debug ilpower

To enable debugging of the power controller and Power over Ethernet (PoE) system, use the **debug ilpower** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug ilpower {cdp | event | ha | ipc | police | port | powerman | registries | scp | sense | upoe} no debug ilpower {cdp | event | ha | ipc | police | port | powerman | registries | scp | sense | upoe}

Syntax Description	cdp	es.			
	event	Displays PoE event debug messages.			
	ha	Displays PoE high-availability messages.			
	ірс	Displays PoE Inter-Process Communication (IPC) debug messa	ages.		
	police Displays PoE police debug messages.				
	port	port Displays PoE port manager debug messages.			
	powerman				
	registries				
	scp	Displays PoE SCP debug messages.			
	sense	Displays PoE sense debug messages.			
	upoe	upoe Displays Cisco UPOE debug messages.			
Command Default	Debugging is disabled.				
Command Modes	Privileged I	EXEC			
Command History	Release	Μ	odification		
	Cisco IOS	XE 3.3SE Th	nis command was introduced.		
Usage Guidelines	This command is supported only on PoE-capable switches.				
		enable debugging on a switch stack, it is enabled only on the act nember, you can start a session from the active switch by using t	66 6		

command. Then enter the **debug** command at the command-line prompt of the stack member.

debug interface

To enable debugging of interface-related activities, use the **debug interface** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug interface {*interface-id* | counters {exceptions | protocol memory} | states} no debug interface {*interface-id* | counters {exceptions | protocol memory} | states}

Syntax Description	interface-id	<i>d</i> ID of the physical interface. Displays debug messages for the specified physical port, identified by type switch number/module number/port, for example, gigabitethernet 1/0/2.			
	counters Displays counters debugging information.				
	exceptions	exceptions Displays debug messages when a recoverable exceptional condition occurs during the computation of the interface packet and data rate statistics.			
	protocol memory Displays debug messages for memory operations of protocol counters.				
	states Displays intermediary debug messages when an interface's state transitions.				
Command Default	Debugging is disabled.				
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS XE 3.3	SE This command was introd	duced.		
Usage Guidelines	If you do not specify a keyword, all debug messages appear.				
	The undebug interface command is the same as the no debug interface command.				
	on a stack member	debugging on a switch stack, it is enabled only on the active switch. To enable d y you can start a session from the active switch by using the session <i>switch-numb</i> neter the debug command at the command-line prompt of the stack member.			

I

debug IIdp packets

To enable debugging of Link Layer Discovery Protocol (LLDP) packets, use the **debug lldp packets** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug lldp packets no debug lldp packets

Syntax Description This command has no arguments or keywords.

Command Default Debugging is disabled.

Command Modes Privileged EXEC

Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines The undebug lldp packets command is the same as the no debug lldp packets command.

When you enable debugging on a switch stack, it is enabled only on the active switch. To enable debugging on a stack member, you can start a session from the active switch by using the **session** *switch-number* EXEC command.

debug platform poe

To enable debugging of a Power over Ethernet (PoE) port, use the **debug platform poe** command in privileged EXEC mode. To disable debugging, use the **no** form of this command.

debug platform poe [{error | info}] [switch switch-number] no debug platform poe [{error | info}] [switch switch-number]

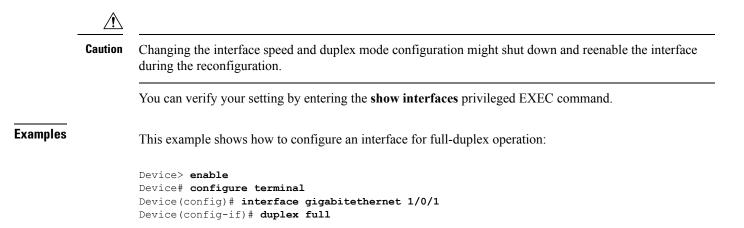

Syntax Description	error	(Optional) Displays PoE-related error debug messages.(Optional) Displays PoE-related information debug messages.		
	info			
	switch switch-number	(Optional) Specifies the stack member. This keyword is supported only on stacking-capable switches.		
Command Default	Debugging is disabled.			
Command Modes	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS XE 3.3SE	This command was introduced.		
Usage Guidelines	The undebug platform	poe command is the same as the no debug platform poe command.		

duplex

To specify the duplex mode of operation for a port, use the **duplex** command in interface configuration mode. To return to the default value, use the **no** form of this command.

duplex {auto | full | half} no duplex {auto | full | half}

Syntax Description	autoEnables automatic duplex configuration. The port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.fullEnables full-duplex mode.halfEnables half-duplex mode (only for interfaces operating at 10 or 100 Mbps). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mbps.		
Command Default	For Gigabit Ethernet ports, the default is auto .		
	For 100BASE- <i>x</i> (where - <i>x</i> is -BX, -FX, -FX-FE	For 100BASE-x (where -x is -BX, -FX, -FX-FE, or -LX) SFP modules, the default is half.	
Command Modes	Interface configuration (config-if)		
Command History	Release	Modification	
	Cisco IOS XE 3.3SE	This command was introduced.	
Usage Guidelines	For Gigabit Ethernet ports, setting the port to auto has the same effect as specifying full if the attached device does not autonegotiate the duplex parameter.		
	does not autonegotiate the duplex parameter.		
	does not autonegotiate the duplex parameter. You cannot configure the duplex mode on 10-G	igabit Ethernet ports; it is always full.	
	You cannot configure the duplex mode on 10-G	ASE-x or 10GBASE-x (where -x is -BX, -CWDM, -LX, -SX	
	You cannot configure the duplex mode on 10-G Duplex options are not supported on the 1000B.	ASE-x or 10GBASE-x (where -x is -BX, -CWDM, -LX, -SX

The duplex setting remains as configured on each	

Syntax Description

L

errdisable detect cause

To enable error-disable detection for a specific cause or for all causes, use the **errdisable detect cause** command in global configuration mode. To disable the error-disable detection feature, use the **no** form of this command.

errdisable detect cause {all | arp-inspection | bpduguard shutdown vlan | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | pppoe-ia-rate-limit | security-violation shutdown vlan | sfp-config-mismatch}

no errdisable detect cause {all|arp-inspection|bpduguard shutdown vlan|dhcp-rate-limit|dtp-flap |gbic-invalid|inline-power|l2ptguard|link-flap|loopback|pagp-flap|pppoe-ia-rate-limit | security-violation shutdown vlan|sfp-config-mismatch}

all Enables error detection for all error-disabled causes.			
arp-inspection	Enables error detection for dynamic Address Resolution Protocol (ARP) inspection.		
bpduguard shutdown vlan Enables per-VLAN error-disable for BPDU guard.			
dhcp-rate-limit	Enables error detection for DHCP snooping.		
dtp-flap	Enables error detection for the Dynamic Trunking Protocol (DTP) flapping.		
gbic-invalid	Enables error detection for an invalid Gigabit Interface Converter (GBIC) module.		
	Note This error refers to an invalid small form-factor pluggable (SFP) module.		
inline-power	Enables error detection for the Power over Ethernet (PoE) error-disabled cause.		
	Note This keyword is supported only on switches with PoE ports.		
l2ptguard	Enables error detection for a Layer 2 protocol-tunnel error-disabled cause.		
link-flap	Enables error detection for link-state flapping.		
loopback	Enables error detection for detected loopbacks.		
pagp-flap	Enables error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.		
pppoe-ia-rate-limit	Enables error detection for the PPPoE Intermediate Agent rate-limit error-disabled cause.		
security-violation shutdown Enables voice aware 802.1x security. vlan			
sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.		

Command Default	Detection is enabled for all causes. All causes, except per-VLAN error disabling, are configured to shut down the entire port. Global configuration		
Command Modes			
Command History	Release	Modification	
	Cisco IOS XE 3.3SE	This command was introduced.	
Usage Guidelines	A cause (such as a link-flap or dhcp-rate-limit) is the reason for the error-disabled state. When a cause is detected on an interface, the interface is placed in an error-disabled state, an operational state that is similar to a link-down state.		
	the bridge protocol data unit (BPDU) guard, voice	When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For he bridge protocol data unit (BPDU) guard, voice-aware 802.1x security, and port-security features, you can onfigure the switch to shut down only the offending VLAN on the port when a violation occurs, instead of	
	If you set a recovery mechanism for the cause by entering the errdisable recovery global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the shutdown and then the no shutdown commands to manually recover an interface from the error-disabled state.		
	To verify your settings, enter the show errdisable detect privileged EXEC command.		
	This example shows how to enable error-disabled detection for the link-flap error-disabled cause: Device(config)# errdisable detect cause link-flap		
	This command shows how to globally configure BPDU guard for a per-VLAN error-disabled state: Device(config)# errdisable detect cause bpduguard shutdown vlan		
	This command shows how to globally configure voice-aware 802.1x security for a per-VLAN error-disabled state:		
	Device(config)# errdisable detect cause se	ecurity-violation shutdown vlan	
	You can verify your setting by entering the show	errdisable detect privileged EXEC command	

You can verify your setting by entering the show errdisable detect privileged EXEC command.

L

errdisable recovery cause

To enable the error-disabled mechanism to recover from a specific cause, use the **errdisable recovery cause** command in global configuration mode. To return to the default setting, use the **no** form of this command.

errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | security-violation | sfp-config-mismatch | storm-control | udld}

no errdisable recovery cause {all | arp-inspection | bpduguard | channel-misconfig | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | mac-limit | pagp-flap | port-mode-failure | pppoe-ia-rate-limit | psecure-violation | security-violation | sfp-config-mismatch | storm-control | udld}

Syntax Description	all	Enables the timer to recover from all error-disabled causes. Enables the timer to recover from the Address Resolution Protocol (ARP) inspection error-disabled state. Enables the timer to recover from the bridge protocol data unit (BPDU) guard error-disabled state. Enables the timer to recover from the EtherChannel misconfiguration error-disabled state. Enables the timer to recover from the DHCP snooping error-disabled state.	
	arp-inspection		
	bpduguard		
	channel-misconfig		
	dhcp-rate-limit		
	dtp-flap	Enables the timer to recover from the Dynamic Trunking Protocol (DTP) flap error-disabled state.	
	gbic-invalid	Enables the timer to recover from an invalid Gigabit Interface Converter (GBIC) module error-disabled state.	
		Note This error refers to an invalid small form-factor pluggable (SFP) error-disabled state.	
	inline-power	Enables the timer to recover from the Power over Ethernet (PoE) error-disabled state.	
		This keyword is supported only on switches with PoE ports.	
	l2ptguard	Enables the timer to recover from a Layer 2 protocol tunnel error-disabled state.	
	link-flap	Enables the timer to recover from the link-flap error-disabled state.	
	loopback	Enables the timer to recover from a loopback error-disabled state.	
	mac-limit	Enables the timer to recover from the mac limit error-disabled state.	

	pagp-flap	Enables the timer to recover from the Port Aggregation Protocol (PAgP)-flap error-disabled state.
	port-mode-failure	Enables the timer to recover from the port mode change failure error-disabled state.
	pppoe-ia-rate-limit	Enables the timer to recover from the PPPoE IA rate limit error-disabled state.
	psecure-violation	Enables the timer to recover from a port security violation disable state.
	security-violation	Enables the timer to recover from an IEEE 802.1x-violation disabled state.
	sfp-config-mismatch	Enables error detection on an SFP configuration mismatch.
	storm-control	Enables the timer to recover from a storm control error.
	udld	Enables the timer to recover from the UniDirectional Link Detection (UDLD) error-disabled state.
Command Default	Recovery is disabled for all cau	ises.
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	A cause (such as all or BDPU guard) is defined as the reason that the error-disabled state occurred. cause is detected on an interface, the interface is placed in the error-disabled state, an operational stat to link-down state.	
	When a partia array disabled is

errdisable recovery interval

To specify the time to recover from an error-disabled state, use the **errdisable recovery interval** command in global configuration mode. To return to the default setting, use the **no** form of this command.

errdisable recovery interval timer-interval no errdisable recovery interval timer-interval

Syntax Description	<i>timer-interval</i> Time to recover from the error-disabled state. The range is 30 to 86400 seconds. The same interval is applied to all causes. The default interval is 300 seconds.		
Command Default	The default recovery interval is 300 seconds.		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS XE 3.3SE	This command was introduced.	
Usage Guidelines The error-disabled recovery timer is initialized at a random differential from The difference between the actual timeout value and the configured value car configured interval.		6	
	You can verify your settings by entering the show errdisable recovery privileged EXEC command.		
Examples	This example shows how to set the timer to 500 se	conds:	
	Device(config)# errdisable recovery interv	al 500	

interface

To configure an interface, use the interface command.

interface {Auto-Template interface-number | GigabitEthernet switch-number/slot-number/port-number | Group VI Group VI interface number | Internal Interface Internal Interface number | Loopback interface-number Null interface-number Port-channel interface-number TenGigabitEthernet switch-number/slot-number/port-number Tunnel interface-number Vlan interface-number }

Auto-Template interface-number	Enables you to configure a auto-template interface. The range is from 1 to 999.
GigabitEthernet switch-number/slot-number/port-number	Enables you to configure a Gigabit Ethernet IEEE 802.3z interface. The range is from 0 to 9
Group VI Group VI interface number	Enables you to configure a Group VI interface. The range is from 0 to 9.
Internal Interface Internal Interface	Enables you to configure an internal interface.
Loopback interface-number	Enables you to configure a loopback interface. The range is from 0 to 2147483647.
Null interface-number	Enables you to configure a null interface. The default value is 0.
Port-channel interface-number	Enables you to configure a port-channel interface. The range is from 1 to 128.
TenGigabitEthernet switch-number/slot-number/port-number	 Enables you to configure a 10-Gigabit Ethernet interface. <i>switch-number</i> — Switch ID. The range is from 1 to 8. <i>slot-number</i> — Slot number. The range is from 0 to 1. <i>port-number</i> — Port number. The range is from 1 to 24 and 37 to 48
Tunnel interface-number	Enables you to configure a tunnel interface. The range is from 0 to 2147483647.
Vlan interface-number	Enables you to configure a switch VLAN. The range is from 1 to 4094.

