter determines whether hardware-forwarded traffic is copied to software for Wireshark purposes.
- Display filter—The display filter is applied by Wireshark. Packets that fail the display filter are not displayed.

Core System Filter

You can specify core system filter match criteria by using the class map or ACL, or explicitly by using the CLI.

Note

When specifying CAPWAP as an attachment point, the core system filter is not used.

In some installations, you need to obtain authorization to modify the configuration, which can lead to extended delays if the approval process is lengthy. This can limit the ability of network administrators to monitor and analyze traffic. To address this situation, Wireshark supports explicit specification of core system filter match criteria from the EXEC mode CLI. The disadvantage is that the match criteria that you can specify is a limited subset of what class map supports, such as MAC, IP source and destination addresses, ether-type, IP protocol, and TCP/UDP source and destination ports.

If you prefer to use configuration mode, you can define ACLs or have class maps refer capture points to them. Explicit and ACL-based match criteria are used internally to construct class maps and policy maps.

Note The ACL and class map configuration are part of the system and not aspects of the Wireshark feature.

Display Filter

With the display filter, you can direct Wireshark to further narrow the set of packets to display when decoding and displaying from a .pcap file.

Actions

Wireshark can be invoked on live traffic or on a previously existing .pcap file. When invoked on live traffic, it can perform four types of actions on packets that pass its display filters:

- Captures to buffer in memory to decode and analyze and store
- Stores to a .pcap file
- Decodes and displays
- Stores and displays

When invoked on a .pcap file only, only the decode and display action is applicable.
Storage of Captured Packets to Buffer in Memory

Packets can be stored in the capture buffer in memory for subsequent decode, analysis, or storage to a .pcap file.

The capture buffer can be in linear or circular mode. In linear mode, new packets are discarded when the buffer is full. In circular mode, if the buffer is full, the oldest packets are discarded to accommodate the new packets. Although the buffer can also be cleared when needed, this mode is mainly used for debugging network traffic. However, it is not possible to only clear the contents of the buffer alone without deleting it. Stop the current captures and restart the capture again for this to take effect.

Note
If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.

Storage of Captured Packets to a .pcap File

Note
When WireShark is used on switches in a stack, packet captures can be stored only on flash or USB flash devices connected to the active switch.

For example, if flash1 is connected to the active switch, and flash2 is connected to the secondary switch, only flash1 can be used to store packet captures.

Attempts to store packet captures on devices other than flash or USB flash devices connected to the active switch will probably result in errors.

Wireshark can store captured packets to a .pcap file. The capture file can be located on the following storage devices:

- on-board flash storage (flash:)
- USB drive (usbflash0:)

Note
Attempts to store packet captures on unsupported devices or devices not connected to the active switch will probably result in errors.

When configuring a Wireshark capture point, you can associate a filename. When the capture point is activated, Wireshark creates a file with the specified name and writes packets to it. If the file already exists at the time of creation of the capture point, Wireshark queries you as to whether the file can be overwritten. If the file already exists at the time of activating the capture point, Wireshark will overwrite the existing file. Only one capture point may be associated with a given filename.

If the destination of the Wireshark writing process is full, Wireshark fails with partial data in the file. You must ensure that there is sufficient space in the file system before you start the capture session. With Cisco IOS Release IOS XE 3.3.0(SE), the file system full status is not detected for some storage devices.

You can reduce the required storage space by retaining only a segment, instead of the entire packet. Typically, you do not require details beyond the first 64 or 128 bytes. The default behavior is to store the entire packet.
To avoid possible packet drops when processing and writing to the file system, Wireshark can optionally use a memory buffer to temporarily hold packets as they arrive. Memory buffer size can be specified when the capture point is associated with a .pcap file.

Packet Decoding and Display

Wireshark can decode and display packets to the console. This functionality is possible for capture points applied to live traffic and for capture points applied to a previously existing .pcap file.

Note

Decoding and displaying packets may be CPU intensive.

Wireshark can decode and display packet details for a wide variety of packet formats. The details are displayed by entering the `monitor capture name start` command with one of the following keyword options, which place you into a display and decode mode:

- **brief**—Displays one line per packet (the default).
- **detailed**—Decodes and displays all the fields of all the packets whose protocols are supported. Detailed modes require more CPU than the other two modes.
- **(hexadecimal) dump**—Displays one line per packet as a hexadecimal dump of the packet data and the printable characters of each packet.

When you enter the `capture` command with the decode and display option, the Wireshark output is returned to Cisco IOS and displayed on the console unchanged.

Live Traffic Display

Wireshark receives copies of packets from the core system. Wireshark applies its display filters to discard uninteresting packets, and then decodes and displays the remaining packets.

.pcap File Display

Wireshark can decode and display packets from a previously stored .pcap file and direct the display filter to selectively displayed packets.

Packet Storage and Display

Functionally, this mode is a combination of the previous two modes. Wireshark stores packets in the specified .pcap file and decodes and displays them to the console. Only the core filters are applicable here.

Wireshark Capture Point Activation and Deactivation

After a Wireshark capture point has been defined with its attachment points, filters, actions, and other options, it must be activated. Until the capture point is activated, it does not actually capture packets.

Before a capture point is activated, some functional checks are performed. A capture point cannot be activated if it has neither a core system filter nor attachment points defined. Attempting to activate a capture point that does not meet these requirements generates an error.*
When performing a wireless capture with a CAPWAP tunneling interface, the core system filter is not required and cannot be used.

The display filters are specified as needed.

After Wireshark capture points are activated, they can be deactivated in multiple ways. A capture point that is storing only packets to a .pcap file can be halted manually or configured with time or packet limits, after which the capture point halts automatically.

When a Wireshark capture point is activated, a fixed rate policer is applied automatically in the hardware so that the CPU is not flooded with Wireshark-directed packets. The disadvantage of the rate policer is that you cannot capture contiguous packets beyond the established rate even if more resources are available.

The set packet capture rate is 1000 packets per sec (pps). The 1000 pps limit is applied to the sum of all attachment points. For example, if we have a capture session with 3 attachment points, the rates of all 3 attachment points added together is policed to 1000 pps.

Policer is not supported for control-plane packet capture. When activating control-plane capture points, you need to be extra cautious, so that it does not flood the CPU.

Wireshark Features

This section describes how Wireshark features function in the environment:

- If port security and Wireshark are applied on an ingress capture, a packet that is dropped by port security will still be captured by Wireshark. If port security is applied on an ingress capture, and Wireshark is applied on an egress capture, a packet that is dropped by port security will not be captured by Wireshark.

- Packets dropped by Dynamic ARP Inspection (DAI) are not captured by Wireshark.

- If a port that is in STP blocked state is used as an attachment point and the core filter is matched, Wireshark will capture the packets that come into the port, even though the packets will be dropped by the switch.

- Classification-based security features—Packets that are dropped by input classification-based security features (such as ACLs and IPSG) are not caught by Wireshark capture points that are connected to attachment points at the same layer. In contrast, packets that are dropped by output classification-based security features are caught by Wireshark capture points that are connected to attachment points at the same layer. The logical model is that the Wireshark attachment point occurs after the security feature lookup on the input side, and symmetrically before the security feature lookup on the output side.

  On ingress, a packet goes through a Layer 2 port, a VLAN, and a Layer 3 port/SVI. On egress, the packet goes through a Layer 3 port/SVI, a VLAN, and a Layer 2 port. If the attachment point is before the point where the packet is dropped, Wireshark will capture the packet. Otherwise, Wireshark will not capture the packet. For example, Wireshark capture policies connected to Layer 2 attachment points in the input direction capture packets dropped by Layer 3 classification-based security features. Symmetrically, Wireshark capture policies attached to Layer 3 attachment points in the output direction capture packets dropped by Layer 2 classification-based security features.

- Routed ports and switch virtual interfaces (SVIs)—Wireshark cannot capture the output of an SVI because the packets that go out of an SVI's output are generated by CPU. To capture these packets, include the control plane as an attachment point.
• **VLANs**—Starting with Cisco IOS Release 16.1, when a VLAN is used as a Wireshark attachment point, packet capture is supported on L2 and L3 in both input and output directions.

• **Redirection features**—In the input direction, features traffic redirected by Layer 3 (such as PBR and WCCP) are logically later than Layer 3 Wireshark attachment points. Wireshark captures these packets even though they might later be redirected out another Layer 3 interface. Symmetrically, output features redirected by Layer 3 (such as egress WCCP) are logically prior to Layer 3 Wireshark attachment points, and Wireshark will not capture them.

• **SPAN**—Wireshark cannot capture packets on interface configured as a SPAN destination.

• **SPAN**—Wireshark is able to capture packets on interfaces configured as a SPAN source in the ingress direction, and may be available for egress direction too.

• You can capture packets from a maximum of 1000 VLANs at a time, if no ACLs are applied. If ACLs are applied, the hardware will have less space for Wireshark to use. As a result, the maximum number of VLANs than can be used for packet capture at a time will be lower. Using more than 1000 VLANs tunnels at a time or extensive ACLs might have unpredictable results. For example, mobility may go down.

---

**Note**
Capturing an excessive number of attachment points at the same time is strongly discouraged because it may cause excessive CPU utilization and unpredictable hardware behavior.

---

**Wireless Packet Capture in Wireshark**

• Wireless traffic is encapsulated inside CAPWAP packets. However, capturing only a particular wireless client's traffic inside a CAPWAP tunnel is not supported when using the CAPWAP tunnel as an attachment point. To capture only a particular wireless client's traffic, use the client VLAN as an attachment point and formulate the core filter accordingly.

• Limited decoding of inner wireless traffic is supported. Decoding of inner wireless packets inside encrypted CAPWAP tunnels is not supported.

• No other interface type can be used with the CAPWAP tunneling interface on the same capture point. A CAPWAP tunneling interface and a Level 2 port cannot be attachment points on the same capture point.

• You cannot specify a core filter when capturing packets for Wireshark via the CAPWAP tunnel. However, you can use the Wireshark display filters for filtering wireless client traffic against a specific wireless client.

• You can capture packets from a maximum of 135 CAPWAP tunnels at a time if no ACLs are applied. If ACLs are applied, the hardware memory will have less space for Wireshark to use. As a result, the maximum number of CAPWAP tunnels than can be used for packet capture at a time will be lower. Using more than 135 CAPWAP tunnels at a time or using extensive ACLs might have unpredictable results. For example, mobility may go down.

---

**Note**
Capturing an excessive number of attachment points at the same time is strongly discouraged because it may cause excessive CPU utilization and unpredictable hardware behavior.
Guidelines for Wireshark

- During Wireshark packet capture, hardware forwarding happens concurrently.
- Before starting a Wireshark capture process, ensure that CPU usage is moderate and that sufficient memory (at least 200 MB) is available.
- If you plan to store packets to a storage file, ensure that sufficient space is available before beginning a Wireshark capture process.
- The CPU usage during Wireshark capture depends on how many packets match the specified conditions and on the intended actions for the matched packets (store, decode and display, or both).
- Where possible, keep the capture to the minimum (limit by packets, duration) to avoid high CPU usage and other undesirable conditions.
- Because packet forwarding typically occurs in hardware, packets are not copied to the CPU for software processing. For Wireshark packet capture, packets are copied and delivered to the CPU, which causes an increase in CPU usage.

To avoid high CPU usage, do the following:

- Attach only relevant ports.
- Use a class map, and secondarily, an access list to express match conditions. If neither is viable, use an explicit, in-line filter.
- Adhere closely to the filter rules. Restrict the traffic type (such as, IPv4 only) with a restrictive, rather than relaxed ACL, which elicits unwanted traffic.

- Always limit packet capture to either a shorter duration or a smaller packet number. The parameters of the capture command enable you to specify the following:
  - Capture duration
  - Number of packets captured
  - File size
  - Packet segment size

- Run a capture session without limits if you know that very little traffic matches the core filter.

- You might experience high CPU (or memory) usage if:
  - You leave a capture session enabled and unattended for a long period of time, resulting in unanticipated bursts of traffic.
  - You launch a capture session with ring files or capture buffer and leave it unattended for a long time, resulting in performance or system health issues.

- During a capture session, watch for high CPU usage and memory consumption due to Wireshark that may impact performance or health. If these situations arise, stop the Wireshark session immediately.

- Avoid decoding and displaying packets from a .pcap file for a large file. Instead, transfer the .pcap file to a PC and run Wireshark on the PC.
• You can define up to eight Wireshark instances. An active show command that decodes and displays packets from a .pcap file or capture buffer counts as one instance. However, only one of the instances can be active.

• Whenever an ACL that is associated with a running capture is modified, you must restart the capture for the ACL modifications to take effect. If you do not restart the capture, it will continue to use the original ACL as if it had not been modified.

• To avoid packet loss, consider the following:
  • Use store-only (when you do not specify the display option) while capturing live packets rather than decode and display, which is an CPU-intensive operation (especially in detailed mode).
  • If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss.
  • If you use the default buffer size and see that you are losing packets, you can increase the buffer size to avoid losing packets.
  • Writing to flash disk is a CPU-intensive operation, so if the capture rate is insufficient, you may want to use a buffer capture.
  • The Wireshark capture session always operates in streaming mode at the rate of 1000 pps.

• The streaming capture mode rate is 1000 pps.

• If you want to decode and display live packets in the console window, ensure that the Wireshark session is bounded by a short capture duration.

⚠️ Warning

A Wireshark session with either a longer duration limit or no capture duration (using a terminal with no auto-more support using the term len 0 command) may make the console or terminal unusable.

• When using Wireshark to capture live traffic that leads to high CPU, usage, consider applying a QoS policy temporarily to limit the actual traffic until the capture process concludes.

• All Wireshark-related commands are in EXEC mode; no configuration commands exist for Wireshark.

  If you need to use access list or class-map in the Wireshark CLI, you must define an access list and class map with configuration commands.

• No specific order applies when defining a capture point; you can define capture point parameters in any order, provided that CLI allows this. The Wireshark CLI allows as many parameters as possible on a single line. This limits the number of commands required to define a capture point.

• All parameters except attachment points take a single value. Generally, you can replace the value with a new one by reentering the command. After user confirmation, the system accepts the new value and overrides the older one. A no form of the command is unnecessary to provide a new value, but it is necessary to remove a parameter.

• Wireshark allows you to specify one or more attachment points. To add more than one attachment point, reenter the command with the new attachment point. To remove an attachment point, use the no form of the command. You can specify an interface range as an attachment point. For example, enter monitor capture mycap interface GigabitEthernet1/0/1 in where interface GigabitEthernet1/0/1 is an attachment point.
If you also need to attach interface GigabitEthernet1/0/2, specify it in another line as follows:

```
monitor capture mycap interface GigabitEthernet1/0/2 in
```

- You cannot make changes to a capture point when the capture is active.
- The action you want to perform determines which parameters are mandatory. The Wireshark CLI allows you to specify or modify any parameter prior to entering the `start` command. When you enter the `start` command, Wireshark will start only after determining that all mandatory parameters have been provided.
- If the file already exists at the time of creation of the capture point, Wireshark queries you as to whether the file can be overwritten. If the file already exists at the time of activating the capture point, Wireshark will overwrite the existing file.
- The core filter can be an explicit filter, access list, or class map. Specifying a newer filter of these types replaces the existing one.

**Note**

A core filter is required except when using a CAPWAP tunnel interface as a capture point attachment point.

- You can terminate a Wireshark session with an explicit `stop` command or by entering `q` in automore mode. The session could terminate itself automatically when a stop condition such as duration or packet capture limit is met, or if an internal error occurs, or resource is full (specifically if disk is full in file mode).

- Dropped packets will not be shown at the end of the capture. However, only the count of dropped, oversized packets will be displayed.

### Default Wireshark Configuration

The table below shows the default Wireshark configuration.

### Information About Embedded Packet Capture

**Embedded Packet Capture Overview**

Embedded Packet Capture (EPC) provides an embedded systems management facility that helps in tracing and troubleshooting packets. This feature allows network administrators to capture data packets flowing through, to, and from a Cisco device. The network administrator may define the capture buffer size and type.
Benefits of Embedded Packet Capture

- Ability to capture IPv4 and IPv6 packets in the device, and also capture non-IP packets with MAC filter or match any MAC address.
- Extensible infrastructure for enabling packet capture points. A capture point is a traffic transit point where a packet is captured and associated with a buffer.
- Facility to export the packet capture in packet capture file (PCAP) format suitable for analysis using any external tool.
- Methods to decode data packets captured with varying degrees of detail.

Packet Data Capture

Packet data capture is the capture of data packets that are then stored in a buffer. You can define packet data captures by providing unique names and parameters.

You can perform the following actions on the capture:
- Activate captures at any interface.
- Apply access control lists (ACLs) or class maps to capture points.

Note

Network Based Application Recognition (NBAR) and MAC-style class map is not supported.

- Destroy captures.
- Specify buffer storage parameters such as size and type. The size ranges from 1 MB to 100 MB. The default buffer is linear; the other option for the buffer is circular.
- Specify match criteria that includes information about the protocol, IP address or port address.

Configuring Packet Capture

How to Configure Wireshark

To configure Wireshark, perform these basic steps.

1. Define a capture point.
2. (Optional) Add or modify the capture point's parameters.
3. Activate or deactivate a capture point.
4. Delete the capture point when you are no longer using it.

**Defining a Capture Point**

The example in this procedure defines a very simple capture point. If you choose, you can define a capture point and all of its parameters with one instance of the `monitor capture` command.

---

**Note**

You must define an attachment point, direction of capture, and core filter to have a functional capture point.

An exception to needing to define a core filter is when you are defining a wireless capture point using a CAPWAP tunneling interface. In this case, you do not define your core filter. It cannot be used.

Follow these steps to define a capture point.

---

**SUMMARY STEPS**

1. `enable`
2. `show capwap summary`
3. `monitor capture {capture-name} {interface interface-type interface-id | control-plane} {in | out | both}`
4. `monitor capture {capture-name} [match {any | ipv4 any any | ipv6 any any}]`
5. `show monitor capture {capture-name} [parameter]`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
`enable`
**Example:**
Device> `enable`
| Enables privileged EXEC mode. |
| * Enter your password if prompted. |
| **Step 2**  
`show capwap summary`
**Example:**
Device# `show capwap summary`
| Displays the CAPWAP tunnels available as attachment points for a wireless capture. |
| **Note**  
Use this command only if you are using a CAPWAP tunnel as an attachment point to perform a wireless capture. See the CAPWAP example in the examples section. |
| **Step 3**  
`monitor capture {capture-name} {interface interface-type interface-id | control-plane} {in | out | both}`
**Example:**
Device# `monitor capture mycap interface GigabitEthernet1/0/1 in`
| Defines the capture point, specifies the attachment point with which the capture point is associated, and specifies the direction of the capture. |
| The keywords have these meanings:  
* `capture-name`—Specifies the name of the capture point to be defined (mycap is used in the example). Capture |
Defining a Capture Point

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>monitor capture {capture-name} [match {any</td>
<td>ipv4 any any</td>
</tr>
</tbody>
</table>

**Example:**

```
Device# monitor capture mycap interface GigabitEthernet1/0/1 in match any
```

**Step 4**

Name should be less than or equal to 8 characters. Only alphanumeric characters and underscore (_) is permitted.

- (Optional) `interface interface-type`
  - `interface-id`—Specifies the attachment point with which the capture point is associated. (GigabitEthernet1/0/1 is used in the example).

**Note**
Optionally, you can define multiple attachment points and all of the parameters for this capture point with this one command instance. These parameters are discussed in the instructions for modifying capture point parameters. Range support is also available both for adding and removing attachment points.

Use one of the following for `interface-type`:

- **GigabitEthernet**—Specifies the attachment point as GigabitEthernet.

- **vlan**—Specifies the attachment point as a VLAN.

  **Note**
  Only ingress capture (in) is allowed when using this interface as an attachment point.

- **capwap**—Specifies the attachment point as a CAPWAP tunnel.

  **Note**
  When using this interface as an attachment point, a core filter cannot be used.

- (Optional) `control-plane`—Specifies the control plane as an attachment point.

- `in` | `out` | `both`—Specifies the direction of capture.

The keywords have these meanings:

- **capture-name**—Specifies the name of the capture point to be defined (mycap is used in the example).
**Defining a Capture Point**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>match — Specifies a filter. The first filter defined is the core filter.</td>
<td></td>
</tr>
<tr>
<td>Note — A capture point cannot be activated if it has neither a core system filter nor attachment points defined. Attempting to activate a capture point that does not meet these requirements generates an error.</td>
<td></td>
</tr>
<tr>
<td>ipv4 — Specifies an IP version 4 filter.</td>
<td></td>
</tr>
<tr>
<td>ipv6 — Specifies an IP version 6 filter.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 5

**show monitor capture** `{capture-name}`[ parameter]

**Example:**

```
Device# show monitor capture mycap parameter
    monitor capture mycap interface
    GigabitEthernet1/0/1 in
    monitor capture mycap match any
```

**Step 5**

Displays the capture point parameters that you defined in Step 2 and confirms that you defined a capture point.

### Step 6

**show running-config**

**Example:**

```
Device# show running-config
```

Verifies your entries.

### Step 7

**copy running-config startup-config**

(Optional) Saves your entries in the configuration file.

**Example:**

```
Device# copy running-config startup-config
```

### Example

To define a capture point with a CAPWAP attachment point:

```
Device# show capwap summary

CAPWAP Tunnels General Statistics:
   Number of Capwap Data Tunnels = 1
   Number of Capwap Mobility Tunnels = 0
   Number of Capwap Multicast Tunnels = 0

Name APName Type PhyPortIf Mode McastIf
    ------ -------------------------------- ---- --------- --------- -------
   Ca0    AP442b.03a9.6715 data Gi3/0/6 unicast -

16 9.231998 10.10.14.2 -> 10.10.14.32 DTLSv1.0 Application Data
```
What to do next
You can add additional attachment points, modify the parameters of your capture point, then activate it, or if you want to use your capture point just as it is, you can now activate it.

Note
You cannot change a capture point's parameters using the methods presented in this topic.

If the user enters an incorrect capture name, or an invalid/non existing attachment point, the switch will show errors like "Capture Name should be less than or equal to 8 characters. Only alphanumeric characters and underscore (_) is permitted" and "% Invalid input detected at '^' marker" respectively.

Adding or Modifying Capture Point Parameters
Although listed in sequence, the steps to specify values for the parameters can be executed in any order. You can also specify them in one, two, or several lines. Except for attachment points, which can be multiple, you can replace any value with a more recent value by redefining the same option. You will need to confirm interactively when certain parameters already specified are being modified.

Follow these steps to modify a capture point's parameters.

Before you begin
A capture point must be defined before you can use these instructions.

Summary Steps

1. enable
2. monitor capture {capture-name} match {any | mac mac-match-string | ipv4 {any | host | protocol}{any | host} | ipv6 {any | host | protocol}{any | host}}
3. monitor capture {capture-name} limit {[duration seconds] [packet-length size] [packets num]}
4. monitor capture {capture-name} file {location filename}
5. monitor capture {capture-name} file {buffer-size size}
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2** monitor capture \{capture-name\} match \{any | mac mac-match-string | ipv4 \{any | host \} | protocol \{any | host \} | ipv6 \{any | host \} | protocol \{any | host \}\} | Defines the core system filter (ipv4 any any), defined either explicitly, through ACL or through a class map.  
  **Note** If you are defining a wireless capture point using a CAPWAP tunneling interface, this command will have no effect, so it should not be used. |
| **Step 3** monitor capture \{capture-name\} limit \{[duration seconds] | [packet-length size] | [packets num]\} | Specifies the session limit in seconds (60), packets captured, or the packet segment length to be retained by Wireshark (400). |
| **Step 4** monitor capture \{capture-name\} file \{location filename\} | Specifies the file association, if the capture point intends to capture packets rather than only display them.  
  **Note** If the file already exists, you have to confirm if it can be overwritten.  
  **Note** File option does not exist on LAN base license. |
<p>| <strong>Step 5</strong> monitor capture {capture-name} file {buffer-size size} | Specifies the size of the memory buffer used by Wireshark to handle traffic bursts. |
| <strong>Step 6</strong> show monitor capture {capture-name} [ parameter] | Displays the capture point parameters that you defined previously. |</p>
<table>
<thead>
<tr>
<th>Step 7</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

**Modifying Parameters**

**Associating or Disassociating a Capture File**

Device# monitor capture point mycap file location flash:mycap.pcap
Device# no monitor capture mycap file

**Specifying a Memory Buffer Size for Packet Burst Handling**

Device# monitor capture mycap buffer size 100

**Defining an Explicit Core System Filter to Match Both IPv4 and IPv6**

Device# monitor capture mycap match any

**What to do next**

If your capture point contains all of the parameters you want, activate it.

**Deleting Capture Point Parameters**

Although listed in sequence, the steps to delete parameters can be executed in any order. You can also delete them in one, two, or several lines. Except for attachment points, which can be multiple, you can delete any parameter.

Follow these steps to delete a capture point’s parameters.

**Before you begin**

A capture point parameter must be defined before you can use these instructions to delete it.

**SUMMARY STEPS**

1. enable
2. no monitor capture {capture-name} match
3. no monitor capture {capture-name} limit [duration] [packet-length] [packets]
4. no monitor capture {capture-name} file [location] [buffer-size]
5. show monitor capture {capture-name} [ parameter]
6. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Example:** | Device> enable | |
| **Step 2** | no monitor capture {capture-name} match | Deletes all filters defined on capture point (mycap). |
| **Example:** | Device# no monitor capture mycap match | |
| **Step 3** | no monitor capture {capture-name} limit [duration] [packet-length] [packets] | Deletes the session time limit and the packet segment length to be retained by Wireshark. It leaves other specified limits in place.  
Deletes all limits on Wireshark. |
| **Example:** | Device# no monitor capture mycap limit duration packet-len  
Device# no monitor capture mycap limit | |
| **Step 4** | no monitor capture {capture-name} file [location] [buffer-size] | Deletes the file association. The capture point will no longer capture packets. It will only display them.  
Deletes the file location association. The file location will no longer be associated with the capture point. However, other defined file association will be unaffected by this action. |
| **Example:** | Device# no monitor capture mycap file  
Device# no monitor capture mycap file location | |
| **Step 5** | show monitor capture {capture-name} [parameter] | Displays the capture point parameters that remain defined after your parameter deletion operations. This command can be run at any point in the procedure to see what parameters are associated with a capture point. |
| **Example:** | Device# show monitor capture mycap parameter  
mmonitor capture mycap interface  
GigabitEthernet1/0/1 in | |
| **Step 6** | end | Returns to privileged EXEC mode. |
| **Example:** | Device(config)# end | |

### What to do next

If your capture point contains all of the parameters you want, activate it.

---

### Note

If the parameters are deleted when the capture point is active, the switch will show an error "Capture is active".
Deleting a Capture Point

Follow these steps to delete a capture point.

Before you begin

A capture point must be defined before you can use these instructions to delete it. You have to stop the capture point before you can delete it.

SUMMARY STEPS

1. enable
2. no monitor capture {capture-name}
3. show monitor capture {capture-name} [ parameter]
4. end
5. show running-config
6. copy running-config startup-config

DETAILED STEPS

<td>show running-config&lt;br&gt;Example: Device# show running-config</td>
</tr>
<tr>
<td></td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>
Activating and Deactivating a Capture Point

Follow these steps to activate or deactivate a capture point.

**Before you begin**

A capture point can be activated even if an attachment point and a core system filter have been defined and the associated filename already exists. In such an instance, the existing file will be overwritten.

A capture point with no associated filename can only be activated to display. When the filename is not specified, the packets are captured into the buffer. Live display (display during capture) is available in both file and buffer modes.

If no display filters are specified, packets are not displayed live, and all the packets captured by the core system filter are displayed. The default display mode is brief.

**Note**

When using a CAPWAP tunneling interface as an attachment point, core filters are not used, so there is no requirement to define them in this case.

**SUMMARY STEPS**

1. `enable`
2. `monitor capture {capture-name} start [display [display-filter filter-string]] [brief | detailed | dump]`
3. `monitor capture {capture-name} stop`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device# enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

**What to do next**

You can define a new capture point with the same name as the one you deleted. These instructions are usually performed when one wants to start over with defining a capture point.
<table>
<thead>
<tr>

Clearing the Capture Point Buffer

Follow these steps to clear the buffer contents or save them to an external file for storage.

---

**Note**
If you have more than one capture that is storing packets in a buffer, clear the buffer before starting a new capture to avoid memory loss. Do not try to clear buffer on an active capture point.

---

**Note**
Clearing buffer on an active capture point is supported only on Lan Base as this only clears the content. On all other licenses, it deletes the buffer itself, hence cannot be run during active capture.

### SUMMARY STEPS

1. **enable**
2. **monitor capture** `{capture-name} [clear | export filename]`
3. **end**
4. **show running-config**
5. **copy running-config startup-config**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

**Examples: Capture Point Buffer Handling**

**Exporting Capture to a File**

Device# monitor capture mycap export flash:mycap.pcap

Storage configured as File for this capture

**Clearing Capture Point Buffer**

Device# monitor capture mycap clear

Capture configured with file options

**What to do next**

**Note**

If you try to clear the capture point buffer on licenses other than LAN Base, the switch will show an error "Failed to clear capture buffer : Capture Buffer BUSY".
How to Implement Embedded Packet Capture

Managing Packet Data Capture

Export of an active capture point is only supported on LAN Base licence. On all other license we need to stop the capture first and only then export.

To manage Packet Data Capture in the buffer mode, perform the following steps:

SUMMARY STEPS

1. enable
2. monitor capture capture-name access-list access-list-name
3. monitor capture capture-name limit duration seconds
4. monitor capture capture-name interface interface-name both
5. monitor capture capture-name buffer circular size bytes
6. monitor capture capture-name start
7. monitor capture capture-name stop
8. monitor capture capture-name export file-location/file-name
9. end

DETAILED STEPS

</table>

### What to do next

**Note**

If you try to export an active capture point on licenses other than LAN Base, the switch will show an error "Failed to Export : Capture Buffer BUSY".

### Monitoring and Maintaining Captured Data

Perform this task to monitor and maintain the packet data captured. Capture buffer details and capture point details are displayed.

### SUMMARY STEPS

1. enable
2. show monitor capture *capture-buffer-name* buffer dump
3. show monitor capture *capture-buffer-name* parameter
4. debug epc capture-point
DETAILED STEPS

Monitoring Packet Capture

Configuration Examples for Wireshark

Example: Displaying a Brief Output from a .pcap File

You can display the output from a .pcap file by entering:
### Example: Displaying Detailed Output from a .pcap File

You can display the detailed .pcap file output by entering:

```bash
Device# show monitor capture file flash:mycap.pcap detailed
Starting the packet display ........ Press Ctrl + Shift + 6 to exit
```

```
Frame 1: 114 bytes on wire (912 bits), 114 bytes captured (912 bits) on interface 0
Interface id: 0
```

Example: Displaying Packets from a .pcap File using a Display Filter

You can display the .pcap file packets output by entering:

```
Device# show monitor capture file flash:mycap.pcap display-filter "ip.src == 10.10.10.2" brief
Starting the packet display .......... Press Ctrl + Shift + 6 to exit
```

```
1 0.00000000 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-0/0, ttl-254
3 0.000908000 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-1/256, ttl-254
5 0.004835000 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-3/768, ttl-254
9 0.008768000 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-4/1024, ttl-254
11 0.012728000 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-5/1280, ttl-254
13 0.0166595000 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-6/1536, ttl-254
15 0.020592000 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-7/1792, ttl-254
17 0.024524500 10.10.10.2 --> 10.10.1. ICMP 114 Echo (ping) request id=0x002e,
seq-8/2048, ttl-254
```
Example: Displaying the Number of Packets Captured in a .pcap File

You can display the number of packets captured in a .pcap file by entering:

```
Device# show monitor capture file flash:mycap.pcap packet-count
File name: /flash/mycap.pcap
Number of packets: 50
```

Example: Displaying a Single Packet Dump from a .pcap File

You can display a single packet dump from a .pcap file by entering:

```
Device# show monitor capture file flash:mycap.pcap packet-number 10 dump
Starting the packet display ......... Press Ctrl + Shift + 6 to exit
```

Example: Displaying Statistics of Packets Captured in a .pcap File

You can display the statistics of the packets captured in a .pcap file by entering:

```
Device# show monitor capture file flash:mycap.pcap statistics "h225,counter"
```

Example: Simple Capture and Display

This example shows how to monitor traffic in the Layer 3 interface Gigabit Ethernet 1/0/1:

**Step 1:** Define a capture point to match on the relevant traffic by entering:

```
Device# monitor capture mycap interface GigabitEthernet1/0/3 in
Device# monitor capture mycap match ipv4 any any
Device# monitor capture mycap limit duration 60 packets 50
Device# monitor capture mycap buffer size 100
```

To avoid high CPU utilization, a low packet count and duration as limits has been set.

**Step 2:** Confirm that the capture point has been correctly defined by entering:

```
Device# show monitor capture mycap parameter
```

```
monitor capture mycap interface GigabitEthernet1/0/3 in
monitor capture mycap match ipv4 any any
monitor capture mycap buffer size 100
```
monitor capture mycap limit packets 50 duration 60

Device# show monitor capture mycap
Status Information for Capture mycap
   Target Type:
   Interface: GigabitEthernet1/0/3, Direction: in
   Status : Inactive
Filter Details:
   IPv4
      Source IP: any
      Destination IP: any
      Protocol: any
Buffer Details:
   Buffer Type: LINEAR (default)
   Buffer Size (in MB): 100
File Details:
   File not associated
Limit Details:
   Number of Packets to capture: 50
   Packet Capture duration: 60
   Packet Size to capture: 0 (no limit)
   Packet sampling rate: 0 (no sampling)

Step 3: Start the capture process and display the results.
Device# monitor capture mycap start display
Starting the packet display ........ Press Ctrl + Shift + 6 to exit

  1 0.000000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=0/0, ttl=254
  2 0.003682 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=1/256, ttl=254
  3 0.006586 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=2/512, ttl=254
  4 0.008941 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=3/768, ttl=254
  5 0.011138 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=4/1024, ttl=254
  6 0.014099 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=5/1280, ttl=254
  7 0.016868 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=6/1536, ttl=254
  8 0.019210 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=7/1792, ttl=254
  9 0.024785 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0030, seq=8/2048, ttl=254
--More--

Step 4: Delete the capture point by entering:
Device# no monitor capture mycap

Note
A stop command is not required in this particular case since we have set a limit and the capture will automatically stop once that limit is reached.

For more information on syntax to be used for pcap statistics, refer the "Additional References" section.
Example: Simple Capture and Store

This example shows how to capture packets to a filter:

**Step 1:** Define a capture point to match on the relevant traffic and associate it to a file by entering:

```
Device# monitor capture mycap interface GigabitEthernet1/0/3 in
Device# monitor capture mycap match ipv4 any any
Device# monitor capture mycap limit duration 60 packets 50
Device# monitor capture mycap file location flash:mycap.pcap
```

**Step 2:** Confirm that the capture point has been correctly defined by entering:

```
Device# show monitor capture mycap parameter
Device# show monitor capture mycap
```

**Step 3:** Launch packet capture by entering:

```
Device# monitor capture mycap start
```

**Step 4:** Display extended capture statistics during runtime by entering:

```
Device# show monitor capture mycap capture-statistics
```

**Step 5:** After sufficient time has passed, stop the capture by entering:
Device# `monitor capture mycap stop`
Capture statistics collected at software (Buffer & Wireshark):
- Capture duration - 20 seconds
- Packets received - 50
- Packets dropped - 0
- Packets oversized - 0

Alternatively, you could allow the capture operation stop automatically after the time has elapsed or the packet count has been met.

The mycap.pcap file now contains the captured packets.

**Step 6:** Display extended capture statistics after stop by entering:
Device# `show monitor capture mycap capture-statistics`
Capture statistics collected at software:
- Capture duration - 20 seconds
- Packets received - 50
- Packets dropped - 0
- Packets oversized - 0
- Packets errored - 0
- Packets sent - 50
- Bytes received - 8190
- Bytes dropped - 0
- Bytes oversized - 0
- Bytes errored - 0
- Bytes sent - 5130

**Step 7:** Display the packets by entering:
Device# `show monitor capture file flash:mycap.pcap`
Starting the packet display ........ Press Ctrl + Shift + 6 to exit

1 0.000000000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0031,

   seq=9/2304, ttl=254
11 0.026890000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0031,
   seq=10/2560, ttl=254
12 0.028862000 10.10.10.2 -> 10.10.10.1 ICMP 114 Echo (ping) request id=0x0031,
For more information on syntax to be used for pcap statistics, refer the "Additional References" section.

**Step 8:** Delete the capture point by entering:

```
Device# no monitor capture mycap
```

---

**Example: Using Buffer Capture**

This example shows how to use buffer capture:

**Step 1:** Launch a capture session with the buffer capture option by entering:

```
Device# monitor capture mycap interface GigabitEthernet1/0/3 in
Device# monitor capture mycap match ipv4 any any
Device# monitor capture mycap buffer circular size 1
Device# monitor capture mycap start
```

**Step 2:** Determine whether the capture is active by entering:

```
Device# show monitor capture mycap
```

- **Status Information for Capture mycap**
  - **Target Type:** Interface: GigabitEthernet1/0/3, Direction: in
  - **Status:** Active
  - **Filter Details:**
    - **IPv4**
      - Source IP: any
      - Destination IP: any
      - Protocol: any
  - **Buffer Details:**
    - Buffer Type: CIRCULAR
    - Buffer Size (in MB): 1
  - **File Details:**
    - File not associated
  - **Limit Details:**
    - Number of Packets to capture: 0 (no limit)
    - Packet Capture duration: 0 (no limit)
    - Packet Size to capture: 0 (no limit)
    - Maximum number of packets to capture per second: 1000
    - Packet sampling rate: 0 (no sampling)

**Step 3:** Display extended capture statistics during runtime by entering:

```
Device# show monitor capture mycap capture-statistics
```

- **Capture statistics collected at software:**
  - Capture duration: 88 seconds
  - Packets received: 1000
  - Packets dropped: 0
  - Packets oversized: 0
  - Packets errored: 0
  - Packets sent: 1000
  - Bytes received: 182000
  - Bytes dropped: 0
  - Bytes oversized: 0
  - Bytes errored: 0
  - Bytes sent: 114000

**Step 4:** Stop the capture by entering:
Example: Using Buffer Capture

```bash
Device# monitor capture mycap stop
Capture statistics collected at software (Buffer):
  Capture duration - 2185 seconds
  Packets received - 51500
  Packets dropped - 0
  Packets oversized - 0

Step 5: Display extended capture statistics after stop by entering:

```bash
Device# show monitor capture mycap capture-statistics
Capture statistics collected at software:
  Capture duration - 156 seconds
  Packets received - 2000
  Packets dropped - 0
  Packets oversized - 0
  Packets errored - 0
  Packets sent - 2000
  Bytes received - 364000
  Bytes dropped - 0
  Bytes oversized - 0
  Bytes errored - 0
  Bytes sent - 228000

Step 6: Determine whether the capture is active by entering:

```bash
Device# show monitor capture mycap
Status Information for Capture mycap
  Target Type:
    Interface: GigabitEthernet1/0/3, Direction: in
  Status : Inactive
  Filter Details:
    IPv4
      Source IP: any
      Destination IP: any
      Protocol: any
  Buffer Details:
    Buffer Type: CIRCULAR
    Buffer Size (in MB): 1
  File Details:
    File not associated
  Limit Details:
    Number of Packets to capture: 0 (no limit)
    Packet Capture duration: 0 (no limit)
    Packet Size to capture: 0 (no limit)
    Maximum number of packets to capture per second: 1000
    Packet sampling rate: 0 (no sampling)

Step 7: Display the packets in the buffer by entering:

```bash
Device# show monitor capture mycap buffer brief
Starting the packet display ......... Press Ctrl + Shift + 6 to exit

1  0.000000  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0038,
seg=40057/31132, ttl=254
2  0.000030  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0038,
seg=40058/31388, ttl=254
3  0.000052  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0038,
seg=40059/31644, ttl=254
4  0.000073  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0038,
seg=40060/31900, ttl=254
5  0.000094  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0038,
seg=40061/32156, ttl=254
6  0.000115  10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request id=0x0038,
```
Notice that the packets have been buffered.

**Step 8: Display the packets in other display modes.**

```
Device# show monitor capture mycap buffer detailed
Starting the packet display .......... Press Ctrl + Shift + 6 to exit
```

Frame 1: 114 bytes on wire (912 bits), 114 bytes captured (912 bits) on interface 0
Interface id: 0
Encapsulation type: Ethernet (1)
Arrival Time: Nov 6, 2015 18:10:06.297972000 UTC
[Time shift for this packet: 0.000000000 seconds]
Epoch Time: 1446833406.297972000 seconds
[Time delta from previous captured frame: 0.000000000 seconds]
[Time delta from previous displayed frame: 0.000000000 seconds]
[Time since reference or first frame: 0.000000000 seconds]
Frame Number: 1
Frame Length: 114 bytes (912 bits)
Capture Length: 114 bytes (912 bits)
[Frame is marked: False]
[Frame is ignored: False]
  Destination: Cisco_31:f1:c6 (00:e1:6d:31:f1:c6)
  Address: Cisco_31:f1:c6 (00:e1:6d:31:f1:c6)
  .... ..0. .... .... .... .... = LG bit: Globally unique address (factory default)

[Good: False]
[Bad: False]
Source: 10.10.10.2 (10.10.10.2)
Destination: 10.10.10.1 (10.10.10.1)

Internet Control Message Protocol
Type: 8 (Echo (ping) request)
Code: 0
Checksum: 0xa620 [correct]
Identifier (BE): 56 (0x0038)
Identifier (LE): 14336 (0x3800)
Sequence number (BE): 40057 (0x9c79)
Sequence number (LE): 31132 (0x799c)
Data (72 bytes)

0000 00 00 00 00 0b 15 30 63 ab cd ab cd ab cd ab cd ab cd ......0c........
0010 ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd .................
0020 ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd .................
0030 ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd .................
0040 ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd ab cd .................

Frame 2: 114 bytes on wire (912 bits), 114 bytes captured (912 bits) on interface 0

Device# show monitor capture mycap buffer dump
Starting the packet display ......... Press Ctrl + Shift + 6 to exit

Step 9: Clear the buffer by entering:

Device# monitor capture mycap clear

---

**Note**

NOTE - Clearing the buffer deletes the buffer along with the contents.

---

**Note**

If you require the buffer contents to be displayed, run the clear commands after show commands.
Step 10: Restart the traffic, wait for 10 seconds, then display the buffer contents by entering:

```
Device# monitor capture mycap start
Switch# show monitor capture mycap

Status Information for Capture mycap
  Target Type: Interface: GigabitEthernet1/0/3, Direction: in
  Status : Active
  Filter Details:
    IPv4
    Source IP: any
    Destination IP: any
    Protocol: any
  Buffer Details:
    Buffer Type: CIRCULAR
    Buffer Size (in MB): 1
  File Details:
    File not associated
  Limit Details:
    Number of Packets to capture: 0 (no limit)
    Packet Capture duration: 0 (no limit)
    Packet Size to capture: 0 (no limit)
    Maximum number of packets to capture per second: 1000
    Packet sampling rate: 0 (no sampling)
```

Step 11: Stop the packet capture and display the buffer contents by entering:

```
Device# monitor capture mycap stop
Capture statistics collected at software (Buffer):
  Capture duration - 111 seconds
  Packets received - 5000
  Packets dropped - 0
  Packets oversized - 0
```

Step 12: Determine whether the capture is active by entering:

```
Device# show monitor capture mycap
Status Information for Capture mycap
  Target Type:
    Interface: GigabitEthernet1/0/3, Direction: in
  Status : Inactive
  Filter Details:
    IPv4
    Source IP: any
    Destination IP: any
    Protocol: any
  Buffer Details:
    Buffer Type: CIRCULAR
    Buffer Size (in MB): 1
  File Details:
    File not associated
  Limit Details:
    Number of Packets to capture: 0 (no limit)
```

**Note**

We cannot run show from buffer during an active capture. Capture should be stopped before running show from buffer. We can however run a show on a pcap file during an active capture in both file and buffer mode. In file mode, we can display the packets in the current capture session’s pcap file as well when the capture is active.
Step 13: Display the packets in the buffer by entering:

```
Device# show monitor capture mycap buffer brief
Starting the packet display .......... Press Ctrl + Shift + 6 to exit
```

1 0.0000000000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=0/0, ttl=254
2 0.0000030000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=1/256, ttl=254
3 0.0000051000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=2/512, ttl=254
4 0.0000072000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=3/768, ttl=254
5 0.0000093000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=4/1024, ttl=254
6 0.0000114000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=5/1280, ttl=254
7 0.0000136000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=6/1536, ttl=254
8 0.0000157000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=7/1792, ttl=254
9 0.0000178000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=8/2048, ttl=254
10 0.0000199000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=9/2304, ttl=254
11 0.0000220000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=10/2560, ttl=254
12 0.0000241000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=11/2816, ttl=254
```

Step 14: Store the buffer contents to the mycap.pcap file in the internal flash: storage device by entering:

```
Device# monitor capture mycap export flash:mycap.pcap
Exported Successfully
```

**Note**

The current implementation of export is such that when the command is run, export is "started" but not complete when it returns the prompt to the user. So we have to wait for a message display on the console from Wireshark before it can run a display of packets in the file.

Step 15: Display capture packets from the file by entering:

```
Device# show monitor capture file flash:mycap.pcap
Starting the packet display .......... Press Ctrl + Shift + 6 to exit
```

1 0.0000000000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=0/0, ttl=254
2 0.0000030000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=1/256, ttl=254
3 0.0000051000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=2/512, ttl=254
4 0.0000072000 10.10.10.2 -> 10.10.10.1  ICMP 114 Echo (ping) request  id=0x0039, seq=3/768, ttl=254
Example: Simple Capture and Store of Packets in Egress Direction

This example shows how to capture packets to a filter:

**Step 1:** Define a capture point to match on the relevant traffic and associate it to a file by entering:
```
Device# monitor capture mycap interface Gigabit 1/0/1 out match ipv4 any any
Device# monitor capture mycap limit duration 60 packets 100
Device# monitor capture mycap file location flash:mycap.pcap buffer-size 90
```

**Step 2:** Confirm that the capture point has been correctly defined by entering:
```
Device# show monitor capture mycap parameter
monitor capture mycap interface GigabitEthernet1/0/1 out
monitor capture mycap match ipv4 any any
monitor capture mycap file location flash:mycap.pcap buffer-size 90
monitor capture mycap limit packets 100 duration 60
```

```
Device# show monitor capture mycap
Status Information for Capture mycap
Target Type:
  Interface: GigabitEthernet1/0/1, Direction: out
Status : Inactive
Filter Details:
  IPv4
  Source IP: any
  Destination IP: any
  Protocol: any
Buffer Details:
  Buffer Type: LINEAR (default)
File Details:
  Associated file name: flash:mycap.pcap
  Size of buffer(in MB): 90
Limit Details:
  Number of Packets to capture: 100
  Packet Capture duration: 60
  Packet Size to capture: 0 (no limit)
```

**Step 16:** Delete the capture point by entering:
```
Device# no monitor capture mycap
```
Packets per second: 0 (no limit)
Packet sampling rate: 0 (no sampling)

Step 3: Launch packet capture by entering:

Device# monitor capture mycap start
A file by the same capture file name already exists, overwrite?[confirm]
Turning on lock-step mode

Device#

*Oct 14 09:35:32.661: %BUFCAP-6-ENABLE: Capture Point mycap enabled.

Note

Allow the capture operation stop automatically after the time has elapsed or the packet count has been met. When you see the following message in the output, will know that the capture operation has stopped:

*Oct 14 09:36:34.632: %BUFCAP-6-DISABLE_ASYNC: Capture Point mycap disabled. Reason : Wireshark Session Ended

The mycap.pcap file now contains the captured packets.

Step 4: Display the packets by entering:

Device# show monitor capture file flash:mycap.pcap
Starting the packet display ......... Press Ctrl + Shift + 6 to exit

0.000000 10.1.1.30 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
1.000000 10.1.1.31 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
2.000000 10.1.1.32 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
3.000000 10.1.1.33 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
4.000000 10.1.1.34 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
5.000000 10.1.1.35 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
6.000000 10.1.1.36 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
7.000000 10.1.1.37 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
8.000000 10.1.1.38 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002
9.000000 10.1.1.39 -> 20.1.1.2 UDP Source port: 20001 Destination port: 20002

Step 5: Delete the capture point by entering:

Device# no monitor capture mycap

Configuration Examples for Embedded Packet Capture

Example: Managing Packet Data Capture

The following example shows how to manage packet data capture:

Device> enable
Device# monitor capture mycap start
Device# monitor capture mycap access-list v4acl
Device# monitor capture mycap limit duration 1000
Device# monitor capture mycap interface GigabitEthernet 0/0/1 both
Device# monitor capture mycap buffer circular size 10
Device# monitor capture mycap start
Device# monitor capture mycap export tftp://10.1.88.9/mycap.pcap
Device# monitor capture mycap stop
Device# end
Example: Monitoring and Maintaining Captured Data

The following example shows how to dump packets in ASCII format:

Device# set monitor capture mycap buffer dump
Starting the packet display .......... Press Ctrl + Shift + 6 to exit

0
0000: 01005E00 00020000 0C07AC1D 080045C0 ..^...........E.

0040: 000F0004 00080501 0300

The following example shows how to display the list of commands used to configure the capture named mycap:

Device# show monitor capture mycap parameter
monitor capture mycap interface GigabitEthernet 1/0/1 both
monitor capture mycap match any
monitor capture mycap buffer size 10
monitor capture mycap limit pps 1000

The following example shows how to debug the capture point:

Device# debug epc capture-point
EPC capture point operations debugging is on

Device# show monitor capture mycap start
*Jun 4 14:17:15.463: EPC CP: Starting the capture cap1
*Jun 4 14:17:15.463: EPC CP: (brief=3, detailed=4, dump=5) = 0
*Jun 4 14:17:15.463: EPC CP: final check before activation
*Jun 4 14:17:15.463: EPC CP: setting up c3pl infra
*Jun 4 14:17:15.463: EPC CP: Setup c3pl acl-class-policy
*Jun 4 14:17:15.463: EPC CP: Creating a class
*Jun 4 14:17:15.464: EPC CP: Creating a class : Successful
*Jun 4 14:17:15.464: EPC CP: class-map Created
*Jun 4 14:17:15.464: EPC CP: creating policy-name epc_policy_cap1

Configuring Flexible NetFlow

- Prerequisites for Flexible NetFlow, on page 1211
- Restrictions for Flexible NetFlow, on page 1212
- Information About Flexible Netflow, on page 1214
- How to Configure Flexible Netflow, on page 1229
- Monitoring Flexible NetFlow, on page 1243
- Configuration Examples for Flexible NetFlow, on page 1244
- Additional References for NetFlow, on page 1249
- Feature Information for Flexible NetFlow, on page 1250

Prerequisites for Flexible NetFlow

The following are prerequisites for your Flexible NetFlow configuration:

- You must configure a source interface. If you do not configure a source interface, the exporter remains in a disabled state.
- You must configure a valid record name for every flow monitor.
- You must enable IPv6 routing to export the flow records to an IPv6 destination server.
- You must configure IPFIX export protocol for the flow exporter to export netflow records in IPFIX format.
- You are familiar with the Flexible NetFlow key fields as they are defined in the following commands in the Cisco IOS Flexible NetFlow Command Reference:
  - `match datalink`—Datalink (layer2) fields
  - `match flow`—Flow identifying fields
  - `match interface`—Interface fields
  - `match ipv4`—IPv4 fields
  - `match ipv6`—IPv6 fields
  - `match transport`—Transport layer fields
  - `match wireless`—Wireless fields
• You are familiar with the Flexible NetFlow non-key fields as they are defined in the following commands in the Cisco IOS Flexible NetFlow Command Reference:
  • **collect counter**—Counter fields
  • **collect flow**—Flow identifying fields
  • **collect interface**—Interface fields
  • **collect timestamp**—Timestamp fields
  • **collect transport**—Transport layer fields
  • **collect wireless**—Wireless fields

**IPv4 Traffic**

• The networking device must be configured for IPv4 routing.

• One of the following must be enabled on your device and on any interfaces on which you want to enable Flexible NetFlow: Cisco Express Forwarding or distributed Cisco Express Forwarding.

**IPv6 Traffic**

• The networking device must be configured for IPv6 routing.

• One of the following must be enabled on your device and on any interfaces on which you want to enable Flexible NetFlow: Cisco Express Forwarding IPv6 or distributed Cisco Express Forwarding.

**Restrictions for Flexible NetFlow**

The following are restrictions for Flexible NetFlow:

• Flexible NetFlow is not supported on the L2 port-channel interface, but is supported on the L2 port-channel member ports.

• Flexible NetFlow is not supported on the L3 port-channel interface, but is supported on the L3 port-channel member ports.

• Traditional NetFlow (TNF) accounting is not supported.

• Flexible NetFlow version 9 and version 10 export formats are supported. However, if you have not configured the export protocol, version 9 export format is applied by default.

• Microflow policing feature shares the NetFlow hardware resource with FNF.

• Only one flow monitor per interface and per direction is supported.

• Layer 2, IPv4, and IPv6 traffic types are supported. Multiple flow monitors of different traffic types can be applied for a given interface and direction. Multiple flow monitors of same traffic type cannot be applied for a given interface and direction.

• Layer 2, VLAN, WLAN and Layer 3 interfaces are supported, but the device does not support SVI and tunnels.
• The following NetFlow table sizes are supported:

<table>
<thead>
<tr>
<th>Trim Level</th>
<th>Ingress NetFlow Table</th>
<th>Egress NetFlow Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAN Base</td>
<td>Not supported</td>
<td>Not supported</td>
</tr>
<tr>
<td>IP Base</td>
<td>8K</td>
<td>16K</td>
</tr>
<tr>
<td>IP Services</td>
<td>8K</td>
<td>16K</td>
</tr>
</tbody>
</table>

• Depending on the switch type, a switch will have one or two forwarding ASICs. The capacities listed in the above table are on a per-ASIC basis.

• The switch can support either one or two ASICs. Each ASIC has 8K ingress and 16K egress entries, whereas each TCAM can handle up to 6K ingress and 12K egress entries.

• The NetFlow tables are on separate compartments and cannot be combined. Depending on which ASIC processed the packet, the flows will be created in the table in the corresponding ASIC.

• NetFlow hardware implementation supports four hardware samplers. You can select a sampler rate from 1 out of 2 to 1 out of 1024. Only random sampling mode is supported.

• NetFlow hardware uses hash tables internally. Hash collisions can occur in the hardware. Therefore, in spite of the internal overflow Content Addressable Memory (CAM), the actual NetFlow table utilization could be about 80 percent.

• Depending on the fields that are used for the flow, a single flow could take two consecutive entries. IPv6 flows also take two entries. In these situations, the effective usage of NetFlow entries is half the table size, which is separate from the above hash collision limitation.

• The device supports up to 63 flow monitors.

• SSID-based NetFlow accounting is supported. SSID is treated in a manner similar to an interface. However, certain fields are not supported such as user ID.

• The NetFlow software implementation supports distributed NetFlow export, so the flows are exported from the same device in which the flow was created.

• Ingress flows are present in the ASIC that first received the packets for the flow. Egress flows are present in the ASIC from which the packets actually left the device set up.

• The reported value for the bytes count field (called “bytes long”) is Layer-2-packet-size—18 bytes. For classic Ethernet traffic (802.3), this will be accurate. For all other Ethernet types, this field will not be accurate. Use the "bytes layer2" field, which always reports the accurate Layer 2 packet size. For information about supported Flexible NetFlow fields, see Supported Flexible NetFlow Fields, on page 1225.

• Configuration of IPFIX exporter on an AVC flow monitor is not supported.

• Flexible NetFlow export is not supported on the Ethernet management port, Gi0/0.

• When a flow record has only Source Group Tag (SGT) and Destination Group Tag (DGT) fields (or only either of the two) and if both the values are not applicable, then a flow will still be created with zero values for SGT and DGT. The flow records are expected to include source and destination IP addresses, along with SGT and DGT fields.

• The flow monitor with flow record, that contains the CTS field, cannot be attached on the WLAN (SSID).
Information About Flexible Netflow

Flexible NetFlow Overview

Flexible NetFlow uses flows to provide statistics for accounting, network monitoring, and network planning. A flow is a unidirectional stream of packets that arrives on a source interface and has the same values for the keys. A key is an identified value for a field within the packet. You create a flow using a flow record to define the unique keys for your flow.

The device supports the Flexible NetFlow feature that enables enhanced network anomalies and security detection. Flexible NetFlow allows you to define an optimal flow record for a particular application by selecting the keys from a large collection of predefined fields.

All key values must match for the packet to count in a given flow. A flow might gather other fields of interest, depending on the export record version that you configure. Flows are stored in the Flexible NetFlow cache.

You can export the data that Flexible NetFlow gathers for your flow by using an exporter and export this data to a remote system such as a Flexible NetFlow collector. The Flexible NetFlow collector can use an IPv4 or IPv6 address.

You define the size of the data that you want to collect for a flow using a monitor. The monitor combines the flow record and exporter with the Flexible NetFlow cache information.

Wireless Flexible NetFlow Overview

The wireless Flexible NetFlow infrastructure supports the following:

- Flexible NetFlow Version 9.0 and 10
- User-based rate limiting
- Microflow policing
- Voice and video flow monitoring
- Reflexive access control list (ACL)

Microflow Policing and User-Based Rate Limiting

Microflow policing associates a 2-color 1-rate policer and related drop statistics to each flow present in the NetFlow table. When the flow mask comprises all packet fields, this functionality is known as microflow policing. When the flow mask comprises either source or destination only, this functionality is known as user-based rate limiting.

Voice and Video Flow Monitoring

Voice and video flows are full flow mask-based entries. The ASIC provides the flexibility to program the policer parameters, share policers across multiple flows and rewrite the IP address and Layer 4 port numbers of these flows.

For dynamic entries, the NetFlow engine will use the policer parameters that are derived for the flow based on the policy (ACL/QoS-based policies). Dynamic entries cannot share policer across multiple flows.
Reflexive ACLs allow IP packets to be filtered based on upper-layer session information. The ACLs allow outbound traffic and limit inbound traffic in response to the sessions that originate inside the trusted network. The reflexive ACLs are transparent to the filtering mechanism until a data packet that matches the reflexive entry activates it. At this time, a temporary ACL entry is created and added to the IP-named access lists. The information obtained from the data packet to generate the reflexive ACL entry is permit/deny bit, the source IP address and port, the destination IP address, port, and the protocol type. During reflexive ACL entry evaluation, if the protocol type is either TCP or UDP, then the port information must match exactly. For other protocols, there is no port information to match. After this ACL is installed, the firewall is then opened for the reply packets to pass through. At this time, a potential hacker could have access to the network behind the firewall. To narrow this window, an idle timeout period can be defined. However, in the case of TCP, if two FIN bits or an RST is detected, the ACL entry can be removed.

Original NetFlow and Benefits of Flexible NetFlow

Original NetFlow uses a fixed seven tuples of IP information to identify a flow. Flexible NetFlow allows the flow to be user defined. The benefits of Flexible NetFlow include:

- High-capacity flow recognition, including scalability and aggregation of flow information.
- Enhanced flow infrastructure for security monitoring and dDoS detection and identification.
- New information from packets to adapt flow information to a particular service or operation in the network. The flow information available will be customizable by Flexible NetFlow users.
- Extensive use of Cisco’s flexible and extensible NetFlow Version 9 and version 10 export formats. With version 10 export format, support for variable length field for the wireless client's SSID is available.
- A comprehensive IP accounting feature that can be used to replace many accounting features, such as IP accounting, Border Gateway Protocol (BGP) Policy Accounting, and persistent caches.
- Support for ingress and egress NetFlow accounting.

Original NetFlow allows you to understand the activities in the network and thus to optimize network design and reduce operational costs.

Flexible NetFlow allows you to understand network behavior with more efficiency, with specific flow information tailored for various services used in the network. The following are some example applications for a Flexible NetFlow feature:

- Flexible NetFlow enhances Cisco NetFlow as a security monitoring tool. For instance, new flow keys can be defined for packet length or MAC address, allowing users to search for a specific type of attack in the network.
- Flexible NetFlow allows you to quickly identify how much application traffic is being sent between hosts by specifically tracking TCP or UDP applications by the class of service (CoS) in the packets.
- The accounting of traffic entering a Multiprotocol Label Switching (MPLS) or IP core network and its destination for each next hop per class of service. This capability allows the building of an edge-to-edge traffic matrix.

The figure below is an example of how Flexible NetFlow might be deployed in a network.
Flexible NetFlow Components

Flexible NetFlow consists of components that can be used together in several variations to perform traffic analysis and data export. The user-defined flow records and the component structure of Flexible NetFlow facilitates the creation of various configurations for traffic analysis and data export on a networking device with a minimum number of configuration commands. Each flow monitor can have a unique combination of flow record, flow exporter, and cache type. If you change a parameter such as the destination IP address for a flow exporter, it is automatically changed for all the flow monitors that use the flow exporter. The same flow monitor can be used in conjunction with different flow samplers to sample the same type of network traffic at different rates on different interfaces. The following sections provide more information on Flexible NetFlow components:

Flow Records

In Flexible NetFlow a combination of key and nonkey fields is called a record. Flexible NetFlow records are assigned to Flexible NetFlow flow monitors to define the cache that is used for storing flow data. Flexible NetFlow includes several predefined records that can help you get started using Flexible NetFlow.

A flow record defines the keys that Flexible NetFlow uses to identify packets in the flow, as well as other fields of interest that Flexible NetFlow gathers for the flow. You can define a flow record with any combination of keys and fields of interest. The device supports a rich set of keys. A flow record also defines the types of counters gathered per flow. You can configure 64-bit packet or byte counters. The device enables the following match fields as the defaults when you create a flow record:

• match datalink—Layer 2 attributes
• match flow direction — Specifies a match to the fields identifying the direction of flow.
• match interface—Interface attributes
• match ipv4—IPv4 attributes
• match ipv6—IPv6 attributes
• match transport—Transport layer fields
• match wireless—Wireless fields
NetFlow Predefined Records

Flexible NetFlow includes several predefined records that you can use to start monitoring traffic in your network. The predefined records are available to help you quickly deploy Flexible NetFlow and are easier to use than user-defined flow records. You can choose from a list of already defined records that may meet the needs for network monitoring. As Flexible NetFlow evolves, popular user-defined flow records will be made available as predefined records to make them easier to implement.

The predefined records ensure backward compatibility with your existing NetFlow collector configurations for the data that is exported. Each of the predefined records has a unique combination of key and nonkey fields that offer you the built-in ability to monitor various types of traffic in your network without customizing Flexible NetFlow on your router.

Two of the predefined records (NetFlow original and NetFlow IPv4/IPv6 original output), which are functionally equivalent, emulate original (ingress) NetFlow and the Egress NetFlow Accounting feature in original NetFlow, respectively. Some of the other Flexible NetFlow predefined records are based on the aggregation cache schemes available in original NetFlow. The Flexible NetFlow predefined records that are based on the aggregation cache schemes available in original NetFlow do not perform aggregation. Instead each flow is tracked separately by the predefined records.

User-Defined Records

Flexible NetFlow enables you to define your own records for a Flexible NetFlow flow monitor cache by specifying the key and nonkey fields to customize the data collection to your specific requirements. When you define your own records for a Flexible NetFlow flow monitor cache, they are referred to as user-defined records. The values in nonkey fields are added to flows to provide additional information about the traffic in the flows. A change in the value of a nonkey field does not create a new flow. In most cases the values for nonkey fields are taken from only the first packet in the flow. Flexible NetFlow enables you to capture counter values such as the number of bytes and packets in a flow as nonkey fields.

You can create user-defined records for applications such as QoS and bandwidth monitoring, application and end user traffic profiling, and security monitoring for dDoS attacks. Flexible NetFlow also includes several predefined records that emulate original NetFlow. Flexible NetFlow user-defined records provide the capability to monitor a contiguous section of a packet of a user-configurable size, and use it in a flow record as a key or a nonkey field along with other fields and attributes of the packet. The section may include any Layer 3 data from the packet. The packet section fields allow the user to monitor any packet fields that are not covered by the Flexible NetFlow predefined keys. The ability to analyze packet fields that are not collected with the predefined keys enables more detailed traffic monitoring, facilitates the investigation of dDoS attacks, and enables implementation of other security applications such as URL monitoring.

Flexible NetFlow provides predefined types of packet sections of a user-configurable size. The following Flexible NetFlow commands (used in Flexible NetFlow flow record configuration mode) can be used to configure the predefined types of packet sections:

- **collect ipv4 section header size** *bytes* --Starts capturing the number of bytes specified by the *bytes* argument from the beginning of the IPv4 header of each packet.

- **collect ipv4 section payload size** *bytes* --Starts capturing bytes immediately after the IPv4 header from each packet. The number of bytes captured is specified by the *bytes* argument.

- **collect ipv6 section header size** *bytes* --Starts capturing the number of bytes specified by the *bytes* argument from the beginning of the IPv6 header of each packet.

- **collect ipv6 section payload size** *bytes* --Starts capturing bytes immediately after the IPv6 header from each packet. The number of bytes captured is specified by the *bytes* argument.
The bytes values are the sizes in bytes of these fields in the flow record. If the corresponding fragment of the packet is smaller than the requested section size, Flexible NetFlow will fill the rest of the section field in the flow record with zeros. If the packet type does not match the requested section type, Flexible NetFlow will fill the entire section field in the flow record with zeros.

Flexible NetFlow adds a new Version 9 export format field type for the header and packet section types. Flexible NetFlow will communicate to the NetFlow collector the configured section sizes in the corresponding Version 9 export template fields. The payload sections will have a corresponding length field that can be used to collect the actual size of the collected section.

**Flexible NetFlow Match Parameters**

The following table describes Flexible NetFlow match parameters. You must configure at least one of the following match parameters for the flow records.

**Table 84: Match Parameters**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| match datalink \{dot1q | ethertype | mac | vlan \} | Specifies a match to datalink or Layer 2 fields. The following command options are available: 
  - **dot1q**—Matches to the dot1q field.
  - **ethertype**—Matches to the ethertype of the packet.
  - **mac**—Matches the source or destination MAC fields.
  - **vlan**—Matches to the VLAN that the packet is located on (input or output). |
| match flow direction | Specifies a match to the flow identifying fields. |
| match interface \{input | output\} | Specifies a match to the interface fields. The following command options are available: 
  - **input**—Matches to the input interface.
  - **output**—Matches to the output interface. |
<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| match ipv4 \{destination | protocol | source | tos | ttl | version\} | Specifies a match to the IPv4 fields. The following command options are available:  
  • destination—Matches to the IPv4 destination address-based fields.  
  • protocol—Matches to the IPv4 protocols.  
  • source—Matches to the IPv4 source address based fields.  
  • tos—Matches to the IPv4 Type of Service fields.  
  • ttl—Matches to the IPv4 Time To Live fields.  
  • version—Matches to the IP version from the IPv4 header. |
| match ipv6 \{destination | hop-limit | protocol | source | traffic-class | version \} | Specifies a match to the IPv6 fields. The following command options are available:  
  • destination—Matches to the IPv6 destination address-based fields.  
  • hop-limit—Matches to the IPv6 hop limit fields.  
  • protocol—Matches to the IPv6 payload protocol fields.  
  • source—Matches to the IPv6 source address based fields.  
  • traffic-class—Matches to the IPv6 traffic class.  
  • version—Matches to the IP version from the IPv6 header. |
| match transport \{destination-port | igmp | icmp | source-port\} | Specifies a match to the Transport Layer fields. The following command options are available:  
  • destination-port—Matches to the transport destination port.  
  • icmp—Matches to ICMP fields, including ICMP IPv4 and IPv6 fields.  
  • igmp—Matches to IGMP fields.  
  • source-port—Matches to the transport source port. |

**Flexible NetFlow Collect Parameters**

The following table describes the Flexible NetFlow collect parameters.
Table 85: Collect Parameters

<table>
<thead>
<tr>
<th>Command</th>

<td>Configures the system uptime for the time the last packet was seen from the flows as a nonkey field and enables collecting time stamps based on the system uptime for the time the most recent packet was seen from the flows.</td>
</tr>
</tbody>
</table>
Flow Exporters

Flow exporters export the data in the flow monitor cache to a remote system, such as a server running NetFlow collector, for analysis and storage. Flow exporters are created as separate entities in the configuration. Flow exporters are assigned to flow monitors to provide data export capability for the flow monitors. You can create several flow exporters and assign them to one or more flow monitors to provide several export destinations. You can create one flow exporter and apply it to several flow monitors.

NetFlow Data Export Format Version 9

The basic output of NetFlow is a flow record. Several different formats for flow records have evolved as NetFlow has matured. The most recent evolution of the NetFlow export format is known as Version 9. The distinguishing feature of the NetFlow Version 9 export format is that it is template-based. Templates provide an extensible design to the record format, a feature that should allow future enhancements to NetFlow services without requiring concurrent changes to the basic flow-record format. Using templates provides several key benefits:

- Third-party business partners who produce applications that provide collector or display services for NetFlow do not have to recompile their applications each time a new NetFlow feature is added. Instead, they should be able to use an external data file that documents the known template formats.
- New features can be added to NetFlow quickly without breaking current implementations.
- NetFlow is “future-proofed” against new or developing protocols because the Version 9 format can be adapted to provide support for them.

The Version 9 export format consists of a packet header followed by one or more template flow or data flow sets. A template flow set provides a description of the fields that will be present in future data flow sets. These data flow sets may occur later within the same export packet or in subsequent export packets. Template flow and data flow sets can be intermingled within a single export packet, as illustrated in the figure below.

Figure 84: Version 9 Export Packet

<table>
<thead>
<tr>
<th>Packet Header</th>
<th>Template FlowSet</th>
<th>Data FlowSet</th>
<th>Data FlowSet</th>
<th>Template FlowSet</th>
<th>Data FlowSet</th>
</tr>
</thead>
</table>

NetFlow Version 9 will periodically export the template data so the NetFlow collector will understand what data is to be sent and also export the data flow set for the template. The key advantage to Flexible NetFlow is that the user configures a flow record, which is effectively converted to a Version 9 template and then forwarded to the collector. The figure below is a detailed example of the NetFlow Version 9 export format, including the header, template flow, and data flow sets.
Flow Monitors

Flow monitors are the Flexible NetFlow component that is applied to interfaces to perform network traffic monitoring.

Flow monitors consist of a user-defined record, an optional flow exporter, and a cache that is automatically created at the time the flow monitor is applied to the first interface.

Flow data is collected from the network traffic and added to the flow monitor cache during the monitoring process based on the key and nonkey fields in the flow record.

Flexible NetFlow can be used to perform different types of analysis on the same traffic. In the figure below, packet 1 is analyzed using a record designed for standard traffic analysis on the input interface and a record designed for security analysis on the output interface.

The figure below shows a more complex example of how you can apply different types of flow monitors with custom records.

There are three types of flow monitor caches. You change the type of cache used by the flow monitor after you create the flow monitor. The three types of flow monitor caches are described in the following sections:

**Normal**

The default cache type is “normal”. In this mode, the entries in the cache are aged out according to the timeout active and timeout inactive settings. When a cache entry is aged out, it is removed from the cache and exported via any exporters configured.
Immediate

A cache of type "immediate" ages out every record as soon as it is created. As a result, every flow contains just one packet. The commands that display the cache contents will provide a history of the packets seen.

This mode is desirable when you expect only very small flows and you want a minimum amount of latency between seeing a packet and exporting a report.

Caution

This mode may result in a large amount of export data that can overload low-speed links and overwhelm any systems that you are exporting to. We recommended that you configure sampling to reduce the number of packets that are processed.

Note

The cache timeout settings have no effect in this mode.

Permanent

A cache of type "permanent" never ages out any flows. A permanent cache is useful when the number of flows you expect to see is low and there is a need to keep long-term statistics on the router. For example, if the only key field in the flow record is the 8-bit IP ToS field, only 256 flows can be monitored. To monitor the long-term usage of the IP ToS field in the network traffic, you can use a permanent cache. Permanent caches are useful for billing applications and for an edge-to-edge traffic matrix for a fixed set of flows that are being tracked. Update messages will be sent periodically to any flow exporters configured according to the "timeout update" setting.

Note

When a cache becomes full in permanent mode, new flows will not be monitored. If this occurs, a "Flows not added" message will appear in the cache statistics.

Note

A permanent cache uses update counters rather than delta counters. This means that when a flow is exported, the counters represent the totals seen for the full lifetime of the flow and not the additional packets and bytes seen since the last export was sent.

Flow Samplers

Flow samplers are created as separate components in a router’s configuration. Flow samplers are used to reduce the load on the device that is running Flexible NetFlow by limiting the number of packets that are selected for analysis.

Samplers use random sampling techniques (modes); that is, a randomly selected sampling position is used each time a sample is taken.

Flow sampling exchanges monitoring accuracy for router performance. When you apply a sampler to a flow monitor, the overhead load on the router of running the flow monitor is reduced because the number of packets that the flow monitor must analyze is reduced. The reduction in the number of packets that are analyzed by the flow monitor causes a corresponding reduction in the accuracy of the information stored in the flow monitor’s cache.
Samplers are combined with flow monitors when they are applied to an interface with the `ip flow monitor` command.

**Supported Flexible NetFlow Fields**

The following tables provide a consolidated list of supported fields in Flexible NetFlow (FNF) for various traffic types and traffic direction.

---

### Notes

If the packet has a VLAN field, then that length is not accounted for.

Default Settings

The following table lists the Flexible NetFlow default settings for the device.

Table 86: Default Flexible NetFlow Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow active timeout</td>
<td>1800 seconds</td>
</tr>
<tr>
<td>Flow timeout inactive</td>
<td>15 seconds</td>
</tr>
</tbody>
</table>

How to Configure Flexible Netflow

To configure Flexible Netflow, follow these general steps:
1. Create a flow record by specifying keys and non-key fields to the flow.
2. Create an optional flow exporter by specifying the protocol and transport destination port, destination, and other parameters.
3. Create a flow monitor based on the flow record and flow exporter.
4. Create an optional sampler.
5. Apply the flow monitor to a Layer 2 port, Layer 3 port, or VLAN.
6. If applicable to your configuration, configure a WLAN to apply a flow monitor to.

Creating a Customized Flow Record

Perform this task to configure a customized flow record.

Customized flow records are used to analyze traffic data for a specific purpose. A customized flow record must have at least one `match` criterion for use as the key field and typically has at least one `collect` criterion for use as a nonkey field.

There are hundreds of possible permutations of customized flow records. This task shows the steps that are used to create one of the possible permutations. Modify the steps in this task as appropriate to create a customized flow record for your requirements.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `flow record record-name`
4. `description description`
5. `match {ip | ipv6} {destination | source} address`
6. Repeat Step 5 as required to configure additional key fields for the record.
7. `end`
8. Repeat the above step as required to configure additional nonkey fields for the record.
9. `show flow record record-name`
10. `show running-config flow record record-name`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; enable</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Creates a flow record and enters Flexible NetFlow flow record configuration mode.</td>
</tr>
<tr>
<td><code>flow record record-name</code></td>
<td>• This command also allows you to modify an existing flow record.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# flow record FLOW-RECORD-1</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Creates a description for the flow record.</td>
</tr>
<tr>
<td><code>description description</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-flow-record)# description Used for basic traffic analysis</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Configures a key field for the flow record.</td>
</tr>
<tr>
<td>`match {ip</td>
<td>ipv6} {destination</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-flow-record)# match ipv4 destination address</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>—</td>
</tr>
<tr>
<td>Repeat Step 5 as required to configure additional key fields for the record.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Configures the input interface as a nonkey field for the record.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Note</strong> This example configures the input interface as a nonkey field for the record.</td>
</tr>
</tbody>
</table>
Purpose

Step 8
Repeat the above step as required to configure additional nonkey fields for the record.

Purpose

Step 9
end

Example:
Device(config-flow-record)# end

Purpose

Step 10
show flow record record-name

Example:
Device# show flow record FLOW_RECORD-1

Purpose

Step 11
show running-config flow record record-name

Example:
Device# show running-config flow record FLOW_RECORD-1

Creating a Flow Exporter

You can create a flow export to define the export parameters for a flow.

Note
Each flow exporter supports only one destination. If you want to export the data to multiple destinations, you must configure multiple flow exporters and assign them to the flow monitor.

You can export to a destination using IPv4 or IPv6 address.

SUMMARY STEPS

1. configure terminal
2. flow exporter name
3. description string
4. destination {ipv4-address | ipv6-address}
5. dscp value
6. source { source type | }
7. transport udp number
8. ttl seconds
9. export-protocol {netflow-v9 | ipfix}
10. end
11. show flow exporter [name record-name]
12. copy running-config startup-config
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> flow exporter name</td>
<td>Creates a flow exporter and enters flow exporter configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# flow exporter ExportTest</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> description string</td>
<td>(Optional) Describes this flow record as a maximum 63-character string.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-flow-exporter)# description ExportV9</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> destination {ipv4-address</td>
<td>ipv6-address}</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-flow-exporter)# destination 192.0.2.1 (IPv4 destination)</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> dscp value</td>
<td>(Optional) Specifies the differentiated services codepoint value. The range is from 0 to 63. The default is 0.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-flow-exporter)# dscp 0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> source { source type</td>
<td>}</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-flow-exporter)# source gilabitEthernet1/0/1</td>
<td></td>
</tr>
</tbody>
</table>

---

(Optional) Specifies the different interfaces that the exporter can use to reach the collector.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>transport udp number</td>
<td>(Optional) Specifies the UDP port to use to reach the NetFlow collector. The range is from 0 to 65535. For IPFIX exporting protocol, the default destination port is 4739.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-flow-exporter)# transport udp 200</td>
<td></td>
</tr>
<tr>
<td>ttl seconds</td>
<td>(Optional) Configures the time-to-live (TTL) value for datagrams sent by the exporter. The range is from 1 to 255 seconds. The default is 255.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-flow-exporter)# ttl 210</td>
<td></td>
</tr>
<tr>
<td>export-protocol {netflow-v9</td>
<td>Specifies the version of the NetFlow export protocol used by the exporter.</td>
</tr>
<tr>
<td>ipfix}</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-flow-exporter)# export-protocol netflow-v9</td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-flow-record)# end</td>
<td></td>
</tr>
<tr>
<td>show flow exporter [name record-name]</td>
<td>(Optional) Displays information about NetFlow flow exporters.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show flow exporter ExportTest</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

Define a flow monitor based on the flow record and flow exporter.
Creating a Customized Flow Monitor

Perform this required task to create a customized flow monitor.

Each flow monitor has a separate cache assigned to it. Each flow monitor requires a record to define the contents and layout of its cache entries. These record formats can be one of the predefined formats or a user-defined format. An advanced user can create a customized format using the `flow record` command.

**Before you begin**

If you want to use a customized record instead of using one of the Flexible NetFlow predefined records, you must create the customized record before you can perform this task. If you want to add a flow exporter to the flow monitor for data export, you must create the exporter before you can complete this task.

---

**Note**

You must use the `no ip flow monitor` command to remove a flow monitor from all of the interfaces to which you have applied it before you can modify the parameters for the `record` command on the flow monitor.

---

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `flow monitor monitor-name`
4. `description description`
5. `record {record-name | netflow-original | netflow {ipv4 | ipv6} record [peer]}`
6. `cache {entries number | timeout {active | inactive | update} seconds | {immediate | normal | permanent}}`
7. Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor.
8. `statistics packet protocol`
9. `statistics packet size`
10. `exporter exporter-name`
11. `end`
12. `show flow monitor [[name] monitor-name [cache {format {csv | record | table} }] [statistics]]`
13. `show running-config flow monitor monitor-name`
14. `copy running-config startup-config`

---

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td>Creates a flow monitor and enters Flexible NetFlow flow monitor configuration mode.</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 3**  
flow monitor *monitor-name*  
Example:  
Device(config)# flow monitor FLOW-MONITOR-1 | (Optional) Creates a description for the flow monitor. |
| **Step 4**  
description *description*  
Example:  
Device(config-flow-monitor)# description Used for basic IPv4 traffic analysis | Specifies the record for the flow monitor. |
| **Step 5**  
record {record-name | netflow-original | netflow {ipv4 | ipv6} record [peer]}  
Example:  
Device(config-flow-monitor)# record FLOW-RECORD-1 | The values for the keywords associated with the `timeout` keyword have no effect when the cache type is set to `immediate`. Associates a flow cache with the specified flow monitor. |
| **Step 6**  
cache {entries number | timeout {active | inactive | update} seconds | {immediate | normal | permanent}}  
Example:  
Device(config-flow-monitor)# cache FLOW-CACHE-1 |  |
| **Step 7**  
Repeat Step 6 as required to finish modifying the cache parameters for this flow monitor. |  |
| **Step 8**  
statistics packet protocol  
Example:  
| **Step 9**  
statistics packet size  
Example:  
| **Step 10**  
exporter *exporter-name*  
Example:  
Device(config-flow-monitor)# exporter EXPORTER-1 | (Optional) Specifies the name of an exporter that was created previously. |
| **Step 11**  
end  
Example:  
Device(config-flow-monitor)# end | Exits Flexible NetFlow flow monitor configuration mode and returns to privileged EXEC mode. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-flow-monitor)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Step 12**
```
show flow monitor [name] monitor-name [cache [format {csv | record | table}]] [statistics]
```
Example:
```
Device# show flow monitor FLOW-MONITOR-2 cache
```
(Optional) Displays the status and statistics for a Flexible NetFlow flow monitor.

**Step 13**
```
show running-config flow monitor monitor-name
```
Example:
```
Device# show running-config flow monitor FLOW_MONITOR-1
```
(Optional) Displays the configuration of the specified flow monitor.

**Step 14**
```
copy running-config startup-config
```
Example:
```
Device# copy running-config startup-config
```
(Optional) Saves your entries in the configuration file.

---

**Configuring and Enabling Flow Sampling**

**Creating a Flow Sampler**

Perform this required task to configure and enable a flow sampler.

**Note**
When you specify the "NetFlow original," or the "NetFlow IPv4 original input," or the "NetFlow IPv6 original input" predefined record for the flow monitor to emulate original NetFlow, the flow monitor can be used only for analyzing input (ingress) traffic.

When you specify the "NetFlow IPv4 original output" or the "NetFlow IPv6 original output" predefined record for the flow monitor to emulate the Egress NetFlow Accounting feature, the flow monitor can be used only for analyzing output (egress) traffic.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. sampler sampler-name
4. description description
5. mode {random} 1 out-of window-size
6. exit
7. interface type number
8. {ip | ipv6} flow monitor monitor-name [[sampler] sampler-name] {input | output}
9. end
10. show sampler sampler-name
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td><strong>Step 9</strong> end</td>
<td>Exits interface configuration mode and returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
Applying a Flow to an Interface

You can apply a flow monitor and an optional sampler to an interface.

**SUMMARY STEPS**

1. configure terminal
2. interface type
3. {ip flow monitor | ipv6 flow monitor} name [ sampler name ] { input }
4. {ip flow monitor | ipv6 flow monitor | datalink flow monitor} name [ sampler name ] { input | output }
5. end
6. show flow interface [ interface-type number ]
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> interface type</td>
<td>Enters interface configuration mode and configures an interface.</td>
</tr>
</tbody>
</table>
| Example: Device(config)# interface GigabitEthernet1/0/1 | Flexible NetFlow is not supported on the L2 port-channel interface, but is supported on the L2 port-channel member ports. Flexible NetFlow is not supported on the L3 port-channel interface, but is supported on the L3 port-channel member ports. Command parameters for the interface configuration include:  
  • GigabitEthernet—GigabitEthernet IEEE 802  
  • Loopback—Loopback interface  
  • TenGigabitEthernet—10- Gigabit Ethernet |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Vlan—Catalyst VLANs</td>
<td></td>
</tr>
<tr>
<td>• Range—Interface range</td>
<td></td>
</tr>
<tr>
<td>• WLAN—WLAN interface</td>
<td></td>
</tr>
</tbody>
</table>

### Step 3

```bash
{ip flow monitor | ipv6 flow monitor} name \[| sampler name\] \{input\}
```

**Example:**

```
Device(config-if)# ip flow monitor MonitorTest input
```

Associate an IPv4 or an IPv6 flow monitor, and an optional sampler to the interface for input or output packets. You can associate multiple monitors to an interface in both input and output directions.

### Step 4

```bash
{ip flow monitor | ipv6 flow monitor | datalink flow monitor} name \[| sampler name\] \{input | output\}
```

**Example:**

```
Device(config-if)# ip flow monitor MonitorTest input
```

Associate an IPv4, IPv6 and datalink flow monitor, and an optional sampler to the interface for input or output packets. You can associate multiple monitors of different traffic types to an interface in the same direction. However, you cannot associate multiple monitors of same traffic type to an interface in the same direction.

### Step 5

**Example:**

```
Device(config-flow-monitor)# end
```

Returns to privileged EXEC mode.

### Step 6

**Example:**

```
Device# show flow interface
```

(Optional) Displays information about NetFlow on an interface.

### Step 7

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

---

### Configuring a Bridged NetFlow on a VLAN

You can apply a flow monitor and an optional sampler to a VLAN.

**SUMMARY STEPS**

1. configure terminal
2. vlan [configuration] vlan-id
3. `ip flow monitor monitor name [sampler sampler name] {input | output}
4. `copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>

**Configuring Layer 2 NetFlow**

You can define Layer 2 keys in Flexible NetFlow records that you can use to capture flows in Layer 2 interfaces.

**SUMMARY STEPS**

1. configure terminal
2. flow record name
3. match datalink {dot1q | ethertype | mac | vlan}
4. end
5. show flow record [name ]
6. copy running-config startup-config
## DETAILED STEPS

<table>
<thead>

</tr>
</thead>
</table>
| **Step 1** | configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 2** | flow record *name*  
Example:  
Device(config)# flow record L2_record  
Device(config-flow-record)# | Enters flow record configuration mode. |
| **Step 3** | match datalink {dot1q | ethertype | mac | vlan}  
Example:  
Device(config-flow-record)# match datalink ethertype | Specifies the Layer 2 attribute as a key. |
| **Step 4** | end  
Example:  
Device(config-flow-record)# end | Returns to privileged EXEC mode. |
| **Step 5** | show flow record [name ]  
Example:  
Device# show flow record | (Optional) Displays information about NetFlow on an interface. |
| **Step 6** | copy running-config startup-config  
Example:  
Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

## Configuring WLAN to Apply Flow Monitor in Data Link Input/Output Direction

### SUMMARY STEPS

1. configure terminal
2. wlan [wlan-name { wlan-id SSID_NetworkName | wlan_id} | wlan-name | shutdown]  
3. datalink flow monitor monitor-name {input | output}  
4. end  
5. show run wlan wlan-name

### Configuration Examples for Flexible NetFlow

#### Example: Configuring a Flow

This example shows how to create a flow and apply it to an interface:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Device(config)# flow export export1
Device(config-flow-exporter)# destination 10.0.101.254
Device(config-flow-exporter)# transport udp 2055
Device(config-flow-exporter)# exit
Device(config)# flow record record1
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# match ipv4 protocol
Device(config-flow-record)# match transport source-port
Device(config-flow-record)# match transport destination-port
Device(config-flow-record)# collect counter byte long
Device(config-flow-record)# collect counter packet long
Device(config-flow-record)# collect timestamp absolute first
Device(config-flow-record)# collect timestamp absolute last
Device(config-flow-record)# exit
Device(config)# flow monitor monitor1
Device(config-flow-monitor)# record record1
Device(config-flow-monitor)# exporter export1
Device(config-flow-monitor)# exit
Device(config)# interface tenGigabitEthernet 1/0/1
Device(config-if)# ip flow monitor monitor1 input
Device(config-if)# end
```
Example: Monitoring IPv4 ingress traffic

This example shows how to monitor IPv4 ingress traffic (int g1/0/11 sends traffic to int g1/0/36 and int g3/0/11).

```
Device# configure terminal
Device(config)# flow record fr-1
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# match interface input
Device(config-flow-record)# collect counter bytes long
Device(config-flow-record)# collect counter packets long
Device(config-flow-record)# collect timestamp absolute first
Device(config-flow-record)# collect timestamp absolute last
Device(config-flow-record)# collect counter bytes layer2 long
Device(config-flow-record)# exit

Device(config)# flow exporter fe-ipfix6
Device(config-flow-exporter)# destination 2001:0:0:24::10
Device(config-flow-exporter)# source Vlan106
Device(config-flow-exporter)# transport udp 4739
Device(config-flow-exporter)# export-protocol ipfix
Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow exporter fe-ipfix
Device(config-flow-exporter)# description IPFIX format collector 100.0.0.80
Device(config-flow-exporter)# destination 100.0.0.80
Device(config-flow-exporter)# dscp 30
Device(config-flow-exporter)# ttl 210
Device(config-flow-exporter)# transport udp 4739
Device(config-flow-exporter)# export-protocol ipfix
Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow exporter fe-1
Device(config-flow-exporter)# destination 10.5.120.16
Device(config-flow-exporter)# source Vlan105
Device(config-flow-exporter)# dscp 32
Device(config-flow-exporter)# ttl 200
Device(config-flow-exporter)# transport udp 2055

Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow monitor fm-1
Device(config-flow-monitor)# exporter fe-ipfix6
Device(config-flow-monitor)# exporter fe-ipfix
Device(config-flow-monitor)# exporter fe-1
Device(config-flow-monitor)# cache timeout inactive 60
Device(config-flow-monitor)# cache timeout active 180
Device(config-flow-monitor)# record fr-1
Device(config-flow-monitor)# end

Device# show running-config interface g1/0/11
Device# show running-config interface g1/0/36
Device# show running-config interface g3/0/11
Device# show flow monitor fm-1 cache format table
```
Example: Monitoring IPv4 egress traffic

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# flow record fr-1 out
Device(config-flow-record)# match ipv4 source address
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# match interface output
Device(config-flow-record)# collect counter bytes long
Device(config-flow-record)# collect counter packets long
Device(config-flow-record)# collect timestamp absolute first
Device(config-flow-record)# collect timestamp absolute last
Device(config-flow-record)# exit

Device(config)# flow exporter fe-1
Device(config-flow-exporter)# destination 10.5.120.16
Device(config-flow-exporter)# source Vlan105
Device(config-flow-exporter)# dscp 32
Device(config-flow-exporter)# ttl 200
Device(config-flow-exporter)# transport udp 2055
Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow exporter fe-ipfix6
Device(config-flow-exporter)# destination 2001:0:0:24::10
Device(config-flow-exporter)# source Vlan106
Device(config-flow-exporter)# transport udp 4739
Device(config-flow-exporter)# export-protocol ipfix
Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow exporter fe-ipfix
Device(config-flow-exporter)# description IPFIX format collector 100.0.0.80
Device(config-flow-exporter)# destination 100.0.0.80
Device(config-flow-exporter)# dscp 30
Device(config-flow-exporter)# ttl 210
Device(config-flow-exporter)# transport udp 4739
Device(config-flow-exporter)# export-protocol ipfix
Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow monitor fm-1-output
Device(config-flow-monitor)# exporter fe-1
Device(config-flow-monitor)# exporter fe-ipfix6
Device(config-flow-monitor)# exporter fe-ipfix
Device(config-flow-monitor)# cache timeout inactive 50
Device(config-flow-monitor)# cache timeout active 120
Device(config-flow-monitor)# record fr-1-out
Device(config-flow-monitor)# end

Device# show flow monitor fm-1-output cache format table

Example: Configuring IPv4 Flexible NetFlow in WLAN (Ingress Direction)

The following example shows how to configure IPv4 Flexible NetFlow on WLAN ingress direction:

flow record WLAN-FLOW07
Example: Configuring IPv6 and Transport Flag Flexible NetFlow in WLAN (Egress Direction)

The following example shows how to configure IPv6 and transport flag Flexible NetFlow on WLAN egress direction:

Device# configure terminal
Device(config)# flow record fr_v6
Device(config-flow-record)# match ipv6 destination address
Device(config-flow-record)# match ipv6 source address
Device(config-flow-record)# match ipv6 hop-limit
Device(config-flow-record)# match ipv6 protocol
Device(config-flow-record)# match ipv6 traffic
Device(config-flow-record)# match ipv6 version
Device(config-flow-record)# match wireless ssid
Device(config-flow-record)# collect wireless ap mac address
Device(config-flow-record)# collect counter bytes long
Device(config-flow-record)# collect transport tcp flags
Device(config-flow-record)# exit
Example: Configuring IPv6 Flexible NetFlow in WLAN (Both Ingress and Egress Directions)

The following example shows how to configure IPv6 Flexible NetFlow on WLAN in both directions:

```
Device# configure terminal
Device (config)# flow record fr_v6
Device (config-flow-record)# match ipv6 destination address
Device (config-flow-record)# match ipv6 source address
Device (config-flow-record)# match ipv6 hop-limit
Device (config-flow-record)# match ipv6 protocol
Device (config-flow-record)# match ipv6 traffic
Device (config-flow-record)# match ipv6 version
Device (config-flow-record)# match wireless ssid
Device (config-flow-record)# collect wireless ap mac address
Device (config-flow-record)# collect counter packets long
Device (config-flow-record)# exit

Device (config)# flow monitor fm_v6
Device (config-flow-monitor)# record fr_v6
Device (config-flow-monitor)# exit

Device (config)# wlan wlan_1
Device (config-wlan)# ipv6 flow monitor fm_v6 out
Device (config-wlan)# end

Device# show flow monitor fm_v6 cache
```

Example: Monitoring wireless ingress traffic

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# flow record fr-wlan-input
Device(config-flow-record)# match datalink mac source address input
Device(config-flow-record)# match datalink mac destination address input
Device(config-flow-record)# match ipv4 source address
```

Note: On the device, you cannot specify which TCP flag to collect. You can only specify to collect transport TCP flags.
Device(config-flow-record)# match ipv4 destination address
Device(config-flow-record)# match wireless ssid
Device(config-flow-record)# collect counter bytes long
Device(config-flow-record)# collect counter packets long
Device(config-flow-record)# collect timestamp absolute first
Device(config-flow-record)# collect timestamp absolute last
Device(config-flow-record)# exit

Device(config)# flow exporter fe-ipfix
Device(config-flow-exporter)# description IPFIX format collector 100.0.0.80
Device(config-flow-exporter)# destination 100.0.0.80
Device(config-flow-exporter)# dscp 30
Device(config-flow-exporter)# ttl 210
Device(config-flow-exporter)# transport udp 4739
Device(config-flow-exporter)# export-protocol ipfix
Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow exporter fe-ipfix6
Device(config-flow-exporter)# destination 2001:0:0:24::10
Device(config-flow-exporter)# source Vlan106
Device(config-flow-exporter)# transport udp 4739
Device(config-flow-exporter)# export-protocol ipfix
Device(config-flow-exporter)# template data timeout 240
Device(config-flow-exporter)# exit

Device(config)# flow monitor fm-wlan-input
Device(config-flow-monitor)# exporter fe-ipfix
Device(config-flow-monitor)# exporter fe-ipfix6
Device(config-flow-monitor)# cache timeout inactive 30
Device(config-flow-monitor)# cache timeout active 180
Device(config-flow-monitor)# record fr-wlan-input
Device(config-flow-monitor)# end

Device# show running-config wlan nfl_1
Device# show flow monitor fm-wlan-input cache format table

---

Quality of Service

- Configuring QoS, on page 1253
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Auto-QoS

The prerequisites for auto-QoS are the same as the prerequisites for standard QoS.

Restrictions for Auto-QoS

The following are restrictions for auto-QoS:

- Auto-qos is not supported on SVI interfaces.
- The trust device device_type command available in interface configuration mode is a stand-alone command on the switch. When using this command, if the connected peer device is not a corresponding device (defined as a device matching your trust policy), both CoS and DSCP values are set to "0" and any input policy will not take effect. If the connected peer device is a corresponding device, input policy will take effect.
- You must exercise caution when copying a pre-3.2.2 software version to this device. If you do copy a pre-3.2.2 software version to this device, then you must follow the auto-QoS upgrade procedure described later in this chapter.
- Do not configure the auto qos voip cisco-phone option for IP phones that support video. This option causes DSCP markings of video packets to get overwritten, because these packets do not have Expedited Forwarding priority, which results in these packets getting classified in the class-default class.
- Auto-QoS does not generate configuration when it is pushed from the startup-configuration using the auto qos voip cisco-phone command to the running-configuration. This is expected behavior and this is to prevent overwriting of user-created customized QoS policies by the default configuration, if any, every time the command auto qos voip cisco-phone is pushed from the startup-config.

You can use any of the following workarounds for this limitation:

- Configure the auto qos voip cisco-phone command manually on the switch interfaces.
- For new switches, if you push auto-QoS commands through startup-config, the command should include each of the following as part of the standard template
  1. Interface-level:
     - trust device cisco-phone
     - auto qos voip cisco-phone
     - service-policy input AutoQos-4.0-CiscoPhone-Input-Policy
     - service-policy output AutoQos-4.0-Output-Policy
  2. Global-level:
     - Class-map
     - Policy-map
     - ACL(ACE)
• If the auto qos voip cisco-phone command is already configured on an interface but policies are not being generated, disable the command from all the interfaces and reconfigure the command on each interface manually.

Information About Configuring Auto-QoS

Auto-QoS Overview

You can use the auto-QoS feature to simplify the deployment of QoS features. Auto-QoS determines the network design and enables QoS configurations so that the switch can prioritize different traffic flows.

The switch employs the MQC model. This means that instead of using certain global configurations, auto-QoS applied to any interface on a switch configures several global class maps and policy maps.

Auto-QoS matches traffic and assigns each matched packet to qos-groups. This allows the output policy map to put specific qos-groups into specific queues, including into the priority queue.

QoS is needed in both directions, both on inbound and outbound. When inbound, the switch port needs to trust the DSCP in the packet (done by default). When outbound, the switch port needs to give voice packets "front of line" priority. If voice is delayed too long by waiting behind other packets in the outbound queue, the end host drops the packet because it arrives outside of the receive window for that packet.

Auto-QoS Compact Overview

When you enter an auto-QoS command, the switch displays all the generated commands as if the commands were entered from the CLI. You can use the auto-QoS compact feature to hide the auto-QoS generated commands from the running configuration. This would make it easier to comprehend the running-configuration and also help to increase efficient usage of memory.

Auto-QoS Global Configuration Templates

In general, an auto-QoS command generates a series of class maps that either match on ACLs or on DSCP and/or CoS values to differentiate traffic into application classes. An input policy is also generated, which matches the generated classes and in some cases, polices the classes to a set bandwidth. Eight egress-queue class maps are generated. The actual egress output policy assigns a queue to each one of these eight egress-queue class maps.

The auto-QoS commands only generate templates as needed. For example, the first time any new auto-QoS command is used, global configurations that define the eight queue egress service-policy are generated. From this point on, auto-QoS commands applied to other interfaces do not generate templates for egress queuing because all auto-QoS commands rely on the same eight queue models, which have already been generated from the first time a new auto-QoS command was used.
Auto-QoS Policy and Class Maps

After entering the appropriate auto-QoS command, the following actions occur:

- Specific class maps are created.
- Specific policy maps (input and output) are created.
- Policy maps are attached to the specified interface.
- Trust level for the interface is configured.

