Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Radio Resource Management

The switch should be configured as a mobility controller and not a mobility anchor to configure Radio Resource Management. It may require dynamic channel assignment functionality for the home APs to be supported.

The new mobility architecture that involves mobility controller and mobility agent must be configured on the switch or controllers for RRM to work.

Note

Refer Mobility Configuration Guide for configuring mobility controller and mobility agent.
Restrictions for Radio Resource Management

If an AP tries to join the RF-group that already holds the maximum number of APs it can support, the device rejects the application and throws an error.

Information About Radio Resource Management

The Radio Resource Management (RRM) software embedded in the switch acts as a built-in RF engineer to consistently provide real-time RF management of your wireless network. RRM enables switches to continually monitor their associated lightweight access points for the following information:

- Traffic load—The total bandwidth used for transmitting and receiving traffic. It enables wireless LAN managers to track and plan network growth ahead of client demand.
- Interference—The amount of traffic coming from other 802.11 sources.
- Noise—The amount of non-802.11 traffic that is interfering with the currently assigned channel.
- Coverage—The Received Signal Strength (RSSI) and signal-to-noise ratio (SNR) for all connected clients.
- Other —The number of nearby access points.

RRM performs these functions:

- Radio resource monitoring
- Transmit power control
- Dynamic channel assignment
- Coverage hole detection and correction
- RF grouping

Radio Resource Monitoring

RRM automatically detects and configures new switches and lightweight access points as they are added to the network. It then automatically adjusts associated and nearby lightweight access points to optimize coverage and capacity.

Lightweight access points can scan all valid channels for the country of operation as well as for channels available in other locations. The access points in local mode go “off-channel” for a period not greater than 60 ms to monitor these channels for noise and interference. Packets collected during this time are analyzed to detect rogue access points, rogue clients, ad-hoc clients, and interfering access points.

Note

In the presence of voice traffic or other critical traffic (in the last 100 ms), the access points can defer off-channel measurements. It also defers based on WLAN scan defer priority configurations.
Each access point spends only 0.2 percent of its time off-channel. This activity is distributed across all access points so that adjacent access points are not scanning at the same time, which could adversely affect wireless LAN performance.

RRM supports new mobility architecture for RF grouping that involves Mobility Controller (MC) and Mobility Agent (MA).

- **Mobility Controller (MC)**—The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.

- **Mobility Agent (MA)**—The Mobility Agent is the component that maintains client mobility state machine for a mobile client.

### Information About RF Groups

An RF group is a logical collection of Cisco WLCs that coordinate to perform RRM in a globally optimized manner to perform network calculations on a per-radio basis. An RF group exists for each 802.11 network type. Clustering Cisco WLCs into a single RF group enable the RRM algorithms to scale beyond the capabilities of a single Cisco WLC.

RF group is created based on following parameters:

- User-configured RF network name.
- Neighbor discovery performed at the radio level.
- Country list configured on MC.

RF grouping runs between MCs.

Lightweight access points periodically send out neighbor messages over the air. Access points using the the same RF group name validate messages from each other.

When access points on different Cisco WLCs hear validated neighbor messages at a signal strength of –80 dBm or stronger, the Cisco WLCs dynamically form an RF neighborhood in auto mode. In static mode, the leader is manually selected and the members are added to the RF Group. To know more about RF Group modes, **RF Group Leader**.

---

**Note**

RF groups and mobility groups are similar in that they both define clusters of Cisco WLCs, but they are different in terms of their use. An RF group facilitates scalable, system-wide dynamic RF management while a mobility group facilitates scalable, system-wide mobility and Cisco WLC redundancy.

### RF Group Leader

Starting in the 7.0.116.0 release, the RF Group Leader can be configured in two ways as follows:

- **Auto Mode**—In this mode, the members of an RF group elect an RF group leader to maintain a “master” power and channel scheme for the group. The RF grouping algorithm dynamically chooses the RF group leader and ensures that an RF group leader is always present. Group leader assignments can and do change (for instance, if the current RF group leader becomes inoperable or if RF group members experience major changes).
• Static Mode—In this mode, the user selects a Cisco WLC as an RF group leader manually. In this mode, the leader and the members are manually configured and are therefore fixed. If the members are unable to join the RF group, the reason is indicated. The leader tries to establish a connection with a member every 1 minute if the member has not joined in the previous attempt.

The RF group leader analyzes real-time radio data collected by the system, calculates the power and channel assignments, and sends them to each of the Cisco WLCs in the RF group. The RRM algorithms ensure system-wide stability and restrain channel and power scheme changes to the appropriate local RF neighborhoods.

In Cisco WLC software releases prior to 6.0, the dynamic channel assignment (DCA) search algorithm attempts to find a good channel plan for the radios associated to Cisco WLCs in the RF group, but it does not adopt a new channel plan unless it is considerably better than the current plan. The channel metric of the worst radio in both plans determines which plan is adopted. Using the worst-performing radio as the single criterion for adopting a new channel plan can result in pinning or cascading problems.

Pinning occurs when the algorithm could find a better channel plan for some of the radios in an RF group but is prevented from pursuing such a channel plan change because the worst radio in the network does not have any better channel options. The worst radio in the RF group could potentially prevent other radios in the group from seeking better channel plans. The larger the network, the more likely pinning becomes.

Cascading occurs when one radio’s channel change results in successive channel changes to optimize the remaining radios in the RF neighborhood. Optimizing these radios could lead to their neighbors and their neighbors’ neighbors having a suboptimal channel plan and triggering their channel optimization. This effect could propagate across multiple floors or even multiple buildings, if all the access point radios belong to the same RF group. This change results in considerable client confusion and network instability.

The main cause of both pinning and cascading is the way in which the search for a new channel plan is performed and that any potential channel plan changes are controlled by the RF circumstances of a single radio. In Cisco WLC software release 6.0, the DCA algorithm has been redesigned to prevent both pinning and cascading. The following changes have been implemented:

• Multiple local searches—The DCA search algorithm performs multiple local searches initiated by different radios within the same DCA run rather than performing a single global search driven by a single radio. This change addresses both pinning and cascading while maintaining the desired flexibility and adaptability of DCA and without jeopardizing stability.

• Multiple channel plan change initiators (CPCIs)—Previously, the single worst radio was the sole initiator of a channel plan change. Now each radio within the RF group is evaluated and prioritized as a potential initiator. Intelligent randomization of the resulting list ensures that every radio is eventually evaluated, which eliminates the potential for pinning.

• Limiting the propagation of channel plan changes (Localization)—For each CPCI radio, the DCA algorithm performs a local search for a better channel plan, but only the CPCI radio itself and its one-hop neighboring access points are actually allowed to change their current transmit channels. The impact of an access point triggering a channel plan change is felt only to within two RF hops from that access point, and the actual channel plan changes are confined to within a one-hop RF neighborhood. Because this limitation applies across all CPCI radios, cascading cannot occur.

• Non-RSSI-based cumulative cost metric—A cumulative cost metric measures how well an entire region, neighborhood, or network performs with respect to a given channel plan. The individual cost metrics of all access points in that area are considered in order to provide an overall understanding of the channel plan’s quality. These metrics ensure that the improvement or deterioration of each single radio is factored into any channel plan change. The objective is to prevent channel plan changes in which a single radio improves but at the expense of multiple other radios experiencing a considerable performance decline.
The RRM algorithms run at a specified updated interval, which is 600 seconds by default. Between update intervals, the RF group leader sends keepalive messages to each of the RF group members and collects real-time RF data.

**Note**
Several monitoring intervals are also available. See the Configuring RRM section for details.

### RF Group Name

A Cisco WLC is configured with an RF group name, which is sent to all access points joined to the Cisco WLC and used by the access points as the shared secret for generating the hashed MIC in the neighbor messages. To create an RF group, you configure all of the Cisco WLCs to be included in the group with the same RF group name.

If there is any possibility that an access point joined to a Cisco WLC may hear RF transmissions from an access point on a different Cisco WLC, you should configure the Cisco WLCs with the same RF group name. If RF transmissions between access points can be heard, then system-wide RRM is recommended to avoid 802.11 interference and contention as much as possible.

### Mobility Controller

An MC can either be a group leader or a group member. One of the MCs can act as a RF group leader based on RF grouping and RF group election with other MCs. The order of priority to elect the RF leader is based on the maximum number of APs the controller or switch can support. The highest priority being 1 and the least being 5.

1. WiSM 2 Controllers
2. Cisco WLC 5700 Series Controllers
3. WiSM 1 Controllers
4. Catalyst 3850 Series Switches
5. Catalyst 3650 Series Switches

When one of the MCs becomes the RRM group leader, the remaining MCs become RRM group members. RRM group members send their RF information to the Group Leader. The group leader determines a channel and Tx power plan for the network and passes the information back to the RF group members. The MCs push the power plan to MA for the radios that belong to MA. These channel and power plans are ultimately pushed down to individual radios.

**Note**
MC has MA functionality within it.

### Mobility Agent

The MA communicates with the MC. The MC includes MAC or IP address of the switch/controller while communicating with the MA.

The MA provides the following information when polled by the MC:

- Interference or noise data.
• Neighbor data.
• Radio capabilities (supported channels, power levels).
• Radio configuration (power, channel, channel width).
• Radar data.

The MC exchanges the following information with the switch/controller (MA). The message includes:
• Configurations (channel/power/channel width) for individual radios.
• Polling requests for current configurations and RF measurements for individual radios
• Group Leader Update

In turn, the MA communicates the following messages with the MC:
• RF measurements from radios (e.g. load, noise and neighbor information)
• RF capabilities and configurations of individual radios

The MA sets channel, power, and channel width on the radios when directed by the MC. The DFS, coverage hole detection/mitigation, static channel/power configurations are performed by the MA.

Information About Rogue Access Point Detection in RF Groups

After you have created an RF group of Cisco WLCs, you need to configure the access points connected to the Cisco WLCs to detect rogue access points. The access points will then select the beacon/probe-response frames in neighboring access point messages to see if they contain an authentication information element (IE) that matches that of the RF group. If the select is successful, the frames are authenticated. Otherwise, the authorized access point reports the neighboring access point as a rogue, records its BSSID in a rogue table, and sends the table to the Cisco WLC.

Transmit Power Control

The switch dynamically controls access point transmit power based on real-time wireless LAN conditions. The Transmit Power Control (TPC) algorithm both increases and decreases an access point’s power in response to changes in the RF environment. In most instances, TPC seeks to lower an access point's power to reduce interference, but in the case of a sudden change in the RF coverage—for example, if an access point fails or becomes disabled—TPC can also increase power on surrounding access points. This feature is different from coverage hole detection, which is primarily concerned with clients. TPC provides enough RF power to achieve desired coverage levels while avoiding channel interference between access points.

Overriding the TPC Algorithm with Minimum and Maximum Transmit Power Settings

The TPC algorithm balances RF power in many diverse RF environments. However, it is possible that automatic power control will not be able to resolve some scenarios in which an adequate RF design was not possible to implement due to architectural restrictions or site restrictions—for example, when all access points must be mounted in a central hallway, placing the access points close together, but requiring coverage out to the edge of the building.
In these scenarios, you can configure maximum and minimum transmit power limits to override TPC recommendations. The maximum and minimum TPC power settings apply to all access points through RF profiles in a RF network.

To set the Maximum Power Level Assignment and Minimum Power Level Assignment, enter the maximum and minimum transmit power used by RRM in the text boxes in the Tx Power Control page. The range for these parameters is -10 to 30 dBm. The minimum value cannot be greater than the maximum value; the maximum value cannot be less than the minimum value.

If you configure a maximum transmit power, RRM does not allow any access point attached to the switch to exceed this transmit power level (whether the power is set by RRM TPC or by coverage hole detection). For example, if you configure a maximum transmit power of 11 dBm, then no access point would transmit above 11 dBm, unless the access point is configured manually.

Dynamic Channel Assignment

Two adjacent access points on the same channel can cause either signal contention or signal collision. In a collision, data is not received by the access point. This functionality can become a problem, for example, when someone reading e-mail in a café affects the performance of the access point in a neighboring business. Even though these are completely separate networks, someone sending traffic to the café on channel 1 can disrupt communication in an enterprise using the same channel. Switches can dynamically allocate access point channel assignments to avoid conflict and to increase capacity and performance. Channels are “reused” to avoid wasting scarce RF resources. In other words, channel 1 is allocated to a different access point far from the café, which is more effective than not using channel 1 altogether.

The switch’s Dynamic Channel Assignment (DCA) capabilities are also useful in minimizing adjacent channel interference between access points. For example, two overlapping channels in the 802.11b/g band, such as 1 and 2, cannot both simultaneously use 11/54 Mbps. By effectively reassigning channels, the switch keeps adjacent channels separated.

---

Note

We recommend that you use only non-overlapping channels (1, 6, 11, and so on).

The switch examines a variety of real-time RF characteristics to efficiently handle channel assignments as follows:

- Access point received energy—The received signal strength measured between each access point and its nearby neighboring access points. Channels are optimized for the highest network capacity.

- Noise—Noise can limit signal quality at the client and access point. An increase in noise reduces the effective cell size and degrades user experience. By optimizing channels to avoid noise sources, the switch can optimize coverage while maintaining system capacity. If a channel is unusable due to excessive noise, that channel can be avoided.

- 802.11 Interference—Interference is any 802.11 traffic that is not part of your wireless LAN, including rogue access points and neighboring wireless networks. Lightweight access points constantly scan all channels looking for sources of interference. If the amount of 802.11 interference exceeds a predefined configurable threshold (the default is 10 percent), the access point sends an alert to the switch. Using the RRM algorithms, the switch may then dynamically rearrange channel assignments to increase system performance in the presence of the interference. Such an adjustment could result in adjacent lightweight access points being on the same channel, but this setup is preferable to having the access points remain on a channel that is unusable due to an interfering foreign access point.
In addition, if other wireless networks are present, the switch shifts the usage of channels to complement the other networks. For example, if one network is on channel 6, an adjacent wireless LAN is assigned to channel 1 or 11. This arrangement increases the capacity of the network by limiting the sharing of frequencies. If a channel has virtually no capacity remaining, the switch may choose to avoid this channel. In very dense deployments in which all nonoverlapping channels are occupied, the switch does its best, but you must consider RF density when setting expectations.

- Load and utilization—When utilization monitoring is enabled, capacity calculations can consider that some access points are deployed in ways that carry more traffic than other access points (for example, a lobby versus an engineering area). The switch can then assign channels to improve the access point with the worst performance reported. The load is taken into account when changing the channel structure to minimize the impact on clients currently in the wireless LAN. This metric keeps track of every access point’s transmitted and received packet counts to determine how busy the access points are. New clients avoid an overloaded access point and associate to a new access point. This parameter is disabled by default.

The switch combines this RF characteristic information with RRM algorithms to make system-wide decisions. Conflicting demands are resolved using soft-decision metrics that guarantee the best choice for minimizing network interference. The end result is optimal channel configuration in a three-dimensional space, where access points on the floor above and below play a major factor in an overall wireless LAN configuration.

**Note**

Radios using 40-MHz channels in the 2.4-GHz band or or 80MHz channels are not supported by DCA.

The RRM startup mode is invoked in the following conditions:

- In a single-switch environment, the RRM startup mode is invoked after the switch is rebooted.
- In a multiple-switch environment, the RRM startup mode is invoked after an RF Group leader is elected.

You can trigger RRM startup mode from CLI.

RRM startup mode runs for 100 minutes (10 iterations at 10-minute intervals). The duration of the RRM startup mode is independent of the DCA interval, sensitivity, and network size. The startup mode consists of 10 DCA runs with high sensitivity (making channel changes easy and sensitive to the environment) to converge to a steady state channel plan. After the startup mode is finished, DCA continues to run at the specified interval and sensitivity.

**Coverage Hole Detection and Correction**

The RRM coverage hole detection algorithm can detect areas of radio coverage in a wireless LAN that are below the level needed for robust radio performance. This feature can alert you to the need for an additional (or relocated) lightweight access point.

If clients on a lightweight access point are detected at threshold levels (RSSI, failed client count, percentage of failed packets, and number of failed packets) lower than those specified in the RRM configuration, the access point sends a “coverage hole” alert to the switch. The alert indicates the existence of an area where clients are continually experiencing poor signal coverage, without having a viable access point to which to roam. The switch discriminates between coverage holes that can and cannot be corrected. For coverage holes that can be corrected, the switch mitigates the coverage hole by increasing the transmit power level for that specific access point. The switch does not mitigate coverage holes caused by clients that are unable to increase
their transmit power or are statically set to a power level because increasing their downstream transmit power might increase interference in the network.

**Configuring RRM Profile Thresholds, Monitoring Channels, and Monitoring Intervals (GUI)**

**Step 1** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > General** or **Configuration > Wireless > 802.11b/g/n > RRM > General** to open RRM General page.

**Step 2** Configure profile thresholds used for alarming as follows:

**Note** The profile thresholds have no bearing on the functionality of the RRM algorithms. Switches send an SNMP trap (or an alert) to the Cisco Prime Infrastructure or another trap receiver when individual APs values set for these threshold parameters are exceeded.

a) In the **Interference** text box, enter the percentage of interference (802.11 traffic from sources outside of your wireless network) on a single access point. The valid range is 0 to 100%, and the default value is 10%.

b) In the **Clients** text box, enter the number of clients on a single access point. The valid range is 1 to 75, and the default value is 12.

c) In the **Noise** text box, enter the level of noise (non-802.11 traffic) on a single access point. The valid range is –127 to 0 dBm, and the default value is –70 dBm.

d) In the **Utilization** text box, enter the percentage of RF bandwidth being used by a single access point. The valid range is 0 to 100%, and the default value is 80%.

e) In the **Throughput** text box, enter the level of Throughput being used by a single access point. The valid range is 1000 to 10000000, and the default value is 1000000.

**Step 3** From the **Channel List** drop-down list, choose one of the following options to specify the set of channels that the access point uses for RRM scanning:

- **All Channels**—RRM channel scanning occurs on all channels supported by the selected radio, which includes channels not allowed in the country of operation.
• **Country Channels**—RRM channel scanning occurs only on the data channels in the country of operation. This is the default value.

• **DCA Channels**—RRM channel scanning occurs only on the channel set used by the DCA algorithm, which by default includes all of the non-overlapping channels allowed in the country of operation. However, you can specify the channel set to be used by DCA if desired. To do so, follow instructions in the [Dynamic Channel Assignment](#).

**Step 4** Configure monitor intervals as follows:

a. In the **Channel Scan Interval** text box, enter (in seconds) the sum of the time between scans for each channel within a radio band. The entire scanning process takes 50 ms per channel, per radio and runs at the interval configured here. The time spent listening on each channel is determined by the non-configurable 50-ms scan time and the number of channels to be scanned. For example, in the U.S. all 11 802.11b/g channels are scanned for 50 ms each within the default 180-second interval. So every 16 seconds, 50 ms is spent listening on each scanned channel (180/11 = ~16 seconds). The Channel Scan Interval parameter determines the interval at which the scanning occurs. The valid range is 60 to 3600 seconds, and the default value for 802.11a/n/ac and 802.11b/g/n radios is 180 seconds.

b. In the **Neighbor Packet Frequency** text box, enter (in seconds) how frequently neighbor packets (messages) are sent, which eventually builds the neighbor list. The valid range is 60 to 3600 seconds, and the default value is 60 seconds.

**Note** If the access point radio does not receive a neighbor packet from an existing neighbor within 60 minutes, the Cisco WLC deletes that neighbor from the neighbor list.

**Step 5** Click **Apply**.

**Step 6** Click **Save Configuration**.

**Note** Click **Set to Factory Default** if you want to return all of the Cisco WLC’s RRM parameters to their factory-default values.

---

### Configuring RF Groups

This section describes how to configure RF groups through either the GUI or the CLI.

**Note** The RF group name is generally set at deployment time through the Startup Wizard. However, you can change it as necessary.

**Note** When the multiple-country feature is being used, all Cisco WLCs intended to join the same RF group must be configured with the same set of countries, configured in the same order.

**Note** You can also configure RF groups using the Cisco Prime Infrastructure.
Configuring the RF Group Mode (GUI)

**Step 1** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > RF Grouping** or **Configuration > Wireless > 802.11b/g/n > RRM > RF Grouping** to open the RF Grouping page.

**Step 2** From the **Group Mode** drop-down list, choose the mode that you want to configure for this Cisco WLC.

You can configure RF grouping in the following modes:

- **auto**—Sets the RF group selection to automatic update mode.
  
  **Note** A configured static leader cannot become a member of another RF group until its mode is set to “auto”.

- **leader**—Sets the RF group selection to static mode, and sets this Cisco WLC as the group leader.

- **off**—Sets the RF group selection off. Every Cisco WLC optimizes its own access point parameters.
  
  **Note** A Cisco WLC with a lower priority cannot assume the role of a group leader if a Cisco WLC with a higher priority is available. Here, priority is related to the processing power of the Cisco WLC.

  **Note** We recommend that Cisco WLCs participate in automatic RF grouping. You can override RRM settings without disabling automatic RF group participation.

**Step 3** Click **Apply** to save the configuration and click **Restart** to restart the RRM RF Grouping algorithm.

**Step 4** If you configured RF Grouping mode for this Cisco WLC as a static leader, you can add group members from the Group Members section as follows:

- **a.** In the switch Name text box, enter the Cisco WLC that you want to add as a member to this group.

- **b.** In the IP Address text box, enter the IP address of the Cisco WLC.

- **c.** Click **Add** to add the member to this group.

  **Note** If the member has not joined the static leader, the reason of the failure is shown in parentheses.

**Step 5** Click **Apply**.

**Step 6** Click **Save Configuration**.

---

**Configuring RF Group Selection Mode (CLI)**

**SUMMARY STEPS**

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm group-mode {auto | leader | off}`
3. `end`

</tr>
</tbody>
</table>
Command or Action | Purpose
---|---
Switch(config)#ap dot11 24ghz rrm txpower auto | • min—Configures the minimum auto-RF tx-power.
• once—Enables one-time auto-RF.

Step 3 | end
Example:
Switch(config)# end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

### Configuring Transmit Power Control (GUI)

**Step 1**  Choose Configuration > Wireless > 802.11a/n/ac > RRM > TPC or Configuration > Wireless > 802.11b/g/n > RRM > TPC to open RRM Tx Power Control (TPC) page.

**Step 2**  Choose the Transmit Power Control.
Coverage Optimal Mode (TPCv1)—Offers strong signal coverage and stability. In this mode, power can be kept low to gain extra capacity and reduce interference.

**Step 3**  Choose one of the following options from the Power Level Assignment Method list to specify the Cisco WLC’s dynamic power assignment mode:

- **Automatic**—Causes the Cisco WLC to periodically evaluate and, if necessary, update the transmit power for all joined access points. This is the default value.
- **On Demand**—Causes the Cisco WLC to periodically evaluate the transmit power for all joined access points. However, the Cisco WLC updates the power, if necessary, only when you click **Apply** after choosing **On Demand**.

  **Note**  The Cisco WLC does not evaluate and update the transmit power immediately when you click **Apply** after choosing **On Demand**. It waits for the next 600-second interval. This value is not configurable.

- **Fixed**—Prevents the Cisco WLC from evaluating and, if necessary, updating the transmit power for joined access points. The power level is set to the fixed value chosen from the drop-down list. The corresponding option for **Fixed** when you try to configure from CLI is **once**.

  **Note**  The transmit power level is assigned an integer value instead of a value in mW or dBm. The integer corresponds to a power level that varies depending on the regulatory domain, channel, and antennas in which the access points are deployed.

  **Note**  For optimal performance, we recommend that you use the Automatic setting.

**Step 4**  Enter the maximum and minimum power level assignment values in the Maximum Power Level Assignment and Minimum Power Level Assignment text boxes.

  The range for the Maximum Power Level Assignment is –10 to 30 dBm.

  The range for the Minimum Power Level Assignment is –10 to 30 dBm.

**Step 5**  In the Power Threshold text box, enter the cutoff signal level used by RRM when determining whether to reduce an access point’s power. The default value for this parameter is –70 dBm for TPCv1, but can be changed when access points are transmitting at higher (or lower) than desired power levels.

  The range for this parameter is –80 to –50 dBm. Increasing this value (between –65 and –50 dBm) causes the access points to operate at a higher transmit power. Decreasing the value has the opposite effect.
In applications with a dense population of access points, it may be useful to decrease the threshold to −80 or −75 dBm to reduce the number of BSSIDs (access points) and beacons seen by the wireless clients. Some wireless clients might have difficulty processing a large number of BSSIDs or a high beacon rate and might exhibit problematic behavior with the default threshold.

This page also shows the following nonconfigurable transmit power level parameter settings:

- **Power Neighbor Count**—The minimum number of neighbors an access point must have for the transmit power control algorithm to run.

- **Power Assignment Leader**—The MAC address of the RF group leader, which is responsible for power level assignment.

- **Last Power Level Assignment**—The last time RRM evaluated the current transmit power level assignments.

**Step 6**  
Click **Apply**.

**Step 7**  
Click **Save Configuration**.

---

## Configuring 802.11 RRM Parameters

### Configuring Advanced 802.11 Channel Assignment Parameters (CLI)

**SUMMARY STEPS**

1. `configure terminal`
2. `ap dot11 {24ghz | 5ghz} rrm channel cleanair-event sensitivity {high | low | medium}
3. `ap dot11 {24ghz | 5ghz} rrm channel dca {channel number | anchor-time | global {auto | once} | interval | min-metric | sensitivity {high | low | medium}}

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch(config)#ap dot11 24ghz rrm channel cleansair-event sensitivity high` | - **Low**—Specifies the least sensitivity to non-Wi-Fi interference as indicated by the AQ value.  
- **Medium**—Specifies medium sensitivity to non-Wi-Fi interference as indicated by the AQ value. |

**Step 3**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `ap dot11 {24ghz | 5ghz} rrm channel dca {channel number | anchor-time | global | auto | once} | interval | min-metric | sensitivity {high | low | medium}}` | Configures Dynamic Channel Assignment (DCA) algorithm parameters for the 802.11 band.  
- `<1-14>`—Enter a channel number to be added to the DCA list.  
- **anchor-time**—Configures the anchor time for the DCA. The range is between 0 and 23 hours.  
- **global**—Configures the DCA mode for all 802.11 Cisco APs.  
  - **auto**—Enables auto-RF.  
  - **once**—Enables auto-RF only once.  
- **interval**—Configures the DCA interval value. The values are 1, 2, 3, 4, 6, 8, 12 and 24 hours and the default value 0 denotes 10 minutes.  
- **min-metric**—Configures the DCA minimum RSSI energy metric. The range is between -100 and -60.  
- **sensitivity**—Configures the DCA sensitivity level to changes in the environment.  
  - **high**—Specifies the most sensitivity.  
  - **low**—Specifies the least sensitivity.  
  - **medium**—Specifies medium sensitivity. |

**Step 4**

<tbody>
<tr>
<td>`ap dot11 {24ghz</td>
<td>5ghz} rrm channel foreign`</td>
</tr>
</tbody>
</table>

**Example:**

Switch(config)#ap dot11 24ghz rrm channel foreign
### Configuring Dynamic Channel Assignment (GUI)

You can specify the channels that the Dynamic Channel Assignment (DCA) algorithm considers when selecting the channels to be used for RRM scanning by using the Cisco WLC GUI.

**Note**

This functionality is helpful when you know that the clients do not support certain channels because they are legacy devices or they have certain regulatory restrictions.

#### Step 1

Disable the 80.11a/n/ac or 80.11b/g/n network as follows:

a) Choose **Configuration > Wireless > 80.11a/n/ac > Network** or **Configuration > Wireless > 80.11b/g/n > Network** to open the Global Parameters page.

b) Unselect the **80.11a/n/ac** (or **80.11b/g/n**) **Network Status** check box.

c) Click **Apply**.

#### Step 2

Choose **Configuration > Wireless > 80.11a/n/ac > RRM > DCA** or **Configuration > Wireless > 80.11b/g/n > RRM > DCA** to open the Dynamic Channel Assignment (DCA) page.

#### Step 3

Choose one of the following options from the **Channel Assignment Method** drop-down list to specify the Cisco WLC’s DCA mode:

- **Automatic**—Causes the Cisco WLC to periodically evaluate and, if necessary, update the channel assignment for all joined access points. This is the default value.

- **Freeze**—Causes the Cisco WLC to evaluate and update the channel assignment for all joined access points, if necessary, only when you click **Apply** after selecting the **Freeze** option.

**Note**

The Cisco WLC does not evaluate and update the channel assignment immediately when you click **Apply** after selecting the **Freeze** option. It waits for the next interval to elapse.

- **OFF**—Turns off DCA and sets all access point radios to the first channel of the band. If you choose this option, you must manually assign channels on all radios.

**Note**

For optimal performance, we recommend that you use the Automatic setting.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>
<td>**ap dot11 {24ghz</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><strong>Switch(config)# ap dot11 24ghz rrm channel load</strong></td>
</tr>
<tr>
<td></td>
<td>Configures the Cisco AP 80.11 load avoidance in the channel assignment.</td>
</tr>
</tbody>
</table>

| **Step 8** | **ap dot11 {24ghz | 5ghz} rrm channel noise**  |
| **Example:** | **Switch(config)# ap dot11 24ghz rrm channel noise**  |
| | Configures the 80.11 noise avoidance in the channel assignment. |

| **Step 9** | **end**  |
| **Example:** | **Switch(config)# end**  |
| | Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode. |
Step 4  From the Interval drop-down list, choose one of the following options to specify how often the DCA algorithm is allowed to run: **10 minutes, 1 hour, 2 hours, 3 hours, 4 hours, 6 hours, 8 hours, 12 hours, or 24 hours**. The default value is 10 minutes.

Step 5  From the Anchor Time drop-down list, choose a number to specify the time of day when the DCA algorithm is to start. The options are numbers between 0 and 23 (inclusive) representing the hour of the day from 12:00 a.m. to 11:00 p.m.

Step 6  From the **DCA Channel Sensitivity** drop-down list, choose one of the following options to specify how sensitive the DCA algorithm is to environmental changes such as signal, load, noise, and interference when determining whether to change channels:

- **Low**—The DCA algorithm is not particularly sensitive to environmental changes.
- **Medium**—The DCA algorithm is moderately sensitive to environmental changes.
- **High**—The DCA algorithm is highly sensitive to environmental changes.

The default value is Medium. The DCA sensitivity thresholds vary by radio band, as noted in the following table:

**Table 90: DCA Sensitivity Thresholds**

<table>
<thead>
<tr>
<th>Option</th>
<th>2.4-GHz DCA Sensitivity Threshold</th>
<th>5-GHz DCA Sensitivity Threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
<td>5 dB</td>
<td>5 dB</td>
</tr>
<tr>
<td>Medium</td>
<td>10 dB</td>
<td>15 dB</td>
</tr>
<tr>
<td>Low</td>
<td>20 dB</td>
<td>20 dB</td>
</tr>
</tbody>
</table>

Step 7  This page also shows the following nonconfigurable channel parameter settings:

- **Channel Assignment Leader**—The MAC address of the RF group leader, which is responsible for channel assignment.

Step 8  In the DCA Channel List area, the DCA Channels text box shows the channels that are currently selected. To choose a channel, select its check box in the Select column. To exclude a channel, unselect its check box.

The ranges are as follows:

- **802.11a**—36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 149, 153, 157, 161, 165 (depending on countries).
- **802.11b/g**—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 (depending on countries).

The defaults are as follows:

- **802.11a**—36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 149, 153, 157, 161
- **802.11b/g**—1, 6, 11

Step 9  Click **Apply**.

Step 10  Reenable the 802.11 networks as follows:

a. Choose **Configuration > Wireless > 802.11a/n/ac > Network** or **Configuration > Wireless > 802.11b/g/n > Network** to open the Global Parameters page.

b. Select the **802.11a/n/ac** (or **802.11b/g/n**) **Network Status** check box.
c. Click Apply.

**Step 11**  
Click Save Configuration.

---

## Configuring 802.11 Coverage Hole Detection (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm coverage data {fail-percentage | packet-count | rssi-threshold}`
3. `ap dot11 24ghz | 5ghz rrm coverage exception global exception level`
4. `ap dot11 24ghz | 5ghz rrm coverage level global cli_min exception level`
5. `ap dot11 24ghz | 5ghz rrm coverage voice {fail-percentage | packet-count | rssi-threshold}`
6. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `configure terminal`  
**Example:**  
Switch# configure terminal | Enters global configuration mode. |
| **Step 2** | `ap dot11 24ghz | 5ghz rrm coverage data {fail-percentage | packet-count | rssi-threshold}`  
**Example:**  
Switch(config)# ap dot11 24ghz rrm coverage data fail-percentage 60 | Configures the 802.11 coverage hole detection for data packets.  
- **fail-percentage**—Configures the 802.11 coverage failure-rate threshold for uplink data packets as a percentage that ranges from 1 to 100%.  
- **packet-count**—Configures the 802.11 coverage minimum failure count threshold for uplink data packets that ranges from 1 to 255.  
- **rssi-threshold**—Configures the 802.11 minimum receive coverage level for data packets that range from –90 to –60 dBm. |
| **Step 3** | `ap dot11 24ghz | 5ghz rrm coverage exception global exception level`  
**Example:**  
Switch(config)# ap dot11 24ghz rrm coverage exception global 50 | Configures the 802.11 Cisco AP coverage exception level as a percentage that ranges from 0 to 100%. |
| **Step 4** | `ap dot11 24ghz | 5ghz rrm coverage level global cli_min exception level`  
**Example:** | Configures the 802.11 Cisco AP client minimum exception level that ranges from 1 to 75 clients. |

<td><strong>returnsto privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</strong></td>
</tr>
</tbody>
</table>

**Configuring Coverage Hole Detection (GUI)**

**Step 1** Disable the 802.11 network as follows:
  a) Choose **Configuration > Wireless > 802.11a/n/ac** or **Configuration > Wireless > 802.11b/g/n** to open the 802.11a/n/ac (or 802.11b/g/n) Global Parameters page.
  b) Unselect the 802.11a/n/ac (or 802.11b/g/n) **Network Status** check box.
  c) Click **Apply**.

**Step 2** Choose **Configuration > Wireless > 802.11a/n/ac > RRM > Coverage Thresholds** or **Configuration > Wireless > 802.11b/g/n > RRM > Coverage Thresholds** to open coverage page.

**Step 3** Select the **Enable Coverage Hole Detection** check box to enable coverage hole detection, or unselect it to disable this feature. If you enable coverage hole detection, the Cisco WLC automatically determines, based on data received from the access points, if any access points have clients that are potentially located in areas with poor coverage. The default value is selected.

**Step 4** In the **Data RSSI** text box, enter the minimum Receive Signal Strength Indication (RSSI) value for data packets received by the access point. The value that you enter is used to identify coverage holes (or areas of poor coverage) within your network. If the access point receives a packet in the data queue with an RSSI value below the value that you enter here, a potential coverage hole has been detected. The valid range is –90 to –60 dBm, and the default value is –80 dBm. The access point takes data RSSI measurements every 5 seconds and reports them to the Cisco WLC in 90-second intervals.

**Step 5** In the **Voice RSSI** text box, enter the minimum Receive Signal Strength Indication (RSSI) value for voice packets received by the access point. The value that you enter is used to identify coverage holes within your network. If the access point receives a packet in the voice queue with an RSSI value below the value that you enter here, a potential coverage hole has been detected. The valid range is –90 to –60 dBm, and the default value is –80 dBm. The access point takes voice RSSI measurements every 5 seconds and reports them to the Cisco WLC in 90-second intervals.
Step 6
In the **Min Failed Client Count per AP** text box, enter the minimum number of clients on an access point with an RSSI value at or below the data or voice RSSI threshold. The valid range is 1 to 75, and the default value is 3.

Step 7
In the **Coverage Exception Level per AP** text box, enter the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point. The valid range is 0 to 100%, and the default value is 25%.

**Note**
If both the number and percentage of failed packets exceed the values configured for Failed Packet Count and Failed Packet Percentage (configurable through the Cisco WLC CLI) for a 5-second period, the client is considered to be in a pre-alarm condition. The Cisco WLC uses this information to distinguish between real and false coverage holes. False positives are generally due to the poor roaming logic implemented on most clients. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the Min Failed Client Count per AP and Coverage Exception Level per AP text boxes over two 90-second periods (a total of 180 seconds). The Cisco WLC determines if the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

Step 8
Click **Apply**.

Step 9
Reenable the 802.11 network as follows:

a) Choose **Configuration > Wireless > 802.11a/n/ac > Network** or **Configuration > Wireless > 802.11b/g/n > Network** to open the 802.11a (or 802.11b/g) Global Parameters page.

b) Select the **802.11a/n/ac** (or **802.11b/g/n**) **Network Status** check box.

c) Click **Apply**.

Step 10
Click **Save Configuration**.

---

### Configuring 802.11 Event Logging (CLI)

#### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 24ghz | 5ghz rrm logging {channel | coverage | foreign | load | noise | performance | txpower}`
3. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> `ap dot11 24ghz</td>
<td>5ghz rrm logging {channel</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)#ap dot11 24ghz rrm logging channel</td>
<td></td>
</tr>
<tr>
<td>Switch(config)#ap dot11 24ghz rrm logging coverage</td>
<td></td>
</tr>
<tr>
<td>Switch(config)#ap dot11 24ghz rrm logging foreign</td>
<td></td>
</tr>
</tbody>
</table>

- **channel**—Configures the 802.11 channel change logging mode.
- **coverage**—Configures the 802.11 coverage profile logging mode.
- **foreign**—Configures the 802.11 foreign interference profile logging mode.
### Purpose

**Command or Action**

- `Switch(config)# ap dot11 24ghz rrm logging load`
- `Switch(config)# ap dot11 24ghz rrm logging noise`
- `Switch(config)# ap dot11 24ghz rrm logging performance`
- `Switch(config)# ap dot11 24ghz rrm logging txpower`

**Purpose**

- **load**—Configures the 802.11 load profile logging mode.
- **noise**—Configures the 802.11 noise profile logging mode.
- **performance**—Configures the 802.11 performance profile logging mode.
- **txpower**—Configures the 802.11 transmit power change logging mode.

### Step 3

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode. Alternatively, you can also press `Ctrl-Z` to exit global configuration mode.

### Configuring 802.11 Statistics Monitoring (CLI)

#### SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 24ghz | 5ghz rrm monitor channel-list {all | country | dca}**
3. **ap dot11 24ghz | 5ghz rrm monitor coverage interval**
4. **ap dot11 24ghz | 5ghz rrm monitor load interval**
5. **ap dot11 24ghz | 5ghz rrm monitor noise interval**
6. **ap dot11 24ghz | 5ghz rrm monitor signal interval**
7. **end**

#### DETAILED STEPS

**Step 1**

**Example:**

```
Switch# configure terminal
```

Enters global configuration mode.

**Step 2**

**Example:**

```
Switch(config)# ap dot11 24ghz | 5ghz rrm monitor channel-list all
```

Sets the 802.11 monitoring channel-list for parameters such as noise/interference/rogue.

- **all**—Monitors all channels.
- **country**—Monitor channels used in configured country code.
- **dca**—Monitor channels used by dynamic channel assignment.

**Step 3**

**Example:**

```
ap dot11 24ghz | 5ghz rrm monitor coverage interval
```

Configures the 802.11 coverage measurement interval in seconds that ranges from 60 to 3600.
### Purpose

<table>
<thead>

`Switch(config)#end` |

## Configuring Rogue Access Point Detection in RF Groups

### Configuring Rogue Access Point Detection in RF Groups (CLI)

**Before you begin**

Ensure that each Cisco WLC in the RF group has been configured with the same RF group name.
The name is used to verify the authentication IE in all beacon frames. If the Cisco WLCs have different names, false alarms will occur.

**SUMMARY STEPS**

1. `ap name Cisco_AP mode {local | monitor}
2. end
3. configure terminal
4. wireless wps ap-authentication
5. wireless wps ap-authentication threshold `value`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Configures a particular access point for local (normal) mode or monitor (listen-only) mode. Perform this step for every access point connected to the Cisco WLC.</td>
</tr>
<tr>
<td>`ap name Cisco_AP mode {local</td>
<td>monitor}`</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press <code>Ctrl-Z</code> to exit global configuration mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td>Example: <code>Switch(config)# end</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Example: <code>Switch# configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Enables rogue access point detection.</td>
</tr>
<tr>
<td><code>wireless wps ap-authentication</code></td>
<td>Example: <code>Switch (config)# wireless wps ap-authentication</code></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Specifies when a rogue access point alarm is generated. An alarm occurs when the threshold value (which specifies the number of access point frames with an invalid authentication IE) is met or exceeded within the detection period.</td>
</tr>
<tr>
<td><code>wireless wps ap-authentication threshold </code>value`</td>
<td>Example: <code>Switch (config)# wireless wps ap-authentication threshold 50</code></td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Enable rogue access point detection and threshold value on every Cisco WLC in the RF group.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If rogue access point detection is not enabled on every Cisco WLC in the RF group, the access points on the Cisco WLCs with this feature disabled are reported as rogues.</td>
</tr>
</tbody>
</table>
Enabling Rogue Access Point Detection in RF Groups (GUI)

**Step 1** Make sure that each Cisco WLC in the RF group has been configured with the same RF group name.

*Note* The name is used to verify the authentication IE in all beacon frames. If the Cisco WLCs have different names, false alarms will occur.

**Step 2** Choose **Configuration > Wireless > Access Points > All APs** to open the All APs page.

**Step 3** Click the name of an access point to open the All APs > Edit page.

**Step 4** Choose either **local** or **monitor** from the AP Mode drop-down list and click **Apply** to commit your changes.

**Step 5** Click **Save Configuration** to save your changes.

**Step 6** Repeat **Step 2** through **Step 5** for every access point connected to the Cisco WLC.

**Step 7** Choose **Configuration > Security > Wireless Protection Policies > AP Authentication/MFP** to open the AP Authentication Policy page.

The name of the RF group to which this Cisco WLC belongs appears at the top of the page.

**Step 8** Choose **AP Authentication** from the Protection Type drop-down list to enable rogue access point detection.

**Step 9** Enter a number in the Alarm Trigger Threshold edit box to specify when a rogue access point alarm is generated. An alarm occurs when the threshold value (which specifies the number of access point frames with an invalid authentication IE) is met or exceeded within the detection period.

*Note* The valid threshold range is from 1 to 255, and the default threshold value is 1. To avoid false alarms, you may want to set the threshold to a higher value.

**Step 10** Click **Apply** to commit your changes.

**Step 11** Click **Save Configuration** to save your changes.

**Step 12** Repeat this procedure on every Cisco WLC in the RF group.

*Note* If rogue access point detection is not enabled on every Cisco WLC in the RF group, the access points on the Cisco WLCs with this feature disabled are reported as rogues.

### Monitoring RRM Parameters and RF Group Status

#### Monitoring RRM Parameters

<table>
<thead>
<tr>
<th>Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ap dot11 24ghz ccx</td>
<td>Displays the 802.11b CCX information for all Cisco APs.</td>
</tr>
<tr>
<td>show ap dot11 24ghz channel</td>
<td>Displays the configuration and statistics of the 802.11b channel assignment.</td>
</tr>
<tr>
<td>show ap dot11 24ghz coverage</td>
<td>Displays the configuration and statistics of the 802.11b coverage.</td>
</tr>
</tbody>
</table>
### Monitoring RF Group Status (CLI)

This section describes the new commands for RF group status.

The following commands can be used to monitor RF group status on the switch.

#### Table 92: Monitoring Aggressive Load Balancing Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ap dot11 5ghz group</td>
<td>Displays the Cisco WLC name which is the RF group leader for the 802.11a RF network.</td>
</tr>
</tbody>
</table>

Monitoring RF Group Status (GUI)

**Step 1** Choose **Configuration > Wireless > 802.11a/n > or 802.11b/g/n > RRM > RF Grouping** to open the RF Grouping Algorithm page.

This page shows the details of the RF group, displaying the configurable parameter **Group mode**, the **Group role** of this Cisco WLC, the **Group Update Interval** and the Cisco WLC name and IP address of the **Group Leader** to this Cisco WLC.

**Note** RF grouping mode can be set using the **Group Mode** drop-down list.

**Tip** Once a Cisco WLC has joined as a static member and you want to change the grouping mode, we recommend that you remove the member from the configured static-leader and also make sure that a member Cisco WLC has not been configured to be a member on multiple static leaders. This is to avoid repeated join attempts from one or more RF static leaders.

**Step 2** (Optional) Repeat this procedure for the network type that you did not select (802.11a/n or 802.11b/g/n).

Examples: RF Group Configuration

This example shows how to configure RF group name:

```
Switch# configure terminal
Switch(config)# wireless rf-network test1
Switch(config)# ap dot11 24ghz shutdown
Switch(config)# end
Switch # show network profile 5
```

This example shows how to configure rogue access point detection in RF groups:

```
Switch# ap name apl mode local
Switch# end
Switch# configure terminal
Switch(config)# wireless wps ap-authentication
Switch(config)# wireless wps ap-authentication threshold 50
Switch(config)# end
```

Information About ED-RRM

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate.
through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

**Configuring ED-RRM on the Cisco Wireless LAN Controller (CLI)**

**Step 1**
Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled access point detects a significant level of interference by entering these commands:

```
ap dot11 {24ghz | 5ghz} rrm channel clean-air-event
```
—Configures CleanAir driven RRM parameters for the 802.11 Cisco lightweight access points.

```
ap dot11 {24ghz | 5ghz} rrm channel clean-air-event sensitivity {low | medium | high | custom}
```
—Configures CleanAir driven RRM sensitivity for the 802.11 Cisco lightweight access points. Default selection is Medium.

```
ap dot11 {24ghz | 5ghz} rrm channel clean-air-event rogue-contribution
```
—Enables rogue contribution.

```
ap dot11 {24ghz | 5ghz} rrm channel clean-air-event rogue-contribution duty-cycle thresholdvalue
```
—Configures threshold value for rogue contribution. The valid range is from 1 to 99, with 80 as the default.

**Step 2**
Save your changes by entering this command:

```
write memory
```

**Step 3**
See the CleanAir configuration for the 802.11a/n/ac or 802.11b/g/n network by entering this command:

```
show ap dot11 {24ghz | 5ghz} cleanair config
```

Information similar to the following appears:

```
Additional Clean Air Settings:
CleanAir Event-driven RRM State.............. : Enabled
CleanAir Driven RRM Sensitivity.............. : LOW
CleanAir Event-driven RRM Rogue Option...... : Enabled
CleanAir Event-driven RRM Rogue Duty Cycle... : 80
CleanAir Persistent Devices state............ : Disabled
CleanAir Persistent Device Propagation....... : Disabled
```

**Configuring ED-RRM (GUI)**

**Step 1**
Choose **Configure > Radio Configurations > 2.4 GHZ or 5 GHZ > RRM > DCA** to open the ED-RRM page.

**Note**
Before enabling ED-RRM, you have to disable Network Status from **Configure > Radio Configurations > 2.4 GHZ or 5 GHZ > Network > General** page, and then re-enable the network after configuring ED-RRM.

**Step 2**
In the Event Driven RRM section, select the **EDRRM** check box to reveal ED-RRM parameters.

**Step 3**
From the Sensitivity Threshold drop-down, select the value.

Options are: Low, Medium, or High. Default selection is Medium.
Step 4  Select the Rogue Contribution check box to reveal Rogue Duty-Cycle parameters.
Step 5  Enter the Rogue Duty Cycle value in the text box.
The valid range is from 1 to 99, with 80 as the default.
Step 6  Click Apply.
Step 7  Click Save Configuration.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring MSDP

This section describes how to configure the Multicast Source Discovery Protocol (MSDP) on the switch. The MSDP connects multiple Protocol-Independent Multicast sparse-mode (PIM-SM) domains.

MSDP is not fully supported in this software release because of a lack of support for Multicast Border Gateway Protocol (MBGP), which works closely with MSDP. However, it is possible to create default peers that MSDP can operate with if MBGP is not running.

To use this feature, the active switch must be running the IP services feature set.

Understanding MSDP

MSDP allows multicast sources for a group to be known to all rendezvous points (RPs) in different domains. Each PIM-SM domain uses its own RPs and does not depend on RPs in other domains. An RP runs MSDP over the Transmission Control Protocol (TCP) to discover multicast sources in other domains.

An RP in a PIM-SM domain has an MSDP peering relationship with MSDP-enabled devices in another domain. The peering relationship occurs over a TCP connection, primarily exchanging a list of sources sending to multicast groups. The TCP connections between RPs are achieved by the underlying routing system. The receiving RP uses the source lists to establish a source path.
The purpose of this topology is to have domains discover multicast sources in other domains. If the multicast sources are of interest to a domain that has receivers, multicast data is delivered over the normal, source-tree building mechanism in PIM-SM. MSDP is also used to announce sources sending to a group. These announcements must originate at the domain’s RP.

MSDP depends heavily on the Border Gateway Protocol (BGP) or MBGP for interdomain operation. We recommend that you run MSDP in RPs in your domain that are RPs for sources sending to global groups to be announced to the Internet.

**MSDP Operation**

When a source sends its first multicast packet, the first-hop router (designated router or RP) directly connected to the source sends a PIM register message to the RP. The RP uses the register message to register the active source and to forward the multicast packet down the shared tree in the local domain. With MSDP configured, the RP also forwards a source-active (SA) message to all MSDP peers. The SA message identifies the source, the group the source is sending to, and the address of the RP or the originator ID (the IP address of the interface used as the RP address), if configured.

Each MSDP peer receives and forwards the SA message away from the originating RP to achieve peer reverse-path flooding (RPF). The MSDP device examines the BGP or MBGP routing table to discover which peer is the next hop toward the originating RP of the SA message. Such a peer is called an RPF peer (reverse-path forwarding peer). The MSDP device forwards the message to all MSDP peers other than the RPF peer. For information on how to configure an MSDP peer when BGP and MBGP are not supported, see the Configuring a Default MSDP Peer, on page 1093.

If the MSDP peer receives the same SA message from a non-RPF peer toward the originating RP, it drops the message. Otherwise, it forwards the message to all its MSDP peers.

The RP for a domain receives the SA message from an MSDP peer. If the RP has any join requests for the group the SA message describes and if the (*,G) entry exists with a nonempty outgoing interface list, the domain is interested in the group, and the RP triggers an (S,G) join toward the source. After the (S,G) join reaches the source’s DR, a branch of the source tree has been built from the source to the RP in the remote domain. Multicast traffic can now flow from the source across the source tree to the RP and then down the shared tree in the remote domain to the receiver.

**MSDP Benefits**

MSDP has these benefits:

- It breaks up the shared multicast distribution tree. You can make the shared tree local to your domain. Your local members join the local tree, and join messages for the shared tree never need to leave your domain.
- PIM sparse-mode domains can rely only on their own RPs, decreasing reliance on RPs in another domain. This increases security because you can prevent your sources from being known outside your domain.
- Domains with only receivers can receive data without globally advertising group membership.
- Global source multicast routing table state is not required, saving memory.
How to Configure MSDP

Default MSDP Configuration

MSDP is not enabled, and no default MSDP peer exists.

Configuring a Default MSDP Peer

In this software release, because BGP and MBGP are not supported, you cannot configure an MSDP peer on the local switch by using the `ip msdp peer` global configuration command. Instead, you define a default MSDP peer (by using the `ip msdp default-peer` global configuration command) from which to accept all SA messages for the switch. The default MSDP peer must be a previously configured MSDP peer. Configure a default MSDP peer when the switch is not BGP- or MBGP-peering with an MSDP peer. If a single MSDP peer is configured, the switch always accepts all SA messages from that peer.

This figure shows a network in which default MSDP peers might be used. A customer who owns Switch B is connected to the Internet through two Internet service providers (ISPs), one owning Router A and the other owning Router C. They are not running BGP or MBGP between them. To learn about sources in the ISP’s domain or in other domains, Switch B at the customer site identifies Router A as its default MSDP peer. Switch B advertises SA messages to both Router A and Router C but accepts SA messages only from Router A or only from Router C. If Router A is first in the configuration file, it is used if it is running. If Router A is not running, only then does Switch B accept SA messages from Router C. This is the default behavior without a prefix list.

If you specify a prefix list, the peer is a default peer only for the prefixes in the list. You can have multiple active default peers when you have a prefix list associated with each. When you do not have any prefix lists, you can configure multiple default peers, but only the first one is the active default peer as long as the router has connectivity to this peer and the peer is alive. If the first configured peer fails or the connectivity to this peer fails, the second configured peer becomes the active default, and so on.

The ISP probably uses a prefix list to define which prefixes it accepts from the customer’s router.

### Procedure

<table>

<tr>
<td>listed prefixes. You can have multiple active default peers when you have a prefix list associated with each. When you enter multiple <code>ip msdp default-peer</code> commands with the <code>prefix-list</code> keyword, you use all the default peers at the same time for different RP prefixes. This syntax is typically used in a service provider cloud that connects stub site clouds. When you enter multiple <code>ip msdp default-peer</code> commands without the <code>prefix-list</code> keyword, a single active peer accepts all SA messages. If that peer fails, the next configured default peer accepts all SA messages. This syntax is typically used at a stub site.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**

```
Step 3 ip prefix-list name [description string] | seq number {permit | deny} network length

Example:
Router(config)# prefix-list site-a seq 3 permit 12 network length 128
```

(Optional) Creates a prefix list using the name specified in Step 2.

- (Optional) For `description string`, enter a description of up to 80 characters to describe this prefix list.
- For `seq number`, enter the sequence number of the entry. The range is 1 to 4294967294.
- The `deny` keyword denies access to matching conditions.
- The `permit` keyword permits access to matching conditions.
- For `network length`, specify the network number and length (in bits) of the network mask that is permitted or denied.

**Step 4**

```
Step 4 ip msdp description {peer-name | peer-address} text

Example:
Router(config)# ip msdp description peer-name site-b
```

(Optional) Configures a description for the specified peer to make it easier to identify in a configuration or in `show` command output.

By default, no description is associated with an MSDP peer.

**Step 5**

```
Step 5 end

Example:
Router(config)# end
```

Returns to privileged EXEC mode.

**Step 6**

```
Step 6 show running-config

Example:
Router# show running-config
```

Verifies your entries.
### Caching Source-Active State

By default, the switch does not cache source/group pairs from received SA messages. When the switch forwards the MSDP SA information, it does not store it in memory. Therefore, if a member joins a group soon after a SA message is received by the local RP, that member needs to wait until the next SA message to hear about the source. This delay is known as join latency.

If you want to sacrifice some memory in exchange for reducing the latency of the source information, you can configure the switch to cache SA messages.

Beginning in privileged EXEC mode, follow these steps to enable the caching of source/group pairs. This procedure is optional.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
Example:  
Switch# configure terminal | Enters global configuration mode. |
| **Step 2** | ip msdp cache-sa-state [list access-list-number]  
Example:  
Switch(config)# ip msdp cache-sa-state 100 | Enables the caching of source/group pairs (create an SA state). Those pairs that pass the access list are cached.  
For list access-list-number, the range is 100 to 199.  
**Note** An alternative to this command is the ip msdp sa-reques global configuration command, which causes the switch to send an SA request message to the MSDP peer when a new member for a group becomes active. |
| **Step 3** | access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard  
Example:  
Switch(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.255.255 | Creates an IP extended access list, repeating the command as many times as necessary.  
• For access-list-number, the range is 100 to 199. Enter the same number created in Step 2.  
• The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.  
• For protocol, enter ip as the protocol name. |
Controlling Source Information that Your Switch Originates

You can control the multicast source information that originates with your switch:

- Sources you advertise (based on your sources)
- Receivers of source information (based on knowing the requestor)

For more information, see the Redistributing Sources, on page 1096 and the Filtering Source-Active Request Messages, on page 1098.

Redistributing Sources

SA messages originate on RPs to which sources have registered. By default, any source that registers with an RP is advertised. The A flag is set in the RP when a source is registered, which means the source is advertised in an SA unless it is filtered.

### Command or Action

| Purpose |
|------------------|------------------|
| • For source, enter the number of the network or host from which the packet is being sent. |
| • For source-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. |
| • For destination, enter the number of the network or host to which the packet is being sent. |
| • For destination-wildcard, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore. |

Recall that the access list is always terminated by an implicit deny statement for everything.

### Step 4

**end**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

### Step 5

**show running-config**

**Example:**

Switch# show running-config

Verifies your entries.

### Step 6

**copy running-config startup-config**

**Example:**

Switch# copy running-config startup-config

(Optional) Saves your entries in the configuration file.
This task is optional.

### Procedure

<table>
<thead>
<tr>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip msdp redistribute [list access-list-name] [asn aspath-access-list-number] [route-map map]</td>
<td>Configures which (S,G) entries from the multicast routing table are advertised in SA messages.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# ip msdp redistribute list 21</td>
<td>By default, only sources within the local domain are advertised.</td>
</tr>
<tr>
<td>• (Optional) list access-list-name—Enters the name or number of an IP standard or extended access list. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists. The access list controls which local sources are advertised and to which groups they send.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• (Optional) asn aspath-access-list-number—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the ip as-path access-list command.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• (Optional) route-map map—Enters the IP standard or extended access list number in the range 1 to 199. This access list number must also be configured in the ip as-path access-list command.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>The switch advertises (S,G) pairs according to the access list or autonomous system path access list.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Use one of the following:</td>
<td>Creates an IP standard access list, repeating the command as many times as necessary.</td>
</tr>
<tr>
<td>• access-list access-list-number {deny</td>
<td>permit} source [source-wildcard]</td>
<td>or</td>
</tr>
<tr>
<td>• access-list access-list-number {deny</td>
<td>permit} protocol source source-wildcard destination destination-wildcard</td>
<td>Creates an IP extended access list, repeating the command as many times as necessary.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# access list 21 permit 194.1.22.0</td>
<td></td>
</tr>
<tr>
<td>or</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• access-list-number—Enters the same number created in Step 2. The range is 1 to 99 for standard access lists and 100 to 199 for extended lists.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• deny—Denies access if the conditions are matched. The permit keyword permits access if the conditions are matched.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• protocol—Enters ip as the protocol name.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# access list 21 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</code></td>
<td>- <code>source</code>—Enters the number of the network or host from which the packet is being sent.&lt;br&gt;- <code>source-wildcard</code>—Enters the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.&lt;br&gt;- <code>destination</code>—Enters the number of the network or host to which the packet is being sent.&lt;br&gt;- <code>destination-wildcard</code>—Enters the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</td>
</tr>
</tbody>
</table>

Recall that the access list is always terminated by an implicit deny statement for everything.

### Step 4

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

### Step 5

**Example:**

```
Switch# show running-config
```

Verifies your entries.

### Step 6

**Example:**

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

### Filtering Source-Active Request Messages

By default, only switches that are caching SA information can respond to SA requests. By default, such a switch honors all SA request messages from its MSDP peers and supplies the IP addresses of the active sources.

However, you can configure the switch to ignore all SA requests from an MSDP peer. You can also honor only those SA request messages from a peer for groups described by a standard access list. If the groups in the access list pass, SA request messages are accepted. All other such messages from the peer for other groups are ignored.

This task is optional.
<table>

Example:

Switch# `copy running-config startup-config`

---

### Controlling Source Information that Your Switch Forwards

By default, the switch forwards all SA messages it receives to all its MSDP peers. However, you can prevent outgoing messages from being forwarded to a peer by using a filter or by setting a time-to-live (TTL) value.

### Using a Filter

By creating a filter, you can perform one of these actions:

- Filter all source/group pairs
- Specify an IP extended access list to pass only certain source/group pairs
- Filter based on match criteria in a route map

This task is optional.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
</tr>
</tbody>
</table>

Example:

Switch# `configure terminal`

Step 2

Use one of the following:

- `ip msdp sa-filter out`
  
  `{ip-address name}`
- `ip msdp sa-filter out`
  
  `{ip-address name}
   list  access-list-number`
- `ip msdp sa-filter out`
  
  `{ip-address name}
   route-map  map-tag

Example:

Switch(config)# `ip msdp sa-filter out switch.cisco.com`
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>or Switch(config)# ip msdp sa-filter out list 100 or Switch(config)# ip msdp sa-filter out switch.cisco.com route-map 22</td>
<td>(Optional) Creates an IP extended access list, repeating the command as many times as necessary.</td>
</tr>
</tbody>
</table>
| Step 3 access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard | - For `access-list-number`, enter the number specified in Step 2.  
- The `deny` keyword denies access if the conditions are matched. The `permit` keyword permits access if the conditions are matched.  
- For `protocol`, enter `ip` as the protocol name.  
- For `source`, enter the number of the network or host from which the packet is being sent.  
- For `source-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.  
- For `destination`, enter the number of the network or host to which the packet is being sent.  
- For `destination-wildcard`, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.  
Recall that the access list is always terminated by an implicit deny statement for everything. |
| Step 4 end | Returns to privileged EXEC mode. |
| Example: Switch(config)# end | |
| Step 5 show running-config | Verifies your entries. |
| Example: Switch# show running-config | |
| Step 6 copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: | |
### Using TTL to Limit the Multicast Data Sent in SA Messages

You can use a TTL value to control what data is encapsulated in the first SA message for every source. Only multicast packets with an IP-header TTL greater than or equal to the `ttl` argument are sent to the specified MSDP peer. For example, you can limit internal traffic to a TTL of 8. If you want other groups to go to external locations, you must send those packets with a TTL greater than 8.

This task is optional.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> `ip msdp ttl-threshold {ip-address</td>
<td>name} ttl`</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip msdp ttl-threshold switch.cisco.com 0</td>
<td>• For `ip-address</td>
</tr>
<tr>
<td></td>
<td>• For <code>ttl</code>, enter the TTL value. The default is 0, which means all multicast data packets are forwarded to the peer until the TTL is exhausted. The range is 0 to 255.</td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>show running-config</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

<tr>
<td>Switch# show running-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Controlling Source Information that Your Switch Receives

By default, the switch receives all SA messages that its MSDP RPF peers send to it. However, you can control the source information that you receive from MSDP peers by filtering incoming SA messages. In other words, you can configure the switch to not accept them.

You can perform one of these actions:

• Filter all incoming SA messages from an MSDP peer
• Specify an IP extended access list to pass certain source/group pairs
• Filter based on match criteria in a route map

This task is optional.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Filters all SA messages to the specified MSDP peer. |
| Use one of the following: |  |
| • ip msdp sa-filter in | |
| {ip-address name} | |
| • ip msdp sa-filter in | |
| {ip-address name} | |
| list access-list-number | |
| • ip msdp sa-filter in | |
| {ip-address name} | |
| route-map map-tag | |
| **Example:** | |
| Switch(config)# ip msdp sa-filter in switch.cisco.com | |
| or | |
| Switch(config)# ip msdp sa-filter in list 100 | |
| or | |
| Switch(config)# ip msdp sa-filter in switch.cisco.com route-map 22 | |

| **Step 3** | (Optional) Creates an IP extended access list, repeating the command as many times as necessary. |
| access-list access-list-number {deny | permit} protocol source source-wildcard destination destination-wildcard | |
### Configuring an MSDP Mesh Group

An MSDP mesh group is a group of MSDP speakers that have fully meshed MSDP connectivity among one another. Any SA messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group. Thus, you reduce SA message flooding and simplify peer-RPF flooding. Use the `ip msdp mesh-group` global configuration command when there are multiple RPs within a domain. It is especially

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# access list 100 permit ip 194.1.22.0 1.1.1.1 194.3.44.0 1.1.1.1</code></td>
<td></td>
</tr>
<tr>
<td>• <code>access-list-number</code>, enter the number specified in Step 2.</td>
<td></td>
</tr>
<tr>
<td>• The <code>deny</code> keyword denies access if the conditions are matched. The <code>permit</code> keyword permits access if the conditions are matched.</td>
<td></td>
</tr>
<tr>
<td>• For <code>protocol</code>, enter <code>ip</code> as the protocol name.</td>
<td></td>
</tr>
<tr>
<td>• For <code>source</code>, enter the number of the network or host from which the packet is being sent.</td>
<td></td>
</tr>
<tr>
<td>• For <code>source-wildcard</code>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore.</td>
<td></td>
</tr>
<tr>
<td>• For <code>destination</code>, enter the number of the network or host to which the packet is being sent.</td>
<td></td>
</tr>
<tr>
<td>• For <code>destination-wildcard</code>, enter the wildcard bits in dotted decimal notation to be applied to the destination. Place ones in the bit positions that you want to ignore.</td>
<td></td>

### Shutting Down an MSDP Peer

If you want to configure many MSDP commands for the same peer and you do not want the peer to become active, you can shut down the peer, configure it, and later bring it up. When a peer is shut down, the TCP connection is terminated and is not restarted. You can also shut down an MSDP session without losing configuration information for the peer.

This task is optional.
Including a Bordering PIM Dense-Mode Region in MSDP

You can configure MSDP on a switch that borders a PIM sparse-mode region with a dense-mode region. By default, active sources in the dense-mode region do not participate in MSDP.

We do not recommend using the `ip msdp border sa-address` global configuration command. It is better to configure the border router in the sparse-mode domain to proxy-register sources in the dense-mode domain to the RP of the sparse-mode domain and have the sparse-mode domain use standard MSDP procedures to advertise these sources.

The `ip msdp originator-id` global configuration command also identifies an interface to be used as the RP address. If both the `ip msdp border sa-address` and the `ip msdp originator-id` global configuration commands are configured, the address derived from the `ip msdp originator-id` command specifies the RP address.

This task is optional.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Step 2</td>
<td>`ip msdp shutdown {peer-name</td>
<td>peer address}`&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# ip msdp shutdown switch.cisco.com</td>
</tr>
<tr>
<td>Step 3</td>
<td><strong>end</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>show running-config</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# show running-config</td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>copy running-config startup-config</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

### Note

We do not recommend using the `ip msdp border sa-address` global configuration command. It is better to configure the border router in the sparse-mode domain to proxy-register sources in the dense-mode domain to the RP of the sparse-mode domain and have the sparse-mode domain use standard MSDP procedures to advertise these sources.

The `ip msdp originator-id` global configuration command also identifies an interface to be used as the RP address. If both the `ip msdp border sa-address` and the `ip msdp originator-id` global configuration commands are configured, the address derived from the `ip msdp originator-id` command specifies the RP address.

This task is optional.
### Procedure

### Configuring an Originating Address other than the RP Address

You can allow an MSDP speaker that originates an SA message to use the IP address of the interface as the RP address in the SA message by changing the Originator ID. You might change the Originator ID in one of these cases:

- If you configure a logical RP on multiple switches in an MSDP mesh group.
If you have a switch that borders a PIM sparse-mode domain and a dense-mode domain. If a switch borders a dense-mode domain for a site, and sparse-mode is being used externally, you might want dense-mode sources to be known to the outside world. Because this switch is not an RP, it would not have an RP address to use in an SA message. Therefore, this command provides the RP address by specifying the address of the interface.

If both the `ip msdp border sa-address` and the `ip msdp originator-id` global configuration commands are configured, the address derived from the `ip msdp originator-id` command specifies the address of the RP.

This task is optional.

Configuration Examples for Configuring MSDP

Configuring a Default MSDP Peer: Example

This example shows a partial configuration of Router A and Router C in. Each of these ISPs have more than one customer (like the customer in ) who use default peering (no BGP or MBGP). In that case, they might have similar configurations. That is, they accept SAs only from a default peer if the SA is permitted by the corresponding prefix list.

Router A

Router(config)# ip msdp default-peer 10.1.1.1
Router(config)# ip msdp default-peer 10.1.1.1 prefix-list site-a
Caching Source-Active State: Example

This example shows how to enable the cache state for all sources in 171.69.0.0/16 sending to groups 224.2.0.0/16:

Switch(config)# ip msdp cache-sa-state 100
Switch(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.2.0.0 0.0.0.255

Controlling Source Information that Your Switch Originates: Example

This example shows how to configure the switch to filter SA request messages from the MSDP peer at 171.69.2.2. SA request messages from sources on network 192.4.22.0 pass access list 1 and are accepted; all others are ignored.

Switch(config)# ip msdp filter sa-request 171.69.2.2 list 1
Switch(config)# access-list 1 permit 192.4.22.0 0.0.0.255

Controlling Source Information that Your Switch Forwards: Example

This example shows how to allow only (S,G) pairs that pass access list 100 to be forwarded in an SA message to the peer named switch.cisco.com:

Switch(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Switch(config)# ip msdp sa-filter out switch.cisco.com list 100
Switch(config)# access-list 100 permit ip 171.69.0.0 0.0.255.255 224.20 0 0.0.255.255

Controlling Source Information that Your Switch Receives: Example

This example shows how to filter all SA messages from the peer named switch.cisco.com:

Switch(config)# ip msdp peer switch.cisco.com connect-source gigabitethernet1/0/1
Switch(config)# ip msdp sa-filter in switch.cisco.com

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring IP Unicast Routing

This module describes how to configure IP Version 4 (IPv4) unicast routing on the switch.

**Note**

On switches running the LAN base feature, static routing on VLANs is supported only with this release.

A switch stack operates and appears as a single router to the rest of the routers in the network. Basic routing functions, including static routing and the Routing Information Protocol (RIP), are available with both the IP base feature set and the IP services feature set. To use advanced routing features and other routing protocols, you must have the IP services feature set enabled on the standalone switch or on the active switch.

**Note**

In addition to IPv4 traffic, you can also enable IP Version 6 (IPv6) unicast routing and configure interfaces to forward IPv6 traffic if the switch or switch stack is running the IP base or IP services feature set.

Information About IP Routing

In some network environments, VLANs are associated with individual networks or subnetworks. In an IP network, each subnetwork is mapped to an individual VLAN. Configuring VLANs helps control the size of the broadcast domain and keeps local traffic local. However, network devices in different VLANs cannot communicate with one another without a Layer 3 device (router) to route traffic between the VLAN, referred to as inter-VLAN routing. You configure one or more routers to route traffic to the appropriate destination VLAN.

**Figure 63: Routing Topology Example**

This figure shows a basic routing topology. Switch A is in VLAN 10, and Switch B is in VLAN 20. The router has an interface in each VLAN.
When Host A in VLAN 10 needs to communicate with Host B in VLAN 10, it sends a packet addressed to that host. Switch A forwards the packet directly to Host B, without sending it to the router.

When Host A sends a packet to Host C in VLAN 20, Switch A forwards the packet to the router, which receives the traffic on the VLAN 10 interface. The router checks the routing table, finds the correct outgoing interface, and forwards the packet on the VLAN 20 interface to Switch B. Switch B receives the packet and forwards it to Host C.

Types of Routing

Routers and Layer 3 switches can route packets in these ways:

- By using default routing
- By using preprogrammed static routes for the traffic
- By dynamically calculating routes by using a routing protocol

Default routing refers to sending traffic with a destination unknown to the router to a default outlet or destination.

Static unicast routing forwards packets from predetermined ports through a single path into and out of a network. Static routing is secure and uses little bandwidth, but does not automatically respond to changes in the network, such as link failures, and therefore, might result in unreachable destinations. As networks grow, static routing becomes a labor-intensive liability.

Switches running the LAN base feature set support 16 user-configured static routes, in addition to any default routes used for the management interface. The LAN base image supports static routing only on SVIs.

Dynamic routing protocols are used by routers to dynamically calculate the best route for forwarding traffic. There are two types of dynamic routing protocols:

- Routers using distance-vector protocols maintain routing tables with distance values of networked resources, and periodically pass these tables to their neighbors. Distance-vector protocols use one or a series of metrics for calculating the best routes. These protocols are easy to configure and use.
- Routers using link-state protocols maintain a complex database of network topology, based on the exchange of link-state advertisements (LSAs) between routers. LSAs are triggered by an event in the network, which speeds up the convergence time or time required to respond to these changes. Link-state protocols respond quickly to topology changes, but require greater bandwidth and more resources than distance-vector protocols.

Distance-vector protocols supported by the switch are Routing Information Protocol (RIP), which uses a single distance metric (cost) to determine the best path and Border Gateway Protocol (BGP), which adds a path vector mechanism. The switch also supports the Open Shortest Path First (OSPF) link-state protocol and Enhanced IGRP (EIGRP), which adds some link-state routing features to traditional Interior Gateway Routing Protocol (IGRP) to improve efficiency.

---

**Note**

On a switch or switch stack, the supported protocols are determined by the software running on the active switch. If the active switch is running the IP base feature set, only default routing, static routing and RIP are supported. If the active switch is running the IP base feature set, only default routing, static routing and RIP are supported. If the switch is running the LAN base feature set, you can configure 16 static routes on SVIs. All other routing protocols require the IP services feature set.
IP Routing and Switch Stacks

A switch stack appears to the network as a single switch, regardless of which switch in the stack is connected to a routing peer.

The active switch performs these functions:

- It initializes and configures the routing protocols.
- It sends routing protocol messages and updates to other routers.
- It processes routing protocol messages and updates received from peer routers.
- It generates, maintains, and distributes the distributed Cisco Express Forwarding (dCEF) database to all stack members. The routes are programmed on all switches in the stack bases on this database.
- The MAC address of the active switch is used as the router MAC address for the whole stack, and all outside devices use this address to send IP packets to the stack.
- All IP packets that require software forwarding or processing go through the CPU of the active switch.

Stack members perform these functions:

- They act as routing standby switches, ready to take over in case they are elected as the new active switch if the active switch fails.
- They program the routes into hardware.

If a active switch fails, the stack detects that the active switch is down and elects one of the stack members to be the new active switch. During this period, except for a momentary interruption, the hardware continues to forward packets with no active protocols.

However, even though the switch stack maintains the hardware identification after a failure, the routing protocols on the router neighbors might flap during the brief interruption before the active switch restarts. Routing protocols such as OSPF and EIGRP need to recognize neighbor transitions. The router uses two levels of nonstop forwarding (NSF) to detect a switchover, to continue forwarding network traffic, and to recover route information from peer devices:

- NSF-aware routers tolerate neighboring router failures. After the neighbor router restarts, an NSF-aware router supplies information about its state and route adjacencies on request.
- NSF-capable routers support NSF. When they detect a active switch change, they rebuild routing information from NSF-aware or NSF-capable neighbors and do not wait for a restart.

The switch stack supports NSF-capable routing for OSPF and EIGRP.

Upon election, the new active switch performs these functions:

- It starts generating, receiving, and processing routing updates.
- It builds routing tables, generates the CEF database, and distributes it to stack members.
- It uses its MAC address as the router MAC address. To notify its network peers of the new MAC address, it periodically (every few seconds for 5 minutes) sends a gratuitous ARP reply with the new router MAC address.
If you configure the persistent MAC address feature on the stack and the active switch changes, the stack MAC address does not change for the configured time period. If the previous active switch rejoins the stack as a member switch during that time period, the stack MAC address remains the MAC address of the previous active switch.

**Note**

- It attempts to determine the reachability of every proxy ARP entry by sending an ARP request to the proxy ARP IP address and receiving an ARP reply. For each reachable proxy ARP IP address, it generates a gratuitous ARP reply with the new router MAC address. This process is repeated for 5 minutes after a new active switch election.

**Note**

When a active switch is running the IP services feature set, the stack can run all supported protocols, including Open Shortest Path First (OSPF), Enhanced IGRP (EIGRP), and Border Gateway Protocol (BGP). If the active switch fails and the new elected active switch is running the IP base or LAN base feature set, these protocols will no longer run in the stack.

**Caution**

Partitioning of the switch stack into two or more stacks might lead to undesirable behavior in the network.

If the switch is reloaded, then all the ports on that switch go down and there is a loss of traffic for the interfaces involved in routing, despite NSF/SSO capability.

### Classless Routing

By default, classless routing behavior is enabled on the switch when it is configured to route. With classless routing, if a router receives packets for a subnet of a network with no default route, the router forwards the packet to the best supernet route. A supernet consists of contiguous blocks of Class C address spaces used to simulate a single, larger address space and is designed to relieve the pressure on the rapidly depleting Class B address space.

In Figure 41-2, classless routing is enabled. When the host sends a packet to 120.20.4.1, instead of discarding the packet, the router forwards it to the best supernet route. If you disable classless routing and a router receives packets destined for a subnet of a network with no network default route, the router discards the packet.
In Figure 41-3, the router in network 128.20.0.0 is connected to subnets 128.20.1.0, 128.20.2.0, and 128.20.3.0. If the host sends a packet to 120.20.4.1, because there is no network default route, the router discards the packet.

**Address Resolution**

You can control interface-specific handling of IP by using address resolution. A device using IP can have both a local address or MAC address, which uniquely defines the device on its local segment or LAN, and a network address, which identifies the network to which the device belongs.

---

**Note**

In a switch stack, network communication uses a single MAC address and the IP address of the stack.
The local address or MAC address is known as a data link address because it is contained in the data link layer (Layer 2) section of the packet header and is read by data link (Layer 2) devices. To communicate with a device on Ethernet, the software must learn the MAC address of the device. The process of learning the MAC address from an IP address is called address resolution. The process of learning the IP address from the MAC address is called reverse address resolution.

The switch can use these forms of address resolution:

- Address Resolution Protocol (ARP) is used to associate IP address with MAC addresses. Taking an IP address as input, ARP learns the associated MAC address and then stores the IP address/MAC address association in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests or replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP).

- Proxy ARP helps hosts with no routing tables learn the MAC addresses of hosts on other networks or subnets. If the switch (router) receives an ARP request for a host that is not on the same interface as the ARP request sender, and if the router has all of its routes to the host through other interfaces, it generates a proxy ARP packet giving its own local data link address. The host that sent the ARP request then sends its packets to the router, which forwards them to the intended host.

The switch also uses the Reverse Address Resolution Protocol (RARP), which functions the same as ARP does, except that the RARP packets request an IP address instead of a local MAC address. Using RARP requires a RARP server on the same network segment as the router interface. Use the `ip rarp-server address` interface configuration command to identify the server.

For more information on RARP, see the Cisco IOS Configuration Fundamentals Configuration Guide, Release 12.4.

**Proxy ARP**

Proxy ARP, the most common method for learning about other routes, enables an Ethernet host with no routing information to communicate with hosts on other networks or subnets. The host assumes that all hosts are on the same local Ethernet and that they can use ARP to learn their MAC addresses. If a switch receives an ARP request for a host that is not on the same network as the sender, the switch evaluates whether it has the best route to that host. If it does, it sends an ARP reply packet with its own Ethernet MAC address, and the host that sent the request sends the packet to the switch, which forwards it to the intended host. Proxy ARP treats all networks as if they are local and performs ARP requests for every IP address.

**ICMP Router Discovery Protocol**

Router discovery allows the switch to dynamically learn about routes to other networks using ICMP router discovery protocol (IRDP). IRDP allows hosts to locate routers. When operating as a client, the switch generates router discovery packets. When operating as a host, the switch receives router discovery packets. The switch can also listen to Routing Information Protocol (RIP) routing updates and use this information to infer locations of routers. The switch does not actually store the routing tables sent by routing devices; it merely keeps track of which systems are sending the data. The advantage of using IRDP is that it allows each router to specify both a priority and the time after which a device is assumed to be down if no further packets are received.

Each device discovered becomes a candidate for the default router, and a new highest-priority router is selected when a higher priority router is discovered, when the current default router is declared down, or when a TCP connection is about to time out because of excessive retransmissions.
UDP Broadcast Packets and Protocols

User Datagram Protocol (UDP) is an IP host-to-host layer protocol, as is TCP. UDP provides a low-overhead, connectionless session between two end systems and does not provide for acknowledgment of received datagrams. Network hosts occasionally use UDP broadcasts to find address, configuration, and name information. If such a host is on a network segment that does not include a server, UDP broadcasts are normally not forwarded. You can remedy this situation by configuring an interface on a router to forward certain classes of broadcasts to a helper address. You can use more than one helper address per interface.

You can specify a UDP destination port to control which UDP services are forwarded. You can specify multiple UDP protocols. You can also specify the Network Disk (ND) protocol, which is used by older diskless Sun workstations and the network security protocol SDNS.

By default, both UDP and ND forwarding are enabled if a helper address has been defined for an interface. The description for the `ip forward-protocol` interface configuration command in the *Cisco IOS IP Command Reference, Volume 1 of 3: Addressing and Services, Release 12.4* lists the ports that are forwarded by default if you do not specify any UDP ports.

Broadcast Packet Handling

After configuring an IP interface address, you can enable routing and configure one or more routing protocols, or you can configure the way the switch responds to network broadcasts. A broadcast is a data packet destined for all hosts on a physical network. The switch supports two kinds of broadcasting:

- A directed broadcast packet is sent to a specific network or series of networks. A directed broadcast address includes the network or subnet fields.
- A flooded broadcast packet is sent to every network.

Note

You can also limit broadcast, unicast, and multicast traffic on Layer 2 interfaces by using the `storm-control` interface configuration command to set traffic suppression levels.

Routers provide some protection from broadcast storms by limiting their extent to the local cable. Bridges (including intelligent bridges), because they are Layer 2 devices, forward broadcasts to all network segments, thus propagating broadcast storms. The best solution to the broadcast storm problem is to use a single broadcast address scheme on a network. In most modern IP implementations, you can set the address to be used as the broadcast address. Many implementations, including the one in the switch, support several addressing schemes for forwarding broadcast messages.

IP Broadcast Flooding

You can allow IP broadcasts to be flooded throughout your internetwork in a controlled fashion by using the database created by the bridging STP. Using this feature also prevents loops. To support this capability, bridging must be configured on each interface that is to participate in the flooding. If bridging is not configured on an interface, it still can receive broadcasts. However, the interface never forwards broadcasts it receives, and the router never uses that interface to send broadcasts received on a different interface.

Packets that are forwarded to a single network address using the IP helper-address mechanism can be flooded. Only one copy of the packet is sent on each network segment.
To be considered for flooding, packets must meet these criteria. (Note that these are the same conditions used to consider packet forwarding using IP helper addresses.)

- The packet must be a MAC-level broadcast.
- The packet must be an IP-level broadcast.
- The packet must be a TFTP, DNS, Time, NetBIOS, ND, or BOOTP packet, or a UDP specified by the `ip forward-protocol udp` global configuration command.
- The time-to-live (TTL) value of the packet must be at least two.

A flooded UDP datagram is given the destination address specified with the `ip broadcast-address` interface configuration command on the output interface. The destination address can be set to any address. Thus, the destination address might change as the datagram propagates through the network. The source address is never changed. The TTL value is decremented.

When a flooded UDP datagram is sent out an interface (and the destination address possibly changed), the datagram is handed to the normal IP output routines and is, therefore, subject to access lists, if they are present on the output interface.

In the switch, the majority of packets are forwarded in hardware; most packets do not go through the switch CPU. For those packets that do go to the CPU, you can speed up spanning tree-based UDP flooding by a factor of about four to five times by using turbo-flooding. This feature is supported over Ethernet interfaces configured for ARP encapsulation.

### How to Configure IP Routing

By default, IP routing is disabled on the switch, and you must enable it before routing can take place. For detailed IP routing configuration information, see the *Cisco IOS IP Configuration Guide, Release 12.4*

In the following procedures, the specified interface must be one of these Layer 3 interfaces:

- A routed port: a physical port configured as a Layer 3 port by using the `no switchport` interface configuration command.
- A switch virtual interface (SVI): a VLAN interface created by using the `interface vlan vlan_id` global configuration command and by default a Layer 3 interface.
- An EtherChannel port channel in Layer 3 mode: a port-channel logical interface created by using the `interface port-channel port-channel-number` global configuration command and binding the Ethernet interface into the channel group. For more information, see the “Configuring Layer 3 EtherChannels” section on page 39-15.

**Note**
The switch does not support tunnel interfaces for unicast routed traffic.

All Layer 3 interfaces on which routing will occur must have IP addresses assigned to them. See the “Assigning IP Addresses to Network Interfaces” section on page 41-7.
A Layer 3 switch can have an IP address assigned to each routed port and SVI. The number of routed ports and SVIs that you can configure is limited to 128, exceeding the recommended number and volume of features being implemented might impact CPU utilization because of hardware limitations.

Configuring routing consists of several main procedures:

- To support VLAN interfaces, create and configure VLANs on the switch or switch stack, and assign VLAN membership to Layer 2 interfaces. For more information, see Chapter 14, “Configuring VLANs.”
- Configure Layer 3 interfaces.
- Enable IP routing on the switch.
- Assign IP addresses to the Layer 3 interfaces.
- Enable selected routing protocols on the switch.
- Configure routing protocol parameters (optional).

### How to Configure IP Addressing

A required task for configuring IP routing is to assign IP addresses to Layer 3 network interfaces to enable the interfaces and allow communication with the hosts on those interfaces that use IP. The following sections describe how to configure various IP addressing features. Assigning IP addresses to the interface is required; the other procedures are optional.

### Default IP Addressing Configuration

### Assigning IP Addresses to Network Interfaces

An IP address identifies a location to which IP packets can be sent. Some IP addresses are reserved for special uses and cannot be used for host, subnet, or network addresses. RFC 1166, “Internet Numbers,” contains the official description of IP addresses.

An interface can have one primary IP address. A mask identifies the bits that denote the network number in an IP address. When you use the mask to subnet a network, the mask is referred to as a subnet mask. To receive an assigned network number, contact your Internet service provider.

</tr>
</tbody>
</table>
Purpose
Command or Action | Purpose
--- | ---
Step 10 | copy running-config startup-config
Example: Switch# copy running-config startup-config
(Optional) Saves your entries in the configuration file.

Using Subnet Zero

Subnetting with a subnet address of zero is strongly discouraged because of the problems that can arise if a network and a subnet have the same addresses. For example, if network 131.108.0.0 is subnetted as 255.255.255.0, subnet zero would be written as 131.108.0.0, which is the same as the network address.

You can use the all ones subnet (131.108.255.0) and even though it is discouraged, you can enable the use of subnet zero if you need the entire subnet space for your IP address.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | configure terminal
Example: Switch# configure terminal
Enters global configuration mode. |
| Step 2 | ip subnet-zero
Example: Switch(config)# ip subnet-zero
Enables the use of subnet zero for interface addresses and routing updates. |
| Step 3 | end
Example: Switch(config)# end
Returns to privileged EXEC mode. |
| Step 4 | show running-config
Example: Switch# show running-config
Verifies your entry. |
| Step 5 | copy running-config startup-config
Example: Switch# copy running-config startup-config
(Optional) Saves your entry in the configuration file. |

Enabling Classless Routing

To prevent the switch from forwarding packets destined for unrecognized subnets to the best supernet route possible, you can disable classless routing routing behavior.
### Configuring Address Resolution Methods

You can perform the following tasks to configure address resolution.

#### Defining a Static ARP Cache

ARP and other address resolution protocols provide dynamic mapping between IP addresses and MAC addresses. Because most hosts support dynamic address resolution, you usually do not need to specify static ARP cache entries. If you must define a static ARP cache entry, you can do so globally, which installs a permanent entry in the ARP cache that the switch uses to translate IP addresses into MAC addresses. Optionally, you can also specify that the switch respond to ARP requests as if it were the owner of the specified IP address. If you do not want the ARP entry to be permanent, you can specify a timeout period for the ARP entry.

**Procedure**

<table>
<thead>

</tbody>
</table>
| 2    | `arp ip-address hardware-address type` | Associates an IP address with a MAC (hardware) address in the ARP cache, and specifies encapsulation type as one of these:  
  - `arpa`—ARP encapsulation for Ethernet interfaces  
  - `snap`—Subnetwork Address Protocol encapsulation for Token Ring and FDDI interfaces  
  - `sap`—HP’s ARP type |
|      | Example: `Switch(config)# ip 10.1.5.1 c2f3.220a.12f4 arpa` |
| 3    | `arp ip-address hardware-address type [alias]` | (Optional) Specifies that the switch respond to ARP requests as if it were the owner of the specified IP address. |
|      | Example: `Switch(config)# ip 10.1.5.3 d7f3.220d.12f5 arpa alias` |
| 4    | `interface interface-id` | Enters interface configuration mode, and specifies the interface to configure. |
|      | Example: `Switch(config)# interface gigabitethernet 1/0/1` |
| 5    | `arp timeout seconds` | (Optional) Sets the length of time an ARP cache entry will stay in the cache. The default is 14400 seconds (4 hours). The range is 0 to 2147483 seconds. |
|      | Example: `Switch(config-if)# arp 20000` |
| 6    | `end` | Returns to privileged EXEC mode. |
|      | Example: `Switch(config-if)# end` |
| 7    | `show interfaces [interface-id]` | Verifies the type of ARP and the timeout value used on all interfaces or a specific interface. |
|      | Example: `Switch# show interfaces gigabitethernet 1/0/1` |
| 8    | `show arp` | Views the contents of the ARP cache. |
|      | Example: `Switch# show arp` |
| 9    | `show ip arp` | Views the contents of the ARP cache. |
|      | Example: `Switch# show ip arp` |
### Setting ARP Encapsulation

By default, Ethernet ARP encapsulation (represented by the **arpa** keyword) is enabled on an IP interface. You can change the encapsulation methods to SNAP if required by your network.

#### Procedure

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

## Routing Assistance When IP Routing is Disabled

These mechanisms allow the switch to learn about routes to other networks when it does not have IP routing enabled:

- Proxy ARP
- Default Gateway
- ICMP Router Discovery Protocol (IRDP)
Proxy ARP

Proxy ARP is enabled by default. To enable it after it has been disabled, see the “Enabling Proxy ARP” section. Proxy ARP works as long as other routers support it.

Default Gateway

Another method for locating routes is to define a default router or default gateway. All non-local packets are sent to this router, which either routes them appropriately or sends an IP Control Message Protocol (ICMP) redirect message back, defining which local router the host should use. The switch caches the redirect messages and forwards each packet as efficiently as possible. A limitation of this method is that there is no means of detecting when the default router has gone down or is unavailable.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>ip default-gateway <em>ip-address</em></td>
<td>Sets up a default gateway (router).</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# ip default gateway 10.1.5.1</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>show ip redirects</td>
<td>Displays the address of the default gateway router to verify the setting.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# show ip redirects</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

ICMP Router Discovery Protocol (IRDP)

The only required task for IRDP routing on an interface is to enable IRDP processing on that interface. When enabled, the default parameters apply.

You can optionally change any of these parameters. If you change the `maxadvertinterval` value, the `holdtime` and `minadvertinterval` values also change, so it is important to first change the `maxadvertinterval` value, before manually changing either the `holdtime` or `minadvertinterval` values.
## Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip irdp</td>
<td>Enables IRDP processing on the interface.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip irdp</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> ip irdp multicast</td>
<td>(Optional) Sends IRDP advertisements to the multicast address (224.0.0.1) instead of IP broadcasts.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip irdp multicast</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ip irdp holdtime seconds</td>
<td>(Optional) Sets the IRDP period for which advertisements are valid. The default is three times the <code>maxadvertinterval</code> value. It must be greater than <code>maxadvertinterval</code> and cannot be greater than 9000 seconds. If you change the <code>maxadvertinterval</code> value, this value also changes.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip irdp holdtime 1000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ip irdp maxadvertinterval seconds</td>
<td>(Optional) Sets the IRDP maximum interval between advertisements. The default is 600 seconds.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip irdp maxadvertinterval 650</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> ip irdp minadvertinterval seconds</td>
<td>(Optional) Sets the IRDP minimum interval between advertisements. The default is 0.75 times the <code>maxadvertinterval</code>. If you change the <code>maxadvertinterval</code>, this value changes to the new default (0.75 of <code>maxadvertinterval</code>).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip irdp minadvertinterval 500</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> ip irdp preference number</td>
<td>(Optional) Sets a device IRDP preference level. The allowed range is −231 to 231. The default is 0. A higher value increases the router preference level.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip irdp preference 2</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>-------------------------------------------------------------------------</td>

**Configuring Broadcast Packet Handling**

Perform the tasks in these sections to enable these schemes:

- Enabling Directed Broadcast-to-Physical Broadcast Translation, page 41-19
- Forwarding UDP Broadcast Packets and Protocols, page 41-20
- Establishing an IP Broadcast Address, page 41-22
- Flooding IP Broadcasts, page 41-23

**Enabling Directed Broadcast-to-Physical Broadcast Translation**

By default, IP directed broadcasts are dropped; they are not forwarded. Dropping IP-directed broadcasts makes routers less susceptible to denial-of-service attacks.

You can enable forwarding of IP-directed broadcasts on an interface where the broadcast becomes a physical (MAC-layer) broadcast. Only those protocols configured by using the `ip forward-protocol` global configuration command are forwarded.

You can specify an access list to control which broadcasts are forwarded. When an access list is specified, only those IP packets permitted by the access list are eligible to be translated from directed broadcasts to physical broadcasts. For more information on access lists, see Chapter 36, “Configuring Network Security with ACLs.”
## Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | `configure terminal`  
Example: `Switch# configure terminal` | Enters global configuration mode. |
| **Step 2** | `interface interface-id`  
Example: `Switch(config)# interface gigabitethernet 1/0/2` | Enters interface configuration mode, and specifies the interface to configure. |
| **Step 3** | `ip directed-broadcast [access-list-number]`  
Example: `Switch(config-if)# ip directed-broadcast 103` | Enables directed broadcast-to-physical broadcast translation on the interface. You can include an access list to control which broadcasts are forwarded. When an access list, only IP packets permitted by the access list can be translated.  
**Note** The `ip directed-broadcast` interface configuration command can be configured on a VPN routing/forwarding (VRF) interface and is VRF aware. Directed broadcast traffic is routed only within the VRF. |
| **Step 4** | `exit`  
Example: `Switch(config-if)# exit` | Returns to global configuration mode. |
| **Step 5** | `ip forward-protocol {udp [port] | nd | sdns}`  
Example: `Switch(config)# ip forward-protocol nd` | Specifies which protocols and ports the router forwards when forwarding broadcast packets.  
• `udp`—Forward UDP datagrams.  
  port: (Optional) Destination port that controls which UDP services are forwarded.  
• `nd`—Forward ND datagrams.  
• `sdns`—Forward SDNS datagrams |
| **Step 6** | `end`  
Example: `Switch(config)# end` | Returns to privileged EXEC mode. |
| **Step 7** | `show ip interface [interface-id]`  
Example: `Switch# show ip interface` | Verifies the configuration on the interface or all interfaces |
### Forwarding UDP Broadcast Packets and Protocols

If you do not specify any UDP ports when you configure the forwarding of UDP broadcasts, you are configuring the router to act as a BOOTP forwarding agent. BOOTP packets carry DHCP information.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>

<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Example: Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip helper-address address</td>
<td>Enables forwarding and specifies the destination address for forwarding UDP broadcast packets, including BOOTP.</td>
</tr>
<tr>
<td>Example: Switch(config-if)# ip helper address 10.1.10.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config-if)# exit</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ip forward-protocol {udp [port]</td>
<td>nd</td>
</tr>
<tr>
<td>Example: Switch(config)# ip forward-protocol sdns</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Establishing an IP Broadcast Address

The most popular IP broadcast address (and the default) is an address consisting of all ones (255.255.255.255). However, the switch can be configured to generate any form of IP broadcast address.