Command Default

Command Modes Global configuration

None

Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	You can not use the "	'no" form of this command.
	The following examp	ble shows how to configure a tunnel interface:
	Device# interface	Tunnel 15

interface range

To configure an interface range, use the interface range command.

interface range {Auto-Template interface-number | GigabitEthernet

switch-number/slot-number/port-number | **Loopback** *interface-number* | **Null** *interface-number* | **Port-channel** *interface-number* | **TenGigabitEthernet** *switch-number/slot-number/port-number* | **Tunnel** *interface-number* | **Vlan** *interface-number* }

Auto-Template interface-number	Enables you to configure an auto-template interface. The range is from 1 to 999.
GigabitEthernet switch-number/slot-number/port-number	Enables you to configure a Gigabit Ethernet IEEE 802.3z interface.
	• <i>switch-number</i> — Switch ID. The range is from 1 to 8.
	• slot-number
	— Slot number. The range is from 0 to 1.<i>port-number</i>
	— Port number. The range is from 1 to 48.
Loopback interface-number	Enables you to configure a loopback interface. The range is from 0 to 2147483647.
Null interface-number	Enables you to configure a null interface. The default value is 0.
Port-channel interface-number	Enables you to configure a port-channel interface. The range is from 1 to 128.
TenGigabitEthernet switch-number/slot-number/port-number	Enables you to configure a 10-Gigabit Ethernet interface.
	• <i>switch-number</i> — Switch ID. The range is from 1 to 8.
	• <i>slot-number</i> — Slot number. The range is from 0 to 1.
	• <i>port-number</i> — Port number. The range is from 1 to 24 and 37 to 48.
Tunnel interface-number	Enables you to configure a tunnel interface. The range is from 0 to 2147483647.
Vlan interface-number	Enables you to configure a switch VLAN. The range is from 1 to 4094.

This example shows how you can configure interface range:

Device(config)# interface range vlan 1-100

ip mtu

To set the IP maximum transmission unit (MTU) size of routed packets on all routed ports of the switch or switch stack, use the **ip mtu** command in interface configuration mode. To restore the default IP MTU size, use the no form of this command. ip mtu bytes no ip mtu bytes **Syntax Description** *bytes* MTU size, in bytes. The range is from 68 up to the system MTU value (in bytes). The default IP MTU size for frames received and sent on all switch interfaces is 1500 bytes. **Command Default** Interface configuration **Command Modes Command History** Release Modification Cisco IOS XE 3.3SE This command was introduced. The upper limit of the IP value is based on the switch or switch stack configuration and refers to the currently **Usage Guidelines** applied system MTU value. For more information about setting the MTU sizes, see the system mtu global configuration command. To return to the default IP MTU setting, you can apply the **default ip mtu** command or the **no ip mtu** command on the interface. You can verify your setting by entering the show ip interface interface-id or show interfaces interface-id privileged EXEC command. The following example sets the maximum IP packet size for VLAN 200 to 1000 bytes: Device(config) # interface vlan 200 Device (config-if) # ip mtu 1000 The following example sets the maximum IP packet size for VLAN 200 to the default setting of 1500 bytes: Device (config) # interface vlan 200 Device (config-if) # default ip mtu This is an example of partial output from the **show ip interface** *interface-id* command. It displays the current IP MTU setting for the interface. Device# show ip interface gigabitethernet4/0/1 GigabitEthernet4/0/1 is up, line protocol is up Internet address is 18.0.0.1/24 Broadcast address is 255.255.255.255 Address determined by setup command MTU is 1500 bytes Helper address is not set <output truncated>

ipv6 mtu

I

		TU) size of routed packets on all routed ports of the switch or terface configuration mode. To restore the default IPv6 MTU
	ipv6 mtu bytes no ipv6 mtu bytes	
Syntax Description	bytes MTU size, in bytes. The range is from	1280 up to the system MTU value (in bytes).
Command Default	The default IPv6 MTU size for frames received	d and sent on all switch interfaces is 1500 bytes.
Command Modes	Interface configuration	
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines		d on the switch or switch stack configuration and refers to the information about setting the MTU sizes, see the system mtu
	To return to the default IPv6 MTU setting, you command on the interface.	can apply the default ipv6 mtu command or the no ipv6 mtu
	You can verify your setting by entering the sho privileged EXEC command.	w ipv6 interface interface-id or show interface interface-id

IIdp (interface configuration)

To enable Link Layer Discovery Protocol (LLDP) on an interface, use the **lldp** command in interface configuration mode. To disable LLDP on an interface, use the **no** form of this command.

lldp {med-tlv-select tlv | receive | tlv-select power-management | transmit} no lldp {med-tlv-select tlv | receive | tlv-select power-management | transmit}

Syntax Description	med-tlv-select	Selects an LLDP Media Endpoint Discovery (MED) time-length-value (TLV) element to send.
	tlv	String that identifies the TLV element. Valid values are the following:
		• inventory-management— LLDP MED Inventory Management TLV.
		location— LLDP MED Location TLV.
		• network-policy— LLDP MED Network Policy TLV.
		• power-management— LLDP MED Power Management TLV.
	receive	Enables the interface to receive LLDP transmissions.
	tlv-select	Selects the LLDP TLVs to send.
	power-management	Sends the LLDP Power Management TLV.
	transmit	Enables LLDP transmission on the interface.
Command Default	LLDP is disabled.	
Command Modes	Interface configuration	
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	This command is supported	on 802.1 media types.
	If the interface is configured	as a tunnel port, LLDP is automatically disabled.
	The following example show	ws how to disable LLDP transmission on an interface:
	Device(config)# interfa c Device(config-if)# no 1 :	
	The following example show	ws how to enable LLDP transmission on an interface:
	Device(config)# interfa	ce gigabitethernet1/0/1

Device(config-if) # lldp transmit

logging event power-inline-status

To enable the logging of Power over Ethernet (PoE) events, use the **logging event power-inline-status** command in interface configuration mode. To disable the logging of PoE status events, use the **no** form of this command.

logging event power-inline-status no logging event power-inline-status

Syntax Description	This command has no arguments or keywords.	
Command Default	Logging of PoE events is enabled.	
Command Modes	Interface configuration	
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	The no form of this command does not disable PoE error events.	
Examples	This example shows how to enable logging of PoE events on a port:	
	Device(config-if)# interface gigabitethernet1/0/1 Device(config-if)# logging event power-inline-status Device(config-if)#	

mdix auto

To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the mdix auto command in interface configuration mode. To disable auto-MDIX, use the no form of this command.

mdix auto no mdix auto

This command has no arguments or keywords. Syntax Description

Auto-MDIX is enabled. **Command Default**

Interface configuration **Command Modes**

Command History Release Modification Cisco IOS XE 3.3SE This command was introduced.

Usage Guidelines

When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately.

> When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to auto so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of the connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect.

This example shows how to enable auto-MDIX on a port:

```
Device# configure terminal
Device(config) # interface gigabitethernet1/0/1
Device(config-if) # speed auto
Device(config-if) # duplex auto
Device (config-if) # mdix auto
Device(config-if)# end
```

mode (power-stack configuration)

To configure power stack mode for the power stack, use the **mode** command in power-stack configuration mode. To return to the default settings, use the **no** form of the command.

mode {power-shared | redundant} [strict]
no mode

Syntax Description	power-shared	Sets the power stack to operate in power-shared mode. This is the default.
	redundant	Sets the power stack to operate in redundant mode. The largest power supply is removed from the power pool to be used as backup power in case one of the other power supplies fails.
	strict	(Optional) Configures the power stack mode to run a strict power budget. The stack power needs cannot exceed the available power.
Command Default	The default modes are j	power-shared and nonstrict.
Command Modes	Power-stack configuration	ion
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	This command is availa	able only on switch stacks running the IP Base or IP Services feature set.
	To access power-stack co command.	onfiguration mode, enter the stack-power stack power stack name global configuration
	Entering the no mode c	command sets the switch to the defaults of power-shared and non-strict mode.
Note	stack, available power i	ble power is the total power available for PoE from all power supplies in the power is the power allocated to all powered devices connected to PoE ports in the stack, and actual power consumed by the powered devices.
	as one large power supp	e, all of the input power can be used for loads, and the total available power appears ply. The power budget includes all power from all supplies. No power is set aside for if a power supply fails, load shedding (shutting down of powered devices or switches)
	one of the other power supply. This reduces the	e largest power supply is removed from the power pool to use as backup power in case supplies fails. The available power budget is the total power minus the largest power e available power in the pool for switches and powered devices, but in case of a failure ad, there is less chance of having to shut down switches or powered devices.
	balances the budget thro	ower supply fails and the available power drops below the budgeted power, the system ough load shedding of powered devices, even if the actual power is less than the strict mode, the power stack can run in an over-allocated state and is stable as long as

the actual power does not exceed the available power. In this mode, a powered device drawing more than normal power could cause the power stack to start shedding loads. This is normally not a problem because most devices do not run at full power. The chances of multiple powered devices in the stack requiring maximum power at the same time is small.

In both strict and nonstrict modes, power is denied when there is no power available in the power budget.

This is an example of setting the power stack mode for the stack named power1 to power-shared with strict power budgeting. All power in the stack is shared, but when the total available power is allotted, no more devices are allowed power.

```
Device(config)# stack-power stack power1
Device(config-stackpower)# mode power-shared strict
Device(config-stackpower)# exit
```

This is an example of setting the power stack mode for the stack named power2 to redundant. The largest power supply in the stack is removed from the power pool to provide redundancy in case one of the other supplies fails.

```
Device(config)# stack-power stack power2
Device(config-stackpower)# mode redundant
Device(config-stackpower)# exit
```

network-policy

To apply a network-policy profile to an interface, use the **network-policy** command in interface configuration mode. To remove the policy, use the **no** form of this command.

network-policy *profile-number* **no network-policy**

Syntax Description	<i>profile-number</i> The network-policy profile number to apply to the interface.	
Command Default	No network-policy profiles are applied.	
Command Modes	Interface configuration	
Command History	Release	Modification
	Cisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	Use the network-policy <i>profile number</i> interface config	uration command to apply a profile to an interface.
	You cannot apply the switchport voice vlan command on profile on it. However, if switchport voice vlan <i>vlan-id</i> i a network-policy profile on the interface. The interface the network-policy profile applied.	is already configured on the interface, you can apply
	This example shows how to apply network-policy profile	e 60 to an interface:
	<pre>Device(config)# interface gigabitethernet1/0/1 Device(config-if)# network-policy 60</pre>	

network-policy profile (global configuration)

To create a network-policy profile and to enter network-policy configuration mode, use the **network-policy profile** command in global configuration mode. To delete the policy and to return to global configuration mode, use the **no** form of this command.

network-policy profile profile-number **no network-policy profile** profile-number

Syntax Description *profile-number* Network-policy profile number. The range is 1 to 4294967295.

Command Default No network-policy profiles are defined.

Command Modes Global configuration

Command History	Release	Modification
	Cisco IOS XE 3.3SECisco IOS XE 3.3SE	This command was introduced.

Usage Guidelines Use the network-policy profile global configuration command to create a profile and to enter network-policy profile configuration mode.

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

When you are in network-policy profile configuration mode, you can create the profile for voice and voice signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

This example shows how to create network-policy profile 60:

Device(config)# network-policy profile 60
Device(config-network-policy)#

power efficient-ethernet auto

To enable Energy Efficient Ethernet (EEE) for an interface, use the **power efficient-ethernet auto** command in interface configuration mode. To disable EEE on an interface, use the **no** form of this command.

power efficient-ethernet auto no power efficient-ethernet auto

Syntax Description This command has no arguments or keywords.