Example: auto qos voip cisco-softphone
auto qos classify police

Effects of Auto-QoS on Running Configuration

When auto-QoS is enabled, the auto qos interface configuration commands and the generated global configuration are added to the running configuration.

The switch applies the auto-QoS-generated commands as if the commands were entered from the CLI. An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions may occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands are not applied, the previous running configuration is restored.

Effects of Auto-Qos Compact on Running Configuration

If auto-QoS compact is enabled:

- Only the auto-QoS commands entered from the CLI are displayed in running-config.
- The generated global and interface configurations are hidden.
- When you save the configuration, only the auto-qos commands you have entered are saved (and not the hidden configuration).
- When you reload the switch, the system detects and re-executes the saved auto-QoS commands and the AutoQoS SRND4.0 compliant config-set is generated.
How to Configure Auto-QoS

Configuring Auto-QoS (CLI)

For optimum QoS performance, configure auto-QoS on all the devices in your network.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. Depending on your auto-QoS configuration, use one of the following commands:
   - auto qos voip  {cisco-phone | cisco-softphone | trust}
   - auto qos video  {cts | ip-camera | media-player}
   - auto qos classify  [police]
   - auto qos trust  {cos | dscp}
4. end
5. show auto qos interface interface-id

DETAILED STEPS

Purpose

Command or Action                     | Purpose
---                                    | ---
 gigabitethernet 3/0/1                 | The following commands enable auto-QoS for VoIP:

Step 3

Depending on your auto-QoS configuration, use one of the following commands:

- **auto qos voip cisco-phone** — If the port is connected to a Cisco IP Phone, the QoS labels of incoming packets are only trusted (conditional trust through CDP) when the telephone is detected.
- **auto qos video {cts | ip-camera | media-player}**
- **auto qos classify [police]**
- **auto qos trust {cos | dscp}**

**Note**

Do not configure the **auto qos voip cisco-phone** option for IP phones that support video. This option causes DSCP markings of video packets to get overwritten, because these packets do not have Expedited Forwarding priority, which results in these packets getting classified in the class-default class.

- **auto qos voip cisco-softphone** — The port is connected to device running the Cisco SoftPhone feature. This command generates a QoS configuration for interfaces connected to PCs running the Cisco IP SoftPhone application and mark, as well as police traffic coming from such interfaces. Ports configured with this command are considered untrusted.
- **auto qos voip trust** — The uplink port is connected to a trusted switch or router, and the VoIP traffic classification in the ingress packet is trusted.

The following commands enable auto-QoS for the specified video device (system, camera, or media player):

- **auto qos video cts** — A port connected to a Cisco Telepresence system. QoS labels of incoming packets are only trusted (conditional trust through CDP) when a Cisco TelePresence is detected.
- **auto qos video ip-camera** — A port connected to a Cisco video surveillance camera. QoS labels of incoming packets are only trusted (conditional trust through CDP) when a Cisco camera is detected.
- **auto qos video media-player** — A port connected to a CDP-capable Cisco digital media player. QoS labels of incoming packets are only trusted (conditional trust through CDP) when a digital media player is detected.

The following command enables auto-QoS for classification:

- **auto qos classify police** — This command generates a QoS configuration for untrusted interfaces. The
<table>

</tbody>
</table>

The following commands enable auto-QoS for trusted interfaces:

- `auto qos trust cos` — Class of service.
- `auto qos trust dscp` — Differentiated Services Code Point.

**Step 4**

End

**Example:**

```
Device(config-if)# end
```

Returns to privileged EXEC mode.

**Step 5**

`show auto qos interface interface-id`

**Example:**

```
Device# show auto qos interface gigabitethernet 3/0/1
```

(Optional) Displays the auto-QoS command on the interface on which auto-QoS was enabled. Use the `show running-config` command to display the auto-QoS configuration and user modifications.

**Upgrading Auto-QoS (CLI)**

This procedure should only be followed after copying a pre-3.2.2 software version to this device. If you do copy a pre-3.2.2 software version to this device, then you must follow this auto-QoS upgrade procedure.

**Before you begin**

Prior to upgrading, you need to remove all auto-QoS configurations currently on the switch. This sample procedure describes that process.
After following this sample procedure, you must then reboot the switch with the new or upgraded software image and reconfigure auto-QoS.

**SUMMARY STEPS**

1. show auto qos
2. no auto qos
3. show running-config | i autoQos
4. no policy-map policy-map_name
5. show running-config | i AutoQoS
6. show auto qos
7. write memory

**DETAILED STEPS**

**Step 1**  
show auto qos  
**Example:**

Device# show auto qos  
GigabitEthernet2/0/3  
auto qos voip cisco-phone
GigabitEthernet2/0/27  
auto qos voip cisco-softphone

In privileged EXEC mode, record all current auto QoS configurations by entering this command.

**Step 2**  
no auto qos  
**Example:**

Device(config-if)#no auto qos

In interface configuration mode, run the appropriate no auto qos command on each interface that has an auto QoS configuration.

**Step 3**  
show running-config | i autoQos  
**Example:**

Device# show running-config | i autoQos

Return to privileged EXEC mode, and record any remaining auto QoS maps class maps, policy maps, access lists, table maps, or other configurations by entering this command.

**Step 4**  
no policy-map policy-map_name  
**Example:**

Device)config# no policy-map pmap_101  
Device)config# no class-map cmap_101
In global configuration mode, remove the QoS class maps, policy maps, access-lists, table maps, and any other auto QoS configurations by entering these commands:

- `no policy-map policy-map-name`
- `no class-map class-map-name`
- `no ip access-list extended Auto-QoS-x`
- `no table-map table-map-name`
- `no table-map policed-dscp`

**Step 5**

`show running-config | i AutoQoS`

**Example:**

```
Device# show running-config | i AutoQoS
```

Return to privileged EXEC mode, run this command again to ensure that no auto-QoS configuration or remaining parts of the auto-QoS configuration exists.

**Step 6**

`show auto qos`

**Example:**

```
Device# show auto qos
```

Run this command to ensure that no auto-QoS configuration or remaining parts of the configuration exists.

**Step 7**

`write memory`

**Example:**

```
Device# write memory
```

Write the changes to the auto QoS configuration to NV memory by entering the `write memory` command.

---

### What to do next

Reboot the switch with the new or upgraded software image.

After rebooting with the new or upgraded software image, re-configure auto-QoS for the appropriate switch interfaces as determined by running the `show auto qos` command described in step 1.

---

### Note

There is only one table-map for exceed and another table-map for violate markdown per switch or stack. If the switch already has a table-map under the exceed action, then the auto-qos policy cannot be applied.
Enabling Auto-Qos Compact

To enable auto-Qos compact, enter this command:

SUMMARY STEPS

1. configure terminal
2. auto qos global compact

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>auto qos global compact</td>
<td>Enables auto-Qos compact and generates (hidden) the global configurations for auto-QoS.</td>
</tr>
<tr>
<td></td>
<td>Example: Device(config)# auto qos global compact</td>
<td>You can then enter the auto-QoS command you want to configure in the interface configuration mode and the interface commands that the system generates are also hidden.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>To display the auto-QoS configuration that has been applied, use these the privileged EXEC commands:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show derived-config</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show policy-map</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show access-list</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show class-map</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show table-map</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show auto-qos</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show policy-map interface</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• show ip access-lists</td>
</tr>
<tr>
<td></td>
<td></td>
<td>These commands will have keyword &quot;AutoQos&quot;.</td>
</tr>
</tbody>
</table>

What to do next

To disable auto-QoS compact, remove auto-Qos instances from all interfaces by entering the no form of the corresponding auto-QoS commands and then enter the no auto qos global compact global configuration command.
Monitoring Auto-QoS

Table 88: Commands for Monitoring Auto-QoS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show auto qos [interface [interface-id]]</td>
<td>Displays the initial auto-QoS configuration. You can compare the show auto qos and the show running-config command output to identify the user-defined QoS settings.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Displays information about the QoS configuration that might be affected by auto-QoS. You can compare the show auto qos and the show running-config command output to identify the user-defined QoS settings.</td>
</tr>
<tr>
<td>show derived-config</td>
<td>Displays the hidden mls qos command which get configured along with the running configs because of auto-qos template.</td>
</tr>
</tbody>
</table>

Troubleshooting Auto-QoS

To troubleshoot auto-QoS, use the debug auto qos privileged EXEC command. For more information, see the debug auto qos command in the command reference for this release.

To disable auto-QoS on a port, use the no form of the auto qos command interface configuration command, such as no auto qos voip. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the no auto qos voip command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration).

Configuration Examples for Auto-QoS

Example: auto qos trust cos

The following is an example of the auto qos trust cos command and the applied policies and class maps.

The following policy maps are created and applied when running this command:

- AutoQos-4.0-Trust-Cos-Input-Policy
- AutoQos-4.0-Output-Policy

The following class maps are created and applied when running this command:

- class-default (match-any)
 Device(config)# interface gigabitEthernet1/0/17
 Device(config-if)# auto qos trust cos
 Device(config-if)# end
 Device# show policy-map interface GigabitEthernet1/0/17

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Quality of Service

Before configuring standard QoS, you must have a thorough understanding of these items:

- Standard QoS concepts.
- Wireless concepts and network topologies.
- Classic Cisco IOS QoS.
- Modular QoS CLI (MQC).
- Understanding of QoS implementation.
- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. For example, is the traffic on your network bursty? Do you need to reserve bandwidth for voice and video streams?
• Bandwidth requirements and speed of the network.
• Location of congestion points in the network.

QoS Components

Quality of service (QoS) consists of the following key components:

• Classification — Classification is the process of distinguishing one type of traffic from another based upon access control lists (ACLs), Differentiated Services Code Point (DSCP), Class of Service (CoS), and other factors.

• Marking and mutation — Marking is used on traffic to convey specific information to a downstream device in the network, or to carry information from one interface in a to another. When traffic is marked, QoS operations on that traffic can be applied. This can be accomplished directly using the `set` command or through a table map, which takes input values and translates them directly to values on output.

• Shaping and policing — Shaping is the process of imposing a maximum rate of traffic, while regulating the traffic rate in such a way that downstream devices are not subjected to congestion. Shaping in the most common form is used to limit the traffic sent from a physical or logical interface. Policing is used to impose a maximum rate on a traffic class. If the rate is exceeded, then a specific action is taken as soon as the event occurs.

• Queuing — Queueing is used to prevent traffic congestion. Traffic is sent to specific queues for servicing and scheduling based upon bandwidth allocation. Traffic is then scheduled or sent out through the port.

• Bandwidth — Bandwidth allocation determines the available capacity for traffic that is subject to QoS policies.

• Trust — Trust enables traffic to pass through the , and the Differentiated Services Code Point (DSCP), precedence, or CoS values coming in from the end points are retained in the absence of any explicit policy configuration.

QoS Terminology

The following terms are used interchangeably in this QoS configuration guide:

• Upstream (direction towards the device) is the same as ingress.
• Downstream (direction from the device) is the same as egress.

Note
Upstream is wireless to wired. Downstream is wired to wireless. Wireless to wireless has no specific term.
Information About QoS

QoS Overview

By configuring the quality of service (QoS), you can provide preferential treatment to specific types of traffic at the expense of other traffic types. Without QoS, the device offers best-effort service to each packet, regardless of the packet contents or size. The device sends the packets without any assurance of reliability, delay bounds, or throughput.

The following are specific features provided by QoS:

- Low latency
- Bandwidth guarantee
- Buffering capabilities and dropping disciplines
- Traffic policing
- Enables the changing of the attribute of the frame or packet header
- Relative services

Related Topics

Modular QoS Command-Line Interface

With the device, QoS features are enabled through the Modular QoS command-line interface (MQC). The MQC is a command-line interface (CLI) structure that allows you to create traffic policies and attach these policies to interfaces. A traffic policy contains a traffic class and one or more QoS features. A traffic class is used to classify traffic, while the QoS features in the traffic policy determine how to treat the classified traffic. One of the main goals of MQC is to provide a platform-independent interface for configuring QoS across Cisco platforms.

Wireless QoS Overview

Wireless QoS can be configured on the following wireless targets:

- Wireless ports, including all physical ports to which an access point can be associated.
- Radio
- SSID (applicable on a per-radio, per-AP, and per-SSID)
- Client

From Cisco IOS XE Release 3E, marking and policing actions for ingress SSID and client policies are applied at the access point. The SSID and client ingress policies that you configure in the are moved to the access point. The access point performs policing and marking actions for each packet. However, the selects the QoS policies. Marking and policing of egress SSID and client policies are applied at the .

The following table displays how policies are supported for the wireless targets.
### Table 89: Wireless Targets Policies Support

<table>
<thead>

<td>Client</td>
<td>Yes</td>
<td>Yes - user configurable</td>
<td>Yes - user configurable</td>
</tr>
</tbody>
</table>

Additional polices that are user configured include multidestination policers and VLANs.

Wireless QoS supports the following features:

- Queuing in the egress direction.
- Policing of wireless traffic.
- Marking of wireless traffic.
- Shaping of wireless traffic in the egress direction.
- Approximate Fair Drop (AFD) in the egress direction.
- Mobility support for QoS.
- Compatibility with precious metal QoS policies available on Cisco Unified Wireless Controllers.
- Combination of CLI/Traffic Class (TCLAS) and CLI/snooping.
- Application control (can drop or mark the data traffic) by configuring an AVC QoS client policy.
- Drop action for ingress policies.
- QoS statistics for client and SSID targets in the ingress direction.
- QoS attribute for local profiling policy.
- Hierarchical policies.

**QoS and IPv6 for Wireless**

The supports QoS for both IPv4 and IPv6 traffic, and client policies can now have IPv4 and IPv6 filters.
### Wired and Wireless Access Supported Features

Port Policies

Port child policies only apply to wireless ports and not to wired ports on the switch. A wireless port is defined as a port to which APs join. A default port child policy is applied on the switch to the wireless ports at start up. The port shaper rate is limited to 1G

Note
Port shaper specifies the traffic policy applicable between the device and the AP. This is the sum of the radio rates supported on the access point.

The child policy determines the mapping between packets and queues defined by the port-child policy. The child policy can be configured to include voice, video, class-default, and non-client-nrt classes where voice and video are based on DSCP value (which is the outer CAPWAP header DSCP value). The definition of class-default is known to the system as any value other than voice and video DSCP.

The DSCP value is assigned when the packet reaches the port. Before the packet arrives at the port, the SSID policies are applied on the packet. Port child policy also includes multicast percentage for a given port traffic. By default, the port child policy allocates up to 10 percent of the available rate.

Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic, on page 1392

Port Policy Format
This section describes the behavior of the port policies on a switch. The ports on the switch do not distinguish between wired or wireless physical ports. Depending on the kind of device associated to the switch, the policies are applied. For example, when an access point is connected to a switch port, the switch detects it as a wireless device and applies the default hierarchical policy which is in the format of a parent-child policy. This policy is an hierarchical policy. The parent policy cannot be modified but the child policy (port-child policy) can be modified to suit the QoS configuration. The switch is preconfigured with a default class map and a policy map.

Default class map:

Class Map match-any non-client-nrt-class
  Match non-client-nrt

The above port policy processes all network traffic to the Q3 queue. You can view the class map by executing the show class-map command.

Default policy map:

Policy Map port_child_policy
  Class non-client-nrt-class
    bandwidth remaining ratio 10

Note
The class map and policy map listed are system-defined policies and cannot be changed.
The following is the system-defined policy map available on the ports on which wireless devices are associated. The format consists of a parent policy and a service child policy (port_child_policy). To customize the policies to suite your network needs, you must configure the port child policy.

```
Policy-map policy_map_name
  Class class-default
    Shape average average_rate
    Service-policy port_child_policy
```

**Note**
The parent policy is system generated and cannot be changed. You must configure the port_child_policy policy to suit the QoS requirements on your network.

Depending on the type of traffic in your network, you can configure the port child policy. For example, in a typical wireless network deployment, you can assign specific priorities to voice and video traffic. Here is an example:

```
Policy-map port_child_policy
  Class voice-policy-name (match dscp ef)
    Priority level 1
    Police (multicast-policer-name-voice) Multicast Policer
  Class video-policy-name (match dscp af41)
    Priority level 2
    Police (multicast-policer-name-video) Multicast Policer
  Class non-client-nrt-class traffic (match non-client-nrt)
    Bandwidth remaining ratio (brr-value-nrt-q2)
  Class class-default (NRT Data)
    Bandwidth remaining ratio (brr-value-q3)
```

In the above port child policy:

- **voice-policy-name**— Refers to the name of the class that specifies rules for the traffic for voice packets. Here the DSCP value is mapped to a value of 46 (represented by the keyword ef). The voice traffic is assigned the highest priority of 1.

- **video-policy-name**— Refers to the name of the class that specifies rules for the traffic for video packets. The DSCP value is mapped to a value of 34 (represented by the keyword af41).

- **multicast-policer-name-voice**— If you need to configure multicast voice traffic, you can configure policing for the voice class map.

- **multicast-policer-name-video**— If you need to configure multicast video traffic, you can configure policing for the video class map.

In the above sample configuration, all voice and video traffic is directed to the Q0 and Q1 queues, respectively. These queues maintain a strict priority. The packets in Q0 and Q1 are processed in that order. The bandwidth remaining ratios brr-value-nrt-q2 and brr-value-q3 are directed to the Q2 and Q3 respectively specified by the class maps and class-default and non-client-nrt. The processing of packets on Q2 and Q3 are based on a weighted round-robin approach. For example, if the brr-value-nrtq2 has a value of 90 and brr-value-nrtq3 is 10, the packets in queue 2 and queue 3 are processed in the ratio of 9:1.

**Related Topics**
- Restrictions for QoS on Wireless Targets, on page 1334
- Supported QoS Features on Wireless Targets, on page 1299
Radio Policies

The radio policies are system defined and are not user configurable. Radio wireless targets are only applicable in the egress direction.

Radio policies are applicable on a per-radio, per-access point basis. The rate limit on the radios is the practical limit of the AP radio rate. This value is equivalent to the sum of the radios supported by the access point.

The following radios are supported:

- 802.11 a/n
- 802.11 b/n
- 802.11 ac

SSID Policies

You can create QoS policies on SSID BSSID (Basic Service Set Identification) in both the ingress and egress directions. By default, there is no SSID policy. All traffic is transmitted as best effort because the wireless traffic in untrusted. You can configure an SSID policy based on the SSID name. The policy is applicable on a per BSSID.

The types of policies you can create on SSID include marking by using table maps (table-maps), shape rate, and RT1 (Real Time 1) and RT2 (Real Time 2) policers. If traffic is ingress, you usually configure a marking and policing policy on the SSID. If traffic is downstream, you can configure marking and queuing.

There should be a one-to-one mapping between the policies configured on a port and an SSID. For example, if you configure class voice and class video on the port, you can have a similar policy on the SSID.

SSID priorities can be specified by configuring bandwidth remaining ratio. Queuing SSID policies are applied in the egress direction.

Client Policies

Client policies are applicable in the ingress and egress direction. The wireless control module of the device applies the default client policies when admission control is enabled for WMM clients. When admission control is disabled, there is no default client policy. You can configure policing and marking policies on clients.
A client policy can have both IPv4 and IPv6 filters.

You can configure client policies in the following ways:

- Using AAA
- Using the Cisco IOS MQC CLI
  - You can use `service policy client` command in the WLAN configuration.
- Using the default configuration
- Using local policies (native profiling)

Use the `show wireless client mac address mac_address service-policy` command to display the source of the client policy (for example, local profiling policy, AAA, or CLI). The precedence order of client policies is AAA > local policy > WLAN service client policy CLI > default configuration.

Note
If you configured AAA by configuring the unified wireless controller procedure, and using the MQC QoS commands, the policy configuration performed through the MQC QoS commands takes precedence.

Note
When applying client policies on a WLAN, you must disable the WLAN before modifying the client policy. SSID policies can be modified even if the WLAN is enabled.

The default client policy is enabled only on Wi-Fi Multimedia (WMM) clients that are admission control (ACM)-enabled.

**Policy Chaining**

Every packet has a maximum of two applicable policies, first at the client target and second at the SSID target. The client policing action is applied to the packet before the marking action that is specified in the client policy. After the client policing and marking actions are applied to the packet, the SSID policy action is applied to the updated packet. If no custom policies are specified, the system trust configuration is applied to the packet. Egress trust is based on DSCP, and ingress trust is based on WLAN user priority.

**Related Topics**

- Configuring Client Policies (CLI)
- Supported QoS Features on Wireless Targets, on page 1299
- Examples: Client Policies, on page 1394

**Hierarchical QoS**

The supports hierarchical QoS (HQoS). HQoS allows you to perform:

- Hierarchical classification—Traffic classification is based upon other classes.
- Hierarchical policing—The process of having the policing configuration at multiple levels in a hierarchical policy.
Hierarchical shaping—Shaping can also be configured at multiple levels in the hierarchy.

**Note**
Hierarchical shaping is only supported for the port shaper, where for the parent you only have a configuration for the class default, and the only action for the class default is shaping.

**Related Topics**
- Examples: Hierarchical Classification, on page 1389
- Examples: Hierarchical Policy Configuration, on page 1389

**Hierarchical Wireless QoS**

The device supports hierarchical QoS for wireless targets. Hierarchical QoS policies are applicable on port, radio, SSID, and client. QoS policies configured on the device (including marking, shaping, policing) can be applied across the targets. If the network contains non-realtime traffic, the non-realtime traffic is subject to approximate fair drop. Hierarchy refers to the process of application of the various QoS policies on the packets arriving to the device. You can configure policing in both the parent and child policies.

**Note**
For hierarchical client and SSID policies, you only configure marking either in the parent or child policy.

**Wireless Packet Format**

*Figure 88: Wireless Packet Path in the Egress Direction during First Pass*

This figure displays the wireless packet flow and encapsulation used in hierarchical wireless QoS. The incoming packet enters the device. The device encapsulates this incoming packet and adds the 802.11e and CAPWAP headers.
Hierarchical AFD

Approximate Fair Dropping (AFD) is a feature provided by the QoS infrastructure in Cisco IOS. For wireless targets, AFD can be configured on SSID (via shaping) and clients (via policing). AFD shaping rate is only applicable for downstream direction. Unicast real-time traffic is not subjected to AFD drops.

QoS Implementation

Typically, networks operate on a best-effort delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

When you configure the QoS feature, you can select specific network traffic, prioritize it according to its relative importance, and use congestion-management and congestion-avoidance techniques to provide preferential treatment. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

The QoS implementation is based on the Differentiated Services (Diff-Serv) architecture, a standard from the Internet Engineering Task Force (IETF). This architecture specifies that each packet is classified upon entry into the network.

The classification is carried in the IP packet header, using 6 bits from the deprecated IP type of service (ToS) field to carry the classification (class) information. Classification can also be carried in the Layer 2 frame.
**Layer 2 Frame Prioritization Bits**

Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p class of service (CoS) value in the three least-significant bits. On ports configured as Layer 2 ISL trunks, all traffic is in ISL frames.

Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most-significant bits, which are called the User Priority bits. On ports configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

Other frame types cannot carry Layer 2 CoS values.

Layer 2 CoS values range from 0 for low priority to 7 for high priority.
Layer 3 Packet Prioritization Bits

Layer 3 IP packets can carry either an IP precedence value or a Differentiated Services Code Point (DSCP) value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values.

IP precedence values range from 0 to 7. DSCP values range from 0 to 63.

End-to-End QoS Solution Using Classification

All switches and routers that access the Internet rely on the class information to provide the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to occur closer to the edge of the network, so that the core switches and routers are not overloaded with this task.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the Diff-Serv architecture is called per-hop behavior. If all devices along a path provide a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple task or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control that you need over incoming and outgoing traffic.

Packet Classification

Packet classification is the process of identifying a packet as belonging to one of several classes in a defined policy, based on certain criteria. The Modular QoS CLI (MQC) is a policy-class based language. The policy class language is used to define the following:

- Class-map template with one or several match criteria
- Policy-map template with one or several classes associated to the policy map

The policy map template is then associated to one or several interfaces on the device.

Packet classification is the process of identifying a packet as belonging to one of the classes defined in the policy map. The process of classification will exit when the packet being processed matches a specific filter in a class. This is referred to as first-match exit. If a packet matches multiple classes in a policy, irrespective of the order of classes in the policy map, it would still exit the classification process after matching the first class.

If a packet does not match any of the classes in the policy, it would be classified into the default class in the policy. Every policy map has a default class, which is a system-defined class to match packets that do not match any of the user-defined classes.

Packet classification can be categorized into the following types:

- Classification based on information that is propagated with the packet
- Classification based on information that is device specific
- Hierarchical classification
Classification Based on Information That is Propagated with the Packet

Classification that is based on information that is part of the packet and propagated either end-to-end or between hops, typically includes the following:

- Classification based on Layer 3 or 4 headers
- Classification based on Layer 2 information

Classification Based on Layer 3 or Layer 4 Header

This is the most common deployment scenario. Numerous fields in the Layer 3 and Layer 4 headers can be used for packet classification.

At the most granular level, this classification methodology can be used to match an entire flow. For this deployment type, an access control list (ACLs) can be used. ACLs can also be used to match based on various subsets of the flow (for example, source IP address only, or destination IP address only, or a combination of both).

Classification can also be done based on the precedence or DSCP values in the IP header. The IP precedence field is used to indicate the relative priority with which a particular packet needs to be handled. It is made up of three bits in the IP header's type of service (ToS) byte.

The following table shows the different IP precedence bit values and their names.

**Note**  IP precedence is not supported for wireless QoS.

**Table 92: IP Precedence Values and Names**

<table>
<thead>
<tr>
<th>IP Precedence Value</th>
<th>IP Precedence Bits</th>
<th>IP Precedence Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>000</td>
<td>Routine</td>
</tr>
<tr>

</tr>
<tr>
<td>6</td>
<td>110</td>
<td>Internetwork control</td>
</tr>
<tr>
<td>7</td>
<td>111</td>
<td>Network control</td>
</tr>
</tbody>
</table>

All routing control traffic in the network uses IP precedence value 6 by default. IP precedence value 7 also is reserved for network control traffic. Therefore, the use of IP precedence values 6 and 7 is not recommended for user traffic.

The DSCP field is made up of 6 bits in the IP header and is being standardized by the Internet Engineering Task Force (IETF) Differentiated Services Working Group. The original ToS byte contained the DSCP bits has been renamed the DSCP byte. The DSCP field is part of the IP header, similar to IP precedence. The
DSCP field is a super set of the IP precedence field. Therefore, the DSCP field is used and is set in ways similar to what was described with respect to IP precedence.

---

**Note**
The DSCP field definition is backward-compatible with the IP precedence values.

---

**Classification Based on Layer 2 Header**

A variety of methods can be used to perform classification based on the Layer 2 header information. The most common methods include the following:

- **MAC address-based classification (only for access groups)**—Classification is based upon the source MAC address (for policies in the input direction) and destination MAC address (for policies in the output direction).

- **Class-of-Service**—Classification is based on the 3 bits in the Layer 2 header based on the IEEE 802.1p standard. This usually maps to the ToS byte in the IP header.

- **VLAN ID**—Classification is based on the VLAN ID of the packet.

---

**Note**
Some of these fields in the Layer 2 header can also be set using a policy.

---

**Classification Based on Information that is Device Specific (QoS Groups)**

The device also provides classification mechanisms that are available where classification is not based on information in the packet header or payload.

At times you might be required to aggregate traffic coming from multiple input interfaces into a specific class in the output interface. For example, multiple customer edge routers might be going into the same access device on different interfaces. The service provider might want to police all the aggregate voice traffic going into the core to a specific rate. However, the voice traffic coming in from the different customers could have a different ToS settings. QoS group-based classification is a feature that is useful in these scenarios.

Policies configured on the input interfaces set the QoS group to a specific value, which can then be used to classify packets in the policy enabled on output interface.

The QoS group is a field in the packet data structure internal to the device. It is important to note that a QoS group is an internal label to the device and is not part of the packet header.

---

**Hierarchical Classification**

The device permits you to perform a classification based on other classes. Typically, this action may be required when there is a need to combine the classification mechanisms (that is, filters) from two or more classes into a single class map.

---

**QoS Wired Model**

To implement QoS, the device must perform the following tasks:

- **Traffic classification**—Distinguishes packets or flows from one another.
Quality of Service

Ingress Port Activity

The following activities occur at the ingress port of the device:

- **Classification**—Classifying a distinct path for a packet by associating it with a QoS label. For example, the device maps the CoS or DSCP in the packet to a QoS label to distinguish one type of traffic from another. The QoS label that is generated identifies all future QoS actions to be performed on this packet.

- **Policing**—Policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. The policer limits the bandwidth consumed by a flow of traffic. The result is passed to the marker.

- **Marking**—Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, mark down the QoS label in the packet, or drop the packet).

**Note**
Applying polices on the wireless ingress port is not supported on the device.

Egress Port Activity

The following activities occur at the egress port of the device:

- **Policing**—Policing determines whether a packet is in or out of profile by comparing the rate of the incoming traffic to the configured policer. The policer limits the bandwidth consumed by a flow of traffic. The result is passed to the marker.

- **Marking**—Marking evaluates the policer and configuration information for the action to be taken when a packet is out of profile and determines what to do with the packet (pass through a packet without modification, mark down the QoS label in the packet, or drop the packet).

- **Queueing**—Queueing evaluates the QoS packet label and the corresponding DSCP or CoS value before selecting which of the egress queues to use. Because congestion can occur when multiple ingress ports simultaneously send data to an egress port, Weighted Tail Drop (WTD) differentiates traffic classes and subjects the packets to different thresholds based on the QoS label. If the threshold is exceeded, the packet is dropped.

Classification

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification is enabled only if QoS is enabled on the . By default, QoS is enabled on the .

During classification, the performs a lookup and assigns a QoS label to the packet. The QoS label identifies all QoS actions to be performed on the packet and from which queue the packet is sent.
Access Control Lists

You can use IP standard, IP extended, or Layer 2 MAC ACLs to define a group of packets with the same characteristics (class). You can also classify IP traffic based on IPv6 ACLs.

In the QoS context, the permit and deny actions in the access control entries (ACEs) have different meanings from security ACLs:

- If a match with a permit action is encountered (first-match principle), the specified QoS-related action is taken.
- If a match with a deny action is encountered, the ACL being processed is skipped, and the next ACL is processed.

### Note
Deny action is supported in Cisco IOS Release 3.7.4E and later releases.

- If no match with a permit action is encountered and all the ACEs have been examined, no QoS processing occurs on the packet, and the packet offers best-effort service to the packet.
- If multiple ACLs are configured on a port, the lookup stops after the packet matches the first ACL with a permit action, and QoS processing begins.

### Note
After creating an access list, note that by default the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

After a traffic class has been defined with the ACL, you can attach a policy to it. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate-limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the `access-list` global configuration command; you implement Layer 2 MAC ACLs to classify non-IP traffic by using the `mac access-list extended` global configuration command.

### Class Maps

A class map is a mechanism that you use to name a specific traffic flow (or class) and isolate it from all other traffic. The class map defines the criteria used to match against a specific traffic flow to further classify it. The criteria can include matching the access group defined by the ACL or matching a specific list of DSCP or IP precedence values. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you further classify it through the use of a policy map.

You create a class map by using the `class-map` global configuration command or the `class` policy-map configuration command. You should use the `class-map` command when the map is shared among many ports. When you enter the `class-map` command, the enters the class-map configuration mode. In this mode, you define the match criterion for the traffic by using the `match` class-map configuration command.
You can create a default class by using the `class class-default` policy-map configuration command. The default class is system-defined and cannot be configured. Unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as default traffic.

**Related Topics**
- Creating a Traffic Class (CLI), on page 1337
- Examples: Classification by Access Control Lists, on page 1387

### Policy Maps

A policy map specifies which traffic class to act on. Actions can include the following:

- Setting a specific DSCP or IP precedence value in the traffic class
- Setting a CoS value in the traffic class
- Setting a QoS group
- Setting a wireless LAN (WLAN) value in the traffic class
- Specifying the traffic bandwidth limitations and the action to take when the traffic is out of profile

Before a policy map can be effective, you must attach it to a port.

You create and name a policy map using the `policy-map` global configuration command. When you enter this command, the enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the `class` or `set` policy-map configuration and policy-map class configuration commands.

The policy map can also be configured using the `police` and `bandwidth` policy-map class configuration commands, which define the policer, the bandwidth limitations of the traffic, and the action to take if the limits are exceeded. In addition, the policy-map can further be configured using the `priority` policy-map class configuration command, to schedule priority for the class or the queueing policy-map class configuration commands, `queue-buffers` and `queue-limit`.

To enable the policy map, you attach it to a port by using the `service-policy` interface configuration command.

### Policy Map on Physical Port

You can configure a nonhierarchical policy map on a physical port that specifies which traffic class to act on. Actions can include setting a specific DSCP or IP precedence value in the traffic class, specifying the traffic bandwidth limitations for each matched traffic class (policer), and taking action when the traffic is out of profile (marking).

A policy map also has these characteristics:

- A policy map can contain multiple class statements, each with different match criteria and policers.
- A policy map can contain a predefined default traffic class explicitly placed at the end of the map.

When you configure a default traffic class by using the `class class-default` policy-map configuration command, unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as the default traffic class (`class-default`).
• A separate policy-map class can exist for each type of traffic received through a port.

---

**Policy Map on VLANs**

The VLAN QoS feature allows the user to perform QoS treatment at the VLAN level (classification and QoS actions) using the incoming frame’s VLAN information. In VLAN-based QoS, a service policy is applied to an SVI interface. All physical interfaces belonging to a VLAN policy map then need to be programmed to refer to the VLAN-based policy maps instead of the port-based policy map.

Although the policy map is applied to the VLAN SVI, any policing (rate-limiting) action can only be performed on a per-port basis. You cannot configure the policer to take account of the sum of traffic from a number of physical ports. Each port needs to have a separate policer governing the traffic coming into that port.

---

**Policing**

After a packet is classified and has a DSCP-based, CoS-based, or QoS-group label assigned to it, the policing and marking process can begin.

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are *out of profile* or *nonconforming*. Each policer decides on a packet-by-packet basis whether the packet is in or out of profile and specifies the actions on the packet. These actions, carried out by the marker, include passing through the packet without modification, dropping the packet, or modifying (marking down) the assigned DSCP or CoS value of the packet and allowing the packet to pass through.

To avoid out-of-order packets, both conform and nonconforming traffic typically exit the same queue.

---

**Note**

All traffic, regardless of whether it is bridged or routed, is subjected to a policer, if one is configured. As a result, bridged packets might be dropped or might have their DSCP or CoS fields modified when they are policed and marked.

---

You can only configure policing on a physical port.

After you configure the policy map and policing actions, attach the policy to an ingress port or SVI by using the `service-policy` interface configuration command.

Token-Bucket Algorithm

Policing uses a token-bucket algorithm. As each frame is received by the device, a token is added to the bucket. The bucket has a hole in it and leaks at a rate that you specify as the average traffic rate in bits per second. Each time a token is added to the bucket, the device verifies that there is enough room in the bucket. If there is not enough room, the packet is marked as nonconforming, and the specified policer action is taken (dropped or marked down).

How quickly the bucket fills is a function of the bucket depth (burst-byte), the rate at which the tokens are removed (rate-bps), and the duration of the burst above the average rate. The size of the bucket imposes an upper limit on the burst length and limits the number of frames that can be transmitted back-to-back. If the burst is short, the bucket does not overflow, and no action is taken against the traffic flow. However, if a burst is long and at a higher rate, the bucket overflows, and the policing actions are taken against the frames in that burst.

You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the burst-byte option of the `police` policy-map class configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the rate option of the `police` policy-map class configuration command.

Marking

Marking is used to convey specific information to a downstream device in the network, or to carry information from one interface in a device to another.

Marking can be used to set certain field/bits in the packet headers, or marking can also be used to set certain fields in the packet structure that is internal to the device. Additionally, the marking feature can be used to define mapping between fields. The following marking methods are available for QoS:

- Packet header
- Device-specific information
- Table maps

Packet Header Marking

Marking on fields in the packet header can be classified into two general categories:

- IPv4/v6 header bit marking
- Layer 2 header bit marking

The marking feature at the IP level is used to set the precedence or the DSCP in the IP header to a specific value to get a specific per-hop behavior at the downstream device (switch or router), or it can also be used to aggregate traffic from different input interfaces into a single class in the output interface. The functionality is currently supported on both the IPv4 and IPv6 headers.

Marking in the Layer 2 headers is typically used to influence dropping behavior in the downstream devices (switch or router). It works in tandem with the match on the Layer 2 headers. The bits in the Layer 2 header that can be set using a policy map are class of service.
Switch Specific Information Marking

This form of marking includes marking of fields in the packet data structure that are not part of the packets header, so that the marking can be used later in the data path. This is not propagated between the switches. Marking of QoS-group falls into this category. This form of marking is only supported in policies that are enabled on the input interfaces. The corresponding matching mechanism can be enabled on the output interfaces on the same switch and an appropriate QoS action can be applied.

Table Map Marking

Note

QoS marking is not supported on the 802.11ac Wave 2 APs. This is because table-maps used for QoS marking are not supported on the 802.11ac Wave 2 APs.

Table map marking enables the mapping and conversion from one field to another using a conversion table. This conversion table is called a table map.

Depending upon the table map attached to an interface, CoS, DSCP, and UP values (UP specific to wireless packets) of the packet are rewritten. The device allows configuring both ingress table map policies and egress table map policies.

Note

The device stack supports a total of 14 table maps. Only one table map is supported per wired port, per direction.

As an example, a table map can be used to map the Layer 2 CoS setting to a precedence value in Layer 3. This feature enables combining multiple set commands into a single table, which indicates the method to perform the mapping. This table can be referenced in multiple policies, or multiple times in the same policy.

The following table shows the currently supported forms of mapping:

Table 93: Packet-Marking Types Used for Establishing a To-From Relationship

<table>
<thead>
<tr>
<th>The To Packet-Marking Type</th>
<th>The From Packet-Marking Type</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

A table map-based policy supports the following capabilities:
• Mutation—You can have a table map that maps from one DSCP value set to another DSCP value set, and this can be attached to an egress port.

• Rewrite—Packets coming in are rewritten depending upon the configured table map.

• Mapping—Table map based policies can be used instead of set policies.

The following steps are required for table map marking:

1. Define the table map—Use the `table-map` global configuration command to map the values. The table does not know of the policies or classes within which it will be used. The default command in the table map is used to indicate the value to be copied into the `to` field when there is no matching from field.

2. Define the policy map—You must define the policy map where the table map will be used.

3. Associate the policy to an interface.

Note
A table map policy on an input port changes the trust setting of that port to the from type of qos-marking.

Traffic Conditioning

To support QoS in a network, traffic entering the service provider network needs to be policed on the network boundary routers to ensure that the traffic rate stays within the service limit. Even if a few routers at the network boundary start sending more traffic than what the network core is provisioned to handle, the increased traffic load leads to network congestion. The degraded performance in the network makes it difficult to deliver QoS for all the network traffic.

Traffic policing functions (using the police feature) and shaping functions (using the traffic shaping feature) manage the traffic rate, but differ in how they treat traffic when tokens are exhausted. The concept of tokens comes from the token bucket scheme, a traffic metering function.

Note
When running QoS tests on network traffic, you may see different results for the shaper and policing data. Network traffic data from shaping provides more accurate results.

This table compares the policing and shaping functions.

Table 94: Comparison Between Policing and Shaping Functions

<table>
<thead>
<tr>
<th>Policing Function</th>

<tr>
<td>Transmission Control Protocol (TCP) detects the line at line speed but adapts to the configured rate when a packet drop occurs by lowering its window size.</td>
<td>TCP can detect that it has a lower speed line and adapt its retransmission timer accordingly. This results in less scope of retransmissions and is TCP-friendly.</td>
</tr>
</tbody>
</table>

### Policing

The QoS policing feature is used to impose a maximum rate on a traffic class. The QoS policing feature can also be used with the priority feature to restrict priority traffic. If the rate is exceeded, then a specific action is taken as soon as the event occurs. The rate (committed information rate [CIR] and peak information rate [PIR]) and the burst parameters (conformed burst size [B_c] and extended burst size [B_e]) are all configured in bytes per second.

The following policing forms or policers are supported for QoS:

- Single-rate two-color policing
- Dual-rate three-color policing

**Note**

Single-rate three-color policing is not supported.

### Single-Rate Two-Color Policing

Single-rate two-color policer is the mode in which you configure only a CIR and a B_c.

The B_c is an optional parameter, and if it is not specified it is computed by default. In this mode, when an incoming packet has enough tokens available, the packet is considered to be conforming. If at the time of packet arrival, enough tokens are not available within the bounds of B_c, the packet is considered to have exceeded the configured rate.

**Note**

For information about the token-bucket algorithm, see [Token-Bucket Algorithm, on page 1315](#).

**Related Topics**

- [Configuring Police (CLI), on page 1372](#)
Examples: Single-Rate Two-Color Policing Configuration, on page 1400

**Dual-Rate Three-Color Policing**

With the dual rate policer, the device supports only color-blind mode. In this mode, you configure a committed information rate (CIR) and a peak information rate (PIR). As the name suggests, there are two token buckets in this case, one for the peak rate, and one for the conformed rate.

---

**Note**

For information about the token-bucket algorithm, see *Token-Bucket Algorithm, on page 1315.*

In the color-blind mode, the incoming packet is first checked against the peak rate bucket. If there are not enough tokens available, the packet is said to violate the rate. If there are enough tokens available, then the tokens in the conformed rate buckets are checked to determine if there are enough tokens available. The tokens in the peak rate bucket are decremented by the size of the packet. If it does not have enough tokens available, the packet is said to have exceeded the configured rate. If there are enough tokens available, then the packet is said to conform, and the tokens in both the buckets are decremented by the size of the packet.

The rate at which tokens are replenished depends on the packet arrival. Assume that a packet comes in at time T1 and the next one comes in at time T2. The time interval between T1 and T2 determines the number of tokens that need to be added to the token bucket. This is calculated as:

\[
\text{Time interval between packets (T2-T1) } \times \text{CIR})/8 \text{ bytes}
\]

- Examples: Dual-Rate Three-Color Policing Configuration, on page 1400

**Shaping**

Shaping is the process of imposing a maximum rate of traffic, while regulating the traffic rate in such a way that the downstream switches and routers are not subjected to congestion. Shaping in the most common form is used to limit the traffic sent from a physical or logical interface.

Shaping has a buffer associated with it that ensures that packets which do not have enough tokens are buffered as opposed to being immediately dropped. The number of buffers available to the subset of traffic being shaped is limited and is computed based on a variety of factors. The number of buffers available can also be tuned using specific QoS commands. Packets are buffered as buffers are available, beyond which they are dropped.

**Class-Based Traffic Shaping**

The uses class-based traffic shaping. This shaping feature is enabled on a class in a policy that is associated to an interface. A class that has shaping configured is allocated a number of buffers to hold the packets that do not have tokens. The buffered packets are sent out from the class using FIFO. In the most common form of usage, class-based shaping is used to impose a maximum rate for an physical interface or logical interface as a whole. The following shaping forms are supported in a class:

- Average rate shaping
- Hierarchical shaping

Shaping is implemented using a token bucket. The values of CIR, B_c and B_e determine the rate at which the packets are sent out and the rate at which the tokens are replenished.
Average Rate Shaping

You use the `shape average` policy-map class command to configure average rate shaping. This command configures a maximum bandwidth for a particular class. The queue bandwidth is restricted to this value even though the port has more bandwidth available. The supports configuring shape average by either a percentage or by a target bit rate value.

Related Topics
- Configuring Shaping (CLI), on page 1382
- Examples: Average Rate Shaping Configuration, on page 1396

Hierarchical Shaping

Shaping can also be configured at multiple levels in a hierarchy. This is accomplished by creating a parent policy with shaping configured, and then attaching child policies with additional shaping configurations to the parent policy.

There are two supported types of hierarchical shaping:

- Port shaper
- User-configured shaping

The port shaper uses the class default and the only action permitted in the parent is shaping. The queueing action is in the child with the port shaper. With the user configured shaping, you cannot have queueing action in the child.

Related Topics
- Configuring Shaping (CLI), on page 1382

Queueing and Scheduling

The uses both queueing and scheduling to help prevent traffic congestion. The supports the following queueing and scheduling features:

- Bandwidth
- Weighted Tail Drop
- Priority queues
- Queue buffers

When you define a queueing policy on a port, control packets are mapped to the best priority queue with the highest threshold. Control packets queue mapping works differently in the following scenarios:

- Without a quality of service (QoS) policy—if no QoS policy is configured, control packets with DSCP values 16, 24, 48, and 56 are mapped to queue 0 with the highest threshold of threshold2.

- With an user-defined policy—an user-defined queueing policy configured on egress ports can affect the default priority queue setting on control packets.
Control traffic is redirected to the best queue based on the following rules:

1. If defined in a user policy, the highest-level priority queue is always chosen as the best queue.

2. In the absence of a priority queue, Cisco IOS software selects queue 0 as the best queue. When the software selects queue 0 as the best queue, you must define the highest bandwidth to this queue to get the best QoS treatment to the control plane traffic.

3. If thresholds are not configured on the best queue, Cisco IOS software assigns control packets with Differentiated Services Code Point (DSCP) values 16, 24, 48, and 56 are mapped to threshold2 and reassigns the rest of the control traffic in the best queue to threshold1.

If a policy is not configured explicitly for control traffic, the Cisco IOS software maps all unmatched control traffic to the best queue with threshold2, and the matched control traffic is mapped to the queue as configured in the policy.

Note  
To provide proper QoS for Layer 3 packets, you must ensure that packets are explicitly classified into appropriate queues. When the software detects DSCP values in the default queue, then it automatically reassigns this queue as the best queue.

**Bandwidth**

The supports the following bandwidth configurations:

- Bandwidth percent
- Bandwidth remaining ratio

**Related Topics**

Configuring Bandwidth (CLI), on page 1370

**Bandwidth Percent**

You can use the `bandwidth percent` policy-map class command to allocate a minimum bandwidth to a particular class. The total sum cannot exceed 100 percent and in case the total sum is less than 100 percent, then the rest of the bandwidth is divided equally among all bandwidth queues.

Note  
A queue can oversubscribe bandwidth in case the other queues do not utilize the entire port bandwidth.

You cannot mix bandwidth types on a policy map. For example, you cannot configure bandwidth in a single policy map using both a bandwidth percent and in kilobits per second.

**Bandwidth Remaining Ratio**

You use the `bandwidth remaining ratio` policy-map class command to create a ratio for sharing unused bandwidth in specified queues. Any unused bandwidth will be used by these specific queues in the ratio that is specified by the configuration. Use this command when the `priority` command is also used for certain queues in the policy.
When you assign ratios, the queues will be assigned certain weights which are inline with these ratios.

You can specify ratios using a range from 0 to 100. For example, you can configure a bandwidth remaining ratio of 2 on one class, and another queue with a bandwidth remaining ratio of 4 on another class. The bandwidth remaining ratio of 4 will be scheduled twice as often as the bandwidth remaining ratio of 2.

The total bandwidth ratio allocation for the policy can exceed 100. For example, you can configure a queue with a bandwidth remaining ratio of 50, and another queue with a bandwidth remaining ratio of 100.

### Weighted Tail Drop

The egress queues use an enhanced version of the tail-drop congestion-avoidance mechanism called weighted tail drop (WTD). WTD is implemented on queues to manage the queue lengths and to provide drop precedences for different traffic classifications.

As a frame is enqueued to a particular queue, WTD uses the frame’s assigned QoS label to subject it to different thresholds. If the threshold is exceeded for that QoS label (the space available in the destination queue is less than the size of the frame), the drops the frame.

Each queue has three configurable threshold values. The QoS label determines which of the three threshold values is subjected to the frame.

*Figure 90: WTD and Queue Operation*

The following figure shows an example of WTD operating on a queue whose size is 1000 frames. Three drop percentages are configured: 40 percent (400 frames), 60 percent (600 frames), and 100 percent (1000 frames). These percentages indicate that up to 400 frames can be queued at the 40-percent threshold, up to 600 frames at the 60-percent threshold, and up to 1000 frames at the 100-percent threshold.

In the example, CoS value 6 has a greater importance than the other CoS values, and is assigned to the 100-percent drop threshold (queue-full state). CoS values 4 is assigned to the 60-percent threshold, and CoS values 3 is assigned to the 40-percent threshold. All of these threshold values are assigned using the `queue-limit cos` command.

Assuming the queue is already filled with 600 frames, and a new frame arrives. It contains CoS value 4 and is subjected to the 60-percent threshold. If this frame is added to the queue, the threshold will be exceeded, so the drops it.

**Related Topics**

- Configuring Queue Limits (CLI), on page 1379
- Examples: Queue-limit Configuration, on page 1397

### Weighted Tail Drop Default Values

The following are the Weighted Tail Drop (WTD) default values and the rules for configuring WTD threshold values.

- If you configure less than three queue-limit percentages for WTD, then WTD default values are assigned to these thresholds.
The following are the WTD threshold default values:

**Table 95: WTD Threshold Default Values**

<table>
<thead>
<tr>
<th>Threshold</th>
<th>Default Value Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>80</td>
</tr>
<tr>
<td>1</td>
<td>90</td>
</tr>
<tr>
<td>2</td>
<td>400</td>
</tr>
</tbody>
</table>

- If 3 different WTD thresholds are configured, then the queues are programmed as configured.
- If 2 WTD thresholds are configured, then the maximum value percentage will be 400.
- If a WTD single threshold is configured as x, then the maximum value percentage will be 400.
  - If the value of x is less than 90, then threshold 1 = 90 and threshold 0 = x.
  - If the value of x equals 90, then threshold 1 = 90, threshold 0 = 80.
  - If the value x is greater than 90, then threshold 1 = x, threshold 0 = 80.

**Priority Queues**

Each port supports eight egress queues, of which two can be given a priority.

You use the `priority level` policy class-map command to configure the priority for two classes. One of the classes has to be configured with a priority queue level 1, and the other class has to be configured with a priority queue level 2. Packets on these two queues are subjected to less latency with respect to other queues.

**Note**

You can configure a priority only with a level.

Only one strict priority or a priority with levels is allowed in one policy map. Multiple priorities with the same priority levels without kbps/percent are allowed in a policy map only if all of them are configured with police.

**Related Topics**

- Configuring Priority (CLI), on page 1374

**Queue Buffer**

Each 1-gigabit port on the device is allocated 168 buffers for a wireless port and 300 buffers for a wired port. Each 10-gigabit port is allocated 1800 buffers.

At boot time, when there is no policy map enabled on the wired port, there are two queues created by default. Wired ports can have a maximum of 8 queues configured using MQC-based policies. The following table shows which packets go into which one of the queues:
You can guarantee the availability of buffers, set drop thresholds, and configure the maximum memory allocation for a queue. You use the `queue-buffers` policy-map class command to configure the queue buffers. You use the `queue-limit` policy-map class command to configure the maximum thresholds.

There are two types of buffer allocations: hard buffers, which are explicitly reserved for the queue, and soft buffers, which are available for other ports when unused by a given port.

For the wireless port default, Queue 0 will be given 40 percent of the buffers that are available for the interface as hard buffers, that is 67 buffers are allocated for Queue 0 in the context of 1-gigabit ports. The soft maximum for this queue is set to 268 (calculated as 67 * 400/100) for 1-gigabit ports, where 400 is the default maximum threshold that is configured for any queue.

For the wired port default, Queue 0 will be given 40 percent of the buffers that are available for the interface as hard buffers, that is 120 buffers are allocated for Queue 0 in the context of 1-gigabit ports, and 720 buffers in the context of 10-gigabit ports. The soft maximum for this queue is set to 480 (calculated as 120 * 400/100) for 1-gigabit ports and 2880 for 10-gigabit ports, where 400 is the default maximum threshold that is configured for any queue.

### Queue Buffer Allocation

The buffer allocation to any queue can be tuned using the `queue-buffers ratio` policy-map class configuration command.

**Related Topics**

- Configuring Queue Buffers (CLI), on page 1377
- Examples: Queue Buffers Configuration, on page 1398

### Dynamic Threshold and Scaling

Traditionally, reserved buffers are statically allocated for each queue. No matter whether the queue is active or not, its buffers are held up by the queue. In addition, as the number of queues increases, the portion of the reserved buffers allocated for each queue can become smaller and smaller. Eventually, a situation may occur where there are not enough reserved buffers to support a jumbo frame for all queues.

The device supports Dynamic Thresholding and Scaling (DTS), which is a feature that provides a fair and efficient allocation of buffer resources. When congestion occurs, this DTS mechanism provides an elastic buffer allocation for the incoming data based on the occupancy of the global/port resources. Conceptually, DTS scales down the queue buffer allocation gradually as the resources are used up to leave room for other queues, and vice versa. This flexible method allows the buffers to be more efficiently and fairly utilized.

As mentioned in the previous sections, there are two limits configured on a queue—a hard limit and a soft limit.

Hard limits are not part of DTS. These buffers are available only for that queue. The sum of the hard limits should be less than the globally set up hard maximum limit. The global hard limit configured for egress

Queuing in wireless component is performed based on the port policy and is applicable only in the downstream direction. The wireless module supports the following four queues:

- **Voice**—This is a strict priority queue. Represented by Q0, this queue processes control traffic and multicast or unicast voice traffic. All control traffic (such as CAPWAP packets) is processed through the voice queue. The QoS module uses a different threshold within the voice queue to process control and voice packets to ensure that control packets get higher priority over other non-control packets.

- **Video**—This is a strict priority queue. Represented by Q1, this queue processes multicast or unicast video traffic.

- **Data NRT**—Represented by Q2, this queue processes all non-real-time unicast traffic.

- **Multicast NRT**—Represented by Q3, this queue processes Multicast NRT traffic. Any traffic that does not match the traffic in Q0, Q1, or Q2 is processed through Q3.

**Note**

By default, the queues Q0 and Q1 are not enabled.

**Note**

A weighted round-robin policy is applied for traffic in the queues Q2 and Q3.

For upstream direction only one queue is available. Port and radio policies are applicable only in the downstream direction.

**Note**

The wired ports support eight queues.

**Trust Behavior**

**Trust Behavior for Wired and Wireless Ports**

For wired or wireless ports that are connected to the device (end points such as IP phones, laptops, cameras, telepresence units, or other devices), their DSCP, precedence, or CoS values coming in from these end points are trusted by the device and therefore are retained in the absence of any explicit policy configuration.
This trust behavior is applicable to both upstream and downstream QoS.

The packets are enqueued to the appropriate queue per the default initial configuration. No priority queueing at the device is done by default. This is true for unicast and multicast packets.

In scenarios where the incoming packet type differs from the outgoing packet type, the trust behavior and the queuing behavior are explained in the following table. Note that the default trust mode for a port is DSCP based. The trust mode ‘falls back’ to CoS if the incoming packet is a pure Layer 2 packet. You can also change the trust setting from DSCP to CoS. This setting change is accomplished by using an MQC policy that has a class default with a 'set cos cos table default default-cos' action, where default-cos is the name of the table map created (which only performs a default copy).

The Cisco IOS XE 3.2 Release supported different trust defaults for wired and wireless ports. The trust default for wired ports was the same as for this software release. For wireless ports, the default system behavior was non-trust, which meant that when the device came up, all markings for the wireless ports were defaulted to zero and no traffic received priority treatment. For compatibility with an existing wired device, all traffic went to the best-effort queue by default. The access point performed priority queuing by default. In the downstream direction, the access point maintained voice, video, best-effort, and background queues for queuing. The access selected the queuing strategy based on the 11e tag information. By default, the access point treated all wireless packets as best effort.

**Port Security on a Trusted Boundary for Cisco IP Phones**

In a typical network, you connect a Cisco IP Phone to a device port and cascade devices that generate data packets from the back of the telephone. The Cisco IP Phone guarantees the voice quality through a shared data link by marking the CoS level of the voice packets as high priority (CoS = 5) and by marking the data packets as low priority (CoS = 0). Traffic sent from the telephone to the device is typically marked with a tag that uses the 802.1Q header. The header contains the VLAN information and the class of service (CoS) 3-bit field, which is the priority of the packet.

For most Cisco IP Phone configurations, the traffic sent from the telephone to the device should be trusted to ensure that voice traffic is properly prioritized over other types of traffic in the network. By using the **trust device** interface configuration command, you configure the device port to which the telephone is connected to trust the traffic received on that port.
The trust device device_type command available in interface configuration mode is a stand-alone command on the device. When using this command in an AutoQoS configuration, if the connected peer device is not a corresponding device (defined as a device matching your trust policy), both CoS and DSCP values are set to "0" and any input policy will not take effect. If the connected peer device is a corresponding device, input policy will take effect.

With the trusted setting, you also can use the trusted boundary feature to prevent misuse of a high-priority queue if a user bypasses the telephone and connects the PC directly to the device. Without trusted boundary, the CoS labels generated by the PC are trusted by the device (because of the trusted CoS setting). By contrast, trusted boundary uses CDP to detect the presence of a Cisco IP Phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a device port. If the telephone is not detected, the trusted boundary feature disables the trusted setting on the device port and prevents misuse of a high-priority queue. Note that the trusted boundary feature is not effective if the PC and Cisco IP Phone are connected to a hub that is connected to the device.

### Wireless QoS Mobility

Wireless QoS mobility enables you to configure QoS policies so that the network provides the same service anywhere in the network. A wireless client can roam from one location to another and as a result the client can get associated to different access points associated with a different device. Wireless client roaming can be classified into two types:

- Intra-device roaming
- Inter-device roaming

**Note**

The client policies must be available on all of the devices in the mobility group. The same SSID and port policy must be applied to all devices in the mobility group so that the clients get consistent treatment.

### Inter-Device Roaming

When a client roams from one location to another, the client can get associated to access points either associated to the same device (anchor device) or a different device (foreign device). Inter-device roaming refers to the scenario where the client gets associated to an access point that is not associated to the same device before the client roamed. The host device is now foreign to the device to which the client was initially anchored.

In the case of inter-device roaming, the client QoS policy is always executed on the foreign controller. When a client roams from anchor device to foreign device, the QoS policy is uninstalled on the anchor device and installed on the foreign device. In the mobility handoff message, the anchor device passes the name of the policy to the foreign device. The foreign device should have a policy with the same name configured for the QoS policy to be applied correctly.

In the case of inter-device roaming, all of the QoS policies are moved from the anchor device to the foreign device. While the QoS policies are in transition from the anchor device to the foreign device, the traffic on
the foreign device is provided the default treatment. This is comparable to a new policy installation on the client target.

Note

If the foreign device is not configured with the user-defined physical port policy, the default port policy is applicable to all traffic is routed through the NRT queue, except the control traffic which goes through RT1 queue. The network administrator must configure the same physical port policy on both the anchor and foreign devices symmetrically.

During inter-device roaming, client and SSID policy statistics are collected only for the duration that the client is associated with the foreign device. Cumulative statistics for the whole roaming (anchor device and foreign device) are not collected.

Intra-Device Roaming

With intra-device roaming, the client gets associated to an access point that is associated to the same device before the client roamed, but this association to the device occurs through a different access point.

Note

QoS policies remain intact in the case of intra-device roaming.

Precious Metal Policies for Wireless QoS

Wireless QoS is backward compatible with the precious metal policies offered by the unified wireless controller platforms. The precious metal policies are system-defined policies that are available on the controller.

The following policies are available:

- Platinum—Used for VoIP clients.
- Gold—Used for video clients.
- Silver—Used for traffic that can be considered best-effort.
- Bronze—Used for NRT traffic.

These policies (also known as profiles) can be applied to a WLAN based on the traffic. We recommend the configuration using the Cisco IOS MQC configuration. The policies are available in the system based on the precious metal policy required. You can configure precious metal policies only for SSID ingress and egress policies.

Based on the policies applied, the 802.1p, 802.11e (WMM), and DSCP fields in the packets are affected. These values are preconfigured and installed when the device is booted.

Note

Unlike the precious metal policies that were applicable in the Cisco Unified Wireless controllers, the attributes rt-average-rate, nrt-average-rate, and peak rates are not applicable for the precious metal policies configured on this device platform.
Standard QoS Default Settings

Default Wired QoS Configuration

There are two queues configured by default on each wired interface on the device. All control traffic traverses and is processed through queue 0. All other traffic traverses and is processed through queue 1.

DSCP Maps

Default CoS-to-DSCP Map

When DSCP transparency mode is disabled, the DSCP values are derived from CoS as per the following table. If these values are not appropriate for your network, you need to modify them.

Note: The DSCP transparency mode is disabled by default. If it is enabled (no mls qos rewrite ip dscp interface configuration command), DSCP rewrite will not happen.

Table 98: Default CoS-to-DSCP Map

<table>
<thead>
<tr>

Default IP-Precedence-to-DSCP Map

You use the IP-precedence-to-DSCP map to map IP precedence values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic. The following table shows the default IP-precedence-to-DSCP map. If these values are not appropriate for your network, you need to modify them.

Table 99: Default IP-Precedence-to-DSCP Map

Default Wireless QoS Configuration

The ports on the switch do not distinguish between wired or wireless physical ports. Depending on the kind of device associated to the switch, the policies are applied. For example, when an access point is connected to a switch port, the switch detects it as a wireless device and applies the default hierarchical policy which is in the format of a parent-child policy. This policy is an hierarchical policy. The parent policy cannot be modified but the child policy (port-child policy) can be modified to suite the QoS configuration. The switch is preconfigured with a default class map and a policy map.

Guidelines for QoS Policies

Follow these guidelines to prevent clients from getting excluded due to malformed QoS policies:
• When a new QoS policy is added to the device, a QoS policy with the same name should be added to other device within the same roam or mobility domain.

• When a device is loaded with a software image of a later release, the new policy formats are supported. If you have upgraded the software image from an earlier release to a later release, you should save the configuration separately. When an earlier release image is loaded, some QoS policies might show as not supported, and you should restore those QoS policies to supported policy formats.

Restrictions for QoS on Wired Targets

A target is an entity where a policy is applied. You can apply a policy to either a wired or wireless target. A wired target can be either a port or VLAN. A wireless target can be either a port, radio, SSID, or client. Only port, SSID, and client policies are user configurable. Radio policies are not user configurable. Wireless QoS policies for port, radio, SSID, and client are applied in the downstream direction, and for upstream only SSID and client targets are supported. Downstream indicates that traffic is flowing from the device to the wireless client. Upstream indicates that traffic is flowing from wireless client to the device.

The following are restrictions for applying QoS features on the device for the wired target:

• A maximum of 8 queuing classes are supported on the device port for the wired target.

• A maximum of 63 policers are supported per policy on the wired port for the wired target.

• A maximum of 1599 policy-maps can be created.

• No more than two levels are supported in a QoS hierarchy.

• In a hierarchical policy, overlapping actions between parent and child are not allowed, except when a policy has the port shaper in the parent and queueing features in the child policy.

• A QoS policy cannot be attached to any EtherChannel interface.

• Policing in both the parent and child is not supported in a QoS hierarchy.

• Marking in both the parent and child is not supported in a QoS hierarchy.

• A mixture of queue limit and queue buffer in the same policy is not supported.

Note

The queue-limit percent is not supported on the device because the queue-buffer command handles this functionality. Queue limit is only supported with the DSCP and CoS extensions.

• With shaping, there is an IPG overhead of 20Bytes for every packet that is accounted internally in the hardware. Shaping accuracy will be effected by this, specially for packets of small size.

• The classification sequence for all wired queuing-based policies should be the same across all wired upstream ports (10-Gigabit Ethernet), and the same for all downstream wired ports (1-Gigabit Ethernet).

• Empty classes are not supported.

• Class-maps with empty actions are not supported. If there are two policies with the same order of class-maps and if there are class-maps with no action in one of the policies, there may be traffic drops. As a workaround, allocate minimal bandwidth for all the classes in PRIORITY_QUEUE.
• A maximum of 256 classes are supported per policy on the wired port for the wired target.

• The actions under a policer within a policy map have the following restrictions:
  • The conform action must be transmit.
  • The exceed/violate action for markdown type can only be cos2cos, prec2prec, dscp2dscp.
  • The markdown types must be the same within a policy.

• A port-level input marking policy takes precedence over an SVI policy; however, if no port policy is configured, the SVI policy takes precedence. For a port policy to take precedence, define a port-level policy; so that the SVI policy is overwritten.

• Classification counters have the following specific restrictions:
  • Classification counters count packets instead of bytes.
  • Filter-based classification counters are not supported
  • Only QoS configurations with marking or policing trigger the classification counter.
  • The classification counter is not port based. This means that the classification counter aggregates all packets belonging to the same class of the same policy which attach to different interfaces.
  • As long as there is policing or marking action in the policy, the class-default will have classification counters.
  • When there are multiple match statements in a class, then the classification counter only shows the traffic counter for one of the match statements.

• Table maps have the following specific restrictions:
  • Only one table map for policing exceeding the markdown and one table map for policing violating the markdown per direction per target is supported.
  • Table maps must be configured under the class-default; table maps are unsupported for a user-defined class.

• Hierarchical policies are required for the following:
  • Port-shapers
  • Aggregate policers
  • PV policy
  • Parent shaping and child marking/policing

• In a HQoS policy with parent shaping and child policy having priority level queuing and priority level policing, the statistics for policing are not updated. Only QoS shaper statistics are updated. To view the QoS shaper statistics, use the `show policy-map interface` command in global configuration mode.

• For ports with wired targets, these are the only supported hierarchical policies:
  • Police chaining in the same policy is unsupported, except for wireless client.
  • Hierarchical queueing is unsupported in the same policy (port shaper is the exception).
• In a parent class, all filters must have the same type. The child filter type must match the parent filter type with the following exceptions:
  • If the parent class is configured to match IP, then the child class can be configured to match the ACL.
  • If the parent class is configured to match CoS, then the child class can be configured to match the ACL.

• The `trust device device_type` command available in interface configuration mode is a stand-alone command on the device. When using this command in an AutoQoS configuration, if the connected peer device is not a corresponding device (defined as a device matching your trust policy), both CoS and DSCP values are set to "0" and any input policy will not take effect. If the connected peer device is a corresponding device, input policy will take effect.

The following are restrictions for applying QoS features on the VLAN to the wired target:
  • For a flat or nonhierarchical policy, only marking or a table map is supported.

The following are restrictions and considerations for applying QoS features on EtherChannel and channel member interfaces:
  • QoS is not supported on an EtherChannel interface.
  • QoS is supported on EtherChannel member interfaces in both ingress and egression directions. All EtherChannel members must have the same QoS policy applied. If the QoS policy is not the same, each individual policy on the different link acts independently.
  • On attaching a service policy to channel members, the following warning message appears to remind the user to make sure the same policy is attached to all ports in the EtherChannel: ‘Warning: add service policy will cause inconsistency with port xxx in ether channel xxx.’.
  • Auto QoS is not supported on EtherChannel members.

---

**Note**

On attaching a service policy to an EtherChannel, the following message appears on the console: ‘Warning: add service policy will cause inconsistency with port xxx in ether channel xxx.’. This warning message should be expected. This warning message is a reminder to attach the same policy to other ports in the same EtherChannel. The same message will be seen during boot up. This message does not mean there is a discrepancy between the EtherChannel member ports.

---

Restrictions for QoS on Wireless Targets

General Restrictions

A target is an entity where a policy is applied. You can apply a policy to either a wired or wireless target. A wired target can be either a port or VLAN. A wireless target can be either a port, radio, SSID, or client. Only port, SSID, and client policies are user configurable. Radio policies are not user configurable. Wireless QoS policies for port, radio, SSID, and client are applied in the downstream direction, and for upstream only SSID and client targets are supported. Downstream indicates that traffic is flowing from the device to the wireless client. Upstream indicates that traffic is flowing from wireless client to the device.

Note

Auto QOS SRND is enabled by default on the Cisco Catalyst 4500E Supervisor Engine 8-E. When AP is connected, egress QoS policy is automatically applied on the AP connected ports and the QoS policy is removed when the AP is disconnected. This policy classification is applied through DSCP, so the drop threshold can be configured for voice and CAPWAP control packets. All other traffic goes to different queues. If you prefer to have a different QoS policy to prioritize different class of traffic, you can configure it using the 'no auto qos srnd4' command. This will remove the Auto QOS SRND4 policies attached to AP connected port and BB-DC inter-link port, and a default policy to protect CAPWAP control and voice traffic will be attached to BB-DC inter-link port.

- Only port, SSID, and client (using AAA and Cisco IOS command-line interface) policies are user-configurable. Radio policies are set by the wireless control module and are not user-configurable.
- Port and radio policies are applicable only in the egress direction.
- SSID and client targets can be configured only with marking and policing policies.
- One policy per target per direction is supported.
- For the egress class-default SSID policy, you must configure the queue buffer ratio as 0 after you configure the average shape rate.
- Class maps in a policy map can have different types of filters. However, only one marking action (either table map, or set dscp, or set cos) is supported in a map in egress direction.
- For hierarchical client and SSID ingress policies, you cannot configure marking in both the parent and child policies. You can only configure marking either in the parent or child policy.
- You cannot configure multiple set actions in the same class.
- For both SSID and client ingress policies, supported set actions are only for DSCP, and CoS values.
- You cannot delete a group of WLANs or QoS policy.

Wireless QoS Restrictions on Ports

The following are restrictions for applying QoS features on a wireless port target:

- All wireless ports have similar parent policy with one class-default and one action shape under class-default. Shape rates are dependent on the 802.11a/b/g/ac bands.
- You can create a maximum of four classes in a child policy by modifying the port_child_policy.
If there are four classes in the `port_child_policy` at the port level, one must be a non-client-nrt class and one must be class-default.

No two classes can have the same priority level. Only priority level 1 (for voice traffic and control traffic) and 2 (for video) are supported.

Priority is not supported in the multicast NRT class (non-client-nrt class) and class-default.

If four classes are configured, two of them have to be priority classes. If only three classes are configured, at least one of them should be a priority class. If three classes are configured and there is no non-client-nrt class, both priority levels must be present.

Only match DSCP is supported.

The port policy applied by the wireless control module cannot be removed using the CLI.

Both priority rate and police CIR (using MQC) in the same class is unsupported.

Queue limit (which is used to configure Weighted Tail Drop) is unsupported.

### Wireless QoS Restrictions on SSID

The following are restrictions for applying QoS features on SSID:

- One table map is supported at the ingress policy.
- Table maps are supported for the parent class-default only. Up to two table maps are supported in the egress direction and three table-maps can be configured when a QoS group is involved.

| Note | Table-maps are not supported at the client targets. |

If a wireless port has a default policy with only two queues (one for multicast-NRT, one for class-default), the policy at SSID level cannot have voice and video class in the egress direction.

Policing without priority is not supported in the egress direction.

Priority configuration at the SSID level is used only to configure the RT1 and RT2 policers (AFD for policer). Priority configuration does not include the shape rate. Therefore, priority is restricted for SSID policies without police.

If `set` is not enabled in class-default, the classification at the SSID for voice or video must be a subset of the classification for the voice or video class at the port level.

The mapping in the DSCP2DSCP and COS2COS table should be based on the classification function for the voice and video classes in the port level policy.

No action is allowed under the class-default of a child policy.

For SSID ingress policies, only UP and DSCP filters (match criteria) are supported. ACL and protocol match criteria are not supported.

For a flat policy (non hierarchical), in the ingress direction, the policy configuration must be a set (table map) or policing or both.
Wireless QoS Restrictions on Clients

The following are restrictions for applying QoS policies on client targets:

- The default client policy is enabled only on WMM clients that are ACM-enabled.
- Queuing is not supported.
- Attaching, removing, or modifying client policies on a WLAN in the enabled state is not supported. You must shut down the WLAN to apply, remove, or modify a policy.
- Table-map configuration is not supported for client targets.
- Policing and set configured together in class-default is blocked in egress direction:

  ```
  policy-map foo
  class class-default
  police X
  set dscp Y
  ```

- Child policy is not supported under class-default if the parent policy contains other user-defined class maps in it.
- For flat egress client policy, policing in class-default and marking action in other classes are not supported.
- Only set marking actions are supported in the client policies.
- For client ingress policies, only ACL, UP, DSCP, and protocol filters (match criteria) are supported.

- All the filters in classes in a policy map for client policy must have the same attributes. Filters matching on protocol-specific attributes such as IPv4 or IPv6 addresses are considered as different attribute sets.

- For filters matching on ACLs, all ACEs (Access Control Entry) in the access list should have the same type and number of attributes.

- In client egress policies, all filters in the policy-map must match on the same marking attribute for filters matching on marking attributes. For example, If filter matches on DSCP, then all filters in the policy must match on DSCP.

- ACL matching on port ranges and subnet are only supported in ingress direction.

# How to Configure QoS

## Configuring Class, Policy, and Table Maps

### Creating a Traffic Class (CLI)

To create a traffic class containing match criteria, use the `class-map` command to specify the traffic class name, and then use the following `match` commands in class-map configuration mode, as needed.

**Before you begin**

All match commands specified in this configuration task are considered optional, but you must configure at least one match criterion for a class.

### SUMMARY STEPS

1. `configure terminal`
2. `class-map class-mapname { match-any | match-all}`
3. `match access-group {index number | name}`
4. `match class-map class-mapname`
5. `match cos cos value`
6. `match dscp dscp value`
7. `match ip { dscp dscp value | precedence precedence value }`
8. `match non-client-nrt`
9. `match qos-group qos group value`
10. `match vlan vlan value`
11. `match wlan user-priority wlan value`
12. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>`class-map class-mapname { match-any</td>
<td>match-all}`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config)# class-map test_1000</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-cmap)#</td>
<td></td>
</tr>
</tbody>
</table>

- Creates a class map to be used for matching packets to the class whose name you specify.

**match-any**: Any one of the match criteria must be met for traffic entering the traffic class to be classified as part of it.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **match-access-group** \(\{index\ \text{number} | \text{name}\}\) | • **match-all**: All of the match criteria must be met for traffic entering the traffic class to be classified as part of the traffic class.  
**Note**: This is the default. If **match-any** or **match-all** is not explicitly defined, **match-all** is chosen by default. |
| **Step 3** | The following parameters are available for this command:  
• access-group  
• class-map  
• cos  
• dscp  
• ip  
• non-client-nrt  
• precedence  
• qos-group  
• vlan  
• wlan user priority  
(Optional) For this example, enter the access-group ID:  
• Access list index (value from 1 to 2799)  
• Named access list  
Example:  
Device(config-cmap)# match access-group 100  
Device(config-cmap)# |
| **match-class-map** \(\text{class-map} \ \text{name}\) | (Optional) Matches to another class-map name.  
Example:  
Device(config-cmap)# match class-map test_2000  
Device(config-cmap)# |
| **match cos** \(\text{cos} \ \text{value}\) | (Optional) Matches IEEE 802.1Q or ISL class of service (user) priority values.  
• Enters up to 4 CoS values separated by spaces (0 to 7).  
Example:  
Device(config-cmap)# match cos 2 3 4 5  
Device(config-cmap)# |
| **match dscp** \(\text{dscp} \ \text{value}\) | (Optional) Matches the DSCP values in IPv4 and IPv6 packets.  
Example:  
Device(config-cmap)# match dscp af11 af12  
Device(config-cmap)# |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config-cmap)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Matches IP values including the following:</td>
</tr>
<tr>
<td>match ip { dscp dscp value</td>
<td>precedence precedence value }</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#  match ip dscp af11 af12</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>(Optional) Matches non-client NRT (Non-Real-Time).</td>
</tr>
<tr>
<td>match non-client-nrt</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#  match non-client-nrt</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>(Optional) Matches QoS group value (from 0 to 31).</td>
</tr>
<tr>
<td>match qos-group qos group value</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#  match qos-group 10</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>(Optional) Matches a VLAN ID (from 1 to 4095).</td>
</tr>
<tr>
<td>match vlan vlan value</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#  match vlan 210</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>(Optional) Matches 802.11e specific values. Enter the user priority 802.11e user priority (0 to 7).</td>
</tr>
<tr>
<td>match wlan user-priority wlan value</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#  match wlan user priority 7</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>Saves the configuration changes.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-cmap)#  end</code></td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

Configure the policy map.
Creating a Traffic Policy (CLI)

To create a traffic policy, use the `policy-map` global configuration command to specify the traffic policy name.

The traffic class is associated with the traffic policy when the `class` command is used. The `class` command must be entered after you enter the policy map configuration mode. After entering the `class` command, the device is automatically in policy map class configuration mode, which is where the QoS policies for the traffic policy are defined.

The following policy map class-actions are supported:

- **admit**—Admits the request for Call Admission Control (CAC).
- **bandwidth**—Bandwidth configuration options.
- **exit**—Exits from the QoS class action configuration mode.
- **no**—Negates or sets default values for the command.
- **police**—Policer configuration options.
- **priority**—Strict scheduling priority configuration options for this class.
- **queue-buffers**—Queue buffer configuration options.
- **queue-limit**—Queue maximum threshold for Weighted Tail Drop (WTD) configuration options.
- **service-policy**—Configures the QoS service policy.
- **set**—Sets QoS values using the following options:
  - CoS values
  - DSCP values
  - Precedence values
  - QoS group values
  - WLAN values
- **shape**—Traffic-shaping configuration options.

**Before you begin**

You should have first created a class map.

**SUMMARY STEPS**

1. `configure terminal`
2. `policy-map policy-map-name`
3. `class {class-name | class-default}`
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> policy-map policy-map name</td>
<td>Enters policy map configuration mode. Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# policy-map test_2000 Device(config-pmap)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> class {class-name</td>
<td>class-default}</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-pmap)# class test_1000 Device(config-pmap-c)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> admit</td>
<td>(Optional) Admits the request for Call Admission Control (CAC). For a more detailed example of this command and its usage, see the section Configuring Call Admission Control.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-pmap-c)# admit cac wmm-tspec Device(config-pmap-c)#</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> This command only configures CAC for wireless QoS.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> bandwidth {kb/s kb/s value</td>
<td>percent percentage</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-pmap-c)# bandwidth 50</td>
<td></td>
</tr>
</tbody>
</table>

- **kb/s**—Kilobits per second, enter a value between 20000 and 10000000 for Kb/s.
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-pmap-c)#</td>
<td><strong>• percent</strong> Enter the percentage of the total bandwidth to be used for this policy map. <strong>• remaining</strong> Enter the percentage ratio of the remaining bandwidth. For a more detailed example of this command and its usage, see Configuring Bandwidth (CLI), on page 1370.</td>
</tr>
</tbody>
</table>

### Step 6

**exit**

#### Example:

```
Device(config-pmap-c)# exit
Device(config-pmap-c)#
```

(Optional) Exits from QoS class action configuration mode.

### Step 7

**no**

#### Example:

```
Device(config-pmap-c)# no
Device(config-pmap-c)#
```

(Optional) Negates the command.

### Step 8

**police **

#### Example:

```
Device(config-pmap-c)# police 100000
Device(config-pmap-c)#
```

(Optional) Configures the policer:

- **target_bit_rate**—Enter the bit rate per second, enter a value between 8000 and 1000000000.
- **cir**—Committed Information Rate
- **rate**—Specify police rate, PCR for hierarchical policies or SCR for single-level ATM 4.0 policer policies.

For a more detailed example of this command and its usage, see Configuring Police (CLI), on page 1372.

### Step 9

**priority **

#### Example:

```
Device(config-pmap-c)# priority percent 50
Device(config-pmap-c)#
```

(Optional) Sets the strict scheduling priority for this class. Command options include:

- **kb/s**—Kilobits per second, enter a value between 1 and 2000000.
- **level**—Establishes a multi-level priority queue. Enter a value (1 or 2).
- **percent**—Enter a percent of the total bandwidth for this priority.

For a more detailed example of this command and its usage, see Configuring Priority (CLI), on page 1374.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>queue-buffers ratio ratio limit</td>
<td>(Optional) Configures the queue buffer for the class. Enter the queue buffers ratio limit (0 to 100). For a more detailed example of this command and its usage, see Configuring Queue Buffers (CLI), on page 1377.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) # queue-buffers ratio 10</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) #</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>queue-limit (packets</td>
<td>(Optional) Specifies the queue maximum threshold for the tail drop:</td>
</tr>
<tr>
<td></td>
<td>cos</td>
<td>dscp</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) # queue-limit cos 7 percent 50</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) #</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>service-policy policy-map name</td>
<td>(Optional) Configures the QoS service policy.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) # service-policy test_2000</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) #</td>
<td></td>
</tr>
<tr>
<td>13</td>
<td>set {cos</td>
<td>dscp</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) # set cos 7</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) #</td>
<td></td>
</tr>
<tr>
<td>14</td>
<td>shape average {target_bit_rate</td>
<td>percent}</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) #shape average percent 50</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c) #</td>
<td></td>
</tr>
</tbody>
</table>
For a more detailed example of this command and its usage, see Configuring Shaping (CLI), on page 1382.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 15 end</td>
<td>Saves the configuration changes.</td>
</tr>
</tbody>
</table>

Example:

```
Device(config-pmap-c) # end
Device(config-pmap-c) #
```

What to do next

Configure the interface.

### Configuring Client Policies

You can configure client policies using one of the following methods:

<table>
<thead>
<tr>
<th>Method</th>
<th>Topic/ Details</th>
</tr>
</thead>
</table>
| Default client policies | The wireless control module of the applies the default client policies when admission control (ACM) is enabled for WMM clients. When ACM is disabled, there is no default client policy. The default policies are:
  - Ingress—cldeffromWMM
  - Egress—cldeftoWMM
  You can verify if ACM is enabled by using the `show ap dot11 {5ghz | 24ghz} cac voice acm` command. To enable ACM, use the `ap dot11 {5ghz | 24ghz} cac voice acm` command. |
| Apply the client policy on the WLAN using the CLI. | Applying an SSID or Client Policy on a WLAN (CLI), on page 1352 |
| Apply the QoS attributes policy using a local profiling policy using the CLI. | Applying a Local Policy for a Device on a WLAN (CLI), on page 1106 |

### Configuring Class-Based Packet Marking (CLI)

This procedure explains how to configure the following class-based packet marking features on your device:
Quality of Service

• CoS value
• DSCP value
• IP value
• Precedence value
• QoS group value
• WLAN value

Before you begin
You should have created a class map and a policy map before beginning this procedure.

SUMMARY STEPS

1. configure terminal
2. policy-map policy name
3. class class name
4. set cos {cos value | cos table table-map name | dscp table table-map name | precedence table table-map name | qos-group table table-map name | wlan user-priority table table-map name}
5. set dscp {dscp value | default | dscp table table-map name | ef | precedence table table-map name | qos-group table table-map name | wlan user-priority table table-map name}
6. set ip {dscp | precedence}
7. set precedence {precedence value | cos table table-map name | dscp table table-map name | precedence table table-map name | qos-group table table-map name}
8. set qos-group {qos-group value | dscp table table-map name | precedence table table-map name}
9. set wlan user-priority {wlan user-priority value | cos table table-map name | dscp table table-map name | qos-group table table-map name | wlan table table-map name}
10. end
11. show policy-map

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters policy map configuration mode.</td>
</tr>
<tr>
<td>policy-map policy name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
<tr>
<td>Device(config)# policy-map policy1</td>
<td></td>
</tr>
<tr>
<td>Device(config-pmap)#</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Command or Action</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
</tr>
<tr>
<td><strong>class class name</strong></td>
<td>Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-pmap)# <strong>class class1</strong> Device(config-pmap-c)#</td>
<td></td>
</tr>
</tbody>
</table>

Command options for policy class map configuration mode include the following:

- **admit**—Admits the request for Call Admission Control (CAC).
- **bandwidth**—Bandwidth configuration options.
- **exit**—Exits from the QoS class action configuration mode.
- **no**—Negates or sets default values for the command.
- **police**—Policer configuration options.
- **priority**—Strict scheduling priority configuration options for this class.
- **queue-buffers**—Queue buffer configuration options.
- **queue-limit**—Queue maximum threshold for Weighted Tail Drop (WTD) configuration options.
- **service-policy**—Configures the QoS service policy.
- **set**—Sets QoS values using the following options:
  - CoS values
  - DSCP values
  - Precedence values
  - QoS group values
  - WLAN values
- **shape**—Traffic-shaping configuration options.

**Note** This procedure describes the available configurations using **set** command options. The other command options (**admit**, **bandwidth**, etc.) are described in other sections of this guide. Although this task lists all of the possible **set** commands, only one **set** command is supported per class.

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>

<td><strong>set cos</strong> `{cos value</td>
<td>cos table table-map name</td>
<td>dscp table table-map name</td>
</tr>
</tbody>
</table>

Software Configuration Guide, Cisco IOS XE Denali 16.3.x (Catalyst 3650 Switches)
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| Device(config-pmap)# set cos 5  
Device(config-pmap)# | • cos table—Sets the CoS value based on a table map.  
• dscp table—Sets the code point value based on a table map.  
• precedence table—Sets the code point value based on a table map.  
• qos-group table—Sets the CoS value from QoS group based on a table map.  
• wlan user-priority table—Sets the CoS value from the WLAN user priority based on a table map. |
| **Step 5**        |         |
| set dscp {dscp value | default| dscp table table-map name | ef | precedence table table-map name | qos-group table table-map name | wlan user-priority table table-map name} | (Optional) Sets the DSCP value. In addition to setting specific DSCP values, you can also set the following using the set dscp command:  
• default—Matches packets with default DSCP value (000000).  
• dscp table—Sets the packet DSCP value from DSCP based on a table map.  
• ef—Matches packets with EF DSCP value (101110).  
• precedence table—Sets the packet DSCP value from precedence based on a table map.  
• qos-group table—Sets the packet DSCP value from a QoS group based upon a table map.  
• wlan user-priority table—Sets the packet DSCP value based upon a WLAN user-priority based upon a table map. |
| **Example:**      |         |
| Device(config-pmap)# set dscp af11  
Device(config-pmap)# | |
| **Step 6**        |         |
| set ip {dscp | precedence} | (Optional) Sets IP specific values. These values are either IP DSCP or IP precedence values. You can set the following values using the set ip dscp command:  
• dscp value—Sets a specific DSCP value.  
• default—Matches packets with default DSCP value (000000).  
• dscp table—Sets the packet DSCP value from DSCP based on a table map.  
• ef—Matches packets with EF DSCP value (101110).  
• precedence table—Sets the packet DSCP value from precedence based on a table map. |
| **Example:**      |         |
| Device(config-pmap)# set ip dscp c3  
Device(config-pmap)# | |
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• qos-group table</td>
<td>Sets the packet DSCP value from a QoS group based upon a table map.</td>
</tr>
<tr>
<td>• wlan-user-priority table</td>
<td>Sets the packet DSCP value based upon a WLAN user-priority based upon a table map.</td>
</tr>
</tbody>
</table>

You can set the following values using the `set ip precedence` command:

• precedence value—Sets the precedence value (from 0 to 7).

• cos table—Sets the packet precedence value from Layer 2 CoS based on a table map.

• dscp table—Sets the packet precedence from DSCP value based on a table map.

• precedence table—Sets the precedence value from precedence based on a table map.

• qos-group table—Sets the precedence value from a QoS group based upon a table map.

### Step 7

**set precedence** `{precedence value | cos table table-map name | dscp table table-map name | precedence table table-map name | qos-group table table-map name}`

**Example:**

Device(config-pmap)# set precedence 5
Device(config-pmap)#

### Step 8

**set qos-group** `{qos-group value | dscp table table-map name | precedence table table-map name}`

**Example:**

Device(config-pmap)# set qos-group 10
Device(config-pmap)#

(Optional) Sets precedence values in IPv4 and IPv6 packets.

You can set the following values using the `set precedence` command:

• precedence value—Sets the precedence value (from 0 to 7).

• cos table—Sets the packet precedence value from Layer 2 CoS on a table map.

• dscp table—Sets the packet precedence from DSCP value on a table map.

• precedence table—Sets the precedence value from precedence based on a table map.

• qos-group table—Sets the precedence value from a QoS group based upon a table map.

(Optional) Sets QoS group values. You can set the following values using this command:

• qos-group value—A number from 1 to 31.

• dscp table—Sets the code point value from DSCP based on a table map.
### Purpose

**Command or Action**

**Step 9**

```bash
set wlan user-priority <wlan-user-priority-value> [cos table <table-name> | dscp table <table-name> | qos-group table <table-name> | wlan table <table-name>]
```

**Example:**

```bash
Device(config-pmap)# set wlan user-priority 1
```

- **生涯**—Sets the code point value from precedence based on the table map.

**Step 10**

```bash
end
```

**Example:**

```bash
Device(config-pmap)# end
```

**Step 11**

```
show policy-map
```

**Example:**

```bash
Device# show policy-map
```

**What to do next**

Attach the traffic policy to an interface using the **service-policy** command.

### Configuring Class Maps for Voice and Video (CLI)

To configure class maps for voice and video traffic, follow these steps:

**SUMMARY STEPS**

1. **class-map**  
2. **match dscp** <dscp-value-for-voice>
3. **class-map** <class-map-name>
4. **match dscp** <dscp-value-for-video>
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> class-map class-map-name</td>
<td>Creates a class map.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# class-map voice</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> match dscp dscp-value-for-voice</td>
<td>Matches the DSCP value in the IPv4 and IPv6 packets. Set this value to 46.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-cmap)# match dscp 46</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> class-map class-map-name</td>
<td>Configures a class map.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# class-map video</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> match dscp dscp-value-for-video</td>
<td>Matches the DSCP value in the IPv4 and IPv6 packets. Set this value to 34.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-cmap)# match dscp 34</td>
<td></td>
</tr>
</tbody>
</table>

Attaching a Traffic Policy to an Interface (CLI)

After the traffic class and traffic policy are created, you must use the `service-policy` interface configuration command to attach a traffic policy to an interface, and to specify the direction in which the policy should be applied (either on packets coming into the interface or packets leaving the interface).

**Before you begin**

A traffic class and traffic policy must be created before attaching a traffic policy to an interface.

SUMMARY STEPS

1. configure terminal
2. interface type
3. service-policy {input policy-map | output policy-map }
4. end
5. show policy map

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| 2    | interface type   | Enters interface configuration mode and configures an interface. Command parameters for the interface configuration include:  
- Auto Template— Auto-template interface  
- Capwap—CAPWAP tunnel interface  
- GigabitEthernet—Gigabit Ethernet IEEE 802  
- GroupVI—Group virtual interface  
- Internal Interface— Internal interface  
- Loopback—Loopback interface  
- Null—Null interface  
- Port-channel—Ethernet Channel of interface  
- TenGigabitEthernet—10-Gigabit Ethernet  
- Tunnel—Tunnel interface  
- Vlan—Catalyst VLANs  
- Range—Interface range |
|      | Example:         |         |
|      | Device(config)# interface GigabitEthernet1/0/1 | |
|      | Device(config-if)# | |
| 3    | service-policy {input policy-map | output policy-map } | Attaches a policy map to an input or output interface. This policy map is then used as the service policy for that interface. In this example, the traffic policy evaluates all traffic leaving that interface. |
|      | Example:         |         |
|      | Device(config-if)# service-policy output policy_map_01 | |
|      | Device(config-if)# | |
| 4    | end              | Saves configuration changes. |
|      | Example:         |         |
|      | Device(config-if)# end | |
|      | Device# | |
| 5    | show policy map  | (Optional) Displays statistics for the policy on the specified interface. |
|      | Example:         |         |
|      | Device# show policy map | |
What to do next
Proceed to attach any other traffic policy to an interface, and to specify the direction in which the policy should be applied.

Policy Map on Physical Port, on page 1313

Applying an SSID or Client Policy on a WLAN (CLI)

Before you begin
You must have a service-policy map configured before applying it on an SSID.

**SUMMARY STEPS**

1. `configure terminal`
2. `wlan profile-name`
3. `service-policy [ input | output ] policy-name`
4. `service-policy client [ input | output ] policy-name`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
Example:  
Device# configure terminal |
Enters global configuration mode. |
| **Step 2** | wlan profile-name  
Example:  
Device# wlan test4 |
Enters WLAN configuration submode. The `profile-name` is the profile name of the configured WLAN. |
| **Step 3** | service-policy [ input | output ] policy-name  
Example:  
Device(config-wlan)# service-policy input policy-map-ssid |
Applies the policy. The following options are available:  
- `input`— Assigns the policy map to WLAN ingress traffic.  
- `output`— Assigns the policy map to WLAN egress traffic. |
| **Step 4** | service-policy client [ input | output ] policy-name  
Example:  
Device(config-wlan)# service-policy client input policy-map-client |
Applies the policy. The following options are available:  
- `input`— Assigns the client policy for ingress direction on the WLAN.  
- `output`— Assigns the client policy for egress direction on the WLAN. |
| **Step 5** | end  
Example:  
Device(config-wlan)# end |
Returns to privileged EXEC mode. Alternatively, you can also press `Ctrl-Z` to exit global configuration mode. |
### Classifying, Policing, and Marking Traffic on Physical Ports by Using Policy Maps (CLI)

You can configure a nonhierarchical policy map on a physical port that specifies which traffic class to act on. Actions supported are remarking and policing.

#### Before you begin

You should have already decided upon the classification, policing, and marking of your network traffic by policy maps prior to beginning this procedure.

#### SUMMARY STEPS

1. `configure terminal`
2. `class-map {class-map-name | match-any}
3. `match access-group {access-list-index | access-list-name}
4. `policy-map policy-map-name
5. `class {class-map-name | class-default}
6. `set {cos | dscp | ip | precedence | qos-group | wlan user-priority}
7. `police {target_bit_rate | cir | rate}
8. `exit
9. `exit
10. `interface interface-id
11. `service-policy input policy-map-name
12. `end
13. `show policy-map [policy-map-name [class class-map-name]]
14. `copy running-config startup-config

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Device(config)# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>`class-map {class-map-name</td>
<td>match-any}`</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| Device(config)# `class-map ipclass1`  
Device(config-cmap)# `exit`  
Device(config)# | • Creates a class map to be used for matching packets to the class whose name you specify.  
• If you specify `match-any`, one of the match criteria must be met for traffic entering the traffic class to be classified as part of the traffic class. This is the default. |

**Step 3**  
**match access-group** `{ access list index | access list name }`  

**Example:**  
Device(config-cmap)# `match access-group 1000`  
Device(config-cmap)# `exit`  
Device(config)#  

Specifies the classification criteria to match to the class map. You can match on the following criteria:  
• `access-group`—Matches to access group.  
• `class-map`—Matches to another class map.  
• `cos`—Matches to a CoS value.  
• `dscp`—Matches to a DSCP value.  
• `ip`—Matches to a specific IP value.  
• `non-client-nrt`—Matches non-client NRT.  
• `precedence`—Matches precedence in IPv4 and IPv6 packets.  
• `qos-group`—Matches to a QoS group.  
• `vlan`—Matches to a VLAN.  

**Step 4**  
`policy-map policy-map-name`  

**Example:**  
Device(config)# `policy-map flowit`  
Device(config-pmap)#  

Creates a policy map by entering the policy map name, and enters policy-map configuration mode.  
By default, no policy maps are defined.  

**Step 5**  
`class { class-map-name | class-default }`  

**Example:**  
Device(config-pmap)# `class ipclass1`  
Device(config-pmap-c)#  

Defines a traffic classification, and enter policy-map class configuration mode.  
By default, no policy map class-maps are defined.  
If a traffic class has already been defined by using the `class-map` global configuration command, specify its name for `class-map-name` in this command.  
A `class-default` traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied `match any` included in the `class-default` class, all packets that have not already matched the other traffic classes will match `class-default`.  

**Step 6**  
`set { cos | dscp | ip | precedence | qos-group | wlan user-priority }`  

(Optional) Sets the QoS values. Possible QoS configuration values include:
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-pmap-c)# set dscp 45</td>
<td>• <strong>cos</strong>—Sets the IEEE 802.1Q/ISL class of service/user priority.</td>
</tr>
<tr>
<td>Device(config-pmap-c)#</td>
<td>• <strong>dscp</strong>—Sets DSCP in IP(v4) and IPv6 packets.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ip</strong>—Sets IP specific values.</td>
</tr>
<tr>
<td></td>
<td>• <strong>precedence</strong>—Sets precedence in IP(v4) and IPv6 packet.</td>
</tr>
<tr>
<td></td>
<td>• <strong>qos-group</strong>—Sets QoS group.</td>
</tr>
<tr>
<td></td>
<td>• <strong>wlan user-priority</strong>—Sets WLAN user priority.</td>
</tr>
<tr>
<td><strong>In this example,</strong> the <strong>set dscp</strong> command classifies the IP traffic by setting a new DSCP value in the packet.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 7**

| police {target_bit_rate | cir | rate } | (Optional) Configures the policer: |
|------------------------|------|-------|
| **Example:**           |      |       |
| Device(config-pmap-c)# police 100000 | • **target_bit_rate**—Specifies the bit rate per second, enter a value between 8000 and 10000000000. |
| conform-action transmit exceed-action drop | • **cir**—Committed Information Rate. |
| Device(config-pmap-c)# | • **rate**—Specifies the policer rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies. |
| **In this example,** the **police** command adds a policer to the class where any traffic beyond the 100000 set target bit rate is dropped. |

**Step 8**

<table>
<thead>
<tr>
<th>exit</th>
<th>Returns to policy map configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-pmap-c)# exit</td>
<td></td>
</tr>
</tbody>
</table>

**Step 9**

<table>
<thead>
<tr>
<th>exit</th>
<th>Returns to global configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-pmap)# exit</td>
<td></td>
</tr>
</tbody>
</table>

**Step 10**

<table>
<thead>
<tr>
<th>interface interface-id</th>
<th>Specifies the port to attach to the policy map, and enters interface configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Valid interfaces include physical ports.</td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 2/0/1</td>
<td></td>
</tr>
</tbody>
</table>

**Step 11**

<table>
<thead>
<tr>
<th>service-policy input policy-map-name</th>
<th>Specifies the policy-map name, and applies it to an ingress port. Only one policy map per ingress port is supported.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Classifying, Policing, and Marking Traffic on SVIs by Using Policy Maps (CLI)

#### Before you begin

You should have already decided upon the classification, policing, and marking of your network traffic by using policy maps prior to beginning this procedure.

#### SUMMARY STEPS

1. configure terminal
2. class-map {class-map name | match-any }
3. match vlan  vlan number
4. policy-map policy-map-name
5. description description
6. class {class-map-name | class-default}
7. set {cos | dscp | ip | precedence | qos-group | wlan user-priority}
8. police {target_bit_rate | cir | rate}
9. exit
10. exit

#### What to do next

If applicable to your QoS configuration, configure classification, policing, and marking of traffic on SVIs by using policy maps.