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>

### Monitoring and Maintaining IP Addressing

When the contents of a particular cache, table, or database have become or are suspected to be invalid, you can remove all its contents by using the `clear` privileged EXEC commands. Table 41-2 lists the commands for clearing contents.

**Table 96: Commands to Clear Caches, Tables, and Databases**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear arp-cache</td>
<td>Clears the IP ARP cache and the fast-switching cache.</td>
</tr>
<tr>
<td>clear host {name</td>
<td>*}</td>
</tr>
<tr>
<td>clear ip route {network [mask]</td>
<td>*}</td>
</tr>
</tbody>
</table>

You can display specific statistics, such as the contents of IP routing tables, caches, and databases; the reachability of nodes; and the routing path that packets are taking through the network. Table 41-3 lists the privileged EXEC commands for displaying IP statistics.

**Table 97: Commands to Display Caches, Tables, and Databases**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp</td>
<td>Displays the entries in the ARP table.</td>
</tr>
<tr>

### How to Configure IP Unicast Routing

#### Enabling IP Unicast Routing

By default, the switch is in Layer 2 switching mode and IP routing is disabled. To use the Layer 3 capabilities of the switch, you must enable IP routing.

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>ip routing</td>
<td>Enables IP routing.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ip routing</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>router ip_routing_protocol</td>
<td>Specifies an IP routing protocol. This step might include other commands, such as specifying the networks to route with the network (RIP) router configuration command. For information on specific protocols, see sections later in this chapter and to the Cisco IOS IP Configuration Guide, Release 12.4.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# router rip</td>
<td></td>
</tr>
</tbody>
</table>

**Note** The IP base feature set supports only RIP as a routing protocol.
### Example of Enabling IP Routing

This example shows how to enable IP routing using RIP as the routing protocol:

Switch# configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
Switch(config)# ip routing  
Switch(config)# router rip  
Switch(config-router)# network 10.0.0.0  
Switch(config-router)# end

### What to Do Next

You can now set up parameters for the selected routing protocols as described in these sections:

- RIP
- OSPF
- EIGRP
- BGP
- Unicast Reverse Path Forwarding
- Protocol-Independent Features (optional)

### Information About RIP

The Routing Information Protocol (RIP) is an interior gateway protocol (IGP) created for use in small, homogeneous networks. It is a distance-vector routing protocol that uses broadcast User Datagram Protocol (UDP) data packets to exchange routing information. The protocol is documented in RFC 1058. You can find detailed information about RIP in *IP Routing Fundamentals*, published by Cisco Press.
RIP is supported in the IP Base.

Using RIP, the switch sends routing information updates (advertisements) every 30 seconds. If a router does not receive an update from another router for 180 seconds or more, it marks the routes served by that router as unusable. If there is still no update after 240 seconds, the router removes all routing table entries for the non-updating router.

RIP uses hop counts to rate the value of different routes. The hop count is the number of routers that can be traversed in a route. A directly connected network has a hop count of zero; a network with a hop count of 16 is unreachable. This small range (0 to 15) makes RIP unsuitable for large networks.

If the router has a default network path, RIP advertises a route that links the router to the pseudonetwork 0.0.0.0. The 0.0.0.0 network does not exist; it is treated by RIP as a network to implement the default routing feature. The switch advertises the default network if a default was learned by RIP or if the router has a gateway of last resort and RIP is configured with a default metric. RIP sends updates to the interfaces in specified networks. If an interface’s network is not specified, it is not advertised in any RIP update.

### Summary Addresses and Split Horizon

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature usually optimizes communication among multiple routers, especially when links are broken.

### How to Configure RIP

#### Default RIP Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto summary</td>
<td>Enabled.</td>
</tr>
<tr>
<td>Default-information originate</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Default metric</td>
<td>Built-in; automatic metric translations.</td>
</tr>
<tr>
<td>IP RIP authentication key-chain</td>
<td>No authentication. Authentication mode: clear text.</td>
</tr>
<tr>
<td>IP RIP triggered</td>
<td>Disabled</td>
</tr>
<tr>
<td>IP split horizon</td>
<td>Varies with media.</td>
</tr>
<tr>
<td>Neighbor</td>
<td>None defined.</td>
</tr>
<tr>
<td>Network</td>
<td>None specified.</td>
</tr>
</tbody>
</table>
## Configuring Basic RIP Parameters

To configure RIP, you enable RIP routing for a network and optionally configure other parameters. On the switches, RIP configuration commands are ignored until you configure the network number.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip routing</td>
<td>Enables IP routing. (Required only if IP routing is disabled.)</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip routing</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> router rip</td>
<td>Enables a RIP routing process, and enter router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# router rip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> network network number</td>
<td>Associates a network with a RIP routing process. You can specify multiple network commands. RIP routing updates are sent and received through interfaces only on these networks.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# network 12</td>
<td></td>
</tr>
</tbody>
</table>

**Note** You must configure a network number for the RIP commands to take effect.
### Configuring Basic RIP Parameters

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td>neighbor ip-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# neighbor 10.2.5.1</td>

<td></td>
</tr>
<tr>
<td><strong>Step 14</strong></td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring RIP Authentication

RIP Version 1 does not support authentication. If you are sending and receiving RIP Version 2 packets, you can enable RIP authentication on an interface. The key chain specifies the set of keys that can be used on the interface. If a key chain is not configured, no authentication is performed.

The switch supports two modes of authentication on interfaces for which RIP authentication is enabled: plain text and MD5. The default is plain text.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>

<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>ip rip authentication key-chain name-of-chain</td>
<td>Enables RIP authentication.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-if)# ip rip authentication key-chain trees</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Summary Addresses and Split Horizon

#### Note

In general, disabling split horizon is not recommended unless you are certain that your application requires it to properly advertise routes.

If you want to configure an interface running RIP to advertise a summarized local IP address pool on a network access server for dial-up clients, use the `ip summary-address rip` interface configuration command.

#### Note

If split horizon is enabled, neither autosummary nor interface IP summary addresses are advertised.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>ip address ip-address subnet-mask</code></td>
<td>Configures the IP address and IP subnet.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# ip address 10.1.1.10 255.255.255.0</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>ip summary-address rip ip address ip-network mask</code></td>
<td>Configures the IP address to be summarized and the IP network mask.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# ip summary-address rip ip address 10.1.1.30 255.255.255.0</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>no ip split horizon</code></td>
<td>Disables split horizon on the interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# no ip split horizon</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config-if)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> <code>show ip interface interface-id</code></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# show ip interface gigabitethernet 1/0/1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> <code>copy running-config startup-config</code></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>

<td></td>
</tr>
<tr>
<td><code>Switch# copy running-config startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>

## Configuring Split Horizon

Routers connected to broadcast-type IP networks and using distance-vector routing protocols normally use the split-horizon mechanism to reduce the possibility of routing loops. Split horizon blocks information about routes from being advertised by a router on any interface from which that information originated. This feature can optimize communication among multiple routers, especially when links are broken.

### Note

In general, we do not recommend disabling split horizon unless you are certain that your application requires it to properly advertise routes.
### Procedure

<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

---

**Configuration Example for Summary Addresses and Split Horizon**

In this example, the major net is 10.0.0.0. The summary address 10.2.0.0 overrides the autosummary address of 10.0.0.0 so that 10.2.0.0 is advertised out interface Gigabit Ethernet port 2, and 10.0.0.0 is not advertised. In the example, if the interface is still in Layer 2 mode (the default), you must enter a `no switchport` interface configuration command before entering the `ip address` interface configuration command.
If split horizon is enabled, neither autosummary nor interface summary addresses (those configured with the `ip summary-address rip` router configuration command) are advertised.

Switch(config)# router rip
Switch(config-router)# interface gigabitethernet1/0/2
Switch(config-if)# ip address 10.1.5.1 255.255.255.0
Switch(config-if)# ip summary-address rip 10.2.0.0 255.255.0.0
Switch(config-if)# no ip split-horizon
Switch(config-if)# exit
Switch(config)# router rip
Switch(config-router)# network 10.0.0.0
Switch(config-router)# neighbor 2.2.2.2 peer-group mygroup
Switch(config-router)# end

---

**Information About OSPF**

OSPF is an Interior Gateway Protocol (IGP) designed expressly for IP networks, supporting IP subnetting and tagging of externally derived routing information. OSPF also allows packet authentication and uses IP multicast when sending and receiving packets. The Cisco implementation supports RFC 1253, OSPF management information base (MIB).

**Note** OSPF is supported in IP Base.

The Cisco implementation conforms to the OSPF Version 2 specifications with these key features:

- Definition of stub areas is supported.

- Routes learned through any IP routing protocol can be redistributed into another IP routing protocol. At the intradomain level, this means that OSPF can import routes learned through EIGRP and RIP. OSPF routes can also be exported into RIP.

- Plain text and MD5 authentication among neighboring routers within an area is supported.

- Configurable routing interface parameters include interface output cost, retransmission interval, interface transmit delay, router priority, router dead and hello intervals, and authentication key.

- Virtual links are supported.

- Not-so-stubby-areas (NSSAs) per RFC 1587 are supported.

OSPF typically requires coordination among many internal routers, area border routers (ABRs) connected to multiple areas, and autonomous system boundary routers (ASBRs). The minimum configuration would use all default parameter values, no authentication, and interfaces assigned to areas. If you customize your environment, you must ensure coordinated configuration of all routers.

**OSPF Nonstop Forwarding**

The switch or switch stack supports two levels of nonstop forwarding (NSF):
OSPF NSF Awareness

The IP services feature set supports OSPF NSF Awareness supported for IPv4. When the neighboring router is NSF-capable, the Layer 3 switch continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router crashing and the backup RP taking over, or while the primary RP is manually reloaded for a non-disruptive software upgrade.

This feature cannot be disabled.

OSPF NSF Capability

The IP services feature set supports the OSPFv2 NSF IETF format in addition to the OSPFv2 NSF Cisco format that is supported in earlier releases. For information about this feature, see NSF—OSPF (RFC 3623 OSPF Graceful Restart):

The IP services feature set also supports OSPF NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change. When a stack master change occurs in an OSPF NSF-capable stack, the new stack master must do two things to resynchronize its link-state database with its OSPF neighbors:

- Release the available OSPF neighbors on the network without resetting the neighbor relationship.
- Reacquire the contents of the link-state database for the network.

After a stack master change, the new master sends an OSPF NSF signal to neighboring NSF-aware devices. A device recognizes this signal to mean that it should not reset the neighbor relationship with the stack. As the NSF-capable stack master receives signals from other routes on the network, it begins to rebuild its neighbor list.

When the neighbor relationships are reestablished, the NSF-capable stack master resynchronizes its database with its NSF-aware neighbors, and routing information is exchanged between the OSPF neighbors. The new stack master uses this routing information to remove stale routes, to update the routing information database (RIB), and to update the forwarding information base (FIB) with the new information. The OSPF protocols then fully converge.

Note

OSPF NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers non-NSF aware neighbors on a network segment, it disables NSF capabilities for that segment. Other network segments where all devices are NSF-aware or NSF-capable continue to provide NSF capabilities.

Use the `nsf` OSPF routing configuration command to enable OSPF NSF routing. Use the `show ip ospf` privileged EXEC command to verify that it is enabled.

For more information, see Cisco Nonstop Forwarding:
OSPF Area Parameters

You can optionally configure several OSPF area parameters. These parameters include authentication for password-based protection against unauthorized access to an area, stub areas, and not-so-stubby-areas (NSSAs). Stub areas are areas into which information on external routes is not sent. Instead, the area border router (ABR) generates a default external route into the stub area for destinations outside the autonomous system (AS). An NSSA does not flood all LSAs from the core into the area, but can import AS external routes within the area by redistribution.

Route summarization is the consolidation of advertised addresses into a single summary route to be advertised by other areas. If network numbers are contiguous, you can use the area range router configuration command to configure the ABR to advertise a summary route that covers all networks in the range.

Other OSPF Parameters

You can optionally configure other OSPF parameters in router configuration mode.

- Route summarization: When redistributing routes from other protocols as described in the “Using Route Maps to Redistribute Routing Information” section on page 41-124, each route is advertised individually in an external LSA. To help decrease the size of the OSPF link state database, you can use the summary-address router configuration command to advertise a single router for all the redistributed routes included in a specified network address and mask.

- Virtual links: In OSPF, all areas must be connected to a backbone area. You can establish a virtual link in case of a backbone-continuity break by configuring two Area Border Routers as endpoints of a virtual link. Configuration information includes the identity of the other virtual endpoint (the other ABR) and the nonbackbone link that the two routers have in common (the transit area). Virtual links cannot be configured through a stub area.

- Default route: When you specifically configure redistribution of routes into an OSPF routing domain, the route automatically becomes an autonomous system boundary router (ASBR). You can force the ASBR to generate a default route into the OSPF routing domain.

- Domain Name Server (DNS) names for use in all OSPF show privileged EXEC command displays makes it easier to identify a router than displaying it by router ID or neighbor ID.

- Default Metrics: OSPF calculates the OSPF metric for an interface according to the bandwidth of the interface. The metric is calculated as \( \text{ref-bw} \) divided by bandwidth, where \( \text{ref} \) is 10 by default, and bandwidth (\( \text{bw} \)) is specified by the bandwidth interface configuration command. For multiple links with high bandwidth, you can specify a larger number to differentiate the cost on those links.

- Administrative distance is a rating of the trustworthiness of a routing information source, an integer between 0 and 255, with a higher value meaning a lower trust rating. An administrative distance of 255 means the routing information source cannot be trusted at all and should be ignored. OSPF uses three different administrative distances: routes within an area (interarea), routes to another area (interarea), and routes from another routing domain learned through redistribution (external). You can change any of the distance values.

- Passive interfaces: Because interfaces between two devices on an Ethernet represent only one network segment, to prevent OSPF from sending hello packets for the sending interface, you must configure the sending device to be a passive interface. Both devices can identify each other through the hello packet for the receiving interface.
• Route calculation timers: You can configure the delay time between when OSPF receives a topology change and when it starts the shortest path first (SPF) calculation and the hold time between two SPF calculations.

• Log neighbor changes: You can configure the router to send a syslog message when an OSPF neighbor state changes, providing a high-level view of changes in the router.

LSA Group Pacing

The OSPF LSA group pacing feature allows the router to group OSPF LSAs and pace the refreshing, check-summing, and aging functions for more efficient router use. This feature is enabled by default with a 4-minute default pacing interval, and you will not usually need to modify this parameter. The optimum group pacing interval is inversely proportional to the number of LSAs the router is refreshing, check-summing, and aging. For example, if you have approximately 10,000 LSAs in the database, decreasing the pacing interval would benefit you. If you have a very small database (40 to 100 LSAs), increasing the pacing interval to 10 to 20 minutes might benefit you slightly.

Loopback Interfaces

OSPF uses the highest IP address configured on the interfaces as its router ID. If this interface is down or removed, the OSPF process must recalculate a new router ID and resend all its routing information out its interfaces. If a loopback interface is configured with an IP address, OSPF uses this IP address as its router ID, even if other interfaces have higher IP addresses. Because loopback interfaces never fail, this provides greater stability. OSPF automatically prefers a loopback interface over other interfaces, and it chooses the highest IP address among all loopback interfaces.

How to Configure OSPF

**Note** The switch stack supports OSPF NSF-capable routing for IPv4.
Configuring Basic OSPF Parameters

To enable OSPF, create an OSPF routing process, specify the range of IP addresses to associate with the routing process, and assign area IDs to be associated with that range. For switches running the IP services image, you can configure either the Cisco OSPFv2 NSF format or the IETF OSPFv2 NSF format.

Procedure

</tbody>
</table>

### Configuring OSPF Interfaces

You can use the `ip ospf` interface configuration commands to modify interface-specific OSPF parameters. You are not required to modify any of these parameters, but some interface parameters (hello interval, dead interval, and authentication key) must be consistent across all routers in an attached network. If you modify these parameters, be sure all routers in the network have compatible values.

**Note** The `ip ospf` interface configuration commands are all optional.

### Procedure

<td>(Optional) Block flooding of OSPF LSA packets to the interface. By default, OSPF floods new LSAs over all</td>
</tr>
</tbody>
</table>
### Command or Action

**Switch(config-if)# ip ospf database-filter all out**

*Purpose*

interfaces in the same area, except the interface on which the LSA arrives.

---

**Step 12**

**end**

*Example:*

```
Switch(config-if)# end
```

*Purpose*

Returns to privileged EXEC mode.

---

**Step 13**

**show ip ospf interface [interface-name]**

*Example:*

```
Switch# show ip ospf interface
```

*Purpose*

Displays OSPF-related interface information.

---

**Step 14**

**show ip ospf neighbor detail**

*Example:*

```
Switch# show ip ospf neighbor detail
```

*Purpose*

Displays NSF awareness status of neighbor switch. The output matches one of these examples:

- **Options is 0x52**
  
  *LLS Options is 0x1 (LR)*

  When both of these lines appear, the neighbor switch is NSF aware.

- **Options is 0x42**—This means the neighbor switch is not NSF aware.

---

**Step 15**

**copy running-config startup-config**

*Example:*

```
Switch# copy running-config startup-config
```

*Purpose*

(Optional) Saves your entries in the configuration file.

---

### Configuring OSPF Area Parameters

### Configuration Examples for OSPF

#### Example: Configuring Basic OSPF Parameters

This example shows how to configure an OSPF routing process and assign it a process number of 109:

```
Switch(config)# router ospf 109
Switch(config-router)# network 131.108.0.0 255.255.255.0 area 24
```
Information About EIGRP

Enhanced IGRP (EIGRP) is a Cisco proprietary enhanced version of the IGRP. EIGRP uses the same distance vector algorithm and distance information as IGRP; however, the convergence properties and the operating efficiency of EIGRP are significantly improved.

The convergence technology employs an algorithm referred to as the Diffusing Update Algorithm (DUAL), which guarantees loop-free operation at every instant throughout a route computation and allows all devices involved in a topology change to synchronize at the same time. Routers that are not affected by topology changes are not involved in recomputations.

IP EIGRP provides increased network width. With RIP, the largest possible width of your network is 15 hops. Because the EIGRP metric is large enough to support thousands of hops, the only barrier to expanding the network is the transport-layer hop counter. EIGRP increments the transport control field only when an IP packet has traversed 15 routers and the next hop to the destination was learned through EIGRP. When a RIP route is used as the next hop to the destination, the transport control field is incremented as usual.

EIGRP Features

EIGRP offers these features:

- Fast convergence.
- Incremental updates when the state of a destination changes, instead of sending the entire contents of the routing table, minimizing the bandwidth required for EIGRP packets.
- Less CPU usage because full update packets need not be processed each time they are received.
- Protocol-independent neighbor discovery mechanism to learn about neighboring routers.
- Variable-length subnet masks (VLSMs).
- Arbitrary route summarization.
- EIGRP scales to large networks.

EIGRP Components

EIGRP has these four basic components:

- Neighbor discovery and recovery is the process that routers use to dynamically learn of other routers on their directly attached networks. Routers must also discover when their neighbors become unreachable or inoperative. Neighbor discovery and recovery is achieved with low overhead by periodically sending small hello packets. As long as hello packets are received, the Cisco IOS software can learn that a neighbor is alive and functioning. When this status is determined, the neighboring routers can exchange routing information.

- The reliable transport protocol is responsible for guaranteed, ordered delivery of EIGRP packets to all neighbors. It supports intermixed transmission of multicast and unicast packets. Some EIGRP packets must be sent reliably, and others need not be. For efficiency, reliability is provided only when necessary. For example, on a multiaccess network that has multicast capabilities (such as Ethernet), it is not necessary to send hellos reliably to all neighbors individually. Therefore, EIGRP sends a single multicast hello with an indication in the packet informing the receivers that the packet need not be acknowledged. Other
types of packets (such as updates) require acknowledgment, which is shown in the packet. The reliable transport has a provision to send multicast packets quickly when there are unacknowledged packets pending. Doing so helps ensure that convergence time remains low in the presence of varying speed links.

- The DUAL finite state machine embodies the decision process for all route computations. It tracks all routes advertised by all neighbors. DUAL uses the distance information (known as a metric) to select efficient, loop-free paths. DUAL selects routes to be inserted into a routing table based on feasible successors. A successor is a neighboring router used for packet forwarding that has a least-cost path to a destination that is guaranteed not to be part of a routing loop. When there are no feasible successors, but there are neighbors advertising the destination, a recomputation must occur. This is the process whereby a new successor is determined. The amount of time it takes to recompute the route affects the convergence time. Recomputation is processor-intensive; it is advantageous to avoid recomputation if it is not necessary. When a topology change occurs, DUAL tests for feasible successors. If there are feasible successors, it uses any it finds to avoid unnecessary recomputation.

- The protocol-dependent modules are responsible for network layer protocol-specific tasks. An example is the IP EIGRP module, which is responsible for sending and receiving EIGRP packets that are encapsulated in IP. It is also responsible for parsing EIGRP packets and informing DUAL of the new information received. EIGRP asks DUAL to make routing decisions, but the results are stored in the IP routing table. EIGRP is also responsible for redistributing routes learned by other IP routing protocols.

Note To enable EIGRP, the switch or stack master must be running the IP services feature set.

EIGRP Nonstop Forwarding

The switch stack supports two levels of EIGRP nonstop forwarding:

- EIGRP NSF Awareness
- EIGRP NSF Capability

EIGRP NSF Awareness

The IP-services feature set supports EIGRP NSF Awareness for IPv4. When the neighboring router is NSF-capable, the Layer 3 switch continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

This feature cannot be disabled. For more information on this feature, see the “EIGRP Nonstop Forwarding (NSF) Awareness” section of the Cisco IOS IP Routing Protocols Configuration Guide, Release 12.4.

EIGRP NSF Capability

The IP-services feature set also supports EIGRP NSF-capable routing for IPv4 for better convergence and lower traffic loss following a stack master change. When an EIGRP NSF-capable stack master restarts or a new stack master starts up and NSF restarts, the switch has no neighbors, and the topology table is empty. The switch must bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables without interrupting the traffic directed toward the switch stack. EIGRP peer routers maintain the routes learned from the new stack master and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the new stack master uses a new Restart (RS) bit in the EIGRP packet header to show the restart. When the neighbor receives this, it synchronizes the stack in its peer list and maintains the adjacency with the stack. The neighbor then sends its topology table to the stack master with the RS bit set to show that it is NSF-aware and is aiding the new stack master.

If at least one of the stack peer neighbors is NSF-aware, the stack master receives updates and rebuilds its database. Each NSF-aware neighbor sends an end of table (EOT) marker in the last update packet to mark the end of the table content. The stack master recognizes the convergence when it receives the EOT marker, and it then begins sending updates. When the stack master has received all EOT markers from its neighbors or when the NSF converge timer expires, EIGRP notifies the routing information database (RIB) of convergence and floods its topology table to all NSF-aware peers.

### EIGRP Stub Routing

The EIGRP stub routing feature, available in all feature sets, reduces resource utilization by moving routed traffic closer to the end user.

---

**Note**

The IP base feature set contains EIGRP stub routing capability, which only advertises connected or summary routes from the routing tables to other switches in the network. The switch uses EIGRP stub routing at the access layer to eliminate the need for other types of routing advertisements. For enhanced capability and complete EIGRP routing, the switch must be running the IP services feature set. On a switch running the IP base feature set, if you try to configure multi-VRF-CE and EIGRP stub routing at the same time, the configuration is not allowed. IPv6 EIGRP stub routing is not supported with the IP base feature set.

In a network using EIGRP stub routing, the only allowable route for IP traffic to the user is through a switch that is configured with EIGRP stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote routers to use EIGRP and to configure only the switch as a stub. Only specified routes are propagated from the switch. The switch responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub router for any routes, and a router that has a stub peer does not query that peer. The stub router depends on the distribution router to send the proper updates to all peers.

In Figure 41-4, switch B is configured as an EIGRP stub router. Switches A and C are connected to the rest of the WAN. Switch B advertises connected, static, redistribution, and summary routes to switch A and C. Switch B does not advertise any routes learned from switch A (and the reverse).
How to Configure EIGRP

To create an EIGRP routing process, you must enable EIGRP and associate networks. EIGRP sends updates to the interfaces in the specified networks. If you do not specify an interface network, it is not advertised in any EIGRP update.

If you have routers on your network that are configured for IGRP, and you want to change to EIGRP, you must designate transition routers that have both IGRP and EIGRP configured. In these cases, perform Steps 1 through 3 in the next section and also see the “Configuring Split Horizon” section. You must use the same AS number for routes to be automatically redistributed.

**Information About BGP**

The Border Gateway Protocol (BGP) is an exterior gateway protocol used to set up an interdomain routing system that guarantees the loop-free exchange of routing information between autonomous systems. Autonomous systems are made up of routers that operate under the same administration and that run Interior Gateway Protocols (IGPs), such as RIP or OSPF, within their boundaries and that interconnect by using an Exterior Gateway Protocol (EGP). BGP Version 4 is the standard EGP for interdomain routing in the Internet. The protocol is defined in RFCs 1163, 1267, and 1771. You can find detailed information about BGP in Internet Routing Architectures, published by Cisco Press, and in the “Configuring BGP” chapter in the Cisco IP and IP Routing Configuration Guide.

For details about BGP commands and keywords, see the “IP Routing Protocols” part of the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols.

**BGP Network Topology**

Routers that belong to the same autonomous system (AS) and that exchange BGP updates run internal BGP (IBGP), and routers that belong to different autonomous systems and that exchange BGP updates run external BGP (EBGP). Most configuration commands are the same for configuring EBGP and IBGP. The difference is that the routing updates are exchanged either between autonomous systems (EBGP) or within an AS (IBGP). Figure 41-5 shows a network that is running both EBGP and IBGP.
Before exchanging information with an external AS, BGP ensures that networks within the AS can be reached by defining internal BGP peering among routers within the AS and by redistributing BGP routing information to IGPs that run within the AS, such as IGRP and OSPF.

Routers that run a BGP routing process are often referred to as BGP speakers. BGP uses the Transmission Control Protocol (TCP) as its transport protocol (specifically port 179). Two BGP speakers that have a TCP connection to each other for exchanging routing information are known as peers or neighbors. In Figure 41-5, Routers A and B are BGP peers, as are Routers B and C and Routers C and D. The routing information is a series of AS numbers that describe the full path to the destination network. BGP uses this information to construct a loop-free map of autonomous systems.

The network has these characteristics:

- Routers A and B are running EBGP, and Routers B and C are running IBGP. Note that the EBGP peers are directly connected and that the IBGP peers are not. As long as there is an IGP running that allows the two neighbors to reach one another, IBGP peers do not have to be directly connected.

- All BGP speakers within an AS must establish a peer relationship with each other. That is, the BGP speakers within an AS must be fully meshed logically. BGP4 provides two techniques that reduce the requirement for a logical full mesh: confederations and route reflectors.

- AS 200 is a transit AS for AS 100 and AS 300—that is, AS 200 is used to transfer packets between AS 100 and AS 300.

BGP peers initially exchange their full BGP routing tables and then send only incremental updates. BGP peers also exchange keepalive messages (to ensure that the connection is up) and notification messages (in response to errors or special conditions).

In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (the autonomous system path), and a list of other path attributes. The primary function of a BGP system is to exchange network reachability information, including information about the list of AS paths, with other BGP systems. This information can be used to determine AS connectivity, to prune routing loops, and to enforce AS-level policy decisions.

A router or switch running Cisco IOS does not select or use an IBGP route unless it has a route available to the next-hop router and it has received synchronization from an IGP (unless IGP synchronization is disabled). When multiple routes are available, BGP bases its path selection on attribute values. See the “Configuring BGP Decision Attributes” section for information about BGP attributes.
BGP Version 4 supports classless interdomain routing (CIDR) so you can reduce the size of your routing tables by creating aggregate routes, resulting in supernets. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes.

Nonstop Forwarding Awareness

The BGP NSF Awareness feature is supported for IPv4 in the IP services feature set. To enable this feature with BGP routing, you need to enable Graceful Restart. When the neighboring router is NSF-capable, and this feature is enabled, the Layer 3 switch continues to forward packets from the neighboring router during the interval between the primary Route Processor (RP) in a router failing and the backup RP taking over, or while the primary RP is manually reloaded for a nondisruptive software upgrade.

For more information, see the “BGP Nonstop Forwarding (NSF) Awareness” section of the Cisco IOS IP Routing Protocols Configuration Guide, Release 12.4.

Information About BGP Routing

To enable BGP routing, you establish a BGP routing process and define the local network. Because BGP must completely recognize the relationships with its neighbors, you must also specify a BGP neighbor.

BGP supports two kinds of neighbors: internal and external. Internal neighbors are in the same AS; external neighbors are in different autonomous systems. External neighbors are usually adjacent to each other and share a subnet, but internal neighbors can be anywhere in the same AS.

The switch supports the use of private AS numbers, usually assigned by service providers and given to systems whose routes are not advertised to external neighbors. The private AS numbers are from 64512 to 65535. You can configure external neighbors to remove private AS numbers from the AS path by using the neighbor remove-private-as router configuration command. Then when an update is passed to an external neighbor, if the AS path includes private AS numbers, these numbers are dropped.

If your AS will be passing traffic through it from another AS to a third AS, it is important to be consistent about the routes it advertises. If BGP advertised a route before all routers in the network had learned about the route through the IGP, the AS might receive traffic that some routers could not yet route. To prevent this from happening, BGP must wait until the IGP has propagated information across the AS so that BGP is synchronized with the IGP. Synchronization is enabled by default. If your AS does not pass traffic from one AS to another AS, or if all routers in your autonomous systems are running BGP, you can disable synchronization, which allows your network to carry fewer routes in the IGP and allows BGP to converge more quickly.

Routing Policy Changes

Routing policies for a peer include all the configurations that might affect inbound or outbound routing table updates. When you have defined two routers as BGP neighbors, they form a BGP connection and exchange routing information. If you later change a BGP filter, weight, distance, version, or timer, or make a similar configuration change, you must reset the BGP sessions so that the configuration changes take effect.

There are two types of reset, hard reset and soft reset. Cisco IOS Releases 12.1 and later support a soft reset without any prior configuration. To use a soft reset without preconfiguration, both BGP peers must support the soft route refresh capability, which is advertised in the OPEN message sent when the peers establish a TCP session. A soft reset allows the dynamic exchange of route refresh requests and routing information between BGP routers and the subsequent re-advertisement of the respective outbound routing table.
- When soft reset generates inbound updates from a neighbor, it is called dynamic inbound soft reset.
- When soft reset sends a set of updates to a neighbor, it is called outbound soft reset.

A soft inbound reset causes the new inbound policy to take effect. A soft outbound reset causes the new local outbound policy to take effect without resetting the BGP session. As a new set of updates is sent during outbound policy reset, a new inbound policy can also take effect.

Table 41-10 lists the advantages and disadvantages hard reset and soft reset.

**Table 103: Advantages and Disadvantages of Hard and Soft Resets**

<table>
<thead>
<tr>
<th>Type of Reset</th>
<th>Advantages</th>
<th>Disadvantages</th>

<td>Does not reset inbound routing table updates.</td>
</tr>
<tr>
<td>Dynamic inbound soft reset</td>
<td>Does not clear the BGP session and cache</td>
<td>Both BGP routers must support the route refresh capability (in Cisco IOS Release 12.1 and later).</td>
</tr>
<tr>
<td></td>
<td>Does not require storing of routing table updates and has no memory overhead</td>
<td></td>
</tr>
</tbody>
</table>

**BGP Decision Attributes**

When a BGP speaker receives updates from multiple autonomous systems that describe different paths to the same destination, it must choose the single best path for reaching that destination. When chosen, the selected path is entered into the BGP routing table and propagated to its neighbors. The decision is based on the value of attributes that the update contains and other BGP-configurable factors.

When a BGP peer learns two EBGP paths for a prefix from a neighboring AS, it chooses the best path and inserts that path in the IP routing table. If BGP multipath support is enabled and the EBGP paths are learned from the same neighboring autonomous systems, instead of a single best path, multiple paths are installed in the IP routing table. Then, during packet switching, per-packet or per-destination load-balancing is performed among the multiple paths. The **maximum-paths** router configuration command controls the number of paths allowed.

These factors summarize the order in which BGP evaluates the attributes for choosing the best path:

1. Prefer the path with the largest weight (a Cisco proprietary parameter). The weight attribute is local to the router and not propagated in routing updates. By default, the weight attribute is 32768 for paths that the router originates and zero for other paths. Routes with the largest weight are preferred. You can use access lists, route maps, or the **neighbor weight** router configuration command to set weights.
2. Prefer the route with the highest local preference. Local preference is part of the routing update and exchanged among routers in the same AS. The default value of the local preference attribute is 100. You can set local preference by using the `bgp default local-preference` router configuration command or by using a route map.

3. Prefer the route that was originated by BGP running on the local router.

4. Prefer the route with the shortest AS path.

5. Prefer the route with the lowest origin type. An interior route or IGP is lower than a route learned by EGP, and an EGP-learned route is lower than one of unknown origin or learned in another way.

6. Prefer the route with the lowest multi -exit discriminator (MED) metric attribute if the neighboring AS is the same for all routes considered. You can configure the MED by using route maps or by using the `default-metric` router configuration command. When an update is sent to an IBGP peer, the MED is included.

7. Prefer the external (EBGP) path over the internal (IBGP) path.

8. Prefer the route that can be reached through the closest IGP neighbor (the lowest IGP metric). This means that the router will prefer the shortest internal path within the AS to reach the destination (the shortest path to the BGP next-hop).

9. If the following conditions are all true, insert the route for this path into the IP routing table:
   - Both the best route and this route are external.
   - Both the best route and this route are from the same neighboring autonomous system.
   - `maximum-paths` is enabled.

10. If multipath is not enabled, prefer the route with the lowest IP address value for the BGP router ID. The router ID is usually the highest IP address on the router or the loopback (virtual) address, but might be implementation-specific.

**Route Maps**

Within BGP, route maps can be used to control and to modify routing information and to define the conditions by which routes are redistributed between routing domains. See the “Using Route Maps to Redistribute Routing Information” section on page 41-124 for more information about route maps. Each route map has a name that identifies the route map (map tag) and an optional sequence number.

**BGP Filtering**

You can filter BGP advertisements by using AS-path filters, such as the `as-path access-list` global configuration command and the `neighbor filter-list` router configuration command. You can also use access lists with the `neighbor distribute-list` router configuration command. Distribute-list filters are applied to network numbers. See the “Controlling Advertising and Processing in Routing Updates” section on page 41-135 for information about the `distribute-list` command.

You can use route maps on a per-neighbor basis to filter updates and to modify various attributes. A route map can be applied to either inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates. On both inbound and outbound updates, matching is supported based on AS path, community, and network numbers. Autonomous system path matching requires the `match as-path access-list`
route-map command, community based matching requires the `match community-list` route-map command, and network-based matching requires the `ip access-list` global configuration command.

**Prefix List for BGP Filtering**

You can use prefix lists as an alternative to access lists in many BGP route filtering commands, including the `neighbor distribute-list` router configuration command. The advantages of using prefix lists include performance improvements in loading and lookup of large lists, incremental update support, easier CLI configuration, and greater flexibility.

Filtering by a prefix list involves matching the prefixes of routes with those listed in the prefix list, as when matching access lists. When there is a match, the route is used. Whether a prefix is permitted or denied is based upon these rules:

- An empty prefix list permits all prefixes.
- An implicit deny is assumed if a given prefix does not match any entries in a prefix list.
- When multiple entries of a prefix list match a given prefix, the sequence number of a prefix list entry identifies the entry with the lowest sequence number.

By default, sequence numbers are generated automatically and incremented in units of five. If you disable the automatic generation of sequence numbers, you must specify the sequence number for each entry. You can specify sequence values in any increment. If you specify increments of one, you cannot insert additional entries into the list; if you choose very large increments, you might run out of values.

**BGP Community Filtering**

One way that BGP controls the distribution of routing information based on the value of the COMMUNITIES attribute. The attribute is a way to groups destinations into communities and to apply routing decisions based on the communities. This method simplifies configuration of a BGP speaker to control distribution of routing information.

A community is a group of destinations that share some common attribute. Each destination can belong to multiple communities. AS administrators can define to which communities a destination belongs. By default, all destinations belong to the general Internet community. The community is identified by the COMMUNITIES attribute, an optional, transitive, global attribute in the numerical range from 1 to 4294967200. These are some predefined, well-known communities:

- **internet**—Advertise this route to the Internet community. All routers belong to it.
- **no-export**—Do not advertise this route to EBGP peers.
- **no-advertise**—Do not advertise this route to any peer (internal or external).
- **local-as**—Do not advertise this route to peers outside the local autonomous system.

Based on the community, you can control which routing information to accept, prefer, or distribute to other neighbors. A BGP speaker can set, append, or modify the community of a route when learning, advertising, or redistributing routes. When routes are aggregated, the resulting aggregate has a COMMUNITIES attribute that contains all communities from all the initial routes.
You can use community lists to create groups of communities to use in a match clause of a route map. As with an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

To set the COMMUNITIES attribute and match clauses based on communities, see the `match community-list` and `set community` route-map configuration commands in the “Using Route Maps to Redistribute Routing Information” section.

**BGP Neighbors and Peer Groups**

Often many BGP neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and to make updating more efficient. When you have configured many peers, we recommend this approach.

To configure a BGP peer group, you create the peer group, assign options to the peer group, and add neighbors as peer group members. You configure the peer group by using the `neighbor` router configuration commands. By default, peer group members inherit all the configuration options of the peer group, including the remote-as (if configured), version, update-source, out-route-map, out-filter-list, out-dist-list, minimum-advertisement-interval, and next-hop-self. All peer group members also inherit changes made to the peer group. Members can also be configured to override the options that do not affect outbound updates.

**Aggregate Routes**

Classless interdomain routing (CIDR) enables you to create aggregate routes (or supernets) to minimize the size of routing tables. You can configure aggregate routes in BGP either by redistributing an aggregate route into BGP or by creating an aggregate entry in the BGP routing table. An aggregate address is added to the BGP table when there is at least one more specific entry in the BGP table.

**Routing Domain Confederations**

One way to reduce the IBGP mesh is to divide an autonomous system into multiple subautonomous systems and to group them into a single confederation that appears as a single autonomous system. Each autonomous system is fully meshed within itself and has a few connections to other autonomous systems in the same confederation. Even though the peers in different autonomous systems have EBGP sessions, they exchange routing information as if they were IBGP peers. Specifically, the next hop, MED, and local preference information is preserved. You can then use a single IGP for all of the autonomous systems.

**BGP Route Reflectors**

BGP requires that all of the IBGP speakers be fully meshed. When a router receives a route from an external neighbor, it must advertise it to all internal neighbors. To prevent a routing information loop, all IBGP speakers must be connected. The internal neighbors do not send routes learned from internal neighbors to other internal neighbors.

With route reflectors, all IBGP speakers need not be fully meshed because another method is used to pass learned routes to neighbors. When you configure an internal BGP peer to be a route reflector, it is responsible for passing IBGP learned routes to a set of IBGP neighbors. The internal peers of the route reflector are divided into two groups: client peers and nonclient peers (all the other routers in the autonomous system). A route reflector reflects routes between these two groups. The route reflector and its client peers form a cluster. The
nonclient peers must be fully meshed with each other, but the client peers need not be fully meshed. The clients in the cluster do not communicate with IBGP speakers outside their cluster.

When the route reflector receives an advertised route, it takes one of these actions, depending on the neighbor:

- A route from an external BGP speaker is advertised to all clients and nonclient peers.
- A route from a nonclient peer is advertised to all clients.
- A route from a client is advertised to all clients and nonclient peers. Hence, the clients need not be fully meshed.

Usually a cluster of clients have a single route reflector, and the cluster is identified by the route reflector router ID. To increase redundancy and to avoid a single point of failure, a cluster might have more than one route reflector. In this case, all route reflectors in the cluster must be configured with the same 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster. All the route reflectors serving a cluster should be fully meshed and should have identical sets of client and nonclient peers.

### Route Dampening

Route flap dampening is a BGP feature designed to minimize the propagation of flapping routes across an internetwork. A route is considered to be flapping when it is repeatedly available, then unavailable, then available, then unavailable, and so on. When route dampening is enabled, a numeric penalty value is assigned to a route when it flaps. When a route's accumulated penalties reach a configurable limit, BGP suppresses advertisements of the route, even if the route is running. The reuse limit is a configurable value that is compared with the penalty. If the penalty is less than the reuse limit, a suppressed route that is up is advertised again.

Dampening is not applied to routes that are learned by IBGP. This policy prevents the IBGP peers from having a higher penalty for routes external to the AS.

### More BGP Information

For detailed descriptions of BGP configuration, see the “Configuring BGP” chapter in the “IP Routing Protocols” part of the *Cisco IOS IP Configuration Guide, Release 12.4*. For details about specific commands, see the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

### How to Configure BGP

### Default BGP Configuration

Table 41-9 shows the basic default BGP configuration. For the defaults for all characteristics, see the specific commands in the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

#### Table 104: Default BGP Configuration

• Send community attributes: None sent to neighbors.  
• Shutdown or soft reconfiguration: Not enabled.  
• Timers: keepalive: 60 seconds; holdtime: 180 seconds.  
• Update source: Best local address.  
• Weight: Routes learned through BGP peer: 0; routes sourced by the local router: 32768.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
### Enabling BGP Routing

#### Before you begin

To enable BGP, the switch or stack master must be running the IP services feature set.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;<code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>ip routing</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;<code>Switch(config)# ip routing</code></td>
<td>Enables IP routing.</td>
</tr>
<tr>
<td>3</td>
<td><code>router bgp autonomous-system</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;<code>Switch(config)# router bgp 45000</code></td>
<td>Enables a BGP routing process, assign it an AS number, and enter router configuration mode. The AS number can be from 1 to 65535, with 64512 to 65535 designated as private autonomous numbers.</td>
</tr>
<tr>
<td>4</td>
<td><code>network network-number [mask network-mask] [route-map route-map-name]</code>&lt;br&gt;<code>Example:</code>&lt;br&gt;<code>Switch(config)# network 10.108.0.0</code></td>
<td>Configures a network as local to this AS, and enter it in the BGP table.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} remote-as number`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# neighbor 10.108.1.2 remote-as 65200</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} remove-private-as`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# neighbor 172.16.2.33 remove-private-as</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>synchronization</td>
<td>(Optional) Enables synchronization between BGP and an IGP.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# synchronization</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>auto-summary</td>
<td>(Optional) Enables automatic network summarization. When a subnet is redistributed from an IGP into BGP, only the network route is inserted into the BGP table.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# auto-summary</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>bgp graceful-restart</td>
<td>(Optional) Enables NSF awareness on switch. By default, NSF awareness is disabled.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# bgp graceful-start</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td><code>show ip bgp network network-number</code></td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch# show ip bgp network 10.108.0.0</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td><code>show ip bgp neighbor</code></td>
<td>Verifies that NSF awareness (Graceful Restart) is enabled on the neighbor.&lt;br&gt;&lt;br&gt;If NSF awareness is enabled on the switch and the neighbor, this message appears:&lt;br&gt;&lt;br&gt;<code>Graceful Restart Capability: advertised and received</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch# show ip bgp neighbor</code></td>
<td></td>
</tr>
</tbody>
</table>
Managing Routing Policy Changes

To learn if a BGP peer supports the route refresh capability and to reset the BGP session:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | show ip bgp neighbors | Displays whether a neighbor supports the route refresh capability. When supported, this message appears for the router: 
`Received route refresh capability from peer.` |
| 2    | clear ip bgp `{* | address | peer-group-name}` | Resets the routing table on the specified connection.  
- Enter an asterisk (*) to specify that all connections be reset.  
- Enter an IP address to specify the connection to be reset.  
- Enter a peer group name to reset the peer group. |
| 3    | clear ip bgp `{* | address | peer-group-name}` soft out | (Optional) Performs an outbound soft reset to reset the inbound routing table on the specified connection. Use this command if route refresh is supported.  
- Enter an asterisk (*) to specify that all connections be reset.  
- Enter an IP address to specify the connection to be reset.  
- Enter a peer group name to reset the peer group. |
| 4    | show ip bgp | Verifies the reset by checking information about the routing table and about BGP neighbors. |
### Configuring BGP Decision Attributes

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>router bgp autonomous-system</code></td>
<td>Enables a BGP routing process, assign it an AS number, and enter router configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# router bgp 4500</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>bgp best-path as-path ignore</code></td>
<td>(Optional) Configures the router to ignore AS path length in selecting a route.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-router)# bgp bestpath as-path ignore</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} next-hop-self`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-router)# neighbor 10.108.1.1 next-hop-self</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} weight weight`</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-router)# neighbor 172.16.12.1 weight 50</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>default-metric number</code></td>
<td>(Optional) Sets a MED metric to set preferred paths to external neighbors. All routes without a MED will also be set to this value. The range is 1 to 4294967295. The lowest value is the most desirable.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-router)# default-metric 300</code></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>--------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> bgp bestpath med missing-as-worst</td>
<td>(Optional) Configures the switch to consider a missing MED as having a value of infinity, making the path without a MED value the least desirable path.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# bgp bestpath med missing-as-worst</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> bgp always-compare med</td>
<td>(Optional) Configures the switch to compare MEDs for paths from neighbors in different autonomous systems. By default, MED comparison is only done among paths in the same AS.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# bgp always-compare-med</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> bgp bestpath med confed</td>
<td>(Optional) Configures the switch to consider the MED in choosing a path from among those advertised by different subautonomous systems within a confederation.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# bgp bestpath med confed</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> bgp deterministic med</td>
<td>(Optional) Configures the switch to consider the MED variable when choosing among routes advertised by different peers in the same AS.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# bgp deterministic med</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> bgp default local-preference value</td>
<td>(Optional) Change the default local preference value. The range is 0 to 4294967295; the default value is 100. The highest local preference value is preferred.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# bgp default local-preference 200</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> maximum-paths number</td>
<td>(Optional) Configures the number of paths to be added to the IP routing table. The default is to only enter the best path in the routing table. The range is from 1 to 16. Having multiple paths allows load-balancing among the paths. (Although the switch software allows a maximum of 32 equal-cost routes, the switch hardware will never use more than 16 paths per route.)</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# maximum-paths 8</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 13</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# end</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 14</strong> show ip bgp</td>
<td>Verifies the reset by checking information about the routing table and about BGP neighbors.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch# show ip bgp</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 15</strong> show ip bgp neighbors</td>
<td>Verifies the reset by checking information about the routing table and about BGP neighbors.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch# show ip bgp neighbors</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Configuring BGP Filtering with Route Maps

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>

Enters global configuration mode.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>route-map map-tag [permit</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# route-map set-peer-address permit 10</td>
</tr>
</tbody>
</table>

Creates a route map, and enters route-map configuration mode.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>set ip next-hop ip-address [...ip-address] [peer-address]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# set ip next-hop 10.1.1.3</td>
</tr>
</tbody>
</table>

(Optional) Sets a route map to disable next-hop processing

- In an inbound route map, set the next hop of matching routes to be the neighbor peering address, overriding third-party next hops.
- In an outbound route map of a BGP peer, set the next hop to the peering address of the local router, disabling the next-hop calculation.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

Returns to privileged EXEC mode.

<table>
<thead>
<tr>

<td><strong>Example:</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Configuring BGP Filtering by Neighbor

This section describes how to configure BGP filtering by neighbor.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 router bgp autonomous-system</td>
<td>Enables a BGP routing process, assign it an AS number, and enter router configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# router bgp 109</td>
<td></td>
</tr>
<tr>
<td>Step 3 neighbor {ip-address</td>
<td>peer-group name} distribute-list {access-list-number</td>
</tr>
<tr>
<td>Example: Switch(config-router)# neighbor 172.16.4.1 distribute-list 39 in</td>
<td></td>
</tr>
<tr>
<td>Step 4 neighbor {ip-address</td>
<td>peer-group name} route-map map-tag {in</td>
</tr>
<tr>
<td>Example: Switch(config-router)# neighbor 172.16.70.24 route-map internal-map in</td>
<td></td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6 show ip bgp neighbors</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td>Example: Switch# show ip bgp neighbors</td>
<td></td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Configuring BGP Filtering by Access Lists and Neighbors

Another method of filtering is to specify an access list filter on both incoming and outbound updates, based on the BGP autonomous system paths. Each filter is an access list based on regular expressions. (See the “Regular Expressions” appendix in the Cisco IOS Dial Technologies Command Reference, Release 12.4 for more information on forming regular expressions.) To use this method, define an autonomous system path access list, and apply it to updates to and from particular neighbors.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>`configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>ip as-path access-list access-list-number {permit</td>
<td>deny} as-regular-expressions</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ip as-path access-list 1 deny <em>65535</em></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>`router bgp autonomous-system</td>
<td>Enters BGP router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# router bgp 110</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>neighbor {ip-address</td>
<td>peer-group name} filter-list {access-list-number</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-router)# neighbor 172.16.1.1 filter-list 1 out</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>`end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config-router)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>`show ip bgp neighbors [paths regular-expression]</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# show ip bgp neighbors</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td>`copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring Prefix Lists for BGP Filtering

You do not need to specify a sequence number when removing a configuration entry. Show commands include the sequence numbers in their output.

Before using a prefix list in a command, you must set up the prefix list.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><strong>configure terminal</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** |  |
| **ip prefix-list list-name [seq seq-value] deny | permit network/len [ge ge-value] [le le-value]** | Creates a prefix list with an optional sequence number to deny or permit access for matching conditions. You must enter at least one permit or deny clause. |
| **Example:** | |
| Switch(config)# ip prefix-list BLUE permit 172.16.1.0/24 |  |

| **Step 3** |  |
| **ip prefix-list list-name seq seq-value deny | permit network/len [ge ge-value] [le le-value]** | (Optional) Adds an entry to a prefix list, and assign a sequence number to the entry. |
| **Example:** | |
| Switch(config)# ip prefix-list BLUE seq 10 permit 172.24.1.0/24 |  |

| **Step 4** |  |
| **end** | Returns to privileged EXEC mode. |
| **Example:** | |
| Switch(config)# end |  |

| **Step 5** |  |
| **show ip prefix list [detail | summary] name [network/len] [seq seq-num] [longer] [first-match]** | Verifies the configuration by displaying information about a prefix list or prefix list entries. |
| **Example:** | |
| Switch# show ip prefix list summary test |  |

| **Step 6** |  |
| **copy running-config startup-config** | (Optional) Saves your entries in the configuration file. |
| **Example:** | |
| Switch# copy running-config startup-config |  |
Configuring BGP Community Filtering

By default, no COMMUNITIES attribute is sent to a neighbor. You can specify that the COMMUNITIES attribute be sent to the neighbor at an IP address by using the neighbor send-community router configuration command.

SUMMARY STEPS

1. configure terminal
2. ip community-list community-list-number {permit | deny} community-number
3. router bgp autonomous-system
4. neighbor {ip-address | peer-group name} send-community
5. set comm-list list-param delete
6. exit
7. ip bgp-community new-format
8. end
9. show ip bgp community
10. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip community-list community-list-number {permit</td>
<td>deny} community-number</td>
</tr>
<tr>
<td>Example: Switch(config)# ip community-list 1 permit 50000:10</td>
<td>• The community-list-number is an integer from 1 to 99 that identifies one or more permit or deny groups of communities.</td>
</tr>
<tr>
<td></td>
<td>• The community-number is the number configured by a set comm-list route-map configuration command.</td>
</tr>
<tr>
<td><strong>Step 3</strong> router bgp autonomous-system</td>
<td>Enters BGP router configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# router bgp 108</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> neighbor {ip-address</td>
<td>peer-group name} send-community</td>
</tr>
<tr>
<td>Example: Switch(config-router)# neighbor 172.16.70.23 send-community</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring BGP Neighbors and Peer Groups

To assign configuration options to an individual neighbor, specify any of these router configuration commands by using the neighbor IP address. To assign the options to a peer group, specify any of the commands by using the peer group name. You can disable a BGP peer or peer group without removing all the configuration information by using the `neighbor shutdown` router configuration command.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> router bgp autonomous-system</td>
<td>Enters BGP router configuration mode.</td>
</tr>
</tbody>
</table>

#### Configuring BGP Neighbors and Peer Groups

<table>
<thead>
<tr>
<th>Step 5</th>
<th>set comm-list <code>list-num delete</code></th>
<th><strong>Purpose</strong></th>
<th>(Optional) Removes communities from the community attribute of an inbound or outbound update that match a standard or extended community list specified by a route map.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-router)# set comm-list 500 delete</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>exit</td>
<td><strong>Example:</strong></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-router)# end</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>ip bgp-community new-format</td>
<td><strong>Example:</strong></td>
<td>(Optional) Displays and parses BGP communities in the format AA:NN. A BGP community is displayed in a two-part format 2 bytes long. The Cisco default community format is in the format NNAA. In the most recent RFC for BGP, a community takes the form AA:NN, where the first part is the AS number and the second part is a 2-byte number.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip bgp-community new format</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>end</td>
<td><strong>Example:</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# end</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>show ip bgp community</td>
<td><strong>Example:</strong></td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# show ip bgp community</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>copy running-config startup-config</td>
<td><strong>Example:</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# copy running-config startup-config</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>------</td>
<td>------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>neighbor peer-group-name peer-group</code></td>
<td>Creates a BGP peer group.</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>neighbor ip-address peer-group peer-group-name</code></td>
<td>Makes a BGP neighbor a member of the peer group.</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} remote-as number`</td>
<td>Specifies a BGP neighbor. If a peer group is not configured with a <code>remote-as number</code>, use this command to create peer groups containing EBGP neighbors. The range is 1 to 65535.</td>
</tr>
<tr>
<td>Step 6</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} description text`</td>
<td>(Optional) Associates a description with a neighbor.</td>
</tr>
<tr>
<td>Step 7</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} default-originate [route-map map-name]`</td>
<td>(Optional) Allows a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route.</td>
</tr>
<tr>
<td>Step 8</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} send-community`</td>
<td>(Optional) Specifies that the COMMUNITIES attribute be sent to the neighbor at this IP address.</td>
</tr>
<tr>
<td>Step 9</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} update-source interface`</td>
<td>(Optional) Allows internal BGP sessions to use any operational interface for TCP connections.</td>
</tr>
<tr>
<td>Step 10</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} ebgp-multihop`</td>
<td>(Optional) Allows BGP sessions, even when the neighbor is not on a directly connected segment. The multihop session is not established if the only route to the multihop peer’s address is the default route (0.0.0.0).</td>
</tr>
<tr>
<td>Step 11</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} local-as number`</td>
<td>(Optional) Specifies an AS number to use as the local AS. The range is 1 to 65535.</td>
</tr>
<tr>
<td>Step 12</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} advertisement-interval seconds`</td>
<td>(Optional) Sets the minimum interval between sending BGP routing updates.</td>
</tr>
<tr>
<td>Step 13</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} maximum-prefix maximum [threshold]`</td>
<td>(Optional) Controls how many prefixes can be received from a neighbor. The range is 1 to 4294967295. The <code>threshold</code> (optional) is the percentage of maximum at which a warning message is generated. The default is 75 percent.</td>
</tr>
<tr>
<td>Step 14</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} next-hop-self`</td>
<td>(Optional) Disables next-hop processing on the BGP updates to a neighbor.</td>
</tr>
<tr>
<td>Step 15</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} password string`</td>
<td>(Optional) Sets MD5 authentication on a TCP connection to a BGP peer. The same password must be configured on both BGP peers, or the connection between them is not made.</td>
</tr>
<tr>
<td>Step 16</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} route-map map-name [in</td>
<td>out]`</td>
</tr>
<tr>
<td>Step 17</td>
<td>`neighbor {ip-address</td>
<td>peer-group-name} send-community`</td>
<td>(Optional) Specifies that the COMMUNITIES attribute be sent to the neighbor at this IP address.</td>
</tr>
</tbody>

### Configuring Aggregate Addresses in a Routing Table

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>router bgp autonomous-system</code></td>
<td>Enter BGP router configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# router bgp 106</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>aggregate-address address mask</code></td>
<td>Creates an aggregate entry in the BGP routing table. The aggregate route is advertised as coming from the AS, and</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>----------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0</td>
<td>the atomic aggregate attribute is set to indicate that information might be missing.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aggregate-address address-mask as-set</td>
<td>(Optional) Generates AS set path information. This command creates an aggregate entry following the same rules as the previous command, but the advertised path will be an AS_SET consisting of all elements contained in all paths. Do not use this keyword when aggregating many paths because this route must be continually withdrawn and updated.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 as-set</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> aggregate-address address-mask summary-only</td>
<td>(Optional) Advertises summary addresses only.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 summary-only</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> aggregate-address address-mask suppress-map map-name</td>
<td>(Optional) Suppresses selected, more specific routes.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 suppress-map map1</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> aggregate-address address-mask advertise-map map-name</td>
<td>(Optional) Generates an aggregate based on conditions specified by the route map.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 advertise-map map2</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> aggregate-address address-mask attribute-map map-name</td>
<td>(Optional) Generates an aggregate with attributes specified in the route map.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# aggregate-address 10.0.0.0 255.0.0.0 attribute-map map3</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# end</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> show ip bgp neighbors [advertised-routes]</td>
<td>Verifies the configuration.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Switch# show ip bgp neighbors</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Routing Domain Confederations

You must specify a confederation identifier that acts as the autonomous system number for the group of autonomous systems.

#### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>router bgp autonomous-system</td>
<td>Enters BGP router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# router bgp 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>bgp confederation identifier autonomous-system</td>
<td>Configures a BGP confederation identifier.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# bgp confederation identifier 50007</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>bgp confederation peers autonomous-system [autonomous-system ...]</td>
<td>Specifies the autonomous systems that belong to the confederation and that will be treated as special EBGP peers.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# bgp confederation peers 51000 51001 51002</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>show ip bgp neighbor</td>
<td>Verifies the configuration.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# show ip bgp neighbor</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring BGP Route Reflectors

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> router bgp autonomous-system</td>
<td>Enters BGP router configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# router bgp 101</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> neighbor {ip-address</td>
<td>peer-group-name} route-reflector-client</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# neighbor 172.16.70.24 route-reflector-client</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> bgp cluster-id cluster-id</td>
<td>(Optional) Configures the cluster ID if the cluster has more than one route reflector.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# bgp cluster-id 10.0.1.2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> no bgp client-to-client reflection</td>
<td>(Optional) Disables client-to-client route reflection. By default, the routes from a route reflector client are reflected to other clients. However, if the clients are fully meshed, the route reflector does not need to reflect routes to clients.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# no bgp client-to-client reflection</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring Route Dampening

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> router bgp autonomous-system</td>
<td>Enters BGP router configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# router bgp 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> bgp dampening</td>
<td>Enables BGP route dampening.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# bgp dampening</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> bgp dampening half-life reuse suppress max-suppress [route-map map]</td>
<td>(Optional) Changes the default values of route dampening factors.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# bgp dampening 30 1500 10000 120</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# end</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| **Step 6** show ip bgp flap-statistics [\{regexp regexp\} [ [filter-list
list] | [address mask [longer-prefix]]] ] | (Optional) Monitors the flaps of all paths that are flapping. The statistics are deleted when the route is not suppressed and is stable. |
| Example: Switch# show ip bgp flap-statistics | |
| **Step 7** show ip bgp dampened-paths | (Optional) Displays the dampened routes, including the time remaining before they are suppressed. |
| Example: Switch# show pi bgp dampened-paths | |
| **Step 8** clear ip bgp flap-statistics [\{regexp regexp\} [ [filter-list
list] | [address mask [longer-prefix]]] ] | (Optional) Clears BGP flap statistics to make it less likely that a route will be dampened. |
| Example: Switch# clear ip bgp flap-statistics | |
| **Step 9** clear ip bgp dampening | (Optional) Clears route dampening information, and unsuppress the suppressed routes. |
| Example: Switch# clear ip bgp dampening | |
| **Step 10** copy running-config startup-config | (Optional) Saves your entries in the configuration file. |
| Example: Switch# copy running-config startup-config | |

**Monitoring and Maintaining BGP**

You can remove all contents of a particular cache, table, or database. This might be necessary when the contents of the particular structure have become or are suspected to be invalid.

You can display specific statistics, such as the contents of BGP routing tables, caches, and databases. You can use the information to get resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device’s packets are taking through the network.

Table 41-8 lists the privileged EXEC commands for clearing and displaying BGP. For explanations of the display fields, see the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4.*

**Table 105: IP BGP Clear and Show Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip bgp address</td>
<td>Resets a particular BGP connection.</td>
</tr>
<tr>
<td>clear ip bgp *</td>
<td>Resets all BGP connections.</td>
</tr>
<tr>
<td>clear ip bgp peer-group tag</td>
<td>Removes all members of a BGP peer group.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>show ip bgp prefix</code></td>
<td>Displays peer groups and peers not in peer groups to which the prefix has been advertised. Also display prefix attributes such as the next hop and the local prefix.</td>
</tr>
<tr>
<td><code>show ip bgp cidr-only</code></td>
<td>Displays all BGP routes that contain subnet and supernet network masks.</td>
</tr>
<tr>
<td><code>show ip bgp community [community-number] [exact]</code></td>
<td>Displays routes that belong to the specified communities.</td>
</tr>
<tr>
<td><code>show ip bgp community-list community-list-number [exact-match]</code></td>
<td>Displays routes that are permitted by the community list.</td>
</tr>
<tr>
<td><code>show ip bgp filter-list access-list-number</code></td>
<td>Displays routes that are matched by the specified AS path access list.</td>
</tr>
<tr>
<td><code>show ip bgp inconsistent-as</code></td>
<td>Displays the routes with inconsistent originating autonomous systems.</td>
</tr>
<tr>
<td><code>show ip bgp regexp regular-expression</code></td>
<td>Displays the routes that have an AS path that matches the specified regular expression entered on the command line.</td>
</tr>
<tr>
<td><code>show ip bgp</code></td>
<td>Displays the contents of the BGP routing table.</td>
</tr>
<tr>
<td><code>show ip bgp neighbors [address]</code></td>
<td>Displays detailed information on the BGP and TCP connections to individual neighbors.</td>
</tr>
<tr>
<td>`show ip bgp neighbors [address] [advertised-routes</td>
<td>dampened-routes</td>
</tr>
<tr>
<td><code>show ip bgp paths</code></td>
<td>Displays all BGP paths in the database.</td>
</tr>
<tr>
<td><code>show ip bgp peer-group [tag] [summary]</code></td>
<td>Displays information about BGP peer groups.</td>
</tr>
<tr>
<td><code>show ip bgp summary</code></td>
<td>Displays the status of all BGP connections.</td>
</tr>
</tbody>
</table>

The `bgp log-neighbor changes` command is enabled by default. It allows to log messages that are generated when a BGP neighbor resets, comes up, or goes down.

**Configuration Examples for BGP**

**Example: Configuring BGP on Routers**

In Figure 41-5

Router A:
Switch(config)# router bgp 100
Switch(config-router)# neighbor 129.213.1.1 remote-as 200

Router B:

Switch(config)# router bgp 200
Switch(config-router)# neighbor 129.213.1.2 remote-as 100
Switch(config-router)# neighbor 175.220.1.2 remote-as 200

Router C:

Switch(config)# router bgp 200
Switch(config-router)# neighbor 175.220.212.1 remote-as 200
Switch(config-router)# neighbor 192.208.10.1 remote-as 300

Router D:

Switch(config)# router bgp 300
Switch(config-router)# neighbor 192.208.10.2 remote-as 200

To verify that BGP peers are running, use the show ip bgp neighbors privileged EXEC command. This is the output of this command on Router A:

Switch# show ip bgp neighbors
BGP neighbor is 129.213.1.1, remote AS 200, external link
BGP version 4, remote router ID 175.220.212.1
BGP state = established, table version = 3, up for 0:10:59
Last read 0:00:29, hold time is 180, keepalive interval is 60 seconds
Minimum time between advertisement runs is 30 seconds
Received 2828 messages, 0 notifications, 0 in queue
Sent 2826 messages, 0 notifications, 0 in queue
Connections established 11; dropped 10

Anything other than state = established means that the peers are not running. The remote router ID is the highest IP address on that router (or the highest loopback interface). Each time the table is updated with new information, the table version number increments. A table version number that continually increments means that a route is flapping, causing continual routing updates.

For exterior protocols, a reference to an IP network from the network router configuration command controls only which networks are advertised. This is in contrast to Interior Gateway Protocols (IGPs), such as EIGRP, which also use the network command to specify where to send updates.

Information About ISO CLNS Routing

Connectionless Routing

The International Organization for Standardization (ISO) Connectionless Network Service (CLNS) protocol is a standard for the network layer of the Open System Interconnection (OSI) model. Addresses in the ISO network architecture are referred to as network service access point (NSAP) addresses and network entity
titles (NETs). Each node in an OSI network has one or more NETs. In addition, each node has many NSAP addresses.

When you enable connectionless routing on the switch by using the `clns routing` global configuration command, the switch makes only forwarding decisions, with no routing-related functionality. For dynamic routing, you must also enable a routing protocol. The switch supports the Intermediate System-to-Intermediate System (IS-IS) dynamic routing protocol that is based on the OSI routing protocol for ISO CLNS networks.

When dynamically routing, you use IS-IS. This routing protocol supports the concept of areas. Within an area, all routers know how to reach all the system IDs. Between areas, routers know how to reach the proper area. IS-IS supports two levels of routing: station routing (within an area) and area routing (between areas).

The key difference between the ISO IGRP and IS-IS NSAP addressing schemes is in the definition of area addresses. Both use the system ID for Level 1 routing (routing within an area). However, they differ in the way addresses are specified for area routing. An ISO IGRP NSAP address includes three separate fields for routing: the domain, area, and system ID. An IS-IS address includes two fields: a single continuous area field (comprising the domain and area fields) and the system ID.

**Note**

For more detailed information about ISO CLNS, see the *Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Configuration Guide, Release 12.4*. For complete syntax and usage information for the commands used in this chapter, see the *Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Command Reference, Release 12.4*, use the IOS command reference master index, or search online.

---

**IS-IS Dynamic Routing**

IS-IS is an ISO dynamic routing protocol (described in ISO 105890). Unlike other routing protocols, enabling IS-IS requires that you create an IS-IS routing process and assign it to a specific interface, rather than to a network. You can specify more than one IS-IS routing process per Layer 3 switch or router by using the multiarea IS-IS configuration syntax. You then configure the parameters for each instance of the IS-IS routing process.

Small IS-IS networks are built as a single area that includes all the routers in the network. As the network grows larger, it is usually reorganized into a backbone area made up of the connected set of all Level 2 routers from all areas, which is in turn connected to local areas. Within a local area, routers know how to reach all system IDs. Between areas, routers know how to reach the backbone, and the backbone routers know how to reach other areas.

Routers establish Level 1 adjacencies to perform routing within a local area (station routing). Routers establish Level 2 adjacencies to perform routing between Level 1 areas (area routing).

A single Cisco router can participate in routing in up to 29 areas and can perform Level 2 routing in the backbone. In general, each routing process corresponds to an area. By default, the first instance of the routing process configured performs both Level 1 and Level 2 routing. You can configure additional router instances, which are automatically treated as Level 1 areas. You must configure the parameters for each instance of the IS-IS routing process individually.

For IS-IS multiarea routing, you can configure only one process to perform Level 2 routing, although you can define up to 29 Level 1 areas for each Cisco unit. If Level 2 routing is configured on any process, all additional processes are automatically configured as Level 1. You can configure this process to perform Level 1 routing at the same time. If Level 2 routing is not desired for a router instance, remove the Level 2 capability using the `is-type` global configuration command. Use the `is-type` command also to configure a different router instance as a Level 2 router.
Nonstop Forwarding Awareness

The integrated IS-IS NSF Awareness feature is supported for IPv4G. The feature allows customer premises equipment (CPE) routers that are NSF-aware to help NSF-capable routers perform nonstop forwarding of packets. The local router is not necessarily performing NSF, but its awareness of NSF allows the integrity and accuracy of the routing database and link-state database on the neighboring NSF-capable router to be maintained during the switchover process.

This feature is automatically enabled and requires no configuration. For more information on this feature, see the Integrated IS-IS Nonstop Forwarding (NSF) Awareness Feature Guide.

IS-IS Global Parameters

These are some optional IS-IS global parameters that you can configure:

- You can force a default route into an IS-IS routing domain by configuring a default route controlled by a route map. You can also specify other filtering options configurable under a route map.
- You can configure the router to ignore IS-IS LSPs that are received with internal checksum errors or to purge corrupted LSPs, which causes the initiator of the LSP to regenerate it.
- You can assign passwords to areas and domains.
- You can create aggregate addresses that are represented in the routing table by a summary address (route-summarization). Routes learned from other routing protocols can also be summarized. The metric used to advertise the summary is the smallest metric of all the specific routes.
- You can set an overload bit.
- You can configure the LSP refresh interval and the maximum time that an LSP can remain in the router database without a refresh.
- You can set the throttling timers for LSP generation, shortest path first computation, and partial route computation.
- You can configure the switch to generate a log message when an IS-IS adjacency changes state (up or down).
- If a link in the network has a maximum transmission unit (MTU) size of less than 1500 bytes, you can lower the LSP MTU so that routing will still occur.
- The partition avoidance router configuration command prevents an area from becoming partitioned when full connectivity is lost among a Level1-2 border router, adjacent Level 1 routers, and end hosts.
IS-IS Interface Parameters

You can optionally configure certain interface-specific IS-IS parameters, independently from other attached routers. However, if you change some values from the defaults, such as multipliers and time intervals, it makes sense to also change them on multiple routers and interfaces. Most of the interface parameters can be configured for level 1, level 2, or both.

These are some interface level parameters you can configure:

- The default metric on the interface, which is used as a value for the IS-IS metric and assigned when there is no quality of service (QoS) routing performed.

- The hello interval (length of time between hello packets sent on the interface) or the default hello packet multiplier used on the interface to determine the hold time sent in IS-IS hello packets. The hold time determines how long a neighbor waits for another hello packet before declaring the neighbor down. This determines how quickly a failed link or neighbor is detected so that routes can be recalculated. Change the hello-multiplier in circumstances where hello packets are lost frequently and IS-IS adjacencies are failing unnecessarily. You can raise the hello multiplier and lower the hello interval correspondingly to make the hello protocol more reliable without increasing the time required to detect a link failure.

- Other time intervals:
  - Complete sequence number PDU (CSNP) interval. CSNPs are sent by the designated router to maintain database synchronization.
  - Retransmission interval. This is the time between retransmission of IS-IS LSPs for point-to-point links.
  - IS-IS LSP retransmission throttle interval. This is the maximum rate (number of milliseconds between packets) at which IS-IS LSPs are re-sent on point-to-point links. This interval is different from the retransmission interval, which is the time between successive retransmissions of the same LSP.

- Designated router election priority, which allows you to reduce the number of adjacencies required on a multiaccess network, which in turn reduces the amount of routing protocol traffic and the size of the topology database.

- The interface circuit type, which is the type of adjacency desired for neighbors on the specified interface.

- Password authentication for the interface.

How to Configure ISO CLNS Routing

Default IS-IS Configuration

Table 106: Default IS-IS Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore link-state PDU (LSP) errors</td>
<td>Enabled.</td>

<td>Shortest path first (SPF) throttling timers</td>
<td>Maximum interval between consecutive SFPs: 10 seconds. Initial SPF calculation after a topology change: 5500 ms. Hold time between the first and second SPF calculation: 5500 ms.</td>
</tr>
</tbody>
</table>
Enabling IS-IS Routing

To enable IS-IS, you specify a name and NET for each routing process. You then enable IS-IS routing on the interface and specify the area for each instance of the routing process.

### Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code>&lt;br&gt;<code>Switch# configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>clns routing</code>&lt;br&gt;<code>Switch(config)# clns routing</code></td>
<td>Enables ISO connectionless routing on the switch.</td>
</tr>
<tr>
<td>3</td>
<td><code>router isis [area tag]</code>&lt;br&gt;<code>Switch(config)# router isis tag1</code></td>
<td>Enables the IS-IS routing for the specified routing process and enter IS-IS routing configuration mode.&lt;br&gt;(Optional) Use the <code>area tag</code> argument to identify the area to which the IS-IS router is assigned. You must enter a value if you are configuring multiple IS-IS areas.&lt;br&gt;The first IS-IS instance configured is Level 1-2 by default. Later instances are automatically Level 1. You can change the level of routing by using the <code>is-type</code> global configuration command.</td>
</tr>
<tr>
<td>4</td>
<td><code>net network-entity-title</code>&lt;br&gt;<code>Switch(config-router)# net 47.0004.004d.0001.0001.0c11.1111.00</code></td>
<td>Configures the NETs for the routing process. If you are configuring multiarea IS-IS, specify a NET for each routing process. You can specify a name for a NET and for an address.</td>

</tbody>
</table>
## Configuring IS-IS Global Parameters

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> clns routing</td>
<td>Enables ISO connectionless routing on the switch.</td>
</tr>
<tr>
<td>Example: Switch(config)# clns routing</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> router isis</td>
<td>Specifies the IS-IS routing protocol and enter router configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# router isis</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> default-information originate [route-map map-name]</td>
<td>(Optional) Forces a default route into the IS-IS routing domain. If you enter route-map map-name, the routing process generates the default route if the route map is satisfied.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# default-information originate route-map map1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ignore-lsp-errors</td>
<td>(Optional) Configures the router to ignore LSPs with internal checksum errors, instead of purging the LSPs. This command is enabled by default (corrupted LSPs are dropped). To purge the corrupted LSPs, enter the <strong>no</strong> ignore-lsp-errors router configuration command.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# ignore-lsp-errors</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> area-password password</td>
<td>(Optional) Configures the area authentication password, which is inserted in Level 1 (station router level) LSPs.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# area-password 1password</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> domain-password password</td>
<td>(Optional) Configures the routing domain authentication password, which is inserted in Level 2 (area router level) LSPs.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# domain-password 2password</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> summary-address address mask [level-1</td>
<td>level-1-2</td>
</tr>
<tr>
<td>Example: Switch(config-router)# summary-address 10.1.0.0 255.255.0.0 level-2</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring IS-IS Global Parameters

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 9</strong> set-overload-bit [on-startup {seconds</td>
<td>wait-for-bgp}]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# set-overload-bit on-startup wait-for-bgp</td>
<td>• (Optional) on-startup—sets the overload bit only on startup. If on-startup is not specified, the overload bit is set immediately and remains set until you enter the no set-overload-bit command. If on-startup is specified, you must enter a number of seconds or wait-for-bgp.</td>
</tr>
<tr>
<td></td>
<td>• seconds—When the on-startup keyword is configured, causes the overload bit to be set upon system startup and remain set for this number of seconds. The range is from 5 to 86400 seconds.</td>
</tr>
<tr>
<td></td>
<td>• wait-for-bgp—When the on-startup keyword is configured, causes the overload bit to be set upon system startup and remain set until BGP has converged. If BGP does not signal IS-IS that it is converged, IS-IS will turn off the overload bit after 10 minutes.</td>
</tr>
<tr>
<td><strong>Step 10</strong> lsp-refresh-interval seconds</td>
<td>(Optional) Sets an LSP refresh interval in seconds. The range is from 1 to 65535 seconds. The default is to send LSP refreshes every 900 seconds (15 minutes).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# lsp-refresh-interval 1080</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> max-lsp-lifetime seconds</td>
<td>(Optional) Sets the maximum time that LSP packets remain in the router database without being refreshed. The range is from 1 to 65535 seconds. The default is 1200 seconds (20 minutes). After the specified time interval, the LSP packet is deleted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# max-lsp-lifetime 1000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 12</strong> lsp-gen-interval [level-1</td>
<td>level-2] lsp-max-wait [lsp-initial-wait lsp-second-wait]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# lsp-gen-interval level-2 2 50 100</td>
<td>• lsp-max-wait—the maximum interval (in seconds) between two consecutive occurrences of an LSP being generated. The range is 1 to 120, the default is 5.</td>
</tr>
<tr>
<td></td>
<td>• lsp-initial-wait—the initial LSP generation delay (in milliseconds). The range is 1 to 10000; the default is 50.</td>
</tr>
<tr>
<td></td>
<td>• lsp-second-wait—the hold time between the first and second LSP generation (in milliseconds). The range is 1 to 10000; the default is 5000.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

```
Switch(config-router)# spf-interval level-2 5 10 20
```

#### Purpose
- **spf-max-wait**—the maximum interval between consecutive SFPs (in seconds). The range is 1 to 120, the default is 10.
- **spf-initial-wait**—the initial SFP calculation after a topology change (in milliseconds). The range is 1 to 10000; the default is 5500.
- **spf-second-wait**—the holdtime between the first and second SFP calculation (in milliseconds). The range is 1 to 10000; the default is 5500.

### Step 14

**pre-interval** **pre-max-wait** [**pre-initial-wait** **pre-second-wait**]

**Example:**
```
Switch(config-router)# pre-interval 5 10 20
```

(Optional) Sets IS-IS partial route computation (PRC) throttling timers.
- **pre-max-wait**—the maximum interval (in seconds) between two consecutive PRC calculations. The range is 1 to 120; the default is 5.
- **pre-initial-wait**—the initial PRC calculation delay (in milliseconds) after a topology change. The range is 1 to 10,000; the default is 2000.
- **pre-second-wait**—the holdtime between the first and second PRC calculation (in milliseconds). The range is 1 to 10,000; the default is 5000.

### Step 15

**log-adjacency-changes** [**all**]

**Example:**
```
Switch(config-router)# log-adjacency-changes all
```

(Optional) Sets the router to log IS-IS adjacency state changes. Enter **all** to include all changes generated by events that are not related to the Intermediate System-to-Intermediate System Hellos, including End System-to-Intermediate System PDUs and link state packets (LSPs).

### Step 16

**lsp-mtu** **size**

**Example:**
```
Switch(config-router)# lsp mtu 1560
```

(Optional) Specifies the maximum LSP packet size in bytes. The range is 128 to 4352; the default is 1497 bytes.

**Note** If any link in the network has a reduced MTU size, you must change the LSP MTU size on all routers in the network.

### Step 17

**partition avoidance**

**Example:**
```
Switch(config-router)# partition avoidance
```

(Optional) Causes an IS-IS Level 1-2 border router to stop advertising the Level 1 area prefix into the Level 2 backbone when full connectivity is lost among the border router, all adjacent level 1 routers, and end hosts.

### Step 18

**end**

**Example:**
```
Switch(config-router)# end
```

Returns to privileged EXEC mode.

Monitoring and Maintaining ISO IGRP and IS-IS

You can remove all contents of a CLNS cache or remove information for a particular neighbor or route. You can display specific CLNS or IS-IS statistics, such as the contents of routing tables, caches, and databases. You can also display information about specific interfaces, filters, or neighbors.

Table 41-13 lists the privileged EXEC commands for clearing and displaying ISO CLNS and IS-IS routing. For explanations of the display fields, see the Cisco IOS Apollo Domain, Banyan VINES, DECnet, ISO CLNS and XNS Command Reference, Release 12.4, use the Cisco IOS command reference master index, or search online.

### Configuration Examples for ISO CLNS Routing

#### Example: Configuring IS-IS Routing

This example shows how to configure three routers to run conventional IS-IS as an IP routing protocol. In conventional IS-IS, all routers act as Level 1 and Level 2 routers (by default).

**Router A:**

```bash
Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000a.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet1/0/1
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show clns filter-expr</code></td>
<td>Displays filter expressions.</td>
</tr>
<tr>
<td><code>show clns filter-set</code></td>
<td>Displays filter sets.</td>
</tr>
<tr>
<td><code>show clns interface [interface-id]</code></td>
<td>Displays the CLNS-specific or ES-IS information about each interface.</td>
</tr>
<tr>
<td><code>show clns neighbor</code></td>
<td>Displays information about IS-IS neighbors.</td>
</tr>
<tr>
<td><code>show clns protocol</code></td>
<td>List the protocol-specific information for each IS-IS or ISO IGRP routing process in this router.</td>
</tr>
<tr>
<td><code>show clns route</code></td>
<td>Displays all the destinations to which this router knows how to route CLNS packets.</td>
</tr>
<tr>
<td><code>show clns traffic</code></td>
<td>Displays information about the CLNS packets this router has seen.</td>
</tr>
<tr>
<td><code>show ip route isis</code></td>
<td>Displays the current state of the ISIS IP routing table.</td>
</tr>
<tr>
<td><code>show isis database</code></td>
<td>Displays the IS-IS link-state database.</td>
</tr>
<tr>
<td><code>show isis routes</code></td>
<td>Displays the IS-IS Level 1 routing table.</td>
</tr>
<tr>
<td><code>show isis spf-log</code></td>
<td>Displays a history of the shortest path first (SPF) calculations for IS-IS.</td>
</tr>
<tr>
<td><code>show isis topology</code></td>
<td>Displays a list of all connected routers in all areas.</td>
</tr>
<tr>
<td><code>show route-map</code></td>
<td>Displays all route maps configured or only the one specified.</td>
</tr>
<tr>
<td><code>trace clns destination</code></td>
<td>Discover the paths taken to a specified destination by packets in the network.</td>
</tr>
<tr>
<td>`which-route {nsap-address</td>
<td>clns-name}`</td>
</tr>
</tbody>
</table>
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit

Router B:

Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000b.00
Switch(config-router)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit

Router C:

Switch(config)# clns routing
Switch(config)# router isis
Switch(config-router)# net 49.0001.0000.0000.000c.00
Switch(config-router)# exit

Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip router isis
Switch(config-if)# clns router isis
Switch(config-router)# exit

Information About Multi-VRF CE

Virtual Private Networks (VPNs) provide a secure way for customers to share bandwidth over an ISP backbone network. A VPN is a collection of sites sharing a common routing table. A customer site is connected to the service-provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table, called a VPN routing/forwarding (VRF) table.

The switch supports multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices (multi-VRF CE) when the it is running the IP services or advanced IP services feature set. Multi-VRF CE allows a service provider to support two or more VPNs with overlapping IP addresses.

Note

The switch does not use Multiprotocol Label Switching (MPLS) to support VPNs. For information about MPLS VRF, see the Cisco IOS Switching Services Configuration Guide, Release 12.4.

Understanding Multi-VRF CE

Multi-VRF CE is a feature that allows a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. Multi-VRF CE uses input interfaces to distinguish routes for different
VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but an interface cannot belong to more than one VRF at any time.

Multi-VRF CE interfaces must be Layer 3 interfaces.

Multi-VRF CE includes these devices:

- Customer edge (CE) devices provide customers access to the service-provider network over a data link to one or more provider edge routers. The CE device advertises the site’s local routes to the router and learns the remote VPN routes from it. A switch can be a CE.

- Provider edge (PE) routers exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv2, OSPF, or EIGRP. The PE is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE to maintain all of the service-provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE router can be associated with a single VRF if all of these sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CE devices, a PE router exchanges VPN routing information with other PE routers by using internal BGP (IBGP).

- Provider routers or core routers are any routers in the service provider network that do not attach to CE devices.

With multi-VRF CE, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. Multi-VRF CE extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

**Network Topology**

Figure 41-6 shows a configuration using switches as multiple virtual CEs. This scenario is suited for customers who have low bandwidth requirements for their VPN service, for example, small companies. In this case, multi-VRF CE support is required in the switches. Because multi-VRF CE is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.

*Figure 68: Switches Acting as Multiple Virtual CEs*
When the CE switch receives a command to add a Layer 3 interface to a VRF, it sets up the appropriate mapping between the VLAN ID and the policy label (PL) in multi-VRF-CE-related data structures and adds the VLAN ID and PL to the VLAN database.

When multi-VRF CE is configured, the Layer 3 forwarding table is conceptually partitioned into two sections:

- The multi-VRF CE routing section contains the routes from different VPNs.
- The global routing section contains routes to non-VPN networks, such as the Internet.

VLAN IDs from different VRFs are mapped into different policy labels, which are used to distinguish the VRFs during processing. For each new VPN route learned, the Layer 3 setup function retrieves the policy label by using the VLAN ID of the ingress port and inserts the policy label and new route to the multi-VRF CE routing section. If the packet is received from a routed port, the port internal VLAN ID number is used; if the packet is received from an SVI, the VLAN number is used.

Packet-Forwarding Process

This is the packet-forwarding process in a multi-VRF-CE-enabled network:

- When the switch receives a packet from a VPN, the switch looks up the routing table based on the input policy label number. When a route is found, the switch forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. Then it performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input policy label to look up the correct VPN routing table. If a route is found, it forwards the packet within the VPN.

Network Components

To configure VRF, you create a VRF table and specify the Layer 3 interface associated with the VRF. Then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the provider’s backbone. The multi-VRF CE network has three major components:

- VPN route target communities—lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- Multiprotocol BGP peering of VPN community PE routers—propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- VPN forwarding—transports all traffic between all VPN community members across a VPN service-provider network.

VRF-Aware Services

IP services can be configured on global interfaces, and these services run within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.
VRF-Aware services are implemented in platform-independent modules. VRF means multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

- The user can ping a host in a user-specified VRF.
- ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.

How to Configure Multi-VRF CE

Default Multi-VRF CE Configuration

Table 108: Default VRF Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRF</td>
<td>Disabled. No VRFs are defined.</td>
</tr>
<tr>
<td>Maps</td>
<td>No import maps, export maps, or route maps are defined.</td>
</tr>
<tr>
<td>VRF maximum routes</td>
<td>Fast Ethernet switches: 8000 Gigabit Ethernet switches: 12000.</td>
</tr>
<tr>
<td>Forwarding table</td>
<td>The default for an interface is the global routing table.</td>
</tr>
</tbody>
</table>
Multi-VRF CE Configuration Guidelines

To use multi-VRF CE, you must have the IP services or advanced IP services feature set enabled on your switch.

- A switch with multi-VRF CE is shared by multiple customers, and each customer has its own routing table.
- Because customers use different VRF tables, the same IP addresses can be reused. Overlapped IP addresses are allowed in different VPNs.
- Multi-VRF CE lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. Each customer has its own VLAN.
- Multi-VRF CE does not support all MPLS-VRF functionality. It does not support label exchange, LDP adjacency, or labeled packets.
- For the PE router, there is no difference between using multi-VRF CE or using multiple CEs. In Figure 41-6, multiple virtual Layer 3 interfaces are connected to the multi-VRF CE device.
- The switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. The SVIs can be connected through an access port or a trunk port.
- A customer can use multiple VLANs as long as they do not overlap with those of other customers. A customer’s VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
- The switch supports one global network and up to 26 VRFs.
- Most routing protocols (BGP, OSPF, RIP, and static routing) can be used between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
  - BGP does not require multiple algorithms to communicate with multiple CEs.
  - BGP is designed for passing routing information between systems run by different administrations.
  - BGP makes it easy to pass attributes of the routes to the CE.
- Multi-VRF CE does not affect the packet switching rate.
- VPN multicast is not supported.
- You can enable VRF on a private VLAN, and the reverse.
- You cannot enable VRF when policy-based routing (PBR) is enabled on an interface, and the reverse.
- You cannot enable VRF when Web Cache Communication Protocol (WCCP) is enabled on an interface, and the reverse.

Configuring VRFs

For complete syntax and usage information for the commands, see the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.4.

### Configuring VRF-Aware Services

These services are VRF-Aware:

- ARP
- Ping
- Simple Network Management Protocol (SNMP)
- Unicast Reverse Path Forwarding (uRPF)
- Syslog
- Traceroute
- FTP and TFTP

**Note**
The switch does not support VRF-aware services for Unicast Reverse Path Forwarding (uRPF) or Network Time Protocol (NTP).

### Configuring VRF-Aware Services for ARP

For complete syntax and usage information for the commands, see the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

```
show ip arp vrf vrf-name
```

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Example:</td>
</tr>
<tr>
<td><code>Switch# show ip arp vrf vpl1</code></td>
<td>Displays the ARP table in the specified VRF.</td>
</tr>
</tbody>
</table>
## Configuring VRF-Aware Services for Ping

For complete syntax and usage information for the commands, see the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4.*

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>

**Example:**

```plaintext
Switch(config)# end
```

### Configuring VRF-Aware Services for uRPF

uRPF can be configured on an interface assigned to a VRF, and source lookup is done in the VRF table.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.4.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Switch# configure terminal
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters interface configuration mode, and specifies the Layer 3 interface to configure.</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Switch(config)# interface gigabitethernet 1/0/1
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>Removes the interface from Layer 2 configuration mode if it is a physical interface.</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Switch(config-if)# no switchport
```

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong></td>
<td>Configures VRF on the interface.</td>
</tr>
</tbody>
</table>

**Example:**

```plaintext
Switch(config-if)# ip vrf forwarding vpnl
```

  Switch(config-if)# ip address 10.1.5.1 | Enters the IP address for the interface. |
| **Step 6** ip verify unicast reverse-path  
  Example:  
  Switch(config-if)# ip verify unicast reverse-path | Enables uRPF on the interface. |
| **Step 7** end  
  Example:  
  Switch(config-if)# end | Returns to privileged EXEC mode. |

### Configuring VRF-Aware RADIUS

To configure VRF-Aware RADIUS, you must first enable AAA on a RADIUS server. The switch supports the `ip vrf forwarding vrf-name` server-group configuration and the `ip radius source-interface` global configuration commands, as described in the Per VRF AAA Feature Guide.

### Configuring VRF-Aware Services for Syslog

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

#### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal  
  Example:  
  Switch# configure terminal | Enters global configuration mode. |
| **Step 2** logging on  
  Example:  
  Switch(config)# logging on | Enables or temporarily disables logging of storage router event message. |
| **Step 3** logging host *ip-address* vrf *vrf-name*  
  Example:  
  Switch(config)# logging host 10.10.1.0 vrf vpn1 | Specifies the host address of the syslog server where logging messages are to be sent. |
| **Step 4** logging buffered *logging buffered size* debugging  
  Example:  
  Switch(config)# | Logs messages to an internal buffer. |
Purpose
Command or Action
Step 5 logging trap debugging
Example:
Switch(config)# logging trap debugging

Purpose
Step 6 logging facility facility
Example:
Switch(config)# logging facility user

Purpose
Step 7 end
Example:
Switch(config)# end

Configuring VRF-Aware Services for Traceroute

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the Cisco IOS Switching Services Command Reference, Release 12.4.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 traceroute vrf vrf-name ipaddress</td>
<td>Specifies the name of a VPN VRF in which to find the destination address.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# traceroute vrf vpn2 10.10.1.1</td>
<td></td>
</tr>
</tbody>
</table>

Configuring VRF-Aware Services for FTP and TFTP

So that FTP and TFTP are VRF-aware, you must configure some FTP/TFTP CLIs. For example, if you want to use a VRF table that is attached to an interface, say E1/0, you need to configure the ip tftp source-interface E1/0 or the ip ftp source-interface E1/0 command to inform TFTP or FTP server to use a specific routing table. In this example, the VRF table is used to look up the destination IP address. These changes are backward-compatible and do not affect existing behavior. That is, you can use the source-interface CLI to send packets out a particular interface even if no VRF is configured on that interface.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

Switch# configure terminal

**Step 2**

`ip ftp source-interface interface-type interface-number`

**Example:**

Switch(config)# ip ftp source-interface gigabitethernet 1/0/2

**Step 3**

`end`

**Example:**

Switch(config)# end

**Step 4**

`configure terminal`

**Example:**

Switch# configure terminal

**Step 5**

`ip tftp source-interface interface-type interface-number`

**Example:**

Switch(config)# ip tftp source-interface gigabitethernet 1/0/2

**Step 6**

`end`

**Example:**

Switch(config)# end

---

### Configuring Multicast VRFs

For complete syntax and usage information for the commands, see the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.4*.

For more information about configuring a multicast within a Multi-VRF CE, see the *Cisco IOS IP Multicast Configuration Guide, Release 12.4*.

### Procedure

### Configuration Examples for Multi-VRF CE

#### Multi-VRF CE Configuration Example

Figure 41-7 is a simplified example of the physical connections in a network similar to that in Figure 41-6. OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The examples following the illustration show how to configure a switch as CE Switch A, and the VRF configuration for customer switches D and F. Commands for configuring CE Switch C and the other customer switches are not included but would be similar. The example also includes commands for configuring traffic to Switch A for a Catalyst 6000 or Catalyst 6500 switch acting as a PE router.
Figure 69: Multi-VRF CE Configuration Example

On Switch A, enable routing and configure VRF.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# ip vrf v11
Switch(config-vrf)# rd 800:1
Switch(config-vrf)# route-target export 800:1
Switch(config-vrf)# route-target import 800:1
Switch(config-vrf)# exit
Switch(config)# ip vrf v12
Switch(config-vrf)# rd 800:2
Switch(config-vrf)# route-target export 800:2
Switch(config-vrf)# route-target import 800:2
Switch(config-vrf)# exit

Configure the loopback and physical interfaces on Switch A. Gigabit Ethernet port 1 is a trunk connection to the PE. Gigabit Ethernet ports 8 and 11 connect to VPNs:

Switch(config)# interface loopback1
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 8.8.1.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface loopback2
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 8.8.2.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface gigabitethernet1/0/5
Switch(config-if)# switchport trunk encapsulation dot1q
Configure the VLANs used on Switch A. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for the VPNs that include Switch F and Switch D, respectively:

Switch(config)# interface vlan10
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 38.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface vlan20
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 83.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface vlan118
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 118.0.0.8 255.255.255.0
Switch(config-if)# exit
Switch(config)# interface vlan208
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 208.0.0.8 255.255.255.0
Switch(config-if)# exit

Configure OSPF routing in VPN1 and VPN2.

Switch(config)# router ospf 1 vrf vl1
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit
Switch(config)# router ospf 2 vrf vl2
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit

Configure BGP for CE to PE routing.

Switch(config)# router bgp 800
Switch(config-router)# address-family ipv4 vrf vl2
Switch(config-router-af)# redistribute ospf 2 match internal
Switch(config-router-af)# neighbor 83.0.0.3 remote-as 100
Switch(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Switch(config-router-af)# exit
Switch(config-router)# address-family ipv4 vrf vl1
Switch(config-router-af)# redistribute ospf 1 match internal
Switch(config-router-af)# neighbor 38.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 38.0.0.3 activate
Switch(config-router-af)# network 8.8.1.0 mask 255.255.255.0
Switch(config-router-af)# end

Switch D belongs to VPN 1. Configure the connection to Switch A by using these commands.
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 208.0.0.20 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

Switch F belongs to VPN 2. Configure the connection to Switch A by using these commands.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface vlan118
Switch(config-if)# ip address 118.0.0.11 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

When used on switch B (the PE router), these commands configure only the connections to the CE device, Switch A.

Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip vrf v1
Router(config-vrf)# rd 100:1
Router(config-vrf)# route-target export 100:1
Router(config-vrf)# route-target import 100:1
Router(config-vrf)# exit

Router(config)# ip vrf v2
Router(config-vrf)# rd 100:2
Router(config-vrf)# route-target export 100:2
Router(config-vrf)# route-target import 100:2
Router(config-vrf)# exit
Router(config)# ip cef
Router(config)# interface Loopback1
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 3.3.1.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Loopback2
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 3.3.2.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface gigabitethernet1/1/0.10
Router(config-if)# encapsulation dot1q 10
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 38.0.0.3 255.255.255.0
Configuring Unicast Reverse Path Forwarding

The unicast reverse path forwarding (unicast RPF) feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

Note

- Unicast RPF is supported only in IP services.
- Do not configure unicast RPF if the switch is in a mixed hardware stack combining more than one switch type: Catalyst 3750-X, Catalyst 3750-E, and Catalyst 3750 switches.

For detailed IP unicast RPF configuration information, see the Other Security Features chapter in the Cisco IOS Security Configuration Guide, Release 12.4.

Protocol-Independent Features

This section describes IP routing protocol-independent features that are available on switches running the IP base or the IP services feature set; except that with the IP base feature set, protocol-related features are available only for RIP. For a complete description of the IP routing protocol-independent commands in this chapter, see the “IP Routing Protocol-Independent Commands” chapter of the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4.

- Configuring Static Unicast Routes, page 41-121
Information About Cisco Express Forwarding

Cisco Express Forwarding (CEF) is a Layer 3 IP switching technology used to optimize network performance. CEF implements an advanced IP look-up and forwarding algorithm to deliver maximum Layer 3 switching performance. CEF is less CPU-intensive than fast switching route caching, allowing more CPU processing power to be dedicated to packet forwarding. In a switch stack, the hardware uses distributed CEF (dCEF) in the stack. In dynamic networks, fast switching cache entries are frequently invalidated because of routing changes, which can cause traffic to be process switched using the routing table, instead of fast switched using the route cache. CEF and dCEF use the Forwarding Information Base (FIB) lookup table to perform destination-based switching of IP packets.

The two main components in CEF and dCEF are the distributed FIB and the distributed adjacency tables.

- The FIB is similar to a routing table or information base and maintains a mirror image of the forwarding information in the IP routing table. When routing or topology changes occur in the network, the IP routing table is updated, and those changes are reflected in the FIB. The FIB maintains next-hop address information based on the information in the IP routing table. Because the FIB contains all known routes that exist in the routing table, CEF eliminates route cache maintenance, is more efficient for switching traffic, and is not affected by traffic patterns.

- Nodes in the network are said to be adjacent if they can reach each other with a single hop across a link layer. CEF uses adjacency tables to prepend Layer 2 addressing information. The adjacency table maintains Layer 2 next-hop addresses for all FIB entries.

Because the switch or switch stack uses Application Specific Integrated Circuits (ASICs) to achieve Gigabit-speed line rate IP traffic, CEF or dCEF forwarding applies only to the software-forwarding path, that is, traffic that is forwarded by the CPU.

How to Configure Cisco Express Forwarding

CEF or distributed CEF is enabled globally by default. If for some reason it is disabled, you can re-enable it by using the ip cef or ip cef distributed global configuration command.

The default configuration is CEF or dCEF enabled on all Layer 3 interfaces. Entering the no ip route-cache cef interface configuration command disables CEF for traffic that is being forwarded by software. This command does not affect the hardware forwarding path. Disabling CEF and using the debug ip packet detail privileged EXEC command can be useful to debug software-forwarded traffic. To enable CEF on an interface for the software-forwarding path, use the ip route-cache cef interface configuration command.
Although the `no ip route-cache cef` interface configuration command to disable CEF on an interface is visible in the CLI, we strongly recommend that you do not disable CEF or dCEF on interfaces except for debugging purposes.

To enable CEF or dCEF globally and on an interface for software-forwarded traffic if it has been disabled:

**Procedure**

<table>

**Number of Equal-Cost Routing Paths**

**Information About Equal-Cost Routing Paths**

When a router has two or more routes to the same network with the same metrics, these routes can be thought of as having an equal cost. The term parallel path is another way to see occurrences of equal-cost routes in a routing table. If a router has two or more equal-cost paths to a network, it can use them concurrently. Parallel paths provide redundancy in case of a circuit failure and also enable a router to load balance packets over the available paths for more efficient use of available bandwidth. Equal-cost routes are supported across switches in a stack.

Even though the router automatically learns about and configures equal-cost routes, you can control the maximum number of parallel paths supported by an IP routing protocol in its routing table. Although the switch software allows a maximum of 32 equal-cost routes, the switch hardware will never use more than 16 paths per route.

**How to Configure Equal-Cost Routing Paths**

**Procedure**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>

<td></td>
</tr>
</tbody>
</table>

**Static Unicast Routes**

**Information About Static Unicast Routes**

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

The switch retains static routes until you remove them. However, you can override static routes with dynamic routing information by assigning administrative distance values. Each dynamic routing protocol has a default administrative distance, as listed in Table 41-16. If you want a static route to be overridden by information from a dynamic routing protocol, set the administrative distance of the static route higher than that of the dynamic protocol.

**Table 110: Dynamic Routing Protocol Default Administrative Distances**

<table>
<thead>
<tr>
<th>Route Source</th>
<th>Default Distance</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Static routes that point to an interface are advertised through RIP, IGRP, and other dynamic routing protocols, whether or not static `redistribute` router configuration commands were specified for those routing protocols. These static routes are advertised because static routes that point to an interface are considered in the routing table to be connected and hence lose their static nature. However, if you define a static route to an interface that is not one of the networks defined in a network command, no dynamic routing protocols advertise the route unless a `redistribute` static command is specified for these protocols.

When an interface goes down, all static routes through that interface are removed from the IP routing table. When the software can no longer find a valid next hop for the address specified as the forwarding router's address in a static route, the static route is also removed from the IP routing table.

### Configuring Static Unicast Routes

Static unicast routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the router cannot build a route to a particular destination and are useful for specifying a gateway of last resort to which all unroutable packets are sent.

Beginning in privileged EXEC mode, follow these steps to configure a static route:

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>

<td>Switch(config)# ip route prefix mask gigabitethernet 1/0/4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Default Routes and Networks

Information About Default Routes and Networks

A router might not be able to learn the routes to all other networks. To provide complete routing capability, you can use some routers as smart routers and give the remaining routers default routes to the smart router. (Smart routers have routing table information for the entire internetwork.) These default routes can be dynamically learned or can be configured in the individual routers. Most dynamic interior routing protocols include a mechanism for causing a smart router to generate dynamic default information that is then forwarded to other routers.

If a router has a directly connected interface to the specified default network, the dynamic routing protocols running on that device generate a default route. In RIP, it advertises the pseudonetwork 0.0.0.0.

A router that is generating the default for a network also might need a default of its own. One way a router can generate its own default is to specify a static route to the network 0.0.0.0 through the appropriate device.

When default information is passed through a dynamic routing protocol, no further configuration is required. The system periodically scans its routing table to choose the optimal default network as its default route. In IGRP networks, there might be several candidate networks for the system default. Cisco routers use administrative distance and metric information to set the default route or the gateway of last resort.

If dynamic default information is not being passed to the system, candidates for the default route are specified with the `ip default-network` global configuration command. If this network appears in the routing table from any source, it is flagged as a possible choice for the default route. If the router has no interface on the default network, but does have a path to it, the network is considered as a possible candidate, and the gateway to the best default path becomes the gateway of last resort.

### Route Maps to Redistribute Routing Information

#### Information About Route Maps

The switch can run multiple routing protocols simultaneously, and it can redistribute information from one routing protocol to another. Redistributing information from one routing protocol to another applies to all supported IP-based routing protocols.

You can also conditionally control the redistribution of routes between routing domains by defining enhanced packet filters or route maps between the two domains. The **match** and **set** route-map configuration commands define the condition portion of a route map. The **match** command specifies that a criterion must be matched. The **set** command specifies an action to be taken if the routing update meets the conditions defined by the match command. Although redistribution is a protocol-independent feature, some of the **match** and **set** route-map configuration commands are specific to a particular protocol.

One or more **match** commands and one or more **set** commands follow a **route-map** command. If there are no **match** commands, everything matches. If there are no **set** commands, nothing is done, other than the match. Therefore, you need at least one **match** or **set** command.

A route map with no **set** route-map configuration commands is sent to the CPU, which causes high CPU utilization.

You can also identify route-map statements as **permit** or **deny**. If the statement is marked as a deny, the packets meeting the match criteria are sent back through the normal forwarding channels (destination-based...
routing). If the statement is marked as permit, set clauses are applied to packets meeting the match criteria. Packets that do not meet the match criteria are forwarded through the normal routing channel.

You can use the BGP route map `continue` clause to execute additional entries in a route map after an entry is executed with successful match and set clauses. You can use the `continue` clause to configure and organize more modular policy definitions so that specific policy configurations need not be repeated within the same route map. The switch supports the `continue` clause for outbound policies. For more information about using the route map `continue` clause, see the BGP Route-Map Continue Support for an Outbound Policy feature guide for Cisco IOS Release 12.4(4)T.

### How to Configure a Route Map

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one `match` route-map configuration command and one `set` route-map configuration command.

#### Note

The keywords are the same as defined in the procedure to control the route distribution.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
  *configure terminal*  
  *Example:*  
  `Switch# configure terminal` | Enters global configuration mode. |
| **Step 2**  
  *route-map* `map-tag [permit | deny] [sequence number]`  
  *Example:*  
  `Switch(config)# route-map rip-to-ospf permit 4` | Defines any route maps used to control redistribution and enter route-map configuration mode.  
  `map-tag`—A meaningful name for the route map. The `redistribute` router configuration command uses this name to reference this route map. Multiple route maps might share the same map tag name.  
  (Optional) If `permit` is specified and the match criteria are met for this route map, the route is redistributed as controlled by the set actions. If `deny` is specified, the route is not redistributed.  
  `sequence number` (Optional)—Number that indicates the position a new route map is to have in the list of route maps already configured with the same name. |
| **Step 3**  
  *match as-path* `path-list-number`  
  *Example:*  
  `Switch(config-route-map)#match as-path 10` | Matches a BGP AS path access list. |
| **Step 4**  
  *match community-list* `community-list-number [exact]`  
  *Example:* | Matches a BGP community list. |
### How to Configure a Route Map

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config-route-map)# match community-list 150</code></td>
<td>Matches a standard access list by specifying the name or number. It can be an integer from 1 to 199.</td>
</tr>
<tr>
<td><strong>Step 5</strong> match ip address `{access-list-number</td>
<td>access-list-name}<code> </code>[...access-list-number</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>Switch(config-route-map)# match ip address 5 80</code></td>
<td></td>

</table>

### How to Control Route Distribution

Although each of Steps 3 through 14 in the following section is optional, you must enter at least one `match` route-map configuration command and one `set` route-map configuration command.

---

**Note**
The keywords are the same as defined in the procedure to configure the route map for redistribution.
The metrics of one routing protocol do not necessarily translate into the metrics of another. For example, the RIP metric is a hop count, and the IGRP metric is a combination of five qualities. In these situations, an artificial metric is assigned to the redistributed route. Uncontrolled exchanging of routing information between different routing protocols can create routing loops and seriously degrade network operation.

If you have not defined a default redistribution metric that replaces metric conversion, some automatic metric translations occur between routing protocols:

- RIP can automatically redistribute static routes. It assigns static routes a metric of 1 (directly connected).
- Any protocol can redistribute other routing protocols if a default mode is in effect.

### Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>

<td><strong>Step 6</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-router)# end</td>
<td></td>
</tr>
</tbody>
</table>
**Policy-Based Routing**

**Information About Policy-Based Routing**

You can use policy-based routing (PBR) to configure a defined policy for traffic flows. By using PBR, you can have more control over routing by reducing the reliance on routes derived from routing protocols. PBR can specify and implement routing policies that allow or deny paths based on:

- Identity of a particular end system
- Application
- Protocol

You can use PBR to provide equal-access and source-sensitive routing, routing based on interactive versus batch traffic, or routing based on dedicated links. For example, you could transfer stock records to a corporate office on a high-bandwidth, high-cost link for a short time while transmitting routine application data such as e-mail over a low-bandwidth, low-cost link.

With PBR, you classify traffic using access control lists (ACLs) and then make traffic go through a different path. PBR is applied to incoming packets. All packets received on an interface with PBR enabled are passed through route maps. Based on the criteria defined in the route maps, packets are forwarded (routed) to the appropriate next hop.

- Route map statement marked as permit is processed as follows:
  - A match command can match on length or multiple ACLs. A route map statement can contain multiple match commands. Logical or algorithm function is performed across all the match commands to reach a permit or deny decision.

For example:

```
machine length A B
match ip address acl1 acl2
match ip address acl3
```

A packet is permitted if it is permitted by match length A B or acl1 or acl2 or acl3

- If the decision reached is permit, then the action specified by the set command is applied on the packet.
• If the decision reached is deny, then the PBR action (specified in the set command) is not applied. Instead the processing logic moves forward to look at the next route-map statement in the sequence (the statement with the next higher sequence number). If no next statement exists, PBR processing terminates, and the packet is routed using the default IP routing table.

• For PBR, route-map statements marked as deny are not supported.

For more information about configuring route maps, see the “Using Route Maps to Redistribute Routing Information” section.

You can use standard IP ACLs to specify match criteria for a source address or extended IP ACLs to specify match criteria based on an application, a protocol type, or an end station. The process proceeds through the route map until a match is found. If no match is found, normal destination-based routing occurs. There is an implicit deny at the end of the list of match statements.

If match clauses are satisfied, you can use a set clause to specify the IP addresses identifying the next hop router in the path.

For details about PBR commands and keywords, see the Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols.

How to Configure PBR

• To use PBR, you must have the IP Base feature set enabled on the switch or stack master.

• Multicast traffic is not policy-routed. PBR applies only to unicast traffic.

• You can enable PBR on a routed port or an SVI.

• The switch supports PBR based on match length.

• You can apply a policy route map to an EtherChannel port channel in Layer 3 mode, but you cannot apply a policy route map to a physical interface that is a member of the EtherChannel. If you try to do so, the command is rejected. When a policy route map is applied to a physical interface, that interface cannot become a member of an EtherChannel.

• You can define a maximum of 128 IP policy route maps on the switch or switch stack.

• You can define a maximum of 512 access control entries(ACEs) for PBR on the switch or switch stack.

• When configuring match criteria in a route map, follow these guidelines:
  • Do not match ACLs that permit packets destined for a local address.

  • VRF and PBR are mutually exclusive on a switch interface. You cannot enable VRF when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when VRF is enabled on an interface.

  • Web Cache Communication Protocol (WCCP) and PBR are mutually exclusive on a switch interface. You cannot enable WCCP when PBR is enabled on an interface. The reverse is also true, you cannot enable PBR when WCCP is enabled on an interface.

  • The number of hardware entries used by PBR depends on the route map itself, the ACLs used, and the order of the ACLs and route-map entries.

  • PBR based on TOS, DSCP and IP Precedence are not supported.

  • Set interface, set default next-hop and set default interface are not supported.
• **ip next-hop recursive** and **ip next-hop verify availability** features are not available and the next-hop should be directly connected.

• Policy-maps with no set actions are supported. Matching packets are routed normally.

• Policy-maps with no match clauses are supported. Set actions are applied to all packets.

By default, PBR is disabled on the switch. To enable PBR, you must create a route map that specifies the match criteria and the resulting action. Then, you must enable PBR for that route map on an interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

Packets that are generated by the switch, or local packets, are not normally policy-routed. When you globally enable local PBR on the switch, all packets that originate on the switch are subject to local PBR. Local PBR is disabled by default.

**SUMMARY STEPS**

1. configure terminal
2. route-map map-tag [permit] [sequence number]
3. match ip address \{access-list-number | access-list-name\} \{access-list-number |...access-list-name\}
4. match length min max
5. set ip next-hop ip-address [...ip-address]
6. exit
7. interface interface-id
8. ip policy route-map map-tag
9. ip route-cache policy
10. exit
11. ip local policy route-map map-tag
12. end
13. show route-map [map-name]
14. show ip policy
15. show ip local policy

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> route-map map-tag [permit] [sequence number]</td>
<td>Defines route maps that are used to control where packets are output, and enters route-map configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# route-map pbr-map permit</td>
<td></td>
</tr>
</tbody>
</table>

- **map-tag** — A meaningful name for the route map.
- The **ip policy route-map** interface configuration command uses this name to reference the route map.
- Multiple route-map statements with the same map tag define a single route map.
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 3    | match ip address \{access-list-number| access-list-name\} [access-list-number [...access-list-name]] | - (Optional) **permit** — If **permit** is specified and the match criteria are met for this route map, the route is policy routed as defined by the set actions.  
- (Optional) **sequence number** — The sequence number shows the position of the route-map statement in the given route map.  

**Example:**  
Switch(config-route-map)# match ip address 110 140  
Matches the source and destination IP addresses that are permitted by one or more standard or extended access lists. ACLs can match on more than one source and destination IP address.  
If you do not specify a **match** command, the route map is applicable to all packets. |
| 4    | match length min max | Matches the length of the packet.  
**Example:**  
Switch(config-route-map)# match length 64 1500 |
| 5    | set ip next-hop ip-address [...ip-address] | Specifies the action to be taken on the packets that match the criteria. Sets next hop to which to route the packet (the next hop must be adjacent).  
**Example:**  
Switch(config-route-map)# set ip next-hop 10.1.6.2 |
| 6    | exit | Returns to global configuration mode.  
**Example:**  
Switch(config-route-map)# exit |
| 7    | interface interface-id | Enters interface configuration mode, and specifies the interface to be configured.  
**Example:**  
Switch(config)# interface gigabitethernet 1/0/1 |
| 8    | ip policy route-map map-tag | Enables PBR on a Layer 3 interface, and identify the route map to use. You can configure only one route map on an interface. However, you can have multiple route map entries with different sequence numbers. These entries are evaluated in the order of sequence number until the first match. If there is no match, packets are routed as usual.  
**Example:**  
Switch(config-if)# ip policy route-map pbr-map |
| 9    | ip route-cache policy | (Optional) Enables fast-switching PBR. You must enable PBR before enabling fast-switching PBR.  
**Example:**  
Switch(config-if)# ip route-cache policy |
| 10   | exit | Returns to global configuration mode.  
**Example:**  
Switch(config-if)# exit |
### Filtering Routing Information

You can filter routing protocol information by performing the tasks described in this section.

#### Note
When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

#### Setting Passive Interfaces

To prevent other routers on a local network from dynamically learning about routes, you can use the `passive-interface` router configuration command to keep routing update messages from being sent through a router interface. When you use this command in the OSPF protocol, the interface address you specify as passive appears as a stub network in the OSPF domain. OSPF routing information is neither sent nor received through the specified router interface.

In networks with many interfaces, to avoid having to manually set them as passive, you can set all interfaces to be passive by default by using the `passive-interface default` router configuration command and manually setting interfaces where adjacencies are desired.

Use a network monitoring privileged EXEC command such as `show ip ospf interface` to verify the interfaces that you enabled as passive, or use the `show ip interface` privileged EXEC command to verify the interfaces that you enabled as active.

</tbody>
</table>
Controlling Advertising and Processing in Routing Updates

You can use the `distribute-list` router configuration command with access control lists to suppress routes from being advertised in routing updates and to prevent other routers from learning one or more routes. When used in OSPF, this feature applies to only external routes, and you cannot specify an interface name.

You can also use a `distribute-list` router configuration command to avoid processing certain routes listed in incoming updates. (This feature does not apply to OSPF.)

### Procedure

<td></td>
</tr>
</tbody>
</table>

### Filtering Sources of Routing Information

Because some routing information might be more accurate than others, you can use filtering to prioritize information coming from different sources. An administrative distance is a rating of the trustworthiness of a
Routing information source, such as a router or group of routers. In a large network, some routing protocols can be more reliable than others. By specifying administrative distance values, you enable the router to intelligently discriminate between sources of routing information. The router always picks the route whose routing protocol has the lowest administrative distance. Table 41-16 on page 41-122 shows the default administrative distances for various routing information sources. Because each network has its own requirements, there are no general guidelines for assigning administrative distances.

Managing Authentication Keys

Key management is a method of controlling authentication keys used by routing protocols. Not all protocols can use key management. Authentication keys are available for EIGRP and RIP Version 2.

Prerequisites

Before you manage authentication keys, you must enable authentication. See the appropriate protocol section to see how to enable authentication for that protocol. To manage authentication keys, define a key chain, identify the keys that belong to the key chain, and specify how long each key is valid. Each key has its own key identifier (specified with the `key number` key chain configuration command), which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use.

How to Configure Authentication Keys

You can configure multiple keys with life times. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in order from lowest to highest, and uses the first valid key it encounters. The lifetimes allow for overlap during key changes. Note that the router must know these lifetimes.

**Procedure**

<tr>
<td><code>show ip route supernets-onl</code></td>
<td>Displays supernets.</td>
</tr>
<tr>
<td><code>show ip cache</code></td>
<td>Displays the routing table used to switch IP traffic.</td>
</tr>
</tbody>
</table>

---

**Step 6**

**send-lifetime** \(\text{start-time \{infinite | end-time | duration \} seconds}\)

**Example:**

```
Switch(config-keychain)# accept-lifetime 23:30:00
Jan 25 1019 infinite
```

(Optional) Specifies the time period during which the key can be sent.

The **start-time** and **end-time** syntax can be either \(hh:mm:ss\) Month date year or \(hh:mm:ss\) date Month year. The default is forever with the default **start-time** and the earliest acceptable date as January 1, 1993. The default **end-time** and **duration** is infinite.

**Step 7**

**end**

**Example:**

```
Switch(config-keychain)# end
```

Returns to privileged EXEC mode.

**Step 8**

**show key chain**

**Example:**

```
Switch# show key chain
```

Displays authentication key information.

**Step 9**

**copy running-config startup-config**

**Example:**

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

Preventing Unauthorized Access

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Preventing Unauthorized Access

You can prevent unauthorized users from reconfiguring your switch and viewing configuration information. Typically, you want network administrators to have access to your switch while you restrict access to users who dial from outside the network through an asynchronous port, connect from outside the network through a serial port, or connect through a terminal or workstation from within the local network.

To prevent unauthorized access into your switch, you should configure one or more of these security features:

• At a minimum, you should configure passwords and privileges at each switch port. These passwords are locally stored on the switch. When users attempt to access the switch through a port or line, they must enter the password specified for the port or line before they can access the switch.

• For an additional layer of security, you can also configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

• If you want to use username and password pairs, but you want to store them centrally on a server instead of locally, you can store them in a database on a security server. Multiple networking devices can then use the same database to obtain user authentication (and, if necessary, authorization) information.

• You can also enable the login enhancements feature, which logs both failed and unsuccessful login attempts. Login enhancements can also be configured to block future login attempts after a set number
of unsuccessful attempts are made. For more information, see the Cisco IOS Login Enhancements documentation.

Restrictions for Controlling Switch Access with Passwords and Privileges

The following are the restrictions for controlling switch access with passwords and privileges:

- Disabling password recovery will not work if you have set the switch to boot up manually by using the boot manual global configuration command. This command produces the boot loader prompt (switch:) after the switch is power cycled.

Information About Passwords and Privilege Levels

Default Password and Privilege Level Configuration

A simple way of providing terminal access control in your network is to use passwords and assign privilege levels. Password protection restricts access to a network or network device. Privilege levels define what commands users can enter after they have logged into a network device.

This table shows the default password and privilege level configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is not encrypted in the configuration file.</td>
</tr>
<tr>
<td>Enable secret password and privilege level</td>
<td>No password is defined. The default is level 15 (privileged EXEC level). The password is encrypted before it is written to the configuration file.</td>
</tr>
<tr>
<td>Line password</td>
<td>No password is defined.</td>
</tr>
</tbody>
</table>

Additional Password Security

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a Trivial File Transfer Protocol (TFTP) server, you can use either the enable password or enable secret global configuration commands. Both commands accomplish the same thing; that is, you can establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify.

We recommend that you use the enable secret command because it uses an improved encryption algorithm.

If you configure the enable secret command, it takes precedence over the enable password command; the two commands cannot be in effect simultaneously.

If you enable password encryption, it applies to all passwords including username passwords, authentication key passwords, the privileged command password, and console and virtual terminal line passwords.

- Example: Protecting Enable and Enable Secret Passwords with Encryption, on page 1276

Password Recovery

By default, any end user with physical access to the switch can recover from a lost password by interrupting the boot process while the switch is powering on and then by entering a new password.

The password-recovery disable feature protects access to the switch password by disabling part of this functionality. When this feature is enabled, the end user can interrupt the boot process only by agreeing to set
the system back to the default configuration. With password recovery disabled, you can still interrupt the boot process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted.

If you disable password recovery, we recommend that you keep a backup copy of the configuration file on a secure server in case the end user interrupts the boot process and sets the system back to default values. Do not keep a backup copy of the configuration file on the switch. If the switch is operating in VTP transparent mode, we recommend that you also keep a backup copy of the VLAN database file on a secure server. When the switch is returned to the default system configuration, you can download the saved files to the switch by using the Xmodem protocol.

To re-enable password recovery, use the `service password-recovery` global configuration command.

- Restrictions for Controlling Switch Access with Passwords and Privileges, on page 1263

### Terminal Line Telnet Configuration

When you power-up your switch for the first time, an automatic setup program runs to assign IP information and to create a default configuration for continued use. The setup program also prompts you to configure your switch for Telnet access through a password. If you did not configure this password during the setup program, you can configure it when you set a Telnet password for a terminal line. For more information on doing this, see Related Topics.

**Related Topics**
- Setting a Telnet Password for a Terminal Line, on page 1270
- Example: Setting a Telnet Password for a Terminal Line, on page 1276

### Username and Password Pairs

You can configure username and password pairs, which are locally stored on the switch. These pairs are assigned to lines or ports and authenticate each user before that user can access the switch. If you have defined privilege levels, you can also assign a specific privilege level (with associated rights and privileges) to each username and password pair.

**Related Topics**
- Configuring Username and Password Pairs, on page 1271

### Privilege Levels

Cisco switches (and other devices) use privilege levels to provide password security for different levels of switch operation. By default, the Cisco IOS software operates in two modes (privilege levels) of password security: user EXEC (Level 1) and privileged EXEC (Level 15). You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

**Privilege Levels on Lines**

Users can override the privilege level you set using the `privilege level` line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the `disable` command.
command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

For example, if you want many users to have access to the `clear line` command, you can assign it level 2 security and distribute the level 2 password fairly widely. But if you want more restricted access to the `configure` command, you can assign it level 3 security and distribute that password to a more restricted group of users.

**Command Privilege Levels**

When you set a command to a privilege level, all commands whose syntax is a subset of that command are also set to that level. For example, if you set the `show ip traffic` command to level 15, the `show` commands and `show ip` commands are automatically set to privilege level 15 unless you set them individually to different levels.

**How to Control Switch Access with Passwords and Privilege Levels**

**Setting or Changing a Static Enable Password**

The enable password controls access to the privileged EXEC mode. Beginning in privileged EXEC mode, follow these steps to set or change a static enable password:

**SUMMARY STEPS**

1. `configure terminal`
2. `enable password password`
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> enable password <code>password</code></td>
<td>Defines a new password or changes an existing password for access to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>By default, no password is defined.</td>
</tr>
</tbody>
</table>
Command or Action | Purpose
---|---
Switch(config)# enable password secret321 | For password, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. It can contain the question mark (?) character if you precede the question mark with the key combination Ctrl-v when you create the password; for example, to create the password abc?123, do this:
Enter abc.
Enter Ctrl-v.
Enter ?123.
When the system prompts you to enter the enable password, you need not precede the question mark with the Ctrl-v; you can simply enter abc?123 at the password prompt.

Step 3 | end
Example:
Switch(config)# end | Returns to privileged EXEC mode.

Example: Setting or Changing a Static Enable Password, on page 1275

Protecting Enable and Enable Secret Passwords with Encryption

Beginning in privileged EXEC mode, follow these steps to establish an encrypted password that users must enter to access privileged EXEC mode (the default) or any privilege level you specify:

**SUMMARY STEPS**

1. configure terminal
2. Use one of the following:
   * enable password [level level] password encryption-type encrypted-password
   * enable secret [level level] password encryption-type encrypted-password
3. service password-encryption
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Use one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <code>enable password [level level] {password encryption-type encrypted-password}</code></td>
<td></td>
</tr>
<tr>
<td>• <code>enable secret [level level] {password encryption-type encrypted-password}</code></td>
<td></td>
</tr>
</tbody>
</table>

**Example:**

Switch(config)# `enable password example102`

or

Switch(config)# `enable secret level 1 password secret123sample`

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Defines a new password or changes an existing password for access to privileged EXEC mode.</td>
</tr>
<tr>
<td>• Defines a secret password, which is saved using a nonreversible encryption method.</td>
</tr>
</tbody>
</table>

  - (Optional) For `level`, the range is from 0 to 15. Level 1 is normal user EXEC mode privileges. The default level is 15 (privileged EXEC mode privileges).

  - For `password`, specify a string from 1 to 25 alphanumeric characters. The string cannot start with a number, is case sensitive, and allows spaces but ignores leading spaces. By default, no password is defined.

  - (Optional) For `encryption-type`, only type 5, a Cisco proprietary encryption algorithm, is available. If you specify an encryption type, you must provide an encrypted password—an encrypted password that you copy from another switch configuration.

  **Note** If you specify an encryption type and then enter a clear text password, you cannot re-enter privileged EXEC mode. You cannot recover a lost encrypted password by any method.

### Step 3

**service password-encryption**

**Example:**

Switch(config)# `service password-encryption`

(Optional) Encrypts the password when the password is defined or when the configuration is written.

Encryption prevents the password from being readable in the configuration file.

### Step 4

**end**

**Example:**

Switch(config)# `end`

Returns to privileged EXEC mode.

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• For <em>password</em>, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the <em>username</em> command.</td>
</tr>
</tbody>
</table>

**Step 3**

Use one of the following:

- `line console 0`
- `line vty 0 15`

**Example:**

```
Switch(config)# line console 0
```

or

```
Switch(config)# line vty 15
```

Enters line configuration mode, and configures the console port (line 0) or the VTY lines (line 0 to 15).

**Step 4**

`login local`

**Example:**

```
Switch(config-line)# login local
```

Enables local password checking at login time. Authentication is based on the username specified in Step 2.

**Step 5**

`end`

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.
# DETAILED STEPS

<td>Example:</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

What to do next

Users can override the privilege level you set using the privilege level line configuration command by logging in to the line and enabling a different privilege level. They can lower the privilege level by using the disable command. If users know the password to a higher privilege level, they can use that password to enable the higher privilege level. You might specify a high level or privilege level for your console line to restrict line usage.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+)

The following are the prerequisites for set up and configuration of switch access with Terminal Access Controller Access Control System Plus (TACACS+) (must be performed in the order presented):

1. Configure the switches with the TACACS+ server addresses.
2. Set an authentication key.
3. Configure the key from Step 2 on the TACACS+ servers.
4. Enable AAA.
5. Create a login authentication method list.
6. Apply the list to the terminal lines.
Create an authorization and accounting method list.

The following are the prerequisites for controlling switch access with TACACS+:

- You must have access to a configured TACACS+ server to configure TACACS+ features on your switch. Also, you must have access to TACACS+ services maintained in a database on a TACACS+ daemon typically running on a LINUX or Windows workstation.

- We recommend a redundant connection between a switch stack and the TACACS+ server. This is to help ensure that the TACACS+ server remains accessible in case one of the connected stack members is removed from the switch stack.

- You need a system running the TACACS+ daemon software to use TACACS+ on your switch.

- To use TACACS+, it must be enabled.

- Authorization must be enabled on the switch to be used.

- Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

- To use any of the AAA commands listed in this section or elsewhere, you must first enable AAA with the aaa new-model command.

- At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting.

- The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list (which, by coincidence, is named default). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.

- Use the local database if authentication was not performed by using TACACS+.

Information About TACACS+

TACACS+ and Switch Access

This section describes TACACS+. TACACS+ provides detailed accounting information and flexible administrative control over the authentication and authorization processes. It is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

For information about configuring this feature, see the “Configuring TACACS+ over IPv6” section of the “Implementing ADSL for IPv6” chapter in the Cisco IOS XE IPv6 Configuration Guide, Release 2.

Note

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Security Command Reference, Release 12.4 and the Cisco IOS IPv6 Command Reference.

TACACS+ Overview

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—indipendently. Each service can be tied into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers.
TACACS+, administered through the AAA security services, can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.

  The authentication facility can conduct a dialog with the user (for example, after a username and password are provided, to challenge a user with several questions, such as home address, mother’s maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company’s password aging policy.

- **Authorization**—Provides fine-grained control over user capabilities for the duration of the user’s session, including but not limited to setting autocmds, access control, session duration, or protocol support. You can also enforce restrictions on what commands a user can execute with the TACACS+ authorization feature.

- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

**Related Topics**

TACACS+ Operation

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt to show to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

   TACACS+ allows a dialog between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items, such as the user’s mother’s maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
   - ACCEPT—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
   - REJECT—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
   - ERROR—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
   - CONTINUE—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
   - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
   - Connection parameters, including the host or client IP address, access list, and user timeouts

Method List Description

A method list defines the sequence and methods to be used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols to be used, thus ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.
**TACACS+ Configuration Options**

You can configure the switch to use a single server or AAA server groups to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contiene the list of IP addresses of the selected server hosts.

**Related Topics**

- Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+), on page 1279

**TACACS+ Login Authentication**

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

**Related Topics**

- Configuring TACACS+ Login Authentication, on page 1286
- Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+), on page 1279

**TACACS+ Authorization for Privileged EXEC Access and Network Services**

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is located either in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

**Related Topics**

- Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services, on page 1289
- Prerequisites for Controlling Switch Access with Terminal Access Controller Access Control System Plus (TACACS+), on page 1279

**TACACS+ Accounting**

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value
(AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

**Related Topics**

Starting TACACS+ Accounting, on page 1290

**Default TACACS+ Configuration**

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

**Note**

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

**How to Configure TACACS+**

This section describes how to configure your switch to support TACACS+.

**Identifying the TACACS+ Server Host and Setting the Authentication Key**

Beginning in privileged EXEC mode, follow these steps to identify the TACACS+ server host and set the authentication key:

**SUMMARY STEPS**

1. configure terminal
2. tacacs-server host hostname
3. aaa new-model
4. aaa group server tacacs+ group-name
5. server ip-address
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

Switch# configure terminal

**Step 2**  
\texttt{tacacs-server host hostname}  
**Example:**  
Switch(config)# tacacs-server host yourserver

**Purpose**  
Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them.  
For \textit{hostname}, specify the name or IP address of the host.

**Step 3**  
\texttt{aaa new-model}  
**Example:**  
Switch(config)# aaa new-model

**Purpose**  
Enables AAA.

**Step 4**  
\texttt{aaa group server tacacs+ group-name}  
**Example:**  
Switch(config)# aaa group server tacacs+ your_server_group

**Purpose**  
(Optional) Defines the AAA server-group with a group name.  
This command puts the switch in a server group subconfiguration mode.

**Step 5**  
\texttt{server ip-address}  
**Example:**  
Switch(config)# server 10.1.2.3

**Purpose**  
(Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group.  
Each server in the group must be previously defined in Step 2.

**Step 6**  
\texttt{end}  
**Example:**  
Switch(config)# end

**Purpose**  
Returns to privileged EXEC mode.

### Related Topics

## Configuring TACACS+ Login Authentication

Beginning in privileged EXEC mode, follow these steps to configure TACACS+ login authentication:

### Before you begin

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports.
To secure the switch for HTTP access by using AAA methods, you must configure the switch with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

For more information about the `ip http authentication` command, see the *Cisco IOS Security Command Reference, Release 12.4*.

**SUMMARY STEPS**

1. `configure terminal`
2. `aaa new-model`
3. `aaa authentication login {default | list-name} method1 [method2...]
4. `line [console | tty | vty] line-number [ending-line-number]
5. `login authentication {default | list-name}
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong>  <code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong>  <code>aaa new-model</code></td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example: <code>Switch(config)# aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong>  `aaa authentication login {default</td>
<td>list-name} method1 [method2...]`</td>
</tr>
<tr>
<td>Example: <code>Switch(config)# aaa authentication login default tacacs+ local</code></td>
<td>- To create a default list that is used when a named list is not specified in the <code>login authentication</code> command, use the <code>default</code> keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.</td>
</tr>
<tr>
<td></td>
<td>- For <code>list-name</code>, specify a character string to name the list you are creating.</td>
</tr>
<tr>
<td></td>
<td>- For <code>method1...</code>, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.</td>
</tr>
<tr>
<td>Select one of these methods:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>- <code>enable</code> — Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the <code>enable password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>- <code>group tacacs+</code> — Uses TACACS+ authentication. Before you can use this authentication method, you must configure the TACACS+ server. For more information, see the Identifying the TACACS+ Server Host and Setting the Authentication Key, on page 1285.</td>
<td></td>
</tr>
<tr>
<td>- <code>line</code> — Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the <code>password</code> command.</td>
<td></td>
</tr>
<tr>
<td>- <code>local</code> — Use the local username database for authentication. You must enter username information in the database. Use the <code>username password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>- <code>local-case</code> — Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>- <code>none</code> — Do not use any authentication for login.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 4

**Example:**

```bash
Switch(config)# line 2 4
```

Enters line configuration mode, and configures the lines to which you want to apply the authentication list.

### Step 5

**Example:**

```bash
Switch(config-line)# login authentication default
```

Applies the authentication list to a line or set of lines.

- If you specify `default`, use the default list created with the `aaa authentication login` command.
- For `list-name`, specify the list created with the `aaa authentication login` command.

### Step 6

**Example:**

```bash
Switch(config-line)# end
```

Returns to privileged EXEC mode.

**Related Topics**

TACACS+ Login Authentication, on page 1284
Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

You can use the `aaa authorization` global configuration command with the `tacacs+` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec tacacs+ local` command sets these authorization parameters:

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
- Use the local database if authentication was not performed by using TACACS+.

**Note**
Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

**SUMMARY STEPS**

1. `configure terminal`
2. `aaa authorization network tacacs+`
3. `aaa authorization exec tacacs+`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>

<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  configure terminal
  Example:
  Switch# configure terminal | Enters the global configuration mode. |
| **Step 2**
  aaa accounting network start-stop tacacs+
  Example:
  Switch(config)# aaa accounting network start-stop tacacs+ | Enables TACACS+ accounting for all network-related service requests. |
| **Step 3**
  aaa accounting exec start-stop tacacs+
  Example:
  Switch(config)# aaa accounting exec start-stop tacacs+ | Enables TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end. |
| **Step 4**
  end
  Example: | Returns to privileged EXEC mode. |
Establishing a Session with a Router if the AAA Server is Unreachable

To establish a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. It guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Switch Access with RADIUS

This section lists the prerequisites for controlling Catalyst switch access with RADIUS.

General:

- RADIUS and AAA must be enabled to use any of the configuration commands in this chapter.
- RADIUS is facilitated through AAA and can be enabled only through AAA commands.
- At a minimum, you must identify the host or hosts that run the RADIUS server software and define the method lists for RADIUS authentication. You can optionally define method lists for RADIUS authorization and accounting.
- You should have access to and should configure a RADIUS server before configuring RADIUS features on your switch.
• The RADIUS host is normally a multiuser system running RADIUS server software from Cisco (Cisco Secure Access Control Server Version 3.0), Livingston, Merit, Microsoft, or another software provider. For more information, see the RADIUS server documentation.

• To use the Change-of-Authorization (CoA) interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

• A redundant connection between a switch stack and the RADIUS server is recommended. This is to help ensure that the RADIUS server remains accessible in case one of the connected stack members is removed from the switch stack.

For RADIUS operation:

• Users must first successfully complete RADIUS authentication before proceeding to RADIUS authorization, if it is enabled.

RADIUS and Switch Access, on page 1296
RADIUS Operation, on page 1298

Restrictions for Controlling Switch Access with RADIUS

This topic covers restrictions for controlling switch access with RADIUS.

General:

• To prevent a lapse in security, you cannot configure RADIUS through a network management application.

RADIUS is not suitable in the following network security situations:

• Multiprotocol access environments. RADIUS does not support AppleTalk Remote Access (ARA), NetBIOS Frame Control Protocol (NBFCP), NetWare Asynchronous Services Interface (NASI), or X.25 PAD connections.

• Switch-to-switch or router-to-router situations. RADIUS does not provide two-way authentication. RADIUS can be used to authenticate from one device to a non-Cisco device if the non-Cisco device requires authentication.

• Networks using a variety of services. RADIUS generally binds a user to one service model.

Information about RADIUS

RADIUS and Switch Access

This section describes how to enable and configure RADIUS. RADIUS provides detailed accounting information and flexible administrative control over the authentication and authorization processes.

**Note**

For complete syntax and usage information for the commands used in this section, see the Cisco IOS Security Command Reference, Release 12.4 and the Cisco IOS IPv6 Command Reference.

## RADIUS Overview

RADIUS is a distributed client/server system that secures networks against unauthorized access. RADIUS clients run on supported Cisco routers and switches. Clients send authentication requests to a central RADIUS server, which contains all user authentication and network service access information.

Use RADIUS in these network environments that require access security:

- Networks with multiple-vendor access servers, each supporting RADIUS. For example, access servers from several vendors use a single RADIUS server-based security database. In an IP-based network with multiple vendors’ access servers, dial-in users are authenticated through a RADIUS server that has been customized to work with the Kerberos security system.

- Turnkey network security environments in which applications support the RADIUS protocol, such as in an access environment that uses a smart card access control system. In one case, RADIUS has been used with Enigma’s security cards to validates users and grant access to network resources.

- Networks already using RADIUS. You can add a Cisco switch containing a RADIUS client to the network. This might be the first step when you make a transition to a TACACS+ server. See Figure 2: Transitioning from RADIUS to TACACS+ Services below.

- Network in which the user must only access a single service. Using RADIUS, you can control user access to a single host, to a single utility such as Telnet, or to the network through a protocol such as IEEE 802.1x. For more information about this protocol, see Chapter 11, “Configuring IEEE 802.1x Port-Based Authentication.”

- Networks that require resource accounting. You can use RADIUS accounting independently of RADIUS authentication or authorization. The RADIUS accounting functions allow data to be sent at the start and end of services, showing the amount of resources (such as time, packets, bytes, and so forth) used during the session. An Internet service provider might use a freeware-based version of RADIUS access control and accounting software to meet special security and billing needs.
RADIUS Operation

When a user attempts to log in and authenticate to a switch that is access controlled by a RADIUS server, these events occur:

1. The user is prompted to enter a username and password.
2. The username and encrypted password are sent over the network to the RADIUS server.
3. The user receives one of the following responses from the RADIUS server:
   - ACCEPT—The user is authenticated.
   - REJECT—The user is either not authenticated and is prompted to re-enter the username and password, or access is denied.
   - CHALLENGE—A challenge requires additional data from the user.
   - CHALLENGE PASSWORD—A response requests the user to select a new password.

The ACCEPT or REJECT response is bundled with additional data that is used for privileged EXEC or network authorization. The additional data included with the ACCEPT or REJECT packets includes these items:

- Telnet, SSH, rlogin, or privileged EXEC services
- Connection parameters, including the host or client IP address, access list, and user timeouts

RADIUS Change of Authorization

This section provides an overview of the RADIUS interface including available primitives and how they are used during a Change of Authorization (CoA).

- Change-of-Authorization Requests
- CoA Request Response Code
- CoA Request Commands
- Session Reauthentication
- Stacking Guidelines for Session Termination

A standard RADIUS interface is typically used in a pulled model where the request originates from a network attached device and the response comes from the queried servers. Catalyst switches support the RADIUS Change of Authorization (CoA) extensions defined in RFC 5176 that are typically used in a pushed model and allow for the dynamic reconfiguring of sessions from external authentication, authorization, and accounting (AAA) or policy servers.

The switch supports these per-session CoA requests:

- Session reauthentication
- Session termination
- Session termination with port shutdown
- Session termination with port bounce

This feature is integrated with the Cisco Identity Services Engine, and the Cisco Secure Access Control Server (ACS) 5.1.

The RADIUS interface is enabled by default on Catalyst switches. However, some basic configuration is required for the following attributes:

- Security and Password—refer to the “Preventing Unauthorized Access to Your Switch” section in this guide.

- Accounting—refer to the “Starting RADIUS Accounting” section in the Configuring Switch-Based Authentication chapter in this guide.

Change-of-Authorization Requests

Change of Authorization (CoA) requests, as described in RFC 5176, are used in a push model to allow for session identification, host reauthentication, and session termination. The model is comprised of one request (CoA-Request) and two possible response codes:

- CoA acknowledgment (ACK) [CoA-ACK]
- CoA non-acknowledgment (NAK) [CoA-NAK]

The request is initiated from a CoA client (typically a RADIUS or policy server) and directed to the switch that acts as a listener.
RFC 5176 Compliance

The Disconnect Request message, which is also referred to as Packet of Disconnect (POD), is supported by the switch for session termination.

This table shows the IETF attributes supported for this feature.

### Preconditions

To use the CoA interface, a session must already exist on the switch. CoA can be used to identify a session and enforce a disconnect request. The update affects only the specified session.

### CoA Request Response Code

The CoA Request response code can be used to convey a command to the switch.

**Related Topics**

- [CoA Request Commands](#), on page 1302

### Session Identification

For disconnect and CoA requests targeted at a particular session, the switch locates the session based on one or more of the following attributes:

- Calling-Station-Id (IETF attribute #31 which contains the host MAC address)
- Audit-Session-Id (Cisco VSA)
- Acct-Session-Id (IETF attribute #44)

Unless all session identification attributes included in the CoA message match the session, the switch returns a Disconnect-NAK or CoA-NAK with the “Invalid Attribute Value” error-code attribute.

If more than one session identification attribute is included in the message, all the attributes must match the session or the switch returns a Disconnect-negative acknowledgment (NAK) or CoA-NAK with the error code “Invalid Attribute Value.”

The packet format for a CoA Request code as defined in RFC 5176 consists of the fields: Code, Identifier, Length, Authenticator, and Attributes in Type:Length:Value (TLV) format.

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| Code | Identifier | Length |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
| Authenticator |
| Attributes ... |
+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+-+
```

The attributes field is used to carry Cisco vendor-specific attributes (VSAs).

**Related Topics**

- [CoA Disconnect-Request](#), on page 1303
CoA ACK Response Code

If the authorization state is changed successfully, a positive acknowledgment (ACK) is sent. The attributes returned within CoA ACK will vary based on the CoA Request and are discussed in individual CoA Commands.

CoA NAK Response Code

A negative acknowledgment (NAK) indicates a failure to change the authorization state and can include attributes that indicate the reason for the failure. Use show commands to verify a successful CoA.

CoA Request Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Cisco VSA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reauthenticate host</td>
<td>Cisco:Avpair=&quot;subscriber:command=reauthenticate&quot;</td>
</tr>
<tr>
<td>Terminate session</td>
<td>This is a standard disconnect request that does not require a VSA.</td>
</tr>
<tr>
<td>Bounce host port</td>
<td>Cisco:Avpair=&quot;subscriber:command=bounce-host-port&quot;</td>
</tr>
<tr>
<td>Disable host port</td>
<td>Cisco:Avpair=&quot;subscriber:command=disable-host-port&quot;</td>
</tr>
</tbody>
</table>

All CoA commands must include the session identifier between the switch and the CoA client.

Related Topics

CoA Request Response Code, on page 1301

Session Reauthentication

The AAA server typically generates a session reauthentication request when a host with an unknown identity or posture joins the network and is associated with a restricted access authorization profile (such as a guest VLAN). A reauthentication request allows the host to be placed in the appropriate authorization group when its credentials are known.

To initiate session authentication, the AAA server sends a standard CoA-Request message which contains a Cisco VSA in this form: Cisco:Avpair="subscriber:command=reauthenticate" and one or more session identification attributes.

The current session state determines the switch response to the message. If the session is currently authenticated by IEEE 802.1x, the switch responds by sending an EAPoL (Extensible Authentication Protocol over Lan) -RequestId message to the server.

If the session is currently authenticated by MAC authentication bypass (MAB), the switch sends an access-request to the server, passing the same identity attributes used for the initial successful authentication.

If session authentication is in progress when the switch receives the command, the switch terminates the process, and restarts the authentication sequence, starting with the method configured to be attempted first.
If the session is not yet authorized, or is authorized via guest VLAN, or critical VLAN, or similar policies, the reauthentication message restarts the access control methods, beginning with the method configured to be attempted first. The current authorization of the session is maintained until the reauthentication leads to a different authorization result.

**Session Reauthentication in a Switch Stack**

When a switch stack receives a session reauthentication message:

- It checkpoints the need for a re-authentication before returning an acknowledgment (ACK).
- It initiates reauthentication for the appropriate session.
- If authentication completes with either success or failure, the signal that triggered the reauthentication is removed from the stack member.
- If the stack master fails before authentication completes, reauthentication is initiated after stack master switch-over based on the original command (which is subsequently removed).
- If the stack master fails before sending an ACK, the new stack master treats the re-transmitted command as a new command.

**Session Termination**

There are three types of CoA requests that can trigger session termination. A CoA Disconnect-Request terminates the session, without disabling the host port. This command causes re-initialization of the authenticator state machine for the specified host, but does not restrict that host’s access to the network.

To restrict a host’s access to the network, use a CoA Request with the Cisco:Avpair="subscriber:command=disable-host-port" VSA. This command is useful when a host is known to be causing problems on the network, and you need to immediately block network access for the host. When you want to restore network access on the port, re-enable it using a non-RADIUS mechanism.

When a device with no supplicant, such as a printer, needs to acquire a new IP address (for example, after a VLAN change), terminate the session on the host port with port-bounce (temporarily disable and then re-enable the port).

**CoA Disconnect-Request**

This command is a standard Disconnect-Request. Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a Disconnect-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch terminates the session. After the session has been completely removed, the switch returns a Disconnect-ACK.

If the switch fails-over to a standby switch before returning a Disconnect-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the session is not found following re-sending, a Disconnect-ACK is sent with the “Session Context Not Found” error-code attribute.

**Related Topics**

- Session Identification, on page 1301

**CoA Request: Disable Host Port**

This command is carried in a standard CoA-Request message that has this new VSA:

Cisco:Avpair="subscriber:command=disable-host-port"
Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port and returns a CoA-ACK message.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is restarted on the new active switch.

**Note**

A Disconnect-Request failure following command re-sending could be the result of either a successful session termination before change-over (if the Disconnect-ACK was not sent) or a session termination by other means (for example, a link failure) that occurred after the original command was issued and before the standby switch became active.

**Related Topics**

Session Identification, on page 1301

---

**CoA Request: Bounce-Port**

This command is carried in a standard CoA-Request message that contains the following VSA:

Cisco:Avpair="subscriber:command=bounce-host-port"

Because this command is session-oriented, it must be accompanied by one or more of the session identification attributes. If the session cannot be located, the switch returns a CoA-NAK message with the “Session Context Not Found” error-code attribute. If the session is located, the switch disables the hosting port for a period of 10 seconds, re-enables it (port-bounce), and returns a CoA-ACK.

If the switch fails before returning a CoA-ACK to the client, the process is repeated on the new active switch when the request is re-sent from the client. If the switch fails after returning a CoA-ACK message to the client but before the operation has completed, the operation is re-started on the new active switch.

**Related Topics**

Session Identification, on page 1301

---

**Stacking Guidelines for Session Termination**

No special handling is required for CoA Disconnect-Request messages in a switch stack.

**Stacking Guidelines for CoA-Request Bounce-Port**

Because the **bounce-port** command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid **bounce-port** command, it checkpoints the following information before returning a CoA-ACK message:

- the need for a port-bounce
- the port-id (found in the local session context)

The switch initiates a port-bounce (disables the port for 10 seconds, then re-enables it).

If the port-bounce is successful, the signal that triggered the port-bounce is removed from the standby stack master.
If the stack master fails before the port-bounce completes, a port-bounce is initiated after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

**Stacking Guidelines for CoA-Request Disable-Port**

Because the `disable-port` command is targeted at a session, not a port, if the session is not found, the command cannot be executed.

When the Auth Manager command handler on the stack master receives a valid `disable-port` command, it verifies this information before returning a CoA-ACK message:

- the need for a port-disable
- the port-id (found in the local session context)

The switch attempts to disable the port.

If the port-disable operation is successful, the signal that triggered the port-disable is removed from the standby stack master.

If the stack master fails before the port-disable operation completes, the port is disabled after stack master change-over based on the original command (which is subsequently removed).

If the stack master fails before sending a CoA-ACK message, the new stack master treats the re-sent command as a new command.

**Default RADIUS Configuration**

RADIUS and AAA are disabled by default.

To prevent a lapse in security, you cannot configure RADIUS through a network management application. When enabled, RADIUS can authenticate users accessing the switch through the CLI.

**RADIUS Server Host**

Switch-to-RADIUS-server communication involves several components:

- Hostname or IP address
- Authentication destination port
- Accounting destination port
- Key string
- Timeout period
- Retransmission value

You identify RADIUS security servers by their hostname or IP address, hostname and specific UDP port numbers, or their IP address and specific UDP port numbers. The combination of the IP address and the UDP port number creates a unique identifier, allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. This unique identifier enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address.
If two different host entries on the same RADIUS server are configured for the same service—for example, accounting—the second host entry configured acts as a fail-over backup to the first one. Using this example, if the first host entry fails to provide accounting services, the %RADIUS-4-RADIUS_DEAD message appears, and then the switch tries the second host entry configured on the same device for accounting services. (The RADIUS host entries are tried in the order that they are configured.)

A RADIUS server and the switch use a shared secret text string to encrypt passwords and exchange responses. To configure RADIUS to use the AAA security commands, you must specify the host running the RADIUS server daemon and a secret text (key) string that it shares with the switch.

The timeout, retransmission, and encryption key values can be configured globally for all RADIUS servers, on a per-server basis, or in some combination of global and per-server settings.

**Related Topics**
- Identifying the RADIUS Server Host, on page 1308
- Defining AAA Server Groups, on page 1312
- Configuring Settings for All RADIUS Servers, on page 1317
- Configuring RADIUS Login Authentication, on page 1310

### RADIUS Login Authentication

To configure AAA authentication, you define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication to be performed and the sequence in which they are performed; it must be applied to a specific port before any of the defined authentication methods are performed. The only exception is the default method list. The default method list is automatically applied to all ports except those that have a named method list explicitly defined.

A method list describes the sequence and authentication methods to be queried to authenticate a user. You can designate one or more security protocols to be used for authentication, thus ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

**Related Topics**
- Configuring RADIUS Login Authentication, on page 1310

### AAA Server Groups

You can configure the switch to use AAA server groups to group existing server hosts for authentication. You select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list, which lists the IP addresses of the selected server hosts.

Server groups also can include multiple host entries for the same server if each entry has a unique identifier (the combination of the IP address and UDP port number), allowing different ports to be individually defined as RADIUS hosts providing a specific AAA service. If you configure two different host entries on the same RADIUS server for the same service, (for example, accounting), the second configured host entry acts as a fail-over backup to the first one.

**Related Topics**
- Defining AAA Server Groups, on page 1312
AAA Authorization

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user’s profile, which is in the local user database or on the security server, to configure the user’s session. The user is granted access to a requested service only if the information in the user profile allows it.

Related Topics
Configuring RADIUS Authorization for User Privileged Access and Network Services, on page 1314

RADIUS Accounting

The AAA accounting feature tracks the services that users are using and the amount of network resources that they are consuming. When you enable AAA accounting, the switch reports user activity to the RADIUS security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. You can then analyze the data for network management, client billing, or auditing.

Related Topics
Starting RADIUS Accounting, on page 1315

Vendor-Specific RADIUS Attributes

The Internet Engineering Task Force (IETF) draft standard specifies a method for communicating vendor-specific information between the switch and the RADIUS server by using the vendor-specific attribute (attribute 26). Vendor-specific attributes (VSAs) allow vendors to support their own extended attributes not suitable for general use. The Cisco RADIUS implementation supports one vendor-specific option by using the format recommended in the specification. Cisco’s vendor-ID is 9, and the supported option has vendor-type 1, which is named cisco-avpair. The value is a string with this format:

protocol : attribute sep value *

Protocol is a value of the Cisco protocol attribute for a particular type of authorization. Attribute and value are an appropriate attribute-value (AV) pair defined in the Cisco TACACS+ specification, and sep is = for mandatory attributes and is * for optional attributes. The full set of features available for TACACS+ authorization can then be used for RADIUS.

Other vendors have their own unique vendor-IDs, options, and associated VSAs. For more information about vendor-IDs and VSAs, see RFC 2138, “Remote Authentication Dial-In User Service (RADIUS).”

For a complete list of RADIUS attributes or more information about vendor-specific attribute 26, see the “RADIUS Attributes” appendix in the Cisco IOS Security Configuration Guide.

Related Topics
Configuring the Switch to Use Vendor-Specific RADIUS Attributes, on page 1318

Vendor-Proprietary RADIUS Server Communication

Although an IETF draft standard for RADIUS specifies a method for communicating vendor-proprietary information between the switch and the RADIUS server, some vendors have extended the RADIUS attribute set in a unique way. Cisco IOS software supports a subset of vendor-proprietary RADIUS attributes.
As mentioned earlier, to configure RADIUS (whether vendor-proprietary or IETF draft-compliant), you must specify the host running the RADIUS server daemon and the secret text string it shares with the switch. You specify the RADIUS host and secret text string by using the `radius-server` global configuration commands.

**Related Topics**
- Configuring the Switch for Vendor-Proprietary RADIUS Server Communication, on page 1319

## How to Configure RADIUS

### Identifying the RADIUS Server Host

To apply these settings globally to all RADIUS servers communicating with the switch, use the three unique global configuration commands: `radius-server timeout`, `radius-server retransmit`, and `radius-server key`. To apply these values on a specific RADIUS server, use the `radius-server host` global configuration command.

You can configure the switch to use AAA server groups to group existing server hosts for authentication. For more information, see Related Topics below.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

**Before you begin**

If you configure both global and per-server functions (timeout, retransmission, and key commands) on the switch, the per-server timer, retransmission, and key value commands override global timer, retransmission, and key value commands. For information on configuring these settings on all RADIUS servers, see Related Topics below.

### SUMMARY STEPS

1. `configure terminal`
2. `radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]`
3. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`radius-server host {hostname</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| `Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1` | - (Optional) For `acct-port port-number`, specify the UDP destination port for accounting requests.  
- (Optional) For `timeout seconds`, specify the time interval that the switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the `radius-server timeout` global configuration command setting. If no timeout is set with the `radius-server host` command, the setting of the `radius-server timeout` command is used.  
- (Optional) For `retransmit retries`, specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The range is 1 to 1000. If no retransmit value is set with the `radius-server host` command, the setting of the `radius-server retransmit` global configuration command is used.  
- (Optional) For `key string`, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.  

**Note** The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the `radius-server host` command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key. |

To configure the switch to recognize more than one host entry associated with a single IP address, enter this command as many times as necessary, making sure that each UDP port number is different. The switch software searches for hosts in the order in which you specify them. Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host.

**Step 3**

Example:

`Switch(config)# end`

- Returns to privileged EXEC mode.

**Related Topics**

- RADIUS Server Host, on page 1305

<tr>
<td><strong>Step 2</strong></td>
<td>aaa new-model</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# aaa new-model</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>aaa authentication login {default</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# aaa authentication login default local</td>
</tr>
<tr>
<td></td>
<td>• To create a default list that is used when a named list is not specified in the <code>login authentication</code> command, use the <code>default</code> keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all ports.</td>
</tr>
<tr>
<td></td>
<td>• For <code>list-name</code>, specify a character string to name the list you are creating.</td>
</tr>
<tr>
<td></td>
<td>• For <code>method1</code>, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Select one of these methods:</td>
<td></td>
</tr>
<tr>
<td>• <strong>enable</strong>—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the <code>enable password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>group radius</strong>—Use RADIUS authentication. Before you can use this authentication method, you must configure the RADIUS server.</td>
<td></td>
</tr>
<tr>
<td>• <strong>line</strong>—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the <code>password password</code> line configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>local</strong>—Use the local username database for authentication. You must enter username information in the database. Use the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>local-case</strong>—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the <code>username name password</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td>• <strong>none</strong>—Do not use any authentication for login.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 4**

**Command:**

```
line [console | tty | vty] line-number [ending-line-number]
```

**Example:**

```
Switch(config)# line 1 4
```

Enters line configuration mode, and configure the lines to which you want to apply the authentication list.

**Step 5**

**Command:**

```
login authentication {default | list-name}
```

**Example:**

```
Switch(config)# login authentication default
```

Applies the authentication list to a line or set of lines.

- If you specify `default`, use the default list created with the `aaa authentication login` command.

- For `list-name`, specify the list created with the `aaa authentication login` command.

**Step 6**

**Command:**

```
end
```

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.
Defining AAA Server Groups

You use the `server` group server configuration command to associate a particular server with a defined group server. You can either identify the server by its IP address or identify multiple host instances or entries by using the optional `auth-port` and `acct-port` keywords.

Beginning in privileged EXEC mode, follow these steps to define AAA server groups:

**SUMMARY STEPS**

1. `configure terminal`
2. `radius-server host {hostname | ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]`
3. `aaa new-model`
4. `aaa group server radius group-name`
5. `server ip-address`
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>`radius-server host {hostname</td>
<td>ip-address} [auth-port port-number] [acct-port port-number] [timeout seconds] [retransmit retries] [key string]`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1</code></td>
<td></td>
</tr>
</tbody>
</table>

- (Optional) For `auth-port port-number`, specify the UDP destination port for authentication requests.
- (Optional) For `acct-port port-number`, specify the UDP destination port for accounting requests.
- (Optional) For `timeout seconds`, specify the time interval that the switch waits for the RADIUS server to reply before resending. The range is 1 to 1000. This setting overrides the `radius-server timeout` global configuration command setting. If no timeout is set with the `radius-server host` command, the setting of the `radius-server timeout` command is used.
- (Optional) For `retransmit retries`, specify the number of times a RADIUS request is resent to a server if that server is not responding or responding slowly. The
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>range is 1 to 1000. If no retransmit value is set with the <code>radius-server host</code> command, the setting of the <code>radius-server retransmit</code> global configuration command is used.</td>
<td></td>
</tr>
<tr>
<td>range is 1 to 1000. If no retransmit value is set with the <code>radius-server host</code> command, the setting of the <code>radius-server retransmit</code> global configuration command is used.</td>
<td></td>
</tr>
<tr>
<td><strong>(Optional)</strong> For <code>key string</code>, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.</td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in the <code>radius-server host</code> command. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
<td></td>
</tr>
<tr>
<td>To configure the switch to recognize more than one host entry associated with a single IP address, enter this command as many times as necessary, making sure that each UDP port number is different. The switch software searches for hosts in the order in which you specify them. Set the timeout, retransmit, and encryption key values to use with the specific RADIUS host.</td>
<td></td>
</tr>
</tbody>
</table>

### Step 3

**aaa new-model**

**Example:**

```bash
Switch(config)# aaa new-model
```

Enables AAA.

### Step 4

**aaa group server radius group-name**

**Example:**

```bash
Switch(config)# aaa group server radius group1
```

Defines the AAA server-group with a group name. This command puts the switch in a server group configuration mode.

### Step 5

**server ip-address**

**Example:**

```bash
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
```

 Associates a particular RADIUS server with the defined server group. Repeat this step for each RADIUS server in the AAA server group. Each server in the group must be previously defined in Step 2.

### Step 6

**end**

**Example:**

```bash
Switch(config)# end
```

Returns to privileged EXEC mode.
Using Two Different RADIUS Group Servers

In this example, the switch is configured to recognize two different RADIUS group servers (group1 and group2). Group1 has two different host entries on the same RADIUS server configured for the same services. The second host entry acts as a fail-over backup to the first entry.

```
Switch(config)# radius-server host 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config)# radius-server host 172.10.0.1 auth-port 1645 acct-port 1646
Switch(config)# aaa new-model
Switch(config)# aaa group server radius group1
Switch(config-sg-radius)# server 172.20.0.1 auth-port 1000 acct-port 1001
Switch(config-sg-radius)# exit
Switch(config)# aaa group server radius group2
Switch(config-sg-radius)# server 172.20.0.1 auth-port 2000 acct-port 2001
Switch(config-sg-radius)# exit
```

Configuring RADIUS Authorization for User Privileged Access and Network Services

Note
Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Beginning in privileged EXEC mode, follow these steps to configure RADIUS authorization for user privileged access and network services:

**SUMMARY STEPS**

1. configure terminal
2. aaa authorization network radius
3. aaa authorization exec radius
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>aaa authorization network radius</td>
<td>Configures the switch for user RADIUS authorization for all network-related service requests.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa authorization network radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>aaa authorization exec radius</td>
<td>Configures the switch for user RADIUS authorization if the user has privileged EXEC access.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa authorization exec radius</td>
<td>The exec keyword might return user profile information (such as autocommand information).</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

You can use the `aaa authorization` global configuration command with the `radius` keyword to set parameters that restrict a user’s network access to privileged EXEC mode.

The `aaa authorization exec radius local` command sets these authorization parameters:

- Use RADIUS for privileged EXEC access authorization if authentication was performed by using RADIUS.
- Use the local database if authentication was not performed by using RADIUS.

**Related Topics**

AAA Authorization, on page 1307

**Starting RADIUS Accounting**

Beginning in privileged EXEC mode, follow these steps to start RADIUS accounting:

**SUMMARY STEPS**

1. configure terminal
2. aaa accounting network start-stop radius
3. aaa accounting exec start-stop radius
4. end
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>aaa accounting network start-stop radius</td>
<td>Enables RADIUS accounting for all network-related service requests.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa accounting network start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>aaa accounting exec start-stop radius</td>
<td>Enables RADIUS accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# aaa accounting exec start-stop radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

What to do next

To establishing a session with a router if the AAA server is unreachable, use the `aaa accounting system guarantee-first` command. This command guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.

Related Topics

- RADIUS Accounting, on page 1307

Establishing a Session with a Router if the AAA Server is Unreachable

The `aaa accounting system guarantee-first` command guarantees system accounting as the first record, which is the default condition. In some situations, users might be prevented from starting a session on the console or terminal connection until after the system reloads, which can take more than 3 minutes.

To establish a console or Telnet session with the router if the AAA server is unreachable when the router reloads, use the `no aaa accounting system guarantee-first` command.
Configuring Settings for All RADIUS Servers

Beginning in privileged EXEC mode, follow these steps to configure settings for all RADIUS servers:

### SUMMARY STEPS

1. `configure terminal`
2. `radius-server key string`
3. `radius-server retransmit retries`
4. `radius-server timeout seconds`
5. `radius-server deadtime minutes`
6. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td><code>radius-server key string</code></td>
<td>Specifies the shared secret text string used between the switch and all RADIUS servers.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# radius-server key your_server_key</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td><code>radius-server retransmit retries</code></td>
<td>Specifies the number of times the switch sends each RADIUS request to the server before giving up. The default is 3; the range 1 to 1000.</td>

Configuring the Switch to Use Vendor-Specific RADIUS Attributes

Beginning in privileged EXEC mode, follow these steps to configure the switch to use vendor-specific RADIUS attributes:

**SUMMARY STEPS**

1. configure terminal
2. radius-server vsa send [accounting | authentication]
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enables the switch to recognize and use VSAs as defined by RADIUS IETF attribute 26.</td>
</tr>
<tr>
<td>radius-server vsa send [accounting</td>
<td>authentication]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# radius-server vsa send</td>
<td></td>
</tr>
<tr>

### Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

Beginning in privileged EXEC mode, follow these steps to configure the switch to use vendor-proprietary RADIUS server communication:

**SUMMARY STEPS**

1. `configure terminal`
2. `radius-server host {hostname | ip-address} non-standard`
3. `radius-server key string`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>`radius-server host {hostname</td>
<td>ip-address} non-standard`</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# radius-server host 172.20.30.15 nonstandard</code></td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td><code>radius-server key string</code></td>
<td>Specifies the shared secret text string used between the switch and the vendor-proprietary RADIUS server. The switch and the RADIUS server use this text string to encrypt passwords and exchange responses.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config)# radius-server key rad124</code></td>
<td></td>
</tr>
</tbody>
</table>

**Note**

The key is a text string that must match the encryption key used on the RADIUS server. Leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.
What to do next

This feature allows access and authentication requests to be evenly across all RADIUS servers in a server group. For more information, see the “RADIUS Server Load Balancing” chapter of the Cisco IOS Security Configuration Guide, Release 12.4.

Vendor-Proprietary RADIUS Server Communication, on page 1307

Configuring CoA on the Switch

Beginning in privileged EXEC mode, follow these steps to configure CoA on a switch. This procedure is required.

SUMMARY STEPS

1. configure terminal
2. aaa new-model
3. aaa server radius dynamic-author
4. client {ip-address | name} [vrf vrfname] [server-key string]
5. server-key [0 7] string
6. port port-number
7. auth-type {any | all | session-key}
8. ignore session-key
9. ignore server-key
10. authentication command bounce-port ignore
11. authentication command disable-port ignore
12. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td>Step 2</td>
<td>aaa new-model</td>
</tr>
</tbody>
</table>
## Configuring CoA on the Switch

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(config)# aaa new-model</code></td>
<td>Configures the switch as an authentication, authorization, and accounting (AAA) server to facilitate interaction with an external policy server.</td>
</tr>
</tbody>
</table>

### Step 3

**aaa server radius dynamic-author**

**Example:**

```
Switch(config)# aaa server radius dynamic-author
```

Enters dynamic authorization local server configuration mode and specifies a RADIUS client from which a device will accept CoA and disconnect requests.

### Step 4

**client {ip-address | name} [vrf vrfname] [server-key string]**

### Step 5

**server-key [0 | 7] string**

**Example:**

```
Switch(config-sg-radius)# server-key your_server_key
```

Configures the RADIUS key to be shared between a device and RADIUS clients.

### Step 6

**port port-number**

**Example:**

```
Switch(config-sg-radius)# port 25
```

Specifies the port on which a device listens for RADIUS requests from configured RADIUS clients.

### Step 7

**auth-type {any | all | session-key}**

**Example:**

```
Switch(config-sg-radius)# auth-type any
```

Specifies the type of authorization the switch uses for RADIUS clients.

The client must match all the configured attributes for authorization.

### Step 8

**ignore session-key**

(Optional) Configures the switch to ignore the session-key.

For more information about the `ignore` command, see the *Cisco IOS Intelligent Services Gateway Command Reference* on Cisco.com.

### Step 9

**ignore server-key**

**Example:**

```
Switch(config-sg-radius)# ignore server-key
```

(Optional) Configures the switch to ignore the server-key.

For more information about the `ignore` command, see the *Cisco IOS Intelligent Services Gateway Command Reference* on Cisco.com.

### Step 10

**authentication command bounce-port ignore**

**Example:**

```
Switch(config-sg-radius)# authentication command bounce-port ignore
```

(Optional) Configures the switch to ignore a CoA request to temporarily disable the port hosting a session. The purpose of temporarily disabling the port is to trigger a DHCP renegotiation from the host when a VLAN change occurs and there is no supplicant on the endpoint to detect the change.
## Configuring RADIUS Server Load Balancing

This feature allows access and authentication requests to be evenly across all RADIUS servers in a server group. For more information, see the “RADIUS Server Load Balancing” chapter of the *Cisco IOS Security Configuration Guide, Release 12.4*.

## Monitoring CoA Functionality

Configuration Examples for Controlling Switch Access with RADIUS

Examples: Identifying the RADIUS Server Host

This example shows how to configure one RADIUS server to be used for authentication and another to be used for accounting:

Switch(config)# radius-server host 172.29.36.49 auth-port 1612 key rad1
Switch(config)# radius-server host 172.20.36.50 acct-port 1618 key rad2

This example shows how to configure host1 as the RADIUS server and to use the default ports for both authentication and accounting:

Switch(config)# radius-server host host1

Examples: Configuring the Switch to Use Vendor-Specific RADIUS Attributes

For example, this AV pair activates Cisco’s multiple named ip address pools feature during IP authorization (during PPP IPCP address assignment):

cisco-avpair= "ip:addr-pool=first"

This example shows how to provide a user logging in from a switch with immediate access to privileged EXEC commands:

cisco-avpair= "shell:priv-lvl=15"

This example shows how to specify an authorized VLAN in the RADIUS server database:

cisco-avpair= "tunnel-type(#64)=VLAN(13)"
cisco-avpair= "tunnel-medium-type(#65)=802 media(6)"
cisco-avpair= "tunnel-private-group-id(#81)=vlanid"

This example shows how to apply an input ACL in ASCII format to an interface for the duration of this connection:

cisco-avpair= "ip:inacl#1=deny ip 10.10.10.10 0.0.255.255 20.20.20.20 255.255.0.0"
cisco-avpair= "ip:inacl#2=deny ip 10.10.10.10 0.0.255.255 any"
cisco-avpair= "mac:inacl#3=deny any any decnet-iv"

This example shows how to apply an output ACL in ASCII format to an interface for the duration of this connection:
Example: Configuring the Switch for Vendor-Proprietary RADIUS Server Communication

This example shows how to specify a vendor-proprietary RADIUS host and to use a secret key of $\textit{rad124}$ between the switch and the server:

```
Switch(config)# radius-server host 172.20.30.15 nonstandard
Switch(config)# radius-server key rad124
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Controlling Switch Access with Kerberos

The following are the prerequisites for controlling switch access with Kerberos.

• So that remote users can authenticate to network services, you must configure the hosts and the KDC in the Kerberos realm to communicate and mutually authenticate users and network services. To do this, you must identify them to each other. You add entries for the hosts to the Kerberos database on the KDC and add KEYTAB files generated by the KDC to all hosts in the Kerberos realm. You also create entries for the users in the KDC database.

• A Kerberos server can be a switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.

When you add or create entries for the hosts and users, follow these guidelines:

• The Kerberos principal name must be in all lowercase characters.

• The Kerberos instance name must be in all lowercase characters.
Restrictions for Controlling Switch Access with Kerberos

The following lists any restrictions for controlling switch access with Kerberos.

Information about Kerberos

This section provides Kerberos information.

Kerberos and Switch Access

This section describes how to enable and configure the Kerberos security system, which authenticates requests for network resources by using a trusted third party.

For complete syntax and usage information for the commands used in this section, see the “Kerberos Commands” section in the “Security Server Protocols” chapter of the Cisco IOS Security Command Reference, Release 12.4.

Note

In the Kerberos configuration examples and in the Cisco IOS Security Command Reference, Release 12.4, the trusted third party can be a switch that supports Kerberos, that is configured as a network security server, and that can authenticate users by using the Kerberos protocol.

Kerberos Overview

Kerberos is a secret-key network authentication protocol, which was developed at the Massachusetts Institute of Technology (MIT). It uses the Data Encryption Standard (DES) cryptographic algorithm for encryption and authentication and authenticates requests for network resources. Kerberos uses the concept of a trusted third party to perform secure verification of users and services. This trusted third party is called the key distribution center (KDC).

Kerberos verifies that users are who they claim to be and the network services that they use are what the services claim to be. To do this, a KDC or trusted Kerberos server issues tickets to users. These tickets, which have a limited life span, are stored in user credential caches. The Kerberos server uses the tickets instead of user names and passwords to authenticate users and network services.

Note

A Kerberos server can be a switch that is configured as a network security server and that can authenticate users by using the Kerberos protocol.
The Kerberos credential scheme uses a process called *single logon*. This process authenticates a user once and then allows secure authentication (without encrypting another password) wherever that user credential is accepted.

This software release supports Kerberos 5, which allows organizations that are already using Kerberos 5 to use the same Kerberos authentication database on the KDC that they are already using on their other network hosts (such as UNIX servers and PCs).

In this software release, Kerberos supports these network services:

- Telnet
- rlogin
- rsh

This table lists the common Kerberos-related terms and definitions.

*Table 120: Kerberos Terms*

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication</td>
<td>A process by which a user or service identifies itself to another service. For example, a client can authenticate to a switch or a switch can authenticate to another switch.</td>
</tr>
<tr>
<td>Authorization</td>
<td>A means by which the switch identifies what privileges the user has in a network or on the switch and what actions the user can perform.</td>
</tr>
<tr>
<td>Credential</td>
<td>A general term that refers to authentication tickets, such as TGTs¹¹ and service credentials. Kerberos credentials verify the identity of a user or service. If a network service decides to trust the Kerberos server that issued a ticket, it can be used in place of re-entering a username and password. Credentials have a default life span of eight hours.</td>
</tr>
</tbody>
</table>
| Instance    | An authorization level label for Kerberos principals. Most Kerberos principals are of the form *user@REALM* (for example, smith@example.com). A Kerberos principal with a Kerberos instance has the form *user/instance@REALM* (for example, smith/admin@example.com). The Kerberos instance can be used to specify the authorization level for the user if authentication is successful. The server of each network service might implement and enforce the authorization mappings of Kerberos instances but is not required to do so.  
_note_ The Kerberos principal and instance names *must* be in all lowercase characters.  
_note_ The Kerberos realm name *must* be in all uppercase characters. |
| KDC¹²       | Key distribution center that consists of a Kerberos server and database program that is running on a network host. |
| Kerberized  | A term that describes applications and services that have been modified to support the Kerberos credential infrastructure. |
| Kerberos realm | A domain consisting of users, hosts, and network services that are registered to a Kerberos server. The Kerberos server is trusted to verify the identity of a user or network service to another user or network service.  
_note_ The Kerberos realm name *must* be in all uppercase characters. |
Definition

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kerberos server</td>
<td>A daemon that is running on a network host. Users and network services register their identity with the Kerberos server. Network services query the Kerberos server to authenticate to other network services.</td>
</tr>
<tr>
<td>KEYTAB</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 and later Kerberos versions, the network service authenticates an encrypted service credential by using the KEYTAB to decrypt it. In Kerberos versions earlier than Kerberos 5, KEYTAB is referred to as SRVTAB.</td>
</tr>
<tr>
<td>Principal</td>
<td>Also known as a Kerberos identity, this is who you are or what a service is according to the Kerberos server. Note: The Kerberos principal name must be in all lowercase characters.</td>
</tr>
<tr>
<td>Service</td>
<td>A credential for a network service. When issued from the KDC, this credential is encrypted with the password shared by the network service and the KDC. The password is also shared with the user TGT.</td>
</tr>
<tr>
<td>credential</td>
<td></td>
</tr>
<tr>
<td>SRVTAB</td>
<td>A password that a network service shares with the KDC. In Kerberos 5 or later Kerberos versions, SRVTAB is referred to as KEYTAB.</td>
</tr>
<tr>
<td>TGT</td>
<td>Ticket granting ticket that is a credential that the KDC issues to authenticated users. When users receive a TGT, they can authenticate to network services within the Kerberos realm represented by the KDC.</td>
</tr>
</tbody>
</table>

Kerberos Operation

A Kerberos server can be a switch that is configured as a network security server and that can authenticate remote users by using the Kerberos protocol. Although you can customize Kerberos in a number of ways, remote users attempting to access network services must pass through three layers of security before they can access network services.

To authenticate to network services by using a switch as a Kerberos server, remote users must follow these steps:

1. **Authenticating to a Boundary Switch**, on page 1330
2. **Obtaining a TGT from a KDC**, on page 1331
3. **Authenticating to Network Services**, on page 1331

Authenticating to a Boundary Switch

This section describes the first layer of security through which a remote user must pass. The user must first authenticate to the boundary switch. This process then occurs:

1. The user opens an un-Kerberized Telnet connection to the boundary switch.
2. The switch prompts the user for a username and password.
3. The switch requests a TGT from the KDC for this user.
4. The KDC sends an encrypted TGT that includes the user identity to the switch.
5. The switch attempts to decrypt the TGT by using the password that the user entered.
   • If the decryption is successful, the user is authenticated to the switch.
   • If the decryption is not successful, the user repeats Step 2 either by re-entering the username and password (noting if Caps Lock or Num Lock is on or off) or by entering a different username and password.

A remote user who initiates a un-Kerberized Telnet session and authenticates to a boundary switch is inside the firewall, but the user must still authenticate directly to the KDC before getting access to the network services. The user must authenticate to the KDC because the TGT that the KDC issues is stored on the switch and cannot be used for additional authentication until the user logs on to the switch.

Obtaining a TGT from a KDC

This section describes the second layer of security through which a remote user must pass. The user must now authenticate to a KDC and obtain a TGT from the KDC to access network services.

For instructions about how to authenticate to a KDC, see the “Obtaining a TGT from a KDC” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.4.

Authenticating to Network Services

This section describes the third layer of security through which a remote user must pass. The user with a TGT must now authenticate to the network services in a Kerberos realm.

For instructions about how to authenticate to a network service, see the “Authenticating to Network Services” section in the “Security Server Protocols” chapter of the Cisco IOS Security Configuration Guide, Release 12.4.

How to Configure Kerberos

To set up a Kerberos-authenticated server-client system, follow these steps:
   • Configure the KDC by using Kerberos commands.
   • Configure the switch to use the Kerberos protocol.

Monitoring the Kerberos Configuration

To display the Kerberos configuration, use the show running-config privileged EXEC command.

Configuring Local Authentication and Authorization

- Finding Feature Information, on page 1335
- How to Configure Local Authentication and Authorization, on page 1335
- Monitoring Local Authentication and Authorization, on page 1337
- Additional References, on page 1337
- Feature Information for Local Authentication and Authorization, on page 1338

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the `ip http authentication aaa` global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Beginning in privileged EXEC mode, follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:
### SUMMARY STEPS

1. `configure terminal`
2. `aaa new-model`
3. `aaa authentication login default local`
4. `aaa authorization exec local`
5. `aaa authorization network local`
6. `username name [privilege level] {password encryption-type password}`
7. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>aaa new-model</code></td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# aaa new-model</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>aaa authentication login default local</code></td>
<td>Sets the login authentication to use the local username database. The <code>default</code> keyword applies the local user database authentication to all ports.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# aaa authentication login default local</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>aaa authorization exec local</code></td>
<td>Configures user AAA authorization, check the local database, and allow the user to run an EXEC shell.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# aaa authorization exec local</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>aaa authorization network local</code></td>
<td>Configures user AAA authorization for all network-related service requests.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# aaa authorization network local</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>username name [privilege level] {password encryption-type password}</code></td>
<td>Enters the local database, and establishes a username-based authentication system. Repeat this command for each user.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# username your_user_name privilege</code></td>
<td></td>
</tr>
</tbody>
</table>

- For `name`, specify the user ID as one word. Spaces and quotation marks are not allowed.
### Command or Action

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 password 7 secret567</td>
<td>• (Optional) For level, specify the privilege level the user has after gaining access. The range is 0 to 15. Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access. &lt;br&gt; • For encryption-type, enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows. &lt;br&gt; • For password, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command.</td>
</tr>
</tbody>
</table>

### Step 7

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring the Switch for Secure Shell (SSH) and Secure Copy Protocol (SCP)

The following are the prerequisites for configuring the switch for secure shell (SSH):

- For SSH to work, the switch needs an RSA public/private key pair. This is the same with Secure Copy Protocol (SCP), which relies on SSH for its secure transport.

- Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.

- Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

- SCP relies on SSH for security.
• SCP requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.

• A user must have appropriate authorization to use SCP.

• A user who has appropriate authorization can use SCP to copy any file in the Cisco IOS File System (IFS) to and from a switch by using the copy command. An authorized administrator can also do this from a workstation.

Related Topics
Secure Copy Protocol Concepts, on page 1342

Restrictions for Configuring the Switch for SSH

The following are restrictions for configuring the switch for secure shell.

• The switch supports Rivest, Shamir, and Adelman (RSA) authentication.

• SSH supports only the execution-shell application.

• The SSH server and the SSH client are supported only on DES (56-bit) and 3DES (168-bit) data encryption software.

• The switch supports the Advanced Encryption Standard (AES) encryption algorithm with a 128-bit key, 192-bit key, or 256-bit key. However, symmetric cipher AES to encrypt the keys is not supported.

• This software release does not support IP Security (IPSec).

• When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Related Topics
Secure Copy Protocol Concepts, on page 1342

Information about SSH

Secure Shell (SSH) is a protocol that provides a secure, remote connection to a device. SSH provides more security for remote connections than Telnet does by providing strong encryption when a device is authenticated. This software release supports SSH Version 1 (SSHv1) and SSH Version 2 (SSHv2).

SSH and Switch Access

For SSH configuration examples, see the “SSH Configuration Examples” section in the “Configuring Secure Shell” section in the “Other Security Features” chapter of the Cisco IOS Security Configuration Guide, Cisco IOS Release 12.4.

SSH functions the same in IPv6 as in IPv4. For IPv6, SSH supports IPv6 addresses and enables secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.
SSH Servers, Integrated Clients, and Supported Versions

The SSH feature has an SSH server and an SSH integrated client, which are applications that run on the switch. You can use an SSH client to connect to a switch running the SSH server. The SSH server works with the SSH client supported in this release and with non-Cisco SSH clients. The SSH client also works with the SSH server supported in this release and with non-Cisco SSH servers.

The switch supports an SSHv1 or an SSHv2 server.

The switch supports an SSHv1 client.

SSH supports the Data Encryption Standard (DES) encryption algorithm, the Triple DES (3DES) encryption algorithm, and password-based user authentication.

SSH also supports these user authentication methods:

- TACACS+
- RADIUS
- Local authentication and authorization

Related Topics

- Configuring the Switch for Local Authentication and Authorization, on page 1335
- TACACS+ and Switch Access, on page 1281
- RADIUS and Switch Access, on page 1296

SSH Configuration Guidelines

Follow these guidelines when configuring the switch as an SSH server or SSH client:

- An RSA key pair generated by a SSHv1 server can be used by an SSHv2 server, and the reverse.

- If the SSH server is running on a stack master and the stack master fails, the new stack master uses the RSA key pair generated by the previous stack master.

- If you get CLI error messages after entering the `crypto key generate rsa` global configuration command, an RSA key pair has not been generated. Reconfigure the hostname and domain, and then enter the `crypto key generate rsa` command. For more information, see Related Topics below.

- When generating the RSA key pair, the message No host name specified might appear. If it does, you must configure a hostname by using the `hostname` global configuration command.

- When generating the RSA key pair, the message No domain specified might appear. If it does, you must configure an IP domain name by using the `ip domain-name` global configuration command.

- When configuring the local authentication and authorization authentication method, make sure that AAA is disabled on the console.
Secure Copy Protocol Overview

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

For SSH to work, the switch needs an RSA public/private key pair. This is the same with SCP, which relies on SSH for its secure transport.

Because SSH also relies on AAA authentication, and SCP relies further on AAA authorization, correct configuration is necessary.

• Before enabling SCP, you must correctly configure SSH, authentication, and authorization on the switch.
• Because SCP relies on SSH for its secure transport, the router must have an Rivest, Shamir, and Adelman (RSA) key pair.

Note: When using SCP, you cannot enter the password into the copy command. You must enter the password when prompted.

Secure Copy Protocol Concepts

The Secure Copy Protocol (SCP) feature provides a secure and authenticated method for copying switch configurations or switch image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

To configure the Secure Copy feature, you should understand the SCP concepts.

The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that SCP relies on SSH for security. SCP also requires that authentication, authorization, and accounting (AAA) authorization be configured so the router can determine whether the user has the correct privilege level.

For information about how to configure and verify SCP, see the “Secure Copy Protocol” section in the Cisco IOS Security Configuration Guide: Securing User Services, Release 12.4.
How to Configure SSH

Setting Up the Switch to Run SSH

Beginning in privileged EXEC mode, follow these steps to set up your switch to run SSH:

**Before you begin**

Configure user authentication for local or remote access. This step is required. For more information, see Related Topics below.

**SUMMARY STEPS**

1. `configure terminal`
2. `hostname hostname`
3. `ip domain-name domain_name`
4. `crypto key generate rsa`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> <code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>hostname hostname</code></td>
<td>Configures a hostname and IP domain name for your switch. <strong>Note</strong> Follow this procedure only if you are configuring the switch as an SSH server.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> <code>Switch(config)# hostname your_hostname</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ip domain-name domain_name</code></td>
<td>Configures a host domain for your switch.</td>

<tr>
<td></td>
<td><strong>Example:</strong> <code>Switch(config)# ip domain-name your_domain</code></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>crypto key generate rsa</code></td>
<td>Enables the SSH server for local and remote authentication on the switch and generates an RSA key pair. Generating an RSA key pair for the switch automatically enables SSH. We recommend that a minimum modulus size of 1024 bits. When you generate RSA keys, you are prompted to enter a modulus length. A longer modulus length might be more secure, but it takes longer to generate and to use.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> <code>Switch(config)# crypto key generate rsa</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring the SSH Server

Beginning in privileged EXEC mode, follow these steps to configure the SSH server:

**Note**
This procedure is only required if you are configuring the switch as an SSH server.

**SUMMARY STEPS**

1. `configure terminal`
2. `ip ssh version 1 | 2`
3. `ip ssh {timeout seconds | authentication-retries number}`
4. Use one or both of the following:
   - `line vtyline_number[ending_line_number]`
   - `transport input ssh`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>

<td></td>
</tr>
</tbody>
</table>

**Related Topics**

- SSH Configuration Guidelines, on page 1341
- Configuring the Switch for Local Authentication and Authorization, on page 1335
### Command or Action

**Purpose**
If you do not enter this command or do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.

### Step 3

**ip ssh** `{timeout seconds} | {authentication-retries number}`

**Example:**

Switch(config)# ip ssh timeout 90
authentication-retries 2

Configures the SSH control parameters:

- Specify the time-out value in seconds; the default is 120 seconds. The range is 0 to 120 seconds. This parameter applies to the SSH negotiation phase. After the connection is established, the switch uses the default time-out values of the CLI-based sessions.

- By default, up to five simultaneous, encrypted SSH connections for multiple CLI-based sessions over the network are available (session 0 to session 4). After the execution shell starts, the CLI-based session time-out value returns to the default of 10 minutes.

- Specify the number of times that a client can re-authenticate to the server. The default is 3; the range is 0 to 5.

Repeat this step when configuring both parameters.

### Step 4

Use one or both of the following:

- **line** `vty line_number[ending_line_number]`
- **transport input ssh**

**Example:**

Switch(config)# line vty 1 10

or

Switch(config-line)# transport input ssh

(Optional) Configures the virtual terminal line settings.

- Enters line configuration mode to configure the virtual terminal line settings. For `line_number` and `ending_line_number`, specify a pair of lines. The range is 0 to 15.

- Specifies that the switch prevent non-SSH Telnet connections. This limits the router to only SSH connections.

### Step 5

**end**

**Example:**

Switch(config-line)# end

Returns to privileged EXEC mode.
Monitoring the SSH Configuration and Status

This table displays the SSH server configuration and status.

**Table 121: Commands for Displaying the SSH Server Configuration and Status**

<table>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about Secure Sockets Layer (SSL) HTTP

This section describes how to configure Secure Sockets Layer (SSL) Version 3.0 support for the HTTP 1.1 server and client. SSL provides server authentication, encryption, and message integrity, as well as HTTP client authentication, to allow secure HTTP communications.

SSL evolved into Transport Layer Security (TLS) in 1999, but is still used in this particular context.

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with https:// instead of http://.
The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

For configuration examples and complete syntax and usage information for the commands used in this section, see the “HTTPS - HTTP Server and Client with SSL 3.0” feature description for Cisco IOS Release 12.2(15)T.

Certificate Authority Trustpoints

Certificate authorities (CAs) manage certificate requests and issue certificates to participating network devices. These services provide centralized security key and certificate management for the participating devices. Specific CA servers are referred to as trustpoints.

When a connection attempt is made, the HTTPS server provides a secure connection by issuing a certified X.509v3 certificate, obtained from a specified CA trustpoint, to the client. The client (usually a Web browser), in turn, has a public key that allows it to authenticate the certificate.

For secure HTTP connections, we highly recommend that you configure a CA trustpoint. If a CA trustpoint is not configured for the device running the HTTPS server, the server certifies itself and generates the needed RSA key pair. Because a self-certified (self-signed) certificate does not provide adequate security, the connecting client generates a notification that the certificate is self-certified, and the user has the opportunity to accept or reject the connection. This option is useful for internal network topologies (such as testing).

If you do not configure a CA trustpoint, when you enable a secure HTTP connection, either a temporary or a persistent self-signed certificate for the secure HTTP server (or client) is automatically generated.

- If the switch is not configured with a hostname and a domain name, a temporary self-signed certificate is generated. If the switch reboots, any temporary self-signed certificate is lost, and a new temporary new self-signed certificate is assigned.

- If the switch has been configured with a host and domain name, a persistent self-signed certificate is generated. This certificate remains active if you reboot the switch or if you disable the secure HTTP server so that it will be there the next time you re-enable a secure HTTP connection.

Note

The certificate authorities and trustpoints must be configured on each device individually. Copying them from other devices makes them invalid on the switch.

If a self-signed certificate has been generated, this information is included in the output of the show running-config privileged EXEC command. This is a partial sample output from that command displaying a self-signed certificate.

```
Switch# show running-config
Building configuration...
<output truncated>
crypto pki trustpoint TP=self-signed-3080755072
  enrollment selfsigned
```
subject-name cn=IOS-Self-Signed-Certificate-3080755072
revocation-check none
rsaekpair TP=self-signed-3080755072

!  !
crypto ca certificate chain TP-self-signed-3080755072
certificate self-signed 01
3082029F 30820208 A0030201 02020101 300D0609 2A864886 F70D0101 04050030
5931F30 2D60355 04031326 494F532D 53656C66 2D536967 6E65642D 33303830
37353530 37323126 30240609 2A864886 F70D0109
02161743 45322D33 3535302D 31332E73 756D6D30 342D3335 3530301E 170D3933
30333031 30303030 35395A17 0D323030 31303130 30303030 305A3059 312F302D

<output truncated>

You can remove this self-signed certificate by disabling the secure HTTP server and entering the no crypto pki trustpoint TP-self-signed-30890755072 global configuration command. If you later re-enable a secure HTTP server, a new self-signed certificate is generated.

Note

The values that follow TP self-signed depend on the serial number of the device.

You can use an optional command (ip http secure-client-auth) to allow the HTTPS server to request an X.509v3 certificate from the client. Authenticating the client provides more security than server authentication by itself.

For additional information on Certificate Authorities, see the “Configuring Certification Authority Interoperability” chapter in the Cisco IOS Security Configuration Guide, Release 12.4.