Command Default EEE is disabled.

Command Modes Interface configuration

 Command History
 Release
 Modification

 Cisco IOS XE 3.3SE
 This command was introduced.

Usage Guidelines You can enable EEE on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.

The **power efficient-ethernet auto** command is available only if the interface is EEE capable. To check if an interface is EEE capable, use the **show eee capabilities** EXEC command.

When EEE is enabled, the device advertises and autonegotiates EEE to its link partner. To view the current EEE status for an interface, use the **show eee status** EXEC command.

This command does not require a license.

This example shows how to enable EEE for an interface:

```
Device(config-if)# power efficient-ethernet auto
Device(config-if)#
```

This example shows how to disable EEE for an interface:

Device(config-if) # no power efficient-ethernet auto
Device(config-if) #

power-priority

To configure Cisco StackPower power-priority values for a switch in a power stack and for its high-priority and low-priority PoE ports, use the **power-priority** command in switch stack-power configuration mode. To return to the default setting, use the **no** form of the command.

power-priority {high value | low value | switch value}
no power-priority {high | low | switch}

Syntax Description	high value	Sets the power priority for the ports configured as high-priority ports. The range is 1 to 27, with 1 as the highest priority. The high value must be lower than the value set for the low-priority ports and higher than the value set for the switch.
	low value	Sets the power priority for the ports configured as low-priority ports. The range is 1 to 27. The low value must be higher than the value set for the high-priority ports and the value set for the switch.
	switch value	Sets the power priority for the switch. The range is 1 to 27. The switch value must be lower than the values set for the low and high-priority ports.
Command Default	If no values a	are configured, the power stack randomly determines a default priority.
	The default ra	anges are 1 to 9 for switches, 10 to 18 for high-priority ports, 19 to 27 for low-priority ports.
	On non-PoE	switches, the high and low values (for port priority) have no effect.
Command Modes	Switch stack-	-power configuration
Command History	Release	Modification
	Cisco IOS X	XE 3.3SECisco IOS XE 3.3SEThis command was introduced.
Usage Guidelines	To access swi configuration	itch stack-power configuration mode, enter the stack-power switch <i>switch-number</i> global a command.
		ower power-priority values determine the order for shutting down switches and ports when powe ad shedding must occur. Priority values are from 1 to 27; the highest numbers are shut down first
	low priority p configure the	and that you configure different priority values for each switch and for its high priority ports and ports to limit the number of devices shut down at one time during a loss of power. If you try to a same priority value on different switches in a power stack, the configuration is allowed, but you rning message.
	à	
Note	This comman	nd is available only on switch stacks running the IP Base or IP Services feature set.
Examples		mple of setting the power priority for switch 1 in power stack a to 7, for the high-priority

This is an example of setting the power priority for switch 1 in power stack a to 7, for the high-priority ports to 11, and for the low-priority ports to 20.

Device(config)# stack-power switch 1
Device(config-switch-stackpower)# stack-id power_stack_a
Device(config-switch-stackpower)# power-priority high 11
Device(config-switch-stackpower)# power-priority low 20
Device(config-switch-stackpower)# power-priority switch 7
Device(config-switch-stackpower)# exit

power inline

To configure the power management mode on Power over Ethernet (PoE) ports, use the **power inline** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

no power inline {auto | four-pair forced | never | port priority {high | low} | static [max max-wattage]}

Syntax Description	auto	Enables powered-device detection. If enough power is available, automatically allocates power to the PoE port after device detection. Allocation is first-come, first-serve.
	max max-wattage	(Optional) Limits the power allowed on the port. The range is 4000 to 30000 mW. If no value is specified, the maximum is allowed.
	four-pair forced	(Optional) Enable Four-pair PoE without L2 negotiation (Cisco UPOE switches only).
	never	Disables device detection, and disables power to the port.
	port	Configures the power priority of the port. The default priority is low.
	priority { high low }	Sets the power priority of the port. In case of a power supply failure, ports configured as low priority are turned off first and ports configured as high priority are turned off last. The default priority is low.
	static	Enables powered-device detection. Pre-allocates (reserves) power for a port before the switch discovers the powered device. This action guarantees that the device connected to the interface receives enough power.

Command Default

The default is **auto** (enabled).

The maximum wattage is 30,000 mW.

The default port priority is low.

Command DefaultInterface configurationCommand HistoryReleaseModificationCisco IOS XE 3.3SEThis command was introduced.Usage GuidelinesThis command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, this error message appears:Device (config) # interface gigabitethernet1/0/1
Device (config-if) # power inline auto

% Invalid input detected at '^' marker.

In a switch stack, this command is supported on all ports in the stack that support PoE.

Cisco Universal Power Over Ethernet (Cisco UPOE) is a Cisco proprietary technology that extends the IEEE 802.at PoE standard to provide the capability to source up to 60 W of power over standard Ethernet cabling infrastructure (Class D or better) by using the spare pair of an RJ-45 cable (wires 4,5,7,8) with the signal pair (wires 1,2,3,6). Power on the spare pair is enabled when the switch port and end device mutually identify themselves as Cisco UPOE-capable using CDP or LLDP and the end device requests for power to be enabled on the spare pair. When the spare pair is powered, the end device can negotiate up to 60 W of power from the switch using CDP or LLDP. Use the **power inline four-pair forced** command when the end device is PoE-capable on both signal and spare pairs, but does not support the CDP or LLDP extensions required for Cisco UPOE.

Use the **max** *max-wattage* option to disallow higher-power powered devices. With this configuration, when the powered device sends Cisco Discovery Protocol (CDP) messages requesting more power than the maximum wattage, the switch removes power from the port. If the powered-device IEEE class maximum is greater than the maximum wattage, the switch does not power the device. The power is reclaimed into the global power budget.

Note

The switch never powers any class 0 or class 3 device if the **power inline max max-wattage** command is configured for less than 30 W.

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** privileged EXEC command output shows *power-deny*.

Use the **power inline static max** *max-wattage* command to give a port high priority. The switch allocates PoE to a port configured in static mode before allocating power to a port configured in auto mode. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

Examples

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

If a port has a Cisco powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur, placing the port in an error-disabled state.

Use the **power inline port priority {high | low}** command to configure the power priority of a PoE port. Powered devices connected to ports with low port priority are shut down first in case of a power shortage.

You can verify your settings by entering the **show power inline** EXEC command.

This example shows how to enable detection of a powered device and to automatically power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline auto
```

This example shows how to automatically enable power on both signal and spare pairs from switch port Gigabit Ethernet 1/0/1:

```
Device (config) # interface gigabitethernet1/0/1
Device (config-if) # power inline four-pair forced
```

This example shows how to configure a PoE port on a switch to allow a class 1 or a class 2 powered device:

```
Device (config) # interface gigabitethernet1/0/2
Device (config-if) # power inline auto max 7000
```

This example shows how to disable powered-device detection and to not power a PoE port on a switch:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline never
```

This example shows how to set the priority of a port to high, so that it would be one of the last ports to be shut down in case of power supply failure:

```
Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline port priority high
```

power inline police

To enable policing of real-time power consumption on a powered device, use the **power inline police** command in interface configuration mode. To disable this feature, use the **no** form of this command

power inline police [action {errdisable | log}]
no power inline police

Syntax Description	action errdisable		rn off power to the port if the real-time power wer allocation on the port. This is the default action.
	action log		nerate a syslog message while still providing power power consumption exceeds the maximum power
Command Default	Policing of the	real-time power consumption of the power	red device is disabled.
Command Modes	Interface config	guration	
Command History	Release		Modification
	Cisco IOS XE	3.3SE	This command was introduced.
Usage Guidelines	This command	is supported only on the LAN Base image.	
		is supported only on Power over Ethernet (t that does not support PoE, an error messa	(PoE)-capable ports. If you enter this command on ge appears.
		k, this command is supported on all switches ption monitoring.	s or ports in the stack that support PoE and real-time
		of the real-time power consumption is enab e power than the allocated maximum amou	oled, the device takes action when a powered device nt.
			er consumption of the powered device. This feature lso polices the power usage with the <i>power policing</i>
	When power po in this order:	blicing is enabled, the device uses one of the	he these values as the cutoff power on the PoE port
	auto max <i>i</i> 2. The device	max-wattage or the power inline static ma	owed on the port when you enter the power inline <i>max-wattage</i> interface configuration command device by using CDP power negotiation or by the
	power negotiat enabled, the de devices to cons	ion or the device IEEE classification and L fault value of 30 W is applied. However we ume more than 15.4 W of power because v	he device automatically determines it by using CDP LDP power negotiation. If CDP or LLDP are not ithout CDP or LLDP, the device does not allow values from 15400 to 30000 mW are only allocated asumes more than 15.4 W without CDP or LLDP

negotiation, the device might be in violation of the maximum current *Imax* limitation and might experience an *Icut* fault for drawing more current than the maximum. The port remains in the fault state for a time before attempting to power on again. If the port continuously draws more than 15.4 W, the cycle repeats.

When a powered device connected to a PoE+ port restarts and sends a CDP or LLDP packet with a power TLV, the device locks to the power-negotiation protocol of that first packet and does not respond to power requests from the other protocol. For example, if the device is locked to CDP, it does not provide power to devices that send LLDP requests. If CDP is disabled after the device has locked on it, the device does not respond to LLDP power requests and can no longer power on any accessories. In this case, you should restart the powered device.

If power policing is enabled, the device polices power usage by comparing the real-time power consumption to the maximum power allocated on the PoE port. If the device uses more than the maximum power allocation (or *cutoff power*) on the port, the device either turns power off to the port, or the device generates a syslog message and updates the LEDs (the port LEDs are blinking amber) while still providing power to the device.

- To configure the device to turn off power to the port and put the port in the error-disabled state, use the **power inline police** interface configuration command.
- To configure the device to generate a syslog message while still providing power to the device, use the **power inline police action log** command.

If you do not enter the **action log** keywords, the default action is to shut down the port, turn off power to it, and put the port in the PoE error-disabled state. To configure the PoE port to automatically recover from the error-disabled state, use the **errdisable detect cause inline-power** global configuration command to enable error-disabled detection for the PoE cause and the **errdisable recovery cause inline-power interval** *interval global* configuration command to enable the recovery timer for the PoE error-disabled cause.

/ľ Caution

If policing is disabled, no action occurs when the powered device consumes more than the maximum power allocation on the port, which could adversely affect the device.

You can verify your settings by entering the show power inline police privileged EXEC command.

Examples

This example shows how to enable policing of the power consumption and configuring the device to generate a syslog message on the PoE port on a device:

Device(config)# interface gigabitethernet1/0/2
Device(config-if)# power inline police action log

power supply

To configure and manage the internal power supplies on a switch, use the **power supply** command in privileged EXEC mode.

power supply stack-member-number slot $\{A \mid B\}$ {off | on}

Syntax Description	stack-member-number	Stack member number for which to configure the internal possible supplies. The range is 1 to 9, depending on the number of swittin the stack.		
		This parameter is available only on stacking-capable switch		
	slot	Selects the switch power supply to set.		
	A	Selects the power supply in slot A.		
	B	Selects the power supply in slot B.		
		Note Power supply slot B is the closest slot to the outer e of the switch.		
	off Sets the switch power supply to off.			
	on Sets the switch power supply to on.			
Command Default	The switch power supply is on.	The switch power supply is on.		
Command Modes	Privileged EXEC			
Command History	Release Modification			
	Cisco IOS XE 3.3SE	This command was introduced		
<u> </u>	The power supply command applies to a switch or to a switch stack where all switches are the same platfo

1B	Not Present					

show eee

To display Energy Efficient Ethernet (EEE) information for an interface, use the **show eee** command in EXEC mode.

show eee{capabilities| status}interfaceinterface-id

Syntax Description	capabilities	Displays EEE capabilities for the specified interface.			
	status	Displays EEE status information for the specified interface.			
	interface interface-id	Specifies the interface for which to display EEE capabilities or status information.			
Command Default	None				
Command Modes	User EXEC				
	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS XE 3.3SE	This command was introduced.			
Usage Guidelines	You can enable EEE on devices that support low power idle (LPI) mode. Such devices can save power by entering LPI mode during periods of low power utilization. In LPI mode, systems on both ends of the link can save power by shutting down certain services. EEE provides the protocol needed to transition into and out of LPI mode in a way that is transparent to upper layer protocols and applications.				
	To check if an interface is EEE capable, use the show eee capabilities command. You can enable EEE on an interface that is EEE capable by using the power efficient-ethernet auto interface configuration command.				
	To view the EEE status, LPI status, and wake error count information for an interface, use the show eee status command.				
	This is an example of output from the show eee capabilities command on an interface where EEE is enabled:				
	Device# show eee capabilities interface gigabitethernet1/0/1 Gi1/0/1				
	EEE(efficient-ethernet):	yes (100-Tx and 1000T auto) yes (100-Tx and 1000T auto)			
	This is an example of output from the show eee capabilities command on an interface where EEE is not enabled:				
	Device# show eee capabilities interface gigabitethernet2/0/1 Gi2/0/1				
	EEE(efficient-ethernet):	not enabled			

L

Link Partner : not enabled

This is an example of output from the **show eee status** command on an interface where EEE is enabled and operational. The table that follows describes the fields in the display.

```
Device# show eee status interface gigabitethernet1/0/4
Gil/0/4 is up
EEE(efficient-ethernet): Operational
Rx LPI Status : Received
Tx LPI Status : Received
```

This is an example of output from the **show eee status** command on an interface where EEE operational and the ports are in low power save mode:

```
Device# show eee status interface gigabitethernet1/0/3
Gi1/0/3 is up
EEE(efficient-ethernet): Operational
Rx LPI Status : Low Power
Tx LPI Status : Low Power
Wake Error Count : 0
```

This is an example of output from the **show eee status** command on an interface where EEE is not enabled because a remote link partner is incompatible with EEE:

```
Device# show eee status interface gigabitethernet1/0/3
Gil/0/3 is down
EEE(efficient-ethernet): Disagreed
Rx LPI Status : None
Tx LPI Status : None
Wake Error Count : 0
```

Table 1: show eee status Field Descriptions

Field	Description
EEE (efficient-ethernet)	The EEE status for the interface. This field can have any of the following values:
	• N/A—The port is not capable of EEE.
	• Disabled—The port EEE is disabled.
	• Disagreed—The port EEE is not set because a remote link partner might be incompatible with EEE; either it is not EEE capable, or its EEE setting is incompatible.
	• Operational—The port EEE is enabled and operating.
	If the interface speed is configured as 10 Mbps, EEE is disabled internally. When the interface speed moves back to auto, 100 Mbps or 1000 Mbps, EEE becomes active again.