### Classifying, Policing, and Marking Traffic on SVIs by Using Policy Maps (CLI)

Quality of Service

Classifying, Policing, and Marking Traffic on SVIs by Using Policy Maps (CLI)

11. `interface interface-id`
12. `service-policy input policy-map-name`
13. `end`
14. `show policy-map [policy-map-name [class class-map-name]]`
15. `copy running-config startup-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1 | `configure terminal`
   | **Example:**
   | Device# configure terminal | Enters global configuration mode. |
| 2 | `class-map {class-map name | match-any}`
   | **Example:**
   | Device(config)# class-map class_vlan100 | Enters class map configuration mode. |
|   |   |   |   | • Creates a class map to be used for matching packets to the class whose name you specify. |
|   |   |   |   | • If you specify `match-any`, one of the match criteria must be met for traffic entering the traffic class to be classified as part of the traffic class. This is the default. |
| 3 | `match vlan vlan number`
   | **Example:**
   | Device(config-cmap)# match vlan 100
   | Device(config-cmap)# exit
   | Device(config)# | Specifies the VLAN to match to the class map. |
| 4 | `policy-map policy-map-name`
   | **Example:**
   | Device(config)# policy-map policy_vlan100
   | Device(config-pmap)# | Creates a policy map by entering the policy map name, and enters policy-map configuration mode. |
   |   | By default, no policy maps are defined. |
| 5 | `description description`
   | **Example:**
   | Device(config-pmap)# description vlan 100 | (Optional) Enters a description of the policy map. |
| 6 | `class {class-map-name | class-default}`
   | **Example:**
   | Device(config-pmap)# class class_vlan100 | Defines a traffic classification, and enters the policy-map class configuration mode. |
   |   | By default, no policy map class-maps are defined. |
### Purpose

If a traffic class has already been defined by using the `class-map` global configuration command, specify its name for `class-name` in this command.

A **class-default** traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied `match any` included in the **class-default** class, all packets that have not already matched the other traffic classes will match **class-default**.

### Step 7

**set {cos | dscp | ip | precedence | qos-group | wlan user-priority}**

**Example:**

```
Device(config-pmap-c)# set dscp af23
Device(config-pmap-c)#
```

(Optional) Sets the QoS values. Possible QoS configuration values include:

- **cos**—Sets the IEEE 802.1Q/ISL class of service/user priority.
- **dscp**—Sets DSCP in IP(v4) and IPv6 packets.
- **ip**—Sets IP specific values.
- **precedence**—Sets precedence in IP(v4) and IPv6 packet.
- **qos-group**—Sets QoS group.
- **wlan user-priority**—Sets WLAN user-priority.

In this example, the `set dscp` command classifies the IP traffic by matching the packets with a DSCP value of AF23 (010010).

### Step 8

**police {target_bit_rate | cir | rate}**

**Example:**

```
Device(config-pmap-c)# police 200000
conform-action transmit
exceed-action drop
Device(config-pmap-c)#
```

(Optional) Configures the policer:

- **target_bit_rate**—Specifies the bit rate per second. Enter a value between 8000 and 10000000000.
- **cir**—Committed Information Rate.
- **rate**—Specifies the police rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies.

In this example, the `police` command adds a policer to the class where any traffic beyond the 200000 set target bit rate is dropped.

### Step 9

```
exit
```

Example:

```
Device(config-pmap-c)# exit
```

Returns to policy map configuration mode.

### Step 10

```
exit
```

Example:

```
Device(config-pmap-c)# exit
```

Returns to global configuration mode.
### Purpose

Device(config-pmap)# exit

### Command or Action

#### Step 11

**interface** *interface-id*

**Example:**

Device(config)# interface gigabitethernet 1/0/3

**Purpose:** Specifies the port to attach to the policy map, and enters interface configuration mode. Valid interfaces include physical ports.

#### Step 12

**service-policy** input *policy-map-name*

**Example:**

Device(config-if)# service-policy input policy_vlan100

**Purpose:** Specifies the policy-map name, and applies it to an ingress port. Only one policy map per ingress port is supported.

#### Step 13

**end**

**Example:**

Device(config-if)# end

**Purpose:** Returns to privileged EXEC mode.

#### Step 14

**show policy-map** [policy-map-name [class class-map-name]]

**Example:**

Device# show policy-map

**Purpose:** (Optional) Verifies your entries.

#### Step 15

**copy running-config startup-config**

**Example:**

Device# copy-running-config startup-config

**Purpose:** (Optional) Saves your entries in the configuration file.

### Related Topics

- Policy Map on VLANs, on page 1314

### Configuring Table Maps (CLI)

Table maps are a form of marking, and also enable the mapping and conversion of one field to another using a table. For example, a table map can be used to map and convert a Layer 2 CoS setting to a precedence value in Layer 3.

### Note

A table map can be referenced in multiple policies or multiple times in the same policy.
SUMMARY STEPS

1. configure terminal
2. table-map name {default {default value | copy | ignore} | exit | map {from from value to to value } | no}
3. map from value to value
4. exit
5. exit
6. show table-map
7. configure terminal
8. policy-map
9. class class-default
10. set cos dscp table table map name
11. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

Device(config-pmap-c)# | |
### Configuring Trust

#### Configuring Trust Behavior for Wireless Traffic (CLI)

The Cisco IOS XE 3.2 Release supported different trust defaults for wired and wireless ports. The trust default for wired ports was the same as for this software release. For wireless ports, the default system behavior was non-trust, which meant that when the device came up, all markings for the wireless ports were defaulted to zero and no traffic received priority treatment. For compatibility with an existing wired device, all traffic went to the best-effort queue by default. The access point performed priority queuing by default. In the downstream direction, the access point maintained voice, video, best-effort, and background queues for queuing. The access selected the queuing strategy based on the 11e tag information. By default, the access point treated all wireless packets as best effort.

#### SUMMARY STEPS

1. `configure terminal`
2. `qos wireless-default-untrust`
3. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  - `configure terminal`
  - **Example:**
    - `Device# configure terminal`
| Enters global configuration mode. |
| **Step 2**
  - `qos wireless-default-untrust`
  - **Example:**
    - `Device (config)# qos wireless-default-untrust`
| Configures the behavior of the device to untrust wireless traffic. To configure the device to trust wireless traffic by default, use the `no` form of the command. |
## Configuring QoS Features and Functionality

### Configuring Call Admission Control (CLI)

This task explains how to configure class-based, unconditional packet marking features on your device for Call Admission Control (CAC).

### SUMMARY STEPS

1. configure terminal
2. class-map class name
3. match dscp dscp value
4. exit
5. class-map class name
6. match dscp dscp value
7. exit
8. table-map name
9. default copy
10. exit
11. table-map name
12. default copy
13. exit
14. policy-map policy name
15. class class-map-name
16. priority level level_value
17. police [target_bit_rate | cir | rate ]
18. admit cac wmm-tspec
19. rate value
20. wlan-up value
21. exit
22. exit
23. class class name
24. priority level level_value
25. police [target_bit_rate | cir | rate ]
26. admit cac wmm-tspec
27. rate value

<td><strong>Step 24</strong> The <strong>priority</strong> command assigns a strict scheduling priority for the class.</td>
</tr>
<tr>
<td>cir</td>
<td>rate</td>
</tr>
<tr>
<td><strong>Step 25</strong> (Optional) Configures the policer:</td>
<td></td>
</tr>
</tbody>
</table>

- **target_bit_rate**—Specifies the bit rate per second. Enter a value between 8000 and 10000000000.
- **cir**—Committed Information Rate.
- **rate**—Specifies the policer rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 26** admitt cac wmm-tspec | Configures call admission control for the policy map.  
**Note** This command only configures CAC for wireless QoS. |
| **Example:** | |
| Device(config-pmap-c)# **admit cac wmm-tspec**  
Device(config-pmap-admit-cac-wmm)# | |
| **Step 27** rate value | Configures the target bit rate (Kilo Bits per second). Enter a value from 8 to 10000000. |
| **Example:** | |
| Device(config-pmap-admit-cac-wmm)# **rate 5000** | |
| **Step 28** wlan-up value | Configures the WLAN UP value. Enter a value from 0 to 7. |
| **Example:** | |
| Device(config-pmap-admit-cac-wmm)# **wlan-up 4 5** | |
| **Step 29** exit | Returns to policy map configuration mode. |
| **Example:** | |
| Device(config-pmap-cac-wmm)# **exit**  
Device(config-pmap)# | |
| **Step 30** exit | Returns to global configuration mode. |
| **Example:** | |
| Device(config-pmap)# **exit**  
Device(config)# | |
| **Step 31** policy-map policy name | Enters policy map configuration mode.  
Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy. |
| **Example:** | |
| Device(config)# **policy-map ssid_cac**  
Device(config-pmap)# | |
| **Step 32** class class-map-name | Defines an interface-level traffic classification, and enters policy-map configuration mode.  
In this example, the class map is set to default. |
| **Example:** | |
| Device(config-pmap)# **class default** | |
### Quality of Service

#### Configuring Call Admission Control (CLI)

<td><code>service-policy</code> <code>policy_map_name</code>&lt;br&gt;&lt;br&gt;Example: &lt;br&gt;Device(config-pmap-c)# service-policy ssid_child_cac</td>
</tr>
<tr>
<td><strong>Step 38</strong></td>
<td><code>end</code>&lt;br&gt;&lt;br&gt;Example: &lt;br&gt;Device(config-pmap)# end Device#</td>
</tr>
</tbody>
</table>
### Configuring Bandwidth (CLI)

This procedure explains how to configure bandwidth on your network.

**Before you begin**

You should have created a class map for bandwidth before beginning this procedure.

**SUMMARY STEPS**

1. `configure terminal`
2. `policy-map policy name`
3. `class class name`
4. `bandwidth {Kb/s | percent percentage | remaining { ratio ratio }}`
5. `end`
6. `show policy-map`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device# <code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters policy map configuration mode. Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy.</td>
</tr>
<tr>
<td><code>policy-map policy name</code></td>
<td></td>
</tr>
</tbody>
</table>
| Example: | Device(config)# `policy-map policy_bandwidth01`
Device(config-pmap)# |

(Original document page contains additional content not relevant to the above summary.)

---

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the `service-policy` command.

For additional information about CAC, refer to the `System Management Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3650 Switches)`.
### Purpose

**Command or Action**

<table>
<thead>
<tr>
<th>Step 3</th>
<th>class class name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-pmap)# class class_bandwidth01</td>
</tr>
<tr>
<td></td>
<td>Device(config-pmap-c)#</td>
</tr>
</tbody>
</table>

Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following:

- **word**—Class map name.
- **class-default**—System default class matching any otherwise unclassified packets.

| Step 4 | bandwidth \(|Kb/s|\) percent percentage | remaining \{ ratio ratio \} |
|---|---|---|
| Example: | Device(config-pmap-c)# bandwidth 200000 |
| | Device(config-pmap-c)# |

Configures the bandwidth for the policy map. The parameters include:

- **Kb/s**—Configures a specific value in kilobits per second (from 20000 to 10000000).
- **percent**—Allocates minimum bandwidth to a particular class based on a percentage. The queue can oversubscribe bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided along all bandwidth queues.
- **remaining**—Allocates minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the priority command is used for certain queues in the policy. You can also assign ratios rather than percentages to each queue; the queues will be assigned certain weights which are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.

**Note**

You cannot mix bandwidth types on a policy map. For example, you cannot configure bandwidth in a single policy map using both a bandwidth percent and in kilobits per second.

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-pmap-c)# end</td>
</tr>
<tr>
<td></td>
<td>Device#</td>
</tr>
</tbody>
</table>

Saves configuration changes.

<table>
<thead>
<tr>
<th>Step 6</th>
<th>show policy-map</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>(Optional) Displays policy configuration information for all classes configured for all service policies.</td>
</tr>
</tbody>
</table>
What to do next

Configure any additional policy maps for QoS for your network. After creating the policy maps, attach the traffic policy or polices to an interface using the `service-policy` command.

</tr>
<tr>
<td>Device(config)# policy-map policy_police01</td>
<td></td>
</tr>
<tr>
<td>Device(config-pmap)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> class class name</td>
<td>Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config-pmap)# class class_police01</code></td>
<td>change. Command options for policy class map configuration mode include the following:</td>
</tr>
<tr>
<td></td>
<td>• <code>word</code>—Class map name.</td>
</tr>
<tr>
<td></td>
<td>• <code>class-default</code>—System default class matching any otherwise unclassified packets.</td>
</tr>
<tr>
<td><code>Device(config-pmap-c)#</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config-pmap-c)# police 8000 conform-action transmit exceed-action drop</code></td>
<td></td>
</tr>
<tr>
<td><code>Device(config-pmap-c)#</code></td>
<td></td>
</tr>
</tbody>
</table>

The following `police` subcommand options are available:

- `target_bit_rate`—Bits per second (from 8000 to 10000000000).
  - `burst bytes`—Enter a value from 1000 to 512000000.
  - `bc`—Conform burst.
- `pir`—Peak Information Rate.
- `cir`—Committed Information Rate.
  - `target_bit_rate`—Target bit rate (8000 to 10000000000).
  - `percent`—Percentage of interface bandwidth for CIR.
- `rate`—Specifies the police rate, PCR for hierarchical policies, or SCR for single-level ATM 4.0 policer policies.
  - `target_bit_rate`—Target Bit Rate (8000 to 10000000000).
  - `percent`—Percentage of interface bandwidth for rate.

The following `police conform-action transmit exceed-action` subcommand options are available:

- `drop`—Drops the packet.
- `set-cos-transmit`—Sets the CoS value and sends it.
- `set-dscp-transmit`—Sets the DSCP value and sends it.
- `set-prec-transmit`—Rewrites the packet precedence and sends it.
- `transmit`—Transmits the packet.
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Saves configuration changes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-pmap-c)# end</td>
<td></td>
</tr>
<tr>
<td>Device#</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 6** show policy-map | (Optional) Displays policy configuration information for all classes configured for all service policies. |
| **Example:**              |         |
| Device# show policy-map   |         |

**Note**  
Policer-based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the service-policy command.

### What to do next

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the `service-policy` command.

### Configuring Priority (CLI)

This procedure explains how to configure priority on your device. The device supports giving priority to specified queues. There are two priority levels available (1 and 2).

**Note**  
Queues supporting voice and video should be assigned a priority level of 1.

**Before you begin**

You should have created a class map for priority before beginning this procedure.
### SUMMARY STEPS

1. configure terminal
2. policy-map policy name
3. class class name
4. priority \([Kb/s \ [burst\_in\_bytes]] \ [level\_value \ [Kb/s \ [burst\_in\_bytes]] \ [percent\_percentage \ [burst\_in\_bytes]]] \ [percent\_percentage \ [burst\_in\_bytes]]\) end
5. show policy-map

<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>priority ([Kb/s \ [burst_in_bytes]] \ [level_value \ [Kb/s \ [burst_in_bytes]] \ [percent_percentage \ [burst_in_bytes]]] \ [percent_percentage \ [burst_in_bytes]])</td>
<td>(Optional) The priority command assigns a strict scheduling priority for the class. The command options include:</td>
</tr>
<tr>
<td>Device(config-pmap-c)# priority level 1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device(config-pmap-c)#</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Kb/s—Specifies the kilobits per second (from 1 to 2000000).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• burst_in_bytes—Specifies the burst in bytes (from 32 to 2000000).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• level level_value—Specifies the multilevel (1-2) priority queue.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Kb/s—Specifies the kilobits per second (from 1 to 2000000).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Command or Action** | **Purpose**  
--- | ---  
• burst_in_bytes—Specifies the burst in bytes (from 32 to 2000000).  
• percent—Percentage of the total bandwidth.  
  • burst_in_bytes—Specifies the burst in bytes (from 32 to 2000000).  
• percent—Percentage of the total bandwidth.  
  • burst_in_bytes—Specifies the burst in bytes (32 to 2000000).  
**Note** | Priority level 1 is more important than priority level 2. Priority level 1 reserves bandwidth that is processed first for QoS, so its latency is very low. Both priority level 1 and 2 reserve bandwidth.  
**Step 5** | end  
**Example:**  
Device(config-pmap-c)# end  
Device#  
**Step 6** | show policy-map  
**Example:**  
Device# show policy-map  
**What to do next**  
Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.  
**Related Topics**  
Priority Queues, on page 1323  

**Configuring Queues and Shaping**  

**Configuring Egress Queue Characteristics**  
Depending on the complexity of your network and your QoS solution, you may need to perform all of the procedures in this section. You need to make decisions about these characteristics:  
• Which packets are mapped by DSCP, CoS, or QoS group value to each queue and threshold ID?
• What drop percentage thresholds apply to the queues, and how much reserved and maximum memory is needed for the traffic type?
• How much of the fixed buffer space is allocated to the queues?
• Does the bandwidth of the port need to be rate limited?
• How often should the egress queues be serviced and which technique (shaped, shared, or both) should be used?

Note: You can only configure the egress queues on the device.

**Configuring Queue Buffers (CLI)**

The allows you to allocate buffers to queues. If there is no allocation made to buffers, then they are divided equally for all queues. You can use the queue-buffer ratio to divide it in a particular ratio. Since by default DTS (Dynamic Threshold and Scaling) is active on all queues, these are soft buffers.

**Before you begin**

The following are prerequisites for this procedure:

• You should have created a class map for the queue buffer before beginning this procedure.

• You must have configured either bandwidth, shape, or priority on the policy map prior to configuring the queue buffers.

**SUMMARY STEPS**

1. configure terminal
2. policy-map policy name
3. class class name
4. bandwidth {Kb/s | percent percentage | remaining { ratio ratio value }}
5. queue-buffers {ratio ratio value}
6. end
7. show policy-map

<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

Device(config)# policy-map policy_queuebuffer01  
Device(config-pmap)#

- **Create or modifies a policy map that can be attached to one or more interfaces to specify a service policy.**

### Step 3

**class class name**

**Example:**

Device(config-pmap)# class class_queuebuffer01  
Device(config-pmap-c)#

- **Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Command options for policy class map configuration mode include the following:**
  - `word`—Class map name.
  - `class-default`—System default class matching any otherwise unclassified packets.

### Step 4

**bandwidth \{Kb/s | percent percentage | remaining \{ ratio ratio value \} \}

**Example:**

Device(config-pmap-c)# bandwidth percent 80  
Device(config-pmap-c)#

- **Configures the bandwidth for the policy map. The command parameters include:**
  - `Kb/s`—Use this command to configure a specific value. The range is 20000 to 10000000.
  - `percent`—Allocates a minimum bandwidth to a particular class using a percentage. The queue can oversubscribe bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided among all bandwidth queues.
  - `remaining`—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the `priority` command is used for certain queues in the policy. You can also assign ratios rather than a percentage to each queue; the queues will be assigned certain weights that are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.

**Note**

You cannot mix bandwidth types on a policy map.

### Step 5

**queue-buffers \{ratio ratio value\}

**Example:**

Device(config-pmap-c)# queue-buffers ratio 10  
Device(config-pmap-c)#

- **Configures the relative buffer size for the queue.**

**Note**

The sum of all configured buffers in a policy must be less than or equal to 100 percent. Unallocated buffers are are evenly distributed to all the remaining queues. Ensure sufficient buffers are allocated to all queues including the priority queues.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
</tbody>
</table>

**Step 6**

**end**

**Example:**

```
Device(config-pmap-c)# end
Device#
```

**Step 7**

**show policy-map**

**Example:**

```
Device# show policy-map
```

(Optional) Displays policy configuration information for all classes configured for all service policies.

---

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

**Related Topics**

- Queue Buffer Allocation, on page 1324
- Examples: Queue Buffers Configuration, on page 1398

**Configuring Queue Limits (CLI)**

You use queue limits to configure Weighted Tail Drop (WTD). WTD ensures the configuration of more than one threshold per queue. Each class of service is dropped at a different threshold value to provide for QoS differentiation. With the, each queue has 3 explicit programmable threshold classes—0, 1, 2. Therefore, the enqueue/drop decision of each packet per queue is determined by the packet’s threshold class assignment, which is determined by the DSCP, CoS, or QoS group field of the frame header.

WTD also uses a soft limit, and therefore you are allowed to configure the queue limit to up to 400 percent (maximum four times the reserved buffer from common pool). This soft limit prevents overrunning the common pool without impacting other features.

**Note**

You can only configure queue limits on the egress queues on wired ports.

**Before you begin**

The following are prerequisites for this procedure:

- You should have created a class map for the queue limits before beginning this procedure.
You must have configured either bandwidth, shape, or priority on the policy map prior to configuring the queue limits.

**SUMMARY STEPS**

1. configure terminal
2. policy-map policy name
3. class class name
4. bandwidth \{Kb/s | percent percentage | remaining \{ ratio ratio value \}\}
5. queue-limit \{packets packets | cos \{cos value \{ maximum threshold value | percent percentage \} | values \{cos value | percent percentage \} \}| dscp \{dscp value \{ maximum threshold value | percent percentage \} | default \{maximum threshold value | percent percentage \} | ef \{maximum threshold value | percent percentage \} | dscp values dscp value\} | percent percentage \}
6. end
7. show policy-map

**DETAILED STEPS**

### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Purpose</strong></td>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td>bandwidth in case other queues do not utilize the entire port bandwidth. The total sum cannot exceed 100 percent, and in case it is less than 100 percent, the rest of the bandwidth is equally divided along all bandwidth queues.</td>
<td><strong>remaining</strong>—Allocates a minimum bandwidth to a particular class. The queue can oversubscribe bandwidth in case other queues do not utilize entire port bandwidth. The total sum cannot exceed 100 percent. It is preferred to use this command when the <strong>priority</strong> command is used for certain queues in the policy. You can also assign ratios rather than a percentage to each queue; the queues will be assigned certain weights that are inline with these ratios. Ratios can range from 0 to 100. Total bandwidth ratio allocation for the policy in this case can exceed 100.</td>
</tr>
</tbody>
</table>

**Note**
You cannot mix bandwidth types on a policy map.

### Step 5

**queue-limit** `{packets packets | cos {cos value {maximum threshold value | percent percentage}} | values {cos value | percent percentage} | dscp {dscp value {maximum threshold value | percent percentage} | match packet {maximum threshold value | percent percentage} | default {maximum threshold value | percent percentage} | ef {maximum threshold value | percent percentage} | dscp values dscp value | percent percentage}}`  

**Example:**  
Device(config-pmap-c)# queue-limit dscp 3 percent 20  
Device(config-pmap-c)# queue-limit dscp 4 percent 30  
Device(config-pmap-c)# queue-limit dscp 5 percent 40  

Sets the queue limit threshold percentage values.  
With every queue, there are three thresholds (0,1,2), and there are default values for each of these thresholds. Use this command to change the default or any other queue limit threshold setting. For example, if DSCP 3, 4, and 5 packets are being sent into a specific queue in a configuration, then you can use this command to set the threshold percentages for these three DSCP values. For additional information about queue limit threshold values, see Weighted Tail Drop, on page 1322.  

**Note**  
The does not support absolute queue-limit percentages. The only supports DSCP or CoS queue-limit percentages.

### Step 6

**end**  

**Example:**  
Device(config-pmap-c)# end  
Device#  

Saves configuration changes.

### Step 7

**show policy-map**  

**Example:**  
Device# show policy-map  

(Optional) Displays policy configuration information for all classes configured for all service policies.
What to do next

Proceed to configure any additional policy maps for QoS for your network. After creating your policy maps, proceed to attach the traffic policy or polices to an interface using the `service-policy` command.

Configuring Shaping (CLI)

You use the `shape` command to configure shaping (maximum bandwidth) for a particular class. The queue's bandwidth is restricted to this value even though the port has additional bandwidth left. You can configure shaping as an average percent, as well as a shape average value in bits per second.

Before you begin

You should have created a class map for shaping before beginning this procedure.

SUMMARY STEPS

1. configure terminal
2. policy-map policy name
3. class class name
4. shape average {target bit rate | percent percentage}
5. end
6. show policy-map

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>policy-map policy name</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# policy-map policy_shaping01</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>class class name</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-pmap)# class class_shaping01</td>
</tr>
</tbody>
</table>

Command options for policy class map configuration mode include the following:

- `word`—Class map name.
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>* class-default—System default class matching any otherwise unclassified packets.</td>
<td></td>
</tr>
</tbody>
</table>

#### Step 4

**shape average** *(target bit rate | percent percentage)*

**Example:**

Device(config-pmap-c)# shape average percent 50

Device(config-pmap-c)#

Configures the average shape rate. You can configure the average shape rate by target bit rates (bits per second) or by percentage of interface bandwidth for the Committed Information Rate (CIR).

**Note** For the egress class-default SSID policy, you must configure the queue buffer ratio as 0 after you configure the average shape rate.

#### Step 5

**end**

**Example:**

Device(config-pmap-c)# end

Device#

Saves configuration changes.

#### Step 6

**show policy-map**

**Example:**

Device# show policy-map

(Optional) Displays policy configuration information for all classes configured for all service policies.

---

**What to do next**

Configure any additional policy maps for QoS for your network. After creating your policy maps, attach the traffic policy or polices to an interface using the `service-policy` command.

### Command

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>show policy-map interface { Auto-template</td>
</tr>
</tbody>
</table>

### Description
Displays the runtime representation and statistics of all the policies configured on the. Command parameters include:

- **Auto-template**—Auto-Template interface
- **Capwap**—CAPWAP tunnel interface
- **GigabitEthernet**—Gigabit Ethernet IEEE.802.3z
- **GroupVI**—Group virtual interface
- **InternalInterface**—Internal interface
- **Loopback**—Loopback interface
- **Null**—Null interface
- **Lspvif**—LSP virtual interface
- **Port-channel**—Ethernet channel of interfaces
- **TenGigabitEthernet**—10-Gigabit Ethernet
- **Tunnel**—Tunnel interface
- **Vlan**—Catalyst VLANs
- **brief**—Brief description of policy maps
- **class**—Statistics for individual class
- **input**—Input policy
- **output**—Output policy
- **wireless**—wireless

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>show policy-map interface wireless ap [access point]</td>
</tr>
</tbody>
</table>

Displays the runtime representation and statistics for all the wireless APs on the.

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>show policy-map interface wireless ssid [ssid]</td>
</tr>
</tbody>
</table>

Displays the runtime representation and statistics for all the SSID targets on the.
**Command** | **Description**  
--- | ---  
`show policy-map interface wireless client mac [mac_address]` | Displays the runtime representation and statistics for all the client targets on the.  
`show policy-map session [ input | output | uid UUID ]` | Displays the session QoS policy. Command parameters include:  
  - `input`—Input policy  
  - `output`—Output policy  
  - `uid`—Policy based on SSS unique identification.  
`show policy-map type control subscriber { all | name }` | Displays the type QoS policy-map.  
`show table-map` | Displays all the table maps and their configurations.  
`show platform qos wireless {afd { client | ssid } | stats { bssid bssid-value | client name | ssid {ssid-value | all} client all} }` | Displays wireless targets. The following command parameters are supported:  
  - `afd`—AFD information  
  - `stats`—Statistics information  
`show policy-map interface wireless ssid name ssid-name [radio type {24ghz | 5ghz} ap name ap-name | ap name ap-name]` | Displays SSID policy configuration on an access point.  
`show wireless client mac-address mac_address service-policy {input | output}` | Displays details of the client policy.  
`show wlan qos service-policies` | Displays the SSID policies configured on all WLANs.  
`show ap name ap_name service-policy` | Displays all the policies configured on the AP.  

**Configuration Examples for QoS**

**Examples: Classification by Access Control Lists**

This example shows how to classify packets for QoS by using access control lists (ACLs):

```
Device# configure terminal
Device(config)# access-list 101 permit ip host 12.4.1.1 host 15.2.1.1
Device(config)# class-map acl-101
Device(config-cmap)# description match on access-list 101
```
After creating a class map by using an ACL, you then create a policy map for the class, and apply the policy map to an interface for QoS.

Related Topics
- Creating a Traffic Class (CLI), on page 1337
- Class Maps, on page 1312

Examples: Class of Service Layer 2 Classification

This example shows how to classify packets for QoS using a class of service Layer 2 classification:

```
Device(config-cmap)# match access-group 101
Device(config-cmap)#
```

After creating a class map by using a CoS Layer 2 classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

Examples: Class of Service DSCP Classification

This example shows how to classify packets for QoS using a class of service DSCP classification:

```
Device(config-cmap)# class-map cos
Device(config-cmap)# match cos ?
  <0-7> Enter up to 4 class-of-service values separated by white-spaces
Device(config-cmap)# match cos 3 4 5
Device(config-cmap)#
```

After creating a class map by using a DSCP classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.

Examples: VLAN ID Layer 2 Classification

This example shows how to classify for QoS using a VLAN ID Layer 2 classification:

```
Device(config-cmap)# class-map vlan-120
Device(config-cmap)# match vlan ?
  <1-4095> VLAN id
Device(config-cmap)# match vlan 120
Device(config-cmap)#
```

After creating a class map by using a VLAN Layer 2 classification, you then create a policy map for the class, and apply the policy map to an interface for QoS.
Examples: Classification by DSCP or Precedence Values

This example shows how to classify packets by using DSCP or precedence values:

```
Device# configure terminal
Device(config)# class-map prec2
Device(config-cmap)# description matching precedence 2 packets
Device(config-cmap)# match ip precedence 2
Device(config-cmap)# exit
Device(config)# class-map ef
Device(config-cmap)# description EF traffic
Device(config-cmap)# match ip dscp ef
Device(config-cmap)#
```

After creating a class map by using a DSCP or precedence values, you then create a policy map for the class, and apply the policy map to an interface for QoS.

Examples: Hierarchical Classification

The following is an example of a hierarchical classification, where a class named parent is created, which matches another class named child. The class named child matches based on the IP precedence being set to 2.

```
Device# configure terminal
Device(config)# class-map child
Device(config-cmap)# match ip precedence 2
Device(config-cmap)# exit
Device(config)# class-map parent
Device(config-cmap)# class-map child
Device(config-cmap)#
```

After creating the parent class map, you then create a policy map for the class, and apply the policy map to an interface for QoS.

Hierarchical QoS, on page 1304

Examples: Hierarchical Policy Configuration

The following is an example of a configuration using hierarchical polices:

```
Device# configure terminal
Device(config)# class-map c1
Device(config-cmap)# match dscp 30
Device(config-cmap)# exit
Device(config)# class-map c2
Device(config-cmap)# match precedence 4
Device(config-cmap)# exit
Device(config)# class-map c3
Device(config-cmap)# exit
Device(config)# policy-map child
```
Device(config-pmap)# class c1
Device(config-pmap-c)# priority level 1
Device(config-pmap-c)# police rate percent 20 conform-action transmit exceed action drop
Device(config-pmap-c)# exit
Device(config-pmap-c)# exit
Device(config-pmap-c)# class c2
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
Device(config-pmap-c)# class class-default
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
Device(config-pmap-c)# exit
Device(config-pmap-c)# policy-map parent
Device(config-pmap-c)# class class-default
Device(config-pmap-c)# shape average 1000000
Device(config-pmap-c)# service-policy child
Device(config-pmap-c)# end

The following example shows a hierarchical policy using table maps:

Device(config)# table-map dscp2dscp
Device(config-tablemap)# default copy
Device(config)# table-map dscp2up
Device(config-tablemap)# map from 46 to 6
Device(config-tablemap)# map from 34 to 5
Device(config-tablemap)# default copy
Device(config)# policy-map ssid_child_policy
Device(config-pmap)# class voice
Device(config-pmap-c)# priority level 1
Device(config-pmap-c)# police 15000000
Device(config-pmap-c)# class video
Device(config-pmap-c)# priority level 2
Device(config-pmap-c)# police 10000000
Device(config)# policy-map ssid_policy
Device(config-pmap-c)# class class-default
Device(config-pmap-c)# shape average 30000000
Device(config-pmap-c)# queue-buffer ratio 0
Device(config-pmap-c)# set dscp dscp table dscp2dscp
Device(config-pmap-c)# service-policy ssid_child_policy

Related Topics
Hierarchical QoS, on page 1304

Examples: Classification for Voice and Video

This example describes how to classify packet streams for voice and video using device specific information.

In this example, voice and video are coming in from end-point A into GigabitEthernet1/0/1 on the device and have precedence values of 5 and 6, respectively. Additionally, voice and video are also coming from end-point B into GigabitEthernet1/0/2 on the device with DSCP values of EF and AF11, respectively.

Assume that all the packets from the both the interfaces are sent on the uplink interface, and there is a requirement to police voice to 100 Mbps and video to 150 Mbps.

To classify per the above requirements, a class to match voice packets coming in on GigabitEthernet1/0/1 is created, named voice-interface-1, which matches precedence 5. Similarly another class for voice is created, named voice-interface-2, which will match voice packets in GigabitEthernet1/0/2. These classes are associated
to two separate policies named input-interface-1, which is attached to GigabitEthernet1/0/1, and input-interface-2, which is attached to GigabitEthernet1/0/2. The action for this class is to mark the qos-group to 10. To match packets with QoS-group 10 on the output interface, a class named voice is created which matches on QoS-group 10. This is then associated to another policy named output-interface, which is associated to the uplink interface. Video is handled in the same way, but matches on QoS-group 20.

The following example shows how classify using the above device specific information:

```
Device(config)#
Device(config)# class-map voice-interface-1
Device(config-cmap)# match ip precedence 5
Device(config-cmap)# exit

Device(config)# class-map video-interface-1
Device(config-cmap)# match ip precedence 6
Device(config-cmap)# exit

Device(config)# class-map voice-interface-2
Device(config-cmap)# match ip dscp ef
Device(config-cmap)# exit

Device(config)# class-map video-interface-2
Device(config-cmap)# match ip dscp af11
Device(config-cmap)# exit

Device(config)# policy-map input-interface-1
Device(config-pmap)# class voice-interface-1
Device(config-pmap-c)# set qos-group 10
Device(config-pmap-c)# exit

Device(config-pmap)# class video-interface-1
Device(config-pmap-c)# set qos-group 20
Device(config-pmap-c)# exit

Device(config-pmap)# class-map voice
Device(config-cmap)# match qos-group 10
Device(config-cmap)# exit

Device(config-pmap)# class-map video
Device(config-cmap)# match qos-group 20
Device(config-cmap)# exit

Device(config)# policy-map output-interface
Device(config-pmap)# class voice
Device(config-pmap-c)# police 256000 conform-action transmit exceed-action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)# exit

Device(config-pmap)# class video
Device(config-pmap-c)# police 1024000 conform-action transmit exceed-action drop
Device(config-pmap-c-police)# exit
Device(config-pmap-c)# exit
```
Examples: Wireless QoS Policy Classified by Voice, Video, and Multicast Traffic

The following example provides a template for creating a port child policy for managing quality of service for voice and video traffic.

```
Policy-map port_child_policy
  Class voice (match dscp ef)
    Priority level 1
    Police Multicast Policer
  Class video (match dscp af41)
    Priority level 2
    Police Multicast Policer
  Class mcast-data (match non-client-nrt)
    Bandwidth remaining ratio <>
  Class class-default (NRT Data)
    Bandwidth remaining ratio <>
```

Note

Multicast Policer in the example above is not a keyword. It refers to the policing policy configured.

Two class maps with name voice and video are configured with DSCP assignments of 46 and 34. The voice traffic is assigned the priority of 1 and the video traffic is assigned the priority level 2 and is processed using Q0 and Q1. If your network receives multicast voice and video traffic, you can configure multicast policers. The non-client NRT data and NRT data are processed using the Q2 and Q3 queues.

### Examples: Average Rate Shaping Configuration

The following example shows how to configure average rate shaping:

```
Device# configure terminal  
Device(config)# class-map prerec
```
After configuring the class maps, policy map, and shape averages for your configuration, proceed to then apply the policy map to the interface for QoS.

Related Topics

Examples: Queue-limit Configuration

The following example shows how to configure a queue-limit policy based upon DSCP values and percentages:

Device# configure terminal
Device(config)# policy-map port-queue
Device(config-pmap)# class dscp-1-2-3
Device(config-pmap-c)# bandwidth percent 20
Device(config-pmap-c)# queue-limit dscp 1 percent 80
Device(config-pmap-c)# queue-limit dscp 2 percent 90
Device(config-pmap-c)# queue-limit dscp 3 percent 100
Device(config-pmap-c)# exit

Device(config-pmap)# class dscp-4-5-6
Device(config-pmap-c)# bandwidth percent 20
Device(config-pmap-c)# queue-limit dscp 4 percent 20
Device(config-pmap-c)# queue-limit dscp 5 percent 30
Device(config-pmap-c)# queue-limit dscp 6 percent 20
Device(config-pmap-c)# exit

Device(config-pmap)# class dscp-7-8-9
Device(config-pmap-c)# bandwidth percent 20
Device(config-pmap-c)# queue-limit dscp 7 percent 20
Device(config-pmap-c)# queue-limit dscp 8 percent 30
Device(config-pmap-c)# queue-limit dscp 9 percent 20
Device(config-pmap-c)# exit

Device(config-pmap)# class dscp-10-11-12
Device(config-pmap-c)# bandwidth percent 20
After finishing with the above policy map queue-limit configuration, you can then proceed to apply the policy map to an interface for QoS.

### Examples: Queue Buffers Configuration

The following example shows how configure a queue buffer policy and then apply it to an interface for QoS:

```plaintext
Device# configure terminal
Device(config)# policy-map policy1001
Device(config-pmap)# class class1001
Device(config-pmap-c)# bandwidth remaining ratio 10
Device(config-pmap-c)# queue-buffer ratio ?
<0-100> Queue-buffers ratio limit
Device(config-pmap-c)# queue-buffer ratio 20
Device(config-pmap-c)# end

Device# configure terminal
Device(config)# interface gigabitEthernet2/0/3
Device(config-if)# service-policy output policy1001
Device(config-if)# end
```

**Related Topics**

### Examples: Policing Action Configuration

The following example displays the various policing actions that can be associated to the policer. These actions are accomplished using the conforming, exceeding, or violating packet configurations. You have the flexibility to drop, mark and transmit, or transmit packets that have exceeded or violated a traffic profile.

For example, a common deployment scenario is one where the enterprise customer polices traffic exiting the network towards the service provider and marks the conforming, exceeding and violating packets with different DSCP values. The service provider could then choose to drop the packets marked with the exceeded and violated DSCP values under cases of congestion, but may choose to transmit them when bandwidth is available.
The Layer 2 fields can be marked to include the CoS fields, and the Layer 3 fields can be marked to include the precedence and the DSCP fields.

One useful feature is the ability to associate multiple actions with an event. For example, you could set the precedence bit and the CoS for all conforming packets. A submode for an action configuration could then be provided by the policing feature.

This is an example of a policing action configuration:

```
Device# configure terminal
Device(config)# policy-map police
Device(config-pmap)# class class-default
Device(config-pmap-c)# police cir 1000000 pir 2000000
Device(config-pmap-c-policy)# conform-action transmit
Device(config-pmap-c-police)# exceed-action set-dscp-transmit dscp table exceed-markdown-table
Device(config-pmap-c-police)# violate-action set-dscp-transmit dscp table violate-markdown-table
Device(config-pmap-c-police)# end
```

In this example, the exceed-markdown-table and violate-mark-down-table are table maps.

Note

Policer-based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the device.

Examples: Policer VLAN Configuration

The following example displays a VLAN policer configuration. At the end of this configuration, the VLAN policy map is applied to an interface for QoS.

```
Device# configure terminal
Device(config)# class-map vlan100
Device(config-cmap)# match vlan 100
Device(config-cmap)# exit
Device(config)# policy-map vlan100
Device(config-pmap)# policy-map class vlan100
Device(config-pmap-c)# police 1000000 bc conform-action transmit exceed-action drop
Device(config-pmap-c-police)# end
Device# configure terminal
Device(config)# interface gigabitEthernet1/0/5
Device(config-if)# service-policy input vlan100
```

Examples: Policing Units

The policing unit is the basis on which the token bucket works. CIR and PIR are specified in bits per second. The burst parameters are specified in bytes. This is the default mode; it is the unit that is assumed when no units are specified. The CIR and PIR can also be configured in percent, in which case the burst parameters have to be configured in milliseconds.

The following is an example of a policer configuration in bits per second. In this configuration, a dual-rate three-color policer is configured where the units of measurement is bits. The burst and peak burst are all specified in bits.

```
Device(config)# policy-map bps-policer
Device(config-pmap)# class class-default
Device(config-pmap-c)# police rate 100000 peak-rate 1000000
conform-action transmit exceed-action set-dscp-transmit
dscp table DSCP_EXCE violate-action drop
```

Examples: Single-Rate Two-Color Policing Configuration

The following example shows how to configure a single-rate two-color policer:

```
Device(config)# class-map match-any prec1
Device(config-cmap)# match ip precedence 1
Device(config-cmap)# exit
Device(config)# policy-map policer
Device(config-pmap)# class prec1
Device(config-pmap-c)# police cir 256000 conform-action transmit exceed-action drop
Device(config-pmap-c)# exit
Device(config-pmap-c)#
```

Related Topics
- Configuring Police (CLI), on page 1372
- Single-Rate Two-Color Policing, on page 1318

Examples: Dual-Rate Three-Color Policing Configuration

The following example shows how to configure a dual-rate three-color policer:

```
Device# configure terminal
Device(config)# policy-Map dual-rate-3color-policer
Device(config-pmap)# class class-default
Device(config-pmap-c)# police cir 64000 bc 2000 pir 128000 be 2000
Device(config-pmap-c-policer)# conform-action transmit
Device(config-pmap-c-policer)# exceed-action set-dscp-transmit dscp table exceed-markdown-table
Device(config-pmap-c-policer)# violate-action set-dscp-transmit dscp table violate-markdown-table
Device(config-pmap-c-policer)# exit
Device(config-pmap-c)#
```

In this example, the exceed-markdown-table and violate-markdown-table are table maps.
Policer based markdown actions are only supported using table maps. Only one markdown table map is allowed for each marking field in the device.

**Examples: Table Map Marking Configuration**

The following steps and examples show how to use table map marking for your QoS configuration:

1. Define the table map.

   Define the table-map using the `table-map` command and indicate the mapping of the values. This table does not know of the policies or classes within which it will be used. The default command in the table map indicates the value to be copied into the ‘to’ field when there is no matching ‘from’ field. In the example, a table map named table-map1 is created. The mapping defined is to convert the value from 0 to 1 and from 2 to 3, while setting the default value to 4.

   ```
   Device(config)# table-map table-map1
   Device(config-tablemap)# map from 0 to 1
   Device(config-tablemap)# map from 2 to 3
   Device(config-tablemap)# default 4
   Device(config-tablemap)# exit
   ```

2. Define the policy map where the table map will be used.

   In the example, the incoming CoS is mapped to the DSCP based on the mapping specified in the table table-map1. For this example, if the incoming packet has a DSCP of 0, the CoS in the packet is set 1. If no table map name is specified the command assumes a default behavior where the value is copied as is from the ‘from’ field (DSCP in this case) to the ‘to’ field (CoS in this case). Note however, that while the CoS is a 3-bit field, the DSCP is a 6-bit field, which implies that the CoS is copied to the first three bits in the DSCP.

   ```
   Device(config)# policy map policy1
   Device(config-pmap)# class class-default
   Device(config-pmap-c)# set cos dscp table table-map1
   Device(config-pmap-c)# exit
   ```

3. Associate the policy to an interface.

   ```
   Device(config)# interface GigabitEthernet1/0/1
   Device(config-if)# service-policy output policy1
   Device(config-if)# exit
   ```

Example: Table Map Configuration to Retain CoS Markings

The following example shows how to use table maps to retain CoS markings on an interface for your QoS configuration.

The cos-trust-policy policy (configured in the example) is enabled in the ingress direction to retain the CoS marking coming into the interface. If the policy is not enabled, only the DSCP is trusted by default. If a pure Layer 2 packet arrives at the interface, then the CoS value will be rewritten to 0 when there is no such policy in the ingress port for CoS.

Device# configure terminal
Device(config)# table-map cos2cos
Device(config-tablemap)# default copy
Device(config-tablemap)# exit

Device(config)# policy map cos-trust-policy
Device(config-pmap)# class class-default
Device(config-pmap-c)# set cos cos table cos2cos
Device(config-pmap-c)# exit

Device(config)# interface GigabitEthernet1/0/2
Device(config-if)# service-policy input cos-trust-policy
Device(config-if)# exit

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Radio Resource Management

The device should be configured as a mobility controller and not a mobility anchor to configure Radio Resource Management. It may require dynamic channel assignment functionality for the home APs to be supported.

The new mobility architecture that involves mobility controller and mobility agent must be configured on the switch or controllers for RRM to work.

Refer Mobility Configuration Guide for configuring mobility controller and mobility agent.
Restrictions for Radio Resource Management

If an AP tries to join the RF-group that already holds the maximum number of APs it can support, the device rejects the application and throws an error.

To enable Airtime Fairness mode for APs, you should disable enforce-policy mode and reapply it again. This will change the airtime fairness configuration for all the APs. You can also use the `ap name <ap-name> dot11 24ghz airtime-fairness mode enforce-policy` command to change airtime fairness mode for individual APs.

Information About Radio Resource Management

The Radio Resource Management (RRM) software that is embedded in the device acts as a built-in Radio Frequency (RF) engine to consistently provide real-time RF management of your wireless network. RRM enables devices to continually monitor their associated lightweight access points for the following information:

- Traffic load—The total bandwidth used for transmitting and receiving traffic. It enables wireless LAN managers to track and plan network growth ahead of client demand.
- Interference—The amount of traffic coming from other 802.11 sources.
- Noise—The amount of non-802.11 traffic that is interfering with the currently assigned channel.
- Coverage—The Received Signal Strength (RSSI) and signal-to-noise ratio (SNR) for all connected clients.
- Other — The number of nearby access points.

RRM performs these functions:

- Radio resource monitoring
- Power control transmission
- Dynamic channel assignment
- Coverage hole detection and correction
- RF grouping

Note

RRM grouping does not occur when an AP operates in a static channel that is not in the DCA channel list. The Neighbor Discovery Protocol (NDP) is sent only on DCA channels; therefore, when a radio operates on a non-DCA channel, it does not receive NDP on the channel.

Radio Resource Monitoring

RRM automatically detects and configures new devices and lightweight access points as they are added to the network. It then automatically adjusts the associated and nearby lightweight access points to optimize coverage and capacity.
Lightweight access points can scan all the valid channels for the country of operation as well as for channels available in other locations. The access points in local mode go offchannel for a period not greater than 60 ms to monitor these channels for noise and interference. Packets collected during this time are analyzed to detect rogue access points, rogue clients, ad-hoc clients, and interfering access points.

Note

In the presence of voice traffic or other critical traffic (in the last 100 ms), access points can defer off-channel measurements. The access points also defer off-channel measurements based on the WLAN scan priority configurations.

Each access point spends only 0.2 percent of its time off channel. This activity is distributed across all the access points so that adjacent access points are not scanning at the same time, which could adversely affect wireless LAN performance.

RRM supports new mobility architecture for RF grouping that involves Mobility Controller (MC) and Mobility Agent (MA).

- **Mobility Controller (MC)**—The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.
- **Mobility Agent (MA)**—The Mobility Agent is the component that maintains client mobility state machine for a mobile client.

### Information About RF Groups

An RF group is a logical collection of controllers that coordinate to perform RRM in a globally optimized manner to perform network calculations on a per-radio basis. An RF group exists for each 802.11 network type. Clustering Cisco Catalyst 9800 Series Wireless Controller into a single RF group enables the RRM algorithms to scale beyond the capabilities of a single Cisco Catalyst 9800 Series Wireless Controller.

An RF group is created based on the following parameters:

- User-configured RF network name.
- Neighbor discovery performed at the radio level.
- Country list configured on MC.

RF grouping runs between MCs.

Lightweight access points periodically send out neighbor messages over the air. Access points using the same RF group name validate messages from each other.

When access points on different controllers hear validated neighbor messages at a signal strength of –80 dBm or stronger, the controllers dynamically form an RF neighborhood in auto mode. In static mode, the leader is manually selected and the members are added to the RF Group.

Note

RF groups and mobility groups are similar, in that, they both define clusters of controllers, but they are different in terms of their use. An RF group facilitates scalable, system-wide dynamic RF management, while a mobility group facilitates scalable, system-wide mobility and controller redundancy.
RF Group Leader

Starting in the 7.0.116.0 release, the RF Group Leader can be configured in two ways as follows:

- **Auto Mode**—In this mode, the members of an RF group elect an RF group leader to maintain a *master* power and channel scheme for the group. The RF grouping algorithm dynamically chooses the RF group leader and ensures that an RF group leader is always present. Group leader assignments can and do change (for instance, if the current RF group leader becomes inoperable or RF group members experience major changes).

- **Static Mode**—In this mode, a user selects a controller as an RF group leader manually. In this mode, the leader and the members are manually configured and fixed. If the members are unable to join the RF group, the reason is indicated. The leader tries to establish a connection with a member every minute if the member has not joined in the previous attempt.

The RF group leader analyzes real-time radio data collected by the system, calculates the power and channel assignments, and sends them to each of the controllers in the RF group. The RRM algorithms ensure system-wide stability, and restrain channel and power scheme changes to the appropriate local RF neighborhoods.

In Cisco WLC software releases prior to 6.0, the dynamic channel assignment (DCA) search algorithm attempts to find a good channel plan for the radios associated to Cisco WLCs in the RF group, but it does not adopt a new channel plan unless it is considerably better than the current plan. The channel metric of the worst radio in both plans determines which plan is adopted. Using the worst-performing radio as the single criterion for adopting a new channel plan can result in pinning or cascading problems.

Pinning occurs when the algorithm could find a better channel plan for some of the radios in an RF group, but is prevented from pursuing such a channel plan change because the worst radio in the network does not have any better channel options. The worst radio in the RF group could potentially prevent other radios in the group from seeking better channel plans. The larger the network, the more likely pinning becomes.

Cascading occurs when one radio’s channel change results in successive channel changes to optimize the remaining radios in the RF neighborhood. Optimizing these radios could lead to their neighbors and their neighbors’ neighbors having a suboptimal channel plan and triggering their channel optimization. This effect could propagate across multiple floors or even multiple buildings if all the access point radios belong to the same RF group. This change results in considerable client confusion and network instability.

The main cause of both pinning and cascading is the way in which the search for a new channel plan is performed and that any potential channel plan changes are controlled by the RF circumstances of a single radio. In Cisco WLC software release 6.0, the DCA algorithm has been redesigned to prevent both pinning and cascading. The following changes have been implemented:

- **Multiple local searches**—The DCA search algorithm performs multiple local searches initiated by different radios in the same DCA run rather than performing a single global search that is driven by a single radio. This change addresses both pinning and cascading, while maintaining the desired flexibility and adaptability of DCA and without jeopardizing stability.

- **Multiple Channel Plan Change Initiators (CPCIs)**—Previously, the single worst radio was the sole initiator of a channel plan change. Now each radio in an RF group is evaluated and prioritized as a potential initiator. Intelligent randomization of the resulting list ensures that every radio is eventually evaluated, which eliminates the potential for pinning.

- **Limiting the propagation of channel plan changes (Localization)**—For each CPCI radio, the DCA algorithm performs a local search for a better channel plan, but only the CPCI radio itself and its one-hop neighboring access points are actually allowed to change their current transmit channels. The impact of an access point triggering a channel plan change is felt only to within two RF hops from that access point,
and the actual channel plan changes are confined to within a one-hop RF neighborhood. Because this limitation applies across all CPC radios, cascading cannot occur.

- Non-RSSI-based cumulative cost metric—A cumulative cost metric measures how well an entire region, neighborhood, or network performs with respect to a given channel plan. The individual cost metrics of all the access points in that area are considered in order to provide an overall understanding of the channel plan’s quality. These metrics ensure that the improvement or deterioration of each single radio is factored into any channel plan change. The objective is to prevent channel plan changes in which a single radio improves, but at the expense of multiple other radios experiencing a considerable performance decline.

The RRM algorithms run at a specified updated interval, which is 600 seconds by default. Between update intervals, the RF group leader sends keepalive messages to each of the RF group members and collects real-time RF data.

---

**Note**

Several monitoring intervals are also available. See the Configuring RRM section for details.

---

## RF Group Name

A controller is configured in an RF group name, which is sent to all the access points joined to the controller and used by the access points as the shared secret for generating the hashed MIC in the neighbor messages. To create an RF group, you configure all of the controllers to be included in the group with the same RF group name.

If there is any possibility that an access point joined to a controller might hear RF transmissions from an access point on a different controller, you should configure the controller with the same RF group name. If RF transmissions between access points can be heard, then system-wide RRM is recommended to avoid 802.11 interference and contention as much as possible.

## Mobility Controller

An MC can either be a group leader or a group member. One of the MCs can act as a RF group leader based on RF grouping and RF group election with other MCs. The order of priority to elect the RF leader is based on the maximum number of APs the controller or switch can support. The highest priority being 1 and the least being 5.

1. WiSM 2 Controllers
2. Cisco WLC 5700 Series Controllers
3. WiSM 1 Controllers
4. Catalyst 3850 Series Switches
5. Catalyst 3650 Series Switches

When one of the MCs becomes the RRM group leader, the remaining MCs become RRM group members. RRM group members send their RF information to the Group Leader. The group leader determines a channel and Tx power plan for the network and passes the information back to the RF group members. The MCs push the power plan to MA for the radios that belong to MA. These channel and power plans are ultimately pushed down to individual radios.
Mobility Agent

The MA communicates with the MC. The MC includes MAC or IP address of the switch/controller while communicating with the MA.

The MA provides the following information when polled by the MC:
- Interference or noise data.
- Neighbor data.
- Radio capabilities (supported channels, power levels).
- Radio configuration (power, channel, channel width).
- Radar data.

The MC exchanges the following information with the switch/controller (MA). The message includes:
- Configurations (channel/power/channel width) for individual radios.
- Polling requests for current configurations and RF measurements for individual radios
- Group Leader Update

In turn, the MA communicates the following messages with the MC:
- RF measurements from radios (e.g. load, noise and neighbor information)
- RF capabilities and configurations of individual radios

The MA sets channel, power, and channel width on the radios when directed by the MC. The DFS, coverage hole detection/mitigation, static channel/power configurations are performed by the MA.

Rogue Access Point Detection in RF Groups

After you have created an RF group of controller, you need to configure the access points connected to the controller to detect rogue access points. The access points will then select the beacon or probe-response frames in neighboring access point messages to see if they contain an authentication information element (IE) that matches that of the RF group. If the selection is successful, the frames are authenticated. Otherwise, the authorized access point reports the neighboring access point as a rogue, records its BSSID in a rogue table, and sends the table to the controller.

Transmit Power Control

The device dynamically controls access point transmit power based on the real-time wireless LAN conditions.

The Transmit Power Control (TPC) algorithm increases and decreases an access point’s power in response to changes in the RF environment. In most instances, TPC seeks to lower an access point’s power to reduce interference, but in the case of a sudden change in the RF coverage, for example, if an access point fails or becomes disabled, TPC can also increase power on the surrounding access points. This feature is different...
from coverage hole detection, which is primarily concerned with clients. TPC provides enough RF power to achieve the required coverage levels while avoiding channel interference between access points.

**Overriding the TPC Algorithm with Minimum and Maximum Transmit Power Settings**

The TPC algorithm balances RF power in many diverse RF environments. However, it is possible that automatic power control will not be able to resolve some scenarios in which an adequate RF design was not possible to implement due to architectural restrictions or site restrictions, for example, when all the access points must be mounted in a central hallway, placing the access points close together, but requiring coverage to the edge of the building.

In these scenarios, you can configure maximum and minimum transmit power limits to override TPC recommendations. The maximum and minimum TPC power settings apply to all the access points through RF profiles in a RF network.

To set the Maximum Power Level Assignment and Minimum Power Level Assignment, enter the maximum and minimum transmit power used by RRM in the fields in the **Tx Power Control** window. The range for these parameters is -10 to 30 dBm. The minimum value cannot be greater than the maximum value; the maximum value cannot be less than the minimum value.

If you configure a maximum transmit power, RRM does not allow any access point attached to the device to exceed this transmit power level (whether the power is set by RRM TPC or by coverage hole detection). For example, if you configure a maximum transmit power of 11 dBm, no access point will transmit above 11 dBm, unless the access point is configured manually.

**Dynamic Channel Assignment**

Two adjacent access points on the same channel can cause either signal contention or signal collision. In a collision, data is not received by the access point. This functionality can become a problem, for example, when someone reading an e-mail in a café affects the performance of the access point in a neighboring business. Even though these are separate networks, someone sending traffic to the café on channel 1 can disrupt communication in an enterprise using the same channel. Devices can dynamically allocate access point channel assignments to avoid conflict and increase capacity and performance. Channels are *reused* to avoid wasting scarce RF resources. In other words, channel 1 is allocated to a different access point far from the café, which is more effective than not using channel 1 altogether.

The device’s Dynamic Channel Assignment (DCA) capabilities are also useful in minimizing adjacent channel interference between access points. For example, two overlapping channels in the 802.11b/g band, such as 1 and 2, cannot simultaneously use 11 or 54 Mbps. By effectively reassigning channels, the device keeps adjacent channels that are separated.

---

**Note**

We recommend that you use only nonoverlapping channels (1, 6, 11, and so on).

---

**Note**

Channel change does not require you to shut down the radio.
The device examines a variety of real-time RF characteristics to efficiently handle channel assignments as follows:

- **Access point received energy**—The received signal strength measured between each access point and its nearby neighboring access points. Channels are optimized for the highest network capacity.

- **Noise**—Noise can limit signal quality at the client and access point. An increase in noise reduces the effective cell size and degrades user experience. By optimizing channels to avoid noise sources, the device can optimize coverage while maintaining system capacity. If a channel is unusable due to excessive noise, that channel can be avoided.

- **802.11 interference**—Interference is any 802.11 traffic that is not a part of your wireless LAN, including rogue access points and neighboring wireless networks. Lightweight access points constantly scan all the channels looking for sources of interference. If the amount of 802.11 interference exceeds a predefined configurable threshold (the default is 10 percent), the access point sends an alert to the device. Using the RRM algorithms, the device may then dynamically rearrange channel assignments to increase system performance in the presence of the interference. Such an adjustment could result in adjacent lightweight access points being on the same channel, but this setup is preferable to having the access points remain on a channel that is unusable due to an interfering foreign access point.

  In addition, if other wireless networks are present, the device shifts the usage of channels to complement the other networks. For example, if one network is on channel 6, an adjacent wireless LAN is assigned to channel 1 or 11. This arrangement increases the capacity of the network by limiting the sharing of frequencies. If a channel has virtually no capacity remaining, the device may choose to avoid this channel. In huge deployments in which all nonoverlapping channels are occupied, the device does its best, but you must consider RF density when setting expectations.

- **Load and utilization**—When utilization monitoring is enabled, capacity calculations can consider that some access points are deployed in ways that carry more traffic than other access points, for example, a lobby versus an engineering area. The device can then assign channels to improve the access point that has performed the worst. The load is taken into account when changing the channel structure to minimize the impact on the clients that are currently in the wireless LAN. This metric keeps track of every access point’s transmitted and received packet counts to determine how busy the access points are. New clients avoid an overloaded access point and associate to a new access point. This *Load and utilization* parameter is disabled by default.

The device combines this RF characteristic information with RRM algorithms to make system-wide decisions. Conflicting demands are resolved using soft-decision metrics that guarantee the best choice for minimizing network interference. The end result is optimal channel configuration in a three-dimensional space, where access points on the floor above and below play a major factor in an overall wireless LAN configuration.

---

**Note**

Radios using 40-MHz channels in the 2.4-GHz band or 80MHz channels are not supported by DCA.

The RRM startup mode is invoked in the following conditions:

- In a single-device environment, the RRM startup mode is invoked after the device is upgraded and rebooted.

- In a multiple-device environment, the RRM startup mode is invoked after an RF Group leader is elected.

You can trigger the RRM startup mode from the CLI.
The RRM startup mode runs for 100 minutes (10 iterations at 10-minute intervals). The duration of the RRM startup mode is independent of the DCA interval, sensitivity, and network size. The startup mode consists of 10 DCA runs with high sensitivity (making channel changes easy and sensitive to the environment) to converge to a steady-state channel plan. After the startup mode is finished, DCA continues to run at the specified interval and sensitivity.

DCA algorithm interval is set to 1 hour, but DCA algorithm always runs in default interval of 10 min, channel allocation occurs at 10-min intervals for the first 10 cycles, and channel changes occur as per the DCA algorithm every 10 min. After that the DCA algorithm goes back to the configured time interval. This is common for both DCA interval and anchor time because it follows the steady state.

Coverage Hole Detection and Correction

The RRM coverage hole detection algorithm can detect areas of radio coverage in a wireless LAN that are below the level needed for robust radio performance. This feature can alert you to the need for an additional (or relocated) lightweight access point.

If clients on a lightweight access point are detected at threshold levels (RSSI, failed client count, percentage of failed packets, and number of failed packets) lower than those specified in the RRM configuration, the access point sends a “coverage hole” alert to the device. The alert indicates the existence of an area where clients are continually experiencing poor signal coverage, without having a viable access point to which to roam. The device discriminates between coverage holes that can and cannot be corrected. For coverage holes that can be corrected, the device mitigates the coverage hole by increasing the transmit power level for that specific access point. The device does not mitigate coverage holes caused by clients that are unable to increase their transmit power or are statically set to a power level because increasing their downstream transmit power might increase interference in the network.

How to Configure RRM

Configuring Advanced RRM CCX Parameters (CLI)

### Configuring Neighbor Discovery Type (CLI)

#### Purpose
- **Command or Action**
- **Purpose**

**Step 1**
- `configure terminal`
- Example:
  - Device# `configure terminal`

**Step 2**
- `ap dot11 24ghz | 5ghz rrm ndp-type {protected | transparent}`
- Example:
  - Device(config)# `ap dot11 24ghz rrm ndp-type protected`
  - Device(config)# `ap dot11 24ghz rrm ndp-type transparent`

**Step 3**
- `end`
- Example:
  - Device(config)# `end`
Configuring RRM Profile Thresholds, Monitoring Channels, and Monitoring Intervals (GUI)

**Step 1**  Choose Configuration > Wireless > 802.11a/n/ac > RRM > General or Configuration > Wireless > 802.11b/g/n > RRM > General to open RRM General page.

**Step 2**  Configure profile thresholds used for alarming as follows:

Note  The profile thresholds have no bearing on the functionality of the RRM algorithms. Devices send an SNMP trap (or an alert) to the Cisco Prime Infrastructure or another trap receiver when individual APs values set for these threshold parameters are exceeded.

a)  In the Interference text box, enter the percentage of interference (802.11 traffic from sources outside of your wireless network) on a single access point. The valid range is 0 to 100%, and the default value is 10%.

b)  In the Clients text box, enter the number of clients on a single access point. The valid range is 1 to 75, and the default value is 12.

c)  In the Noise text box, enter the level of noise (non-802.11 traffic) on a single access point. The valid range is –127 to 0 dBm, and the default value is –70 dBm.

d)  In the Utilization text box, enter the percentage of RF bandwidth being used by a single access point. The valid range is 0 to 100%, and the default value is 80%.

e)  In the Throughput text box, enter the level of Throughput being used by a single access point. The valid range is 1000 to 1000000, and the default value is 1000000.

**Step 3**  From the Channel List drop-down list, choose one of the following options to specify the set of channels that the access point uses for RRM scanning:

- **All Channels**—RRM channel scanning occurs on all channels supported by the selected radio, which includes channels not allowed in the country of operation.

- **Country Channels**—RRM channel scanning occurs only on the data channels in the country of operation. This is the default value.

- **DCA Channels**—RRM channel scanning occurs only on the channel set used by the DCA algorithm, which by default includes all of the non-overlapping channels allowed in the country of operation. However, you can specify the channel set to be used by DCA if desired. To do so, follow instructions in the Dynamic Channel Assignment.

**Step 4**  Configure monitor intervals as follows:

1.  In the Channel Scan Interval text box, enter (in seconds) the sum of the time between scans for each channel within a radio band. The entire scanning process takes 50 ms per channel, per radio and runs at the interval configured here. The time spent listening on each channel is determined by the non-configurable 50-ms scan time and the number of channels to be scanned. For example, in the U.S. all 11 802.11b/g channels are scanned for 50 ms each within the default 180-second interval. So every 16 seconds, 50 ms is spent listening on each scanned channel (180/11 = ~16 seconds). The Channel Scan Interval parameter determines the interval at which the scanning occurs. The valid range is 60 to 3600 seconds, and the default value for 802.11a/n/ac and 802.11b/g/n radios is 180 seconds.

2.  In the Neighbor Packet Frequency text box, enter (in seconds) how frequently neighbor packets (messages) are sent, which eventually builds the neighbor list. The valid range is 60 to 3600 seconds, and the default value is 60 seconds.

Note  If the access point radio does not receive a neighbor packet from an existing neighbor within 60 minutes, the Cisco WLC deletes that neighbor from the neighbor list.
Step 5  Click **Apply**.

Step 6  Click **Save Configuration**.

**Note**  Click **Set to Factory Default** if you want to return all of the Cisco WLC’s RRM parameters to their factory-default values.

---

**Configuring RF Groups**

This section describes how to configure RF groups through either the GUI or the CLI.

**Note**  The RF group name is generally set at deployment time through the Startup Wizard. However, you can change it as necessary.

**Note**  When the multiple-country feature is being used, all controllers intended to join the same RF group must be configured with the same set of countries, configured in the same order.

**Note**  You can also configure RF groups using the Cisco Prime Infrastructure.

**Note**  In Auto mode, RF group leader will skip TPC and DCA for first three runs of grouping cycle in order to stabilize the RF-group.

---

**Configuring the RF Group Mode (GUI)**

**Step 1**  Choose **Configuration > Wireless > 802.11a/n/ac > RRM > RF Grouping** or **Configuration > Wireless > 802.11b/g/n > RRM > RF Grouping** to open the RF Grouping page.

**Step 2**  From the **Group Mode** drop-down list, choose the mode that you want to configure for this Cisco WLC.

You can configure RF grouping in the following modes:

- **auto**—Sets the RF group selection to automatic update mode.
  
  **Note**  A configured static leader cannot become a member of another RF group until its mode is set to “auto”.

- **leader**—Sets the RF group selection to static mode, and sets this Cisco WLC as the group leader.

- **off**—Sets the RF group selection off. Every Cisco WLC optimizes its own access point parameters.

  **Note**  A Cisco WLC with a lower priority cannot assume the role of a group leader if a Cisco WLC with a higher priority is available. Here, priority is related to the processing power of the Cisco WLC.
We recommend that Cisco WLCs participate in automatic RF grouping. You can override RRM settings without disabling automatic RF group participation.

Step 3 Click **Apply** to save the configuration and click **Restart** to restart the RRM RF Grouping algorithm.

Step 4 If you configured RF Grouping mode for this Cisco WLC as a static leader, you can add group members from the Group Members section as follows:

1. In the device Name text box, enter the Cisco WLC that you want to add as a member to this group.
2. In the IP Address text box, enter the IP address of the Cisco WLC.
3. Click **Add** to add the member to this group.

*Note* If the member has not joined the static leader, the reason of the failure is shown in parentheses.

Step 5 Click **Apply**.

Step 6 Click **Save Configuration**.

---

### Configuring RF Group Selection Mode (CLI)

Configuring the Tx-Power Level (CLI)

**SUMMARY STEPS**

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm txpower {trans_power_level | auto | max | min | once}`
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

configure terminal

Example:

Device(config)# configure terminal |

Enters global configuration mode. |

**Step 2**

ap dot11 24ghz | 5ghz rrm txpower {trans_power_level | auto | max | min | once}

Example:

Device(config)# ap dot11 24ghz rrm txpower auto |

Configures the 802.11 tx-power level

- `trans_power_level`—Sets the transmit power level.
- `auto`—Enables auto-RF.
- `max`—Configures the maximum auto-RF tx-power.
- `min`—Configures the minimum auto-RF tx-power.
- `once`—Enables one-time auto-RF. |

**Step 3**

dead

Example:

Device(config)# end |

Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |

Configuring Transmit Power Control (GUI)

**Step 1**

Choose Configuration > Wireless > 802.11a/n/ac > RRM > TPC or Configuration > Wireless > 802.11b > RRM > TPC to open RRM Tx Power Control (TPC) page. |

**Step 2**

Choose the Transmit Power Control.

Coverage Optimal Mode (TPCv1)—Offers strong signal coverage and stability. In this mode, power can be kept low to gain extra capacity and reduce interference. |

**Step 3**

Choose one of the following options from the Power Level Assignment Method list to specify the Cisco WLC’s dynamic power assignment mode:

- **Automatic**—Causes the Cisco WLC to periodically evaluate and, if necessary, update the transmit power for all joined access points. This is the default value.
• **On Demand**—Causes the Cisco WLC to periodically evaluate the transmit power for all joined access points. However, the Cisco WLC updates the power, if necessary, only when you click **Apply** after choosing **On Demand**.

  **Note** The Cisco WLC does not evaluate and update the transmit power immediately when you click **Apply** after choosing **On Demand**. It waits for the next 600-second interval. This value is not configurable.

• **Fixed**—Prevents the Cisco WLC from evaluating and, if necessary, updating the transmit power for joined access points. The power level is set to the fixed value chosen from the drop-down list. The corresponding option for **Fixed** when you try to configure from CLI is **once**.

  **Note** The transmit power level is assigned an integer value instead of a value in mW or dBm. The integer corresponds to a power level that varies depending on the regulatory domain, channel, and antennas in which the access points are deployed.

  **Note** For optimal performance, we recommend that you use the Automatic setting.

**Step 4**
Enter the maximum and minimum power level assignment values in the Maximum Power Level Assignment and Minimum Power Level Assignment text boxes.

The range for the Maximum Power Level Assignment is –10 to 30 dBm.

The range for the Minimum Power Level Assignment is –10 to 30 dBm.

**Step 5**
In the Power Threshold text box, enter the cutoff signal level used by RRM when determining whether to reduce an access point’s power. The default value for this parameter is –70 dBm for TPCv1, but can be changed when access points are transmitting at higher (or lower) than desired power levels.

The range for this parameter is –80 to –50 dBm. Increasing this value (between –65 and –50 dBm) causes the access points to operate at a higher transmit power. Decreasing the value has the opposite effect.

In applications with a dense population of access points, it may be useful to decrease the threshold to –80 or –75 dBm to reduce the number of BSSIDs (access points) and beacons seen by the wireless clients. Some wireless clients might have difficulty processing a large number of BSSIDs or a high beacon rate and might exhibit problematic behavior with the default threshold.

This page also shows the following nonconfigurable transmit power level parameter settings:

• **Power Neighbor Count**—The minimum number of neighbors an access point must have for the transmit power control algorithm to run.

• **Power Assignment Leader**—The MAC address of the RF group leader, which is responsible for power level assignment.

• **Last Power Level Assignment**—The last time RRM evaluated the current transmit power level assignments.

**Step 6**
Click **Apply**.

**Step 7**
Click **Save Configuration**.
Configuring 802.11 RRM Parameters

Configuring Advanced 802.11 Channel Assignment Parameters (CLI)

SUMMARY STEPS

1. configure terminal
2. ap dot11 {24ghz | 5ghz} rrm channel cleanair-event sensitivity {high | low | medium}
3. ap dot11 {24ghz | 5ghz} rrm channel dca {channel number | anchor-time | global {auto | once} | interval | min-metric | sensitivity {high | low | medium}}
4. ap dot11 5ghz rrm channel dca chan-width {20 | 40 | 80 | 160 | best maximum {20 | 40 | 80 | MAX}}
5. ap dot11 {24ghz | 5ghz} rrm channel device
6. ap dot11 {24ghz | 5ghz} rrm channel foreign
7. ap dot11 {24ghz | 5ghz} rrm channel load
8. ap dot11 {24ghz | 5ghz} rrm channel noise
9. end

</table>

**Return to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.**
Configuring Dynamic Channel Assignment (GUI)

You can specify the channels that the Dynamic Channel Assignment (DCA) algorithm considers when selecting the channels to be used for RRM scanning by using the Cisco WLC GUI.

Note This functionality is helpful when you know that the clients do not support certain channels because they are legacy devices or they have certain regulatory restrictions.

Step 1 Disable the 802.11a/n/ac or 802.11b/g/n network as follows:

a) Choose Configuration > Wireless > 802.11a/n/ac > Network or Configuration > Wireless > 802.11b/g/n > Network to open the Global Parameters page.

b) Unselect the 802.11a/n/ac (or 802.11b/g/n) Network Status check box.

c) Click Apply.

Step 2 Choose Configuration > Wireless > 802.11a/n/ac > RRM > DCA or Configuration > Wireless > 802.11b/g/n > RRM > DCA to open the Dynamic Channel Assignment (DCA) page.

Step 3 Choose one of the following options from the Channel Assignment Method drop-down list to specify the Cisco WLC’s DCA mode:

- **Automatic**—Causes the Cisco WLC to periodically evaluate and, if necessary, update the channel assignment for all joined access points. This is the default value.

- **Freeze**—Causes the Cisco WLC to evaluate and update the channel assignment for all joined access points, if necessary, only when you click Apply after selecting the Freeze option.

  Note The Cisco WLC does not evaluate and update the channel assignment immediately when you click Apply after selecting the Freeze option. It waits for the next interval to elapse.

- **OFF**—Turns off DCA and sets all access point radios to the first channel of the band. If you choose this option, you must manually assign channels on all radios.

  Note For optimal performance, we recommend that you use the Automatic setting.

Step 4 From the Interval drop-down list, choose one of the following options to specify how often the DCA algorithm is allowed to run: **10 minutes, 1 hour, 2 hours, 3 hours, 4 hours, 6 hours, 8 hours, 12 hours, or 24 hours**. The default value is 10 minutes.

Step 5 From the AnchorTime drop-down list, choose a number to specify the time of day when the DCA algorithm is to start. The options are numbers between 0 and 23 (inclusive) representing the hour of the day from 12:00 a.m. to 11:00 p.m.

Step 6 From the DCA Channel Sensitivity drop-down list, choose one of the following options to specify how sensitive the DCA algorithm is to environmental changes such as signal, load, noise, and interference when determining whether to change channels:

- **Low**—The DCA algorithm is not particularly sensitive to environmental changes.

- **Medium**—The DCA algorithm is moderately sensitive to environmental changes.

- **High**—The DCA algorithm is highly sensitive to environmental changes.

The default value is Medium. The DCA sensitivity thresholds vary by radio band, as noted in the following table:
Table 102: DCA Sensitivity Thresholds

<table>
<thead>
<tr>
<th>Option</th>
<th>2.4-GHz DCA Sensitivity Threshold</th>
<th>5-GHz DCA Sensitivity Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
<td>5 dB</td>
<td>5 dB</td>
</tr>
<tr>
<td>Medium</td>
<td>10 dB</td>
<td>15 dB</td>
</tr>
<tr>
<td>Low</td>
<td>20 dB</td>
<td>20 dB</td>
</tr>
</tbody>
</table>

Step 7
This page also shows the following nonconfigurable channel parameter settings:

- Channel Assignment Leader—The MAC address of the RF group leader, which is responsible for channel assignment.

Step 8
In the DCA Channel List area, the DCA Channels text box shows the channels that are currently selected. To choose a channel, select its check box in the Select column. To exclude a channel, unselect its check box.

The ranges are as follows:

- 802.11b/g—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 (depending on countries).

The defaults are as follows:

- 802.11a—36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 149, 153, 157, 161
- 802.11b/g—1, 6, 11

Step 9
Click Apply.

Step 10
Reenable the 802.11 networks as follows:

1. Choose Configuration > Wireless > 802.11a/n/ac > Network or Configuration > Wireless > 802.11b/g/n > Network to open the Global Parameters page.
2. Select the 802.11a/n/ac (or 802.11b/g/n) Network Status check box.
3. Click Apply.

Step 11
Click Save Configuration.

Configuring 802.11 Coverage Hole Detection (CLI)

**SUMMARY STEPS**

1. configure terminal
2. ap dot11 24ghz | 5ghz rrm coverage data {fail-percentage | packet-count | rssi-threshold}

</tr>
</tbody>
</table>
### Configuring Coverage Hole Detection (GUI)

**Step 1** Disable the 802.11 network as follows:

a) Choose Configuration > Wireless > 802.11a/n/ac or Configuration > Wireless > 802.11b/g/n to open the 802.11a/n/ac (or 802.11b/g/n) Global Parameters page.

b) Unselect the 802.11a/n/ac (or 802.11b/g/n) Network Status check box.

c) Click Apply.

**Step 2** Choose Configuration > Wireless > 802.11a/n/ac > RRM > Coverage Thresholds or Configuration > Wireless > 802.11b/g/n > RRM > Coverage Thresholds to open coverage page.

**Step 3** Select the Enable Coverage Hole Detection check box to enable coverage hole detection, or unselect it to disable this feature. If you enable coverage hole detection, the Cisco WLC automatically determines, based on data received from the access points, if any access points have clients that are potentially located in areas with poor coverage. The default value is selected.

**Step 4** In the Data RSSI text box, enter the minimum Receive Signal Strength Indication (RSSI) value for data packets received by the access point. The value that you enter is used to identify coverage holes (or areas of poor coverage) within your network. If the access point receives a packet in the data queue with an RSSI value below the value that you enter here, a potential coverage hole has been detected. The valid range is –90 to –60 dBm, and the default value is –80 dBm. The access point takes data RSSI measurements every 5 seconds and reports them to the Cisco WLC in 90-second intervals.

**Step 5** In the Voice RSSI text box, enter the minimum Receive Signal Strength Indication (RSSI) value for voice packets received by the access point. The value that you enter is used to identify coverage holes within your network. If the access point receives a packet in the voice queue with an RSSI value below the value that you enter here, a potential coverage hole has been detected. The valid range is –90 to –60 dBm, and the default value is –80 dBm. The access point takes voice RSSI measurements every 5 seconds and reports them to the Cisco WLC in 90-second intervals.

**Step 6** In the Min Failed Client Count per AP text box, enter the minimum number of clients on an access point with an RSSI value at or below the data or voice RSSI threshold. The valid range is 1 to 75, and the default value is 3.

**Step 7** In the Coverage Exception Level per AP text box, enter the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point. The valid range is 0 to 100%, and the default value is 25%.

**Note** If both the number and percentage of failed packets exceed the values configured for Failed Packet Count and Failed Packet Percentage (configurable through the Cisco WLC CLI) for a 5-second period, the client is considered to be in a pre-alarm condition. The Cisco WLC uses this information to distinguish between real and false coverage holes. False positives are generally due to the poor roaming logic implemented on most clients. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the Min Failed Client Count per AP and Coverage Exception Level per AP text boxes over two 90-second periods (a total of 180 seconds). The Cisco WLC determines if the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

**Step 8** Click Apply.

**Step 9** Reenable the 802.11 network as follows:
Configuring 802.11 Event Logging (CLI)

SUMMARY STEPS

1. configure terminal

Configuring Rogue Access Point Detection in RF Groups

Configuring Rogue Access Point Detection in RF Groups (CLI)

**Before you begin**

Ensure that each controller in the RF group has been configured with the same RF group name.

**Note**

The name is used to verify the authentication IE in all beacon frames. If the controller have different names, false alarms will occur.

**SUMMARY STEPS**

1. `ap name Cisco_AP mode {local | monitor}`
2. `end`
3. `configure terminal`
4. `wireless wps ap-authentication`
5. `wireless wps ap-authentication threshold value`
### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **ap name Cisco_AP mode {local | monitor}**<br>**Example:**<br>Device# ap name ap1 mode local | Configures a particular access point for local (normal) mode or monitor (listen-only) mode. Perform this step for every access point connected to the controller.  
  - **monitor** — Sets the AP mode to monitor mode.  
  - **clear** — Resets AP mode to local or remote based on the site.  
  - **sensor** — Sets the AP mode to sensor mode.  
  - **sniffer** — Sets the AP mode to wireless sniffer mode. |
| **Step 2** | **end**<br>**Example:**<br>Device(config)# end | Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode. |
| **Step 3** | **configure terminal**<br>**Example:**<br>Device# configure terminal | Enters global configuration mode. |
| **Step 4** | **wireless wps ap-authentication**<br>**Example:**<br>Device (config)# wireless wps ap-authentication | Enables rogue access point detection. |
| **Step 5** | **wireless wps ap-authentication threshold value**<br>**Example:**<br>Device (config)# wireless wps ap-authentication threshold 50 | Specifies when a rogue access point alarm is generated. An alarm occurs when the threshold value (which specifies the number of access point frames with an invalid authentication IE) is met or exceeded within the detection period.  
  
  The valid threshold range is from 1 to 255, and the default threshold value is 1. To avoid false alarms, you may want to set the threshold to a higher value.  
  
  **Note** Enable rogue access point detection and threshold value on every controller in the RF group.  
  
  **Note** If rogue access point detection is not enabled on every controller in the RF group, the access points on the controller with this feature disabled are reported as rogues. |

### Enabling Rogue Access Point Detection in RF Groups (GUI)

**Step 1**  
Make sure that each Cisco WLC in the RF group has been configured with the same RF group name.
The name is used to verify the authentication IE in all beacon frames. If the Cisco WLCs have different names, false alarms will occur.

Step 2 Choose Configuration > Wireless > Access Points > All APs to open the All APs page.
Step 3 Click the name of an access point to open the All APs > Edit page.
Step 4 Choose either local or monitor from the AP Mode drop-down list and click Apply to commit your changes.
Step 5 Click Save Configuration to save your changes.
Step 6 Repeat Step 2 through Step 5 for every access point connected to the Cisco WLC.

The name of the RF group to which this Cisco WLC belongs appears at the top of the page.

Step 8 Choose AP Authentication from the Protection Type drop-down list to enable rogue access point detection.
Step 9 Enter a number in the Alarm Trigger Threshold edit box to specify when a rogue access point alarm is generated. An alarm occurs when the threshold value (which specifies the number of access point frames with an invalid authentication IE) is met or exceeded within the detection period.

Note The valid threshold range is from 1 to 255, and the default threshold value is 1. To avoid false alarms, you may want to set the threshold to a higher value.

Step 10 Click Apply to commit your changes.
Step 11 Click Save Configuration to save your changes.
Step 12 Repeat this procedure on every Cisco WLC in the RF group.

Note If rogue access point detection is not enabled on every Cisco WLC in the RF group, the access points on the Cisco WLCs with this feature disabled are reported as rogues.

### Monitoring RRM Parameters and RF Group Status

#### Monitoring RRM Parameters

</tr>
</tbody>
</table>
Monitoring RF Group Status (GUI)

Step 1  Choose Configuration > Wireless > 802.11a/n > or 802.11b/g/n > RRM > RF Grouping to open the RF Grouping Algorithm page.

This page shows the details of the RF group, displaying the configurable parameter Group mode, the Group role of this Cisco WLC, the Group Update Interval and the Cisco WLC name and IP address of the Group Leader to this Cisco WLC.

Note  RF grouping mode can be set using the Group Mode drop-down list.

Tip Once a Cisco WLC has joined as a static member and you want to change the grouping mode, we recommend that you remove the member from the configured static-leader and also make sure that a member Cisco WLC has not been configured to be a member on multiple static leaders. This is to avoid repeated join attempts from one or more RF static leaders.

Step 2  (Optional) Repeat this procedure for the network type that you did not select (802.11a/n or 802.11b/g/n).

Examples: RF Group Configuration

This example shows how to configure RF group name:

```
Device# configure terminal
Device(config)# wireless rf-network test1
Device(config)# ap dot11 24ghz shutdown
Device(config)# end
Device # show network profile 5
```

This example shows how to configure rogue access point detection in RF groups:

```
Device# ap name ap1 mode local
Device# end
Device# configure terminal
Device(config)# wireless wps ap-authentication
Device(config)# wireless wps ap-authentication threshold 50
Device(config)# end
```

Information About ED-RRM

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.
Configuring ED-RRM on the Cisco Wireless LAN Controller (CLI)

**Step 1**
Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled access point detects a significant level of interference by entering these commands:

```
ap dot11 {24ghz | 5ghz} rrm channel cleanair-event —Configures CleanAir driven RRM parameters for the 802.11 Cisco lightweight access points.
ap dot11 {24ghz | 5ghz} rrm channel cleanair-event sensitivity {low | medium | high | custom} —Configures CleanAir driven RRM sensitivity for the 802.11 Cisco lightweight access points. Default selection is Medium.
ap dot11 {24ghz | 5ghz} rrm channel cleanair-event rogue-contribution —Enables rogue contribution.
ap dot11 {24ghz | 5ghz} rrm channel cleanair-event rogue-contribution duty-cycle threshold-value —Configures threshold value for rogue contribution. The valid range is from 1 to 99, with 80 as the default.
```

**Step 2**
Save your changes by entering this command:

```
write memory
```

**Step 3**
See the CleanAir configuration for the 802.11a/n/ac or 802.11b/g/n network by entering this command:

```
show ap dot11 {24ghz | 5ghz} cleanair config
```

Information similar to the following appears:

```
Additional Clean Air Settings:
CleanAir Event-driven RRM State ............ : Enabled
CleanAir Driven RRM Sensitivity ............ : LOW
CleanAir Event-driven RRM Rogue Option ...... : Enabled
CleanAir Event-driven RRM Rogue Duty Cycle .. : 80
CleanAir Persistent Devices state .......... : Disabled
CleanAir Persistent Device Propagation ...... : Disabled
```

Configuring ED-RRM (GUI)

**Step 1**
Choose **Configure > Radio Configurations > 2.4 GHZ or 5 GHZ > RRM > DCA** to open the ED-RRM page.

**Note** Before enabling ED-RRM, you have to disable Network Status from **Configure > Radio Configurations > 2.4 GHZ or 5 GHZ > Network > General** page, and then re-enable the network after configuring ED-RRM.

**Step 2**
In the Event Driven RRM section, select the **EDRRM** check box to reveal ED-RRM parameters.

**Step 3**
From the Sensitivity Threshold drop-down, select the value.

**Note** In the Show running configuration, the Sensitivity Threshold value selected by default is not visible.

**Step 4**
Select the **Rogue Contribution** check box to reveal Rogue Duty-Cycle parameters.

**Step 5**
Enter the **Rogue Duty Cycle** value in the text box.

The valid range is from 1 to 99, with 80 as the default.
Step 6  Click Apply.
Step 7  Click Save Configuration.

Configuring Optimized Roaming

- Information About Optimized Roaming, on page 1441
- Restrictions for Optimized Roaming, on page 1441
- Configuring Optimized Roaming (CLI), on page 1442

Information About Optimized Roaming

Optimized roaming resolves the problem of sticky clients that remain associated to access points that are far away and outbound clients that attempt to connect to a Wi-Fi network without having a stable connection. This feature disassociates clients based on the RSSI of the client data packets and data rate. The client is disassociated if the RSSI alarm condition is met and the current data rate of the client is lower than the optimized roaming data rate threshold. You can disable the data rate option so that only RSSI is used for disassociating clients.

Optimized roaming also prevents client association when the client's RSSI is low. This feature checks the RSSI of the incoming client against the RSSI threshold. This check prevents the clients from connecting to a Wi-Fi network unless the client has a viable connection. In many scenarios, even though clients can hear beacons and connect to a Wi-Fi network, the signal might not be strong enough to support a stable connection.

You can also configure the client coverage reporting interval for a radio by using optimized roaming. The client coverage statistics include data packet RSSIs, Coverage Hole Detection and Mitigation (CHDM) prealarm failures, retransmission requests, and current data rates.

Optimized roaming is useful in the following scenarios:

- Addresses the sticky client challenge by proactively disconnecting clients.
- Actively monitors data RSSI packets.
- Disassociates client when the RSSI is lower than the set threshold.

Restrictions for Optimized Roaming

- You cannot configure the optimized roaming interval until you disable the 802.11a/b network.
- When basic service set (BSS) transition is sent 802.11v-capable clients, and if the clients are not transitioned to other BSS before the disconnect timer expires, the corresponding client is disconnected forcefully. BSS transition is enabled by default for 802.11v-capable clients.

Configuring Optimized Roaming (CLI)
Information About Rx-SOP

Receiver Start of Packet Detection Threshold (Rx SOP) determines the Wi-Fi signal level in dBm at which an access point's radio demodulates and decodes a packet. As the Wi-Fi level increases, the radio sensitivity decreases and the receiver cell size becomes smaller. Reduction of the cell size affects the distribution of clients in the network.

Rx SOP is used to address clients with weak RF links, sticky clients, and client load balancing across access points. Rx SOP helps to optimize the network performance at high-density deployments such as stadiums and auditoriums where access points need to optimize the nearest and strongest clients.

Configuring Rx SOP (CLI)

Step 1  Configure the Rx SOP mode by entering this command:

```
ap dot11 {24ghz | 5ghz} rx-sop threshold {auto | high | low | medium}
```

Step 2  Verify Rx SOP high-density parameters:

```
show ap dot11 24ghz high-density
```

Controller# show ap dot11 24ghz high-density
Receiver Start-of-Packet threshold: auto
Multicast Data Rate: auto
AP Name : AP5475.d064.0552
Receiver Start-of-Packet threshold: auto
Multicast Data Rate: auto 2:33 PM
Configuring Rx SOP (CLI)
 CHAPTER 79

Configuring AirTime Fairness

- Information About Air Time Fairness, on page 1447
- Configure, View, and Modify AirTime Fairness, on page 1449

Information About Air Time Fairness

Cisco Air Time Fairness (ATF) for Cisco High Density Experience (HDX) functions as a wireless quality of service (QoS) that regulates the downlink air time. It allows network administrators to create and apply policies to enable some groups to receive traffic from a WLAN more frequently than other groups.

Cisco ATF has the following capabilities:

- Allocates Wi-Fi air time for user groups or device categories.
- Cisco ATF is defined by the network administrator, and not by the network.
- Provides a simplified mechanism for allocating air time.
- Dynamically adapts to changing conditions in a WLAN.
- Enables a more efficient fulfillment of service-level agreements.
- Augments standards-based Wi-Fi QoS mechanisms.

By enabling network administrators to define what fairness means within their environments with regard to the amount of on air time per client group, the amount of traffic is also controlled.

Policies are created to allow, prevent, and prioritize data packets in a network. All the policies that are created must have a weight value that denotes the importance of that policy in the network. You can assign a weight value in the range of 5 to 100. If no policy is assigned to a WLAN, the system will assign the default policy (policy ID 0) with a weight value of 10 to it. The weight value impacts the percentage of air-time assigned to a policy. The air time percentage is calculated by the system without any user intervention. Therefore, air time percentages will automatically change when a WLAN and a policy are added or removed from a network.

Note

When percentages change, the changed values might not be optimal for the new traffic.

For example, if there are three WLANs with policy values of 5, 10, and 35 in a network, the calculations for the air time percentage for weight value 5 is 10%, and for weight values of 10 and 35, it is 20% and 70% air.
time respectively. If you add a new policy of weight 15, the system recalculates the air time percentages as 7.7%, 15.38%, 23.07%, and 53.84%, or 5, 10, 15, 35 weight values respectively.

Cisco ATF has three modes, that can be subdivided into three levels per mode, thus providing flexibility in the configuration. The three modes are:

• Disable mode—ATF is disabled in a Cisco WLC. The default option is **Disable**.

• Monitor mode—Users can perform the following actions:
  • View the air time
  • Report air time usage for all AP transmissions
  • View reports
    • Per SSID/WLAN
    • Per AP Group
    • Per AP
  • Report air time usage at periodic intervals
  • Block ACKs are not reported
  • Enforcement disabled as part of Monitor mode

• Enforce-policy mode—Users can perform the following functions:
  • Enforce air time based on configured policy
  • Enforce air time on
    • A WLAN
    • All APs connected within a Cisco WLC’s network
    • An AP group
    • An AP

  • Strict Enforcement per WLAN—Air time used by the WLANs on a radio will be strictly enforced up to the configured limits in the policies.

  • Optimal Enforcement per WLAN—Share unused Air time from other SSIDs that are not using their allocated air time.

---

**Note**

AP group Global configuration and per AP level Privileged EXEC commands are allowed to override a policy applied on a WLAN and air time fairness mode applied at the radio level.
Configure, View, and Modify AirTime Fairness

Configuring Cisco Air Time Fairness (CLI)

The Cisco Air Time Fairness (ATF) feature can be configured using the following CLIs:

- Enable Cisco ATF in the Enforce policy mode or Monitor mode by entering this command:
  ```
  ap dot11 {24ghz | 5ghz} airtime-fairness mode {enforce-policy | monitor}
  ```

- Disable Cisco ATF in the Enforce policy mode or Monitor mode by entering this command:
  ```
  no ap dot11 {24ghz | 5ghz} airtime-fairness mode {enforce-policy | monitor}
  ```

- Create a new ATF policy and apply policy weight by entering this command:
  ```
  1. controller#configure terminal
  2. controller(config)#apdot11
  3. controller(config-airtime-fairnesspolicy)#policy-weight
  ```
  The range for a policy weight is between 05 and 100. The default value of 10 is applied if no policy is applied to the corresponding WLAN.

- Delete a policy by entering this command:
  ```
  no ap dot11 airtime-fairness policy-name policy-name
  ```

- Configure a Cisco ATF policy for a WLAN by using these commands:
  ```
  1. controller#configure terminal
  2. controller(config)#wlan wlan-name
  3. controller(config-wlan)#airtime-fairness policy policy-name
  ```

- Configure Cisco ATF mode for an AP group by using these commands:
  ```
  1. controller#configure terminal
  2. controller(config)#apgroup apgroup-name
  3. controller(config-apgroup)#no airtime-fairness dot11 {24ghz | 5ghz} mode {enforce-policy | monitor}
  ```

- Configure Cisco ATF optimization for an AP group by using these commands:
  ```
  1. controller#configure terminal
  2. controller(config)#apgroup apgroup-name
  3. controller(config-apgroup)#no airtime-fairness dot11 {24ghz | 5ghz} optimization
  ```

- Configure applied policy override on a WLAN through an AP-specific WLAN list by using these commands:
  ```
  1. controller#configure terminal
  2. controller(config)#apgroup apgroup-name
  3. controller(config-apgroup)#wlan wlan-name
  4. controller(config-wlan-apgroup)#no airtime-fairness dot11 {24ghz | 5ghz} policy policy-name
  ```

- Configure a Cisco ATF policy for a WLAN by using these commands:
1. `controller# configure terminal`
2. `controller(config)# wlan wlan-name`
3. `controller(config-wlan)# airtime-fairness policy policy-name`

- Clear wireless ATF statistics by entering this command:
  1. `controller# clear wireless airtime-fairness statistics`

**Viewing Cisco Air Time Fairness (CLI)**

Cisco Air Time Fairness (ATF) feature configurations can be viewed using the following CLIs:

- View all the configured policies by entering this command:
  
  `show ap airtime-fairness policy`

- View the list of configured WLANs, and the ATF policy applied by entering this command:
  
  `show ap airtime-fairness wlan`

- View the ATF configuration for a specific AP group by entering this command:
  
  `show ap airtime-fairness ap-group group-name`

- View the AP list with ATF configuration per radio by entering this command:
  
  `show ap airtime-fairness`

- View the AP list with ATF configured for 2.4-GHz and 5-GHz radio by entering this command:
  
  `show ap dot11 {24ghz | 5ghz} airtime-fairness`

- View ATF configuration for a specific AP
  
  `show ap name ap-name airtime-fairness`

- View statistics for specified ATF policy
  
  `show ap name ap-name dot11 {24ghz | 5ghz} airtime-fairness policy policy-name statistics`

- View ATF statistics for a specified WLAN active on specific AP
  
  `show ap name ap-name dot11 {24ghz | 5ghz} airtime-fairness wlan name wlan-name statistics`

- View ATF statistics per WLAN
  
  `show ap name ap-name dot11 {24ghz | 5ghz} airtime-fairness summary`

**Modifying AirTime Fairness Parameters for AP (CLI)**

The following commands allows modification of specific AP ATF parameters. The user can enable, disable, change, or override ATF policy per AP using these commands:

- Enable ATF in enforce-policy or monitor mode for a specific AP
  
  `ap name ap-name dot11 {24ghz | 5ghz} airtime-fairness mode {enforce-policy | monitor}`

- Disable ATF in enforce-policy or monitor mode for a specific AP
  
  `ap name ap-name no dot11 {24ghz | 5ghz} airtime-fairness mode {enforce-policy | monitor}`
• Enable ATF optimization for a specific AP
  ap name ap-name dot11 {24ghz | 5ghz} airtime-fairness optimization

• Disable ATF optimization for a specific AP
  ap name ap-name no dot11 {24ghz | 5ghz} airtime-fairness optimization

• Override the policy on WLAN specific to one AP
  ap name ap-name dot11 {24ghz | 5ghz} airtime-fairness wlan-name wlan-name policy-name policy-name

• Disable the ATF policy override on the WLAN specific to WLAN
  ap name ap-name no dot11 {24ghz | 5ghz} airtime-fairness wlan-name wlan-name
Modifying AirTime Fairness Parameters for AP (CLI)
Prerequisites for RF Profile on CA

The latest RF Profile settings are applied to an AP group (new or modified). The rule of the same RF Profile to be applied on every controller of the AP group comes into effect or the activation fails for that controller.

---

Note

The same RF Profile can be assigned to multiple AP groups.

Restrictions for RF Profile on CA

- When Centralized Mode is enabled, configuration is lost at reboot and must be reconfigured.

---

Note

Cisco Communications Media Module (CMM) feature is deprecated.

- Configurations must be exactly the same at the MC and at all the MAs.
- Custom power settings on an AP is not supported.
- RF Profile is active only when channel and the transmit power (TPC) is managed by RRM on all APs.
- An RF Profile which is applied to an AP group cannot be deleted.
- You need to shutdown the RF profile which is assigned to an AP group to make any changes to its settings.
- Changing the RF Profile assignment within the AP group on either of the bands causes the AP to reboot.
Information About RF Profile on CA

RF Profile on Converged Access (CA) (local mode only) allows customization to groups of APs that share a common radio configuration. Special RF profiles can be created per 802.11 band. These RF profiles have default settings for all the existing RF parameters and additional new configurations.

Newly installed APs are by default assigned to the 'default group' AP group. The radios are disabled to eliminate any RF interference. The new APs need to be manually added to an AP group if RF Profile configurations need to be applied to them.

RF profiles are applied to all APs that belong to an AP group, where all APs in that group have the same profile settings. The priority order of configurations for APs in an AP Group that has an RF Profile attached is as follows:

1. AP specific.
2. RF-Profile.

The priorities of Rx-SOP and Multicast data rate do not follow the priority order. They follow the following rules:

- If an AP is in an AP group with an RF profile attached, between RF profile configuration and AP specific configuration, the configuration done last takes precedence.
- If the AP is not in an AP group, or the AP group does not have an RF profile, then between global configuration and AP specific configuration, the configuration done last takes precedence.
- When an RF Profile is removed, the last RF Profile configuration is stored in the AP. This stored configuration gets applied when the AP is added back.

The RF Profile on CA feature allows customization of the following configurations:

- Band Select Configurations.
- Coverage Hole Mitigation Configurations.
- Dynamic Channel Assignment (DCA) Configurations.
- High Density Configurations.
- Load Balancing Configurations.
- Stadium Vision Configurations.
- Transmit Power Control (TPC) Configurations.
RF Profile Customizations

Band Select Configurations

This configuration addresses client distribution between the 2.4-GHz and 5-GHz bands by identifying client capabilities. Enabling band select on a WLAN forces the AP to suppress 2.4-GHz band to move dual band clients to 5-GHz spectrum. The following band select parameters can be configured per AP Group:

• Probe response—probe responses to clients. You can enable or disable this function.

• Probe Cycle Count—probe cycle count for the RF profile. The cycle count sets the number of suppression cycles for a new client.

• Cycle Threshold—time threshold for a new scanning RF Profile band select cycle period. This setting determines the time threshold during which new probe requests from a client come in a new scanning cycle.

• Suppression Expire—expiration time for pruning previously known 802.11b/g clients. After this time elapses, clients become new and are subject to probe response suppression.

• Dual Band Expire—expiration time for pruning previously known dual-band clients. After this time elapses, clients become new and are subject to probe response suppression.

• Client RSSI—minimum RSSI for a client to respond to a probe.