CipherSuites

A CipherSuite specifies the encryption algorithm and the digest algorithm to use on a SSL connection. When connecting to the HTTPS server, the client Web browser offers a list of supported CipherSuites, and the client and server negotiate the best encryption algorithm to use from those on the list that are supported by both. For example, Netscape Communicator 4.76 supports U.S. security with RSA Public Key Cryptography, MD2, MD5, RC2-CBC, RC4, DES-CBC, and DES-EDE3-CBC.

For the best possible encryption, you should use a client browser that supports 128-bit encryption, such as Microsoft Internet Explorer Version 5.5 (or later) or Netscape Communicator Version 4.76 (or later). The SSL_RSA_WITH_DES_CBC_SHA CipherSuite provides less security than the other CipherSuites, as it does not offer 128-bit encryption.

The more secure and more complex CipherSuites require slightly more processing time. This list defines the CipherSuites supported by the switch and ranks them from fastest to slowest in terms of router processing load (speed):

1. SSL_RSA_WITH_DES_CBC_SHA—RSA key exchange (RSA Public Key Cryptography) with DES-CBC for message encryption and SHA for message digest
2. SSL_RSA_WITH_RC4_128_MD5—RSA key exchange with RC4 128-bit encryption and MD5 for message digest
3. SSL_RSA_WITH_RC4_128_SHA—RSA key exchange with RC4 128-bit encryption and SHA for message digest
4. **SSL_RSA_WITH_3DES_EDE_CBC_SHA**—RSA key exchange with 3DES and DES-EDE3-CBC for message encryption and SHA for message digest

RSA (in conjunction with the specified encryption and digest algorithm combinations) is used for both key generation and authentication on SSL connections. This usage is independent of whether or not a CA trustpoint is configured.

**Default SSL Configuration**

The standard HTTP server is enabled.
SSL is enabled.
No CA trustpoints are configured.
No self-signed certificates are generated.

**SSL Configuration Guidelines**

When SSL is used in a switch cluster, the SSL session terminates at the cluster commander. Cluster member switches must run standard HTTP.

Before you configure a CA trustpoint, you should ensure that the system clock is set. If the clock is not set, the certificate is rejected due to an incorrect date.

In a switch stack, the SSL session terminates at the stack master.

**Secure HTTP Servers and Clients Overview**

On a secure HTTP connection, data to and from an HTTP server is encrypted before being sent over the Internet. HTTP with SSL encryption provides a secure connection to allow such functions as configuring a switch from a Web browser. Cisco's implementation of the secure HTTP server and secure HTTP client uses an implementation of SSL Version 3.0 with application-layer encryption. HTTP over SSL is abbreviated as HTTPS; the URL of a secure connection begins with `https://` instead of `http://`.

The primary role of the HTTP secure server (the switch) is to listen for HTTPS requests on a designated port (the default HTTPS port is 443) and pass the request to the HTTP 1.1 Web server. The HTTP 1.1 server processes requests and passes responses (pages) back to the HTTP secure server, which, in turn, responds to the original request.

The primary role of the HTTP secure client (the web browser) is to respond to Cisco IOS application requests for HTTPS User Agent services, perform HTTPS User Agent services for the application, and pass the response back to the application.

**How to Configure Secure HTTP Servers and Clients**

**Configuring a CA Trustpoint**

For secure HTTP connections, we recommend that you configure an official CA trustpoint. A CA trustpoint is more secure than a self-signed certificate.
Beginning in privileged EXEC mode, follow these steps to configure a CA Trustpoint:

**SUMMARY STEPS**

1. `configure terminal`
2. `hostname hostname`
3. `ip domain-name domain-name`
4. `crypto key generate rsa`
5. `crypto ca trustpoint name`
6. `enrollment url url`
7. `enrollment http-proxy host-name port-number`
8. `crl query url`
9. `primary name`
10. `exit`
11. `crypto ca authentication name`
12. `crypto ca enroll name`
13. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

<td></td>
</tr>
</tbody>
</table>

**Step 12**

<table>
<thead>
<tr>
<th>crypto ca enroll <code>name</code></th>
<th>Obtains the certificate from the specified CA trustpoint. This command requests a signed certificate for each RSA key pair.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# crypto ca enroll your_trustpoint</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring the Secure HTTP Server

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP server:

Before you begin

If you are using a certificate authority for certification, you should use the previous procedure to configure the CA trustpoint on the switch before enabling the HTTP server. If you have not configured a CA trustpoint, a self-signed certificate is generated the first time that you enable the secure HTTP server. After you have configured the server, you can configure options (path, access list to apply, maximum number of connections, or timeout policy) that apply to both standard and secure HTTP servers.

To verify the secure HTTP connection by using a Web browser, enter \texttt{https://URL}, where the URL is the IP address or hostname of the server switch. If you configure a port other than the default port, you must also specify the port number after the URL. For example:

\texttt{https://209.165.129:1026}

or

\texttt{https://host.domain.com:1026}

SUMMARY STEPS

1. \texttt{show ip http server status}
2. \texttt{configure terminal}
3. \texttt{ip http secure-server}
4. \texttt{ip http secure-port port-number}
5. \texttt{ip http secure-ciphersuite \{[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]\}}
6. \texttt{ip http secure-client-auth}
7. \texttt{ip http secure-trustpoint name}
8. \texttt{ip http path path-name}
9. \texttt{ip http access-class access-list-number}
10. \texttt{ip http max-connections value}
11. \texttt{ip http timeout-policy idle seconds life seconds requests value}
12. \texttt{end}
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | show ip http server status | (Optional) Displays the status of the HTTP server to determine if the secure HTTP server feature is supported in the software. You should see one of these lines in the output:  
HTTP secure server capability: Present  
or  
HTTP secure server capability: Not present |
<p>| <strong>Step 2</strong> | configure terminal | Enters global configuration mode. |
| <strong>Step 3</strong> | ip http secure-server | Enables the HTTPS server if it has been disabled. The HTTPS server is enabled by default. |
| <strong>Step 4</strong> | ip http secure-port port-number | (Optional) Specifies the port number to be used for the HTTPS server. The default port number is 443. Valid options are 443 or any number in the range 1025 to 65535. |
| <strong>Step 5</strong> | ip http secure-ciphersuite { [3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]} | (Optional) Specifies the CipherSuites (encryption algorithms) to be used for encryption over the HTTPS connection. If you do not have a reason to specify a particularly CipherSuite, you should allow the server and client to negotiate a CipherSuite that they both support. This is the default. |
| <strong>Step 6</strong> | ip http secure-client-auth | (Optional) Configures the HTTP server to request an X.509v3 certificate from the client for authentication during the connection process. The default is for the client to request a certificate from the server, but the server does not attempt to authenticate the client. |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>
<td>ip http secure-trustpoint <em>name</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip http secure-trustpoint your_trustpoint</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Specifies the CA trustpoint to use to get an X.509v3 security certificate and to authenticate the client certificate connection.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>Use of this command assumes you have already configured a CA trustpoint according to the previous procedure.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>ip http path <em>path-name</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip http path /your_server:80</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Sets a base HTTP path for HTML files. The path specifies the location of the HTTP server files on the local system (usually located in system flash memory).</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>ip http access-class <em>access-list-number</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip http access-class 2</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Specifies an access list to use to allow access to the HTTP server.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>ip http max-connections <em>value</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip http max-connections 4</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Sets the maximum number of concurrent connections that are allowed to the HTTP server. The range is 1 to 16; the default value is 5.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>ip http timeout-policy idle <em>seconds</em> life <em>seconds</em> requests <em>requests</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# ip http timeout-policy idle 120 life 240 requests 1</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Specifies how long a connection to the HTTP server can remain open under the defined circumstances:</td>
</tr>
<tr>
<td></td>
<td>• idle—the maximum time period when no data is received or response data cannot be sent. The range is 1 to 600 seconds. The default is 180 seconds (3 minutes).</td>
</tr>
<tr>
<td></td>
<td>• life—the maximum time period from the time that the connection is established. The range is 1 to 86400 seconds (24 hours). The default is 180 seconds.</td>
</tr>
<tr>
<td></td>
<td>• requests—the maximum number of requests processed on a persistent connection. The maximum value is 86400. The default is 1.</td>
</tr>
<tr>
<td><strong>Step 12</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# end</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Configuring the Secure HTTP Client

Beginning in privileged EXEC mode, follow these steps to configure a secure HTTP client:

**Before you begin**

The standard HTTP client and secure HTTP client are always enabled. A certificate authority is required for secure HTTP client certification. This procedure assumes that you have previously configured a CA trustpoint on the switch. If a CA trustpoint is not configured and the remote HTTPS server requires client authentication, connections to the secure HTTP client fail.

**SUMMARY STEPS**

1. configure terminal
2. ip http client secure-trustpoint *name*
3. ip http client secure-ciphersuite \{[3des-ede-cbc-sha] [rc4-128-md5] [rc4-128-sha] [des-cbc-sha]\}
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring Network Security with ACLs

This section lists the prerequisites for configuring network security with Access Control Lists (ACLs).

- On switches running the LAN base feature set, VLAN maps are not supported.

Restrictions for Configuring Network Security with ACLs

General Network Security

The following are restrictions for configuring network security with ACLs:

- You cannot apply named MAC extended ACLs to Layer 3 interfaces.
• Though visible in the command-line help strings, **appletalk** is not supported as a matching condition for the **deny** and **permit** MAC access-list configuration mode commands.

**ACL Filtering**

The following are restrictions on ACL filtering:

• If IEEE 802.1Q tunneling is configured on an interface, any IEEE 802.1Q encapsulated IP packets received on the tunnel port can be filtered by MAC ACLs, but not by IP ACLs. This is because the switch does not recognize the protocol inside the IEEE 802.1Q header. This restriction applies to router ACLs, port ACLs, and VLAN maps.

**IPv4 ACL Network Interfaces**

The following restrictions apply to IPv4 ACLs to network interfaces:

• When controlling access to an interface, you can use a named or numbered ACL.

• If you apply an ACL to a Layer 2 interface that is a member of a VLAN, the Layer 2 (port) ACL takes precedence over an input Layer 3 ACL applied to the VLAN interface or a VLAN map applied to the VLAN.

• If you apply an ACL to a Layer 3 interface and routing is not enabled on the switch, the ACL only filters packets that are intended for the CPU, such as SNMP, Telnet, or web traffic.

• You do not have to enable routing to apply ACLs to Layer 2 interfaces.

• When private VLANs are configured, you can apply router ACLs only on the primary-VLAN SVIs. The ACL is applied to both primary and secondary VLAN Layer 3 traffic.

**Note**

By default, the router sends Internet Control Message Protocol (ICMP) unreachable messages when a packet is denied by an access group on a Layer 3 interface. These access-group denied packets are not dropped in hardware but are bridged to the switch CPU so that it can generate the ICMP-unreachable message. They do not generate ICMP unreachable messages. ICMP unreachable messages can be disabled on router ACLs with the **no ip unreachable** interface command.

**MAC ACLs on a Layer 2 Interface**

After you create a MAC ACL, you can apply it to a Layer 2 interface to filter non-IP traffic coming in that interface. When you apply the MAC ACL, consider these guidelines:

• If you apply an ACL to a Layer 2 interface that is a member of a VLAN, the Layer 2 (port) ACL takes precedence over an input Layer 3 ACL applied to the VLAN interface or a VLAN map applied to the VLAN. Incoming packets received on the Layer 2 port are always filtered by the port ACL.

• You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface. The IP access list filters only IP packets, and the MAC access list filters non-IP packets.

• A Layer 2 interface can have only one MAC access list. If you apply a MAC access list to a Layer 2 interface that has a MAC ACL configured, the new ACL replaces the previously configured one.
The **mac access-group** interface configuration command is only valid when applied to a physical Layer 2 interface. You cannot use the command on EtherChannel port channels.

### Information about Network Security with ACLs

This chapter describes how to configure network security on the switch by using access control lists (ACLs), which in commands and tables are also referred to as access lists.

### Cisco TrustSec and ACLs

Catalyst 3850 switches running the IP base or IP services feature set also support Cisco TrustSec Security Group Tag (SCT) Exchange Protocol (SXP). This feature supports security group access control lists (SGACLs), which define ACL policies for a group of devices instead of an IP address. The SXP control protocol allows tagging packets with SCTs without a hardware upgrade, and runs between access layer devices at the Cisco TrustSec domain edge and distribution layer devices within the Cisco TrustSec domain. Catalyst 3850 switches operate as access layer switches in the Cisco TrustSec network.

The sections on SXP define the capabilities supported on the Catalyst 3850 switches.

### ACL Overview

Packet filtering can help limit network traffic and restrict network use by certain users or devices. ACLs filter traffic as it passes through a router or switch and permit or deny packets crossing specified interfaces or VLANs. An ACL is a sequential collection of permit and deny conditions that apply to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the required permissions to be forwarded, based on the criteria specified in the access lists. One by one, it tests packets against the conditions in an access list. The first match decides whether the switch accepts or rejects the packets. Because the switch stops testing after the first match, the order of conditions in the list is critical. If no conditions match, the switch rejects the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet. The switch can use ACLs on all packets it forwards, including packets bridged within a VLAN.

You configure access lists on a router or Layer 3 switch to provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed onto all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both.
Access Control Entries

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies permit or deny and a set of conditions the packet must satisfy in order to match the ACE. The meaning of permit or deny depends on the context in which the ACL is used.

ACL Supported Types

The switch supports IP ACLs and Ethernet (MAC) ACLs:

- IP ACLs filter IPv4 traffic, including TCP, User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- Ethernet ACLs filter non-IP traffic.

This switch also supports quality of service (QoS) classification ACLs.

Supported ACLs

The switch supports three types of ACLs to filter traffic:

- Port ACLs access-control traffic entering a Layer 2 interface. You can apply only one IP access list and one MAC access list to a Layer 2 interface.
- Router ACLs access-control routed traffic between VLANs and are applied to Layer 3 interfaces in a specific direction (inbound or outbound).
- VLAN ACLs or VLAN maps access-control all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. VLAN maps are configured to provide access control based on Layer 3 addresses for IPv4. Unsupported protocols are access-controlled through MAC addresses using Ethernet ACEs. After a VLAN map is applied to a VLAN, all packets (routed or bridged) entering the VLAN are checked against the VLAN map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

ACL Precedence

When Port ACLs, router ACLs, and VLAN maps are configured on the same switch, the filtering precedence, from greatest to least, is port ACL, router ACL, then VLAN map. The following examples describe simple use cases:

- When both an input port ACL and a VLAN map are applied, incoming packets received on ports with a port ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.
- When an input router ACL and input port ACL exist in a switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.
- When an output router ACL and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.
- When a VLAN map, input router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets
received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

- When a VLAN map, output router ACL, and input port ACL exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

Restrictions for Configuring Network Security with ACLs, on page 1361

**Port ACLs**

Port ACLs are ACLs that are applied to Layer 2 interfaces on a switch. Port ACLs are supported only on physical interfaces and not on EtherChannel interfaces. Port ACLs can be applied on outbound and inbound interfaces. The following access lists are supported:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

The switch examines ACLs on an interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In this way, ACLs control access to a network or to part of a network.

*Figure 72: Using ACLs to Control Traffic in a Network*

This is an example of using port ACLs to control access to a network when all workstations are in the same VLAN. ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network. Port ACLs can only be applied to Layer 2 interfaces in the inbound direction.
When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

Note

You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

Router ACLs

You can apply router ACLs on switch virtual interfaces (SVIs), which are Layer 3 interfaces to VLANs; on physical Layer 3 interfaces; and on Layer 3 EtherChannel interfaces. You apply router ACLs on interfaces for specific directions (inbound or outbound). You can apply one router ACL in each direction on an interface.

The switch supports these access lists for IPv4 traffic:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

As with port ACLs, the switch examines ACLs associated with features configured on a given interface. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL, and can be used to control access to a network or to part of a network.

VLAN Maps

Use VLAN ACLs or VLAN maps to access-control all traffic. You can apply VLAN maps to all packets that are routed into or out of a VLAN or are bridged within a VLAN in the switch or switch stack.

Use VLAN maps for security packet filtering. VLAN maps are not defined by direction (input or output).

You can configure VLAN maps to match Layer 3 addresses for IPv4 traffic.

All non-IP protocols are access-controlled through MAC addresses and Ethertype using MAC VLAN maps. (IP traffic is not access controlled by MAC VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding of packets is permitted or denied, based on the action specified in the map.
This shows how a VLAN map is applied to prevent a specific type of traffic from Host A in VLAN 10 from being forwarded. You can apply only one VLAN map to a VLAN.

**ACEs and Fragmented and Unfragmented Traffic**

IP packets can be fragmented as they cross the network. When this happens, only the fragment containing the beginning of the packet contains the Layer 4 information, such as TCP or UDP port numbers, ICMP type and code, and so on. All other fragments are missing this information.

Some access control entries (ACEs) do not check Layer 4 information and therefore can be applied to all packet fragments. ACEs that do test Layer 4 information cannot be applied in the standard manner to most of the fragments in a fragmented IP packet. When the fragment contains no Layer 4 information and the ACE tests some Layer 4 information, the matching rules are modified:

- Permit ACEs that check the Layer 3 information in the fragment (including protocol type, such as TCP, UDP, and so on) are considered to match the fragment regardless of what the missing Layer 4 information might have been.
- Deny ACEs that check Layer 4 information never match a fragment unless the fragment contains Layer 4 information.

**Example: ACEs and Fragmented and Unfragmented Traffic**

Consider access list 102, configured with these commands, applied to three fragmented packets:

```
Switch(config)# access-list 102 permit tcp any host 10.1.1.1 eq smtp
Switch(config)# access-list 102 deny tcp any host 10.1.1.2 eq telnet
Switch(config)# access-list 102 permit tcp any host 10.1.1.2
Switch(config)# access-list 102 deny tcp any any
```

In the first and second ACEs in the examples, the `eq` keyword after the destination address means to test for the TCP-destination-port well-known numbers equaling Simple Mail Transfer Protocol (SMTP) and Telnet, respectively.

- Packet A is a TCP packet from host 10.2.2.2, port 65000, going to host 10.1.1.1 on the SMTP port. If this packet is fragmented, the first fragment matches the first ACE (a permit) as if it were a complete packet because all Layer 4 information is present. The remaining fragments also match the first ACE, even though they do not contain the SMTP port information, because the first ACE only checks Layer
3 information when applied to fragments. The information in this example is that the packet is TCP and that the destination is 10.1.1.1.

- Packet B is from host 10.2.2.2, port 65001, going to host 10.1.1.2 on the Telnet port. If this packet is fragmented, the first fragment matches the second ACE (a deny) because all Layer 3 and Layer 4 information is present. The remaining fragments in the packet do not match the second ACE because they are missing Layer 4 information. Instead, they match the third ACE (a permit).

Because the first fragment was denied, host 10.1.1.2 cannot reassemble a complete packet, so packet B is effectively denied. However, the later fragments that are permitted will consume bandwidth on the network and resources of host 10.1.1.2 as it tries to reassemble the packet.

- Fragmented packet C is from host 10.2.2.2, port 65001, going to host 10.1.1.3, port ftp. If this packet is fragmented, the first fragment matches the fourth ACE (a deny). All other fragments also match the fourth ACE because that ACE does not check any Layer 4 information and because Layer 3 information in all fragments shows that they are being sent to host 10.1.1.3, and the earlier permit ACEs were checking different hosts.

### ACLs and Switch Stacks

ACL support is the same for a switch stack as for a standalone switch. ACL configuration information is propagated to all switches in the stack. All switches in the stack, including the active switch, process the information and program their hardware.

### Active Switch and ACL Functions

The active switch performs these ACL functions:

- It processes the ACL configuration and propagates the information to all stack members.
- It distributes the ACL information to any switch that joins the stack.
- If packets must be forwarded by software for any reason (for example, not enough hardware resources), the active switch forwards the packets only after applying ACLs on the packets.
- It programs its hardware with the ACL information it processes.

### Stack Member and ACL Functions

Stack members perform these ACL functions:

- They receive the ACL information from the active switch and program their hardware.
- A stack member configured as a standby switch, performs the functions of the active switch in the event the active switch fails.

### Active Switch Failure and ACLs

Both the active and standby switches have the ACL information. When the active switch fails, the standby takes over. The new active switch distributes the ACL information to all stack members.
Standard and Extended IPv4 ACLs

This section describes IP ACLs.

An ACL is a sequential collection of permit and deny conditions. One by one, the switch tests packets against the conditions in an access list. The first match determines whether the switch accepts or rejects the packet. Because the switch stops testing after the first match, the order of the conditions is critical. If no conditions match, the switch denies the packet.

The software supports these types of ACLs or access lists for IPv4:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses for matching operations and optional protocol-type information for finer granularity of control.

IPv4 ACL Switch Unsupported Features

Configuring IPv4 ACLs on the switch is the same as configuring IPv4 ACLs on other Cisco switches and routers.

The switch does not support these Cisco IOS router ACL-related features:

- Non-IP protocol ACLs
- IP accounting
- Reflexive ACLs and dynamic ACLs are not supported.
- ACL logging for port ACLs and VLAN maps

Access List Numbers

The number you use to denote your ACL shows the type of access list that you are creating.

This lists the access-list number and corresponding access list type and shows whether or not they are supported in the switch. The switch supports IPv4 standard and extended access lists, numbers 1 to 199 and 1300 to 2699.

Table 123: Access List Numbers

<table>
<thead>
<tr>
<th>Access List Number</th>
<th>Type</th>
<th>Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>1–99</td>
<td>IP standard access list</td>
<td>Yes</td>
</tr>
<tr>
<td>100–199</td>
<td>IP extended access list</td>
<td>Yes</td>
</tr>
<tr>
<td>200–299</td>
<td>Protocol type-code access list</td>
<td>No</td>
</tr>
<tr>
<td>300–399</td>
<td>DECnet access list</td>
<td>No</td>
</tr>
<tr>
<td>400–499</td>
<td>XNS standard access list</td>
<td>No</td>
</tr>
<tr>
<td>500–599</td>
<td>XNS extended access list</td>
<td>No</td>
</tr>
<tr>
<td>600–699</td>
<td>AppleTalk access list</td>
<td>No</td>
</tr>
</tbody>
</table>
In addition to numbered standard and extended ACLs, you can also create standard and extended named IP ACLs by using the supported numbers. That is, the name of a standard IP ACL can be 1 to 99; the name of an extended IP ACL can be 100 to 199. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

### Numbered Standard IPv4 ACLs

When creating an ACL, remember that, by default, the end of the ACL contains an implicit deny statement for all packets that it did not find a match for before reaching the end. With standard access lists, if you omit the mask from an associated IP host address ACL specification, 0.0.0.0 is assumed to be the mask.

The switch always rewrites the order of standard access lists so that entries with host matches and entries with matches having a don’t care mask of 0.0.0.0 are moved to the top of the list, above any entries with non-zero don’t care masks. Therefore, in show command output and in the configuration file, the ACEs do not necessarily appear in the order in which they were entered.

After creating a numbered standard IPv4 ACL, you can apply it to terminal lines, to interfaces, or to VLANs.

### Numbered Extended IPv4 ACLs

Although standard ACLs use only source addresses for matching, you can use extended ACL source and destination addresses for matching operations and optional protocol type information for finer granularity of control. When you are creating ACEs in numbered extended access lists, remember that after you create the ACL, any additions are placed at the end of the list. You cannot reorder the list or selectively add or remove ACEs from a numbered list.

The switch does not support dynamic or reflexive access lists. It also does not support filtering based on the type of service (ToS) minimize-monetary-cost bit.

Some protocols also have specific parameters and keywords that apply to that protocol.

You can define an extended TCP, UDP, ICMP, IGMP, or other IP ACL. The switch also supports these IP protocols:
Note

ICMP echo-reply cannot be filtered. All other ICMP codes or types can be filtered.

These IP protocols are supported:

• Authentication Header Protocol (ahp)
• Encapsulation Security Payload (esp)
• Enhanced Interior Gateway Routing Protocol (eigrp)
• generic routing encapsulation (gre)
• Internet Control Message Protocol (icmp)
• Internet Group Management Protocol (igmp)
• any Interior Protocol (ip)
• IP in IP tunneling (ipinip)
• KA9Q NOS-compatible IP over IP tunneling (nos)
• Open Shortest Path First routing (ospf)
• Payload Compression Protocol (pcp)
• Protocol-Independent Multicast (pim)
• Transmission Control Protocol (tcp)
• User Datagram Protocol (udp)

Named IPv4 ACLs

You can identify IPv4 ACLs with an alphanumeric string (a name) rather than a number. You can use named ACLs to configure more IPv4 access lists in a router than if you were to use numbered access lists. If you identify your access list with a name rather than a number, the mode and command syntax are slightly different. However, not all commands that use IP access lists accept a named access list.

The name you give to a standard or extended ACL can also be a number in the supported range of access list numbers. That is, the name of a standard IP ACL can be 1 to 99. The advantage of using named ACLs instead of numbered lists is that you can delete individual entries from a named list.

Consider these guidelines and limitations before configuring named ACLs:

• Not all commands that accept a numbered ACL accept a named ACL. ACLs for packet filters and route filters on interfaces can use a name. VLAN maps also accept a name.
• A standard ACL and an extended ACL cannot have the same name.
• Numbered ACLs are also available.
• You can use standard or extended ACLs (named or numbered) in VLAN maps.
• With IPv4 QoS ACLs, if you enter the class-map \{match-all | match-any\} class-map-name global configuration command, you can enter these match commands:

  • match access-group acl-name

    Note: The ACL must be an extended named ACL.

  • match input-interface interface-id-list
  • match ip dscp dscp-list
  • match ip precedence ip-precedence-list

    You cannot enter the match access-group acl-index command.

**ACL Logging**

The switch software can provide logging messages about packets permitted or denied by a standard IP access list. That is, any packet that matches the ACL causes an informational logging message about the packet to be sent to the console. The level of messages logged to the console is controlled by the logging console commands controlling the syslog messages.

**Note**

Because routing is done in hardware and logging is done in software, if a large number of packets match a permit or deny ACE containing a log keyword, the software might not be able to match the hardware processing rate, and not all packets will be logged.

The first packet that triggers the ACL causes a logging message right away, and subsequent packets are collected over 5-minute intervals before they appear or logged. The logging message includes the access list number, whether the packet was permitted or denied, the source IP address of the packet, and the number of packets from that source permitted or denied in the prior 5-minute interval.

**Smart Logging**

When smart logging is enabled on the switch and an ACL configured with smart logging is attached to a Layer 2 interface (port ACL), the contents of packets denied or permitted because of the ACL are also sent to a specified NetFlow collector.

**Hardware and Software Treatment of IP ACLs**

ACL processing is performed in hardware. If the hardware reaches its capacity to store ACL configurations, all packets on that interface are dropped.

**Note**

If an ACL configuration cannot be implemented in hardware due to an out-of-resource condition on a switch or stack member, then only the traffic in that VLAN arriving on that switch is affected.

For router ACLs, other factors can cause packets to be sent to the CPU:
Using the **log** keyword

• Generating ICMP unreachable messages

When traffic flows are both logged and forwarded, forwarding is done by hardware, but logging must be done by software. Because of the difference in packet handling capacity between hardware and software, if the sum of all flows being logged (both permitted flows and denied flows) is of great enough bandwidth, not all of the packets that are forwarded can be logged.

When you enter the **show ip access-lists** privileged EXEC command, the match count displayed does not account for packets that are access controlled in hardware. Use the **show platform acl counters hardware** privileged EXEC command to obtain some basic hardware ACL statistics for switched and routed packets.

Router ACLs function as follows:

• The hardware controls permit and deny actions of standard and extended ACLs (input and output) for security access control.

• If **log** has not been specified, the flows that match a **deny** statement in a security ACL are dropped by the hardware if **ip unreachables** is disabled. The flows matching a **permit** statement are switched in hardware.

• Adding the **log** keyword to an ACE in a router ACL causes a copy of the packet to be sent to the CPU for logging only. If the ACE is a **permit** statement, the packet is still switched and routed in hardware.

### VLAN Map Configuration Guidelines

VLAN maps are the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

The following are the VLAN map configuration guidelines:

• If there is no ACL configured to deny traffic on an interface and no VLAN map is configured, all traffic is permitted.

• Each VLAN map consists of a series of entries. The order of entries in an VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.

• If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.

• Logging is not supported for VLAN maps.

• When a switch has an IP access list or MAC access list applied to a Layer 2 interface, and you apply a VLAN map to a VLAN that the port belongs to, the port ACL takes precedence over the VLAN map.

• If a VLAN map configuration cannot be applied in hardware, all packets in that VLAN are dropped.

• You can configure VLAN maps on primary and secondary VLANs. However, we recommend that you configure the same VLAN maps on private-VLAN primary and secondary VLANs.
When a frame is Layer-2 forwarded within a private VLAN, the same VLAN map is applied at the ingress side and at the egress side. When a frame is routed from inside a private VLAN to an external port, the private-VLAN map is applied at the ingress side.

- For frames going upstream from a host port to a promiscuous port, the VLAN map configured on the secondary VLAN is applied.
- For frames going downstream from a promiscuous port to a host port, the VLAN map configured on the primary VLAN is applied.

To filter out specific IP traffic for a private VLAN, you should apply the VLAN map to both the primary and secondary VLANs.

VLAN Maps with Router ACLs

To access control both bridged and routed traffic, you can use VLAN maps only or a combination of router ACLs and VLAN maps. You can define router ACLs on both input and output routed VLAN interfaces, and you can define a VLAN map to access control the bridged traffic.

If a packet flow matches a VLAN-map deny clause in the ACL, regardless of the router ACL configuration, the packet flow is denied.

Note

When you use router ACLs with VLAN maps, packets that require logging on the router ACLs are not logged if they are denied by a VLAN map.

If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action specified, the packet is forwarded if it does not match any VLAN map entry.

VLAN Maps and Router ACL Configuration Guidelines

These guidelines are for configurations where you need to have an router ACL and a VLAN map on the same VLAN. These guidelines do not apply to configurations where you are mapping router ACLs and VLAN maps on different VLANs.

If you must configure a router ACL and a VLAN map on the same VLAN, use these guidelines for both router ACL and VLAN map configuration:

- You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.
- Whenever possible, try to write the ACL with all entries having a single action except for the final, default action of the other type. That is, write the ACL using one of these two forms:
  
  ```permit... permit... permit... deny ip any any```
  
  or
  
  ```deny... deny... deny... permit ip any any```

- To define multiple actions in an ACL (permit, deny), group each action type together to reduce the number of entries.
• Avoid including Layer 4 information in an ACL; adding this information complicates the merging process. The best merge results are obtained if the ACLs are filtered based on IP addresses (source and destination) and not on the full flow (source IP address, destination IP address, protocol, and protocol ports). It is also helpful to use don’t care bits in the IP address, whenever possible.

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. This gives priority to the filtering of traffic based on IP addresses.

**Time Ranges for ACLs**

You can selectively apply extended ACLs based on the time of day and the week by using the `time-range` global configuration command. First, define a time-range name and set the times and the dates or the days of the week in the time range. Then enter the time-range name when applying an ACL to set restrictions to the access list. You can use the time range to define when the permit or deny statements in the ACL are in effect, for example, during a specified time period or on specified days of the week. The `time-range` keyword and argument are referenced in the named and numbered extended ACL task tables.

These are some benefits of using time ranges:

• You have more control over permitting or denying a user access to resources, such as an application (identified by an IP address/mask pair and a port number).

• You can control logging messages. ACL entries can be set to log traffic only at certain times of the day. Therefore, you can simply deny access without needing to analyze many logs generated during peak hours.

Time-based access lists trigger CPU activity because the new configuration of the access list must be merged with other features and the combined configuration loaded into the hardware memory. For this reason, you should be careful not to have several access lists configured to take affect in close succession (within a small number of minutes of each other.)

---

**Note**

The time range relies on the switch system clock; therefore, you need a reliable clock source. We recommend that you use Network Time Protocol (NTP) to synchronize the switch clock.

**Related Topics**

Configuring Time Ranges for ACLs, on page 1384

**IPv4 ACL Interface Considerations**

When you apply the `ip access-group` interface configuration command to a Layer 3 interface (an SVI, a Layer 3 EtherChannel, or a routed port), the interface must have been configured with an IP address. Layer 3 access groups filter packets that are routed or are received by Layer 3 processes on the CPU. They do not affect packets bridged within a VLAN.

For inbound ACLs, after receiving a packet, the switch checks the packet against the ACL. If the ACL permits the packet, the switch continues to process the packet. If the ACL rejects the packet, the switch discards the packet.
For outbound ACLs, after receiving and routing a packet to a controlled interface, the switch checks the packet against the ACL. If the ACL permits the packet, the switch sends the packet. If the ACL rejects the packet, the switch discards the packet.

By default, the input interface sends ICMP Unreachable messages whenever a packet is discarded, regardless of whether the packet was discarded because of an ACL on the input interface or because of an ACL on the output interface. ICMP Unreachables are normally limited to no more than one every one-half second per input interface, but this can be changed by using the `ip icmp rate-limit unreachable` global configuration command.

When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied to the interface and permits all packets. Remember this behavior if you use undefined ACLs for network security.

## How to Configure ACLs

### Configuring IPv4 ACLs

These are the steps to use IP ACLs on the switch:

**SUMMARY STEPS**

1. Create an ACL by specifying an access list number or name and the access conditions.
2. Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Create an ACL by specifying an access list number or name and the access conditions.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Apply the ACL to interfaces or terminal lines. You can also apply standard and extended IP ACLs to VLAN maps.</td>
</tr>
</tbody>
</table>

### Creating a Numbered Standard ACL

Beginning in privileged EXEC mode, follow these steps to create a numbered standard ACL:

**SUMMARY STEPS**

1. `configure terminal`
2. `access-list access-list-number {deny | permit} source source-wildcard [log]`
3. `end`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** configure terminal  
Example:  
Switch# configure terminal | Enters the global configuration mode. |
| **Step 2** access-list access-list-number {deny | permit} source source-wildcard [log]  
Example:  
Switch(config)# access-list 2 deny your_host | Defines a standard IPv4 access list by using a source address and wildcard.  
The access-list-number is a decimal number from 1 to 99 or 1300 to 1999.  
Enter deny or permit to specify whether to deny or permit access if conditions are matched.  
The source is the source address of the network or host from which the packet is being sent specified as:  
- The 32-bit quantity in dotted-decimal format.  
- The keyword any as an abbreviation for source and source-wildcard of 0.0.0.0/255.255.255.255. You do not need to enter a source-wildcard.  
- The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0.  
(Optional) The source-wildcard applies wildcard bits to the source.  
(Optional) Enter log to cause an informational logging message about the packet that matches the entry to be sent to the console.  
(Optional) Enter smartlog to send copies of denied or permitted packets to a NetFlow collector.  
**Note** Logging is supported only on ACLs attached to Layer 3 interfaces. |
| **Step 3** end  
Example:  
Switch(config)# end | Returns to privileged EXEC mode. |

<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td>The source-wildcard applies wildcard bits to the source. The destination is the network or host number to which the packet is sent. The destination-wildcard applies wildcard bits to the destination. Source, source-wildcard, destination, and destination-wildcard can be specified as:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• The 32-bit quantity in dotted-decimal format. • The keyword any for 0.0.0.0 255.255.255.255 (any host). • The keyword host for a single host 0.0.0.0. The other keywords are optional and have these meanings:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• precedence—Enter to match packets with a precedence level specified as a number from 0 to 7 or by name: routine (0), priority (1), immediate (2), flash (3), flash-override (4), critical (5), internet (6), network (7). • fragments—Enter to check non-initial fragments. • tos—Enter to match by type of service level, specified by a number from 0 to 15 or a name: normal (0), max-reliability (2), max-throughput (4), min-delay (8). • log—Enter to create an informational logging message to be sent to the console about the packet that matches the entry or log-input to include the input interface in the log entry. • smartlog—Enter when smart logging is globally enabled to have a copy of the denied or permitted packet sent to a NetFlow collector. • time-range—Specify the time-range name. • dscp—Enter to match packets with the DSCP value specified by a number from 0 to 63, or use the question mark (?) to see a list of available values.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note** If you enter a dscp value, you cannot enter tos or precedence. You can enter both a tos and a precedence value with no dscp.

**Step 3**

```plaintext
access-list access-list-number {deny | permit} tcp source source-wildcard [operator port] destination destination-wildcard [operator port] [established]
```

Defines an extended TCP access list and the access conditions.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| [precedence] [tos] [log] [log-input] [time-range] [dscp] [flag] | The parameters are the same as those described for an extended IPv4 ACL, with these exceptions: (Optional) Enter an operator and port to compare source (if positioned after source-wildcard) or destination (if positioned after destination-wildcard) port. Possible operators include eq (equal), gt (greater than), lt (less than), neq (not equal), and range (inclusive range). Operators require a port number (range requires two port numbers separated by a space). Enter the port number as a decimal number (from 0 to 65535) or the name of a TCP port. The other optional keywords have these meanings:  
  - **established**—Enter to match an established connection. This has the same function as matching on the ack or rst flag.  
  - **flag**—Enter one of these flags to match by the specified TCP header bits: ack (acknowledge), fin (finish), psh (push), rst (reset), syn (synchronize), or urg (urgent). |
| Example: Switch(config)# access-list 101 permit tcp any any eq 500 | |

**Step 4**

| access-list access-list-number {deny | permit} udp source source-wildcard [operator port] destination destination-wildcard [operator port] [precedence] [tos] [fragments] [log] [log-input] [time-range] [dscp] dscp |
|---|
| Example: Switch(config)# access-list 101 permit udp any any eq 100 |

| Step 5 | access-list access-list-number {deny | permit} icmp source source-wildcard destination destination-wildcard [operator port] [precedence] [tos] [fragments] [log] [log-input] [time-range] [dscp] dscp |
|---|
| Example: Switch(config)# access-list 101 permit icmp any any 200 |

**Step 5**

| access-list access-list-number {deny | permit} icmp source source-wildcard destination destination-wildcard [operator port] [precedence] [tos] [fragments] [log] [log-input] [time-range] [dscp] dscp |
|---|
| Example: Switch(config)# access-list 101 permit icmp any any 200 |

<table>
<thead>
<tr>
<th>Define an extended ICMP access list and the access conditions.</th>
</tr>
</thead>
</table>
| The ICMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:  
  - **icmp-type**—Enter to filter by ICMP message type, a number from 0 to 255.  
  - **icmp-code**—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.  
  - **icmp-message**—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. |
### Purpose

Command or Action | Purpose
--- | ---
Step 6  
access-list access-list-number {deny | permit} igmp source source-wildcard destination destination-wildcard [igmp-type] [precedence precedence] [tos tos] [fragments] [log [log-input]] [time-range time-range-name] [dscp dscp] | (Optional) Defines an extended IGMP access list and the access conditions. The IGMP parameters are the same as those described for most IP protocols in an extended IPv4 ACL, with this optional parameter.

**Example:**

Switch(config)# access-list 101 permit igmp any any 14

Step 7  
end | Returns to privileged EXEC mode.

**Example:**

Switch(config)# end

---

**Extended IP ACL with the any Keyword**

**Extended IP ACL with the host Keyword**

To use an abbreviation for a source and source wildcard of 0.0.0.0 255.255.255.255 and an abbreviation for a destination and destination wildcard of 0.0.0.0 255.255.255.255 when defining an extended IP ACL, use the `any` keyword in place of source and destination address and wildcard:

Switch# configure terminal
Switch(config)# access-list 101 permit ip any any precedence 0 tos 0 fragments log time-range workhours dscp 10
Switch(config)# end

To use an abbreviation for a source and a source wildcard of source 0.0.0.0 and an abbreviation for a destination and destination wildcard of destination 0.0.0.0 when defining an extended IP ACL, use the `host` keyword in place of the source and destination wildcard or mask:

Switch# configure terminal
Switch(config)# access-list 101 permit ip host 10.1.1.2 any
Switch(config)# end

**Creating Named Standard ACLs**

Beginning in privileged EXEC mode, follow these steps to create a standard ACL using names:
SUMMARY STEPS

1. configure terminal
2. ip access-list standard name
3. Use one of the following:
   - deny {source [source-wildcard] | host source | any} [log]
   - permit {source [source-wildcard] | host source | any} [log]
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Defines a standard IPv4 access list using a name, and enter access-list configuration mode. |
| ip access-list standard name |         |
| Example:          | The name can be a number from 1 to 99. |
| Switch(config)# ip access-list standard 20 |         |

| **Step 3**        | In access-list configuration mode, specify one or more conditions denied or permitted to decide if the packet is forwarded or dropped. |
| Use one of the following: |         |
| • deny {source [source-wildcard] | host source | any} [log] |         |
| • permit {source [source-wildcard] | host source | any} [log] |         |
| Example:          |         |
| Switch(config-std-nacl)# deny 192.168.0.0 0.0.255.255 255.255.0.0 0.0.255.255 |         |
| or                |         |
| Switch(config-std-nacl)# permit 10.108.0.0 0.0.0.0 255.255.255.0 0.0.0.0 |         |

| **Step 4**        | Returns to privileged EXEC mode. |
| end               |         |
| Example:          |         |
| Switch(config-std-nacl)# end |         |
Creating Extended Named ACLs

Beginning in privileged EXEC mode, follow these steps to create an extended ACL using names:

**SUMMARY STEPS**

1. configure terminal
2. ip access-list extended name
3. {deny | permit} protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [precedence precedence] [tos tos] [established] [log] [time-range time-range-name]
4. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip access-list extended name</td>
<td>Defines an extended IPv4 access list using a name, and enter access-list configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip access-list extended 150</td>
<td>The name can be a number from 100 to 199.</td>
</tr>
<tr>
<td><strong>Step 3</strong> {deny</td>
<td>permit} protocol {source [source-wildcard]</td>
</tr>
<tr>
<td>Example: Switch(config-ext-nacl)# permit 0 any any</td>
<td>* host source—A source and source wildcard of source 0.0.0.0.</td>
</tr>
<tr>
<td></td>
<td>* host destination—A destination and destination wildcard of destination 0.0.0.0.</td>
</tr>
<tr>
<td></td>
<td>* any—A source and source wildcard or destination and destination wildcard of 0.0.0.0 255.255.255.255.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config-ext-nacl)# end</td>
<td></td>
</tr>
</tbody>
</table>

When you are creating extended ACLs, remember that, by default, the end of the ACL contains an implicit deny statement for everything if it did not find a match before reaching the end. For standard ACLs, if you omit the mask from an associated IP host address access list specification, 0.0.0.0 is assumed to be the mask.
After you create an ACL, any additions are placed at the end of the list. You cannot selectively add ACL entries to a specific ACL. However, you can use `no permit` and `no deny` access-list configuration mode commands to remove entries from a named ACL. This example shows how you can delete individual ACEs from the named access list `border-list`:

```
Switch(config)# ip access-list extended border-list
Switch(config-ext-nacl)# no permit ip host 10.1.1.3 any
```

Being able to selectively remove lines from a named ACL is one reason you might use named ACLs instead of numbered ACLs.

**What to do next**

After creating a named ACL, you can apply it to interfaces or to VLANs.

## Configuring Time Ranges for ACLs

Beginning in privileged EXEC mode, follow these steps to configure a time-range parameter for an ACL:

**SUMMARY STEPS**

1. `configure terminal`
2. `time-range time-range-name`
3. Use one of the following:
   - `absolute [start time date] [end time date]`
   - `periodic day-of-the-week hh:mm to [day-of-the-week] hh:mm`
   - `periodic {weekdays | weekend | daily} hh:mm to hh:mm`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>time-range time-range-name</code></td>
<td>Assigns a meaningful name (for example, <code>workhours</code>) to the time range to be created, and enter time-range configuration mode. The name cannot contain a space or quotation mark and must begin with a letter.</td>
</tr>
<tr>
<td></td>
<td>Example: Switch(config)# time-range workhours</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>Use one of the following:</td>
<td>Specifies when the function it will be applied to is operational.</td>
</tr>
<tr>
<td></td>
<td>• <code>absolute [start time date] [end time date]</code></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

- **periodic** `day-of-the-week hh:mm` to `[day-of-the-week] hh:mm`
- **periodic** `{weekdays | weekend | daily}` `hh:mm` to `hh:mm`

**Example:**

Switch(config-time-range)# absolute start 00:00 1 Jan 2006 end 23:59 1 Jan 2006

or

Switch(config-time-range)# periodic weekdays 8:00 to 12:00

### Purpose

- You can use only one `absolute` statement in the time range. If you configure more than one absolute statement, only the one configured last is executed.
- You can enter multiple `periodic` statements. For example, you could configure different hours for weekdays and weekends.

See the example configurations.

### Step 4: `end`

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

---

**What to do next**

Repeat the steps if you have multiple items that you want in effect at different times.

**Related Topics**

- Time Ranges for ACLs, on page 1375

---

## Applying an IPv4 ACL to a Terminal Line

You can use numbered ACLs to control access to one or more terminal lines. You cannot apply named ACLs to lines. You must set identical restrictions on all the virtual terminal lines because a user can attempt to connect to any of them.

Beginning in privileged EXEC mode, follow these steps to restrict incoming and outgoing connections between a virtual terminal line and the addresses in an ACL:

### SUMMARY STEPS

1. `configure terminal`
2. `line [console | vty] line-number`
3. `access-class access-list-number {in | out}`
4. `end`
5. `show running-config`
6. `copy running-config startup-config`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>

Creating Named MAC Extended ACLs

You can filter non-IPv4 traffic on a VLAN or on a Layer 2 interface by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs.

Beginning in privileged EXEC mode, follow these steps to create a named MAC extended ACL:

### SUMMARY STEPS
1. `configure terminal`
2. `mac access-list extended name`
3. `{deny | permit} {any | host source MAC address | source MAC address mask} {any | host destination MAC address | destination MAC address mask} [type mask | lsap lsap mask | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp | 0-65535} [cos cos]`
4. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>

| **Step 2** | mac access-list extended name |
| **Example:** | Switch(config)# mac access-list extended mac1 |

| **Step 3** | `{deny | permit} {any | host source MAC address | source MAC address mask} {any | host destination MAC address | destination MAC address mask} [type mask | lsap lsap mask | aarp | amber | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp | 0-65535} [cos cos]` |
| **Example:** | Switch(config-ext-macl)# deny any any decnet-iv or |

In extended MAC access-list configuration mode, specifies to permit or deny any source MAC address, a source MAC address with a mask, or a specific host source MAC address and any destination MAC address, destination MAC address with a mask, or a specific destination MAC address. (Optional) You can also enter these options:

- **type mask**—An arbitrary EtherType number of a packet with Ethernet II or SNAP encapsulation in decimal, hexadecimal, or octal with optional mask of don’t care bits applied to the EtherType before testing for a match.
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-ext-macl)# permit any any | 1. **lsap lsap mask**—An LSAP number of a packet with IEEE 802.2 encapsulation in decimal, hexadecimal, or octal with optional mask of *don’t care* bits.  
3. **cos cos**—An IEEE 802.1Q cost of service number from 0 to 7 used to set priority. |

### Step 4

**Example:**

Switch(config-ext-macl)# end

Returns to privileged EXEC mode.

<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Step 2** | **interface interface-id**  
*Example:*  
Switch(config)# interface gigabitethernet1/0/2  
**Identifies a specific interface, and enter interface configuration mode. The interface must be a physical Layer 2 interface (port ACL).**

**Step 3** | **mac access-group {name} {in | out }**  
*Example:*  
Switch(config-if)# mac access-group mac1 in  
**Controls access to the specified interface by using the MAC access list.**  
**Port ACLs are supported in the outbound and inbound directions.**

**Step 4** | **end**  
*Example:*  
Switch(config-if)# end  
**Returns to privileged EXEC mode.**

**Step 5** | **show mac access-group [interface interface-id]**  
*Example:*  
Switch# show mac access-group interface gigabitethernet1/0/2  
**Displays the MAC access list applied to the interface or all Layer 2 interfaces.**

**Step 6** | **copy running-config startup-config**  
*Example:*  
Switch# copy running-config startup-config  
**(Optional) Saves your entries in the configuration file.**

---

After receiving a packet, the switch checks it against the inbound ACL. If the ACL permits it, the switch continues to process the packet. If the ACL rejects the packet, the switch discards it. When you apply an undefined ACL to an interface, the switch acts as if the ACL has not been applied and permits all packets. Remember this behavior if you use undefined ACLs for network security.

## Configuring VLAN Maps

To create a VLAN map and apply it to one or more VLANs, perform these steps:

**Before you begin**

Create the standard or extended IPv4 ACLs or named MAC extended ACLs that you want to apply to the VLAN.
SUMMARY STEPS

1. vlan access-map name [number]
2. match {ip | mac} address {name | number} [name | number]
3. Enter one of the following commands to specify an IP packet or a non-IP packet (with only a known MAC address) and to match the packet against one or more ACLs (standard or extended):
   - action { forward}
     
     Switch(config-access-map)# action forward
   - action { drop}
     
     Switch(config-access-map)# action drop

4. vlan filter mapname vlan-list list

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>vlan access-map name [number]</td>
<td>Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# vlan access-map map_1 20</td>
<td>When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete.</td>
</tr>
<tr>
<td>VLAN maps do not use the specific permit or deny keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and set the action to drop. A permit in the ACL counts as a match. A deny in the ACL means no match.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Entering this command changes to access-map configuration mode.</td>

<td>match {ip</td>
<td>mac} address {name</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-access-map)# match ip address ip2</td>
<td>If the VLAN map is configured with a match clause for a type of packet (IP or MAC) and the map action is drop, all packets that match the type are dropped. If the VLAN map has no match clause, and the configured action is drop, all IP and Layer 2 packets are dropped.</td>
</tr>
</tbody>
</table>
## Creating a VLAN Map

Each VLAN map consists of an ordered series of entries. Beginning in privileged EXEC mode, follow these steps to create, add to, or delete a VLAN map entry:

### SUMMARY STEPS

1. configure terminal  
2. vlan access-map name [number]  
3. match {ip | mac} address {name | number} [name | number]  
4. action {drop | forward}  
5. end  
6. show running-config  
7. copy running-config startup-config
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>

### Applying a VLAN Map to a VLAN

Beginning in privileged EXEC mode, follow these steps to apply a VLAN map to one or more VLANs:

**SUMMARY STEPS**

1. configure terminal
2. vlan filter mapname vlan-list list
3. end
4. show running-config
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal
| | Enters the global configuration mode.
| Example:
| Switch# configure terminal
| **Step 2** | vlan filter mapname vlan-list list
| | Applies the VLAN map to one or more VLAN IDs.
| | The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around the comma and hyphen are optional.
| Example:
| Switch(config)# vlan filter map 1 vlan-list 20-22
| **Step 3** | end
| | Returns to privileged EXEC mode.
| Example:
| Switch(config)# end
| **Step 4** | show running-config
| | Displays the access list configuration.
| Example:
| Switch# show running-config
Purpose
Command or Action | Purpose
---|---
Step 5 | copy running-config startup-config
Example: | (Optional) Saves your entries in the configuration file.
Switch# copy running-config startup-config

## Configuring VACL Logging

Beginning in privileged EXEC mode:

**SUMMARY STEPS**

1. configure terminal
2. vlan access-map name [number]
3. action drop log
4. exit
5. vlan access-log \{maxflow max_number | threshold pkt_count\}
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>vlan access-map name [number]</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# vlan access-map gandymede 10</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>action drop log</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

Switch(config-access-map)# **action drop log**

### Purpose

Exits the VLAN access map configuration mode and return to the global configuration mode.

### Step 4

**exit**

**Example:**

Switch(config-access-map)# **exit**

### Step 5

**vlan access-log {maxflow max_number | threshold pkt_count}**

**Example:**

Switch(config)# **vlan access-log threshold 4000**

Configures the VACL logging parameters.

- **maxflow max_number**—Sets the log table size. The content of the log table can be deleted by setting the maxflow to 0. When the log table is full, the software drops logged packets from new flows.
  
  The range is from 0 to 2048. The default is 500.

- **threshold pkt_count**—Sets the logging threshold. A logging message is generated if the threshold for a flow is reached before the 5-minute interval.
  
  The threshold range is from 0 to 2147483647. The default threshold is 0, which means that a syslog message is generated every 5 minutes.

### Step 6

**end**

**Example:**

Switch(config)# **end**

Returns to privileged EXEC mode.

---

### Monitoring IPv4 ACLs

You can monitor IPv4 ACLs by displaying the ACLs that are configured on the switch, and displaying the ACLs that have been applied to interfaces and VLANs.

When you use the **ip access-group** interface configuration command to apply ACLs to a Layer 2 or 3 interface, you can display the access groups on the interface. You can also display the MAC ACLs applied to a Layer 2 interface. You can use the privileged EXEC commands as described in this table to display this information.

#### Table 124: Commands for Displaying Access Lists and Access Groups

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>**show access-lists [number</td>
<td>name]**</td>
</tr>
</tbody>
</table>
### Command and Purpose

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show ip access-lists [number</td>
<td>name]`</td>
</tr>
<tr>
<td><code>show ip interface interface-id</code></td>
<td>Displays detailed configuration and status of an interface. If IP is enabled on the interface and ACLs have been applied by using the <code>ip access-group</code> interface configuration command, the access groups are included in the display.</td>
</tr>
<tr>
<td><code>show running-config [interface interface-id]</code></td>
<td>Displays the contents of the configuration file for the switch or the specified interface, including all configured MAC and IP access lists and which access groups are applied to an interface.</td>
</tr>
<tr>
<td><code>show mac access-group [interface interface-id]</code></td>
<td>Displays MAC access lists applied to all Layer 2 interfaces or the specified Layer 2 interface.</td>
</tr>
</tbody>
</table>

You can also monitor VLAN maps by displaying information about VLAN access maps or VLAN filters. Use the privileged EXEC commands in this table to display VLAN map information.

### Table 125: Commands for Displaying VLAN Map Information

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vlan access-map [mapname]</code></td>
<td>Displays information about all VLAN access maps or the specified access map.</td>
</tr>
<tr>
<td>`show vlan filter [access-map name</td>
<td>vlan vlan-id]`</td>
</tr>
</tbody>
</table>

## Configuration Examples for ACLs

### Examples: Using Time Ranges with ACLs

This example shows how to verify after you configure time ranges for `workhours` and to configure January 1, 2006, as a company holiday.

```
Switch# show time-range
time-range entry: new_year_day_2003 (inactive)
    absolute start 00:00 01 January 2006 end 23:59 01 January 2006
time-range entry: workhours (inactive)
    periodic weekdays 8:00 to 12:00
    periodic weekdays 13:00 to 17:00
```

To apply a time range, enter the time-range name in an extended ACL that can implement time ranges. This example shows how to create and verify extended access list 188 that denies TCP traffic from any source to any destination during the defined holiday times and permits all TCP traffic during work hours.
Switch(config)# access-list 188 deny tcp any any time-range new_year_day_2006
Switch(config)# access-list 188 permit tcp any any time-range workhours
Switch(config)# end
Switch# show access-lists
Extended IP access list 188
  10 deny tcp any any time-range new_year_day_2006 (inactive)
  20 permit tcp any any time-range workhours (inactive)

This example uses named ACLs to permit and deny the same traffic.

Switch(config)# ip access-list extended deny_access
Switch(config-ext-nacl)# deny tcp any any time-range new_year_day_2006
Switch(config-ext-nacl)# exit
Switch(config)# ip access-list extended may_access
Switch(config-ext-nacl)# permit tcp any any time-range workhours
Switch(config-ext-nacl)# end
Switch# show ip access-lists
Extended IP access list lpip_default
  10 permit ip any any
Extended IP access list deny_access
  10 deny tcp any any time-range new_year_day_2006 (inactive)
Extended IP access list may_access
  10 permit tcp any any time-range workhours (inactive)

Examples: Including Comments in ACLs

You can use the **remark** keyword to include comments (remarks) about entries in any IP standard or extended ACL. The remarks make the ACL easier for you to understand and scan. Each remark line is limited to 100 characters.

The remark can go before or after a permit or deny statement. You should be consistent about where you put the remark so that it is clear which remark describes which permit or deny statement. For example, it would be confusing to have some remarks before the associated permit or deny statements and some remarks after the associated statements.

To include a comment for IP numbered standard or extended ACLs, use the **access-list access-list number remark remark** global configuration command. To remove the remark, use the **no** form of this command.

In this example, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith through
Switch(config)# access-list 1 deny 171.69.3.13

For an entry in a named IP ACL, use the **remark** access-list configuration command. To remove the remark, use the **no** form of this command.

In this example, the Jones subnet is not allowed to use outbound Telnet:

Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp host 171.69.2.88 any eq telnet
Examples: Troubleshooting ACLs

If this ACL manager message appears and [chars] is the access-list name,

ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]

The switch has insufficient resources to create a hardware representation of the ACL. The resources include hardware memory and label space but not CPU memory. A lack of available logical operation units or specialized hardware resources causes this problem. Logical operation units are needed for a TCP flag match or a test other than eq (ne, gt, lt, or range) on TCP, UDP, or SCTP port numbers.

Use one of these workarounds:

• Modify the ACL configuration to use fewer resources.

• Rename the ACL with a name or number that alphanumerically precedes the ACL names or numbers.

To determine the specialized hardware resources, enter the show platform layer4 acl map privileged EXEC command. If the switch does not have available resources, the output shows that index 0 to index 15 are not available.

For more information about configuring ACLs with insufficient resources, see CSCsq63926 in the Bug Toolkit.

For example, if you apply this ACL to an interface:

```
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
permit tcp source source-wildcard destination destination-wildcard
```

And if this message appears:

ACLMGR-2-NOVMR: Cannot generate hardware representation of access list [chars]

The flag-related operators are not available. To avoid this issue,

• Move the fourth ACE before the first ACE by using ip access-list resequence global configuration command:

```
permit tcp source source-wildcard destination destination-wildcard
permit tcp source source-wildcard destination destination-wildcard range 5 60
permit tcp source source-wildcard destination destination-wildcard range 15 160
permit tcp source source-wildcard destination destination-wildcard range 115 1660
```

or

• Rename the ACL with a name or number that alphanumerically precedes the other ACLs (for example, rename ACL 79 to ACL 1).

You can now apply the first ACE in the ACL to the interface. The switch allocates the ACE to available mapping bits in the Opselect index and then allocates flag-related operators to use the same bits in the hardware memory.
IPv4 ACL Configuration Examples

This section provides examples of configuring and applying IPv4 ACLs. For detailed information about compiling ACLs, see the *Cisco IOS Security Configuration Guide, Release 12.4* and to the Configuring IP Services’ section in the “IP Addressing and Services” chapter of the *Cisco IOS IP Configuration Guide, Release 12.4*.

**ACLs in a Small Networked Office**

*Figure 74: Using Router ACLs to Control Traffic*

This shows a small networked office environment with routed Port 2 connected to Server A, containing benefits and other information that all employees can access, and routed Port 1 connected to Server B, containing confidential payroll data. All users can access Server A, but Server B has restricted access.

Use router ACLs to do this in one of two ways:

- Create a standard ACL, and filter traffic coming to the server from Port 1.
- Create an extended ACL, and filter traffic coming from the server into Port 1.

**Examples: ACLs in a Small Networked Office**

This example uses a standard ACL to filter traffic coming into Server B from a port, permitting traffic only from Accounting’s source addresses 172.20.128.64 to 172.20.128.95. The ACL is applied to traffic coming out of routed Port 1 from the specified source address.

```
Switch(config)# access-list 6 permit 172.20.128.64 0.0.0.31
Switch(config)# end
Switch# show access-lists
Standard IP access list 6
  10 permit 172.20.128.64, wildcard bits 0.0.0.31
```
**Example: Numbered ACLs**

In this example, network 36.0.0.0 is a Class A network whose second octet specifies a subnet; that is, its subnet mask is 255.255.0.0. The third and fourth octets of a network 36.0.0.0 address specify a particular host. Using access list 2, the switch accepts one address on subnet 48 and reject all others on that subnet. The last line of the list shows that the switch accepts addresses on all other network 36.0.0.0 subnets. The ACL is applied to packets entering a port.

```
Switch(config)# access-list 2 permit 36.48.0.3
Switch(config)# access-list 2 deny 36.48.0.0 0.0.255.255
Switch(config)# access-list 2 permit 36.0.0.0 0.255.255.255
```

**Examples: Extended ACLs**

In this example, the first line permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 128.88.1.2. The third line permits incoming ICMP messages for error feedback.

```
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 gt 1023
Switch(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Switch(config)# access-list 102 permit icmp any any
```

In this example, suppose that you have a network connected to the Internet, and you want any host on the network to be able to form TCP connections to any host on the Internet. However, you do not want IP hosts to be able to form TCP connections to hosts on your network, except to the mail (SMTP) port of a dedicated mail host.

SMTP uses TCP port 25 on one end of the connection and a random port number on the other end. The same port numbers are used throughout the life of the connection. Mail packets coming in from the Internet have a destination port of 25. Outbound packets have the port numbers reversed. Because the secure system of the network always accepts mail connections on port 25, the incoming and outgoing services are separately
controlled. The ACL must be configured as an input ACL on the outbound interface and an output ACL on the inbound interface.

```lua
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 23
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 eq 25
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 102 in
```

In this example, the network is a Class B network with the address 128.88.0.0, and the mail host address is 128.88.1.2. The `established` keyword is used only for the TCP to show an established connection. A match occurs if the TCP datagram has the ACK or RST bits set, which show that the packet belongs to an existing connection. Gigabit Ethernet interface 1 on stack member 1 is the interface that connects the router to the Internet.

```lua
Switch(config)# access-list 102 permit tcp any 128.88.0.0 0.0.255.255 established
Switch(config)# access-list 102 permit tcp any host 128.88.1.2 eq 25
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 102 in
```

### Examples: Named ACLs

This example creates a standard ACL named `internet_filter` and an extended ACL named `marketing_group`. The `internet_filter` ACL allows all traffic from the source address 1.2.3.4.

```lua
Switch(config)# ip access-list standard Internet_filter
Switch(config-ext-nacl)# permit 1.2.3.4
Switch(config-ext-nacl)# exit
```

The `marketing_group` ACL allows any TCP Telnet traffic to the destination address and wildcard 171.69.0.0 0.0.255.255 and denies any other TCP traffic. It permits ICMP traffic, denies UDP traffic from any source to the destination address range 171.69.0.0 through 179.69.255.255 with a destination port less than 1024, denies any other IP traffic, and provides a log of the result.

```lua
Switch(config)# ip access-list extended marketing_group
Switch(config-ext-nacl)# permit tcp any 171.69.0.0 0.0.255.255 eq telnet
Switch(config-ext-nacl)# deny tcp any
Switch(config-ext-nacl)# permit icmp any any
Switch(config-ext-nacl)# deny udp any 171.69.0.0 0.0.255.255 lt 1024
Switch(config-ext-nacl)# deny ip any any log
Switch(config-ext-nacl)# exit
```

The `Internet_filter` ACL is applied to outgoing traffic and the `marketing_group` ACL is applied to incoming traffic on a Layer 3 port.

```lua
Switch(config)# interface gigabitethernet3/0/2
Switch(config-if)# no switchport
Switch(config-if)# ip address 2.0.5.1 255.255.255.0
Switch(config-if)# ip access-group Internet_filter out
Switch(config-if)# ip access-group marketing_group in
```
Examples: Time Range Applied to an IP ACL

This example denies HTTP traffic on IP on Monday through Friday between the hours of 8:00 a.m. and 6:00 p.m (18:00). The example allows UDP traffic only on Saturday and Sunday from noon to 8:00 p.m. (20:00).

```plaintext
Switch(config)# time-range no-http
Switch(config)# periodic weekdays 8:00 to 18:00
!
Switch(config)# time-range udp-yes
Switch(config)# periodic weekend 12:00 to 20:00
!
Switch(config)# ip access-list extended strict
Switch(config-ext-nacl)# deny tcp any any eq www time-range no-http
Switch(config-ext-nacl)# permit udp any any time-range udp-yes
!
Switch(config-ext-nacl)# exit
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip access-group strict in
```

Examples: Commented IP ACL Entries

In this example of a numbered ACL, the workstation that belongs to Jones is allowed access, and the workstation that belongs to Smith is not allowed access:

```plaintext
Switch(config)# access-list 1 remark Permit only Jones workstation through
Switch(config)# access-list 1 permit 171.69.2.88
Switch(config)# access-list 1 remark Do not allow Smith workstation through
Switch(config)# access-list 1 deny 171.69.3.13
```

In this example of a numbered ACL, the Winter and Smith workstations are not allowed to browse the web:

```plaintext
Switch(config)# access-list 100 remark Do not allow Winter to browse the web
Switch(config)# access-list 100 deny host 171.69.3.85 any eq www
Switch(config)# access-list 100 remark Do not allow Smith to browse the web
Switch(config)# access-list 100 deny host 171.69.3.13 any eq www
```

In this example of a named ACL, the Jones subnet is not allowed access:

```plaintext
Switch(config)# ip access-list standard prevention
Switch(config-std-nacl)# remark Do not allow Jones subnet through
Switch(config-std-nacl)# deny 171.69.0.0 0.0.255.255
```

In this example of a named ACL, the Jones subnet is not allowed to use outbound Telnet:

```plaintext
Switch(config)# ip access-list extended telnetting
Switch(config-ext-nacl)# remark Do not allow Jones subnet to telnet out
Switch(config-ext-nacl)# deny tcp 171.69.0.0 0.0.255.255 any eq telnet
```

Examples: ACL Logging

Two variations of logging are supported on router ACLs. The `log` keyword sends an informational logging message to the console about the packet that matches the entry; the `log-input` keyword includes the input interface in the log entry.
In this example, standard named access list *stan1* denies traffic from 10.1.1.0 0.0.0.255, allows traffic from all other sources, and includes the *log* keyword.

```plaintext
Switch(config)# ip access-list standard stan1
Switch(config-standard-nacl)# deny 10.1.1.0 0.0.0.255 log
Switch(config-standard-nacl)# permit any log
Switch(config-standard-nacl)# exit
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group stan1 in
Switch(config-if)# end
```

Syslog logging: enabled (0 messages dropped, 0 flushes, 0 overruns)
- Console logging: level debugging, 37 messages logged
- Monitor logging: level debugging, 0 messages logged
- Buffer logging: level debugging, 37 messages logged
- File logging: disabled
- Trap logging: level debugging, 39 message lines logged

Log Buffer (4096 bytes):

- 00:00:48: NTP: authentication delay calculation problems
- <output truncated>
- 00:09:34:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet
- 00:09:59:%SEC-6-IPACCESSLOGS:list stan1 denied 10.1.1.15 1 packet
- 00:10:11:%SEC-6-IPACCESSLOGS:list stan1 permitted 0.0.0.0 1 packet

This example is a named extended access list *ext1* that permits ICMP packets from any source to 10.1.1.0 0.0.0.255 and denies all UDP packets.

```plaintext
Switch(config)# ip access-list extended ext1
Switch(config-ext-nacl)# permit icmp any 10.1.1.0 0.0.0.255 log
Switch(config-ext-nacl)# deny udp any any log
Switch(config-ext-nacl)# exit
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# ip access-group ext1 in
```

This is an example of a log for an extended ACL:

- 01:24:23:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 1 packet
- 01:25:14:%SEC-6-IPACCESSLOGDP:list ext1 permitted icmp 10.1.1.15 -> 10.1.1.61 (0/0), 7 packets
- 01:26:12:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 1 packet
- 01:31:33:%SEC-6-IPACCESSLOGDP:list ext1 denied udp 0.0.0.0(0) -> 255.255.255.255(0), 8 packets

Note that all logging entries for IP ACLs start with %SEC-6-IPACCESSLOG with minor variations in format depending on the kind of ACL and the access entry that has been matched.

This is an example of an output message when the *log-input* keyword is entered:

- 00:04:21:%SEC-6-IPACCESSLOGDP:list inputlog permitted icmp 10.1.1.10 (Vlan1 0001.42ef.a400) -> 10.1.1.61 (0/0), 1 packet
A log message for the same sort of packet using the log keyword does not include the input interface information:

00:05:47:%SEC-6-IPACCESSLOGDF:list inputlog permitted icmp 10.1.1.10 -> 10.1.1.61 (0/0), 1 packet

**Configuration Examples for ACLs and VLAN Maps**

**Example: Creating an ACL and a VLAN Map to Deny a Packet**

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the ip1 ACL (TCP packets) would be dropped. You first create the ip1 ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

```
Switch(config)# ip access-list extended ip1
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 10
Switch(config-access-map)# match ip address ip1
Switch(config-access-map)# action drop
```

**Example: Creating an ACL and a VLAN Map to Permit a Packet**

This example shows how to create a VLAN map to permit a packet. ACL ip2 permits UDP packets and any packets that match the ip2 ACL are forwarded. In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

```
Switch(config)# ip access-list extended ip2
Switch(config-ext-nacl)# permit udp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 20
Switch(config-access-map)# match ip address ip2
Switch(config-access-map)# action forward
```

**Example: Default Action of Dropping IP Packets and Forwarding MAC Packets**

In this example, the VLAN map has a default action of drop for IP packets and a default action of forward for MAC packets. Used with standard ACL 101 and extended named access lists igmp-match and tcp-match, the map will have the following results:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

```
Switch(config)# access-list 101 permit udp any any
Switch(config)# ip access-list extended igmp-match
```
Example: Default Action of Dropping MAC Packets and Forwarding IP Packets

In this example, the VLAN map has a default action of drop for MAC packets and a default action of forward for IP packets. Used with MAC extended access lists `good-hosts` and `good-protocols`, the map will have the following results:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets with decnet-iv or vines-ip protocols
- Drop all other non-IP packets
- Forward all IP packets

Example: Default Action of Dropping All Packets

In this example, the VLAN map has a default action of drop for all packets (IP and non-IP). Used with access lists `tcp-match` and `good-hosts` from Examples 2 and 3, the map will have the following results:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets
Configuration Examples for Using VLAN Maps in Your Network

Example: Wiring Closet Configuration

In a wiring closet configuration, routing might not be enabled on the switch. In this configuration, the switch can still support a VLAN map and a QoS classification ACL. Assume that Host X and Host Y are in different VLANs and are connected to wiring closet switches A and C. Traffic from Host X to Host Y is eventually being routed by Switch B, a Layer 3 switch with routing enabled. Traffic from Host X to Host Y can be access-controlled at the traffic entry point, Switch A.

If you do not want HTTP traffic switched from Host X to Host Y, you can configure a VLAN map on Switch A to drop all HTTP traffic from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge it to Switch B.

First, define the IP access list `http` that permits (matches) any TCP traffic on the HTTP port.

```
Switch(config) # ip access-list extended http
Switch(config-ext-nacl) # permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Switch(config-ext-nacl) # exit
```

Next, create VLAN access map `map2` so that traffic that matches the `http` access list is dropped and all other IP traffic is forwarded.

```
Switch(config) # vlan access-map drop-all-default 10
Switch(config-access-map) # match ip address tcp-match
Switch(config-access-map) # action forward
Switch(config-access-map) # exit
Switch(config) # vlan access-map drop-all-default 20
Switch(config-access-map) # match mac address good-hosts
Switch(config-access-map) # action forward
```
Example: Restricting Access to a Server on Another VLAN

You can restrict access to a server on another VLAN. For example, server 10.1.1.100 in VLAN 10 needs to have access denied to these hosts:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

![Diagram of VLAN map](image)

Example: Denying Access to a Server on Another VLAN

This example shows how to deny access to a server on another VLAN by creating the VLAN map SERVER1 that denies access to hosts in subnet 10.1.2.0/8, host 10.1.1.4, and host 10.1.1.8 and permits other IP traffic. The final step is to apply the map SERVER1 to VLAN 10.

Define the IP ACL that will match the correct packets.

```bash
Switch(config)# ip access-list extended SERVER1_ACL
Switch(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
```
Define a VLAN map using this ACL that will drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

Switch(config)# vlan access-map SERVER1_MAP
Switch(config-access-map)# match ip address SERVER1_ACL
Switch(config-access-map)# action drop
Switch(config)# vlan access-map SERVER1_MAP 20
Switch(config-access-map)# action forward
Switch(config-access-map)# exit

Apply the VLAN map to VLAN 10.

Switch(config)# vlan filter SERVER1_MAP vlan-list 10

Configuration Examples of Router ACLs and VLAN Maps Applied to VLANs

This section gives examples of applying router ACLs and VLAN maps to a VLAN for switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time the packet’s path crosses a line indicating a VLAN map or an ACL, it is also possible that the packet might be dropped, rather than forwarded.

Example: ACLs and Switched Packets

Figure 77: Applying ACLs on Switched Packets

This example shows how an ACL is applied on packets that are switched within a VLAN. Packets switched within the VLAN without being routed or forwarded by fallback bridging are only subject to the VLAN map of the input VLAN.

![Diagram of VLAN map and ACLs applied to switched packets](image-url)
Example: ACLs and Bridged Packets

Figure 78: Applying ACLs on Bridged Packets

This example shows how an ACL is applied on fallback-bridged packets. For bridged packets, only Layer 2 ACLs are applied to the input VLAN. Only non-IP, non-ARP packets can be fallback-bridged.

Example: ACLs and Routed Packets

Figure 79: Applying ACLs on Routed Packets

This example shows how ACLs are applied on routed packets. The ACLs are applied in this order:

1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN
Example: ACLs and Multicast Packets

This example shows how ACLs are applied on packets that are replicated for IP multicasting. A multicast packet being routed has two different kinds of filters applied: one for destinations that are other ports in the input VLAN and another for each of the destinations that are in other VLANs to which the packet has been routed. The packet might be routed to more than one output VLAN, in which case a different router output ACL and VLAN map would apply for each destination VLAN. The final result is that the packet might be permitted in some of the output VLANs and not in others. A copy of the packet is forwarded to those destinations where it is permitted. However, if the input VLAN map drops the packet, no destination receives a copy of the packet.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about IPv6 ACLs

You can filter IP Version 6 (IPv6) traffic by creating IPv6 access control lists (ACLs) and applying them to interfaces similarly to the way that you create and apply IP Version 4 (IPv4) named ACLs. You can also create and apply input router ACLs to filter Layer 3 management traffic when the switch is running the IP base and LAN base feature sets.

A switch supports two types of IPv6 ACLs:

• IPv6 router ACLs are supported on outbound or inbound traffic on Layer 3 interfaces, which can be routed ports, switch virtual interfaces (SVIs), or Layer 3 EtherChannels. IPv6 router ACLs apply only to IPv6 packets that are routed.

• IPv6 port ACLs are supported on inbound and outbound Layer 2 interfaces. IPv6 port ACLs are applied to all IPv6 packets entering the interface.

The switch does not support VLAN ACLs (VLAN maps) for IPv6 traffic.
You can apply both IPv4 and IPv6 ACLs to an interface. As with IPv4 ACLs, IPv6 port ACLs take precedence over router ACLs.

**Switch Stacks and IPv6 ACLs**

The active switch supports IPv6 ACLs in hardware and distributes the IPv6 ACLs to the stack members.

If a standby switch takes over as the active switch, it distributes the ACL configuration to all stack members. The member switches sync up the configuration distributed by the new active switch and flush out entries that are not required.

When an ACL is modified, attached to, or detached from an interface, the active switch distributes the change to all stack members.

**Interactions with Other Features and Switches**

- If an IPv6 router ACL is configured to deny a packet, the packet is not routed. A copy of the packet is sent to the Internet Control Message Protocol (ICMP) queue to generate an ICMP unreachable message for the frame.
- If a bridged frame is to be dropped due to a port ACL, the frame is not bridged.
- You can create both IPv4 and IPv6 ACLs on a switch or switch stack, and you can apply both IPv4 and IPv6 ACLs to the same interface. Each ACL must have a unique name; an error message appears if you try to use a name that is already configured.
  
  You use different commands to create IPv4 and IPv6 ACLs and to attach IPv4 or IPv6 ACLs to the same Layer 2 or Layer 3 interface. If you use the wrong command to attach an ACL (for example, an IPv4 command to attach an IPv6 ACL), you receive an error message.
- You cannot use MAC ACLs to filter IPv6 frames. MAC ACLs can only filter non-IP frames.
- If the hardware memory is full, packets are dropped on the interface and an unload error message is logged.

**Restrictions for IPv6 ACLs**

With IPv4, you can configure standard and extended numbered IP ACLs, named IP ACLs, and MAC ACLs. IPv6 supports only named ACLs.

The switch supports most Cisco IOS-supported IPv6 ACLs with some exceptions:

- The switch does not support matching on these keywords: `flowlabel`, `routing header`, and `undetermined-transport`.
- The switch does not support reflexive ACLs (the `reflect` keyword).
- This release supports only port ACLs and router ACLs for IPv6; it does not support VLAN ACLs (VLAN maps).
- The switch does not apply MAC-based ACLs on IPv6 frames.
- You cannot apply IPv6 port ACLs to Layer 2 EtherChannels.
• When configuring an ACL, there is no restriction on keywords entered in the ACL, regardless of whether or not they are supported on the platform. When you apply the ACL to an interface that requires hardware forwarding (physical ports or SVIs), the switch checks to determine whether or not the ACL can be supported on the interface. If not, attaching the ACL is rejected.

• If an ACL is applied to an interface and you attempt to add an access control entry (ACE) with an unsupported keyword, the switch does not allow the ACE to be added to the ACL that is currently attached to the interface.

IPv6 ACLs on the switch have these characteristics:

• Fragmented frames (the fragments keyword as in IPv4) are supported
• The same statistics supported in IPv4 are supported for IPv6 ACLs.
• If the switch runs out of hardware space, the packets associated with the ACL are dropped on the interface.
• Logging is supported for router ACLs, but not for port ACLs.
• The switch supports IPv6 address-matching for a full range of prefix-lengths.

### Default Configuration for IPv6 ACLs

The default IPv6 ACL configuration is as follows:

```
Switch# show access-lists preauth_ipv6_acl
IPv6 access list preauth_ipv6_acl (per-user)
permit udp any any eq domain sequence 10
permit tcp any any eq domain sequence 20
permit icmp any any nd-ns sequence 30
permit icmp any any router-solicitation sequence 50
permit icmp any any router-advertisement sequence 60
permit icmp any any redirect sequence 70
permit udp any eq 547 any eq 546 sequence 80
permit udp any eq 546 any eq 547 sequence 90
deny ipv6 any any sequence 100
```

### How to Configure IPv6 ACLs

To filter IPv6 traffic, you perform these steps:

1. Create an IPv6 ACL, and enter IPv6 access list configuration mode.
2. Configure the IPv6 ACL to block (deny) or pass (permit) traffic.
3. Apply the IPv6 ACL to an interface. For router ACLs, you must also configure an IPv6 address on the Layer 3 interface to which the ACL is applied.

### SUMMARY STEPS

1. `configure terminal`
2. `[no] ipv6 access-list list-name [client permit-control-packets] [log-update threshold] [role-based]
   list-name`
3.  [no]deny | permit| protocol {source-ipv6-prefix/prefix-length|any threshold| host source-ipv6-address} 
   [ operator [ port-number ] } { destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address} 
   [operator [port-number]]| [dscp value] [fragments] [log] [log-input] [routing] [sequence value] 
   [time-range name]
4.  {deny | permit} tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator 
   [port-number]] {destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address} [operator 
   [port-number]] | [ack] [dscp value] [established] | [fin] [log] [log-input] | [neq] | [port | protocol] | [psh] 
   | [range | port | protocol] | [rst] | [routing] | [sequence value] | [syn] | [time-range name] | [urg]
5.  {deny | permit} udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator 
   [port-number]] {destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address} [operator 
   [port-number]] | [dscp value] [log] [log-input] | [neq] | [port | protocol] | [range | port | protocol] | [routing] 
   | [sequence value] | [time-range name]
6.  {deny | permit} icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator 
   [port-number]] {destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address} [operator 
   [port-number]] | [icmp-type] [icmp-code] | icmp-message] | [dscp value] [log] [log-input] | [routing] | [sequence value] | [time-range name]
7.  end
8.  show ipv6 access-list
9.  copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch)# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 [no] ipv6 access-list list-name</td>
<td>client permit-control-packets log-update threshold</td>
</tr>
<tr>
<td>Example: Switch(config)# ipv6 access-list example_acl_list</td>
<td>Defines an IPv6 ACL name, and enters IPv6 access list configuration mode.</td>
</tr>
</tbody>
</table>
| Step 3 [no] deny | permit| protocol | source-ipv6-prefix/prefix-length|any threshold| host source-ipv6-address} 
   [ operator [ port-number ] } { destination-ipv6-prefix/ prefix-length | any | host destination-ipv6-address} 
   [operator [port-number]]| [dscp value] [fragments] [log] [log-input] [routing] [sequence value] | [time-range name] | Enter deny or permit to specify whether to deny or permit the packet if conditions are matched. These are the conditions:

- For protocol, enter the name or number of an Internet protocol: ahp, esp, icmp, ipv6, pcp, step, tcp, or udp, or an integer in the range 0 to 255 representing an IPv6 protocol number.
- The source-ipv6-prefix/ prefix-length or destination-ipv6-prefix/ prefix-length is the source or destination IPv6 network or class of networks for which to set deny or permit conditions, specified in hexadecimal and using 16-bit values between colons (see RFC 2373).
- Enter any as an abbreviation for the IPv6 prefix ::/0.
### Command or Action

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{deny</td>
<td>permit} tcp {source-ipv6-prefix/prefix-length</td>
</tr>
</tbody>
</table>

### Purpose

- For **host** source-ipv6-address or destination-ipv6-address, enter the source or destination IPv6 host address for which to set deny or permit conditions, specified in hexadecimal using 16-bit values between colons.

- (Optional) For operator, specify an operand that compares the source or destination ports of the specified protocol. Operands are **lt** (less than), **gt** (greater than), **eq** (equal), **neq** (not equal), and **range**. If the operator follows the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator follows the destination-ipv6-prefix/prefix-length argument, it must match the destination port.

- (Optional) The **port-number** is a decimal number from 0 to 65535 or the name of a TCP or UDP port. You can use TCP port names only when filtering TCP. You can use UDP port names only when filtering UDP.

- (Optional) Enter **dscp** value to match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.

- (Optional) Enter **fragments** to check noninitial fragments. This keyword is visible only if the protocol is ipv6.

- (Optional) Enter **log** to cause an logging message to be sent to the console about the packet that matches the entry. Enter **log-input** to include the input interface in the log entry. Logging is supported only for router ACLs.

- (Optional) Enter **routing** to specify that IPv6 packets be routed.

- (Optional) Enter **sequence value** to specify the sequence number for the access list statement. The acceptable range is from 1 to 4,294,967,295.

- (Optional) Enter **time-range** name to specify the time range that applies to the deny or permit statement.

---

### Step 4

(Optional) Define a TCP access list and the access conditions.

Enter **tcp** for Transmission Control Protocol. The parameters are the same as those described in Step 3a, with these additional optional parameters:
### How to Configure IPv6 ACLs

**Step 5**

```plaintext
{deny | permit} udp
{source-ipv6-prefix/prefix-length | any | host source-ipv6-address}
{destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
{operator [port-number]} [operator [port-number]]
{dscp value} [log] [log-input] [neq {port | protocol}] [range {port | protocol}]
{routing} [sequence value] [time-range name]
```

(Optional) Define a UDP access list and the access conditions.

Enter **udp** for the User Datagram Protocol. The UDP parameters are the same as those described for TCP, except that the [operator [port]] port number or name must be a UDP port number or name, and the established parameter is not valid for UDP.

**Step 6**

```plaintext
{deny | permit} icmp
{source-ipv6-prefix/prefix-length | any | host source-ipv6-address}
{destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address}
{operator [port-number]} [operator [port-number]]
{icmp-type [icmp-code]} [icmp-message] [dscp value] [log]
[log-input] [routing] [sequence value] [time-range name]
```

(Optional) Define an ICMP access list and the access conditions.

Enter **icmp** for Internet Control Message Protocol. The ICMP parameters are the same as those described for most IP protocols in Step 1, with the addition of the ICMP message type and code parameters. These optional keywords have these meanings:

- **icmp-type**—Enter to filter by ICMP message type, a number from 0 to 255.
- **icmp-code**—Enter to filter ICMP packets that are filtered by the ICMP message code type, a number from 0 to 255.
- **icmp-message**—Enter to filter ICMP packets by the ICMP message type name or the ICMP message type and code name. To see a list of ICMP message type names and code names, use the `?` key or see command reference for this release.

**Step 7**

```plaintext
end
```

Return to privileged EXEC mode.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 8 show ipv6 access-list</td>
<td>Verify the access list configuration.</td>
</tr>
<tr>
<td>Step 9 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Example**

Use the `no {deny | permit} IPv6 access-list` configuration commands with keywords to remove the deny or permit conditions from the specified access list.

This example configures the IPv6 access list named CISCO. The first deny entry in the list denies all packets that have a destination TCP port number greater than 5000. The second deny entry denies packets that have a source UDP port number less than 5000. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets. The second permit entry in the list permits all other traffic. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch(config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
```

**What to do next**

Attach the IPv6 ACL to an Interface

**How to Attach an IPv6 ACL to an Interface**

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces, or to inbound traffic on Layer 2 interfaces. You can also apply ACLs only to inbound management traffic on Layer 3 interfaces.

Beginning in privileged EXEC mode, follow these steps to control access to an interface:

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. no switchport
4. ipv6 address ipv6-address
5. ipv6 traffic-filter access-list-name [in | out]
6. end
7. show running-config
8. copy running-config startup-config
DETAILED STEPS

<table>

<tr>
<td><strong>Step 4</strong> ipv6 address pv6-address</td>
<td>Configure an IPv6 address on a Layer 3 interface (for router ACLs).</td>
</tr>
<tr>
<td><strong>Step 5</strong> ipv6 traffic-filter access-list-name {in</td>
<td>out}</td>
</tr>
<tr>
<td><strong>Step 6</strong> end</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 7</strong> show running-config</td>
<td>Verify the access list configuration.</td>
</tr>
<tr>
<td><strong>Step 8</strong> copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Example**

Use the *no ipv6 traffic-filter access-list-name* interface configuration command to remove an access list from an interface.

This example shows how to apply the access list Cisco to outbound traffic on a Layer 3 interface:

```
Switch(config)# interface gigabitethernet 1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

**Monitoring IPv6 ACLs**

You can display information about all configured access lists, all IPv6 access lists, or a specific access list by using one or more of the privileged EXEC commands shown in the table below:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show access-lists</td>
<td>Displays all access lists configured on the switch.</td>
</tr>
<tr>
<td>show ipv6 access-list [access-list-name]</td>
<td>Displays all configured IPv6 access lists or the access list specified by name.</td>
</tr>
</tbody>
</table>
This is an example of the output from the show access-lists privileged EXEC command. The output shows all access lists that are configured on the switch or switch stack.

```
Switch # show access-lists
Extended IP access list hello
    10 permit ip any any
IPv6 access list ipv6
    permit ipv6 any any sequence 10
```

This is an example of the output from the show ipv6 access-list privileged EXEC command. The output shows only IPv6 access lists configured on the switch or switch stack.

```
Switch# show ipv6 access-list
IPv6 access list inbound
    permit tcp any any eq bgp (8 matches) sequence 10
    permit tcp any any eq telnet (15 matches) sequence 20
    permit udp any any sequence 30

IPv6 access list outbound
    deny udp any any sequence 10
    deny tcp any any eq telnet sequence 20
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About DHCP

DHCP Server

The DHCP server assigns IP addresses from specified address pools on a switch or router to DHCP clients and manages them. If the DHCP server cannot give the DHCP client the requested configuration parameters from its database, it forwards the request to one or more secondary DHCP servers defined by the network administrator.

The switch can act as a DHCP server.

DHCP Relay Agent

A DHCP relay agent is a Layer 3 device that forwards DHCP packets between clients and servers. Relay agents forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is different from the normal Layer 2 forwarding, in which IP datagrams are switched transparently between networks. Relay agents receive DHCP messages and generate new DHCP messages to send on output interfaces.
**DHCP Snooping**

DHCP snooping is a DHCP security feature that provides network security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding database, also referred to as a DHCP snooping binding table.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. You use DHCP snooping to differentiate between untrusted interfaces connected to the end user and trusted interfaces connected to the DHCP server or another switch.

**Note**

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

An untrusted DHCP message is a message that is received through an untrusted interface. By default, the switch considers all interfaces untrusted. So, the switch must be configured to trust some interfaces to use DHCP Snooping. When you use DHCP snooping in a service-provider environment, an untrusted message is sent from a device that is not in the service-provider network, such as a customer’s switch. Messages from unknown devices are untrusted because they can be sources of traffic attacks.

The DHCP snooping binding database has the MAC address, the IP address, the lease time, the binding type, the VLAN number, and the interface information that corresponds to the local untrusted interfaces of a switch. It does not have information regarding hosts interconnected with a trusted interface.

In a service-provider network, an example of an interface you might configure as trusted is one connected to a port on a device in the same network. An example of an untrusted interface is one that is connected to an untrusted interface in the network or to an interface on a device that is not in the network.

When a switch receives a packet on an untrusted interface and the interface belongs to a VLAN in which DHCP snooping is enabled, the switch compares the source MAC address and the DHCP client hardware address. If the addresses match (the default), the switch forwards the packet. If the addresses do not match, the switch drops the packet.

The switch drops a DHCP packet when one of these situations occurs:

- A packet from a DHCP server, such as a DHCPOFFER, DHCPACK, DHCPNAK, or DHCPLEASEQUERY packet, is received from outside the network or firewall.
- A packet is received on an untrusted interface, and the source MAC address and the DHCP client hardware address do not match.
- The switch receives a DHCPRELEASE or DHCPDECLINE broadcast message that has a MAC address in the DHCP snooping binding database, but the interface information in the binding database does not match the interface on which the message was received.
- A DHCP relay agent forwards a DHCP packet that includes a relay-agent IP address that is not 0.0.0.0, or the relay agent forwards a packet that includes option-82 information to an untrusted port.

If the switch is an aggregation switch supporting DHCP snooping and is connected to an edge switch that is inserting DHCP option-82 information, the switch drops packets with option-82 information when packets are received on an untrusted interface. If DHCP snooping is enabled and packets are received on a trusted port, the aggregation switch does not learn the DHCP snooping bindings for connected devices and cannot build a complete DHCP snooping binding database.
When an aggregation switch can be connected to an edge switch through an untrusted interface and you enter the `ip dhcp snooping information option allow-untrusted` global configuration command, the aggregation switch accepts packets with option-82 information from the edge switch. The aggregation switch learns the bindings for hosts connected through an untrusted switch interface. The DHCP security features, such as dynamic ARP inspection or IP source guard, can still be enabled on the aggregation switch while the switch receives packets with option-82 information on untrusted input interfaces to which hosts are connected. The port on the edge switch that connects to the aggregation switch must be configured as a trusted interface.

## Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

---

**Note**
The DHCP option-82 feature is supported only when DHCP snooping is globally enabled on the VLANs to which subscriber devices using option-82 are assigned.

---

The following illustration shows a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

*Figure 81: DHCP Relay Agent in a Metropolitan Ethernet Network*

When you enable the DHCP snooping information option 82 on the switch, the following sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
• When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, `vlan-mod-port`, from which the packet is received. You can configure the remote ID and circuit ID.

• If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.

• The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

• The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

• The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields do not change (see the illustration, `Suboption Packet Formats`):

• Circuit-ID suboption fields
  • Suboption type
  • Length of the suboption type
  • Circuit-ID type
  • Length of the circuit-ID type

• Remote-ID suboption fields
  • Suboption type
  • Length of the suboption type
  • Remote-ID type
  • Length of the remote-ID type

In the port field of the circuit ID suboption, the port numbers start at 3. For example, on a switch with 24 10/100/1000 ports and four small form-factor pluggable (SFP) module slots, port 3 is the Gigabit Ethernet 1/0/1 port, port 4 is the Gigabit Ethernet 1/0/2 port, and so forth. Port 27 is the SFP module slot Gigabit Ethernet1/0/25, and so forth.

The illustration, `Suboption Packet Formats`, shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch number in the stack. The switch uses the packet formats when you globally enable DHCP snooping and enter the `ip dhcp snooping information option global configuration command.`
Figure 82: Suboption Packet Formats

**Circuit ID Suboption Frame Format**

<table>
<thead>
<tr>
<th>Suboption type</th>
<th>Circuit ID type</th>
<th>Length</th>
<th>VLAN</th>
<th>Module</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>1 byte</td>
<td>2 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
</tr>
</tbody>
</table>

**Remote ID Suboption Frame Format**

<table>
<thead>
<tr>
<th>Suboption type</th>
<th>Remote ID type</th>
<th>Length</th>
<th>MAC address</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>1 byte</td>
<td>6 bytes</td>
</tr>
</tbody>
</table>

The illustration, *User-Configured Suboption Packet Formats*, shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the `ip dhcp snooping information option format remote-id` global configuration command and the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- **Circuit-ID suboption fields**
  - The circuit-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.

- **Remote-ID suboption fields**
  - The remote-ID type is 1.
  - The length values are variable, depending on the length of the string that you configure.
Cisco IOS DHCP Server Database

During the DHCP-based autoconfiguration process, the designated DHCP server uses the Cisco IOS DHCP server database. It has IP addresses, address bindings, and configuration parameters, such as the boot file.

An address binding is a mapping between an IP address and a MAC address of a host in the Cisco IOS DHCP server database. You can manually assign the client IP address, or the DHCP server can allocate an IP address from a DHCP address pool. For more information about manual and automatic address bindings, see the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4.

DHCP Snooping Binding Database

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 64,000 bindings.

Each database entry (binding) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database agent stores the bindings in a file at a configured location. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP inspection or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.
When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch updates the file when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

This is the format of the file with bindings:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
...
<entry-n> <checksum-1-2-..-n>
END
```

Each entry in the file is tagged with a checksum value that the switch uses to verify the entries when it reads the file. The initial-checksum entry on the first line distinguishes entries associated with the latest file update from entries associated with a previous file update.

This is an example of a binding file:

```
2bb4c2a1
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
192.1.168.1 3 0003.47d8.c91f 2BB6488E Gi1/0/4 21ae5fbb
192.1.168.3 3 0003.44d6.c52f 2BB648EB Gi1/0/4 1b0b223f
192.1.168.2 3 0003.47d9.c8f1 2BB648AB Gi1/0/4 58a438f0
END
```

When the switch starts and the calculated checksum value equals the stored checksum value, the switch reads entries from the binding file and adds the bindings to its DHCP snooping binding database. The switch ignores an entry when one of these situations occurs:

- The switch reads the entry and the calculated checksum value does not equal the stored checksum value. The entry and the ones following it are ignored.
- An entry has an expired lease time (the switch might not remove a binding entry when the lease time expires).
- The interface in the entry no longer exists on the system.
- The interface is a routed interface or a DHCP snooping-trusted interface.