I

Field	Description
Rx/Tx LPI Status	The Low Power Idle (LPI) status for the link partner. These fields can have any of the following values:
	• N/A—The port is not capable of EEE.
	• Interrupted—The link partner is in the process of moving to low power mode.
	• Low Power—The link partner is in low power mode.
	• None— EEE is disabled or not capable at the link partner side.
	• Received—The link partner is in low power mode and there is traffic activity.
	If an interface is configured as half-duplex, the LPI status is None, which means the interface cannot be in low power mode until it is configured as full-duplex.
Wake Error Count	The number of PHY wake-up faults that have occurred. A wake-up fault can occur when EEE is enabled and the connection to the link partner is broken.
	This information is useful for PHY debugging.

show env

To display fan, temperature, and power information, use the show env command in EXEC mode.

show env {all | fan | power [{all | switch [stack-member-number]}] | stack [stack-member-number] |
temperature [status]}

Syntax Description	all	Displays the fan and temperature environmental status and the status of the internal power supplies.		
	fan	Displays the switch fan status.		
	power	Displays the internal power status of the active switch.		
	all	(Optional) Displays the status of all the internal power supplies in a standalone switch when the command is entered on the switch, or in all the stack members when the command is entered on the active switch.		
	switch	(Optional) Displays the status of the internal power supplies for each switch in the stack or for the specified switch. This keyword is available only on stacking-capable switches.		
	stack-member-number	(Optional) Number of the stack member for which to display the status of the internal power supplies or the environmental status.		
		The range is 1 to 9.		
	stack	Displays all environmental status for each switch in the stack or for the specified switch.		
		This keyword is available only on stacking-capable switches.		
	temperature	Displays the switch temperature status.		
	status	(Optional) Displays the switch internal temperature (not the external temperature) and the threshold values.		
Command Default	None			
Command Modes	User EXEC			
	Privileged EXEC			
Command History	Release	Modification		
	Cisco IOS XE 3.3SE	This command was introduced.		
Usage Guidelines		ommand to display the information for the switch being accessed—a standalone Jse this command with the stack and switch keywords to display all information fied stack member.		

If you enter the **show env temperature status** command, the command output shows the switch temperature state and the threshold level.

You can also use the **show env temperature** command to display the switch temperature status. The command output shows the green and yellow states as *OK* and the red state as *FAULTY*. If you enter the **show env all** command, the command output is the same as the **show env temperature status** command output.

Examples

This is an example of output from the show env all command:

Device> show env all					
Switch 1 FAN 1 is OK					
Switch 1 FAN 2 is OK					
Switch 1 FAN 3 is OK					
FAN PS-1 is NOT PRESENT					
FAN PS-2 is OK					
Switch 1: SYSTEM TEMPER.	ATURE is OK				
SW PID	Serial#	Status	Sys Pwr	PoE Pwr	Watts
1A Not Present					
1B PWR-C1-715WAC	LIT150119Z1	OK	Good	Good	715
Device> show env all					
Switch 1 FAN 1 is OK					
Switch 1 FAN 2 is OK					
Switch 1 FAN 3 is OK					
FAN PS-1 is OK					
FAN PS-2 is NOT PRESENT					
Switch 1: SYSTEM TEMPER	ATURE is OK				
SW PID	Serial#	Status	Svs Pwr	PoE Pwr	Watts
			-		
1A PWR-C2-250WAC	LIT16372A1M	OK	Good	Good	250
1B Not Present					

This is an example of output from the show env fan command:

```
Device>show env fan
Switch 1 FAN 1 is OK
Switch 1 FAN 2 is OK
Switch 1 FAN 3 is OK
FAN PS-1 is NOT PRESENT
FAN PS-2 is OK
```

This is an example of output from the show env power command:

Device>show env power					
SW PID Serial# Status Sys Pwr	PoE Pwr	Watts			
1A Not Present 1B PWR-C1-715WAC LIT150119Z1 OK Good	Good	715			

This is an example of output from the **show env power all** command on the active switch:

Dev	ice# show env power	all				
SW	PID	Serial#	Status	Sys Pwr	PoE Pwr	Watts
1A	Not Present					

L

1В	PWR-C1-715WAC	LIT150119Z1	OK	Good	Good	715
Dev	ice# show env power	all				
SW	PID	Serial#	Status	Sys Pwr	PoE Pwr	Watts
1A	PWR-C2-250WAC	LIT16372A1M	OK	Good	Good	250
1B	Not Present					

This is an example of output from the **show env stack** command on the active switch:

```
Device> show env stack

SWITCH: 1

Switch 1 FAN 1 is OK

Switch 1 FAN 2 is OK

Switch 1 FAN 3 is OK

FAN PS-1 is NOT PRESENT

FAN PS-2 is OK

Switch 1: SYSTEM TEMPERATURE is OK

Temperature Value: 28 Degree Celsius

Temperature State: GREEN

Yellow Threshold : 41 Degree Celsius

Red Threshold : 56 Degree Celsius
```

This example shows how to display the temperature value, state, and the threshold values on a standalone switch. The table describes the temperature states in the command output.

```
Device> show env temperature status
Temperature Value: 33 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 65 Degree Celsius
Red Threshold : 75 Degree Celsius
```

Table 2: States in the show env temperature status Command Output

State	Description
Green	The switch temperature is in the <i>normal</i> operating range.
Yellow	The temperature is in the <i>warning</i> range. You should check the external temperature around the switch.
Red	The temperature is in the <i>critical</i> range. The switch might not run properly if the temperature is in this range.

show errdisable detect

To display error-disabled detection status, use the show errdisable detect command in EXEC mode.

	show errdisable detect				
Syntax Description	This command has no arguments or keywords.				
Command Default	None				
Command Modes	User EXEC				
	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS XE 3.3SE	This command was introduced.			
Usage Guidelines	A gbic-invalid error reason refers to an invalid sma	ll form-factor pluggable (SFP) module.			
	The error-disable reasons in the command output are listed in alphabetical order. The mode colum how error-disable is configured for each feature.				
	You can configure error-disabled detection in these	modes:			
	• port mode—The entire physical port is error-d	isabled if a violation occurs.			
	• vlan mode—The VLAN is error-disabled if a	violation occurs.			
	• port/vlan mode—The entire physical port is error	or-disabled on some ports and is per-VLAN error-disabled			

Device> show errdisable detect					
ErrDisable Reason	Detection	Mode			
arp-inspection	Enabled	port			
bpduguard	Enabled	vlan			
channel-misconfig	Enabled	port			
community-limit	Enabled	port			
dhcp-rate-limit	Enabled	port			
dtp-flap	Enabled	port			
gbic-invalid	Enabled	port			
inline-power	Enabled	port			
invalid-policy	Enabled	port			
l2ptguard	Enabled	port			
link-flap	Enabled	port			
loopback	Enabled	port			
lsgroup	Enabled	port			
pagp-flap	Enabled	port			
psecure-violation	Enabled	port/vlan			
security-violatio	Enabled	port			
sfp-config-mismat	Enabled	port			
storm-control	Enabled	port			
udld	Enabled	port			

on other ports.

show errdisable recovery

To display the error-disabled recovery timer information, use the **show errdisable recovery** command in EXEC mode.

show errdisable recovery

Syntax Description	This command has no arguments or keywords	
Command Default	None	
Command Modes	User EXEC	
	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	A gbic-invalid error-disable reason refers to a	n invalid small form-factor pluggable (SFP) module interface.
Note	Though visible in the output, the unicast-flood	l field is not valid.

This is an example of output from the show errdisable recovery command:

Device> show errdisa ErrDisable Reason	_
udld	Disabled
bpduguard	Disabled
security-violatio	Disabled
channel-misconfig	Disabled
pagp-flap	Disabled
dtp-flap	Disabled
link-flap	Enabled
l2ptguard	Disabled
psecure-violation	Disabled
gbic-invalid	Disabled
dhcp-rate-limit	Disabled
unicast-flood	Disabled
storm-control	Disabled
arp-inspection	Disabled
loopback	Disabled
Timer interval:300 s	
Interfaces that will	be enabled at the next timeout:
Interface Errdisa	ble reason Time left(sec)
Gi1/0/2 link-	flap 279

show interfaces

To display the administrative and operational status of all interfaces or for a specified interface, use the **show interfaces** command in privileged EXEC mode.

show interfaces [{interface-id | vlan vlan-id}] [{accounting | capabilities [module number] | debounce | description | etherchannel | flowcontrol | private-vlan mapping | pruning | stats | status [{err-disabled}] | trunk}]

Syntax Description	interface-id	(Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channels. The port channel range is 1 to 48.
	vlan vlan-id	(Optional) VLAN identification. The range is 1 to 4094.
	accounting	(Optional) Displays accounting information on the interface, including active protocols and input and output packets and octets.
		Note The display shows only packets processed in software; hardware-switched packets do not appear.
	capabilities	(Optional) Displays the capabilities of all interfaces or the specified interface, including the features and options that you can configure on the interface. Though visible in the command line help, this option is not available for VLAN IDs.
	module number	(Optional) Displays capabilities of all interfaces on the switch or specified stack member.
		This option is not available if you entered a specific interface ID.
	description	(Optional) Displays the administrative status and description set for an interface.
	etherchannel	(Optional) Displays interface EtherChannel information.
	flowcontrol	(Optional) Displays interface flow control information.
	private-vlan mapping	(Optional) Displays private-VLAN mapping information for the VLAN switch virtual interfaces (SVIs). This keyword is not available if the switch is running the LAN base feature set.
	pruning	(Optional) Displays trunk VTP pruning information for the interface.
	stats	(Optional) Displays the input and output packets by switching the path for the interface.
	status	(Optional) Displays the status of the interface. A status of unsupported in the Type field means that a non-Cisco small form-factor pluggable (SFP) module is inserted in the module slot.

	err-disabled	(Optional) Displays interfaces in an error-disabled state.
	trunk	(Optional) Displays interface trunk information. If you do not specify an interface, only information for active trunking ports appears.
Note	Though visible in the comma	nd-line help strings, the crb, fair-queue, irb, mac-accounting, precedence,
	random-detect, rate-limit, a	nd shape keywords are not supported.
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	The show interfaces capabil	ities command with different keywords has these results:
	• Use the show interfaces	kk. If there is no switch with that module number in the stack, there is no output <i>interface-id</i> capabilities to display the capabilities of the specified interface capabilities (with no module number or interface ID) to display the capabilities ack.
	This is an example of output 3:	from the show interfaces command for an interface on stack member
	Hardware is Gigabit Eth MTU 1500 bytes, BW 1000 reliability 255/255, Encapsulation ARPA, loc Keepalive set (10 sec) Auto-duplex, Auto-speed input flow-control is of ARP type: ARPA, ARP Tin Last input never, output Last clearing of "show Input queue: 0/2000/0/0 Queueing strategy: fifz Output queue: 0/40 (siz 5 minute input rate 0 k 5 minute output rate 0 0 packets input, 0 k Received 0 broadcast	down, line protocol is down (notconnect) hernet, address is 2037.064d.4381 (bia 2037.064d.4381) 0000 Kbit/sec, DLY 10 usec, , txload 1/255, rxload 1/255 opback not set d, media type is 10/100/1000BaseTX off, output flow-control is unsupported meout 04:00:00 ut never, output hang never interface" counters never 0 (size/max/drops/flushes); Total output drops: 0 o ze/max) oits/sec, 0 packets/sec bits/sec, 0 packets/sec oytes, 0 no buffer