Coverage Hole Mitigation Configurations

For Coverage Hole Mitigation, the following parameters can be configured under this feature:

• Data RSSI—minimum receive signal strength indication (RSSI) value for data packets received by the access point. The value that you enter is used to identify coverage holes (or areas of poor coverage) within your network.

• Voice RSSI—minimum receive signal strength indication (RSSI) value for voice packets received by the access point.

• Coverage Exception—percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point. If an access point has more number of such clients than the configured coverage level it triggers a coverage hole event.

• Coverage Level—minimum number of clients on an access point with an RSSI value at or below the data or voice RSSI threshold to trigger a coverage hole exception.

Dynamic Channel Assignment Configurations

For Dynamic Channel Assignment (DCA), the following parameters can be configured under this feature:

• Avoid foreign AP interference—DCA algorithm bases its optimization on multiple sets of inputs, which include detected traffic and interference from foreign 802.11 traffic access points. Each access point periodically measures interference, noise level, foreign interference, and load and maintains a list of
neighbor APs. Foreign AP interference is that which is received from 802.11 non-neighbors. This interference is measured using the same mechanism as the noise level.

- **Channel width**—You can choose one of the following channel width options to specify the channel bandwidth supported for all 802.11n and 802.11ac radios in the 5-GHz band.
  - 20 MHz—20 MHz is also the maximum channel width allowed for 2.4 GHz. This is the default value for channel width.
  - 40 MHz—The 40-MHz channel bandwidth.
  - 80 MHz—The 80-MHz channel bandwidth.

- **DCA channel list**—You can choose a channel set used by DCA to assign one of the channels to an access point radio. The channel set selected for an RF profile must be a subset of the DCA global channel list. The available channels are preselected based on the globally configured countries. DCA compares the metrics measured on these channels and selects the most suitable channel.

- **Trap thresholds**—The profile threshold for the traps can be configured for the specific AP groups based on the RF profiles.

### High Density Configurations

The following configurations are available to fine tune RF environments in a dense wireless network:

- **Client limit per WLAN or radio:** maximum number of clients that can communicate with the AP in a high-density environment.

- **Client trap threshold:** threshold value of the number of clients that associate with an access point, after which an SNMP trap is sent to the controller and Cisco Prime Infrastructure.

### Load Balancing Configurations

Load balancing maintains fair distribution of clients across APs. You can configure the following parameters:

- **Window**—load balancing sets client association limits by enforcing a client window size.

- **Denial**—the denial count sets the maximum number of association denials during load balancing.

### Stadium Vision Configurations

For Stadium Vision, the following parameters can be configured under this feature:

- **Multicast data rates**—configurable data rate for multicast traffic based on the RF condition of an AP.

### Transmit Power Control Configurations

For Transmit Power Control (TPC), the following parameters can be configured under this feature:

- **Minimum Power**—minimum allowed power for the APs belonging to the AP group where the RF Profile is applied.
• Maximum Power—maximum allowed power for the APs belonging to the AP group where the RF Profile is applied.

• Threshold—if the power of the strongest neighbors is above the configured threshold, then the RRM runs for the APs in the AP group where the RF Profile is applied.

How to Configure RF Profile on CA

Configuring RF-Profile parameters

Routing

- Configuring Bidirectional Forwarding Detection, on page 1463
- Configuring MSDP, on page 1487
- Configuring IP Unicast Routing, on page 1511
Bidirectional Forwarding Detection

This document describes how to enable the Bidirectional Forwarding Detection (BFD) protocol. BFD is a detection protocol that is designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols.

BFD provides a consistent failure detection method for network administrators, in addition to fast forwarding path failure detection. Because the network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol hello mechanisms, network profiling and planning will be easier, and reconvergence time will be consistent and predictable.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Bidirectional Forwarding Detection

- Cisco Express Forwarding and IP routing must be enabled on all participating switches.
- One of the IP routing protocols supported by BFD must be configured on the switches before BFD is deployed. You should implement fast convergence for the routing protocol that you are using. See the IP routing documentation for your version of Cisco IOS software for information on configuring fast convergence. See the Restrictions for Bidirectional Forwarding Detection section for more information on BFD routing protocol support in Cisco IOS software.
Restrictions for Bidirectional Forwarding Detection

- BFD works only for directly connected neighbors. BFD neighbors must be no more than one IP hop away. Multihop configurations are not supported.
- BFD support is not available for all platforms and interfaces. To confirm BFD support for a specific platform or interface and obtain the most accurate platform and hardware restrictions, see the Cisco IOS software release notes for your software version.
- BFD packets are not matched in the QoS policy for self-generated packets.
- BFD packets are matched in the `class class-default` command. So, the user must make sure of the availability of appropriate bandwidth to prevent dropping of BFD packets due to oversubscription.
- BFD HA support is not available starting Cisco Denali IOS XE 16.3.1

Information About Bidirectional Forwarding Detection

**BFD Operation**

BFD provides a low-overhead, short-duration method of detecting failures in the forwarding path between two adjacent routers, including the interfaces, data links, and forwarding planes.

BFD is a detection protocol that you enable at the interface and routing protocol levels. Cisco supports BFD asynchronous mode, which depends on the sending of BFD control packets between two systems to activate and maintain BFD neighbor sessions between routers. Therefore, in order for a BFD session to be created, you must configure BFD on both systems (or BFD peers). Once BFD has been enabled on the interfaces and at the router level for the appropriate routing protocols, a BFD session is created, BFD timers are negotiated, and the BFD peers will begin to send BFD control packets to each other at the negotiated interval.

**Neighbor Relationships**

BFD provides fast BFD peer failure detection times independently of all media types, encapsulations, topologies, and routing protocols BGP, EIGRP, IS-IS, and OSPF. By sending rapid failure detection notices to the routing protocols in the local router to initiate the routing table recalculation process, BFD contributes to greatly reduced overall network convergence time. The figure below shows a simple network with two routers running OSPF and BFD. When OSPF discovers a neighbor (1) it sends a request to the local BFD process to initiate a BFD neighbor session with the OSPF neighbor router (2). The BFD neighbor session with the OSPF neighbor router is established (3).

The figure below shows what happens when a failure occurs in the network (1). The BFD neighbor session with the OSPF neighbor router is torn down (2). BFD notifies the local OSPF process that the BFD neighbor is no longer reachable (3). The local OSPF process tears down the OSPF neighbor relationship (4). If an alternative path is available, the routers will immediately start converging on it.
A routing protocol needs to register with BFD for every neighbor it acquires. Once a neighbor is registered, BFD initiates a session with the neighbor if a session does not already exist.

OSPF registers with BFD when:

- A neighbor finite state machine (FSM) transitions to full state.
- Both OSPF BFD and BFD are enabled.

On broadcast interfaces, OSPF establishes a BFD session only with the designated router (DR) and backup designated router (BDR), but not between any two routers in DROTHER state.

### BFD Detection of Failures

Once a BFD session has been established and timer negotiations are complete, BFD peers send BFD control packets that act in the same manner as an IGP hello protocol to detect liveliness, except at a more accelerated rate. The following information should be noted:

- BFD is a forwarding path failure detection protocol. BFD detects a failure, but the routing protocol must take action to bypass a failed peer.

- Starting Cisco IOS XE Denali 16.3.1, Cisco devices will support BFD version 0, where devices will use one BFD session for multiple client protocols in the implementation. For example, if a network is running OSPF and EIGRP across the same link to the same peer, only one BFD session will be established, and BFD will share session information with both routing protocols.

### BFD Version Interoperability

All BFD sessions come up as Version 1 by default and will be interoperable with Version 0. The system automatically performs BFD version detection, and BFD sessions between neighbors will run in the highest common BFD version between neighbors. For example, if one BFD neighbor is running BFD Version 0 and the other BFD neighbor is running Version 1, the session will run BFD Version 0. The output from the `show bfd neighbors [details]` command will verify which BFD version a BFD neighbor is running.

See the Example Configuring BFD in an EIGRP Network with Echo Mode Enabled by Default for an example of BFD version detection.

### BFD Session Limits

Starting Cisco IOS XE Denali 16.3.1, the number of BFD sessions that can be created has been increased to 100.

### BFD Support for Nonbroadcast Media Interfaces

Starting Cisco IOS XE Denali 16.3.1, the BFD feature is supported on routed, SVI and L3 portchannels. The `bfd interval` command must be configured on the interface to initiate BFD monitoring.
**BFD Support for Nonstop Forwarding with Stateful Switchover**

Typically, when a networking device restarts, all routing peers of that device detect that the device went down and then came back up. This transition results in a routing flap, which could spread across multiple routing domains. Routing flaps caused by routing restarts create routing instabilities, which are detrimental to the overall network performance. Nonstop forwarding (NSF) helps to suppress routing flaps in devices that are enabled with stateful switchover (SSO), thereby reducing network instability.

NSF allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored after a switchover. With NSF, peer networking devices do not experience routing flaps. Data traffic is forwarded through intelligent line cards or dual forwarding processors while the standby RP assumes control from the failed active RP during a switchover. The ability of line cards and forwarding processors to remain up through a switchover and to be kept current with the Forwarding Information Base (FIB) on the active RP is key to NSF operation.

In devices that support dual RPs, SSO establishes one of the RPs as the active processor; the other RP is designated as the standby processor, and then synchronizes information between them. A switchover from the active to the standby processor occurs when the active RP fails, when it is removed from the networking device, or when it is manually taken down for maintenance.

**BFD Support for Stateful Switchover**

The BFD protocol provides short-duration detection of failures in the path between adjacent forwarding engines. In network deployments that use dual RP routers or switches (to provide redundancy), the routers have a graceful restart mechanism that protects the forwarding state during a switchover between the active RP and the standby RP.

The dual RPs have variable switchover times that depend on the ability of the hardware to detect a communication failure. When BFD is running on the RP, some platforms are not able to detect a switchover before the BFD protocol times out; these platforms are referred to as slow switchover platforms.

**BFD Support for Static Routing**

Unlike dynamic routing protocols, such as OSPF and BGP, static routing has no method of peer discovery. Therefore, when BFD is configured, the reachability of the gateway is completely dependent on the state of the BFD session to the specified neighbor. Unless the BFD session is up, the gateway for the static route is considered unreachable, and therefore the affected routes will not be installed in the appropriate Routing Information Base (RIB).

For a BFD session to be successfully established, BFD must be configured on the interface on the peer and there must be a BFD client registered on the peer for the address of the BFD neighbor. When an interface is used by dynamic routing protocols, the latter requirement is usually met by configuring the routing protocol instances on each neighbor for BFD. When an interface is used exclusively for static routing, this requirement must be met by configuring static routes on the peers.

If a BFD configuration is removed from the remote peer while the BFD session is in the up state, the updated state of the BFD session is not signaled to IPv4 static. This will cause the static route to remain in the RIB. The only workaround is to remove the IPv4 static BFD neighbor configuration so that the static route no longer tracks BFD session state. Also, if you change the encapsulation type on a serial interface to one that is unsupported by BFD, BFD will be in a down state on that interface. The workaround is to shut down the interface, change to a supported encapsulation type, and then reconfigure BFD.

A single BFD session can be used by an IPv4 static client to track the reachability of next hops through a specific interface. You can assign a BFD group for a set of BFD-tracked static routes. Each group must have one active static BFD configuration, one or more passive BFD configurations, and the corresponding static routes to be BFD-tracked. Nongroup entries are BFD-tracked static routes for which a BFD group is not
assigned. A BFD group must accommodate static BFD configurations that can be part of different VRFs. Effectively, the passive static BFD configurations need not be in the same VRF as that of the active configuration.

For each BFD group, there can be only one active static BFD session. You can configure the active BFD session by adding a static BFD configuration and a corresponding static route that uses the BFD configuration. The BFD session in a group is created only when there is an active static BFD configuration and the static route that uses the BFD configuration. When the active static BFD configuration or the active static route is removed from a BFD group, all the passive static routes are withdrawn from the RIB. Effectively, all the passive static routes are inactive until an active static BFD configuration and a static route to be tracked by the active BFD session are configured in the group.

Similarly, for each BFD group, there can be one or more passive static BFD configurations and their corresponding static routes to be BFD-tracked. Passive static session routes take effect only when the active BFD session state is reachable. Though the active BFD session state of the group is reachable, the passive static route is added to the RIB only if the corresponding interface state is up. When a passive BFD session is removed from a group, it will not affect the active BFD session if one existed, or the BFD group reachability status.

**Benefits of Using BFD for Failure Detection**

When you deploy any feature, it is important to consider all the alternatives and be aware of any trade-offs being made.

The closest alternative to BFD in conventional EIGRP, IS-IS, and OSPF deployments is the use of modified failure detection mechanisms for EIGRP, IS-IS, and OSPF routing protocols.

If you set EIGRP hello and hold timers to their absolute minimums, the failure detection rate for EIGRP falls to within a one- to two-second range.

If you use fast hellos for either IS-IS or OSPF, these Interior Gateway Protocol (IGP) protocols reduce their failure detection mechanisms to a minimum of one second.

There are several advantages to implementing BFD over reduced timer mechanisms for routing protocols:

- Although reducing the EIGRP, IS-IS, and OSPF timers can result in minimum detection timer of one to two seconds, BFD can provide failure detection in less than one second.

- Because BFD is not tied to any particular routing protocol, it can be used as a generic and consistent failure detection mechanism for EIGRP, IS-IS, and OSPF.

- Because some parts of BFD can be distributed to the data plane, it can be less CPU-intensive than the reduced EIGRP, IS-IS, and OSPF timers, which exist wholly at the control plane.

**How to Configure Bidirectional Forwarding Detection**

**Configuring BFD Session Parameters on the Interface**

To configure BFD on an interface, you need to set the baseline BFD session parameters on an interface. Repeat the steps in this procedure for each interface over which you want to run BFD sessions to BFD neighbors.

**SUMMARY STEPS**

1. enable
2. `configure terminal`  
3. Perform one of the following steps:  
   - `ip address ipv4-address mask`  
   - `ipv6 address ipv6-address/mask`  
4. `bfd interval milliseconds min_rx milliseconds multiplier interval-multiplier`  
5. `end`

### Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable Example:  
Device> enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Step 2** `configure terminal` Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 3** Perform one of the following steps:  
- `ip address ipv4-address mask`  
- `ipv6 address ipv6-address/mask`  
Example:  
Configuring an IPv4 address for the interface:  
Device(config-if)# ip address 10.201.201.1 255.255.255.0  
Configuring an IPv6 address for the interface:  
Device(config-if)# ipv6 address 2001:db8:1:1::1/32 | Configures an IP address for the interface. |
| **Step 4** `bfd interval milliseconds min_rx milliseconds multiplier interval-multiplier` Example:  
Device(config-if)# bfd interval 100 min_rx 100 multiplier 3 | Enables BFD on the interface.  
The BFD interval configuration is removed when the subinterface on which it is configured is removed.  
The BFD interval configuration is not removed when:  
• an IPv4 address is removed from an interface  
• an IPv6 address is removed from an interface  
• IPv6 is disabled from an interface  
• an interface is shutdown  
• IPv4 CEF is disabled globally or locally on an interface |
### Configuring BFD Support for Dynamic Routing Protocols

#### Configuring BFD Support for eBGP

This section describes the procedure for configuring BFD support for BGP so that BGP is a registered protocol with BFD and will receive forwarding path detection failure messages from BFD.

**Before you begin**

- e BGP must be running on all participating routers.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the Configuring BFD Session Parameters on the Interface section for more information.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `router bgp as-tag`
4. `neighbor ip-address fall-over bfd`
5. `end`
6. `show bfd neighbors [details]`
7. `show ip bgp neighbor`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

**Note**

Output from the `show bfd neighbors details` command shows the configured intervals.
Program Command or Action | Purpose
--- | ---
Device# configure terminal | Specifies a BGP process and enters router configuration mode.

**Step 3**

**router bgp** **as-tag**  
**Example:**  
Device(config)# router bgp tag1

**Step 4**

**neighbor** **ip-address** **fall-over bfd**  
**Example:**  
Device(config-router)# neighbor 172.16.10.2 fall-over bfd

**Step 5**

**end**  
**Example:**  
Device(config-router)# end

**Step 6**

**show bfd neighbors [details]**  
**Example:**  
Device# show bfd neighbors detail

**Step 7**

**show ip bgp neighbor**  
**Example:**  
Device# show ip bgp neighbor

### Configuring BFD Support for EIGRP

This section describes the procedure for configuring BFD support for EIGRP so that EIGRP is a registered protocol with BFD and will receive forwarding path detection failure messages from BFD. There are two methods for enabling BFD support for EIGRP:

- You can enable BFD for all of the interfaces for which EIGRP is routing by using the **bfd all-interfaces** command in router configuration mode.

- You can enable BFD for a subset of the interfaces for which EIGRP is routing by using the **bfd interface type number** command in router configuration mode.

**Before you begin**

EIGRP must be running on all participating routers.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the Configuring BFD Session Parameters on the Interface section for more information.
SUMMARY STEPS

1. enable
2. configure terminal
3. router eigrp as-number
4. Do one of the following:
   • bfd all-interfaces
   • bfd interface type number
5. end
6. show bfd neighbors [details]
7. show ip eigrp interfaces [type number] [as-number] [detail]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
| Example: | Device> enable | • Enter your password if prompted. |
| Step 2 | configure terminal | Enters global configuration mode.  
| Example: | Device# configure terminal | |
| Step 3 | router eigrp as-number | Configures the EIGRP routing process and enters router configuration mode.  
| Example: | Device(config)# router eigrp 123 | |
| Step 4 | Do one of the following:  
| Example: | Device(config-router)# bfd all-interfaces | Enables BFD globally on all interfaces associated with the EIGRP routing process.  
| | Device(config-router)# bfd interface GigabitFastEthernet 1/0/1 | or  
| | | Enables BFD on a per-interface basis for one or more interfaces associated with the EIGRP routing process. |
Purpose

Command or Action | Purpose |
--- | --- |
**Step 5** | Exits router configuration mode and returns the router to privileged EXEC mode. |
**Example:**
Device(config-router) end |

**Step 6** | (Optional) Verifies that the BFD neighbor is active and displays the routing protocols that BFD has registered. |
**Example:**
Device# show bfd neighbors details |

**Step 7** | (Optional) Displays the interfaces for which BFD support for EIGRP has been enabled. |
**Example:**
Device# show ip eigrp interfaces detail |

**Configuring BFD Support for IS-IS**

This section describes the procedures for configuring BFD support for IS-IS so that IS-IS is a registered protocol with BFD and will receive forwarding path detection failure messages from BFD. There are two methods for enabling BFD support for IS-IS:

- You can enable BFD for all of the interfaces on which IS-IS is supporting IPv4 routing by using the `bfd all-interfaces` command in router configuration mode. You can then disable BFD for one or more of those interfaces using the `isis bfd disable` command in interface configuration mode.

- You can enable BFD for a subset of the interfaces for which IS-IS is routing by using the `isis bfd` command in interface configuration mode.

To configure BFD support for IS-IS, perform the steps in one of the following sections:

**Prerequisites**

IS-IS must be running on all participating routers.

The baseline parameters for BFD sessions on the interfaces that you want to run BFD sessions to BFD neighbors over must be configured. See the Configuring BFD Session Parameters on the Interface section for more information.

**Note**

Output from the `show bfd neighbors details` command shows the configured intervals. The output does not show intervals that were changed because hardware-offloaded BFD sessions were configured with Tx and Rx intervals that are not multiples of 50 ms.

**Configuring BFD Support for IS-IS for All Interfaces**

To configure BFD on all IS-IS interfaces that support IPv4 routing, perform the steps in this section.
SUMMARY STEPS

1. enable
2. configure terminal
3. router isis area-tag
4. bfd all-interfaces
5. exit
6. interface type number
7. ip router isis [tag]
8. isis bfd [disable]
9. end
10. show bfd neighbors [details]
11. show clns interface

| Step 1 | enable | Enables privileged EXEC mode.  
Example:  
Device> enable |
| Step 2 | configure terminal | Enters global configuration mode.  
Example:  
Device# configure terminal |
| Step 3 | interface type number | Enters interface configuration mode.  
Example:  
Device(config)# interface fastethernet 6/0 |
| Step 4 | ip router isis [ tag ] | Enables support for IPv4 routing on the interface.  
Example:  
Device(config-if)# ip router isis tag1 |
| Step 5 | isis bfd [disable] | Enables or disables BFD on a per-interface basis for one or more interfaces associated with the IS-IS routing process.  
Example:  
Device(config-if)# isis bfd |
| Note | You should use the disable keyword only if you enabled BFD on all of the interfaces that IS-IS is associated with using the bfd all-interfaces command in router configuration mode. |
| Step 6 | end | Exits interface configuration mode and returns the router to privileged EXEC mode.  
Example:  
Device(config-if)# end |
| Step 7 | show bfd neighbors [details] | (Optional) Displays information that can help verify if the BFD neighbor is active and displays the routing protocols that BFD has registered.  
Example:  
Device# show bfd neighbors details |
| Step 8 | show clns interface | (Optional) Displays information that can help verify if BFD for IS-IS has been enabled for a specific IS-IS interface that is associated.  
Example:  
Device# show clns interface |
Configuring BFD Support for OSPF

This section describes the procedures for configuring BFD support for OSPF so that OSPF is a registered protocol with BFD and will receive forwarding path detection failure messages from BFD. You can either configure BFD support for OSPF globally on all interfaces or configure it selectively on one or more interfaces.

There are two methods for enabling BFD support for OSPF:

- You can enable BFD for all of the interfaces for which OSPF is routing by using the `bfd all-interfaces` command in router configuration mode. You can disable BFD support on individual interfaces using the `ip ospf bfd [disable]` command in interface configuration mode.

- You can enable BFD for a subset of the interfaces for which OSPF is routing by using the `ip ospf bfd` command in interface configuration mode.

See the following sections for tasks for configuring BFD support for OSPF:

**Configuring BFD Support for OSPF for All Interfaces**

To configure BFD for all OSPF interfaces, perform the steps in this section.

If you do not want to configure BFD on all OSPF interfaces and would rather configure BFD support specifically for one or more interfaces, see the Configuring BFD Support for OSPF for One or More Interfaces section.

**Before you begin**

OSPF must be running on all participating routers.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the Configuring BFD Session Parameters on the Interface section for more information.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `router ospf process-id`
4. `bfd all-interfaces`
5. `exit`
6. `interface type number`
7. `ip ospf bfd [disable]`
8. `end`
9. `show bfd neighbors [details]`
10. `show ip ospf`

</tr>
</tbody>
</table>

**Step 5**

**Example:**

```
Device(config-if)# end
```

Exits interface configuration mode and returns the router to privileged EXEC mode.

**Step 6**

**Example:**

```
Device# show bfd neighbors details
```

(Optional) Displays information that can help verify if the BFD neighbor is active and displays the routing protocols that BFD has registered.

**Step 7**

**Example:**

```
Device# show ip ospf
```

(Optional) Displays information that can help verify if BFD support for OSPF has been enabled.

---

### Configuring BFD Support for HSRP

Perform this task to enable BFD support for Hot Standby Router Protocol (HSRP.) Repeat the steps in this procedure for each interface over which you want to run BFD sessions to HSRP peers.

HSRP supports BFD by default. If HSRP support for BFD has been manually disabled, you can reenable it at the router level to enable BFD support globally for all interfaces or on a per-interface basis at the interface level.

**Before you begin**

- HSRP must be running on all participating routers.
- Cisco Express Forwarding must be enabled.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip cef [distributed]`
4. `interface type number`
5. `ip address ip-address mask`
6. `standby [group-number] ip [ip-address [secondary]]`
7. `standby bfd`
8. `exit`
9. `standby bfd all-interfaces`
10. `exit`
11. `show standby neighbors`
### DETAILED STEPS

### Configuring BFD Support for Static Routing

Perform this task to configure BFD support for static routing. Repeat the steps in this procedure on each BFD neighbor. For more information, see the "Example: Configuring BFD Support for Static Routing" section.

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. Perform one of the following steps:
   - `ip address ipv4-address mask`
   - `ipv6 address ipv6-address/mask`
5. `bfd interval milliseconds mix_rx milliseconds multiplier interval-multiplier`
6. `exit`
7. `ip route static bfd interface-type interface-number ip-address [group group-name [passive]]`
8. `ip route [vrf vrf-name] prefix mask {ip-address | interface-type interface-number [ip-address]} [dhop] [distance] [name next-hop-name] [permanent | track number] [tag tag]
9. `exit`
10. `show ip static route`
11. `show ip static route bfd`
12. `exit`

### Configuring BFD Echo Mode

BFD echo mode is enabled by default, but you can disable it such that it can run independently in each direction.

BFD echo mode works with asynchronous BFD. Echo packets are sent by the forwarding engine and forwarded back along the same path in order to perform detection—the BFD session at the other end does not participate in the actual forwarding of the echo packets. The echo function and the forwarding engine are responsible for the detection process; therefore, the number of BFD control packets that are sent out between two BFD neighbors is reduced. In addition, because the forwarding engine is testing the forwarding path on the remote (neighbor) system without involving the remote system, there is an opportunity to improve the interpacket delay variance, thereby achieving quicker failure detection times than when using BFD Version 0 with BFD control packets for the BFD session.

Echo mode is described as without asymmetry when it is running on both sides (both BFD neighbors are running echo mode).
Prerequisites

BFD must be running on all participating routers.

Before using BFD echo mode, you must disable the sending of Internet Control Message Protocol (ICMP) redirect messages by entering the `no ip redirects` command, in order to avoid high CPU utilization.

The baseline parameters for BFD sessions on the interfaces over which you want to run BFD sessions to BFD neighbors must be configured. See the Configuring BFD Session Parameters on the Interface section for more information.

Restrictions

BFD echo mode does not work in conjunction with Unicast Reverse Path Forwarding (uRPF) configuration. If BFD echo mode and uRPF configurations are enabled, then the sessions will flap.

Disabling BFD Echo Mode Without Asymmetry

The steps in this procedure show how to disable BFD echo mode without asymmetry—no echo packets will be sent by the router, and the router will not forward BFD echo packets that are received from any neighbor routers.

Repeat the steps in this procedure for each BFD router.

SUMMARY STEPS

1. enable
2. configure terminal
3. no bfd echo
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>

Creating and Configuring BFD Templates

You can configure a single-hop template to specify a set of BFD interval values. BFD interval values specified as part of the BFD template are not specific to a single interface.

**Note**
Configuring bfd-template will disable echo mode.

Configuring a Single-Hop Template

Perform this task to create a BFD single-hop template and configure BFD interval timers.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `bfd-template single-hop template-name`
4. `interval min-tx milliseconds min-rx milliseconds multiplier multiplier-value`
5. `end`

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring MSDP

This section describes how to configure the Multicast Source Discovery Protocol (MSDP on the switch. The MSDP connects multiple Protocol-Independent Multicast sparse-mode (PIM-SM) domains.

MSDP is not fully supported in this software release because of a lack of support for Multicast Border Gateway Protocol (MBGP), which works closely with MSDP. However, it is possible to create default peers that MSDP can operate with if MBGP is not running.

Note

To use this feature, the active switch must be running the IP services feature set.
MSDP Overview

MSDP allows multicast sources for a group to be known to all rendezvous points (RPs) in different domains. Each PIM-SM domain uses its own RPs and does not depend on RPs in other domains. An RP runs MSDP over the Transmission Control Protocol (TCP) to discover multicast sources in other domains.

An RP in a PIM-SM domain has an MSDP peering relationship with MSDP-enabled devices in another domain. The peering relationship occurs over a TCP connection, primarily exchanging a list of sources sending to multicast groups. The TCP connections between RPs are achieved by the underlying routing system. The receiving RP uses the source lists to establish a source path.

The purpose of this topology is to have domains discover multicast sources in other domains. If the multicast sources are of interest to a domain that has receivers, multicast data is delivered over the normal, source-tree building mechanism in PIM-SM. MSDP is also used to announce sources sending to a group. These announcements must originate at the domain’s RP.

MSDP depends heavily on the Border Gateway Protocol (BGP) or MBGP for interdomain operation. We recommend that you run MSDP in RPs in your domain that are RPs for sources sending to global groups to be announced to the Internet.

MSDP Operation

When a source sends its first multicast packet, the first-hop router (designated router or RP) directly connected to the source sends a PIM register message to the RP. The RP uses the register message to register the active source and to forward the multicast packet down the shared tree in the local domain. With MSDP configured, the RP also forwards a source-active (SA) message to all MSDP peers. The SA message identifies the source, the group the source is sending to, and the address of the RP or the originator ID (the IP address of the interface used as the RP address), if configured.

Each MSDP peer receives and forwards the SA message away from the originating RP to achieve peer reverse-path flooding (RPF). The MSDP device examines the BGP or MBGP routing table to discover which peer is the next hop toward the originating RP of the SA message. Such a peer is called an RPF peer (reverse-path forwarding peer). The MSDP device forwards the message to all MSDP peers other than the RPF peer. For information on how to configure an MSDP peer when BGP and MBGP are not supported, see the Configuring a Default MSDP Peer, on page 1490.

If the MSDP peer receives the same SA message from a non-RPF peer toward the originating RP, it drops the message. Otherwise, it forwards the message to all its MSDP peers.

The RP for a domain receives the SA message from an MSDP peer. If the RP has any join requests for the group the SA message describes and if the (*,G) entry exists with a nonempty outgoing interface list, the domain is interested in the group, and the RP triggers an (S,G) join toward the source. After the (S,G) join reaches the source’s DR, a branch of the source tree has been built from the source to the RP in the remote domain. Multicast traffic can now flow from the source across the source tree to the RP and then down the shared tree in the remote domain to the receiver.
Figure 91: MSDP Running Between RP Peers

This figure shows MSDP operating between two MSDP peers. PIM uses MSDP as the standard mechanism to register a source with the RP of a domain. When MSDP is configured, this sequence occurs.

By default, the switch does not cache source or group pairs from received SA messages. When the switch forwards the MSDP SA information, it does not store it in memory. Therefore, if a member joins a group soon after an SA message is received by the local RP, that member needs to wait until the next SA message to hear about the source. This delay is known as join latency.

Local RPs can send SA requests and get immediate responses for all active sources for a given group. By default, the switch does not send any SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member waits to receive the next periodic SA message.

If you want a new member of a group to learn the active multicast sources in a connected PIM sparse-mode domain that are sending to a group, configure the switch to send SA request messages to the specified MSDP peer when a new member joins a group.

**MSDP Benefits**

MSDP has these benefits:

- It breaks up the shared multicast distribution tree. You can make the shared tree local to your domain. Your local members join the local tree, and join messages for the shared tree never need to leave your domain.

- PIM sparse-mode domains can rely only on their own RPs, decreasing reliance on RPs in another domain. This increases security because you can prevent your sources from being known outside your domain.

- Domains with only receivers can receive data without globally advertising group membership.

- Global source multicast routing table state is not required, saving memory.
# How to Configure MSDP

## Default MSDP Configuration

MSDP is not enabled, and no default MSDP peer exists.

## Configuring a Default MSDP Peer

**Before you begin**

Configure an MSDP peer.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| configure terminal | Enters global configuration mode. |
| Example:           |         |
| Device# configure terminal | |

<p>| <strong>Step 3</strong>        |         |
| ip msdp default-peer ip-address | Defines a default peer from which to accept all MSDP SA messages. |
| name [prefix-list list] |         |
| Example:            |         |
| Router(config)# ip msdp default-peer 10.1.1.1 | • For ip-address | name, enter the IP address or Domain Name System (DNS) server name of the MSDP default peer. |
| prefix-list site-a  | (Optional) For prefix-list list, enter the list name that specifies the peer to be the default peer only for the listed prefixes. You can have multiple active default peers when you have a prefix list associated with each. |
|                     | When you enter multiple ip msdp default-peer commands with the prefix-list keyword, you use all the default peers at the same time for different RP prefixes. This syntax is typically used in a service provider cloud that connects stub site clouds. |
|                     | When you enter multiple ip msdp default-peer commands without the prefix-list keyword, a single active peer accepts all SA messages. If that peer fails, |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>the next configured default peer accepts all SA messages. This syntax is typically used at a stub site.</td>
</tr>
<tr>
<td>`ip prefix-list name [description string]</td>
<td>seq number</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# prefix-list site-a seq 3 permit 12 network length 128</code></td>
<td>• (Optional) For <code>description string</code>, enter a description of up to 80 characters to describe this prefix list.</td>
</tr>
<tr>
<td></td>
<td>• For <code>seq number</code>, enter the sequence number of the entry. The range is 1 to 4294967294.</td>
</tr>
<tr>
<td></td>
<td>• The <code>deny</code> keyword denies access to matching conditions.</td>
</tr>
<tr>
<td></td>
<td>• The <code>permit</code> keyword permits access to matching conditions.</td>
</tr>
<tr>
<td></td>
<td>• For <code>network length</code>, specify the network number and length (in bits) of the network mask that is permitted or denied.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Configures a description for the specified peer to make it easier to identify in a configuration or in <code>show</code> command output.</td>
</tr>
<tr>
<td>`ip msdp description {peer-name</td>
<td>peer-address} text`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# ip msdp description peer-name site-b</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# show running-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
Caching Source-Active State

If you want to sacrifice some memory in exchange for reducing the latency of the source information, you can configure the Device to cache SA messages. Perform the following steps to enable the caching of source/group pairs:

Follow these steps to enable the caching of source/group pairs:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><strong>enable</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Device&gt; enable</strong></td>
<td></td>
</tr>
</tbody>
</table>

Enables privileged EXEC mode.

- Enter your password if prompted.

| Step 2 | **configure terminal**  |
| Example: | **Device# configure terminal**  |

Enters global configuration mode.

| Step 3 | **ip msdp cache-sa-state [list access-list-number]**  |
| Example: | **Device(config)# ip msdp cache-sa-state 100**  |

Enables the caching of source/group pairs (create an SA state). Those pairs that pass the access list are cached.

For **list access-list-number**, the range is 100 to 199.

**Note** An alternative to this command is the **ip msdp sa-request** global configuration command, which causes the Device to send an SA request message to the MSDP peer when a new member for a group becomes active.

| Step 4 | **access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard**  |
| Example: | **Device(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255**  |

Creates an IP extended access list, repeating the command as many times as necessary.

- For **access-list-number**, the range is 100 to 199. Enter the same number created in Step 2.

- The **deny** keyword denies access if the conditions are matched. The **permit** keyword permits access if the conditions are matched.

- For **protocol**, enter **ip** as the protocol name.

- For **source**, enter the number of the network or host from which the packet is being sent.

- For **source-wildcard**, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.
### Requesting Source Information from an MSDP Peer

If you want a new member of a group to learn the active multicast sources in a connected PIM sparse-mode domain that are sending to a group, perform this task for the Device to send SA request messages to the specified MSDP peer when a new member joins a group. The peer replies with the information in its SA cache. If the peer does not have a cache configured, this command has no result. Configuring this feature reduces join latency but sacrifices memory.

Follow these steps to configure the Device to send SA request messages to the MSDP peer when a new member joins a group and wants to receive multicast traffic:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

Software Configuration Guide, Cisco IOS XE Denali 16.3.x (Catalyst 3650 Switches)
### Command or Action

<table>
<thead>
<tr>
<th>Step 2</th>
<th>configure terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
</tbody>
</table>

| Step 3 | ip msdp sa-request {ip-address | name} |
|--------|----------------------------------|
| Example: | Device(config)# ip msdp sa-request 171.69.1.1 |

<table>
<thead>
<tr>
<th>Step 4</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config)# end</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>show running-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# show running-config</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# copy running-config startup-config</td>
</tr>
</tbody>
</table>

### Purpose

Enters global configuration mode.

Configure the Device to send SA request messages to the specified MSDP peer.

For ip-address | name, enter the IP address or name of the MSDP peer from which the local Device requests SA messages when a new member for a group becomes active. Repeat the command for each MSDP peer that you want to supply with SA messages.

Returns to privileged EXEC mode.

Verifies your entries.

(Optional) Saves your entries in the configuration file.

### Controlling Source Information that Your Switch Originates

You can control the multicast source information that originates with your Device:

- Sources you advertise (based on your sources)
- Receivers of source information (based on knowing the requestor)

For more information, see the Redistributing Sources, on page 1494 and the Filtering Source-Active Request Messages, on page 1496.

### Redistributing Sources

SA messages originate on RPs to which sources have registered. By default, any source that registers with an RP is advertised. The A flag is set in the RP when a source is registered, which means the source is advertised in an SA unless it is filtered.
Follow these steps to further restrict which registered sources are advertised:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip msdp redistribute [list access-list-name] [asn aspath-access-list-number] [route-map map]</td>
<td>Configures which (S,G) entries from the multicast routing table are advertised in SA messages.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip msdp redistribute list 21</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Creates an IP standard access list, repeating the command as many times as necessary.</td>
</tr>
<tr>
<td>Use one of the following:</td>
<td></td>
</tr>
<tr>
<td>• access-list access-list-number</td>
<td></td>
</tr>
<tr>
<td>{deny</td>
<td>permit} source</td>
</tr>
<tr>
<td>[source-wildcard]</td>
<td></td>
</tr>
<tr>
<td>• access-list access-list-number</td>
<td></td>
</tr>
<tr>
<td>{deny</td>
<td>permit} protocol source source-wildcard destination destination-wildcard</td>
</tr>
</tbody>
</table>

- (Optional) **list access-list-name**—Enters the name or number of an IP standard or extended access list. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists. The access list controls which local sources are advertised and to which groups they send.

- (Optional) **asn aspath-access-list-number**—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the **ip as-path access-list** command.

- (Optional) **route-map map**—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the **ip as-path access-list** command.

The Device advertises (S,G) pairs according to the access list or autonomous system path access list.
Filtering Source-Active Request Messages

By default, only Device that are caching SA information can respond to SA requests. By default, such a Device honors all SA request messages from its MSDP peers and supplies the IP addresses of the active sources. However, you can configure the Device to ignore all SA requests from an MSDP peer. You can also honor only those SA request messages from a peer for groups described by a standard access list. If the groups in the access list pass, SA request messages are accepted. All other such messages from the peer for other groups are ignored.
To return to the default setting, use the **no ip msdp filter-sa-request {ip-address|name}** global configuration command.

Follow these steps to configure one of these options:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **enable** | Enables privileged EXEC mode.  
*Example:*  
Device> enable |
| **Step 2** | **configure terminal** | Enters global configuration mode.  
*Example:*  
Device# configure terminal |
| **Step 3** | Use one of the following:  
• ip msdp filter-sa-request {ip-address|name}  
• ip msdp filter-sa-request {ip-address|name}  
list access-list-number | Filters all SA request messages from the specified MSDP peer.  
or  
Filters SA request messages from the specified MSDP peer for groups that pass the standard access list. The access list describes a multicast group address. The range for the access-list-number is 1 to 99.  
*Example:*  
Device(config)# ip msdp filter sa-request 171.69.2.2 |
| **Step 4** | access-list access-list-number {deny | permit} source [source-wildcard] | Creates an IP standard access list, repeating the command as many times as necessary.  
*Example:*  
Device(config)# access-list 1 permit 192.4.22.0 0.0.0.255 |

Recall that the access list is always terminated by an implicit deny statement for everything.
### Controlling Source Information that Your Switch Forwards

By default, the Device forwards all SA messages it receives to all its MSDP peers. However, you can prevent outgoing messages from being forwarded to a peer by using a filter or by setting a time-to-live (TTL) value.

#### Using a Filter

By creating a filter, you can perform one of these actions:
- Filter all source/group pairs
- Specify an IP extended access list to pass only certain source/group pairs
- Filter based on match criteria in a route map

Follow these steps to apply a filter:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**  
Use one of the following:

- **ip msdp sa-filter out**
  ```plaintext
  {ip-address name}
  ```
- **ip msdp sa-filter out**
  ```plaintext
  {ip-address name}
  list access-list-number
  ```
- **ip msdp sa-filter out**
  ```plaintext
  {ip-address name}
  route-map map-tag
  ```

**Example:**

Device(config)# ip msdp sa-filter out switch.cisco.com

or

Device(config)# ip msdp sa-filter out list 100

or

Device(config)# ip msdp sa-filter out switch.cisco.com route-map 22

**Step 4**  
**access-list** access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard

**Example:**

Device(config)# access list 100 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1

(Optional) Creates an IP extended access list, repeating the command as many times as necessary.

- For **access-list-number**, enter the number specified in Step 2.
- The **deny** keyword denies access if the conditions are matched. The **permit** keyword permits access if the conditions are matched.
- For **protocol**, enter **ip** as the protocol name.
- For **source**, enter the number of the network or host from which the packet is being sent.
- For **source-wildcard**, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.
- For **destination**, enter the number of the network or host to which the packet is being sent.
Using TTL to Limit the Multicast Data Sent in SA Messages

You can use a TTL value to control what data is encapsulated in the first SA message for every source. Only multicast packets with an IP-header TTL greater than or equal to the \( ttl \) argument are sent to the specified MSDP peer. For example, you can limit internal traffic to a TTL of 8. If you want other groups to go to external locations, you must send those packets with a TTL greater than 8.

Follow these steps to establish a TTL threshold:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
Controlling Source Information that Your Switch Receives

By default, the Device receives all SA messages that its MSDP RPF peers send to it. However, you can control the source information that you receive from MSDP peers by filtering incoming SA messages. In other words, you can configure the Device to not accept them.

You can perform one of these actions:

- Filter all incoming SA messages from an MSDP peer
- Specify an IP extended access list to pass certain source/group pairs
- Filter based on match criteria in a route map

Follow these steps to apply a filter:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

---

**Note:**

- For *ip-address | name*, enter the IP address or name of the MSDP peer to which the TTL limitation applies.
- For *ttl*, enter the TTL value. The default is 0, which means all multicast data packets are forwarded to the peer until the TTL is exhausted. The range is 0 to 255.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**  
**Example:**  
Device# configure terminal

**Step 3**  
Use one of the following:  
- `ip msdp sa-filter in`  
  `{ip-address name}`  
- `ip msdp sa-filter in`  
  `{ip-address name}`  
  `list access-list-number`  
- `ip msdp sa-filter in`  
  `{ip-address name}`  
  `route-map map-tag`  

**Example:**  
Device(config)# ip msdp sa-filter in switch.cisco.com  
or  
Device(config)# ip msdp sa-filter in list 100  
or  
Device(config)# ip msdp sa-filter in switch.cisco.com route-map 22

**Step 4**  
access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard  

**Example:**  
Device(config)# access list 100 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1

(Optional) Creates an IP extended access list, repeating the command as many times as necessary.

- `access-list-number`, enter the number specified in Step 2.
- The `deny` keyword denies access if the conditions are matched. The `permit` keyword permits access if the conditions are matched.
- For `protocol`, enter `ip` as the protocol name.
- For `source`, enter the number of the network or host from which the packet is being sent.
**Purpose**

Command or Action | Purpose |
---|---|
**• For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.**

**• For destination, enter the number of the network or host to which the packet is being sent.**

**• For destination-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.**

Recall that the access list is always terminated by an implicit deny statement for everything.

**Step 5**

**end**

Example:

Device(config)# end

Returns to privileged EXEC mode.

**Step 6**

**show running-config**

Example:

Device# show running-config

Verifies your entries.

**Step 7**

**copy running-config startup-config**

Example:

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

---

**Configuring an MSDP Mesh Group**

An MSDP mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among one another. Any SA messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group. Thus, you reduce SA message flooding and simplify peer-RPF flooding. Use the `ip msdp mesh-group` global configuration command when there are multiple RPs within a domain. It is especially used to send SA messages across a domain. You can configure multiple mesh groups (with different names) in a single Device.

Follow these steps to create a mesh group:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables global configuration mode.</td>
</tr>
</tbody>
</table>

#### Step 2
**configure terminal**

**Example:**

Device# configure terminal

#### Step 3
**ip msdp mesh-group name {ip-address | name}**

**Example:**

Device(config)# ip msdp mesh-group 2 switch.cisco.com

- For `name`, enter the name of the mesh group.
- For `ip-address | name`, enter the IP address or name of the MSDP peer to be a member of the mesh group.

Repeat this procedure on each MSDP peer in the group.

#### Step 4
**end**

**Example:**

Device(config)# end

#### Step 5
**show running-config**

**Example:**

Device# show running-config

#### Step 6
**copy running-config startup-config**

**Example:**

Device# copy running-config startup-config

---

### Shutting Down an MSDP Peer

If you want to configure many MSDP commands for the same peer and you do not want the peer to become active, you can shut down the peer, configure it, and later bring it up. When a peer is shut down, the TCP connection is terminated and is not restarted. You can also shut down an MSDP session without losing configuration information for the peer.

Follow these steps to shut down a peer:
### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>- Enters privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Shuts down the specified MSDP peer without losing configuration information.</td>
</tr>
<tr>
<td>ip msdp shutdown {peer-name</td>
<td>peer address}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip msdp shutdown switch.cisco.com</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>

<td><strong>Step 6</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Including a Bordering PIM Dense-Mode Region in MSDP

You can configure MSDP on a Device that borders a PIM sparse-mode region with a dense-mode region. By default, active sources in the dense-mode region do not participate in MSDP.
We do not recommend using the **ip msdp border sa-address** global configuration command. It is better to configure the border router in the sparse-mode domain to proxy-register sources in the dense-mode domain to the RP of the sparse-domain domain and have the sparse-mode domain use standard MSDP procedures to advertise these sources.

The **ip msdp originator-id** global configuration command also identifies an interface to be used as the RP address. If both the **ip msdp border sa-address** and the **ip msdp originator-id** global configuration commands are configured, the address derived from the **ip msdp originator-id** command specifies the RP address.

Follow these steps to configure the border router to send SA messages for sources active in the dense-mode region to the MSDP peers:

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><em>enable</em></td>
<td><em>Enter your password if prompted.</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; <em>enable</em></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><em>configure terminal</em></td>
<td>Device# <em>configure terminal</em></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures the switch on the border between a dense-mode and sparse-mode region to send SA messages about active sources in the dense-mode region.</td>
</tr>
<tr>
<td><em>ip msdp border sa-address interface-id</em></td>
<td>For <em>interface-id</em>, specifies the interface from which the IP address is derived and used as the RP address in SA messages. The IP address of the interface is used as the Originator-ID, which is the RP field in the SA message.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <em>ip msdp border sa-address 0/1</em></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures which (S,G) entries from the multicast routing table are advertised in SA messages.</td>
</tr>
<tr>
<td><em>ip msdp redistribute [list access-list-name] [asn aspath-access-list-number] [route-map map]</em></td>
<td>For more information, see the <strong>Redistributing Sources</strong>, on page 1494.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# <em>ip msdp redistribute list 100</em></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><em>end</em></td>
<td>Device(config)# <em>end</em></td>
</tr>
</tbody>
</table>
### Configuring an Originating Address other than the RP Address

You can allow an MSDP speaker that originates an SA message to use the IP address of the interface as the RP address in the SA message by changing the Originator ID. You might change the Originator ID in one of these cases:

- If you configure a logical RP on multiple Device in an MSDP mesh group.
- If you have a Device that borders a PIM sparse-mode domain and a dense-mode domain. If a Device borders a dense-mode domain for a site, and sparse-mode is being used externally, you might want dense-mode sources to be known to the outside world. Because this Device is not an RP, it would not have an RP address to use in an SA message. Therefore, this command provides the RP address by specifying the address of the interface.

If both the `ip msdp border sa-address` and the `ip msdp originator-id` global configuration commands are configured, the address derived from the `ip msdp originator-id` command specifies the address of the RP.

Follow these steps to allow an MSDP speaker that originates an SA message to use the IP address on the interface as the RP address in the SA message:

### Configuration Examples for Configuring MSDP

#### Configuring a Default MSDP Peer: Example

This example shows a partial configuration of Router A and Router C in. Each of these ISPs have more than one customer (like the customer in ) who use default peering (no BGP or MBGP). In that case, they might have similar configurations. That is, they accept SAs only from a default peer if the SA is permitted by the corresponding prefix list.

**Router A**

```
Router(config)# ip msdp default-peer 10.1.1.1
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
```

**Router C**

```
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
```

#### Caching Source-Active State: Example

This example shows how to enable the cache state for all sources in 171.69.0.0/16 sending to groups 224.2.0.0/16:

```
Device(config)# ip msdp cache-sa-state 100
Device(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255
```
Requesting Source Information from an MSDP Peer: Example

This example shows how to configure the switch to send SA request messages to the MSDP peer at 171.69.1.1:

Device(config)# ip msdp sa-request 171.69.1.1

Controlling Source Information that Your Switch Originates: Example

This example shows how to configure the switch to filter SA request messages from the MSDP peer at 171.69.2.2. SA request messages from sources on network 192.4.22.0 pass access list 1 and are accepted; all others are ignored.

Device(config)# ip msdp filter sa-request 171.69.2.2 list 1
Device(config)# access-list 1 permit 192.4.22.0 0.0.0.255

Controlling Source Information that Your Switch Forwards: Example

This example shows how to allow only (S,G) pairs that pass access list 100 to be forwarded in an SA message to the peer named switch.cisco.com:

Device(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Device(config)# ip msdp sa-filter out switch.cisco.com list 100
Device(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.20 0 0.0.255.255

Controlling Source Information that Your Switch Receives: Example

This example shows how to filter all SA messages from the peer named switch.cisco.com:

Device(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Device(config)# ip msdp sa-filter in switch.cisco.com

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IP Unicast Routing

This module describes how to configure IP Version 4 (IPv4) unicast routing on the switch.

A switch stack operates and appears as a single router to the rest of the routers in the network. Basic routing functions like static routing are available with both the IP Base feature set and the IP Services feature set. To use advanced routing features and other routing protocols, you must have the IP Services feature set enabled on the standalone switch or on the active switch.

\[\text{Note}\]

In addition to IPv4 traffic, you can also enable IP Version 6 (IPv6) unicast routing and configure interfaces to forward IPv6 traffic if the switch or switch stack is running the IP Base or IP Services feature set.

Information About IP Routing

In some network environments, VLANs are associated with individual networks or subnetworks. In an IP network, each subnetwork is mapped to an individual VLAN. Configuring VLANs helps control the size of the broadcast domain and keeps local traffic local. However, network devices in different VLANs cannot communicate with one another without a Layer 3 device (router) to route traffic between the VLAN, referred to as inter-VLAN routing. You configure one or more routers to route traffic to the appropriate destination VLAN.

\[\text{Figure 92: Routing Topology Example}\]

This figure shows a basic routing topology. Switch A is in VLAN 10, and Switch B is in VLAN 20. The router has an interface in each VLAN.

When Host A in VLAN 10 needs to communicate with Host B in VLAN 10, it sends a packet addressed to that host. Switch A forwards the packet directly to Host B, without sending it to the router.

When Host A sends a packet to Host C in VLAN 20, Switch A forwards the packet to the router, which receives the traffic on the VLAN 10 interface. The router checks the routing table, finds the correct outgoing
interface, and forwards the packet on the VLAN 20 interface to Switch B. Switch B receives the packet and forwards it to Host C.

**Types of Routing**

Routers and Layer 3 switches can route packets in these ways:

- By using default routing
- By using preprogrammed static routes for the traffic
- By dynamically calculating routes by using a routing protocol

Default routing refers to sending traffic with a destination unknown to the router to a default outlet or destination.

Static unicast routing forwards packets from predetermined ports through a single path into and out of a network. Static routing is secure and uses little bandwidth, but does not automatically respond to changes in the network, such as link failures, and therefore, might result in unreachable destinations. As networks grow, static routing becomes a labor-intensive liability.

Switches running the LAN base feature set support 16 user-configured static routes, in addition to any default routes used for the management interface. The LAN base image supports static routing only on SVIs.

Dynamic routing protocols are used by routers to dynamically calculate the best route for forwarding traffic. There are two types of dynamic routing protocols:

- Routers using distance-vector protocols maintain routing tables with distance values of networked resources, and periodically pass these tables to their neighbors. Distance-vector protocols use one or a series of metrics for calculating the best routes. These protocols are easy to configure and use.
- Routers using link-state protocols maintain a complex database of network topology, based on the exchange of link-state advertisements (LSAs) between routers. LSAs are triggered by an event in the network, which speeds up the convergence time or time required to respond to these changes. Link-state protocols respond quickly to topology changes, but require greater bandwidth and more resources than distance-vector protocols.

Distance-vector protocols supported by the switch are Routing Information Protocol (RIP), which uses a single distance metric (cost) to determine the best path and Border Gateway Protocol (BGP), which adds a path vector mechanism. The switch also supports the Open Shortest Path First (OSPF) link-state protocol and Enhanced IGRP (EIGRP), which adds some link-state routing features to traditional Interior Gateway Routing Protocol (IGRP) to improve efficiency.

---

**Note**

On a switch or switch stack, the supported protocols are determined by the software running on the active switch. If the active switch is running the IP base feature set, only default routing, static routing and RIP are supported. If the switch is running the LAN base feature set, you can configure 16 static routes on SVIs. All other routing protocols require the IP services feature set.
IP Routing and Switch Stacks

A switch stack appears to the network as a single switch, regardless of which switch in the stack is connected to a routing peer.

The active switch performs these functions:

- It initializes and configures the routing protocols.
- It sends routing protocol messages and updates to other routers.
- It processes routing protocol messages and updates received from peer routers.
- It generates, maintains, and distributes the distributed Cisco Express Forwarding (dCEF) database to all stack members. The routes are programmed on all switches in the stack bases on this database.
- The MAC address of the active switch is used as the router MAC address for the whole stack, and all outside devices use this address to send IP packets to the stack.
- All IP packets that require software forwarding or processing go through the CPU of the active switch.

Stack members perform these functions:

- They act as routing standby switches, ready to take over in case they are elected as the new active switch if the active switch fails.
- They program the routes into hardware.

If a active switch fails, the stack detects that the active switch is down and elects one of the stack members to be the new active switch. During this period, except for a momentary interruption, the hardware continues to forward packets with no active protocols.

However, even though the switch stack maintains the hardware identification after a failure, the routing protocols on the router neighbors might flap during the brief interruption before the active switch restarts. Routing protocols such as OSPF and EIGRP need to recognize neighbor transitions. The router uses two levels of nonstop forwarding (NSF) to detect a switchover, to continue forwarding network traffic, and to recover route information from peer devices:

- NSF-aware routers tolerate neighboring router failures. After the neighbor router restarts, an NSF-aware router supplies information about its state and route adjacencies on request.
- NSF-capable routers support NSF. When they detect a active switch change, they rebuild routing information from NSF-aware or NSF-capable neighbors and do not wait for a restart.

The switch stack supports NSF-capable routing for OSPF and EIGRP.

Upon election, the new active switch performs these functions:

- It starts generating, receiving, and processing routing updates.
- It builds routing tables, generates the CEF database, and distributes it to stack members.
- It uses its MAC address as the router MAC address. To notify its network peers of the new MAC address, it periodically (every few seconds for 5 minutes) sends a gratuitous ARP reply with the new router MAC address.
If you configure the persistent MAC address feature on the stack and the active switch changes, the stack MAC address does not change for the configured time period. If the previous active switch rejoins the stack as a member switch during that time period, the stack MAC address remains the MAC address of the previous active switch.

**Note**

It attempts to determine the reachability of every proxy ARP entry by sending an ARP request to the proxy ARP IP address and receiving an ARP reply. For each reachable proxy ARP IP address, it generates a gratuitous ARP reply with the new router MAC address. This process is repeated for 5 minutes after a new active switch election.

**Note**

When a active switch is running the IP services feature set, the stack can run all supported protocols, including Open Shortest Path First (OSPF), and Enhanced IGRP (EIGRP). If the active switch fails and the new elected active switch is running the IP base or LAN base feature set, these protocols will no longer run in the stack.

**Caution**

Partitioning of the switch stack into two or more stacks might lead to undesirable behavior in the network.

If the switch is reloaded, then all the ports on that switch go down and there is a loss of traffic for the interfaces involved in routing, despite NSF/SSO capability.

### Classless Routing

By default, classless routing behavior is enabled on the Device when it is configured to route. With classless routing, if a router receives packets for a subnet of a network with no default route, the router forwards the packet to the best supernet route. A supernet consists of contiguous blocks of Class C address spaces used to simulate a single, larger address space and is designed to relieve the pressure on the rapidly depleting Class B address space.

In the figure, classless routing is enabled. When the host sends a packet to 120.20.4.1, instead of discarding the packet, the router forwards it to the best supernet route. If you disable classless routing and a router receives packets destined for a subnet of a network with no network default route, the router discards the packet.
Figure 93: IP Classless Routing

In the figure, the router in network 128.20.0.0 is connected to subnets 128.20.1.0, 128.20.2.0, and 128.20.3.0. If the host sends a packet to 120.20.4.1, because there is no network default route, the router discards the packet.

Figure 94: No IP Classless Routing

To prevent the Device from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing behavior.

Address Resolution

You can control interface-specific handling of IP by using address resolution. A device using IP can have both a local address or MAC address, which uniquely defines the device on its local segment or LAN, and a network address, which identifies the network to which the device belongs.
In a switch stack, network communication uses a single MAC address and the IP address of the stack.

The local address or MAC address is known as a data link address because it is contained in the data link layer (Layer 2) section of the packet header and is read by data link (Layer 2) devices. To communicate with a device on Ethernet, the software must learn the MAC address of the device. The process of learning the MAC address from an IP address is called address resolution. The process of learning the IP address from the MAC address is called reverse address resolution.

The Device can use these forms of address resolution:

- **Address Resolution Protocol (ARP)** is used to associate IP address with MAC addresses. Taking an IP address as input, ARP learns the associated MAC address and then stores the IP address/MAC address association in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests or replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP).

- **Proxy ARP** helps hosts with no routing tables learn the MAC addresses of hosts on other networks or subnets. If the Device (router) receives an ARP request for a host that is not on the same interface as the ARP request sender, and if the router has all of its routes to the host through other interfaces, it generates a proxy ARP packet giving its own local data link address. The host that sent the ARP request then sends its packets to the router, which forwards them to the intended host.

The Device also uses the Reverse Address Resolution Protocol (RARP), which functions the same as ARP does, except that the RARP packets request an IP address instead of a local MAC address. Using RARP requires a RARP server on the same network segment as the router interface. Use the `ip rarp-server address` interface configuration command to identify the server.

**Proxy ARP**

Proxy ARP, the most common method for learning about other routes, enables an Ethernet host with no routing information to communicate with hosts on other networks or subnets. The host assumes that all hosts are on the same local Ethernet and that they can use ARP to learn their MAC addresses. If a Device receives an ARP request for a host that is not on the same network as the sender, the Device evaluates whether it has the best route to that host. If it does, it sends an ARP reply packet with its own Ethernet MAC address, and the host that sent the request sends the packet to the Device, which forwards it to the intended host. Proxy ARP treats all networks as if they are local, and performs ARP requests for every IP address.

**ICMP Router Discovery Protocol**

Router discovery allows the Device to dynamically learn about routes to other networks using ICMP router discovery protocol (IRDP). IRDP allows hosts to locate routers. When operating as a client, the Device generates router discovery packets. When operating as a host, the Device receives router discovery packets. The Device can also listen to Routing Information Protocol (RIP) routing updates and use this information to infer locations of routers. The Device does not actually store the routing tables sent by routing devices; it merely keeps track of which systems are sending the data. The advantage of using IRDP is that it allows each router to specify both a priority and the time after which a device is assumed to be down if no further packets are received.
Each device discovered becomes a candidate for the default router, and a new highest-priority router is selected when a higher priority router is discovered, when the current default router is declared down, or when a TCP connection is about to time out because of excessive retransmissions.

**UDP Broadcast Packets and Protocols**

User Datagram Protocol (UDP) is an IP host-to-host layer protocol, as is TCP. UDP provides a low-overhead, connectionless session between two end systems and does not provide for acknowledgment of received datagrams. Network hosts occasionally use UDP broadcasts to find address, configuration, and name information. If such a host is on a network segment that does not include a server, UDP broadcasts are normally not forwarded. You can remedy this situation by configuring an interface on a router to forward certain classes of broadcasts to a helper address. You can use more than one helper address per interface.

You can specify a UDP destination port to control which UDP services are forwarded. You can specify multiple UDP protocols. You can also specify the Network Disk (ND) protocol, which is used by older diskless Sun workstations and the network security protocol SDNS.

By default, both UDP and ND forwarding are enabled if a helper address has been defined for an interface.

**Broadcast Packet Handling**

After configuring an IP interface address, you can enable routing and configure one or more routing protocols, or you can configure the way the Device responds to network broadcasts. A broadcast is a data packet destined for all hosts on a physical network. The Device supports two kinds of broadcasting:

- A directed broadcast packet is sent to a specific network or series of networks. A directed broadcast address includes the network or subnet fields.
- A flooded broadcast packet is sent to every network.

**Note**

You can also limit broadcast, unicast, and multicast traffic on Layer 2 interfaces by using the `storm-control` interface configuration command to set traffic suppression levels.

Routers provide some protection from broadcast storms by limiting their extent to the local cable. Bridges (including intelligent bridges), because they are Layer 2 devices, forward broadcasts to all network segments, thus propagating broadcast storms. The best solution to the broadcast storm problem is to use a single broadcast address scheme on a network. In most modern IP implementations, you can set the address to be used as the broadcast address. Many implementations, including the one in the Device, support several addressing schemes for forwarding broadcast messages.

**IP Broadcast Flooding**

You can allow IP broadcasts to be flooded throughout your internetwork in a controlled fashion by using the database created by the bridging STP. Using this feature also prevents loops. To support this capability, bridging must be configured on each interface that is to participate in the flooding. If bridging is not configured on an interface, it still can receive broadcasts. However, the interface never forwards broadcasts it receives, and the router never uses that interface to send broadcasts received on a different interface.
Packets that are forwarded to a single network address using the IP helper-address mechanism can be flooded. Only one copy of the packet is sent on each network segment.

To be considered for flooding, packets must meet these criteria. (Note that these are the same conditions used to consider packet forwarding using IP helper addresses.)

- The packet must be a MAC-level broadcast.
- The packet must be an IP-level broadcast.
- The packet must be a TFTP, DNS, Time, NetBIOS, ND, or BOOTP packet, or a UDP specified by the `ip forward-protocol udp` global configuration command.
- The time-to-live (TTL) value of the packet must be at least two.

A flooded UDP datagram is given the destination address specified with the `ip broadcast-address` interface configuration command on the output interface. The destination address can be set to any address. Thus, the destination address might change as the datagram propagates through the network. The source address is never changed. The TTL value is decremented.

When a flooded UDP datagram is sent out an interface (and the destination address possibly changed), the datagram is handed to the normal IP output routines and is, therefore, subject to access lists, if they are present on the output interface.

In the Device, the majority of packets are forwarded in hardware; most packets do not go through the Device CPU. For those packets that do go to the CPU, you can speed up spanning tree-based UDP flooding by a factor of about four to five times by using turbo-flooding. This feature is supported over Ethernet interfaces configured for ARP encapsulation.

## How to Configure IP Routing

By default, IP routing is disabled on the Device, and you must enable it before routing can take place.

In the following procedures, the specified interface must be one of these Layer 3 interfaces:

- A routed port: a physical port configured as a Layer 3 port by using the `no switchport` interface configuration command.

- A switch virtual interface (SVI): a VLAN interface created by using the `interface vlan vlan_id` global configuration command and by default a Layer 3 interface.

- An EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the `interface port-channel port-channel-number` global configuration command and binding the Ethernet interface into the channel group.

### Note

The switch does not support tunnel interfaces for unicast routed traffic.

All Layer 3 interfaces on which routing will occur must have IP addresses assigned to them.
A Layer 3 switch can have an IP address assigned to each routed port and SVI.

The number of routed ports and SVIs that you can configure is limited to 128, exceeding the recommended number and volume of features being implemented might impact CPU utilization because of hardware limitations.

Configuring routing consists of several main procedures:

- To support VLAN interfaces, create and configure VLANs on the Device or switch stack, and assign VLAN membership to Layer 2 interfaces. For more information, see the "Configuring VLANs" chapter.
- Configure Layer 3 interfaces.
- Enable IP routing on the switch.
- Assign IP addresses to the Layer 3 interfaces.
- Enable selected routing protocols on the switch.
- Configure routing protocol parameters (optional).

How to Configure IP Addressing

A required task for configuring IP routing is to assign IP addresses to Layer 3 network interfaces to enable the interfaces and allow communication with the hosts on those interfaces that use IP. The following sections describe how to configure various IP addressing features. Assigning IP addresses to the interface is required; the other procedures are optional.

- Default Addressing Configuration
- Assigning IP Addresses to Network Interfaces
- Configuring Address Resolution Methods
- Routing Assistance When IP Routing is Disabled
- Configuring Broadcast Packet Handling
- Monitoring and Maintaining IP Addressing

Default IP Addressing Configuration

<table>
<thead>
<tr>

| IP proxy ARP            | Enabled. |
| IP routing              | Disabled. |
| IP subnet-zero          | Disabled. |
Assigning IP Addresses to Network Interfaces

An IP address identifies a location to which IP packets can be sent. Some IP addresses are reserved for special uses and cannot be used for host, subnet, or network addresses. RFC 1166, “Internet Numbers,” contains the official description of IP addresses.

An interface can have one primary IP address. A mask identifies the bits that denote the network number in an IP address. When you use the mask to subnet a network, the mask is referred to as a subnet mask. To receive an assigned network number, contact your Internet service provider.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | **Command or Action**: enable  
Example:  
Device> enable |
|                   | Enables privileged EXEC mode. |
|                   | • Enter your password if prompted. |
| **Step 2**        | **Command or Action**: configure terminal  
Example:  
Device# configure terminal |
|                   | Enters global configuration mode. |
| **Step 3**        | **Command or Action**: interface interface-id  
Example:  
Device(config)# interface gigabitethernet 1/0/1 |
|                   | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| **Step 4**        | **Command or Action**: no switchport  
Example:  
Device(config-if)# no switchport |
|                   | Removes the interface from Layer 2 configuration mode (if it is a physical interface). |
| **Step 5**        | **Command or Action**: ip address ip-address subnet-mask  
Example:  
Device(config-if)# ip address 10.1.5.1 255.255.255.0 |
|                   | Configures the IP address and IP subnet mask. |
| **Step 6**        | **Command or Action**: no shutdown  
Example:  
Device(config-if)# no shutdown |
|                   | Enables the physical interface. |
| **Step 7**        | **Command or Action**: end  
Example:  
Device(config-if)# end |
|                   | Returns to privileged EXEC mode. |
Using Subnet Zero

Subnetting with a subnet address of zero is strongly discouraged because of the problems that can arise if a network and a subnet have the same addresses. For example, if network 131.108.0.0 is subnetted as 255.255.255.0, subnet zero would be written as 131.108.0.0, which is the same as the network address.

You can use the all ones subnet (131.108.255.0) and even though it is discouraged, you can enable the use of subnet zero if you need the entire subnet space for your IP address.

Use the **no ip subnet-zero** global configuration command to restore the default and disable the use of subnet zero.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>

<tr>
<td>Step 4 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 5 show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 6 copy running-config startup-config</td>
<td>Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Disabling Classless Routing

To prevent the Device from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing behavior.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Address Resolution Methods

You can perform the following tasks to configure address resolution.

#### Defining a Static ARP Cache

ARP and other address resolution protocols provide dynamic mapping between IP addresses and MAC addresses. Because most hosts support dynamic address resolution, you usually do not need to specify static ARP cache entries. If you must define a static ARP cache entry, you can do so globally, which installs a permanent entry in the ARP cache that the Device uses to translate IP addresses into MAC addresses. Optionally, you can also specify that the Device respond to ARP requests as if it were the owner of the specified IP address. If you do not want the ARP entry to be permanent, you can specify a timeout period for the ARP entry.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| configure terminal|         |
## Defining a Static ARP Cache

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# configure terminal</td>
<td>Associates an IP address with a MAC (hardware) address in the ARP cache, and specifies encapsulation type as one of these:</td>
</tr>
<tr>
<td><strong>Step 3</strong> <strong>arp</strong> ip-address hardware-address type</td>
<td><strong>arpa</strong>—ARP encapsulation for Ethernet interfaces</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip 10.1.5.1 c2f3.220a.12f4 arpa</td>
<td><strong>snap</strong>—Subnetwork Address Protocol encapsulation for Token Ring and FDDI interfaces</td>
</tr>
<tr>
<td><strong>arpa</strong>—ARP encapsulation for Ethernet interfaces</td>
<td><strong>sap</strong>—HP’s ARP type</td>
</tr>
<tr>
<td><strong>Step 4</strong> <strong>arpa</strong> ip-address hardware-address type [alias]</td>
<td>(Optional) Specifies that the switch respond to ARP requests as if it were the owner of the specified IP address.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip 10.1.5.3 d7f3.220d.12f5 arpa alias</td>
<td><strong>Step 5</strong> <strong>interface</strong> interface-id</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# interface gigabitethernet 1/0/1</td>
<td>Enters interface configuration mode, and specifies the interface to configure.</td>
</tr>
<tr>
<td><strong>Step 6</strong> <strong>arp</strong> timeout seconds</td>
<td>(Optional) Sets the length of time an ARP cache entry will stay in the cache. The default is 14400 seconds (4 hours). The range is 0 to 2147483 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# arp 20000</td>
<td><strong>Step 7</strong> end</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong> <strong>show interfaces</strong> [interface-id]</td>
<td>Verifies the type of ARP and the timeout value used on all interfaces or a specific interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show interfaces gigabitethernet 1/0/1</td>
<td><strong>Step 9</strong> <strong>show arp</strong></td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show arp</td>
<td>Views the contents of the ARP cache.</td>
</tr>
<tr>
<td><strong>Step 10</strong> <strong>show ip arp</strong></td>
<td>Views the contents of the ARP cache.</td>
</tr>
</tbody>
</table>
Setting ARP Encapsulation

By default, Ethernet ARP encapsulation (represented by the `arpa` keyword) is enabled on an IP interface. You can change the encapsulation methods to SNAP if required by your network.

To disable an encapsulation type, use the `no arpa` or `no arp snap` interface configuration command.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| Example:           |         |
| Device> enable     |         |
| **Step 2** configure terminal | Enters global configuration mode. |
| Example:           |         |
| Device# configure terminal |         |
| **Step 3** interface interface-id | Enters interface configuration mode, and specifies the Layer 3 interface to configure. |
| Example:           |         |
| Device(config)# interface gigabitethernet 1/0/2 |         |
| **Step 4** arp {arpa | snap} | Specifies the ARP encapsulation method:  
  • arpa — Address Resolution Protocol  
  • snap — Subnetwork Address Protocol |
| Example:           |         |
| Device(config-if)# arp arpa |         |
| **Step 5** end | Returns to privileged EXEC mode. |
| Example:           |         |
| Device(config)# end |         |
Enabling Proxy ARP

By default, the Device uses proxy ARP to help hosts learn MAC addresses of hosts on other networks or subnets.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Example: Device(config)# interface gigabitethernet 1/0/2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip proxy-arp</td>
<td>Enables proxy ARP on the interface.</td>
</tr>
<tr>
<td>Example: Device(config-if)# ip proxy-arp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Routing Assistance When IP Routing is Disabled

These mechanisms allow the Device to learn about routes to other networks when it does not have IP routing enabled:

- Proxy ARP
- Default Gateway
- ICMP Router Discovery Protocol (IRDP)

Proxy ARP

Proxy ARP is enabled by default. To enable it after it has been disabled, see the “Enabling Proxy ARP” section. Proxy ARP works as long as other routers support it.

Default Gateway

Another method for locating routes is to define a default router or default gateway. All non-local packets are sent to this router, which either routes them appropriately or sends an IP Control Message Protocol (ICMP) redirect message back, defining which local router the host should use. The Device caches the redirect messages and forwards each packet as efficiently as possible. A limitation of this method is that there is no means of detecting when the default router has gone down or is unavailable.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
ICMP Router Discovery Protocol (IRDP)

The only required task for IRDP routing on an interface is to enable IRDP processing on that interface. When enabled, the default parameters apply.

You can optionally change any of these parameters. If you change the `maxadvertinterval` value, the `holdtime` and `minadvertinterval` values also change, so it is important to first change the `maxadvertinterval` value, before manually changing either the `holdtime` or `minadvertinterval` values.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
<tr>
<td>3</td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
</tr>
<tr>
<td>4</td>
<td>ip irdp</td>
</tr>
<tr>

### Configuring Broadcast Packet Handling

Perform the tasks in these sections to enable these schemes:

- Enabling Directed Broadcast-to-Physical Broadcast Translation
- Forwarding UDP Broadcast Packets and Protocols
- Establishing an IP Broadcast Address
- Flooding IP Broadcasts

#### Enabling Directed Broadcast-to-Physical Broadcast Translation

By default, IP directed broadcasts are dropped; they are not forwarded. Dropping IP-directed broadcasts makes routers less susceptible to denial-of-service attacks.

You can enable forwarding of IP-directed broadcasts on an interface where the broadcast becomes a physical (MAC-layer) broadcast. Only those protocols configured by using the `ip forward-protocol` global configuration command are forwarded.

You can specify an access list to control which broadcasts are forwarded. When an access list is specified, only those IP packets permitted by the access list are eligible to be translated from directed broadcasts to physical broadcasts. For more information on access lists, see the “Configuring ACLs” chapter in the Security section.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  enable
  Example: |
  Enables privileged EXEC mode.
  - Enter your password if prompted. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; <strong>enable</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters interface configuration mode, and specifies the interface to configure.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# <strong>configure terminal</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>interface <strong>interface-id</strong></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# <strong>interface gigabitethernet 1/0/2</strong></td>
<td>Enables directed broadcast-to-physical broadcast translation on the interface. You can include an access list to control which broadcasts are forwarded. When an access list, only IP packets permitted by the access list can be translated.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><strong>exit</strong></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# <strong>exit</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>ip forward-protocol {udp [port]</td>
<td>nd</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# <strong>ip forward-protocol nd</strong></td>
<td>• <strong>udp</strong>—Forward UDP datagrams.</td>
</tr>
<tr>
<td></td>
<td>port: (Optional) Destination port that controls which UDP services are forwarded.</td>
</tr>
<tr>
<td></td>
<td>• <strong>nd</strong>—Forward ND datagrams.</td>
</tr>
<tr>
<td></td>
<td>• <strong>sdns</strong>—Forward SDNS datagrams</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td><strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# <strong>end</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td>show ip interface [<strong>interface-id</strong>]</td>
<td>Verifies the configuration on the interface or all interfaces</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# <strong>show ip interface</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td></td>
</tr>
<tr>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# <strong>show running-config</strong></td>
<td></td>
</tr>
</tbody>
</table>
Forwarding UDP Broadcast Packets and Protocols

If you do not specify any UDP ports when you configure the forwarding of UDP broadcasts, you are configuring the router to act as a BOOTP forwarding agent. BOOTP packets carry DHCP information.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip helper-address address</td>
<td>Enables forwarding and specifies the destination address for forwarding UDP broadcast packets, including BOOTP.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# ip helper address 10.1.10.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ip forward-protocol {udp [port]</td>
<td>nd</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.

```
Device# show running-config

Step 10  copy running-config startup-config

Example:
Device# copy running-config startup-config
```
### Establishing an IP Broadcast Address

The most popular IP broadcast address (and the default) is an address consisting of all ones (255.255.255.255). However, the Device can be configured to generate any form of IP broadcast address.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong>&lt;br&gt;Enables privileged EXEC mode.</td>
</tr>
<tr>

</tbody>
</table>
Monitoring and Maintaining IP Addressing

When the contents of a particular cache, table, or database have become or are suspected to be invalid, you can remove all its contents by using the `clear` privileged EXEC commands. The Table lists the commands for clearing contents.

**Table 108: Commands to Clear Caches, Tables, and Databases**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear arp-cache</td>
<td>Clears the IP ARP cache and the fast-switching cache.</td>
</tr>
<tr>
<td>clear host `name</td>
<td>*`</td>
</tr>
<tr>
<td>clear ip route `network [mask]</td>
<td>*`</td>
</tr>
</tbody>
</table>

You can display specific statistics, such as the contents of IP routing tables, caches, and databases; the reachability of nodes; and the routing path that packets are taking through the network. The Table lists the privileged EXEC commands for displaying IP statistics.

**Table 109: Commands to Display Caches, Tables, and Databases**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp</td>
<td>Displays the entries in the ARP table.</td>
</tr>
<tr>
<td>show hosts</td>
<td>Displays the default domain name, style of lookup service, name server hosts, and the cached list of hostnames and addresses.</td>
</tr>
<tr>
<td>show ip aliases</td>
<td>Displays IP addresses mapped to TCP ports (aliases).</td>
</tr>
<tr>
<td>show ip arp</td>
<td>Displays the IP ARP cache.</td>
</tr>
<tr>

<td>Displays the IP status of interfaces.</td>
</tr>
<tr>
<td>show ip irdp</td>
<td>Displays IRDP values.</td>
</tr>
<tr>
<td>show ip masks <code>address</code></td>
<td>Displays the masks used for network addresses and the number of subnets using each mask.</td>
</tr>
<tr>
<td>show ip redirects</td>
<td>Displays the address of a default gateway.</td>
</tr>
<tr>
<td>show ip route `address [mask]</td>
<td>[protocol]</td>
</tr>
<tr>
<td>show ip route summary</td>
<td>Displays the current state of the routing table in summary form.</td>
</tr>
</tbody>
</table>
# How to Configure IP Unicast Routing

## Enabling IP Unicast Routing

By default, the Device is in Layer 2 switching mode and IP routing is disabled. To use the Layer 3 capabilities of the Device, you must enable IP routing.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable | Enables privileged EXEC mode.  
Example:  
Device> enable |
| **Step 2** | configure terminal | Enters global configuration mode.  
Example:  
Device# configure terminal |
| **Step 3** | ip routing | Enables IP routing.  
Example:  
Device(config)# ip routing |
| **Step 4** | end | Returns to privileged EXEC mode.  
Example:  
Device(config)# end |
| **Step 5** | show running-config | Verifies your entries.  
Example:  
Device# show running-config |
| **Step 6** | copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
Example:  
Device# copy running-config startup-config |
Example of Enabling IP Routing

This example shows how to enable IP routing using RIP as the routing protocol:

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip routing
Device(config)# router rip
Device(config-router)# network 10.0.0.0
Device(config-router)# end

What to Do Next

You can now set up parameters for the selected routing protocols as described in these sections:

- RIP
- OSPF
- EIGRP
- BGP
- Unicast Reverse Path Forwarding
- Protocol-Independent Features (optional)

Information About RIP

The Routing Information Protocol (RIP) is an interior gateway protocol (IGP) created for use in small, homogeneous networks. It is a distance-vector routing protocol that uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. The protocol is documented in RFC 1058. You can find detailed information about RIP in IP Routing Fundamentals, published by Cisco Press.

Note

RIP is supported in the IP Base Network Essentials feature set.

Using RIP, the Device sends routing information updates (advertisements) every 30 seconds. If a router does not receive an update from another router for 180 seconds or more, it marks the routes served by that router as unusable. If there is still no update after 240 seconds, the router removes all routing table entries for the non-updating router.

RIP uses hop counts to rate the value of different routes. The hop count is the number of routers that can be traversed in a route. A directly connected network has a hop count of zero; a network with a hop count of 16 is unreachable. This small range (0 to 15) makes RIP unsuitable for large networks.

If the router has a default network path, RIP advertises a route that links the router to the pseudonetwork 0.0.0.0. The 0.0.0.0 network does not exist; it is treated by RIP as a network to implement the default routing feature. The Device advertises the default network if a default was learned by RIP or if the router has a gateway of last resort and RIP is configured with a default metric. RIP sends updates to the interfaces in specified networks. If an interface’s network is not specified, it is not advertised in any RIP update.
Summary Addresses and Split Horizon

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature usually optimizes communication among multiple routers, especially when links are broken.

How to Configure RIP

Configuring Basic RIP Parameters

To configure RIP, you enable RIP routing for a network and optionally configure other parameters. On the Device, RIP configuration commands are ignored until you configure the network number.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable  
Example:  
Device> enable | Enables privileged EXEC mode.  
- Enter your password if prompted. |
| Step 2 | configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| Step 3 | ip routing  
Example:  
Device(config)# ip routing | Enables IP routing. (Required only if IP routing is disabled.) |
| Step 4 | router rip  
Example:  
Device(config)# router rip | Enables a RIP routing process, and enter router configuration mode. |
| Step 5 | network network number  
Example:  
Device(config-router)# network 12.0.0.0 | Associates a network with a RIP routing process. You can specify multiple network commands. RIP routing updates are sent and received through interfaces only on these networks.  
**Note**  
You must configure a network number for the RIP commands to take effect. |
| Step 6 | neighbor ip-address  
Example:  
Device(config-router)# neighbor 10.2.5.1 | (Optional) Defines a neighboring router with which to exchange routing information. This step allows routing updates from RIP (normally a broadcast protocol) to reach nonbroadcast networks. |
| Step 7 | offset-list [access-list number | name] [in | out] offset [type number]  
Example:  
Device(config-router)# offset-list 103 in 10 | (Optional) Applies an offset list to routing metrics to increase incoming and outgoing metrics to routes learned through RIP. You can limit the offset list with an access list or an interface. |
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 8    | timers basic *update invalid holddown flush* | (Optional) Adjusts routing protocol timers. Valid ranges for all timers are 0 to 4294967295 seconds.  
  - *update*—The time between sending routing updates. The default is 30 seconds.  
  - *invalid*—The timer after which a route is declared invalid. The default is 180 seconds.  
  - *holddown*—The time before a route is removed from the routing table. The default is 180 seconds.  
  - *flush*—The amount of time for which routing updates are postponed. The default is 240 seconds. |
| 9    | version {1 | 2} | (Optional) Configures the switch to receive and send only RIP Version 1 or RIP Version 2 packets. By default, the switch receives Version 1 and 2 but sends only Version 1. You can also use the interface commands `ip rip {send | receive} version 1 | 2 | 12` to control what versions are used for sending and receiving on interfaces. |
| 10   | no auto summary | (Optional) Disables automatic summarization. By default, the switch summarizes subprefixes when crossing classful network boundaries. Disable summarization (RIP Version 2 only) to advertise subnet and host routing information to classful network boundaries. |
| 11   | output-delay delay | (Optional) Adds interpacket delay for RIP updates sent. By default, packets in a multiple-packet RIP update have no delay added between packets. If you are sending packets to a lower-speed device, you can add an interpacket delay in the range of 8 to 50 milliseconds. |
| 12   | end | Returns to privileged EXEC mode. |
| 13   | show ip protocols | Verifies your entries. |
| 14   | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
## Configuring RIP Authentication

RIP Version 1 does not support authentication. If you are sending and receiving RIP Version 2 packets, you can enable RIP authentication on an interface. The key chain specifies the set of keys that can be used on the interface. If a key chain is not configured, no authentication is performed, not even the default.

The Device supports two modes of authentication on interfaces for which RIP authentication is enabled: plain text and MD5. The default is plain text.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `enable` | Enables privileged EXEC mode.  
*Example:* Enter your password if prompted. |
| | `Example:` | |
| | `Device> enable` | |
| **Step 2** | `configure terminal` | Enters global configuration mode. |
| | `Example:` | |
| | `Device# configure terminal` | |
| **Step 3** | `interface interface-id` | Enters interface configuration mode, and specifies the interface to configure. |
| | `Example:` | |
| | `Device(config)# interface gigabitethernet 1/0/1` | |
| **Step 4** | `ip rip authentication key-chain name-of-chain` | Enables RIP authentication. |
| | `Example:` | |
| | `Device(config-if)# ip rip authentication key-chain trees` | |
| **Step 5** | `ip rip authentication mode {text | md5}` | Configures the interface to use plain text authentication (the default) or MD5 digest authentication. |
| | `Example:` | |
| | `Device(config-if)# ip rip authentication mode md5` | |
| **Step 6** | `end` | Returns to privileged EXEC mode. |
| | `Example:` | |
| | `Device(config)# end` | |
| **Step 7** | `show running-config` | Verifies your entries. |
| | `Example:` | |
### Configuring Summary Addresses and Split Horizon

**Note**
In general, disabling split horizon is not recommended unless you are certain that your application requires it to properly advertise routes.

If you want to configure an interface running RIP to advertise a summarized local IP address pool on a network access server for dial-up clients, use the `ip summary-address rip` interface configuration command.

**Note**
If split horizon is enabled, neither autosummary nor interface IP summary addresses are advertised.

**Procedure**

<table>

</tbody>
</table>
Configuration Example for Summary Addresses and Split Horizon

In this example, the major net is 10.0.0.0. The summary address 10.2.0.0 overrides the autosummary address of 10.0.0.0 so that 10.2.0.0 is advertised out interface Gigabit Ethernet port 2, and 10.0.0.0 is not advertised. In the example, if the interface is still in Layer 2 mode (the default), you must enter a `no switchport` interface configuration command before entering the `ip address` interface configuration command.

Note

If split horizon is enabled, neither autosummary nor interface summary addresses (those configured with the `ip summary-address rip` router configuration command) are advertised.

```
Device(config)# router rip
Device(config-router)# interface gigabitethernet1/0/2
Device(config-if)# ip address 10.1.5.1 255.255.255.0
Device(config-if)# ip summary-address rip 10.2.0.0 255.255.0.0
Device(config-if)# no ip split-horizon
Device(config-if)# exit
Device(config)# router rip
Device(config-router)# network 10.0.0.0
Device(config-router)# neighbor 2.2.2.2 peer-group mygroup
Device(config-router)# end
```

Information About OSPF

OSPF is an Interior Gateway Protocol (IGP) designed expressly for IP networks, supporting IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets. The Cisco implementation supports RFC 1253, OSPF management information base (MIB).

Note

OSPF is supported in IP Base.

The Cisco implementation conforms to the OSPF Version 2 specifications with these key features:

- Definition of stub areas is supported.
- Routes learned through any IP routing protocol can be redistributed into another IP routing protocol. At the intradomain level, this means that OSPF can import routes learned through EIGRP and RIP. OSPF routes can also be exported into RIP.
- Plain text and MD5 authentication among neighboring routers within an area is supported.
- Configurable routing interface parameters include interface output cost, retransmission interval, interface transmit delay, router priority, router dead and hello intervals, and authentication key.
- Virtual links are supported.
- Not-so-stubby-areas (NSSAs) per RFC 1587 are supported.
OSPF typically requires coordination among many internal routers, area border routers (ABRs) connected to multiple areas, and autonomous system boundary routers (ASBRs). The minimum configuration would use all default parameter values, no authentication, and interfaces assigned to areas. If you customize your environment, you must ensure coordinated configuration of all routers.

It is not recommended to use OSPF aggressive timers. An OSPF hello timer of less than five seconds is considered aggressive. OSPF and other routing protocols are handled at normal priority and sub second scheduling under high CPU usage conditions in not guaranteed.

BFD control packets are handled with high priority by a separate queue and bfd packets are processed in a high priority thread. BFD is preferred over OSPF for faster convergence.

### OSPF Nonstop Forwarding

The Device or switch stack supports two levels of nonstop forwarding (NSF):

- OSPF NSF Awareness, on page 1549
- OSPF NSF Capability, on page 1549

#### OSPF NSF Awareness

When the neighboring router is NSF-capable, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router crashing and the backup RP taking over, or while the primary RP is manually reloaded for a non-disruptive software upgrade.

This feature cannot be disabled.

#### OSPF NSF Capability

supports the OSPFv2 NSF IETF format in addition to the OSPFv2 NSF Cisco format that is supported in earlier releases. For information about this feature, see: NSF—OSPF (RFC 3623 OSPF Graceful Restart).

The also supports OSPF NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change. When a stack master change occurs in an OSPF NSF-capable stack, the new stack master must do two things to resynchronize its link-state database with its OSPF neighbors:

- Release the available OSPF neighbors on the network without resetting the neighbor relationship.
- Reacquire the contents of the link-state database for the network.

After a stack master change, the new master sends an OSPF NSF signal to neighboring NSF-aware devices. A device recognizes this signal to mean that it should not reset the neighbor relationship with the stack. As the NSF-capable stack master receives signals from other routes on the network, it begins to rebuild its neighbor list.

When the neighbor relationships are reestablished, the NSF-capable stack master resynchronizes its database with its NSF-aware neighbors, and routing information is exchanged between the OSPF neighbors. The new stack master uses this routing information to remove stale routes, to update the routing information database (RIB), and to update the forwarding information base (FIB) with the new information. The OSPF protocols then fully converge.
OSPF NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers non-NSF aware neighbors on a network segment, it disables NSF capabilities for that segment. Other network segments where all devices are NSF-aware or NSF-capable continue to provide NSF capabilities.

Use the `nsf` OSPF routing configuration command to enable OSPF NSF routing. Use the `show ip ospf` privileged EXEC command to verify that it is enabled.

For more information, see *Cisco Nonstop Forwarding*:

### OSPF Area Parameters

You can optionally configure several OSPF area parameters. These parameters include authentication for password-based protection against unauthorized access to an area, stub areas, and not-so-stubby-areas (NSSAs). Stub areas are areas into which information on external routes is not sent. Instead, the area border router (ABR) generates a default external route into the stub area for destinations outside the autonomous system (AS). An NSSA does not flood all LSAs from the core into the area, but can import AS external routes within the area by redistribution.

Route summarization is the consolidation of advertised addresses into a single summary route to be advertised by other areas. If network numbers are contiguous, you can use the `area range` router configuration command to configure the ABR to advertise a summary route that covers all networks in the range.

### Other OSPF Parameters

You can optionally configure other OSPF parameters in router configuration mode.

- **Route summarization:** When redistributing routes from other protocols. Each route is advertised individually in an external LSA. To help decrease the size of the OSPF link state database, you can use the `summary-address` router configuration command to advertise a single router for all the redistributed routes included in a specified network address and mask.

- **Virtual links:** In OSPF, all areas must be connected to a backbone area. You can establish a virtual link in case of a backbone-continuity break by configuring two Area Border Routers as endpoints of a virtual link. Configuration information includes the identity of the other virtual endpoint (the other ABR) and the nonbackbone link that the two routers have in common (the transit area). Virtual links cannot be configured through a stub area.

- **Default route:** When you specifically configure redistribution of routes into an OSPF routing domain, the route automatically becomes an autonomous system boundary router (ASBR). You can force the ASBR to generate a default route into the OSPF routing domain.

- **Domain Name Server (DNS) names for use in all OSPF `show` privileged EXEC command displays makes it easier to identify a router than displaying it by router ID or neighbor ID.

- **Default Metrics:** OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. The metric is calculated as `ref-bw` divided by `bandwidth`, where `ref` is 10 by default, and `bandwidth (bw)` is specified by the `bandwidth` interface configuration command. For multiple links with high bandwidth, you can specify a larger number to differentiate the cost on those links.
• Administrative distance is a rating of the trustworthiness of a routing information source, an integer between 0 and 255, with a higher value meaning a lower trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored. OSPF uses three different administrative distances: routes within an area (interarea), routes to another area (interarea), and routes from another routing domain learned through redistribution (external). You can change any of the distance values.

• Passive interfaces: Because interfaces between two devices on an Ethernet represent only one network segment, to prevent OSPF from sending hello packets for the sending interface, you must configure the sending device to be a passive interface. Both devices can identify each other through the hello packet for the receiving interface.

• Route calculation timers: You can configure the delay time between when OSPF receives a topology change and when it starts the shortest path first (SPF) calculation and the hold time between two SPF calculations.

• Log neighbor changes: You can configure the router to send a syslog message when an OSPF neighbor state changes, providing a high-level view of changes in the router.

**LSA Group Pacing**

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, check-summing, and aging functions for more efficient router use. This feature is enabled by default with a 4-minute default pacing interval, and you will not usually need to modify this parameter. The optimum group pacing interval is inversely proportional to the number of LSAs the router is refreshing, check-summing, and aging. For example, if you have approximately 10,000 LSAs in the database, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

**Loopback Interfaces**

OSPF uses the highest IP address configured on the interfaces as its router ID. If this interface is down or removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces. If a loopback interface is configured with an IP address, OSPF uses this IP address as its router ID, even if other interfaces have higher IP addresses. Because loopback interfaces never fail, this provides greater stability. OSPF automatically prefers a loopback interface over other interfaces, and it chooses the highest IP address among all loopback interfaces.

### Configuring Basic OSPF Parameters

To enable OSPF, create an OSPF routing process, specify the range of IP addresses to associate with the routing process, and assign area IDs to be associated with that range. For switches running the IP services image, you can configure either the Cisco OSPFv2 NSF format or the IETF OSPFv2 NSF format.

#### Procedure

<td>Example: Device# copy running-config startup-config</td>
</tr>
</tbody>
</table>
## Configuring OSPF Interfaces

You can use the `ip ospf` interface configuration commands to modify interface-specific OSPF parameters. You are not required to modify any of these parameters, but some interface parameters (hello interval, dead interval, and authentication key) must be consistent across all routers in an attached network. If you modify these parameters, be sure all routers in the network have compatible values.

### Note

The `ip ospf` interface configuration commands are all optional.

### Procedure

<table>

<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Device(config)# interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) Explicitly specifies the cost of sending a packet on the interface.</td>
</tr>
<tr>
<td><code>ip ospf cost</code></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Device(config-if)# ip ospf 8</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Specifies the number of seconds between link state advertisement transmissions. The range is 1 to 65535 seconds. The default is 5 seconds.</td>
</tr>
<tr>
<td><code>ip ospf retransmit-interval seconds</code></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Device(config-if)# ip ospf transmit-interval 10</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Sets the estimated number of seconds to wait before sending a link state update packet. The range is 1 to 65535 seconds. The default is 1 second.</td>
</tr>
<tr>
<td><code>ip ospf transmit-delay seconds</code></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Device(config-if)# ip ospf transmit-delay 2</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>(Optional) Sets priority to help find the OSPF designated router for a network. The range is from 0 to 255. The default is 1.</td>
</tr>
<tr>
<td><code>ip ospf priority number</code></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Device(config-if)# ip ospf priority 5</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Sets the number of seconds between hello packets sent on an OSPF interface. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td><code>ip ospf hello-interval seconds</code></td>
<td>Example:</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>

**Step 8**  
`ip ospf hello-interval 12`  
(Optional) Sets the number of seconds after the last device hello packet was seen before its neighbors declare the OSPF router to be down. The value must be the same for all nodes on a network. The range is 1 to 65535 seconds. The default is 4 times the hello interval.

**Step 9**  
`ip ospf dead-interval seconds`  
Example:  
`Device(config-if)# ip ospf dead-interval 8`  
(Optional) Assign a password to be used by neighboring OSPF routers. The password can be any string of keyboard-entered characters up to 8 bytes in length. All neighboring routers on the same network must have the same password to exchange OSPF information.

**Step 10**  
`ip ospf authentication-key key`  
Example:  
`Device(config-if)# ip ospf authentication-key password`  
(Optional) Enables MDS authentication.  
- `keyid`—An identifier from 1 to 255.  
- `key`—An alphanumeric password of up to 16 bytes.

**Step 11**  
`ip ospf message digest-key keyid md5 key`  
Example:  
`Device(config-if)# ip ospf message digest-key 16 md5 your1pass`  
(Optional) Block flooding of OSPF LSA packets to the interface. By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives.

**Step 12**  
`end`  
Example:  
`Device(config)# end`  
Returns to privileged EXEC mode.

**Step 13**  
`show ip ospf interface [interface-name]`  
Example:  
`Device# show ip ospf interface`  
Displays OSPF-related interface information.

**Step 14**  
`show ip ospf neighbor detail`  
Example:  
`Device# show ip ospf neighbor detail`  
Displays NSF awareness status of neighbor switch. The output matches one of these examples:  
- **Options is 0x52**  
  - **LLS Options is 0x1 (LR)**  
  When both of these lines appear, the neighbor switch is NSF aware.  
- **Options is 0x42**—This means the neighbor switch is not NSF aware.
### Configuring OSPF Area Parameters

#### Before you begin

Note

The OSPF area router configuration commands are all optional.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>router ospf</code> <code>process-id</code></td>
<td>Enables OSPF routing, and enter router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>router ospf 109</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>area area-id</code> <code>authentication</code></td>
<td>(Optional) Allow password-based protection against unauthorized access to the identified area. The identifier can be either a decimal value or an IP address.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# <code>area 1 authentication</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>area area-id</code> <code>authentication message-digest</code></td>
<td>(Optional) Enables MD5 authentication on the area.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# <code>area 1 authentication message-digest</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>area area-id</code> <code>stub</code> <code>[no-summary]</code></td>
<td>(Optional) Define an area as a stub area. The no-summary keyword prevents an ABR from sending summary link advertisements into the stub area.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# <code>area 1 stub</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring OSPF Area Parameters

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 6** | area area-id nssa [no-redistribution] [default-information-originate] [no-summary] | (Optional) Defines an area as a not-so-stubby-area. Every router within the same area must agree that the area is NSSA. Select one of these keywords:  
  - **no-redistribution** — Select when the router is an NSSA ABR and you want the distribute command to import routes into normal areas, but not into the NSSA.  
  - **default-information-originate** — Select on an ABR to allow importing type 7 LSAs into the NSSA.  
  - **no-redistribution** — Select to not send summary LSAs into the NSSA. |
| **Example:** | Device(config-router)# area 1 nssa default-information-originate |
| **Step 7** | area area-id range address mask | (Optional) Specifies an address range for which a single route is advertised. Use this command only with area border routers. |
| **Example:** | Device(config-router)# area 1 range 255.240.0.0 |
| **Step 8** | end | Returns to privileged EXEC mode. |
| **Example:** | Device(config)# end |
| **Step 9** | show ip ospf [process-id] | Displays information about the OSPF routing process in general or for a specific process ID to verify configuration. |
| **Example:** | Device# show ip ospf |
| **Step 10** | show ip ospf [process-id [area-id]] database | Displays lists of information related to the OSPF database for a specific router. |
| **Example:** | Device# show ip osfp database |
| **Step 11** | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| **Example:** | Device# copy running-config startup-config |

Device(config)# end

### Step 5
show ip interface  
**Example:**  
Device# show ip interface

### Step 6
copy running-config startup-config  
**Example:**  
Device# copy running-config startup-config

---

### Monitoring OSPF

You can display specific statistics such as the contents of IP routing tables, caches, and databases.

**Table 112: Show IP OSPF Statistics Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip ospf [process-id]</code></td>
<td>Displays general information about OSPF routing processes.</td>
</tr>
</tbody>
</table>
Configuration Examples for OSPF

Example: Configuring Basic OSPF Parameters

This example shows how to configure an OSPF routing process and assign it a process number of 109:

```
Device(config)# router ospf 109
Device(config-router)# network 131.108.0.0 255.255.255.0 area 24
```

Information About EIGRP

Enhanced IGRP (EIGRP) is a Cisco proprietary enhanced version of the IGRP. EIGRP uses the same distance vector algorithm and distance information as IGRP; however, the convergence properties and the operating efficiency of EIGRP are significantly improved.

The convergence technology employs an algorithm referred to as the Diffusing Update Algorithm (DUAL), which guarantees loop-free operation at every instant throughout a route computation and allows all devices
involved in a topology change to synchronize at the same time. Routers that are not affected by topology changes are not involved in recomputations.