**DHCP Snooping and Switch Stacks**

DHCP snooping is managed on the stack master. When a new switch joins the stack, the switch receives the DHCP snooping configuration from the stack master. When a member leaves the stack, all DHCP snooping address bindings associated with the switch age out.
All snooping statistics are generated on the stack master. If a new stack master is elected, the statistics counters reset.

When a stack merge occurs, all DHCP snooping bindings in the stack master are lost if it is no longer the stack master. With a stack partition, the existing stack master is unchanged, and the bindings belonging to the partitioned switches age out. The new master of the partitioned stack begins processing the new incoming DHCP packets.

How to Configure DHCP Features

Default DHCP Snooping Configuration

Table 126: Default DHCP Configuration

<table>
<thead>
<tr>
<th>Feature</th>

</tr>
<tr>
<td>DHCP snooping binding database agent</td>
<td>Enabled in Cisco IOS software, requires configuration. This feature is</td>
</tr>
<tr>
<td></td>
<td>operational only when a destination is configured.</td>
</tr>
</tbody>
</table>
The switch responds to DHCP requests only if it is configured as a DHCP server.
The switch relays DHCP packets only if the IP address of the DHCP server is configured on the SVI of the DHCP client.
Use this feature when the switch is an aggregation switch that receives packets with option-82 information from an edge switch.

DHCP Snooping Configuration Guidelines

- If a switch port is connected to a DHCP server, configure a port as trusted by entering the `ip dhcp snooping trust interface` configuration command.
- If a switch port is connected to a DHCP client, configure a port as untrusted by entering the `no ip dhcp snooping trust` interface configuration command.
- You can display DHCP snooping statistics by entering the `show ip dhcp snooping statistics` user EXEC command, and you can clear the snooping statistics counters by entering the `clear ip dhcp snooping statistics` privileged EXEC command.

Configuring the DHCP Server

The switch can act as a DHCP server.

For procedures to configure the switch as a DHCP server, see the “Configuring DHCP” section of the “IP addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.4.

DHCP Server and Switch Stacks

The DHCP binding database is managed on the stack master. When a new stack master is assigned, the new master downloads the saved binding database from the TFTP server. If the stack master fails, all unsaved bindings are lost. The IP addresses associated with the lost bindings are released. You should configure an automatic backup by using the `ip dhcp database url [timeout seconds] [write-delay seconds]` global configuration command.

When a stack merge occurs, the stack master that becomes a stack member loses all of the DHCP lease bindings. With a stack partition, the new master in the partition acts as a new DHCP server without any of the existing DHCP lease bindings.

Configuring the DHCP Relay Agent

Beginning in privileged EXEC mode, follow these steps to enable the DHCP relay agent on the switch:

SUMMARY STEPS

1. configure terminal
2. service dhcp
3. end
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enables the DHCP server and relay agent on your switch. By default, this feature is enabled.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Examples:</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>service dhcp</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# service dhcp</code></td>
<td>Examples:</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>end</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# end</code></td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

See the “Configuring DHCP” section of the “IP Addressing and Services” section of the Cisco IOS IP Configuration Guide, Release 12.4 for these procedures:

- Checking (validating) the relay agent information
- Configuring the relay agent forwarding policy

**Specifying the Packet Forwarding Address**

If the DHCP server and the DHCP clients are on different networks or subnets, you must configure the switch with the `ip helper-address address` interface configuration command. The general rule is to configure the command on the Layer 3 interface closest to the client. The address used in the `ip helper-address` command can be a specific DHCP server IP address, or it can be the network address if other DHCP servers are on the destination network segment. Using the network address enables any DHCP server to respond to requests.

Beginning in privileged EXEC mode, follow these steps to specify the packet forwarding address:

**SUMMARY STEPS**

1. `configure terminal`
2. `interface vlan vlan-id`
3. `ip address ip-address subnet-mask`
4. `ip helper-address address`
5. `end`
6. `interface range port-range` or `interface interface-id`
7. `switchport mode access`
8. `switchport access vlan vlan-id`
# Specifying the Packet Forwarding Address

## DETAILED STEPS

<table>
<thead>
<tr>

</tbody>
</table>
Prerequisites for Configuring DHCP Snooping and Option 82

The prerequisites for DHCP Snooping and Option 82 are as follows:

- Before configuring the DHCP snooping information option on your switch, be sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, or you must configure DHCP options for these devices.

- For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces.

- Before configuring the DHCP relay agent on your switch, make sure to configure the device that is acting as the DHCP server. You must specify the IP addresses that the DHCP server can assign or exclude, configure DHCP options for devices, or set up the DHCP database agent.

- The following prerequisites apply to DHCP snooping binding database configuration:
  - Because both NVRAM and the flash memory have limited storage capacity, we recommend that you store the binding file on a TFTP server.
  - For network-based URLs (such as TFTP and FTP), you must create an empty file at the configured URL before the switch can write bindings to the binding file at that URL. See the documentation for your TFTP server to determine whether you must first create an empty file on the server; some TFTP servers cannot be configured this way.
  - To ensure that the lease time in the database is accurate, we recommend that you enable and configure Network Time Protocol (NTP).
  - If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

- If you want the switch to respond to DHCP requests, it must be configured as a DHCP server.

- If you want the switch to relay DHCP packets, the IP address of the DHCP server must be configured on the switch virtual interface (SVI) of the DHCP client.

- To use the DHCP snooping option of accepting packets on untrusted inputs, the switch must be an aggregation switch that receives packets with option-82 information from an edge switch.

- The following two list items should be checked for technical accuracy by a subject matter expert:
  - You must configure the switch to use the Cisco IOS DHCP server binding database to use it for DHCP snooping.
• You must configure a destination on the DHCP snooping binding database to use the switch for DHCP snooping.

• For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces. In a service-provider network, a trusted interface is connected to a port on a device in the same network.

• You must globally enable DHCP snooping on the switch.

• Before globally enabling DHCP snooping on the switch, make sure that the devices acting as the DHCP server and the DHCP relay agent are configured and enabled.

• When you configure DHCP snooping smart logging, the contents of packets dropped by DHCP are sent to a NetFlow collector. If you configure this feature, make sure that smart logging is globally enabled.

Note: Do not enable Dynamic Host Configuration Protocol (DHCP) snooping on RSPAN VLANs. If DHCP snooping is enabled on RSPAN VLANs, DHCP packets might not reach the RSPAN destination port.

DHCP Snooping, on page 1424

### Enabling DHCP Snooping and Option 82

Beginning in privileged EXEC mode, follow these steps to enable DHCP snooping on the switch:

#### SUMMARY STEPS

1. configure terminal
2. ip dhcp snooping
3. ip dhcp snooping vlan vlan-range [smartlog]
4. ip dhcp snooping information option
5. ip dhcp snooping information option format remote-id [string ASCII-string | hostname]
6. ip dhcp snooping information option allow-untrusted
7. interface interface-id
8. ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string
9. ip dhcp snooping trust
10. ip dhcp snooping limit rate rate
11. exit
12. ip dhcp snooping verify mac-address
13. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>

Example:
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch# configure terminal</code></td>
<td>Enables DHCP snooping globally.</td>
</tr>
</tbody>
</table>

**Step 2**

**ip dhcp snooping**

**Example:**

`Switch(config)# ip dhcp snooping`

**Step 3**

**ip dhcp snooping vlan vlan-range [smartlog]**

**Example:**

`Switch(config)# ip dhcp snooping vlan 10`

- Enables DHCP snooping on a VLAN or range of VLANs. The range is 1 to 4094.
  - You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space.
  - (Optional) Enter `smartlog` to configure the switch to send the contents of dropped packets to a NetFlow collector.

**Step 4**

**ip dhcp snooping information option**

**Example:**

`Switch(config)# ip dhcp snooping information option`

**Step 5**

**ip dhcp snooping information option format remote-id [string ASCII-string | hostname]**

**Example:**

`Switch(config)# ip dhcp snooping information option format remote-id string asciistring2`

- (Optional) Configures the remote-ID suboption.
  - You can configure the remote ID as:
    - String of up to 63 ASCII characters (no spaces)
    - Configured hostname for the switch
  - **Note** If the hostname is longer than 63 characters, it is truncated to 63 characters in the remote-ID configuration.

**Step 6**

**ip dhcp snooping information option allow-untrusted**

**Example:**

`Switch(config)# ip dhcp snooping information option allow-untrusted`

- (Optional) If the switch is an aggregation switch connected to an edge switch, this command enables the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch.
  - The default setting is disabled.
  - **Note** Enter this command only on aggregation switches that are connected to trusted devices.
<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7</td>
<td><code>interface interface-id</code>&lt;br&gt;Example:&lt;br&gt;<code>Switch(config)# interface gigabitethernet2/0/1</code></td>
<td>Specifies the interface to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 8</td>
<td><code>ip dhcp snooping vlan vlan information option format-type circuit-id [override] string ASCII-string</code>&lt;br&gt;Example:&lt;br&gt;<code>Switch(config-if)# ip dhcp snooping vlan 1 information option format-type circuit-id override string override2</code></td>
<td>(Optional) Configures the circuit-ID suboption for the specified interface.&lt;br&gt;Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. The default circuit ID is the port identifier, in the format <code>vlan-mod-port</code>.&lt;br&gt;You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces).&lt;br&gt;(Optional) Use the <code>override</code> keyword when you do not want the circuit-ID suboption inserted in TLV format to define subscriber information.</td>
</tr>
<tr>
<td>Step 9</td>
<td><code>ip dhcp snooping trust</code>&lt;br&gt;Example:&lt;br&gt;<code>Switch(config-if)# ip dhcp snooping trust</code></td>
<td>(Optional) Configures the interface as trusted or untrusted.&lt;br&gt;Use the <code>no</code> keyword to configure an interface to receive messages from an untrusted client. The default setting is untrusted.</td>
</tr>
<tr>
<td>Step 10</td>
<td><code>ip dhcp snooping limit rate rate</code>&lt;br&gt;Example:&lt;br&gt;<code>Switch(config-if)# ip dhcp snooping limit rate 100</code></td>
<td>(Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured.&lt;br&gt;<strong>Note</strong> We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN with DHCP snooping.</td>
</tr>
<tr>
<td>Step 11</td>
<td><code>exit</code>&lt;br&gt;Example:&lt;br&gt;<code>Switch(config-if)# exit</code></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td>Step 12</td>
<td><code>ip dhcp snooping verify mac-address</code>&lt;br&gt;Example:&lt;br&gt;<code>Switch(config)# ip dhcp snooping verify mac-address</code></td>
<td>(Optional) Configures the switch to verify that the source MAC address in a DHCP packet received on untrusted ports matches the client hardware address in the packet. The default is to verify that the source MAC address matches the client hardware address in the packet.</td>
</tr>
<tr>
<td>Step 13</td>
<td><code>end</code>&lt;br&gt;Example:&lt;br&gt;<code>Switch(config)# end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
Enabling DHCP Snooping on Private VLANs

You can enable DHCP snooping on private VLANs. If DHCP snooping is enabled, the configuration is propagated to both a primary VLAN and its associated secondary VLANs. If DHCP snooping is enabled on the primary VLAN, it is also configured on the secondary VLANs.

If DHCP snooping is already configured on the primary VLAN and you configure DHCP snooping with different settings on a secondary VLAN, the configuration for the secondary VLAN does not take effect. You must configure DHCP snooping on the primary VLAN. If DHCP snooping is not configured on the primary VLAN, this message appears when you are configuring DHCP snooping on the secondary VLAN, such as VLAN 200:

```
2w5d:%DHCP_SNOOPING-4-DHCP_SNOOPING_PVLAN_WARNING:DHCP Snooping configuration may not take effect on secondary vlan 200. DHCP Snooping configuration on secondary vlan is derived from its primary vlan.
```

The `show ip dhcp snooping` privileged EXEC command output shows all VLANs, including primary and secondary private VLANs, on which DHCP snooping is enabled.

Enabling the Cisco IOS DHCP Server Database

For procedures to enable and configure the Cisco IOS DHCP server database, see the “DHCP Configuration Task List” section in the “Configuring DHCP” chapter of the Cisco IOS IP Configuration Guide, Release 12.4

Configuring DHCP Server Port-Based Address Allocation

Information About Configuring DHCP Server Port-Based Address Allocation

DHCP server port-based address allocation is a feature that enables DHCP to maintain the same IP address on an Ethernet switch port regardless of the attached device client identifier or client hardware address.

When Ethernet switches are deployed in the network, they offer connectivity to the directly connected devices. In some environments, such as on a factory floor, if a device fails, the replacement device must be working immediately in the existing network. With the current DHCP implementation, there is no guarantee that DHCP would offer the same IP address to the replacement device. Control, monitoring, and other software expect a stable IP address associated with each device. If a device is replaced, the address assignment should remain stable even though the DHCP client has changed.

When configured, the DHCP server port-based address allocation feature ensures that the same IP address is always offered to the same connected port even as the client identifier or client hardware address changes in the DHCP messages received on that port. The DHCP protocol recognizes DHCP clients by the client identifier option in the DHCP packet. Clients that do not include the client identifier option are identified by the client hardware address. When you configure this feature, the port name of the interface overrides the client identifier or hardware address and the actual point of connection, the switch port, becomes the client identifier.

In all cases, by connecting the Ethernet cable to the same port, the same IP address is allocated through DHCP to the attached device.

The DHCP server port-based address allocation feature is only supported on a Cisco IOS DHCP server and not a third-party server.

Default Port-Based Address Allocation Configuration

By default, DHCP server port-based address allocation is disabled.

Port-Based Address Allocation Configuration Guidelines

- By default, DHCP server port-based address allocation is disabled.
- To restrict assignments from the DHCP pool to preconfigured reservations (unreserved addresses are not offered to the client and other clients are not served by the pool), you can enter the reserved-only DHCP pool configuration command.

Enabling the DHCP Snooping Binding Database Agent

Beginning in privileged EXEC mode, follow these steps to enable and configure the DHCP snooping binding database agent on the switch:
SUMMARY STEPS

1. configure terminal
2. ip dhcp snooping database {flash[number]:filename | ftp://user:password@host:filename | http://[[username:password]@]host|host-ip]{directory}image-name.tar | rcp://user@host:filename} | tftp://host:filename
3. ip dhcp snooping database timeout seconds
4. ip dhcp snooping database write-delay seconds
5. end
6. ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** ip dhcp snooping database {flash[number]:filename | ftp://user:password@host:filename | http://[[username:password]@]host|host-ip]{directory}image-name.tar | rcp://user@host:filename} | tftp://host:filename     |
| Example:                                                                         | Specifies the URL for the database agent or the binding file by using one of these forms: |
| Switch(config)# ip dhcp snooping database tftp://10.90.90.90/snooping-rp2         |   • flash[number]:filename                                                 |
|                                                                                 |     (Optional) Use the number parameter to specify the stack member number of the stack master. The range for number is 1 to 9. |
|                                                                                 |     • ftp://user:password@host:filename                                      |
|                                                                                 |     • http://[[username:password]@]host|host-ip]{directory}image-name.tar |
|                                                                                 |     • rcp://user@host:filename                                                |
|                                                                                 |     • tftp://host:filename                                                    |

| **Step 3** ip dhcp snooping database timeout seconds                            | Specifies (in seconds) how long to wait for the database transfer process to finish before stopping the process. |
| Example:                                                                         | The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely. |
| Switch(config)# ip dhcp snooping database timeout 300                             |                                                                         |

| **Step 4** ip dhcp snooping database write-delay seconds                         | Specifies the duration for which the transfer should be delayed after the binding database changes. The range is from 15 to 86400 seconds. The default is 300 seconds (5 minutes). |
| Example:                                                                         |                                                                         |
| Switch(config)# ip dhcp snooping database write-delay 15                         |                                                                         |

| **Step 5** end                                                                  | Returns to privileged EXEC mode.                                           |
| Example:                                                                         |                                                                         |
Enabling DHCP Server Port-Based Address Allocation

Beginning in privileged EXEC mode, follow these steps to globally enable port-based address allocation and to automatically generate a subscriber identifier on an interface.

SUMMARY STEPS

1. configure terminal
2. ip dhcp use subscriber-id client-id
3. ip dhcp subscriber-id interface-name
4. interface interface-id
5. ip dhcp server use subscriber-id client-id
6. end

DETAILED STEPS

<table>

Feature Information for DHCP Snooping and Option 82
Configuring IP Source Guard

IP Source Guard (IPSG) is a security feature that restricts IP traffic on nonrouted, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings.

This chapter contains the following topics:

- Finding Feature Information, on page 1445
- Information About IP Source Guard, on page 1445
- How to Configure IP Source Guard, on page 1447
- Monitoring IP Source Guard, on page 1453
- Additional References, on page 1454

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About IP Source Guard

IP Source Guard

You can use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor and you can enable IP source guard when DHCP snooping is enabled on an untrusted interface.

After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping.

The switch uses a source IP lookup table in hardware to bind IP addresses to ports. For IP and MAC filtering, a combination of source IP and source MAC lookups are used. IP traffic with a source IP address is the binding table is allowed, all other traffic is denied.
The IP source binding table has bindings that are learned by DHCP snooping or are manually configured (static IP source bindings). An entry in this table has an IP address, its associated MAC address, and its associated VLAN number. The switch uses the IP source binding table only when IP source guard is enabled.

IPSG is supported only on Layer 2 ports, including access and trunk ports. You can configure IPSG with source IP address filtering or with source IP and MAC address filtering.

**IP Source Guard for Static Hosts**

---

**Note**

Do not use IPSG (IP source guard) for static hosts on uplink ports or trunk ports.

IPSG for static hosts extends the IPSG capability to non-DHCP and static environments. The previous IPSG used the entries created by DHCP snooping to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. This security feature restricts IP traffic on nonrouted Layer 2 interfaces. It filters traffic based on the DHCP snooping binding database and on manually configured IP source bindings. The previous version of IPSG required a DHCP environment for IPSG to work.

IPSG for static hosts allows IPSG to work without DHCP. IPSG for static hosts relies on IP device tracking-table entries to install port ACLs. The switch creates static entries based on ARP requests or other IP packets to maintain the list of valid hosts for a given port. You can also specify the number of hosts allowed to send traffic to a given port. This is equivalent to port security at Layer 3.

IPSG for static hosts also supports dynamic hosts. If a dynamic host receives a DHCP-assigned IP address that is available in the IP DHCP snooping table, the same entry is learned by the IP device tracking table. In a stacked environment, when the master failover occurs, the IP source guard entries for static hosts attached to member ports are retained. When you enter the `show ip devicetracking all` EXEC command, the IP device tracking table displays the entries as ACTIVE.

---

**Note**

Some IP hosts with multiple network interfaces can inject some invalid packets into a network interface. The invalid packets contain the IP or MAC address for another network interface of the host as the source address. The invalid packets can cause IPSG for static hosts to connect to the host, to learn the invalid IP or MAC address bindings, and to reject the valid bindings. Consult the vendor of the corresponding operating system and the network interface to prevent the host from injecting invalid packets.

IPSG for static hosts initially learns IP or MAC bindings dynamically through an ACL-based snooping mechanism. IP or MAC bindings are learned from static hosts by ARP and IP packets. They are stored in the device tracking database. When the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum, the hardware drops any packet with a new IP address. To resolve hosts that have moved or gone away for any reason, IPSG for static hosts leverages IP device tracking to age out dynamically learned IP address bindings. This feature can be used with DHCP snooping. Multiple bindings are established on a port that is connected to both DHCP and static hosts. For example, bindings are stored in both the device tracking database as well as in the DHCP snooping binding database.
IP Source Guard Configuration Guidelines

• You can configure static IP bindings only on nonrouted ports. If you enter the `ip source binding mac-address vlan vlan-id ip-address interface interface-id` global configuration command on a routed interface, this error message appears:

```
Static IP source binding can only be configured on switch port.
```

• When IP source guard with source IP filtering is enabled on an interface, DHCP snooping must be enabled on the access VLAN for that interface.

• If you are enabling IP source guard on a trunk interface with multiple VLANs and DHCP snooping is enabled on all the VLANs, the source IP address filter is applied on all the VLANs.

```
Note
If IP source guard is enabled and you enable or disable DHCP snooping on a VLAN on the trunk interface, the switch might not properly filter traffic.
```

• You can enable this feature when 802.1x port-based authentication is enabled.

• When you configure IP source guard smart logging, packets with a source address other than the specified address or an address learned by DHCP are denied, and the packet contents are sent to a NetFlow collector. If you configure this feature, make sure that smart logging is globally enabled.

• In a switch stack, if IP source guard is configured on a stack member interface and you remove the the configuration of that switch by entering the `no switch stack-member-number provision` global configuration command, the interface static bindings are removed from the binding table, but they are not removed from the running configuration. If you again provision the switch by entering the `switch stack-member-number provision` command, the binding is restored.

To remove the binding from the running configuration, you must disable IP source guard before entering the `no switch provision` command. The configuration is also removed if the switch reloads while the interface is removed from the binding table.

How to Configure IP Source Guard

Enabling IP Source Guard

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `ip verify source [mac-check ]`
4. Use one of the following:
   - `ip verify source[smartlog]`
   - `ip verify source port-security`

### Enabling IP source guard with source IP and MAC filtering on VLANs 10 and 11

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# ip verify source
Switch(config-if)# exit
Switch(config)# ip source binding 0100.0022.0010 vlan 10 10.0.0.2 interface gigabitethernet 1/0/1
Switch(config)# ip source binding 0100.0230.0002 vlan 11 10.0.0.4 interface gigabitethernet 1/0/1
Switch(config)# end

### Configuring IP Source Guard for Static Hosts on a Layer 2 Access Port

You must configure the `ip device tracking maximum limit-number` interface configuration command globally for IPSG for static hosts to work. If you only configure this command on a port without enabling IP device tracking globally or by setting an IP device tracking maximum on that interface, IPSG with static hosts rejects all the IP traffic from that interface. This requirement also applies to IPSG with static hosts on a private VLAN host port.

### SUMMARY STEPS

1. `configure terminal`
2. `ip device tracking`
3. `interface interface-id`
4. `switchport mode access`
5. `switchport access vlan vlan-id`
6. `ip verify source[tracking] [mac-check ]`
7. `ip device tracking maximum number`
8. `end`
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>ip device tracking</td>
<td>Turns on the IP host table, and globally enables IP device tracking.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# ip device tracking</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>interface interface-id</td>
<td>Enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>switchport mode access</td>
<td>Configures a port as access.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>switchport access vlan vlan-id</td>
<td>Configures the VLAN for this port.</td>
</tr>
<tr>

<td>Switch(config-if)# switchport access vlan 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>ip verify source[tracking] [mac-check ]</td>
<td>Enables IP source guard with source IP address filtering. (Optional) tracking—Enables IP source guard for static hosts. (Optional) mac-check—Enables MAC address filtering. The command <strong>ip verify source tracking mac-check</strong> enables IP source guard for static hosts with MAC address filtering.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip verify source tracking mac-check</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>ip device tracking maximum number</td>
<td>Establishes a maximum limit for the number of static IPs that the IP device tracking table allows on the port. The range is 1 to 10. The maximum number is 10.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# ip device tracking maximum 8</td>
<td><strong>Note</strong> You must configure the <strong>ip device tracking maximum limit-number</strong> interface configuration command.</td>
</tr>
</tbody>
</table>
**Purpose**

Command or Action | Purpose |
--- | --- |
**Step 8** | end |
Example: | Switch(config)# **end** |
| | Returns to privileged EXEC mode. |

---

**Eight Examples**

This example shows how to stop IPSG with static hosts on an interface.

Switch(config-if)# **no ip verify source**
Switch(config-if)# **no ip device tracking max**

This example shows how to enable IPSG with static hosts on a port.

Switch(config)# **ip device tracking**
Switch(config-if)# **ip device tracking maximum 10**
Switch(config-if)# **ip verify source tracking**

This example shows how to enable IPSG for static hosts with IP filters on a Layer 2 access port and to verify the valid IP bindings on the interface Gi1/0/3:

Switch# **configure terminal**
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# **ip device tracking**
Switch(config)# **interface gigabitethernet1/0/3**
Switch(config-if)# **switchport mode access**
Switch(config-if)# **switchport access vlan 10**
Switch(config-if)# **ip device tracking maximum 5**
Switch(config-if)# **ip verify source tracking**
Switch(config-if)# **end**

Switch# **show ip verify source**

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>

<td>40.1.1.21</td>
<td></td>
<td>10</td>
</tr>
</tbody>
</table>

This example shows how to enable IPSG for static hosts with IP-MAC filters on a Layer 2 access port, to verify the valid IP-MAC bindings on the interface Gi1/0/3, and to verify that the number of bindings on this interface has reached the maximum:

Switch# **configure terminal**
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# **ip device tracking**
Switch(config)# **interface gigabitethernet1/0/3**
Switch(config)# **switchport mode access**
Switch(config-if)# **switchport access vlan 1**
Switch(config-if)# **ip device tracking maximum 5**
Switch(config-if)# ip verify source tracking
Switch(config-if)# end

Switch# show ip verify source

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>

</tr>
</thead>
<tbody>
<tr>
<td>Gi1/0/3</td>
<td>ip trk</td>
<td>active</td>
<td>deny-all</td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>

This example displays all IP or MAC binding entries for all interfaces. The CLI displays all active as well as inactive entries. When a host is learned on a interface, the new entry is marked as active. When the same host is disconnected from that interface and connected to a different interface, a new IP or MAC binding entry displays as active as soon as the host is detected. The old entry for this host on the previous interface is marked as INACTIVE.

Switch# show ip device tracking all

Restrictions for Dynamic ARP Inspection

This section lists the restrictions and guidelines for configuring Dynamic ARP Inspection on the switch.

- Dynamic ARP inspection is an ingress security feature; it does not perform any egress checking.

- Dynamic ARP inspection is not effective for hosts connected to switches that do not support dynamic ARP inspection or that do not have this feature enabled. Because man-in-the-middle attacks are limited to a single Layer 2 broadcast domain, separate the domain with dynamic ARP inspection checks from the one with no checking. This action secures the ARP caches of hosts in the domain enabled for dynamic ARP inspection.
Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

When DHCP snooping is disabled or in non-DHCP environments, use ARP ACLs to permit or to deny packets.

Dynamic ARP inspection is supported on access ports, trunk ports, and EtherChannel ports.

**Note**
Do not enable Dynamic ARP inspection on RSPAN VLANs. If Dynamic ARP inspection is enabled on RSPAN VLANs, Dynamic ARP inspection packets might not reach the RSPAN destination port.

A physical port can join an EtherChannel port channel only when the trust state of the physical port and the channel port match. Otherwise, the physical port remains suspended in the port channel. A port channel inherits its trust state from the first physical port that joins the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when you change the trust state on the port channel, the switch configures a new trust state on all the physical ports that comprise the channel.

The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

The operating rate for the port channel is cumulative across all the physical ports within the channel. For example, if you configure the port channel with an ARP rate-limit of 400 pps, all the interfaces combined on the channel receive an aggregate 400 pps. The rate of incoming ARP packets on EtherChannel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on the channel-port members.

The rate of incoming packets on a physical port is checked against the port-channel configuration rather than the physical-ports configuration. The rate-limit configuration on a port channel is independent of the configuration on its physical ports.

If the EtherChannel receives more ARP packets than the configured rate, the channel (including all physical ports) is placed in the error-disabled state.

Make sure to limit the rate of ARP packets on incoming trunk ports. Configure trunk ports with higher rates to reflect their aggregation and to handle packets across multiple dynamic ARP inspection-enabled VLANs. You also can use the `ip arp inspection limit none interface configuration command to make the rate unlimited. A high rate-limit on one VLAN can cause a denial-of-service attack to other VLANs when the software places the port in the error-disabled state.

When you enable dynamic ARP inspection on the switch, policers that were configured to police ARP traffic are no longer effective. The result is that all ARP traffic is sent to the CPU.

When you configure dynamic ARP inspection smart logging, the contents of all packets in the log buffer (by default, all dropped packets) are sent to a NetFlow collector. If you configure this feature, make sure that smart logging is globally enabled. For more information about smart logging, see the “Configuring Smart Logging” section on page xxx.
Understanding Dynamic ARP Inspection

ARP provides IP communication within a Layer 2 broadcast domain by mapping an IP address to a MAC address. For example, Host B wants to send information to Host A but does not have the MAC address of Host A in its ARP cache. Host B generates a broadcast message for all hosts within the broadcast domain to obtain the MAC address associated with the IP address of Host A. All hosts within the broadcast domain receive the ARP request, and Host A responds with its MAC address. However, because ARP allows a gratuitous reply from a host even if an ARP request was not received, an ARP spoofing attack and the poisoning of ARP caches can occur. After the attack, all traffic from the device under attack flows through the attacker’s computer and then to the router, switch, or host.

A malicious user can attack hosts, switches, and routers connected to your Layer 2 network by poisoning the ARP caches of systems connected to the subnet and by intercepting traffic intended for other hosts on the subnet. Figure 26-1 shows an example of ARP cache poisoning.

Figure 26-1: ARP Cache Poisoning

Hosts A, B, and C are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host A uses IP address IA and MAC address MA. When Host A needs to communicate to Host B at the IP layer, it broadcasts an ARP request for the MAC address associated with IP address IB. When the switch and Host B receive the ARP request, they populate their ARP caches with an ARP binding for a host with the IP address IA and a MAC address MA; for example, IP address IA is bound to MAC address MA. When Host B responds, the switch and Host A populate their ARP caches with a binding for a host with the IP address IB and the MAC address MB.

Host C can poison the ARP caches of the switch, Host A, and Host B by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that Host C intercepts that traffic. Because Host C knows the true MAC addresses associated with IA and IB, it can forward the intercepted traffic to those hosts by using the correct MAC address as the destination. Host C has inserted itself into the traffic stream from Host A to Host B, the classic man-in-the-middle attack.

Dynamic ARP inspection is a security feature that validates ARP packets in a network. It intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. This capability protects the network from certain man-in-the-middle attacks.

Dynamic ARP inspection ensures that only valid ARP requests and responses are relayed. The switch performs these activities:

- Intercepts all ARP requests and responses on untrusted ports
- Verifies that each of these intercepted packets has a valid IP-to-MAC address binding before updating the local ARP cache or before forwarding the packet to the appropriate destination
- Drops invalid ARP packets
Dynamic ARP inspection determines the validity of an ARP packet based on valid IP-to-MAC address bindings stored in a trusted database, the DHCP snooping binding database. This database is built by DHCP snooping if DHCP snooping is enabled on the VLANs and on the switch. If the ARP packet is received on a trusted interface, the switch forwards the packet without any checks. On untrusted interfaces, the switch forwards the packet only if it is valid.

You enable dynamic ARP inspection on a per-VLAN basis by using the `ip arp inspection vlan vlan-range` global configuration command.

In non-DHCP environments, dynamic ARP inspection can validate ARP packets against user-configured ARP access control lists (ACLs) for hosts with static IP addresses. You define an ARP ACL by using the `arp access-list acl-name` global configuration command.

You can configure dynamic ARP inspection to drop ARP packets when the IP addresses in the packets are invalid or when the MAC addresses in the body of the ARP packets do not match the addresses specified in the Ethernet header. Use the `ip arp inspection validate {src-mac|dst-mac|ip}` global configuration command.

**Interface Trust States and Network Security**

Dynamic ARP inspection associates a trust state with each interface on the switch. Packets arriving on trusted interfaces bypass all dynamic ARP inspection validation checks, and those arriving on untrusted interfaces undergo the dynamic ARP inspection validation process.

In a typical network configuration, you configure all switch ports connected to host ports as untrusted and configure all switch ports connected to switches as trusted. With this configuration, all ARP packets entering the network from a given switch bypass the security check. No other validation is needed at any other place in the VLAN or in the network. You configure the trust setting by using the `ip arp inspection trust interface` configuration command.

---

**Caution**

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity.

---

In the following figure, assume that both Switch A and Switch B are running dynamic ARP inspection on the VLAN that includes Host 1 and Host 2. If Host 1 and Host 2 acquire their IP addresses from the DHCP server connected to Switch A, only Switch A binds the IP-to-MAC address of Host 1. Therefore, if the interface between Switch A and Switch B is untrusted, the ARP packets from Host 1 are dropped by Switch B. Connectivity between Host 1 and Host 2 is lost.
Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If Switch A is not running dynamic ARP inspection, Host 1 can easily poison the ARP cache of Switch B (and Host 2, if the link between the switches is configured as trusted). This condition can occur even though Switch B is running dynamic ARP inspection.

Dynamic ARP inspection ensures that hosts (on untrusted interfaces) connected to a switch running dynamic ARP inspection do not poison the ARP caches of other hosts in the network. However, dynamic ARP inspection does not prevent hosts in other portions of the network from poisoning the caches of the hosts that are connected to a switch running dynamic ARP inspection.

In cases in which some switches in a VLAN run dynamic ARP inspection and other switches do not, configure the interfaces connecting such switches as untrusted. However, to validate the bindings of packets from nondynamic ARP inspection switches, configure the switch running dynamic ARP inspection with ARP ACLs. When you cannot determine such bindings, at Layer 3, isolate switches running dynamic ARP inspection from switches not running dynamic ARP inspection switches.

---

**Note**

Depending on the setup of the DHCP server and the network, it might not be possible to validate a given ARP packet on all switches in the VLAN.

---

**Rate Limiting of ARP Packets**

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack. By default, the rate for untrusted interfaces is 15 packets per second (pps). Trusted interfaces are not rate-limited. You can change this setting by using the `ip arp inspection limit` interface configuration command.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene. You can use the `errdisable recovery` global configuration command to enable error disable recovery so that ports automatically emerge from this state after a specified timeout period.
The rate limit for an EtherChannel is applied separately to each switch in a stack. For example, if a limit of 20 pps is configured on the EtherChannel, each switch with ports in the EtherChannel can carry up to 20 pps. If any switch exceeds the limit, the entire EtherChannel is placed into the error-disabled state.

Relative Priority of ARP ACLs and DHCP Snooping Entries

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the ip arp inspection filter vlan global configuration command. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the `ip arp inspection log-buffer` global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the `ip arp inspection vlan logging` global configuration command.

</table>

**Relative Priority of ARP ACLs and DHCP Snooping Entries**

Dynamic ARP inspection uses the DHCP snooping binding database for the list of valid IP-to-MAC address bindings.

ARP ACLs take precedence over entries in the DHCP snooping binding database. The switch uses ACLs only if you configure them by using the `ip arp inspection filter vlan global configuration command`. The switch first compares ARP packets to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, the switch also denies the packet even if a valid binding exists in the database populated by DHCP snooping.

**Configuring ARP ACLs for Non-DHCP Environments**

This procedure shows how to configure dynamic ARP inspection when Switch B shown in Figure 2 does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 1. If the IP address of Host 2 is not static (it is impossible to apply the ACL configuration on Switch A) you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

Beginning in privileged EXEC mode, follow these steps to configure an ARP ACL on Switch A. This procedure is required in non-DHCP environments.

**SUMMARY STEPS**

1. `configure terminal`
2. `arp access-list acl-name`
3. `permit ip host sender-ip mac host sender-mac`
4. `exit`
5. `ip arp inspection filter arp-acl-name vlan vlan-range [static]`
6. `ip arp inspection smartlog`
7. `interface interface-id`
8. `no ip arp inspection trust`
9. `end`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>2</td>
<td><code>arp access-list acl-name</code></td>
<td>Define an ARP ACL, and enter ARP access-list configuration mode. By default, no ARP access lists are defined. <strong>Note</strong> At the end of the ARP access list, there is an implicit <code>deny ip any mac any</code> command.</td>
</tr>
</tbody>
</table>
| 3    | `permit ip host sender-ip mac host sender-mac` | Permit ARP packets from the specified host (Host 2).  
- For `sender-ip`, enter the IP address of Host 2.  
- For `sender-mac`, enter the MAC address of Host 2. |
| 4    | `exit` | Return to global configuration mode. |
| 5    | `ip arp inspection filter arp-acl-name vlan vlan-range [static]` | Apply the ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.  
- For `arp-acl-name`, specify the name of the ACL created in Step 2.  
- For `vlan-range`, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.  
- (Optional) Specify `static` to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.
  
  If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.

  ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them. |
| 6    | `ip arp inspection smartlog` | Specify that whatever packets are currently being logged are also smart-logged. By default, all dropped packets are logged. |
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 7</td>
<td>interface <em>interface-id</em> Specify the Switch A interface that is connected to Switch B, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 8</td>
<td>no ip arp inspection trust Configure the Switch A interface that is connected to Switch B as untrusted. By default, all interfaces are untrusted. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the ip arp inspection vlan logging global configuration command.</td>
</tr>
<tr>
<td>Step 9</td>
<td>end Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 10</td>
<td>show arp access-list acl-name show ip arp inspection vlan vlan-range show ip arp inspection interfaces Verify your entries.</td>
</tr>
<tr>
<td>Step 11</td>
<td>copy running-config startup-config (Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

### Example

To remove the ARP ACL, use the `no arp access-list` global configuration command. To remove the ARP ACL attached to a VLAN, use the `no ip arp inspection filter arp-acl-name vlan vlan-range` global configuration command.

This example shows how to configure an ARP ACL called `host2` on Switch A, to permit ARP packets from Host 2 (IP address 1.1.1.1 and MAC address 0001.0001.0001), to apply the ACL to VLAN 1, and to configure port 1 on Switch A as untrusted:

```bash
Switch(config)#arp access-list host2
Switch(config-arp-acl)#permit ip host 1.1.1.1 mac host 1.1.1
Switch(config-arp-acl)# exit
Switch(config)# ip arp inspection filter host2 vlan 1
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# no ip arp inspection trust
```

### Configuring Dynamic ARP Inspection in DHCP Environments

#### Before you begin

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B. Both switches are running dynamic ARP inspection on VLAN 1 where the hosts are located. A DHCP server is connected to Switch A. Both hosts...
acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1 and Host 2, and Switch B has the binding for Host 2.

Note

Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses.

Beginning in privileged EXEC mode, follow these steps to configure dynamic ARP inspection. You must perform this procedure on both switches. This procedure is required.

SUMMARY STEPS

1. show cdp neighbors
2. configure terminal
3. ip arp inspection vlan vlan-range
4. ip arp inspection smartlog
5. Interface interface-id
6. ip arp inspection trust
7. end
8. show ip arp inspection interfaces
9. show ip arp inspection vlan vlan-range
10. show ip dhcp snooping binding
11. show ip arp inspection statistics vlan vlan-range
12. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 show cdp neighbors</td>
<td>Verify the connection between the switches.</td>

<td>Purpose</td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Specify the interface connected to the other switch, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Configure the connection between the switches as trusted.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>By default, all interfaces are untrusted. The switch does not check ARP packets that it receives from the other switch on the trusted interface. It simply forwards the packets. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the ip arp inspection vlan logging global configuration command.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Verify the dynamic ARP inspection configuration on interfaces.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>Verify the dynamic ARP inspection configuration on VLAN.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>Verify the DHCP bindings.</td>
</tr>
<tr>
<td><strong>Step 10</strong></td>
<td>Check the dynamic ARP inspection statistics on VLAN.</td>
</tr>
<tr>
<td><strong>Step 11</strong></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

**Example**

To disable dynamic ARP inspection, use the **no ip arp inspection vlan vlan-range** global configuration command. To return the interfaces to an untrusted state, use the **no ip arp inspection trust** interface configuration command.

This example shows how to configure dynamic ARP inspection on Switch A in VLAN 1. You would perform a similar procedure on Switch B:

Switch(config)# ip arp inspection vlan 1
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)#ip arp inspection trust
How to Limit the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming ARP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you enable error-disabled recovery so that ports automatically emerge from this state after a specified timeout period.

Note

Unless you configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the no ip arp inspection limit interface configuration command, the interface reverts to its default rate limit.

For configuration guidelines for rate limiting trunk ports and EtherChannel ports, see the section, “Dynamic ARP Inspection Configuration Guidelines.”

To return to the default rate-limit configuration, use the no ip arp inspection limit interface configuration command. To disable error recovery for dynamic ARP inspection, use the no errdisable recovery cause arp-inspection global configuration command.

Beginning in privileged EXEC mode, follow these steps to limit the rate of incoming ARP packets. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. ip arp inspection limit {rate pps [burst interval seconds] | none}
4. exit
5. errdisable detect cause arp-inspection and errdisable recovery causearp-inspection errdisable recovery interval  interval
6. exit
7. show ip arp inspection interfaces show errdisable recovery
8. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 interface interface-id</td>
<td>Specify the interface to be rate-limited, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Step 3 ip arp inspection limit {rate pps [burst interval seconds]</td>
<td>none}</td>
</tr>
</tbody>
</table>
The default rate is 15 pps on untrusted interfaces and unlimited on trusted interfaces. The burst interval is 1 second.

The keywords have these meanings:

- For rate pps, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps.
- (Optional) For burst interval seconds, specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15.
- For rate none, specify no upper limit for the rate of incoming ARP packets that can be processed.

<table>
<thead>
<tr>
<th>Command or Action</th>

</tr>
<tr>
<td>Step 5 errdisable detect cause arp-inspection and errdisable recovery causearp-inspection errdisable recovery interval interval</td>
<td>(Optional) Enable error recovery from the dynamic ARP inspection error-disabled state, and configure the dynamic ARP inspection recover mechanism variables. By default, recovery is disabled, and the recovery interval is 300 seconds. For interval interval, specify the time in seconds to recover from the error-disabled state. The range is 30 to 86400.</td>
</tr>
<tr>
<td>Step 6 exit</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 7 show ip arp inspection interfaces show errdisable recovery</td>
<td>Verify your settings.</td>
</tr>
<tr>
<td>Step 8 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>

How to Perform Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address. Beginning in privileged EXEC mode, follow these steps to perform specific checks on incoming ARP packets.

This procedure is optional.

To disable checking, use the `no ip arp inspection validate [src-mac] [dst-mac] [ip]` global configuration command. To display statistics for forwarded, dropped, and MAC and IP validation failure packets, use the `show ip arp inspection statistics` privileged EXEC command.
How to Perform Validation Checks

SUMMARY STEPS

1. configure terminal
2. ip arp inspection validate {src-mac} {dst-mac} {ip}
3. exit
4. show ip arp inspection vlan vlan-range
5. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enter global configuration mode.</td>
</tr>
<tr>
<td>Step 2 ip arp inspection validate {src-mac} {dst-mac} {ip}</td>
<td>Perform a specific check on incoming ARP packets. By default, no checks are performed. The keywords have these meanings: • For src-mac, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped. • For dst-mac, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped. • For ip, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses. You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src and dst mac validations, and a second command enables IP validation only, the src and dst mac validations are disabled as a result of the second command.</td>
</tr>
<tr>
<td>Step 3 exit</td>
<td>Return to privileged EXEC mode.</td>
</tr>
<tr>
<td>Step 4 show ip arp inspection vlan vlan-range</td>
<td>Verify your settings.</td>
</tr>
<tr>
<td>Step 5 copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
Monitoring DAI

To monitor DAI, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip arp inspection statistics</td>
<td>Clears dynamic ARP inspection statistics.</td>
</tr>
<tr>
<td>show ip arp inspection statistics [vlan vlan-range]</td>
<td>Displays statistics for forwarded, dropped, MAC validation failure, IP validation failure, ACL permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the dynamic ARP inspection log buffer.</td>
</tr>
<tr>
<td>show ip arp inspection log</td>
<td>Displays the configuration and contents of the dynamic ARP inspection log buffer.</td>
</tr>
</tbody>
</table>

For the `show ip arp inspection statistics` command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate.

Verifying the DAI Configuration

To display and verify the DAI configuration, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show arp access-list [acl-name]</td>
<td>Displays detailed information about ARP ACLs.</td>
</tr>
<tr>
<td>show ip arp inspection interfaces [interface-id]</td>
<td>Displays the trust state and the rate limit of ARP packets for the specified interface or all interfaces.</td>
</tr>
<tr>
<td>show ip arp inspection vlan vlan-range</td>
<td>Displays the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, displays information only for VLANs with dynamic ARP inspection enabled (active).</td>
</tr>
</tbody>
</table>

Configuring IEEE 802.1x Port-Based Authentication

This chapter describes how to configure IEEE 802.1x port-based authentication. IEEE 802.1x authentication prevents unauthorized devices (clients) from gaining access to the network. Unless otherwise noted, the term **switch** refers to a standalone switch or a switch stack.

- Finding Feature Information, on page 1471
- Information About 802.1x Port-Based Authentication, on page 1471
- How to Configure 802.1x Port-Based Authentication, on page 1502
- Monitoring 802.1x Statistics and Status, on page 1555
- Additional References, on page 1556
- Feature Information for 802.1x Port-Based Authentication, on page 1557

**Finding Feature Information**

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

**Information About 802.1x Port-Based Authentication**

The 802.1x standard defines a client-server-based access control and authentication protocol that prevents unauthorized clients from connecting to a LAN through publicly accessible ports unless they are properly authenticated. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Until the client is authenticated, 802.1x access control allows only Extensible Authentication Protocol over LAN (EAPOL), Cisco Discovery Protocol (CDP), and Spanning Tree Protocol (STP) traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.
For complete syntax and usage information for the commands used in this chapter, see the “RADIUS Commands” section in the Cisco IOS Security Command Reference, Release 12.4 and the command reference for this release.

**Port-Based Authentication Process**

When 802.1x port-based authentication is enabled and the client supports 802.1x-compliant client software, these events occur:

- If the client identity is valid and the 802.1x authentication succeeds, the switch grants the client access to the network.

- If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can use the client MAC address for authorization. If the client MAC address is valid and the authorization succeeds, the switch grants the client access to the network. If the client MAC address is invalid and the authorization fails, the switch assigns the client to a guest VLAN that provides limited services if a guest VLAN is configured.

- If the switch gets an invalid identity from an 802.1x-capable client and a restricted VLAN is specified, the switch can assign the client to a restricted VLAN that provides limited services.

- If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network by putting the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN.

### Note

Inaccessible authentication bypass is also referred to as critical authentication or the AAA fail policy.

If Multi Domain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization.
Figure 86: Authentication Flowchart

This figure shows the authentication process.

The switch re-authenticates a client when one of these situations occurs:

- Periodic re-authentication is enabled, and the re-authentication timer expires.

You can configure the re-authentication timer to use a switch-specific value or to be based on values from the RADIUS server.

After 802.1x authentication using a RADIUS server is configured, the switch uses timers based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]).

The Session-Timeout RADIUS attribute (Attribute[27]) specifies the time after which re-authentication occurs.

The Termination-Action RADIUS attribute (Attribute[29]) specifies the action to take during re-authentication. The actions are Initialize and ReAuthenticate. When the Initialize action is set (the attribute value is DEFAULT), the 802.1x session ends, and connectivity is lost during re-authentication. When the ReAuthenticate action is set (the attribute value is RADIUS-Request), the session is not affected during re-authentication.

- You manually re-authenticate the client by entering the `dot1x re-authenticate interface interface-id` privileged EXEC command.
Port-Based Authentication Initiation and Message Exchange

During 802.1x authentication, the switch or the client can initiate authentication. If you enable authentication on a port by using the `authentication port-control auto` interface configuration command, the switch initiates authentication when the link state changes from down to up or periodically as long as the port remains up and unauthenticated. The switch sends an EAP-request/identity frame to the client to request its identity. Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity.

---

**Note**

If 802.1x authentication is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client sends frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized. If the authentication fails, authentication can be retried, the port might be assigned to a VLAN that provides limited services, or network access is not granted.

The specific exchange of EAP frames depends on the authentication method being used.

---

**Figure 87: Message Exchange**

This figure shows a message exchange initiated by the client when the client uses the One-Time-Password (OTP) authentication method with a RADIUS server.

If 802.1x authentication times out while waiting for an EAPOL message exchange and MAC authentication bypass is enabled, the switch can authorize the client when the switch detects an Ethernet packet from the...
client. The switch uses the MAC address of the client as its identity and includes this information in the RADIUS-access/request frame that is sent to the RADIUS server. After the server sends the switch the RADIUS-access/accept frame (authorization is successful), the port becomes authorized. If authorization fails and a guest VLAN is specified, the switch assigns the port to the guest VLAN. If the switch detects an EAPOL packet while waiting for an Ethernet packet, the switch stops the MAC authentication bypass process and starts 802.1x authentication.

**Figure 88: Message Exchange During MAC Authentication Bypass**

This figure shows the message exchange during MAC authentication.

---

### Authentication Manager for Port-Based Authentication

In Cisco IOS Release 12.2(46)SE and earlier, you could not use the same authorization methods, including CLI commands and messages, on this switch and also on other network devices, such as a Catalyst 6000. You had to use separate authentication configurations. Cisco IOS Release 12.2(50)SE and later supports the same authorization methods on all Catalyst switches in a network.

Cisco IOS Release 12.2(55)SE supports filtering verbose system messages from the authentication manager.

18 Supported in Cisco IOS Release 12.2(50)SE and later.
19 For clients that do not support 802.1x authentication.

### Per-User ACLs and Filter-Ids

ACLs configured on the switch are compatible with other devices running Cisco IOS releases.

You can only set `any` as the source in the ACL.

**Note**

For any ACL configured for multiple-host mode, the source portion of statement must be `any`. (For example, `permit icmp any host 10.10.1.1`.)

### Port-Based Authentication Manager CLI Commands

The authentication-manager interface-configuration commands control all the authentication methods, such as 802.1x, MAC authentication bypass, and web authentication. The authentication manager commands determine the priority and order of authentication methods applied to a connected host.

The authentication manager commands control generic authentication features, such as host-mode, violation mode, and the authentication timer. Generic authentication commands include the `authentication host-mode`, `authentication violation`, and `authentication timer` interface configuration commands.

802.1x-specific commands begin with the `dot1x` keyword. For example, the `authentication port-control auto` interface configuration command enables authentication on an interface. However, the `dot1x`
system-authentication control global configuration command only globally enables or disables 802.1x authentication.

Note

If 802.1x authentication is globally disabled, other authentication methods are still enabled on that port, such as web authentication.

The authentication manager commands provide the same functionality as earlier 802.1x commands.

Beginning with Cisco IOS Release 12.2(55)SE, you can filter out verbose system messages generated by the authentication manager. The filtered content typically relates to authentication success. You can also filter verbose messages for 802.1x authentication and MAB authentication. There is a separate command for each authentication method:

- The no authentication logging verbose global configuration command filters verbose messages from the authentication manager.
- The no dot1x logging verbose global configuration command filters 802.1x authentication verbose messages.
- The no mab logging verbose global configuration command filters MAC authentication bypass (MAB) verbose messages.

**Ports in Authorized and Unauthorized States**

During 802.1x authentication, depending on the switch port state, the switch can grant a client access to the network. The port starts in the unauthorized state. While in this state, the port that is not configured as a voice VLAN port disallows all ingress and egress traffic except for 802.1x authentication, CDP, and STP packets. When a client is successfully authenticated, the port changes to the authorized state, allowing all traffic for the client to flow normally. If the port is configured as a voice VLAN port, the port allows VoIP traffic and 802.1x protocol packets before the client is successfully authenticated.

If a client that does not support 802.1x authentication connects to an unauthorized 802.1x port, the switch requests the client’s identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1x-enabled client connects to a port that is not running the 802.1x standard, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You control the port authorization state by using the authentication port-control interface configuration command and these keywords:
- **force-authorized**—disables 802.1x authentication and causes the port to change to the authorized state without any authentication exchange required. The port sends and receives normal traffic without 802.1x-based authentication of the client. This is the default setting.

- **force-unauthorized**—causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.

- **auto**—enables 802.1x authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port changes from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the switch by using the client MAC address.

---

**Note**

In Session Aware Networking mode, the authentication port-control command is access-session port-control.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can resend the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to change to the unauthorized state.

If the link state of a port changes from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

### Port-Based Authentication and Switch Stacks

If a switch is added to or removed from a switch stack, 802.1x authentication is not affected as long as the IP connectivity between the RADIUS server and the stack remains intact. This statement also applies if the stack master is removed from the switch stack. Note that if the stack master fails, a stack member becomes the new stack master by using the election process, and the 802.1x authentication process continues as usual.

If IP connectivity to the RADIUS server is interrupted because the switch that was connected to the server is removed or fails, these events occur:

- Ports that are already authenticated and that do not have periodic re-authentication enabled remain in the authenticated state. Communication with the RADIUS server is not required.

- Ports that are already authenticated and that have periodic re-authentication enabled (with the authentication periodic global configuration command) fail the authentication process when the re-authentication occurs. Ports return to the unauthenticated state during the re-authentication process. Communication with the RADIUS server is required.

  For an ongoing authentication, the authentication fails immediately because there is no server connectivity.

If the switch that failed comes up and rejoins the switch stack, the authentications might or might not fail depending on the boot-up time and whether the connectivity to the RADIUS server is re-established by the time the authentication is attempted.
To avoid loss of connectivity to the RADIUS server, you should ensure that there is a redundant connection to it. For example, you can have a redundant connection to the stack master and another to a stack member, and if the stack master fails, the switch stack still has connectivity to the RADIUS server.

802.1x Host Mode

You can configure an 802.1x port for single-host or for multiple-hosts mode. In single-host mode, only one client can be connected to the 802.1x-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

In multiple-hosts mode, you can attach multiple hosts to a single 802.1x-enabled port. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients. In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

Figure 89: Multiple Host Mode Example

This figure shows 802.1x port-based authentication in a wireless LAN.

802.1x Multiple Authentication Mode

Multiple-authentication (multiauth) mode allows multiple authenticated clients on the data VLAN and voice VLAN. Each host is individually authenticated. There is no limit to the number of data or voice device that can be authenticated on a multiauth port.

If a hub or access point is connected to an 802.1x-enabled port, each connected client must be authenticated. For non-802.1x devices, you can use MAC authentication bypass or web authentication as the per-host authentication fallback method to authenticate different hosts with different methods on a single port.

Note

When a port is in multiple-authentication mode, the authentication-failed VLAN features do not activate.

You can assign a RADIUS-server-supplied VLAN in multi-auth mode, under the following conditions:

- The host is the first host authorized on the port, and the RADIUS server supplies VLAN information
- Subsequent hosts are authorized with a VLAN that matches the operational VLAN.
- A host is authorized on the port with no VLAN assignment, and subsequent hosts either have no VLAN assignment, or their VLAN information matches the operational VLAN.
• The first host authorized on the port has a group VLAN assignment, and subsequent hosts either have no VLAN assignment, or their group VLAN matches the group VLAN on the port. Subsequent hosts must use the same VLAN from the VLAN group as the first host. If a VLAN list is used, all hosts are subject to the conditions specified in the VLAN list.

• After a VLAN is assigned to a host on the port, subsequent hosts must have matching VLAN information or be denied access to the port.

• You cannot configure a guest VLAN or an auth-fail VLAN in multi-auth mode.

• The behavior of the critical-auth VLAN is not changed for multi-auth mode. When a host tries to authenticate and the server is not reachable, all authorized hosts are reinitialized in the configured VLAN.

Multi-auth Per User VLAN assignment

The Multi-auth Per User VLAN assignment feature allows you to create multiple operational access VLANs based on VLANs assigned to the clients on the port that has a single configured access VLAN. The port configured as an access port where the traffic for all the VLANs associated with data domain is not dot1q tagged, and these VLANs are treated as native VLANs.

The number of hosts per multi-auth port is 8, however there can be more hosts.

The Multi-auth Per User VLAN assignment feature is not supported for Voice domain. All clients in Voice domain on a port must use the same VLAN.

The following scenarios are associated with the multi-auth Per User VLAN assignments:

Scenario one

When a hub is connected to an access port, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. This behaviour is similar on a single-host or multi-domain-auth port.

When a second host (H2) is connected and gets assigned to VLAN (V2), the port will have two operational VLANs (V1 and V2). If H1 and H2 sends untagged ingress traffic, H1 traffic is mapped to VLAN (V1) and H2 traffic to VLAN (V2), all egress traffic going out of the port on VLAN (V1) and VLAN (V2) are untagged.

If both the hosts, H1 and H2 are logged out or the sessions are removed due to some reason then VLAN (V1) and VLAN (V2) are removed from the port, and the configured VLAN (V0) is restored on the port.

Scenario two

When a hub is connected to an access port, and the port is configured with an access VLAN (V0). The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1.

When a second host (H2) is connected and gets authorized without explicit vlan policy, H2 is expected to use the configured VLAN (V0) that is restored on the port. All egress traffic going out of two operational VLANs, VLAN (V0) and VLAN (V1) are untagged.

If host (H2) is logged out or the session is removed due to some reason then the configured VLAN (V0) is removed from the port, and VLAN (V1) becomes the only operational VLAN on the port.

Scenario three
When a hub is connected to an access port in open mode, and the port is configured with an access VLAN (V0).

The host (H1) is assigned to VLAN (V1) through the hub. The operational VLAN of the port is changed to V1. When a second host (H2) is connected and remains unauthorized, it still has access to operational VLAN (V1) due to open mode.

If host H1 is logged out or the session is removed due to some reason, VLAN (V1) is removed from the port and host (H2) gets assigned to VLAN (V0).

---

**Note**

The combination of Open mode and VLAN assignment has an adverse affect on host (H2) because it has an IP address in the subnet that corresponds to VLAN (V1).

---

**Limitation in Multi-auth Per User VLAN assignment**

In the Multi-auth Per User VLAN assignment feature, egress traffic from multiple vlans are untagged on a port where the hosts receive traffic that is not meant for them. This can be a problem with broadcast and multicast traffic.

- **IPv4 ARPs**: Hosts receive ARP packets from other subnets. This is a problem if two subnets in different Virtual Routing and Forwarding (VRF) tables with overlapping IP address range are active on the port. The host ARP cache may get invalid entries.

- **IPv6 control packets**: In IPv6 deployments, Router Advertisements (RA) are processed by hosts that are not supposed to receive them. When a host from one VLAN receives RA from a different VLAN, the host assign incorrect IPv6 address to itself. Such a host is unable to get access to the network.

  The workaround is to enable the IPv6 first hop security so that the broadcast ICMPv6 packets are converted to unicast and sent out from multi-auth enabled ports. The packet is replicated for each client in multi-auth port belonging to the VLAN and the destination MAC is set to an individual client. Ports having one VLAN, ICMPv6 packets broadcast normally.

- **IP multicast**: Multicast traffic destined to a multicast group gets replicated for different VLANs if the hosts on those VLANS join the multicast group. When two hosts in different VLANS join a multicast group (on the same multi-auth port), two copies of each multicast packet are sent out from that port.

---

**MAC Move**

When a MAC address is authenticated on one switch port, that address is not allowed on another authentication manager-enabled port of the switch. If the switch detects that same MAC address on another authentication manager-enabled port, the address is not allowed.

There are situations where a MAC address might need to move from one port to another on the same switch. For example, when there is another device (for example a hub or an IP phone) between an authenticated host and a switch port, you might want to disconnect the host from the device and connect it directly to another port on the same switch.

You can globally enable MAC move so the device is reauthenticated on the new port. When a host moves to a second port, the session on the first port is deleted, and the host is reauthenticated on the new port.

MAC move is supported on all host modes. (The authenticated host can move to any port on the switch, no matter which host mode is enabled on the that port.)
When a MAC address moves from one port to another, the switch terminates the authenticated session on the original port and initiates a new authentication sequence on the new port.

The MAC move feature applies to both voice and data hosts.

**Note**

In open authentication mode, a MAC address is immediately moved from the original port to the new port, with no requirement for authorization on the new port.

---

**MAC Replace**

Beginning with Cisco IOS Release 12.2(55)SE, the MAC replace feature can be configured to address the violation that occurs when a host attempts to connect to a port where another host was previously authenticated.

**Note**

This feature does not apply to ports in multi-auth mode, because violations are not triggered in that mode. It does not apply to ports in multiple host mode, because in that mode, only the first host requires authentication.

If you configure the `authentication violation interface configuration command with the replace keyword`, the authentication process on a port in multi-domain mode is:

- A new MAC address is received on a port with an existing authenticated MAC address.
- The authentication manager replaces the MAC address of the current data host on the port with the new MAC address.
- The authentication manager initiates the authentication process for the new MAC address.
- If the authentication manager determines that the new host is a voice host, the original voice host is removed.

If a port is in open authentication mode, any new MAC address is immediately added to the MAC address table.

---

**802.1x Accounting**

The 802.1x standard defines how users are authorized and authenticated for network access but does not keep track of network usage. 802.1x accounting is disabled by default. You can enable 802.1x accounting to monitor this activity on 802.1x-enabled ports:

- User successfully authenticates.
- User logs off.
- Link-down occurs.
- Re-authentication successfully occurs.
- Re-authentication fails.

The switch does not log 802.1x accounting information. Instead, it sends this information to the RADIUS server, which must be configured to log accounting messages.
802.1x Accounting Attribute-Value Pairs

The information sent to the RADIUS server is represented in the form of Attribute-Value (AV) pairs. These AV pairs provide data for different applications. (For example, a billing application might require information that is in the Acct-Input-Octets or the Acct-Output-Octets attributes of a RADIUS packet.)

AV pairs are automatically sent by a switch that is configured for 802.1x accounting. Three types of RADIUS accounting packets are sent by a switch:

- **START**–sent when a new user session starts
- **INTERIM**–sent during an existing session for updates
- **STOP**–sent when a session terminates

You can view the AV pairs that are being sent by the switch by entering the `debug radius accounting` privileged EXEC command. For more information about this command, see the *Cisco IOS Debug Command Reference, Release 12.4*.

This table lists the AV pairs and when they are sent are sent by the switch.

802.1x Readiness Check

The 802.1x readiness check monitors 802.1x activity on all the switch ports and displays information about the devices connected to the ports that support 802.1x. You can use this feature to determine if the devices connected to the switch ports are 802.1x-capable. You use an alternate authentication such as MAC authentication bypass or web authentication for the devices that do not support 802.1x functionality.

This feature only works if the supplicant on the client supports a query with the NOTIFY EAP notification packet. The client must respond within the 802.1x timeout value.

The 802.1x readiness check is allowed on all ports that can be configured for 802.1x. The readiness check is not available on a port that is configured as dot1x force-unauthorized.

Follow these guidelines to enable the readiness check on the switch:

• The readiness check is typically used before 802.1x is enabled on the switch.

• If you use the dot1x test capol-capable privileged EXEC command without specifying an interface, all the ports on the switch stack are tested.

• When you configure the dot1x test capol-capable command on an 802.1x-enabled port, and the link comes up, the port queries the connected client about its 802.1x capability. When the client responds with a notification packet, it is 802.1x-capable. A syslog message is generated if the client responds within the timeout period. If the client does not respond to the query, the client is not 802.1x-capable. No syslog message is generated.

• The readiness check can be sent on a port that handles multiple hosts (for example, a PC that is connected to an IP phone). A syslog message is generated for each of the clients that respond to the readiness check within the timer period.

Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by their hostname or IP address, hostname and specific UDP port numbers, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order that they were configured.

Related Topics
Configuring the Switch-to-RADIUS-Server Communication, on page 1513

802.1x Authentication with VLAN Assignment

The switch supports 802.1x authentication with VLAN assignment. After successful 802.1x authentication of a port, the RADIUS server sends the VLAN assignment to configure the switch port. The RADIUS server
database maintains the username-to-VLAN mappings, assigning the VLAN based on the username of the client connected to the switch port. You can use this feature to limit network access for certain users.

Voice device authentication is supported with multidomain host mode. When a voice device is authorized and the RADIUS server returned an authorized VLAN, the voice VLAN on the port is configured to send and receive packets on the assigned voice VLAN. Voice VLAN assignment behaves the same as data VLAN assignment on multidomain authentication (MDA)-enabled ports.

When configured on the switch and the RADIUS server, 802.1x authentication with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server or if 802.1x authentication is disabled, the port is configured in its access VLAN after successful authentication. Recall that an access VLAN is a VLAN assigned to an access port. All packets sent from or received on this port belong to this VLAN.
- If 802.1x authentication is enabled but the VLAN information from the RADIUS server is not valid, authorization fails and configured VLAN remains in use. This prevents ports from appearing unexpectedly in an inappropriate VLAN because of a configuration error.

  Configuration errors could include specifying a VLAN for a routed port, a malformed VLAN ID, a nonexistent or internal (routed port) VLAN ID, an RSPAN VLAN, a shut down or suspended VLAN. In the case of a multidomain host port, configuration errors can also be due to an attempted assignment of a data VLAN that matches the configured or assigned voice VLAN ID (or the reverse).
- If 802.1x authentication is enabled and all information from the RADIUS server is valid, the authorized device is placed in the specified VLAN after authentication.
- If the multiple-hosts mode is enabled on an 802.1x port, all hosts are placed in the same VLAN (specified by the RADIUS server) as the first authenticated host.
- Enabling port security does not impact the RADIUS server-assigned VLAN behavior.
- If 802.1x authentication is disabled on the port, it is returned to the configured access VLAN and configured voice VLAN.

When the port is in the force authorized, force unauthorized, unauthorized, or shutdown state, it is put into the configured access VLAN.

If an 802.1x port is authenticated and put in the RADIUS server-assigned VLAN, any change to the port access VLAN configuration does not take effect. In the case of a multidomain host, the same applies to voice devices when the port is fully authorized with these exceptions:

- If the VLAN configuration change of one device results in matching the other device configured or assigned VLAN, authorization of all devices on the port is terminated and multidomain host mode is disabled until a valid configuration is restored where data and voice device configured VLANs no longer match.
- If a voice device is authorized and is using a downloaded voice VLAN, the removal of the voice VLAN configuration, or modifying the configuration value to dot1p or untagged results in voice device un-authorization and the disablement of multi-domain host mode.

The 802.1x authentication with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VLAN Membership Policy Server (VMPS).

To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization by using the network keyword to allow interface configuration from the RADIUS server.
• Enable 802.1x authentication. (The VLAN assignment feature is automatically enabled when you configure 802.1x authentication on an access port).

• Assign vendor-specific tunnel attributes in the RADIUS server. The RADIUS server must return these attributes to the switch:
  • [64] Tunnel-Type = VLAN
  • [65] Tunnel-Medium-Type = 802
  • [81] Tunnel-Private-Group-ID = VLAN name or VLAN ID

  Attribute [64] must contain the value VLAN (type 13). Attribute [65] must contain the value 802 (type 6). Attribute [81] specifies the VLAN name or VLAN ID assigned to the IEEE 802.1x-authenticated user.

802.1x Authentication with Per-User ACLs

You can enable per-user access control lists (ACLs) to provide different levels of network access and service to an 802.1x-authenticated user. When the RADIUS server authenticates a user connected to an 802.1x port, it retrieves the ACL attributes based on the user identity and sends them to the switch. The switch applies the attributes to the 802.1x port for the duration of the user session. The switch removes the per-user ACL configuration when the session is over, if authentication fails, or if a link-down condition occurs. The switch does not save RADIUS-specified ACLs in the running configuration. When the port is unauthorized, the switch removes the ACL from the port.

You can configure router ACLs and input port ACLs on the same switch. However, a port ACL takes precedence over a router ACL. If you apply input port ACL to an interface that belongs to a VLAN, the port ACL takes precedence over an input router ACL applied to the VLAN interface. Incoming packets received on the port to which a port ACL is applied are filtered by the port ACL. Incoming routed packets received on other ports are filtered by the router ACL. Outgoing routed packets are filtered by the router ACL. To avoid configuration conflicts, you should carefully plan the user profiles stored on the RADIUS server.

RADIUS supports per-user attributes, including vendor-specific attributes. These vendor-specific attributes (VSAs) are in octet-string format and are passed to the switch during the authentication process. The VSAs used for per-user ACLs are in acl#<n> for the ingress direction and outacl#<n> for the egress direction. MAC ACLs are supported only in the ingress direction. The switch supports VSAs only in the ingress direction. It does not support port ACLs in the egress direction on Layer 2 ports.

Use only the extended ACL syntax style to define the per-user configuration stored on the RADIUS server. When the definitions are passed from the RADIUS server, they are created by using the extended naming convention. However, if you use the Filter-Id attribute, it can point to a standard ACL.

You can use the Filter-Id attribute to specify an inbound or outbound ACL that is already configured on the switch. The attribute contains the ACL number followed by .in for ingress filtering or .out for egress filtering. If the RADIUS server does not allow the .in or .out syntax, the access list is applied to the outbound ACL by default. Because of limited support of Cisco IOS access lists on the switch, the Filter-Id attribute is supported only for IP ACLs numbered 1 to 199 and 1300 to 2699 (IP standard and IP extended ACLs).

Only one 802.1x-authenticated user is supported on a port. If the multiple-hosts mode is enabled on the port, the per-user ACL attribute is disabled for the associated port.

The maximum size of the per-user ACL is 4000 ASCII characters but is limited by the maximum size of RADIUS-server per-user ACLs.

To configure per-user ACLs:
• Enable AAA authentication.
• Enable AAA authorization by using the `network` keyword to allow interface configuration from the RADIUS server.
• Enable 802.1x authentication.
• Configure the user profile and VSAs on the RADIUS server.
• Configure the 802.1x port for single-host mode.

Note: Per-user ACLs are supported only in single-host mode.

---

### 802.1x Authentication with Downloadable ACLs and Redirect URLs

You can download ACLs and redirect URLs from a RADIUS server to the switch during 802.1x authentication or MAC authentication bypass of the host. You can also download ACLs during web authentication.

Note: A downloadable ACL is also referred to as a `dACL`.

If more than one host is authenticated and the host is in single-host, MDA, or multiple-authentication mode, the switch changes the source address of the ACL to the host IP address.

You can apply the ACLs and redirect URLs to all the devices connected to the 802.1x-enabled port.

If no ACLs are downloaded during 802.1x authentication, the switch applies the static default ACL on the port to the host. On a voice VLAN port configured in multi-auth or MDA mode, the switch applies the ACL only to the phone as part of the authorization policies.

Beginning with Cisco IOS Release 12.2(55)SE, if there is no static ACL on a port, a dynamic auth-default ACL is created, and policies are enforced before dACLs are downloaded and applied.

Note: The auth-default-ACL does not appear in the running configuration.

The auth-default ACL is created when at least one host with an authorization policy is detected on the port. The auth-default ACL is removed from the port when the last authenticated session ends. You can configure the auth-default ACL by using the `ip access-list extended auth-default-acl` global configuration command.

Note: The auth-default-ACL does not support Cisco Discovery Protocol (CDP) bypass in the single host mode. You must configure a static ACL on the interface to support CDP bypass.

The 802.1x and MAB authentication methods support two authentication modes, open and closed. If there is no static ACL on a port in closed authentication mode:

• An auth-default-ACL is created.
• The auth-default-ACL allows only DHCP traffic until policies are enforced.
• When the first host authenticates, the authorization policy is applied without IP address insertion.
• When a second host is detected, the policies for the first host are refreshed, and policies for the first and subsequent sessions are enforced with IP address insertion.

If there is no static ACL on a port in open authentication mode:
• An auth-default-ACL-OPEN is created and allows all traffic.
• Policies are enforced with IP address insertion to prevent security breaches.
• Web authentication is subject to the auth-default-ACL-OPEN.

To control access for hosts with no authorization policy, you can configure a directive. The supported values for the directive are open and default. When you configure the open directive, all traffic is allowed. The default directive subjects traffic to the access provided by the port. You can configure the directive either in the user profile on the AAA server or on the switch. To configure the directive on the AAA server, use the `authz-directive=<open/default>` global command. To configure the directive on the switch, use the `epm access-control open` global configuration command.

Note
The default value of the directive is default.

If a host falls back to web authentication on a port without a configured ACL:
• If the port is in open authentication mode, the auth-default-ACL-OPEN is created.
• If the port is in closed authentication mode, the auth-default-ACL is created.

The access control entries (ACEs) in the fallback ACL are converted to per-user entries. If the configured fallback profile does not include a fallback ACL, the host is subject to the auth-default-ACL associated with the port.

Note
If you use a custom logo with web authentication and it is stored on an external server, the port ACL must allow access to the external server before authentication. You must either configure a static port ACL or change the auth-default-ACL to provide appropriate access to the external server.

Cisco Secure ACS and Attribute-Value Pairs for the Redirect URL

The switch uses these `cisco-av-pair` VSAs:
• url-redirect is the HTTP or HTTPS URL.
• url-redirect-acl is the switch ACL name or number.

The switch uses the CiscoSecure-defined-ACL attribute value pair to intercept an HTTP or HTTPS request from the endpoint. The switch then forwards the client web browser to the specified redirect address. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl attribute value pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to redirect.
• Traffic that matches a permit ACE in the ACL is redirected.
• Define the URL redirect ACL and the default port ACL on the switch.

If a redirect URL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

Cisco Secure ACS and Attribute-Value Pairs for Downloadable ACLs

You can set the CiscoSecure-Defined-ACL Attribute-Value (AV) pair on the Cisco Secure ACS with the RADIUS cisco-av-pair vendor-specific attributes (VSAs). This pair specifies the names of the downloadable ACLs on the Cisco Secure ACS with the #ACL#-IP-name-number attribute.

• The name is the ACL name.
• The number is the version number (for example, 3f783768).

If a downloadable ACL is configured for a client on the authentication server, a default port ACL on the connected client switch port must also be configured.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host-access-policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL that is configured on the switch port. However, if the switch receives an host access policy from the Cisco Secure ACS but the default ACL is not configured, the authorization failure is declared.

VLAN ID-based MAC Authentication

You can use VLAN ID-based MAC authentication if you wish to authenticate hosts based on a static VLAN ID instead of a downloadable VLAN. When you have a static VLAN policy configured on your switch, VLAN information is sent to an IAS (Microsoft) RADIUS server along with the MAC address of each host for authentication. The VLAN ID configured on the connected port is used for MAC authentication. By using VLAN ID-based MAC authentication with an IAS server, you can have a fixed number of VLANs in the network.

The feature also limits the number of VLANs monitored and handled by STP. The network can be managed as a fixed VLAN.

Note
This feature is not supported on Cisco ACS Server. (The ACS server ignores the sent VLAN-IDs for new hosts and only authenticates based on the MAC address.)

802.1x Authentication with Guest VLAN

You can configure a guest VLAN for each 802.1x port on the switch to provide limited services to clients, such as downloading the 802.1x client. These clients might be upgrading their system for 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.
When you enable a guest VLAN on an 802.1x port, the switch assigns clients to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant, and the interface does not change to the guest VLAN state. EAPOL history is cleared if the interface link status goes down. If no EAPOL packet is detected on the interface, the interface changes to the guest VLAN state.

If the switch is trying to authorize an 802.1x-capable voice device and the AAA server is unavailable, the authorization attempt fails, but the detection of the EAPOL packet is saved in the EAPOL history. When the AAA server becomes available, the switch authorizes the voice device. However, the switch no longer allows other devices access to the guest VLAN. To prevent this situation, use one of these command sequences:

- Enter the `authentication event no-response action authorize vlan vlan-id` interface configuration command to allow access to the guest VLAN.

- Enter the `shutdown` interface configuration command followed by the `no shutdown` interface configuration command to restart the port.

Use a restricted VLAN to allow clients that failed authentication access to the network by entering the `dot1x auth-fail vlan vlan-id` interface configuration command.

If devices send EAPOL packets to the switch during the lifetime of the link, the switch no longer allows clients that fail authentication access to the guest VLAN.

---

**Note**

If an EAPOL packet is detected after the interface has changed to the guest VLAN, the interface reverts to an unauthorized state, and 802.1x authentication restarts.

When the switch port is moved to the guest VLAN, the number of allowed 802.1x-incapable hosts is determined by the configured host-mode. If an 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1x ports in single host, multiple host, multi-auth and multi-domain modes.

You can configure any active VLAN except an RSPAN VLAN, a private VLAN, or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

The switch supports MAC authentication bypass. When MAC authentication bypass is enabled on an 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified.

### 802.1x Authentication with Restricted VLAN

You can configure a restricted VLAN (also referred to as an `authentication failed VLAN`) for each IEEE 802.1x port on a switch stack or a switch to provide limited services to clients that cannot access the guest VLAN.
These clients are 802.1x-compliant and cannot access another VLAN because they fail the authentication process. A restricted VLAN allows users without valid credentials in an authentication server (typically, visitors to an enterprise) to access a limited set of services. The administrator can control the services available to the restricted VLAN.

**Note**
You can configure a VLAN to be both the guest VLAN and the restricted VLAN if you want to provide the same services to both types of users.

Without this feature, the client attempts and fails authentication indefinitely, and the switch port remains in the spanning-tree blocking state. With this feature, you can configure the switch port to be in the restricted VLAN after a specified number of authentication attempts (the default value is 3 attempts).

The authenticator counts the failed authentication attempts for the client. When this count exceeds the configured maximum number of authentication attempts, the port moves to the restricted VLAN. The failed attempt count increments when the RADIUS server replies with either an *EAP failure* or an empty response without an EAP packet. When the port moves into the restricted VLAN, the failed attempt counter resets.

Users who fail authentication remain in the restricted VLAN until the next re-authentication attempt. A port in the restricted VLAN tries to re-authenticate at configured intervals (the default is 60 seconds). If re-authentication fails, the port remains in the restricted VLAN. If re-authentication is successful, the port moves either to the configured VLAN or to a VLAN sent by the RADIUS server. You can disable re-authentication. If you do this, the only way to restart the authentication process is for the port to receive a *link down* or *EAP logoff* event. We recommend that you keep re-authentication enabled if a client might connect through a hub. When a client disconnects from the hub, the port might not receive the *link down* or *EAP logoff* event.

After a port moves to the restricted VLAN, a simulated EAP success message is sent to the client. This prevents clients from indefinitely attempting authentication. Some clients (for example, devices running Windows XP) cannot implement DHCP without EAP success.

Restricted VLANs are supported on 802.1x ports in all host modes and on Layer 2 ports.

You can configure any active VLAN except an RSPAN VLAN, a primary private VLAN, or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

Other security port features such as dynamic ARP Inspection, DHCP snooping, and IP source guard can be configured independently on a restricted VLAN.

### 802.1x Authentication with Inaccessible Authentication Bypass

Use the inaccessible authentication bypass feature, also referred to as *critical authentication* or the *AAA fail policy*, when the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated. You can configure the switch to connect those hosts to *critical ports*.

When a new host tries to connect to the critical port, that host is moved to a user-specified access VLAN, the *critical VLAN*. The administrator gives limited authentication to the hosts.

When the switch tries to authenticate a host connected to a critical port, the switch checks the status of the configured RADIUS server. If a server is available, the switch can authenticate the host. However, if all the RADIUS servers are unavailable, the switch grants network access to the host and puts the port in the *critical-authentication* state, which is a special case of the authentication state.

**Inaccessible Authentication Bypass Support on Multiple-Authentication Ports**

When a port is configured on any host mode and the AAA server is unavailable, the port is then configured to multi-host mode and moved to the critical VLAN. To support this inaccessible bypass on multiple-authentication (multiauth) ports, use the `authentication event server dead action reinitialize_vlan vlan-id` command. When a new host tries to connect to the critical port, that port is reinitialized and all the connected hosts are moved to the user-specified access VLAN.

This command is supported on all host modes.

**Inaccessible Authentication Bypass Authentication Results**

The behavior of the inaccessible authentication bypass feature depends on the authorization state of the port:

- If the port is unauthorized when a host connected to a critical port tries to authenticate and all servers are unavailable, the switch puts the port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.

- If the port is already authorized and reauthentication occurs, the switch puts the critical port in the critical-authentication state in the current VLAN, which might be the one previously assigned by the RADIUS server.

- If the RADIUS server becomes unavailable during an authentication exchange, the current exchange times out, and the switch puts the critical port in the critical-authentication state during the next authentication attempt.

You can configure the critical port to reinitialize hosts and move them out of the critical VLAN when the RADIUS server is again available. When this is configured, all critical ports in the critical-authentication state are automatically re-authenticated.

**Inaccessible Authentication Bypass Feature Interactions**

Inaccessible authentication bypass interacts with these features:

- **Guest VLAN**—Inaccessible authentication bypass is compatible with guest VLAN. When a guest VLAN is enabled on 802.1x port, the features interact as follows:
  
  - If at least one RADIUS server is available, the switch assigns a client to a guest VLAN when the switch does not receive a response to its EAP request/identity frame or when EAPOL packets are not sent by the client.
  
  - If all the RADIUS servers are not available and the client is connected to a critical port, the switch authenticates the client and puts the critical port in the critical-authentication state in the RADIUS-configured or user-specified access VLAN.
  
  - If all the RADIUS servers are not available and the client is not connected to a critical port, the switch might not assign clients to the guest VLAN if one is configured.
  
  - If all the RADIUS servers are not available and if a client is connected to a critical port and was previously assigned to a guest VLAN, the switch keeps the port in the guest VLAN.

- **Restricted VLAN**—If the port is already authorized in a restricted VLAN and the RADIUS servers are unavailable, the switch puts the critical port in the critical-authentication state in the restricted VLAN.

- **802.1x accounting**—Accounting is not affected if the RADIUS servers are unavailable.
• Private VLAN—You can configure inaccessible authentication bypass on a private VLAN host port. The access VLAN must be a secondary private VLAN.

• Voice VLAN—Inaccessible authentication bypass is compatible with voice VLAN, but the RADIUS-configured or user-specified access VLAN and the voice VLAN must be different.

• Remote Switched Port Analyzer (RSPAN)—Do not configure an RSPAN VLAN as the RADIUS-configured or user-specified access VLAN for inaccessible authentication bypass.

In a switch stack, the stack master checks the status of the RADIUS servers by sending keepalive packets. When the status of a RADIUS server changes, the stack master sends the information to the stack members. The stack members can then check the status of RADIUS servers when re-authenticating critical ports.

If the new stack master is elected, the link between the switch stack and RADIUS server might change, and the new stack immediately sends keepalive packets to update the status of the RADIUS servers. If the server status changes from dead to alive, the switch re-authenticates all switch ports in the critical-authentication state.

When a member is added to the stack, the stack master sends the member the server status.

802.1x Critical Voice VLAN

When an IP phone connected to a port is authenticated by the access control server (ACS), the phone is put into the voice domain. If the ACS is not reachable, the switch cannot determine if the device is a voice device. If the server is unavailable, the phone cannot access the voice network and therefore cannot operate.

For data traffic, you can configure inaccessible authentication bypass, or critical authentication, to allow traffic to pass through on the native VLAN when the server is not available. If the RADIUS authentication server is unavailable (down) and inaccessible authentication bypass is enabled, the switch grants the client access to the network and puts the port in the critical-authentication state in the RADIUS-configured or the user-specified access VLAN. When the switch cannot reach the configured RADIUS servers and new hosts cannot be authenticated, the switch connects those hosts to critical ports. A new host trying to connect to the critical port is moved to a user-specified access VLAN, the critical VLAN, and granted limited authentication.

You can enter the authentication event server dead action authorize voice interface configuration command to configure the critical voice VLAN feature. When the ACS does not respond, the port goes into critical authentication mode. When traffic coming from the host is tagged with the voice VLAN, the connected device (the phone) is put in the configured voice VLAN for the port. The IP phones learn the voice VLAN identification through CDP (Cisco devices) or through LLDP or DHCP.

You can configure the voice VLAN for a port by entering the switchport voice vlan vlan-id interface configuration command.

This feature is supported in multidomain and multi-auth host modes. Although you can enter the command when the switch in single-host or multi-host mode, the command has no effect unless the device changes to multidomain or multi-auth host mode.

802.1x User Distribution

You can configure 802.1x user distribution to load-balance users with the same group name across multiple different VLANs.

The VLANs are either supplied by the RADIUS server or configured through the switch CLI under a VLAN group name.
• Configure the RADIUS server to send more than one VLAN name for a user. The multiple VLAN names can be sent as part of the response to the user. The 802.1x user distribution tracks all the users in a particular VLAN and achieves load balancing by moving the authorized user to the least populated VLAN.

• Configure the RADIUS server to send a VLAN group name for a user. The VLAN group name can be sent as part of the response to the user. You can search for the selected VLAN group name among the VLAN group names that you configured by using the switch CLI. If the VLAN group name is found, the corresponding VLANs under this VLAN group name are searched to find the least populated VLAN. Load balancing is achieved by moving the corresponding authorized user to that VLAN.

| Note | The RADIUS server can send the VLAN information in any combination of VLAN-IDs, VLAN names, or VLAN groups. |

**802.1x User Distribution Configuration Guidelines**

- Confirm that at least one VLAN is mapped to the VLAN group.
- You can map more than one VLAN to a VLAN group.
- You can modify the VLAN group by adding or deleting a VLAN.
- When you clear an existing VLAN from the VLAN group name, none of the authenticated ports in the VLAN are cleared, but the mappings are removed from the existing VLAN group.
- If you clear the last VLAN from the VLAN group name, the VLAN group is cleared.
- You can clear a VLAN group even when the active VLANs are mapped to the group. When you clear a VLAN group, none of the ports or users that are in the authenticated state in any VLAN within the group are cleared, but the VLAN mappings to the VLAN group are cleared.

**IEEE 802.1x Authentication with Voice VLAN Ports**

A voice VLAN port is a special access port associated with two VLAN identifiers:

- VVID to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- PVID to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

The IP phone uses the VVID for its voice traffic, regardless of the authorization state of the port. This allows the phone to work independently of IEEE 802.1x authentication.

In single-host mode, only the IP phone is allowed on the voice VLAN. In multiple-hosts mode, additional clients can send traffic on the voice VLAN after a supplicant is authenticated on the PVID. When multiple-hosts mode is enabled, the supplicant authentication affects both the PVID and the VVID.
If an IP phone and PC are connected to a switchport, and the port is configured in single- or multi-host mode, we do not recommend configuring that port in standalone MAC authentication bypass mode. We recommend only using MAC authentication bypass as a fallback method to 802.1x authentication with the timeout period set to the default of five seconds.

A voice VLAN port becomes active when there is a link, and the device MAC address appears after the first CDP message from the IP phone. Cisco IP phones do not relay CDP messages from other devices. As a result, if several IP phones are connected in series, the switch recognizes only the one directly connected to it. When IEEE 802.1x authentication is enabled on a voice VLAN port, the switch drops packets from unrecognized IP phones more than one hop away.

When IEEE 802.1x authentication is enabled on a switch port, you can configure an access port VLAN that is also a voice VLAN.

---

**Note**

If you enable IEEE 802.1x authentication on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the Cisco IP phone loses connectivity to the switch for up to 30 seconds.

---

**IEEE 802.1x Authentication with Port Security**

In general, Cisco does not recommend enabling port security when IEEE 802.1x is enabled. Since IEEE 802.1x enforces a single MAC address per port (or per VLAN when MDA is configured for IP telephony), port security is redundant and in some cases may interfere with expected IEEE 802.1x operations.

**IEEE 802.1x Authentication with Wake-on-LAN**

The IEEE 802.1x authentication with wake-on-LAN (WoL) feature allows dormant PCs to be powered when the switch receives a specific Ethernet frame, known as the magic packet. You can use this feature in environments where administrators need to connect to systems that have been powered down.

When a host that uses WoL is attached through an IEEE 802.1x port and the host powers off, the IEEE 802.1x port becomes unauthorized. The port can only receive and send EAPOL packets, and WoL magic packets cannot reach the host. When the PC is powered off, it is not authorized, and the switch port is not opened.

When the switch uses IEEE 802.1x authentication with WoL, the switch forwards traffic to unauthorized IEEE 802.1x ports, including magic packets. While the port is unauthorized, the switch continues to block ingress traffic other than EAPOL packets. The host can receive packets but cannot send packets to other devices in the network.

---

**Note**

If PortFast is not enabled on the port, the port is forced to the bidirectional state.

When you configure a port as unidirectional by using the `authentication control-direction` in interface configuration command, the port changes to the spanning-tree forwarding state. The port can send packets to the host but cannot receive packets from the host.
When you configure a port as bidirectional by using the `authentication control-direction both` interface configuration command, the port is access-controlled in both directions. The port does not receive packets from or send packets to the host.

**IEEE 802.1x Authentication with MAC Authentication Bypass**

You can configure the switch to authorize clients based on the client MAC address by using the MAC authentication bypass feature. For example, you can enable this feature on IEEE 802.1x ports connected to devices such as printers.

If IEEE 802.1x authentication times out while waiting for an EAPOL response from the client, the switch tries to authorize the client by using MAC authentication bypass.

When the MAC authentication bypass feature is enabled on an IEEE 802.1x port, the switch uses the MAC address as the client identity. The authentication server has a database of client MAC addresses that are allowed network access. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is configured.

If the switch already authorized a port by using MAC authentication bypass and detects an IEEE 802.1x supplicant, the switch does not unauthorize the client connected to the port. When re-authentication occurs, the switch uses the authentication or re-authentication methods configured on the port, if the previous session ended because the Termination-Action RADIUS attribute value is DEFAULT.

Clients that were authorized with MAC authentication bypass can be re-authenticated. The re-authentication process is the same as that for clients that were authenticated with IEEE 802.1x. During re-authentication, the port remains in the previously assigned VLAN. If re-authentication is successful, the switch keeps the port in the same VLAN. If re-authentication fails, the switch assigns the port to the guest VLAN, if one is configured.

If re-authentication is based on the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute [29]) and if the Termination-Action RADIUS attribute (Attribute [29]) action is `Initialize` (the attribute value is `DEFAULT`), the MAC authentication bypass session ends, and connectivity is lost during re-authentication. If MAC authentication bypass is enabled and the IEEE 802.1x authentication times out, the switch uses the MAC authentication bypass feature to initiate re-authorization. For more information about these AV pairs, see RFC 3580, “IEEE 802.1X Remote Authentication Dial In User Service (RADIUS) Usage Guidelines.”

MAC authentication bypass interacts with the features:

- IEEE 802.1x authentication—MAC authentication bypass and IEEE 802.1x authentication are configured independently on the port.

- Guest VLAN—if a client has an invalid MAC address identity, the switch assigns the client to a guest VLAN if one is configured.

- Restricted VLAN—This feature is not supported when the client connected to an IEEE 802.1x port is authenticated with MAC authentication bypass.

- Port security

- Voice VLAN

- VLAN Membership Policy Server (VMPS)—IEEE802.1x and VMPS are mutually exclusive.

- Private VLAN—You can assign a client to a private VLAN.
Network Admission Control Layer 2 IEEE 802.1x Validation

The switch supports the Network Admission Control (NAC) Layer 2 IEEE 802.1x validation, which checks the antivirus condition or posture of endpoint systems or clients before granting the devices network access. With NAC Layer 2 IEEE 802.1x validation, you can do these tasks:

- Download the Session-Timeout RADIUS attribute (Attribute[27]) and the Termination-Action RADIUS attribute (Attribute[29]) from the authentication server.
- Set the number of seconds between re-authentication attempts as the value of the Session-Timeout RADIUS attribute (Attribute[27]) and get an access policy against the client from the RADIUS server.
- Set the action to be taken when the switch tries to re-authenticate the client by using the Termination-Action RADIUS attribute (Attribute[29]). If the value is the DEFAULT or is not set, the session ends. If the value is RADIUS-Request, the re-authentication process starts.
- View the NAC posture token, which shows the posture of the client, by using the `show authentication` privileged EXEC command.
- Configure secondary private VLANs as guest VLANs.

Configuring NAC Layer 2 IEEE 802.1x validation is similar to configuring IEEE 802.1x port-based authentication except that you must configure a posture token on the RADIUS server.

Flexible Authentication Ordering

You can use flexible authentication ordering to configure the order of methods that a port uses to authenticate a new host. MAC authentication bypass and 802.1x can be the primary or secondary authentication methods, and web authentication can be the fallback method if either or both of those authentication attempts fail.

Related Topics

- Configuring Flexible Authentication Ordering, on page 1550

Open1x Authentication

Open1x authentication allows a device access to a port before that device is authenticated. When open authentication is configured, a new host can pass traffic according to the access control list (ACL) defined on the port. After the host is authenticated, the policies configured on the RADIUS server are applied to that host.

You can configure open authentication with these scenarios:

- Single-host mode with open authentication—Only one user is allowed network access before and after authentication.
• MDA mode with open authentication–Only one user in the voice domain and one user in the data domain are allowed.

• Multiple-hosts mode with open authentication–Any host can access the network.

• Multiple-authentication mode with open authentication–Similar to MDA, except multiple hosts can be authenticated.

### Note

If open authentication is configured, it takes precedence over other authentication controls. This means that if you use the `authentication open` interface configuration command, the port will grant access to the host irrespective of the `authentication port-control` interface configuration command.

In Session Aware Networking mode, to enable open authentication, use `no access-session closed`. To disable open authentication, use `access-session closed`.

## Multidomain Authentication

The switch supports multidomain authentication (MDA), which allows both a data device and voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port. The port is divided into a data domain and a voice domain.

MDA does not enforce the order of device authentication. However, for best results, we recommend that a voice device is authenticated before a data device on an MDA-enabled port.

Follow these guidelines for configuring MDA:

- You must configure a switch port for MDA.

- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain.

- Voice VLAN assignment on an MDA-enabled port is supported.

### Note

You can assign a dynamic VLAN to a voice device on an MDA-enabled switch port, but the voice device fails authorization if a static voice VLAN configured on the switchport is the same as the dynamic VLAN assigned for the voice device in the RADIUS server.

• To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of `device-traffic-class=voice`. Without this value, the switch treats the voice device as a data device.

• The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.

• If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.
Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked.

A voice device MAC address that is binding on the data VLAN is not counted towards the port security MAC address limit.

You can use dynamic VLAN assignment from a RADIUS server only for data devices.

MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support IEEE 802.1x authentication.

When a data or a voice device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.

If more than five devices are detected on the data VLAN or more than one voice device is detected on the voice VLAN while a port is unauthorized, the port is error disabled.

When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port voice VLAN is automatically removed and must be reauthenticated on that port.

Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.

Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.

If a data domain is authorized first and placed in the guest VLAN, non-IEEE 802.1x-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.

We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

**802.1x Supplicant and Authenticator Switches with Network Edge Access Topology (NEAT)**

The Network Edge Access Topology (NEAT) feature extends identity to areas outside the wiring closet (such as conference rooms). This allows any type of device to authenticate on the port.

- **802.1x switch supplicant:** You can configure a switch to act as a supplicant to another switch by using the 802.1x supplicant feature. This configuration is helpful in a scenario, where, for example, a switch is outside a wiring closet and is connected to an upstream switch through a trunk port. A switch configured with the 802.1x switch supplicant feature authenticates with the upstream switch for secure connectivity. Once the supplicant switch authenticates successfully the port mode changes from access to trunk.

- **If the access VLAN is configured on the authenticator switch, it becomes the native VLAN for the trunk port after successful authentication.**

You can enable MDA or multiauth mode on the authenticator switch interface that connects to one more supplicant switches. Multihost mode is not supported on the authenticator switch interface.
Use the `dot1x supplicant force-multicast` global configuration command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

- **Host Authorization**: Ensures that only traffic from authorized hosts (connecting to the switch with supplicant) is allowed on the network. The switches use Client Information Signalling Protocol (CISP) to send the MAC addresses connecting to the supplicant switch to the authenticator switch.