0 output errors, 0 collisions, 1 interface resets 0 unknown protocol drops 0 babbles, 0 late collision, 0 deferred 0 lost carrier, 0 no carrier, 0 pause output 0 output buffer failures, 0 output buffers swapped out

This is an example of output from the **show interfaces** *interface* **description** command when the interface has been described as *Connects to Marketing* by using the **description** interface configuration command:

Device# show interfaces	gigabitethernet1/0/2	descripti	on
Interface	Status	Protocol	Description
Gi1/0/2	up	down	Connects to Marketing

This is an example of output from the **show interfaces** *interface-id* **pruning** command when pruning is enabled in the VTP domain:

```
Device# show interfaces gigabitethernet1/0/2 pruning

Port Vlans pruned for lack of request by neighbor

Gil/0/2 3,4

Port Vlans traffic requested of neighbor

Gil/0/2 1-3
```

This is an example of output from the **show interfaces stats** command for a specified VLAN interface:

Device# show interfaces vlan 1 stats							
Switching path	Pkts In	Chars In	Pkts Out	Chars Out			
Processor	1165354	136205310	570800	91731594			
Route cache	0	0	0	0			
Total	1165354	136205310	570800	91731594			

These are examples of output from the **show interfaces status** command for a specific interface when private VLANs are configured. Port 22 is configured as a private-VLAN host port. It is associated with primary VLAN 20 and secondary VLAN 25:

Device# :	show interf	aces gigabite	ethernet1,	/0/22 status		
Port	Name	Status	Vlan	Duplex	Speed	Туре
Gi1/0/22		connected	20,25	a-full	a-100	10/100BaseTX

In this example, port 20 is configured as a private-VLAN promiscuous port. The display shows only the primary VLAN 20:

Device#	show interf	faces gigabite	thernet:	1/0/20 status		
Port	Name	Status	Vlan	Duplex	Speed	Туре
Gi1/0/20)	connected	20	a-full	a-100	10/100BaseTX

This is an example of output from the **show interfaces status err-disabled** command. It displays the status of interfaces in the error-disabled state:

Device#	show interf	faces status erm	-disabled
Port	Name	Status	Reason
Gi1/0/2		err-disabled	gbic-invalid
Gi2/0/3		err-disabled	dtp-flap

This is an example of output from the **show interfaces** *interface-id* **pruning** command:

Device#	show inte	rfaces g	igabitethe	rnet1,	/0/2 pruning
Port Vla	ans pruned	for lac	k of reque	st by	neighbor

Device#	show	interfaces	gigabitethernet1/0/1	trunk
---------	------	------------	----------------------	-------

Port Gi1/0/1	Mode on	Encapsulation 802.1q	Status other	Native vlan 10
Port Gil/0/1	Vlans allowed on none	trunk		
Port Gil/0/1	Vlans allowed an none	d active in man	agement domain	
Port Gil/0/1	Vlans in spannin none	g tree forwardi	ng state and n	ot pruned

I

show interfaces counters

To display various counters for the switch or for a specific interface, use the **show interfaces counters** command in privileged EXEC mode.

show interfaces [interface-id] counters [{errors | etherchannel | module stack-member-number | protocol status | trunk}]

Syntax Description	interface-id	(Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.					
	errors	(Optional) Displays error counters. (Optional) Displays EtherChannel counters, including octets, broadcast packets, multicast packets, and unicast packets received and sent.					
	etherchannel						
	module	(Optional) Displays counters for the specified stack member.					
	stack-member-number	Note In this command, the module keyword refers to the stack member number. The module number that is part of the interface ID is always zero.					
	protocol status	protocol status (Optional) Displays the status of protocols enabled on interfaces.					
	trunk	(Optional) Displays trunk counters.					
	l						
Note	Though visible in the com	mand-line help string, the vlan <i>vlan-id</i> keyword is not supported.					
Command Default	None						
Command Modes	Privileged EXEC						
Command History	Release	Modification					
	Cisco IOS XE 3.3SE	This command was introduced.					
Usage Guidelines	If you do not enter any key	ywords, all counters for all interfaces are included.					
Usage Guidelines		ywords, all counters for all interfaces are included. ial output from the show interfaces counters command. It displays all					

<output truncated>

This is an example of partial output from the **show interfaces counters module** command for stack member 2. It displays all counters for the specified switch in the stack.

Device# show	interfaces cou	inters module 2		
Port	InOctets	InUcastPkts	InMcastPkts	InBcastPkts
Gi1/0/1	520	2	0	0
Gi1/0/2	520	2	0	0
Gi1/0/3	520	2	0	0
Gi1/0/4	520	2	0	0

<output truncated>

This is an example of partial output from the **show interfaces counters protocol status** command for all interfaces:

```
Device# show interfaces counters protocol status
Protocols allocated:
Vlan1: Other, IP
Vlan20: Other, IP, ARP
Vlan30: Other, IP, ARP
Vlan40: Other, IP, ARP
Vlan50: Other, IP, ARP
Vlan60: Other, IP, ARP
Vlan70: Other, IP, ARP
Vlan80: Other, IP, ARP
Vlan90: Other, IP, ARP
Vlan900: Other, IP, ARP
Vlan3000: Other, IP
Vlan3500: Other, IP
GigabitEthernet1/0/1: Other, IP, ARP, CDP
GigabitEthernet1/0/2: Other, IP
GigabitEthernet1/0/3: Other, IP
GigabitEthernet1/0/4: Other, IP
GigabitEthernet1/0/5: Other, IP
GigabitEthernet1/0/6: Other, IP
GigabitEthernet1/0/7: Other, IP
GigabitEthernet1/0/8: Other, IP
GigabitEthernet1/0/9: Other, IP
GigabitEthernet1/0/10: Other, IP, CDP
```

<output truncated>

This is an example of output from the **show interfaces counters trunk** command. It displays trunk counters for all interfaces.

Device# show interfaces counters trunk							
Port	TrunkFramesTx	TrunkFramesRx	WrongEncap				
Gi1/0/1	0	0	0				
Gi1/0/2	0	0	0				
Gi1/0/3	80678	0	0				
Gi1/0/4	82320	0	0				
Gi1/0/5	0	0	0				

<output truncated>

show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings, use the **show interfaces switchport** command in privileged EXEC mode.

show interfaces [interface-id] switchport [{module number}]

Syntax Description	<i>interface-id</i> (Optional) ID of the interface. Valid interfaces include physical ports (including type, stack member for stacking-capable switches, module, and port number) and port channel. The port channel range is 1 to 48.				
	module number	(Optional) Displays switchport configuration of all interfaces on the switch or specified stack member.			
		This option is not available if you entered a specific interface ID.			
Command Default	None				
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS XE 3.3	SE This command was introduced.			
	no output. This is an example	It switch in the stack. If there is no switch with that module number in the stack, there is of output from the show interfaces switchport command for a port. The table bes the fields in the display.			
Note	Private VLANs are	not supported in this release, so those fields are not applicable.			
	Name: Gi1/0/1 Switchport: Enak Administrative M Operational Mode Administrative T Negotiation of T Access Mode VLAN Trunking Native Administrative M Voice VLAN: none Administrative M Administrative M Administrative M Administrative M Administrative M	ode: trunk : down runking Encapsulation: dotlq runking: On

Protected: false Unknown unicast blocked: disabled Unknown multicast blocked: disabled Appliance trust: none

Field	Description
Name	Displays the port name.
Switchport	Displays the administrative and operational status of the port. In this display, the port is in switchport mode.
Administrative Mode	Displays the administrative and operational modes.
Operational Mode	
Administrative Trunking Encapsulation Operational Trunking Encapsulation Negotiation of Trunking	Displays the administrative and operational encapsulation method and whether trunking negotiation is enabled.
Access Mode VLAN	Displays the VLAN ID to which the port is configured.
Trunking Native Mode VLAN Trunking VLANs Enabled Trunking VLANs Active	Lists the VLAN ID of the trunk that is in native mode. Lists the allowed VLANs on the trunk. Lists the active VLANs on the trunk.
Pruning VLANs Enabled	Lists the VLANs that are pruning-eligible.
Protected	Displays whether or not protected port is enabled (True) or disabled (False) on the interface.
Unknown unicast blocked	Displays whether or not unknown multicast and
Unknown multicast blocked	unknown unicast traffic is blocked on the interface.
Voice VLAN	Displays the VLAN ID on which voice VLAN is enabled.
Appliance trust	Displays the class of service (CoS) setting of the data packets of the IP phone.

show interfaces transceiver

To display the physical properties of a small form-factor pluggable (SFP) module interface, use the **show interfaces transceiver** command in EXEC mode.

show interfaces [*interface-id*] transceiver [{detail | module *number* | properties | supported-list | threshold-table}]

Suntax Description								
Syntax Description	<i>interface-id</i> (Optional) ID of the physical interface, including type, stack member (stacking-capable switches only) module, and port number.							
	detail	etail (Optional) Displays calibration properties, including high and low numbers and any alarm information for any Digital Optical Monitoring (DoM)-capable transceiver if one is installed in the switch.						
	module <i>number</i> (Optional) Limits display to interfac					nodule on th	e switch.	
		The rang	ge is 1 to 9					
		This opt	ion is not a	available if	you entered a	a specific into	erface ID.	
	properties (Optional) Displays speed, duplex, and inline power settings on an interface.							
	supported-list	supported-list (Optional) Lists all supported transceivers.						
	threshold-table (Optional) Displays alarm and warning threshold table.							
Command Modes	User EXEC							
	Drivilaged EVEC							
	Privileged EXEC

Related Commands

Command	Description
transceiver type all	Enters the transceiver type configuration mode.
monitoring	Enables digital optical monitoring.

show memory platform

To display memory statistics of a platform, use the **show memory platform** command in privileged EXEC mode.

show memory platform [{compressed-swap | information | page-merging}]

Syntax Description	compressed-swap	(Optional) Displays platform memory compressed-swap information.
information		(Optional) Displays general information about the platform.
	page-merging	(Optional) Displays platform memory page-merging information.
Command Modes	Privileged EXEC (#)
Command History	Release	Modification
	Cisco IOS XE Dena 16.1.1	ali This command was introduced.
Usage Guidelines	the underlying Linux	E Denali 16.3.1, the Free Memory displayed in the command output was obtained from k kernel. This value was not accurate because some memory chunks that was available idered as free memory.
	In Cisco IOS XE De field of the command	nali 16.3.1, the free memory is accurately computed and displayed in the Free Memo d output.
Examples	The following is san	nple output from the show memory platform command:
	Switch# show memo	ry platform
	Virtual memory Pages resident Major page faul Minor page faul	ts: 2220
	Architecture Memory (kB) Physical Total Used Free Active Inactive Inact-dirty Inact-clean Dirty AnonPages Bounce Cached Commit Limit Committed As High Total High Free	<pre>: mips64 : 3976852 : 3976852 : 2761276 : 1215576 : 2128196 : 1581856 : 0 : 0 : 0 : 0 : 0 : 1294984 : 0 : 1978168 : 1988424 : 3343324 : 0 : 0</pre>

Interface and Hardware Commands

show module

To display module information such as switch number, model number, serial number, hardware revision number, software version, MAC address and so on, use this command in user EXEC or privileged EXEC mode.

show module [{switch-num}]

Syntax Description	switch-num	(Optional) Number of the switch.
Command Default	None	
Command Modes	User EXEC (>)	
	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Denali 16.1.1	This command was introduced.
Usage Guidelines	Entering the show module of module all command.	ommand without the <i>switch-num</i> argument is the same as entering the show
Examples	This example shows how to c switch:	splay information for all the modules on a Cisco Catalyst 3850 Series

show mgmt-infra trace messages ilpower

To display inline power messages within a trace buffer, use the **show mgmt-infra trace messages ilpower** command in privileged EXEC mode.

show mgmt-infra trace messages ilpower [switch stack-member-number]

 Syntax Description
 switch stack-member-number (Optional) Specifies the stack member number for which to display inline power messages within a trace buffer.

 Command Default
 None

Command Default None

Command Modes Privileged EXEC

Command History Release		Modification
	Cisco IOS XE 3.3SE	This command was introduced.