IP EIGRP provides increased network width. With RIP, the largest possible width of your network is 15 hops. Because the EIGRP metric is large enough to support thousands of hops, the only barrier to expanding the network is the transport-layer hop counter. EIGRP increments the transport control field only when an IP packet has traversed 15 routers and the next hop to the destination was learned through EIGRP. When a RIP route is used as the next hop to the destination, the transport control field is incremented as usual.

**EIGRP Features**

EIGRP offers these features:

- Fast convergence.
- Incremental updates when the state of a destination changes, instead of sending the entire contents of the routing table, minimizing the bandwidth required for EIGRP packets.
- Less CPU usage because full update packets need not be processed each time they are received.
- Protocol-independent neighbor discovery mechanism to learn about neighboring routers.
- Variable-length subnet masks (VLSMs).
- Arbitrary route summarization.
- EIGRP scales to large networks.

**EIGRP Components**

EIGRP has these four basic components:

- Neighbor discovery and recovery is the process that routers use to dynamically learn of other routers on their directly attached networks. Routers must also discover when their neighbors become unreachable or inoperative. Neighbor discovery and recovery is achieved with low overhead by periodically sending small hello packets. As long as hello packets are received, the Cisco IOS software can learn that a neighbor is alive and functioning. When this status is determined, the neighboring routers can exchange routing information.

- The reliable transport protocol is responsible for guaranteed, ordered delivery of EIGRP packets to all neighbors. It supports intermixed transmission of multicast and unicast packets. Some EIGRP packets must be sent reliably, and others need not be. For efficiency, reliability is provided only when necessary. For example, on a multiaccess network that has multicast capabilities (such as Ethernet), it is not necessary to send hellos reliably to all neighbors individually. Therefore, EIGRP sends a single multicast hello with an indication in the packet informing the receivers that the packet need not be acknowledged. Other types of packets (such as updates) require acknowledgment, which is shown in the packet. The reliable transport has a provision to send multicast packets quickly when there are unacknowledged packets pending. Doing so helps ensure that convergence time remains low in the presence of varying speed links.

- The DUAL finite state machine embodies the decision process for all route computations. It tracks all routes advertised by all neighbors. DUAL uses the distance information (known as a metric) to select efficient, loop-free paths. DUAL selects routes to be inserted into a routing table based on feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to
a destination that is guaranteed not to be part of a routing loop. When there are no feasible successors, but there are neighbors advertising the destination, a recomputation must occur. This is the process whereby a new successor is determined. The amount of time it takes to recompute the route affects the convergence time. Recomputation is processor-intensive; it is advantageous to avoid recomputation if it is not necessary. When a topology change occurs, DUAL tests for feasible successors. If there are feasible successors, it uses any it finds to avoid unnecessary recomputation.

• The protocol-dependent modules are responsible for network layer protocol-specific tasks. An example is the IP EIGRP module, which is responsible for sending and receiving EIGRP packets that are encapsulated in IP. It is also responsible for parsing EIGRP packets and informing DUAL of the new information received. EIGRP asks DUAL to make routing decisions, but the results are stored in the IP routing table. EIGRP is also responsible for redistributing routes learned by other IP routing protocols.

| Note | To enable EIGRP, the Device or stack master must be running the |

## EIGRP Nonstop Forwarding

The Device stack supports two levels of EIGRP nonstop forwarding:

- EIGRP NSF Awareness

- EIGRP NSF Capability

## EIGRP NSF Awareness

The supports EIGRP NSF Awareness for IPv4. When the neighboring router is NSF-capable, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade. This feature cannot be disabled.

## EIGRP NSF Capability

The supports EIGRP Cisco NSF routing to speed up convergence and to eliminate traffic loss after a stack master change.

The also supports EIGRP NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change. When an EIGRP NSF-capable stack master restarts or a new stack master starts up and NSF restarts, the Device has no neighbors, and the topology table is empty. The Device must bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables without interrupting the traffic directed toward the Device stack. EIGRP peer routers maintain the routes learned from the new stack master and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the new stack master uses a new Restart (RS) bit in the EIGRP packet header to show the restart. When the neighbor receives this, it synchronizes the stack in its peer list and maintains the adjacency with the stack. The neighbor then sends its topology table to the stack master with the RS bit set to show that it is NSF-aware and is aiding the new stack master.

If at least one of the stack peer neighbors is NSF-aware, the stack master receives updates and rebuilds its database. Each NSF-aware neighbor sends an end of table (EOT) marker in the last update packet to mark the end of the table content. The stack master recognizes the convergence when it receives the EOT marker, and
it then begins sending updates. When the stack master has received all EOT markers from its neighbors or when the NSF converge timer expires, EIGRP notifies the routing information database (RIB) of convergence and floods its topology table to all NSF-aware peers.

**EIGRP Stub Routing**

The EIGRP stub routing feature, available in all feature sets, reduces resource utilization by moving routed traffic closer to the end user.

---

**Note**

The IP Base feature set contains EIGRP stub routing capability, which only advertises connected or summary routes from the routing tables to other device in the network. The device uses EIGRP stub routing at the access layer to eliminate the need for other types of routing advertisements. For enhanced capability and complete EIGRP routing, the device must be running the IP Base feature set. On a device running the IP base feature set, if you try to configure multi-VRF-CE and EIGRP stub routing at the same time, the configuration is not allowed. IPv6 EIGRP stub routing is not supported with the IP base feature set.

In a network using EIGRP stub routing, the only allowable route for IP traffic to the user is through a device that is configured with EIGRP stub routing. The device sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote routers to use EIGRP and to configure only the device as a stub. Only specified routes are propagated from the device. The device responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In the figure given below, device B is configured as an EIGRP stub router. Devices A and C are connected to the rest of the WAN. Device B advertises connected, static, redistribution, and summary routes to Device A and C. Device B does not advertise any routes learned from Device A (and the reverse).

*Figure 95: EIGRP Stub Router Configuration*
How to Configure EIGRP

To create an EIGRP routing process, you must enable EIGRP and associate networks. EIGRP sends updates to the interfaces in the specified networks. If you do not specify an interface network, it is not advertised in any EIGRP update.

Note

If you have routers on your network that are configured for IGRP, and you want to change to EIGRP, you must designate transition routers that have both IGRP and EIGRP configured. In these cases, perform Steps 1 through 3 in the next section and also see the “Configuring Split Horizon” section. You must use the same AS number for routes to be automatically redistributed.

Default EIGRP Configuration

Table 113: Default EIGRP Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto summary</td>

### Configuring Basic EIGRP Parameters

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config)# router eigrp 10</td>
<td>to other EIGRP routers and is used to tag routing information.</td>
</tr>
</tbody>
</table>

**Step 3**

**nsf**

**Example:**

Device(config)# nsf

(Optional) Enables EIGRP NSF. Enter this command on the stack master and on all of its peers.

**Step 4**

**network network-number**

**Example:**

Device(config)# network 192.168.0.0

Associate networks with an EIGRP routing process. EIGRP sends updates to the interfaces in the specified networks.

**Step 5**

**eigrp log-neighbor-changes**

**Example:**

Device(config)# eigrp log-neighbor-changes

(Optional) Enables logging of EIGRP neighbor changes to monitor routing system stability.

**Step 6**

**metric weights tos k1 k2 k3 k4 k5**

**Example:**

Device(config)# metric weights 0 2 0 2 0 0

(Optional) Adjust the EIGRP metric. Although the defaults have been carefully set to provide excellent operation in most networks, you can adjust them.

**Caution** Setting metrics is complex and is not recommended without guidance from an experienced network designer.

**Step 7**

**offset-list [access-list number | name] [in | out] offset [type number]**

**Example:**

Device(config)# offset-list 21 out 10

(Optional) Applies an offset list to routing metrics to increase incoming and outgoing metrics to routes learned through EIGRP. You can limit the offset list with an access list or an interface.

**Step 8**

**auto-summary**

**Example:**

Device(config)# auto-summary

(Optional) Enables automatic summarization of subnet routes into network-level routes.

**Step 9**

**ip summary-address eigrp autonomous-system-number address mask**

**Example:**

Device(config)# ip summary-address eigrp 1 192.168.0.0 255.255.0.0

(Optional) Configures a summary aggregate.

**Step 10**

**end**

**Example:**

Returns to privileged EXEC mode.
Purpose

Command or Action

Device(config)# end

Step 11

show ip protocols

Example:

Device# show ip protocols

Verifies your entries.

For NSF awareness, the output shows:

*** IP Routing is NSF aware *** EIGRP NSF enabled

Step 12

copy running-config startup-config

Example:

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

Configuring EIGRP Interfaces

Other optional EIGRP parameters can be configured on an interface basis.

<td>Example:</td>
<td>Device(config-if)# ip authentication key-chain eigrp 105 chain1</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>exit</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# exit</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Identify a key chain and enter key-chain configuration mode. Match the name configured in Step 4.</td>
</tr>
<tr>
<td>key chain name-of-chain</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# key chain chain1</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>In key-chain configuration mode, identify the key number.</td>
</tr>
<tr>
<td>key number</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-keychain)# key 1</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>In key-chain key configuration mode, identify the key string.</td>
</tr>
<tr>
<td>key-string text</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-keychain-key)# key-string key1</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>(Optional) Specifies the time period during which the key can be received.</td>
</tr>
<tr>
<td>accept-lifetime start-time {infinite</td>
<td>end-time</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-keychain-key)# accept-lifetime 13:30:00 Jan 25 2011 duration 7200</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>(Optional) Specifies the time period during which the key can be sent.</td>
</tr>
<tr>
<td>send-lifetime start-time {infinite</td>
<td>end-time</td>
</tr>
</tbody>
</table>
Purpose

Command or Action | Purpose
--- | ---
**Example:** Device(config-keychain-key)# send-lifetime 14:00:00 Jan 25 2011 duration 3600 | The start-time and end-time syntax can be either `hh:mm:ss Month date year` or `hh:mm:ss date Month year`. The default is forever with the default start-time and the earliest acceptable date as January 1, 1993. The default end-time and duration is infinite.

**Step 11** end | Returns to privileged EXEC mode.

**Example:** Device(config)# end

**Step 12** show key chain | Displays authentication key information.

**Example:** Device# show key chain

**Step 13** copy running-config startup-config | (Optional) Saves your entries in the configuration file.

**Example:** Device# copy running-config startup-config

---

**Monitoring and Maintaining EIGRP**

You can delete neighbors from the neighbor table. You can also display various EIGRP routing statistics. The table given below lists the privileged EXEC commands for deleting neighbors and displaying statistics.

**Table 114: IP EIGRP Clear and Show Commands**

<table>

</table>
Information About BGP

The Border Gateway Protocol (BGP) is an exterior gateway protocol used to set up an interdomain routing system that guarantees the loop-free exchange of routing information between autonomous systems. Autonomous systems are made up of routers that operate under the same administration and that run Interior Gateway Protocols (IGPs), such as RIP or OSPF, within their boundaries and that interconnect by using an Exterior Gateway Protocol (EGP). BGP Version 4 is the standard EGP for interdomain routing in the Internet. The protocol is defined in RFCs 1163, 1267, and 1771.

BGP Network Topology

Routers that belong to the same autonomous system (AS) and that exchange BGP updates run internal BGP (IBGP), and routers that belong to different autonomous systems and that exchange BGP updates run external BGP (EBGP). Most configuration commands are the same for configuring EBGP and IBGP. The difference is that the routing updates are exchanged either between autonomous systems (EBGP) or within an AS (IBGP). The figure given below shows a network that is running both EBGP and IBGP.

Figure 96: EBGP, IBGP, and Multiple Autonomous Systems

Before exchanging information with an external AS, BGP ensures that networks within the AS can be reached by defining internal BGP peering among routers within the AS and by redistributing BGP routing information to IGPs that run within the AS, such as IGRP and OSPF.

Routers that run a BGP routing process are often referred to as BGP speakers. BGP uses the Transmission Control Protocol (TCP) as its transport protocol (specifically port 179). Two BGP speakers that have a TCP connection to each other for exchanging routing information are known as peers or neighbors. In the above figure, Routers A and B are BGP peers, as are Routers B and C and Routers C and D. The routing information is a series of AS numbers that describe the full path to the destination network. BGP uses this information to construct a loop-free map of autonomous systems.

The network has these characteristics:

- Routers A and B are running EBGP, and Routers B and C are running IBGP. Note that the EBGP peers are directly connected and that the IBGP peers are not. As long as there is an IGP running that allows the two neighbors to reach one another, IBGP peers do not have to be directly connected.
• All BGP speakers within an AS must establish a peer relationship with each other. That is, the BGP speakers within an AS must be fully meshed logically. BGP4 provides two techniques that reduce the requirement for a logical full mesh: confederations and route reflectors.

• AS 200 is a transit AS for AS 100 and AS 300—that is, AS 200 is used to transfer packets between AS 100 and AS 300.

BGP peers initially exchange their full BGP routing tables and then send only incremental updates. BGP peers also exchange keepalive messages (to ensure that the connection is up) and notification messages (in response to errors or special conditions).

In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (the autonomous system path), and a list of other path attributes. The primary function of a BGP system is to exchange network reachability information, including information about the list of AS paths, with other BGP systems. This information can be used to determine AS connectivity, to prune routing loops, and to enforce AS-level policy decisions.

A router or Device running Cisco IOS does not select or use an IBGP route unless it has a route available to the next-hop router and it has received synchronization from an IGP (unless IGP synchronization is disabled). When multiple routes are available, BGP bases its path selection on attribute values. See the “Configuring BGP Decision Attributes” section for information about BGP attributes.

BGP Version 4 supports classless interdomain routing (CIDR) so you can reduce the size of your routing tables by creating aggregate routes, resulting in supernets. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes.

Nonstop Forwarding Awareness

The BGP NSF Awareness feature is supported for IPv4 in the . To enable this feature with BGP routing, you need to enable Graceful Restart. When the neighboring router is NSF-capable, and this feature is enabled, the Layer 3 Device continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

Information About BGP Routing

To enable BGP routing, you establish a BGP routing process and define the local network. Because BGP must completely recognize the relationships with its neighbors, you must also specify a BGP neighbor.

BGP supports two kinds of neighbors: internal and external. Internal neighbors are in the same AS; external neighbors are in different autonomous systems. External neighbors are usually adjacent to each other and share a subnet, but internal neighbors can be anywhere in the same AS.

The switch supports the use of private AS numbers, usually assigned by service providers and given to systems whose routes are not advertised to external neighbors. The private AS numbers are from 64512 to 65535. You can configure external neighbors to remove private AS numbers from the AS path by using the neighbor remove-private-as router configuration command. Then when an update is passed to an external neighbor, if the AS path includes private AS numbers, these numbers are dropped.

If your AS will be passing traffic through it from another AS to a third AS, it is important to be consistent about the routes it advertises. If BGP advertised a route before all routers in the network had learned about the route through the IGP, the AS might receive traffic that some routers could not yet route. To prevent this from happening, BGP must wait until the IGP has propagated information across the AS so that BGP is
synchronized with the IGP. Synchronization is enabled by default. If your AS does not pass traffic from one AS to another AS, or if all routers in your autonomous systems are running BGP, you can disable synchronization, which allows your network to carry fewer routes in the IGP and allows BGP to converge more quickly.

Routing Policy Changes

Routing policies for a peer include all the configurations that might affect inbound or outbound routing table updates. When you have defined two routers as BGP neighbors, they form a BGP connection and exchange routing information. If you later change a BGP filter, weight, distance, version, or timer, or make a similar configuration change, you must reset the BGP sessions so that the configuration changes take effect.

There are two types of reset, hard reset and soft reset. Cisco IOS Releases 12.1 and later support a soft reset without any prior configuration. To use a soft reset without preconfiguration, both BGP peers must support the soft route refresh capability, which is advertised in the OPEN message sent when the peers establish a TCP session. A soft reset allows the dynamic exchange of route refresh requests and routing information between BGP routers and the subsequent re-advertisement of the respective outbound routing table.

- When soft reset generates inbound updates from a neighbor, it is called dynamic inbound soft reset.
- When soft reset sends a set of updates to a neighbor, it is called outbound soft reset.

A soft inbound reset causes the new inbound policy to take effect. A soft outbound reset causes the new local outbound policy to take effect without resetting the BGP session. As a new set of updates is sent during outbound policy reset, a new inbound policy can also take effect.

The table given below lists the advantages and disadvantages hard reset and soft reset.

<table>
<thead>
<tr>
<th>Type of Reset</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hard reset</td>
<td>No memory overhead</td>
<td>The prefixes in the BGP, IP, and FIB tables provided by the neighbor are lost. Not recommended.</td>
</tr>
<tr>
<td>Outbound soft reset</td>

<td>Does not reset inbound routing table updates.</td>
</tr>
<tr>
<td>Dynamic inbound soft reset</td>
<td>Does not clear the BGP session and cache</td>
<td>Does not require storing of routing table updates and has no memory overhead</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Both BGP routers must support the route refresh capability (in Cisco IOS Release 12.1 and later).</td>
</tr>
</tbody>
</table>

BGP Decision Attributes

When a BGP speaker receives updates from multiple autonomous systems that describe different paths to the same destination, it must choose the single best path for reaching that destination. When chosen, the selected path is entered into the BGP routing table and propagated to its neighbors. The decision is based on the value of attributes that the update contains and other BGP-configurable factors.
When a BGP peer learns two EBGP paths for a prefix from a neighboring AS, it chooses the best path and inserts that path in the IP routing table. If BGP multipath support is enabled and the EBGP paths are learned from the same neighboring autonomous systems, instead of a single best path, multiple paths are installed in the IP routing table. Then, during packet switching, per-packet or per-destination load-balancing is performed among the multiple paths. The **maximum-paths** router configuration command controls the number of paths allowed.

These factors summarize the order in which BGP evaluates the attributes for choosing the best path:

1. If the path specifies a next hop that is inaccessible, drop the update. The BGP next-hop attribute, automatically determined by the software, is the IP address of the next hop that is going to be used to reach a destination. For EBGP, this is usually the IP address of the neighbor specified by the `neighbor remote-as` router configuration command. You can disable next-hop processing by using route maps or the `neighbor next-hop-self` router configuration command.

2. Prefer the path with the largest weight (a Cisco proprietary parameter). The weight attribute is local to the router and not propagated in routing updates. By default, the weight attribute is 32768 for paths that the router originates and zero for other paths. Routes with the largest weight are preferred. You can use access lists, route maps, or the `neighbor weight` router configuration command to set weights.

3. Prefer the route with the highest local preference. Local preference is part of the routing update and exchanged among routers in the same AS. The default value of the local preference attribute is 100. You can set local preference by using the `bgp default local-preference` router configuration command or by using a route map.

4. Prefer the route that was originated by BGP running on the local router.

5. Prefer the route with the shortest AS path.

6. Prefer the route with the lowest origin type. An interior route or IGP is lower than a route learned by EGP, and an EGP-learned route is lower than one of unknown origin or learned in another way.

7. Prefer the route with the lowest multi-exit discriminator (MED) metric attribute if the neighboring AS is the same for all routes considered. You can configure the MED by using route maps or by using the `default-metric` router configuration command. When an update is sent to an IBGP peer, the MED is included.

8. Prefer the external (EBGP) path over the internal (IBGP) path.

9. Prefer the route that can be reached through the closest IGP neighbor (the lowest IGP metric). This means that the router will prefer the shortest internal path within the AS to reach the destination (the shortest path to the BGP next-hop).

10. If the following conditions are all true, insert the route for this path into the IP routing table:
    Both the best route and this route are external.
    Both the best route and this route are from the same neighboring autonomous system.
    Maximum-paths is enabled.

11. If multipath is not enabled, prefer the route with the lowest IP address value for the BGP router ID. The router ID is usually the highest IP address on the router or the loopback (virtual) address, but might be implementation-specific.
Route Maps

Within BGP, route maps can be used to control and to modify routing information and to define the conditions by which routes are redistributed between routing domains. Each route map has a name that identifies the route map (map tag) and an optional sequence number.

BGP Filtering

You can filter BGP advertisements by using AS-path filters, such as the as-path access-list global configuration command and the neighbor filter-list router configuration command. You can also use access lists with the neighbor distribute-list router configuration command. Distribute-list filters are applied to network numbers. See the “Controlling Advertising and Processing in Routing Updates” section for information about the distribute-list command.

You can use route maps on a per-neighbor basis to filter updates and to modify various attributes. A route map can be applied to either inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates. On both inbound and outbound updates, matching is supported based on AS path, community, and network numbers. Autonomous system path matching requires the match as-path access-list route-map command, community based matching requires the match community-list route-map command, and network-based matching requires the ip access-list global configuration command.

Prefix List for BGP Filtering

You can use prefix lists as an alternative to access lists in many BGP route filtering commands, including the neighbor distribute-list router configuration command. The advantages of using prefix lists include performance improvements in loading and lookup of large lists, incremental update support, easier CLI configuration, and greater flexibility.

Filtering by a prefix list involves matching the prefixes of routes with those listed in the prefix list, as when matching access lists. When there is a match, the route is used. Whether a prefix is permitted or denied is based upon these rules:

- An empty prefix list permits all prefixes.
- An implicit deny is assumed if a given prefix does not match any entries in a prefix list.
- When multiple entries of a prefix list match a given prefix, the sequence number of a prefix list entry identifies the entry with the lowest sequence number.

By default, sequence numbers are generated automatically and incremented in units of five. If you disable the automatic generation of sequence numbers, you must specify the sequence number for each entry. You can specify sequence values in any increment. If you specify increments of one, you cannot insert additional entries into the list; if you choose very large increments, you might run out of values.

BGP Community Filtering

One way that BGP controls the distribution of routing information based on the value of the COMMUNITIES attribute. The attribute is a way to groups destinations into communities and to apply routing decisions based on the communities. This method simplifies configuration of a BGP speaker to control distribution of routing information.
A community is a group of destinations that share some common attribute. Each destination can belong to multiple communities. AS administrators can define to which communities a destination belongs. By default, all destinations belong to the general Internet community. The community is identified by the COMMUNITIES attribute, an optional, transitive, global attribute in the numerical range from 1 to 4294967200. These are some predefined, well-known communities:

- **internet**—Advertise this route to the Internet community. All routers belong to it.
- **no-export**—Do not advertise this route to EBGP peers.
- **no-advertise**—Do not advertise this route to any peer (internal or external).
- **local-as**—Do not advertise this route to peers outside the local autonomous system.

Based on the community, you can control which routing information to accept, prefer, or distribute to other neighbors. A BGP speaker can set, append, or modify the community of a route when learning, advertising, or redistributing routes. When routes are aggregated, the resulting aggregate has a COMMUNITIES attribute that contains all communities from all the initial routes.

You can use community lists to create groups of communities to use in a match clause of a route map. As with an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

### BGP Neighbors and Peer Groups

Often many BGP neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and to make updating more efficient. When you have configured many peers, we recommend this approach.

To configure a BGP peer group, you create the peer group, assign options to the peer group, and add neighbors as peer group members. You configure the peer group by using the `neighbor` router configuration commands. By default, peer group members inherit all the configuration options of the peer group, including the remote-as (if configured), version, update-source, out-route-map, out-filter-list, out-dist-list, minimum-advertisement-interval, and next-hop-self. All peer group members also inherit changes made to the peer group. Members can also be configured to override the options that do not affect outbound updates.

### Aggregate Routes

Classless interdomain routing (CIDR) enables you to create aggregate routes (or supernets) to minimize the size of routing tables. You can configure aggregate routes in BGP either by redistributing an aggregate route into BGP or by creating an aggregate entry in the BGP routing table. An aggregate address is added to the BGP table when there is at least one more specific entry in the BGP table.

### Routing Domain Confederations

One way to reduce the IBGP mesh is to divide an autonomous system into multiple subautonomous systems and to group them into a single confederation that appears as a single autonomous system. Each autonomous system is fully meshed within itself and has a few connections to other autonomous systems in the same confederation. Even though the peers in different autonomous systems have EBGP sessions, they exchange routing information as if they were IBGP peers. Specifically, the next hop, MED, and local preference information is preserved. You can then use a single IGP for all of the autonomous systems.
BGP Route Reflectors

BGP requires that all of the IBGP speakers be fully meshed. When a router receives a route from an external neighbor, it must advertise it to all internal neighbors. To prevent a routing information loop, all IBPG speakers must be connected. The internal neighbors do not send routes learned from internal neighbors to other internal neighbors.

With route reflectors, all IBGP speakers need not be fully meshed because another method is used to pass learned routes to neighbors. When you configure an internal BGP peer to be a route reflector, it is responsible for passing IBGP learned routes to a set of IBGP neighbors. The internal peers of the route reflector are divided into two groups: client peers and nonclient peers (all the other routers in the autonomous system). A route reflector reflects routes between these two groups. The route reflector and its client peers form a cluster. The nonclient peers must be fully meshed with each other, but the client peers need not be fully meshed. The clients in the cluster do not communicate with IBGP speakers outside their cluster.

When the route reflector receives an advertised route, it takes one of these actions, depending on the neighbor:

- A route from an external BGP speaker is advertised to all clients and nonclient peers.
- A route from a nonclient peer is advertised to all clients.
- A route from a client is advertised to all clients and nonclient peers. Hence, the clients need not be fully meshed.

Usually a cluster of clients have a single route reflector, and the cluster is identified by the route reflector router ID. To increase redundancy and to avoid a single point of failure, a cluster might have more than one route reflector. In this case, all route reflectors in the cluster must be configured with the same 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster. All the route reflectors serving a cluster should be fully meshed and should have identical sets of client and nonclient peers.

Route Dampening

Route flap dampening is a BGP feature designed to minimize the propagation of flapping routes across an internetwork. A route is considered to be flapping when it is repeatedly available, then unavailable, then available, then unavailable, and so on. When route dampening is enabled, a numeric penalty value is assigned to a route when it flaps. When a route’s accumulated penalties reach a configurable limit, BGP suppresses advertisements of the route, even if the route is running. The reuse limit is a configurable value that is compared with the penalty. If the penalty is less than the reuse limit, a suppressed route that is up is advertised again.

Dampening is not applied to routes that are learned by IBGP. This policy prevents the IBGP peers from having a higher penalty for routes external to the AS.

How to Configure BGP

Default BGP Configuration

The table given below shows the basic default BGP configuration.
<table>
<thead>
<tr>
<th><strong>Feature</strong></th>
<th><strong>Default Setting</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregate address</td>
<td>Disabled: None defined.</td>
</tr>
<tr>
<td>AS path access list</td>
<td>None defined.</td>
</tr>
<tr>
<td>Auto summary</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>
| Best path                         | • The router considers *as-path* in choosing a route and does not compare similar routes from external BGP peers.  

  • Compare router ID: Disabled.  

| BGP community list                | • Number: None defined. When you permit a value for the community number, the list defaults to an implicit deny for everything else that has not been permitted.  

  • Format: Cisco default format (32-bit number).  

| BGP confederation identifier/peers | • Identifier: None configured.  

  • Peers: None identified.  

| BGP Fast external fallover        | Enabled.                                                                           |
| BGP local preference              | 100. The range is 0 to 4294967295 with the higher value preferred.                 |
| BGP network                       | None specified; no backdoor route advertised.                                       |
| BGP route dampening               | Disabled by default. When enabled:  

  • Half-life is 15 minutes.  

  • Re-use is 750 (10-second increments).  

  • Suppress is 2000 (10-second increments).  

  • Max-suppress-time is 4 times half-life; 60 minutes.  

| BGP router ID                     | The IP address of a loopback interface if one is configured or the highest IP address configured for a physical interface on the router.  

| Default information originate (protocol or network redistribution) | Disabled.  

| Default metric                   | Built-in, automatic metric translations.  

**Table 116: Default BGP Configuration**
### Default BGP Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
</table>
| **Distance**                     | • External route administrative distance: 20 (acceptable values are from 1 to 255).  
                                  | • Internal route administrative distance: 200 (acceptable values are from 1 to 255).  
                                  | • Local route administrative distance: 200 (acceptable values are from 1 to 255).                                                          |
| **Distribute list**              | • In (filter networks received in updates): Disabled.  
                                  | • Out (suppress networks from being advertised in updates): Disabled.                                                                     |
| **Internal route redistribution**| Disabled.                                                                                                                                 |
| **IP prefix list**               | None defined.                                                                                                                                   |
| **Multi exit discriminator (MED)**| • Always compare: Disabled. Does not compare MEDs for paths from neighbors in different autonomous systems.  
                                  | • Best path compare: Disabled.  
                                  | • MED missing as worst path: Disabled.  
<pre><code>                              | • Deterministic MED comparison is disabled.                                                                                              |
</code></pre>
<table>

</table>
| NSF\(^a\) Awareness | Disabled\(^2\). If enabled, allows Layer 3 switches to continue forwarding packets from a neighboring NSF-capable router during hardware or software changes.
### Enabling BGP Routing

#### Before you begin

**Note**
To enable BGP, the switch or stack master must be running the IP services feature set.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip routing</strong></td>
<td>Enables IP routing.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# ip routing</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>router bgp autonomous-system</strong></td>
<td>Enables a BGP routing process, assign it an AS number, and enter router configuration mode. The AS number can be from 1 to 65535, with 64512 to 65535 designated as private autonomous numbers.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# router bgp 45000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>network network-number [mask network-mask] [route-map route-map-name]</strong></td>
<td>Configures a network as local to this AS, and enter it in the BGP table.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# network 10.108.0.0</td>
<td></td>
</tr>
</tbody>
</table>

---

6 Nonstop Forwarding
7 NSF Awareness can be enabled for IPv4 on switches with the license by enabling Graceful Restart.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 5</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} remote-as number`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device(config)# neighbor 10.108.1.2 remote-as 65200</td>
</tr>
<tr>
<td>Step 6</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} remove-private-as`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device(config)# neighbor 172.16.2.33 remove-private-as</td>
</tr>
<tr>
<td>Step 7</td>
<td><code>synchronization</code></td>
<td>(Optional) Enables synchronization between BGP and an IGP.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device(config)# synchronization</td>
</tr>
<tr>
<td>Step 8</td>
<td><code>auto-summary</code></td>
<td>(Optional) Enables automatic network summarization. When a subnet is redistributed from an IGP into BGP, only the network route is inserted into the BGP table.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device(config)# auto-summary</td>
</tr>
<tr>
<td>Step 9</td>
<td><code>bgp graceful-restart</code></td>
<td>(Optional) Enables NSF awareness on switch. By default, NSF awareness is disabled.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device(config)# bgp graceful-start</td>
</tr>
<tr>
<td>Step 10</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device(config)# end</td>
</tr>
<tr>
<td>Step 11</td>
<td><code>show ip bgp network network-number</code></td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device# show ip bgp network 10.108.0.0</td>
</tr>
<tr>
<td>Step 12</td>
<td><code>show ip bgp neighbor</code></td>
<td>Verifies that NSF awareness (Graceful Restart) is enabled on the neighbor. If NSF awareness is enabled on the switch and the neighbor, this message appears: Graceful Restart Capability: advertised and received</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>Device# show ip bgp neighbor</td>
</tr>
</tbody>
</table>
Managing Routing Policy Changes

To learn if a BGP peer supports the route refresh capability and to reset the BGP session:

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
show ip bgp neighbors  
Example:  
Device# show ip bgp neighbors | Displays whether a neighbor supports the route refresh capability. When supported, this message appears for the router:  
*Received route refresh capability from peer.* |
| **Step 2**  
clear ip bgp {* | address | peer-group-name}  
Example:  
Device# clear ip bgp * | Resets the routing table on the specified connection.  
- Enter an asterisk (*) to specify that all connections be reset.  
- Enter an IP address to specify the connection to be reset.  
- Enter a peer group name to reset the peer group. |
| **Step 3**  
clear ip bgp {* | address | peer-group-name} soft out  
Example:  
Device# clear ip bgp * soft out | (Optional) Performs an outbound soft reset to reset the inbound routing table on the specified connection. Use this command if route refresh is supported.  
- Enter an asterisk (*) to specify that all connections be reset.  
- Enter an IP address to specify the connection to be reset.  
- Enter a peer group name to reset the peer group. |
| **Step 4**  
show ip bgp  
Example:  
Device# show ip bgp | Verifies the reset by checking information about the routing table and about BGP neighbors. |
### Purpose

Command or Action | Purpose
---|---
**Verifiestheresetbycheckinginformationabouttherouting tableandaboutBGPneighbors.**

| Step 5 | show ip bgp neighbors  
*Example:*  
Device# show ip bgp neighbors |  
*Verifies the reset by checking information about the routing table and about BGP neighbors.*

### Configuring BGP Decision Attributes

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>
<td>bgp bestpath med missing-as-worst</td>
<td>(Optional) Configures the switch to consider a missing MED as having a value of infinity, making the path without a MED value the least desirable path.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-router)# bgp bestpath med missing-as-worst</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>bgp always-compare med</td>
<td>(Optional) Configures the switch to compare MEDs for paths from neighbors in different autonomous systems. By default, MED comparison is only done among paths in the same AS.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-router)# bgp always-compare-med</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>bgp bestpath med confed</td>
<td>(Optional) Configures the switch to consider the MED in choosing a path from among those advertised by different subautonomous systems within a confederation.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-router)# bgp bestpath med confed</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>bgp deterministic med</td>
<td>(Optional) Configures the switch to consider the MED variable when choosing among routes advertised by different peers in the same AS.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-router)# bgp deterministic med</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>bgp default local-preference <em>value</em></td>
<td>(Optional) Change the default local preference value. The range is 0 to 4294967295; the default value is 100. The highest local preference value is preferred.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-router)# bgp default local-preference 200</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>maximum-paths <em>number</em></td>
<td>(Optional) Configures the number of paths to be added to the IP routing table. The default is to only enter the best path in the routing table. The range is from 1 to 16. Having multiple paths allows load-balancing among the paths. (Although the switch software allows a maximum of 32 equal-cost routes, the switch hardware will never use more than 16 paths per route.)</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config-router)# maximum-paths 8</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td>show ip bgp</td>
<td>Verifies the reset by checking information about the routing table and about BGP neighbors.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# show ip bgp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td>show ip bgp neighbors</td>
<td>Verifies the reset by checking information about the routing table and about BGP neighbors.</td>
</tr>
</tbody>
</table>
### Configuring BGP Filtering with Route Maps

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Creates a route map, and enter route-map configuration mode.</td>
</tr>
<tr>
<td>route-map map-tag [permit</td>
<td>deny] [sequence-number]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# route-map set-peer-address permit 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) Sets a route map to disable next-hop processing</td>
</tr>
<tr>
<td>set ip next-hop ip-address [...ip-address] [peer-address]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# set ip next-hop 10.1.1.3</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Displays all route maps configured or only the one specified to verify configuration.</td>
</tr>
<tr>
<td>show route-map [map-name]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show route-map</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring BGP Filtering by Neighbor

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
Example: Device# configure terminal | Enters global configuration mode. |
| **Step 2** | router bgp autonomous-system  
Example: Device(config)# router bgp 109 | Enables a BGP routing process, assign it an AS number, and enter router configuration mode. |
| **Step 3** | neighbor {ip-address | peer-group name} distribute-list {access-list-number | name} {in | out}  
Example: Device(config-router)# neighbor 172.16.4.1 distribute-list 39 in | (Optional) Filters BGP routing updates to or from neighbors as specified in an access list.  
**Note** You can also use the **neighbor prefix-list** router configuration command to filter updates, but you cannot use both commands to configure the same BGP peer. |
| **Step 4** | neighbor {ip-address | peer-group name} route-map map-tag {in | out}  
Example: Device(config-router)# neighbor 172.16.70.24 route-map internal-map in | (Optional) Applies a route map to filter an incoming or outgoing route. |
| **Step 5** | end  
Example: Device(config)# end | Returns to privileged EXEC mode. |
| **Step 6** | show ip bgp neighbors  
Example: | Verifies the configuration. |

(Optional) Saves your entries in the configuration file.

Example:

```
Device# copy running-config startup-config
```
Configuring BGP Filtering by Access Lists and Neighbors

Another method of filtering is to specify an access list filter on both incoming and outbound updates, based on the BGP autonomous system paths. Each filter is an access list based on regular expressions. To use this method, define an autonomous system path access list, and apply it to updates to and from particular neighbors.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
    configure terminal
    Example:
    Device# configure terminal | Enters global configuration mode. |
| **Step 2**
    ip as-path access-list access-list-number {permit | deny} as-regular-expressions
    Example:
    Device(config)# ip as-path access-list 1 deny _65535_
    | Defines a BGP-related access list. |
| **Step 3**
    router bgp autonomous-system
    Example:
    Device(config)# router bgp 110
    | Enters BGP router configuration mode. |
| **Step 4**
    neighbor {ip-address | peer-group name} filter-list {access-list-number | name} {in | out | weight weight}
    Example:
    Device(config-router)# neighbor 172.16.1.1 filter-list 1 out
    | Establishes a BGP filter based on an access list. |
| **Step 5**
    end
    Example:
    Device(config)# end
    | Returns to privileged EXEC mode. |
### Configuring Prefix Lists for BGP Filtering

You do not need to specify a sequence number when removing a configuration entry. **Show** commands include the sequence numbers in their output.

Before using a prefix list in a command, you must set up the prefix list.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code> Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Creates a prefix list with an optional sequence number to deny or permit access for matching conditions. You must enter at least one permit or deny clause.</td>
</tr>
<tr>
<td>`ip prefix-list list-name [seq seq-value] deny</td>
<td>permit network/len [ge ge-value] [le le-value]<code>Example:</code>Device(config)# ip prefix-list BLUE permit 172.16.1.0/24`</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) Adds an entry to a prefix list, and assign a sequence number to the entry.</td>
</tr>
<tr>
<td>`ip prefix-list list-name seq seq-value deny</td>
<td>permit network/len [ge ge-value] [le le-value]<code>Example:</code>Device(config)# ip prefix-list BLUE seq 10 permit 172.24.1.0/24`</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>end</code> Example: <code>Device# end</code></td>
<td></td>
</tr>
</tbody>
</table>
Verifies the configuration by displaying information about a prefix list or prefix list entries.

Example:
Device# show ip prefix list summary test

(Optional) Saves your entries in the configuration file.

Example:
Device# copy running-config startup-config

### Configuring BGP Community Filtering

By default, no COMMUNITIES attribute is sent to a neighbor. You can specify that the COMMUNITIES attribute be sent to the neighbor at an IP address by using the `neighbor send-community` router configuration command.

### SUMMARY STEPS

1. configure terminal
2. ip community-list community-list-number {permit | deny} community-number
3. router bgp autonomous-system
4. neighbor {ip-address | peer-group name} send-community
5. set comm-list list-num delete
6. exit
7. ip bgp-community new-format
8. end
9. show ip bgp community
10. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal
  Example:
  Device# configure terminal | Enters global configuration mode. |
<p>| <strong>Step 2</strong> ip community-list community-list-number {permit | deny} community-number | Creates a community list, and assigns it a number. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Example:** Device(config)# ip community-list 1 permit 50000:10 | • The *community-list-number* is an integer from 1 to 99 that identifies one or more permit or deny groups of communities.  
• The *community-number* is the number configured by a *set community* route-map configuration command. |
| **Step 3** router bgp *autonomous-system*  
**Example:** Device(config)# router bgp 108 | Enters BGP router configuration mode. |
| **Step 4** neighbor {ip-address | peer-group name} send-community  
**Example:** Device(config-router)# neighbor 172.16.70.23 send-community | Specifies that the COMMUNITIES attribute be sent to the neighbor at this IP address. |
| **Step 5** set comm-list list-num delete  
**Example:** Device(config-router)# set comm-list 500 delete | (Optional) Removes communities from the community attribute of an inbound or outbound update that match a standard or extended community list specified by a route map. |
| **Step 6** exit  
**Example:** Device(config-router)# end | Returns to global configuration mode. |
| **Step 7** ip bgp-community new-format  
**Example:** Device(config)# ip bgp-community new format | (Optional) Displays and parses BGP communities in the format AA:NN.  
A BGP community is displayed in a two-part format 2 bytes long. The Cisco default community format is in the format NNAA. In the most recent RFC for BGP, a community takes the form AA:NN, where the first part is the AS number and the second part is a 2-byte number. |
| **Step 8** end  
**Example:** Device(config)# end | Returns to privileged EXEC mode. |
| **Step 9** show ip bgp community  
**Example:** Device# show ip bgp community | Verifies the configuration. |
### Configuring BGP Neighbors and Peer Groups

To assign configuration options to an individual neighbor, specify any of these router configuration commands by using the neighbor IP address. To assign the options to a peer group, specify any of the commands by using the peer group name. You can disable a BGP peer or peer group without removing all the configuration information by using the `neighbor shutdown` router configuration command.

| **Step 18** `neighbor {ip-address | peer-group-name} timers keepalive holdtime` | (Optional) Sets timers for the neighbor or peer group.  
  • The `keepalive` interval is the time within which keepalive messages are sent to peers. The range is 1 to 4294967295 seconds; the default is 60.  
  • The `holdtime` is the interval after which a peer is declared inactive after not receiving a keepalive message from it. The range is 1 to 4294967295 seconds; the default is 180. |
| **Step 19** `neighbor {ip-address | peer-group-name} weight weight` | (Optional) Specifies a weight for all routes from a neighbor. |
| **Step 20** `neighbor {ip-address | peer-group-name} distribute-list {access-list-number | name} {in | out}` | (Optional) Filter BGP routing updates to or from neighbors, as specified in an access list. |
| **Step 21** `neighbor {ip-address | peer-group-name} filter-list access-list-number {in | out | weight weight}` | (Optional) Establish a BGP filter. |
| **Step 22** `neighbor {ip-address | peer-group-name} version value` | (Optional) Specifies the BGP version to use when communicating with a neighbor. |
| **Step 23** `neighbor {ip-address | peer-group-name} soft-reconfiguration inbound` | (Optional) Configures the software to start storing received updates. |
## Configuring Aggregate Addresses in a Routing Table

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> router bgp autonomous-system</td>
<td>Enters BGP router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# router bgp 106</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aggregate-address address mask</td>
<td>Creates an aggregate entry in the BGP routing table. The aggregate route is advertised as coming from the AS, and the atomic aggregate attribute is set to indicate that information might be missing.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# aggregate-address 10.0.0.0 255.0.0.0</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aggregate-address address mask as-set</td>
<td>(Optional) Generates AS set path information. This command creates an aggregate entry following the same rules as the previous command, but the advertised path will be an AS_SET consisting of all elements contained in all paths. Do not use this keyword when aggregating many paths because this route must be continually withdrawn and updated.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# aggregate-address 10.0.0.0 255.0.0.0 as-set</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> aggregate-address address-mask summary-only</td>
<td>(Optional) Advertises summary addresses only.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

Device(config-router)# aggregate-address 10.0.0.0 255.0.0.0 summary-only

### Purpose

(Optional) Suppresses selected, more specific routes.

### Step 6

**aggregate-address address mask suppress-map map-name**

**Example:**

Device(config-router)# aggregate-address 10.0.0.0 255.0.0.0 suppress-map map1

### Step 7

**aggregate-address address mask advertise-map map-name**

**Example:**

Device(config-router)# aggregate-address 10.0.0.0 255.0.0.0 advertise-map map2

### Step 8

**aggregate-address address mask attribute-map map-name**

**Example:**

Device(config-router)# aggregate-address 10.0.0.0 255.0.0.0 attribute-map map3

### Step 9

**end**

**Example:**

Device(config)# end

### Step 10

**show ip bgp neighbors [advertised-routes]**

**Example:**

Device# show ip bgp neighbors

### Step 11

**copy running-config startup-config**

**Example:**

Device# copy running-config startup-config

---

### Configuring Routing Domain Confederations

You must specify a confederation identifier that acts as the autonomous system number for the group of autonomous systems.
### Procedure

## Configuring Route Dampening

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `configure terminal` | Enters global configuration mode.  
**Example:**  
Device# `configure terminal` |
| **Step 2** | `router bgp autonomous-system` | Enters BGP router configuration mode.  
**Example:**  
Device(config)# `router bgp 100` |
| **Step 3** | `bgp dampening` | Enables BGP route dampening.  
**Example:**  
Device(config-router)# `bgp dampening` |
| **Step 4** | `bgp dampening half-life reuse suppress max-suppress [route-map map]` | (Optional) Changes the default values of route dampening factors.  
**Example:**  
Device(config-router)# `bgp dampening 30 1500 10000 120` |
| **Step 5** | `end` | Returns to privileged EXEC mode.  
**Example:**  
Device(config)# `end` |
| **Step 6** | `show ip bgp flap-statistics [regexp regexp] | [filter-list list] | [address mask [longer-prefix]]` | (Optional) Monitors the flaps of all paths that are flapping. The statistics are deleted when the route is not suppressed and is stable.  
**Example:**  
Device# `show ip bgp flap-statistics` |
| **Step 7** | `show ip bgp dampened-paths` | (Optional) Displays the dampened routes, including the time remaining before they are suppressed.  
**Example:**  

### Monitoring and Maintaining BGP

You can remove all contents of a particular cache, table, or database. This might be necessary when the contents of the particular structure have become or are suspected to be invalid.

You can display specific statistics, such as the contents of BGP routing tables, caches, and databases. You can use the information to get resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device’s packets are taking through the network.

The table given below lists the privileged EXEC commands for clearing and displaying BGP.

**Table 117: IP BGP Clear and Show Commands**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip bgp address</td>
<td>Resets a particular BGP connection.</td>
</tr>
<tr>
<td>clear ip bgp *</td>
<td>Resets all BGP connections.</td>
</tr>
<tr>
<td>clear ip bgp peer-group tag</td>
<td>Removes all members of a BGP peer group.</td>
</tr>
<tr>
<td>show ip bgp prefix</td>
<td>Displays peer groups and peers not in peer groups to which the prefix has been advertised. Also displays prefix attributes such as the next hop and the local prefix.</td>
</tr>
<tr>
<td>show ip bgp cidr-only</td>
<td>Displays all BGP routes that contain subnet and supernet network masks.</td>
</tr>
<tr>
<td>show ip bgp community [community-number] [exact]</td>
<td>Displays routes that belong to the specified communities.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>show ip bgp community-list community-list-number</code> [exact-match]</td>
<td>Displays routes that are permitted by the community list.</td>
</tr>
<tr>
<td><code>show ip bgp filter-list access-list-number</code></td>
<td>Displays routes that are matched by the specified AS path access list.</td>
</tr>
<tr>
<td><code>show ip bgp inconsistent-as</code></td>
<td>Displays the routes with inconsistent originating autonomous systems.</td>
</tr>
<tr>
<td><code>show ip bgp regexp regular-expression</code></td>
<td>Displays the routes that have an AS path that matches the specified regular expression entered on the command line.</td>
</tr>
<tr>
<td><code>show ip bgp</code></td>
<td>Displays the contents of the BGP routing table.</td>
</tr>
<tr>
<td><code>show ip bgp neighbors [address]</code></td>
<td>Displays detailed information on the BGP and TCP connections to individual neighbors.</td>
</tr>
<tr>
<td>`show ip bgp neighbors [address] [advertised-routes</td>
<td>dampened-routes</td>
</tr>
<tr>
<td><code>show ip bgp paths</code></td>
<td>Displays all BGP paths in the database.</td>
</tr>
<tr>
<td><code>show ip bgp peer-group [tag] [summary]</code></td>
<td>Displays information about BGP peer groups.</td>
</tr>
<tr>
<td><code>show ip bgp summary</code></td>
<td>Displays the status of all BGP connections.</td>
</tr>
</tbody>
</table>

The `bgp log-neighbor changes` command is enabled by default. It allows to log messages that are generated when a BGP neighbor resets, comes up, or goes down.

# Configuration Examples for BGP

## Example: Configuring BGP on Routers

These examples show how to configure BGP on the routers in the figure below,
Figure 97: EBGP, IBGP, and Multiple Autonomous Systems

Router A:

```
Device(config)# router bgp 100
Device(config-router)# neighbor 129.213.1.1 remote-as 200
```

Router B:

```
Device(config)# router bgp 200
Device(config-router)# neighbor 129.213.1.2 remote-as 100
Device(config-router)# neighbor 175.220.1.2 remote-as 200
```

Router C:

```
Device(config)# router bgp 200
Device(config-router)# neighbor 175.220.212.1 remote-as 200
Device(config-router)# neighbor 192.208.10.1 remote-as 300
```

Router D:

```
Device(config)# router bgp 300
Device(config-router)# neighbor 192.208.10.2 remote-as 200
```

To verify that BGP peers are running, use the `show ip bgp neighbors` privileged EXEC command. This is the output of this command on Router A:

```
Device# show ip bgp neighbors
BGP neighbor is 129.213.1.1, remote AS 200, external link
BGP version 4, remote router ID 175.220.212.1
BGP state = established, table version = 3, up for 0:10:59
Last read 0:00:29, hold time is 180, keepalive interval is 60 seconds
Minimum time between advertisement runs is 30 seconds
Received 2828 messages, 0 notifications, 0 in queue
Sent 2826 messages, 0 notifications, 0 in queue
Connections established 11; dropped 10
```

Anything other than `state = established` means that the peers are not running. The remote router ID is the highest IP address on that router (or the highest loopback interface). Each time the table is updated with new information, the table version number increments. A table version number that continually increments means that a route is flapping, causing continual routing updates.
For exterior protocols, a reference to an IP network from the `network` router configuration command controls only which networks are advertised. This is in contrast to Interior Gateway Protocols (IGPs), such as EIGRP, which also use the `network` command to specify where to send updates.

## Information About ISO CLNS Routing

### Connectionless Routing

The International Organization for Standardization (ISO) Connectionless Network Service (CLNS) protocol is a standard for the network layer of the Open System Interconnection (OSI) model. Addresses in the ISO network architecture are referred to as network service access point (NSAP) addresses and network entity titles (NETs). Each node in an OSI network has one or more NETs. In addition, each node has many NSAP addresses.

When you enable connectionless routing on the Device by using the `clns routing` global configuration command, the Device makes only forwarding decisions, with no routing-related functionality. For dynamic routing, you must also enable a routing protocol. The Device supports the Intermediate System-to-Intermediate System (IS-IS) dynamic routing protocol that is based on the OSI routing protocol for ISO CLNS networks.

When dynamically routing, you use IS-IS. This routing protocol supports the concept of areas. Within an area, all routers know how to reach all the system IDs. Between areas, routers know how to reach the proper area. IS-IS supports two levels of routing: station routing (within an area) and area routing (between areas).

The key difference between the ISO IGRP and IS-IS NSAP addressing schemes is in the definition of area addresses. Both use the system ID for Level 1 routing (routing within an area). However, they differ in the way addresses are specified for area routing. An ISO IGRP NSAP address includes three separate fields for routing: the domain, area, and system ID. An IS-IS address includes two fields: a single continuous area field (comprising the domain and area fields) and the system ID.

## Information About IS-IS Routing

Integrated Intermediate System-to-Intermediate System (IS-IS) is an ISO dynamic routing protocol (described in ISO 105890). To enable IS-IS you should create an IS-IS routing process and assign it to a specific interface, rather than to a network. You can specify more than one IS-IS routing process per Layer 3 device by using the multiarea IS-IS configuration syntax. You should then configure the parameters for each instance of the IS-IS routing process.

Small IS-IS networks are built as a single area that includes all the devices in the network. As the network grows larger, the network reorganizes itself into a backbone area made up of all the connected set of Level 2 devices still connected to their local areas. Within a local area, devices know how to reach all system IDs. Between areas, devices know how to reach the backbone, and the backbone devices know how to reach other areas.

Devices establish Level 1 adjacencies to perform routing within a local area (station routing). Devices establish Level 2 adjacencies to perform routing between Level 1 areas (area routing).

A single Cisco device can participate in routing in up to 29 areas and can perform Level 2 routing in the backbone. In general, each routing process corresponds to an area. By default, the first instance of the routing process that is configured performs both Level 1 and Level 2 routing. You can configure additional device instances, which are automatically treated as Level 1 areas. You must configure the parameters for each instance of the IS-IS routing process individually.
For IS-IS multiarea routing, you can configure only one process to perform Level 2 routing, although you can define up to 29 Level 1 areas for each Cisco unit. If Level 2 routing is configured on any process, all additional processes are automatically configured as Level 1. You can configure this process to perform Level 1 routing at the same time. If Level 2 routing is not desired for a device instance, remove the Level 2 capability using the `is-type` command in global configuration mode. Use the `is-type` command also to configure a different device instance as a Level 2 device.

**Nonstop Forwarding Awareness**

The integrated IS-IS Nonstop Forwarding (NSF) Awareness feature is supported for IPv4G. The feature allows customer premises equipment (CPE) devices that are NSF-aware to help NSF-capable devices perform nonstop forwarding of packets. The local device is not necessarily performing NSF, but its NSF awareness capability allows the integrity and accuracy of the routing database and the link-state database on the neighboring NSF-capable device to be maintained during the switchover process.

The integrated IS-IS Nonstop Forwarding (NSF) Awareness feature is automatically enabled and requires no configuration.

**IS-IS Global Parameters**

The following are the optional IS-IS global parameters that you can configure:

- You can force a default route into an IS-IS routing domain by configuring a default route that is controlled by a route map. You can also specify the other filtering options that are configurable under a route map.

- You can configure the device to ignore IS-IS link-state packets (LSPs) that are received with internal checksum errors, or to purge corrupted LSPs, and cause the initiator of the LSP to regenerate it.

- You can assign passwords to areas and domains.

- You can create aggregate addresses that are represented in the routing table by a summary address (based on route summarization). Routes learned from other routing protocols can also be summarized. The metric used to advertise the summary is the smallest metric of all the specific routes.

- You can set an overload bit.

- You can configure the LSP refresh interval and the maximum time that an LSP can remain in the device database without a refresh.

- You can set the throttling timers for LSP generation, shortest path first computation, and partial route computation.

- You can configure the device to generate a log message when an IS-IS adjacency changes state (Up or Down).

- If a link in the network has a maximum transmission unit (MTU) size of less than 1500 bytes, you can lower the LSP MTU so that routing still occurs.

- You can use the `partition avoidance` command to prevent an area from becoming partitioned when full connectivity is lost among a Level 1-2 border device, adjacent Level 1 devices, and end hosts.
IS-IS Interface Parameters

You can optionally configure certain interface-specific IS-IS parameters independently from other attached devices. However, if you change default value, such as multipliers and time intervals, it makes sense to also change them on multiple devices and interfaces. Most of the interface parameters can be configured for level 1, level 2, or both.

The following are the interface-level parameters that you can configure:

- The default metric on the interface that is used as a value for the IS-IS metric and assigned when quality of service (QoS) routing is not performed.

- The hello interval (length of time between hello packets sent on the interface) or the default hello packet multiplier used on the interface to determine the hold time sent in IS-IS hello packets. The hold time determines how long a neighbor waits for another hello packet before declaring the neighbor down. This determines how quickly a failed link or neighbor is detected so that routes can be recalculated. Change the hello multiplier in circumstances where hello packets are lost frequently and IS-IS adjacencies are failing unnecessarily. You can raise the hello multiplier and lower the hello interval correspondingly to make the hello protocol more reliable, without increasing the time required to detect a link failure.

- Other time intervals:
  - Complete sequence number PDU (CSNP) interval—CSNPs are sent by the designated device to maintain database synchronization.
  - Retransmission interval—This is the time between retransmission of IS-IS LSPs for point-to-point links.
  - IS-IS LSP retransmission throttle interval—This is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs are resent on point-to-point links. This interval is different from the retransmission interval, which is the time between successive retransmissions of the same LSP.

- Designated device-election priority, which allows you to reduce the number of adjacencies required on a multiaccess network, which in turn reduces the amount of routing protocol traffic and the size of the topology database.

- The interface circuit type, which is the type of adjacency required for neighbors on the specified interface.

- Password authentication for the interface.

How to Configure ISO CLNS Routing

Default IS-IS Configuration

### Enabling IS-IS Routing

To enable IS-IS, you specify a name and network entity title (NET) for each routing process. You then enable IS-IS routing on the interface and specify the area for each instance of the routing process.

#### Procedure

<tr>
<td><strong>Step 3</strong></td>
<td>router isis [area tag]</td>
<td>Enables the IS-IS routing for the specified routing process and enter IS-IS routing configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>router isis tag1</td>
<td></td>
</tr>
<tr>
<td>Device(config)#</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>net network-entity-title</td>
<td>Configures the NETs for the routing process. If you are configuring multiarea IS-IS, specify a NET for each routing process. You can specify a name for a NET and for an address.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>net 47.0004.004d.0001.0001.0c11.1111.00</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 5** is-type \{level-1 | level-1-2 | level-2-only\} | (Optional) Configures the router to act as a Level 1 (station) router, a Level 2 (area) router for multi-area routing, or both (the default):
  - **level-1**—Acts as a station router only.
  - **level-1-2**—Acts as both a station router and an area router.
  - **level 2**—Acts as an area router only. |
| **Example:** | |
| Device(config-router)# is-type level-2-only | |
| **Step 6** exit | Returns to global configuration mode. |
| **Example:** | |
| Device(config-router)# end | |
| **Step 7** interface interface-id | Specifies an interface to route IS-IS, and enters interface configuration mode. If the interface is not already configured as a Layer 3 interface, enter the no switchport command to configure the interface into Layer 3 mode. |
| **Example:** | |
| Device(config)# interface gigabitethernet 1/0/1 | |
| **Step 8** ip router isis [area tag] | Configures an IS-IS routing process for ISO CLNS on the interface and attaches an area designator to the routing process. |
| **Example:** | |
| Device(config-if)# ip router isis tag1 | |
| **Step 9** clns router isis [area tag] | Enables ISO CLNS on the interface. |
| **Example:** | |
| Device(config-if)# clns router isis tag1 | |
| **Step 10** ip address ip-address-mask | Defines the IP address for the interface. An IP address is required on all the interfaces in an area enabled for IS-IS if any one interface is configured for IS-IS routing. |
| **Example:** | |
| Device(config-if)# ip address 10.0.0.5 255.255.255.0 | |
| **Step 11** end | Returns to privileged EXEC mode. |
| **Example:** | |
| Device(config)# end | |
| **Step 12** show isis [area tag] database detail | Verifies your entries. |
| **Example:** | |
| Device# show isis database detail | |
### Configuring IS-IS Global Parameters

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enables ISO connectionless routing on the switch.</td>
</tr>
<tr>
<td>clns routing</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# clns routing</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the IS-IS routing protocol and enters router configuration mode.</td>
</tr>
<tr>
<td>router isis</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# router isis</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Forces a default route into the IS-IS routing domain. If you enter <code>route-map map-name</code>, the routing process generates the default route if the route map is satisfied.</td>
</tr>
<tr>
<td>default-information originate [route-map map-name]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# default-information originate route-map map1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Configures the router to ignore LSPs with internal checksum errors, instead of purging the LSPs. This command is enabled by default (corrupted LSPs are dropped). To purge the corrupted LSPs, enter the <code>no ignore-lsp-errors</code> router configuration command.</td>
</tr>
<tr>
<td>ignore-lsp-errors</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# ignore-lsp-errors</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>(Optional) Configures the area authentication password that is inserted in Level 1 (station router level) LSPs.</td>
</tr>
<tr>
<td>area-password password</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# area-password password</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>(Optional) Configures the routing domain authentication password that is inserted in Level 2 (area router level) LSPs.</td>
</tr>
<tr>
<td>domain-password password</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-router)# domain-password password</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

| Step 8 | summary-address address mask [level-1 | level-1-2 | level-2] |
|--------|--------------------------------------------------|
| Purpose | (Optional) Creates a summary of addresses for a given level. |

**Example:**

Device(config-router)# summary-address 10.1.0.0 255.255.0.0 level-2

| Step 9 | set-overload-bit [on-startup {seconds | wait-for-bgp}] |
|--------|----------------------------------------------------------|
| Purpose | (Optional) Sets an overload bit to allow other routers to ignore the router in their shortest path first (SPF) calculations if the router is having problems. |

- **(Optional) on-startup**—Sets the overload bit only on startup. If on-startup is not specified, the overload bit is set immediately and remains set until you enter the no set-overload-bit command. If on-startup is specified, you must either enter number of seconds or enter wait-for-bgp.

- **seconds**—When the on-startup keyword is configured, it causes the overload bit to be set when the system is started and remains set for the specified number of seconds. The range is from 5 to 86400 seconds.

- **wait-for-bgp**—When the on-startup keyword is configured, it causes the overload bit to be set when the system is started and remains set until BGP has converged. If BGP does not signal the IS-IS that it is converged, the IS-IS will turn off the overload bit after 10 minutes.

**Example:**

Device(config-router)# set-overload-bit on-startup wait-for-bgp

<table>
<thead>
<tr>
<th>Step 10</th>
<th>lsp-refresh-interval seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>(Optional) Sets an LSP refresh interval, in seconds. The range is from 1 to 65535 seconds. The default is to send LSP refreshes every 900 seconds (15 minutes).</td>
</tr>
</tbody>
</table>

**Example:**

Device(config-router)# lsp-refresh-interval 1080

<table>
<thead>
<tr>
<th>Step 11</th>
<th>max-lsp-lifetime seconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>(Optional) Sets the maximum time that LSP packets remain in the router database without being refreshed. The range is from 1 to 65535 seconds. The default is 1200 seconds (20 minutes). After the specified time interval, the LSP packet is deleted.</td>
</tr>
</tbody>
</table>

**Example:**

Device(config-router)# max-lsp-lifetime 1000

| Step 12 | lsp-gen-interval [level-1 | level-2] lsp-max-wait [lsp-initial-wait lsp-second-wait] |
|---------|-------------------------------------------------------------|
| Purpose | (Optional) Sets the IS-IS LSP generation throttling timers: |

- **lsp-max-wait**—Maximum interval (in seconds) between two consecutive occurrences of an LSP being generated. The range is from 1 to 120; the default is 5.

**Example:**

Device(config-router)# lsp-gen-interval level-2 2 50 100
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <strong>lsp-initial-wait</strong>—Initial LSP generation delay (in milliseconds). The range is from 1 to 10000; the default is 50.</td>
<td></td>
</tr>
<tr>
<td>• <strong>lsp-second-wait</strong>—Hold time between the first and second LSP generation (in milliseconds). The range is from 1 to 10000; the default is 5000.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 13**

**spf-interval [level-1 | level-2] spf-max-wait [spf-initial-wait spf-second-wait]**

(Optional) Sets IS-IS SPF throttling timers.

- **spf-max-wait**—Maximum interval between consecutive SFPs (in seconds). The range is from 1 to 120; the default is 10.
- **spf-initial-wait**—Initial SFP calculation after a topology change (in milliseconds). The range is from 1 to 10000; the default is 5500.
- **spf-second-wait**—Hold time between the first and second SFP calculation (in milliseconds). The range is from 1 to 10000; the default is 5500.

**Example:**

```
Device(config-router)# spf-interval level-2 5 10 20
```

**Step 14**

**prc-interval prc-max-wait [prc-initial-wait prc-second-wait]**

(Optional) Sets IS-IS PRC throttling timers.

- **prc-max-wait**—Maximum interval (in seconds) between two consecutive PRC calculations. The range is from 1 to 120; the default is 5.
- **prc-initial-wait**—Initial PRC calculation delay (in milliseconds) after a topology change. The range is from 1 to 10,000; the default is 2000.
- **prc-second-wait**—Hold time between the first and second PRC calculation (in milliseconds). The range is from 1 to 10,000; the default is 5000.

**Example:**

```
Device(config-router)# prc-interval 5 10 20
```

**Step 15**

**log-adjacency-changes [all]**

(Optional) Sets the router to log IS-IS adjacency state changes. Enter **all** to include all changes generated by events that are not related to the IS-IS hellos, including End System-to-Intermediate System PDUs and link state packets (LSPs).

**Example:**

```
Device(config-router)# log-adjacency-changes all
```

**Step 16**

**lsp-mtu size**

(Optional) Specifies the maximum LSP packet size, in bytes. The range is from 128 to 4352; the default is 1497 bytes.

**Note** If a link in the network has a reduced MTU size, you must change the LSP MTU size on all the devices in the network.

**Example:**

```
Device(config-router)# lsp mtu 1560
```

**Step 17**

**partition avoidance**

(Optional) Causes an IS-IS Level 1-2 border router to stop advertising the Level 1 area prefix into the Level 2
Purpose

Command or Action

Purpose

backbone when full connectivity is lost among the border router, all adjacent level 1 routers, and end hosts.

Device(config-router)# partition avoidance

Step 18

end

Returns to privileged EXEC mode.

Example:

Device(config)# end

Step 19

show clns

Verifies your entries.

Example:

Device# show clns

Step 20

copy running-config startup-config

(Optional) Saves your entries in the configuration file.

Example:

Device# copy running-config startup-config

Configuring IS-IS Interface Parameters

To configure IS-IS interface-specific parameters, perform this procedure:

Procedure

Command or Action

Purpose

Step 1

configure terminal

Enters global configuration mode.

Example:

Device# configure terminal

Step 2

interface interface-id

Specifies the interface to be configured and enter interface configuration mode. If the interface is not already configured as a Layer 3 interface, enter the no switchport command to configure the interface in Layer 3 mode.

Example:

Device(config)# interface gigabitethernet 1/0/1

Step 3

isis metric default-metric [level-1 | level-2]

(Optional) Configures the metric (or cost) for the specified interface. The range is from 0 to 63; the default is 10. If no level is entered, the default is to apply to both Level 1 and Level 2 routers.

Example:

Device(config-if)# isis metric 15

Step 4

isis hello-interval {seconds | minimal} [level-1 | level-2]

(Optional) Specifies the length of time between the hello packets sent by the switch. By default, a value that is three times the hello interval seconds is advertised as the holdtime in the hello packets sent. With smaller hello intervals, topological changes are detected faster, but there is more routing traffic.

Example:

Device(config-if)# isis hello-interval minimal
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>minimal</strong> — Causes the system to compute the hello interval based on the hello multiplier so that the resulting hold time is 1 second.</td>
<td></td>
</tr>
<tr>
<td><strong>seconds</strong> — Range is from 1 to 65535; the default is 10 seconds.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**  
`isis hello-multiplier multiplier [level-1 | level-2]`  
*Example:*  
Device(config-if)# isis hello-multiplier 5  
*(Optional)* Specifies the number of IS-IS hello packets a neighbor must miss before the device should declare the adjacency as down. The range is from 3 to 1000; the default is 3.  
*Note* Using a smaller hello multiplier causes fast convergence, but might result in routing instability.

**Step 6**  
`isis csnp-interval seconds [level-1 | level-2]`  
*Example:*  
Device(config-if)# isis csnp-interval 15  
*(Optional)* Configures the IS-IS complete sequence number PDU (CSNP) interval for the interface. The range is from 0 to 65535; the default is 10 seconds.

**Step 7**  
`isis retransmit-interval seconds`  
*Example:*  
Device(config-if)# isis retransmit-interval 7  
*(Optional)* Configures the number of seconds between the retransmission of IS-IS LSPs for point-to-point links. Specify an integer that is greater than the expected round-trip delay between any two routers on the network. The range is from 0 to 65535; the default is 5 seconds.

**Step 8**  
`isis retransmit-throttle-interval milliseconds`  
*Example:*  
Device(config-if)# isis retransmit-throttle-interval 4000  
*(Optional)* Configures the IS-IS LSP retransmission throttle interval, which is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs will be resent on point-to-point links. The range is from 0 to 65535. The default is determined by the `isis lsp-interval` command.

**Step 9**  
`isis priority value [level-1 | level-2]`  
*Example:*  
Device(config-if)# isis priority 50  
*(Optional)* Configures the priority to use for the designated device. The range is from 0 to 127; the default is 64.

**Step 10**  
`isis circuit-type {level-1 | level-1-2 | level-2-only}`  
*Example:*  
Device(config-if)# isis circuit-type level-1-2  
*(Optional)* Configures the type of adjacency required for neighbors on the specified interface (specify the interface circuit type).  
*level-1* — Level 1 adjacency is established if there is at least one area address that is common to both this node and its neighbors.  
*level-1-2* — Level 1 and Level 2 adjacency is established if the neighbor is also configured as both Level 1 and Level 2, and there is at least one area in
Monitoring and Maintaining ISO IGRP and IS-IS

You can remove all contents of a CLNS cache or remove information for a particular neighbor or route. You can display specific CLNS or IS-IS statistics, such as the contents of routing tables, caches, and databases. You can also display information about specific interfaces, filters, or neighbors.

The following table lists the privileged EXEC commands for clearing and displaying ISO CLNS and IS-IS routing.

Table 119: ISO CLNS and IS-IS Clear and Show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear clns cache</td>
<td>Clears and reinitializes the CLNS routing cache.</td>
</tr>
<tr>
<td>clear clns es-neighbors</td>
<td>Removes end system (ES) neighbor information from the adjacency database.</td>
</tr>
<tr>
<td>clear clns is-neighbors</td>
<td>Removes intermediate system (IS) neighbor information from the adjacency database.</td>
</tr>
<tr>
<td>Command</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>clear clns neighbors</td>
<td>Removes CLNS neighbor information from the adjacency database.</td>
</tr>
<tr>
<td>clear clns route</td>
<td>Removes dynamically derived CLNS routing information.</td>
</tr>
<tr>
<td>show clns</td>
<td>Displays information about the CLNS network.</td>
</tr>
<tr>
<td>show clns cache</td>
<td>Displays the entries in the CLNS routing cache.</td>
</tr>
<tr>
<td>show clns es-neighbors</td>
<td>Displays ES neighbor entries, including the associated areas.</td>
</tr>
<tr>
<td>show clns filter-expr</td>
<td>Displays filter expressions.</td>
</tr>
<tr>
<td>show clns filter-set</td>
<td>Displays filter sets.</td>
</tr>
<tr>
<td>show clns interface [interface-id]</td>
<td>Displays the CLNS-specific or ES-IS information about each interface.</td>
</tr>
<tr>
<td>show clns neighbor</td>
<td>Displays information about IS-IS neighbors.</td>
</tr>
<tr>
<td>show clns protocol</td>
<td>List the protocol-specific information for each IS-IS or ISO IGRP routing process in this router.</td>
</tr>
<tr>
<td>show clns route</td>
<td>Displays all the destinations to which this router knows how to route CLNS packets.</td>
</tr>
<tr>
<td>show clns traffic</td>
<td>Displays information about the CLNS packets this router has seen.</td>
</tr>
<tr>
<td>show ip route isis</td>
<td>Displays the current state of the ISIS IP routing table.</td>
</tr>
<tr>
<td>show isis database</td>
<td>Displays the IS-IS link-state database.</td>
</tr>
<tr>
<td>show isis routes</td>
<td>Displays the IS-IS Level 1 routing table.</td>
</tr>
<tr>
<td>show isis spf-log</td>
<td>Displays a history of the shortest path first (SPF) calculations for IS-IS.</td>
</tr>
<tr>
<td>show isis topology</td>
<td>Displays a list of all connected routers in all areas.</td>
</tr>
<tr>
<td>show route-map</td>
<td>Displays all route maps configured or only the one specified.</td>
</tr>
<tr>
<td>trace clns destination</td>
<td>Discover the paths taken to a specified destination by packets in the network.</td>
</tr>
<tr>
<td>which-route {nsap-address</td>
<td>clns-name}</td>
</tr>
</tbody>
</table>
Configuration Examples for ISO CLNS Routing

Example: Configuring IS-IS Routing

This example shows how to configure three routers to run conventional IS-IS as an IP routing protocol. In conventional IS-IS, all routers act as Level 1 and Level 2 routers (by default).

Router A:

Device(config)# clns routing
Device(config)# router isis
Device(config-router)# net 49.0001.0000.0000.000a.00
Device(config-router)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config-router)# exit

Router B:

Device(config)# clns routing
Device(config)# router isis
Device(config-router)# net 49.0001.0000.0000.000b.00
Device(config-router)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config-router)# exit

Router C:

Device(config)# clns routing
Device(config)# router isis
Device(config-router)# net 49.0001.0000.0000.000c.00
Device(config-router)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip router isis
Device(config-if)# clns router isis
Device(config-router)# exit

Information About Multi-VRF CE

Virtual Private Networks (VPNs) provide a secure way for customers to share bandwidth over an ISP backbone network. A VPN is a collection of sites sharing a common routing table. A customer site is connected to the
service-provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table, called a VPN routing/forwarding (VRF) table.

The switch supports multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices (multi-VRF CE) when the it is running the Multi-VRF CE allows a service provider to support two or more VPNs with overlapping IP addresses.

---

**Note**
The switch does not use Multiprotocol Label Switching (MPLS) to support VPNs.

---

### Understanding Multi-VRF CE

Multi-VRF CE is a feature that allows a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. Multi-VRF CE uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but an interface cannot belong to more than one VRF at any time.

---

**Note**
Multi-VRF CE interfaces must be Layer 3 interfaces.

---

Multi-VRF CE includes these devices:

- Customer edge (CE) devices provide customers access to the service-provider network over a data link to one or more provider edge routers. The CE device advertises the site’s local routes to the router and learns the remote VPN routes from it. A switch can be a CE.

- Provider edge (PE) routers exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv2, OSPF, or EIGRP. The PE is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE to maintain all of the service-provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE router can be associated with a single VRF if all of these sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CEs, a PE router exchanges VPN routing information with other PE routers by using internal BGP (IBPG).

- Provider routers or core routers are any routers in the service provider network that do not attach to CE devices.

With multi-VRF CE, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. Multi-VRF CE extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

### Network Topology

The figure shows a configuration using switches as multiple virtual CEs. This scenario is suited for customers who have low bandwidth requirements for their VPN service, for example, small companies. In this case, multi-VRF CE support is required in the switches. Because multi-VRF CE is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.
When the CE switch receives a command to add a Layer 3 interface to a VRF, it sets up the appropriate mapping between the VLAN ID and the policy label (PL) in multi-VRF-CE-related data structures and adds the VLAN ID and PL to the VLAN database.

When multi-VRF CE is configured, the Layer 3 forwarding table is conceptually partitioned into two sections:

- The multi-VRF CE routing section contains the routes from different VPNs.
- The global routing section contains routes to non-VPN networks, such as the Internet.

VLAN IDs from different VRFs are mapped into different policy labels, which are used to distinguish the VRFs during processing. For each new VPN route learned, the Layer 3 setup function retrieves the policy label by using the VLAN ID of the ingress port and inserts the policy label and new route to the multi-VRF CE routing section. If the packet is received from a routed port, the port internal VLAN ID number is used; if the packet is received from an SVI, the VLAN number is used.

**Packet-Forwarding Process**

This is the packet-forwarding process in a multi-VRF-CE-enabled network:

- When the switch receives a packet from a VPN, the switch looks up the routing table based on the input policy label number. When a route is found, the switch forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. Then it performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input policy label to look up the correct VPN routing table. If a route is found, it forwards the packet within the VPN.

**Network Components**

To configure VRF, you create a VRF table and specify the Layer 3 interface associated with the VRF. Then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the provider’s backbone. The multi-VRF CE network has three major components:
• VPN route target communities—lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.

• Multiprotocol BGP peering of VPN community PE routers—propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.

• VPN forwarding—transports all traffic between all VPN community members across a VPN service-provider network.

VRF-Aware Services

IP services can be configured on global interfaces, and these services run within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.

VRF-Aware services are implemented in platform-independent modules. VRF means multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

• The user can ping a host in a user-specified VRF.

• ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.

How to Configure Multi-VRF CE

Default Multi-VRF CE Configuration

Table 120: Default VRF Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRF</td>
<td>Disabled. No VRFs are defined.</td>
</tr>
<tr>
<td>Maps</td>
<td>No import maps, export maps, or route maps are defined.</td>
</tr>
<tr>
<td>VRF maximum routes</td>
<td>Fast Ethernet switches: 8000 Gigabit Ethernet switches: 12000.</td>
</tr>
<tr>
<td>Forwards table</td>
<td>The default for an interface is the global routing table.</td>
</tr>
</tbody>
</table>
Multi-VRF CE Configuration Guidelines

To use multi-VRF CE, you must have the enabled on your switch.

- A switch with multi-VRF CE is shared by multiple customers, and each customer has its own routing table.
- Because customers use different VRF tables, the same IP addresses can be reused. Overlapped IP addresses are allowed in different VPNs.
- Multi-VRF CE lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. Each customer has its own VLAN.
- Multi-VRF CE does not support all MPLS-VRF functionality. It does not support label exchange, LDP adjacency, or labeled packets.
- For the PE router, there is no difference between using multi-VRF CE or using multiple CEs. In Figure 41-6, multiple virtual Layer 3 interfaces are connected to the multi-VRF CE device.
- The switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. The SVIs can be connected through an access port or a trunk port.
- A customer can use multiple VLANs as long as they do not overlap with those of other customers. A customer’s VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
- The switch supports one global network and up to 32 VRFs.
- Most routing protocols (BGP, OSPF, RIP, and static routing) can be used between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
  - BGP does not require multiple algorithms to communicate with multiple CEs.
  - BGP is designed for passing routing information between systems run by different administrations.
  - BGP makes it easy to pass attributes of the routes to the CE.
- Multi-VRF CE does not affect the packet switching rate.
- VPN multicast is not supported.
- You can enable VRF on a private VLAN, and the reverse.
- You cannot enable VRF when policy-based routing (PBR) is enabled on an interface, and the reverse.
- You cannot enable VRF when Web Cache Communication Protocol (WCCP) is enabled on an interface, and the reverse.

Configuring VRFs

Perform the following steps:
## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `configure terminal` | Enters global configuration mode.  
Example: `Device# configure terminal` |
| **Step 2** | `ip routing` | Enables IP routing.  
Example: `Device(config)# ip routing` |
| **Step 3** | `ip vrf vrf-name` | Names the VRF, and enter VRF configuration mode.  
Example: `Device(config)# ip vrf vpn1` |
| **Step 4** | `rd route-distinguisher` | Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y)  
Example: `Device(config-vrf)# rd 100:2` |
| **Step 5** | `route-target {export | import | both} route-target-ext-community` | Creates a list of import, export, or import and export route target communities for the specified VRF. Enter either an AS system number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y). The `route-target-ext-community` should be the same as the `route-distinguisher` entered in Step 4.  
Example: `Device(config-vrf)# route-target both 100:2` |
| **Step 6** | `import map route-map` | (Optional) Associates a route map with the VRF.  
Example: `Device(config-vrf)# import map importmap1` |
| **Step 7** | `interface interface-id` | Specifies the Layer 3 interface to be associated with the VRF, and enter interface configuration mode. The interface can be a routed port or SVI.  
Example: `Device(config-vrf)# interface gigabitethernet 1/0/1` |
| **Step 8** | `ip vrf forwarding vrf-name` | Associates the VRF with the Layer 3 interface.  
**Note** When `ip vrf forwarding` is enabled in the Management Interface, the access point does not join.  
Example: `Device(config-if)# ip vrf forwarding vpn1` |
| **Step 9** | `end` | Returns to privileged EXEC mode.  
Example: ```|

### Example of configuration:

```
Device# configure terminal
Device(config)# ip routing
Device(config)# ip vrf vpn1
Device(config-vrf)# rd 100:2
Device(config-vrf)# route-target both 100:2
Device(config-vrf)# import map importmap1
Device(config-vrf)# interface gigabitethernet 1/0/1
Device(config-if)# ip vrf forwarding vpn1
Device(config-if)# end
```
### Configuring VRF-Aware Services

These services are VRF-Aware:

- ARP
- Ping
- Simple Network Management Protocol (SNMP)
- Unicast Reverse Path Forwarding (uRPF)
- Syslog
- Traceroute
- FTP and TFTP

#### Note

The switch does not support VRF-aware services for Unicast Reverse Path Forwarding (uRPF) or Network Time Protocol (NTP).

### Configuring VRF-Aware Services for ARP

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> show ip arp vrf <code>vrf-name</code></td>
<td>Displays the ARP table in the specified VRF.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# show ip arp vrf vpn1</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring VRF-Aware Services for Ping

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> ping vrf-name ip-host</td>
<td>Displays the ARP table in the specified VRF.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# ping vrf vpn1 ip-host</td>
<td></td>
</tr>
</tbody>
</table>

## Configuring VRF-Aware Services for SNMP

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> snmp-server trap authentication vrf</td>
<td>Enables SNMP traps for packets on a VRF.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# snmp-server trap authentication vrf</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> snmp-server engineID remote host vrf vpn-instance engine-id string</td>
<td>Configures a name for the remote SNMP engine on a switch.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# snmp-server engineID remote 172.16.20.3 vrf vpn1 80000009030000B064EFE100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> snmp-server host host vrf vpn-instance traps community</td>
<td>Specifies the recipient of an SNMP trap operation and specifies the VRF table to be used for sending SNMP traps.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# snmp-server host 172.16.20.3 vrf vpn1 traps comaccess</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> snmp-server host host vrf vpn-instance informs community</td>
<td>Specifies the recipient of an SNMP inform operation and specifies the VRF table to be used for sending SNMP informs.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# snmp-server host 172.16.20.3 vrf vpn1 informs comaccess</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring VRF-Aware Services for uRPF

uRPF can be configured on an interface assigned to a VRF, and source lookup is done in the VRF table.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
</tr>
<tr>
<td><strong>Step 3</strong> no switchport</td>
<td>Removes the interface from Layer 2 configuration mode if it is a physical interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# no switchport</td>
</tr>
<tr>
<td><strong>Step 4</strong> ip vrf forwarding vrf-name</td>
<td>Configures VRF on the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# ip vrf forwarding vpn2</td>
</tr>
<tr>
<td><strong>Step 5</strong> ip address ip-address</td>
<td>Enters the IP address for the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-if)# ip address 10.1.5.1</td>
</tr>
</tbody>
</table>
### Configuring VRF-Aware RADIUS

To configure VRF-Aware RADIUS, you must first enable AAA on a RADIUS server. The switch supports the `ip vrf forwarding vrf-name` server-group configuration and the `ip radius source-interface` global configuration commands, as described in the Per VRF AAA Feature Guide.

### Configuring VRF-Aware Services for Syslog

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
- configure terminal  
  Example:  
  Device# configure terminal | Enters global configuration mode. |
| **Step 2**
- logging on  
  Example:  
  Device(config)# logging on | Enables or temporarily disables logging of storage router event message. |
| **Step 3**
- logging host *ip-address* vrf *vrf-name*  
  Example:  
  Device(config)# logging host 10.10.1.0 vrf vpn1 | Specifies the host address of the syslog server where logging messages are to be sent. |
| **Step 4**
- logging buffered  
  Example:  
  Device(config)# logging buffered critical 6000 debugging | Logs messages to an internal buffer. |
| **Step 5**
- logging trap debugging  
  Example: | Limits the logging messages sent to the syslog server. |
### Configuring VRF-Aware Services for Traceroute

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong> logging facility <em>facility</em></td>
<td>Sends system logging messages to a logging facility.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# logging facility user</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring VRF-Aware Services for FTP and TFTP

So that FTP and TFTP are VRF-aware, you must configure some FTP/TFTP CLIs. For example, if you want to use a VRF table that is attached to an interface, say E1/0, you need to configure the `ip ftp source-interface E1/0` or the `ip ftp source-interface E1/0` command to inform TFTP or FTP server to use a specific routing table. In this example, the VRF table is used to look up the destination IP address. These changes are backward-compatible and do not affect existing behavior. That is, you can use the source-interface CLI to send packets out a particular interface even if no VRF is configured on that interface.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip ftp source-interface <em>interface-type interface-number</em></td>
<td>Specifies the source IP address for FTP connections.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# ip ftp source-interface gigabitethernet 1/0/2</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Multicast VRFs

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip routing</code></td>
<td>Enables IP routing mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip vrf vrf-name</code></td>
<td>Names the VRF, and enter VRF configuration mode.</td>
</tr>
</tbody>
</table>

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)#end</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Step 3
Device(config)#end
```

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Step 4
Device# configure terminal
```

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip tftp source-interface interface-type interface-number</code></td>
<td>Specifies the source IP address for TFTP connections.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# ip tftp source-interface gigabitethernet 1/0/2</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Step 5
Device(config)# ip tftp source-interface gigabitethernet 1/0/2
```

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

```
Step 6
Device(config)# end
```
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>rd route-distinguisher</td>
<td>Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y)</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-vrf)# rd 100:2</td>
<td></td>

<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# ip address 10.1.5.1 255.255.255.0</td>
<td></td>
</tr>
<tr>
<td>11</td>
<td>ip pim sparse-dense mode</td>
<td>Enables PIM on the VRF-associated Layer 3 interface.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Device(config-if)# ip pim sparse-dense mode</td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Command or Action</th>
</tr>
</thead>
</table>
| Enters global configuration mode. | `configure terminal`  
Example:  
Device# configure terminal |
| Enables OSPF routing, specifies a VPN forwarding table, and enter router configuration mode. | `router ospf process-id vrf vrf-name`  
Example:  
Device(config)# router ospf 1 vrf vpn1 |
| (Optional) Logs changes in the adjacency state. This is the default state. | `log-adjacency-changes`  
Example:  
Device(config-router)# log-adjacency-changes |
| Sets the switch to redistribute information from the BGP network to the OSPF network. | `redistribute bgp autonomous-system-number subnets`  
Example: |
### Configuring BGP PE to CE Routing Sessions

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configures the BGP routing process with the AS number passed to other BGP routers, and enter router configuration mode.</td>
</tr>
<tr>
<td>router bgp autonomous-system-number</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config)# router bgp 2</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies a network and mask to announce using BGP.</td>
</tr>
<tr>
<td>network network-number mask network-mask</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Device(config-router)# network 5 mask 255.255.255.0</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 4</strong> redistribute ospf <em>process-id</em> match internal</td>
<td>Sets the switch to redistribute OSPF internal routes.</td>
</tr>
<tr>
<td>Example: Device(config-router)# redistribute ospf 1 match internal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> network <em>network-number</em> area <em>area-id</em></td>
<td>Defines a network address and mask on which OSPF runs and the area ID for that network address.</td>
</tr>
<tr>
<td>Example: Device(config-router)# network 5 area 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> address-family ipv4 vrf <em>vrf-name</em></td>
<td>Defines BGP parameters for PE to CE routing sessions, and enter VRF address-family mode.</td>
</tr>
<tr>
<td>Example: Device(config-router)# address-family ipv4 vrf vpn1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> neighbor <em>address</em> remote-as <em>as-number</em></td>
<td>Defines a BGP session between PE and CE routers.</td>
</tr>
<tr>
<td>Example: Device(config-router)# neighbor 10.1.1.2 remote-as 2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> neighbor <em>address</em> activate</td>
<td>Activates the advertisement of the IPv4 address family.</td>
</tr>
<tr>
<td>Example: Device(config-router)# neighbor 10.2.1.1 activate</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device(config-router)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> show ip bgp [ipv4] [neighbors]</td>
<td>Verifies BGP configuration.</td>
</tr>
<tr>
<td>Example: Device# show ip bgp ipv4 neighbors</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
**Monitoring Multi-VRF CE**

**Table 121: Commands for Displaying Multi-VRF CE Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip protocols vrf vrf-name</code></td>
<td>Displays routing protocol information associated with a VRF.</td>
</tr>
<tr>
<td><code>show ip route vrf vrf-name [connected] [protocol [as-number]] [list] [mobile] [odr] [profile] [static] [summary] [supernets-only]</code></td>
<td>Displays IP routing table information associated with a VRF.</td>
</tr>
<tr>
<td>`show ip vrf [brief</td>
<td>detail</td>
</tr>
</tbody>
</table>

**Configuration Examples for Multi-VRF CE**

**Multi-VRF CE Configuration Example**

OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The examples following the illustration show how to configure a switch as CE Switch A, and the VRF configuration for customer switches D and F. Commands for configuring CE Switch C and the other customer switches are not included but would be similar.

*Figure 99: Multi-VRF CE Configuration Example*

On Switch A, enable routing and configure VRF.
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip routing
Device(config)# ip vrf v11
Device(config-vrf)# rd 800:1
Device(config-vrf)# route-target export 800:1
Device(config-vrf)# route-target import 800:1
Device(config-vrf)# exit
Device(config)# ip vrf v12
Device(config-vrf)# rd 800:2
Device(config-vrf)# route-target export 800:2
Device(config-vrf)# route-target import 800:2
Device(config-vrf)# exit

Configure the loopback and physical interfaces on Switch A. Gigabit Ethernet port 1 is a trunk connection to the PE. Gigabit Ethernet ports 8 and 11 connect to VPNs:

Device(config)# interface loopback1
Device(config-if)# ip vrf forwarding v11
Device(config-if)# ip address 8.8.1.8 255.255.255.0
Device(config-if)# exit

Device(config)# interface loopback2
Device(config-if)# ip vrf forwarding v12
Device(config-if)# ip address 8.8.2.8 255.255.255.0
Device(config-if)# exit

Device(config)# interface gigabitethernet1/0/5
Device(config-if)# switchport trunk encapsulation dot1q
Device(config-if)# switchport mode trunk
Device(config-if)# no ip address
Device(config-if)# exit

Device(config)# interface gigabitethernet1/0/8
Device(config-if)# switchport access vlan 208
Device(config-if)# no ip address
Device(config-if)# exit

Device(config)# interface gigabitethernet1/0/11
Device(config-if)# switchport trunk encapsulation dot1q
Device(config-if)# switchport mode trunk
Device(config-if)# no ip address
Device(config-if)# exit

Configure the VLANs used on Switch A. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for the VPNs that include Switch F and Switch D, respectively:

Device(config)# interface vlan10
Device(config-if)# ip vrf forwarding v11
Device(config-if)# ip address 38.0.0.8 255.255.255.0
Device(config-if)# exit

Device(config)# interface vlan20
Device(config-if)# ip vrf forwarding v12
Device(config-if)# ip address 83.0.0.8 255.255.255.0
Device(config-if)# exit

Device(config)# interface vlan118
Device(config-if)# ip vrf forwarding v12
Device(config-if)# ip address 118.0.0.8 255.255.255.0
Device(config-if)# exit

Device(config)# interface vlan208
Device(config-if)# ip vrf forwarding v11
Device(config-if)# ip address 208.0.0.8 255.255.255.0
Device(config-if)# exit
Configure OSPF routing in VPN1 and VPN2.

Device(config)# router ospf 1 vrf vl1
Device(config-router)# redistribute bgp 800 subnets
Device(config-router)# network 208.0.0.0 0.0.0.255 area 0
Device(config-router)# exit
Device(config)# router ospf 2 vrf vl2
Device(config-router)# redistribute bgp 800 subnets
Device(config-router)# network 118.0.0.0 0.0.0.255 area 0
Device(config-router)# exit

Configure BGP for CE to PE routing.

Device(config)# router bgp 800
Device(config-router)# address-family ipv4 vrf vl2
Device(config-router-af)# redistribute ospf 2 match internal
Device(config-router-af)# neighbor 83.0.0.3 remote-as 100
Device(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Device(config-router-af)# exit
Device(config-router)# address-family ipv4 vrf vl1
Device(config-router-af)# redistribute ospf 1 match internal
Device(config-router-af)# neighbor 38.0.0.3 remote-as 100
Device(config-router-af)# network 8.8.1.0 mask 255.255.255.0
Device(config-router-af)# end

Switch D belongs to VPN 1. Configure the connection to Switch A by using these commands.

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip routing
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# no switchport
Device(config-if)# ip address 208.0.0.20 255.255.255.0
Device(config-if)# exit

Device(config)# router ospf 101
Device(config-router)# network 208.0.0.0 0.0.0.255 area 0
Device(config-router)# end

Switch F belongs to VPN 2. Configure the connection to Switch A by using these commands.

Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip routing
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# switchport trunk encapsulation dot1q
Device(config-if)# switchport mode trunk
Device(config-if)# no ip address
Device(config-if)# exit

Device(config)# interface vlan118
Device(config-if)# ip address 118.0.0.11 255.255.255.0
Device(config-if)# exit

Device(config)# router ospf 101
Device(config-router)# network 118.0.0.0 0.0.0.255 area 0
Device(config-router)# end

When used on switch B (the PE router), these commands configure only the connections to the CE device, Switch A.
Configuring Unicast Reverse Path Forwarding

The unicast reverse path forwarding (unicast RPF) feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.
Protocol-Independent Features

This section describes IP routing protocol-independent features that are available on switches running the IP Base or the IP Services feature set; except that with the IP Base feature set, protocol-related features are available only for RIP.

Distributed Cisco Express Forwarding

Information About Cisco Express Forwarding

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology used to optimize network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. CEF is less CPU-intensive than fast switching route caching, allowing more CPU processing power to be dedicated to packet forwarding. In a switch stack, the hardware uses distributed CEF (dCEF) in the stack. In dynamic networks, fast switching cache entries are frequently invalidated because of routing changes, which can cause traffic to be process switched using the routing table, instead of fast switched using the route cache. CEF and dCEF use the Forwarding Information Base (FIB) lookup table to perform destination-based switching of IP packets.

The two main components in CEF and dCEF are the distributed FIB and the distributed adjacency tables.

- The FIB is similar to a routing table or information base and maintains a mirror image of the forwarding information in the IP routing table. When routing or topology changes occur in the network, the IP routing table is updated, and those changes are reflected in the FIB. The FIB maintains next-hop address information based on the information in the IP routing table. Because the FIB contains all known routes that exist in the routing table, CEF eliminates route cache maintenance, is more efficient for switching traffic, and is not affected by traffic patterns.

- Nodes in the network are said to be adjacent if they can reach each other with a single hop across a link layer. CEF uses adjacency tables to prepend Layer 2 addressing information. The adjacency table maintains Layer 2 next-hop addresses for all FIB entries.

Because the switch or switch stack uses Application Specific Integrated Circuits (ASICs) to achieve Gigabit-speed line rate IP traffic, CEF or dCEF forwarding applies only to the software-forwarding path, that is, traffic that is forwarded by the CPU.

How to Configure Cisco Express Forwarding

CEF or distributed CEF is enabled globally by default. If for some reason it is disabled, you can re-enable it by using the `ip cef` or `ip cef distributed` global configuration command.

The default configuration is CEF or dCEF enabled on all Layer 3 interfaces. Entering the `no ip route-cache cef` interface configuration command disables CEF for traffic that is being forwarded by software. This command does not affect the hardware forwarding path. Disabling CEF and using the `debug ip packet detail`
privileged EXEC command can be useful to debug software-forwarded traffic. To enable CEF on an interface for the software-forwarding path, use the **ip route-cache cef** interface configuration command.

**Caution**

Although the **no ip route-cache cef** interface configuration command to disable CEF on an interface is visible in the CLI, we strongly recommend that you do not disable CEF or dCEF on interfaces except for debugging purposes.

To enable CEF or dCEF globally and on an interface for software-forwarded traffic if it has been disabled:

### Procedure

### Purpose

**Command or Action**  
**Purpose**

**Step 8**  
show cef linecard [detail]  
Example:  
Device# show cef linecard detail  
(Optional) Displays CEF-related interface information on a non-stacking switch.

**Step 9**  
show cef linecard [slot-number] [detail]  
Example:  
Device# show cef linecard 5 detail  
(Optional) Displays CEF-related interface information on a switch by stack member for all switches in the stack or for the specified switch.  
(Optional) For *slot-number*, enter the stack member switch number.

**Step 10**  
show cef interface [interface-id]  
Example:  
Device# show cef interface gigabitethernet 1/0/1  
Displays detailed CEF information for all interfaces or the specified interface.

**Step 11**  
show adjacency  
Example:  
Device# show adjacency  
Displays CEF adjacency table information.

**Step 12**  
copy running-config startup-config  
Example:  
Device# copy running-config startup-config  
(Optional) Saves your entries in the configuration file.

---

### Load-Balancing Scheme for CEF Traffic

#### Restrictions for Configuring a Load-Balancing Scheme for CEF Traffic

You must globally configure load balancing on device or device stack members in the same way: either in per-destination or per-packet mode. It is not possible to configure some packet prefixes in per-destination mode and others in per-packet mode.

#### Prerequisites for Configuring a Load-Balancing Scheme for CEF Traffic

If you enable per-packet load balancing for traffic going to a particular destination, all interfaces that can forward traffic to that destination must be enabled for per-packet load balancing.

#### CEF Load-Balancing Overview

CEF load balancing allows you to optimize resources by distributing traffic over multiple paths. CEF load balancing works based on a combination of source and destination packet information.

You can configure load balancing on a per-destination or per-packet basis. Because load-balancing decisions are made on the outbound interface, load balancing must be configured on the outbound interface.
**Per-Destination Load Balancing for CEF Traffic**

Per-destination load balancing allows the device to use multiple paths to achieve load sharing across multiple source-destination host pairs. Packets for a given source-destination host pair are guaranteed to take the same path, even if multiple paths are available. Traffic streams destined for different pairs tend to take different paths.

Per-destination load balancing is enabled by default when you enable CEF. To use per-destination load balancing, you do not perform any additional tasks once CEF is enabled. Per-destination is the load-balancing method of choice for most situations.

Because per-destination load balancing depends on the statistical distribution of traffic, load sharing becomes more effective as the number of source-destination host pairs increases.

You can use per-destination load balancing to ensure that packets for a given host pair arrive in order. All packets intended for a certain host pair are routed over the same link (or links).

Typically, you disable per-destination load balancing when you want to enable per-packet load balancing.

**Per-Packet Load Balancing for CEF Traffic**

Per-packet load balancing allows the device to send successive data packets over different paths without regard to individual hosts or user sessions. It uses the round-robin method to determine which path each packet takes to the destination. Per-packet load balancing ensures that the traffic is balanced over multiple links.

Per-packet load balancing is good for single-path destinations, but packets for a given source-destination host pair might take different paths. Per-packet load balancing can therefore introduce reordering of packets. This type of load balancing is inappropriate for certain types of data traffic (such as voice traffic over IP) that depend on packets arriving at the destination in sequence.

Use per-packet load balancing to help ensure that a path for a single source-destination host pair does not get overloaded. If the bulk of the data passing through parallel links is for a single pair, per-destination load balancing overloads a single link while other links have very little traffic. Enabling per-packet load balancing allows you to use alternate paths to the same busy destination.

**Load-Balancing Algorithms for CEF Traffic**

The following load-balancing algorithms are provided for use with CEF traffic. You select a load-balancing algorithm with the `ip cef load-sharing algorithm` command.

- **Original algorithm** — The original load-balancing algorithm produces distortions in load sharing across multiple devices because the same algorithm was used on every device. Depending on your network environment, you should select the algorithm.

- **Universal algorithm** — The universal load-balancing algorithm allows each device on the network to make a different load sharing decision for each source-destination address pair, which resolves load-sharing imbalances. The device is set to perform universal load sharing by default.

**How to Configure a Load-Balancing for CEF Traffic**

The following sections provide information on configuring load-balancing for CEF traffic.

**Enabling or Disabling CEF Per-Destination Load Balancing**

To enable per-packet load balancing, per-destination load balancing needs to be disabled.
To enable or disable CEF per-destination load balancing, perform the following procedure:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **interface interface-id**
4. [no] ip cef load-sharing [per-packet] [per-destination]
5. **end**

**DETAILED STEPS**

<table>

Selecting a Tunnel Load-Balancing Algorithm for CEF Traffic

Select the tunnel algorithm when your network environment contains only a few source and destination pairs. The device is set to perform universal load sharing by default.

To select a tunnel load-balancing algorithm for CEF traffic, perform the following procedure:
### SUMMARY STEPS

1. `enable`  
2. `configure terminal`  
3. `ip cef load-sharing algorithm {original | universal [id] }`  
4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| **Example:**  
  `Device# enable` | |
| **Step 2** `configure terminal` | Enters global configuration mode. |
| **Example:**  
  `Device# configure terminal` | |
| **Step 3** `ip cef load-sharing algorithm {original | universal [id] }` | Selects a CEF load-balancing algorithm. |
| **Example:**  
  `Device(config)# ip cef load-sharing algorithm universal` | - The `original` keyword sets the load-balancing algorithm to the original algorithm, based on a source and destination hash.  
  - The `universal` keyword sets the load-balancing algorithm to one that uses a source and destination and an ID hash.  
  - The `id` argument is a fixed identifier. |
| **Step 4** `end` | Returns to privileged EXEC mode. |
| **Example:**  
  `Device(config)# end` | |
Example: Configuring CEF Per-Packet Load Balancing

The following example shows how to configure per-packet load balancing for CEF:

```
Device> enable
Device# configure terminal
Device(config)# interface Ethernet1/0/1
Device(config-if)# ip load-sharing per-packet
Device(config-if)# end
```

Number of Equal-Cost Routing Paths

Information About Equal-Cost Routing Paths

When a router has two or more routes to the same network with the same metrics, these routes can be thought of as having an equal cost. The term parallel path is another way to see occurrences of equal-cost routes in a routing table. If a router has two or more equal-cost paths to a network, it can use them concurrently. Parallel paths provide redundancy in case of a circuit failure and also enable a router to load balance packets over the available paths for more efficient use of available bandwidth. Equal-cost routes are supported across switches in a stack.

Even though the router automatically learns about and configures equal-cost routes, you can control the maximum number of parallel paths supported by an IP routing protocol in its routing table. Although the switch software allows a maximum of 32 equal-cost routes, the switch hardware will never use more than 16 paths per route.

How to Configure Equal-Cost Routing Paths

### Static Unicast Routes

#### Information About Static Unicast Routes

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

The switch retains static routes until you remove them. However, you can override static routes with dynamic routing information by assigning administrative distance values. Each dynamic routing protocol has a default administrative distance, as listed in Table 41-16. If you want a static route to be overridden by information from a dynamic routing protocol, set the administrative distance of the static route higher than that of the dynamic protocol.

#### Table 122: Dynamic Routing Protocol Default Administrative Distances

---

**Step 4**

**Command or Action**: end

**Example**: Device(config-router)# end

**Purpose**: Returns to privileged EXEC mode.

**Step 5**

**Command or Action**: show ip protocols

**Example**: Device# show ip protocols

**Purpose**: Verifies the setting in the Maximum path field.

**Step 6**

**Command or Action**: copy running-config startup-config

**Example**: Device# copy running-config startup-config

**Purpose**: (Optional) Saves your entries in the configuration file.
Static routes that point to an interface are advertised through RIP, IGRP, and other dynamic routing protocols, whether or not static `redistribute` router configuration commands were specified for those routing protocols. These static routes are advertised because static routes that point to an interface are considered in the routing table to be connected and hence lose their static nature. However, if you define a static route to an interface that is not one of the networks defined in a network command, no dynamic routing protocols advertise the route unless a `redistribute` static command is specified for these protocols.

When an interface goes down, all static routes through that interface are removed from the IP routing table. When the software can no longer find a valid next hop for the address specified as the forwarding router's address in a static route, the static route is also removed from the IP routing table.

**Configuring Static Unicast Routes**

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

Follow these steps to configure a static route:

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable                                                 | Enables privileged EXEC mode.  
  **Example:**  
  Device> enable |  
  • Enter your password if prompted. |
| Step 2 | configure terminal                                    | Enters global configuration mode.  
  **Example:**  
  Device# configure terminal |
| Step 3 | ip route prefix mask `{address | interface} [distance]` | Establish a static route.  
  **Example:**  
  Device(config)# ip route prefix mask  
  gigabitethernet 1/0/4 |
| Step 4 | end                                                    | Returns to privileged EXEC mode.  
  **Example:**  
  Device(config)# end |
| Step 5 | show ip route                                          | Displays the current state of the routing table to verify the configuration.  
  **Example:**  
  Device# show ip route |
Default Routes and Networks

Information About Default Routes and Networks

A router might not be able to learn the routes to all other networks. To provide complete routing capability, you can use some routers as smart routers and give the remaining routers default routes to the smart router. (Smart routers have routing table information for the entire internetwork.) These default routes can be dynamically learned or can be configured in the individual routers. Most dynamic interior routing protocols include a mechanism for causing a smart router to generate dynamic default information that is then forwarded to other routers.

If a router has a directly connected interface to the specified default network, the dynamic routing protocols running on that device generate a default route. In RIP, it advertises the pseudonetwork 0.0.0.0.

A router that is generating the default for a network also might need a default of its own. One way a router can generate its own default is to specify a static route to the network 0.0.0.0 through the appropriate device.

When default information is passed through a dynamic routing protocol, no further configuration is required. The system periodically scans its routing table to choose the optimal default network as its default route. In IGRP networks, there might be several candidate networks for the system default. Cisco routers use administrative distance and metric information to set the default route or the gateway of last resort.

If dynamic default information is not being passed to the system, candidates for the default route are specified with the `ip default-network` global configuration command. If this network appears in the routing table from any source, it is flagged as a possible choice for the default route. If the router has no interface on the default network, but does have a path to it, the network is considered as a possible candidate, and the gateway to the best default path becomes the gateway of last resort.

How to Configure Default Routes and Networks

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

## Route Maps to Redistribute Routing Information

### Information About Route Maps

The switch can run multiple routing protocols simultaneously, and it can redistribute information from one routing protocol to another. Redistributing information from one routing protocol to another applies to all supported IP-based routing protocols.

You can also conditionally control the redistribution of routes between routing domains by defining enhanced packet filters or route maps between the two domains. The `match` and `set` route-map configuration commands define the condition portion of a route map. The `match` command specifies that a criterion must be matched. The `set` command specifies an action to be taken if the routing update meets the conditions defined by the `match` command. Although redistribution is a protocol-independent feature, some of the `match` and `set` route-map configuration commands are specific to a particular protocol.

One or more `match` commands and one or more `set` commands follow a `route-map` command. If there are no `match` commands, everything matches. If there are no `set` commands, nothing is done, other than the match. Therefore, you need at least one `match` or `set` command.

---

A route map with no `set` route-map configuration commands is sent to the CPU, which causes high CPU utilization.

You can also identify route-map statements as `permit` or `deny`. If the statement is marked as a deny, the packets meeting the match criteria are sent back through the normal forwarding channels (destination-based routing). If the statement is marked as permit, set clauses are applied to packets meeting the match criteria. Packets that do not meet the match criteria are forwarded through the normal routing channel.
How to Configure a Route Map

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one `match` route-map configuration command and one `set` route-map configuration command. The keywords are the same as defined in the procedure to control the route distribution.

<table>

</tr>
<tr>
<td>Device(config-route-map)# set local-preference 100</td>
</tr>
</tbody>
</table>

**Step 14**

- **set origin {igp | egp as | incomplete}**

  **Example:**

  ```
  Device(config-route-map)# set origin igp
  ```

  **Sets the BGP origin code.**

**Step 15**

- **set as-path {tag | prepend as-path-string}**

  **Example:**

  ```
  Device(config-route-map)# set as-path tag
  ```

  **Modifies the BGP autonomous system path.**

**Step 16**

- **set level {level-1 | level-2 | level-1-2 | stub-area | backbone}**

  **Example:**

  ```
  Device(config-route-map)# set level level-1-2
  ```

  **Sets the level for routes that are advertised into the specified area of the routing domain. The stub-area and backbone are OSPF NSSA and backbone areas.**

**Step 17**

- **set metric metric value**

  **Example:**

  ```
  Device(config-route-map)# set metric 100
  ```

  **Sets the metric value to give the redistributed routes (for EIGRP only). The metric value is an integer from -294967295 to 294967295.**

**Step 18**

- **set metric bandwidth delay reliability loading mtu**

  **Example:**

  ```
  Device(config-route-map)# set metric 10000 10 255 1 1500
  ```

  **Sets the metric value to give the redistributed routes (for EIGRP only):**
  - **bandwidth**—Metric value or IGRP bandwidth of the route in kilobits per second in the range 0 to 4294967295
  - **delay**—Route delay in tens of microseconds in the range 0 to 4294967295.
  - **reliability**—Likelihood of successful packet transmission expressed as a number between 0 and 255, where 255 means 100 percent reliability and 0 means no reliability.
  - **loading**—Effective bandwidth of the route expressed as a number from 0 to 255 (255 is 100 percent loading).
  - **mtu**—Minimum maximum transmission unit (MTU) size of the route in bytes in the range 0 to 4294967295.

**Step 19**

- **set metric-type {type-1 | type-2}**

  **Example:**

  **Sets the OSPF external metric type for redistributed routes.**
| Step 20 | **set metric-type internal**  
**Example:**  
Device(config-route-map)# set metric-type internal | Sets the multi-exit discriminator (MED) value on prefixes advertised to external BGP neighbor to match the IGP metric of the next hop. |
|---|---|
| Step 21 | **set weight number**  
**Example:**  
Device(config-route-map)# set weight 100 | Sets the BGP weight for the routing table. The value can be from 1 to 65535. |
| Step 22 | **end**  
**Example:**  
Device(config-route-map)# end | Returns to privileged EXEC mode. |
| Step 23 | **show route-map**  
**Example:**  
Device# show route-map | Displays all route maps configured or only the one specified to verify configuration. |
| Step 24 | **copy running-config startup-config**  
**Example:**  
Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

### How to Control Route Distribution

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one `match` route-map configuration command and one `set` route-map configuration command.

**Note**

The keywords are the same as defined in the procedure to configure the route map for redistribution.

The metrics of one routing protocol do not necessarily translate into the metrics of another. For example, the RIP metric is a hop count, and the IGRP metric is a combination of five qualities. In these situations, an artificial metric is assigned to the redistributed route. Uncontrolled exchanging of routing information between different routing protocols can create routing loops and seriously degrade network operation.

If you have not defined a default redistribution metric that replaces metric conversion, some automatic metric translations occur between routing protocols:

- RIP can automatically redistribute static routes. It assigns static routes a metric of 1 (directly connected).
- Any protocol can redistribute other routing protocols if a default mode is in effect.

Policy-Based Routing

Information About Policy-Based Routing

You can use policy-based routing (PBR) to configure a defined policy for traffic flows. By using PBR, you can have more control over routing by reducing the reliance on routes derived from routing protocols. PBR can specify and implement routing policies that allow or deny paths based on:

- Identity of a particular end system
- Application
- Protocol

You can use PBR to provide equal-access and source-sensitive routing, routing based on interactive versus batch traffic, or routing based on dedicated links. For example, you could transfer stock records to a corporate office on a high-bandwidth, high-cost link for a short time while transmitting routine application data such as e-mail over a low-bandwidth, low-cost link.

With PBR, you classify traffic using access control lists (ACLs) and then make traffic go through a different path. PBR is applied to incoming packets. All packets received on an interface with PBR enabled are passed through route maps. Based on the criteria defined in the route maps, packets are forwarded (routed) to the appropriate next hop.

- Route map statement marked as permit is processed as follows:
  - A match command can match on length or multiple ACLs. A route map statement can contain multiple match commands. Logical or algorithm function is performed across all the match commands to reach a permit or deny decision.

  For example:
  
  match length A B
  
  match ip address acl1 acl2
  
  match ip address acl3
  
  A packet is permitted if it is permitted by match length A B or acl1 or acl2 or acl3
  
  - If the decision reached is permit, then the action specified by the set command is applied on the packet.
  
  - If the decision reached is deny, then the PBR action (specified in the set command) is not applied. Instead the processing logic moves forward to look at the next route-map statement in the sequence (the statement with the next higher sequence number). If no next statement exists, PBR processing terminates, and the packet is routed using the default IP routing table.

  - For PBR, route-map statements marked as deny are not supported.

You can use standard IP ACLs to specify match criteria for a source address or extended IP ACLs to specify match criteria based on an application, a protocol type, or an end station. The process proceeds through the route map until a match is found. If no match is found, normal destination-based routing occurs. There is an implicit deny at the end of the list of match statements.

If match clauses are satisfied, you can use a set clause to specify the IP addresses identifying the next hop router in the path.
How to Configure PBR

- To use PBR, you must have the IP Base feature set enabled on the switch or stack master.
- Multicast traffic is not policy-routed. PBR applies only to unicast traffic.
- You can enable PBR on a routed port or an SVI.
- The switch supports PBR based on match length.
- You can apply a policy route map to an EtherChannel port channel in Layer 3 mode, but you cannot apply a policy route map to a physical interface that is a member of the EtherChannel. If you try to do so, the command is rejected. When a policy route map is applied to a physical interface, that interface cannot become a member of an EtherChannel.
- You can define a maximum of 128 IP policy route maps on the switch or switch stack.
- You can define a maximum of 512 access control entries (ACEs) for PBR on the switch or switch stack.
- When configuring match criteria in a route map, follow these guidelines:
  - Do not match ACLs that permit packets destined for a local address.
  - VRF and PBR are mutually exclusive on a switch interface. You cannot enable VRF when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when VRF is enabled on an interface.
  - Web Cache Communication Protocol (WCCP) and PBR are mutually exclusive on a switch interface. You cannot enable WCCP when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when WCCP is enabled on an interface.
  - The number of hardware entries used by PBR depends on the route map itself, the ACLs used, and the order of the ACLs and route-map entries.
  - PBR based on TOS, DSCP and IP Precedence are not supported.
  - Set interface, set default next-hop and set default interface are not supported.
  - `ip next-hop recursive` and `ip next-hop verify availability` features are not available and the next-hop should be directly connected.
  - Policy-maps with no set actions are supported. Matching packets are routed normally.
  - Policy-maps with no match clauses are supported. Set actions are applied to all packets.

By default, PBR is disabled on the switch. To enable PBR, you must create a route map that specifies the match criteria and the resulting action. Then, you must enable PBR for that route map on an interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

Packets that are generated by the switch, or local packets, are not normally policy-routed. When you globally enable local PBR on the switch, all packets that originate on the switch are subject to local PBR. Local PBR is disabled by default.

**SUMMARY STEPS**

1. `configure terminal`
2. `route-map map-tag [permit] [sequence number]`
3. `match ip address {access-list-number | access-list-name} [access-list-number | ...access-list-name]`
4. match length min max
5. set ip next-hop ip-address [...ip-address]
6. exit
7. interface interface-id
8. ip policy route-map map-tag
9. ip route-cache policy
10. exit
11. ip local policy route-map map-tag
12. end
13. show route-map [map-name]
14. show ip policy
15. show ip local policy

**DETAILED STEPS**

<tr>
<td><strong>Example:</strong> Device(config-route-map)# match length 64 1500</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 5</strong> set ip next-hop ip-address [...ip-address]</td>
<td>Specifies the action to be taken on the packets that match the criteria. Sets next hop to which to route the packet (the next hop must be adjacent).</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-route-map)# set ip next-hop 10.1.6.2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-route-map)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the interface to be configured.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> ip policy route-map map-tag</td>
<td>Enables PBR on a Layer 3 interface, and identify the route map to use. You can configure only one route map on an interface. However, you can have multiple route map entries with different sequence numbers. These entries are evaluated in the order of sequence number until the first match. If there is no match, packets are routed as usual.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# ip policy route-map pbr-map</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> ip route-cache policy</td>
<td>(Optional) Enables fast-switching PBR. You must enable PBR before enabling fast-switching PBR.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# ip route-cache policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> ip local policy route-map map-tag</td>
<td>(Optional) Enables local PBR to perform policy-based routing on packets originating at the switch. This applies to packets generated by the switch, and not to incoming packets.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# ip local policy route-map local-pbr</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> show route-map [map-name]</td>
<td>(Optional) Displays all the route maps configured or only the one specified to verify configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show route-map</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> show ip policy</td>
<td>(Optional) Displays policy route maps attached to the interface.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# show ip policy</td>
<td></td>
</tr>
</tbody>
</table>
**Filtering Routing Information**

You can filter routing protocol information by performing the tasks described in this section.

---

**Note**

When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

**Setting Passive Interfaces**

To prevent other routers on a local network from dynamically learning about routes, you can use the `passive-interface` router configuration command to keep routing update messages from being sent through a router interface. When you use this command in the OSPF protocol, the interface address you specify as passive appears as a stub network in the OSPF domain. OSPF routing information is neither sent nor received through the specified router interface.

In networks with many interfaces, to avoid having to manually set them as passive, you can set all interfaces to be passive by default by using the `passive-interface default` router configuration command and manually setting interfaces where adjacencies are desired.

Use a network monitoring privileged EXEC command such as `show ip ospf interface` to verify the interfaces that you enabled as passive, or use the `show ip interface` privileged EXEC command to verify the interfaces that you enabled as active.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>

<td>Device(config-router)# passive-interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

Command or Action | Purpose |
--- | --- |
**Step 4** | passive-interface default | (Optional) Sets all interfaces as passive by default. |
Example: | Device(config-router)# passive-interface default |
**Step 5** | no passive-interface interface type | (Optional) Activates only those interfaces that need to have adjacencies sent. |
Example: | Device(config-router)# no passive-interface gigabitethernet1/0/3 gigabitethernet 1/0/5 |
**Step 6** | network network-address | (Optional) Specifies the list of networks for the routing process. The network-address is an IP address. |
Example: | Device(config-router)# network 10.1.1.1 |
**Step 7** | end | Returns to privileged EXEC mode. |
Example: | Device(config-router)# end |
**Step 8** | copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
Example: | Device# copy running-config startup-config |

### Controlling Advertising and Processing in Routing Updates

You can use the **distribute-list** router configuration command with access control lists to suppress routes from being advertised in routing updates and to prevent other routers from learning one or more routes. When used in OSPF, this feature applies to only external routes, and you cannot specify an interface name.

You can also use a **distribute-list** router configuration command to avoid processing certain routes listed in incoming updates. (This feature does not apply to OSPF.)

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
</tbody>
</table>
Example: | Device# configure terminal |
| **Step 2** | router { rip | eigrp} | Enters router configuration mode. |
Example: | Device(config)# router eigrp 10 |
### Filtering Sources of Routing Information

Because some routing information might be more accurate than others, you can use filtering to prioritize information coming from different sources. An administrative distance is a rating of the trustworthiness of a routing information source, such as a router or group of routers. In a large network, some routing protocols can be more reliable than others. By specifying administrative distance values, you enable the router to intelligently discriminate between sources of routing information. The router always picks the route whose routing protocol has the lowest administrative distance.

Because each network has its own requirements, there are no general guidelines for assigning administrative distances.

Managing Authentication Keys

Key management is a method of controlling authentication keys used by routing protocols. Not all protocols can use key management. Authentication keys are available for EIGRP and RIP Version 2.

Prerequisites

Before you manage authentication keys, you must enable authentication. See the appropriate protocol section to see how to enable authentication for that protocol. To manage authentication keys, define a key chain, identify the keys that belong to the key chain, and specify how long each key is valid. Each key has its own key identifier (specified with the key number key chain configuration command), which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use.

How to Configure Authentication Keys

You can configure multiple keys with life times. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in order from lowest to highest, and uses the first valid key it encounters. The lifetimes allow for overlap during key changes. Note that the router must know these lifetimes.
## Procedure

Preventing Unauthorized Access

• Finding Feature Information, on page 1667
• Preventing Unauthorized Access, on page 1667

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Preventing Unauthorized Access

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

• At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch.

• For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

• If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information.
• You can also enable the login enhancements feature, which logs both failed and unsuccessful login attempts. Login enhancements can also be configured to block future login attempts after a set number of unsuccessful attempts are made. For more information, see the Cisco IOS Login Enhancements documentation.

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Restrictions for Controlling Switch Access with Passwords and Privileges

The following are the restrictions for controlling switch access with passwords and privileges:

- Disabling password recovery will not work if you have set the switch to boot up manually by using the `boot manual` global configuration command. This command produces the boot loader prompt (`switch:`) after the switch is power cycled.

Information About Passwords and Privilege Levels

Default Password and Privilege Level Configuration

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

This table shows the default password and privilege level configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.</td>
</tr>
<tr>
<td>Enable secret password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file.</td>
</tr>
<tr>
<td>Line password</td>
<td>No password is defined.</td>
</tr>
</tbody>
</table>

Additional Password Security

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the enable password or enable secret global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the enable secret command because it uses an improved encryption algorithm.

If you configure the enable secret command, it takes precedence over the enable password command; the two commands cannot be in effect simultaneously.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

- Protecting Enable and Enable Secret Passwords with Encryption, on page 1674
- Example: Protecting Enable and Enable Secret Passwords with Encryption, on page 1684

Password Recovery

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set
the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

To re-enable password recovery, use the `service password-recovery` global configuration command.

- Disabling Password Recovery, on page 1675
- Restrictions for Controlling Switch Access with Passwords and Privileges, on page 1669

**Terminal Line Telnet Configuration**

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it when you set a Telnet password for a terminal line.

**Related Topics**
- Setting a Telnet Password for a Terminal Line, on page 1677
- Example: Setting a Telnet Password for a Terminal Line, on page 1684

**Username and Password Pairs**

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

**Related Topics**
- Configuring Username and Password Pairs, on page 1678

**Privilege Levels**

Cisco devices use privilege levels to provide password security for different levels of switch operation. By default, the Cisco IOS software operates in two modes (privilege levels) of password security: user EXEC (Level 1) and privileged EXEC (Level 15). You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

**Privilege Levels on Lines**

Users can override the privilege level you set using the `privilege level` line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command. If users know the password to a higher privilege level, they can use that password to enable the
higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

For example, if you want many users to have access to the `clear line` command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the `configure` command, you can assign it level 3 security and distribute that password to a more restricted group of users.

**Command Privilege Levels**

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the `show ip traffic` command to level 15, the `show` commands and `show ip` commands are automatically set to privilege level 15 unless you set them individually to different levels.

### How to Control Switch Access with Passwords and Privilege Levels

#### Setting or Changing a Static Enable Password

The enable password controls access to the privileged EXEC mode. Follow these steps to set or change a static enable password:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `enable password` *password*
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>Example:</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>Command or Action</td>
</tr>
<tr>
<td>--------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td></td>
<td>configure terminal</td>
</tr>
<tr>

<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Device# configure terminal</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable password password</td>
<td>Defines a new password or changes an existing password for access to privileged EXEC mode. By default, no password is defined. For <code>password</code>, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password <code>abc?123</code>, do this: 1. Enter <code>abc</code>. 2. Enter Ctrl-v. 3. Enter <code>?123</code>. When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter <code>abc?123</code> at the password prompt.</td>

Protecting Enable and Enable Secret Passwords with Encryption

Follow these steps to establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. Use one of the following:
   - `enable password [level level] {password encryption-type encrypted-password}`
   - `enable secret [level level] {password encryption-type encrypted-password}`
4. `service password-encryption`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> Use one of the following:</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# enable password example102</code></td>
<td>Defines a new password or changes an existing password for access to privileged EXEC mode.</td>
</tr>
<tr>
<td>or</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# enable secret level 1 password secret123sample</code></td>
<td>Defines a secret password, which is saved using a nonreversible encryption method.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>(Optional) For level, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges).</td>
<td></td>
</tr>
<tr>
<td>For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.</td>
<td></td>
</tr>
</tbody>
</table>
For encryption-type, only type 5, a Cisco proprietary encryption algorithm, is available. If you specify an encryption type, you must provide an encrypted password—an encrypted password that you copy from another switch configuration.

Note: If you specify an encryption type and then enter a clear text password, you cannot re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method.

**Step 4**

**Command or Action:**

- `service password-encryption`

**Example:**

```
Device(config)# service password-encryption
```

(Optional) Encrypts the password when the password is defined or when the configuration is written. Encryption prevents the password from being readable in the configuration file.

**Step 5**

**Command or Action:**

- `end`

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

**Step 6**

**Command or Action:**

- `show running-config`

**Example:**

```
Device# show running-config
```

Verifies your entries.

**Step 7**

**Command or Action:**

- `copy running-config startup-config`

**Example:**

```
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

**Disabling Password Recovery**

Follow these steps to disable password recovery to protect the security of your switch:
Before you begin

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `system disable password recovery switch {all | <1-9>}`
4. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>enable</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device&gt; <code>enable</code>&lt;br&gt;Enables privileged EXEC mode.&lt;br&gt;<strong>-</strong> Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device# <code>configure terminal</code>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>**system disable password recovery switch {all</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>end</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Device(config)# <code>end</code>&lt;br&gt;Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Setting a Telnet Password for a Terminal Line

Beginning in user EXEC mode, follow these steps to set a Telnet password for the connected terminal line:

**Before you begin**
- Attach a PC or workstation with emulation software to the switch console port, or attach a PC to the Ethernet management port.
- The default data characteristics of the console port are 9600, 8, 1, no parity. You might need to press the Return key several times to see the command-line prompt.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `line vty 0 15`
4. `password password`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>enable</code></td>
<td><strong>Note</strong> If a password is required for access to privileged EXEC mode, you will be prompted for it. Enters privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device&gt; <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>line vty 0 15</code></td>
<td>Configures the number of Telnet sessions (lines), and enters line configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Username and Password Pairs

Follow these steps to configure username and password pairs:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `username name [privilege level] {password encryption-type password}`
4. Use one of the following:
   - `line console 0`
   - `line vty 0 15`
5. login local  
6. end  
7. show running-config  
8. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | enable  
**Example:** Device> enable | Enables privileged EXEC mode.  
* Enter your password if prompted. |
| **Step 2** | configure terminal  
**Example:** Device# configure terminal | Enters global configuration mode. |
| **Step 3** | username name [privilege level] [password encryption-type password]  
**Example:** Device(config)# username adamsample privilege 1 password secret456  
Device(config)# username 111111111111 mac attribute | Sets the username, privilege level, and password for each user.  
* For *name*, specify the user ID as one word or the MAC address. Spaces and quotation marks are not allowed.  
* You can configure a maximum of 12000 clients each, for both username and MAC filter.  
* (Optional) For *level*, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 1 gives user EXEC mode access.  
* For *encryption-type*, enter 0 to specify that an unencrypted password will follow. Enter 7 to specify that a hidden password will follow.  
* For *password*, specify the password the user must enter to gain access to the Device. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the `username` command. |
| **Step 4** | Use one of the following:  
* line console 0  
* line vty 0 15  
**Example:** Device(config)# line console 0 |
| **or** | Enters line configuration mode, and configures the console port (line 0) or the VTY lines (line 0 to 15). |
### Setting the Privilege Level for a Command

Follow these steps to set the privilege level for a command:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `privilege mode level level command`
4. `enable password level level password`
5. `end`
6. `copy running-config startup-config`

</table>
### Changing the Default Privilege Level for Lines

Follow these steps to change the default privilege level for the specified line:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `line vty line`
4. `privilege level level`
5. `end`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

<tr>
<td><strong>Example:</strong> Device(config)# privilege level 15</td>
<td>For <code>level</code>, the range is from 0 to 15. Level 1 is for normal user EXEC mode privileges. Level 15 is the level of access permitted by the <code>enable</code> password.</td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

Command or Action | Purpose
--- | ---
**Step 6** | (Optional) Saves your entries in the configuration file.
copy running-config startup-config |  
**Example:**
Device# copy running-config startup-config

**What to do next**

Users can override the privilege level you set using the `privilege level` line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

**Related Topics**

Privilege Levels, on page 1671

---

**Logging into and Exiting a Privilege Level**

Beginning in user EXEC mode, follow these steps to log into a specified privilege level and exit a specified privilege level.

**SUMMARY STEPS**

1. `enable level`
2. `disable level`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

Configuring TACACS+

• Finding Feature Information, on page 1687
• Prerequisites for TACACS+, on page 1687
• Information About TACACS+, on page 1689
• How to Configure Switch Access with TACACS+, on page 1693
• Monitoring TACACS+, on page 1701

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for TACACS+

The following are the prerequisites for set up and configuration of switch access with TACACS+ (must be performed in the order presented):

1. Configure the switches with the TACACS+ server addresses.
2. Set an authentication key.
3. Configure the key from Step 2 on the TACACS+ servers.
4. Enable authentication, authorization, and accounting (AAA).
5. Create a login authentication method list.
6. Apply the list to the terminal lines.
7. Create an authorization and accounting method list.

The following are the prerequisites for controlling switch access with TACACS+:
Prerequisites for TACACS+

- You must have access to a configured TACACS+ server to configure TACACS+ features on your switch. Also, you must have access to TACACS+ services maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation.

- We recommend a redundant connection between a switch stack and the TACACS+ server. This is to help ensure that the TACACS+ server remains accessible in case one of the connected stack members is removed from the switch stack.

- You need a system running the TACACS+ daemon software to use TACACS+ on your switch.

- To use TACACS+, it must be enabled.

- Authorization must be enabled on the switch to be used.

- Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

- To use any of the AAA commands listed in this section or elsewhere, you must first enable AAA with the `aaa new-model` command.

- At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting.

- The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named `default`). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.

- Use the local database if authentication was not performed by using TACACS+.

Information About TACACS+

TACACS+ and Switch Access

This section describes TACACS+. TACACS+ provides detailed accounting information and flexible administrative control over the authentication and authorization processes. It is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

Related Topics

TACACS+ Overview

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—individually. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers.

Figure 100: Typical TACACS+ Network Configuration

![Figure 100: Typical TACACS+ Network Configuration](image-url)
TACACS+, administered through the AAA security services, can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.
  
  The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother’s maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- **Authorization**—Provides fine-grained control over user capabilities for the duration of the user’s session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

**Related Topics**

Prerequisites for TACACS+, on page 1687

---

**TACACS+ Operation**

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

   TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
   
   - **ACCEPT**—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
   
   - **REJECT**—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
   
   - **ERROR**—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
   
   - **CONTINUE**—The user is prompted for additional authentication information.
After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
   - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
   - Connection parameters, including the host or client IP address, access list, and user timeouts

Prerequisites for TACACS+, on page 1687

Method List

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

If a method list is configured under VTY lines, the corresponding method list must be added to AAA. The following example shows how to configure a method list under a VTY line:

```
Device# configure terminal
Device(config)# line vty 0 4
Device(config)# authorization commands 15 auth1
```

The following example shows how to configure a method list in AAA:

```
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authorization commands 15 auth1 group tacacs+
```

If no method list is configured under VTY lines, the default method list must be added to AAA. The following example shows a VTY configuration without a method list:

```
Device# configure terminal
Device(config)# line vty 0 4
```

The following example shows how to configure the default method list:

```
Device# configure terminal
Device(config)# aaa new-model
Device(config)# aaa authorization commands 15 default group tacacs+
```

Related Topics
How to Configure Switch Access with TACACS+, on page 1693
Prerequisites for TACACS+, on page 1687
TACACS+ Configuration Options

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

Related Topics
Identifying the TACACS+ Server Host and Setting the Authentication Key, on page 1693

TACACS+ Login Authentication

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

Related Topics
Configuring TACACS+ Login Authentication, on page 1695
Prerequisites for TACACS+, on page 1687

TACACS+ Authorization for Privileged EXEC Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

Related Topics
Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services, on page 1698
Prerequisites for TACACS+, on page 1687

TACACS+ Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

Related Topics
Starting TACACS+ Accounting, on page 1699

Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.
To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

**Note**
Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

### Identifying the TACACS+ Server Host and Setting the Authentication Key

Follow these steps to identify the TACACS+ server host and set the authentication key:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `tacacs server server-name`
4. `address {ipv4 | ipv6} ip address`
5. `exit`
6. `aaa new-model`
7. `aaa group server tacacs+ group-name`
8. `server ip-address`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt;</code> <code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3** tacacs server server-name  
Example:  
Device(config)# tacacs server yourserver  
Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.  
For server-name, specify the server name.

**Step 4** address \{ipv4 | ipv6\} ip address  
Example:  
Device(config-server-tacacs)# address ipv4 10.0.1.12  
Configures the IP address for the TACACS server.

**Step 5** exit  
Example:  
Device(config-server-tacacs)# exit  
Exits the TACACS server mode and enters the global configuration mode.

**Step 6** aaa new-model  
Example:  
Device(config)# aaa new-model  
Enables AAA.

**Step 7** aaa group server tacacs+ group-name  
Example:  
Device(config)# aaa group server tacacs+ your_server_group  
(Optional) Defines the AAA server-group with a group name.  
This command puts the Device in a server group subconfiguration mode.

**Step 8** server ip-address  
Example:  
Device(config)# server 10.1.2.3  
(Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group.  
Each server in the group must be previously defined in Step 3.

**Step 9** end  
Example:  
Device(config)# end  
Returns to privileged EXEC mode.
Configuring TACACS+ Login Authentication

Follow these steps to configure TACACS+ login authentication:

**Before you begin**
To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports.

**Note**
To secure the for HTTP access by using AAA methods, you must configure the with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the for HTTP access by using AAA methods.

For more information about the `ip http authentication` command, see the *Cisco IOS Security Command Reference, Release 12.4*.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login {default | list-name} method [method2...]`
5. `line [console | tty | vty] line-number [ending-line-number]`
6. `login authentication {default | list-name}`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa authentication login</td>
<td>Creates a login authentication method list.</td>
</tr>
<tr>
<td>{default</td>
<td>list-name} method1 [method2...]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# aaa authentication login</td>
<td></td>
</tr>
<tr>
<td>default tacacs+ local</td>
<td></td>
</tr>
</tbody>
</table>

**Select one of these methods:**

- **enable**—Use the enable password for authentication.
  Before you can use this authentication method, you must define an enable password by using the `enable password` global configuration command.

- **group tacacs+**—Uses TACACS+ authentication.
  Before you can use this authentication method, you must configure the TACACS+ server.

- **line**—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the `password password` line configuration command.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• local—Use the local username database for authentication. You must enter username information in the database. Use the <code>username password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• local-case—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• none—Do not use any authentication for login.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**  
`line [console | tty | vty] line-number [ending-line-number]`  
Example:  
Device(config)# line 2 4  
Enters line configuration mode, and configures the lines to which you want to apply the authentication list.

**Step 6**  
`login authentication {default | list-name}`  
Example:  
Device(config-line)# login authentication default  
Applies the authentication list to a line or set of lines.  
• If you specify `default`, use the default list created with the `aaa authentication login` command.  
• For `list-name`, specify the list created with the `aaa authentication login` command.

**Step 7**  
`end`  
Example:  
Device(config-line)# end  
Returns to privileged EXEC mode.

**Step 8**  
`show running-config`  
Example:  
Device# show running-config  
Verifies your entries.

**Step 9**  
`copy running-config startup-config`  
Example:  
Device# copy running-config startup-config  
(Optional) Saves your entries in the configuration file.

| **Example:** |
| `Device# copy running-config startup-config`  | (Optional) Saves your entries in the configuration file. |

### What to do next

To establish a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.

### Related Topics

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About MACsec Encryption

MACsec is the IEEE 802.1AE standard for authenticating and encrypting packets between two MACsec-capable devices. These Catalyst switches support 802.1AE encryption with MACsec Key Agreement (MKA) on downlink ports for encryption between the switch and host device. The switch also supports MACsec encryption for switch-to-switch (inter-network device) security using both Cisco TrustSec Network Device Admission Control (NDAC), Security Association Protocol (SAP) and MKA-based key exchange protocol. Link layer security can include both packet authentication between switches and MACsec encryption between switches (encryption is optional).

Note

MACsec is not supported with the NPE license or the LAN Base service image.
Media Access Control Security and MACsec Key Agreement

MACsec, defined in 802.1AE, provides MAC-layer encryption over wired networks by using out-of-band methods for encryption keying. The MACsec Key Agreement (MKA) Protocol provides the required session keys and manages the required encryption keys. MKA and MACsec are implemented after successful authentication using the 802.1x Extensible Authentication Protocol (EAP-TLS) or Pre Shared Key (PSK) framework.

A switch using MACsec accepts either MACsec or non-MACsec frames, depending on the policy associated with the MKA peer. MACsec frames are encrypted and protected with an integrity check value (ICV). When the switch receives frames from the MKA peer, it decrypts them and calculates the correct ICV by using session keys provided by MKA. The switch compares that ICV to the ICV within the frame. If they are not identical, the frame is dropped. The switch also encrypts and adds an ICV to any frames sent over the secured port (the access point used to provide the secure MAC service to a MKA peer) using the current session key.

The MKA Protocol manages the encryption keys used by the underlying MACsec protocol. The basic requirements of MKA are defined in 802.1x-REV. The MKA Protocol extends 802.1x to allow peer discovery with confirmation of mutual authentication and sharing of MACsec secret keys to protect data exchanged by the peers.

The EAP framework implements MKA as a newly defined EAP-over-LAN (EAPOL) packet. EAP authentication produces a master session key (MSK) shared by both partners in the data exchange. Entering the EAP session ID generates a secure connectivity association key name (CKN). The switch acts as the authenticator for both uplink and downlink; and acts as the key server for downlink. It generates a random secure association key (SAK), which is sent to the client partner. The client is never a key server and can only interact with a single MKA entity, the key server. After key derivation and generation, the switch sends periodic transports to the partner at a default interval of 2 seconds.

The packet body in an EAPOL Protocol Data Unit (PDU) is referred to as a MACsec Key Agreement PDU (MKPDU). MKA sessions and participants are deleted when the MKA lifetime (6 seconds) passes with no MKPDU received from a participant. For example, if a MKA peer disconnects, the participant on the switch continues to operate MKA until 6 seconds have elapsed after the last MKPDU is received from the MKA peer.

Table 127: MACsec Support on Switch Ports

<table>
<thead>
<tr>
<th>Interface</th>
<th>Connections</th>
<th>MACsec support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Downlink ports</td>
<td>Switch-to-host</td>
<td>MACsec MKA encryption</td>
</tr>
<tr>
<td>Uplink ports</td>
<td>Switch-to-switch</td>
<td>MACsec MKA encryption</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Cisco TrustSec NDAC MACsec</td>
</tr>
</tbody>
</table>

Cisco TrustSec and Cisco SAP are meant only for switch-to-switch links and are not supported on switch ports connected to end hosts, such as PCs or IP phones. MKA is supported on switch-to-host facing links (downlink) as well as switch-to-switch links (uplink). Host-facing links typically use flexible authentication ordering for handling heterogeneous devices with or without IEEE 802.1x, and can optionally use MKA-based MACsec encryption. Cisco NDAC and SAP are mutually exclusive with Network Edge Access Topology (NEAT), which is used for compact switches to extend security outside the wiring closet.
Integrity check value (ICV) indicator in MKPDU is optional. ICV is not optional when the traffic is encrypted.

EAPoL Announcements indicate the use of the type of keying material. The announcements can be used to announce the capability of the supplicant as well as the authenticator. Based on the capability of each side, the largest common denominator of the keying material could be used.

Prior to Cisco IOS XE Fuji 16.8.1a, should-secure was supported for MKA and SAP. With should-secure enabled, if the peer is configured for MACsec, the data traffic is encrypted, otherwise it is sent in clear text. Starting with Cisco IOS XE Fuji 16.8.1a, must-secure support is enabled on both the ingress and the egress. Must-secure is supported for MKA and SAP. With must-secure enabled, only EAPoL traffic will not be encrypted. The rest of the traffic will be encrypted. Unencrypted packets are dropped.

MKA Policies

To enable MKA on an interface, a defined MKA policy should be applied to the interface. You can configure these options:

- Policy name, not to exceed 16 ASCII characters.
- Confidentiality (encryption) offset of 0, 30, or 50 bytes for each physical interface

Virtual Ports

Use virtual ports for multiple secured connectivity associations on a single physical port. Each connectivity association (pair) represents a virtual port. In uplink, you can have only one virtual port per physical port. In downlink, you can have a maximum of two virtual ports per physical port, of which one virtual port can be part of a data VLAN; the other must externally tag its packets for the voice VLAN. You cannot simultaneously host secured and unsecured sessions in the same VLAN on the same port. Because of this limitation, 802.1x multiple authentication mode is not supported.

The exception to this limitation is in multiple-host mode when the first MACsec supplicant is successfully authenticated and connected to a hub that is connected to the switch. A non-MACsec host connected to the hub can send traffic without authentication because it is in multiple-host mode. We do not recommend using multi-host mode because after the first successful client, authentication is not required for other clients.

Virtual ports represent an arbitrary identifier for a connectivity association and have no meaning outside the MKA Protocol. A virtual port corresponds to a separate logical port ID. Valid port IDs for a virtual port are 0x0002 to 0xFFFF. Each virtual port receives a unique secure channel identifier (SCI) based on the MAC address of the physical interface concatenated with a 16-bit port ID.

MACsec and Stacking

A switch stack master running MACsec maintains the configuration files that show which ports on a member switch support MACsec. The stack master performs these functions:

- Processes secure channel and secure association creation and deletion
- Sends secure association service requests to the stack members.
• Processes packet number and replay-window information from local or remote ports and notifies the key management protocol.
• Sends MACsec initialization requests with the globally configured options to new switches that are added to the stack.
• Sends any per-port configuration to the member switches.

A member switch performs these functions:
• Processes MACsec initialization requests from the stack master.
• Processes MACsec service requests sent by the stack master.
• Sends information about local ports to the stack master.

**MACsec, MKA and 802.1x Host Modes**

You can use MACsec and the MKA Protocol with 802.1x single-host mode, multi-host mode, or Multi Domain Authentication (MDA) mode. Multiple authentication mode is not supported.

**Single-Host Mode**

The figure shows how a single EAP authenticated session is secured by MACsec by using MKA

*Figure 101: MACsec in Single-Host Mode with a Secured Data Session*

**Multiple Host Mode**

In standard (not 802.1x REV) 802.1x multiple-host mode, a port is open or closed based on a single authentication. If one user, the primary secured client services client host, is authenticated, the same level of network access is provided to any host connected to the same port. If a secondary host is a MACsec supplicant, it cannot be authenticated and traffic would not flow. A secondary host that is a non-MACsec host can send traffic to the network without authentication because it is in multiple-host mode. The figure shows MACsec in Standard Multiple-Host Unsecure Mode.

*Figure 102: MACsec in Multiple-Host Mode - Unsecured*
Multi-host mode is not recommended because after the first successful client, authentication is not required for other clients, which is not secure.

In standard (not 802.1x REV) 802.1x multiple-domain mode, a port is open or closed based on a single authentication. If the primary user, a PC on data domain, is authenticated, the same level of network access is provided to any domain connected to the same port. If a secondary user is a MACsec supplicant, it cannot be authenticated and traffic would no flow. A secondary user, an IP phone on voice domain, that is a non-MACsec host, can send traffic to the network without authentication because it is in multiple-domain mode.

MKA Statistics

Some MKA counters are aggregated globally, while others are updated both globally and per session. You can also obtain information about the status of MKA sessions.

This is an example of the `show mka statistics` command output:

```
Switch# show mka statistics

Configuring MKA and MACsec

Default MACsec MKA Configuration

MACsec is disabled. No MKA policies are configured.

Configuring an MKA Policy

SUMMARY STEPS
1. configure terminal
2. mka policy policy name
3. send-secure-announcements
4. key-server priority
5. include-icv-indicator
6. macsec-cipher-suite gcm-aes-128
7. confidentiality-offset Offset value
8. end
9. show mka policy

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 2** mka policy *policy name* | Identify an MKA policy, and enter MKA policy configuration mode. The maximum policy name length is 16 characters.  
**Note** The default MACsec cipher suite in the MKA policy will always be "GCM-AES-128". If the device supports both "GCM-AES-128" and "GCM-AES-256" ciphers, it is highly recommended to define and use a user defined MKA policy to include both 128 and 256 bits ciphers or only 256 bits cipher, as may be required. |
| **Step 3** send-secure-announcements | Enabled secure announcements.  
**Note** By default, secure announcements are disabled. |
| **Step 4** key-server *priority* | Configure MKA key server options and set priority (between 0-255).  
**Note** When value of key server priority is set to 255, the peer can not become the key server. The key server priority value is valid only for MKA PSK; and not for MKA EAPTLS. |
| **Step 5** include-icv-indicator | Enables the ICV indicator in MKPDU. Use the no form of this command to disable the ICV indicator — no include-icv-indicator. |
| **Step 6** macsec-cipher-suite *gcm-aes-128* | Configures cipher suite for deriving SAK with 128-bit encryption. |
| **Step 7** confidentiality-offset *Offset value* | Set the Confidentiality (encryption) offset for each physical interface  
**Note** Offset Value can be 0, 30 or 50. If you are using Anyconnect on the client, it is recommended to use Offset 0. |
| **Step 8** end | Returns to privileged EXEC mode. |
| **Step 9** show mka policy | Verify your entries. |

**Example**

This example configures the MKA policy:

```
Switch(config)# mka policy mka_policy
Switch(config-mka-policy)# key-server priority 200
Switch(config-mka-policy)# macsec-cipher-suite gcm-aes-128
```
### Configuring MACsec on an Interface

Follow these steps to configure MACsec on an interface with one MACsec session for voice and one for data:

#### SUMMARY STEPS

1. `enable`
2. `configureterminal`
3. `interface interface-id`
4. `switchport access vlan vlan-id`
5. `switchport mode access`
6. `macsec`
7. `authentication event linksec fail action authorize vlan vlan-id`
8. `authentication host-mode multi-domain`
9. `authentication linksec policy must-secure`
10. `authentication port-control auto`
11. `authentication periodic`
12. `authentication timer reauthenticate`
13. `authentication violation protect`
14. `mka policy policy name`
15. `dot1x pae authenticator`
16. `spanning-tree portfast`
17. `end`
18. `show authentication session interface interface-id`
19. `show authentication session interface interface-id details`
20. `show macsec interface interface-id`
21. `show mka sessions`
22. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

### Configuring MACsec MKA using PSK

#### SUMMARY STEPS

1. configure terminal
2. key chain key-chain-name macsec
3. key hex-string
4. cryptographic-algorithm\ {gcm-aes-128 | gcm-aes-256}\n5. key-string\ \{[0|6|7] pwd-string | pwd-string\}
6. lifetime local \{start timestamp\ \{hh:mm:ss | day | month | year\} [duration \seconds | end timestamp\ \{hh:mm:ss | day | month | year\]\n7. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>key chain key-chain-name macsec</td>
<td>Configures a key chain and enters the key chain configuration mode.</td>
</tr>
<tr>
<td>key hex-string</td>
<td>Configures a unique identifier for each key in the keychain and enters the keychain's key configuration mode.</td>
</tr>
</tbody>
</table>

**Note** For 128-bit encryption, use 32 hex digit key-string. For 256-bit encryption, use 64 hex digit key-string.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>cryptographic-algorithm {gcm-aes-128</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>key-string { [0</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>lifetime local [start timestamp {hh:mm:ss</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
</tr>
</tbody>
</table>

**Example**

Following is an indicative example:

```
Switch(config)# Key chain keychain1 macsec
Switch(config-key-chain)# key 1000
Switch(config-keychain-key)# cryptographic-algorithm gcm-aes-128
Switch(config-keychain-key)# key-string 12345678901234567890123456789012
Switch(config-keychain-key)# lifetime local 12:12:00 July 28 2016 12:19:00 July 28 2016
Switch(config-keychain-key)# end
```

**Configuring MACsec MKA on an Interface using PSK**

**Note**

To avoid traffic drop across sessions, the **mka policy** command must be configured before the **mka pre-shared-key key-chain** command.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. macsec network-link
4. mka policy policy-name
5. mka pre-shared-key key-chain key-chain name
6. macsec replay-protection window-size frame number
7. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>-------------------------------------------</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>macsec network-link</code></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>mka policy policy-name</code></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>mka pre-shared-key key-chain name</code></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>macsec replay-protection window-size frame number</code></td>
</tr>
<tr>
<td>Step 7</td>
<td><code>end</code></td>
</tr>
</tbody>
</table>

**Example**

Following is an indicative example:

```plaintext
Switch(config)# interface GigabitEthernet 0/0/0
Switch(config-if)# mka policy mka_policy
Switch(config-if)# mka pre-shared-key key-chain name
Switch(config-if)# macsec replay-protection window-size 10
Switch(config-if)# end
```

**What to do next**

It is not recommended to change the MKA policy on an interface with MKA PSK configured when the session is running. However, if a change is required, you must reconfigure the policy as follows:

1. Disable the existing session by removing `macsec network-link` configuration on each of the participating node using the **no macsec network-link** command.
2. Configure the MKA policy on the interface on each of the participating node using the **mka policy policy-name** command.
3. Enable the new session on each of the participating node by using the **macsec network-link** command.

**Information About MACsec MKA using EAP-TLS**

MACsec MKA is supported on switch-to-switch links. Using IEE 802.1X Port-based Authentication with Extensible Authentication Protocol (EAP-TLS), you can configure MACsec MKA between device uplink ports. EAP-TLS allows mutual authentication and obtains an MSK (master session key) from which the connectivity association key (CAK) is derived for MKA operations. Device certificates are carried, using EAP-TLS, for authentication to the AAA server.

**Prerequisites for MACsec MKA using EAP-TLS**

- Ensure that you have a Certificate Authority (CA) server configured for your network.
Limitations for MACsec MKA using EAP-TLS

- MKA is not supported on port-channels.
- MKA is not supported with High Availability and local authentication.
- MKA/EAPTLS is not supported for promiscuous PVLAN Primary port.
- While configuring MACsec MKA using EAP-TLS, MACsec secure channels encrypt counters does not increment before first Rekey.

Configuring MACsec MKA using EAP-TLS

To configure MACsec with MKA on point-to-point links, perform these tasks:
- Configure Certificate Enrollment
  - Generate Key Pairs
  - Configure SCEP Enrollment
  - Configure Certificates Manually
- Configure an Authentication Policy
- Configure EAP-TLS Profiles and IEEE 802.1x Credentials
- Configure MKA MACsec using EAP-TLS on Interfaces

Remote Authentication

Generating Key Pairs

<table>

<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>
### Configuring Enrollment using SCEP

Simple Certificate Enrollment Protocol (SCEP) is a Cisco-developed enrollment protocol that uses HTTP to communicate with the certificate authority (CA) or registration authority (RA). SCEP is the most commonly used method for sending and receiving requests and certificates.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Declares the trustpoint and a given name and enters ca-trustpoint mode.</td>
</tr>
<tr>
<td>crypto pki trustpoint server name</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the URL of the CA on which your device should send certificate requests.</td>
</tr>
<tr>
<td>enrollment url url name pem</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Specifies which key pair to associate with the certificate.</td>
</tr>
<tr>
<td>rsakeypair label</td>
<td></td>
</tr>
<tr>
<td>Note: rsakeypair name must match trust-point name.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>The <strong>none</strong> keyword specifies that a serial number will not be included in the certificate request.</td>
</tr>
<tr>
<td>serial-number none</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>The <strong>none</strong> keyword specifies that no IP address should be included in the certificate request.</td>
</tr>
<tr>
<td>ip-address none</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>revocation-check crl</td>
</tr>
<tr>
<td></td>
<td>Specifies CRL as the method to ensure that the certificate of a peer has not been revoked.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>auto-enroll <code>percent</code> <code>regenerate</code></td>
</tr>
<tr>
<td></td>
<td>Enables auto-enrollment, allowing the client to automatically request a rollover certificate from the CA.</td>
</tr>
<tr>
<td></td>
<td>If auto-enrollment is not enabled, the client must be manually re-enrolled in your PKI upon certificate expiration.</td>
</tr>
<tr>
<td></td>
<td>By default, only the Domain Name System (DNS) name of the device is included in the certificate.</td>
</tr>
<tr>
<td></td>
<td>Use the percent argument to specify that a new certificate will be requested after the percentage of the lifetime of the current certificate is reached.</td>
</tr>
<tr>
<td></td>
<td>Use the regenerate keyword to generate a new key for the certificate even if a named key already exists.</td>
</tr>
<tr>
<td></td>
<td>If the key pair being rolled over is exportable, the new key pair will also be exportable. The following comment will appear in the trustpoint configuration to indicate whether the key pair is exportable: &quot;! RSA key pair associated with trustpoint is exportable.&quot;</td>
</tr>
<tr>
<td></td>
<td>It is recommended that a new key pair be generated for security reasons.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>crypto pki authenticate <code>name</code></td>
</tr>
<tr>
<td></td>
<td>Retrieves the CA certificate and authenticates it.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>exit</td>
</tr>
<tr>
<td></td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>show crypto pki certificate <code>trustpoint name</code></td>
</tr>
<tr>
<td></td>
<td>Displays information about the certificate for the trust point.</td>
</tr>
</tbody>
</table>

### Configuring Enrollment Manually

If your CA does not support SCEP or if a network connection between the router and CA is not possible. Perform the following task to set up manual certificate enrollment:

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>crypto pki trustpoint <code>server name</code></td>
</tr>
<tr>
<td></td>
<td>Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>enrollment url <code>url name pem</code></td>
</tr>
<tr>
<td></td>
<td>Specifies the URL of the CA on which your device should send certificate requests.</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose |
--- | --- |
An IPv6 address can be added in the URL enclosed in brackets. For example: http://[2001:DB8:1:1::1]:80. | Specifying which key pair to associate with the certificate. |
The pem keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request. |
**Step 4** rsakeypair label | Specifies which key pair to associate with the certificate. |
**Step 5** serial-number none | The none keyword specifies that a serial number will not be included in the certificate request. |
**Step 6** ip-address none | The none keyword specifies that no IP address should be included in the certificate request. |
**Step 7** revocation-check crl | Specifies CRL as the method to ensure that the certificate of a peer has not been revoked. |
**Step 8** exit | Exits Global Configuration mode. |
**Step 9** crypto pki authenticate name | Retrieves the CA certificate and authenticates it. |
**Step 10** crypto pki enroll name | Generates certificate request and displays the request for copying and pasting into the certificate server. |
Enter enrollment information when you are prompted. For example, specify whether to include the device FQDN and IP address in the certificate request. |
You are also given the choice about displaying the certificate request to the console terminal. |
The base-64 encoded certificate with or without PEM headers as requested is displayed. |
**Step 11** crypto pki import name certificate | Imports a certificate via TFTP at the console terminal, which retrieves the granted certificate. |
The device attempts to retrieve the granted certificate via TFTP using the same filename used to send the request, except the extension is changed from “.req” to “.crt”. For usage key certificates, the extensions “-sign.crt” and “-encr.crt” are used. |
The device parses the received files, verifies the certificates, and inserts the certificates into the internal certificate database on the switch. |
**Note** Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If your CA ignores the usage key information in the certificate request, only import the general purpose certificate. The router will not use one of the two key pairs generated.
## Enabling 802.1x Authentication and Configuring AAA

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><em>enable</em>&lt;br&gt;Enables privileged EXEC mode.&lt;br&gt;- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><em>configure terminal</em>&lt;br&gt;Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><em>aaa new-model</em>&lt;br&gt;Enables AAA.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><em>dot1x system-auth-control</em>&lt;br&gt;Enables 802.1X on your device.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><em>radius server name</em>&lt;br&gt; Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><em>address ip-address auth-port port-number acct-port port-number</em>&lt;br&gt;Configures the IPv4 address for the RADIUS server accounting and authentication parameters.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td><em>automate-tester username username</em>&lt;br&gt; Enables the automated testing feature for the RADIUS server.&lt;br&gt;With this practice, the device sends periodic test authentication messages to the RADIUS server. It looks for a RADIUS response from the server. A success message is not necessary – a failed authentication suffices, because it shows that the server is alive.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td><em>key string</em>&lt;br&gt;Configures the authentication and encryption key for all RADIUS communications between the device and the RADIUS server.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td><em>radius-server deadtime minutes</em>&lt;br&gt;Improves RADIUS response time when some servers might be unavailable and skips unavailable servers immediately.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td><em>exit</em>&lt;br&gt;Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td><em>aaa group server radius group-name</em>&lt;br&gt;Groups different RADIUS server hosts into distinct lists and distinct methods, and enters server group configuration mode.</td>
</tr>
</tbody>
</table>

---

### Additional Information

- **Step 12**
  - *exit*<br>Exits global configuration mode.
- **Step 13**
  - *show crypto pki certificate trustpoint name*<br>Displays information about the certificate for the trust point.
- **Step 14**

**Configuring EAP-TLS Profile and 802.1x Credentials**

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable           | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| 2    | configure terminal | Enters global configuration mode. |
| 3    | eap profile profile-name | Configures EAP profile and enters EAP profile configuration mode. |
| 4    | method tls       | Enables EAP-TLS method on the device. |
| 5    | pki-trustpoint name | Sets the default PKI trustpoint. |
| 6    | exit             | Returns to global configuration mode. |
| 7    | dot1x credentials profile-name | Configures 802.1x credentials profile and enters dot1x credentials configuration mode. |
| 8    | username username | Sets the authentication user ID. |
| 9    | pki-trustpoint name | Sets the default PKI trustpoint. |
| 10   | end              | Returns to privileged EXEC mode. |

**Applying the 802.1x MACsec MKA Configuration on Interfaces**

To apply MACsec MKA using EAP-TLS to interfaces, perform the following task:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td>interface interface-id</td>
<td>Identifies the MACsec interface, and enter interface configuration mode. The interface must be a physical interface.</td>
</tr>
<tr>
<td>Command or Action</td>

<td></td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> maecsec network-link</td>
<td>Enables MACsec on the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> authentication periodic</td>
<td>Enables reauthentication for this port.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> authentication timer reauthenticate interval</td>
<td>Sets the reauthentication interval.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> access-session host-mode multi-domain</td>
<td>Allows hosts to gain access to the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> access-session closed</td>
<td>Prevents preauthentication access on the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> access-session port-control auto</td>
<td>Sets the authorization state of a port.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> dot1x pae both</td>
<td>Configures the port as an 802.1X port access entity (PAE) supplicant and authenticator.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> dot1x credentials profile</td>
<td>Assigns a 802.1x credentials profile to the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> dot1x supplicant eap profile name</td>
<td>Assigns the EAP-TLS profile to the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> service-policy type control subscriber control-policy name</td>
<td>Applies a subscriber control policy to the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> exit</td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> show macsec interface</td>
<td>Displays MACsec details for the interface.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
<td></td>
</tr>
</tbody>
</table>

### Local Authentication

**Configuring the EAP Credentials using Local Authentication**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
  - Enter your password if prompted. |
| **Step 2** configure terminal | Enters global configuration mode. |
| **Step 3** aaa new-model | Enables AAA. |
| **Step 4** aaa local authentication default authorization default | Sets the default local authentication and default local authorization method. |
| **Step 5** aaa authentication dot1x default local | Sets the default local username authentication list for IEEE 802.1x. |
| **Step 6** aaa authorization network default local | Sets an authorization method list for local user. |
Configuring the Local EAP-TLS Authentication and Authorization Profile

### Procedure

### Configuring Enrollment using SCEP

Simple Certificate Enrollment Protocol (SCEP) is a Cisco-developed enrollment protocol that uses HTTP to communicate with the certificate authority (CA) or registration authority (RA). SCEP is the most commonly used method for sending and receiving requests and certificates.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>crypto pki trustpoint <em>servername</em></td>
</tr>
</tbody>
</table>
| **Step 4** | enrollment url *url name pem* | Specifies the URL of the CA on which your devices should send certificate requests.  
  An IPv6 address can be added in the URL enclosed in brackets. For example: `http://[2001:DB8:1::1]:80`.  
  The `pem` keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request. |
| **Step 5** | rsakeypair *label* | Specifies which key pair to associate with the certificate.  
  **Note** The `rsakeypair` name must match the trust-point name. |
| **Step 6** | serial-number none | The `none` keyword specifies that a serial number will not be included in the certificate request. |
| **Step 7** | ip-address none | The `none` keyword specifies that no IP address should be included in the certificate request. |
| **Step 8** | revocation-check crl | Specifies CRL as the method to ensure that the certificate of a peer has not been revoked. |
| **Step 9** | auto-enroll *percent regenerate* | Enables auto-enrollment, allowing the client to automatically request a rollover certificate from the CA.  
  If auto-enrollment is not enabled, the client must be manually re-enrolled in your PKI upon certificate expiration.  
  By default, only the Domain Name System (DNS) name of the device is included in the certificate.  
  Use the `percent` argument to specify that a new certificate will be requested after the percentage of the lifetime of the current certificate is reached.  
  Use the `regenerate` keyword to generate a new key for the certificate even if a named key already exists.  
  If the key pair being rolled over is exportable, the new key pair will also be exportable. The following comment will appear in the trustpoint configuration to indicate whether the key pair is exportable: “! RSA key pair associated with trustpoint is exportable.”  
  It is recommended that a new key pair be generated for security reasons. |
| **Step 10** | crypto pki authenticate *name* | Retrieves the CA certificate and authenticates it. |
| **Step 11** | exit | Exits global configuration mode. |
### Configuring Enrollment Manually

If your CA does not support SCEP or if a network connection between the router and CA is not possible, perform the following task to set up manual certificate enrollment:

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> crypto pki trustpoint server name</td>
<td>Declares the trustpoint and a given name and enters ca-trustpoint configuration mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> enrollment url url name pem</td>
<td>Specifies the URL of the CA on which your device should send certificate requests.</td>
</tr>
<tr>
<td></td>
<td>An IPv6 address can be added in the URL enclosed in brackets. For example: http://[2001:DB8:1:1::1]:80.</td>
</tr>
<tr>
<td></td>
<td>The pem keyword adds privacy-enhanced mail (PEM) boundaries to the certificate request.</td>
</tr>
<tr>
<td><strong>Step 5</strong> rsakeypair label</td>
<td>Specifies which key pair to associate with the certificate.</td>
</tr>
<tr>
<td><strong>Step 6</strong> serial-number none</td>
<td>The <em>none</em> keyword specifies that a serial number will not be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 7</strong> ip-address none</td>
<td>The <em>none</em> keyword specifies that no IP address should be included in the certificate request.</td>
</tr>
<tr>
<td><strong>Step 8</strong> revocation-check crl</td>
<td>Specifies CRL as the method to ensure that the certificate of a peer has not been revoked.</td>
</tr>
<tr>
<td><strong>Step 9</strong> exit</td>
<td>Exits Global Configuration mode.</td>
</tr>
<tr>
<td><strong>Step 10</strong> crypto pki authenticate name</td>
<td>Retrieves the CA certificate and authenticates it.</td>
</tr>
<tr>
<td><strong>Step 11</strong> crypto pki enroll name</td>
<td>Generates certificate request and displays the request for copying and pasting into the certificate server.</td>
</tr>
<tr>
<td></td>
<td>Enter enrollment information when you are prompted. For example, specify whether to include the device FQDN and IP address in the certificate request.</td>
</tr>
<tr>
<td></td>
<td>You are also given the choice about displaying the certificate request to the console terminal.</td>
</tr>
</tbody>
</table>
**Purpose**

The base-64 encoded certificate with or without PEM headers as requested is displayed.

**Step 12**

- **crypto pki import** *name* certificate

Imports a certificate via TFTP at the console terminal, which retrieves the granted certificate.

The device attempts to retrieve the granted certificate via TFTP using the same filename used to send the request, except the extension is changed from “.req” to “.crt”. For usage key certificates, the extensions “-sign.crt” and “-encr.crt” are used.

The device parses the received files, verifies the certificates, and inserts the certificates into the internal certificate database on the switch.

**Note**

Some CAs ignore the usage key information in the certificate request and issue general purpose usage certificates. If your CA ignores the usage key information in the certificate request, only import the general purpose certificate. The router will not use one of the two key pairs generated.

**Step 13**

- **exit**

Exits Global Configuration mode.

**Step 14**

- **show crypto pki certificate** *trustpoint name*

Displays information about the certificate for the trust point.

**Step 15**

- **copy running-config startup-config**

(Optional) Saves your entries in the configuration file.

---

### Configuring EAP-TLS Profile and 802.1x Credentials

**Procedure**

<table>

### Appyling the 802.1x MKA MACsec Configuration on Interfaces

To apply MKA MACsec using EAP-TLS to interfaces, perform the following task:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td>interface interface-id</td>
<td>Identifies the MACsec interface, and enter interface configuration mode. The interface must be a physical interface.</td>
</tr>
<tr>
<td>Step 4</td>
<td>macsec</td>
<td>Enables MACsec on the interface.</td>
</tr>
<tr>
<td>Step 5</td>
<td>authentication periodic</td>
<td>Enables reauthentication for this port.</td>
</tr>
<tr>
<td>Step 6</td>
<td>authentication timer reauthenticate interval</td>
<td>Sets the reauthentication interval.</td>
</tr>
<tr>
<td>Step 7</td>
<td>access-session host-mode multi-domain</td>
<td>Allows hosts to gain access to the interface.</td>
</tr>
<tr>
<td>Step 8</td>
<td>access-session closed</td>
<td>Prevents preauthentication access on the interface.</td>
</tr>
<tr>
<td>Step 9</td>
<td>access-session port-control auto</td>
<td>Sets the authorization state of a port.</td>
</tr>
<tr>
<td>Step 10</td>
<td>dot1x pae both</td>
<td>Configures the port as an 802.1X port access entity (PAE) supplicant and authenticator.</td>
</tr>
<tr>
<td>Step 11</td>
<td>dot1x credentials profile</td>
<td>Assigns a 802.1x credentials profile to the interface.</td>
</tr>
<tr>
<td>Step 12</td>
<td>dot1x authenticator eap profile name</td>
<td>Assigns the EAP-TLS authenticator profile to the interface.</td>
</tr>
<tr>
<td>Step 13</td>
<td>dot1x supplicant eap profile name</td>
<td>Assigns the EAP-TLS supplicant profile to the interface.</td>
</tr>
<tr>
<td>Step 14</td>
<td>service-policy type control subscriber control-policy name</td>
<td>Applies a subscriber control policy to the interface.</td>
</tr>
<tr>
<td>Step 15</td>
<td>exit</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 16</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------</td>
<td>----------------------------</td>
<td>----------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>show macsec interface</td>
<td>Displays MACsec details for the interface.</td>
</tr>
<tr>
<td></td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

## Verifying MACsec MKA using EAP-TLS

Use the following `show` commands to verify the configuration of MACsec MKA using EAP-TLS. Given below are the sample outputs of the `show` commands.

The `show mka sessions` command displays a summary of active MACsec Key Agreement (MKA) Protocol sessions.

```
Device# show mka sessions

Total MKA Sessions....... 1
Secured Sessions... 1
Pending Sessions... 0

Interface Local-TxSCI Policy-Name Inherited Key-Server
Port-ID Peer-RxSCI MACsec-Peers Status CKN

Te0/1/3 74a2.e625.4413/0013 *DEFAULT POLICY* NO YES
1 74a2.e625.4c22/0012 1 Secured
1000000000000000000000000000000000000000000000000000000000000000
```

The `show macsec status interface` command displays MACsec status information for the given interface.

```
Device# show macsec status interface te0/1/2

Capabilities:
Ciphers Supported: GCM-AES-128 GCM-AES-256
Cipher: GCM-AES-128
Confidentiality Offset: 0
Replay Window: 64
Delay Protect Enable: FALSE
Access Control: must-secure

Transmit SC: 74A2E6254C220012
Transmitting: TRUE
Transmit SA:
Next PN: 412
Delay Protect AN/nextPN: 99/0

Receive SC: 74A2E62544130013
Receiving: TRUE
Receive SA:
Next PN: 64
AN: 0
Delay Protect AN/LPN: 0/0
```
The `show access-session interface interface-id details` displays detailed information about the access session for the given interface.

```
Device# show access-session interface te1/0/1 details

Interface: TenGigabitEthernet1/0/1
  IIF-ID: 0x17298FCD
  MAC Address: f8a5.c592.13e4
  IPv6 Address: Unknown

## Cisco TrustSec Overview

The table below lists the TrustSec features to be eventually implemented on TrustSec-enabled Cisco switches. Successive general availability releases of TrustSec will expand the number of switches supported and the number of TrustSec features supported per switch.

<table>
<thead>
<tr>
<th>Cisco TrustSec Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1AE Tagging (MACsec)</td>
<td>Protocol for IEEE 802.1AE-based wire-rate hop-to-hop Layer 2 encryption.</td>
</tr>
<tr>
<td></td>
<td>Between MACsec-capable devices, packets are encrypted on egress from the transmitting device, decrypted on ingress to the receiving device, and in the clear within the devices.</td>
</tr>
<tr>
<td></td>
<td>This feature is only available between TrustSec hardware-capable devices.</td>
</tr>
<tr>
<td>Cisco TrustSec Feature</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Endpoint Admission Control (EAC)</td>
<td>EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).</td>
</tr>
<tr>
<td>Network Device Admission Control (NDAC)</td>
<td>NDAC is an authentication process where each network device in the TrustSec domain can verify the credentials and trustworthiness of its peer device. NDAC utilizes an authentication framework based on IEEE 802.1X port-based authentication and uses EAP-FAST as its EAP method. Successful authentication and authorization in NDAC process results in Security Association Protocol negotiation for IEEE 802.1AE encryption.</td>
</tr>
<tr>
<td>Security Association Protocol (SAP)</td>
<td>After NDAC authentication, the Security Association Protocol (SAP) automatically negotiates keys and the cipher suite for subsequent MACSec link encryption between TrustSec peers. SAP is defined in IEEE 802.11i.</td>
</tr>
<tr>
<td>Security Group Tag (SGT)</td>
<td>An SGT is a 16-bit single label indicating the security classification of a source in the TrustSec domain. It is appended to an Ethernet frame or an IP packet.</td>
</tr>
<tr>
<td>SGT Exchange Protocol (SXP)</td>
<td>Security Group Tag Exchange Protocol (SXP). With SXP, devices that are not TrustSec-hardware-capable can receive SGT attributes for authenticated users and devices from the Cisco Identity Services Engine (ISE) or the Cisco Secure Access Control System (ACS). The devices can then forward a sourceIP-to-SGT binding to a TrustSec-hardware-capable device will tag the source traffic for SGACL enforcement.</td>
</tr>
</tbody>
</table>

When both ends of a link support 802.1AE MACsec, SAP negotiation occurs. An EAPOL-key exchange occurs between the supplicant and the authenticator to negotiate a cipher suite, exchange security parameters, and manage keys. Successful completion of these tasks results in the establishment of a security association (SA).

Depending on your software version and licensing and link hardware support, SAP negotiation can use one of these modes of operation:

- Galois Counter Mode (GCM)—authentication and encryption
- GCM authentication (GMAC)—GCM authentication, no encryption
- No Encapsulation—no encapsulation (clear text)
• Null—encapsulation, no authentication or encryption

Configuring Cisco TrustSec MACsec

Configuring Cisco TrustSec Switch-to-Switch Link Security in Manual Mode

Before you begin

When manually configuring Cisco TrustSec on an interface, consider these usage guidelines and restrictions:

• If no SAP parameters are defined, Cisco TrustSec encapsulation or encryption is not performed.
• If you select GCM as the SAP operating mode, you must have a MACsec Encryption software license from Cisco. If you select GCM without the required license, the interface is forced to a link-down state.
• These protection levels are supported when you configure SAP pairwise master key (sap pmk):
  • SAP is not configured—no protection.
  • `sap mode-list gcm-encrypt gmac no-encap`—protection desirable but not mandatory.
  • `sap mode-list gcm-encrypt gmac`—confidentiality preferred and integrity required. The protection is selected by the supplicant according to supplicant preference.
  • `sap mode-list gmac`—integrity only.
  • `sap mode-list gcm-encrypt`—confidentiality required.
  • `sap mode-list gmac gcm-encrypt`—integrity required and preferred, confidentiality optional.

• Before changing the configuration from MKA to Cisco TrustSec SAP and vice versa, we recommend that you remove the interface configuration.

Beginning in privileged EXEC mode, follow these steps to manually configure Cisco TrustSec on an interface to another Cisco TrustSec device:

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. cts manual
5. no propagate sgt
6. exit
7. end
8. show cts interface [ interface-id | brief | summary ]
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `configure terminal`  
Example:  
`Switch# configure terminal` | Enters global configuration mode. |
| 2    | `interface interface-id`  
Example:  
`Switch(config)# interface tengigabitethernet 1/1/2` | Enters interface configuration mode. |
| 3    | `cts manual`  
Example:  
`Switch(config-if)# cts manual` | Enters Cisco TrustSec manual configuration mode. |
| 4    | `sap pmk key [mode-list mode1 [mode2 [mode3 [mode4]]]]`  
Example:  
`Switch(config-if-cts-manual)# sap pmk 1234abcdef mode-list gcm-encrypt null no-encap` | (Optional) Configures the SAP pairwise master key (PMK) and operation mode. SAP is disabled by default in Cisco TrustSec manual mode.  
- `key`—A hexadecimal value with an even number of characters and a maximum length of 32 characters.  
The SAP operation mode options:  
  - `gcm-encrypt`—Authentication and encryption  
    Note: Select this mode for MACsec authentication and encryption if your software license supports MACsec encryption.  
  - `gmac`—Authentication, no encryption  
  - `no-encap`—No encapsulation  
  - `null`—Encapsulation, no authentication or encryption  
    Note: If the interface is not capable of data link encryption, `no-encap` is the default and the only available SAP operating mode. SGT is not supported. |
| 5    | `no propagate sgt`  
Example:  
`Switch(config-if-cts-manual)# no propagate sgt` | Use the `no` form of this command when the peer is incapable of processing a SGT. The `no propagate sgt` command prevents the interface from transmitting the SGT to the peer. |
| 6    | `exit`  
Example:  
`Switch(config-if-cts-manual)# exit` | Exits Cisco TrustSec 802.1x interface configuration mode. |
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.</td>
<td><strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-if)# <strong>end</strong></td>
<td></td>
</tr>
<tr>
<td>8.</td>
<td><code>show cts interface</code> <code>[interface-id]</code> <code>[brief]</code> <code>[summary]</code></td>
<td>(Optional) Verify the configuration by displaying TrustSec-related interface characteristics.</td>
</tr>
</tbody>
</table>

### Example

This example shows how to configure Cisco TrustSec authentication in manual mode on an interface:

```
Switch# configure terminal
Switch(config)# interface tengigabitethernet 1/1/2
Switch(config-if)# cts manual
Switch(config-if-cts-manual)# sap pmk 1234abcdef mode-list gcm-encrypt null no-encap
Switch(config-if-cts-manual)# no propagate sgt
Switch(config-if-cts-manual)# exit
Switch(config-if)# end
```

## Configuration Examples

### Configuring MACsec on an Interface

Follow these steps to configure MACsec on an interface with one MACsec session for voice and one for data:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface `interface-id`
4. switchport access vlan `vlan-id`
5. switchport mode access
6. macsec
7. authentication event linksec fail action authorize vlan `vlan-id`
8. authentication host-mode multi-domain
9. authentication linksec policy must-secure
10. authentication port-control auto
11. authentication periodic
12. authentication timer reauthenticate
13. authentication violation protect
14. mka policy `policy name`
15. dot1x pae authenticator
16. spanning-tree portfast
17. end
18. `show authentication session interface interface-id`
19. `show authentication session interface interface-id details`
20. `show mka sessions`
21. `show macsec interface interface-id details`
22. `copy running-config startup-config`

<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Example: Enrolling the Certificate

```
Configure Crypto PKI Trustpoint:
crypto pki trustpoint POLESTAR-IOS-CA
enrollment terminal
subject-name CN=ASR1000x1@polestar.com, C=IN, ST=KA, OU=ENG, O=Polestar
```
revocation-check none
rsakeypair mkaioscarca
storage nvram:
!

**Manual Installation of Root CA certificate:**
crypto pki authenticate POLESTAR-IOS-CA

---

### Example: Enabling 802.1x Authentication and AAA Configuration

```plaintext
aaa new-model
dot1x system-auth-control
radius server ISE
  address ipv4 <ISE ipv4 address> auth-port 1645 acct-port 1646
  automate-tester username dummy
  key dummy123
  radius-server deadtime 2
!
aaa group server radius ISEGRP
  server name ISE
!
aaa authentication dot1x default group ISEGRP
aaa authorization network default group ISEGRP
```

---

### Example: Configuring EAP-TLS Profile and 802.1X Credentials

```plaintext
eap profile EAPTLS-PROF-IOSCA
  method tls
    pki-trustpoint POLESTAR-IOS-CA
!
dot1x credentials EAPTLSRED-IOSCA
  username asr1000@polestar.company.com
  pki-trustpoint POLESTAR-IOS-CA
!
```

---

### Example: Applying 802.1X, PKI, and MACsec Configuration on the Interface

```plaintext
interface TenGigabitEthernet0/1
  macsec network-link
  authentication periodic
  authentication timer reauthenticate <reauthentication interval>
  access-session host-mode multi-host
  access-session closed
  access-session port-control auto
  dot1x pae both
  dot1x credentials EAPTLSRED-IOSCA
  dot1x supplicant eap profile EAPTLS-PROF-IOSCA
  service-policy type control subscriber DOT1X_POLICY_RADIUS
```
Example: Cisco TrustSec Switch-to-Switch Link Security Configuration

This example shows the configuration necessary for a seed and non-seed device for Cisco TrustSec switch-to-switch security. You must configure the AAA and RADIUS for link security. In this example, ACS-1 through ACS-3 can be any server names and cts-radius is the Cisco TrustSec server.

Seed Device Configuration:

```
Switch(config)#aaa new-model
Switch(config)#radius server ACS-1
Switch(config-radius-server)#address ipv4 10.5.120.12 auth-port 1812 acct-port 1813
Switch(config-radius-server)#pac key cisco123
Switch(config-radius-server)#exit
Switch(config)#radius server ACS-2
Switch(config-radius-server)#address ipv4 10.5.120.14 auth-port 1812 acct-port 1813
Switch(config-radius-server)#pac key cisco123
Switch(config-radius-server)#exit
Switch(config)#radius server ACS-3
Switch(config-radius-server)#address ipv4 10.5.120.15 auth-port 1812 acct-port 1813
Switch(config-radius-server)#pac key cisco123
Switch(config-radius-server)#exit
Switch(config)#aaa group server radius cts-radius
Switch(config-sg-radius)#server name ACS-1
Switch(config-sg-radius)#server name ACS-2
Switch(config-sg-radius)#server name ACS-3
Switch(config-sg-radius)#exit
Switch(config)#aaa authentication login default none
Switch(config)#aaa authentication dot1x default group cts-radius
Switch(config)#aaa authorization network cts-radius group cts-radius
Switch(config)#aaa session-id common
Switch(config)#cts authorization list cts-radius
Switch(config)#dot1x system-auth-control
Switch(config)#interface gi1/1/2
Switch(config-if)#switchport mode trunk
Switch(config-if)#cts manual
Switch(config-if-cts-manual)#sap pmk 0 abcd mode-list gcm-encrypt gmac
Switch(config-if-cts-manual)#exit
Switch(config-if)#exit
Switch(config)#interface gi1/1/4
Switch(config-if)#switchport mode trunk
Switch(config-if)#cts manual
Switch(config-if-cts-manual)#sap pmk 03345AABBCCDDEEFF mode-list gcm-encrypt gmac
Switch(config-if-cts-manual)#no propagate sgt
Switch(config-if-cts-manual)#exit
Switch(config-if)#exit
```
Switch(config)#radius-server vsa send authentication
Switch(config)#end
Switch#cts credentials id cts-36 password trustsec123

Non-Seed Device:
Switch(config)#aaa new-model
Switch(config)#aaa session-id common
Switch(config)#dot1x system-auth-control
Switch(config)#interface gi1/1/2
Switch(config-if)#switchport mode trunk
Switch(config-if)#shutdown
Switch(config-if)#cts manual
Switch(config-if-cts-manual)#sap pmk 0 abcd mode-list gcm-encrypt gmac
Switch(config-if-cts-manual)#exit
Switch(config-if)#exit
Switch(config)#interface gi1/1/4
Switch(config-if)#switchport mode trunk
Switch(config-if)#shutdown
Switch(config-if)#cts manual
Switch(config-if-cts-manual)#sap pmk 03345AABBCCDDEEFF mode-list gcm-encrypt gmac
Switch(config-if-cts-manual)#no propagate sgt
Switch(config-if-cts-manual)#exit
Switch(config-if)#exit
Switch(config)#radius-server vsa send authentication
Switch(config)#cts credentials id cts-72 password trustsec123
Switch(config)#end
Example: Cisco TrustSec Switch-to-Switch Link Security Configuration
## Configuring RADIUS

- Finding Feature Information, on page 1743
- Prerequisites for Configuring RADIUS, on page 1743
- Restrictions for Configuring RADIUS, on page 1744
- Information about RADIUS, on page 1745
- How to Configure RADIUS, on page 1768
- Monitoring CoA Functionality, on page 1785

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Prerequisites for Configuring RADIUS

This section lists the prerequisites for controlling Device access with RADIUS.

**General:**

- RADIUS and Authentication, Authorization, and Accounting (AAA) must be enabled to use any of the configuration commands in this chapter.

- RADIUS is facilitated through AAA and can be enabled only through AAA commands.

- Use the `aaa new-model` global configuration command to enable AAA.

- Use the `aaa authentication` global configuration command to define method lists for RADIUS authentication.

- Use `line` and `interface` commands to enable the defined method lists to be used.
• At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.

• You should have access to and should configure a RADIUS server before configuring RADIUS features on your Device.

• The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

• To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

• A redundant connection between a switch stack and the RADIUS server is recommended. This is to help ensure that the RADIUS server remains accessible in case one of the connected stack members is removed from the switch stack.

For RADIUS operation:

• Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

  RADIUS and Switch Access, on page 1745
  RADIUS Operation, on page 1746

Restrictions for Configuring RADIUS

This topic covers restrictions for controlling Device access with RADIUS.

General:

• To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

• Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.

• Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.

• Networks using a variety of services. RADIUS generally binds a user to one service model.

Information about RADIUS

RADIUS and Switch Access

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.

Related Topics

RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.

- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validate users and to grant access to network resources.

- Networks already using RADIUS. You can add a Cisco Device containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.

- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 11, “Configuring IEEE 802.1x Port-Based Authentication.”

- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.
**RADIUS Operation**

When a user attempts to log in and authenticate to a Device that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of the following responses from the RADIUS server:
   - **ACCEPT**—The user is authenticated.
   - **REJECT**—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   - **CHALLENGE**—A challenge requires additional data from the user.
   - **CHALLENGE PASSWORD**—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

RADIUS Change of Authorization

The RADIUS Change of Authorization (CoA) provides a mechanism to change the attributes of an authentication, authorization, and accounting (AAA) session after it is authenticated. When a policy changes for a user or user group in AAA, administrators can send RADIUS CoA packets from the AAA server such as a Cisco Secure Access Control Server (ACS) to reinitialize authentication and apply the new policy. This section provides an overview of the RADIUS interface including available primitives and how they are used during a CoA.

- Change-of-Authorization Requests
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication
- Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response come from the queried servers. Catalyst supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external AAA or policy servers.

The Catalyst supports these per-session CoA requests:

- Session reauthentication
- Session termination
- Session termination with port shutdown
- Session termination with port bounce

This feature is integrated with Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst. However, some basic configuration is required for the following attributes:

- Security and Password—refer to the “Preventing Unauthorized Access to Your Switch” section in this guide.
- Accounting—refer to the “Starting RADIUS Accounting” section in the Configuring Switch-Based Authentication chapter in this guide.

Cisco IOS software supports the RADIUS CoA extensions defined in RFC 5176 that are typically used in a push model to allow the dynamic reconfiguring of sessions from external AAA or policy servers. Per-session CoA requests are supported for session identification, session termination, host reauthentication, port shutdown, and port bounce. This model comprises one request (CoA-Request) and two possible response codes:

- CoA acknowledgement (ACK) [CoA-ACK]
- CoA nonacknowledgement (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a AAA or policy server) and directed to the device that acts as a listener.
The table below shows the RADIUS CoA commands and vendor-specific attributes (VSAs) supported by Identity-Based Networking Services. All CoA commands must include the session identifier between the device and the CoA client.

**Table 128: RADIUS CoA Commands Supported by Identity-Based Networking Services**

**Change-of-Authorization Requests**

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.

**RFC 5176 Compliance**

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.
This table shows the IETF attributes are supported for this feature.

CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch.

The packet format for a CoA Request Response code as defined in RFC 5176 consists of the following fields: Code, Identifier, Length, Authenticator, and Attributes in the Type:Length:Value (TLV) format. The Attributes field is used to carry Cisco vendor-specific attributes (VSAs).

CoA Request Commands, on page 1751

Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Acct-Session-Id (IETF attribute #44)
- Audit-Session-Id (Cisco VSA)
- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- IPv6 Attributes, which can be one of the following:
  - Framed-IPv6-Prefix (IETF attribute #97) and Framed-Interface-Id (IETF attribute #96), which together create a full IPv6 address per RFC 3162
  - Framed-IPv6-Address
  - Plain IP Address (IETF attribute #8)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect-negative acknowledgment (NAK) or CoA-NAK with the error code “Invalid Attribute Value.”

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.

```
+-------------------+-------------------+-------------------+-------------------+
| | | | |
| Code | Identifier | Length |
| +-------------------+-------------------+-------------------+
| | Authenticator |
| | | |
| | Attributes ... |
```

The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

For CoA requests targeted at a particular enforcement policy, the device returns a CoA-NAK with the error code “Invalid Attribute Value” if any of the above session identification attributes are included in the message.
CoA ACK Response Code

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

CoA NAK Response Code

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use `show` commands to verify a successful CoA.

CoA Request Commands

Table 131: CoA Commands Supported on the Cisco VSA

<table>
<thead>
<tr>
<th>Command</th>
<th>Cisco VSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reauthenticate host</td>
<td>Cisco:Avpair=&quot;subscriber:command=reauthenticate&quot;</td>
</tr>
<tr>
<td>Terminate session</td>
<td>This is a standard disconnect request that does not require a VSA.</td>
</tr>
<tr>
<td>Bounce host port</td>
<td>Cisco:Avpair=&quot;subscriber:command=bounce-host-port&quot;</td>
</tr>
<tr>
<td>Disable host port</td>
<td>Cisco:Avpair=&quot;subscriber:command=disable-host-port&quot;</td>
</tr>
</tbody>
</table>

8 All CoA commands must include the session identifier between the `and` and the CoA client.

Session Reauthentication

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: `Cisco:Avpair="subscriber:command=reauthenticate"` and one or more session identification attributes.

The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.
If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

Session Reauthentication in a Switch Stack

When a switch stack receives a session reauthentication message:

- It checkpoints the need for a re-authentication before returning an acknowledgment (ACK).
- It initiates reauthentication for the appropriate session.
- If authentication completes with either success or failure, the signal that triggered the reauthentication is removed from the stack member.
- If the stack master fails before authentication completes, reauthentication is initiated after stack master switch-over based on the original command (which is subsequently removed).
- If the stack master fails before sending an ACK, the new stack master treats the re-transmitted command as a new command.

Session Termination

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host access to the network.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

CoA Disconnect-Request

This command is a standard Disconnect-Request. If the session cannot be located, the switch returns a Disconnect-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch terminates the session. After the session has been completely removed, the switch returns a Disconnect-ACK.

If the switch fails-over to a standby switch before returning a Disconnect-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the session is not found following re-sending, a Disconnect-ACK is sent with the “Session Context Not Found” error-code attribute.

Related Topics

- Session Identification, on page 1750

CoA Request: Disable Host Port

The RADIUS server CoA disable port command administratively shuts down the authentication port that is hosting a session, resulting in session termination. This command is useful when a host is known to cause problems on the network and network access needs to be immediately blocked for the host. To restore network
access on the port, reenable it using a non-RADIUS mechanism. This command is carried in a standard CoA-Request message that has this new vendor-specific attribute (VSA):

Cisco:Avpair="subscriber:command=disable-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes described in the “Session Identification” section. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK message. If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

---

**Note**

A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.

---

**Related Topics**

- Session Identification, on page 1750

---

**CoA Request: Bounce-Port**

A RADIUS server CoA bounce port sent from a RADIUS server can cause a link flap on an authentication port, which triggers DHCP renegotiation from one or more hosts connected to this port. This incident can occur when there is a VLAN change and the endpoint is a device (such as a printer) that does not have a mechanism to detect a change on this authentication port. The CoA bounce port is carried in a standard CoA-Request message that contains the following VSA:

Cisco:Avpair="subscriber:command=bounce-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

**Stacking Guidelines for Session Termination**

No special handling is required for CoA Disconnect-Request messages in a switch stack.

**Stacking Guidelines for CoA-Request Bounce-Port**

Because the **bounce-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.
When the Auth Manager command handler on the stack master receives a valid `bounce-port` command, it checkpoints the following information before returning a CoA-ACK message:

- the need for a port-bounce
- the port-id (found in the local session context)

The switch initiates a port-bounce (disables the port for 10 seconds, then re-enables it).

If the port-bounce is successful, the signal that triggered the port-bounce is removed from the standby stack master.

If the stack master fails before the port-bounce completes, a port-bounce is initiated after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

**Stacking Guidelines for CoA-Request Disable-Port**

Because the `disable-port` command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid `disable-port` command, it verifies this information before returning a CoA-ACK message:

- the need for a port-disable
- the port-id (found in the local session context)

The switch attempts to disable the port.

If the port-disable operation is successful, the signal that triggered the port-disable is removed from the standby stack master.

If the stack master fails before the port-disable operation completes, the port is disabled after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

**Default RADIUS Configuration**

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

**RADIUS Server Host**

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.

If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS_DEAD message appears, and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

- Defining AAA Server Groups, on page 1773
- Configuring Settings for All RADIUS Servers, on page 1778
- Configuring RADIUS Login Authentication, on page 1771

RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

Related Topics
- Configuring RADIUS Login Authentication, on page 1771
AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to different UDP ports on a server at the same IP address. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one. If the first host entry fails to provide accounting services, the network access server tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order in which they are configured.)

- Defining AAA Server Groups, on page 1773

AAA Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

Related Topics
- Configuring RADIUS Authorization for User Privileged Access and Network Services, on page 1775

RADIUS Accounting

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named cisco-avpair. The value is a string with this format:

```
protocol : attribute sep value *
```
Protocol is a value of the Cisco protocol attribute for a particular type of authorization. Attribute and value are an appropriate attribute value (AV) pair defined in the Cisco TACACS+ specification, and sep is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

For example, the following AV pair causes Cisco’s “multiple named IP address pools” feature to be activated during IP authorization (during PPP’s Internet Protocol Control Protocol (IPCP) address assignment):

cisco-avpair= "ip:addr-pool=first"

If you insert an “*”, the AV pair “ip:addr-pool=first” becomes optional. Note that any AV pair can be made optional:

cisco-avpair= "ip:addr-pool*first"

The following example shows how to cause a user logging in from a network access server to have immediate access to EXEC commands:

cisco-avpair= "shell:priv-lvl=15"

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

Attribute 26 contains the following three elements:

• Type

• Length

• String (also known as data)
  • Vendor-Id
  • Vendor-Type
  • Vendor-Length
  • Vendor-Data

The figure below shows the packet format for a VSA encapsulated “behind” attribute 26.

![Figure 104: VSA Encapsulated Behind Attribute 26](image)

It is up to the vendor to specify the format of their VSA. The Attribute-Specific field (also known as Vendor-Data) is dependent on the vendor's definition of that attribute.

The table below describes significant fields listed in the Vendor-Specific RADIUS IETF Attributes table (second table below), which lists supported vendor-specific RADIUS attributes (IETF attribute 26).
Table 132: Vendor-Specific Attributes Table Field Descriptions

<td>proxyacl#&lt;n&gt;</td>
<td>Allows users to configure the downloadable user profiles (dynamic ACLs) by using the authentication proxy feature so that users can have the configured authorization to permit traffic going through the configured interfaces.</td>
</tr>
</tbody>
</table>
### Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.

As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius server` global configuration commands.

### How to Configure RADIUS

#### Identifying the RADIUS Server Host

To apply these settings globally to all RADIUS servers communicating with the Device, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `key string`.

You can configure the Device to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.
You also need to configure some settings on the RADIUS server. These settings include the IP address of the Device and the key string to be shared by both the server and the Device. For more information, see the RADIUS server documentation.

Follow these steps to configure per-server RADIUS server communication.

**Before you begin**

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the device, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. radius server server name
4. address {ipv4 | ipv6} ip address { auth-port port number | acct-port port number}
5. key string
6. retransmit value
7. timeout seconds
8. exit
9. end
10. show running-config
11. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
<p>| Example: Device&gt; enable |<br />
| <strong>Step 2</strong> configure terminal | Enters global configuration mode. |
| Example: Device# configure terminal | |
| <strong>Step 3</strong> radius server server name | |
| Example: Device(config)# radius server rsim | |
| <strong>Step 4</strong> address {ipv4 | ipv6} ip address { auth-port port number | acct-port port number} | (Optional) Specifies the RADIUS server parameters. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-radius-server)# address ipv4 124.2.2.12 auth-port 1612</td>
<td>For <strong>auth-port</strong> port-number, specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536. For <strong>acct-port</strong> port-number, specify the UDP destination port for authentication requests. The default is 1646.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>key string</td>
<td>(Optional) For <strong>key string</strong>, specify the authentication and encryption key used between the Device and the RADIUS daemon running on the RADIUS server. <strong>Note</strong> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <strong>radius server</strong> command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>retransmit value</td>
<td>(Optional) Specifies the number of times a RADIUS request is resent when the server is not responding or responding slowly. The range is 1 to 100. This setting overrides the <strong>radius-server retransmit</strong> global configuration command setting.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td></td>
</tr>
<tr>
<td>timeout seconds</td>
<td>(Optional) Specifies the time interval that the Device waits for the RADIUS server to reply before sending a request again. The range is 1 to 1000. This setting overrides the <strong>radius-server timeout</strong> global configuration command setting.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td></td>
</tr>
<tr>
<td>exit</td>
<td>Exits the RADIUS server mode and enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td></td>
</tr>
<tr>
<td>show running-config</td>
<td>Verifies your entries.</td>
</tr>
</tbody>
</table>
## Configuring RADIUS Login Authentication

Follow these steps to configure RADIUS login authentication:

### Before you begin

To secure the device for HTTP access by using AAA methods, you must configure the device with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the device for HTTP access by using AAA methods.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login {default | list-name} method1 [method2...]`
5. `line [console | tty | vty] line-number [ending-line-number]`
6. `login authentication {default | list-name}`
7. `end`
8. `show running-config`
9. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | `enable`          | Enables privileged EXEC mode.  
* Enter your password if prompted. |
|      | `configure terminal` | Enters global configuration mode. |

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Device# configure terminal</strong></td>
<td>Enables AAA.</td>
</tr>
</tbody>
</table>

### Step 3

**aaa new-model**

**Example:**

```
Device(config)# aaa new-model
```

### Step 4

**aaa authentication login {default | list-name} method1 [method2...]**

**Example:**

```
Device(config)# aaa authentication login default local
```

Creates a login authentication method list.

- To create a default list that is used when a named list is not specified in the `login authentication` command, use the `default` keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.

- For `list-name`, specify a character string to name the list you are creating.

- For `method1...`, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.

Select one of these methods:

- **enable**—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the `enable password` global configuration command.

- **group radius**—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server.

- **line**—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the `password` line configuration command.

- **local**—Use the local username database for authentication. You must enter username information in the database. Use the `username name password` global configuration command.

- **local-case**—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the `username password` global configuration command.
<table>

### Defining AAA Server Groups

You use the server group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional auth-port and acct-port keywords.

Follow these steps to define AAA server groups:
## SUMMARY STEPS

1. enable
2. configure terminal
3. radius server name
4. address {ipv4 | ipv6} {ip-address | hostname} auth-port port-number acct-port port-number
5. key string
6. end
7. show running-config
8. copy running-config startup-config

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> radius server name</td>
<td>Specifies the name of the RADIUS server configuration for Protected Access Credential (PAC) provisioning and enters RADIUS server configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# radius server ISE</td>
<td>The device also supports RADIUS for IPv6.</td>
</tr>
<tr>
<td><strong>Step 4</strong> address {ipv4</td>
<td>ipv6} {ip-address</td>
</tr>
<tr>
<td>Example: Device(config-radius-server)# address ipv4 10.1.1.1 auth-port 1645 acct-port 1646</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> key string</td>
<td>Specifies the authentication and encryption key for all RADIUS communications between the device and the RADIUS server.</td>
</tr>
<tr>
<td>Example: Device(config-radius-server)# key cisco123</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Exits RADIUS server configuration mode and returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Configuring RADIUS Authorization for User Privileged Access and Network Services

**Note**

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Follow these steps to configure RADIUS authorization for user privileged access and network services:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa authorization network radius`
4. `aaa authorization exec radius`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  
  **enable**
  
  **Example:** |
  
  Enables privileged EXEC mode.
  
  * Enter your password if prompted.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**command or Action**
- configure terminal

**Example:**
- Device# configure terminal

**Purpose**
- Enters global configuration mode.

**Step 3**

**Command or Action**
- aaa authorization network radius

**Example:**
- Device(config)# aaa authorization network radius

**Purpose**
- Configures the device for user RADIUS authorization for all network-related service requests.

**Step 4**

**Command or Action**
- aaa authorization exec radius

**Example:**
- Device(config)# aaa authorization exec radius

**Purpose**
- Configures the device for user RADIUS authorization if the user has privileged EXEC access.

The **exec** keyword might return user profile information (such as **autocommand** information).

**Step 5**

**Command or Action**
- end

**Example:**
- Device(config)# end

**Purpose**
- Returns to privileged EXEC mode.

**Step 6**

**Command or Action**
- show running-config

**Example:**
- Device# show running-config

**Purpose**
- Verifies your entries.

**Step 7**

**Command or Action**
- copy running-config startup-config

**Example:**
- Device# copy running-config startup-config

**Purpose**
- (Optional) Saves your entries in the configuration file.

---

**What to do next**

You can use the **aaa authorization** global configuration command with the **radius** keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The **aaa authorization exec radius local** command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.
Starting RADIUS Accounting

Follow these steps to start RADIUS accounting:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. aaa accounting network start-stop radius
4. aaa accounting exec start-stop radius
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa accounting network start-stop radius</td>
<td>Enables RADIUS accounting for all network-related service requests.</td>
</tr>
<tr>
<td>Example: Device(config)# aaa accounting network start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa accounting exec start-stop radius</td>
<td>Enables RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td>Example: Device(config)# aaa accounting exec start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

**SUMMARY STEPS**

1. `configure terminal`
2. `radius-server key string`
3. `radius-server retransmit retries`
4. `radius-server timeout seconds`
5. `radius-server deadtime minutes`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device# <code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the shared secret text string used between the switch and all RADIUS servers.</td>
</tr>
<tr>
<td><code>radius-server key string</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# radius-server key your_server_key</code></td>
<td>The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
</tr>
<tr>
<td><code>Device(config)# key your_server_key</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>radius-server retransmit retries</code></td>
<td>Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config)# radius-server retransmit 5</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>radius-server timeout seconds</code></td>
<td>Specifies the number of seconds a switch waits for a reply to a RADIUS request before resending the request. The default is 5 seconds; the range is 1 to 1000.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config)# radius-server timeout 3</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>radius-server deadtime minutes</code></td>
<td>When a RADIUS server is not responding to authentication requests, this command specifies a time to stop the request on that server. This avoids the wait for the request to timeout before trying the next configured server. The default is 0; the range is 1 to 1440 minutes.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config)# radius-server deadtime 0</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Device(config)# end</code></td>
<td></td>

Configuring CoA on the Device

Follow these steps to configure CoA on a device. This procedure is required.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa server radius dynamic-author`
5. `client {ip-address | name} [vrf vrflname] [server-key string]`
6. `server-key [0 | 7] string`
7. `port port-number`
8. `auth-type {any | all | session-key}`
9. `ignore session-key`
10. `ignore server-key`
11. `authentication command bounce-port ignore`
12. `authentication command disable-port ignore`
13. `end`
14. `show running-config`
15. `copy running-config startup-config`

**DETAILED STEPS**

Configuring Kerberos

- Finding Feature Information, on page 1787
- Prerequisites for Controlling Switch Access with Kerberos, on page 1787
- Information about Kerberos, on page 1788
- How to Configure Kerberos, on page 1791
- Monitoring the Kerberos Configuration, on page 1791
- Additional References, on page 1791

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Switch Access with Kerberos

The following are the prerequisites for controlling switch access with Kerberos.