- **Auto enablement**: Automatically enables trunk configuration on the authenticator switch, allowing user traffic from multiple VLANs coming from supplicant switches. Configure the cisco-av-pair as `device-traffic-class=switch` at the ACS. (You can configure this under the `group` or the `user` settings.)

**Figure 90: Authenticator and Supplicant Switch using CISP**

**Voice Aware 802.1x Security**

You use the voice aware 802.1x security feature to configure the switch to disable only the VLAN on which a security violation occurs, whether it is a data or voice VLAN. In previous releases, when an attempt to authenticate the data client caused a security violation, the entire port shut down, resulting in a complete loss of connectivity.

You can use this feature in IP phone deployments where a PC is connected to the IP phone. A security violation found on the data VLAN results in the shutdown of only the data VLAN. The traffic on the voice VLAN flows through the switch without interruption.

**Related Topics**

Configuring Voice Aware 802.1x Security, on page 1507

**Common Session ID**

Authentication manager uses a single session ID (referred to as a common session ID) for a client no matter which authentication method is used. This ID is used for all reporting purposes, such as the show commands and MIBs. The session ID appears with all per-session syslog messages.
The session ID includes:

- The IP address of the Network Access Device (NAD)
- A monotonically increasing unique 32 bit integer
- The session start time stamp (a 32 bit integer)

This example shows how the session ID appears in the output of the show authentication command. The session ID in this example is 160000050000000B288508E5:

```bash
Switch# show authentication sessions
Interface MAC Address Method Domain Status Session ID
Fa4/0/4 0000.0000.0203 mab DATA Authz Success 160000050000000B288508E5
```

This is an example of how the session ID appears in the syslog output. The session ID in this example is also 160000050000000B288508E5:

```
1w0d: %AUTHMGR-5-START: Starting 'mab' for client (0000.0000.0203) on Interface Fa4/0/4
AuditSessionID 160000050000000B288508E5
1w0d: %MAB-5-SUCCESS: Authentication successful for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
1w0d: %AUTHMGR-7-RESULT: Authentication result 'success' from 'mab' for client (0000.0000.0203) on Interface Fa4/0/4 AuditSessionID 160000050000000B288508E5
```

The session ID is used by the NAD, the AAA server, and other report-analyzing applications to identify the client. The ID appears automatically. No configuration is required.

802.1x Authentication Configuration Guidelines

802.1x Authentication

These are the 802.1x authentication configuration guidelines:

- When 802.1x authentication is enabled, ports are authenticated before any other Layer 2 or Layer 3 features are enabled.

- If the VLAN to which an 802.1x-enabled port is assigned changes, this change is transparent and does not affect the switch. For example, this change occurs if a port is assigned to a RADIUS server-assigned VLAN and is then assigned to a different VLAN after re-authentication.

If the VLAN to which an 802.1x port is assigned to shut down, disabled, or removed, the port becomes unauthorized. For example, the port is unauthorized after the access VLAN to which a port is assigned shuts down or is removed.

- The 802.1x protocol is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports, but it is not supported on these port types:
  - Trunk port—If you try to enable 802.1x authentication on a trunk port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.
  - Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1x authentication on a dynamic port, an error message appears, and 802.1x authentication is not enabled. If you try to change the mode of an 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
  - Dynamic-access ports—If you try to enable 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and 802.1x authentication is not enabled. If you try to change an 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.
  - EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an 802.1x port. If you try to enable 802.1x authentication on an EtherChannel port, an error message appears, and 802.1x authentication is not enabled.
  - Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination port. You can enable 802.1x authentication on a SPAN or RSPAN source port.

- Before globally enabling 802.1x authentication on a switch by entering the `dot1x system-auth-control` global configuration command, remove the EtherChannel configuration from the interfaces on which 802.1x authentication and EtherChannel are configured.

- If you are using a device running the Cisco Access Control Server (ACS) application for IEEE 802.1x authentication with EAP-Transparent LAN Services (TLS) and EAP-MD5, make sure that the device is running ACS Version 3.2.1 or later.

- When IP phones are connected to an 802.1x-enabled switch port that is in single host mode, the switch grants the phones network access without authenticating them. We recommend that you use multidomain authentication (MDA) on the port to authenticate both a data device and a voice device, such as an IP phone.
Only Catalyst 3750, 3560, and 2960 switches support CDP bypass. The Catalyst 3750-X, 3560-X, 3750-E, and 3560-E switches do not support CDP bypass.

- Cisco IOS Release 12.2(55)SE and later supports filtering of system messages related to 802.1x authentication.

VLAN Assignment, Guest VLAN, Restricted VLAN, and Inaccessible Authentication Bypass

These are the configuration guidelines for VLAN assignment, guest VLAN, restricted VLAN, and inaccessible authentication bypass:

- When 802.1x authentication is enabled on a port, you cannot configure a port VLAN that is equal to a voice VLAN.
- The 802.1x authentication with VLAN assignment feature is not supported on trunk ports, dynamic ports, or with dynamic-access port assignment through a VMPS.
- You can configure 802.1x authentication on a private-VLAN port, but do not configure IEEE 802.1x authentication with port security, a voice VLAN, a guest VLAN, a restricted VLAN, or a per-user ACL on private-VLAN ports.
- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
- After you configure a guest VLAN for an 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the 802.1x authentication process (authentication timer inactivity and authentication timer reauthentication interface configuration commands). The amount to decrease the settings depends on the connected 802.1x client type.
- When configuring the inaccessible authentication bypass feature, follow these guidelines:
  - The feature is supported on 802.1x port in single-host mode and multihost mode.
  - If the client is running Windows XP and the port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.
  - If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.
  - You can configure the inaccessible authentication bypass feature and the restricted VLAN on an 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, switch changes the port state to the critical authentication state and remains in the restricted VLAN.
- You can configure any VLAN except an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN. The restricted VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.
MAC Authentication Bypass

These are the MAC authentication bypass configuration guidelines:

• Unless otherwise stated, the MAC authentication bypass guidelines are the same as the 802.1x authentication guidelines.

• If you disable MAC authentication bypass from a port after the port has been authorized with its MAC address, the port state is not affected.

• If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.

• If the port is in the authorized state, the port remains in this state until re-authorization occurs.

Maximum Number of Allowed Devices Per Port

This is the maximum number of devices allowed on an 802.1x-enabled port:

• In single-host mode, only one device is allowed on the access VLAN. If the port is also configured with a voice VLAN, an unlimited number of Cisco IP phones can send and receive traffic through the voice VLAN.

• In multidomain authentication (MDA) mode, one device is allowed for the access VLAN, and one IP phone is allowed for the voice VLAN.

• In multihost mode, only one 802.1x supplicant is allowed on the port, but an unlimited number of non-802.1x hosts are allowed on the access VLAN. An unlimited number of devices are allowed on the voice VLAN.

Configuring 802.1x Readiness Check

Beginning in privileged EXEC mode, follow these steps to enable the 802.1x readiness check on the switch:

SUMMARY STEPS

1. dot1x test eapol-capable [interface interface-id]
2. configure terminal
3. dot1x test timeout timeout
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> dot1x test eapol-capable [interface interface-id]</td>
<td>Enables the 802.1x readiness check on the switch. (Optional) For <strong>interface-id</strong> specify the port on which to check for IEEE 802.1x readiness.</td>
</tr>
<tr>
<td>Example: Switch# dot1x test eapol-capable interface gigabitethernet1/0/13</td>
<td>Note If you omit the optional <strong>interface</strong> keyword, all interfaces on the switch are tested.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>(Optional) Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> dot1x test timeout timeout</td>
<td>(Optional) Configures the timeout used to wait for EAPOL response. The range is from 1 to 65535 seconds. The default is 10 seconds.</td>
</tr>
<tr>
<td>Example: Switch(config)# dot1x test timeout 300</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

802.1x Readiness Check, on page 1485

### Configuring Voice Aware 802.1x Security

Follow these guidelines to configure voice aware 802.1x voice security on the switch:

- You enable voice aware 802.1x security by entering the `errdisable detect cause security-violation shutdown vlan` global configuration command. You disable voice aware 802.1x security by entering the `no` version of this command. This command applies to all 802.1x-configured ports in the switch.

  ![Note](image)

  If you do not include the `shutdown vlan` keywords, the entire port is shut down when it enters the error-disabled state.

- If you use the `errdisable recovery cause security-violation` global configuration command to configure error-disabled recovery, the port is automatically re-enabled. If error-disabled recovery is not configured for the port, you re-enable it by using the `shutdown` and `no shutdown` interface configuration commands.

- You can re-enable individual VLANs by using the `clear errdisable interface interface-id vlan [vlan-list]` privileged EXEC command. If you do not specify a range, all VLANs on the port are enabled.

Beginning in privileged EXEC mode, follow these steps to enable voice aware 802.1x security:

**SUMMARY STEPS**

1. configure terminal
2. errdisable detect cause security-violation shutdown vlan
3. errdisable recovery cause security-violation
4. clear errdisable interface interface-id vlan [vlan-list]
5. Enter the following:
   - shutdown
   - no shutdown

6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | configure terminal  
  Example:  
  Switch# configure terminal | Enters the global configuration mode. |
| **Step 2** | errdisable detect cause security-violation shutdown vlan  
  Example:  
  Switch(config)# errdisable detect cause security-violation shutdown vlan | Shuts down any VLAN on which a security violation error occurs.  
  **Note** If the **shutdown vlan** keywords are not included, the entire port enters the error-disabled state and shuts down. |
| **Step 3** | errdisable recovery cause security-violation  
  Example:  
  Switch(config)# errdisable recovery cause security-violation | (Optional) Enables automatic per-VLAN error recovery. |
| **Step 4** | clear errdisable interface interface-id vlan [vlan-list]  
  Example:  
  Switch(config)# clear errdisable interface GigabitEthernet4/0/2 vlan | (Optional) Re-enables individual VLANs that have been error disabled.  
  - For **interface-id**, specify the port on which to reenable individual VLANs.  
  - (Optional) For **vlan-list**, specify a list of VLANs to be re-enabled. If **vlan-list** is not specified, all VLANs are re-enabled. |
| **Step 5** | Enter the following:  
  - shutdown  
  - no shutdown  
  Example:  
  Switch(config-if)# shutdown  
  Switch(config-if)# no shutdown | (Optional) Re-enables an error-disabled VLAN, and clear all error-disable indications. |
You can configure an 802.1x port so that it shuts down, generates a syslog error, or discards packets from a new device when:

- a device connects to an 802.1x-enabled port
- the maximum number of allowed about devices have been authenticated on the port

Beginning in privileged EXEC mode, follow these steps to configure the security violation actions on the switch:

**SUMMARY STEPS**

1. configure terminal
2. aaa new-model
3. aaa authentication dot1x {default} method1
4. interface interface-id
5. switchport mode access
6. authentication violation {shutdown | restrict | protect | replace}
7. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>aaa authentication dot1x {default} method1</td>
<td>Creates an 802.1x authentication method list.</td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**

Switch(config)# aaa authentication dot1x default
group radius

**Purpose**

To create a default list that is used when a named list is not specified in the `authentication` command, use the `default` keyword followed by the method that is to be used in default situations. The default method list is automatically applied to all ports.

For `method1`, enter the `group radius` keywords to use the list of all RADIUS servers for authentication.

*Note*  Though other keywords are visible in the command-line help string, only the `group radius` keywords are supported.

**Step 4**  
**interface interface-id**

**Example:**

Switch(config)# interface gigabitethernet1/0/4

**Step 5**  
**switchport mode access**

**Example:**

Switch(config-if)# switchport mode access

**Step 6**  
**authentication violation {shutdown | restrict | protect | replace}**

**Example:**

Switch(config-if)# authentication violation restrict

**Step 7**  
**end**

**Example:**

Switch(config-if)# end

### Configuring 802.1x Authentication

To allow per-user ACLs or VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

This is the 802.1x AAA process:
Before you begin

To configure 802.1x port-based authentication, you must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

SUMMARY STEPS

1. A user connects to a port on the switch.
2. Authentication is performed.
3. VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.
4. The switch sends a start message to an accounting server.
5. Re-authentication is performed, as necessary.
6. The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.
7. The user disconnects from the port.
8. The switch sends a stop message to the accounting server.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>A user connects to a port on the switch.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Authentication is performed.</td>
</tr>
<tr>
<td>Step 3</td>
<td>VLAN assignment is enabled, as appropriate, based on the RADIUS server configuration.</td>
</tr>
<tr>
<td>Step 4</td>
<td>The switch sends a start message to an accounting server.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Re-authentication is performed, as necessary.</td>
</tr>
<tr>
<td>Step 6</td>
<td>The switch sends an interim accounting update to the accounting server that is based on the result of re-authentication.</td>
</tr>
<tr>
<td>Step 7</td>
<td>The user disconnects from the port.</td>
</tr>
<tr>
<td>Step 8</td>
<td>The switch sends a stop message to the accounting server.</td>
</tr>
</tbody>
</table>

Configuring 802.1x Port-Based Authentication

Beginning in privileged EXEC mode, follow these steps to configure 802.1x port-based authentication:

SUMMARY STEPS

1. `configure terminal`
2. `aaa new-model`
3. `aaa authentication dot1x {default} method1`
4. `dot1x system-auth-control`
5. `aaa authorization network {default} group radius`
6. `radius-server host ip-address`
7. radius-server key string
8. interface interface-id
9. switchport mode access
10. authentication port-control auto
11. dot1x pae authenticator
12. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>

<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Enables AAA. |
| aaaa new-model | |
| Example: | |
| Switch(config)# aaaa new-model | |

| **Step 3** | Creates an 802.1x authentication method list. |
| aaaa authentication dot1x {default} method1 | |
| Example: | |
| Switch(config)# aaaa authentication dot1x default group radius | |

| **Step 4** | Enables 802.1x authentication globally on the switch. |
| dot1x system-auth-control | |
| Example: | |
| Switch(config)# dot1x system-auth-control | |

<p>| <strong>Step 5</strong> | (Optional) Configures the switch to use user-RADIUS authorization for all network-related service requests, such as per-user ACLs or VLAN assignment. |
| aaaa authorization network {default} group radius | |
| Note: For per-user ACLs, single-host mode must be configured. This setting is the default. |
| Example: | |
| Switch(config)# aaaa authorization network default group radius | |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 6** | **radius-server host ip-address**  
*Example:*  
Switch(config)# radius-server host 124.2.2.12 | *(Optional) Specifies the IP address of the RADIUS server.* |
| **Step 7** | **radius-server key string**  
*Example:*  
Switch(config)# radius-server key abc1234 | *(Optional) Specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.* |
| **Step 8** | **interface interface-id**  
*Example:*  
Switch(config)# interface gigabitethernet1/0/2 | Specifies the port connected to the client that is to be enabled for IEEE 802.1x authentication, and enter interface configuration mode. |
| **Step 9** | **switchport mode access**  
*Example:*  
Switch(config-if)# switchport mode access | *(Optional) Sets the port to access mode only if you configured the RADIUS server in Step 6 and Step 7.* |
| **Step 10** | **authentication port-control auto**  
*Example:*  
Switch(config-if)# authentication port-control auto | Enables 802.1x authentication on the port. |
| **Step 11** | **dot1x pae authenticator**  
*Example:*  
Switch(config-if)# dot1x pae authenticator | Sets the interface Port Access Entity to act only as an authenticator and ignore messages meant for a supplicant. |
| **Step 12** | **end**  
*Example:*  
Switch(config-if)# end | Returns to privileged EXEC mode. |

**Configuring the Switch-to-RADIUS-Server Communication**

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the `radius-server host` global configuration command. If you want to configure these options on a
per-server basis, use the `radius-server timeout`, the `radius-server retransmit`, and the `radius-server key` global configuration commands.

You also need to configure some settings on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch. For more information, see the RADIUS server documentation.

Beginning in privileged EXEC mode, follow these steps to configure the RADIUS server parameters on the switch. This procedure is required.

**Before you begin**
You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list. A method list describes the sequence and authentication method to be queried to authenticate a user.

**SUMMARY STEPS**

1. `configure terminal`
2. `radius-server host {hostname | ip-address} auth-port port-number key string`
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> radius-server host {hostname</td>
<td>ip-address} auth-port port-number key string</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# radius-server host 125.5.5.43 auth-port 1812 key string</td>
<td>For `hostname</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>For <code>auth-port port-number</code>, specify the UDP destination port for authentication requests. The default is 1812. The range is 0 to 65536.</td>
</tr>
<tr>
<td></td>
<td>For <code>key string</code>, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> Always configure the key as the last item in the <code>radius-server host</code> command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</td>
</tr>
</tbody>
</table>
Configuring the Host Mode

Beginning in privileged EXEC mode, follow these steps to allow multiple hosts (clients) on an IEEE 802.1x-authorized port that has the authentication port-control interface configuration command set to auto. Use the multi-domain keyword to configure and enable multidomain authentication (MDA), which allows both a host and a voice device, such as an IP phone (Cisco or non-Cisco), on the same switch port. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication host-mode [multi-auth | multi-domain | multi-host | single-host]
4. end

**DETAILED STEPS**

Switch-to-RADIUS-Server Communication, on page 1485
### Purpose

Command or Action | Purpose
--- | ---
multi-host | The **multi-auth** keyword is only available with the **authentication host-mode** command.

- **multi-host**—Allow multiple hosts on an 802.1x-authorized port after a single host has been authenticated.
- **multi-domain**—Allow both a host and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port.

**Note** You must configure the voice VLAN for the IP phone when the host mode is set to **multi-domain**.

Make sure that the **authentication port-control** interface configuration command is set to **auto** for the specified interface.

### Step 4

**Example:**

Switch(config-if)# end

Returns to privileged EXEC mode.

---

### Configuring Periodic Re-Authentication

You can enable periodic 802.1x client re-authentication and specify how often it occurs. If you do not specify a time period before enabling re-authentication, the number of seconds between attempts is 3600.

Beginning in privileged EXEC mode, follow these steps to enable periodic re-authentication of the client and to configure the number of seconds between re-authentication attempts. This procedure is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `authentication periodic`
4. `authentication timer {{[inactivity | reauthenticate | restart]} {value}}`
5. `end`

</tbody>
</table>

### Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time and then tries again. The authentication timer inactivity interface configuration command controls the idle period. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

Beginning in privileged EXEC mode, follow these steps to change the quiet period. This procedure is optional.
### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. authentication timer inactivity seconds
4. end
5. show authentication sessions interface interface-id
6. copy running-config startup-config

### DETAILED STEPS

</tr>
</tbody>
</table>
Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then resends the frame.

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to change the amount of time that the switch waits for client notification. This procedure is optional.

SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `authentication timer reauthenticate seconds`
4. `end`
5. `show authentication sessions interface interface-id`
6. `copy running-config startup-config`

DETAILED STEPS

</tbody>
</table>
### Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission time, you can change the number of times that the switch sends an EAP-request/identity frame (assuming no response is received) to the client before restarting the authentication process.

**Note**
You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the switch-to-client frame-retransmission number. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `dot1x max-reauth-req count`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>

<tr>
<td><code>interface interface-id</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Purpose

Command or Action

| Switch(config)# interface gigabitethernet2/0/1 |

Step 3

| dot1x max-reauth-req count |
| Example: |
| Switch(config-if)# dot1x max-reauth-req 5 |

Sets the number of times that the switch sends an EAP-request/identity frame to the client before restarting the authentication process. The range is 1 to 10; the default is 2.

Step 4

| end |
| Example: |
| Switch(config-if)# end |

Returns to privileged EXEC mode.

Setting the Re-Authentication Number

You can also change the number of times that the switch restarts the authentication process before the port changes to the unauthorized state.

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

Beginning in privileged EXEC mode, follow these steps to set the re-authentication number. This procedure is optional.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode access
4. dot1x max-reauth-req count
5. end

Configuring 802.1x Accounting

Enabling AAA system accounting with 802.1x accounting allows system reload events to be sent to the accounting RADIUS server for logging. The server can then infer that all active 802.1x sessions are closed.

Because RADIUS uses the unreliable UDP transport protocol, accounting messages might be lost due to poor network conditions. If the switch does not receive the accounting response message from the RADIUS server after a configurable number of retransmissions of an accounting request, this system message appears:

```
Accounting message %s for session %s failed to receive Accounting Response.
```
When the stop message is not sent successfully, this message appears:

```
00:09:55: %RADIUS-4-RADIUS_DEAD: RADIUS server 172.20.246.201:1645,1646 is not responding.
```

**Note**

You must configure the RADIUS server to perform accounting tasks, such as logging start, stop, and interim-update messages and time stamps. To turn on these functions, enable logging of “Update/Watchdog packets from this AAA client” in your RADIUS server Network Configuration tab. Next, enable “CVS RADIUS Accounting” in your RADIUS server System Configuration tab.

Beginning in privileged EXEC mode, follow these steps to configure 802.1x accounting after AAA is enabled on your switch. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `aaa accounting dot1x default start-stop group radius`
4. `aaa accounting system default start-stop group radius`
5. `end`
6. `show running-config`
7. `copy running-config startup-config`

### Configuring a Guest VLAN

When you configure a guest VLAN, clients that are not 802.1x-capable are put into the guest VLAN when the server does not receive a response to its EAP request/identity frame. Clients that are 802.1x-capable but that fail authentication are not granted network access. The switch supports guest VLANs in single-host or multiple-hosts mode.

Beginning in privileged EXEC mode, follow these steps to configure a guest VLAN. This procedure is optional.

#### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. Use one of the following:
   - switchport mode access
   - switchport mode private-vlan host
4. authentication event no-response action authorize vlan vlan-id
5. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

<tr>
<td>Switch(config-if)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring a Restricted VLAN

When you configure a restricted VLAN on a switch stack or a switch, clients that are IEEE 802.1x-compliant are moved into the restricted VLAN when the authentication server does not receive a valid username and password. The switch supports restricted VLANs only in single-host mode.

Beginning in privileged EXEC mode, follow these steps to configure a restricted VLAN. This procedure is optional.

### SUMMARY STEPS

1. configure terminal
2. `interface interface-id`
3. Use one of the following:
   - `switchport mode access`
   - `switchport mode private-vlan host`
4. `authentication port-control auto`
5. `authentication event fail action authorize vlan vlan-id`
6. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal Example: Switch# configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id Example: Switch(config)# interface gigabitethernet2/0/2</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong> Use one of the following: • <code>switchport mode access</code> • <code>switchport mode private-vlan host</code> Example: Switch(config-if)# switchport mode access</td>
<td>• Sets the port to access mode. • Configures the Layer 2 port as a private-VLAN host port.</td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>authentication port-control auto</code> Example: Switch(config-if)# authentication port-control auto</td>
<td>Enables 802.1x authentication on the port.</td>
</tr>
<tr>
<td><strong>Step 5</strong> <code>authentication event fail action authorize vlan vlan-id</code> Example: Switch(config-if)# authentication event fail action authorize vlan 2</td>
<td>Specifies an active VLAN as an 802.1x restricted VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN or a voice VLAN as an 802.1x restricted VLAN.</td>
</tr>
<tr>
<td><strong>Step 6</strong> <code>end</code> Example:</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>
You can configure the maximum number of authentication attempts allowed before a user is assigned to the restricted VLAN by using the `authentication event retry retry count` interface configuration command. The range of allowable authentication attempts is 1 to 3. The default is 3 attempts.

Beginning in privileged EXEC mode, follow these steps to configure the maximum number of allowed authentication attempts. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. Use one of the following:
   - `switchport mode access`
   - `switchport mode private-vlan host`
4. `authentication port-control auto`
5. `authentication event fail action authorize vlan vlan-id`
6. `authentication event retry retry count`

<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# radius-server host 1.1.1.2 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234</td>
<td></td>
</tr>
</tbody>
</table>

Note: You should configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.
### Command or Action

| Step 6 | dot1x critical {eapol | recovery delay milliseconds} |
|--------|-----------------------------------------------------|
| Example: | Switch(config)# dot1x critical eapol (config)# dot1x critical recovery delay 2000 |

#### Purpose

- **test username**—Enable automated testing of the RADIUS server status, and specify the username to be used.

- **idle-time** *time*—Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes. The default is 60 minutes (1 hour).

- **ignore-acct-port**—Disable testing on the RADIUS-server accounting port.

- **ignore-auth-port**—Disable testing on the RADIUS-server authentication port.

- For **keystring**, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.

  **Note** Always configure the key as the last item in the `radius-server host` command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.

You can also configure the authentication and encryption key by using the `radius-server key {0string | 7string | string}` global configuration command.

(Optional) Configure the parameters for inaccessible authentication bypass:

- **eapol**—Specify that the switch sends an EAPOL-Success message when the switch successfully authenticates the critical port.

- **recovery delay** *milliseconds*—Set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The range is from 1 to 10000 milliseconds. The default is 1000 milliseconds (a port can be re-initialized every second).
## Purpose

### Command or Action

<table>
<thead>
<tr>
<th>Step 7</th>
<th>interface interface-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# interface gigabitethernet 1/0/1</td>
</tr>
</tbody>
</table>

Specify the port to be configured, and enter interface configuration mode.

| Step 8 | authentication event server dead action {authorize | reinitialize} vlan vlan-id |
|--------|---------------------------------|
| Example: | Switch(config-if)# authentication event server dead action reinitialize vlan 20 |

Use these keywords to move hosts on the port if the RADIUS server is unreachable:

- **authorize**—Move any new hosts trying to authenticate to the user-specified critical VLAN.
- **reinitialize**—Move all authorized hosts on the port to the user-specified critical VLAN.

<table>
<thead>
<tr>
<th>Step 9</th>
<th>switchport voice vlan vlan-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# switchport voice vlan</td>
</tr>
</tbody>
</table>

Specifies the voice VLAN for the port. The voice VLAN cannot be the same as the critical data VLAN configured in Step 6.

<table>
<thead>
<tr>
<th>Step 10</th>
<th>authentication event server dead action authorize voice</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# authentication event server dead action authorize voice</td>
</tr>
</tbody>
</table>

Configures critical voice VLAN to move data traffic on the port to the voice VLAN if the RADIUS server is unreachable.

<table>
<thead>
<tr>
<th>Step 11</th>
<th>show authentication interface interface-id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# do show authentication interface gigabit 1/0/1</td>
</tr>
</tbody>
</table>

(Optional) Verify your entries.

<table>
<thead>
<tr>
<th>Step 12</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config-if)# do copy running-config startup-config</td>
</tr>
</tbody>
</table>

(Optional) Verify your entries.

### Example

To return to the RADIUS server default settings, use the **no radius-server dead-criteria**, the **no radius-server deadtime**, and the **no radius-server host** global configuration commands. To disable inaccessible authentication bypass, use the **no authentication event server dead action** interface configuration command. To disable critical voice VLAN, use the **no authentication event server dead action authorize voice** interface configuration command.
Example of Configuring Inaccessible Authentication Bypass

This example shows how to configure the inaccessible authentication bypass feature:

```
Switch(config)# radius-server dead-criteria time 30 tries 20
Switch(config)# radius-server deadtime 60
Switch(config)# radius-server host 1.1.1.2 acct-port 1550 auth-port 1560 test username user1 idle-time 30 key abc1234
Switch(config)# dot1x critical eapol
Switch(config)# dot1x critical recovery delay 2000
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# dot1x critical
Switch(config-if)# dot1x critical recovery action reinitialize
Switch(config-if)# dot1x critical vlan 20
Switch(config-if)# end
```

Configuring 802.1x Authentication with WoL

Beginning in privileged EXEC mode, follow these steps to enable 802.1x authentication with WoL. This procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. authentication control-direction {both | in}
4. end
5. show authentication sessions interface interface-id
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# interface gigabitethernet2/0/3</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> authentication control-direction {both</td>
<td>in}</td>
</tr>
<tr>
<td>Example: Switch(config-if)# authentication control-direction</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| both              | • **both**—Sets the port as bidirectional. The port cannot receive packets from or send packets to the host. By default, the port is bidirectional.  
• **in**—Sets the port as unidirectional. The port can send packets to the host but cannot receive packets from the host. |

### Step 4

**Example:**
```
Switch(config-if)# end
```

### Step 5

**Example:**
```
Switch# show authentication sessions interface gigabitethernet2/0/3
```

### Step 6

**Example:**
```
Switch# copy running-config startup-config
```

---

### Configuring MAC Authentication Bypass

Beginning in privileged EXEC mode, follow these steps to enable MAC authentication bypass. This procedure is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `authentication port-control auto`
4. `mab [eap]`
5. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>

Example:
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>

### Step 2

**interface interface-id**

**Example:**

```
Switch(config)# interface gigabitethernet2/0/1
```

### Step 3

**authentication port-control auto**

**Example:**

```
Switch(config-if)# authentication port-control auto
```

### Step 4

**mab [eap]**

**Example:**

```
Switch(config-if)# mab
```

(Oppational) Use the eap keyword to configure the switch to use EAP for authorization.

### Step 5

**end**

**Example:**

```
Switch(config-if)# end
```

Returns to privileged EXEC mode.

---

### Formatting a MAC Authentication Bypass Username and Password

Use the optional **mab request format** command to format the MAB username and password in a style accepted by the authentication server. The username and password are usually the MAC address of the client. Some authentication server configurations require the password to be different from the username.

Beginning in privileged EXEC mode, follow these steps to format MAC authentication bypass username and passwords.

#### SUMMARY STEPS

1. configure terminal
2. mab request format attribute1 groupsize {1 | 2 | 4 | 12} [separator {- | : | .} {lowercase | uppercase}]
3. mab request format attribute2 {0 | 7} text
4. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>
### Command or Action

```
Switch# configure terminal
```

### Purpose

Specifying the format of the MAC address in the User-Name attribute of MAB-generated Access-Request packets.

**Step 2**

```
mab request format attribute 1 groupsize \{1 | 2 | 4 | 12\} separator \{- | : | .\} \{lowercase | uppercase\}
```

**Example:**

```
Switch(config)# mab request format attribute 1 groupsize 12
```

- **groupsize**: The number of hex nibbles to concatenate before insertion of a separator. A valid group size must be either 1, 2, 4, or 12.
- **separator**: The character that separates the hex nibbles according to group size. A valid separator must be either a hyphen, colon, or period. No separator is used for a group size of 12.
- **{lowercase | uppercase}**: Specifies if nonnumeric hex nibbles should be in lowercase or uppercase.

**Step 3**

```
mab request format attribute2 \{0 | 7\} text
```

**Example:**

```
Switch(config)# mab request format attribute 2 7 A02f44E18B12
```

- **0**: Specifies a cleartext password to follow.
- **7**: Specifies an encrypted password to follow.
- **text**: Specifies the password to be used in the User-Password attribute.

**Note**

When you send configuration information in e-mail, remove type 7 password information. The `show tech-support` command removes this information from its output by default.

**Step 4**

```
end
```

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode.

---

### Configuring 802.1x User Distribution

Beginning in privileged EXEC mode, follow these steps to configure a VLAN group and to map a VLAN to it:

**SUMMARY STEPS**

1. `configure terminal`
2. `vlan group vlan-group-name vlan-list vlan-list`
### Example of Configuring VLAN Groups

This example shows how to configure the VLAN groups, to map the VLANs to the groups, to and verify the VLAN group configurations and mapping to the specified VLANs:

```
Switch(config)# vlan group eng-dept vlan-list 10
Switch(config)# show vlan group group-name eng-dept
Group Name       Vlans Mapped
---------------- -----------
eng-dept         10
Switch(config)# show dot1x vlan-group all
Group Name       Vlans Mapped
---------------- -----------
eng-dept         10
hr-dept          20
```

This example shows how to add a VLAN to an existing VLAN group and to verify that the VLAN was added:
Switch(config)# vlan group eng-dept vlan-list 30
Switch(config)# show vlan group eng-dept
Group Name Vlans Mapped
------------- --------------
eng-dept 10,30

This example shows how to remove a VLAN from a VLAN group:
Switch# no vlan group eng-dept vlan-list 10

This example shows that when all the VLANs are cleared from a VLAN group, the VLAN group is cleared:
Switch(config)# no vlan group eng-dept vlan-list 30
Vlan 30 is successfully cleared from vlan group eng-dept.
Switch(config)# show vlan group group-name eng-dept

This example shows how to clear all the VLAN groups:
Switch(config)# no vlan group end-dept vlan-list all
Switch(config)# show vlan-group all

For more information about these commands, see the Cisco IOS Security Command Reference.

**Configuring NAC Layer 2 802.1x Validation**

You can configure NAC Layer 2 802.1x validation, which is also referred to as 802.1x authentication with a RADIUS server.

Beginning in privileged EXEC mode, follow these steps to configure NAC Layer 2 802.1x validation. The procedure is optional.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication event no-response action authorize vlan vlan-id
5. authentication periodic
6. authentication timer reauthenticate
7. end
8. show authentication sessions interface interface-id
9. copy running-config startup-config
<table>
<thead>
<tr>
<th>DETAILED STEPS</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>switchport mode access</td>
<td>Sets the port to access mode only if you configured the RADIUS server.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# switchport mode access</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>authentication event no-response action authorize vlan vlan-id</td>
<td>Specifies an active VLAN as an 802.1x guest VLAN. The range is 1 to 4094. You can configure any active VLAN except an internal VLAN (routed port), an RSPAN VLAN, or a voice VLAN as an 802.1x guest VLAN.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# authentication event no-response action authorize vlan 8</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>authentication periodic</td>
<td>Enables periodic re-authentication of the client, which is disabled by default.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# authentication periodic</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>authentication timer reauthenticate</td>
<td>Sets re-authentication attempt for the client (set to one hour). This command affects the behavior of the switch only if periodic re-authentication is enabled.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# authentication timer reauthenticate</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-if)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>show authentication sessions interface interface-id</td>
<td>Verifies your entries.</td>

Configuring an Authenticator Switch with NEAT

Configuring this feature requires that one switch outside a wiring closet is configured as a supplicant and is connected to an authenticator switch.

The `cisco-av-pairs` must be configured as `device-traffic-class=switch` on the ACS, which sets the interface as a trunk after the supplicant is successfully authenticated.

Beginning in privileged EXEC mode, follow these steps to configure a switch as an authenticator:

**SUMMARY STEPS**

1. configure terminal
2. cisp enable
3. interface interface-id
4. switchport mode access
5. authentication port-control auto
6. dot1x pae authenticator
7. spanning-tree portfast
8. end
9. show running-config interface interface-id
10. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| configure terminal |
| Example: |
| Switch# configure terminal |
| **Step 2**
| cisp enable |
| Example: |

(Optional) Saves your entries in the configuration file.

Switch# show authentication sessions interface gigabitethernet2/0/3

Switch# copy running-config startup-config
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch(config)# cisp enable` | **Step 3**  
**interface interface-id**  
**Example:**  
`Switch(config)# interface gigabitethernet2/0/1`  
**Specifies the port to be configured, and enter interface configuration mode.** |
| `Switch(config-if)# switchport mode access` | **Step 4**  
**Sets the port mode to access.** |
| `Switch(config-if)# authentication port-control auto` | **Step 5**  
**Sets the port-authentication mode to auto.** |
| `Switch(config-if)# dot1x pae authenticator` | **Step 6**  
**Configures the interface as a port access entity (PAE) authenticator.** |
| `Switch(config-if)# spanning-tree portfast trunk` | **Step 7**  
**Enables Port Fast on an access port connected to a single workstation or server.** |
| `Switch(config-if)# end` | **Step 8**  
**Returns to privileged EXEC mode.** |
| `Switch# show running-config interface gigabitethernet2/0/1` | **Step 9**  
**Verifies your configuration.** |
| `Switch(config-if)# copy running-config startup-config` | **Step 10**  
**(Optional) Saves your entries in the configuration file.**
Configuring a Supplicant Switch with NEAT

Beginning in privileged EXEC mode, follow these steps to configure a switch as a supplicant:

SUMMARY STEPS

1. configure terminal
2. cispenable
3. dot1x credentials profile
4. username suppswitch
5. password password
6. dot1x supplicant force-multicast
7. interface interface-id
8. switchport trunk encapsulation dot1q
9. switchport mode trunk
10. dot1x pae supplicant
11. dot1x credentials profile-name
12. end
13. show running-config interface interface-id
14. copy running-config startup-config
15. Configuring NEAT with Auto Smartports Macros

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

<tr>
<td></td>
<td>You can also use an Auto Smartports user-defined macro instead of the switch VSA to configure the authenticator switch. For more information, see the Auto Smartports Configuration Guide for this release.</td>
<td></td>
</tr>
</tbody>
</table>

### Configuring 802.1x Authentication with Downloadable ACLs and Redirect URLs

In addition to configuring 802.1x authentication on the switch, you need to configure the ACS. For more information, see the Configuration Guide for Cisco Secure ACS 4.2: http://www.cisco.com/en/US/docs/net_mgmt/cisco_secure_access_control_server_for_windows/4.2/configuration/guide/acs_config.pdf

**Note**

You must configure a downloadable ACL on the ACS before downloading it to the switch.

After authentication on the port, you can use the `show ip access-list` privileged EXEC command to display the downloaded ACLs on the port.

### Configuring Downloadable ACLs

The policies take effect after client authentication and the client IP address addition to the IP device tracking table. The switch then applies the downloadable ACL to the port.

Beginning in privileged EXEC mode:

**SUMMARY STEPS**

1. configure terminal
2. ip device tracking
3. aaa new-model
4. **aaa authorization network default local group radius**
5. **radius-server vsa send authentication**
6. **interface interface-id**
7. **ip access-group acl-id in**
8. **show running-config interface interface-id**
9. **copy running-config startup-config**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip device tracking</td>
<td>Sets the ip device tracking table.</td>
</tr>
<tr>
<td>Example: Switch(config)# ip device tracking</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> aaa new-model</td>
<td>Enables AAA.</td>
</tr>
<tr>
<td>Example: Switch(config)# aaa new-model</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> aaa authorization network default local group radius</td>
<td>Sets the authorization method to local. To remove the authorization method, use the <code>no aaa authorization network default local group radius</code> command.</td>
</tr>
<tr>
<td>Example: Switch(config)# aaa authorization network default local group radius</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> radius-server vsa send authentication</td>
<td>Configures the radius vsa send authentication.</td>
</tr>
<tr>
<td>Example: Switch(config)# radius-server vsa send authentication</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> interface interface-id</td>
<td>Specifies the port to be configured, and enter interface configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# interface gigabitethernet2/0/4</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a Downloadable Policy

Beginning in privileged EXEC mode:

**SUMMARY STEPS**

1. configure terminal
2. access-list access-list-number { deny | permit } { hostname | any | host } log
3. interface interface-id
4. ip access-group acl-id in
5. exit
6. aaa new-model
7. aaa authorization network default group radius
8. ip device tracking
9. ip device tracking probe [count | interval | use-svi]
10. radius-server vsa send authentication
11. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong> ip access-group acl-id in</td>
<td>Configures the default ACL on the port in the input direction.</td>
</tr>
<tr>
<td>Example: Switch(config-if)# ip access-group default_acl in</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> show running-config interface interface-id</td>
<td>Verifies your configuration.</td>
</tr>
<tr>
<td>Example: Switch(config-if)# show running-config interface gigabitethernet2/0/4</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> copy running-config startup-config</td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
<tr>
<td>Example: Switch# copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step</strong></td>
<td><strong>Command or Action</strong></td>
</tr>
<tr>
<td>----------</td>
<td>----------------------</td>
</tr>
</tbody>
</table>
| Step 2   | `access-list access-list-number { deny | permit } { hostname | any | host } log` | Defines the default port ACL. The access-list-number is a decimal number from 1 to 99 or 1300 to 1999. Enter `deny` or `permit` to specify whether to deny or permit access if conditions are matched. The source is the source address of the network or host that sends a packet, such as this:  
- `hostname`: The 32-bit quantity in dotted-decimal format.  
- `any`: The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255. You do not need to enter a source-wildcard value.  
- `host`: The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. (Optional) Applies the source-wildcard wildcard bits to the source. (Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console. |
|          | Example: `Switch(config)# access-list 1 deny any log` | |
| Step 3   | `interface interface-id` | Enters interface configuration mode. |
|          | Example: `Switch(config)# interface gigabitethernet2/0/2` | |
| Step 4   | `ip access-group acl-id in` | Configures the default ACL on the port in the input direction.  
**Note** The acl-id is an access list name or number. |
<p>|          | Example: <code>Switch(config-if)# ip access-group default_acl in</code> | |
| Step 5   | <code>exit</code> | Returns to global configuration mode. |
|          | Example: <code>Switch(config-if)# exit</code> | |
| Step 6   | <code>aaa new-model</code> | Enables AAA. |
|          | Example: <code>Switch(config)# aaa new-model</code> | |</p>

## Configuring Flexible Authentication Ordering

The examples used in the instructions below changes the order of Flexible Authentication Ordering so that MAB is attempted before IEEE 802.1X authentication (dot1x). MAB is configured as the first authentication method, so MAB will have priority over all other authentication methods.

### Note

Beginning in privileged EXEC mode, follow these steps:

### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication order [ dot1x | mab ] | {webauth}  
5. authentication priority [ dot1x | mab ] | {webauth}  
6. end
## DETAILED STEPS

## Configuring Open1x

Beginning in privileged EXEC mode, follow these steps to enable manual control of the port authorization state:

- Enter the global configuration mode:
  ```
  Switch# configure terminal
  ```
- Specify the port to be configured, and enter interface configuration mode:
  ```
  Switch(config)# interface gigabitethernet 1/0/1
  ```
- Set the port to access mode only if you previously configured the RADIUS server:
  ```
  Switch(config-if)# switchport mode access
  ```
- (Optional) Set the order of authentication methods used on a port:
  ```
  Switch(config-if)# authentication order mab dot1x
  ```
- (Optional) Add an authentication method to the port-priority list:
  ```
  Switch(config-if)# authentication priority mab dot1x
  ```
- Return to privileged EXEC mode:
  ```
  Switch(config-if)# end
  ```
SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode access
4. authentication control-direction {both | in}
5. authentication fallback name
6. authentication host-mode [multi-auth | multi-domain | multi-host | single-host]
7. authentication open
8. authentication order [ dot1x | mab ] | {webauth}
9. authentication periodic
10. authentication port-control {auto | force-authorized | force-unauthorized}
11. end

CHAPTER 75

Configuring Web-Based Authentication

This chapter describes how to configure web-based authentication on the switch. It contains these sections:

- Finding Feature Information, on page 1559
- Information About Web-Based Authentication, on page 1559
- How to Configure Web-Based Authentication, on page 1567
- Monitoring Web-Based Authentication Status, on page 1581
- Feature Information for Web-Based Authentication, on page 1581

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Web-Based Authentication

Use the web-based authentication feature, known as web authentication proxy, to authenticate end users on host systems that do not run the IEEE 802.1x supplicant.

You can configure web-based authentication on Layer 2 and Layer 3 interfaces.

Note

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the users. The users enter their credentials, which the web-based authentication feature sends to the authentication, authorization, and accounting (AAA) server for authentication.

If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host, and the user is placed on a watch list for a waiting period.
These sections describe the role of web-based authentication as part of AAA:

**Device Roles**

With web-based authentication, the devices in the network have these specific roles:

- **Client**—The device (workstation) that requests access to the LAN and the services and responds to requests from the switch. The workstation must be running an HTML browser with Java Script enabled.

- **Authentication server**—Authenticates the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and the switch services or that the client is denied.

- **Switch**—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.

*Figure 91: Web-Based Authentication Device Roles*

This figure shows the roles of these devices in a network.

**Host Detection**

The switch maintains an IP device tracking table to store information about detected hosts.

---

By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 2 interfaces, web-based authentication detects IP hosts by using these mechanisms:

- **ARP based trigger**—ARP redirect ACL allows web-based authentication to detect hosts with a static IP address or a dynamic IP address.

- **Dynamic ARP inspection**

- **DHCP snooping**—Web-based authentication is notified when the switch creates a DHCP-binding entry for the host.
Session Creation

When web-based authentication detects a new host, it creates a session as follows:

- Reviews the exception list.
  
  If the host IP is included in the exception list, the policy from the exception list entry is applied, and the session is established.

- Reviews for authorization bypass
  
  If the host IP is not on the exception list, web-based authentication sends a nonresponsive-host (NRH) request to the server.
  
  If the server response is access accepted, authorization is bypassed for this host. The session is established.

- Sets up the HTTP intercept ACL
  
  If the server response to the NRH request is access rejected, the HTTP intercept ACL is activated, and the session waits for HTTP traffic from the host.

Authentication Process

When you enable web-based authentication, these events occur:

- The user initiates an HTTP session.

- The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password, and the switch sends the entries to the authentication server.

- If the authentication succeeds, the switch downloads and activates the user’s access policy from the authentication server. The login success page is sent to the user.

- If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page, and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.

- If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user.

- The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or when the host does not send any traffic within the idle timeout on a Layer 3 interface.

- The feature applies the downloaded timeout or the locally configured session timeout.

- If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.

- If the terminate action is default, the session is dismantled, and the applied policy is removed.

Local Web Authentication Banner

With Web Authentication, you can create a default and customized web-browser banners that appears when you log in to a switch.
The banner appears on both the login page and the authentication-result pop-up pages. The default banner messages are as follows:

- Authentication Successful
- Authentication Failed
- Authentication Expired

The Local Web Authentication Banner can be configured in legacy and new-style (Session-aware) CLIs as follows:

- **Legacy mode**—Use the `ip admission auth-proxy-banner http` global configuration command.
- **New-style mode**—Use the `parameter-map type weauth global banner` global configuration command.

The default banner *Cisco Systems* and *Switch host-name Authentication* appear on the Login Page. *Cisco Systems* appears on the authentication result pop-up page.

*Figure 92: Authentication Successful Banner*

The banner can be customized as follows:

- Add a message, such as switch, router, or company name to the banner:
  - **Legacy mode**—Use the `ip admission auth-proxy-banner http banner-text` global configuration command.
  - **New-style mode**—Use the `parameter-map type weauth global banner` global configuration command

- Add a logo or text file to the banner:
  - **Legacy mode**—Use the `ip admission auth-proxy-banner http file-path` global configuration command.
• New-style mode—Use the `parameter-map type webauth global banner` global configuration command

*Figure 93: Customized Web Banner*

If you do not enable a banner, only the username and password dialog boxes appear in the web authentication login screen, and no banner appears when you log into the switch.

*Figure 94: Login Screen With No Banner*
For more information, see the Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches) Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches) and the Web Authentication Enhancements - Customizing Authentication Proxy Web Pages.

Web Authentication Customizable Web Pages

During the web-based authentication process, the switch internal HTTP server hosts four HTML pages to deliver to an authenticating client. The server uses these pages to notify you of these four-authentication process states:

- **Login**—Your credentials are requested.
- **Success**—The login was successful.
- **Fail**—The login failed.
- **Expire**—The login session has expired because of excessive login failures.

**Guidelines**

- You can substitute your own HTML pages for the default internal HTML pages.
- You can use a logo or specify text in the `login`, `success`, `failure`, and `expire` web pages.
- On the banner page, you can specify text in the `login` page.
- The pages are in HTML.
- You must include an HTML redirect command in the success page to access a specific URL.
- The URL string must be a valid URL (for example, http://www.cisco.com). An incomplete URL might cause `page not found` or similar errors on a web browser.
- If you configure web pages for HTTP authentication, they must include the appropriate HTML commands (for example, to set the page time out, to set a hidden password, or to confirm that the same page is not submitted twice).
- The CLI command to redirect users to a specific URL is not available when the configured login form is enabled. The administrator should ensure that the redirection is configured in the web page.
- If the CLI command redirecting users to specific URL after authentication occurs is entered and then the command configuring web pages is entered, the CLI command redirecting users to a specific URL does not take effect.
- Configured web pages can be copied to the switch boot flash or flash.
- On stackable switches, configured pages can be accessed from the flash on the stack master or members.
- The login page can be on one flash, and the success and failure pages can be another flash (for example, the flash on the stack master or a member).
- You must configure all four pages.
- The banner page has no effect if it is configured with the web page.
• All of the logo files (image, flash, audio, video, and so on) that are stored in the system directory (for example, flash, disk0, or disk) and that must be displayed on the login page must use `web_auth_<filename>` as the file name.

• The configured authentication proxy feature supports both HTTP and SSL.

You can substitute your HTML pages for the default internal HTML pages. You can also specify a URL to which users are redirected after authentication occurs, which replaces the internal Success page.

*Figure 95: Customizable Authentication Page*

**Authentication Proxy Web Page Guidelines**

When configuring customized authentication proxy web pages, follow these guidelines:

• To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.

• The four custom HTML files must be present on the flash memory of the switch. The maximum size of each HTML file is 8 KB.

• Any images on the custom pages must be on an accessible HTTP server. Configure an intercept ACL within the admission rule.

• Any external link from a custom page requires configuration of an intercept ACL within the admission rule.

• To access a valid DNS server, any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule.

• If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.

• If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.
To remove the specification of a custom file, use the `no` form of the command.

Because the custom login page is a public web form, consider these guidelines for the page:

- The login form must accept user entries for the username and password and must show them as `uname` and `pwd`.
- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.

**Related Topics**

- Customizing the Authentication Proxy Web Pages, on page 1576

### Redirection URL for Successful Login Guidelines

When configuring a redirection URL for successful login, consider these guidelines:

- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom-login success page.
- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.
- To remove the specification of a redirection URL, use the `no` form of the command.
- If the redirection URL is required after the web-based authentication client is successfully authenticated, then the URL string must start with a valid URL (for example, `http://`) followed by the URL information. If only the URL is given without `http://`, then the redirection URL on successful authentication might cause page not found or similar errors on a web browser.

**Related Topics**

- Specifying a Redirection URL for Successful Login, on page 1578

### Web-based Authentication Interactions with Other Features

#### Port Security

You can configure web-based authentication and port security on the same port. Web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.

For more information about enabling port security, see the...
**Gateway IP**

You cannot configure Gateway IP (GWIP) on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

**ACLs**

If you configure a VLAN ACL or a Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, it is more secure, though not required, to configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL. The Policy ACL is applied to the session even if there is no ACL configured on the port.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

**Context-Based Access Control**

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port VLAN.

**EtherChannel**

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

**How to Configure Web-Based Authentication**

**Default Web-Based Authentication Configuration**

The following table shows the default web-based authentication configuration.

<table>
<thead>
<tr>
<th>Feature</th>

</tr>
</tbody>
</table>

*Table 137: Default Web-based Authentication Configuration*
Web-Based Authentication Configuration Guidelines and Restrictions

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.
- You cannot authenticate hosts on Layer 2 interfaces with static ARP cache assignment. These hosts are not detected by the web-based authentication feature because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must configure at least one IP address to run the switch HTTP server. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.
- Hosts that are more than one hop away might experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This occurs because the ARP and DHCP updates might not be sent after a Layer 2 (STP) topology change.
- Web-based authentication does not support VLAN assignment as a downloadable-host policy.
- Web-based authentication supports IPv6 in Session-aware policy mode. IPv6 Web-authentication requires at least one IPv6 address configured on the switch and IPv6 Snooping configured on the switchport.
- Web-based authentication and Network Edge Access Topology (NEAT) are mutually exclusive. You cannot use web-based authentication when NEAT is enabled on an interface, and you cannot use NEAT when web-based authentication is running on an interface.
- Web-based authentication NRH (Non-Responsive Host) is not supported for voice devices.
- Only the Password Authentication Protocol (PAP) is supported for web-based RADIUS authentication on controllers. The Challenge Handshake Authentication Protocol (CHAP) is not supported for web-based RADIUS authentication on controllers.
- Identify the following RADIUS security server settings that will be used while configuring switch-to-RADIUS-server communication:
  - Host name
  - Host IP address
  - Host name and specific UDP port numbers
  - IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second

<table>

</tr>
<tr>
<td>Inactivity timeout</td>
<td>Enabled</td>
</tr>
</tbody>
</table>
host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

- When you configure the RADIUS server parameters:
  - Specify the **key string** on a separate command line.
  - For **key string**, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
  - When you specify the **key string**, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
  - You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the `radius-server host` global configuration command. If you want to configure these options on a per-server basis, use the `radius-server timeout`, `radius-server transmit`, and the `radius-server key` global configuration commands. For more information, see the *Cisco IOS Security Configuration Guide*, Release 12.4 and the *Cisco IOS Security Command Reference*, Release 12.4.

**Note**
You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). For more information, see the RADIUS server documentation.

## Web-Based Authentication Configuration Task List

### Configuring the Authentication Rule and Interfaces

Examples in this section are legacy-style configurations. For new-style configurations, see the *Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*

This example shows how to verify the configuration:

```
Switch# show ip admission status
IP admission status:
  Enabled interfaces      0
  Total sessions          0
  Init sessions           0  Max init sessions allowed 100
  Limit reached           0  Hi watermark           0
  TCP half-open connections 0  Hi watermark          0
  TCP new connections     0  Hi watermark          0
  TCP half-open + new     0  Hi watermark          0
  HTTPD1 Contexts         0  Hi watermark          0

Parameter Map: Global
  Custom Pages
    Custom pages not configured
  Banner
    Banner not configured
```

**Consolidated Platform Configuration Guide, Cisco IOS XE 3.3SE (Catalyst 3650 Switches)**
Beginning in privileged EXEC mode, follow these steps to configure the authentication rule and interfaces:

**SUMMARY STEPS**

1. configure terminal
2. ip admission name *name* proxy http
3. interface type *slot/port*
4. ip access-group *name*
5. ip admission *name*
6. exit
7. ip device tracking
8. end
9. show ip admission status
10. copy running-config startup-config

**DETAILED STEPS**

</tbody>
</table>
Configuring Switch-to-RADIUS-Server Communication

Beginning in privileged EXEC mode, follow these steps to configure the RADIUS server parameters:

**Before you begin**

Identify the following RADIUS security server settings that will be used in these instructions:

- Host name
- Host IP address
- Host name and specific UDP port numbers
- IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, that enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

**SUMMARY STEPS**

1. configure terminal
2. ip radius source-interface vlan vlan interface number
3. radius-server host {hostname | ip-address} test username username
4. radius-server key string
5. radius-server dead-criteria tries num-tries
6. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>ip radius source-interface vlan vlan interface number</td>
<td>Specifies that the RADIUS packets have the IP address of the indicated interface.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# ip radius source-interface vlan 80</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td>radius-server host {hostname</td>
<td>ip-address} test username username</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# radius-server host 172.120.39.46</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>test username user1</td>
<td>The <strong>key</strong> option specifies an authentication and encryption key to use between the switch and the RADIUS server. To use multiple RADIUS servers, reenter this command for each server.</td>
</tr>
</tbody>
</table>

**Step 4**

**radius-server key** *string*

**Example:**

Switch(config)# radius-server key rad123

**Step 5**

**radius-server dead-criteria tries** *num-tries*

**Example:**

Switch(config)# radius-server dead-criteria tries 30

**Purpose**

- Configures the authorization and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
- Specifies the number of unanswered sent messages to a RADIUS server before considering the server to be inactive. The range of *num-tries* is 1 to 100.

**When you configure the RADIUS server parameters:**

- Specify the **key string** on a separate command line.
- For **key string**, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
- When you specify the **key string**, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
- You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using with the **radius-server host** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, radius-server transmit, and the radius-server key global configuration commands. For more information, see the *Cisco IOS Security Configuration Guide*, Release 12.4 and the *Cisco IOS Security Command Reference*, Release 12.4.

**Note** You need to configure some settings on the RADIUS server, including: the switch IP address, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). For more information, see the RADIUS server documentation.
### Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the switch. You can enable the server for either HTTP or HTTPS.

Beginning in privileged EXEC mode, follow these steps to enable the server for either HTTP or HTTPS:

#### SUMMARY STEPS

1. `configure terminal`
2. `ip http server`
3. `ip http secure-server`
4. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>

</tbody>
</table>
Customizing the Authentication Proxy Web Pages

You can configure web authentication to display four substitute HTML pages to the user in place of the switch default HTML pages during web-based authentication.

For the equivalent Session Aware Networking configuration example for this feature, see the section "Configuring a Parameter Map for Web-Based Authentication" in the chapter, "Configuring Identity Control Policies." of the book, "Session Aware Networking Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)."

Beginning in privileged EXEC mode, follow these steps to specify the use of your custom authentication proxy web pages:

**Before you begin**

Store your custom HTML files on the switch flash memory.

**SUMMARY STEPS**

1. `configure terminal`
2. `ip admission proxy http login page file device:login-filename`
3. `ip admission proxy http success page file device:success-filename`
4. `ip admission proxy http failure page file device:fail-filename`
5. `ip admission proxy http login expired page file device:expired-filename`
6. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>ip admission proxy http login page file device:login-filename</code></td>
<td>Specifies the location in the switch memory file system of the custom HTML file to use in place of the default login page. The <code>device:</code> is flash memory.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# ip admission proxy http login page file disk1:login.htm</code></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ip admission proxy http success page file device:success-filename</code></td>
<td>Specifies the location of the custom HTML file to use in place of the default login success page.</td>
</tr>
<tr>
<td>Example:</td>

Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

- Storm Control
- Protected Ports
- Private Virtual Local Area Network (PVLAN)
- Port Blocking
- Port Security
- Protocol Storm Protection

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Storm Control

Storm Control

Storm control prevents traffic on a LAN from being disrupted by a broadcast, multicast, or unicast storm on one of the physical interfaces. A LAN storm occurs when packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation, mistakes in network configurations, or users issuing a denial-of-service attack can cause a storm.

Storm control (or traffic suppression) monitors packets passing from an interface to the switching bus and determines if the packet is unicast, multicast, or broadcast. The switch counts the number of packets of a specified type received within the 1-second time interval and compares the measurement with a predefined suppression-level threshold.

How Traffic Activity is Measured

Storm control uses one of these methods to measure traffic activity:

- Bandwidth as a percentage of the total available bandwidth of the port that can be used by the broadcast, multicast, or unicast traffic
- Traffic rate in packets per second at which broadcast, multicast, or unicast packets are received
Traffic rate in bits per second at which broadcast, multicast, or unicast packets are received

Traffic rate in packets per second and for small frames. This feature is enabled globally. The threshold for small frames is configured for each interface.

With each method, the port blocks traffic when the rising threshold is reached. The port remains blocked until the traffic rate drops below the falling threshold (if one is specified) and then resumes normal forwarding. If the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. In general, the higher the level, the less effective the protection against broadcast storms.

Note

When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as OSPF, and regular multicast data traffic, so both types of traffic are blocked.

Traffic Patterns

Figure 96: Broadcast Storm Control Example

This example shows broadcast traffic patterns on an interface over a given period of time.

Broadcast traffic being forwarded exceeded the configured threshold between time intervals T1 and T2 and between T4 and T5. When the amount of specified traffic exceeds the threshold, all traffic of that kind is dropped for the next time period. Therefore, broadcast traffic is blocked during the intervals following T2 and T5. At the next time interval (for example, T3), if broadcast traffic does not exceed the threshold, it is again forwarded.

The combination of the storm-control suppression level and the 1-second time interval controls the way the storm control algorithm works. A higher threshold allows more packets to pass through. A threshold value of 100 percent means that no limit is placed on the traffic. A value of 0.0 means that all broadcast, multicast, or unicast traffic on that port is blocked.

Note

Because packets do not arrive at uniform intervals, the 1-second time interval during which traffic activity is measured can affect the behavior of storm control.
You use the `storm-control` interface configuration commands to set the threshold value for each traffic type.

## How to Configure Storm Control

### Configuring Storm Control and Threshold Levels

You configure storm control on a port and enter the threshold level that you want to be used for a particular type of traffic.

However, because of hardware limitations and the way in which packets of different sizes are counted, threshold percentages are approximations. Depending on the sizes of the packets making up the incoming traffic, the actual enforced threshold might differ from the configured level by several percentage points.

### Before you begin

Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `storm-control {broadcast | multicast | unicast} level {level [level-low] | bps bps [bps-low] | pps pps [pps-low]}
4. `storm-control action {shutdown | trap}`
5. `end`
6. `show storm-control [interface-id] [broadcast | multicast | unicast]`
7. `copy running-config startup-config`

</thead>
</table>
| `storm-control unicast level 87 65` | • For *level*, specifies the rising threshold level for broadcast, multicast, or unicast traffic as a percentage (up to two decimal places) of the bandwidth. The port blocks traffic when the rising threshold is reached. The range is 0.00 to 100.00.  
  • (Optional) For *level-low*, specifies the falling threshold level as a percentage (up to two decimal places) of the bandwidth. This value must be less than or equal to the rising suppression value. The port forwards traffic when traffic drops below this level. If you do not configure a falling suppression level, it is set to the rising suppression level. The range is 0.00 to 100.00.  
  If you set the threshold to the maximum value (100 percent), no limit is placed on the traffic. If you set the threshold to 0.0, all broadcast, multicast, and unicast traffic on that port is blocked.  
  • For *bps bps*, specifies the rising threshold level for broadcast, multicast, or unicast traffic in bits per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.  
  • (Optional) For *bps-low*, specifies the falling threshold level in bits per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is 0.0 to 10000000000.0.  
  • For *pps pps*, specifies the rising threshold level for broadcast, multicast, or unicast traffic in packets per second (up to one decimal place). The port blocks traffic when the rising threshold is reached. The range is 0.0 to 10000000000.0.  
  • (Optional) For *pps-low*, specifies the falling threshold level in packets per second (up to one decimal place). It can be less than or equal to the rising threshold level. The port forwards traffic when traffic drops below this level. The range is **0.0 to 10000000000.0**.  
  For BPS and PPS settings, you can use metric suffixes such as k, m, and g for large number thresholds. |
| `storm-control action {shutdown | trap}` | **Step 4**  
  • **Example:**  
  ```bash  
  Switch(config-if)# storm-control action trap  
  ```  
  Specifies the action to be taken when a storm is detected. The default is to filter out the traffic and not to send traps.  
  • Select the *shutdown* keyword to error-disable the port during a storm. |
### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Information About Protected Ports

#### Protected Ports

Some applications require that no traffic be forwarded at Layer 2 between ports on the same switch so that one neighbor does not see the traffic generated by another neighbor. In such an environment, the use of protected ports ensures that there is no exchange of unicast, broadcast, or multicast traffic between these ports on the switch.

Protected ports have these features:

- A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device.
- Forwarding behavior between a protected port and a nonprotected port proceeds as usual.

---

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Switch(config-if)# <strong>end</strong></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 6** | **show storm-control** [[interface-id] [broadcast | multicast | unicast]] |
| Example: | Verifies the storm control suppression levels set on the interface for the specified traffic type. If you do not enter a traffic type, broadcast storm control settings are displayed. |
| Switch# **show storm-control gigabitethernet1/0/1 unicast** |

| **Step 7** | **copy running-config startup-config** |
| Example: | (Optional) Saves your entries in the configuration file. |
| Switch# **copy running-config startup-config** |
Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack.

**Default Protected Port Configuration**

The default is to have no protected ports defined.

**Protected Ports Guidelines**

You can configure protected ports on a physical interface (for example, Gigabit Ethernet port 1) or an EtherChannel group (for example, port-channel 5). When you enable protected ports for a port channel, it is enabled for all ports in the port-channel group.

Do not configure a private-VLAN port as a protected port. Do not configure a protected port as a private-VLAN port. A private-VLAN isolated port does not forward traffic to other isolated ports or community ports.

**How to Configure Protected Ports**

**Configuring a Protected Port**

**Before you begin**

Protected ports are not pre-defined. This is the task to configure one.

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `switchport protected`
4. `end`
5. `show interfaces interface-id switchport`
6. `copy running-config startup-config`

## Information About Port Blocking

### Port Blocking

By default, the switch floods packets with unknown destination MAC addresses out of all ports. If unknown unicast and multicast traffic is forwarded to a protected port, there could be security issues. To prevent unknown unicast or multicast traffic from being forwarded from one port to another, you can block a port (protected or nonprotected) from flooding unknown unicast or multicast packets to other ports.

---

**Note**

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

## How to Configure Port Blocking

### Blocking Flooded Traffic on an Interface

**Before you begin**

The interface can be a physical interface or an EtherChannel group. When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port-channel group.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport block multicast
4. switchport block unicast
5. end
6. show interfaces interface-id switchport
7. copy running-config startup-config

Prerequisites for Port Security

**Note**

If you try to set the maximum value to a number less than the number of secure addresses already configured on an interface, the command is rejected.

Restrictions for Port Security

The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. This number is the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

Information About Port Security

**Port Security**

You can use the port security feature to restrict input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port. When you assign secure MAC addresses to a secure port, the port does not forward packets with source addresses outside the group of defined addresses. If you limit the number
of secure MAC addresses to one and assign a single secure MAC address, the workstation attached to that port is assured the full bandwidth of the port.

If a port is configured as a secure port and the maximum number of secure MAC addresses is reached, when the MAC address of a station attempting to access the port is different from any of the identified secure MAC addresses, a security violation occurs. Also, if a station with a secure MAC address configured or learned on one secure port attempts to access another secure port, a violation is flagged.

**Related Topics**
- Enabling and Configuring Port Security, on page 1600
- Configuration Examples for Port Security, on page 1606

### Types of Secure MAC Addresses

The switch supports these types of secure MAC addresses:

- **Static secure MAC addresses**—These are manually configured by using the `switchport port-security mac-address mac-address` interface configuration command, stored in the address table, and added to the switch running configuration.

- **Dynamic secure MAC addresses**—These are dynamically configured, stored only in the address table, and removed when the switch restarts.

- **Sticky secure MAC addresses**—These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. If these addresses are saved in the configuration file, when the switch restarts, the interface does not need to dynamically reconfigure them.

### Sticky Secure MAC Addresses

You can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and add them to the running configuration by enabling sticky learning. The interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses. All sticky secure MAC addresses are added to the running configuration.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the sticky secure MAC addresses in the configuration file, when the switch restarts, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost.

If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

### Security Violations

It is a security violation when one of these situations occurs:

- The maximum number of secure MAC addresses have been added to the address table, and a station whose MAC address is not in the address table attempts to access the interface.

- An address learned or configured on one secure interface is seen on another secure interface in the same VLAN.

- Running diagnostic tests with port security enabled.
You can configure the interface for one of three violation modes, based on the action to be taken if a violation occurs:

- **protect**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

  
  **Note** We do not recommend configuring the protect violation mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- **restrict**—when the number of secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. In this mode, you are notified that a security violation has occurred. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.

- **shutdown**—a port security violation causes the interface to become error-disabled and to shut down immediately, and the port LED turns off. When a secure port is in the error-disabled state, you can bring it out of this state by entering the `errdisable recovery cause psecure-violation` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands. This is the default mode.

- **shutdown vlan**—Use to set the security violation mode per-VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.

This table shows the violation mode and the actions taken when you configure an interface for port security.

**Table 141: Security Violation Mode Actions**

<table>
<thead>
<tr>
<th>Violation Mode</th>
<th>Traffic is forwarded</th>
<th>Sends SNMP trap</th>
<th>Sends syslog message</th>
<th>Displays error message</th>
<th>Violation counter increments</th>
<th>Shuts down port</th>
</tr>
</thead>
<tbody>
<tr>
<td>protect</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>

<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>shutdown vlan</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>No 23</td>
</tr>
</tbody>
</table>

21 Packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses.

22 The switch returns an error message if you manually configure an address that would cause a security violation.

23 Shuts down only the VLAN on which the violation occurred.
Port Security Aging

You can use port security aging to set the aging time for all secure addresses on a port. Two types of aging are supported per port:

- Absolute—The secure addresses on the port are deleted after the specified aging time.
- Inactivity—The secure addresses on the port are deleted only if the secure addresses are inactive for the specified aging time.

Related Topics

- Enabling and Configuring Port Security Aging, on page 1605

Port Security and Switch Stacks

When a switch joins a stack, the new switch will get the configured secure addresses. All dynamic secure addresses are downloaded by the new stack member from the other stack members.

When a switch (either the active switch or a stack member) leaves the stack, the remaining stack members are notified, and the secure MAC addresses configured or learned by that switch are deleted from the secure MAC address table.

Port Security Configuration Guidelines

- Port security can only be configured on static access ports or trunk ports. A secure port cannot be a dynamic access port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
Voice VLAN is only supported on access ports and not on trunk ports, even though the configuration is allowed.

- A secure port cannot be a private-VLAN port.

- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the phone.

- When a trunk port configured with port security and assigned to an access VLAN for data traffic and to a voice VLAN for voice traffic, entering the `switchport voice` and `switchport priority extend` interface configuration commands has no effect.

  When a connected device uses the same MAC address to request an IP address for the access VLAN and then an IP address for the voice VLAN, only the access VLAN is assigned an IP address.

- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.

- The switch does not support port security aging of sticky secure MAC addresses.

This table summarizes port security compatibility with other port-based features.

Overview of Port-Based Traffic Control

Port-based traffic control is a set of Layer 2 features on the Cisco Catalyst switches used to filter or block packets at the port level in response to specific traffic conditions. The following port-based traffic control features are supported in the Cisco IOS Release for which this guide is written:

- Storm Control
- Protected Ports
- Private Virtual Local Area Network (PVLAN)
- Port Blocking
- Port Security
- Protocol Storm Protection

How to Configure Port Security

Enabling and Configuring Port Security

Before you begin

This task restricts input to an interface by limiting and identifying MAC addresses of the stations allowed to access the port:

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode {access | trunk}
4. switchport voice vlan vlan-id
5. switchport port-security
6. `switchport port-security [maximum value {vlan {vlan-list | {access | voice}}}]`
7. `switchport port-security violation {protect | restrict | shutdown | shutdown vlan}
8. `switchport port-security [mac-address mac-address {vlan {vlan-id | {access | voice}}}]`
9. `switchport port-security mac-address sticky`
10. `switchport port-security mac-address sticky [mac-address | vlan {vlan-id | {access | voice}}]`
11. end
12. show port-security
13. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
- `configure terminal`
- Example:
  
  Switch# configure terminal |

  **Enter global configuration mode.**

| **Step 2**
- `interface interface-id`
- Example:
  
  Switch(config)# interface gigabitethernet1/0/1 |

  **Specify the interface to be configured, and enter interface configuration mode.**

| **Step 3**
- `switchport mode {access | trunk}`
- Example:
  
  Switch(config-if)# switchport mode access |

  **Sets the interface switchport mode as access or trunk; an interface in the default mode (dynamic auto) cannot be configured as a secure port.**

| **Step 4**
- `switchport voice vlan vlan-id`
- Example:
  
  Switch(config-if)# switchport voice vlan 22 |

  **Enables voice VLAN on a port.**

  **vlan-id—Specifies the VLAN to be used for voice traffic.**

| **Step 5**
- `switchport port-security`
- Example:
  
  Switch(config-if)# switchport port-security |

  **Enable port security on the interface.**

| **Step 6**
- `switchport port-security [maximum value {vlan {vlan-list | {access | voice}}}]`
- Example:
  
  Switch(config-if)# switchport port-security maximum 20 |

  **(Optional) Sets the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch or switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is set by the active Switch Database Management (SDM) template. This number is the total of available MAC**
addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces.

(Optional) vlan—sets a per-VLAN maximum value

Enter one of these options after you enter the vlan keyword:

- **vlan-list**—On a trunk port, you can set a per-VLAN maximum value on a range of VLANs separated by a hyphen or a series of VLANs separated by commas. For nonspecified VLANs, the per-VLAN maximum value is used.

- **access**—On an access port, specifies the VLAN as an access VLAN.

- **voice**—On an access port, specifies the VLAN as a voice VLAN.

**Note**  
The *voice* keyword is available only if a voice VLAN is configured on a port and if that port is not the access VLAN. If an interface is configured for voice VLAN, configure a maximum of two secure MAC addresses.

---

**Step 7**

switchport port-security violation {protect | restrict | shutdown | shutdown vlan}

**Example:**

Switch(config-if)# switchport port-security violation restrict

(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:

- **protect**—When the number of port secure MAC addresses reaches the maximum limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses to drop below the maximum value or increase the number of maximum allowable addresses. You are not notified that a security violation has occurred.

**Note**  
We do not recommend configuring the protect mode on a trunk port. The protect mode disables learning when any VLAN reaches its maximum limit, even if the port has not reached its maximum limit.

- **restrict**—When the number of secure MAC addresses reaches the limit allowed on the port, packets with unknown source addresses are dropped until you remove a sufficient number of secure MAC addresses or increase the number of maximum allowable addresses. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>• shutdown—The interface is error-disabled when a violation occurs, and the port LED turns off. An SNMP trap is sent, a syslog message is logged, and the violation counter increments.</td>
<td></td>
</tr>
<tr>
<td>• shutdown vlan—Use to set the security violation mode per VLAN. In this mode, the VLAN is error disabled instead of the entire port when a violation occurs.</td>
<td></td>
</tr>
</tbody>
</table>

**Note** When a secure port is in the error-disabled state, you can bring it out of this state by entering the `errdisable recovery cause psecure-violation` global configuration command. You can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands or by using the `clear errdisable interface vlan` privileged EXEC command.

**Step 8**

```
switchport port-security [mac-address mac-address [vlan {vlan-id | {access | voice}}]]
```

**Example:**

```
Switch(config-if)# switchport port-security
mac-address 00:A0:C7:12:C9:25 vlan 3 voice
```

(Optional) Enters a secure MAC address for the interface. You can use this command to enter the maximum number of secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.

**Note** If you enable sticky learning after you enter this command, the secure addresses that were dynamically learned are converted to sticky secure MAC addresses and are added to the running configuration.

(Optional) `vlan`—sets a per-VLAN maximum value.

Enter one of these options after you enter the `vlan` keyword:

- **`vlan-id`**—On a trunk port, you can specify the VLAN ID and the MAC address. If you do not specify a VLAN ID, the native VLAN is used.
- **`access`**—On an access port, specifies the VLAN as an access VLAN.
- **`voice`**—On an access port, specifies the VLAN as a voice VLAN.

### Enabling and Configuring Port Security Aging

Use this feature to remove and add devices on a secure port without manually deleting the existing secure MAC addresses and to still limit the number of secure addresses on a port. You can enable or disable the aging of secure addresses on a per-port basis.

#### SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport port-security aging \{static | time \textit{time} | type \{absolute | inactivity\}\}
4. end
5. show port-security [interface interface-id] [address]
6. copy running-config startup-config

<td>• <strong>absolute</strong>—Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified lapses and are removed from the secure address list.</td>
</tr>
<tr>
<td><code>Switch(config-if)#</code></td>
<td>• <strong>inactivity</strong>—Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source addresses for the specified time period.</td>
<td>• <strong>inactivity</strong>—Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source addresses for the specified time period.</td>
</tr>
</tbody>
</table>

### Step 4

**Example:**

`Switch(config)# end`

Returns to privileged EXEC mode.

### Step 5

**Example:**

`Switch(config)# show port-security interface gigabitethernet1/0/1`

Verifies your entries.

### Step 6

**Example:**

`Switch(config)# copy running-config startup-config`

(Optional) Saves your entries in the configuration file.

### Configuration Examples for Port Security

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 50. The violation mode is the default, no static secure MAC addresses are configured, and sticky learning is enabled.

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
```
Switch(config-if)# switchport port-security maximum 50
Switch(config-if)# switchport port-security mac-address sticky

This example shows how to configure a static secure MAC address on VLAN 3 on a port:

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 0000.0200.0004 vlan 3

This example shows how to enable sticky port security on a port, to manually configure MAC addresses for data VLAN and voice VLAN, and to set the total maximum number of secure addresses to 20 (10 for data VLAN and 10 for voice VLAN).

Switch(config)# interface tengigabitethernet1/0/1
Switch(config-if)# switchport access vlan 21
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 22
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 20
Switch(config-if)# switchport port-security violation restrict
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security mac-address 0000.0000.0003
Switch(config-if)# switchport port-security mac-address 0000.0000.0002
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0001 vlan voice
Switch(config-if)# switchport port-security mac-address 0000.0000.0004 vlan voice
Switch(config-if)# switchport port-security maximum 10 vlan access
Switch(config-if)# switchport port-security maximum 10 vlan voice

### Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to [http://www.cisco.com/go/cfn](http://www.cisco.com/go/cfn). An account on Cisco.com is not required.

### Information About Protocol Storm Protection

#### Protocol Storm Protection

When a switch is flooded with Address Resolution Protocol (ARP) or control packets, high CPU utilization can cause the CPU to overload. These issues can occur:

- Routing protocol can flap because the protocol control packets are not received, and neighboring adjacencies are dropped.
- Spanning Tree Protocol (STP) reconverges because the STP bridge protocol data unit (BPDU) cannot be sent or received.
- CLI is slow or unresponsive.

Using protocol storm protection, you can control the rate at which control packets are sent to the switch by specifying the upper threshold for the packet flow rate. The supported protocols are ARP, ARP snooping, Dynamic Host Configuration Protocol (DHCP) v4, DHCP snooping, Internet Group Management Protocol (IGMP), and IGMP snooping.

When the packet rate exceeds the defined threshold, the switch drops all traffic arriving on the specified virtual port for 30 seconds. The packet rate is measured again, and protocol storm protection is again applied if necessary.
For further protection, you can manually error disable the virtual port, blocking all incoming traffic on the virtual port. You can manually enable the virtual port or set a time interval for automatic re-enabling of the virtual port.

Note
Excess packets are dropped on no more than two virtual ports.
Virtual port error disabling is not supported for EtherChannel and Flexlink interfaces.

Default Protocol Storm Protection Configuration
Protocol storm protection is disabled by default. When it is enabled, auto-recovery of the virtual port is disabled by default.

How to Configure Protocol Storm Protection

Enabling Protocol Storm Protection

SUMMARY STEPS
1. configure terminal
2. psp {arp | dhcp | igmp} pps value
3. errdisable detect cause psp
4. errdisable recovery interval time

• How to Configure an IPv6 Router Advertisement Guard Policy, on page 1627
• How to Configure an IPv6 DHCP Guard Policy, on page 1632
• Additional References, on page 1637

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for First Hop Security in IPv6

• You have configured the necessary IPv6 enabled SDM template.

• You should be familiar with the IPv6 neighbor discovery feature. For information, see the "Implementing IPv6 Addressing and Basic Connectivity" chapter of the Cisco IOS IPv6 Configuration Library on Cisco.com.

Restrictions for First Hop Security in IPv6

• The following restrictions apply when applying FHS policies to EtherChannel interfaces (Port Channels):
  • A physical port with an FHS policy attached cannot join an EtherChannel group.
• An FHS policy cannot be attached to an physical port when it is a member of an EtherChannel group.

• By default, a snooping policy has a security-level of guard. When such a snooping policy is configured on an access switch, external IPv6 Router Advertisement (RA) or Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server packets are blocked, even though the uplink port facing the router or DHCP server/relay is configured as a trusted port. To allow IPv6 RA or DHCPv6 server messages, do the following:
  • Apply an IPv6 RA-guard policy (for RA) or IPv6 DHCP-guard policy (for DHCP server messages) on the uplink port.
  • Configure a snooping policy with a lower security-level, for example glean or inspect. However; configuring a lower security level is not recommended with such a snooping policy, because benefits of First Hop security features are not effective.

Information about First Hop Security in IPv6

First Hop Security in IPv6 (FHS IPv6) is a set of IPv6 security features, the policies of which can be attached to a physical interface, or a VLAN. An IPv6 software policy database service stores and accesses these policies. When a policy is configured or modified, the attributes of the policy are stored or updated in the software policy database, then applied as was specified. The following IPv6 policies are currently supported:

• IPv6 Snooping Policy—IPv6 Snooping Policy acts as a container policy that enables most of the features available with FHS in IPv6.

• IPv6 FHS Binding Table Content—A database table of IPv6 neighbors connected to the switch is created from information sources such as Neighbor Discovery (ND) protocol snooping. This database, or binding, table is used by various IPv6 guard features (such as IPv6 ND Inspection) to validate the link-layer address (LLA), the IPv4 or IPv6 address, and prefix binding of the neighbors to prevent spoofing and redirect attacks.

• IPv6 Neighbor Discovery Inspection—IPv6 ND inspection learns and secures bindings for stateless autoconfiguration addresses in Layer 2 neighbor tables. IPv6 ND inspection analyzes neighbor discovery messages in order to build a trusted binding table database and IPv6 neighbor discovery messages that do not conform are dropped. An ND message is considered trustworthy if its IPv6-to-Media Access Control (MAC) mapping is verifiable.

  This feature mitigates some of the inherent vulnerabilities of the ND mechanism, such as attacks on DAD, address resolution, router discovery, and the neighbor cache.

• IPv6 Router Advertisement Guard—The IPv6 Router Advertisement (RA) guard feature enables the network administrator to block or reject unwanted or rogue RA guard messages that arrive at the network switch platform. RAs are used by routers to announce themselves on the link. The RA Guard feature analyzes the RAs and filters out bogus RAs sent by unauthorized routers. In host mode, all router advertisement and router redirect messages are disallowed on the port. The RA guard feature compares configuration information on the Layer 2 device with the information found in the received RA frame. Once the Layer 2 device has validated the content of the RA frame and router redirect frame against the configuration, it forwards the RA to its unicast or multicast destination. If the RA frame content is not validated, the RA is dropped.

• IPv6 DHCP Guard—The IPv6 DHCP Guard feature blocks reply and advertisement messages that come from unauthorized DHCPv6 servers and relay agents. IPv6 DHCP guard can prevent forged messages
from being entered in the binding table and block DHCPv6 server messages when they are received on ports that are not explicitly configured as facing a DHCPv6 server or DHCP relay. To use this feature, configure a policy and attach it to an interface or a VLAN. To debug DHCP guard packets, use the **debug ipv6 snooping dhcp-guard** privileged EXEC command.

- IPv6 Source Guard—Like IPv4 Source Guard, IPv6 Source Guard validates the source address or prefix to prevent source address spoofing.

A source guard programs the hardware to allow or deny traffic based on source or destination addresses. It deals exclusively with data packet traffic.

The IPv6 source guard feature provides the ability to store entries in the hardware TCAM table to prevent a host from sending packets with an invalid IPv6 source address.

To debug source-guard packets, use the **debug ipv6 snooping source-guard** privileged EXEC command.

---

**Note** The IPv6 source guard and prefix guard features are supported only in the ingress direction; it is not supported in the egress direction.

The following restrictions apply:

- An FHS policy cannot be attached to an physical port when it is a member of an EtherChannel group.

- When IPv6 source guard is enabled on a switch port, NDP or DHCP snooping must be enabled on the interface to which the switch port belongs. Otherwise, all data traffic from this port will be blocked.

- An IPv6 source guard policy cannot be attached to a VLAN. It is supported only at the interface level.

- When you configure IPv4 and IPv6 source guard together on an interface, it is recommended to use **ip verify source mac-check** instead of **ip verify source**. IPv4 connectivity on a given port might break due to two different filtering rules set — one for IPv4 (IP-filter) and the other for IPv6 (IP-MAC filter).

- You cannot use IPv6 Source Guard and Prefix Guard together. When you attach the policy to an interface, it should be "validate address" or "validate prefix" but not both.

- PVLAN and Source/Prefix Guard cannot be applied together.

- IPv6 Source Guard and Prefix Guard is supported on EtherChannels

For more information on IPv6 Source Guard, see the [IPv6 Source Guard](https://www.cisco.com) chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.

- IPv6 Prefix Guard—The IPv6 prefix guard feature works within the IPv6 source guard feature, to enable the device to deny traffic originated from non-topologically correct addresses. IPv6 prefix guard is often used when IPv6 prefixes are delegated to devices (for example, home gateways) using DHCP prefix delegation. The feature discovers ranges of addresses assigned to the link and blocks any traffic sourced with an address outside this range.

For more information on IPv6 Prefix Guard, see the [IPv6 Prefix Guard](https://www.cisco.com) chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.
How to Configure an IPv6 Snooping Policy

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Snooping Policy:

**SUMMARY STEPS**

1. configure terminal
2. ipv6 snooping policy policy-name
3. {[default ]| [device-role {node | switch}] | [limit address-count value] | [no] | [protocol {dhcp | ndp}] | [security-level {glean | guard | inspect}] | [tracking {disable [stale-lifetime [seconds | infinite]] | enable [reachable-lifetime [seconds | infinite]]} | [trusted-port]}
4. end
5. show ipv6 snooping policy policy-name

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ipv6 snooping policy policy-name</td>
<td>Creates a snooping policy and enters IPv6 Snooping Policy Configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# ipv6 snooping policy example_policy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> {[default ]</td>
<td>[device-role {node</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

- IPv6 Destination Guard—The IPv6 destination guard feature works with IPv6 neighbor discovery to ensure that the device performs address resolution only for those addresses that are known to be active on the link. It relies on the address glean functionality to populate all destinations active on the link into the binding table and then blocks resolutions before they happen when the destination is not found in the binding table.

**Note**
IPv6 Destination Guard is recommended to apply on Layer 2 VLAN with an SVI configured.

For more information about IPv6 Destination Guard, see the IPv6 Destination Guard chapter of the Cisco IOS IPv6 Configuration Guide Library on Cisco.com.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch (config-ipv6-snooping)# security-level inspect</td>
<td>• (Optional) limit address-count value—Limits the number of addresses allowed per target.</td>
</tr>
<tr>
<td>Example: Switch (config-ipv6-snooping)# trusted-port</td>
<td>• (Optional) no—Negates a command or sets it to defaults.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) protocol {dhcp</td>
</tr>
</tbody>
</table>
| | • (Optional) security-level {glean | guard | inspect}—Specifies the level of security enforced by the feature. Default is guard.  
  
glean—Gleans addresses from messages and populates the binding table without any verification.  
guard—Gleans addresses and inspects messages. In addition, it rejects RA and DHCP server messages. This is the default option.  
inspect—Gleans addresses, validates messages for consistency and conformance, and enforces address ownership. |
| | • (Optional) tracking {disable | enable}—Overides the default tracking behavior and specifies a tracking option. |
| | • (Optional) trusted-port—Sets up a trusted port. It disables the guard on applicable targets. Bindings learned through a trusted port have preference over bindings learned through any other port. A trusted port is given preference in case of a collision while making an entry in the table. |

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
</table>
| Step 4 | end | Exits configuration modes to Privileged EXEC mode.  
Example: Switch(config-ipv6-snooping)# exit | |
| Step 5 | show ipv6 snooping policy policy-name | Displays the snooping policy configuration.  
Example: Switch#show ipv6 snooping policy example_policy | |

**What to do next**  
Attach an IPv6 Snooping policy to interfaces or VLANs.
How to Attach an IPv6 Snooping Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping policy on an interface or VLAN:

SUMMARY STEPS

1. configure terminal
2. interface Interface_type stack/module/port
3. switchport
4. ipv6 snooping [attach-policy policy_name [vlan {vlan_id | add vlan_ids | except vlan_ids | none | remove vlan_ids}] | vlan {vlan_id | add vlan_ids | except vlan_ids | none | remove vlan_ids | all}]
5. do show running-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>

</tr>
<tr>
<td>Switch(config-if)# ipv6 snooping vlan 111,112</td>
<td>or</td>
</tr>
<tr>
<td>Switch(config-if)# ipv6 snooping attach-policy example_policy vlan 111,112</td>
<td>or</td>
</tr>
</tbody>
</table>

---

**Step 5**

- do show running-config

Example:

Switch(config-if)# do show running-config

Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.

---

**Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.**

---

**Verifies that the policy is attached to the specified interface without exiting the interface configuration mode.**
### How to Attach an IPv6 Snooping Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Snooping Policy to VLANs across multiple interfaces:

#### SUMMARY STEPS

1. `configure terminal`
2. `vlan configuration vlan_list`
3. `ipv6 snooping [attach-policy policy_name]`
4. `do show running-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>vlan configuration vlan_list</code></td>
<td>Specifies the VLANs to which the IPv6 Snooping policy will be attached; enters the VLAN interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>Switch(config)# vlan configuration 333</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>ipv6 snooping [attach-policy policy_name]</code></td>
<td>Attaches the IPv6 Snooping policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the <code>attach-policy</code> option is not used. The default policy is, security-level <code>guard</code>, device-role <code>node</code>, protocol <code>ndp</code> and <code>dhcp</code>.</td>

How to Configure the IPv6 Binding Table Content

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:

**SUMMARY STEPS**

1. `configure terminal`
2. `[no] ipv6 neighbor binding [vlan vlan-id] [ipv6-address interface interface_type stack/module/port hw_address [reachable-lifetimevalue [seconds | default | infinite]] | [tracking { [default] | disable] [reachable-lifetimevalue [seconds | default | infinite]] | [enable [reachable-lifetimevalue [seconds | default | infinite]] | [retry-interval {seconds | default | infinite] [tracking { default | disable] [reachable-lifetimevalue [seconds | default | infinite]]]}
3. `[no] ipv6 neighbor binding max-entries number [mac-limit number] [port-limit number [mac-limit number]] [vlan-limit number [ [mac-limit number] [port-limit number [mac-limit number]]]]`
4. `ipv6 neighbor binding logging`
5. `exit`
6. `show ipv6 neighbor binding`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `configure terminal` | Enters the global configuration mode. |
| **Example:**  
| Switch# configure terminal | |
| **Step 2**
| `[no] ipv6 neighbor binding [vlan vlan-id] [ipv6-address interface interface_type stack/module/port hw_address [reachable-lifetimevalue [seconds | default | infinite]] | [tracking { [default] | disable] [reachable-lifetimevalue [seconds | default | infinite]] | [enable [reachable-lifetimevalue [seconds | default | infinite]] | [retry-interval {seconds | default | infinite] [tracking { default | disable] [reachable-lifetimevalue [seconds | default | infinite]]]}
| **Example:**  
| Switch(config)# ipv6 neighbor binding | |
| **Step 3**
| `[no] ipv6 neighbor binding max-entries number [mac-limit number] [port-limit number [mac-limit number]] [vlan-limit number [ [mac-limit number] [port-limit number [mac-limit number]]]]`
| **Example:**  
| Switch(config)# ipv6 neighbor binding max-entries 30000 | Specifies the maximum number of entries that are allowed to be inserted in the binding table cache. |
How to Configure an IPv6 Neighbor Discovery Inspection Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 ND Inspection Policy:

**SUMMARY STEPS**

1. configure terminal
2. [no]ipv6 nd inspection policy policy-name
3. device-role {host | monitor | router | switch}
4. drop-unsecure
5. limit address-count value
6. sec-level minimum value
7. tracking {enable [reachable-lifetime {value | infinite}] | disable [stale-lifetime {value | infinite}]}
8. trusted-port
9. validate source-mac
10. no {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}
11. default {device-role | drop-unsecure | limit address-count | sec-level minimum | tracking | trusted-port | validate source-mac}
12. do show ipv6 nd inspection policy policy_name

**DETAILED STEPS**

<table>

### How to Attach an IPv6 Neighbor Discovery Inspection Policy to an Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to an interface or VLANs on an interface:

#### SUMMARY STEPS

1. **configure terminal**
2. **interface** *Interface_type* *stack/module/port*
3. **ipv6 nd inspection [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } ] | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } }]
4. **do show running-config**

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface</strong> <em>Interface_type</em> <em>stack/module/port</em>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# interface gigabitethernet 1/1/4</td>
</tr>
</tbody>
</table>
| **Step 3** | **ipv6 nd inspection [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } ] | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } }]
**Example:**<br>Switch(config-if)# ipv6 nd inspection attach-policy example_policy<br>or<br>Switch(config-if)# ipv6 nd inspection attach-policy example_policy vlan 222,223,224 |

### How to Verify the ND Inspection Configuration without Exiting ND Inspection Configuration Mode

- **Step 12**<br>**do show ipv6 nd inspection policy policy_name**
  **Example:**<br>Switch(config-nd-inspection)# do show ipv6 nd inspection policy example_policy

Verifies the ND Inspection Configuration without exiting ND inspection configuration mode.
How to Attach an IPv6 Neighbor Discovery Inspection Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Neighbor Discovery Inspection policy on an EtherChannel interface or VLAN:

**SUMMARY STEPS**

1. configure terminal
2. interface range Interface_name
3. ipv6 nd inspection [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ]
4. do show running-config interface portchannel_interface_name

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>

</tbody>
</table>
How to Attach an IPv6 Neighbor Discovery Inspection Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 ND Inspection policy to VLANs across multiple interfaces:

**SUMMARY STEPS**

1. configure terminal
2. vlan configuration vlan_list
3. ipv6 nd inspection [attach-policy policy_name]
4. do show running-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>vlan configuration vlan_list</td>
<td>Specifies the VLANs to which the IPv6 Snooping policy will be attached; enters the VLAN interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# vlan configuration 334</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>ipv6 nd inspection [attach-policy policy_name]</td>
<td>Attaches the IPv6 Neighbor Discovery policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the attach-policy option is not used.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config-vlan-config)#ipv6 nd inspection attach-policy example_policy</td>
<td></td>
</tr>
</tbody>
</table>

**How to Attach a Policy to Multiple VLANs**

```
Switch(config-if-range)# ipv6 nd inspection attach-policy example_policy vlan 222,223,224
or
Switch(config-if-range)#ipv6 nd inspection vlan 222,223,224
```

This confirms that the policy is attached to the specified interface without exiting the configuration mode.

Example:
```
Step 4 do show running-config interface portchannel_interface_name
```

**Step 4**

Example:
```
Switch(config-if-range)# do show running-config int poll
```

### How to Attach an IPv6 Router Advertisement Guard Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Router Advertisement Guard Policy on an EtherChannel interface or VLAN:

#### SUMMARY STEPS

1. configure terminal
2. interface range Interface_name
3. ipv6 nd raguard [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all}] | vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all}]
4. do show running-config interface portchannel_interface_name

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# interface gigabitethernet 1/1/4</td>
<td>Enters the global configuration mode.</td>
</tr>
</tbody>
</table>

**Step 3**

```
ipv6 nd raguard [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all}] | vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all}] ]
```

- **Example:**
  - Switch(config-if)# ipv6 nd raguard attach-policy example_policy
  - or
  - Switch(config-if)# ipv6 nd raguard attach-policy example_policy vlan 222,223,224
  - or
  - Switch(config-if)# ipv6 nd raguard vlan 222, 223,224

- **Purpose:** Attaches the Neighbor Discovery Inspection policy to the interface or the specified VLANs on that interface. The default policy is attached if the attach-policy option is not used.

**Step 4**