This is an output example from the **show mgmt-infra trace messages ilpower** command:

```
Device# show mgmt-infra trace messages ilpower

show mgmt-infra trace messages ilpower-ha

To display inline power high availability messages within a trace buffer, use the **show mgmt-infra trace messages ilpower-ha** command in privileged EXEC mode.

show mgmt-infra trace messages ilpower-ha [switch stack-member-number]

 Syntax Description
 switch
 stack-member-number
 (Optional)
 Specifies the stack member number for which to display inline power messages within a trace buffer.

Command Default None

Command Modes Privileged EXEC

 Command History
 Release
 Modification

 Cisco IOS XE 3.3SE
 This command was introduced.

This is an output example from the show mgmt-infra trace messages ilpower-ha command:

Device# show mgmt-infra trace messages ilpower-ha [10/23/12 14:04:48.087 UTC 1 3] NG3K_ILPOWER_HA: Created NGWC ILP CF client succ essfully. I

This command was introduced.

show mgmt-infra trace messages platform-mgr-poe

To display platform manager Power over Ethernet (PoE) messages within a trace buffer, use the **show mgmt-infra trace messages platform-mgr-poe** privileged EXEC command.

show mgmt-infra trace messages platform-mgr-poe [switch stack-member-number]

 Syntax Description
 switch stack-member-number
 (Optional) Specifies the stack member number for which to display messages within a trace buffer.

 Command Default
 None

 Command Modes
 Privileged EXEC

 Command History
 Release

Cisco IOS XE 3.3SE

This is an example of partial output from the **show mgmt-infra trace messages platform-mgr-poe** command:

show network-policy profile

To display the network-policy profiles, use the **show network policy profile** command in privileged EXEC mode.

show network-policy profile [profile-number] [detail]

Syntax Description	<i>profile-number</i> (Optional) Displays the network-policy profile number. If no profile is entered, all network-policy profiles appear.		
	detail	(Optional) Displays detailed status and statistics information.	
Command Default	None		
Command Modes	Privileged E	XEC	
Command History	Release	Modification	
	Cisco IOS 2	KE 3.3SEThis command was introduced.	

This is an example of output from the show network-policy profile command:

```
Device# show network-policy profile
Network Policy Profile 10
voice vlan 17 cos 4
Interface:
none
Network Policy Profile 30
voice vlan 30 cos 5
Interface:
none
Network Policy Profile 36
voice vlan 4 cos 3
Interface:
Interface_id
```

show platform hardware fed switch forward

To display device-specific hardware information, use the **show platform hardware fed switch** *switch_number* command.

This topic elaborates only the forwarding-specific options, that is, the options available with the **show platform** hardware fed switch $\{switch | num | active | standby \}$ forward summary command.

The output of the **show platform hardware fed switch** *switch_number* **forward summary** displays all the details about the forwarding decision taken for the packet.

show platform hardware fed switch {switch_num | active | standby} forward summary

Syntax Description	<pre>switch {switch_num active standby }</pre>	The switch for which you want to display information. You have the following options :			
		• <i>switch_num</i> —ID of the switch.			
		• active—Displays information relating to the active switch.			
		• standby —Displays information relating to the standby switch, if available.			
	forward summary	Displays packet forwarding information.			
Command Modes	Privileged EXEC				
Command History	Release	Modification			
	Cisco IOS XE 3.3SE	This command was introduced.			
Usage Guidelines	Do not use this command unless a technical support representative asks you to. Use this command only when you are working directly with a technical support representative while troubleshooting a problem.				
	Fields displayed in the command output are explained below.				
	• Station Index : The Station Index is the result of the layer 2 lookup and points to a station descriptor which provides the following:				
	 Destination Index : Determines the egress port(s) to which the packets should be sent to. Global Port Number(GPN) can be used as the destination index. A destination index with15 down to 12 bits set indicates the GPN to be used. For example, destination index - 0xF04E corresponds to GPN - 78 (0x4e). 				
	• Rewrite Index : Determines what needs to be done with the packets. For layer 2 switching, this is typically a bridging action				
	 Flexible Lookup Pipelir packet - routing or bridg 	ne Stages(FPS) : Indicates the forwarding decision that was taken for the ging			
	• Replication Bit Map : D	etermines if the packets should be sent to CPU or stack			
	• Local Data Copy =	. 1			

- Remote Data copy = 0
- Local CPU Copy = 0
- Remote CPU Copy = 0

Example

This is an example of output from the **show platform hardware fed switch** {*switch_num* | **active** | **standby** } **forward summary** command.

show platform resources

To display platform resource information, use the **show platform reources** command in privileged EXEC mode.

show platform resources

This command has no arguments or keywords.

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Denali 16.1.1	This command was introduced.

Usage Guidelines The output of this command displays the used memory, which is total memory minus the accurate free memory.

Example

The following is sample output from the show platform resources command:

Switch# show platform resources

**State Acronym: H - Healthy, W - Warning, C - Critical

Resource State	Usage	Max	Warning	Critical
Control Processor H	7.20%	100%	90%	95%
DRAM H	2701MB(69%)	3883MB	90%	95%

show platform software ilpower

To display the inline power details of all the PoE ports on the device, use the **show platform software ilpower** command in privileged EXEC mode.

show platform software ilpower {details | port {GigabitEthernet interface-number } | system
slot-number }

Syntax Description	details	Displays inline power details for all the interfaces.	
	port	Displays inline power port configuration. The GigabitEthernet interface number. Values range from 0 to 9.	
	GigabitEthernet interface-number		
	system slot-number	Displays inline power system configuration.	
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	Cisco IOS XE Denali 16.3.2	This command was modified. The keyword details argument was added.	
	Cisco IOS XE Denali 16.1.1	The command was introduced.	
		NO NO NO NO NULL NULL LILP_DETECTING_S	
	Requested Power in milli wa Short Circuit Detected: Short Circuit Count: Cisco Powerd Device Detect Spare Pair mode: 0 IEEE Detect: Stop IEEE Short: Stop	0 O Count: 0	

Signal Pair Power allocation in milli watts: 0 Spare Pair Power On: 0 Powered Device power state: 0 Timer: Power Good: Stopped Power Denied: Stopped Cisco Powered Device Detect: Stopped

show platform software process list

To display the list of running processes on a platform, use the **show platform software process list** command in privileged EXEC mode.

show platform software process list switch {switch-number | active | standby} {0 | F0 | R0} [{name process-name | process-id process-ID | sort memory | summary}]

Syntax Description	switch switch-number	Displays information about the switch. Valid values for <i>switch-number</i> argument are from 0 to 9.			
	active	Displays information about the active instance of the switch.			
	standby	Displays information about the standby instance of the switch.			
	0	Displays information about the shared port adapters (SPA) Interface Processor slot 0.			
	FO	Displays information about the Embedded Service Processor (ESP) slot 0.			
	R0	Displays information about the Route Processor (RP) slot 0.			
	name process-name	(Optional) Displays information about the specified process.			
	process-id process-ID	(Optional) Displays information about the specified process ID.			
	sort	(Optional) Displays information sorted according to processes.			
	memory	(Optional) Displays information sorted according to memory.			
	summary	(Optional) Displays a summary of the process memory of the host device.			
Command Modes	Privileged EXE (#)				
Command History	Release	Modification			
	Cisco IOS XE Denali 1	6.1.1 The command was introduced.			
Usage Guidelines	Prior to Cisco IOS XE Denali 16.3.1, the Free Memory displayed in the command output was obtained from the underlying Linux kernel. This value was not accurate because some memory chunks that was available for use was not considered as free memory.				
	In Cisco IOS XE Denali 16.3.1, the free memory is accurately computed and displayed in the Free Memory field of the command output.				
Examples	The following is sample output from the show platform software process list switch active R0 command:				
	Switch# show platform software process list switch active R0 summary

show platform software process slot switch

To display platform software process switch information, use the **show platform software process slot switch** command in privileged EXEC mode.

show platform software process slot switch {switch-number | active | standby} {0 | F0 | R0} monitor [{cycles no-of-times [{interval delay [{lines number}]}]}]

Contra Description			
Syntax Description	switch-number		Switch number.
	active		Specifies the active instance.
	standby		Specifies the standby instance.
	0		Specifies the shared port adapter (SPA) interface processor slot 0.
	FO		Specifies the Embedded Service Processor (ESP) slot 0.
	R0		Specifies the Route Processor (RP) slot 0.
	monitor		Monitors the running processes.
	cycles no-of-tmes		(Optional) Sets the number of times to run monitor command. Valid values are from 1 to 4294967295. The default is 5.
	interval delay		(Optional) Sets a delay after each . Valid values are from 0 to 300. The default is 3.
	lines number		(Optional) Sets the number of lines of output displayed. Valid values are from 0 to 512. The default is 0.

show processes cpu platform monitor

To displays information about the CPU utilization of the IOS-XE processes, use the **show processes cpu platform monitor** command in privileged EXEC mode.

show processes cpu platform monitor location switch {switch-number | active | standby} $\{0 | F0 | R0\}$

Syntax Description	location	Displays information about the Field Replaceable Unit (FRU) location.
	switch	Specifies the switch.
	switch-number	Switch number.
	active	Specifies the active instance.
	standby	Specifies the standby instance.
	0	Specifies the shared port adapter (SPA) interface processor slot 0.
	FO	Specifies the Embedded Service Processor (ESP) slot 0.
	R0	Specifies the Route Processor (RP) slot 0.
Command Modes	Privileged EXE	EC (#)
Command History	Release	Modification

show processes memory platform

To display memory usage per Cisco IOS XE process, use the **show processes memory platform** command in privileged EXEC mode.

 $\begin{array}{l} show \ processes \ memory \ platform \ [\{detailed \ \{name \ process-name \ | \ process-id \ process-ID\} \ [\{location \ | \ maps \ [\{location\}] \ | \ smaps \ [\{location\}]\} \ | \ location \ | \ sorted \ [\{location\}]\} \ switch \ \{switch-number \ | \ active \ | \ standby \ \{0 \ | \ F0 \ | \ R0\} \ \end{array}$

Syntax Description (Optional) Displays detailed memory information for detailed process-name a specified Cisco IOS XE process. (Optional) Matches the Cisco IOS XE process name. name process-name (Optional) Matches the Cisco IOS XE process ID. process-id process-ID location (Optional) Displays information about the FRU location. maps (Optional) Displays memory maps of a process. (Optional) Displays smaps of a process. smaps (Optional) Displays the sorted output based on the sorted total memory used by Cisco IOS XE processes. switch switch-number Displays information about the device. active Displays information about the active instance of the switch. standby Displays information about the standby instance of the switch. 0 Displays information about the SPA-Inter-Processor slot 0. FO Displays information about the Embedded Service Processor (ESP) slot 0. R0 Displays information about the Route Processor (RP) slot 0. Privileged EXEC (#) **Command Modes Command History** Release Modification

nercuse	Mounication
Cisco IOS XE Denali 16.1.1	The command was introduced.

Usage Guidelines Prior to Cisco IOS XE Denali 16.3.1, the Free Memory displayed in the command output was obtained from the underlying Linux kernel. This value was not accurate because some memory chunks that was available for use was not considered as free memory.

In Cisco IOS XE Denali 16.3.1, the free memory is accurately computed and displayed in the Free Memory field of the command output.

show power inline

To display the Power over Ethernet (PoE) status for the specified PoE port, the specified stack member, or for all PoE ports in the switch stack, use the **show power inline** command in EXEC mode.

show power inline [{police | priority}] [{interface-id | module stack-member-number}] [detail]

Syntax Description	police					splays the power er consumption.	r policing information about
	priority				(Optional) Dis	splays the power	r inline port priority for each port
	interface	e-id			(Optional) ID	of the physical	interface.
	module	stack-mei	mber-n	umber	(Optional) Lir member.	nits the display	to ports on the specified stack
					This keyword	is supported on	ly on stacking-capable switches.
	detail				(Optional) Dis	splays detailed o	output of the interface or module.

Gi3/0/12	auto	off	0.0	n/a	n/a	30.0
<output t<="" td=""><td>runcate</td><td>ed></td><td></td><td></td><td></td><td></td></output>	runcate	ed>				

This is an example of output from the show power inline interface-id command on a switch port:

Device> s	how pow	er inline g	igabitet	hernet1/0/1		
Interface	Admin	Oper	Power	Device	Class	Max
			(Watts)			
Gi1/0/1	auto	off	0.0	n/a	n/a	30.0

This is an example of output from the **show power inline module** *switch-number* command on stack member 3. The table that follows describes the output fields.

Device> s	how pow	er inline m	odule 3			
Module 2	Availab	le Used	Rem	aining		
	(Watts) (Watt	s) (W	atts)		
3	865.	0 864.	0	1.0		
Interface	Admin	Oper	Power	Device	Class	Max
			(Watts)			
Gi3/0/1	auto	power-deny	4.0	n/a	n/a	15.4
Gi3/0/2	auto	off	0.0	n/a	n/a	15.4
Gi3/0/3	auto	off	0.0	n/a	n/a	15.4
Gi3/0/4	auto	off	0.0	n/a	n/a	15.4
Gi3/0/5	auto	off	0.0	n/a	n/a	15.4
Gi3/0/6	auto	off	0.0	n/a	n/a	15.4
Gi3/0/7	auto	off	0.0	n/a	n/a	15.4
Gi3/0/8	auto	off	0.0	n/a	n/a	15.4
Gi3/0/9	auto	off	0.0	n/a	n/a	15.4
Gi3/0/10	auto	off	0.0	n/a	n/a	15.4
<output t<="" td=""><td>runcate</td><td>d></td><td></td><td></td><td></td><td></td></output>	runcate	d>				

Table 3: show power inline Field Descriptions

Field	Description
Available	The total amount of configured power ^{1} on the PoE switch in watts (W).
Used	The amount of configured power that is allocated to PoE ports in watts.
Remaining	The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining)
Admin	Administration mode: auto, off, static.
Oper	Operating mode:
	• on—The powered device is detected, and power is applied.
	• off—No PoE is applied.
	• faulty—Device detection or a powered device is in a faulty state.
	• power-deny—A powered device is detected, but no PoE is available, or the maximum wattage exceeds the detected powered-device maximum.

Field	Description
Power	The maximum amount of power that is allocated to the powered device in watts. This value is the same as the value in the <i>Cutoff Power</i> field in the show power inline police command output.
Device	The device type detected: n/a, unknown, Cisco powered-device, IEEE powered-device, or the name from CDP.
Class	The IEEE classification: n/a or a value from 0 to 4.
Max	The maximum amount of power allocated to the powered device in watts.
AdminPowerMax	The maximum amount power allocated to the powered device in watts when the switch polices the real-time power consumption. This value is the same as the <i>Max</i> field value.
AdminConsumption	The power consumption of the powered device in watts when the switch polices the real-time power consumption. If policing is disabled, this value is the same as the <i>AdminPowerMax</i> field value.

¹ The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the **show power inline police** command on a stacking-capable switch:

Device> show power inline police							
Module	Availab	le 1	Used	Remainir	ng		
	(Watts)	(Watts)	(Watts))		
1	370.	0	0.0	370.0	C		
3	865.	0	864.0	1.0	C		
	Admin	Oper		Admin	Oper	Cutoff	Oper
Interface	State	State		Police	Police	Power	Power
Gi1/0/1	auto	off		none	n/a	n/a	0.0
Gi1/0/2	auto	off		log	n/a	5.4	0.0
Gi1/0/3	auto	off		errdisable	n/a	5.4	0.0
Gi1/0/4	off	off		none	n/a	n/a	0.0
Gi1/0/5	off	off		log	n/a	5.4	0.0
Gi1/0/6	off	off		errdisable	n/a	5.4	0.0
Gi1/0/7	auto	off		none	n/a	n/a	0.0
Gi1/0/8	auto	off		log	n/a	5.4	0.0
Gi1/0/9	auto	on		none	n/a	n/a	5.1
Gi1/0/10	auto	on		log	ok	5.4	4.2
Gi1/0/11	auto	on		log	log	5.4	5.9
Gi1/0/12	auto	on		errdisable	ok	5.4	4.2
Gi1/0/13	auto	errdi	sable	errdisable	n/a	5.4	0.0
<output t<="" td=""><td>runcate</td><td>d></td><td></td><td></td><td></td><td></td><td></td></output>	runcate	d>					

In the previous example:

- The Gi1/0/1 port is shut down, and policing is not configured.
- The Gi1/0/2 port is shut down, but policing is enabled with a policing action to generate a syslog message.

- The Gi1/0/3 port is shut down, but policing is enabled with a policing action is to shut down the port.
- Device detection is disabled on the Gi1/0/4 port, power is not applied to the port, and policing is disabled.
- Device detection is disabled on the Gi1/0/5 port, and power is not applied to the port, but policing is enabled with a policing action to generate a syslog message.
- Device detection is disabled on the Gi1/0/6 port, and power is not applied to the port, but policing is enabled with a policing action to shut down the port.
- The Gi1/0/7 port is up, and policing is disabled, but the switch does not apply power to the connected device.
- The Gi1/0/8 port is up, and policing is enabled with a policing action to generate a syslog message, but the switch does not apply power to the powered device.
- The Gi1/0/9 port is up and connected to a powered device, and policing is disabled.
- The Gi1/0/10 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/11 port is up and connected to a powered device, and policing is enabled with a policing action to generate a syslog message.
- The Gi1/0/12 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port. The policing action does not take effect because the real-time power consumption is less than the cutoff value.
- The Gi1/0/13 port is up and connected to a powered device, and policing is enabled with a policing action to shut down the port.

This is an example of output from the **show power inline police** *interface-id* command on a standalone switch. The table that follows describes the output fields.

Device> show power inline police gigabitethernet1/0/1							
Interface	Admin	Oper	Admin	Oper	Cutoff	Oper	
	State	State	Police	Police	Power	Power	
Gi1/0/1	auto	off	none	n/a	n/a	0.0	

Table 4: show power inline police Field Descriptions

Field	Description
Available	The total amount of configured power ^{2} on the switch in watts (W).
Used	The amount of configured power allocated to PoE ports in watts.
Remaining	The amount of configured power in watts that is not allocated to ports in the system. (Available – Used = Remaining)
Admin State	Administration mode: auto, off, static.

Operating mode:					
 errdisable—Policing is enabled. faulty—Device detection on a powered device is in a faulty state. off—No PoE is applied. on—The powered device is detected, and power is applied. power-deny—A powered device is detected, but no PoE is available, or the real-time power consumption exceeds the maximum power allocation. 					
Note The operating mode is the current PoE state for the specified PoE port, the specified stack member, or for all PoE ports on the switch.					
Status of the real-time power-consumption policing feature:					
 errdisable—Policing is enabled, and the switch shuts down the port when the real-time power consumption exceeds the maximum power allocation. log—Policing is enabled, and the switch generates a syslog message when the real-time power consumption exceeds the maximum power allocation. none—Policing is disabled. 					
Policing status:					
 errdisable—The real-time power consumption exceeds the maximum power allocation, and the switch shuts down the PoE port. log—The real-time power consumption exceeds the maximum power allocation, and the 					
 switch generates a syslog message. n/a—Device detection is disabled, power is not applied to the PoE port, or no policing action is configured. 					
• ok—Real-time power consumption is less than the maximum power allocation.					
The maximum power allocated on the port. When the real-time power consumption is greater than this value, the switch takes the configured policing action.					
The real-time power consumption of the powered device.					

² The configured power is the power that you manually specify or that the switch specifies by using CDP power negotiation or the IEEE classification, which is different than the real-time power that is monitored with the power sensing feature.

This is an example of output from the show power inline priority command on a standalone switch.

Device> sh	ow powe	r inline pr	iority
Interface	Admin	Oper	Priority
	State	State	
Gi1/0/1	auto	off	low
Gi1/0/2	auto	off	low
Gi1/0/3	auto	off	low
Gi1/0/4	auto	off	low
Gi1/0/5	auto	off	low
Gi1/0/6	auto	off	low
Gi1/0/7	auto	off	low

Gi1/0/8	auto	off	low
Gi1/0/9	auto	off	low

show stack-power

To display information about StackPower stacks or switches in a power stack, use the **show stack-power** command in EXEC mode.

{show stack-power [{budgeting | detail | load-shedding | neighbors}] [order *power-stack-name*] | [{stack-name [*stack-id*] | switch [*switch-id*]}]}

Syntax Description	budgeting	(Optional) Displays the stack power budget table. (Optional) Displays the stack power stack details.						
	detail							
	load-shedding	(Optional) Displays the stack power load she	edding table.				
	neighbors (Optional) Displays the stack power neighbor table.							
	order power-stack-name	order <i>power-stack-name</i> (Optional) Displays the load shedding priority for a power stack.						
	Note This keyword is available only after the load-shedding keyword							
	stack-name	stack-name (Optional) Displays budget table, details, or neighbors for all power stacks or the specified power stack.						
	Note This keyword is not available after the load-shedding keyword.							
	<i>stack-id</i> (Optional) Power stack ID for the power stack. The stack ID must be 31 characters or less.							
	switch (Optional) Displays budget table, details, load-shedding, or neighbors for all switches or the specified switch.							
	<i>switch-id</i> (Optional) Switch ID for the switch. The switch number is from 1 to 9.							
Command Modes	Privileged EXEC							
Command History	Release			Modification				
	Cisco IOS XE Denali 16	.3.2		Support for all the options was enabled for this command.				
	Cisco IOS XE Denali 16	.1.1		This command was reintroduced.				
Usage Guidelines	This command is available only on switch stacks running the IP Base or IP Services image.							
		hutdown n	eighbor switch. The command outp	stack-power command still includes but shows the stack power topology				
Examples	This is an example of out	example of output from the show stack-power command:						

Device# show stack-power										
Power Stack	Stack	Stack	Total	Rsvd	Alloc	Unused	Num	Num		
Name	Mode	Topolgy	Pwr(W)	Pwr(W)	Pwr(W)	Pwr(W)	SW	PS		
Powerstack-1	SP-PS	Stndaln	350	150	200	0	1	1		

This is an example of output from the **show stack-power budgeting** command:

	rice# show stack-pc rer Stack re	ower bude Stack Mode	geting Stack Topolg	Total y Pwr(W)	Rsvd Pwr(W)	Alloc Pwr(W)	Unus Pwr(Num SW	Num PS
Pow	erstack-1	SP-PS	Stndal	n 350	150	200	0		1	1
SW	Power Stack Name	PS (W		B Power Budgt			Avail Pwr(W)		nsumd s/PoE	
1	Powerstack-1	35	0 0	200	200	()	60	/0	
 Tot	als:				200	()	60	/0	

show system mtu

To display the global maximum transmission unit (MTU) or maximum packet size set for the switch, use the **show system mtu** command in privileged EXEC mode.

	show system mtu	
Syntax Description	This command has no arguments or keywords.	
Command Default	None	
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS XE 3.3SE	This command was introduced.
Usage Guidelines	For information about the MTU values and the stac mtu command.	k configurations that affect the MTU values, see the system
Examples	This is an example of output from the show system Device# show system mtu Global Ethernet MTU is 1500 bytes.	m mtu command:

show tech-support

To automatically run **show** commands that display system information, use the **show tech-support** command in the privilege EXEC mode.

show tech-support [{cef | cft | eigrp | evc | fnf | ipc | ipmulticast | ipsec | mfib | nat | nbar | onep | ospf |
page | password | rsvp | subscriber | vrrp | wccp}]

Syntax Description	cef	(Optional) Displays CEF related information.
	cft	(Optional) Displays CFT related information.
	eigrp	(Optional) Displays EIGRP related information.
	evc	(Optional) Displays EVC related information.
	fnf	(Optional) Displays flexible netflow related information.
	ipc	(Optional) Displays IPC related information.
	ipmulticast	(Optional) Displays IP multicast related information.
	ipsec	(Optional) Displays IPSEC related information.
	mfib	(Optional) Displays MFIB related information.
	nat	(Optional) Displays NAT related information.
	nbar	(Optional) Displays NBAR related information.
	onep	(Optional) Displays ONEP related information.
	ospf	(Optional) Displays OSPF related information.
	page	(Optional) Displays the command output on a single page at a time. Use the Return key to display the next line of output or use the space bar to display the next page of information. If not used, the output scrolls (that is, it does not stop for page breaks).
		Press the Ctrl-C keys to stop the command output.
	password	(Optional) Leaves passwords and other security information in the output. If not used, passwords and other security-sensitive information in the output are replaced with the label " <removed>".</removed>
	rsvp	(Optional) Displays IP RSVP related information.
	subscriber	(Optional) Displays subscriber related information.
	vrrp	(Optional) Displays VRRP related information.
	wccp	(Optional) Displays WCCP related information.

Command Modes

Privileged EXEC (#)

Command History	Release	Modification		
	Cisco IOS XE Denali 16.3.2	This command was enhanced to display of the outputs of the following commands in the output modifier :		
		 show power inline show platform software ilpower details 		
		 show power inline police 		
		 show stack-power budgeting 		
	Cisco IOS XE Denali 16.1.1	This command was reintroduced.		
Usage Guidelines	the output to a file (for example, show tech-suppo	is very long. To better manage this output, you can redirect ort $>$ <i>filename</i>) in the local writable storage file system or file also makes sending the output to your Cisco Technical		

You can use one of the following redirection methods:

• > *filename* - Redirects the output to a file.

Assistance Center (TAC) representative easier.

• >> filename - Redirects the output to a file in append mode.

speed

To specify the speed of a 10/100/1000/2500/5000 Mbps port, use the **speed** command in interface configuration mode. To return to the default value, use the **no** form of this command.

 $speed \quad \{10 \mid 100 \mid 1000 \mid 2500 \mid 5000 \mid auto \quad [\{10 \mid 100 \mid 1000 \mid 2500 \mid 5000\}] \mid nonegotiate\} \\ no \quad speed \quad$

Syntax Description	10	Specifies that the port runs at 10 Mbps.				
1	100	Specifies that the port runs at 100 Mbps.				
1	1000	Specifies that the port runs at 1000 Mbps. Mb/s ports.	This option is valid and visible only on 10/100/1000			
	2500	Specifies that the port runs at 2500 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.				
	5000	Specifies that the port runs at 5000 Mbps. This option is valid and visible only on multi-Gigabit-supported Ethernet ports.				
-	auto	Detects the speed at which the port should run, automatically, based on the port at the other end of the link. If you use the 10 , 100 , 1000 , 1000 , 2500 , or 5000 keyword with the auto keyword, the port autonegotiates only at the specified speeds.				
-	nonegotiate	Disables autonegotiation, and the port run	ns at 1000 Mbps.			
Command Default	The default i	s auto.				
Command Modes In	nterface con	figuration				
Command History	Release		Modification			
(Cisco IOS X	XE 3.3SE	This command was introduced.			
_ (Cisco IOS X	KE Denali 16.3.1	This command was modified. The following keywords were added: 2500 and 5000 . These keywords are visible only on multi-Gigabit Ethernet port supporting devices.			
Usage Guidelines	Zou cannot c	onfigure speed on 10-Gigabit Ethernet por	rts.			
E	Except for the 1000BASE-T small form-factor pluggable (SFP) modules, you can configure the speed to not negotiate (nonegotiate) when an SFP module port is connected to a device that does not support autonegotiation.					
Т	The new key	words, 2500 and 5000 are visible only on	multi-Gigabit (m-Gig) Ethernet supporting devices.			
If	If the speed is set to auto , the switch negotiates with the device at the other end of the link for the speed					

setting, and then forces the speed setting to the negotiated value. The duplex setting remains configured on each end of the link, which might result in a duplex setting mismatch.

If both ends of the line support autonegotiation, we highly recommend the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, use the auto setting on the supported side, but set the duplex and speed on the other side.

	Â	
	Caution	Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.
		For guidelines on setting the switch speed and duplex parameters, see the "Configuring Interface Characteristics" chapter in the software configuration guide for this release.
		Verify your settings using the show interfaces privileged EXEC command.
Examples		The following example shows how to set speed on a port to 100 Mbps:
		Device(config)# interface gigabitethernet1/0/1 Device(config-if)# speed 100
		The following example shows how to set a port to autonegotiate at only 10 Mbps:
		Device(config)# interface gigabitethernet1/0/1 Device(config-if)# speed auto 10
		The following example shows how to set a port to autonegotiate at only 10 or 100 Mbps:
		Device (config) # interface gigabitethernet1/0/1

Device (config-if) # speed auto 10 100

stack-power

To configure StackPower parameters for the power stack or for a switch in the power stack, use the **stack power** command in global configuration mode. To return to the default setting, use the **no** form of the command,

stack-power {stack power-stack-name | switch stack-member-number}
no stack-power {stack power-stack-name | switch stack-member-number}

Syntax Description	stack power-stack-name	Specifies the name of the power stack. The name can be up to 31 characters. Entering these keywords followed by a carriage return enters power stack configuration mode.				
	switch <i>stack-member-number</i> Specifies the switch number in the stack (1 to 4) to enter switch stack-per configuration mode for the switch.					
Command Default	There is no default.					
Command Modes	Global configuration					
Command History	Release	Modification				
	Cisco IOS XE 3.3SE	This command was introduced.				
Usage Guidelines	When you enter the stack-pov mode, and these commands an	wer stack <i>power stack name</i> command, you enter power stack configuration re available:				
	_	-				
	If you enter the stack-power switch <i>switch-number</i> command with a switch number that is not participating in StackPower, you receive an error message.					
	When you enter the stack-power switch <i>switch-number</i> command with the number of a switch participating in StackPower, you enter switch stack power configuration mode, and these commands are available:					
	 default—Returns a command to its default setting. exit—Exits switch stack power configuration mode. no—Negates a command or returns to default settings. 					
	• power-priority —Sets the power priority for the switch and the switch ports. See the power-priority command.					
	power stack-ID, the swite	he name of the power stack to which the switch belongs. If you do not enter the ch does not inherit the stack parameters. The name can be up to 31 characters. switch to operate in standalone power mode. This mode shuts down both stack				
Examples	This example removes switch shutting down both power por	2, which is connected to the power stack, from the power pool and ts:				

Interface and Hardware Commands

Device(config)# stack-power switch 2
Device(config-switch-stackpower)# standalone
Device(config-switch-stackpower)# exit

switchport block

To prevent unknown multicast or unicast packets from being forwarded, use the **switchport block** command in interface configuration mode. To allow forwarding unknown multicast or unicast packets, use the **no** form of this command.

switchport block {multicast | unicast}
no switchport block {multicast | unicast}

Syntax Description	multicast Sp	pecifies that unknown multicas	t traffic should be blocked.			
	No	lticast traffic is blocked. Multicast packets that contain IPv4 or e header are not blocked.				
	unicast Sp	pecifies that unknown unicast t	raffic should be blocked.			
Command Default	Unknown mu	ilticast and unicast traffic is no	t blocked.			
Command Modes	Interface con	figuration				
Command History	Release		Modification			
	Cisco IOS X	E 3.3SE	This command was introduced.			
Usage Guidelines	unicast traffic		ddresses is sent to all ports. You can block unknown multicast or ports. If unknown multicast or unicast traffic is not blocked on a s.			
	With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.					
	Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports; you must explicitly configure it.					
	For more information about blocking packets, see the software configuration guide for this release.					
	This example shows how to block unknown unicast traffic on an interface:					
	Device(conf	ig-if)# switchport block v	nicast			
	You can verif EXEC comm		show interfaces interface-id switchport privileged			

system mtu

To set the global maximum packet size or MTU size for switched packets on Gigabit Ethernet and 10-Gigabit Ethernet ports, use the **system mtu** command in global configuration mode. To restore the global MTU value to its default value use the **no** form of this command.

system mtu *bytes* no system mtu

Syntax Description bytes The global MTU size in bytes. The range is 1500 to 9198 bytes; the default is 1500 bytes. The default MTU size for all ports is 1500 bytes. **Command Default** Global configuration **Command Modes Command History** Release Modification Cisco IOS XE 3.3SE This command was introduced. You can verify your setting by entering the show system mtu privileged EXEC command. **Usage Guidelines** The switch does not support the MTU on a per-interface basis. If you enter a value that is outside the allowed range for the specific type of interface, the value is not accepted. **Examples** This example shows how to set the global system MTU size to 6000 bytes: Device(config) # system mtu 6000

Global Ethernet MTU is set to 6000 bytes. Note: this is the Ethernet payload size, not the total Ethernet frame size, which includes the Ethernet header/trailer and possibly other tags, such as ISL or 802.1q tags.

This command was introduced.

test mcu read-register

To enable debugging of the Power over Ethernet (PoE) controller, use the **test mcu read-register** command in privileged EXEC mode.

test mcu read-register {det-cls-offset | manufacture-id | port-mode}

Syntax Description	det-cls-offset	Displays the read detection classification register summary.
	manufacture-id	Displays the PoE controller manufacture ID.
	port-mode	Displays the port mode details.

Command Modes Privileged EXEC

Command History Release

Modification

Cisco IOS XE 3.3SE

Examples

The following is sample output from the **test mcu read-register det-cls-offset** command:

```
Device# test mcu read-register det-cls-offset 1
DETECTION ENABLE BIT SUMMARY
```

Controller	port1	port2	port3	port4	register (hexadecimal)
 1	1	0	1	0	5
2	1	0	1	0	5
3	1	0	1	0	5
4	1	0	1	0	5
5	1	0	1	0	5
6	1	0	1	0	5
7	1	0	1	0	5
8	1	0	1	0	5
9	1	0	1	0	5
10	1	0	1	0	5
11	0	0	1	0	4
12	1	0	0	0	1
CLASSIFICAT	FION ENABLE	BIT SUMMARY			
Controller	port1	port2	port3	port4	register (hexadecimal)

1	1	0	1	0	5
2	1	0	1	0	5
3	1	0	1	0	5
4	1	0	1	0	5
5	1	0	1	0	5
6	1	0	1	0	5
7	1	0	1	0	5
8	1	0	1	0	5
9	1	0	1	0	5
10	1	0	1	0	5
11	0	0	1	0	4
12	1	0	0	0	1

The following is sample output from the **test mcu read-register manufacture-id** command: MANUFACTURE ID : DEVICE_BCM_PALPATINE reg_val = 0x1B

The following is sample output from the test mcu read-register port-mode command:

Controller	port1	port2	port3	port4	register (hexadecimal)
1	01	00	01	00	22
2	01	00	01	00	22
3	01	00	01	00	22
4	01	00	01	00	22
5	01	00	01	00	22
6	01	00	01	00	22
7	01	00	01	00	22
8	01	00	01	00	22
9	01	00	01	00	22
10	01	00	01	00	22
11	00	00	01	00	20
12	01	0 0	0 0	00	2

PORT MODE SUMMERY

voice-signaling vlan (network-policy configuration)

To create a network-policy profile for the voice-signaling application type, use the **voice-signaling vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

voice-signaling vlan {vlan-id [{cos cos-value | dscp dscp-value}] | dot1p [{cos l2-priority | dscp dscp}] | none | untagged}

Syntax Description	vlan-id	(Optional) The VLAN for voice traffic. The range is 1 to 4094.				
	cos cos-value(Optional) Specifies the Layer 2 priority class of service (CoS) for the config The range is 0 to 7; the default is 5.					
	dscp dscp-value	(Optional) Specifies the differentiated services code point (DSCP) value for the configured VLAN. The range is 0 to 63; the default is 46.				
	dot1p	(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use VLAN 0 (the native VLAN).				
	none	(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.				
	untagged	(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.				
Command Default	No network-policy profiles for the voice-signaling application type are defined.					
	The default CoS value is 5.					
	The default DSCP value is 46.					
	The default tagging mode is untagged.					
Command Modes	Network-policy profile configuration					
Command History	Release	Modification				
	Cisco IOS XE 3.3	SE This command was introduced.				
Usage Guidelines	Use the network-policy profile global configuration command to create a profile and to enter network-policy profile configuration mode.					
	The voice-signaling application type is for network topologies that require a different policy for voice signaling than for voice media. This application type should not be advertised if all of the same network policies apply as those advertised in the voice policy TLV.					
	When you are in network-policy profile configuration mode, you can create the profile for voice-signaling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.					
	These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).					

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure voice-signaling for VLAN 200 with a priority 2 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 200 cos 2
```

This example shows how to configure voice-signaling for VLAN 400 with a DSCP value of 45:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice-signaling vlan 400 dscp 45
```

This example shows how to configure voice-signaling for the native VLAN with priority tagging:

```
Device(config-network-policy)# voice-signaling vlan dot1p cos 4
```

voice vlan (network-policy configuration)

To create a network-policy profile for the voice application type, use the **voice vlan** command in network-policy configuration mode. To delete the policy, use the **no** form of this command.

voice vlan {vlan-id [{cos cos-value | dscp dscp-value}] | dot1p [{cos l2-priority | dscp dscp}] | none | untagged}

Syntax Description	vlan-id	(Optional) The VLAN for voice traffic. The range is 1 to 4094.				
	cos cos-value	(Optional) Specifies the Layer 2 priority class of service (CoS) for the configured VLAN. The range is 0 to 7; the default is 5.				
	dscp <i>dscp-value</i> (Optional) Specifies the differentiated services code point (DSCP) value for the co VLAN. The range is 0 to 63; the default is 46.					
	dot1p(Optional) Configures the phone to use IEEE 802.1p priority tagging and to use 0 (the native VLAN).					
	none	(Optional) Does not instruct the Cisco IP phone about the voice VLAN. The phone uses the configuration from the phone key pad.				
	untagged	(Optional) Configures the phone to send untagged voice traffic. This is the default for the phone.				
Command Default	No network-policy profiles for the voice application type are defined.					
	The default CoS value is 5.					
	The default DSCP value is 46.					
	The default tagging mode is untagged.					
Command Modes	Network-policy profile configuration					
Command History	Release	Modification				
	Cisco IOS XE 3.3	3SE This command was introduced.				
Usage Guidelines	Use the network-policy profile global configuration command to create a profile and to enter network-policy profile configuration mode.					
	The voice application type is for dedicated IP telephones and similar devices that support interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security through isolation from data applications.					
	When you are in network-policy profile configuration mode, you can create the profile for voice by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.					
	These profile attributes are contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).					

To return to privileged EXEC mode from the network-policy profile configuration mode, enter the **exit** command.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
Device(config)# network-policy profile 1
Device(config-network-policy)# voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Device(config-network-policy) # voice vlan dot1p cos 4
```