- So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.

- A Kerberos server can be a switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

When you add or create entries for the hosts and users, follow these guidelines:

- The Kerberos principal name must be in all lowercase characters.
- The Kerberos instance name must be in all lowercase characters.
Information about Kerberos

This section provides Kerberos information.

Kerberos and Switch Access

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party.

Note
In the Kerberos configuration examples, the trusted third party can be any switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

Kerberos Overview

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the key distribution center (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited life span, are stored in user credential caches. The Kerberos server uses the tickets instead of user names and passwords to authenticate users and network services.

Note
A Kerberos server can be any switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

The Kerberos credential scheme uses a process called single logon. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.

This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

Kerberos supports these network services:

• Telnet
• rlogin
• rsh
This table lists the common Kerberos-related terms and definitions.

**Table 136: Kerberos Terms**

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.</td>
</tr>
<tr>
<td>Authorization</td>
<td>A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.</td>
</tr>
<tr>
<td>Credential</td>
<td>A general term that refers to authentication tickets, such as TGTs and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default life span of eight hours.</td>
</tr>
<tr>
<td>Instance</td>
<td>An authorization level label for Kerberos principals. Most Kerberos principals are of the form <code>user@REALM</code> (for example, <a href="mailto:smith@EXAMPLE.COM">smith@EXAMPLE.COM</a>). A Kerberos principal with a Kerberos instance has the form <code>user/instance@REALM</code> (for example, smith/admin@EXAMPLE.COM). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so.</td>
</tr>
<tr>
<td>Note</td>
<td>The Kerberos principal and instance names must be in all lowercase characters.</td>
</tr>
<tr>
<td>Note</td>
<td>The Kerberos realm name must be in all uppercase characters.</td>
</tr>
<tr>
<td>KDC</td>
<td>Key distribution center that consists of a Kerberos server and database program that is running on a network host.</td>
</tr>
<tr>
<td>Kerberized</td>
<td>A term that describes applications and services that have been modified to support the Kerberos credential infrastructure.</td>
</tr>
<tr>
<td>Kerberos realm</td>
<td>A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service.</td>
</tr>
<tr>
<td>Note</td>
<td>The Kerberos realm name must be in all uppercase characters.</td>
</tr>
<tr>
<td>Kerberos server</td>
<td>A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services.</td>
</tr>
<tr>
<td>KEYTAB</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB.</td>
</tr>
<tr>
<td>Principal</td>
<td>Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server.</td>
</tr>
<tr>
<td>Note</td>
<td>The Kerberos principal name must be in all lowercase characters.</td>
</tr>
</tbody>
</table>
### Kerberos Operation

A Kerberos server can be a device that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

To authenticate to network services by using a device as a Kerberos server, remote users must follow these steps:

#### Authenticating to a Boundary Switch

This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.
   - If the decryption is successful, the user is authenticated to the switch.
   - If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.
Obtaining a TGT from a KDC

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a KDC and obtain a TGT from the KDC to access network services.

For instructions about how to authenticate to a KDC, see the “Obtaining a TGT from a KDC” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.4.

Authenticating to Network Services

This section describes the third layer of security through which a remote user must pass. The user with a TGT must now authenticate to the network services in a Kerberos realm.

For instructions about how to authenticate to a network service, see the “Authenticating to Network Services” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.4.

How to Configure Kerberos

To set up a Kerberos-authenticated server-client system, follow these steps:

- Configure the KDC by using Kerberos commands.
- Configure the switch to use the Kerberos protocol.

Monitoring the Kerberos Configuration

To display the Kerberos configuration, use the following commands:

- `show running-config`
- `show kerberos creds`: Lists the credentials in a current user’s credentials cache.
- `clear kerberos creds`: Destroys all credentials in a current user’s credentials cache, including those forwarded.

How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:
### SUMMARY STEPS

1. **enable**  
2. **configure terminal**  
3. **aaa new-model**  
4. **aaa authentication login default local**  
5. **aaa authorization exec default local**  
6. **aaa authorization network default local**  
7. **username name [privilege level] {password encryption-type password}**  
8. **end**  
9. **show running-config**  
10. **copy running-config startup-config**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><code>Device&gt; enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| **configure terminal** | |
| **Example:**      | |
| `Device# configure terminal` | |

| **Step 3**        | Enables AAA. |
| `aaa new-model`   | Enables AAA. |
| **Example:**      | |
| `Device(config)# aaa new-model` | |

| **Step 4**        | Sets the login authentication to use the local username database. The **default** keyword applies the local user database authentication to all ports. |
| `aaa authentication login default local` | Sets the login authentication to use the local username database. The **default** keyword applies the local user database authentication to all ports. |
| **Example:**      | |
| `Device(config)# aaa authentication login default local` | |

| **Step 5**        | Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell. |
| `aaa authorization exec default local` | Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell. |
| **Example:**      | |
| `Device(config)# aaa authorization exec default local` | |
### Purpose

**Command or Action**

<table>
<thead>
<tr>
<th>Step 6</th>
<th>aaa authorization network default local</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# aaa authorization network default local</td>
</tr>
</tbody>
</table>

Configures user AAA authorization for all network-related service requests.

<table>
<thead>
<tr>
<th>Step 7</th>
<th>username name [privilege level] {password encryption-type password}</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# username your_user_name privilege 1 password 7 secret567</td>
</tr>
</tbody>
</table>

Enters the local database, and establishes a username-based authentication system.

Repeat this command for each user.

- For name, specify the user ID as one word. Spaces and quotation marks are not allowed.
- (Optional) For level, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access.
- For encryption-type, enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows.
- For password, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command.

<table>
<thead>
<tr>
<th>Step 8</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# end</td>
</tr>
</tbody>
</table>

Returns to privileged EXEC mode.

<table>
<thead>
<tr>
<th>Step 9</th>
<th>show running-config</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device# show running-config</td>
</tr>
</tbody>
</table>

Verifies your entries.

<table>
<thead>
<tr>
<th>Step 10</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Device# copy running-config startup-config</td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.

CHAPTER 91

Configuring Secure Shell

Starting with Cisco IOS XE Denali 16.3.1, Secure Shell Version 1 (SSHv1) is deprecated.

Note

• Finding Feature Information, on page 1797
• Prerequisites for Configuring Secure Shell, on page 1797
• Restrictions for Configuring Secure Shell, on page 1798
• Information About Configuring Secure Shell, on page 1799
• How to Configure SSH, on page 1801
• Monitoring the SSH Configuration and Status, on page 1805
• Additional References for Configuring Secure Shell, on page 1805
• Feature Information for Configuring Secure Shell, on page 1806

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Secure Shell

The following are the prerequisites for configuring the switch for secure shell (SSH):

• For SSH to work, the switch needs an Rivest, Shamir, and Adleman (RSA) public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.

• Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.

• Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.
• SCP relies on SSH for security.

• SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.

• A user must have appropriate authorization to use SCP.

• A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the copy command. An authorized administrator can also do this from a workstation.

• The Secure Shell (SSH) server requires an IPsec (Data Encryption Standard [DES] or 3DES) encryption software image; the SSH client requires an IPsec (DES or 3DES) encryption software image.

• Configure a hostname and host domain for your device by using the hostname and ip domain-name commands in global configuration mode.

Related Topics
Secure Copy Protocol, on page 1800

Restrictions for Configuring Secure Shell

The following are restrictions for configuring the device for secure shell.

• The switch supports Rivest, Shamir, and Adelman (RSA) authentication.

• SSH supports only the execution-shell application.

• The SSH server and the SSH client are supported only on Data Encryption Standard (DES) (56-bit) and 3DES (168-bit) data encryption software. In DES software images, DES is the only encryption algorithm available. In 3DES software images, both DES and 3DES encryption algorithms are available.

• The device supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.

• When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

• The login banner is not supported in Secure Shell Version 1. It is supported in Secure Shell Version 2.

• The -l keyword and userid : {number} {ip-address} delimiter and arguments are mandatory when configuring the alternative method of Reverse SSH for console access.

• To authenticate clients with freeradius over RADSEC, you should generate an RSA key longer than 1024 bit. Use the crypto key generate rsa general-keys exportable label label-name command to achieve this.

Information About Configuring Secure Shell

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH and Switch Access

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

SSH Servers, Integrated Clients, and Supported Versions

The Secure Shell (SSH) Integrated Client feature is an application that runs over the SSH protocol to provide device authentication and encryption. The SSH client enables a Cisco device to make a secure, encrypted connection to another Cisco device or to any other device running the SSH server. This connection provides functionality similar to that of an outbound Telnet connection except that the connection is encrypted. With authentication and encryption, the SSH client allows for secure communication over an unsecured network.

The SSH server and SSH integrated client are applications that run on the switch. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client works with publicly and commercially available SSH servers. The SSH client supports the ciphers of Data Encryption Standard (DES), 3DES, and password authentication.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

Note

The SSH client functionality is available only when the SSH server is enabled.

User authentication is performed like that in the Telnet session to the device. SSH also supports the following user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

SSH Configuration Guidelines

Follow these guidelines when configuring the switch as an SSH server or SSH client:

- An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.

- If the SSH server is running on a stack master and the stack master fails, the new stack master uses the RSA key pair generated by the previous stack master.

- If you get CLI error messages after entering the `crypto key generate rsa` global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the `crypto key generate rsa` command.

- When generating the RSA key pair, the message No host name specified might appear. If it does, you must configure a hostname by using the `hostname` global configuration command.

- When generating the RSA key pair, the message No domain specified might appear. If it does, you must configure an IP domain name by using the `ip domain-name` global configuration command.

- When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.

Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.

- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

Note

When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Secure Copy Protocol

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying device configurations or switch image files. The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication,
authorization, and accounting (AAA) authorization be configured so the device can determine whether the user has the correct privilege level. To configure the Secure Copy feature, you should understand the SCP concepts.

## How to Configure SSH

### Setting Up the Device to Run SSH

Follow the procedure given below to set up your Device to run SSH:

**Before you begin**

Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. hostname *hostname*
4. ip domain-name *domain_name*
5. crypto key generate rsa
6. end
7. show running-config
8. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>hostname <em>hostname</em></td>
<td>Configures a hostname and IP domain name for your Device.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Software Configuration Guide, Cisco IOS XE Denali 16.3.x (Catalyst 3650 Switches)
### Configuring the SSH Server

Follow the procedure given below to configure the SSH server:

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Device(config)# hostname your_hostname</code></td>
<td><strong>Note</strong> Follow this procedure only if you are configuring the Device as an SSH server.</td>
</tr>
</tbody>
</table>
| **Step 4** `ip domain-name domain_name`  
Example:  
`Device(config)# ip domain-name your_domain` | Configures a host domain for your Device. |
| **Step 5** `crypto key generate rsa`  
Example:  
`Device(config)# crypto key generate rsa` | Enables the SSH server for local and remote authentication on the Device and generates an RSA key pair. Generating an RSA key pair for the Device automatically enables SSH. We recommend that a minimum modulus size of 1024 bits. When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.  
**Note** Follow this procedure only if you are configuring the Device as an SSH server. |
| **Step 6** `end`  
Example:  
`Device(config)# end` | Returns to privileged EXEC mode. |
| **Step 7** `show running-config`  
Example:  
`Device# show running-config` | Verifies your entries. |
| **Step 8** `copy running-config startup-config`  
Example:  
`Device# copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |

**Related Topics**

- [SSH Configuration Guidelines](#), on page 1800  
- [Configuring the Switch for Local Authentication and Authorization](#), on page 1793
This procedure is only required if you are configuring the Device as an SSH server.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip ssh version [1 | 2]`
4. `ip ssh {timeout seconds | authentication-retries number}`
5. Use one or both of the following:
   - `line vty line_number[ ending_line_number]`
   - `transport input ssh`
6. `end`
7. `show running-config`
8. `copy running-config startup-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>(Optional) Configures the Device to run SSH Version 1 or SSH Version 2.</td>
</tr>
<tr>
<td>Example: <code>Device(config)# ip ssh version 1</code></td>
<td></td>
</tr>
<tr>
<td>1—Configure the Device to run SSH Version 1.</td>
<td></td>
</tr>
<tr>
<td>2—Configure the Device to run SSH Version 2.</td>
<td></td>
</tr>
<tr>
<td>If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures the SSH control parameters:</td>
</tr>
<tr>
<td>`ip ssh {timeout seconds</td>
<td>authentication-retries number}`</td>
</tr>
<tr>
<td>Example: <code>Device(config)# ip ssh timeout 90</code></td>
<td>Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After</td>
</tr>
</tbody>
</table>
### Configuring the SSH Server

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>authentication-retries 2</td>
<td>By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes. The connection is established, the Device uses the default time-out values of the CLI-based sessions. Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5. Repeat this step when configuring both parameters.</td>
</tr>
</tbody>
</table>

#### Step 5

Use one or both of the following:

- `line vty line_number [ending_line_number]`
- `transport input ssh`

**Example:**

```plaintext
Device(config)# line vty 1 10
```

or

```plaintext
Device(config-line)# transport input ssh
```

(Optional) Configures the virtual terminal line settings.

- Enters line configuration mode to configure the virtual terminal line settings. For `line_number` and `ending_line_number`, specify a pair of lines. The range is 0 to 15.
- Specifies that the Device prevent non-SSH Telnet connections. This limits the router to only SSH connections.

#### Step 6

```plaintext
end
```

**Example:**

```plaintext
Device(config-line)# end
```

Returns to privileged EXEC mode.

#### Step 7

```plaintext
show running-config
```

**Example:**

```plaintext
Device# show running-config
```

Verifies your entries.

#### Step 8

```plaintext
copy running-config startup-config
```

**Example:**

```plaintext
Device# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.
Monitoring the SSH Configuration and Status

This table displays the SSH server configuration and status.

<td><strong>Note</strong> Effective with Cisco IOS XE Denali 16.3.1, Secure Shell Version 1 (SSHv1) is not available in Cisco IOS Software.</td>
</tr>
</tbody>
</table>
| Cisco IOS 15.2(1)E                     | The Reverse SSH Enhancements feature, which is supported for SSH Version 1 and 2, provides an alternative way to configure reverse Secure Shell (SSH) so that separate lines do not need to be configured for every terminal or auxiliary line on which SSH must be enabled. This feature also eliminates the rotary-group limitation. 
This feature was supported on CAT4500-X, CAT4500E-SUP6E, CAT4500E-SUP6L-E, CAT4500E-SUP7E, CAT4500E-SUP7L-E. The following command was introduced: `ssh`. |
X.509v3 Certificates for SSH Authentication

The X.509v3 Certificates for secure shell (SSH) Authentication feature uses the X.509v3 digital certificates in server and user authentication at the SSH server side.

Prerequisites for Digital Certificates for SSH Authentication

The Digital Certificates for SSH Authentication feature introduces the `ip ssh server algorithm authentication` command to replace the `ip ssh server authenticate user` command. If you use the `ip ssh server authenticate user` command, the following deprecation message is displayed.

Warning: SSH command accepted but this CLI will be deprecated soon. Please move to new CLI "ip ssh server algorithm authentication". Please configure "default ip ssh server authenticate user" to make CLI ineffective.

Use the `default ip ssh server authenticate user` command to remove the `ip ssh server authenticate user` command from effect. The IOS secure shell (SSH) server then starts using the `ip ssh server algorithm authentication` command.

Restrictions for X.509v3 Certificates for SSH Authentication

The following restrictions are applicable for X.509v3 Certificate for SSH Authentication:

- The X.509v3 Certificates for SSH Authentication feature implementation is applicable only on the IOS secure shell (SSH) server side.

- IOS SSH server supports only the x509v3-ssh-rsa algorithm based certificate for server and user authentication on the IOS SSH server side.

The X.509v3 Certificate for SSH Authentication fails in the following conditions:
• When root certification authority is configured as a trustpoint on the device.

• When a client passes a certificate chain that leads to a self-signed root certificate authority that includes a client certificate, sub-ca certificate, and self-signed root certificate authority.

• When a sub-ca certification is configured as a trustpoint on the device but not included as a trustpoint on the user certificate.

Information About X.509v3 Certificates for SSH Authentication

The following section provides information about digital certificates, and server and user authentication.

Digital Certificates

The validity of the authentication depends upon the strength of the linkage between the public signing key and the identity of the signer. Digital certificates in the X.509v3 format (RFC5280) are used to provide identity management. A chain of signatures by a trusted root certification authority and its intermediate certificate authorities binds a given public signing key to a given digital identity.

Public key infrastructure (PKI) trustpoint helps manage the digital certificates. The association between the certificate and the trustpoint helps track the certificate. The trustpoint contains information about the certificate authority (CA), different identity parameters, and the digital certificate. Multiple trustpoints can be created to associate with different certificates.

Server and User Authentication using X.509v3

For server authentication, the IOS secure shell (SSH) server sends its own certificate to the SSH client for verification. This server certificate is associated with the trustpoint configured in the server certificate profile (ssh-server-cert-profile-server configuration mode).

For user authentication, the SSH client sends the user's certificate to the IOS SSH server for verification. The SSH server validates the incoming user certificate using public key infrastructure (PKI) trustpoints configured in the server certificate profile (ssh-server-cert-profile-user configuration mode).

By default, certificate-based authentication is enabled for server and user at the IOS SSH server end.

How to Configure X.509v3 Certificates for SSH Authentication

The following section provides information about how to configure X.509v3 Certificates for SSH Authentication.

Configuring IOS SSH Server to Use Digital Certificates for Sever Authentication

The following section provides information about Configuring IOS SSH Server to Use Digital Certificates for Sever Authentication.
**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip ssh server algorithm hostkey {x509v3-ssh-rsa [ssh-rsa]</td>
<td>Defines the order of host key algorithms. Only the configured algorithm is negotiated with the secure shell (SSH) client.</td>
</tr>
<tr>
<td>Example: Device(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip ssh server certificate profile</td>

<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Step 2 show ip ssh</td>
<td>Displays the currently configured authentication methods. To confirm the use of certificate-based authentication, ensure that the x509v3-ssh-rsa algorithm is the configured host key algorithm.</td>
</tr>
</tbody>
</table>

### Configuration Examples for X.509v3 Certificates for SSH Authentication

The following section provides examples for user and server authentication using digital certificates.

#### Example: Configuring IOS SSH Server to Use Digital Certificates for Server Authentication

This example shows how to configure IOS SSH Server to Use Digital Certificates for Server Authentication.

Device> enable
Device# configure terminal
Device(config)# ip ssh server algorithm hostkey x509v3-ssh-rsa
Device(config)# ip ssh server certificate profile
Device(ssh-server-cert-profile)# server
Device(ssh-server-cert-profile-server)# trustpoint sign trust1
Device(ssh-server-cert-profile-server)# exit

#### Example: Configuring IOS SSH Server to Verify User's Digital Certificate for User Authentication

This example shows how to configure IOS SSH Server to Verify User's Digital Certificate for User Authentication.

Device> enable
Device# configure terminal
Device(config)# ip ssh server algorithm authentication publickey
Device(config)# ip ssh server algorithm publickey x509v3-ssh-rsa
Device(config)# ip ssh server certificate profile
Device(ssh-server-cert-profile)# user
Device(ssh-server-cert-profile-user)# trustpoint verify trust2
Device(ssh-server-cert-profile-user)# end

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about Secure Sockets Layer (SSL) HTTP

Secure HTTP Servers and Clients Overview

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with https:// instead of http://.

SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server
processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

Note

Beginning with Cisco IOS XE Denali 16.3.1, support for attaching IPv6 ACL to the HTTP server has been enabled. Prior to Cisco IOS XE Denali 16.3.1, only IPv4 ACL support was available for configuring the secure HTTP server. You can attach the preconfigured IPv6 and IPv4 ACLs to the HTTP server using the configuration CLI for the secure HTTP server.

Certificate Authority Trustpoints

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as trustpoints.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.

- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

Note

The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

When a new certificate is enrolled, the new configuration change is not applied to the HTTPS server until the server is restarted. You can restart the server using either the CLI or by physical reboot. On restarting the server, the switch starts using the new certificate.

If a self-signed certificate has been generated, this information is included in the output of the `show running-config` privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.
Device# show running-config
Building configuration...

<output truncated>
crypto pki trustpoint TP-self-signed-3080755072
    enrollment selfsigned
    subject-name cn=IOS-Self-Signed-Certificate-3080755072
    revocation-check none
    rsakeypair TP-self-signed-3080755072
!  
crypto ca certificate chain TP-self-signed-3080755072
    certificate self-signed 01
        3082029F 30820208 A0030201 02020101 00000000 02020101 04050030
        59312F30 2D060355 04031326 494F532D 53656C66 2D536967 65642D 33303830 37353530
        37323126 30240609 2A864886 F70D0109 02161743 45322D33 3535302D 31332E73 756D6D30 342D3335
        3530301E 170D3933 30333031 30303030 35395A17 0D323030 31303130 30303030 305A3059 312F302D

<output truncated>

You can remove this self-signed certificate by disabling the secure HTTP server and entering the no crypto pki trustpoint TP-self-signed-30890755072 global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

---

The values that follow TP self-signed depend on the serial number of the device.

---

You can use an optional command (ip http secure-client-auth) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

---

**CipherSuites**

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The SSL_RSA_WITH_DES_CBC_SHA CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

1. **SSL_RSA_WITH_DES_CBC_SHA**—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest

2. **SSL_RSA_WITH_NULL_SHA** key exchange with NULL for message encryption and SHA for message digest (only for SSL 3.0).
3. SSL_RSA_WITH_NULL_MD5 key exchange with NULL for message encryption and MD5 for message digest (only for SSL 3.0).

4. SSL_RSA_WITH_RC4_128_MD5—RSA key exchange with RC4 128-bit encryption and MD5 for message digest

5. SSL_RSA_WITH_RC4_128_SHA—RSA key exchange with RC4 128-bit encryption and SHA for message digest

6. SSL_RSA_WITH_3DES_EDE_CBC_SHA—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest

7. SSL_RSA_WITH_AES_128_CBC_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest

8. SSL_RSA_WITH_AES_256_CBC_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

9. SSL_RSA_WITH_DHE_AES_128_CBC_SHA—RSA key exchange with AES 128-bit encryption and SHA for message digest (only for SSL 3.0).

10. SSL_RSA_WITH_DHE_AES_256_CBC_SHA—RSA key exchange with AES 256-bit encryption and SHA for message digest (only for SSL 3.0).

---

**Note**

The latest versions of Chrome do not support the four original cipher suites, thus disallowing access to both web GUI and guest portals.

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

### Default SSL Configuration

The standard HTTP server is enabled.

SSL is enabled.

No CA trustpoints are configured.

No self-signed certificates are generated.

### SSL Configuration Guidelines

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.
How to Configure Secure HTTP Servers and Clients

Configuring a CA Trustpoint

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.

Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:

SUMMARY STEPS

1. configure terminal
2. hostname hostname
3. ip domain-name domain-name
4. crypto key generate rsa
5. crypto ca trustpoint name
6. enrollment url url
7. enrollment http-proxy host-name port-number
8. crl query url
9. primary name
10. exit
11. crypto ca authentication name
12. crypto ca enroll name
13. end

</table>
### Configuring the Secure HTTP Server

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

**Before you begin**

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter https://URL, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

**Note**

AES256_SHA2 is not supported.

https://209.165.129:1026

or

https://host.domain.com:1026

The existing `ip http access-class access-list-number` command for specifying the access-list (Only IPv4 ACLs) is going to be deprecated. You can still use this command to specify an access list to allow access to the HTTP server. Two new commands have been introduced to enable support for specifying IPv4 and IPv6 ACLs. These are `ip http access-class ipv4 access-list-name | access-list-number` for specifying IPv4 ACLs and `ip http access-class ipv6 access-list-name` for specifying IPv6 ACLs. We recommend using the new CLI to avoid receiving warning messages.

Note the following considerations for specifying access-lists:
• If you specify an access-list that does not exist, the configuration takes place but you receive the below warning message:

ACL being attached does not exist, please configure it

• If you use the `ip http access-class` command for specifying an access-list for the HTTP server, the below warning message appears:

This CLI will be deprecated soon, Please use new CLI `ip http access-class ipv4/ipv6 <access-list-name>| <access-list-number>`

• If you use `ip http access-class ipv4 access-list-name | access-list-number` or `ip http access-class ipv6 access-list-name`, and an access-list was already configured using `ip http access-class`, the below warning message appears:

Removing ip http access-class <access-list-number>

`ip http access-class access-list-number` and `ip http access-class ipv4 access-list-name | access-list-number` share the same functionality. Each command overrides the configuration of the previous command. The following combinations between the configuration of the two commands explain the effect on the running configuration:

• If `ip http access-class access-list-number` is already configured and you try to configure using `ip http access-class ipv4 access-list-number` command, the configuration of `ip http access-class access-list-number` will be removed and the configuration of `ip http access-class ipv4 access-list-number` will be added to the running configuration.

• If `ip http access-class access-list-number` is already configured and you try to configure using `ip http access-class ipv4 access-list-name` command, the configuration of `ip http access-class access-list-number` will be removed and the configuration of `ip http access-class ipv4 access-list-name` will be added to the running configuration.

• If `ip http access-class ipv4 access-list-number` is already configured and you try to configure using `ip http access-class access-list-name`, the configuration of `ip http access-class ipv4 access-list-number` will be removed from configuration and the configuration of `ip http access-class access-list-name` will be added to the running configuration.

• If `ip http access-class ipv4 access-list-name` is already configured and you try to configure using `ip http access-class access-list-number`, the configuration of `ip http access-class ipv4 access-list-name` will be removed from the configuration and the configuration of `ip http access-class access-list-number` will be added to the running configuration.

**SUMMARY STEPS**

1. show ip http server status
2. configure terminal
3. ip http secure-server
4. ip http secure-port port-number
5. ip http secure-ciphersuite {[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}
6. ip http secure-client-auth
7. ip http secure-trustpoint name
8. ip http path path-name
9. ip http access-class access-list-number
10. ip http access-class { ipv4 {access-list-number | access-list-name} | ipv6 {access-list-name} }
11. ip http max-connections value
12. `ip http timeout-policy idle seconds life seconds requests value`

13. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | (Optional) Displays the status of the HTTP server to determine if the secure HTTP server feature is supported in the software. You should see one of these lines in the output:  

```
HTTP secure server capability: Present
```

or

```
HTTP secure server capability: Not present
```

<table>
<thead>
<tr>
<th>Step 2</th>
<th>configure terminal</th>
<th>Enters global configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>ip http secure-server</td>
<td>Enables the HTTPS server if it has been disabled. The HTTPS server is enabled by default.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip http secure-port <code>port-number</code></td>
<td>(Optional) Specifies the port number to be used for the HTTPS server. The default port number is 443. Valid options are 443 or any number in the range 1025 to 65535.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>ip http secure-ciphersuite <code>{[3des-edc-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]}</code></td>
<td>(Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particularly CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>ip http secure-client-auth</td>
<td>(Optional) Configures the HTTP server to request an X.509v3 certificate from the client for authentication during the connection process. The default is for the client to request a certificate from the server, but the server does not attempt to authenticate the client.</td>
</tr>
</tbody>
</table>
### Configuring the Secure HTTP Server

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
<td>ip http secure-trustpoint name</td>
<td>Specifies the CA trustpoint to use to get an X.509v3 security certificate and to authenticate the client certificate connection.</td>
<td>Device(config)# ip http secure-trustpoint your_trustpoint</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
<td>Use of this command assumes you have already configured a CA trustpoint according to the previous procedure.</td>
<td></td>
</tr>
<tr>
<td>8</td>
<td>ip http path path-name</td>
<td>(Optional) Sets a base HTTP path for HTML files. The path specifies the location of the HTTP server files on the local system (usually located in system flash memory).</td>
<td>Device(config)# ip http path /your_server:80</td>
</tr>
<tr>
<td>9</td>
<td>ip http access-class access-list-number</td>
<td>(Optional) Specifies an access list to use to allow access to the HTTP server.</td>
<td>Device(config)# ip http access-class 2</td>
</tr>
<tr>
<td>10</td>
<td>ip http access-class { ipv4 { access-list-number</td>
<td>access-list-name }</td>
<td>ipv6 { access-list-name } }</td>
</tr>
<tr>
<td>11</td>
<td>ip http max-connections value</td>
<td>(Optional) Sets the maximum number of concurrent connections that are allowed to the HTTP server. We recommend that the value be at least 10 and not less. This is required for the UI to function as expected.</td>
<td>Device(config)# ip http max-connections 4</td>
</tr>
<tr>
<td>12</td>
<td>ip http timeout-policy idle seconds life seconds requests value</td>
<td>(Optional) Specifies how long a connection to the HTTP server can remain open under the defined circumstances:</td>
<td>Device(config)# ip http timeout-policy idle 120 life 240 requests 1</td>
</tr>
</tbody>
</table>
- idle—the maximum time period when no data is received or response data cannot be sent. The range is 1 to 600 seconds. The default is 180 seconds (3 minutes).
- life—the maximum time period from the time that the connection is established. The range is 1 to 86400 seconds (24 hours). The default is 180 seconds.
- requests—the maximum number of requests processed on a persistent connection. The maximum value is 86400. The default is 1. |
| 13   | end | Returns to privileged EXEC mode. |         |
Configuring the Secure HTTP Client

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:

**Before you begin**

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.

**SUMMARY STEPS**

1. `configure terminal`
2. `ip http client secure-trustpoint name`
3. `ip http client secure-ciphersuite {3des-ede-cbc-sha | rc4-128-md5 | rc4-128-sha | des-cbc-sha}`
4. `end`

**DETAILED STEPS**

<table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about Network Security with ACLs

This chapter describes how to configure network security on the switch by using access control lists (ACLs), which in commands and tables are also referred to as access lists.

ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions
in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.

Access Control Entries

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies *permit* or *deny* and a set of conditions the packet must satisfy in order to match the ACE. The meaning of *permit* or *deny* depends on the context in which the ACL is used.

ACL Supported Types

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

Supported ACLs

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply port ACLs to a Layer 2 interface in each direction to each access list type — IPv4 and MAC.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).
- VLAN ACLs or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

ACL Precedence

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, VLAN map, and then router ACL. For egress traffic, the filtering precedence is router ACL, VLAN map, and then port ACL.

The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
Port ACLs

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied to the interface in outbound and inbound direction. The following access lists are supported:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

**Figure 105: Using ACLs to Control Traffic in a Network**

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but
prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the inbound direction.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

Note: You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

Router ACLs

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.

- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.
**VLAN Maps**

VLAN ACLs or VLAN maps are used to control network traffic within a VLAN. You can apply VLAN maps to all packets that are bridged within a VLAN in the switch or switch stack. VACLs are strictly for security packet filtering and for redirecting traffic to specific physical interfaces. VACLs are not defined by direction (ingress or egress).

All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.

![Figure 106: Using VLAN Maps to Control Traffic](image)

This shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

**ACEs and Fragmented and Unfragmented Traffic**

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- **Permit ACEs** that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.

  - **Note** For TCP ACEs with L4 Ops, the fragmented packets will be dropped per RFC 1858.

- **Deny ACEs** that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

**ACEs and Fragmented and Unfragmented Traffic Examples**

Consider access list 102, configured with these commands, applied to three fragmented packets:
In the first and second ACEs in the examples, the *eq* keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

- Packet A is a TCP packet from host 10.2.2.2, port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer 3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).

Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

### ACLs and Switch Stacks

ACL support is the same for a switch stack as for a standalone switch. ACL configuration information is propagated to all switches in the stack. All switches in the stack, including the active switch, process the information and program their hardware.

### Active Switch and ACL Functions

The active switch performs these ACL functions:

- It processes the ACL configuration and propagates the information to all stack members.
- It distributes the ACL information to any switch that joins the stack.
- If packets must be forwarded by software for any reason (for example, not enough hardware resources), the active switch forwards the packets only after applying ACLs on the packets.
- It programs its hardware with the ACL information it processes.
Stack Member and ACL Functions

Stack members perform these ACL functions:

- They receive the ACL information from the active switch and program their hardware.
- A stack member configured as a standby switch, performs the functions of the active switch in the event the active switch fails.

Active Switch Failure and ACLs

Both the active and standby switches have the ACL information. When the active switch fails, the standby takes over. The new active switch distributes the ACL information to all stack members.

Standard and Extended IPv4 ACLs

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The following ACL-related features are not supported:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs and dynamic ACLs are not supported.

Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating.
This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

Table 140: Access List Numbers

<table>
<thead>
<tr>
<th>Access List Number</th>
<th>Type</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–99</td>
<td>IP standard access list</td>
<td>Yes</td>

<td>No</td>
</tr>
<tr>
<td>1300–1999</td>
<td>IP standard access list (expanded range)</td>
<td>Yes</td>
</tr>
<tr>
<td>2000–2699</td>
<td>IP extended access list (expanded range)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

**Numbered Standard IPv4 ACLs**

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

The switch always rewrites the order of standard access lists so that entries with **host** matches and entries with matches having a **don't care** mask of 0.0.0.0 are moved to the top of the list, above any entries with
non-zero don’t care masks. Therefore, in show command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to VLANs, to terminal lines, or to interfaces.

**Numbered Extended IPv4 ACLs**

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:

- Authentication Header Protocol (ahp)
- Encapsulation Security Payload (esp)
- Enhanced Interior Gateway Routing Protocol (eigrp)
- generic routing encapsulation (gre)
- Internet Control Message Protocol (icmp)
- Internet Group Management Protocol (igmp)
- any Interior Protocol (ip)
- IP in IP tunneling (ipinip)
- KA9Q NOS-compatible IP over IP tunneling (nos)
- Open Shortest Path First routing (ospf)
- Payload Compression Protocol (pcp)
- Protocol-Independent Multicast (pim)
- Transmission Control Protocol (tcp)
- User Datagram Protocol (udp)

**Note**

ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

**Named IPv4 ACLs**

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you
identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

---

**Note**
The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99 and . The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines before configuring named ACLs:

- Numbered ACLs are also available.
- A standard ACL and an extended ACL cannot have the same name.

### ACL Logging

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the `logging console` commands controlling the syslog messages.

---

**Note**
ACL logging is only supported for RACL.

**Note**
Because routing is done in hardware and logging is done in software, if a large number of packets match a `permit or deny` ACE containing a `log` keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.

The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

**Note**
The logging facility might drop some logging message packets if there are too many to be handled or if there is more than one logging message to be handled in 1 second. This behavior prevents the router from crashing due to too many logging packets. Therefore, the logging facility should not be used as a billing tool or an accurate source of the number of matches to an access list.

### Hardware and Software Treatment of IP ACLs

ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.
If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch or stack member, then only the traffic in that VLAN arriving on that switch is affected.

When you enter the `show ip access-lists` privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

**VLAN Map Configuration Guidelines**

VLAN maps are the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

The following are the VLAN map configuration guidelines:

- If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.

- Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.

- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.

- Logging is not supported for VLAN maps.

- When a switch has an IP access list or MAC access list applied to a Layer 2 interface, and you apply a VLAN map to a VLAN that the port belongs to, the port ACL takes precedence over the VLAN map.

- If a VLAN map configuration cannot be applied in hardware, all packets in that VLAN are dropped.

**VLAN Maps with Router ACLs**

To access control both bridged and routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces, and you can define a VLAN map to access control the bridged traffic.

If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.
If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

**VLAN Maps and Router ACL Configuration Guidelines**

These guidelines are for configurations where you need to have a router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.

If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.
- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:
  
  ```
  permit... permit... permit... deny ip any any
  ```

  or

  ```
  deny... deny... deny... permit ip any any
  ```

- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.

- Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use `don't care` bits in the IP address, whenever possible.

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.

**Time Ranges for ACLs**

You can selectively apply extended ACLs based on the time of day and the week by using the `time-range` global configuration command. First, define a time-range name and set the times and the dates or the days of the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect, for example, during a specified time period or on specified days of the week. The `time-range` keyword and argument are referenced in the named and numbered extended ACL task tables.

These are some benefits of using time ranges:

- You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).

- You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.
Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the hardware memory. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

---

**Note**
The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock.

---

### IPv4 ACL Interface Considerations

When you apply the `ip access-group` interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU. They do not affect packets bridged within a VLAN.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.

For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the `ip icmp rate-limit unreachable` global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

### Prerequisites for Configuring IPv4 Access Control Lists

This section lists the prerequisites for configuring network security with access control lists (ACLs).

- On switches running the LAN base feature set, VLAN maps are not supported.
Restrictions for Configuring IPv4 Access Control Lists

**General Network Security**

The following are restrictions for configuring network security with ACLs:

- Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name.

- A standard ACL and an extended ACL cannot have the same name.

- Though visible in the command-line help strings, **appletalk** is not supported as a matching condition for the **deny** and **permit** MAC access-list configuration mode commands.

- ACL wildcard is not supported in downstream client policy.

**IPv4 ACL Network Interfaces**

The following restrictions apply to IPv4 ACLs to network interfaces:

- When controlling access to an interface, you can use a named or numbered ACL.

- If you apply an ACL to a Layer 2 interface that is a member of a VLAN, the Layer 2 (port) ACL takes precedence over an input Layer 3 ACL applied to the VLAN interface or a VLAN map applied to the VLAN.

- If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.

- If the **preauth_ipv4_acl** ACL is configured to filter packets, the ACL is removed after authentication.

- You do not have to enable routing to apply ACLs to Layer 2 interfaces.

---

**Note**

By default, the router sends Internet Control Message Protocol (ICMP) unreachable messages when a packet is denied by an access group on a Layer 3 interface. These access-group denied packets are not dropped in hardware but are bridged to the switch CPU so that it can generate the ICMP-unreachable message. They do not generate ICMP unreachable messages. ICMP unreachable messages can be disabled on router ACLs with the **no ip unreachables** interface command.

---

**MAC ACLs on a Layer 2 Interface**

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

- You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.

- A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.
The `mac access-group` interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

**IP Access List Entry Sequence Numbering**

- This feature does not support dynamic, reflexive, or firewall access lists.

## How to Configure ACLs

### Configuring IPv4 ACLs

Follow the procedure given below to use IP ACLs on the switch:

**SUMMARY STEPS**

1. Create an ACL by specifying an access list number or name and the access conditions.
2. Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Create an ACL by specifying an access list number or name and the access conditions.</td>
</tr>
<tr>
<td>2.</td>
<td>Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.</td>
</tr>
</tbody>
</table>

### Creating a Numbered Standard ACL (CLI)

Follow the procedure given below to create a numbered standard ACL:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `access-list access-list-number {deny | permit} source source-wildcard`
4. `end`
5. `show running-config`
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>access-list access-list-number {deny</td>
<td>permit} source source-wildcard ]</td>
</tr>
</tbody>
</table>
| | Example: Device(config)# access-list 2 deny your_host | The access-list-number is a decimal number from 1 to 99 or 1300 to 1999. Enter **deny** or **permit** to specify whether to deny or permit access if conditions are matched. The source is the source address of the network or host from which the packet is being sent specified as:  
  - The 32-bit quantity in dotted-decimal format.  
  - The keyword **any** as an abbreviation for source and source-wildcard of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard.  
  - The keyword **host** as an abbreviation for source and source-wildcard of source 0.0.0.0. (Optional) The source-wildcard applies wildcard bits to the source.  
**Note** Logging is supported only on ACLs attached to Layer 3 interfaces. |
<p>| <strong>Step 4</strong> | end | Returns to privileged EXEC mode. |
| | Example: Device(config)# end | |
| <strong>Step 5</strong> | show running-config | Verifies your entries. |
| | Example: | |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device# show running-config</td>
<td></td>
</tr>
</tbody>
</table>

**Step 6**

**copy running-config startup-config**

*Example:*

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

### Creating a Numbered Extended ACL (CLI)

Follow the procedure given below to create a numbered extended ACL:

**SUMMARY STEPS**

1. **configure terminal**
2. **access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]]**
3. **access-list access-list-number {deny | permit} tcp source source-wildcard [operator port] destination destination-wildcard [operator port] [established] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]]**
4. **access-list access-list-number {deny | permit} udp source source-wildcard [operator port] destination destination-wildcard [operator port] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]]**
5. **access-list access-list-number {deny | permit} icmp source source-wildcard destination destination-wildcard [icmp-type [icmp-type icmp-code] [icmp-message]] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]]**
6. **access-list access-list-number {deny | permit} igmp source source-wildcard destination destination-wildcard [igmp-type] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp]]**
7. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal Example: Device# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

---

**Step 2**

**access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard**

Defines an extended IPv4 access list and the access conditions.
Creating a Numbered Extended ACL (CLI)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>[precedence (\text{precedence})] [tos tos] [fragments] [log [log-input]] [time-range (\text{time-range-name})] [dscp dscp]</td>
<td>The (\text{access-list-number}) is a decimal number from 100 to 199 or 2000 to 2699. Enter \text{deny} or \text{permit} to specify whether to deny or permit the packet if conditions are matched. For \text{protocol}, enter the name or number of an IP protocol: \text{ahp}, \text{eigrp}, \text{esp}, \text{gre}, \text{icmp}, \text{igmp}, \text{igrp}, \text{ip}, \text{ipinip}, \text{nos}, \text{ospf}, \text{pcp}, \text{pim}, \text{tcp}, \text{or} \text{udp}, or an integer in the range 0 to 255 representing an IP protocol number. To match any Internet protocol (including ICMP, TCP, and UDP), use the keyword \text{ip}.</td>
</tr>
</tbody>
</table>
| Example: Device(config)# access-list 101 permit ip host 10.1.1.2 any precedence 0 tos 0 log | This step includes options for most IP protocols. For additional specific parameters for TCP, UDP, ICMP, and IGMP, see the following steps. The \text{source} is the number of the network or host from which the packet is sent. The \text{source-wildcard} applies wildcard bits to the source. The \text{destination} is the network or host number to which the packet is sent. The \text{destination-wildcard} applies wildcard bits to the destination. Source, source-wildcard, destination, and destination-wildcard can be specified as:
- The 32-bit quantity in dotted-decimal format.
- The keyword \text{any} for 0.0.0.0 255.255.255.255 (any host).
- The keyword \text{host} for a single host 0.0.0.0. The other keywords are optional and have these meanings:
- \text{precedence}—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: \text{routine} (0), \text{priority} (1), \text{immediate} (2), \text{flash} (3), \text{flash-override} (4), \text{critical} (5), \text{internet} (6), \text{network} (7).
- \text{fragments}—Enter to check non-initial fragments.
- \text{tos}—Enter to match by type of service level, specified by a number from 0 to 15 or a name: \text{normal} (0), \text{max-reliability} (2), \text{max-throughput} (4), \text{min-delay} (8).
- \text{log}—Enter to create an informational logging message to be sent to the console about the packet that matches...
### Creating a Numbered Extended ACL (CLI)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`access-list access-list-number {deny</td>
<td>permit} tcp`</td>
</tr>
</tbody>
</table>
| `source source-wildcard [operator port] destination destination-wildcard [operator port] [established] [precedence precedence] [tos tos] [fragments] [log [log-input] [time-range time-range-name] [dscp dscp] [flag]` | **•** `time-range`—Specify the time-range name.  
**•** `dscp`—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values. |
| **Note** | If you enter a `dscp` value, you cannot enter `tos` or `precedence`. You can enter both a `tos` and a `precedence` value with no `dscp`. |

**Step 3**

```bash
Device(config)# access-list 101 permit tcp any any eq 500
```

Defines an extended TCP access list and the access conditions.

The parameters are the same as those described for an extended IPv4 ACL, with these exceptions:

(Optional) Enter an `operator` and `port` to compare source (if positioned after `source source-wildcard`) or destination (if positioned after `destination destination-wildcard`) port. Possible operators include `eq` (equal), `gt` (greater than), `lt` (less than), `neq` (not equal), and `range` (inclusive range). Operators require a port number (range requires two port numbers separated by a space).

Enter the `port` number as a decimal number (from 0 to 65535) or the name of a TCP port. Use only TCP port numbers or names when filtering TCP.

The other optional keywords have these meanings:

**•** `established`—Enter to match an established connection. This has the same function as matching on the `ack` or `rst` flag.

**•** `flag`—Enter one of these flags to match by the specified TCP header bits: `ack` (acknowledge), `fin` (finish), `psh` (push), `rst` (reset), `syn` (synchronize), or `urg` (urgent).

**Step 4**

```bash
Device(config)# access-list 101 permit udp any any eq 100
```

(Optional) Defines an extended UDP access list and the access conditions.

The UDP parameters are the same as those described for TCP except that the `[operator [port]]` port number or name must be a UDP port number or name, and the `flag` and `established` keywords are not valid for UDP.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 5** access-list access-list-number {deny | permit} icmp source source-wildcard destination destination-wildcard [icmp-type | [[icmp-type | icmp-code] | [icmp-message]] [precedence precedence] [tos tos] [fragments] [time-range time-range-name] [dscp dscp] | Defines an extended ICMP access list and the access conditions. The ICMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:  
  - *icmp-type*—Enter to filter by ICMP message type, a number from 0 to 255.  
  - *icmp-code*—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.  
  - *icmp-message*—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. Example:  
  ```bash  
  Device(config)# access-list 101 permit icmp any 200  
  ``` |
| **Step 6** access-list access-list-number {deny | permit} igmp source source-wildcard destination destination-wildcard [igmp-type] [precedence precedence] [tos tos] [fragments] [log log-input] [time-range time-range-name] [dscp dscp] | (Optional) Defines an extended IGMP access list and the access conditions. The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter.  
  - *igmp-type*—To match IGMP message type, enter a number from 0 to 15, or enter the message name: **dvmrp**, **host-query**, **host-report**, **pim**, or **trace**. Example:  
  ```bash  
  Device(config)# access-list 101 permit igmp any any 14  
  ``` |
| **Step 7** end | Returns to privileged EXEC mode. Example:  
  ```bash  
  Device(config)# end  
  ``` |

</table>
### Command or Action

Device(config)# ip access-list extended 150

| Step 4 | {deny | permit} protocol [source [source-wildcard] | host source | any] [destination [destination-wildcard] | host destination | any] [precedence precedence] [tos tos] [established] [log] [time-range time-range-name] |
|--------|---------------------------------------------------------|
| Example: | Device(config-ext-nacl)# permit 0 any any |

<table>
<thead>
<tr>
<th>Purpose</th>
<th>In access-list configuration mode, specify the conditions allowed or denied. Use the log keyword to get access list logging messages, including violations.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• host source—A source and source wildcard of source 0.0.0.0.</td>
</tr>
<tr>
<td></td>
<td>• host destination—A destination and destination wildcard of destination 0.0.0.0.</td>
</tr>
<tr>
<td></td>
<td>• any—A source and source wildcard or destination and destination wildcard of 0.0.0.0 255.255.255.255.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device(config-ext-nacl)# end</td>
</tr>
</tbody>
</table>

| Purpose | Returns to privileged EXEC mode. |

<table>
<thead>
<tr>
<th>Step 6</th>
<th>show running-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# show running-config</td>
</tr>
</tbody>
</table>

| Purpose | Verifies your entries. |

<table>
<thead>
<tr>
<th>Step 7</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Device# copy running-config startup-config</td>
</tr>
</tbody>
</table>

| Purpose | (Optional) Saves your entries in the configuration file. |

When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.

After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use no permit and no deny access-list configuration mode commands to remove entries from a named ACL.

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

### What to do next

After creating a named ACL, you can apply it to interfaces or to VLANs.
## Configuring Time Ranges for ACLs

Follow these steps to configure a time-range parameter for an ACL:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `time-range time-range-name`
4. Use one of the following:
   - `absolute [start time date] [end time date]`
   - `periodic day-of-the-week hh:mm to [day-of-the-week] hh:mm`
   - `periodic {weekdays | weekend | daily} hh:mm to hh:mm`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# <code>enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>time-range time-range-name</code></td>
<td>Assigns a meaningful name (for example, <em>workhours</em>) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config)# <code>time-range workhours</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> Use one of the following:</td>
<td></td>
</tr>
<tr>
<td>- <code>absolute [start time date] [end time date]</code></td>
<td></td>
</tr>
<tr>
<td>- <code>periodic day-of-the-week hh:mm to [day-of-the-week] hh:mm</code></td>
<td></td>
</tr>
<tr>
<td>- `periodic {weekdays</td>
<td>weekend</td>
</tr>
<tr>
<td><strong>Example:</strong> Device(config-time-range)# <code>absolute start 00:00 1</code></td>
<td></td>
</tr>
</tbody>
</table>

- You can use only one `absolute` statement in the time range. If you configure more than one absolute statement, only the one configured last is executed.
- You can enter multiple `periodic` statements. For example, you could configure different hours for weekdays and weekends.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jan 2006 end 23:59 1 Jan 2006 or Device(config-time-range)# periodic weekdays 8:00 to 12:00</td>
<td>See the example configurations.</td>
</tr>
<tr>
<td>Step 5</td>
<td>end</td>
</tr>
<tr>
<td>Example: Device(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>show running-config</td>
</tr>
<tr>
<td>Example: Device# show running-config</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td>Example: Device# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

What to do next
Repeat the steps if you have multiple items that you want in effect at different times.

Related Topics
- Time Ranges for ACLs, on page 1840

**Applying an IPv4 ACL to a Terminal Line**

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

Follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `line [console | vty] line-number`
4. `access-class access-list-number {in | out}`
5. `end`
## Applying an IPv4 ACL to a Terminal Line

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>6.</td>
<td><code>show running-config</code></td>
<td></td>
</tr>
<tr>
<td>7.</td>
<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 1</th>
<th><code>enable</code></th>
<th>Enables privileged EXEC mode. Enter your password if prompted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device(config)# enable</code></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th><code>configure terminal</code></th>
<th>Enters global configuration mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

| Step 3 | `line [console | vty] line-number` | Identifies a specific line to configure, and enter in-line configuration mode. |
|---------|-------------------------------|-----------------------------------------------------------------------------|
| Example: | `Device(config)# line console 0` | - `console`—Specifies the console terminal line. The console port is DCE. |
|          |                               | - `vty`—Specifies a virtual terminal for remote console access. |

The `line-number` is the first line number in a contiguous group that you want to configure when the line type is specified. The range is from 0 to 16.

| Step 4 | `access-class access-list-number {in | out}` | Restricts incoming and outgoing connections between a particular virtual terminal line (into a device) and the addresses in an access list. |
|---------|----------------------------------------------|-----------------------------------------------------------------------------|
| Example: | `Device(config-line)# access-class 10 in` | |

<table>
<thead>
<tr>
<th>Step 5</th>
<th><code>end</code></th>
<th>Returns to privileged EXEC mode.</th>

Creating Named MAC Extended ACLs

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Follow these steps to create a named MAC extended ACL:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. mac access-list extended name
4. {deny | permit} {any | host source MAC address | source MAC address mask} {any | host destination MAC address | destination MAC address mask} {type mask | lsap lsap mask | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp | 0-65535} [cos cos]
5. end
6. show running-config
7. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

### Applying a MAC ACL to a Layer 2 Interface

Follow these steps to apply a MAC access list to control access to a Layer 2 interface:

**SUMMARY STEPS**

1. `configure terminal`
2. `configure terminal`
3. `interface interface-id`
4. `mac access-group {name} {in | out}`
5. `end`
6. `show mac access-group [interface interface-id]`
7. `configure terminal`
8. `configure terminal`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 2** configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 3** interface interface-id  
Example:  
Device(config)# interface gigabitethernet1/0/2 | Identifies a specific interface, and enter interface configuration mode. The interface must be a physical Layer 2 interface (port ACL). |
| **Step 4** mac access-group {name} {in | out}  
Example:  
Device(config-if)# mac access-group mac1 in | Controls access to the specified interface by using the MAC access list.  
Port ACLs are supported in the outbound and inbound directions. |
| **Step 5** end  
Example: | Returns to privileged EXEC mode. |
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Step 6** show mac access-group [interface interface-id]

**Example:**

Device# show mac access-group interface gigabitethernet1/0/2

**Step 7** configure terminal

**Example:**

Device# configure terminal

**Step 8** configure terminal

**Example:**

Device# configure terminal

After receiving a packet, the switch checks it against the inbound ACL. If the ACL permits it, the switch continues to process the packet. If the ACL rejects the packet, the switch discards it. When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied and permits all packets. Remember this behavior if you use undefined ACLs for network security.

## Configuring VLAN Maps

Follow the procedure given below to create a VLAN map and apply it to one or more VLANs:

**Before you begin**

Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN.

### SUMMARY STEPS

1. `vlan access-map name [number]`
2. `match {ip | mac} address {name | number} [name | number]`
3. Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):
   - `action { forward}`
Device(config-access-map)# action forward

• action { drop }

Device(config-access-map)# action drop

4. vlan filter mapname vlan-list list

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>vlan access-map name [number]</td>
<td>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map. When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match. Entering this command changes to access-map configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>:</td>
<td>Device(config)# vlan access-map map_1 20</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>match {ip</td>
<td>mac} address {name</td>
</tr>
<tr>
<td><strong>Example:</strong>:</td>
<td>Device(config-access-map)# match ip address ip2</td>
<td></td>
</tr>
</tbody>
</table>
| Step 3 | Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):  
• action { forward } | Sets the action for the map entry. |
Creating a VLAN Map

Each VLAN map consists of an ordered series of entries. Beginning in privileged EXEC mode, follow these steps to create, add to, or delete a VLAN map entry:

SUMMARY STEPS

1. configure terminal
2. vlan access-map name [number]
3. match {ip | mac} address {name | number} [name | number]
4. action {drop | forward}
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

</table>
You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.

When you use the `ip access-group` interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

### Table 141: Commands for Displaying Access Lists and Access Groups

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show access-lists [number</td>
<td>name]`</td>
</tr>
<tr>
<td>`show ip access-lists [number</td>
<td>name]`</td>

</table>
Configuration Examples for ACLs

Examples: Using TimeRanges with ACLs

This example shows how to verify after you configure time ranges for workhours and to configure January 1, 2006, as a company holiday.

```
Device# show time-range
  time-range entry: new_year_day_2003 (inactive)
    absolute start 00:00 01 January 2006 end 23:59 01 January 2006
  time-range entry: workhours (inactive)
    periodic weekdays 8:00 to 12:00
    periodic weekdays 13:00 to 17:00
```

To apply a time range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.

```
Device(config)# access-list 188 deny tcp any any time-range new_year_day_2006
Device(config)# access-list 188 permit tcp any any time-range workhours
Device(config)# end
Device# show access-lists
  Extended IP access list 188
    10 deny tcp any any time-range new_year_day_2006 (inactive)
    20 permit tcp any any time-range workhours (inactive)
```

This example uses named ACLs to permit and deny the same traffic.

```
Device(config)# ip access-list extended deny_access
Device(config-ext-nacl)# deny tcp any any time-range new_year_day_2006
Device(config-ext-nacl)# exit
Device(config)# ip access-list extended may_access
Device(config-ext-nacl)# permit tcp any any time-range workhours
Device(config-ext-nacl)# end
Device# show ip access-lists
  Extended IP access list l1plp_default
    10 permit ip any
  Extended IP access list deny_access
    10 deny tcp any any time-range new_year_day_2006 (inactive)
  Extended IP access list may_access
    10 permit tcp any any time-range workhours (inactive)
```

Examples: Including Comments in ACLs

You can use the `remark` keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would
be confusing to have some remarks before the associated permit or deny statements and some remarks after
the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the access-list access-list number
remark remark global configuration command. To remove the remark, use the no form of this command.

In this example, the workstation that belongs to Jones is allowed access, and the workstation that belongs to
Smith is not allowed access:

```
Device(config)# access-list 1 remark Permit only Jones workstation through
Device(config)# access-list 1 permit 171.69.2.88
Device(config)# access-list 1 remark Do not allow Smith through
Device(config)# access-list 1 deny 171.69.3.13
```

For an entry in a named IP ACL, use the remark access-list configuration command. To remove the remark,
use the no form of this command.

In this example, the Jones subnet is not allowed to use outbound Telnet:

```
Device(config)# ip access-list extended telnetting
Device(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Device(config-ext-nacl)# deny tcp host 171.69.2.88 any eq telnet
```

### IPv4 ACL Configuration Examples

This section provides examples of configuring and applying IPv4 ACLs. For detailed information about
compiling ACLs, see the *Cisco IOS Security Configuration Guide, Release 12.4* and to the Configuring IP
Services” section in the “IP Addressing and Services” chapter of the *Cisco IOS IP Configuration Guide,
Release 12.4*.

### ACLs in a Small Networked Office

*Figure 107: Using Router ACLs to Control Traffic*

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits
and other information that all employees can access, and routed Port 1 connected to Server B, containing
confidential payroll data. All users can access Server A, but Server B has restricted

access.

Use router ACLs to do this in one of two ways:

• Create a standard ACL, and filter traffic coming to the server from Port 1.

• Create an extended ACL, and filter traffic coming from the server into Port 1.

**Examples: ACLs in a Small Networked Office**

This example uses a standard ACL to filter traffic coming into Server B from a port, permitting traffic only from Accounting’s source addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic coming out of routed Port 1 from the specified source address.

```
Device(config)# access-list 6 permit 172.20.128.64 0.0.0.31
Device(config)# end
Device# show access-lists
Standard IP access list 6
   10 permit 172.20.128.64, wildcard bits 0.0.0.31
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 6 out
```

This example uses an extended ACL to filter traffic coming from Server B into a port, permitting traffic from any source address (in this case Server B) to only the Accounting destination addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic going into routed Port 1, permitting it to go only to the specified destination addresses. Note that with extended ACLs, you must enter the protocol (IP) before the source and destination information.

```
Device(config)# access-list 106 permit ip any 172.20.128.64 0.0.0.31
Device(config)# end
Device# show access-lists
Extended IP access list 106
```
Example: Numbered ACLs

In this example, network 10.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 10.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 10.0.0.0 subnets. The ACL is applied to packets entering a port.

Examples: Extended ACLs

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The established keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 on stack member 1 is the interface that connects the router to the Internet.
Device(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 established
Device(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group 102 in

Examples: Named ACLs

Creating named standard and extended ACLs

This example creates a standard ACL named internet_filter and an extended ACL named marketing_group. The internet_filter ACL allows all traffic from the source address 1.2.3.4.

Device(config)# ip access-list standard Internet_filter
Device(config-ext-nacl)# permit 1.2.3.4
Device(config-ext-nacl)# exit

The marketing_group ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

Device(config)# ip access-list extended marketing_group
Device(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Device(config-ext-nacl)# deny tcp any
Device(config-ext-nacl)# permit icmp any any
Device(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Device(config-ext-nacl)# deny ip any any log
Device(config-ext-nacl)# exit

The Internet_filter ACL is applied to outgoing traffic and the marketing_group ACL is applied to incoming traffic on a Layer 3 port.

Device(config)# interface gigabitethernet3/0/1
Device(config-if)# no switchport
Device(config-if)# ip address 2.0.5.1 255.255.255.0
Device(config-if)# ip access-group Internet_filter out
Device(config-if)# ip access-group marketing_group in

Deleting individual ACEs from named ACLs

This example shows how you can delete individual ACEs from the named access list border-list:

Device(config)# ip access-list extended border-list
Device(config-ext-nacl)# no permit ip host 10.1.1.3 any

Examples: Time Range Applied to an IP ACL

This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).
Examples: Configuring Commented IP ACL Entries

In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

Device(config)# access-list 1 remark Permit only Jones workstation through
Device(config)# access-list 1 permit 171.69.2.88
Device(config)# access-list 1 remark Do not allow Smith workstation through
Device(config)# access-list 1 deny 171.69.3.13

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

Device(config)# access-list 100 remark Do not allow Winter to browse the web
Device(config)# access-list 100 deny host 171.69.3.85 any eq www
Device(config)# access-list 100 remark Do not allow Smith to browse the web
Device(config)# access-list 100 deny host 171.69.3.13 any eq www

In this example of a named ACL, the Jones subnet is not allowed access:

Device(config)# ip access-list standard prevention
Device(config-std-nacl)# remark Do not allow Jones subnet through
Device(config-std-nacl)# deny 171.69.0.0 0.0.255.255

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

Device(config)# ip access-list extended telnetting
Device(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Device(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet

Examples: ACL Logging

Two variations of logging are supported on ACLs. The log keyword sends an informational logging message to the console about the packet that matches the entry; the log-input keyword includes the input interface in the log entry.

In this example, standard named access list stan1 denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the log keyword.
Device(config)# ip access-list standard stan1
Device(config-std-nacl)# deny 10.1.1.0 0.0.0.255 log
Device(config-std-nacl)# permit any log
Device(config-std-nacl)# exit
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip access-group stan1 in
Device(config-if)# end

Device# show logging
Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
  Console logging: level debugging, 37 messages logged
  Monitor logging: level debugging, 0 messages logged
  Buffer logging: level debugging, 37 messages logged
  File logging: disabled
  Trap logging: level debugging, 37 message lines logged

Log Buffer (4096 bytes):
00:00:48: NTP: authentication delay calculation problems

This example is a named extended access list ext1 that permits ICMP packets from any source to 10.1.1.0 0.0.0.255 and denies all UDP packets.

Device(config)# ip access-list extended ext1
Device(config-ext-nacl)# permit icmp any 10.1.1.0 0.0.0.255 log
Device(config-ext-nacl)# deny udp any any log
Device(config-ext-nacl)# exit
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# ip access-group ext1 in

This is an example of a log for an extended ACL:

01:24:23:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 1 packet
01:25:14:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 7 packets
01:26:12:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 1 packet
01:31:33:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 8 packets

Note that all logging entries for IP ACLs start with %SEC-6-IPACCESSLOG with minor variations in format depending on the kind of ACL and the access entry that has been matched.

This is an example of an output message when the log-input keyword is entered:

00:04:21:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 (Vlan1 0001.42ef.a400) -> 10.1.1.61 (0/0), 1 packet

A log message for the same sort of packet using the log keyword does not include the input interface information:
Configuration Examples for ACLs and VLAN Maps

Example: Creating an ACL and a VLAN Map to Deny a Packet

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the \textit{ip1} ACL (TCP packets) would be dropped. You first create the \textit{ip1} ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

Device(config)# ip access-list extended ip1
Device(config-ext-nacl)# permit tcp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 10
Device(config-access-map)# match ip address ip1
Device(config-access-map)# action drop

Example: Creating an ACL and a VLAN Map to Permit a Packet

This example shows how to create a VLAN map to permit a packet. ACL \textit{ip2} permits UDP packets and any packets that match the \textit{ip2} ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

Device(config)# ip access-list extended ip2
Device(config-ext-nacl)# permit udp any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map_1 20
Device(config-access-map)# match ip address ip2
Device(config-access-map)# action forward

Example: Default Action of Dropping IP Packets and Forwarding MAC Packets

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists \texttt{igmp-match} and \texttt{tcp-match}, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

Device(config)# access-list 101 permit udp any any
Device(config)# ip access-list extended igmp-match
Device(config-ext-nacl)# permit igmp any any
Example: Default Action of Dropping MAC Packets and Forwarding IP Packets

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists good-hosts and good-protocols, the map will have the following results:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets with decnet-iv or vines-ip protocols
- Drop all other non-IP packets
- Forward all IP packets

Example: Default Action of Dropping All Packets

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists tcp-match and good-hosts from Examples 2 and 3, the map will have the following results:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets
Configuration Examples for Using VLAN Maps in Your Network

Example: Wiring Closet Configuration

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classification ACL. Assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be access-controlled at the traffic entry point, Switch A.

If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge it to Switch B.

First, define the IP access list http that permits (matches) any TCP traffic on the HTTP port.

```
Device(config)# ip access-list extended http
Device(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Device(config-ext-nacl)# exit
```

Next, create VLAN access map map2 so that traffic that matches the http access list is dropped and all other IP traffic is forwarded.

```
Device(config)# vlan access-map map2 10
Device(config-access-map)# match ip address http
Device(config-access-map)# action drop
Device(config-access-map)# exit
Device(config)# ip access-list extended match_all
Device(config-ext-nacl)# permit ip any any
Device(config-ext-nacl)# exit
Device(config)# vlan access-map map2 20
Device(config-access-map)# match ip address match_all
```
Example: Restricting Access to a Server on Another VLAN

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

Example: Denying Access to a Server on Another VLAN

This example shows how to deny access to a server on another VLAN by creating the VLAN map SERVER1 that denies access to hosts in subnet 10.1.2.0.8, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map SERVER1 to VLAN 10.

Define the IP ACL that will match the correct packets.

```
Device(config)# ip access-list extended SERVER1_ACL
Device(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Device(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Device(config-ext-nacl)# exit
```

Define a VLAN map using this ACL that will drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

```
Device(config)# vlan access-map SERVER1_MAP
Device(config-access-map)# match ip address SERVER1_ACL
Device(config-access-map)# action drop
Device(config)# vlan access-map SERVER1_MAP 20
```
Apply the VLAN map to VLAN 10.

```
Device(config)# vlan filter SERVER1_MAP vlan-list 10
```

## Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet’s path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

### Example: ACLs and Switched Packets

*Figure 110: Applying ACLs on Switched Packets*

This example shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded by fallback bridging are only subject to the VLAN map of the input VLAN.

### Example: ACLs and Bridged Packets

*Figure 111: Applying ACLs on Bridged Packets*

This example shows how an ACL is applied on fallback-bridged packets. For bridged packets, only Layer 2 ACLs are applied to the input VLAN. Only non-IP, non-ARP packets can be fallback-bridged.
Example: ACLs and Routed Packets

Figure 112: Applying ACLs on Routed Packets

This example shows how ACLs are applied on routed packets. The ACLs are applied in this order:
1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN
Example: ACLs and Multicast Packets

Figure 113: Applying ACLs on Multicast Packets

This example shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN. The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map drops the packet, no destination receives a copy of the packet.

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**IPv6 ACLs Overview**

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similar to how you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running IP base and LAN base feature sets.

A switch supports three types of IPv6 ACLs:

- IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.
IPv6 port ACLs are supported on outbound and inbound Layer 2 interfaces. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

VLAN ACLs or VLAN maps access-control all packets in a VLAN. You can use VLAN maps to filter traffic between devices in the same VLAN. ACL VLAN maps are applied on L2 VLANs. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv6. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets entering the VLAN are checked against the VLAN map.

The switch supports VLAN ACLs (VLAN maps) for IPv6 traffic.

You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs.

Switch Stacks and IPv6 ACLs

The active switch supports IPv6 ACLs in hardware and distributes the IPv6 ACLs to the stack members. If a standby switch takes over as the active switch, it distributes the ACL configuration to all stack members. The member switches sync up the configuration distributed by the new active switch and flush out entries that are not required.

When an ACL is modified, attached to, or detached from an interface, the active switch distributes the change to all stack members.

ACL Precedence

When VLAN maps, Port ACLs, and router ACLs are configured on the same switch, the filtering precedence, from greatest to least for ingress traffic is port ACL, VLAN map, and then router ACL. For egress traffic, the filtering precedence is router ACL, VLAN map, and then port ACL.

The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.

- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.

- When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

- When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.
VLAN Maps

VLAN ACLs or VLAN maps are used to control network traffic within a VLAN. You can apply VLAN maps to all packets that are bridged within a VLAN in the switch or switch stack. VACLs are strictly for security packet filtering and for redirecting traffic to specific physical interfaces. VACLs are not defined by direction (ingress or egress).

All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.

Figure 114: Using VLAN Maps to Control Traffic

This shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

Interactions with Other Features and Switches

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.

- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.

- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.

  You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.

- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.

- If the hardware memory is full, packets are dropped on the interface and an unload error message is logged.
Restrictions for IPv6 ACLs

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

- The switch does not support matching on these keywords: routing header, and undetermined-transport.
- The switch does not support reflexive ACLs (the reflect keyword).
- This release supports port ACLs, router ACLs and VLAN ACLs (VLAN maps) for IPv6.
- The switch does not apply MAC-based ACLs on IPv6 frames.
- When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.
- If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

IPv6 ACLs on the switch have these characteristics:

- Fragmented frames (the fragments keyword as in IPv4) are supported
- The same statistics supported in IPv4 are supported for IPv6 ACLs.
- If the switch runs out of hardware space, the packets associated with the ACL are dropped on the interface.
- Logging is supported for router ACLs, but not for port ACLs.
- The switch supports IPv6 address-matching for a full range of prefix-lengths.

Default Configuration for IPv6 ACLs

The default IPv6 ACL configuration is as follows:

```
Switch# show access-lists preauth_ipv6_acl
IPv6 access list preauth_ipv6_acl (per-user)
permit udp any any eq domain sequence 10
permit tcp any any eq domain sequence 20
permit icmp any any nd-ns sequence 30
permit icmp any any nd-na sequence 40
permit icmp any any router-solicitation sequence 50
permit icmp any any router-advertisement sequence 60
permit icmp any any redirect sequence 70
permit udp any eq 547 any eq 546 sequence 80
permit udp any eq 546 any eq 547 sequence 90
deny ipv6 any any sequence 100
```
Configuring IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. [no] ipv6 access-list list-name|client permit-control-packets|log-update threshold|role-based list-name
4. [no] {deny|permit} protocol {source-ipv6-prefix/prefix-length|any threshold|host source-ipv6-address} [operator {port-number}] {destination-ipv6-prefix/prefix-length |any |host destination-ipv6-address} [operator {port-number}]|{dscp value}|{fragments}|{log}|{log-input}|{routing}|{sequence value} [time-range name]
5. {deny|permit} tcp {source-ipv6-prefix/prefix-length |any |host source-ipv6-address} [operator {port-number}] {destination-ipv6-prefix/prefix-length |any |host destination-ipv6-address} [operator {port-number}] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port |protocol}] [psh] [range {port |protocol}] [rst] [routing] [sequence value] [syn] [time-range name] [urg]
6. {deny|permit} udp {source-ipv6-prefix/prefix-length |any |host source-ipv6-address} [operator {port-number}] {destination-ipv6-prefix/prefix-length |any |host destination-ipv6-address} [operator {port-number}] [dscp value] [log] [log-input] [neq {port |protocol}] [range {port |protocol}] [routing] [sequence value] [time-range name]
7. {deny|permit} icmp {source-ipv6-prefix/prefix-length |any |host source-ipv6-address} [operator {port-number}] {destination-ipv6-prefix/prefix-length |any |host destination-ipv6-address} [operator {port-number}] [icmp-type [icmp-code] | icmp-message] [dscp value] [log] [log-input] [routing] [sequence value] [time-range name]
8. **end**
9. **show ipv6 access-list**
10. **show running-config**
11. **copy running-config startup-config**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1.   | enable           | Enables privileged EXEC mode.  
  **Example:**  
  Device> enable |
| 2.   | configure terminal | Enters global configuration mode.  
  **Example:**  
  Device# configure terminal |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>Defines an IPv6 ACL name, and enters IPv6 access list configuration mode.</td>
</tr>
<tr>
<td><code>[no]</code> ipv6 access-list <code>list-name</code> client permit-control-packets log-update threshold role-based <code>list-name</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Device(config)# ipv6 access-list example_acl_list</td>
</tr>
</tbody>
</table>

**Step 4**

Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions:

- For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, step, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number.

- The `source-ipv6-prefix/prefix-length` or `destination-ipv6-prefix/prefix-length` is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).

- Enter any as an abbreviation for the IPv6 prefix `::/0`.

- For `host source-ipv6-address` or `destination-ipv6-address`, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.

- (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are `lt` (less than), `gt` (greater than), `eq` (equal), `neq` (not equal), and `range`.

  If the operator follows the `source-ipv6-prefix/prefix-length` argument, it must match the source port. If the operator follows the `destination-ipv6-prefix/prefix-length` argument, it must match the destination port.

- (Optional) The `port-number` is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.

- (Optional) Enter `dscp` value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>{deny</td>
<td>permit} tcp {source-ipv6-prefix/prefix-length</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <code>log</code> to cause an logging message to be sent to the console about the packet that matches the entry. Enter <code>log-input</code> to include the input interface in the log entry. Logging is supported only for router ACLs.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <code>routing</code> to specify that IPv6 packets be routed.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <code>sequence value</code> to specify the sequence number for the access list statement. The acceptable range is from 1 to 4,294,967,295.</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enter <code>time-range name</code> to specify the time range that applies to the deny or permit statement.</td>
</tr>
</tbody>
</table>

**Step 5**

(Optional) Define a TCP access list and the access conditions.

Enter `tcp` for Transmission Control Protocol. The parameters are the same as those described in Step 3a, with these additional optional parameters:

- `ack`—Acknowledgment bit set.
- `established`—An established connection. A match occurs if the TCP datagram has the ACK or RST bits set.
- `fin`—Finished bit set; no more data from sender.
- `neq [port | protocol]`—Matches only packets that are not on a given port number.
- `psh`—Push function bit set.
- `range [port | protocol]`—Matches only packets in the port number range.
- `rst`—Reset bit set.
- `syn`—Synchronize bit set.
- `urg`—Urgent pointer bit set.

**Step 6**

(Optional) Define a UDP access list and the access conditions.

Enter `udp` for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the [operator [port]] port number or name must be a
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`{port</td>
<td>protocol}` [routing] [sequence value] [time-range name]</td>
</tr>
</tbody>
</table>

**Step 7**

{deny | permit} icmp `{source-ipv6-prefix/prefix-length any host source-ipv6-address} [operator [port-number]]` `{destination-ipv6-prefix/prefix-length any host destination-ipv6-address} [operator [port-number]]` [icmp-type [icmp-code] | icmp-message] [dscp value] [log] [log-input] [routing] [sequence value] [time-range name]

(Optional) Define an ICMP access list and the access conditions.

Enter **icmp** for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 1, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:

- **icmp-type**—Enter to filter by ICMP message type, a number from 0 to 255.
- **icmp-code**—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.
- **icmp-message**—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the ? key or see command reference for this release.

**Step 8**

end

Return to privileged EXEC mode.

**Step 9**

show ipv6 access-list

Verify the access list configuration.

**Step 10**

show running-config

Example:

Device# show running-config

**Step 11**

copy running-config startup-config

Example:

Device# copy running-config startup-config

(Optional) Saves your entries in the configuration file.

**What to do next**

Attach the IPv6 ACL to an Interface

**Attaching an IPv6 ACL to an Interface**

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces. You can also apply ACLs only to inbound management traffic on Layer 3 interfaces.
Follow these steps to control access to an interface:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. interface interface-id
4. no switchport
5. ipv6 address ipv6-address
6. ipv6 traffic-filter access-list-name {in | out}
7. end
8. show running-config
9. copy running-config startup-config

**DETAILED STEPS**

<table>

Configuring VLAN Maps

To create a VLAN map and apply it to one or more VLANs, perform these steps:

**Before you begin**

Create the IPv6 ACL that you want to apply to the VLAN.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. vlan access-map name [number]
4. match {ip | ipv6 | mac} address {name | number} [name | number]
5. Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs:
   - action { forward }
     Device(config-access-map)# action forward
   - action { drop }
     Device(config-access-map)# action drop
6. vlan filter mapname vlan-list list

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>

Applying a VLAN Map to a VLAN

Beginning in privileged EXEC mode, follow the procedure given below to apply a VLAN map to one or more VLANs:

**SUMMARY STEPS**

1. configure terminal
2. vlan filter mapname vlan-list list
3. end
4. show running-config
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2**        | **configure terminal**<br>**Example:**
|                   | Device# configure terminal |
| **Step 3**        | **vlan filter mapname vlan-list list**<br>**Example:**
|                   | Device(config)# vlan filter map 1 vlan-list 20-22 |
|                   | Applies the VLAN map to one or more VLAN IDs.<br>The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around the comma and hyphen are optional. |
| **Step 4**        | **end**<br>**Example:**
|                   | Device(config)# end |
| **Step 5**        | **show running-config**<br>**Example:**
|                   | Device# show running-config |
| **Step 6**        | **copy running-config startup-config**<br>**Example:**
|                   | Device# copy running-config startup-config |
|                   | (Optional) Saves your entries in the configuration file. |
Monitoring IPv6 ACLs

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands shown in the table below:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show access-lists</td>
<td>Displays all access lists configured on the switch.</td>
</tr>
<tr>
<td>show ipv6 access-list [access-list-name]</td>
<td>Displays all configured IPv6 access lists or the access list specified by name.</td>
</tr>
<tr>
<td>show vlan access-map [map-name]</td>
<td>Displays VLAN access map configuration.</td>
</tr>
<tr>
<td>show vlan filter [access-map] vlan [vlan-id]</td>
<td>Displays the mapping between VACLs and VLANs.</td>
</tr>
</tbody>
</table>

This is an example of the output from the show access-lists privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

Switch # show access-lists
Extended IP access list hello
  10 permit ip any any
IPv6 access list ipv6
  permit ipv6 any any sequence 10

This is an example of the output from the show ipv6 access-list privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

Switch# show ipv6 access-list
IPv6 access list inbound
  permit tcp any any eq bgp (8 matches) sequence 10
  permit tcp any any eq telnet (15 matches) sequence 20
  permit udp any any sequence 30
IPv6 access list outbound
  deny udp any any sequence 10
  deny tcp any any eq telnet sequence 20

This is an example of the output from the show vlan access-map privileged EXEC command. The output shows VLAN access map information.

Switch# show vlan access-map
Vlan access-map "ml" 10
  Match clauses:
    ipv6 address: ip2
  Action: drop

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About DHCP

DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator. The switch can act as a DHCP server.

DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on output interfaces.
DHCP Snooping

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

Note

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

An untrusted DHCP message is a message that is received through an untrusted interface. By default, the switch considers all interfaces untrusted. So, the switch must be configured to trust some interfaces to use DHCP Snooping. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer’s switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

In a service-provider network, an example of an interface you might configure as trusted is one connected to a port on a device in the same network. An example of an untrusted interface is one that is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCPOFFER, DHCPACK, DHCPNAK, or DHCPLEASEQUERY packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCPRELEASE or DHCPDECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.
- The maximum snooping queue size of 1000 is exceeded when DHCP snooping is enabled.

Note

This is applicable from Cisco IOS XE Denali 16.1.x release onwards.
If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.

When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the `ip dhcp snooping information option allow-untrusted` global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on untrusted input interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

Normally, it is not desirable to broadcast packets to wireless clients. So, DHCP snooping replaces destination broadcast MAC address (ffff.ffff.ffff) with unicast MAC address for DHCP packets that are going from server to wireless clients. The unicast MAC address is retrieved from CHADDR field in the DHCP payload. This processing is applied for server to client packets such as DHCP OFFER, DHCP ACK, and DHCP NACK messages. The `ip dhcp snooping wireless bootp-broadcast enable` command can be used to revert this behavior. When the wireless BOOTP broadcast is enabled, the broadcast DHCP packets from server are forwarded to wireless clients without changing the destination MAC address.

Prerequisites for Configuring DHCP Snooping and Option 82, on page 1907

### Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

---

**Note**

The DHCP option-82 feature is supported only when DHCP snooping is globally enabled on the VLANs to which subscriber devices using option-82 are assigned.

The following illustration shows a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.
When you enable the DHCP snooping information option 82 on the switch, the following sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, `vlan-mod-port`, from which the packet is received. You can configure the remote ID and circuit ID.
- If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the option-82 field to the DHCP server.
- The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.
- The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields do not change (see the illustration, Suboption Packet Formats):

- Circuit-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Circuit-ID type
  - Length of the circuit-ID type

- Remote-ID suboption fields
  - Suboption type
  - Length of the suboption type
  - Remote-ID type
• Length of the remote-ID type

In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100/1000 ports and four small form-factor pluggable (SFP) module slots, port 3 is the Gigabit Ethernet 1/0/1 port, port 4 is the Gigabit Ethernet 1/0/2 port, and so forth. Port 27 is the SFP module slot Gigabit Ethernet 1/0/25, and so forth.

The illustration, *Suboption Packet Formats*, shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch number in the stack. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option format remote-id` global configuration command.

*Figure 116: Suboption Packet Formats*

The illustration, *User-Configured Suboption Packet Formats*, shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

• Circuit-ID suboption fields
  • The circuit-ID type is 1.
  • The length values are variable, depending on the length of the string that you configure.

• Remote-ID suboption fields
  • The remote-ID type is 1.
  • The length values are variable, depending on the length of the string that you configure.
Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

DHCP Snooping Binding Database

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 64,000 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch updates the file when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is
updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

This is the format of the file with bindings:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
... 
<entry-n> <checksum-1-2-..-n>
END
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The initial-checksum entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
192.1.168.1 3 0003.47d8.c91f 2BB6488E Gi1/0/4 21ae5fbb
192.1.168.3 3 0003.44d6.c52f 2BB648EB Gi1/0/4 1bdb223f
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Gi1/0/4 584a38f0
END
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:

- The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.
- An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).
- The interface in the entry no longer exists on the system.
- The interface is a routed interface or a DHCP snooping-trusted interface.

**DHCP Snooping and Switch Stacks**

DHCP snooping is managed on the stack master. When a new switch joins the stack, the switch receives the DHCP snooping configuration from the stack master. When a member leaves the stack, all DHCP snooping address bindings associated with the switch age out.

All snooping statistics are generated on the stack master. If a new stack master is elected, the statistics counters reset.

When a stack merge occurs, all DHCP snooping bindings in the stack master are lost if it is no longer the stack master. With a stack partition, the existing stack master is unchanged, and the bindings belonging to the
partitioned switches age out. The new master of the partitioned stack begins processing the new incoming DHCP packets.

# How to Configure DHCP Features

</tr>
</tbody>
</table>

¹³ The switch responds to DHCP requests only if it is configured as a DHCP server.
¹⁴ The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.
Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.

**DHCP Snooping Configuration Guidelines**

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust interface` configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.
- You can display DHCP snooping statistics by entering the `show ip dhcp snooping statistics` user EXEC command, and you can clear the snooping statistics counters by entering the `clear ip dhcp snooping statistics` privileged EXEC command.

**Configuring the DHCP Server**

The switch can act as a DHCP server. If IOS based DHCP server for DHCP clients with management ports are used, both DHCP pool and the corresponding interface must be configured using the Management VRF.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the *Cisco IOS IP Configuration Guide, Release 12.4*.

**DHCP Server and Switch Stacks**

The DHCP binding database is managed on the stack master. When a new stack master is assigned, the new master downloads the saved binding database from the TFTP server. When a switchover happens, the new active stack master will use its database file that has been synced from the old active stack master using the SSO function. The IP addresses associated with the lost bindings are released. You should configure an automatic backup by using the `ip dhcp database url [timeout seconds] [write-delay seconds]` global configuration command.

**Configuring the DHCP Relay Agent**

Follow these steps to enable the DHCP relay agent on the switch:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. service dhcp
4. end
5. show running-config
6. copy running-config startup-config

</table>

#### What to do next
- Checking (validating) the relay agent information
- Configuring the relay agent forwarding policy

### Specifying the Packet Forwarding Address

If the DHCP server and the DHCP clients are on different networks or subnets, you must configure the switch with the `ip helper-address address` interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the `ip helper-address` command...
can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface vlan vlan-id`
4. `ip address ip-address subnet-mask`
5. `ip helper-address address`
6. `end`
7. Use one of the following:
   - `interface range port-range`
   - `interface interface-id`
8. `switchport mode access`
9. `switchport access vlan vlan-id`
10. `end`
11. `show running-config`
12. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

Prerequisites for Configuring DHCP Snooping and Option 82

The prerequisites for DHCP Snooping and Option 82 are as follows:

• You must globally enable DHCP snooping on the switch.

• Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.

• If you want the switch to respond to DHCP requests, it must be configured as a DHCP server.

• Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.

• For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces. In a service-provider network, a trusted interface is connected to a port on a device in the same network.

• You must configure the switch to use the Cisco IOS DHCP server binding database to use it for DHCP snooping.

• To use the DHCP snooping option of accepting packets on untrusted inputs, the switch must be an aggregation switch that receives packets with option-82 information from an edge switch.

• The following prerequisites apply to DHCP snooping binding database configuration:
  
  • You must configure a destination on the DHCP snooping binding database to use the switch for DHCP snooping.

  • Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.

  • For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.

  • To ensure that the lease time in the database is accurate, we recommend that you enable and configure Network Time Protocol (NTP).

  • If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

• Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.

• If you want the switch to relay DHCP packets, the IP address of the DHCP server must be configured on the switch virtual interface (SVI) of the DHCP client.

• If a switch port is connected to a DHCP server, configure a port as trusted by entering the **ip dhcp snooping trust interface** configuration command.

• If a switch port is connected to a DHCP client, configure a port as untrusted by entering the **no ip dhcp snooping trust** interface configuration command.
Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4

Monitoring DHCP Snooping Information

<table>
<thead>
<tr>
<th>Table 143: Commands for Displaying DHCP Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip dhcp snooping</td>
</tr>
<tr>

Note

If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the statically configured bindings.

Configuring DHCP Server Port-Based Address Allocation

Information About Configuring DHCP Server Port-Based Address Allocation

DHCP server port-based address allocation is a feature that enables DHCP to maintain the same IP address on an Ethernet switch port regardless of the attached device client identifier or client hardware address.

When Ethernet switches are deployed in the network, they offer connectivity to the directly connected devices. In some environments, such as on a factory floor, if a device fails, the replacement device must be working immediately in the existing network. With the current DHCP implementation, there is no guarantee that DHCP would offer the same IP address to the replacement device. Control, monitoring, and other software expect a stable IP address associated with each device. If a device is replaced, the address assignment should remain stable even though the DHCP client has changed.
When configured, the DHCP server port-based address allocation feature ensures that the same IP address is always offered to the same connected port even as the client identifier or client hardware address changes in the DHCP messages received on that port. The DHCP protocol recognizes DHCP clients by the client identifier option in the DHCP packet. Clients that do not include the client identifier option are identified by the client hardware address. When you configure this feature, the port name of the interface overrides the client identifier or hardware address and the actual point of connection, the switch port, becomes the client identifier.

In all cases, by connecting the Ethernet cable to the same port, the same IP address is allocated through DHCP to the attached device.

The DHCP server port-based address allocation feature is only supported on a Cisco IOS DHCP server and not a third-party server.

**Default Port-Based Address Allocation Configuration**

By default, DHCP server port-based address allocation is disabled.

**Port-Based Address Allocation Configuration Guidelines**

- By default, DHCP server port-based address allocation is disabled.
- To restrict assignments from the DHCP pool to preconfigured reservations (unreserved addresses are not offered to the client and other clients are not served by the pool), you can enter the `reserved-only` DHCP pool configuration command.

**Enabling the DHCP Snooping Binding Database Agent**

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip dhcp snooping database {flash[number]:/filename | ftp://user:password@host|filename | http://[[username:password}@] | [hostname | host-ip]/[directory]/image-name.tar | rcp://user@host|filename | tftp://host|filename`
4. `ip dhcp snooping database timeout seconds`
5. `ip dhcp snooping database write-delay seconds`
6. `end`
7. `ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds`
8. `show ip dhcp snooping database [detail]`
9. `show running-config`
10. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>

   Example: 
   Device(config)# interface gigabitethernet1/0/1 | Specifies the interface to be configured, and enter interface configuration mode. |
| 6    | ip dhcp server use subscriber-id client-id  
   Example: 
   Device(config-if)# ip dhcp server use subscriber-id client-id | Configures the DHCP server to use the subscriber identifier as the client identifier on all incoming DHCP messages on the interface. |
| 7    | end  
   Example: 
   Device(config)# end | Returns to privileged EXEC mode. |
| 8    | show running-config  
   Example: 
   Device# show running-config | Verifies your entries. |
| 9    | copy running-config startup-config  
   Example: 
   Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
What to do next

After enabling DHCP port-based address allocation on the switch, use the `ip dhcp pool` global configuration command to preassign IP addresses and to associate them to clients.

Configuring IP Source Guard

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

• Finding Feature Information, on page 1915
• Information About IP Source Guard, on page 1915
• How to Configure IP Source Guard, on page 1917
• Monitoring IP Source Guard, on page 1920
• Additional References, on page 1921

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IP Source Guard

IP Source Guard

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address in the binding table is allowed, all other traffic is denied.
The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

**IP Source Guard for Static Hosts**

---

**Note**

Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the master failover occurs, the IP source guard entries for static hosts attached to member ports are retained. When you enter the `show device-tracking database` EXEC command, the IP device tracking table displays the entries as ACTIVE.

---

**Note**

Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vendor of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.
IP Source Guard Configuration Guidelines

• You can configure static IP bindings only on nonrouted ports. If you enter the `ip source binding mac-address vlan vlan-id ip-address interface interface-id` global configuration command on a routed interface, this error message appears:

  Static IP source binding can only be configured on switch port.

• When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN for that interface.

• If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

  Note

  If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.

• You can enable this feature when 802.1x port-based authentication is enabled.

How to Configure IP Source Guard

Enabling IP Source Guard

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. ip verify source [mac-check ]
5. exit
6. ip source binding mac-address vlan vlan-id ip-address interface interface-id
7. end
8. show running-config
9. copy running-config startup-config

</table>
Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port

You must configure the `ip device tracking maximum limit-number interface` configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip device tracking
4. interface interface-id
5. switchport mode access
6. switchport access vlan vlan-id
7. ip verify source[tracking] [mac-check ]
8. ip device tracking maximum number
9. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

### Monitoring IP Source Guard

**Purpose**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switchport mode access</code></td>
<td>Configure VLAN for this port.</td>
</tr>
</tbody>
</table>

**Step 6**

**Example:**

```
Device(config-if)# switchport access vlan 10
```

**Step 7**

**Example:**

```
Device(config-if)# ip verify source tracking
```

- Enables IP source guard with source IP address filtering.
- *(Optional) tracking*—Enables IP source guard for static hosts.
- *(Optional) mac-check*—Enables MAC address filtering.

The command `ip verify source tracking mac-check` enables IP source guard for static hosts with MAC address filtering.

**Step 8**

**Example:**

```
Device(config-if)# ip device tracking maximum 8
```

Establishes a maximum limit for the number of static IPs that the IP device tracking table allows on the port. The range is 1 to 10. The maximum number is 10.

**Note**

You must configure the `ip device tracking maximum limit-number` interface configuration command.

**Step 9**

**Example:**