```
do show running-config
```

- **Example:**
  - Switch(config-if)# do show running-config

- **Purpose:** Confirms that the policy is attached to the specified interface without exiting the configuration mode.
### How to Attach an IPv6 Router Advertisement Guard Policy to VLANs Globally

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 Router Advertisement policy to VLANs regardless of interface:

**SUMMARY STEPS**

1. `configure terminal`
2. `vlan configuration vlan_list`
3. `ipv6 dhcp guard [attach-policy policy_name]`
4. `do show running-config`

### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 2 | `interface range Interface_name`  
**Example:**  
Switch(config)# interface range Po11 | Specify the port-channel interface name assigned when the EtherChannel was created. Enters the interface range configuration mode.  
**Tip** Enter the `do show interfaces summary` command for quick reference to interface names and types. |
| Step 3 | `ipv6 nd raguard [attach-policy policy_name] [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ] [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} ]`  
**Example:**  
Switch(config-if-range)# ipv6 nd raguard attach-policy example_policy  
 or  
Switch(config-if-range)# ipv6 nd raguard attach-policy example_policy vlan 222,223,224  
 or  
Switch(config-if-range)#ipv6 nd raguard vlan 222,223,224 | Attaches the RA Guard policy to the interface or the specified VLANs on that interface. The default policy is attached if the `attach-policy` option is not used. |
| Step 4 | `do show running-config`  
`interface portchannel_interface_name`  
**Example:**  
Switch#(config-if-range)# do show running-config int po11 | Confirms that the policy is attached to the specified interface without exiting the configuration mode. |
How to Configure an IPv6 DHCP Guard Policy

Beginning in privileged EXEC mode, follow these steps to configure an IPv6 DHCP (DHCPv6) Guard policy:

**SUMMARY STEPS**

1. `configure terminal`
2. `[no]ipv6 dhcp guard policy policy-name`
3. `[no]device-role {client | server}`
4. `[no] match server access-list ipv6-access-list-name`
5. `[no] match reply prefix-list ipv6-prefix-list-name`
6. `[no] preference { max limit | min limit }`
7. `[no] trusted-port`
8. `default {device-role | trusted-port}`
9. `do show ipv6 dhcp guard policy policy_name`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> vlan configuration vlan_list</td>
<td>Specifies the VLANs to which the IPv6 RA Guard policy will be attached; enters the VLAN interface configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# vlan configuration 335</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> ipv6 dhcp guard [attach-policy policy_name]</td>
<td>Attaches the IPv6 RA Guard policy to the specified VLANs across all switch and stack interfaces. The default policy is attached if the <code>attach-policy</code> option is not used.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-vlan-config)#ipv6 nd raguard attach-policy example_policy</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 4</strong> do show running-config</td>
<td>Confirms that the policy is attached to the specified VLANs without exiting the configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch#(config-if)# do show running-config</td>
<td></td>

</tbody>
</table>
### How to Configure an IPv6 DHCP Guard Policy

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the DHCPv6 Guard policy name and enters DHCPv6 Guard Policy configuration mode.</td>
</tr>
</tbody>
</table>
| [no]ipv6 dhcp guard policy *policy-name*  
**Example:**  
Switch(config)# ipv6 dhcp guard policy example_policy |  |
| **Step 3** | (Optional) Filters out DHCPv6 replies and DHCPv6 advertisements on the port that are not from a device of the specified role. Default is *client*. |
| [no]device-role {*client | server*}  
**Example:**  
Switch(config-dhcp-guard)# device-role server |  |
| **Step 4** | (Optional). Enables verification that the advertised DHCPv6 server or relay address is from an authorized server access list (The destination address in the access list is 'any'). If not configured, this check will be bypassed. An empty access list is treated as a permit all. |
| [no] match server access-list *ipv6-access-list-name*  
**Example:**  
;; Assume a preconfigured IPv6 Access List as follows:  
Switch(config)# ipv6 access-list my_acls  
Switch(config-ipv6-acl)# permit host FE80::A8BB:CCFF:FE01:F700 any  
;; configure DHCPv6 Guard to match approved access list.  
Switch(config-dhcp-guard)# match server access-list my_acls |  |
| **Step 5** | (Optional) Enables verification of the advertised prefixes in DHCPv6 reply messages from the configured authorized prefix list. If not configured, this check will be bypassed. An empty prefix list is treated as a permit. |
| [no] match reply prefix-list *ipv6-prefix-list-name*  
**Example:**  
;; Assume a preconfigured IPv6 prefix list as follows:  
Switch(config)# ipv6 prefix-list my_prefix permit  
2001:0DB8::/64 le 128  
;; Configure DHCPv6 Guard to match prefix  
Switch(config-dhcp-guard)# match reply prefix-list my_prefix |  |
| **Step 6** | Configure *max* and *min* when *device-role* is *server* to filter DHCPv6 server advertisements by the server preference value. The defaults permit all advertisements. |
| [no]preference {*max | min | limit*}  
**Example:**  
Switch(config-dhcp-guard)# preference max 250  
Switch(config-dhcp-guard)# preference min 150 |  |

---

Consolidated Platform Configuration Guide, Cisco IOS XE 3.3SE (Catalyst 3650 Switches)
### Command or Action | Purpose
---|---
min | (0 to 255) (Optional) Enables verification that the advertised preference (in preference option) is greater than the specified limit. Default is 0. If not specified, this check will be bypassed.

**Step 7**  
[no] trusted-port  
**Example:**  
Switch(config-dhcp-guard)# trusted-port

 thief-protected | (Optional) trusted-port—Sets the port to a trusted mode. No further policing takes place on the port.

**Note** If you configure a trusted port then the device-role option is not available.

**Step 8** default {device-role | trusted-port}  
**Example:**  
Switch(config-dhcp-guard)# default device-role

 thief-protected | (Optional) default—Sets a command to its defaults.

**Step 9** do show ipv6 dhcp guard policy policy_name  
**Example:**  
Switch(config-dhcp-guard)# do show ipv6 dhcp guard policy example_policy

 thief-protected | (Optional) Displays the configuration of the IPv6 DHCP guard policy without leaving the configuration submode. Omitting the policy_name variable displays all DHCPv6 policies.

---

**Example of DHCPv6 Guard Configuration**

```shell
enable
cd
c cd
c cd
configure terminal
ipv6 access-list acl1
permit host FE80::A8BB:CCFF:FE01:F700 any
ipv6 prefix-list abc permit 2001:0DB8::/64 le 128
ipv6 dhcp guard policy poll
 device-role server
 match server access-list acl1
 match reply prefix-list abc
 preference min 0
 preference max 255
 trusted-port
 interface GigabitEthernet 0/2/0
 switchport
 ipv6 dhcp guard attach-policy poll vlan add 1
 vlan 1
 ipv6 dhcp guard attach-policy poll
 show ipv6 dhcp guard policy poll
```

---

### How to Attach an IPv6 DHCP Guard Policy to an Interface or a VLAN on an Interface

Beginning in privileged EXEC mode, follow these steps to configure IPv6 Binding Table Content:

**SUMMARY STEPS**

1. configure terminal
2. interface Interface_type stack/module/port
3. `ipv6 dhcp guard [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } ] | vlan [ {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all } ] ]`

4. `do show running-config interface Interface_type stack/module/port`

### Detailed Steps

### How to Attach an IPv6 DHCP Guard Policy to a Layer 2 EtherChannel Interface

Beginning in privileged EXEC mode, follow these steps to attach an IPv6 DHCP Guard policy on an EtherChannel interface or VLAN:
### SUMMARY STEPS

1. `configure terminal`
2. `interface range Interface_name`
3. `ipv6 dhcp guard [attach-policy policy_name [ vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all} | vlan {vlan_ids | add vlan_ids | except vlan_ids | none | remove vlan_ids | all}] ]`
4. `do show running-config interface portchannel_interface_name`

### DETAILED STEPS

<table>
<thead>
<tr>

**Configuring Cisco TrustSec**

Cisco TrustSec provides security improvements to Cisco network devices based on the capability to strongly identify users, hosts, and network devices within a network. TrustSec provides topology-independent and scalable access controls by uniquely classifying data traffic for a particular role. TrustSec ensures data confidentiality and integrity by establishing trust among authenticated peers and encrypting links with those peers.

The key component of Cisco TrustSec is the Cisco Identity Services Engine (ISE). Cisco ISE can provision switches with TrustSec Identities and Security Group ACLs (SGACLs), though these may be configured manually on the switch.

**Finding Feature Information**

For switch configurations verified within the TrustSec solution, see the Cisco TrustSec How-to guides at the following URL:

For general TrustSec configuration summaries, specific platform considerations, and cts command reference information related to Cisco Catalyst switches, see the Cisco TrustSec Switch Configuration Guide at the following URL:

Release notes for Cisco TrustSec General Availability releases are at the following URL:

Additional information about the Cisco TrustSec solution, including overviews, datasheets, features by platform matrix, and case studies, is available at the following URL:
Information About Cisco TrustSec

The table below lists the TrustSec features to be eventually implemented on TrustSec-enabled Cisco switches. Successive general availability releases of TrustSec will expand the number of switches supported and the number of TrustSec features supported per switch.

<table>
<thead>
<tr>
<th>Cisco TrustSec Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1AE Tagging (MACsec)</td>
<td>Protocol for IEEE 802.1AE-based wire-rate hop-to-hop Layer 2 encryption. Between MACsec-capable devices, packets are encrypted on egress from the transmitting device, decrypted on ingress to the receiving device, and in the clear within the devices. This feature is only available between TrustSec hardware-capable devices.</td>
</tr>
<tr>
<td>Endpoint Admission Control (EAC)</td>
<td>EAC is an authentication process for an endpoint user or a device connecting to the TrustSec domain. Usually EAC takes place at the access level switch. Successful authentication and authorization in the EAC process results in Security Group Tag assignment for the user or device. Currently EAC can be 802.1X, MAC Authentication Bypass (MAB), and Web Authentication Proxy (WebAuth).</td>
</tr>
<tr>
<td>Network Device Admission Control (NDAC)</td>
<td>NDAC is an authentication process where each network device in the TrustSec domain can verify the credentials and trustworthiness of its peer device. NDAC utilizes an authentication framework based on IEEE 802.1X port-based authentication and uses EAP-FAST as its EAP method. Successful authentication and authorization in NDAC process results in Security Association Protocol negotiation for IEEE 802.1AE encryption.</td>
</tr>
<tr>
<td>Security Group Access Control List (SGACL)</td>
<td>A Security Group Access Control List (SGACL) associates a Security Group Tag with a policy. The policy is enforced upon SGT-tagged traffic egressing the TrustSec domain.</td>
</tr>
<tr>
<td>Security Association Protocol (SAP)</td>
<td>After NDAC authentication, the Security Association Protocol (SAP) automatically negotiates keys and the cipher suite for subsequent MACSec link encryption between TrustSec peers. SAP is defined in IEEE 802.11i.</td>
</tr>
</tbody>
</table>
Cisco TrustSec Feature | Description
--- | ---
Security Group Tag (SGT) | An SGT is a 16-bit single label indicating the security classification of a source in the TrustSec domain. It is appended to an Ethernet frame or an IP packet.
SGT Exchange Protocol (SXP) | Security Group Tag Exchange Protocol (SXP). With SXP, devices that are not TrustSec-hardware-capable can receive SGT attributes for authenticated users and devices from the Cisco Identity Services Engine (ISE) or the Cisco Secure Access Control System (ACS). The devices can then forward a source IP-to-SGT binding to a TrustSec-hardware-capable device will tag the source traffic for SGACL enforcement.

**Restrictions for Cisco TrustSec**

The following guidelines and limitations apply to configuring Cisco TrustSec SGT and SGACL:

- You cannot statically map an IP-subnet to an SGT. You can only map IP addresses to an SGT. When you configure IP address-to-SGT mappings, the IP address prefix must be 32.

- If a port is configured in Multi-Auth mode, all hosts connecting on that port must be assigned the same SGT. When a host tries to authenticate, its assigned SGT must be the same as the SGT assigned to a previously authenticated host. If a host tries to authenticate and its SGT is different from the SGT of a previously authenticated host, the VLAN port (VP) to which these hosts belong is error-disabled.

- Cisco TrustSec enforcement is supported only on up to eight VLANs on a VLAN-trunk link. If there are more than eight VLANs configured on a VLAN-trunk link and Cisco TrustSec enforcement is enabled on those VLANs, the switch ports on those VLAN-trunk links will be error-disabled.

- The switch can assign SGT and apply corresponding SGACL to end-hosts based on SXP listening only if the end-hosts are Layer2 adjacent to the switch.

- Port-to-SGT mapping can be configured only on Cisco TrustSec links (that is, switch-to-switch links). Port-to-SGT mapping cannot be configured on host-to-switch links.

- When port-to-SGT mapping is configured on a port, an SGT is assigned to all ingress traffic on that port. There is no SGACL enforcement for egress traffic on the port.

- Configuration Examples for Guest Access, on page 1662
- Additional References for Guest Access, on page 1668
- Feature History and Information for Guest Access, on page 1669

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Guest Access

- All mobility peers should be configured for hierarchical mobility architecture.
- For Guest Controller Mobility Anchor configuration on WLAN is must on Mobility Agent and Guest Controller.
- Guest Access can be a 3 box solution or 2 box solution. The mobility tunnel link status should be up between:
  - Mobility Agent, Mobility Controller and Guest Controller.
  or
  - Mobility Agent/Mobility Controller and Guest Controller.
Restrictions for Guess Access

Guest Controller functionality is not supported on the Catalyst 3850 switch whereas Catalyst 3850 can act as mobility agent.

Information about Wireless Guest Access

Ideally, the implementation of a wireless guest network uses as much of an enterprise’s existing wireless and wired infrastructure as possible to avoid the cost and complexity of building a physical overlay network. Assuming this is the case, the following additional elements and functions are needed:

• A dedicated guest WLAN/SSID—Implemented throughout the campus wireless network wherever guest access is required. A guest WLAN is identified by a WLAN with mobility anchor (Guest Controller) configured.
• Guest traffic segregation—Requires implementing Layer 2 or Layer 3 techniques across the campus network to restrict where guests are allowed to go.
• Access control—Involves using imbedded access control functionality within the campus network or implementing an external platform to control guest access to the Internet from the enterprise network.
• Guest user credential management—A process by which a sponsor or lobby administrator can create temporary credentials in behalf of a guest. This function might be resident within an access control platform or it might be a component of AAA or some other management system.

Fast Secure Roaming

Fast secure roaming can be achieved by caching the Pairwise Master Key (PMK) information for Cisco Centralized Key Management (CCKM), 802.11r and 802.11i clients. Cisco Centralized Key Management (CCKM) helps to improve roaming. Only the client can initiate the roaming process, which depends on factors such as:

• Overlap between APs
• Distance between APs
• Channel, signal strength, and load on the AP
• Data rates and output power

Whenever a fast-roaming client 802.11i, [CCKM]) roams to a new device, after fast-roaming the clients go through mobility "handoff" procedure. And new AAA attributes learned through mobility "handoff" procedure get re-applied.

Full L2 authentication must be avoided during roaming if the client uses the 802.11i WPA2, CCKM, 802.11r to achieve the full requirements of fast secure roaming. The PMK cache (802.11i, CCKM, and 802.11r) is used to authenticate and derive the keys for roaming clients to avoid full L2 authentication. This requires all Mobility Anchors (MA) and Mobility Controllers (MC) in the mobility group to have the same PMK cache values.

The session timeout defines when a PMK cache will expire. A PMK cache can also be deleted when a client fails to re-authenticate or when it is manually deleted them from the CLI. The deletion on the original controller or switch shall be propagated to other controllers or switches in the same mobility group.
How to Configure Guest Access

Creating a Lobby Administrator Account

SUMMARY STEPS

1. configure terminal
2. user-name user-name
3. type lobby-admin
4. password 0 password
5. end
6. show running-config | section user-name (or) show running-config | section configured lobby admin username

DETAILED STEPS

<table>
<thead>
<tr>

### Configuring Mobility Agent (MA)

#### SUMMARY STEPS

1. `configure terminal`
2. `wireless mobility controller ip mc-ip address public-ip mc-public-ipaddress`
3. `wlan wlan-name wlan-id ssid`
4. `client vlan id vlan-group name vlan-id`
5. `no security wpa`
6. `mobility anchor ip address`
7. `aaa-override`
8. `no shutdown`
9. `end`
10. `show wireless mobility summary`
11. `show wlan name wlan-name/id`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**        | **configure terminal**<br>
| Example:          | Switch # configure terminal |
| **Step 2**        | **wireless mobility controller ip**<br>
| Example:          | Switch (config) # wireless mobility controller ip 27.0.0.1 public-ip 27.0.0.1 |
| **Step 3**        | **wlan wlan-name wlan-id ssid**<br>
| Example:          | Switch (config) # wlan mywlan 34 mywlan-ssid |

- For `wlan-name` enter, enter the profile name. The range is 1-32 characters.
- For `wlan-id`, enter the WLAN ID. The range is 1-512.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>client vlan id\vlan-group name/\vlan-id</td>
<td>For ssid, enter the Service Set IDentifier (SSID) for this WLAN. If the SSID is not specified, the WLAN profile name is set as the SSID. Configures the VLAN id or group of the WLAN.</td>
</tr>
<tr>
<td>no security wpa</td>
<td>The security configuration must be the same for the WLAN created on the GC. This example is for open authentication. For other security types such as open and webauth, appropriate command should be provided.</td>
</tr>
<tr>
<td>mobility anchor ipaddress</td>
<td>Configures the Guest Controller as mobility anchor.</td>
</tr>
<tr>
<td>aaa-override</td>
<td>(Optional) Enables AAA override. AAA override is required for non open authentication in case AAA attributes are to be prioritized. It is required only in case guest user need to be deauthenticated after lifetime or have to give aaa-override attribute to the user.</td>
</tr>
<tr>
<td>no shutdown</td>
<td>Enables the WLAN.</td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>

**Example**

Consolidated Platform Configuration Guide, Cisco IOS XE 3.3SE (Catalyst 3650 Switches)
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>For wlan-name, enter the profile name. The range is 1-32 characters.</td>
</tr>
</tbody>
</table>

### Step 2

**Example:**

```
Switch (config) # wlan ramban
```

### Step 3

**aaa-override**

*Example:*

```
Switch (config-wlan) # aaa-override
```

Enables AAA override on the WLAN.

### Step 4

**Example:**

```
Switch (config-wlan) # end
```

Returns to privileged EXEC mode.

### Step 5

**Example:**

```
Switch # show running-config | section ramban
```

Displays the configuration details.

### Example

**Configuring Client Load Balancing**

**SUMMARY STEPS**

1. configure terminal
2. wlan wlan-name
3. shutdown
4. mobility anchor ip-address1
5. mobility anchor ip-address2
6. no shutdown wlan
7. end
8. show running-config | section wlan-name

### Example

#### Configuration Examples for Guest Access

**Example: Creating a Lobby Ambassador Account**

This example shows how to configure a lobby ambassador account.

```plaintext
Switch# configure terminal
Switch(config)# user-name lobby
Switch(config)# type lobby-admin
Switch(config)# password 0 lobby
Switch(config)# end
Switch# show running-config | section lobby
  user-name lobby
  creation-time 1351118727
  password 0 lobby
  type lobby-admin
```

**Example: Obtaining Web Authentication Certificate**

This example shows how to obtain web authentication certificate.

```plaintext
Switch# configure terminal
Switch(config)# crypto pki import cert pkcs12 tftp://9.1.0.100/ldapserver-cert.p12 cisco
Switch(config)# end
Switch# show crypto pki trustpoints cert
```
Trustpoint cert:
  Subject Name:
  e=rkannajr@cisco.com

Example: Choosing the Default Web Authentication Login Page

This example shows how to choose a default web authentication login page.

Switch# configure terminal  
Switch(config)# parameter-map type webauth test
This operation will permanently convert all relevant authentication commands to their CPL control-policy equivalents. As this conversion is irreversible and will disable the conversion CLI ‘authentication display [legacy|new-style]’, you are strongly advised to back up your current configuration before proceeding.

Do you wish to continue? [yes]: yes

Switch(config)# wlan wlan50
Switch(config-wlan)# shutdown
Switch(config-wlan)# security web-auth authentication-list test
Switch(config-wlan)# security web-auth parameter-map test
Switch(config-wlan)# no shutdown
Switch(config-wlan)# end
Switch# show running-config | section wlan50
wlan wlan50 50 wlan50
  security wpa akm cckm
  security wpa wpa1
  security wpa wpa1 ciphers aes
  security wpa wpa1 ciphers tkip
  security web-auth authentication-list test
  security web-auth parameter-map test
  session-timeout 1800
  no shutdown

Switch# show running-config | section parameter-map type webauth test
parameter-map type webauth test
  type webauth

Example: Choosing a Customized Web Authentication Login Page from an External Web Server

This example shows how to choose a customized web authentication login page from an external web server.

Switch# configure terminal
Switch(config)# parameter-map type webauth global
Switch(config-params-parameter-map)# virtual-ip ipv4 1.1.1.1
Switch(config-params-parameter-map)# parameter-map type webauth test
Switch(config-params-parameter-map)# type webauth
Switch(config-params-parameter-map)# redirect for-login http://9.1.0.100/login.html
Switch(config-params-parameter-map)# redirect portal ipv4 23.0.0.1
Switch(config-params-parameter-map)# end
Switch# show running-config | section parameter-map
parameter-map type webauth global
virtual-ip ipv4 1.1.1.1
parameter-map type webauth test
type webauth
redirect for-login http://9.1.0.100/login.html
redirect portal ipv4 23.0.0.1
security web-auth parameter-map rasagna-auth-map
security web-auth parameter-map test

Example: Assigning Login, Login Failure, and Logout Pages per WLAN

This example shows how to assign login, login failure and logout pages per WLAN.

Switch# configure terminal
Switch(config)# parameter-map type webauth test
Switch(config-params-parameter-map)# custom-page login device flash:loginsantosh.html
Switch(config-params-parameter-map)# custom-page login expired device flash:loginexpire.html
Example: Configuring AAA-Override

This example shows how to configure aaa-override.

```
Switch# configure terminal
Switch(config)# wlan fff
Switch(config-wlan)# aaa-override
Switch(config-wlan)# end
Switch# show running-config | section fff
wlan fff 44 fff
  aaa-override
  shutdown
```

Example: Configuring Client Load Balancing

This example shows how to configure client load balancing.

```
Switch# configure terminal
Switch(config)# wlan fff
Switch(config-wlan)# shutdown
Switch(config-wlan)# mobility anchor 9.7.136.15
Switch(config-wlan)# mobility anchor 9.7.136.16
Switch(config-wlan)# no shutdown wlan
Switch(config-wlan)# end
Switch# show running-config | section fff
wlan fff 44 fff
  aaa-override
  shutdown
```

Example: Configuring Preauthentication ACL

This example shows how to configure preauthentication ACL.

```
Switch# configure terminal
Switch(config)# wlan fff
Switch(config-wlan)# shutdown
Switch(config-wlan)# ip access-group web preauthrule
Switch(config-wlan)# no shutdown
Switch(config-wlan)# end
Switch# show wlan name fff
```
Example: Configuring IOS ACL Definition

This example shows how to configure IOS ACL definition.

```
Switch# configure terminal
Switch(config)# ip access-list extended 102
Switch(config-ext-nacl)# permit udp any eq 8080 any
Switch(config-ext-nacl)# end
Switch# show access-lists 102
  Extended IP access list 102
    10 permit udp any eq 8080 any
```

Example: Configuring Webpassthrough

This example shows how to configure webpassthrough.

```
Switch# configure terminal
Switch(config)# parameter-map type webauth webparalocal
Switch(config-params-parameter-map)# type consent
Switch(config-params-parameter-map)# end
Switch# show running-config | section parameter-map type webauth test
  parameter-map type webauth test
  type webauth
  redirect for-login http://9.1.0.100/login.html
  redirect portal ipv4 23.0.0.1
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Rogue Devices

Rogue access points can disrupt wireless LAN operations by hijacking legitimate clients and using plain-text or other denial-of-service or man-in-the-middle attacks. That is, a hacker can use a rogue access point to capture sensitive information, such as usernames and passwords. The hacker can then transmit a series of Clear to Send (CTS) frames. This action mimics an access point, informing a particular client to transmit, and instructing all the other clients to wait, which results in legitimate clients being unable to access network resources. Wireless LAN service providers have a strong interest in banning rogue access points from the air space.

Because rogue access points are inexpensive and readily available, employees sometimes plug unauthorized rogue access points into existing LANs and build ad hoc wireless networks without their IT department's knowledge or consent. These rogue access points can be a serious breach of network security because they can be plugged into a network port behind the corporate firewall. Because employees generally do not enable any security settings on the rogue access point, it is easy for unauthorized users to use the access point to intercept network traffic and hijack client sessions. Even more alarming, wireless users frequently publish unsecure access point locations, increasing the odds of having enterprise security breached.

The following are some guidelines to manage rogue devices:
• The containment frames are sent immediately after the authorization and associations are detected. The enhanced containment algorithm provides more effective containment of ad hoc clients.

• The are designed to serve associated clients. These access points spend relatively less time performing off-channel scanning: about 50 milliseconds on each channel. If you want to perform high rogue detection, a monitor mode access point must be used. Alternatively, you can reduce the scan intervals from 180 seconds to a lesser value, for example, 120 or 60 seconds, ensuring that the radio goes off-channel more frequently, which improves the chances of rogue detection. However, the access point will still spend about 50 milliseconds on each channel.

• Rogue detection is disabled by default for OfficeExtend access points because these access points, which are deployed in a home environment, are likely to detect a large number of rogue devices.

• Client card implementations might mitigate the effectiveness of ad hoc containment.

• It is possible to classify and report rogue access points through the use of rogue states and user-defined classification rules that enable rogues to automatically move between states.

• Each controller limits the number of rogue containments to three per radio (or six per radio for access points in the monitor mode).

• Rogue Location Discovery Protocol (RLDP) detects rogue access points that are configured for open authentication.

• RLDP detects rogue access points that use a broadcast Basic Service Set Identifier (BSSID), that is, the access point broadcasts its Service Set Identifier in beacons.

• RLDP detects only those rogue access points that are on the same network. If an access list in the network prevents the sending of RLDP traffic from the rogue access point to the controller, RLDP does not work.

• RLDP does not work on 5-GHz dynamic frequency selection (DFS) channels. However, RLDP works when the managed access point is in the monitor mode on a DFS channel.

• If RLDP is enabled on mesh APs, and the APs perform RLDP tasks, the mesh APs are dissociated from the controller. The workaround is to disable RLDP on mesh APs.

• If RLDP is enabled on nonmonitor APs, client connectivity outages occur when RLDP is in process.

• If the rogue is manually contained, the rogue entry is retained even after the rogue expires.

• If the rogue is contained by any other means, such as auto, rule, and AwIPS preventions, the rogue entry is deleted when it expires.

• The controller will request to AAA server for rogue client validation only once. As a result, if rogue client validation fails on the first attempt then the rogue client will not be detected as a threat any more. To avoid this, add the valid client entries in the authentication server before enabling Validate Rogue Clients Against AAA.

• In the 7.4 and earlier releases, if a rogue that was already classified by a rule was not reclassified. In the 7.5 release, this behavior is enhanced to allow reclassification of rogues based on the priority of the rogue rule. The priority is determined by using the rogue report that is received by the controller.

• The rogue detector AP fails to co-relate and contain the wired rogue AP on a 5Mhz channel because the MAC address of the rogue AP for WLAN, LAN, 11a radio and 11bg radio are configured with a difference of +/-1 of the rogue BSSID. In the 8.0 release, this behavior is enhanced by increasing the range of MAC address, that the rogue detector AP co-relates the wired ARP MAC and rogue BSSID, by +/-3.
Detecting Rogue Devices

The controller continuously monitors all the nearby access points and automatically discovers and collects information on rogue access points and clients. When the controller discovers a rogue access point, it uses the Rogue Location Discovery Protocol (RLDP) and the rogue detector mode access point is connected to determine if the rogue is attached to your network.

Controller initiates RLDP on rogue devices that have open authenticated and configured. If RLDP uses Flexconnect or local mode access points, then clients are disconnected for that moment. After the RLDP cycle, the clients are reconnected to the access points. As and when rogue access points are seen (auto-configuration), the RLDP process is initiated.

You can configure the controller to use RLDP on all the access points or only on the access points configured for the monitor (listen-only) mode. The latter option facilitates automated rogue access point detection in a crowded radio frequency (RF) space, allowing monitoring without creating unnecessary interference and without affecting the regular data access point functionality. If you configure the controller to use RLDP on all the access points, the controller always chooses the monitor access point for RLDP operation if a monitor access point and a local (data) access point are both nearby. If RLDP determines that the rogue is on your network, you can choose to contain the detected rogue either manually or automatically.

RLDP detects on wire presence of the rogue access points that are configured with open authentication only once, which is the default retry configuration. Retries can be configured using the `config rogue ap rldp retries` command.

You can initiate or trigger RLDP from controller in three ways:

1. Enter the RLDP initiation command manually from the controller CLI. The equivalent GUI option for initiating RLDP is not supported.

   ```sh
   config rogue ap rldp initiate mac-address
   ```

2. Schedule RLDP from the controller CLI. The equivalent GUI option for scheduling RLDP is not supported.

   ```sh
   config rogue ap rldp schedule
   ```

3. Auto RLDP. You can configure auto RLDP on controller either from controller CLI or GUI but keep in mind the following guidelines:

   - The auto RLDP option can be configured only when the rogue detection security level is set to custom.
   - Either auto RLDP or schedule of RLDP can be enabled at a time.

A rogue access point is moved to a contained state either automatically or manually. The controller selects the best available access point for containment and pushes the information to the access point. The access point stores the list of containments per radio. For auto containment, you can configure the controller to use only the monitor mode access point. The containment operation occurs in the following two ways:

- The container access point goes through the list of containments periodically and sends unicast containment frames. For rogue access point containment, the frames are sent only if a rogue client is associated.

- Whenever a contained rogue activity is detected, containment frames are transmitted.

Individual rogue containment involves sending a sequence of unicast disassociation and deauthentication frames.

Cisco Prime Infrastructure Interaction and Rogue Detection

Cisco Prime Infrastructure supports rule-based classification and uses the classification rules configured on the controller. The controller sends traps to Cisco Prime Infrastructure after the following events:

• If an unknown access point moves to the Friendly state for the first time, the controller sends a trap to Cisco Prime Infrastructure only if the rogue state is Alert. It does not send a trap if the rogue state is Internal or External.

• If a rogue entry is removed after the timeout expires, the controller sends a trap to Cisco Prime Infrastructure for rogue access points categorized as Malicious (Alert, Threat) or Unclassified (Alert). The controller does not remove rogue entries with the following rogue states: Contained, Contained Pending, Internal, and External.

## How to Configure Rogue Detection

### Configuring Rogue Detection (CLI)

#### SUMMARY STEPS

1. configure terminal
2. wireless wps rogue detection min-rssi rssi in dBm
3. wireless wps rogue detection min-transient-time time in seconds
4. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2** wireless wps rogue detection min-rssi rssi in dBm

**Example:**

Switch(config)# wireless wps rogue detection min-rssi 100

Specify the minimum RSSI value that rogues should have for APs to detect and for rogue entry to be created in the switch.

Valid range for the rssi in dBm parameter is –128 dBm to -70 dBm, and the default value is -128 dBm.

**Note** This feature is applicable to all the AP modes. There can be many rogues with very weak RSSI values that do not provide any valuable information in rogue analysis. Therefore, you can use this option to filter rogues by specifying the minimum RSSI value at which APs should detect rogues.

**Step 3** wireless wps rogue detection min-transient-time time in seconds

**Example:**

Switch(config)# wireless wps rogue detection min-transient-time

Specify the time interval at which rogues have to be consistently scanned for by APs after the first time the rogues are scanned.

Valid range for the time in sec parameter is 120 seconds to 1800 seconds, and the default value is 0.
This feature is applicable to APs that are in monitor mode only.

Using the transient interval values, you can control the time interval at which APs should scan for rogues. APs can also filter the rogues based on their transient interval values.

This feature has the following advantages:

- Rogue reports from APs to the controller are shorter
- Transient rogue entries are avoided in the controller
- Unnecessary memory allocation for transient rogues are avoided

**Note**

Step 4

```
end
```

Example:

```
Switch(config)# end
```

Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

---

## Configuring Rogue Detection (GUI)

### Step 1

Make sure that rogue detection is enabled on the corresponding access points. Rogue detection is enabled by default for all access points joined to the controller (except for OfficeExtend access points). However, you can enable or disable rogue detection for individual access point by choosing **Configuration > Wireless > Access Policies > All APs** to open Edit AP page, selecting or unselecting the Rogue Detector check box in the General area of the Edit AP page.

### Step 2

Choose **Configuration > Security > Wireless Protection Policies > Rogue Policies**.

The Rogue Policies page is displayed.

### Step 3

Choose one of the following options from the Rogue Location Discovery Protocol drop-down list:

- **Disable**—Disables RLDP on all the access points. This is the default value.
- **All APs**—Enables RLDP on all the access points.
- **Monitor Mode APs**—Enables RLDP only on the access points in the monitor mode.

### Step 4

In the Expiration Timeout for Rogue AP and Rogue Client Entries text box, enter the number of seconds after which the rogue access point and client entries expire and are removed from the list. The valid range is 240 to 3600 seconds, and the default value is 1200 seconds.

**Note**

If a rogue access point or client entry times out, it is removed from the controller only if its rogue state is Alert or Threat for any classification type.

### Step 5

To use the AAA server or local database to validate if rogue clients are valid clients, select the **Validate Rogue Clients Against AAA** check box. By default, the check box is unselected.
Step 6  If necessary, select the **Detect and Report Adhoc Networks** check box to enable adhoc rogue detection and reporting. By default, the check box is selected.

Step 7  In the **Rogue Detection Report Interval** text box, enter the time interval, in seconds, at which APs should send the rogue detection report to the controller. The valid range is 10 seconds to 300 seconds, and the default value is 10 seconds.

Step 8  If you want the controller to automatically contain certain rogue devices, enable the following parameters. By default, these parameters are in disabled state.

**Caution**  When you select any of the Auto Contain parameters and click **Apply**, the following message is displayed: “Using this feature may have legal consequences. Do you want to continue?” The 2.4-GHz and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party’s network could have legal consequences.

- **Auto Containment Level**—Set the auto containment level. By default, the auto containment level is set to 1.
- **Auto Containment only for Monitor mode APs**—Configure the monitor mode access points for auto-containment.
- **Rogue on Wire**—Configure the auto containment of rogues that are detected on the wired network.
- **Using Our SSID**—Configure the auto containment of rogues that are advertising your network’s SSID. If you leave this parameter unselected, the controller only generates an alarm when such a rogue is detected.
- **Valid Client on Rogue AP**—Configure the auto containment of a rogue access point to which trusted clients are associated. If you leave this parameter unselected, the controller only generates an alarm when such a rogue is detected.
- **Adhoc Rogue AP**—Configure the auto containment of adhoc networks detected by the controller. If you leave this parameter unselected, the controller only generates an alarm when such a network is detected.

Step 9  Click **Apply**.

Step 10  Click **Save Configuration**.

---

**Monitoring Rogue Detection**

This section describes the new command for rogue detection.

The following command can be used to monitor rogue detection on the switch.

**Table 145: Monitoring Rogue Detection Command**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wireless wps rogue ap summary</code></td>
<td>Displays a list of all rogue access points detected by the switch.</td>
</tr>
<tr>
<td><code>show wireless wps rogue client detailed client-mac</code></td>
<td>Displays detailed information for a specific rogue client.</td>
</tr>
</tbody>
</table>
Examples: Rogue Detection Configuration

This example shows how to configure the minimum RSSI that a detected rogue AP needs to be at, to have an entry created at the switch:

Switch# configure terminal
Switch(config)# wireless wps rogue detection min-rssi -100
Switch(config)# end
Switch# show wireless wps rogue client detailed/show wireless wps rogue ap summary

This example shows how to configure the classification interval:

Switch# configure terminal
Switch(config)# wireless wps rogue detection min-transient-time 500
Switch(config)# end
Switch# show wireless wps rogue client detailed/show wireless wps rogue ap summary

- Examples: Classifying Rogue Access Points, on page 1690
- Additional References for Classifying Rogue Access Points, on page 1690
- Feature History and Information For Classifying Rogue Access Points, on page 1691

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Classifying Rogue Access Points

The controller software enables you to create rules that can organize and display rogue access points as Friendly, Malicious, or Unclassified.

By default, none of the classification rules are enabled. Therefore, all unknown access points are categorized as Unclassified. When you create a rule, configure conditions for it, and enable the rule, the unclassified access points are reclassified. Whenever you change a rule, it is applied to all access points (friendly, malicious, and unclassified) in the Alert state only.

Note

Rule-based rogue classification does not apply to ad hoc rogues and rogue clients.
You can configure up to 64 rogue classification rules per controller. When the controller receives a rogue report from one of its managed access points, it responds as follows:

1. The controller verifies that the unknown access point is in the friendly MAC address list. If it is, the controller classifies the access point as Friendly.
2. If the unknown access point is not in the friendly MAC address list, the controller starts applying rogue classification rules.
3. If the rogue is already classified as Malicious, Alert or Friendly, Internal or External, the controller does not reclassify it automatically. If the rogue is classified differently, the controller reclassifies it automatically only if the rogue is in the Alert state.
4. The controller applies the first rule based on priority. If the rogue access point matches the criteria specified by the rule, the controller classifies the rogue according to the classification type configured for the rule.
5. If the rogue access point does not match any of the configured rules, the controller classifies the rogue as Unclassified.
6. The controller repeats the previous steps for all rogue access points.
7. If RLDP determines that the rogue access point is on the network, the controller marks the rogue state as Threat and classifies it as Malicious automatically, even if no rules are configured. You can then manually contain the rogue (unless you have configured RLDP to automatically contain the rogue), which would change the rogue state to Contained. If the rogue access point is not on the network, the controller marks the rogue state as Alert, and you can manually contain the rogue.
8. If desired, you can manually move the access point to a different classification type and rogue state.

**Table 146: Classification Mapping**

<table>
<thead>
<tr>
<th>Rule-Based Classification Type</th>
<th>Rogue States</th>
</tr>
</thead>
</table>
| Friendly                      | • Internal—If the unknown access point is inside the network and poses no threat to WLAN security, you would manually configure it as Friendly, Internal. An example is the access points in your lab network.  
                                     • External—If the unknown access point is outside the network and poses no threat to WLAN security, you would manually configure it as Friendly, External. An example is an access point that belongs to a neighboring coffee shop.  
                                     • Alert—The unknown access point is moved to Alert if it is not in the neighbor list or in the user-configured friendly MAC list. |
### Rule-Based Classification Type

<table>
<thead>
<tr>
<th>Rogue States</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Malicious</strong></td>
</tr>
<tr>
<td>• Alert—The unknown access point is moved to Alert if it is not in the neighbor list or in the user-configured friendly MAC list.</td>
</tr>
<tr>
<td>• Threat—The unknown access point is found to be on the network and poses a threat to WLAN security.</td>
</tr>
<tr>
<td>• Contained—The unknown access point is contained.</td>
</tr>
<tr>
<td>• Contained Pending—The unknown access point is marked Contained, but the action is delayed due to unavailable resources.</td>
</tr>
<tr>
<td><strong>Unclassified</strong></td>
</tr>
<tr>
<td>• Pending—On first detection, the unknown access point is put in the Pending state for 3 minutes. During this time, the managed access points determine if the unknown access point is a neighbor access point.</td>
</tr>
<tr>
<td>• Alert—The unknown access point is moved to Alert if it is not in the neighbor list or in the user-configured friendly MAC list.</td>
</tr>
<tr>
<td>• Contained—The unknown access point is contained.</td>
</tr>
<tr>
<td>• Contained Pending—The unknown access point is marked Contained, but the action is delayed due to unavailable resources.</td>
</tr>
</tbody>
</table>

The classification and state of the rogue access points are configured as follows:

- From Known to Friendly, Internal
- From Acknowledged to Friendly, External
- From Contained to Malicious, Contained

As mentioned previously, the controller can automatically change the classification type and rogue state of an unknown access point based on user-defined rules, or you can manually move the unknown access point to a different classification type and rogue state.

### Table 147: Allowable Classification Type and Rogue State Transitions

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>Friendly (Internal, External, Alert)</td>
<td>Malicious (Alert)</td>
</tr>
<tr>
<td>Friendly (Internal, External, Alert)</td>
<td>Unclassified (Alert)</td>
</tr>
<tr>
<td>Friendly (Alert)</td>
<td>Friendly (Internal, External)</td>
</tr>
<tr>
<td>Malicious (Alert, Threat)</td>
<td>Friendly (Internal, External)</td>
</tr>
<tr>
<td>Malicious (Contained, Contained Pending)</td>
<td>Malicious (Alert)</td>
</tr>
<tr>
<td>Unclassified (Alert, Threat)</td>
<td>Friendly (Internal, External)</td>
</tr>
<tr>
<td>Unclassified (Contained, Contained Pending)</td>
<td>Unclassified (Alert)</td>
</tr>
<tr>
<td>Unclassified (Alert)</td>
<td>Malicious (Alert)</td>
</tr>
</tbody>
</table>
If the rogue state is Contained, you have to uncontain the rogue access point before you can change the classification type. If you want to move a rogue access point from Malicious to Unclassified, you must delete the access point and allow the controller to reclassify it.

Restrictions for Classifying Rogue Access Points

The following rules apply to this feature:

- Classifying Custom type rogues is tied to rogue rules. Therefore, it is not possible to manually classify a rogue as Custom. Custom class change can occur only using rogue rules.

- There are traps that are sent for containment by rule and for every 30 minutes for rogue classification change. For custom classification, the first trap does not contain the severity score because the trap has existed before the custom classification. The severity score is obtained from the subsequent trap that is generated after 30 minutes if the rogue is classified.

- Rogue rules are applied on every incoming new rogue report in the controller in the order of their priority.

- Once a rogue satisfies a higher priority rule and classified, it does not move down the priority list for the same report.

- Previously classified rogue gets re-classified on every new rogue report with the following restrictions:
  - Rogues which are classified as friendly by rule and whose state is set to ALERT, go through re-classification on receiving the new rogue report.
  - If a rogue is classified as friendly by the administrator manually, then the state is INTERNAL and it does not get re-classified on successive rogue reports.
  - If rogue is classified as malicious, irrespective of the state it does not get re-classified on subsequent rogue reports.

- Transition of the rogue's state from friendly to malicious is possible by multiple rogue rules if some attribute is missing in new rogue report.

- Transition of the rogue's state from malicious to any other classification is not possible by any rogue rule.

- When service set identifiers (SSIDs) are defined as part of a rogue rule, and details of the rogue rule are displayed using the `show wireless wps rogue rule detailed` command, the output differs in Cisco IOS XE Release 3.6E and prior releases and Cisco IOS XE Denali 16.1.1 and later releases.

The following is sample output from the `show wireless wps rogue rule detailed` command in Cisco IOS XE Release 3.6E and prior releases:

```
Switch# show wireless wps rogue rule detailed test
Priority : 1
Rule Name : wpstest
State : Disabled
Type : Pending
Match Operation : Any
Hit Count : 0
Total Conditions : 1
Condition :
type : Ssid
SSID Count : 2 ! SSID count differs.
```
SSID 1 : ssid1
SSID 2 : ssid2

The following is sample output from the `show wireless wps rogue rule detailed` command in Cisco IOS XE Denali 16.1.1 and later releases:

```
Switch# show wireless wps rogue rule detailed test

Priority : 1
Rule Name : wpstest
State : Disabled
Type : Pending
Match Operation : Any
Hit Count : 0
Total Conditions : 1
Condition :
  type : Ssid
SSID Count : 2
  SSID : ssid1
  SSID : ssid2
```

---

**How to Classify Rogue Access Points**

**Configuring Rogue Classification Rules (CLI)**

**SUMMARY STEPS**

1. configure terminal
2. wireless wps rogue rule rule-name priority priority
3. classify {friendly | malicious}
4. condition {client-count | duration | encryption | infrastructure | rssi | ssid}
5. match {all | any}
6. default
7. exit
8. shutdown
9. end
10. configure terminal
11. wireless wps rogue rule shutdown
12. end

**DETAILED STEPS**

<table>
<thead>
<tr>

### Configuring Rogue Classification Rules (CLI)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| `wireless wps rogue rule rule-name priority priority` | Creates or enables a rule. While creating a rule, you must enter priority for the rule. | Switch(config)# wireless wps rogue rule rule_3 priority 3  
Switch(config-rule)# |
| **Step 3**         |         |  |
| `classify {friendly | malicious}` | Classifies a rule. | Switch(config)# wireless wps rogue rule rule_3 priority 3  
Switch(config-rule)# classify friendly |
| **Step 4**         |         |  |
| `condition {client-count | duration | encryption | infrastructure | rssi | ssid}` | Specifies to add the following conditions to a rule that the rogue access point must meet. | Switch(config)# wireless wps rogue rule rule_3 priority 3  
Switch(config-rule)# condition client-count 5 |

- **client-count**—Requires that a minimum number of clients be associated to the rogue access point. For example, if the number of clients associated to the rogue access point is greater than or equal to the configured value, then the access point could be classified as malicious. If you choose this option, enter the minimum number of clients to be associated to the rogue access point for the `condition_value` parameter. The valid range is 1 to 10 (inclusive), and the default value is 0.

- **duration**—Requires that the rogue access point be detected for a minimum period of time. If you choose this option, enter a value for the minimum detection period for the `condition_value` parameter. The valid range is 0 to 3600 seconds (inclusive), and the default value is 0 seconds.

- **encryption**—Requires that the advertised WLAN does not have encryption enabled.

- **infrastructure**—Requires the SSID to be known to the controller.

- **rssi**—Requires that the rogue access point have a minimum RSSI value. For example, if the rogue access point has an RSSI that is greater than the configured value, then the access point could be classified as malicious. If you choose this option, enter the minimum RSSI value for the `condition_value` parameter. The valid range is –95 to –50 dBm (inclusive), and the default value is 0 dBm.

</table>
Configuring Rogue Classification Rules (GUI)

**Step 1** Choose Security > Wireless Protection Policies > Rogue Policies > Rogue Rules to open the Rogue Rules page. Any rules that have already been created are listed in priority order. The name, type, and status of each rule is provided.

*Note* If you ever want to delete a rule, hover your mouse cursor over the blue drop-down arrow for that rule and click *Remove*.

**Step 2** Create a new rule as follows:

a) Click *Add Rule*. An Add Rule section appears at the top of the page.

b) In the *Rule Name* text box, enter a name for the new rule. Ensure that the name does not contain any spaces.

c) From the *Rule Type* drop-down list, choose from the following options to classify rogue access points matching this rule as friendly or malicious:
   
   - Friendly
   - Malicious

   d) Click *Add* to add this rule to the list of existing rules, or click *Cancel* to discard this new rule.

**Step 3** Edit a rule as follows:

a) Click the name of the rule that you want to edit. The Rogue Rule > Edit page appears.

b) From the Type drop-down list, choose from the following options to classify rogue access points matching this rule:
   
   - Friendly
   - Malicious

   c) From the Match Operation text box, choose one of the following:
      
      - *All*—If this rule is enabled, a detected rogue access point must meet all of the conditions specified by the rule in order for the rule to be matched and the rogue to adopt the classification type of the rule.
      - *Any*—If this rule is enabled, a detected rogue access point must meet any of the conditions specified by the rule in order for the rule to be matched and the rogue to adopt the classification type of the rule. This is the default value.

   d) To enable this rule, select the *Enable Rule* check box. The default value is unselected.

e) To disable this particular rule, unselect the *Enable Rule* check box.

  *Note* You cannot disable all the rogue rule in one shot from GUI but you can disable all the rogue rules from CLI using the wireless wps rogue rule shutdown command.

f) From the Add Condition drop-down list, choose one or more of the following conditions that the rogue access point must meet and click *Add Condition*.

   - *SSID*—Requires that the rogue access point have a specific user-configured SSID. If you choose this option, enter the SSID in the User Configured SSID text box, and click *Add SSID*. The user-configured SSIDs are added and listed.
Note To delete an SSID, highlight the SSID and click Remove. The SSID applied on a WLAN cannot be applied for the rogue rule.

- **RSSI**—Requires that the rogue access point have a minimum Received Signal Strength Indication (RSSI) value. For example, if the rogue access point has an RSSI that is greater than the configured value, then the access point could be classified as malicious. If you choose this option, enter the minimum RSSI value in the Minimum RSSI text box. The valid range is −95 to −50 dBm (inclusive), and the default value is 0 dBm.

- **Duration**—Requires that the rogue access point be detected for a minimum period of time. If you choose this option, enter a value for the minimum detection period in the Time Duration text box. The valid range is 0 to 3600 seconds (inclusive), and the default value is 0 seconds.

- **Client Count**—Requires that a minimum number of clients be associated to the rogue access point. For example, if the number of clients associated to the rogue access point is greater than or equal to the configured value, then the access point could be classified as malicious. If you choose this option, enter the minimum number of clients to be associated to the rogue access point in the Minimum Number of Rogue Clients text box. The valid range is 1 to 10 (inclusive), and the default value is 0.

- **No Encryption**—Requires that the rogue access point’s advertised WLAN does not have encryption enabled. If a rogue access point has encryption disabled, it is likely that more clients will try to associate to it. No further configuration is required for this option.

**Note** Cisco Prime Infrastructure refers to this option as “Open Authentication.”

- **Managed SSID**—Requires that the rogue access point’s managed SSID (the SSID configured for the WLAN) be known to the controller. No further configuration is required for this option.

**Note** The SSID and Managed SSID conditions cannot be used with the All operation because these two SSID lists are mutually exclusive. If you define a rule with Match All and have these two conditions configured, the rogue access points are never classified as friendly or malicious because one of the conditions can never be met.

You can add up to six conditions per rule. When you add a condition, it appears under the Conditions section.

**Note** If you ever want to delete a condition from this rule, click Remove near the condition.

- **User configured SSID**—Requires that the rogue access point have a substring of the specific user-configured SSID. The controller searches the substring in the same occurrence pattern and returns a match if the substring is found in the whole string of an SSID.

**g)** Click Apply.

**Step 4** If you want to change the priority in which rogue classification rules are applied, follow these steps:

a. Click **Change Priority** to access the Rogue Rules > Priority page.

   The rogue rules are listed in priority order in the Change Rules Priority text box.

b. Click on a specific rule for which you want to change the priority, and click **Up** to raise its priority in the list or **Down** to lower its priority in the list.

**Note** You can change priority only for the disabled rule. You cannot change priority only for the enabled rule.
Viewing and Classifying Rogue Devices (GUI)

**Step 1**  
Choose **Monitor > Rogues**.

**Step 2**  
Choose the following options to view the different types of rogue access points detected by the controller:

- **Friendly APs**
- **Malicious APs**
- **Unclassified APs**

The respective rogue APs pages provide the following information: the MAC address of the rogue access point, the number of radios that detected the rogue access point, the number of clients connected to the rogue access point, the current status of the rogue access point, and last heard.

**Step 3**  
Get more details about a rogue access point by clicking the MAC address of the access point. The Rogue AP Detail page appears.

This page provides the following information: the MAC address of the rogue device, the type of rogue device (such as an access point), whether the rogue device is on the wired network, the dates and times when the rogue device was first and last reported, and the current status of the device.

The Class Type text box shows the current classification for this rogue access point:

- **Friendly**—An unknown access point that matches the user-defined friendly rules or an existing known and acknowledged rogue access point. Friendly access points cannot be contained.

- **Malicious**—An unknown access point that matches the user-defined malicious rules or is moved manually by the user from the Friendly or Unclassified classification type.

  **Note**  
  Once an access point is classified as Malicious, you cannot apply rules to it in the future, and it cannot be moved to another classification type. If you want to move a malicious access point to the Unclassified classification type, you must delete the access point and allow the controller to reclassify it.

- **Unclassified**—An unknown access point that does not match the user-defined friendly or malicious rules. An unclassified access point can be contained. It can also be moved to the Friendly or Malicious classification type automatically in accordance with user-defined rules or manually by the user.

**Step 4**  
If you want to change the classification of this device, choose a different classification from the Class Type drop-down list.

  **Note**  
  A rogue access point cannot be moved to another class if its current state is Contain.

**Step 5**  
From the Update Status drop-down list, choose one of the following options to specify how the controller should respond to this rogue access point:

- **Internal**—The controller trusts this rogue access point. This option is available if the Class Type is set to Friendly.
• **External**—The controller acknowledges the presence of this rogue access point. This option is available if the Class Type is set to Friendly.

• **Contain**—The controller contains the offending device so that its signals no longer interfere with authorized clients. This option is available if the Class Type is set to Malicious or Unclassified.

• **Alert**—The controller forwards an immediate alert to the system administrator for further action. This option is available if the Class Type is set to Malicious or Unclassified.

The bottom of the page provides information on both the access points that detected this rogue access point and any clients that are associated to it. To see more details for any of the clients, click **Edit** to open the Rogue Client Detail page.

**Step 6**
Click **Apply**.

**Step 7**
Click **Save Configuration**.

**Step 8**
See any adhoc rogues detected by the controller by choosing **Adhoc Rogues**. The Adhoc Rogues page appears.

This page shows the following information: the MAC address, BSSID, and SSID of the adhoc rogue, the number of radios that detected the adhoc rogue, and the current status of the adhoc rogue.

**Step 9**
Obtain more details about an adhoc rogue by clicking the MAC address of the rogue. The Adhoc Rogue Detail page appears.

This page provides the following information: the MAC address and BSSID of the adhoc rogue, the dates and times when the rogue was first and last reported, and the current status of the rogue.

**Step 10**
From the Update Status drop-down list, choose one of the following options to specify how the controller should respond to this adhoc rogue:

• **Contain**—The controller contains the offending device so that its signals no longer interfere with authorized clients.

• **Alert**—The controller forwards an immediate alert to the system administrator for further action.

• **Internal**—The controller trusts this rogue access point.

• **External**—The controller acknowledges the presence of this rogue access point.

**Step 11**
From the Maximum Number of APs to Contain the Rogue drop-down list, choose one of the following options to specify the maximum number of access points used to contain this adhoc rogue: 1, 2, 3, or 4.

The bottom of the page provides information on the access points that detected this adhoc rogue.

**Step 12**
Click **Apply**.

**Step 13**
Click **Save Configuration**.

**Step 14**
View any access points that have been configured to be ignored by choosing **Rogue AP Ignore-List**. The Rogue AP Ignore-List page appears.

This page shows the MAC addresses of any access points that are configured to be ignored. The rogue-ignore list contains a list of any autonomous access points that have been manually added to Cisco Prime Infrastructure maps by the users. The controller regards these autonomous access points as rogues even though the Prime Infrastructure is managing them. The rogue-ignore list allows the controller to ignore these access points. The list is updated as follows:

• When the controller receives a rogue report, it checks to see if the unknown access point is in the rogue-ignore access point list.
• If the unknown access point is in the rogue-ignore list, the controller ignores this access point and continues to process other rogue access points.

• If the unknown access point is not in the rogue-ignore list, the controller sends a trap to the Prime Infrastructure. If the Prime Infrastructure finds this access point in its autonomous access point list, the Prime Infrastructure sends a command to the controller to add this access point to the rogue-ignore list. This access point is then ignored in future rogue reports.

• If a user removes an autonomous access point from the Prime Infrastructure, the Prime Infrastructure sends a command to the controller to remove this access point from the rogue-ignore list.

Examples: Classifying Rogue Access Points

This example shows how to create rule that can organize and display rogue access points as Friendly:

```
Switch# configure terminal
Switch(config)# wireless wps rogue rule ap1 priority 1
Switch(config-rule)# classify friendly
Switch(config-rule)# end
```

This example shows how to apply condition that the rogue access point must meet:

```
Switch# configure terminal
Switch(config)# wireless wps rogue rule ap1 priority 1
Switch(config-rule)# condition client-count 5
Switch(config-rule)# condition duration 1000
Switch(config-rule)# end
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About wIPS

The Cisco Adaptive wireless Intrusion Prevention System (wIPS) is an advanced approach to wireless threat detection and performance management. It combines network traffic analysis, network device and topology information, signature-based techniques, and anomaly detection to deliver highly accurate and complete wireless threat prevention. With a fully infrastructure-integrated solution, you can continually monitor wireless traffic on both the wired and wireless networks and use that network intelligence to analyze attacks from many sources to more accurately pinpoint and proactively prevent attacks rather than waiting until damage or exposure has occurred.

The Cisco Adaptive wIPS is enabled by the Cisco 3300 Series Mobility Services Engine (MSE), which centralizes the processing of intelligence collected by the continuous monitoring of Cisco Aironet access points. With Cisco Adaptive wIPS functionalities and Cisco Prime Infrastructure integration into the MSE, the wIPS service can configure, monitor, and report wIPS policies and alarms.
If your wIPS deployment consists of a controller, access point, and MSE, you must set all the three entities to the UTC time zone.

The Cisco Adaptive wIPS is not configured on the controller. Instead, the Prime Infrastructure forwards the profile configuration to the wIPS service, which forwards the profile to the controller. The profile is stored in flash memory on the controller and sent to access points when they join the controller. When an access point disassociates and joins another controller, it receives the wIPS profile from the new controller.

Local mode access points with a subset of wIPS capabilities is referred to as Enhanced Local Mode access point or ELM AP. You can configure an access point to work in wIPS mode if the access point is in any of the following modes:

- Monitor
- Local

The regular local mode access point is extended with a subset of Wireless Intrusion Prevention System (wIPS) capabilities. This feature enables you to deploy your access points to provide protection without needing a separate overlay network.

wIPS ELM has limited capability of detecting off-channel alarms. The access point periodically goes off-channel, and monitors the non-serving channels for a short duration, and triggers alarms if any attack is detected on the channel. But the off-channel alarm detection is best effort and it takes longer time to detect attacks and trigger alarms, which might cause the ELM AP intermittently detect an alarm and clear it because it is not visible. Access points in any of the above modes can periodically send alarms based on the policy profile to the wIPS service through the controller. The wIPS service stores and processes the alarms and generates SNMP traps. The Prime Infrastructure configures its IP address as a trap destination to receive SNMP traps from the MSE.

This table lists all the SNMP trap controls and their respective traps. When a trap control is enabled, all the traps of the trap control are also enabled.

The controller uses only SNMPv2 for SNMP trap transmission.

</table>
The following are the trap description for the traps mentioned in the SNMP Trap Controls and their respective Traps table:

- **General Traps**
  - SNMP Authentication—The SNMPv2 entity has received a protocol message that is not properly authenticated.

  **Note** When a user who is configured in SNMP V3 mode tries to access the controller with an incorrect password, the authentication fails and a failure message is displayed. However, no trap logs are generated for the authentication failure.

- **Link (Port) Up/Down**—Link changes status from up or down.
- **Link (Port) Up/Down**—Link changes status from up or down.
- **Multiple Users**—Two users log on with the same ID.
- **Rogue AP**—Whenever a rogue access point is detected, this trap is sent with its MAC address; when a rogue access point that was detected earlier no longer exists, this trap is sent.
- **Config Save**—Notification sent when the controller configuration is modified.

- **Cisco AP Traps**
  - **AP Register**—Notification sent when an access point associates or disassociates with the controller.
  - **AP Interface Up/Down**—Notification sent when an access point interface (802.11X) status goes up or down.

- **Client Related Traps**
  - **802.11 Association**—Associate notification that is sent when the client sends an association frame.
  - **802.11 Disassociation**—Disassociate notification that is sent when the client sends a disassociation frame.
• **802.11 Deauthentication**—Deauthentication notification that is sent when the client sends a deauthentication frame.
• **802.11 Failed Authentication**—Authenticate failure notification that is sent when the client sends an authentication frame with a status code other than successful.
• **802.11 Failed Association**—Associate failure notification that is sent when the client sends an association frame with a status code other than successful.
• **Exclusion**—Associate failure notification that is sent when a client is Exclusion Listed (blacklisted).
• **Authentication**—Authentication notification that is sent when a client is successfully authenticated.
• **Max Clients Limit Reached**—Notification that is sent when the maximum number of clients, defined in the Threshold field, have associated with the controller.

• **NAC Alert**—Alert that is sent when a client joins an SNMP NAC-enabled WLAN.

This notification is generated when a client on NAC-enabled SSIDs complete Layer2 authentication to inform about the client's presence to the NAC appliance. `cldcClientWlanProfileName` represents the profile name of the WLAN that the 802.11 wireless client is connected to, `cldcClientIPAddress` represents the unique IP address of the client, `cldcApMacAddress` represents the MAC address of the AP to which the client is associated, `cldcClientQuarantineVLAN` represents the quarantine VLAN for the client, `cldcClientAccessVLAN` represents the access VLAN for the client.

• **Association with Stats**—Associate notification that is sent with data statistics when a client associates with the controller or roams. The data statistics include transmitted and received bytes and packets.

• **Disassociation with Stats**—Disassociate notification that is sent with data statistics when a client disassociates from the controller. The data statistics include transmitted and received bytes and packets, SSID, and session ID.

---

**Note**
When you downgrade to Release 7.4 from a higher release, if a trap that was not supported in Release 7.4 (for example, NAC Alert trap) is enabled before the downgrade, all traps are disabled. After the downgrade, you must enable all the traps that were enabled before the downgrade. We recommend that you disable the new traps before the downgrade so that all the other traps are not disabled.

---

• **Security Traps**

  • **User Auth Failure**—This trap is to inform that a client RADIUS Authentication failure has occurred.
  • **RADIUS Server No Response**—This trap is to indicate that no RADIUS server(s) are responding to authentication requests sent by the RADIUS client.
  • **WEP Decrypt Error**—Notification sent when the controller detects a WEP decrypting error.
  • **Rouge AP**—Whenever a rogue access point is detected, this trap is sent with its MAC address; when a rogue access point that was detected earlier no longer exists, this trap is sent.
  • **SNMP Authentication**—The SNMPv2 entity has received a protocol message that is not properly authenticated.

---

**Note**
When a user who is configured in SNMP V3 mode tries to access the controller with an incorrect password, the authentication fails and a failure message is displayed. However, no trap logs are generated for the authentication failure.
• Multiple Users—Two users log on with the same ID.

• SNMP Authentication
  • Load Profile—Notification sent when the Load Profile state changes between PASS and FAIL.
  • Noise Profile—Notification sent when the Noise Profile state changes between PASS and FAIL.
  • Interference Profile—Notification sent when the Interference Profile state changes between PASS and FAIL.
  • Coverage Profile—Notification sent when the Coverage Profile state changes between PASS and FAIL.

• Auto RF Profile Traps
  • Load Profile—Notification sent when the Load Profile state changes between PASS and FAIL.
  • Noise Profile—Notification sent when the Noise Profile state changes between PASS and FAIL.
  • Interference Profile—Notification sent when the Interference Profile state changes between PASS and FAIL.
  • Coverage Profile—Notification sent when the Coverage Profile state changes between PASS and FAIL.

• Auto RF Update Traps
  • Channel Update—Notification sent when the access point dynamic channel algorithm is updated.
  • Tx Power Update—Notification sent when the access point dynamic transmit power algorithm is updated.

• Mesh Traps
  • Child Excluded Parent—Notification send when a defined number of failed association to the controller occurs through a parent mesh node.
  • Notification sent when a child mesh node exceeds the threshold limit of the number of discovery response timeouts. The child mesh node does not try to associate an excluded parent mesh node for the interval defined. The child mesh node remembers the excluded parent MAC address when it joins the network, it informs the controller.
  • Parent Change—Notification is sent by the agent when a child mesh node changes its parent. The child mesh node remembers its previous parent and it informs the controller about the change of its parent when it rejoin the network.
  • Child Moved—Notification sent when a parent mesh node loses connection with its child mesh node.
  • Excessive Parent Change—Notification sent when the child mesh node changes its parent frequently. Each mesh node keeps a count of the number of parent changes in a fixed time. If it exceeds the defined threshold then child mesh node informs the controller.
  • Excessive Children—Notification sent when the child count exceeds for a RAP and MAP.
  • Poor SNR—Notification sent when the child mesh node detects a lower SNR on a backhaul link. For the other trap, a notification is sent to clear a notification when the child mesh node detects an SNR on a backhaul link that is higher then the object defined by 'clMeshSNRThresholdAbate'.
  • Console Login—Notification is sent by the agent when login on MAP console is successful or failure after three attempts.
  • Default Bridge Group Name—Notification sent when MAP mesh node joins parent using 'default' bridge group name.
The remaining traps do not have trap controls. These traps are not generated too frequently and do not require any trap control. Any other trap that is generated by the controller cannot be turned off.

In all of the above cases, the controller functions solely as a forwarding device.

Configuring wIPS on an Access Point (GUI)

Step 1  Choose Configuration > Wireless > Access Points > All APs. The All APs page appears with a list of all access points that are associated with the switch.

Step 2  Click the name of the access point for which you want to configure wIPS. The AP > Edit page appears.

Step 3  In the General area, set the AP Mode parameter. To configure an access point for wIPS, you must choose one of the following modes from the AP Mode drop-down list:

- Local
- Monitor

Step 4  Set the AP Sub Mode to wIPS by choosing wIPS from the AP Sub Mode drop-down list.

Step 5  Click Apply.

Step 6  Click Save.

Monitoring wIPS Information

This section describes the new command for wIPS. The following command can be used to monitor wIPS configured on the access point.

Table 149: Monitoring wIPS Command

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show wireless wps wips summary</td>
<td>Displays the wIPS configuration on the access point.</td>
</tr>
<tr>
<td>show wireless wps wips statistics</td>
<td>Displays the current state of wIPS configuration.</td>
</tr>
</tbody>
</table>

Examples: wIPS Configuration

This example shows how to configure wIPS on AP1:

```
Switch# ap name ap1 mode local submode wips
Switch# end
Switch# show wireless wps wips summary
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the <TBD>.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Intrusion Detection System

The Cisco Intrusion Detection System/Intrusion Prevention System (CIDS/CIPS) instructs switches to block certain clients from accessing the wireless network when attacks involving these clients are detected at Layer 3 through Layer 7. This system offers significant network protection by helping to detect, classify, and stop threats including worms, spyware/adware, network viruses, and application abuse. Two methods are available to detect potential attacks:

- IDS sensors
- IDS signatures

IDS sensors can be configured to detect various types of IP-level attacks in the network. When the sensors identify an attack, they can alert the switch to shun the offending client. When a new IDS sensor is added, the IDS sensor should be registered with the switch so that the switch can query the sensor to get the list of shunned clients.

When an IDS sensor detects a suspicious client, it alerts the switch to shun this client. The shun entry is distributed to all switches within the same mobility group. If the client to be shunned is currently joined to a switch in this mobility group, the anchor switch adds this client to the dynamic exclusion list, and the foreign
switch removes the client. The next time that the client tries to connect to a switch, the anchor switch rejects the handoff and informs the foreign switch that the client is being excluded.

# How to Configure Intrusion Detection System

## Configuring IDS Sensors

### SUMMARY STEPS

1. configure terminal
2. wireless wps cids-sensor index [ip-address ip-addr username username password password_type password]
3. wireless wps cids-sensor index
4. [default exit fingerprint interval no port shutdown]
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal&lt;br&gt;Example: Switch# configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| **Step 2** | wireless wps cids-sensor index [ip-address ip-addr username username password password_type password]<br>Example: Switch(config)# wireless wps cids-sensor 2 231.1.1.1 admin pwd123 | Configures the IDS sensors that holds and internal index number. The index parameter determines the sequence in which the controller consults the IDS sensors. The controller supports up to five IDS sensors.  
  - ip-address– [optional] Provide the IP address for the IDS.  
  - username– [optional] Configures the username for the IDS.  
  - password– [optional] Configures the password for the respective username. |
| **Step 3** | wireless wps cids-sensor index<br>Example: Switch(config)# wireless wps cids-sensor 1 | Enters the IDS configuration submode. |
| **Step 4** | [default exit fingerprint interval no port shutdown]<br>Example: Switch(config-cids-index)# default | Configures various IDS parameters.  
  - default– [optional] Sets a command to its default.  
  - exit– [optional] Exits the submode. |
### Purpose

- **fingerprint** – [optional] Configure the sensor's TLS fingerprint.
- **interval** – [optional] Configure the sensor's query interval. The range is between 10-3600 seconds.
- **no** – [optional] Negates a command or set its defaults.
- **port** – [optional] Configure the sensor's port number.
- **shutdown** – [optional] Shuts down the intrusion detection sensor.

### Step 5

**end**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.

---

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Switch Stacks

All the switches in the switch stack need to be running the same license level as the active switch. For information about license levels, see the System Management Configuration Guide (Catalyst 3650 Switches).

All switches in the switch stack need to be running compatible software versions.

A StackWise adapter must be installed in the stacking port to enable stacking. For switch stack hardware considerations, see the Catalyst 3650 Switch Hardware Installation Guide.

Restrictions for Switch Stacks

The following are restrictions for your switch stack configuration:
• Switch stacks running the LAN Base license level do not support Layer 3 features.
• A switch stack can have up to nine stacking-capable switches connected through their StackWise-160 ports.
• You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

  Supported Features in a Switch Stack, on page 1710

Information About Switch Stacks

Switch Stack Overview

A switch stack can have up to nine stacking-capable switches connected through their StackWise-160 ports. The stack members work together as a unified system. Layer 2 and Layer 3 protocols present the entire switch stack as a single entity to the network.

A switch stack always has one active switch and one standby switch. If the active switch becomes unavailable, the standby switch assumes the role of the active switch, and continues to keep the switch operational. The active switch controls the operation of the switch stack, and is the single point of stack-wide management. From the active switch, you configure:

• System-level (global) features that apply to all stack members
• Interface-level features for each stack member

The active switch contains the saved and running configuration files for the switch stack. The configuration files include the system-level settings for the switch stack and the interface-level settings for each stack member. Each stack member has a current copy of these files for back-up purposes.

Supported Features in a Switch Stack

The system-level features supported on the active switch are supported on the entire switch stack.

Related Topics
  Restrictions for Switch Stacks, on page 1709

Encryption Features

If the active switch is running the cryptographic universal software image (supports encryption), the encryption features are available on the switch stack.

StackWise-160

The stack members use the StackWise-160 technology to work together as a unified system. Layer 2 and Layer 3 protocols support the entire switch stack as a single entity in the network.

Note
Switch stacks running the LAN Base image do not support Layer 3 features.
StackWise-160 has a stack bandwidth of 160 Gbps, and uses stateful switchover (SSO) to provide resiliency within the stack. The stack behaves as a single switching unit that is managed by an active switch elected by the member switches. The active switch automatically elects a standby switch within the stack. The active switch creates and updates all the switching, routing and wireless information and constantly synchronizes that information with the standby switch. Access points continue to remain connected during an active-to-standby switchover unless the access point is directly connected to the active switch. In this case the access point will lose power and reboot. A working stack can accept new members or delete old ones without service interruption.

**Switch Stack Membership**

A standalone switch is a switch stack with one stack member that also operates as the active switch. You can connect one standalone switch to another to create a switch stack containing two stack members, with one of them as the active switch. You can connect standalone switches to an existing switch stack to increase the stack membership.

**Changes to Switch Stack Membership**

If you replace a stack member with an identical model, the new switch functions with exactly the same configuration as the replaced switch, assuming that the new switch (referred to as the provisioned switch) is using the same member number as the replaced switch.

The operation of the switch stack continues uninterrupted during membership changes unless you remove the active switch or you add powered-on standalone switches or switch stacks.

- Adding powered-on switches (merging) causes all switches to reload and elect a new active switch from among themselves. The newly elected active switch retains its role and configuration. All other switches retain their stack member numbers and use the stack configuration of the newly elected active switch.

- Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. This can cause:

  - An IP address conflict in your network. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks.

  - A MAC address conflict between two members in the stack. You can use the **stack-mac update force** command to resolve the conflict.

If a newly created switch stack does not have an active switch or standby switch, the switch stack will reload and elect a new active switch.

---

**Note**

Make sure that you power off the switches that you add to or remove from the switch stack.

After adding or removing stack members, make sure that the switch stack is operating at full bandwidth (160 Gbps). Press the Mode button on a stack member until the Stack mode LED is on. The last two right port LEDs on all switches in the stack should be green. Depending on the switch model, the last two right ports are 10-Gigabit Ethernet ports or small form-factor pluggable (SFP) module ports (10/100/1000 ports). If one or both of these LEDs are not green on any of the switches, the stack is not operating at full bandwidth.

If you remove powered-on members but do not want to partition the stack:

- Power off the switches in the newly created switch stacks.
• Reconnect them to the original switch stack through their stack ports.
• Power on the switches.

For cabling and power considerations that affect switch stacks, see the Catalyst 3650 Switch Hardware Installation Guide.

Assigning a Stack Member Number, on page 1722
Switch Stack Configuration Scenarios, on page 1730

Stack Member Numbers

The stack member number (1 to 9) identifies each member in the switch stack. The member number also determines the interface-level configuration that a stack member uses. You can display the stack member number by using the show switch EXEC command.

A new, out-of-the-box switch (one that has not joined a switch stack or has not been manually assigned a stack member number) ships with a default stack member number of 1. When it joins a switch stack, its default stack member number changes to the lowest available member number in the stack.

Stack members in the same switch stack cannot have the same stack member number. Every stack member, including a standalone switch, retains its member number until you manually change the number or unless the number is already being used by another member in the stack.

• If you manually change the stack member number by using the switch current-stack-member-number renumber new-stack-member-number command, the new number goes into effect after that stack member resets (or after you use the reload slot stack-member-number privileged EXEC command) and only if that number is not already assigned to any other members in the stack. Another way to change the stack member number is by changing the SWITCH_NUMBER environment variable.

If the number is being used by another member in the stack, the switch selects the lowest available number in the stack.

If you manually change the number of a stack member and no interface-level configuration is associated with that new member number, that stack member resets to its default configuration.

You cannot use the switch current-stack-member-number renumber new-stack-member-number command on a provisioned switch. If you do, the command is rejected.

• If you move a stack member to a different switch stack, the stack member retains its number only if the number is not being used by another member in the stack. If it is being used, the switch selects the lowest available number in the stack.

• If you merge switch stacks, the switches that join the switch stack of a new active switch select the lowest available numbers in the stack.

As described in the hardware installation guide, you can use the switch port LEDs in Stack mode to visually determine the stack member number of each stack member.

Related Topics
Assigning a Stack Member Number, on page 1722
Switch Stack Configuration Scenarios, on page 1730
**Stack Member Priority Values**

A higher priority value for a stack member increases the probability of it being elected active switch and retaining its stack member number. The priority value can be 1 to 15. The default priority value is 1. You can display the stack member priority value by using the `show switch` EXEC command.

**Note**

We recommend assigning the highest priority value to the switch that you prefer to be the active switch. This ensures that the switch is reelected as the active switch if a reelection occurs.

To change the priority value for a stack member, use the `switch stack-member-number priority new priority-value` command.

The new priority value takes effect immediately but does not affect the current active switch. The new priority value helps determine which stack member is elected as the new active switch when the current active switch or the switch stack resets.

**Related Topics**

- [Setting the Stack Member Priority Value](#), on page 1723

**Switch Stack Bridge ID and MAC Address**

A switch stack is identified in the network by its *bridge ID* and, if it is operating as a Layer 3 device, its router MAC address. The bridge ID and router MAC address are determined by the MAC address of the active switch.

If the active switch changes, the MAC address of the new active switch determines the new bridge ID and router MAC address.

If the entire switch stack reloads, the switch stack uses the MAC address of the active switch.

**Persistent MAC Address on the Switch Stack**

You can use the persistent MAC address feature to set a time delay before the stack MAC address changes. During this time period, if the previous active switch rejoins the stack, the stack continues to use its MAC address as the stack MAC address, even if the switch is now a stack member and not an active switch. If the previous active switch does not rejoin the stack during this period, the switch stack takes the MAC address of the new active switch as the stack MAC address. By default, the stack MAC address will be the MAC address of the first active switch, even if a new active switch takes over.

You can also configure stack MAC persistency so that the stack MAC address never changes to the new active switch MAC address.

**Related Topics**

- [Enabling the Persistent MAC Address Feature](#), on page 1721
- [Enabling the Persistent MAC Address Feature: Example](#), on page 1731

**Active and Standby Switch Election and Reelection**

All stack members are eligible to be the active switch or the standby switch. If the active switch becomes unavailable, the standby switch becomes the active switch.
An active switch retains its role unless one of these events occurs:

- The switch stack is reset.
- The active switch is removed from the switch stack.
- The active switch is reset or powered off.
- The active switch fails.
- The switch stack membership is increased by adding powered-on standalone switches or switch stacks.

The active switch is elected or reelected based on one of these factors and in the order listed:

1. The switch that is currently the active switch.
2. The switch with the highest stack member priority value.

**Note**

We recommend assigning the highest priority value to the switch that you prefer to be the active switch. This ensures that the switch is reelected as active switch if a reelection occurs.

3. The switch with the shortest start-up time.
4. The switch with the lowest MAC address.

**Note**

The factors for electing or reelecting a new standby switch are same as those for the active switch election or reelection, and are applied to all participating switches except the active switch.

After election, the new active switch becomes available after a few seconds. In the meantime, the switch stack uses the forwarding tables in memory to minimize network disruption. The physical interfaces on the other available stack members are not affected during a new active switch election and reset.

When the previous active switch becomes available, it does not resume its role as the active switch.

If you power on or reset an entire switch stack, some stack members might not participate in the active switch election. Stack members that are powered on within the same 2-minute timeframe participate in the active switch election and have a chance to become the active switch. Stack members that are powered on after the 120-second timeframe do not participate in this initial election and become stack members. For powering considerations that affect active-switch elections, see the switch hardware installation guide.

As described in the hardware installation guide, you can use the ACTV LED on the switch to see if the switch is the active switch.

### Switch Stack Configuration Files

The active switch has the saved and running configuration file for the switch stack. The standby switch automatically receives the synchronized running configuration file. Stack members receive synchronized copies when the running configuration file is saved into the startup configuration file. If the active switch becomes unavailable, the standby switch takes over with the current running configuration.

The configuration files record these settings:
• System-level (global) configuration settings such as IP, STP, VLAN, and SNMP settings that apply to all stack members

• Stack member interface-specific configuration settings that are specific for each stack member

**Note**

The interface-specific settings of the active switch are saved if the active switch is replaced without saving the running configuration to the startup configuration.

A new, out-of-box switch joining a switch stack uses the system-level settings of that switch stack. If a switch is moved to a different switch stack before it is powered on, that switch loses its saved configuration file and uses the system-level configuration of the new switch stack. If the switch is powered on as a standalone switch before it joins the new switch stack, the stack will reload. When the stack reloads, the new switch may become the active switch, retain its configuration and overwrite the configuration files of the other stack members.

The interface-specific configuration of each stack member is associated with the stack member number. Stack members retain their numbers unless they are manually changed or they are already used by another member in the same switch stack. If the stack member number changes, the new number goes into effect after that stack member resets.

• If an interface-specific configuration does not exist for that member number, the stack member uses its default interface-specific configuration.

• If an interface-specific configuration exists for that member number, the stack member uses the interface-specific configuration associated with that member number.

If you replace a failed member with an identical model, the replacement member automatically uses the same interface-specific configuration as the failed switch. You do not need to reconfigure the interface settings. The replacement switch (referred to as the provisioned switch) must have the same stack member number as the failed switch.

You back up and restore the stack configuration in the same way as you would for a standalone switch configuration.

**Related Topics**

Assigning a Stack Member Number, on page 1722

Switch Stack Configuration Scenarios, on page 1730

**Offline Configuration to Provision a Stack Member**

You can use the offline configuration feature to provision (to supply a configuration to) a new switch before it joins the switch stack. You can configure the stack member number, the switch type, and the interfaces associated with a switch that is not currently part of the stack. The configuration that you create on the switch stack is called the provisioned configuration. The switch that is added to the switch stack and that receives this configuration is called the provisioned switch.

You manually create the provisioned configuration through the `switch stack-member-number provision` global configuration command. You must change the `stack-member-number` on the provisioned switch before you add it to the stack, and it must match the stack member number that you created for the new switch on the switch stack. The switch type in the provisioned configuration must match the switch type of the newly added switch. The provisioned configuration is automatically created when a switch is added to a switch stack and when no provisioned configuration exists.
When you configure the interfaces associated with a provisioned switch, the switch stack accepts the configuration, and the information appears in the running configuration. However, as the switch is not active, any configuration on the interface is not operational and the interface associated with the provisioned switch does not appear in the display of the specific feature. For example, VLAN configuration information associated with a provisioned switch does not appear in the `show vlan` user EXEC command output on the switch stack.

The switch stack retains the provisioned configuration in the running configuration whether or not the provisioned switch is part of the stack. You can save the provisioned configuration to the startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. The startup configuration file ensures that the switch stack can reload and can use the saved information whether or not the provisioned switch is part of the switch stack.

### Effects of Adding a Provisioned Switch to a Switch Stack

When you add a provisioned switch to the switch stack, the stack applies either the provisioned configuration or the default configuration. This table lists the events that occur when the switch stack compares the provisioned configuration with the provisioned switch.

**Table 151: Results of Comparing the Provisioned Configuration with the Provisioned Switch**

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>The stack member numbers and the switch types match.</td>
<td>1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, and 2. If the switch type of the provisioned switch matches the switch type in the provisioned configuration on the stack.</td>
</tr>
<tr>
<td>The stack member numbers match but the switch types do not match.</td>
<td>1. If the stack member number of the provisioned switch matches the stack member number in the provisioned configuration on the stack, but 2. The switch type of the provisioned switch does not match the switch type in the provisioned configuration on the stack.</td>
</tr>
<tr>
<td>Scenario</td>
<td>Result</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>The stack member number is not found in the provisioned configuration.</td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack. The provisioned configuration is changed to reflect the new information.</td>
</tr>
<tr>
<td>The stack member number of the provisioned switch is not found in the provisioned configuration.</td>
<td>The switch stack applies the default configuration to the provisioned switch and adds it to the stack.</td>
</tr>
</tbody>
</table>

If you add a provisioned switch that is a different type than specified in the provisioned configuration to a powered-down switch stack and then apply power, the switch stack rejects the (now incorrect) `switch stack-member-number provision type` global configuration command in the startup configuration file. However, during stack initialization, the nondefault interface configuration information in the startup configuration file for the provisioned interfaces (potentially of the wrong type) is executed. Depending on the differences between the actual switch type and the previously provisioned switch type, some commands are rejected, and some commands are accepted.

If the switch stack does not contain a provisioned configuration for a new switch, the switch joins the stack with the default interface configuration. The switch stack then adds to its running configuration with a `switch stack-member-number provision type` global configuration command that matches the new switch.

**Effects of Replacing a Provisioned Switch in a Switch Stack**

When a provisioned switch in a switch stack fails, it is removed from the stack, and is replaced with another switch, the stack applies either the provisioned configuration or the default configuration to it. The events that occur when the switch stack compares the provisioned configuration with the provisioned switch are the same as those when you add a provisioned switch to a stack.

**Effects of Removing a Provisioned Switch from a Switch Stack**

If you remove a provisioned switch from the switch stack, the configuration associated with the removed stack member remains in the running configuration as provisioned information. To completely remove the configuration, use the `no switch stack-member-number provision` global configuration command.

**Upgrading a Switch Running Incompatible Software**

The auto-upgrade and auto-advise features enable a switch with software packages that are incompatible with the switch stack to be upgraded to a compatible software version so that it can join the switch stack.

**Auto-Upgrade**

The purpose of the auto-upgrade feature is to allow a switch to be upgraded to a compatible software image, so that the switch can join the switch stack.
When a new switch attempts to join a switch stack, each stack member performs compatibility checks with itself and the new switch. Each stack member sends the results of the compatibility checks to the active switch, which uses the results to determine whether the switch can join the switch stack. If the software on the new switch is incompatible with the switch stack, the new switch enters version-mismatch (VM) mode.

If the auto-upgrade feature is enabled on the existing switch stack, the active switch automatically upgrades the new switch with the same software image running on a compatible stack member. Auto-upgrade starts a few minutes after the mismatched software is detected before starting.

Auto-upgrade is disabled by default.

Auto-upgrade includes an auto-copy process and an auto-extract process.

- Auto-copy automatically copies the software image running on any stack member to the new switch to automatically upgrade it. Auto-copy occurs if auto-upgrade is enabled, if there is enough flash memory in the new switch, and if the software image running on the switch stack is suitable for the new switch.

**Note**

A switch in VM mode might not run all released software. For example, new switch hardware is not recognized in earlier versions of software.

- Automatic extraction (auto-extract) occurs when the auto-upgrade process cannot find the appropriate software in the stack to copy to the new switch. In that case, the auto-extract process searches all switches in the stack for the bin file needed to upgrade the switch stack or the new switch. The bin file can be in any flash file system in the switch stack or in the new switch. If a bin file suitable for the new switch is found on a stack member, the process extracts the file and automatically upgrades the new switch.

The auto-upgrade feature is not available in bundle mode. The switch stack must be running in installed mode. If the switch stack is in bundle mode, use the `software expand` privileged EXEC command to change to installed mode.

You can enable auto-upgrade by using the `software auto-upgrade enable` global configuration command on the new switch. You can check the status of auto-upgrade by using the `show running-config` privileged EXEC command and by checking the `Auto upgrade` line in the display.

You can configure auto-upgrade to upgrade the new switch with a specific software bundle by using the `software auto-upgrade source url` global configuration command. If the software bundle is invalid, the new switch is upgraded with the same software image running on a compatible stack member.

When the auto-upgrade process is complete, the new switch reloads and joins the stack as a fully functioning member. If you have both stack cables connected during the reload, network downtime does not occur because the switch stack operates on two rings.

For more information about upgrading a switch running incompatible software see the *Cisco IOS File System, Configuration Files, and Bundle Files Appendix, Cisco IOS XE Release 3SE (Catalyst 3650 Switches).*

**Auto-Advise**

The auto-advise feature is triggered when:

- The auto-upgrade feature is disabled.

- The new switch is in bundle mode and the stack is in installed mode. Auto-advise displays syslog messages about using the `software auto-upgrade` privileged EXEC command to change the new switch to installed mode.
• The stack is in bundle mode. Auto-advice displays syslog messages about booting the new switch in bundle mode so that it can join the stack.

• An auto-upgrade attempt fails because the new switch is running incompatible software. After the switch stack performs compatibility checks with the new switch, auto-advice displays syslog messages about whether the new switch can be auto-upgraded.

Auto-advice cannot be disabled. It does not give suggestions when the switch stack software and the software of the switch in version-mismatch (VM) mode do not contain the same license level.

Examples of Auto-Advise Messages

Auto-Upgrade Is Disabled and Incompatible Switch Attempting to Join: Example

This sample auto-advice output shows the system messages displayed when the auto-upgrade feature is disabled and an incompatible switch 1 tries to join the switch stack:

*Oct 18 08:36:19.379: %INSTALLER-6-AUTO_ADVISE_SW_INITIATED: 2 installer: Auto advise initiated for switch 1
*Oct 18 08:36:19.380: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: Searching stack for software to upgrade switch 1
*Oct 18 08:36:19.382: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: Switch 1 with incompatible software has been
*Oct 18 08:36:19.382: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: added to the stack. The software running on
*Oct 18 08:36:19.382: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: all stack members was scanned and it has been
*Oct 18 08:36:19.382: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: determined that the 'software auto-upgrade' command can be used to install compatible

Auto-Upgrade is Disabled and New Switch is in Bundle Mode: Example

This sample auto-advice output shows the system messages displayed when auto-upgrade is disabled and a switch running in bundle mode tries to join the stack that is running in installed mode:

*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW_INITIATED: 2 installer: Auto advise initiated for switch 1
*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: Switch 1 running bundled software has been added
*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: to the stack that is running installed software.
*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: The 'software auto-upgrade' command can be used to
*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: convert switch 1 to the installed running mode by
*Oct 18 11:09:47.005: %INSTALLER-6-AUTO_ADVISE_SW: 2 installer: installing its running software.

SDM Template Mismatch in Switch Stacks

All stack members use the Switch Database Management (SDM) template configured on the active switch. When a new switch is added to a stack, the SDM configuration that is stored on the active switch overrides the template configured on an individual switch.
You can use the `show switch` privileged EXEC command to see if any stack members are in SDM-mismatch mode.

Version-mismatch (VM) mode has priority over SDM-mismatch mode. If a VM-mode condition and an SDM-mismatch mode exist, the switch stack first attempts to resolve the VM-mode condition.

**Switch Stack Management Connectivity**

You manage the switch stack and the stack member interfaces through the active switch. You can use the CLI, SNMP, and supported network management applications such as CiscoWorks. You cannot manage stack members on an individual switch basis.

---

**Note**

Use SNMP to manage network features across the stack that are defined by supported MIBs. The switch does not support MIBs to manage stacking-specific features such as stack membership and election.

---

**Connectivity to Specific Stack Members**

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug the standby switch, you can access it from the active switch using the `session standby ios` privileged EXEC command. To debug a specific stack member, use the `session switch stack-member-number` privileged EXEC command from the active switch to access the diagnostic shell of the stack member. Only the `show` and `debug` commands are available in a CLI session to a specific stack member.

**Related Topics**

[Accessing the Diagnostic Console of a Stack Member](on page 1727)

---

**Connectivity to the Switch Stack Through an IP Address**

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the active switch or to any other stack member. You can still manage the stack through the same IP address even if you remove the active switch or any other stack member from the stack, provided there is IP connectivity.

---

**Note**

Stack members retain their IP addresses when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP addresses of any switches that you remove from the switch stack.

---

**Connectivity to the Switch Stack Through Console Ports or Ethernet Management Ports**

You can connect to the active switch by using one of these methods:

- You can connect a terminal or a PC to the active switch through the console port of one or more stack members.
- You can connect a PC to the active switch through the Ethernet management ports of one or more stack members.
Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

We recommend using only one CLI session when managing the switch stack.

**How to Configure a Switch Stack**

**Default Switch Stack Configuration**

The following table shows the default switch stack configuration settings:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack MAC address timer</td>
<td>Disabled.</td>
</tr>
<tr>
<td>Stack member number</td>
<td>1</td>
</tr>
<tr>
<td>Stack member priority value</td>
<td>1</td>
</tr>
<tr>
<td>Offline configuration</td>
<td>The switch stack is not provisioned.</td>
</tr>
<tr>
<td>Persistent MAC address</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

**Enabling the Persistent MAC Address Feature**

This procedure is optional.

*Note*

When you enter the command to configure this feature, a warning message appears with the consequences of your configuration. You should use this feature cautiously. Using the old active switch MAC address elsewhere in the same domain could result in lost traffic.

**SUMMARY STEPS**

1. configure terminal
2. stack-mac persistent timer [0 | time-value]
3. end
4. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

**stack-mac persistent timer** `[0 | time-value]`

*Example:*

```
Switch(config)# stack-mac persistent timer 7
```

Enables a time delay after an active-switch change before the stack MAC address changes to that of the new active switch. If the previous active switch rejoins the stack during this period, the stack uses that MAC address as the stack MAC address.

- Enter the command with no value or with a value of `0` to continue using the MAC address of the current active switch indefinitely.
- Enter a `time-value` from 1 to 60 minutes to configure the time period before the stack MAC address changes to the new active switch.

The stack MAC address of the previous active switch is used until the configured time period expires.

**Step 3**

**end**

*Example:*

```
Switch(config)# end
```

Returns to privileged EXEC mode.

**Step 4**

**copy running-config startup-config**

*Example:*

```
Switch# copy running-config startup-config
```

(Optional) Saves your entries in the configuration file.

### Assigning a Stack Member Number

This optional task is available only from the active switch.

**SUMMARY STEPS**

1. `switch current-stack-member-number renumber new-stack-member-number`
2. `reload slot stack-member-number`
### Setting the Stack Member Priority Value

This optional task is available only from the active switch.

Follow these steps to assign a priority value to a stack member:

**SUMMARY STEPS**

1. `enable`
2. `switch stack-member-number priority new-priority-number`
3. `show switch stack-member-number`
4. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code> Example: <code>Switch enable</code></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>switch stack-member-number priority new-priority-number</code> Example: <code>Switch# switch 3 priority 2</code></td>
<td>Specifies the stack member number and the new priority for the stack member. The stack member number range is 1 to 9. The priority value range is 1 to 15. You can display the current priority value by using the <code>show switch</code> user EXEC command.</td>
</tr>
</tbody>
</table>
**Provisioning a New Member for a Switch Stack**

This optional task is available only from the active switch.

**SUMMARY STEPS**

1. **show switch**
2. **configure terminal**
3. **switch stack-member-number provision type**
4. **end**
5. **copy running-config startup-config**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> show switch</td>
<td>Displays summary information about the switch stack.</td>
</tr>
<tr>
<td>Example: Switch# show switch</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> switch stack-member-number provision type</td>
<td>Specifies the stack member number for the preconfigured switch. By default, no switches are provisioned.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Removing Provisioned Switch Information

Before you begin, you must remove the provisioned switch from the stack. This optional task is available only from the active switch.

**SUMMARY STEPS**

1. configure terminal  
2. no switch stack-member-number provision  
3. end  
4. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>no switch stack-member-number provision</th>
<th>Removes the provisioning information for the specified member.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# no switch 3 provision</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>end</th>
<th>Returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

---

### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config)# switch 3 provision WS-xxxx</td>
<td>For stack-member-number, the range is 1 to 9. Specify a stack member number that is not already used in the switch stack. See Step 1. For type, enter the model number of a supported switch that is listed in the command-line help strings.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>end</th>
<th>Returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>copy running-config startup-config</th>
<th>(Optional) Saves your entries in the configuration file.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
### Displaying Incompatible Switches in the Switch Stack

#### SUMMARY STEPS

1. `show switch`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>show switch</code></td>
<td>Displays any incompatible switches in the switch stack (indicated by a 'Current State' of 'V-Mismatch'). The V-Mismatch state identifies the switches with incompatible software. The output displays Lic-Mismatch for switches that are not running the same license level as the active switch. For information about managing license levels, see the System Management Configuration Guide ( Catalyst 3650 Switches).</td>
</tr>
</tbody>
</table>

<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

Troubleshooting the Switch Stack

Accessing the Diagnostic Console of a Stack Member

**Before you begin**

This optional task is available only from the active switch.

SUMMARY STEPS

1. session switch stack-member-number
2. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>session switch stack-member-number</strong></td>
</tr>
<tr>
<td>Example: Switch# session switch 2</td>
<td>Accesses the diagnostic shell of the stack member from the active switch.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>exit</strong></td>
</tr>
<tr>
<td>Example: Switch(diag)&gt; exit</td>
<td>Returns to the CLI session on the active switch.</td>
</tr>
</tbody>
</table>

Connectivity to Specific Stack Members, on page 1720

Temporarily Disabling a Stack Port

If a stack port is flapping and causing instability in the stack ring, to disable the port, enter the `switch stack-member-number stack port port-number disable` privileged EXEC command. To reenable the port, enter the `switch stack-member-number stack port port-number enable` command.

**Note**

Be careful when using the `switch stack-member-number stack port port-number disable` command. When you disable the stack port, the stack operates at half bandwidth.