```
Device(config)# end
```

Returns to privileged EXEC mode.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

• Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.

• Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.

• Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses. When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

• Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

Note: Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

• A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

• The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

• The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.
If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

- Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the `ip arp inspection limit none` interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.

- When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.

### Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker’s computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

#### Figure 118: ARP Cache Poisoning

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic *man-in-the-middle* attack.
Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets

Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the `ip arp inspection vlan vlan-range` global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the `arp access-list acl-name` global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the `ip arp inspection validate {[src-mac] [dst-mac] [ip]}` global configuration command.

### Interface Trust States and Network Security

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `ip arp inspection trust interface` configuration command.

⚠️ **Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.
Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

**Note**

Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

---

### Rate Limiting of ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the `ip arp inspection limit` interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the `errdisable recovery` global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.
Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command.

Default Dynamic ARP Inspection Configuration

### Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

### Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `arp access-list acl-name`
4. `permit ip host sender-ip mac host sender-mac`
5. `exit`
6. `ip arp inspection filter arp-acl-name vlan vlan-range [static]`
7. `interface interface-id`
8. `no ip arp inspection trust`
9. `end`
10. Use the following show commands:
### Configuring ARP ACLs for Non-DHCP Environments

- show arp access-list acl-name
- show ip arp inspection vlan vlan-range
- show ip arp inspection interfaces

11. show running-config
12. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>enable</td>
</tr>
<tr>
<td>Example:</td>
<td>Device&gt; enable</td>
</tr>
</tbody>
</table>

Enables privileged EXEC mode.

- Enter your password if prompted.

| **Step 2** | configure terminal |
| Example: | Device# configure terminal |

Enters global configuration mode.

| **Step 3** | arp access-list acl-name |

Defines an ARP ACL, and enters ARP access-list configuration mode. By default, no ARP access lists are defined.

**Note** At the end of the ARP access list, there is an implicit **deny ip any mac any** command.

| **Step 4** | permit ip host sender-ip mac host sender-mac |

Permits ARP packets from the specified host (Host 2).

- For *sender-ip*, enter the IP address of Host 2.
- For *sender-mac*, enter the MAC address of Host 2.

| **Step 5** | exit |

Returns to global configuration mode.

| **Step 6** | ip arp inspection filter arp-acl-name vlan vlan-range [static] |

Applies ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.

- For *arp-acl-name*, specify the name of the ACL created in Step 2.

- For *vlan-range*, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.

- (Optional) Specify **static** to treat implicit deniers in the ARP ACL as explicit deniers and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL. ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them.</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>\texttt{interface} \textit{interface-id}</td>
</tr>
<tr>

\end{verbatim} \end{itemize} | Verifies your entries. |
| Step 12 | \texttt{copy running-config startup-config} \begin{itemize} \item \texttt{Example:} 

\begin{verbatim}
Device\# copy running-config startup-config
\end{verbatim} \end{itemize} | (Optional) Saves your entries in the configuration file. |
Configuring Dynamic ARP Inspection in DHCP Environments

Before you begin

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

SUMMARY STEPS

1. enable
2. show cdp neighbors
3. configure terminal
4. ip arp inspection vlan \( vlan-range \)
5. Interface \( interface-id \)
6. ip arp inspection trust
7. end
8. show ip arp inspection interfaces
9. show ip arp inspection vlan \( vlan-range \)
10. show ip dhcp snooping binding
11. show ip arp inspection statistics vlan \( vlan-range \)
12. configure terminal
13. configure terminal

**Limiting the Rate of Incoming ARP Packets**

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

**Note**

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the `no ip arp inspection limit` interface configuration command, the interface reverts to its default rate limit.

Follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip arp inspection limit [rate pps [burst interval seconds] | none]`
5. `exit`
6. Use the following commands:
   - `errdisable detect cause arp-inspection`
• errdisable recovery cause arp-inspection
• errdisable recovery interval  *interval*

7. exit
8. Use the following show commands:
   • show ip arp inspection interfaces
   • show errdisable recovery

9. show running-config
10. copy running-config startup-config

Performing Dynamic ARP Inspection Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip arp inspection validate {[src-mac] [dst-mac] [ip]}
4. exit
5. show ip arp inspection vlan vlan-range
6. show running-config
7. copy running-config startup-config
## DETAILED STEPS

Software Configuration Guide, Cisco IOS XE Denali 16.3.x (Catalyst 3650 Switches)
### Monitoring DAI

To monitor DAI, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip arp inspection statistics</td>
<td>Clears dynamic ARP inspection statistics.</td>
</tr>
<tr>
<td>show ip arp inspection statistics [vlan vlan-range]</td>
<td>Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the dynamic ARP inspection log buffer.</td>
</tr>
<tr>
<td>show ip arp inspection log</td>
<td>Displays the configuration and contents of the dynamic ARP inspection log buffer.</td>
</tr>
</tbody>
</table>

For the `show ip arp inspection statistics` command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate.

### Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp access-list [acl-name]</td>
<td>Displays detailed information about ARP ACLs.</td>
</tr>
<tr>
<td>show ip arp inspection interfaces [interface-id]</td>
<td>Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.</td>
</tr>
</tbody>
</table>
**Command** | **Description**
--- | ---
`show ip arp inspection vlan vlan-range` | Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.

- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.

- Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

  When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

- Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

  **Note**
  Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

- A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

  Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

- The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

- The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

  The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.
If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

- Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the `ip arp inspection limit none` interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.

- When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.

Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker’s computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

![Figure 120: ARP Cache Poisoning](image)

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic man-in-the-middle attack.
Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets

Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the `ip arp inspection vlan` global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with statically configured IP addresses. You define an ARP ACL by using the `arp access-list` global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the `ip arp inspection validate` global configuration command.

### Interface Trust States and Network Security

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `arp inspection trust` interface configuration command.

⚠️ **Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.
Figure 121: ARP Packet Validation on a VLAN Enabled for Dynamic ARP Inspection

Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

Note

Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

Rate Limiting of ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the `ip arp inspection limit` interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the `errdisable recovery` global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.
The rate limit for an EtherChannel is applied separately to each switch in a stack. For example, if a limit of 20 pps is configured on the EtherChannel, each switch with ports in the EtherChannel can carry up to 20 pps. If any switch exceeds the limit, the entire EtherChannel is placed into the error-disabled state.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan` global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command.

Default Dynamic ARP Inspection Configuration

<tr>
<td>Validation checks</td>
<td>No checks are performed.</td>
</tr>
</tbody>
</table>
Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the ip arp inspection filter vlan global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

**SUMMARY STEPS**

1. enable
2. configure terminal
3. arp access-list acl-name
4. permit ip host sender-ip mac host sender-mac
5. exit
6. ip arp inspection filter arp-acl-name vlan vlan-range [static]
7. interface interface-id
8. no ip arp inspection trust
9. end
10. Use the following show commands:

</table>
Configuring Dynamic ARP Inspection in DHCP Environments

Before you begin

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

Note

Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

SUMMARY STEPS

1. enable
2. show cdp neighbors
3. configure terminal
4. ip arp inspection vlan vlan-range
5. Interface interface-id
6. ip arp inspection trust

## Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

### Note

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the `no ip arp inspection limit` interface configuration command, the interface reverts to its default rate limit.

Follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `ip arp inspection limit {rate pps [burst interval seconds] | none}`
5. `exit`
6. Use the following commands:
   * `errdisable detect cause arp-inspection`
• errdisablerecovery cause arp-inspection
• errdisablerecovery interval *interval*

7. exit
8. Use the following show commands:
   • show ip arp inspection interfaces
   • show errdisablerecovery
9. show running-config
10. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | enable           | Enables privileged EXEC mode.  
            * Example:*  
            Device> enable  
| 2    | configure terminal | Enters global configuration mode.  
            * Example:*  
            Device# configure terminal  
| 3    | interface *interface-id* | Specifies the interface to be rate-limited, and enter interface configuration mode.  
| 4    | ip arp inspection limit {rate pps |burst interval seconds| none} | Limits the rate of incoming ARP requests and responses on the interface. The default rate is 15 pps on untrusted interfaces and unlimited on trusted interfaces. The burst interval is 1 second. The keywords have these meanings:  
            • For rate pps, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps.  
            • (Optional) For burst interval seconds, specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15.  
            • For rate none, specify no upper limit for the rate of incoming ARP packets that can be processed.  
| 5    | exit             | Returns to global configuration mode. |
Performing Dynamic ARP Inspection Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

Follow these steps to perform specific checks on incoming ARP packets. This procedure is optional.

SUMMARY STEPS

1. enable
2. configure terminal
3. ip arp inspection validate {[src-mac] [dst-mac] [ip]}
4. exit
5. show ip arp inspection vlan vlan-range
6. show running-config
7. copy running-config startup-config

### Monitoring DAI

To monitor DAI, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip arp inspection statistics</td>
<td>Clears dynamic ARP inspection statistics.</td>
</tr>
<tr>
<td>show ip arp inspection statistics [vlan vlan-range]</td>
<td>Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the dynamic ARP inspection log buffer.</td>
</tr>
<tr>
<td>show ip arp inspection log</td>
<td>Displays the configuration and contents of the dynamic ARP inspection log buffer.</td>
</tr>
</tbody>
</table>

For the `show ip arp inspection statistics` command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate.

### Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp access-list [acl-name]</td>
<td>Displays detailed information about ARP ACLs.</td>
</tr>
<tr>
<td>show ip arp inspection interfaces [interface-id]</td>
<td>Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.</td>
</tr>
</tbody>
</table>

CHAPTER 99

Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network. Unless otherwise noted, the term switch refers to a standalone switch or a switch stack.

• Finding Feature Information, on page 1957
• Information About 802.1x Port-Based Authentication, on page 1957
• How to Configure 802.1x Port-Based Authentication, on page 1988
• Monitoring 802.1x Statistics and Status, on page 2041
• Additional References for IEEE 802.1x Port-Based Authentication, on page 2042

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About 802.1x Port-Based Authentication

The 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Note

TACACS is not supported with 802.1x authentication.
Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

The table shown below lists the maximum number of each client session supported on Catalyst 3850 and Catalyst 3650 switches:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Port-Based Authentication Process**

To configure IEEE 802.1X port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

The AAA process begins with authentication. When 802.1x port-based authentication is enabled and the client supports 802.1x-compliant client software, these events occur:

- If the client identity is valid and the 802.1x authentication succeeds, the switch grants the client access to the network.
- If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can use the client MAC address for authorization. If the client MAC address is valid and the authorization succeeds, the switch grants the client access to the network. If the client MAC address is invalid and the authorization fails, the switch assigns the client to a guest VLAN that provides limited services if a guest VLAN is configured.
- If the switch gets an invalid identity from an 802.1x-capable client and a restricted VLAN is specified, the switch can assign the client to a restricted VLAN that provides limited services.
- If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network by putting the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN.

**Note**
Inaccessible authentication bypass is also referred to as critical authentication or the AAA fail policy.

If Multi Domain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization.
This figure shows the authentication process.

![Authentication Flowchart](image)

The switch re-authenticates a client when one of these situations occurs:

- Periodic re-authentication is enabled, and the re-authentication timer expires.

  You can configure the re-authentication timer to use a switch-specific value or to be based on values from the RADIUS server.

  After 802.1x authentication using a RADIUS server is configured, the switch uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]).

  The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which re-authentication occurs.

  The Termination-Action RADIUS attribute (Attribute [29]) specifies the action to take during re-authentication. The actions are Initialize and ReAuthenticate. When the Initialize action is set (the attribute value is DEFAULT), the 802.1x session ends, and connectivity is lost during re-authentication. When the ReAuthenticate action is set (the attribute value is RADIUS-Request), the session is not affected during re-authentication.

- You manually re-authenticate the client by entering the `dot1x re-authenticate interface interface-id` privileged EXEC command.
Port-Based Authentication Initiation and Message Exchange

During 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the `authentication port-control auto` interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client’s identity.

---

### Note

If 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted.

The specific exchange of EAP frames depends on the authentication method being used.

**Figure 123: Message Exchange**

This figure shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.

If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can authorize the client when the switch detects an Ethernet packet from the
client. The switch uses the MAC address of the client as its identity and includes this information in the RADIUS-access/request frame that is sent to the RADIUS server. After the server sends the switch the RADIUS-access/accept frame (authorization is successful), the port becomes authorized. If authorization fails and a guest VLAN is specified, the switch assigns the port to the guest VLAN. If the switch detects an EAPOL packet while waiting for an Ethernet packet, the switch stops the MAC authentication bypass process and starts 802.1x authentication.

*Figure 124: Message Exchange During MAC Authentication Bypass*

This figure shows the message exchange during MAC authentication bypass.

---

### Per-User ACLs and Filter-Ids

- **Note**: Using role-based ACLs as Filter-ID is not recommended.

More than one host can be authenticated on MDA-enabled and multi-auth ports. The ACL policy applied for one host does not affect the traffic of another host. If only one host is authenticated on a multi-host port, and the other hosts gain network access without authentication, the ACL policy for the first host can be applied to the other connected hosts by specifying any in the source address.

### Port-Based Authentication Manager CLI Commands

The authentication-manager interface-configuration commands control all the authentication methods, such as 802.1x, MAC authentication bypass, and web authentication. The authentication manager commands determine the priority and order of authentication methods applied to a connected host.

The authentication manager commands control generic authentication features, such as host-mode, violation mode, and the authentication timer. Generic authentication commands include the **authentication host-mode**, **authentication violation**, and **authentication timer** interface configuration commands.

802.1x-specific commands begin with the `dot1x` keyword. For example, the `authentication port-control auto` interface configuration command enables authentication on an interface.
To disable dot1x on a switch, remove the configuration globally by using the `no dot1x system-auth-control` command, and also remove it from all configured interfaces.

**Note**

If 802.1x authentication is globally disabled, other authentication methods are still enabled on that port, such as web authentication.

To re-enable dot1x on the switch, you must configure both the dot1x global and interface configurations. Incomplete configurations can cause high CPU utilization.

The **authentication manager** commands provide the same functionality as earlier 802.1x commands.

When filtering out verbose system messages generated by the authentication manager, the filtered content typically relates to authentication success. You can also filter verbose messages for 802.1x authentication and MAB authentication. There is a separate command for each authentication method:

- The `no authentication logging verbose` global configuration command filters verbose messages from the authentication manager.
- The `no dot1x logging verbose` global configuration command filters 802.1x authentication verbose messages.
- The `no mab logging verbose` global configuration command filters MAC authentication bypass (MAB) verbose messages.

### Ports in Authorized and Unauthorized States

During 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the *unauthorized* state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the *authorized* state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and 802.1x protocol packets before the client is successfully authenticated.

**Note**

CDP bypass is not supported and may cause a port to go into err-disabled state.

If a client that does not support 802.1x authentication connects to an unauthorized 802.1x port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1x-enabled client connects to a port that is not running the 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the `authentication port-control` interface configuration command and these keywords:

- **force-authorized**—disables 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without 802.1x-based authentication of the client. This is the default setting.
• **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.

• **auto**—enables 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

---

### Port-Based Authentication and Switch Stacks

If a switch is added to or removed from a switch stack, 802.1x authentication is not affected as long as the IP connectivity between the RADIUS server and the stack remains intact. This statement also applies if the stack master is removed from the switch stack. Note that if the stack master fails, a stack member becomes the new stack master by using the election process, and the 802.1x authentication process continues as usual.

If IP connectivity to the RADIUS server is interrupted because the switch that was connected to the server is removed or fails, these events occur:

- Ports that are already authenticated and that do not have periodic re-authentication enabled remain in the authenticated state. Communication with the RADIUS server is not required.

- Ports that are already authenticated and that have periodic re-authentication enabled (with the `dot1x re-authentication` global configuration command) fail the authentication process when the re-authentication occurs. Ports return to the unauthenticated state during the re-authentication process. Communication with the RADIUS server is required.

  For an ongoing authentication, the authentication fails immediately because there is no server connectivity.

If the switch that failed comes up and rejoins the switch stack, the authentications might or might not fail depending on the boot-up time and whether the connectivity to the RADIUS server is re-established by the time the authentication is attempted.

To avoid loss of connectivity to the RADIUS server, you should ensure that there is a redundant connection to it. For example, you can have a redundant connection to the stack master and another to a stack member, and if the stack master fails, the switch stack still has connectivity to the RADIUS server.

---

### 802.1x Host Mode

You can configure an 802.1x port for single-host or for multiple-hosts mode. In single-host mode, only one client can be connected to the 802.1x-enabled switch port. The switch detects the client by sending an EAPOL
frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single 802.1x-enabled port. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients.

In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

*Figure 125: Multiple Host Mode Example*

---

**Note**

For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

The switch supports multidomain authentication (MDA), which allows both a data device and a voice device, such as an IP Phone (Cisco or non-Cisco), to connect to the same switch port.

---

### 802.1x Multiple Authentication Mode

Multiple-authentication (multi-auth) mode allows multiple authenticated clients on the data VLAN and voice VLAN. Each host is individually authenticated. There is no limit to the number of data or voice device that can be authenticated on a multi-auth port.

If a hub or access point is connected to an 802.1x-enabled port, each connected client must be authenticated. For non-802.1x devices, you can use MAC authentication bypass or web authentication as the per-host authentication fallback method to authenticate different hosts with different methods on a single port.

---

**Note**

When a port is in multiple-authentication mode, the authentication-failed VLAN features do not activate.

You can assign a RADIUS-server-supplied VLAN in multi-auth mode, under the following conditions:

- The host is the first host authorized on the port, and the RADIUS server supplies VLAN information
- Subsequent hosts are authorized with a VLAN that matches the operational VLAN.
- A host is authorized on the port with no VLAN assignment, and subsequent hosts either have no VLAN assignment, or their VLAN information matches the operational VLAN.
- The first host authorized on the port has a group VLAN assignment, and subsequent hosts either have no VLAN assignment, or their group VLAN matches the group VLAN on the port. Subsequent hosts must use the same VLAN from the VLAN group as the first host. If a VLAN list is used, all hosts are subject to the conditions specified in the VLAN list.
• After a VLAN is assigned to a host on the port, subsequent hosts must have matching VLAN information or be denied access to the port.

• You cannot configure a guest VLAN or an auth-fail VLAN in multi-auth mode.

• The behavior of the critical-auth VLAN is not changed for multi-auth mode. When a host tries to authenticate and the server is not reachable, all authorized hosts are reinitialized in the configured VLAN.

**Multi-auth Per User VLAN assignment**

The Multi-auth Per User VLAN assignment feature allows you to create multiple operational access VLANs based on VLANs assigned to the clients on the port that has a single configured access VLAN. The port configured as an access port where the traffic for all the VLANs associated with data domain is not dot1q tagged, and these VLANs are treated as native VLANs.

The number of hosts per multi-auth port is 8, however there can be more hosts.

The following scenarios are associated with the multi-auth Per User VLAN assignments:

**Scenario one**

When a hub is connected to an access port, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. This behaviour is similar on a single-host or multi-domain-auth port.

When a second host (H2) is connected and gets assigned to VLAN (V2), the port will have two operational VLANs (V1 and V2). If H1 and H2 sends untagged ingress traffic, H1 traffic is mapped to VLAN (V1) and H2 traffic to VLAN (V2), all egress traffic going out of the port on VLAN (V1) and VLAN (V2) are untagged.

If both the hosts, H1 and H2 are logged out or the sessions are removed due to some reason then VLAN (V1) and VLAN (V2) are removed from the port, and the configured VLAN (V0) is restored on the port.

**Scenario two**

When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1.

When a second host (H2) is connected and gets authorized without explicit vlan policy, H2 is expected to use the configured VLAN (V0) that is restored on the port. All egress traffic going out of two operational VLANs, VLAN (V0) and VLAN (V1) are untagged.

If host (H2) is logged out or the session is removed due to some reason then the configured VLAN (V0) is removed from the port, and VLAN (V1) becomes the only operational VLAN on the port.

**Scenario three**

When a hub is connected to an access port in open mode, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. When a second host (H2) is connected and remains unauthorized, it still has access to operational VLAN (V1) due to open mode.

If host H1 is logged out or the session is removed due to some reason, VLAN (V1) is removed from the port and host (H2) gets assigned to VLAN (V0).
The combination of Open mode and VLAN assignment has an adverse affect on host (H2) because it has an IP address in the subnet that corresponds to VLAN (V1).

Limitation in Multi-auth Per User VLAN assignment

In the Multi-auth Per User VLAN assignment feature, egress traffic from multiple vlans are untagged on a port where the hosts receive traffic that is not meant for them. This can be a problem with broadcast and multicast traffic.

- **IPv4 ARPs**: Hosts receive ARP packets from other subnets. This is a problem if two subnets in different Virtual Routing and Forwarding (VRF) tables with overlapping IP address range are active on the port. The host ARP cache may get invalid entries.

- **IPv6 control packets**: In IPv6 deployments, Router Advertisements (RA) are processed by hosts that are not supposed to receive them. When a host from one VLAN receives RA from a different VLAN, the host assign incorrect IPv6 address to itself. Such a host is unable to get access to the network.

  The workaround is to enable the IPv6 first hop security so that the broadcast ICMPv6 packets are converted to unicast and sent out from multi-auth enabled ports. The packet is replicated for each client in multi-auth port belonging to the VLAN and the destination MAC is set to an individual client. Ports having one VLAN, ICMPv6 packets broadcast normally.

- **IP multicast**: Multicast traffic destined to a multicast group gets replicated for different VLANs if the hosts on those VLANs join the multicast group. When two hosts in different VLANs join a multicast group (on the same multi-auth port), two copies of each multicast packet are sent out from that port.

MAC Move

When a MAC address is authenticated on one switch port, that address is not allowed on another authentication manager-enabled port of the switch. If the switch detects that same MAC address on another authentication manager-enabled port, the address is not allowed.

There are situations where a MAC address might need to move from one port to another on the same switch. For example, when there is another device (for example a hub or an IP phone) between an authenticated host and a switch port, you might want to disconnect the host from the device and connect it directly to another port on the same switch.

You can globally enable MAC move so the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port. MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, no matter which host mode is enabled on the that port.) When a MAC address moves from one port to another, the switch terminates the authenticated session on the original port and initiates a new authentication sequence on the new port. The MAC move feature applies to both voice and data hosts.

Note

In open authentication mode, a MAC address is immediately moved from the original port to the new port, with no requirement for authorization on the new port.
MAC Replace

The MAC replace feature can be configured to address the violation that occurs when a host attempts to connect to a port where another host was previously authenticated.

Note
This feature does not apply to ports in multi-auth mode, because violations are not triggered in that mode. It does not apply to ports in multiple host mode, because in that mode, only the first host requires authentication.

If you configure the authentication violation interface configuration command with the replace keyword, the authentication process on a port in multi-domain mode is:

- A new MAC address is received on a port with an existing authenticated MAC address.
- The authentication manager replaces the MAC address of the current data host on the port with the new MAC address.
- The authentication manager initiates the authentication process for the new MAC address.
- If the authentication manager determines that the new host is a voice host, the original voice host is removed.

If a port is in open authentication mode, any new MAC address is immediately added to the MAC address table.

802.1x Accounting

The 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. 802.1x accounting is disabled by default. You can enable 802.1x accounting to monitor this activity on 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.

802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a switch that is configured for 802.1x accounting. Three types of RADIUS accounting packets are sent by a switch:

- START—sent when a new user session starts
- INTERIM—sent during an existing session for updates
- STOP—sent when a session terminates

To view debug logs for RADIUS and AAA, use the `show platform software trace message smd` command. For more information, see the Tracing Commands section in [Command Reference Guide, Cisco IOS XE Denali 16.1.1](#).

This table lists the AV pairs and when they are sent by the switch.

**Table 149: Accounting AV Pairs**

² The Framed-IP-Address AV pair is sent when a valid static IP address is configured or when a Dynamic Host Control Protocol (DHCP) binding exists for the host in the DHCP snooping bindings table.
802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable. You use an alternate authentication such as MAC authentication bypass or web authentication for the devices that do not support 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the 802.1x timeout value.

Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.

802.1x Authentication with VLAN Assignment

The switch supports 802.1x authentication with VLAN assignment. After successful 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

Voice device authentication is supported with multidomain host mode in Cisco IOS Release 12.2(37)SE. In Cisco IOS Release 12.2(40)SE and later, when a voice device is authorized and the RADIUS server returned an authorized VLAN, the voice VLAN on the port is configured to send and receive packets on the assigned voice VLAN. Voice VLAN assignment behaves the same as data VLAN assignment on multidomain authentication (MDA)-enabled ports.

When configured on the switch and the RADIUS server, 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication. Recall that an access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.

- If 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, authorization fails and configured VLAN remains in use. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, a nonexistent or internal (routed port) VLAN ID, an RSPAN VLAN, a shut down or suspended VLAN. In the case of a multidomain host port, configuration errors can also be due to an attempted assignment of a data VLAN that matches the configured or assigned voice VLAN ID (or the reverse).
• If 802.1x authentication is enabled and all information from the RADIUS server is valid, the authorized device is placed in the specified VLAN after authentication.

• If the multiple-hosts mode is enabled on an 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.

• Enabling port security does not impact the RADIUS server-assigned VLAN behavior.

• If 802.1x authentication is disabled on the port, it is returned to the configured access VLAN and configured voice VLAN.

• If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:
  • If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, then authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.
  • If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

• If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.

• If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

To configure VLAN assignment you need to perform these tasks:

• Enable AAA authorization by using the `network` keyword to allow interface configuration from the RADIUS server.

• Enable 802.1x authentication. (The VLAN assignment feature is automatically enabled when you configure 802.1x authentication on an access port).

• Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  • [64] Tunnel-Type = VLAN
  • [65] Tunnel-Medium-Type = 802
• [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID
• [83] Tunnel-Preference

Attribute [64] must contain the value VLAN (type 13). Attribute [65] must contain the value 802 (type 6). Attribute [81] specifies the VLAN name or VLAN ID assigned to the IEEE 802.1x-authenticated user.

### 802.1x Authentication with Per-User ACLs

You can enable per-user access control lists (ACLs) to provide different levels of network access and service to an 802.1x-authenticated user. When the RADIUS server authenticates a user connected to an 802.1x port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1x port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the switch removes the ACL from the port.

You can configure router ACLs and input port ACLs on the same switch. However, a port ACL takes precedence over a router ACL. If you apply input port ACL to an interface that belongs to a VLAN, the port ACL takes precedence over an input router ACL applied to the VLAN interface. Incoming packets received on the port, to which a port ACL is applied, are filtered by the port ACL. Incoming routed packets received on other ports are filtered by the router ACL. Outgoing routed packets are filtered by the router ACL. To avoid configuration conflicts, you should carefully plan the user profiles stored on the RADIUS server.

RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes (VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs used for per-user ACLs are inacl#<n> for the ingress direction and outacl#<n> for the egress direction. MAC ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It does not support port ACLs in the egress direction on Layer 2 ports.

Use only the extended ACL syntax style to define the per-user configuration stored on the RADIUS server. When the definitions are passed from the RADIUS server, they are created by using the extended naming convention. However, if you use the Filter-Id attribute, it can point to a standard ACL.

You can use the Filter-Id attribute to specify an inbound or outbound ACL that is already configured on the switch. The attribute contains the ACL number followed by .in for ingress filtering or .out for egress filtering. If the RADIUS server does not allow the .in or .out syntax, the access list is applied to the outbound ACL by default. The user is marked unauthorized if the Filter-Id sent from the RADIUS server is not configured on the device. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported only for IP ACLs numbered in the range of 1 to 199 (IP standard ACLs) and 1300 to 2699 (IP extended ACLs).

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of RADIUS-server per-user ACLs.

You must meet the following prerequisites to configure per-user ACLs:

- Enable AAA authentication.
- Enable AAA authorization by using the network keyword to allow interface configuration from the RADIUS server.
- Enable 802.1x authentication.
- Configure the user profile and VSAs on the RADIUS server.
- Configure the 802.1x port for single-host mode.
Per-user ACLs are supported only in single-host mode.

802.1x Authentication with Downloadable ACLs and Redirect URLs

You can download ACLs and redirect URLs from a RADIUS server to the switch during 802.1x authentication or MAC authentication bypass of the host. You can also download ACLs during web authentication.

Note

A downloadable ACL is also referred to as a dACL.

If more than one host is authenticated and the host is in single-host, MDA, or multiple-authentication mode, the switch changes the source address of the ACL to the host IP address.

You can apply the ACLs and redirect URLs to all the devices connected to the 802.1x-enabled port.

If no ACLs are downloaded during 802.1x authentication, the switch applies the static default ACL on the port to the host. On a voice VLAN port configured in multi-auth or MDA mode, the switch applies the ACL only to the phone as part of the authorization policies.

Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL

The switch uses these cisco-av-pair VSAs:

- url-redirect is the HTTP or HTTPS URL.
- url-redirect-acl is the switch ACL name or number.

The switch uses the CiscoSecure-defined-ACL attribute value pair to intercept an HTTP or HTTPS request from the end point. The switch then forwards the client web browser to the specified redirect address. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl attribute value pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to redirect.

Note

- Traffic that matches a permit ACE in the ACL is redirected.
- Define the URL redirect ACL and the default port ACL on the switch.

If a redirect URL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs

You can set the CiscoSecure-Defined-ACL Attribute-Value (AV) pair on the Cisco Secure ACS with the RADIUS cisco-av-pair vendor-specific attributes (VSAs). This pair specifies the names of the downloadable ACLs on the Cisco Secure ACS with the #ACL##-IP-name-number attribute.

- The name is the ACL name.
The number is the version number (for example, 3f783768).

If a downloadable ACL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host-access-policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL that is configured on the switch port. However, if the switch receives an host access policy from the Cisco Secure ACS but the default ACL is not configured, the authorization failure is declared.

VLAN ID-Based MAC Authentication

You can use VLAN ID-based MAC authentication if you wish to authenticate hosts based on a static VLAN ID instead of a downloadable VLAN. When you have a static VLAN policy configured on your switch, VLAN information is sent to an IAS (Microsoft) RADIUS server along with the MAC address of each host for authentication. The VLAN ID configured on the connected port is used for MAC authentication. By using VLAN ID-based MAC authentication with an IAS server, you can have a fixed number of VLANs in the network.

The feature also limits the number of VLANs monitored and handled by STP. The network can be managed as a fixed VLAN.

802.1x Authentication with Guest VLAN

You can configure a guest VLAN for each 802.1x port on the switch to provide limited services to clients, such as downloading the 802.1x client. These clients might be upgrading their system for 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

If the switch is trying to authorize an 802.1x-capable voice device and the AAA server is unavailable, the authorization attempt fails, but the detection of the EAPOL packet is saved in the EAPOL history. When the AAA server becomes available, the switch authorizes the voice device. However, the switch no longer allows other devices access to the guest VLAN. To prevent this situation, use one of these command sequences:

- Enter the authentication event no-response action authorize vlan vlan-id interface configuration command to allow access to the guest VLAN.

- Enter the shutdown interface configuration command followed by the no shutdown interface configuration command to restart the port.

If devices send EAPOL packets to the switch during the lifetime of the link, the switch no longer allows clients that fail authentication access to the guest VLAN.
If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

Any number of 802.1x-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1x ports in single host, multiple host, multi-auth and multi-domain modes.

You can configure any active VLAN except an RSPAN VLAN, a private VLAN, or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

The switch supports MAC authentication bypass. When MAC authentication bypass is enabled on an 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

**802.1x Authentication with Restricted VLAN**

You can configure a restricted VLAN (also referred to as an authentication failed VLAN) for each IEEE 802.1x port on a switch stack or a switch to provide limited services to clients that cannot access the guest VLAN. These clients are 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator counts the failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count increments when the RADIUS server replies with either an EAP failure or an empty response without an EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.

Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves either to the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to restart the authentication process is for the port to receive a link down or EAP logoff event. We recommend that you keep re-authentication enabled if a client might
connect through a hub. When a client disconnects from the hub, the port might not receive the link down or EAP logoff event.

After a port moves to the restricted VLAN, a simulated EAP success message is sent to the client. This prevents clients from indefinitely attempting authentication. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported on 802.1x ports in all host modes and on Layer 2 ports.

You can configure any active VLAN except an RSPAN VLAN, a primary private VLAN, or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

Other security port features such as dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

### 802.1x Authentication with Inaccessible Authentication Bypass

Use the inaccessible authentication bypass feature, also referred to as critical authentication or the AAA fail policy, when the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated. You can configure the switch to connect those hosts to critical ports.

When a new host tries to connect to the critical port, that host is moved to a user-specified access VLAN, the critical VLAN. The administrator gives limited authentication to the hosts.

When the switch tries to authenticate a host connected to a critical port, the switch checks the status of the configured RADIUS server. If a server is available, the switch can authenticate the host. However, if all the RADIUS servers are unavailable, the switch grants network access to the host and puts the port in the critical-authentication state, which is a special case of the authentication state.

---

**Note**

If critical authentication is configured on interface, then vlan used for critical authorization (critical vlan) should be active on the switch. If the critical vlan is inactive (or) down, critical authentication session will keep trying to enable inactive vlan and fail repeatedly. This can lead to large amount of memory holding.

### Inaccessible Authentication Bypass Support on Multiple-Authentication Ports

When a port is configured on any host mode and the AAA server is unavailable, the port is then configured to multi-host mode and moved to the critical VLAN. To support this inaccessible bypass on multiple-authentication (multiauth) ports, use the authentication event server dead action reinitialize vlan vlan-id command. When a new host tries to connect to the critical port, that port is reinitialized and all the connected hosts are moved to the user-specified access VLAN.

This command is supported on all host modes.

### Inaccessible Authentication Bypass Authentication Results

The behavior of the inaccessible authentication bypass feature depends on the authorization state of the port:

- If the port is unauthorized when a host connected to a critical port tries to authenticate and all servers are unavailable, the switch puts the port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
• If the port is already authorized and reauthentication occurs, the switch puts the critical port in the critical-authentication state in the current VLAN, which might be the one previously assigned by the RADIUS server.

• If the RADIUS server becomes unavailable during an authentication exchange, the current exchange times out, and the switch puts the critical port in the critical-authentication state during the next authentication attempt.

You can configure the critical port to reinitialize hosts and move them out of the critical VLAN when the RADIUS server is again available. When this is configured, all critical ports in the critical-authentication state are automatically re-authenticated.

Inaccessible Authentication Bypass Feature Interactions

Inaccessible authentication bypass interacts with these features:

• Guest VLAN—Inaccessible authentication bypass is compatible with guest VLAN. When a guest VLAN is enabled on 8021.x port, the features interact as follows:
  • If at least one RADIUS server is available, the switch assigns a client to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.
  • If all the RADIUS servers are not available and the client is connected to a critical port, the switch authenticates the client and puts the critical port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
  • If all the RADIUS servers are not available and the client is not connected to a critical port, the switch might not assign clients to the guest VLAN if one is configured.
  • If all the RADIUS servers are not available and if a client is connected to a critical port and was previously assigned to a guest VLAN, the switch keeps the port in the guest VLAN.

• Restricted VLAN—If the port is already authorized in a restricted VLAN and the RADIUS servers are unavailable, the switch puts the critical port in the critical-authentication state in the restricted VLAN.

• 802.1x accounting—Accounting is not affected if the RADIUS servers are unavailable.

• Private VLAN—You can configure inaccessible authentication bypass on a private VLAN host port. The access VLAN must be a secondary private VLAN.

• Voice VLAN—Inaccessible authentication bypass is compatible with voice VLAN, but the RADIUS-configured or user-specified access VLAN and the voice VLAN must be different.

• Remote Switched Port Analyzer (RSPAN)—Do not configure an RSPAN VLAN as the RADIUS-configured or user-specified access VLAN for inaccessible authentication bypass.

In a switch stack:

• The stack master checks the status of the RADIUS servers by sending keepalive packets. When the status of a RADIUS server changes, the stack master sends the information to the stack members. The stack members can then check the status of RADIUS servers when re-authenticating critical ports.

• If the new stack master is elected, the link between the switch stack and RADIUS server might change, and the new stack immediately sends keepalive packets to update the status of the RADIUS servers. If
the server status changes from *dead* to *alive*, the switch re-authenticates all switch ports in the critical-authentication state.

When a member is added to the stack, the stack master sends the member the server status.

**802.1x Critical Voice VLAN**

When an IP phone connected to a port is authenticated by the Cisco Identity Services Engine (ISE), the phone is put into the voice domain. If the ISE is not reachable, the switch cannot determine if the device is a voice device. If the server is unavailable, the phone cannot access the voice network and therefore cannot operate.

For data traffic, you can configure inaccessible authentication bypass, or critical authentication, to allow traffic to pass through on the native VLAN when the server is not available. If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network and puts the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN. When the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated, the switch connects those hosts to critical ports. A new host trying to connect to the critical port is moved to a user-specified access VLAN, the critical VLAN, and granted limited authentication.

---

**Note**

Dynamic assignment of critical voice VLAN is not supported with nested service templates. It causes the device to switch between VLANs continuously in a loop.

---

You can enter the **authentication event server dead action authorize voice** interface configuration command to configure the critical voice VLAN feature. When the ISE does not respond, the port goes into critical authentication mode. When traffic coming from the host is tagged with the voice VLAN, the connected device (the phone) is put in the configured voice VLAN for the port. The IP phones learn the voice VLAN identification through Cisco Discovery Protocol (Cisco devices) or through LLDP or DHCP.

You can configure the voice VLAN for a port by entering the **switchport voice vlan vlan-id** interface configuration command.

This feature is supported in multidomain and multi-auth host modes. Although you can enter the command when the switch in single-host or multi-host mode, the command has no effect unless the device changes to multidomain or multi-auth host mode.

**802.1x User Distribution**

You can configure 802.1x user distribution to load-balance users with the same group name across multiple different VLANs.

The VLANs are either supplied by the RADIUS server or configured through the switch CLI under a VLAN group name.

- Configure the RADIUS server to send more than one VLAN name for a user. The multiple VLAN names can be sent as part of the response to the user. The 802.1x user distribution tracks all the users in a particular VLAN and achieves load balancing by moving the authorized user to the least populated VLAN.

- Configure the RADIUS server to send a VLAN group name for a user. The VLAN group name can be sent as part of the response to the user. You can search for the selected VLAN group name among the VLAN group names that you configured by using the switch CLI. If the VLAN group name is found,
the corresponding VLANs under this VLAN group name are searched to find the least populated VLAN. Load balancing is achieved by moving the corresponding authorized user to that VLAN.

**Note**  
The RADIUS server can send the VLAN information in any combination of VLAN-IDs, VLAN names, or VLAN groups.

### 802.1x User Distribution Configuration Guidelines

- Confirm that at least one VLAN is mapped to the VLAN group.
- You can map more than one VLAN to a VLAN group.
- You can modify the VLAN group by adding or deleting a VLAN.
- When you clear an existing VLAN from the VLAN group name, none of the authenticated ports in the VLAN are cleared, but the mappings are removed from the existing VLAN group.
- If you clear the last VLAN from the VLAN group name, the VLAN group is cleared.
- You can clear a VLAN group even when the active VLANs are mapped to the group. When you clear a VLAN group, none of the ports or users that are in the authenticated state in any VLAN within the group are cleared, but the VLAN mappings to the VLAN group are cleared.

### IEEE 802.1x Authentication with Voice VLAN Ports

A voice VLAN port is a special access port associated with two VLAN identifiers:

- **VVID** to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- **PVID** to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a switch port, you can configure an access port VLAN that is also a voice VLAN.

When IP phones are connected to an 802.1x-enabled switch port that is in single host mode, the switch grants the phones network access without authenticating them. We recommend that you use multidomain authentication (MDA) on the port to authenticate both a data device and a voice device, such as an IP phone.
If you enable IEEE 802.1x authentication on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP phone loses connectivity to the switch for up to 30 seconds.

### IEEE 802.1x Authentication with Port Security

In general, Cisco does not recommend enabling port security when IEEE 802.1x is enabled. Since IEEE 802.1x enforces a single MAC address per port (or per VLAN when MDA is configured for IP telephony), port security is redundant and in some cases may interfere with expected IEEE 802.1x operations.

### IEEE 802.1x Authentication with Wake-on-LAN

The IEEE 802.1x authentication with wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the magic packet. You can use this feature in environments where administrators need to connect to systems that have been powered down.

When a host that uses WoL is attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

If PortFast is not enabled on the port, the port is forced to the bidirectional state.

When you configure a port as unidirectional by using the `authentication control-direction in` interface configuration command, the port changes to the spanning-tree forwarding state. The port can send packets to the host but cannot receive packets from the host.

When you configure a port as bidirectional by using the `authentication control-direction both` interface configuration command, the port is access-controlled in both directions. The port does not receive packets from or send packets to the host.

### IEEE 802.1x Authentication with MAC Authentication Bypass

You can configure the switch to authorize clients based on the client MAC address by using the MAC authentication bypass feature. For example, you can enable this feature on IEEE 802.1x ports connected to devices such as printers.

If IEEE 802.1x authentication times out while waiting for an EAPOL response from the client, the switch tries to authorize the client by using MAC authentication bypass.

When the MAC authentication bypass feature is enabled on an IEEE 802.1x port, the switch uses the MAC address as the client identity. The authentication server has a database of client MAC addresses that are allowed network access. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and
password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is configured. This process works for most client devices; however, it does not work for clients that use an alternate MAC address format. You can configure how MAB authentication is performed for clients with MAC addresses that deviate from the standard format or where the RADIUS configuration requires the user name and password to differ.

If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an 802.1x-capable supplicant and uses 802.1x authentication (not MAC authentication bypass) to authorize the interface. EAPOL history is cleared if the interface link status goes down.

If the switch already authorized a port by using MAC authentication bypass and detects an IEEE 802.1x supplicant, the switch does not unauthorize the client connected to the port. When re-authentication occurs, the switch uses the authentication or re-authentication methods configured on the port, if the previous session ended because the Termination-Action RADIUS attribute value is DEFAULT.

Clients that were authorized with MAC authentication bypass can be re-authenticated. The re-authentication process is the same as that for clients that were authenticated with IEEE 802.1x. During re-authentication, the port remains in the previously assigned VLAN. If re-authentication is successful, the switch keeps the port in the same VLAN. If re-authentication fails, the switch assigns the port to the guest VLAN, if one is configured.

If re-authentication is based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]) and if the Termination-Action RADIUS attribute (Attribute [29]) action is Initialize (the attribute value is DEFAULT), the MAC authentication bypass session times out, the switch uses the MAC authentication bypass feature to initiate re-authorization. For more information about these AV pairs, see RFC 3580, “IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines.”

MAC authentication bypass interacts with the features:

- IEEE 802.1x authentication—You can enable MAC authentication bypass only if 802.1x authentication is enabled on the port.
- Guest VLAN—If a client has an invalid MAC address identity, the switch assigns the client to a guest VLAN if one is configured.
- Restricted VLAN—This feature is not supported when the client connected to an IEEE 802.1x port is authenticated with MAC authentication bypass.
- Port security
- Voice VLAN
- Private VLAN—You can assign a client to a private VLAN.
- Network Edge Access Topology (NEAT)—MAB and NEAT are mutually exclusive. You cannot enable MAB when NEAT is enabled on an interface, and you should not enable NEAT when MAB is enabled on an interface.

Cisco IOS Release 12.2(55)SE and later supports filtering of verbose MAB system messages.
Network Admission Control Layer 2 IEEE 802.1x Validation

The switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or posture of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.

- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.

- Set the action to be taken when the switch tries to re-authenticate the client by using the Termination-Action RADIUS attribute (Attribute[29]). If the value is the DEFAULT or is not set, the session ends. If the value is RADIUS-Request, the re-authentication process starts.

- Set the list of VLAN number or name or VLAN group name as the value of the Tunnel Group Private ID (Attribute[81]) and the preference for the VLAN number or name or VLAN group name as the value of the Tunnel Preference (Attribute[83]). If you do not configure the Tunnel Preference, the first Tunnel Group Private ID (Attribute[81]) attribute is picked up from the list.

- View the NAC posture token, which shows the posture of the client, by using the show authentication privileged EXEC command.

- Configure secondary private VLANs as guest VLANs.

Configuring NAC Layer 2 IEEE 802.1x validation is similar to configuring IEEE 802.1x port-based authentication except that you must configure a posture token on the RADIUS server.

Flexible Authentication Ordering

You can use flexible authentication ordering to configure the order of methods that a port uses to authenticate a new host. The IEEE 802.1X Flexible Authentication feature supports three authentication methods:

- dot1X—IEEE 802.1X authentication is a Layer 2 authentication method.

- mab—MAC-Authentication Bypass is a Layer 2 authentication method.

- webauth—Web authentication is a Layer 3 authentication method.

Using this feature, you can control which ports use which authentication methods, and you can control the failover sequencing of methods on those ports. For example, MAC authentication bypass and 802.1x can be the primary or secondary authentication methods, and web authentication can be the fallback method if either or both of those authentication attempts fail.

The IEEE 802.1X Flexible Authentication feature supports the following host modes:

- multi-auth—Multiauthentication allows one authentication on a voice VLAN and multiple authentications on the data VLAN.

- multi-domain—Multidomain authentication allows two authentications: one on the voice VLAN and one on the data VLAN.

Related Topics

Configuring Flexible Authentication Ordering, on page 2035
Open1x Authentication

Open1x authentication allows a device access to a port before that device is authenticated. When open authentication is configured, a new host can pass traffic according to the access control list (ACL) defined on the port. After the host is authenticated, the policies configured on the RADIUS server are applied to that host.

You can configure open authentication with these scenarios:

• Single-host mode with open authentication—Only one user is allowed network access before and after authentication.

• MDA mode with open authentication—Only one user in the voice domain and one user in the data domain are allowed.

• Multiple-hosts mode with open authentication—Any host can access the network.

• Multiple-authentication mode with open authentication—Similar to MDA, except multiple hosts can be authenticated.

Note
If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the `authentication open` interface configuration command, the port will grant access to the host irrespective of the `authentication port-control` interface configuration command.

Configuring Open1x, on page 2037

Multidomain Authentication

The switch supports multidomain authentication (MDA), which allows both a data device and voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port. The port is divided into a data domain and a voice domain.

Note
For all host modes, the line protocol stays up before authorization when port-based authentication is configured.

MDA does not enforce the order of device authentication. However, for best results, we recommend that a voice device is authenticated before a data device on an MDA-enabled port.

Follow these guidelines for configuring MDA:

• You must configure a switch port for MDA.

• You must configure the voice VLAN for the IP phone when the host mode is set to multidomain.

• Voice VLAN assignment on an MDA-enabled port is supported Cisco IOS Release 12.2(40)SE and later.

• To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of `device-traffic-class=voice`. Without this value, the switch treats the voice device as a data device.
The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.

If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.

Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked.

A voice device MAC address that is binding on the data VLAN is not counted towards the port security MAC address limit.

MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support IEEE 802.1x authentication.

When a data or a voice device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.

If more than five devices are detected on the data VLAN or more than one voice device is detected on the voice VLAN while a port is unauthorized, the port is error disabled.

When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port voice VLAN is automatically removed and must be reauthenticated on that port.

Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.

Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.

If a data domain is authorized first and placed in the guest VLAN, non-IEEE 802.1x-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.

We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

### 802.1x Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)

The Network Edge Access Topology (NEAT) feature extends identity to areas outside the wiring closet (such as conference rooms). This allows any type of device to authenticate on the port.

- **802.1x switch supplicant**: You can configure a switch to act as a supplicant to another switch by using the 802.1x supplicant feature. This configuration is helpful in a scenario, where, for example, a switch is outside a wiring closet and is connected to an upstream switch through a trunk port. A switch configured with the 802.1x switch supplicant feature authenticates with the upstream switch for secure connectivity. Once the supplicant switch authenticates successfully the port mode changes from access to trunk in an authenticator switch. In a supplicant switch you must manually configure trunk when enabling CISP.

- **If the access VLAN is configured on the authenticator switch**, it becomes the native VLAN for the trunk port after successful authentication.
In the default state, when you connect a supplicant switch to an authenticator switch that has BPDU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. Beginning with Cisco IOS Release 15.0(1)SE, you can control traffic exiting the supplicant port during the authentication period. Entering the `dot1x supplicant controlled transient` global configuration command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the `no dot1x supplicant controlled transient` global configuration command opens the supplicant port during the authentication period. This is the default behavior.

We strongly recommend using the `dot1x supplicant controlled transient` command on a supplicant switch when BPDU guard is enabled on the authenticator switch port with the `spanning-tree bpduguard enable` interface configuration command.

---

**Note**

If you globally enable BPDU guard on the authenticator switch by using the `spanning-tree portfast bpduguard default` global configuration command, entering the `dot1x supplicant controlled transient` command does not prevent the BPDU violation.

You can enable MDA or multiauth mode on the authenticator switch interface that connects to one more supplicant switches. Multihost mode is not supported on the authenticator switch interface.

When you reboot an authenticator switch with single-host mode enabled on the interface, the interface may move to err-disabled state before authentication. To recover from err-disabled state, flap the authenticator port to activate the interface again and initiate authentication.

Use the `dot1x supplicant force-multicast` global configuration command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

- **Host Authorization:** Ensures that only traffic from authorized hosts (connecting to the switch with supplicant) is allowed on the network. The switches use Client Information Signalling Protocol (CISP) to send the MAC addresses connecting to the supplicant switch to the authenticator switch.

- **Auto enablement:** Automatically enables trunk configuration on the authenticator switch, allowing user traffic from multiple VLANs coming from supplicant switches. Configure the cisco-av-pair as `device-traffic-class=switch` at the ISE. (You can configure this under the group or the user settings.)

*Figure 126: Authenticator and Supplicant Switch using CISP*
The **switchport nonegotiate** command is not supported on supplicant and authenticator switches with NEAT. This command should not be configured at the supplicant side of the topology. If configured on the authenticator side, the internal macros will automatically remove this command from the port.

### Voice Aware 802.1x Security

**Note**

To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature to configure the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. In previous releases, when an attempt to authenticate the data client caused a security violation, the entire port shut down, resulting in a complete loss of connectivity.

You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

### Common Session ID

Authentication manager uses a single session ID (referred to as a common session ID) for a client no matter which authentication method is used. This ID is used for all reporting purposes, such as the show commands and MIBs. The session ID appears with all per-session syslog messages.

The session ID includes:

- The IP address of the Network Access Device (NAD)
- A monotonically increasing unique 32 bit integer
- The session start time stamp (a 32 bit integer)

This example shows how the session ID appears in the output of the show authentication command. The session ID in this example is 16000005000000B288508E5:

```
Device# show authentication sessions
Interface     MAC Address     Method  Domain  Status        Session ID
Fa4/0/4       0000.0000.0203 mab     DATA Authz Success 16000005000000B288508E5
```

This is an example of how the session ID appears in the syslog output. The session ID in this example is also 16000005000000B288508E5:
The session ID is used by the NAD, the AAA server, and other report-analyzing applications to identify the client. The ID appears automatically. No configuration is required.

## How to Configure 802.1x Port-Based Authentication

### Default 802.1x Authentication Configuration

### 802.1x Authentication Configuration Guidelines

#### 802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- You must enable SISF-Based device tracking to use 802.1x authentication. By default, SISF-Based device tracking is disabled on a switch.
- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.
- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.
If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
  - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
  - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.

- Before globally enabling 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.

- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

### VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass

These are the configuration guidelines for VLAN assignment, guest VLAN, restricted VLAN, and inaccessible authentication bypass:

- When 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.

- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

- After you configure a guest VLAN for an 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the 802.1x authentication process (`authentication timer inactivity` and `authentication timer reauthentication` interface configuration commands). The amount to decrease the settings depends on the connected 802.1x client type.

- When configuring the inaccessible authentication bypass feature, follow these guidelines:
  - The feature is supported on 802.1x port in single-host mode and multihosts mode.
  - If the client is running Windows XP and the port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.
• If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.

• You can configure the inaccessible authentication bypass feature and the restricted VLAN on an 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, switch changes the port state to the critical authentication state and remains in the restricted VLAN.

• If the CTS links are in Critical Authentication mode and the master reloads, the policy where SGT was configured on a device will not be available on the new master. This is because the internal bindings will not be synced to the standby switch in a 3750-X switch stack.

• You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

• When wireless guest clients obtains IP from foreign client VLAN instead of anchor client VLAN, you should use the `ip dhcp required` command under the WLAN configuration to force clients to issue a new DHCP request. This prevents the clients from getting an incorrect IP at anchor.

• If the wired guest clients fail to get IP address after a Cisco WLC (foreign) reload, perform a shut/no shut on the ports used by the clients to reconnect them.

**MAC Authentication Bypass**

These are the MAC authentication bypass configuration guidelines:

• Unless otherwise stated, the MAC authentication bypass guidelines are the same as the 802.1x authentication guidelines.

• If you disable MAC authentication bypass from a port after the port has been authorized with its MAC address, the port state is not affected.

• If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.

• If the port is in the authorized state, the port remains in this state until re-authorization occurs.

• You can configure a timeout period for hosts that are connected by MAC authentication bypass but are inactive. The range is 1 to 65535 seconds.

**Maximum Number of Allowed Devices Per Port**

This is the maximum number of devices allowed on an 802.1x-enabled port:

• In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.

• In multidomain authentication (MDA) mode, one device is allowed for the access VLAN, and one IP phone is allowed for the voice VLAN.
• In multihost mode, only one 802.1x supplicant is allowed on the port, but an unlimited number of non-802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

**Configuring 802.1x Readiness Check**

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable.

The 802.1x readiness check is allowed on all ports that can be configured for 802.1x. The readiness check is not available on a port that is configured as `dot1x force-unauthorized`.

Follow these steps to enable the 802.1x readiness check on the switch:

**Before you begin**

Follow these guidelines to enable the readiness check on the switch:

• The readiness check is typically used before 802.1x is enabled on the switch.
• If you use the `dot1x test capol-capable` privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.
• When you configure the `dot1x test capol-capable` command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
• When you configure the `dot1x test capol-capable` command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.
• The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `dot1x test capol-capable [interface interface-id]`
4. `dot1x test timeout timeout`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

Configuring Voice Aware 802.1x Security

To use voice aware IEEE 802.1x authentication, the switch must be running the LAN base image.

You use the voice aware 802.1x security feature on the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

Follow these guidelines to configure voice aware 802.1x voice security on the switch:

• You enable voice aware 802.1x security by entering the `errdisable detect cause security-violation shutdown vlan` global configuration command. You disable voice aware 802.1x security by entering the `no` version of this command. This command applies to all 802.1x-configured ports in the switch.

Note: If you do not include the `shutdown vlan` keywords, the entire port is shut down when it enters the error-disabled state.

• If you use the `errdisable recovery cause security-violation` global configuration command to configure error-disabled recovery, the port is automatically re-enabled. If error-disabled recovery is not configured for the port, you re-enable it by using the `shutdown` and `no shutdown` interface configuration commands.

• You can re-enable individual VLANs by using the `clear errdisable interface interface-id vlan [vlan-list]` privileged EXEC command. If you do not specify a range, all VLANs on the port are enabled.

Beginning in privileged EXEC mode, follow these steps to enable voice aware 802.1x security:

**SUMMARY STEPS**

1. `configure terminal`
2. `errdisable detect cause security-violation shutdown vlan`
3. `errdisable recovery cause security-violation`
4. `clear errdisable interface interface-id vlan [vlan-list]`
5. Enter the following:
   • `shutdown`
   • `no shutdown`
6. `end`
7. `show errdisable detect`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>errdisable detect cause security-violation shutdown vlan</code></td>
</tr>
</tbody>
</table>
### Purpose

If the `shutdown vlan` keywords are not included, the entire port enters the error-disabled state and shuts down.

### Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th>errdisable recovery cause security-violation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Enter global configuration mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>clear errdisable interface interface-id vlan [vlan-list]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note</td>
<td>(Optional) Reenable individual VLANs that have been error disabled.</td>
</tr>
<tr>
<td></td>
<td>• For interface-id specify the port on which to reenable individual VLANs.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) For vlan-list specify a list of VLANs to be re-enabled. If vlan-list is not specified, all VLANs are re-enabled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Enter the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• shutdown</td>
</tr>
<tr>
<td></td>
<td>• no shutdown</td>
</tr>
<tr>
<td>Note</td>
<td>(Optional) Re-enable an error-disabled VLAN, and clear all error-disable indications.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Return to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>show errdisable detect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Purpose</td>
<td>Verify your entries.</td>
</tr>
</tbody>
</table>

### Example

This example shows how to configure the switch to shut down any VLAN on which a security violation error occurs:

```
Switch(config)# errdisable detect cause security-violation shutdown vlan
```

This example shows how to re-enable all VLANs that were error disabled on port Gigabit Ethernet 40/2.

```
Switch# clear errdisable interface gigabitethernet40/2 vlan
```

You can verify your settings by entering the `show errdisable detect` privileged EXEC command.

### Configuring 802.1x Violation Modes

You can configure an 802.1x port so that it shuts down, generates a syslog error, or discards packets from a new device when:

- a device connects to an 802.1x-enabled port
- the maximum number of allowed about devices have been authenticated on the port

Beginning in privileged EXEC mode, follow these steps to configure the security violation actions on the switch:
### SUMMARY STEPS

1. configure terminal
2. aaa new-model
3. aaa authentication dot1x {default} method1
4. interface interface-id
5. switchport mode access
6. authentication violation {shutdown | restrict | protect | replace}
7. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

### Configuring 802.1x Authentication

To allow per-user ACLs or VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the 802.1x AAA process:

**Before you begin**

To configure 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

#### SUMMARY STEPS

1. A user connects to a port on the switch.
2. Authentication is performed.
3. VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
4. The switch sends a start message to an accounting server.
5. Re-authentication is performed, as necessary.
6. The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.
7. The user disconnects from the port.
8. The switch sends a stop message to the accounting server.

#### DETAILED STEPS

### Configuring the Switch-to-RADIUS-Server Communication

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the `radius server` global configuration command. If you want to configure these options on a per-server basis, use the `radius-server timeout`, the `radius-server retransmit`, and the `key string` global configuration commands.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

Follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.
Before you begin
You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `radius server  server name`
4. `address {ipv4 | ipv6} ip address auth-port  port number acct-port  port number`
5. `key  string`
6. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Enters global configuration mode. |
| `configure terminal` | |
| Example:           | |
| `Device# configure terminal` | |

| **Step 3**        | Specifies the name the RADIUS server and enters radius server configuration mode. |
| `radius server  server name` | |
| Example:           | |
| `Device(config)# radius server rsim` | |

| **Step 4**        | Specifies the IP address of the RADIUS server. |
| `address {ipv4 | ipv6} ip address auth-port  port number acct-port  port number` | |
| Example:           | For auth-port port-number, specify the UDP destination port for authentication requests. The default is 1645. The range is 0 to 65536. |
| `Device(config-radius-server)# address ipv4 124.2.2.12` | For acct-port port-number, specify the UDP destination port for authentication requests. The default is 1646. |

| **Step 5**        | Specifies the authentication and encryption key used between the Device and the RADIUS daemon running on the RADIUS server. |
| `key  string`     | |
| Example:          | |
| `Device(config-radius-server)# key rad123` | |
Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the authentication port-control interface configuration command set to auto. Use the multi-domain keyword to configure and enable multidomain authentication (MDA), which allows both a host and a voice device, such as an IP phone (Cisco or non-Cisco), on the same switch port. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. authentication host-mode [multi-auth | multi-domain | multi-host | single-host]
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal  
Example:  
Device# configure terminal | Enters global configuration mode. |
| **Step 2** interface interface-id  
Example:  
Device(config)# interface gigabitethernet2/0/1 | Specifies the port to which multiple hosts are indirectly attached, and enter interface configuration mode. |
| **Step 3** authentication host-mode [multi-auth | multi-domain | multi-host | single-host] | Allows multiple hosts (clients) on an 802.1x-authorized port. |
The keywords have these meanings:

- **multi-auth**—Allow multiple authenticated clients on both the voice VLAN and data VLAN.

  Note  The **multi-auth** keyword is only available with the **authentication host-mode** command.

- **multi-host**—Allow multiple hosts on an 802.1x-authorized port after a single host has been authenticated.

- **multi-domain**—Allow both a host and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port.

  Note  You must configure the voice VLAN for the IP phone when the host mode is set to **multi-domain**.

Make sure that the **authentication port-control** interface configuration command is set to auto for the specified interface.

### Configuring Periodic Re-Authentication

You can enable periodic 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `authentication periodic`
4. `authentication timer { [inactivity | reauthenticate | restart | unauthorized] } {value}`
5. `end`
# Configuring Periodic Re-Authentication

## Detailed Steps

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Device(config)# interface gigabitethernet2/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> authentication periodic</td>
<td>Enables periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Device(config-if)# authentication periodic</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> authentication timer {inactivity</td>
<td>reauthenticate</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Device(config-if)# authentication timer reauthenticate 180</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Note
The default value is 3600 seconds. To change the value of the reauthentication timer or to have the switch use a RADIUS-provided session timeout, enter the `authentication timer reauthenticate` command.

The `authentication timer` keywords have these meanings:

- **inactivity**—Interval in seconds after which if there is no activity from the client then it is unauthorized
- **reauthenticate**—Time in seconds after which an automatic re-authentication attempt is initiated
- **restart**—Interval in seconds after which an attempt is made to authenticate an unauthorized port
- **unauthorized**—Interval in seconds after which an unauthorized session will get deleted

This command affects the behavior of the switch only if periodic re-authentication is enabled.
Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The **authentication timer restart** interface configuration command controls the idle period. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface *interface-id*
3. authentication timer restart *seconds*
4. end
5. show authentication sessions interface *interface-id*
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
<tr>
<td>Device# show authentication sessions interface</td>
<td></td>
</tr>
</tbody>
</table>
Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

![Note]

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication timer reauthenticate seconds
4. end
5. show authentication sessions interface interface-id
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  configure terminal
  Example:
  Device# configure terminal | Enters global configuration mode. |
| **Step 2**
  interface interface-id
  Example:
  Device(config)# interface gigabitethernet2/0/1 | Specifies the port to be configured, and enter interface configuration mode. |
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td></td>
<td><code>authentication timer reauthenticate seconds</code> (Example: <code>Device(config-if)# authentication timer reauthenticate 60</code>)</td>
</tr>
<tr>
<td></td>
<td><code>end</code> (Example: <code>Device(config-if)# end</code>)</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>show authentication sessions interface interface-id</code> (Example: <code>Device# show authentication sessions interface gigabitethernet2/0/1</code>)</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Setting the Switch-to-Client Frame-Retransmission Number**

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

---

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `dot1x max-reauth-req count`
4. `end`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

<tr>
<td><strong>Example:</strong> Device(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

**Note**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode access
4. dot1x max-req count
5. end

</tbody>
</table>

### Enabling MAC Replace

MAC replace allows a host to replace an authenticated host on a port.

Beginning in privileged EXEC mode, follow these steps to enable MAC replace on an interface. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `authentication violation {protect | replace | restrict | shutdown}`
4. `end`
5. `show running-config`
### Enabling MAC Replace

**6. copy running-config startup-config**

</tbody>
</table>
Configuring 802.1x Accounting

Enabling AAA system accounting with 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active 802.1x sessions are closed.

Note

In Cisco IOS XE Denali 16.3.x and Cisco IOS XE Everest 16.6.x, periodic AAA accounting updates are not supported. The switch does not send periodic interim accounting records to the accounting server. Periodic AAA accounting updates are available in Cisco IOS XE Fuji 16.9.x and later releases.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

Accounting message %s for session %s failed to receive Accounting Response.

When the stop message is not sent successfully, this message appears:

00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.

Note

You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. aaa accounting dot1x default start-stop group radius
4. aaa accounting system default start-stop group radius
5. end
6. show running-config
7. copy running-config startup-config

DETAILED STEPS

<td>---------</td>
</tr>
</tbody>
</table>
| **Step 2** | **interface** **interface-id**  
*Example:*  
Device(config)# interface gigabitethernet1/0/3  
| Specifies the port to be configured, and enter interface configuration mode. |
| **Step 3** | **aaa accounting dot1x default start-stop group radius**  
*Example:*  
Device(config-if)# aaa accounting dot1x default start-stop group radius  
| Enables 802.1x accounting using the list of all RADIUS servers. |
| **Step 4** | **aaa accounting system default start-stop group radius**  
*Example:*  
Device(config-if)# aaa accounting system default start-stop group radius  
| (Optional) Enables system accounting (using the list of all RADIUS servers) and generates system accounting reload event messages when the switch reloads. |
| **Step 5** | **end**  
*Example:*  
Device(config-if)# end  
| Returns to privileged EXEc mode. |
| **Step 6** | **show running-config**  
*Example:*  
Device# show running-config  
| Verifies your entries. |
| **Step 7** | **copy running-config startup-config**  
*Example:*  
Device# copy running-config startup-config  
| (Optional) Saves your entries in the configuration file. |

**Configuring a Guest VLAN**

When you configure a guest VLAN, clients that are not 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAP request/identity frame. Clients that are 802.1x-capable but that fail authentication are not granted network access. The switch supports guest VLANs in single-host or multiple-hosts mode.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.
### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. Use one of the following:
   - switchport mode access
   - switchport mode private-vlan host
4. authentication event no-response action authorize vlan vlan-id
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal
Example:
Device# configure terminal | Enters global configuration mode. |
| **Step 2**
interface interface-id
Example:
Device(config)# interface gigabitethernet 2/0/2 | Specifies the port to be configured, and enter interface configuration mode. |
| **Step 3**
Use one of the following:
   - switchport mode access
   - switchport mode private-vlan host
Example:
Device(config-if)# switchport mode private-vlan host | • Sets the port to access mode.  
• Configures the Layer 2 port as a private-VLAN host port. |
| **Step 4**
authentication event no-response action authorize vlan vlan-id
Example:
Device(config-if)# authentication event no-response action authorize vlan 2 | Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094.  
You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. |
| **Step 5**
end
Example:
Device(config-if)# end | Returns to privileged EXEC mode. |
Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch stack or a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.

Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. Use one of the following:
   - `switchport mode access`
   - `switchport mode private-vlan host`
4. `authentication port-control auto`
5. `authentication event fail action authorize vlan vlan-id`
6. `end`

### Configuring Number of Authentication Attempts on a Restricted VLAN

You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the `authentication event retry retry count` interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

#### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. Use one of the following:
   - switchport mode access
   - switchport mode private-vlan host
4. authentication port-control auto
5. authentication event fail action authorize vlan vlan-id
6. authentication event retry retry count
7. end

Software Configuration Guide, Cisco IOS XE Denali 16.3.x (Catalyst 3650 Switches)

2016
### Command or Action

**Step 2**  
*interface interface-id*  
*Example:*  
Device(config)# interface gigabitethernet 2/0/3  

**Purpose**  
Specifies the port to be configured, and enter interface configuration mode.

**Step 3**  
Use one of the following:  
- `switchport mode access`  
- `switchport mode private-vlan host`  
*Example:*  
- or  
Device(config-if)# switchport mode access  
  
**Purpose**  
- Sets the port to access mode.  
- Configures the Layer 2 port as a private-VLAN host port.

**Step 4**  
*authentication port-control auto*  
*Example:*  
Device(config-if)# authentication port-control auto  

**Purpose**  
Enables 802.1x authentication on the port.

**Step 5**  
*authentication event fail action authorize vlan vlan-id*  
*Example:*  
Device(config-if)# authentication event fail action authorize vlan 8  

**Purpose**  
Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094.  
You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.

**Step 6**  
*authentication event retry retry count*  
*Example:*  
Device(config-if)# authentication event retry 2  

**Purpose**  
Specifies a number of authentication attempts to allow before a port moves to the restricted VLAN. The range is 1 to 3, and the default is 3.

**Step 7**  
*end*  
*Example:*  
Device(config-if)# end  

**Purpose**  
Returns to privileged EXEC mode.

---

### Configuring 802.1x Inaccessible Authentication Bypass with Critical Voice VLAN

Beginning in privileged EXEC mode, follow these steps to configure critical voice VLAN on a port and enable the inaccessible authentication bypass feature.
SUMMARY STEPS

1. configure terminal
2. aaa new-model
3. radius-server dead-criteria {time seconds} [tries number]
4. radius-serverdeadtime minutes
5. radius server server name
6. address {ipv4 | ipv6} ip address auth-port port_number acct-port port_number
7. key string
8. exit
9. dot1x critical {eapol | recovery delay milliseconds}
10. interface interface-id
11. authentication event server dead action {authorize | reinitialize} vlan vlan-id
12. switchport voice vlan vlan-id
13. authentication event server dead action authorize voice
14. show authentication interface interface-id
15. copy running-config startup-config

<td>key <em>string</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-radius-server)# key rad123</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Exits the RADIUS server mode and enters the global configuration mode.</td>
</tr>
<tr>
<td>exit</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config-radius-server)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>(Optional) Configure the parameters for inaccessible authentication bypass:</td>
</tr>
<tr>
<td>dot1x critical {eapol</td>
<td>recovery delay milliseconds}</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# dot1x critical eapol</td>
<td></td>
</tr>
<tr>
<td>Device(config)# dot1x critical recovery delay 2000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Specify the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>interface <em>interface-id</em></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>Use these keywords to move hosts on the port if the RADIUS server is unreachable:</td>
</tr>
<tr>
<td>authentication event server dead action {authorize</td>
<td>reinitialize} vlan <em>vlan-id</em></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
| Device(config-if)# authentication event server dead action reinitialize vlan 20 | • authorize—Move any new hosts trying to authenticate to the user-specified critical VLAN.  
• reinitialize—Move all authorized hosts on the port to the user-specified critical VLAN. |

**Step 12** switchport voice vlan *vlan-id*  
**Example:**  
Device(config-if)# switchport voice vlan

**Step 13** authentication event server dead action authorize voice  
**Example:**  
Device(config-if)# authentication event server dead action authorize voice

**Step 14** show authentication interface *interface-id*  
**Example:**  
Device(config-if)# do show authentication interface gigabit 1/0/1

**Step 15** copy running-config startup-config  
**Example:**  
Device(config-if)# do copy running-config startup-config

---

**Example**

To return to the RADIUS server default settings, use the `no radius-server dead-criteria`, the `no radius-server deadtime`, and the `no radius server` global configuration commands. To disable inaccessible authentication bypass, use the `no authentication event server dead action` interface configuration command. To disable critical voice VLAN, use the `no authentication event server dead action authorize voice` interface configuration command.

---

**Example of Configuring Inaccessible Authentication Bypass**

This example shows how to configure the inaccessible authentication bypass feature:

Device(config)# radius-server dead-criteria time 30 tries 20  
Device(config)# radius-server deadtime 60
Device(config)# radius server server1
Device(config-radius-server)# address ipv4 172.29.36.49 acct-port 1618 auth-port 1612
Device(config-radius-server)# key abc1234
Device(config)# dot1x critical eapol
Device(config)# dot1x critical recovery delay 2000
Device(config)# interface gigabitethernet 1/0/1
Device(config-if)# dot1x critical
Device(config-if)# dot1x critical recovery action reinitialize
Device(config-if)# dot1x critical vlan 20
Device(config-if)# end

### Configuring 802.1x Authentication with WoL

Beginning in privileged EXEC mode, follow these steps to enable 802.1x authentication with WoL. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication control-direction {both | in}
4. end
5. show authentication sessions interface interface-id
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>

<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example: Device(config)# interface gigabitethernet2/0/3</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> authentication control-direction {both</td>
<td>in}</td>
</tr>
<tr>
<td>Example: Device(config-if)# authentication control-direction both</td>
<td>• <strong>both</strong>—Sets the port as bidirectional. The port cannot receive packets from or send packets to the host. By default, the port is bidirectional.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• in—Sets the port as unidirectional. The port can send packets to the host but cannot receive packets from the host.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 4

**Example:**

```
Device(config-if)# end
```

### Step 5

**Example:**

```
Device# show authentication sessions interface gigabitethernet2/0/3
```

### Step 6

**Example:**

```
Device# copy running-config startup-config
```

---

## Configuring MAC Authentication Bypass

Beginning in privileged EXEC mode, follow these steps to enable MAC authentication bypass. This procedure is optional.

### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. authentication port-control auto
4. mab [eap]
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
Device# configure terminal
```
### Configuring 802.1x User Distribution

Beginning in privileged EXEC mode, follow these steps to configure a VLAN group and to map a VLAN to it:

**SUMMARY STEPS**

1. `configure terminal`
2. `vlan group vlan-group-name vlan-list vlan-list`
3. `end`
4. `no vlan group vlan-group-name vlan-list vlan-list`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><code>Example: Device# configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>

---

### Command or Action

**Step 2**

- `interface interface-id`
  
  *Example:*
  
  `Device(config)# interface gigabitethernet 2/0/1`

  **Purpose**
  
  Specifies the port to be configured, and enter interface configuration mode.

**Step 3**

- `authentication port-control auto`
  
  *Example:*
  
  `Device(config-if)# authentication port-control auto`

  **Purpose**
  
  Enables 802.1x authentication on the port.

**Step 4**

- `mab [eap]`
  
  *Example:*
  
  `Device(config-if)# mab`

  **Purpose**
  
  Enables MAC authentication bypass. (Optional) Use the `eap` keyword to configure the switch to use EAP for authorization.

**Step 5**

- `end`
  
  *Example:*
  
  `Device(config-if)# end`

  **Purpose**
  
  Returns to privileged EXEC mode.
**Example of Configuring VLAN Groups**

This example shows how to configure the VLAN groups, to map the VLANs to the groups, to and verify the VLAN group configurations and mapping to the specified VLANs:

```plaintext
Device(config)# vlan group eng-dept vlan-list 10
Device(config)# show vlan group group-name eng-dept
Group Name          Vlans Mapped
------------------ --------------
eng-dept            10

Device(config)# show dot1x vlan-group all
Group Name          Vlans Mapped
------------------ --------------
eng-dept            10
hr-dept             20
```

This example shows how to add a VLAN to an existing VLAN group and to verify that the VLAN was added:

```plaintext
Device(config)# vlan group eng-dept vlan-list 30
Device(config)# show vlan group eng-dept
Group Name          Vlans Mapped
------------------ --------------
eng-dept            10,30
```

This example shows how to remove a VLAN from a VLAN group:

```plaintext
Device# no vlan group eng-dept vlan-list 10
```

This example shows that when all the VLANs are cleared from a VLAN group, the VLAN group is cleared:

```plaintext
Device(config)# no vlan group eng-dept
```
Device(config)# no vlan group eng-dept vlan-list 30
Vlan 30 is successfully cleared from vlan group eng-dept.

Device(config)# show vlan group group-name eng-dept

This example shows how to clear all the VLAN groups:

Device(config)# no vlan group end-dept_vlan-list all
Device(config)# show vlan-group all

For more information about these commands, see the Cisco IOS Security Command Reference.

**Configuring NAC Layer 2 802.1x Validation**

You can configure NAC Layer 2 802.1x validation, which is also referred to as 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 802.1x validation. The procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication event no-response action authorize vlan vlan-id
5. authentication periodic
6. authentication timer reauthenticate
7. end
8. show authentication sessions interface interface-id
9. copy running-config startup-config

**DETAILED STEPS**

| **Step 3**
  <ul>
  <li>switchport mode access</li>
  <li>Example:</li>
  <pre>Device(config-if)# switchport mode access</pre>
  </ul> | Sets the port to access mode only if you configured the RADIUS server. |
| **Step 4**
  <ul>
  <li>authentication event no-response action authorize vlan vlan-id</li>
  <li>Example:</li>
  <pre>Device(config-if)# authentication event no-response action authorize vlan 8</pre>
  </ul> | Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094.
You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN, or a voice VLAN as an 802.1x guest VLAN. |
| **Step 5**
  <ul>
  <li>authentication periodic</li>
  <li>Example:</li>
  <pre>Device(config-if)# authentication periodic</pre>
  </ul> | Enables periodic re-authentication of the client, which is disabled by default. |
| **Step 6**
  <ul>
  <li>authentication timer reauthenticate</li>
  <li>Example:</li>
  <pre>Device(config-if)# authentication timer reauthenticate</pre>
  </ul> | Sets re-authentication attempt for the client (set to one hour).
This command affects the behavior of the switch only if periodic re-authentication is enabled. |
| **Step 7**
  <ul>
  <li>end</li>
  <li>Example:</li>
  <pre>Device(config-if)# end</pre>
  </ul> | Returns to privileged EXEC mode. |
| **Step 8**
  <ul>
  <li>show authentication sessions interface interface-id</li>
  <li>Example:</li>
  <pre>Device# show authentication sessions interface gigabitethernet2/0/3</pre>
  </ul> | Verifies your entries. |
| **Step 9**
  <ul>
  <li>copy running-config startup-config</li>
  <li>Example:</li>
  <pre>Device# copy running-config startup-config</pre>
  </ul> | (Optional) Saves your entries in the configuration file. |
Configuring an Authenticator Switch with NEAT

Configuring this feature requires that one switch outside a wiring closet is configured as a supplicant and is connected to an authenticator switch.

- The authenticator switch interface configuration must be restored to access mode by explicitly flapping it if a line card is removed and inserted in the chassis when CISP or NEAT session is active.
- The `cisco-av-pairs` must be configured as `device-traffic-class=switch` on the ISE, which sets the interface as a trunk after the supplicant is successfully authenticated.

Beginning in privileged EXEC mode, follow these steps to configure a switch as an authenticator:

**SUMMARY STEPS**

1. `configure terminal`
2. `cisp enable`
3. `interface interface-id`
4. `switchport mode access`
5. `authentication port-control auto`
6. `dot1x pae authenticator`
7. `spanning-tree portfast`
8. `end`
9. `show running-config interface interface-id`
10. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enables CISP.</td>
</tr>
<tr>
<td><code>cisp enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>cisp enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# <code>interface gigabitethernet 2/0/1</code></td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
</tr>
</tbody>
</table>
| Step 4 | switchport mode access  
Example:  
Device(config-if)# switchport mode access | Sets the port mode to access. |
| Step 5 | authentication port-control auto  
Example:  
Device(config-if)# authentication port-control auto | Sets the port-authentication mode to auto. |
| Step 6 | dot1x pae authenticator  
Example:  
Device(config-if)# dot1x pae authenticator | Configures the interface as a port access entity (PAE) authenticator. |
| Step 7 | spanning-tree portfast  
Example:  
Device(config-if)# spanning-tree portfast trunk | Enables Port Fast on an access port connected to a single workstation or server.. |
| Step 8 | end  
Example:  
Device(config-if)# end | Returns to privileged EXEC mode. |
| Step 9 | show running-config interface interface-id  
Example:  
Device# show running-config interface gigabitethernet 2/0/1 | Verifies your configuration. |
| Step 10 | copy running-config startup-config  
Example:  
Device# copy running-config startup-config | (Optional) Saves your entries in the configuration file.  
**Note** Saving changes to the configuration file will mean that the authenticator interface will continue to be in trunk mode after reload. If you want the authenticator interface to remain as an access port, do not save your changes to the configuration file. |
Configuring a Supplicant Switch with NEAT

Beginning in privileged EXEC mode, follow these steps to configure a switch as a supplicant:

**SUMMARY STEPS**

1. configure terminal
2. cispenable
3. dot1x credentials profile
4. username suppswitch
5. password password
6. dot1x supplicant force-multicast
7. interface interface-id
8. switchport trunk encapsulation dot1q
9. switchport mode trunk
10. dot1x pae supplicant
11. dot1x credentials profile-name
12. end
13. show running-config interface interface-id
14. copy running-config startup-config
15. Configuring NEAT with Auto Smartports Macros

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>

<tr>
<td><strong>Purpose</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Step 15</strong></td>
<td>Configuring NEAT with Auto Smartports Macros</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>You can also use an Auto Smartports user-defined macro instead of the switch VSA to configure the authenticator switch. For more information, see the Auto Smartports Configuration Guide for this release.</td>
</tr>
</tbody>
</table>

### Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs

#### Note
You must configure a downloadable ACL on the ACS before downloading it to the switch.

After authentication on the port, you can use the `show ip access-list` privileged EXEC command to display the downloaded ACLs on the port.

### Configuring Downloadable ACLs

The policies take effect after client authentication and the client IP address addition to the IP device tracking table. The switch then applies the downloadable ACL to the port.

Beginning in privileged EXEC mode:

#### Before you begin
SISF-Based device tracking is a prerequisite to configuring 802.1x authentication. Ensure that you have enabled device tracking programmatically or manually. For more information, see the Configuring SISF-Based Tracking chapter.

### SUMMARY STEPS

1. configure terminal
2. aaa new-model
3. aaa authorization network default local group radius
4. radius-server vsa send authentication
5. interface interface-id
6. ip access-group acl-id in
7. `show running-config interface interface-id`
8. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `configure terminal`  
Device#: `configure terminal` | Enters global configuration mode.  
Example: |
| **Step 2** | `aaa new-model`  
Device(config)# `aaa new-model` | Enables AAA.  
Example: |
| **Step 3** | `aaa authorization network default local group radius`  
Device(config)# `aaa authorization network default local group radius` | Sets the authorization method to local. To remove the authorization method, use the `no aaa authorization network default local group radius` command.  
Example: |
| **Step 4** | `radius-server vsa send authentication`  
Device(config)# `radius-server vsa send authentication` | Configures the radius vsa send authentication.  
Example: |
| **Step 5** | `interface interface-id`  
Device(config)# `interface gigabitethernet2/0/4` | Specifies the port to be configured, and enter interface configuration mode.  
Example: |
| **Step 6** | `ip access-group acl-id in`  
Device(config-if)# `ip access-group default_acl in` | Configures the default ACL on the port in the input direction.  
Example:  
**Note** The `acl-id` is an access list name or number. |
| **Step 7** | `show running-config interface interface-id`  
Device(config-if)# `show running-config interface gigabitethernet2/0/4` | Verifies your configuration.  
Example: |
### Configuring a Downloadable Policy

Beginning in privileged EXEC mode:

**Before you begin**

SISF-Based device tracking is a prerequisite to configuring 802.1x authentication. Ensure that you have enabled device tracking programmatically or manually.

**SUMMARY STEPS**

1. `configure terminal`
2. `access-list access-list-number { deny | permit } { hostname | any | host } log`
3. `interface interface-id`
4. `ip access-group acl-id in`
5. `exit`
6. `aaa new-model`
7. `aaa authorization network default group radius`
8. `radius-server vsa send authentication`
9. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Defines the default port ACL.</td>
</tr>
<tr>
<td>`access-list access-list-number { deny</td>
<td>permit } { hostname</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# access-list 1 deny any log</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>any</strong>: The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard value.</td>
<td></td>
</tr>
<tr>
<td><strong>host</strong>: The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. Als</td>
<td>(Optional) Applies the source-wildcard wildcard bits to the source.</td>
</tr>
<tr>
<td>(Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**

```bash
interface interface-id
```

**Example:**

Device(config)# interface gigabitethernet2/0/2

**Step 4**

```bash
ip access-group acl-id in
```

**Example:**

Device(config-if)# ip access-group default_acl in

**Note**

The acl-id is an access list name or number.

**Step 5**

```bash
exit
```

**Example:**

Device(config-if)# exit

**Step 6**

```bash
aaa new-model
```

**Example:**

Device(config)# aaa new-model

**Step 7**

```bash
aaa authorization network default group radius
```

**Example:**

Device(config)# aaa authorization network default group radius

**Step 8**

```bash
radius-server vsa send authentication
```

**Example:**

Device(config)# radius-server vsa send authentication

**Note**

The downloadable ACL must be operational.
Configuring VLAN ID-based MAC Authentication

Beginning in privileged EXEC mode, follow these steps:

**SUMMARY STEPS**

1. `configure terminal`
2. `mab request format attribute 32 vlan access-vlan`
3. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>[configure terminal](Device# configure terminal)</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>[mab request format attribute 32 vlan access-vlan](Device(config)# mab request format attribute 32 vlan access-vlan)</td>
<td>Enables VLAN ID-based MAC authentication.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>[copy running-config startup-config](Device# copy running-config startup-config)</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Configuring Flexible Authentication Ordering**

The examples used in the instructions below changes the order of Flexible Authentication Ordering so that MAB is attempted before IEEE 802.1X authentication (dot1x). MAB is configured as the first authentication method, so MAB will have priority over all other authentication methods.
Before changing the default order and priority of these authentication methods, however, you should understand the potential consequences of those changes. See http://www.cisco.com/en/US/prod/collateral/iosswrel/ps6537/ps6866/ps6638/application_note_c27-573287_ps6638_Products_White_Paper.html for details.

Beginning in privileged EXEC mode, follow these steps:

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication order [dot1x | mab] | {webauth}
5. authentication priority [dot1x | mab] | {webauth}
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> switchport mode access</td>
<td>Sets the port to access mode only if you previously configured the RADIUS server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> authentication order [dot1x</td>
<td>mab]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# authentication order mab dot1x</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> authentication priority [dot1x</td>
<td>mab]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Device(config-if)# authentication priority mab</td>
<td></td>
</tr>
</tbody>
</table>
Configuring Open1x

Beginning in privileged EXEC mode, follow these steps to enable manual control of the port authorization state:

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication control-direction \{both | in\}
5. authentication fallback name
6. authentication host-mode \{multi-auth | multi-domain | multi-host | single-host\}
7. authentication open
8. authentication order \[ dot1x | mab \] \{webauth\}
9. authentication periodic
10. authentication port-control \{auto | force-authorized | force-un authorized\}
11. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 3** switchport mode access  
Example:  
Device(config-if)# switchport mode access | Sets the port to access mode only if you configured the RADIUS server. |
| **Step 4** authentication control-direction {both | in}  
Example:  
Device(config-if)# authentication control-direction both | (Optional) Configures the port control as unidirectional or bidirectional. |
| **Step 5** authentication fallback name  
Example:  
Device(config-if)# authentication fallback profile1 | (Optional) Configures a port to use web authentication as a fallback method for clients that do not support 802.1x authentication. |
| **Step 6** authentication host-mode [multi-auth | multi-domain | multi-host | single-host]  
Example:  
Device(config-if)# authentication host-mode multi-auth | (Optional) Sets the authorization manager mode on a port. |
| **Step 7** authentication open  
Example:  
Device(config-if)# authentication open | (Optional) Enables or disable open access on a port. |
| **Step 8** authentication order [dot1x | mab ] | webauth}  
Example:  
Device(config-if)# authentication order dot1x webauth | (Optional) Sets the order of authentication methods used on a port. |
| **Step 9** authentication periodic  
Example:  
Device(config-if)# authentication periodic | (Optional) Enables or disable reauthentication on a port. |
### Summary Steps

1. configure terminal
2. interface interface-id
3. switchport mode access
4. no dot1x pae authenticator
5. end

### Detailed Steps

CHAPTER 100

Web-Based Authentication

This chapter describes how to configure web-based authentication on the device. It contains these sections:

- Finding Feature Information, on page 2045
- Web-Based Authentication Overview, on page 2045
- How to Configure Web-Based Authentication, on page 2054
- Verifying Web-Based Authentication Status, on page 2068

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Web-Based Authentication Overview

Use the web-based authentication feature, known as web authentication proxy, to authenticate end users on host systems that do not run the IEEE 802.1x supplicant.

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the users. The users enter their credentials, which the web-based authentication feature sends to the authentication, authorization, and accounting (AAA) server for authentication.

If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host, and the user is placed on a watch list for a waiting period.

HTTPS traffic interception for central web authentication redirect is not supported.
You should use global parameter-map (for method-type, custom, and redirect) only for using the same web authentication methods like consent, web consent, and webauth, for all the clients and SSIDs. This ensures that all the clients have the same web-authentication method.

If the requirement is to use Consent for one SSID and Web-authentication for another SSID, then you should use two named parameter-maps. You should configure Consent in first parameter-map and configure webauth in second parameter-map.

Note

The traceback that you receive when webauth client tries to do authentication does not have any performance or behavioral impact. It happens rarely when the context for which FFM replied back to EPM for ACL application is already dequeued (possibly due to timer expiry) and the session becomes “unauthorized”.

Based on where the web pages are hosted, the local web authentication can be categorized as follows:

- **Internal**—The internal default HTML pages (Login, Success, Fail, and Expire) in the controller are used during the local web authentication.
- **Customized**—The customized web pages (Login, Success, Fail, and Expire) are downloaded onto the controller and used during the local web authentication.
- **External**—The customized web pages are hosted on the external web server instead of using the in-built or custom web pages.

Based on the various web authentication pages, the types of web authentication are as follows:

- **Webauth**—This is a basic web authentication. Herein, the controller presents a policy page with the user name and password. You need to enter the correct credentials to access the network.
- **Consent or web-passthrough**—Herein, the controller presents a policy page with the Accept or Deny buttons. You need to click the Accept button to access the network.
- **Webconsent**—This is a combination of webauth and consent web authentication types. Herein, the controller presents a policy page with Accept or Deny buttons along with user name or password. You need to enter the correct credentials and click the Accept button to access the network.

### Device Roles

With web-based authentication, the devices in the network have these specific roles:

- **Client**—The device (workstation) that requests access to the LAN and the services and responds to requests from the switch. The workstation must be running an HTML browser with JavaScript enabled.
- **Authentication server**—Authenticates the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and the switch services or that the client is denied.
- **Switch**—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.
Host Detection

The switch maintains an IP device tracking table to store information about detected hosts.

Note

By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 2 interfaces, web-based authentication detects IP hosts by using these mechanisms:

- ARP based trigger—ARP redirect ACL allows web-based authentication to detect hosts with a static IP address or a dynamic IP address.
- Dynamic ARP inspection
- DHCP snooping—Web-based authentication is notified when the switch creates a DHCP-binding entry for the host.

Session Creation

When web-based authentication detects a new host, it creates a session as follows:

- Reviews the exception list.
  
  If the host IP is included in the exception list, the policy from the exception list entry is applied, and the session is established.

- Reviews for authorization bypass
  
  If the host IP is not on the exception list, web-based authentication sends a nonresponsive-host (NRH) request to the server.

  If the server response is access accepted, authorization is bypassed for this host. The session is established.

- Sets up the HTTP intercept ACL
  
  If the server response to the NRH request is access rejected, the HTTP intercept ACL is activated, and the session waits for HTTP traffic from the host.
Authentication Process

When you enable web-based authentication, these events occur:

• The user initiates an HTTP session.

• The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password, and the switch sends the entries to the authentication server.

• If the authentication succeeds, the switch downloads and activates the user’s access policy from the authentication server. The login success page is sent to the user.

• If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page, and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.

• If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user.

• The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or when the host does not send any traffic within the idle timeout on a Layer 3 interface.

• The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface.

• The feature applies the downloaded timeout or the locally configured session timeout.

• If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.

• If the terminate action is default, the session is dismantled, and the applied policy is removed.

Local Web Authentication Banner

With Web Authentication, you can create a default and customized web-browser banners that appears when you log in to a switch.

The banner appears on both the login page and the authentication-result pop-up pages. The default banner messages are as follows:

• Authentication Successful

• Authentication Failed

• Authentication Expired

The Local Web Authentication Banner can be configured in legacy and new-style (Session-aware) CLIs as follows:

• Legacy mode—Use the `ip admission auth-proxy-banner http` global configuration command.

• New-style mode—Use the `parameter-map type webauth global banner` global configuration command.

The default banner Cisco Systems and Switch host-name Authentication appear on the Login Page. Cisco Systems appears on the authentication result pop-up page.
The banner can be customized as follows:

- Add a message, such as switch, router, or company name to the banner:
  - Legacy mode—Use the `ip admission auth-proxy-banner http banner-text` global configuration command.
  - New-style mode—Use the `parameter-map type webauth global banner` global configuration command.

- Add a logo or text file to the banner:
  - Legacy mode—Use the `ip admission auth-proxy-banner http file-path` global configuration command.
  - New-style mode—Use the `parameter-map type webauth global banner` global configuration command.
If you do not enable a banner, only the username and password dialog boxes appear in the web authentication login screen, and no banner appears when you log into the switch.
Web Authentication Customizable Web Pages

During the web-based authentication process, the switch internal HTTP server hosts four HTML pages to deliver to an authenticating client. The server uses these pages to notify you of these four-authentication process states:

- **Login**—Your credentials are requested.
- **Success**—The login was successful.
- **Fail**—The login failed.
- **Expire**—The login session has expired because of excessive login failures.

**Guidelines**

- You can substitute your own HTML pages for the default internal HTML pages.
- You can use a logo or specify text in the login, success, failure, and expire web pages.
- On the banner page, you can specify text in the login page.
- The pages are in HTML.
- You must include an HTML redirect command in the success page to access a specific URL.
- The URL string must be a valid URL (for example, http://www.cisco.com). An incomplete URL might cause page not found or similar errors on a web browser.
- If you configure web pages for HTTP authentication, they must include the appropriate HTML commands (for example, to set the page time out, to set a hidden password, or to confirm that the same page is not submitted twice).
- The CLI command to redirect users to a specific URL is not available when the configured login form is enabled. The administrator should ensure that the redirection is configured in the web page.
- If the CLI command redirecting users to specific URL after authentication occurs is entered and then the command configuring web pages is entered, the CLI command redirecting users to a specific URL does not take effect.
- Configured web pages can be copied to the switch boot flash or flash.
- The login page can be on one flash, and the success and failure pages can be another flash (for example, the flash on the stack master or a member).
- You must configure all four pages.
- The banner page has no effect if it is configured with the web page.
- All of the logo files (image, flash, audio, video, and so on) that are stored in the system directory (for example, flash, disk0, or disk) and that must be displayed on the login page must use web_auth_<filename> as the file name.
- The configured authentication proxy feature supports both HTTP and SSL.

You can substitute your HTML pages for the default internal HTML pages. You can also specify a URL to which users are redirected after authentication occurs, which replaces the internal Success page.
Authentication Proxy Web Page Guidelines

When configuring customized authentication proxy web pages, follow these guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.
- The four custom HTML files must be present on the flash memory of the switch. The maximum size of each HTML file is 8 KB.
- Any images on the custom pages must be on an accessible HTTP server. Configure an intercept ACL within the admission rule.
- Any external link from a custom page requires configuration of an intercept ACL within the admission rule.
- To access a valid DNS server, any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule.
- If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.
- If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.
- To remove the specification of a custom file, use the `no` form of the command.

Because the custom login page is a public web form, consider these guidelines for the page:

- The login form must accept user entries for the username and password and must show them as `uname` and `pwd`.
- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.
Redirection URL for Successful Login Guidelines

When configuring a redirection URL for successful login, consider these guidelines:

- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom-login success page.
- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.
- To remove the specification of a redirection URL, use the `no` form of the command.
- If the redirection URL is required after the web-based authentication client is successfully authenticated, then the URL string must start with a valid URL (for example, http://) followed by the URL information. If only the URL is given without http://, then the redirection URL on successful authentication might cause page not found or similar errors on a web browser.

Web-based Authentication Interactions with Other Features

Port Security

You can configure web-based authentication and port security on the same port. Web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.

LAN Port IP

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated by using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated, and posture is validated again.

Gateway IP

You cannot configure Gateway IP (GWIP) on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

ACLs

If you configure a VLAN ACL or a Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.
For Layer 2 web-based authentication, it is more secure, though not required, to configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL. The Policy ACL is applied to the session even if there is no ACL configured on the port.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

**Context-Based Access Control**

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port VLAN.

**EtherChannel**

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

**How to Configure Web-Based Authentication**

**Default Web-Based Authentication Configuration**

The following table shows the default web-based authentication configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>AAA</td>
<td>Disabled</td>
</tr>
<tr>
<td>RADIUS server</td>
<td></td>
</tr>
<tr>
<td>- IP address</td>
<td>None specified</td>
</tr>
<tr>
<td>- UDP authentication port</td>
<td>1645</td>
</tr>
<tr>
<td>- Key</td>
<td>None specified</td>
</tr>
<tr>
<td>Default value of inactivity timeout</td>
<td>3600 seconds</td>
</tr>
<tr>
<td>Inactivity timeout</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

**Web-Based Authentication Configuration Guidelines and Restrictions**

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- External web authentication, where the switch redirects a client to a particular host or web server for displaying login message, is not supported.

- You cannot authenticate hosts on Layer 2 interfaces with static ARP cache assignment. These hosts are not detected by the web-based authentication feature because they do not send ARP messages.

- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

- You must enable SISF-Based device tracking to use web-based authentication. By default, SISF-Based device tracking is disabled on a switch.

- You must configure at least one IP address to run the switch HTTP server. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.

- Hosts that are more than one hop away might experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This occurs because the ARP and DHCP updates might not be sent after a Layer 2 (STP) topology change.

- Web-based authentication does not support VLAN assignment as a downloadable-host policy.

- Web-based authentication supports IPv6 in Session-aware policy mode. IPv6 Web-authentication requires at least one IPv6 address configured on the switch and IPv6 Snooping configured on the switchport.

- Web-based authentication and Network Edge Access Topology (NEAT) are mutually exclusive. You cannot use web-based authentication when NEAT is enabled on an interface, and you cannot use NEAT when web-based authentication is running on an interface.

- Identify the following RADIUS security server settings that will be used while configuring switch-to-RADIUS-server communication:
  - Host name
  - Host IP address
  - Host name and specific UDP port numbers
  - IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

- When you configure the RADIUS server parameters:
  - Specify the **key string** on a separate command line.
  - For **key string**, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
  - When you specify the **key string**, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the `radius-server host` global configuration command. If you want to configure these options on a per-server basis, use the `radius-server timeout`, `radius-server transmit`, and the `radius-server key` global configuration commands.

**Note**
You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). For more information, see the RADIUS server documentation.

## Configuring the Authentication Rule and Interfaces

Follow these steps to configure the authentication rule and interfaces:

**Before you begin**

SISF-Based device tracking is a prerequisite to Web Authentication. Ensure that you have enabled device tracking programmatically or manually.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip admission name name proxy http`
4. `interface type slot/port`
5. `ip access-group name`
6. `ip admission name`
7. `end`
8. `show ip admission`
9. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>Device&gt; enable</code></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Device# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step</strong></td>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td>----------</td>
<td>----------------------</td>
</tr>
</tbody>
</table>
| **Step 3** | `ip admission name name proxy http`  
Example:  
`Device(config)# ip admission name webauth1 proxy http` | Configures an authentication rule for web-based authorization. |
| **Step 4** | `interface type slot/port`  
Example:  
`Device(config)# interface gigabitethernet 1/0/1` | Enters interface configuration mode and specifies the ingress Layer 2 or Layer 3 interface to be enabled for web-based authentication.  
*type* can be fastetherent, gigabit ethernet, or tengigabitethernet. |
| **Step 5** | `ip access-group name`  
Example:  
`Device(config-if)# ip access-group webauthag` | Applies the default ACL. |
| **Step 6** | `ip admission name`  
Example:  
`Device(config)# ip admission name` | Configures an authentication rule for web-based authorization for the interface. |
| **Step 7** | `end`  
Example:  
`Device(config)# end` | Returns to privileged EXEC mode. |
| **Step 8** | `show ip admission`  
Example:  
`Device# show ip admission` | Displays the configuration. |
| **Step 9** | `copy running-config startup-config`  
Example:  
`Device# copy running-config startup-config` | (Optional) Saves your entries in the configuration file. |
Configuring AAA Authentication

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `aaa new-model`
4. `aaa authentication login default group {tacacs+ | radius}`
5. `aaa authorization auth-proxy default group {tacacs+ | radius}`
6. `tacacs server server-name address {ipv4 | ipv6} ip address`
7. `key string`
8. `exit`
9. `end`
10. `show running-config`
11. `copy running-config startup-config`

DETAILED STEPS

<table>
<thead>
<tr>

Configuring Switch-to-RADIUS-Server Communication

Follow these steps to configure the RADIUS server parameters:

**SUMMARY STEPS**

1. **enable**
2. **configure terminal**
3. **ip radius source-interface vlan** `vlan interface number`
4. **radius server** `server name`
5. **address** `{ipv4 | ipv6}` `ip address`
6. **key** `string`
7. **exit**
8. **radius-server dead-criteria tries** `num-tries`
9. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>

<tr>
<td><strong>Step 8</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>radius-server dead-criteria tries num-tries</code></td>
<td>Specifies the number of unanswered sent messages to a RADIUS server before considering the server to be inactive. The range of <code>num-tries</code> is 1 to 100.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# radius-server dead-criteria tries 30</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>Device(config)# end</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the Device. You can enable the server for either HTTP or HTTPS.

**Note**

The Apple pseudobrowser will not open if you configure only the `ip http secure-server` command. You should also configure the `ip http server` command.

Follow the procedure given below to enable the server for either HTTP or HTTPS:
### SUMMARY STEPS

1. enable
2. configure terminal
3. ip http server
4. ip http secure-server
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>

### Customizing the Authentication Proxy Web Pages

You can configure web authentication to display four substitute HTML pages to the user in place of the Device default HTML pages during web-based authentication.

Follow these steps to specify the use of your custom authentication proxy web pages:
### Before you begin

Store your custom HTML files on the Device flash memory.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip admission proxy http login page file device:login-filename`
4. `ip admission proxy http success page file device:success-filename`
5. `ip admission proxy http failure page file device:fail-filename`
6. `ip admission proxy http login expired page file device:expired-filename`
7. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code> &lt;br&gt; <strong>Example:</strong>&lt;br&gt; <code>Device&gt; enable</code></td>
<td>Enables privileged EXEC mode.&lt;br&gt; - Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code> &lt;br&gt; <strong>Example:</strong>&lt;br&gt; <code>Device# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ip admission proxy http login page file device:login-filename</code> &lt;br&gt; <strong>Example:</strong>&lt;br&gt; <code>Device(config)# ip admission proxy http login page file disk1:login.htm</code></td>
<td>Specifies the location in the Device memory file system of the custom HTML file to use in place of the default login page. The <code>device:</code> is flash memory.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>ip admission proxy http success page file device:success-filename</code> &lt;br&gt; <strong>Example:</strong>&lt;br&gt; <code>Device(config)# ip admission proxy http success page file disk1:success.htm</code></td>
<td>Specifies the location of the custom HTML file to use in place of the default login success page.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>ip admission proxy http failure page file device:fail-filename</code> &lt;br&gt; <strong>Example:</strong>&lt;br&gt; <code>Device(config)# ip admission proxy http fail page</code></td>
<td>Specifies the location of the custom HTML file to use in place of the default login failure page.</td>
</tr>
</tbody>
</table>
### Specifying a Redirection URL for Successful Login

Follow these steps to specify a URL to which the user is redirected after authentication, effectively replacing the internal Success HTML page:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip admission proxy http success redirect *url-string*
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>

<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Device# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Web-Based Authentication Parameters

Follow these steps to configure the maximum number of failed login attempts before the client is placed in a watch list for a waiting period:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip admission max-login-attempts number`
4. `exit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable` | Enables privileged EXEC mode.  
   Example:  
   `Device> enable` |
| Step 2 | `configure terminal` | Enters global configuration mode.  
   Example:  
   `Device# configure terminal` |
| Step 3 | `ip admission max-login-attempts number` | Sets the maximum number of failed login attempts. The range is 1 to 2147483647 attempts. The default is 5.  
   Example:  
   `Device(config)# ip admission max-login-attempts 10` |
## Configuring a Web-Based Authentication Local Banner

Follow these steps to configure a local banner on a switch that has web authentication configured.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip admission auth-proxy-banner http [banner-text | file-path]`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection
Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

Information About Storm Control

Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received
- Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.
When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

Traffic Patterns

Figure 132: Broadcast Storm Control Example

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.

You use the `storm-control` interface configuration commands to set the threshold value for each traffic type.
How to Configure Storm Control

Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

Note
Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

Follow these steps to storm control and threshold levels:

Before you begin
Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface interface-id
4. storm-control {broadcast | multicast | unicast} level {level [level-low] | bps bps [bps-low] | pps pps [pps-low]}
5. storm-control action {shutdown | trap}
6. end
7. show storm-control [interface-id] [broadcast | multicast | unicast]
8. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Device&gt; enable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 2** configure terminal  
Example: Device# configure terminal | Enters global configuration mode. |
| **Step 3** interface interface-id  
Example: Device(config)# interface gigabitethernet1/0/1 | Specifies the interface to be configured, and enter interface configuration mode. |
| **Step 4** storm-control {broadcast | multicast | unicast} level {level [level-low] | bps bps [bps-low] | pps pps [pps-low]}  
Example: Device(config-if)# storm-control unicast level 87 65 | Configures broadcast, multicast, or unicast storm control. By default, storm control is disabled. The keywords have these meanings:  
- For **level**, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00.  
- (Optional) For **level-low**, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00. If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.  
- For **bps bps**, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.  
- (Optional) For **bps-low**, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.  
- For **pps pps**, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0. |
Information About Protected Ports

Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

• A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control
traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.

- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

**Default Protected Port Configuration**

The default is to have no protected ports defined.

**Protected Ports Guidelines**

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

**How to Configure Protected Ports**

**Configuring a Protected Port**

**Before you begin**

Protected ports are not pre-defined. This is the task to configure one.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport protected`
5. `end`
6. `show interfaces interface-id switchport`
7. `show running-config`

<td><code>show interfaces [interface-id] switchport</code></td>
<td>Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.</td>
</tr>
</tbody>
</table>

Information About Port Blocking

Port Blocking
By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

Note
With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

How to Configure Port Blocking

Blocking Flooded Traffic on an Interface

Before you begin
The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface interface-id`
4. `switchport block multicast`
5. `switchport block unicast`
6. `end`
7. `show interfaces interface-id switchport`
**8. show running-config**

**9. copy running-config startup-config**

**DETAILED STEPS**

<table>

<tr>
<td><em>show interfaces [interface-id] switchport</em></td>
<td>Displays the administrative and operational status of all switching (nonrouting) ports or the specified port, including port blocking and port protection settings.</td>
</tr>
</tbody>
</table>

### Prerequisites for Port Security

**Note**

If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

### Restrictions for Port Security

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.
Information About Port Security

Port Security

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

Types of Secure MAC Addresses

The switch supports these types of secure MAC addresses:

- Static secure MAC addresses—These are manually configured by using the `switchport port-security mac-address mac-address` interface configuration command, stored in the address table, and added to the switch running configuration.

- Dynamic secure MAC addresses—These are dynamically configured, stored only in the address table, and removed when the switch restarts.

- Sticky secure MAC addresses—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.

Sticky Secure MAC Addresses

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration by enabling sticky learning. The interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.
Security Violations

It is a security violation when one of these situations occurs:

- The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.

- An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.

- Running diagnostic tests with port security enabled.

You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

- **protect**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

  Note
  We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- **restrict**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown**—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. When a secure port is in the error-disabled state, you can bring it out of this state by entering the `errdisable recovery cause psecure-violation` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands. This is the default mode.

- **shutdown vlan**—Use to set the security violation mode per-VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.

This table shows the violation mode and the actions taken when you configure an interface for port security.

Port Security Aging

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

- **Absolute**—The secure addresses on the port are deleted after the specified aging time.
- **Inactivity**—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

- Enabling and Configuring Port Security Aging, on page 2090

Port Security and Switch Stacks

When a switch joins a stack, the new switch will get the configured secure addresses. All dynamic secure addresses are downloaded by the new stack member from the other stack members.

When a switch (either the active switch or a stack member) leaves the stack, the remaining stack members are notified, and the secure MAC addresses configured or learned by that switch are deleted from the secure MAC address table.

Port Security Configuration Guidelines

- Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.

- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).

  Note
  Voice VLAN is only supported on access ports and not on trunk ports, even though the configuration is allowed.

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.

- When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the `switchport voice` and `switchport priority extend` interface configuration commands has no effect.

When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.

- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

- The switch does not support port security aging of sticky secure MAC addresses.

This table summarizes port security compatibility with other port-based features.

### Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported:

- Storm Control
- Protected Ports
- Port Blocking
- Port Security
- Protocol Storm Protection

22 DTP=Dynamic Trunking Protocol
23 A port configured with the `switchport mode dynamic` interface configuration command.
24 A VLAN Query Protocol (VQP) port configured with the `switchport access vlan dynamic` interface configuration command.
25 You must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN.
How to Configure Port Security

Enabling and Configuring Port Security

Before you begin
This task restricts input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

SUMMARY STEPS
1. enable
2. configure terminal
3. interface interface-id
4. switchport mode {access | trunk}
5. switchport voice vlan vlan-id
6. switchport port-security
7. switchport port-security [maximum value [vlan {vlan-list | {access | voice} ]]]