A stack is in the full-ring state when all members are connected through the stack ports and are in the ready state.

The stack is in the partial-ring state when the following occurs:

- All members are connected through their stack ports but some are not in the ready state.
- Some members are not connected through the stack ports.

**SUMMARY STEPS**

1. `switch stack-member-number stack port port-number disable`
2. `switch stack-member-number stack port port-number enable`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>switch stack-member-number stack port port-number disable</code></td>
<td>Disables the specified stack port.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# <code>switch 2 stack port 1 disable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Reenables the stack port.</td>
</tr>
<tr>
<td><code>switch stack-member-number stack port port-number enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# <code>switch 2 stack port 1 enable</code></td>
<td></td>
</tr>
</tbody>
</table>

When you disable a stack port and the stack is in the full-ring state, you can disable only one stack port. This message appears:

`Enabling/disabling a stack port may cause undesired stack changes. Continue?[confirm]`

When you disable a stack port and the stack is in the partial-ring state, you cannot disable the port. This message appears:
Disabling stack port not allowed with current stack configuration.

Reenabling a Stack Port While Another Member Starts

Stack Port 1 on Switch 1 is connected to Port 2 on Switch 4. If Port 1 is flapping, you can disable Port 1 with the `switch1 stack port 1 disable` privileged EXEC command. While Port 1 on Switch 1 is disabled and Switch 1 is still powered on, follow these steps to reenable a stack port:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Disconnect the stack cable between Port 1 on Switch 1 and Port 2 on Switch 4.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Remove Switch 4 from the stack.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Add a switch to replace Switch 4 and assign it switch-number 4.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Reconnect the cable between Port 1 on Switch 1 and Port 2 on Switch 4 (the replacement switch).</td>
</tr>
<tr>
<td>Step 5</td>
<td>Reenable the link between the switches. Enter the <code>switch1 stack port 1 enable</code> privileged EXEC command to enable Port 1 on Switch 1.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Power on Switch 4.</td>
</tr>
</tbody>
</table>

⚠️ Caution

Powering on Switch 4 before enabling the Port 1 on Switch 1 might cause one of the switches to reload. If Switch 4 is powered on first, you might need to enter the `switch1 stack port 1 enable` and the `switch4 stack port 2 enable` privileged EXEC commands to bring up the link.

Monitoring the Switch Stack

**Table 153: Commands for Displaying Stack Information**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show switch</code></td>
<td>Displays summary information about the stack, including the status of provisioned switches and switches in version-mismatch mode.</td>
</tr>
<tr>
<td><code>show switch stack-member-number</code></td>
<td>Displays information about a specific member.</td>
</tr>
<tr>
<td><code>show switch detail</code></td>
<td>Displays detailed information about the stack.</td>
</tr>
<tr>
<td><code>show switch neighbors</code></td>
<td>Displays the stack neighbors.</td>
</tr>
<tr>
<td><code>show switch stack-ports [summary]</code></td>
<td>Displays port information for the stack.</td>
</tr>
<tr>
<td><code>show redundancy</code></td>
<td>Displays the redundant system and the current processor information. The redundant system information includes the system uptime, standby failures, switchover reason, hardware, configured and operating redundancy mode. The current processor information displayed includes the active location, the software state, the uptime in the current state and so on.</td>
</tr>
</tbody>
</table>
### Configuration Examples for Switch Stacks

#### Switch Stack Configuration Scenarios

Most of these switch stack configuration scenarios assume that at least two switches are connected through their StackWise-160 ports.

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active switch election specifically determined by existing active switches</td>
<td>Connect two powered-on switch stacks through the StackWise-160 ports.</td>
</tr>
<tr>
<td>Active switch election specifically determined by the stack member priority value</td>
<td>1. Connect two switches through their StackWise-160 ports.</td>
</tr>
<tr>
<td></td>
<td>2. Use the <strong>switch stack-member-number priority new-priority-number</strong> global configuration command to set one stack member with a higher member priority value.</td>
</tr>
<tr>
<td></td>
<td>3. Restart both stack members at the same time.</td>
</tr>
<tr>
<td>Active switch election specifically determined by the configuration file</td>
<td>Assuming that both stack members have the same priority value:</td>
</tr>
<tr>
<td></td>
<td>1. Make sure that one stack member has a default configuration and that the other stack member has a saved (nondefault) configuration file.</td>
</tr>
<tr>
<td></td>
<td>2. Restart both stack members at the same time.</td>
</tr>
<tr>
<td>Active switch election specifically determined by the MAC address</td>
<td>Assuming that both stack members have the same priority value, configuration file, and feature set, restart both stack members at the same time.</td>
</tr>
</tbody>
</table>
### Scenario

| Stack member number conflict | Assuming that one stack member has a higher priority value than the other stack member:  
1. Ensure that both stack members have the same stack member number. If necessary, use the `switch current-stack-member-number renumber new-stack-member-number` global configuration command.  
2. Restart both stack members at the same time. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Result</td>
<td>The stack member with the higher priority value retains its stack member number. The other stack member has a new stack member number.</td>
</tr>
</tbody>
</table>

| Add a stack member | 1. Power off the new switch.  
2. Through their StackWise-160 ports, connect the new switch to a powered-on switch stack.  
3. Power on the new switch. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Result</td>
<td>The active switch is retained. The new switch is added to the switch stack.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Active switch failure</th>
<th>Remove (or power off) the active switch.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Result</td>
<td>One of the remaining stack members becomes the new stack master. All other stack members in the stack remain as stack members and do not reboot.</td>
</tr>
</tbody>
</table>

| Add more than nine stack members | Through their StackWise-160 ports, connect ten switches.  
2. Power on all switches. |
|----------------------|------------------------------------------------------------------|
| Result               | Two switches become active switches. One active switch has nine stack members. The other active switch remains as a standalone switch.  
Use the Mode button and port LEDs on the switches to identify which switches are active switches and which switches belong to each active switch. |

</tr>
</tbody>
</table>
Software Loopback: Examples

In a stack with three members, stack cables connect all the members:

```
Switch# show switch stack-ports summary
Switch# show switch stack-ports summary
              Sw#/Port# Port Neighbor Cable Length OK Link Sync #Changes In Status Length OK Active OK To Link OK Loopback
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------
1/1          OK          3  50 cm     Yes      Yes      Yes       1           No
1/2          OK          2   3 m      Yes      Yes      Yes       1           No
2/1          OK          1  3 m       Yes      Yes      Yes       1           No
2/2          OK          3  50 cm     Yes      Yes      Yes       1           No
3/1          OK          2  50 cm     Yes      Yes      Yes       1           No
3/2          OK          1  50 cm     Yes      Yes      Yes       1           No
```

If you disconnect the stack cable from Port 1 on Switch 1, these messages appear:

```
01:09:55: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 3 has changed to state DOWN
01:09:56: %STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 1 has changed to state DOWN
```

```
Switch# show switch stack-ports summary
Switch# show switch stack-ports summary
              Sw#/Port# Port Neighbor Cable Length OK Link Sync #Changes In Status Length OK Active OK To Link OK Loopback
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------
1/1          Absent     None No cable     No       No       No        1           No
1/2          OK          2   3 m      Yes      Yes      Yes       1           No
2/1          OK          1   3 m      Yes      Yes      Yes       1           No
2/2          OK          3  50 cm     Yes      Yes      Yes       1           No
3/1          OK          2  50 cm     Yes      Yes      Yes       1           No
3/2          Absent     None No cable     No       No       No        1           No
```

If you disconnect the stack cable from Port 2 on Switch 1, the stack splits.

```
Switch 2 and Switch 3 are now in a two-member stack connected through stack cables:
```

```
Switch# show sw stack-ports summary
Switch# show sw stack-ports summary
              Sw#/Port# Port Neighbor Cable Length OK Link Sync #Changes In Status Length OK Active OK To Link OK Loopback
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------
2/1          Down     None   3 m      No       No       No        1           No
2/2          OK          3  50 cm     Yes      Yes      Yes       1           No
3/1          OK          2  50 cm     Yes      Yes      Yes       1           No
3/2          Down     None No cable     No       No       No        1           No
```

Switch 1 is a standalone switch:

```
Switch# show switch stack-ports summary
Switch# show switch stack-ports summary
              Sw#/Port# Port Neighbor Cable Length OK Link Sync #Changes In Status Length OK Active OK To Link OK Loopback
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------
1/1          Absent     None No cable     No       No       No        1           Yes
1/2          Absent     None No cable     No       No       No        1           Yes
```
Software Loopback with Connected Stack Cables: Examples

- On Port 1 on Switch 1, the port status is **Down**, and a cable is connected.

  On Port 2 on Switch 1, the port status is **Absent**, and no cable is connected.

<table>
<thead>
<tr>
<th>Sw#/Port</th>
<th>Port Status</th>
<th>Neighbor</th>
<th>Cable Length</th>
<th>Link OK</th>
<th>Link Active</th>
<th>Sync To Link OK</th>
<th>#Changes</th>
<th>In Loopback</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>Down</td>
<td>None</td>
<td>50 cm</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>1</td>
<td>No</td>
</tr>
<tr>
<td>1/2</td>
<td>Absent</td>
<td>None</td>
<td>No cable</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>1</td>
<td>No</td>
</tr>
</tbody>
</table>

- In a **physical loopback**, a cable connects both stack ports on a switch. You can use this configuration to test:
  - Cables on a switch that is running properly
  - Stack ports with a cable that works properly

<table>
<thead>
<tr>
<th>Sw#/Port</th>
<th>Port Status</th>
<th>Neighbor</th>
<th>Cable Length</th>
<th>Link OK</th>
<th>Link Active</th>
<th>Sync To Link OK</th>
<th>#Changes</th>
<th>In Loopback</th>
</tr>
</thead>
<tbody>
<tr>
<td>2/1</td>
<td>OK</td>
<td>2</td>
<td>50 cm</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>1</td>
<td>No</td>

<tr>
<td>2/2</td>
<td>OK</td>
<td>2</td>
<td>50 cm</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>1</td>
<td>No</td>
</tr>
</tbody>
</table>

The port status shows that

- Switch 2 is a standalone switch.

- The ports can send and receive traffic.

Software Loopback with no Connected Stack Cable: Example

<table>
<thead>
<tr>
<th>Sw#/Port</th>
<th>Port Status</th>
<th>Neighbor</th>
<th>Cable Length</th>
<th>Link OK</th>
<th>Link Active</th>
<th>Sync To Link OK</th>
<th>#Changes</th>
<th>In Loopback</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>Absent</td>
<td>None</td>
<td>No cable</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>1</td>
<td>Yes</td>
</tr>
<tr>
<td>1/2</td>
<td>Absent</td>
<td>None</td>
<td>No cable</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>1</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Finding a Disconnected Stack Cable: Example

Stack cables connect all stack members. Port 2 on Switch 1 connects to Port 1 on Switch 2.

This is the port status for the members:

<table>
<thead>
<tr>
<th>Sw#/Port</th>
<th>Port Status</th>
<th>Neighbor</th>
<th>Cable Length</th>
<th>Link OK</th>
<th>Link Active</th>
<th>Sync To Link OK</th>
<th>#Changes</th>
<th>In Loopback</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/1</td>
<td>Absent</td>
<td>None</td>
<td>No cable</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>1</td>
<td>Yes</td>
</tr>
<tr>
<td>1/2</td>
<td>Absent</td>
<td>None</td>
<td>No cable</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>1</td>
<td>Yes</td>
</tr>
</tbody>
</table>
If you disconnect the cable from Port 2 on Switch 1, these messages appear:

%STACKMGR-4-STACK_LINK_CHANGE: Stack Port 1 Switch 2 has changed to state DOWN

%STACKMGR-4-STACK_LINK_CHANGE: Stack Port 2 Switch 1 has changed to state DOWN

This is now the port status:

```
Switch# show switch stack-ports summary
Switch#
Sw#/Port# Port Neighbor Cable Length OK Active OK To LinkOK Loopback
-------- ------ -------- -------- ---- ------ ---- --------- --------
1/1 OK 2 50 cm Yes Yes Yes 1 No
1/2 Absent None No cable No No No 2 No
2/1 Down None 50 cm No No No 2 No
2/2 OK 1 50 cm Yes Yes Yes 1 No
```

Only one end of the cable connects to a stack port, Port 1 on Switch 2.

- The Stack Port Status value for Port 2 on Switch 1 is Absent, and the value for Port 1 on Switch 2 is Down.
- The Cable Length value is No cable.

Diagnosing the problem:

- Verify the cable connection for Port 2 on Switch 1.
- Port 2 on Switch 1 has a port or cable problem if
  - The In Loopback value is Yes.

  or

  - The Link OK, Link Active, or Sync OK value is No.

**Fixing a Bad Connection Between Stack Ports: Example**

Stack cables connect all members. Port 2 on Switch 1 connects to Port 1 on Switch 2.

This is the port status:

```
Switch# show switch stack-ports summary
Switch#
Sw#/Port# Port Neighbor Cable Length OK Active OK To LinkOK Loopback
-------- ------ -------- -------- ---- ------ ---- --------- --------
1/1 OK 2 50 cm Yes Yes Yes 1 No
```

Fixing a Bad Connection Between Stack Ports: Example

Stack cables connect all members. Port 2 on Switch 1 connects to Port 1 on Switch 2.

This is the port status:

```
Switch# show switch stack-ports summary
Switch#
Sw#/Port# Port Neighbor Cable Length OK Active OK To LinkOK Loopback
-------- ------ -------- -------- ---- ------ ---- --------- --------
1/1 OK 2 50 cm Yes Yes Yes 1 No
```
Diagnosing the problem:

- The Stack Port Status value is Down.
- Link OK, Link Active, and Sync OK values are No.
- The Cable Length value is 50 cm. The switch detects and correctly identifies the cable.

The connection between Port 2 on Switch 1 and Port 1 on Switch 2 is unreliable on at least one of the connector pins.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for NSF with SSO

The following are prerequisites and considerations for configuring NSF with SSO.

• Use of the routing protocols requires the IP Services license level. EIGRP-stub and OSPF for routed access are supported on IP Base license level.

• BGP support in NSF requires that neighbor networking devices be NSF-aware; that is, the devices must have the graceful restart capability and advertise that capability in their OPEN message during session establishment. If an NSF-capable router discovers that a particular BGP neighbor does not have graceful restart capability, it does not establish an NSF-capable session with that neighbor. All other neighbors that have graceful restart capability continue to have NSF-capable sessions with this NSF-capable networking device.

• OSPF support in NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers that it has non-NSF -aware neighbors on a particular network segment, it disables NSF capabilities for that segment. Other network segments composed entirely of NSF-capable or NSF-aware routers continue to provide NSF capabilities.
Restrictions for NSF with SSO

The following are restrictions for configuring NSF with SSO:

- NSF capability is supported for IPv4 routing protocols only. NSF capability is not supported for IPv6 routing protocols.
- NSF does not support IP Multicast Routing, as it is not SSO-aware.
- NSF is not supported if the IOS-XE software is running in the LAN Base mode.
- For NSF operation, you must have SSO configured on the device.
- NSF with SSO supports IP Version 4 traffic and protocols only; NSF with SSO does not support IPv6 traffic.
- All Layer 3 neighboring devices must be NSF Helper or NSF-capable to support graceful restart capability.
- For IETF, all neighboring devices must be running an NSF-aware software image.

Information About NSF with SSO

Overview of NSF with SSO

The switch supports fault resistance by allowing a standby switch to take over if the active switch becomes unavailable. Cisco nonstop forwarding (NSF) works with stateful switchover (SSO) to minimize the amount of time a network is unavailable.

NSF provides these benefits:

- Improved network availability—NSF continues forwarding network traffic and application state information so that user session information is maintained after a switchover.
- Overall network stability—Network stability may be improved with the reduction in the number of route flaps, which were created when routers in the network failed and lost their routing tables.
- Neighboring routers do not detect a link flap—Because the interfaces remain up during a switchover, neighboring routers do not detect a link flap (the link does not go down and come back up).
- Prevents routing flaps—Because SSO continues forwarding network traffic during a switchover, routing flaps are avoided.
- Maintains user sessions established prior to the switchover.

SSO Operation

When a standby switch runs in SSO mode, the standby switch starts up in a fully-initialized state and synchronizes with the persistent configuration and the running configuration of the active switch. It subsequently maintains the state on the protocols listed below, and all changes in hardware and software states for features that support stateful switchover are kept in synchronization. Consequently, it offers minimum interruption to Layer 2 sessions in a redundant active switch configuration.
If the active switch fails, the standby switch becomes the active switch. This new active switch uses existing Layer 2 switching information to continue forwarding traffic. Layer 3 forwarding will be delayed until the routing tables have been repopulated in the newly active switch.

---

**Note**

SSO is not supported if the IOS-XE software is running the LAN Base license level.

The state of these features is preserved between both the active and standby switches:

- 802.3
- 802.3u
- 802.3x (Flow Control)
- 802.3ab (GE)
- 802.3z (Gigabit Ethernet including CWDM)
- 802.3ad (LACP)
- 802.1p (Layer 2 QoS)
- 802.1q
- 802.1X (Authentication)
- 802.1D (Spanning Tree Protocol)
- 802.3af (Inline power)
- PAgP
- VTP
- Dynamic ARP Inspection
- DHCP snooping
- IP source guard
- IGMP snooping (versions 1 and 2)
- DTP (802.1q and ISL)
- MST
- PVST+
- Rapid-PVST
- PortFast/UplinkFast/BackboneFast
- BPDU guard and filtering
- Voice VLAN
- Port security
- Unicast MAC filtering
- ACL (VACLs, PACLs, RACLs)
- QOS (DBL)
- Multicast storm control/broadcast storm control

SSO is compatible with the following list of features. However, the protocol database for these features is not synchronized between the standby and active switches:

- 802.1Q tunneling with Layer 2 Protocol Tunneling (L2PT)
- Baby giants
- Jumbo frame support
- CDP
- Flood blocking
- UDLD
SPAN/RSPAN
NetFlow

All Layer 3 protocols on a switch are learned on the standby switch if SSO is enabled.

NSF Operation

Cisco IOS Nonstop Forwarding (NSF) always runs with stateful switchover (SSO) and provides redundancy for Layer 3 traffic. NSF is supported by the BGP, OSPF, and EIGRP routing protocols and is supported by Cisco Express Forwarding (CEF) for forwarding. The routing protocols have been enhanced with NSF-capability and awareness, which means that routers running these protocols can detect a switchover and take the necessary actions to continue forwarding network traffic and to recover route information from the peer devices.

Each protocol depends on CEF to continue forwarding packets during switchover while the routing protocols rebuild the Routing Information Base (RIB) tables. After the routing protocols have converged, CEF updates the FIB table and removes stale route entries. CEF then updates the hardware with the new FIB information.

If the active switch is configured for BGP (with the `graceful-restart` command), OSPF, or EIGRP routing protocols, routing updates are automatically sent during the active switch election.

The switch supports NSF-awareness and NSF-capability for the BGP, OSPF, and EIGRP protocols in IP Services license level and NSF-awareness for the EIGRP-stub in IP Base license level.

NSF has two primary components:

- NSF-awareness
  A networking device is NSF-aware if it is running NSF-compatible software. If neighboring router devices detect that an NSF router can still forward packets when an active switch election happens, this capability is referred to as NSF-awareness. Cisco IOS enhancements to the Layer 3 routing protocols (BGP, OSPF, and EIGRP) are designed to prevent route-flapping so that the CEF routing table does not time out or the NSF router does not drop routes. An NSF-aware router helps to send routing protocol information to the neighboring NSF router. NSF-awareness is enabled by default for EIGRP-stub, EIGRP, and OSPF protocols. NSF-awareness is disabled by default for BGP.

- NSF-capability
  A device is NSF-capable if it has been configured to support NSF; it rebuilds routing information from NSF-aware or NSF-capable neighbors. NSF works with SSO to minimize the amount of time that a Layer 3 network is unavailable following an active switch election by continuing to forward IP packets. Reconvergence of Layer 3 routing protocols (BGP, OSPFv2, and EIGRP) is transparent to the user and happens automatically in the background. The routing protocols recover routing information from neighbor devices and rebuild the Cisco Express Forwarding (CEF) table.

Note
NSF does not support IPv6 and is IPv4 Unicast only.

Cisco Express Forwarding

A key element of Cisco IOS Nonstop Forwarding (NSF) is packet forwarding. In a Cisco networking device, packet forwarding is provided by Cisco Express Forwarding (CEF). CEF maintains the FIB and uses the FIB
information that was current at the time of the switchover to continue forwarding packets during a switchover. This feature reduces traffic interruption during the switchover.

During normal NSF operation, CEF on the active supervisor switch synchronizes its current FIB and adjacency databases with the FIB and adjacency databases on the standby switch. Upon switchover, the standby switch initially has FIB and adjacency databases that are mirror images of those that were current on the active switch. CEF keeps the forwarding engine on the standby switch current with changes that are sent to it by CEF on the active switch. The forwarding engine can continue forwarding after a switchover as soon as the interfaces and a data path are available.

As the routing protocols start to repopulate the RIB on a prefix-by-prefix basis, the updates cause prefix-by-prefix updates to CEF, which it uses to update the FIB and adjacency databases. Existing and new entries receive the new version (“epoch”) number, indicating that they have been refreshed. The forwarding information is updated on the forwarding engine during convergence. The switch signals when the RIB has converged. The software removes all FIB and adjacency entries that have an epoch older than the current switchover epoch. The FIB now represents the newest routing protocol forwarding information.

**BGP Operation**

When an NSF-capable router begins a BGP session with a BGP peer, it sends an OPEN message to the peer. Included in the message is a statement that the NSF-capable device has “graceful” restart capability. Graceful restart is the mechanism by which BGP routing peers avoid a routing flap following a switchover. If the BGP peer has received this capability, it is aware that the device sending the message is NSF-capable. Both the NSF-capable router and its BGP peers need to exchange the graceful restart capability in their OPEN messages at the time of session establishment. If both the peers do not exchange the graceful restart capability, the session will not be capable of a graceful restart.

If the BGP session is lost during the active switch switchover, the NSF-aware BGP peer marks all the routes associated with the NSF-capable router as stale; however, it continues to use these routes to make forwarding decisions for a set period of time. This functionality prevents packets from being lost while the newly active switch is waiting for convergence of the routing information with the BGP peers.

After an active switch switchover occurs, the NSF-capable router reestablishes the session with the BGP peer. In establishing the new session, it sends a new graceful restart message that identifies the NSF-capable router as having restarted.

At this point, the routing information is exchanged between the two BGP peers. After this exchange is complete, the NSF-capable device uses the routing information to update the RIB and the FIB with the new forwarding information. The NSF-aware device uses the network information to remove stale routes from its BGP table; the BGP protocol then is fully converged.

If a BGP peer does not support the graceful restart capability, it ignores the graceful restart capability in an OPEN message but establishes a BGP session with the NSF-capable device. This function allows interoperability with non-NSF-aware BGP peers (and without NSF functionality), but the BGP session with non-NSF-aware BGP peers is not capable of a graceful restart.

---

**Note**

BGP support in NSF requires that neighbor networking devices be NSF-aware; that is, the devices must have the graceful restart capability and advertise that capability in their OPEN message during session establishment. If an NSF-capable router discovers that a particular BGP neighbor does not have graceful restart capability, it does not establish an NSF-capable session with that neighbor. All other neighbors that have graceful restart capability continue to have NSF-capable sessions with this NSF-capable networking device.
OSPF Operation

When an OSPF NSF-capable router performs an active switch switchover, it must perform the following tasks in order to resynchronize its link state database with its OSPF neighbors:

- Relearn the available OSPF neighbors on the network without causing a reset of the neighbor relationship
- Reacquire the contents of the link state database for the network

As quickly as possible after an active switch switchover, the NSF-capable router sends an OSPF NSF signal to neighboring NSF-aware devices. Neighbor networking devices recognize this signal as an indicator that the neighbor relationship with this router should not be reset. As the NSF-capable router receives signals from other routers on the network, it can begin to rebuild its neighbor list.

After neighbor relationships are reestablished, the NSF-capable router begins to resynchronize its database with all of its NSF-aware neighbors. At this point, the routing information is exchanged between the OSPF neighbors. Once this exchange is complete, the NSF-capable device uses the routing information to remove stale routes, update the RIB, and update the FIB with the new forwarding information. The OSPF protocols are then fully converged.

Note OSPF support in NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers that it has non-NSF-aware neighbors on a particular network segment, it disables NSF capabilities for that segment. Other network segments composed entirely of NSF-capable or NSF-aware routers continue to provide NSF capabilities.

EIGRP Operation

When an EIGRP NSF-capable router initially re-boots after an NSF restart, it has no neighbor and its topology table is empty. The router is notified by the standby (now active) switch when it needs to bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables. The restarting router and its peers must accomplish these tasks without interrupting the data traffic directed toward the restarting router. EIGRP peer routers maintain the routes learned from the restarting router and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the restarting router uses a new Restart (RS) bit in the EIGRP packet header to indicate a restart. The RS bit is set in the hello packets and in the initial INIT update packets during the NSF restart period. The RS bit in the hello packets allows the neighbors to be quickly notified of the NSF restart. Without seeing the RS bit, the neighbor can only detect an adjacency reset by receiving an INIT update or by the expiration of the hello hold timer. Without the RS bit, a neighbor does not know if the adjacency reset should be handled using NSF or the normal startup method.

When the neighbor receives the restart indication, either by receiving the hello packet or the INIT packet, it recognizes the restarting peer in its peer list and maintains the adjacency with the restarting router. The neighbor then sends its topology table to the restarting router with the RS bit set in the first update packet indicating that it is NSF-aware and is helping out the restarting router. The neighbor does not set the RS bit in their hello packets, unless it is also a NSF restarting neighbor.

Note A router may be NSF-aware but may not be helping the NSF restarting neighbor because booting from a cold start.
If at least one of the peer routers is NSF-aware, the restarting router would then receive updates and rebuild its database. The restarting router must then find out if it had converged so that it can notify the routing information base (RIB). Each NSF-aware router is required to send an end of table (EOT) marker in the last update packet to indicate the end of the table content. The restarting router knows it has converged when it receives the EOT marker. The restarting router can then begin sending updates.

An NSF-aware peer would know when the restarting router had converged when it receives an EOT indication from the restarting router. The peer then scans its topology table to search for the routes with the restarted neighbor as the source. The peer compares the route timestamp with the restart event timestamp to determine if the route is still available. The peer then goes active to find alternate paths for the routes that are no longer available through the restarted router.

When the restarting router has received all EOT indications from its neighbors or when the NSF converge timer expires, EIGRP notifies the RIB of convergence. EIGRP waits for the RIB convergence signal and then floods its topology table to all awaiting NSF-aware peers.

### How to Configure Cisco NSF with SSO

#### Configuring SSO

You must configure SSO in order to use NSF with any supported protocol.

**SUMMARY STEPS**

1. `redundancy`
2. `mode sso`
3. `end`
4. `show running-config`
5. `show redundancy states`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>redundancy</code></td>
<td>Enters redundancy configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# redundancy</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>mode sso</code></td>
<td>Configures SSO. When this command is entered, the standby switch is reloaded and begins to work in SSO mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-red)# mode sso</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>end</code></td>
<td>Returns to EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-red)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>show running-config</code></td>
<td>Verifies that SSO is enabled.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
### Configuring SSO Example

This example shows how to configure the system for SSO and display the redundancy state:

```
Switch(config)# redundancy
Switch(config)# mode sso
Switch(config)# end
Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit = Primary
Unit ID = 5
Redundancy Mode (Operational) = sso
Redundancy Mode (Configured) = sso
Split Mode = Disabled
Manual Swact = Enabled
Communications = Up
client count = 29
client_notification_TMR = 30000 milliseconds
keep_alive TMR = 9000 milliseconds
keep_alive count = 1
keep_alive threshold = 18
RF debug mask = 0x0
```

### Configuring CEF NSF

The CEF NSF feature operates by default while the networking device is running in SSO mode. No configuration is necessary.

### Verifying CEF NSF

To verify CEF NSF, use the `show cef state` privileged EXEX command.

```
Switch# show cef state
CEF Status:
RP instance
common CEF enabled
IPv4 CEF Status:
CEF enabled/running
dCEF enabled/running
CEF switching enabled/running
universal per-destination load sharing algorithm, id DEA83012
IPv6 CEF Status:
CEF disabled/not running
dCEF disabled/not running
universal per-destination load sharing algorithm, id DEA83012
```
Configuring BGP for NSF

You must configure BGP graceful restart on all peer devices participating in BGP NSF.

**SUMMARY STEPS**

1. configure terminal
2. router bgp as-number
3. bgp graceful-restart

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 router bgp as-number</td>
<td>Enables a BGP routing process, which places the switch in switch configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# router bgp 300</td>
<td></td>
</tr>
<tr>
<td>Step 3 bgp graceful-restart</td>
<td>Enables the BGP graceful restart capability, starting BGP NSF. If you enter this command after the BGP session has been established, you must restart the session for the capability to be exchanged with the BGP neighbor. Use this command on the restarting switch and all of its peers.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# bgp graceful-restart</td>
<td></td>
</tr>
</tbody>
</table>
Verifying BGP NSF

To verify BGP NSF, you must check that BGP graceful restart is configured on the SSO-enabled networking device and on the neighbor devices. To verify, follow these steps:

**Step 1**
Verify that “bgp graceful-restart” appears in the BGP configuration of the SSO-enabled switch by entering the show running-config command:

**Example:**
```
Switch# show running-config

router bgp 120
  .
  .
  bgp graceful-restart
  neighbor 192.0.2.0 remote-as 300
  .
```

**Step 2**
Repeat Step 1 on each of the BGP neighbors.

**Step 3**
On the SSO device and the neighbor device, verify that the graceful restart function is shown as both advertised and received, and confirm the address families that have the graceful restart capability. If no address families are listed, BGP NSF does not occur either:

**Example:**
```
Switch# show ip bgp neighbors
BGP neighbor is 192.0.2.3, remote AS 1, internal link
BGP version 4, remote router ID 192.0.2.4
BGP state = Established, up for 00:02:38
Last read 00:00:38, last write 00:00:35, hold time is 180, keepalive interval is 60 seconds
Neighbor capabilities:
  Route refresh: advertised and received(new)
Address family IPv4 Unicast: advertised and received
Message statistics:
  InQ depth is 0
  OutQ depth is 0
  Sent Rcvd
  Opens: 1 1
  Notifications: 0 0
  Updates: 0 0
  Keepalives: 4 4
  Route Refresh: 0 0
  Total: 5 5
Default minimum time between advertisement runs is 0 seconds
```

(Remaining output deleted)
Configuring OSPF NSF

All peer devices participating in OSPF NSF must be made OSPF NSF-aware, which happens automatically when you install an NSF software image on the device.

SUMMARY STEPS

1. `configure terminal`
2. `router ospf processID`
3. `nsf`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enables an OSPF routing process, which places the switch in router configuration mode.</td>
</tr>
<tr>
<td><code>router ospf processID</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# <code>router ospf processID</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Enables NSF operations for OSPF.</td>
</tr>
<tr>
<td><code>nsf</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch(config)# <code>nsf</code></td>
<td></td>
</tr>
</tbody>
</table>

Verifying OSPF NSF

Step 1
Verify that ‘nsf’ appears in the OSPF configuration of the SSO-enabled device by entering the show running-config command:

**Example:**

Switch(config)# `show running-config`
route ospf 120
log-adjacency-changes
nsf
network 192.0.2.0 192.0.2.255 area 0
network 192.0.2.1 192.0.2.255 area 1
network 192.0.2.2 192.0.2.255 area 2
.
.
.

Step 2
Enter the `show ip ospf` command to verify that NSF is enabled on the device:

**Example:**

Switch `show ip ospf`
Routing Process "ospf 1" with ID 192.0.2.1
Start time: 00:02:07.532, Time elapsed: 00:39:05.052
Configuring EIGRP NSF

SUMMARY STEPS

1. configure terminal
2. router eigrp as-number
3. nsf

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> router eigrp as-number</td>
<td>Enables an EIGRP routing process, which places the switch in router configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# router eigrp as-number</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> nsf</td>
<td>Enables EIGRP NSF. Use this command on the “restarting” switch and all of its peers.</td>
</tr>
<tr>
<td>Example: Switch(config-router)# nsf</td>
<td></td>
</tr>
</tbody>
</table>
Verifying EIGRP NSF

Step 1  Verify that “nsf” appears in the EIGRP configuration of the SSO-enabled device by entering the show running-config command:

Example:
Switch show running-config
.. .
router eigrp 100
auto-summary
nsf
..

Step 2  Enter the show ip protocols command to verify that NSF is enabled on the device:

Example:
Switch show ip protocols
*** IP Routing is NSF aware ***
Routing Protocol is "ospf 1"
Outgoing update filter list for all interfaces is not set
Incoming update filter list for all interfaces is not set
Router ID 192.0.2.3
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
Maximum path: 1
Routing for Networks:
Routing on Interfaces Configured Explicitly (Area 0):
Loopback0

Feature History and Information for NSF with SSO
Configuring Wireless High Availability

- Finding Feature Information, on page 1755
- Information about High Availability, on page 1755
- Information about Access Point Stateful Switch Over, on page 1755
- Initiating Graceful Switchover, on page 1756
- Configuring EtherChannels, on page 1756
- Configuring LACP, on page 1756
- Troubleshooting High Availability, on page 1758

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information about High Availability

The high availability feature is enabled by default when the switches are connected using the stack cable and the Cisco StackWise-160 technology is enabled. You cannot disable it; however, you can initiate a manual graceful-switchover using the command line interface to use the high availability feature enabled in the switch.

Information about Access Point Stateful Switch Over

An Access Point Stateful Switch Over (AP SSO) implies that all the access point sessions are switched over state-fully and the user session information is maintained during a switchover, and access points continue to operate in network with no loss of sessions, providing improved network availability. The active switch in the stack is equipped to perform all network functions, including IP functions and routing information exchange. The switch supports 1000 access points and 12000 clients.

However, all the clients are de-authenticated and need to be re-associated with the new active switch except for the locally switched clients in FlexConnect mode when a switchover occurs.
Once a redundancy pair is formed while in a stack, high availability is enabled, which includes that access points continue to remain connected during an active-to-standby switchover.

Note: You cannot disable AP SSO while in a switch stack once the switches form a redundant pair.

## Initiating Graceful Switchover

To perform a manual switchover and to use the high availability feature enabled in the switch, execute the `redundancy force-switchover` command. This command initiates a graceful switchover from the active to the standby switch.

```
Switch# redundancy force-switchover
System configuration has been modified. Save ? [yes/no] : yes
Building configuration ...
Preparing for switchover ...
Compressed configuration from 14977 bytes to 6592 bytes[OK]
This will reload the active unit and force switchover to standby[confirm] : y
```

## Configuring EtherChannels

The LAG, or an EtherChannel, bundles all the existing ports in both the standby and active units into a single logical port to provide an aggregate bandwidth of 60 Gbps. The creation of an EtherChannel enables protection against failures. The EtherChannels or LAGs created are used for link redundancy to ensure high availability of access points.

### Step 1
Connect two switches that are in powered down state using the stack cable.

### Step 2
Power up and perform a boot on both switches simultaneously or power and boot one switch.

The switches boot up successfully, and form a high availability pair.

### Step 3
Configure EtherChannel or LAG on the units.

### Step 4
Use the `show etherchannel summary` command to view the status of the configured EtherChannel.

On successful configuration, all the specified ports will be bundled in a single channel and listed in the command output of `show etherchannel summary`.

### Step 5
Execute the `show ap uptime` command to verify the connected access points.

## Configuring LACP

### SUMMARY STEPS

1. `configure terminal`
2. `interface port-channel number`
3. `lacp max-bundle number`
4. `lacp port-priority number`
5. `switchport backup interface po2`
6. `end`
7. `show etherchannel summary`
8. `show interfaces switchport backup`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>

Troubleshooting High Availability

Access the Standby Console

You can only access the console of the active switch in a stack. To access the standby switch, use the following commands.

Before you begin
Use this functionality only under supervision of Cisco Support.

SUMMARY STEPS
1. configure terminal
2. service internal
3. redundancy
4. main-cpu
5. standby console enable
6. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 service internal</td>
<td>Enables Cisco IOS debug commands.</td>
</tr>
<tr>
<td>Example: Switch(config)# service internal</td>
<td></td>
</tr>
<tr>
<td>Step 3 redundancy</td>
<td>Enters redundancy configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# redundancy</td>
<td></td>
</tr>
<tr>
<td>Step 4 main-cpu</td>
<td>Enters the redundancy main configuration submode.</td>
</tr>
<tr>
<td>Example: Switch(config)# main-cpu</td>
<td></td>
</tr>
<tr>
<td>Step 5 standby console enable</td>
<td>Enables the standby console.</td>
</tr>
<tr>
<td>Example: Switch(config)# standby console enable</td>
<td></td>
</tr>
<tr>
<td>Step 6 exit</td>
<td>Exits the configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Before a Switchover

A switchover happens when the active switch fails; however, while performing a manual switchover, you can execute these commands to initiate a successful switchover:

**SUMMARY STEPS**

1. show redundancy states
2. show switch detail
3. show platform ses states
4. show ap summary
5. show capwap detail
6. show dtls database-brief
7. show power inline

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 show redundancy states</td>
<td>Displays the high availability role of the active and standby switches.</td>
</tr>
<tr>
<td>Example: Switch# show redundancy states</td>
<td></td>
</tr>
<tr>
<td>Step 2 show switch detail</td>
<td>Display physical property of the stack. Verify if the physical states of the stacks are &quot;Ready&quot; or &quot;Port&quot;.</td>
</tr>
<tr>
<td>Example: Switch# show switch detail</td>
<td></td>
</tr>
<tr>
<td>Step 3 show platform ses states</td>
<td>Displays the sequences of the stack manager.</td>
</tr>
<tr>
<td>Example: Switch# show platform ses states</td>

Viewing Redundancy Switchover History (GUI)

**Step 1**
Click Monitor > Controller > Redundancy > States.

The Redundancy States page is displayed. The values for the following parameters are displayed in the page:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Index</td>
<td>Displays the index number of the of the redundant unit.</td>
</tr>
<tr>
<td>Previous Active</td>
<td>Displays the Switches that was active before.</td>
</tr>
<tr>
<td>Current Active</td>
<td>Displays the Switches that is currently active.</td>
</tr>
<tr>
<td>Switch Over Time</td>
<td>Displays the system time when the switchover occurs.</td>
</tr>
<tr>
<td>Switch Over Reason</td>
<td>Displays the cause of the switchover.</td>
</tr>
</tbody>
</table>

**Step 2**
Click Apply.
**Viewing Switchover States (GUI)**

**Step 1**  
Click **Monitor > Controller > Redundancy > States.**

The Redundancy States page is displayed. The values for the following parameters are displayed in the page:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>My State</td>
<td>Shows the state of the active CPU Switch module. Values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Active</td>
</tr>
<tr>
<td></td>
<td>• Standby HOT</td>
</tr>
<tr>
<td></td>
<td>• Disable</td>
</tr>
<tr>
<td>Peer State</td>
<td>Displays the state of the peer (or standby) CPU Switch module. Values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Standby HOT</td>
</tr>
<tr>
<td></td>
<td>• Disable</td>
</tr>
<tr>
<td>Mode</td>
<td>Displays the current state of the redundancy peer. Values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Simplex— Single CPU switch module</td>
</tr>
<tr>
<td></td>
<td>• Duplex— Two CPU switch modules</td>
</tr>
<tr>
<td>Unit ID</td>
<td>Displays the unit ID of the CPU switch module.</td>
</tr>
<tr>
<td>Redundancy Mode</td>
<td>Displays the current operational redundancy mode supported on the unit.</td>
</tr>
<tr>
<td>(Operational)</td>
<td></td>
</tr>
<tr>
<td>Redundancy Mode</td>
<td>Displays the current configured redundancy mode supported on the unit.</td>
</tr>
<tr>
<td>(Configured)</td>
<td></td>
</tr>
<tr>
<td>Redundancy State</td>
<td>Displays the current functioning redundancy state of the unit. Values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• SSP</td>
</tr>
<tr>
<td></td>
<td>• Not Redundant</td>
</tr>
<tr>
<td>Manual SWACT</td>
<td>Displays whether manual switchovers have been enabled without the force option.</td>
</tr>
<tr>
<td>Communications</td>
<td>Displays whether communications are up or down between the two CPU Switch modules.</td>
</tr>
<tr>
<td>Client Count</td>
<td>Displays the number of redundancy subsystems that are registered as RF clients.</td>
</tr>
<tr>
<td>Client Notification</td>
<td>Displays, in milliseconds, the time that an internal RF timer has for notifying RF client subsystems.</td>
</tr>
<tr>
<td>TMR</td>
<td></td>
</tr>
<tr>
<td>Keep Alive TMR</td>
<td>Displays, in milliseconds, the time interval the RF manager has for sending keep-alive messages to its peer on the standby CPU switch module.</td>
</tr>
<tr>
<td>Keep Alive Count</td>
<td>Displays the number of keep-alive messages sent without receiving a response from the standby CPU Switch module.</td>
</tr>
<tr>
<td>Keep Alive Threshold</td>
<td>Displays the threshold for declaring that interprocessor communications are down when keep-alive messages have been enabled (which is the default).</td>
</tr>
<tr>
<td>RF Debug Mask</td>
<td>Displays an internal mask used by the RF to keep track of which debug modes are on.</td>
</tr>
</tbody>
</table>

**Step 2**  
Click **Apply.**

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Administering the Switch

System Time and Date Management

You can manage the system time and date on your switch using automatic configuration methods (RTC and NTP), or manual configuration methods.

System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- NTP
- Manual configuration
The system clock can provide time to these services:

- User `show` commands
- Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is `authoritative` or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

### Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

#### NTP Stratum

NTP uses the concept of a `stratum` to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

#### NTP Associations

The communications between devices running NTP (known as `associations`) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

#### NTP Security

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.
NTP Implementation

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 97: Typical NTP Network Configuration

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F, respectively.

If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Version 4

NTP version 4 is implemented on the switch. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.
NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

**System Name and Prompt**

You configure the system name on the switch to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

**Stack System Name and Prompt**

If you are accessing a stack member through the active switch, you must use the `session stack-member-number` privileged EXEC command. The stack member number range is . When you use this command, the stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is Switch.

**Default System Name and Prompt Configuration**

The default switch system name and prompt is Switch.

**DNS**

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as ping, telnet, connect, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a com domain name, so its domain name is cisco.com. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as ftp.cisco.com.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

**Default DNS Settings**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled.</td>
</tr>
</tbody>
</table>
### Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

The MOTD and login banners are not configured.

### Default Banner Configuration

The MOTD and login banners are not configured.

### MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the switch learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

### MAC Address Table Creation

With multiple MAC addresses supported on all ports, you can connect any port on the switch to other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.
MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

MAC Addresses and Switch Stacks

The MAC address tables on all stack members are synchronized. At any given time, each stack member has the same copy of the address tables for each VLAN. When an address ages out, the address is removed from the address tables on all stack members. When a switch joins a switch stack, that switch receives the addresses for each VLAN learned on the other stack members. When a stack member leaves the switch stack, the remaining stack members age out or remove all addresses learned by the former stack member.

Default MAC Address Table Settings

The following table shows the default settings for the MAC address table.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aging time</td>
<td>300 seconds</td>
</tr>
<tr>
<td>Dynamic addresses</td>
<td>Automatically learned</td>
</tr>
<tr>
<td>Static addresses</td>
<td>None configured</td>
</tr>
</tbody>
</table>

ARP Table Management

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called address resolution.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the `arpa` keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.
How to Administer the Switch

Configuring the Time and Date Manually

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

Note
You must reconfigure this setting if you have manually configured the system clock before the active switch fails and a different stack member assumes the role of active switch.

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

SUMMARY STEPS
1. Use one of the following:
   • clock set \textit{hh:mm:ss day month year}
   • clock set \textit{hh:mm:ss month day year}

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Sets the system clock using one of these formats:</td>
</tr>
<tr>
<td>Use one of the following:</td>
<td>• \textit{hh:mm:ss}—Specifies the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone.</td>
</tr>
<tr>
<td>• clock set \textit{hh:mm:ss day month year}</td>
<td>• \textit{day}—Specifies the day by date in the month.</td>
</tr>
<tr>
<td>• clock set \textit{hh:mm:ss month day year}</td>
<td>• \textit{month}—Specifies the month by name.</td>
</tr>
<tr>
<td>Example:</td>
<td>• \textit{year}—Specifies the year (no abbreviation).</td>
</tr>
<tr>
<td>Switch# clock set 13:32:00 23 March 2013</td>
<td></td>
</tr>
</tbody>
</table>

Configuring the Time Zone

SUMMARY STEPS
1. configure terminal
2. clock timezone \textit{zone hours-offset [minutes-offset]}
3. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> clock timezone zone hours-offset [minutes-offset]</td>
<td>Sets the time zone.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
| Switch(config)# clock timezone AST -3 30 | Internal time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set.
- *zone*—Enters the name of the time zone to be displayed when standard time is in effect. The default is UTC.
- *hours-offset*—Enters the hours offset from UTC.
- *(Optional) minutes-offset*—Enters the minutes offset from UTC. This available where the local time zone is a percentage of an hour different from UTC. |
| **Step 3** end | Returns to privileged EXEC mode. |
| **Example:** | |
| Switch(config)# end | |

## Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

### SUMMARY STEPS

1. configure terminal
2. clock summer-time zone date date month year hh:mm date month year hh:mm [offset]]
3. clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]
4. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring a System Name

#### SUMMARY STEPS

1. `configure terminal`
2. `hostname name`

---

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td><code>clock summer-time zone date date month year hh:mm date month year hh:mm [offset]]</code></td>
<td>Configures summer time to start and end on specified days every year.</td>
</tr>
</tbody>
</table>

**Example:**

```
Switch(config)# clock summer-time PDT date 10 March 2013 2:00 3 November 2013 2:00
```

| Step 3 | `clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]` | Configures summer time to start and end on the specified days every year. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. Summer time is disabled by default. If you specify `clock summer-time zone recurring` without parameters, the summer time rules default to the United States rules. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere. |

**Example:**

```
Switch(config)# clock summer-time PDT recurring 10 March 2013 2:00 3 November 2013 2:00
```

| Step 4 | `end` | Returns to privileged EXEC mode. |

**Example:**

```
Switch(config)# end
```
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td><code>hostname name</code></td>
<td>Configures a system name. When you set the system name, it is also used as the system prompt.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Switch(config)# <code>hostname name remote-users</code></td>
<td>The default setting is Switch. The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters.</td>
</tr>
<tr>
<td>3.</td>
<td><code>end</code></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Switch(config)# <code>end</code></td>
<td></td>
</tr>
</tbody>
</table>

### Setting Up DNS

If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

### SUMMARY STEPS

1. `configure terminal`
2. `ip domain-name name`
3. `ip name-server server-address1 [server-address2 ... server-address6]`
4. `ip domain-lookup [nsap | source-interface interface]`
5. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Switch# <code>configure terminal</code></td>
<td></td>
</tr>
</tbody>
</table>
## Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

### Step 2

**ip domain-name name**

**Example:**

Switch(config)# ip domain-name Cisco.com

- Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name).
- Do not include the initial period that separates an unqualified name from the domain name.
- At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).

### Step 3

**ip name-server server-address1 [server-address2 ... server-address6]**

**Example:**

Switch(config)# ip name-server 192.168.1.100 192.168.1.200 192.168.1.300

- Specifies the address of one or more name servers to use for name and address resolution.
- You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.

### Step 4

**ip domain-lookup [nsap | source-interface interface]**

**Example:**

Switch(config)# ip domain-lookup

- (Optional) Enables DNS-based hostname-to-address translation on your switch. This feature is enabled by default.
- If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).

### Step 5

**end**

**Example:**

Switch(config)# end

- Returns to privileged EXEC mode.

---

## Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

### SUMMARY STEPS

1. configure terminal
2. banner motd message

---
### Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

#### SUMMARY STEPS

1. `configure terminal`
2. `banner login c message c`
3. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# <code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the login message.</td>
</tr>
<tr>
<td><code>banner login c message c</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# <code>banner login #</code> This is a secure site. Only authorized users are allowed. For access, contact technical support. #</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><code>end</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# <code>end</code></td>
</tr>
</tbody>
</table>
### Command or Action

**Example:**

Switch(config)# banner login $
Access for authorized users only.
Please enter your username and password.
$

c—Enters the delimiting character of your choice, for example, a pound sign (#), and press the **Return** key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded.

**message**—Enters a login message up to 255 characters. You cannot use the delimiting character in the message.

**Step 3**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

---

### Managing the MAC Address Table

### Changing the Address Aging Time

**SUMMARY STEPS**

1. `configure terminal`
2. `mac address-table aging-time [0 | 10-1000000] [routed-mac | vlan vlan-id]`
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

`mac address-table aging-time [0 | 10-1000000] [routed-mac | vlan vlan-id]`

**Example:**

Switch(config)# mac address-table aging-time 500 vlan 2

Sets the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated.

The range is 10 to 1000000 seconds. The default is 300. You can also enter 0, which disables aging. Static address entries are never aged or removed from the table.

`vlan-id`—Valid IDs are 1 to 4094.

**Step 3**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.
Configuring MAC Address Change Notification Traps

SUMMARY STEPS

1. configure terminal
2. snmp-server host host-addr community-string notification-type { informs | traps } { version { 1 | 2c | 3 } } { vrf vrfinstance name }
3. snmp-server enable traps mac-notification change
4. mac address-table notification change
5. mac address-table notification change [ interval value ] [ history-size value ]
6. interface interface-id
7. snmp trap mac-notification change { added | removed }
8. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 snmp-server host host-addr community-string notification-type { informs</td>
<td>traps } { version { 1</td>
</tr>
<tr>
<td>Example: Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification</td>
<td>• host-addr—Specifies the name or address of the NMS.</td>
</tr>
<tr>
<td></td>
<td>• traps (the default)—Sends SNMP traps to the host.</td>
</tr>
<tr>
<td></td>
<td>• informs—Sends SNMP informs to the host.</td>
</tr>
<tr>
<td></td>
<td>• version—Specifies the SNMP version to support. Version 1, the default, is not available with informs.</td>
</tr>
<tr>
<td></td>
<td>• community-string—Specifies the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command.</td>
</tr>
<tr>
<td></td>
<td>• notification-type—Uses the mac-notification keyword.</td>
</tr>
<tr>
<td></td>
<td>• vrf vrfinstance name—Specifies the VPN routing/forwarding instance for this host.</td>
</tr>
<tr>
<td>Step 3 snmp-server enable traps mac-notification change</td>
<td>Enables the switch to send MAC address change notification traps to the NMS.</td>
</tr>
<tr>
<td>Example: Switch(config)# snmp-server enable traps mac-notification change</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 4 | `mac address-table notification change`  
Example: Switch(config)# mac address-table notification change | Enables the MAC address change notification feature. |
| Step 5 | `mac address-table notification change [interval value] [history-size value]`  
Example: Switch(config)# mac address-table notification change interval 123  
Switch(config)# mac address-table notification change history-size 100 | Enters the trap interval time and the history table size.  
- (Optional) **interval value**—Specifies the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second.  
- (Optional) **history-size value**—Specifies the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1. |
| Step 6 | `interface interface-id`  
Example: Switch(config)# interface gigabitethernet1/0/2 | Enters interface configuration mode, and specifies the Layer 2 interface on which to enable the SNMP MAC address notification trap. |
| Step 7 | `snmp trap mac-notification change {added | removed}`  
Example: Switch(config-if)# snmp trap mac-notification change added | Enables the MAC address change notification trap on the interface.  
- Enables the trap when a MAC address is **added** on this interface.  
- Enables the trap when a MAC address is **removed** from this interface. |
| Step 8 | `end`  
Example: Switch(config-if)# end | Returns to privileged EXEC mode. |

## Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN. Beginning in privileged EXEC mode, follow these steps to configure the switch to send MAC address-move notification traps to an NMS host:

### SUMMARY STEPS

1. `configure terminal`
2. `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type`
3. `snmp-server enable traps mac-notification move`
4. `mac address-table notification mac-move`
5. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>

### Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

### SUMMARY STEPS

1. `configure terminal`
2. `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type`
3. `snmp-server enable traps mac-notification threshold`
4. `mac address-table notification threshold {limit percentage} | {interval time}`
5. `mac address-table notification threshold {limit percentage} | {interval time}`
6. `end`

Configuration Examples for Switch Administration

Example: Setting the System Clock

This example shows how to manually set the system clock:

```
Switch# clock set 13:32:00 23 July 2013
```

Examples: Configuring Summer Time

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

```
Switch(config)# clock summer-time PDT recurring PST date
10 March 2013 2:00 3 November 2013 2:00
```

This example shows how to set summer time start and end dates:

```
Switch(config)# clock summer-time PST date
20 March 2013 2:00 20 November 2013 2:00
```

Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

```
Switch(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Switch(config)#
```

This example shows the banner that appears from the previous configuration:

```
Unix> telnet 192.0.2.15
Trying 192.0.2.15...
Connected to 192.0.2.15.
Escape character is '^]'.
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
```
User Access Verification

Password:

Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign ($) symbol as the beginning and ending delimiter:

Switch(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
Switch(config)#

Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 123
Switch(config)# mac address-table notification change history-size 100
Switch(config)# interface gigabitethernet1/2/1
Switch(config-if)# snmp trap mac-notification change added

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification threshold
Switch(config)# mac address-table notification threshold
Switch(config)# mac address-table notification threshold interval 123
Switch(config)# mac address-table notification threshold limit 78

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:
Example: Configuring Unicast MAC Address Filtering

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Performing Switch Setup Configuration

Review the sections in this module before performing your initial switch configuration tasks that include IP address assignments and DHCP autoconfiguration.

Switch Boot Process

To start your switch, you need to follow the procedures in the hardware installation guide for installing and powering on the switch and setting up the initial switch configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The normal boot process involves the operation of the boot loader software and includes these activities:

- Locates the bootable (base) package in the bundle or installed package set.
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
• Initializes the file systems on the system board.

• Loads a default operating system software image into memory and boots up the switch.

The boot loader provides access to the file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door mechanism provides enough access to the system so that if it is necessary, you can reinstall the operating system software image by using the `emergency-install` command and restart the operating system.

Before you can assign switch information, make sure you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match these of the switch console port:

• Baud rate default is 9600.

• Data bits default is 8.

• Stop bits default is 2 (minor).

• Parity settings default is none.

Software Installer Features

The following software installer features are supported on your switch:

• Software bundle installation on a standalone switch, a switch stack, or a subset of switches in a stack. The default is installation on all the switches if a switch stack is configured.

• In a stack of switches, Cisco recommends all switches in install mode.

• Software rollback to a previously installed package set.

• Emergency installation in the event that no valid installed packages reside on the boot flash.

• Auto-upgrade of a switch that joins the switch stack with incompatible software.

• Installation using packages on one switch as the source for installing packages on another switch in the switch stack.

Note

Software installation and rollback must be performed while running only in installed mode. You can use the `software expand` EXEC command to convert bundle boot mode to install mode.
Software Boot Modes

Your switch supports two modes to boot the software packages:

- Installed mode
- Bundle mode

Related Topics
- Examples: Displaying Software Bootup in Install Mode, on page 1823
- Example: Emergency Installation, on page 1825

Installed Boot Mode

You can boot your switch in installed mode by booting the software package provisioning file that resides in flash:

switch: boot flash:packages.conf

The provisioning file contains a list of software packages to boot, mount, and run. The ISO file system in each installed package is mounted to the root file system directly from flash.

Note
The packages and provisioning file used to boot in installed mode must reside in flash. Booting in installed mode from usbflash0: or tftp: is not supported.

Related Topics
- Examples: Displaying Software Bootup in Install Mode, on page 1823
- Example: Emergency Installation, on page 1825

Bundle Boot Mode

You can boot your switch in bundle boot mode by booting the bundle (.bin) file:

switch: boot flash:cat3850-universalk9.SSA.03.08.83.EMD.150-8.83.EMD.bin

The provisioning file contained in a bundle is used to decide which packages to boot, mount, and run. Packages are extracted from the bundle and copied to RAM. The ISO file system in each package is mounted to the root file system.

Unlike install boot mode, additional memory that is equivalent to the size of the bundle is used when booting in bundle mode.

Unlike install boot mode, bundle boot mode is available from several locations:

- flash:
- usbflash0:
- tftp:

Note
Auto install and smart install functionality is not supported in bundle boot mode.
Boot Mode for a Switch Stack

All the switches in a stack must be running in installed mode or bundle boot mode. A mixed mode stack is not supported. If a new switch tries to join the stack in a different boot mode then the active switch, the new switch is given a V-mismatch state.

If a mixed mode switch stack is booted at the same time, then all the switches except for the active switch is given a V-mismatch state. If the boot mode does not support auto-upgrade, then the switch stack members must be re-booted in the same boot mode as the active switch.

If the stack is running in installed mode, the auto-upgrade feature can be used to automatically upgrade the new switch that is attempting to join the switch stack.

The auto-upgrade feature changes the boot mode of the new switch to installed mode. If the stack is running in bundle boot mode, the auto-upgrade feature is not available. You will be required to use the bundle mode to boot the new switch so that it can join the switch stack.

This is an example of the state of a switch that attempts to join the switch stack when the boot mode is not compatible with the active switch:

```
Switch# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
-----------------------------------------------
1 Member 6400.f125.1a00 1 0 V-Mismatch
*2 Active 6400.f125.1100 1 V01 Ready
```

Switches Information Assignment

You can assign IP information through the switch setup program, through a DHCP server, or manually.

Use the switch setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the stack master or to any other stack member. You can still manage the stack through the same
IP address even if you remove the stack master or any other stack member from the stack, provided there is IP connectivity.

---

**Note**

Stack members retain their IP address when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP address of the switch that you removed from the switch stack.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

---

**Note**

If you are using DHCP, do not respond to any of the questions in the setup program until the switch receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the switch configuration steps, manually configure the switch. Otherwise, use the setup program described in the Boot Process section.

### Default Switch Information

### DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your switch (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch. However, you need to configure the DHCP server for various lease options associated with IP addresses.
DHCP Client Request Process

If you want to use DHCP client autoconfiguration, you need to configure a Trivial File Transfer Protocol (TFTP) server to fetch the configuration file. The DHCP client then applies the new configuration file to its running configuration.

Note

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

Note

We recommend a redundant connection between a switch stack and the DHCP, DNS, and TFTP servers. This is to help ensure that these servers remain accessible in case one of the connected stack members is removed from the switch stack.

The DHCP server for your switch can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your switch and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

DHCP Client Request Process

When you boot up your switch, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the switch. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

*Figure 98: DHCP Client and Server Message Exchange*

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the switch receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the
parameters, or that the client has been slow in responding to the DHCP OFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the switch accepts replies from a BOOTP server and configures itself, the switch broadcasts, instead of unicasts, TFTP requests to obtain the switch configuration file.

The DHCP hostname option allows a group of switches to obtain hostnames and a standard configuration from the central management DHCP server. A client (switch) includes in its DHCPDISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the hostname global configuration command is not configured or the no hostname global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the ip address dhcp interface configuration command. In this case, if the client receives the DHCP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

**DHCP-based Autoconfiguration and Image Update**

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more switches in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new switch added to a network are synchronous with the network.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

**Restrictions for DHCP-based Autoconfiguration**

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.

- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.

- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.

- The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the write memory or copy running-configuration startup-configuration privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

**DHCP Autoconfiguration**

DHCP autoconfiguration downloads a configuration file to one or more switches in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the switch. It does not over write the bootup configuration saved in the flash, until you reload the switch.
DHCP Auto-Image Update

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more switches in your network. The switch (or switches) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

To enable a DHCP auto-image update on the switch, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the switch in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the switch, and the new image is downloaded and installed on the switch. When you reboot the switch, the configuration is stored in the saved configuration on the switch.

DHCP Server Configuration Guidelines

Follow these guidelines if you are configuring a device as a DHCP server:

• You should configure the DHCP server with reserved leases that are bound to each switch by the switch hardware address.

• If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:
  • IP address of the client (required)
  • Subnet mask of the client (required)
  • DNS server IP address (optional)
  • Router IP address (default gateway address to be used by the switch) (required)

• If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
  • TFTP server name (required)
  • Boot filename (the name of the configuration file that the client needs) (recommended)
  • Hostname (optional)

• Depending on the settings of the DHCP server, the switch can receive IP address information, the configuration file, or both.

• If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the switch is not configured. If the router IP address or the TFTP server name are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

• The switch can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch but are not configured.
Purpose of the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the switch attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, ciscoconfig, hostname-config, or hostname.cfg, where hostname is the switch’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The network-config or the ciscoconfig file (known as the default configuration files).
- The router-config or the ciscoconfig file (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the switch, or if it is to be accessed by the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. The preferred solution is to configure the DHCP server with all the required information.

Purpose of the DNS Server

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same LAN or on a different LAN from the switch. If it is on a different LAN, the switch must be able to access it through a router.

How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the switch and provided in the DHCP reply (one-file read method).

  The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.
• The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).

The switch receives its IP address, subnet mask, and the configuration filename from the DHCP server. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

• Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

The switch receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the network-config or cisconet.cfg default configuration file. (If the network-config file cannot be read, the switch reads the cisconet.cfg file.)

The default configuration file contains the hostnames-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the switch uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the switch uses the default as its hostname.

After obtaining its hostname from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its hostname (hostname-config or hostname.cfg, depending on whether network-config or cisconet.cfg was read earlier) from the TFTP server. If the cisconet.cfg file is read, the filename of the host is truncated to eight characters.

If the switch cannot read the network-config, cisconet.cfg, or the hostname file, it reads the router-config file. If the switch cannot read the router-config file, it reads the ciscortr.cfg file.

---

Note

The switch broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

---

How to Control Environment Variables

With a normally operating switch, you enter the boot loader mode only through the console connection configured for 9600 bps. Unplug the switch power cord, and press the Mode button while reconnecting the power cord. You can release the Mode button after all the amber system LEDs turn on and remain solid. The boot loader switch prompt then appears.

The switch boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader, or any other software running on the system, operates. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system. Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, “”) is a variable with a value. Many environment variables are predefined and have default values.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.
Common Environment Variables

This table describes the function of the most common environment variables.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Boot Loader Command</th>
<th>Cisco IOS Global Configuration Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOT</td>
<td>set BOOT filesystem :/file-url ...</td>
<td>boot system filesystem :/file-url ...</td>
</tr>
<tr>
<td></td>
<td>A semicolon-separated list of executable files to try to load and execute when automatically booting.</td>
<td>Specifies the Cisco IOS image to load during the next boot cycle and the stack members on which the image is loaded. This command changes the setting of the BOOT environment variable. The package provisioning file, also referred to as the packages.conf file, is used by the system to determine which software packages to activate during boot up.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• When booting in installed mode, the package provisioning file specified in the boot command is used to determine which packages to activate. For example boot flash:packages.conf.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• When booting in bundle mode, the package provisioning file contained in the booted bundle is used to activate the packages included in the bundle. For example, boot flash:image.bin.</td>
</tr>
<tr>
<td>MANUAL_BOOT</td>
<td>set MANUAL_BOOT yes</td>
<td>boot manual</td>
</tr>
<tr>
<td></td>
<td>Decides whether the switch automatically or manually boots.</td>
<td>Enables manually booting the switch during the next boot cycle and changes the setting of the MANUAL_BOOT environment variable. The next time you reboot the system, the switch is in boot loader mode. To boot up the system, use the boot flash:filesystem :/file-url boot loader command, and specify the name of the bootable image.</td>
</tr>
<tr>
<td></td>
<td>Valid values are 1, yes, 0, and no. If it is set to no or 0, the boot loader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the boot loader mode.</td>
<td></td>
</tr>
</tbody>
</table>
Environment Variables for TFTP

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

**Table 161: Environment Variables for TFTP**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_ADDR</td>
<td>Specifies the MAC address of the switch.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>We recommend that you do not modify this variable.</td>
</tr>
<tr>
<td></td>
<td>However, if you modify this variable after the boot loader is up or the value is different from the saved value, enter this command before using TFTP.</td>
</tr>
<tr>
<td>IP_ADDR</td>
<td>Specifies the IP address and the subnet mask for the associated IP subnet of the switch.</td>
</tr>
<tr>
<td>DEFAULT_ROUTER</td>
<td>Specifies the IP address and subnet mask of the default gateway.</td>
</tr>
</tbody>
</table>
Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the switch at a later time (for example, late at night or during the weekend when the switch is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all switches in the network).

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.

- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The `reload` command halts the system. If the system is not set to manually boot up, it reboots itself.

If your switch is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the switch from entering the boot loader mode and then taking it from the remote user’s control.

If you modify your configuration file, the switch prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the CONFIG_FILE environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.

How to Perform Switch Setup Configuration

Using DHCP to download a new image and a new configuration to a switch requires that you configure at least two switches. One switch acts as a DHCP and TFTP server and the second switch (client) is configured to download either a new configuration file or a new configuration file and a new image file.

Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing switch in the network so that it can support the autoconfiguration of a new switch.

**SUMMARY STEPS**

1. `configure terminal`
2. `ip dhcp pool poolname`
3. `boot filename`
4. `network network-number mask prefix-length`
5. **default-router address**  
6. **option 150 address**  
7. **exit**  
8. **tftp-server flash:filename.text**  
9. **interface interface-id**  
10. **no switchport**  
11. **ip address address mask**  
12. **end**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** | **configure terminal**  
**Example:**  
Switch# configure terminal |
|  | Enters global configuration mode. |
| **Step 2** | **ip dhcp pool poolname**  
**Example:**  
Switch(config)# ip dhcp pool pool |
|  | Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode. |
| **Step 3** | **boot filename**  
**Example:**  
Switch(dhcp-config)# boot config-boot.text |
|  | Specifies the name of the configuration file that is used as a boot image. |
| **Step 4** | **network network-number mask prefix-length**  
**Example:**  
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0 |
|  | Specifies the subnet network number and mask of the DHCP address pool.  
**Note**  
The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/). |
| **Step 5** | **default-router address**  
**Example:**  
Switch(dhcp-config)# default-router 10.10.1.1 |
|  | Specifies the IP address of the default router for a DHCP client. |
| **Step 6** | **option 150 address**  
**Example:**  
|  | Specifies the IP address of the TFTP server. |
## Command or Action

<table>
<thead>
<tr>
<th>Command/Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Switch(dhcp-config)# option 150 10.10.1</code></td>
<td>Switch the DHCP configuration context.</td>
</tr>
</tbody>
</table>

### Step 7

**exit**

*Example:*

```shell
Switch(dhcp-config)# exit
```

**Purpose: Returns to global configuration mode.**

### Step 8

**tftp-server flash:filename.text**

*Example:*

```shell
Switch(config)# tftp-server flash:config-boot.text
```

**Purpose: Specifies the configuration file on the TFTP server.**

### Step 9

**interface interface-id**

*Example:*

```shell
Switch(config)# interface gigabitethernet1/0/4
```

**Purpose: Specifies the address of the client that will receive the configuration file.**

### Step 10

**no switchport**

*Example:*

```shell
Switch(config-if)# no switchport
```

**Purpose: Puts the interface into Layer 3 mode.**

### Step 11

**ip address address mask**

*Example:*

```shell
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
```

**Purpose: Specifies the IP address and mask for the interface.**

### Step 12

**end**

*Example:*

```shell
Switch(config-if)# end
```

**Purpose: Returns to privileged EXEC mode.**

## Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing switch to support the installation of a new switch.
**Before you begin**

You must first create a text file (for example, autoinstall_dhcp) that will be uploaded to the switch. In the text file, put the name of the image that you want to download.

### SUMMARY STEPS

1. `configure terminal`
2. `ip dhcp pool poolname`
3. `boot filename`
4. `network network-number mask prefix-length`
5. `default-router address`
6. `option 150 address`
7. `option 125 hex`
8. `copy tftp flash filename.txt`
9. `copy tftp flash imagename.bin`
10. `exit`
11. `tftp-server flash: config.text`
12. `tftp-server flash: imagename.bin`
13. `tftp-server flash: filename.txt`
14. `interface interface-id`
15. `no switchport`
16. `ip address address mask`
17. `end`
18. `copy running-config startup-config`

Manually Assigning IP Information to Multiple SVIs

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):

**Note**
If the switch is running the IP services feature set, you can also manually assign IP information to a port if you first put the port into Layer 3 mode by using the `no switchport` interface configuration command.

**SUMMARY STEPS**

1. configure terminal
2. interface vlan vlan-id
3. ip address ip-address subnet-mask
4. exit
5. ip default-gateway ip-address
6. end

Modifying the Switch Startup Configuration

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

**Before you begin**

Use a standalone switch for this task.

**SUMMARY STEPS**

1. `configure terminal`
2. `boot flash:/file-url`
3. `end`
4. `show boot`
5. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code>  Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch# configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>boot flash:/file-url</code>  Specifies the configuration file to load during the next boot cycle.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# boot flash:config.text</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>end</code>  Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch(config)# end</code></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>show boot</code>  Verifies your entries.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>The <code>boot</code> global configuration command changes the setting of the CONFIG_FILE environment variable.</td>
</tr>
</tbody>
</table>
## Manually Booting the Switch

By default, the switch automatically boots up; however, you can configure it to manually boot up.

**Before you begin**

Use a standalone switch for this task.

### SUMMARY STEPS

1. configure terminal
2. boot manual
3. end
4. show boot
5. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Enters global configuration mode.</strong></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>boot manual</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Enables the switch to manually boot up during the next boot cycle.</strong></td>
</tr>
<tr>
<td>Switch(config)# boot manual</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Returns to privileged EXEC mode.</strong></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>show boot</strong></td>
</tr>
<tr>
<td>Example:</td>
<td><strong>Verifies your entries.</strong></td>
</tr>
<tr>
<td>Switch# show boot</td>
<td></td>
</tr>
</tbody>
</table>

(Optional) Saves your entries in the configuration file.
### Purpose

The **boot manual** global command changes the setting of the `MANUAL_BOOT` environment variable.

The next time you reboot the system, the switch is in boot loader mode, shown by the `switch:` prompt. To boot up the system, use the **boot** boot loader command in installed boot mode or bundle boot mode.

- `switch: boot flash:packages.conf`
- `switch: boot flash:cat3650-universalk9.SSA.03.08.83.EMD.150-8.83.EMD.bin`

Filenames and directory names are case-sensitive.

#### Step 5

**copy running-config startup-config**

Example:

`Switch# copy running-config startup-config`

(Optional) Saves your entries in the configuration file.

### Booting the Switch in Installed Mode

**SUMMARY STEPS**

1. `cp source_file_path destination_file_path`
2. `software expand file source_file_path`
3. `reload`
4. `boot flash:packages.conf`
5. `show version`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>cp source_file_path destination_file_path</code></td>
<td>(Optional) Copies the bin file (<em>image.bin</em>) from the FTP or TFTP server to flash or USB flash.</td>
</tr>
</tbody>
</table>

**Example:**

`Switch# cp source_file_path destination_file_path`

```text
Switch# copy
ftp://10.0.0.6/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
flash:
```

Expands the bin file stored in flash, FTP, TFTP, HTTP, or HTTPS server on the booted switch.

**Note** Ensure that the `packages.conf` file is available in the expanded list.
## Command or Action

<table>
<thead>
<tr>
<th>Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code> to active switch 1</td>
<td>Finished downloading file</td>
</tr>
<tr>
<td><code>tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code> to active switch 1</td>
<td>Copying software from active switch 1 to switch 2</td>
</tr>
<tr>
<td><code>cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code></td>
<td>Finished copying software to switch 2</td>
</tr>
<tr>
<td><code>cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code></td>
<td>Expanding bundle</td>
</tr>
<tr>
<td><code>cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code></td>
<td>Copying package files</td>
</tr>
<tr>
<td><code>cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code></td>
<td>Package files copied</td>
</tr>
<tr>
<td><code>cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</code></td>
<td>Finished expanding bundle</td>
</tr>
</tbody>
</table>

### Step 3

**Command:** `reload`  
**Example:**  
Switch: `reload`

**Purpose:** Reloads the switch.

**Note:** You can boot the switch manually or automatically using the `packages.conf` file. If you are booting manually, you can proceed to Step 4. Otherwise, the switch boots up automatically.

### Step 4

**Command:** `boot flash:packages.conf`  
**Example:**  
Switch: `boot flash:packages.conf`

**Purpose:** Boots the switch with the `packages.conf` file.

### Step 5

**Command:** `show version`  
**Example:**  
Switch: `show version`

**Purpose:** Verifies that the switch is in the INSTALL mode.
Booting the Switch in Bundle Mode

There are several methods by which you can boot the switch—either by copying the bin file from the TFTP server and then boot the switch, or by booting the switch straight from flash or USB flash using the commands `boot flash:<image.bin>` or `boot usbflash0:<image.bin>`.

The following procedure explains how to boot the switch from the TFTP server in the bundle mode.

**SUMMARY STEPS**

1. `cp source_file_path destination_file_path`
2. `switch:BOOT=<source path of .bin file>`
3. `boot`
4. `show version`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>cp source_file_path destination_file_path</code></td>
<td>(Optional) Copies the bin file(<code>image.bin</code>) from the FTP or TFTP server to flash or USB flash.</td>
</tr>
</tbody>
</table>
| **Example:**
  Switch# `copy tftp://10.0.0.6/cat3k_caa-universalk9.SSA.03.12.02.EXP.150-12.02.EXP.150-12.02.EXP.bin flash:` | |
| **Step 2** `switch:BOOT=<source path of .bin file>` | Sets the boot parameters. |
| **Example:**
  Switch:
  switch:BOOT=tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin | |
| **Step 3** `boot` | Boots the switch. |
| **Example:**
  switch: `boot` | |
| **Step 4** `show version` | Verifies that the switch is in the BUNDLE mode. |
| **Example:**
  switch# `show version`
  Switch Ports Model SW Version
  SW Image Mode
  -------- ------ ------ ----------
  ----------- ----
  1 6 WS-C3850-6DS-S 03.09.40.EXP
  ct3850-ipservicesk9 BUNDLE | |

Booting a Specific Software Image On a Switch Stack

**SUMMARY STEPS**

1. `configure terminal`
2. `boot system switch {number | all} flash:image_file| tftp: image_file | usbflash0: image_file`
3. `end`
4. show boot system
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  configure terminal
  Example:
  Switch# configure terminal | Enters global configuration mode. |
| **Step 2**
  boot system switch {number | all} flash:image_file | ftp: image_file | tftp: image_file | usbflash0: image_file | (Optional) For switches in a stack, specifies the switch members on which the system image is loaded during the next boot cycle:
  • Use number to specify a stack member. (Specify only one stack member.)
  • Use all to specify all stack members. |
| **Step 3**
  end
  Example:
  Switch(config)# end | Returns to privileged EXEC mode. |
| **Step 4**
  show boot system
  Example:
  Switch# show boot system | Verifies your entries. |
| **Step 5**
  copy running-config startup-config
  Example:
  Switch# copy running-config startup-config | (Optional) Saves your entries in the configuration file. |

**Configuring a Scheduled Software Image Reload**

This task describes how to configure your switch to reload the software image at a later time.

**SUMMARY STEPS**

1. configure terminal
2. copy running-config startup-config
3. reload in [hh:]mm [text]
4. `reload at hh: mm [month day | day month] [text]`
5. `reload cancel`
6. `show reload`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> copy running-config startup-config</td>
<td>Saves your switch configuration information to the startup configuration before you use the <code>reload</code> command.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> reload in [hh:]mm [text]</td>
<td>Schedules a reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# reload in 12</code></td>
<td></td>
</tr>
<tr>
<td>System configuration has been modified. Save? [yes/no]: y</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> reload at hh: mm [month day</td>
<td>day month] [text]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# reload at 14:00</code></td>
<td></td>
</tr>
<tr>
<td><strong>Note</strong> Use the at keyword only if the switch system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the switch. To schedule reloads across several switches to occur simultaneously, the time on each switch must be synchronized with NTP.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> reload cancel</td>
<td>Cancels a previously scheduled reload.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)# reload cancel</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> show reload</td>
<td>Displays information about a previously scheduled reload or identifies if a reload has been scheduled on the switch.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>show reload</code></td>
<td></td>
</tr>
</tbody>
</table>

Example: Configuring a Switch to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

Switch# configure terminal
Switch(config)# boot host dhcp
Switch(config)# boot host retry timeout 300
Switch(config)# banner config-save "Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically Download Configuration Files at Reboot"
Switch(config)# vlan 99
Switch(config-vlan)# interface vlan 99
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# show boot
BOOT path-list:
  Config file: flash:/config.text
  Private Config file: flash:/private-config.text
Enable Break: no
Manual Boot: no
HELPERS path-list:
  NVRAM/Config file
    buffer size: 32768
  Timeout for Config
Examples: Scheduling Software Image Reload

This example shows how to reload the software on the switch on the current day at 7:30 p.m:

Switch# reload at 19:30
Reload scheduled for 19:30:00 UTC Wed Jun 5 2013 (in 2 hours and 25 minutes)
Proceed with reload? [confirm]

This example shows how to reload the software on the switch at a future time:

Switch# reload at 02:00 jun 20
Reload scheduled for 02:00:00 UTC Thu Jun 20 2013 (in 344 hours and 53 minutes)
Proceed with reload? [confirm]

Configuring Right-To-Use Licenses

- Finding Feature Information, on page 1831
- Restrictions for Configuring RTU Licenses, on page 1831
- Information About Configuring RTU Licenses, on page 1832
- How to Configure RTU Licenses, on page 1835
- Monitoring and Maintaining RTU Licenses, on page 1840
- Configuration Examples for RTU Licensing, on page 1840
- Additional References for RTU Licensing, on page 1844
- Feature History and Information for RTU Licensing, on page 1845

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring RTU Licenses

The following are the restrictions for configuring and using RTU licenses.

- AP count licenses can be ordered and pre-activated on your switch.
- Imaged based licenses can be upgraded. AP count licenses can be deactivated and moved between switches and controllers.
- To activate a permanent license, you must reboot your switch after configuring the new image level. The AP-count license does not require a reboot to activate.
- An expired image based evaluation license can not be reactivated after reboot.
- Stack members of a switch stack must run the same license level.
- Licenses on mixed switch stacks are not supported.
• Your switch is pre-installed with the image that you ordered. If an image was not pre-ordered, then the switch is booted with a LAN base image by default.
• Adder AP-count licenses are installed in the factory.

Information About Configuring RTU Licenses

Right-To-Use Licensing

Right-to-use (RTU) licensing allows you to order and activate a specific license type and level, and then to manage license usage on your switch. The types of licenses available to order are:

• Permanent licenses—Purchased with a specific feature set with no expiration date.
• Evaluation licenses—Pre-installed on the switch and is valid for only a 90 day in-use period.

To activate a permanent or evaluation license, you are required to accept the End-User License Agreement (EULA). For the evaluation license, you are notified to purchase a permanent license or deactivate the license before the 90 day period expires.

A permanent license can be moved from one device to another. To activate a license, you must reboot your switch.

An evaluation license is a manufacturing image on your switch and is not transferable to another switch. This type of license cannot be reactivated after reboot.

Related Topics
Activating an Imaged Based License, on page 1835
Examples: Activating RTU Image Based Licenses, on page 1840

Right-To-Use Image Based Licenses

Right-to-use imaged licenses support a set of features based on a specific image-based license:

• LAN Base—Layer 2 features.
• IP Base—Layer 2 and Layer 3 features.
• IP Services—Layer 2, Layer 3, and IPv6 features. (Applicable only to switches and not controllers.)

The default image based license is LAN Base.

Right-To-Use License States

After you configure a specific license type and level, you can manage your licenses by monitoring the license state.
### Table 162: RTU License States

<table>
<thead>
<tr>
<th>License State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active, In Use</td>
<td>EULA was accepted and the license is in use after device reboot.</td>
</tr>
<tr>
<td>Active, Not In Use</td>
<td>EULA was accepted and the switch is ready to use when the license is enabled.</td>
</tr>
<tr>
<td>Not Activated</td>
<td>EULA was not accepted.</td>
</tr>
</tbody>
</table>

Guidelines to follow when monitoring your image based license state:

- A purchased permanent license is set to **Active, In Use** state only after a switch reboot.
- If more than one license was purchased, a reboot will activate the license with the highest feature set. For instance, the IP Services license is activated and not the LAN Base license.
- Remaining licenses purchased after switch reboot, stay in **Active, Not In Use** state.

### License Activation for Switch Stacks

Right-to-use licensing is supported on switch stacks. A switch is a set of up to nine stacking-capable switches connected through their StackWise-160 ports. You can connect only one switch type in a stack. One switch in the stack is identified as the active switch and the remaining switches are standby switches. The active switch is the switch that is activated with an RTU license and from its active console, the license level for the standby switches in the stack can be activated at the same time.

A new switch is allowed to join the switch stack if its license level matches. If there is a mismatch, then the active switch can reconfigure the license level and reboot it to allow it to join the stack.

### Mobility Controller Mode

AP-count licenses are used only when the switch is in Mobility Controller mode. The MC is the gatekeeper for tracking the AP-count licenses and allows an access point to join or not.

Management of AP-count licenses is performed by the switch in mobility controller mode configurable through the CLI.

**Related Topics**

[Changing Mobility Mode](#), on page 1838

### Right-To-Use AP-Count Licensing

Right-to-use licensing (RTU) allows you to order and activate a specific license type, and then to manage license usage on your switch.
You can order your switch with support for a specific number of adder access point count licenses, but the total number of licenses ordered should not exceed 25. You can also order your adder access point count licenses after receiving the switch.

For example, if you have ordered 25 new adder licenses, you can add only those ordered adder licenses to the switch. The licenses can be added in increments of 1, but the total number of licenses added for the switch should not exceed 25.

You can configure your switch to manage the access point count licenses and view the number of access points currently in use from the CLI.

The following are two different types of access point licenses:

1. Permanent licenses for the access points
   - Adder access point count license—You can purchase the adder license to increase the switch capacity at a later time. You can transfer the adder access point count license from one switch to another.

2. Evaluation licenses for the access points
   - You can activate these licenses to evaluate more access points before purchasing the licenses.
   - The maximum number of access points that can be evaluated is 25.
   - The evaluation period for using the access point licenses is 90 days.
   - You can activate and deactivate the evaluation licenses from the CLI.

**Related Topics**
- [Activating an AP-Count License](#), on page 1836
- [Obtaining an Upgrade or Capacity Adder License](#), on page 1837
- [Rehosting a License](#), on page 1838

**Right-to-Use AP-Count Evaluation Licenses**

If you are considering upgrading to a license with a higher access point count, you can try an evaluation license before upgrading to a permanent version of the license. For example, if you are using a permanent license with a 10 access-point count and want to try an evaluation license with a 15-access-point count, you can try out the evaluation license for 90 days.

When an evaluation license is activated, the permanent AP-count licenses are ignored. The maximum supported licenses of 25 access points are available for 90 days.

To prevent disruptions in operation, the switch does not change licenses when an evaluation license expires. A warning expiry message is displayed daily starting five days prior to the expiry date. After 90 days, the evaluation license expires with a warning message. You must disable the evaluation license and then purchase the permanent license.

When the switch reboots after the evaluation license expiry, the license defaults to a permanent license.

Right-To-Use Adder AP-Count Rehosting Licenses

Revoking a license from one device and installing it on another is called rehosting. You might want to rehost a license to change the purpose of a device.

To rehost a license, you must deactivate the adder ap-count license from one device and activate the same license on another device.

Evaluation licenses cannot be rehosted.

How to Configure RTU Licenses

Activating an Imaged Based License

SUMMARY STEPS

1. `license right-to-use activate {ipbase | ipservices | lanbase} {all | evaluation all} [slot slot-number] [ acceptEULA]`
2. `reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`
3. `show license right-to-use usage [ slot slot-number ]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>`license right-to-use activate {ipbase</td>
<td>ipservices</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;Switch# license right-to-use activate ipservices all acceptEULA</td>
<td></td>
</tr>
<tr>
<td>2.</td>
<td>`reload [LINE</td>
<td>at</td>
</tr>
<tr>
<td></td>
<td>Example:&lt;br&gt;Switch# reload slot 1&lt;br&gt;Proceed with reload? [confirm] y</td>
<td></td>
</tr>
<tr>
<td>3.</td>
<td><code>show license right-to-use usage [ slot slot-number ]</code></td>

## Configuration Examples for RTU Licensing

### Examples: Activating RTU Image Based Licenses

This example shows how to activate an IP Services image license and accept the EULA for a specific slot:

```
Switch# license right-to-use activate ipservices slot 1 acceptEULA
`switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level`
```

This example shows how to activate a license for evaluation:

```
Switch# license right-to-use activate ipservices evaluation acceptEULA
`switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level`
```

### Related Topics
- Activating an Imaged Based License, on page 1835
Examples: Displaying RTU Licensing Information

This example shows the consolidated RTU licensing information from the active switch on a switch stack. All of the members in the stack have the same license level. When the evaluation AP-count license is activated, the adder AP-count licenses are ignored. The maximum number of AP-count licenses are available when evaluation is enabled.

Switch# show license right-to-use summary

<table>
<thead>
<tr>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
<th>Period left</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipservices</td>
<td>permanent</td>
<td>10</td>
<td>Lifetime</td>
</tr>
<tr>
<td>apcount</td>
<td>evaluation</td>
<td>15</td>
<td>90</td>
</tr>
</tbody>
</table>

License Level In Use: ipservices
License Level on Reboot: ipbase
Evaluation AP-Count: Enabled
Total AP Count Licenses: 25
AP Count Licenses In-use: 10
AP Count Licenses Remaining: 15

This example shows a summary of permanent and adder licenses. The evaluation AP-count license is disabled displaying the total number of activated adder AP-count licenses in the switch stack. AP-count licenses in-use mean that they are connected.

Switch# show license right-to-use summary

<table>
<thead>
<tr>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
<th>Period left</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipservices</td>
<td>permanent</td>
<td>N/A</td>
<td>Lifetime</td>
</tr>
<tr>
<td>apcount</td>
<td>base</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>apcount</td>
<td>adder</td>
<td>25</td>
<td>Lifetime</td>
</tr>
</tbody>
</table>

License Level In Use: ipservices
License Level on Reboot: ipservices eval
Evaluation AP-Count: Disabled
Total AP Count Licenses: 25
AP Count Licenses In-use: 10
AP Count Licenses Remaining: 15

This example shows the RTU default licenses. Default licenses are pre-installed and cannot be removed or transferred. If no license is activated the switch uses the default license, after a reboot.

Switch# show license right-to-use default

<table>
<thead>
<tr>
<th>Slot#</th>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ipservices</td>

</tbody>
</table>
### Example: Displaying RTU License Details

This example shows all the detailed information for the RTU licenses on slot 1:

```
Switch# show license right-to-use detail slot 1

Index 1: License Name: ipservices
  Period left: Lifetime
  License Type: permanent
  License State: Active, In use
  License Count: Non-Counted
  License Location: Slot 1

Index 2: License Name: ipservices
  Period left: 90
  License Type: evaluation
  License State: Not Activated
  License Count: Non-Counted
  License Location: Slot 1

Index 3: License Name: ipbase
  Period left: Lifetime
  License Type: permanent
  License State: Active, Not In use
  License Count: Non-Counted
  License Location: Slot 1

Index 4: License Name: ipbase
  Period left: 90
  License Type: evaluation
  License State: Not Activated
  License Count: Non-Counted
  License Location: Slot 1

Index 5: License Name: lanbase
  Period left: Lifetime
  License Type: permanent
  License State: Not Activated
  License Count: Non-Counted
  License Location: Slot 1

Index 6: License Name: apcount
  Period left: 90
  License Type: evaluation
  License State: Active, In use
  License Count: 50
  License Location: Slot 1

Index 7: License Name: apcount
```

---

### Table: License Details

<td>10</td>
</tr>
</tbody>
</table>
Example: Displaying RTU License Mismatch

This example shows the license information of the switches in a stack and a mismatch state of a member switch. The member must match the active.

Switch# `show switch`

```
Switch/Stack Mac Address : 6400.f125.0c80

Switch# Role Mac Address Priority Version State
-----------------------------------------------
1 Standby 6400.f125.1b00 1 0 Ready
*2 Active 6400.f125.0c80 1 V01 Ready
3 Member 6400.f125.1780 1 0 Lic-Mismatch
```

Note To resolve the license mismatch, first check the RTU license summary:

Switch# `show switch right-to-use summary`

Then change the license level of the mismatched switch so that it is the same license level of the active switch. This example shows that the IP Base license was activated for the member switch to match the active switch.

Switch# `license right-to-use activate ipbase slot 1 acceptEULA`

Example: Displaying RTU Licensing Usage

This example shows the detailed licensing usage on your switch stack. The IP Services license in Slot 1 is permanent and usage is one day. An AP-count license in Slot 2 is ready for evaluation. EULA was accepted and state shows in use, but after reboot the evaluation license will be deactivated.

Switch# `show license right-to-use usage`

```
Slot# License Name Type usage-duration(y:m:d) In-Use EULA
-----------------------------------------------
```

CHAPTER 90

Configuring Administrator Usernames and Passwords

• Finding Feature Information, on page 1847
• Information About Configuring Administrator Usernames and Passwords, on page 1847
• Configuring Administrator Usernames and Passwords, on page 1848
• Examples: Administrator Usernames and Passwords Configuration, on page 1850
• Additional References for Administrator Usernames and Passwords, on page 1850
• Feature History and Information For Performing Administrator Usernames and Passwords Configuration, on page 1851

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Administrator Usernames and Passwords

You can configure administrator usernames and passwords to prevent unauthorized users from reconfiguring the switch and viewing configuration information. This section provides instructions for initial configuration and for password recovery.

You can also set administrator usernames and passwords to manage and configure one or more access points that are associated with the switch.

Strong Passwords

You can set strong administrator passwords such as encrypted passwords with ASCII keys for the administrator user for managing access points.

Use the following guidelines while creating strong passwords:
• There should be at least three of the following categories—lowercase letters, uppercase letters, digits, and special characters.

• The new password should not be the same as that of the associated username and the username should not be reversed.

• The characters in the password should not be repeated more than three times consecutively.

• The password should not be `cisco`, `ocsic`, `admin`, `nimda`, or any variant obtained by changing the capitalization of letters therein, or by substituting "1" "$" or "1!" for i, and/or substituting "0" for "o", and/or substituting "$" for "s".

• The maximum number of characters accepted for the username and password is 32.

Encrypted Passwords

You can set three types of keys for the password:

• Randomly generated key—This key is generated randomly and it is the most secure option. To export the configuration file from one system to another, the key should also be exported.

• Static key—The simplest option is to use a fixed (static) encryption key. By using a fixed key, no key management is required, but if the key is somehow discovered, the data can be decrypted by anyone with the knowledge of that key. This is not a secure option and it is called obfuscation in the CLI.

• User defined key—You can define the key by yourself. To export the configuration file from one system to another, both systems should have the same key configured.

Configuring Administrator Usernames and Passwords

SUMMARY STEPS

1. `configure terminal`
2. `wireless security strong-password`
3. `username admin-username password {0 unencrypted_password | 7 hidden_password | unencrypted_text}`
4. `username admin-username secret {0 unencrypted_secret_text | 4 SHA256 encrypted_secret_text | 5 MD5 encrypted_secret_text | LINE}`
5. `ap mgmtuser username password {0 unencrypted_password | 8 AES encrypted password | secret {0 unencrypted_password | 8 AES encrypted password}}`
6. `ap dot1x username username password {0 unencrypted_password | 8 AES encrypted password}`
7. `end`
8. `ap name apname mgmtuser username usernamepassword password secret secret_text`
9. `ap name apname dot1x-user username password`

DETAILED STEPS

<tr>
<td>Example: Switch(config)# username adminuser1 secret 0 QZsek239@</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> ap mgmtuser username username password {0 unencrypted_password</td>
<td>8 AES encrypted password</td>
<td>secret {0 unencrypted_password</td>
</tr>
<tr>
<td>Note: If your password is not strong enough to fulfill the strong password policy, then the password is rejected with a valid error message. For example, the following password is rejected because it is not a strong password. Switch# ap mgmtuser username cisco password 0 abcd secret 0 1234</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# ap mgmtuser username cisco password 0 Qwc112@ secret 0 Qwc114@!</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> ap dot1x username username password {0 unencrypted_password</td>
<td>8 AES encrypted password}</td>
<td>Specifies the 802.1X username and password for managing all of the access points configured to the switch.</td>
</tr>
<tr>
<td>Example: Switch(config)# ap dot1x username cisco password 0 Qwc112@</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> ap name apname mgmtuser username username password password secret secret_text</td>
<td>Configures the administrator username, password, and secret text for managing a specific access point that is configured to the switch.</td>
<td></td>
</tr>
<tr>
<td>Example: Switch# ap name APf0£7.55c7.7b23 mgmtuser username cisco password Qne35! secret Nsep592@</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

**Step 9**

Configure the 802.1X username and password for a specific access point.

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ap name apname dot1x-user username password password</code></td>
<td>Configures the 802.1X username and password for a specific access point.</td>
</tr>
</tbody>
</table>

**Example:**

Switch\# `ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qne35!`

### Examples: Administrator Usernames and Passwords Configuration

This example shows how to configure administrator usernames and passwords with the strong password policy in configuration mode:

Switch\# `configure terminal`  
Switch\# `wireless security strong-password`  
Switch\# `username adminuser1 password 0 QZsek239@`  
Switch\# `ap mgmtuser username cisco password 0 Qwci12@ secret 0 Qwci14@`  
Switch\# `ap dot1x username cisco password 0 Qwci12@`  
Switch\# `end`

This example shows how to configure administrator usernames and passwords for an access point in global EXEC mode:

Switch\# `wireless security strong-password`  
Switch\# `ap name APf0f7.55c7.7b23 mgmtuser username cisco password Qwci12@ secret Qwci14@`  
Switch\# `ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qwci12@`  
Switch\# `end`

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on Band Selection, 802.11 Bands, and Parameters

• Band-selection enabled WLANs do not support time-sensitive applications like voice and video because of roaming delays.

• Band selection can be used only with Cisco Aironet 1040, 1140, 1250, 1260, 3500, and the 3600 series access points.

• Band selection operates only on access points that are connected to a controller. A FlexConnect access point without a controller connection does not perform band selection after a reboot.

• The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running.
• You can enable both band selection and aggressive load balancing on the controller. They run independently and do not impact one another.

• It is not possible to enable or disable band selection and client load balancing globally through the controller GUI or CLI. You can, however, enable or disable band selection and client load balancing for a particular WLAN. Band selection and client load balancing are enabled globally by default.

Information About Configuring Band Selection, 802.11 Bands, and Parameters

Band Selection

Band selection enables client radios that are capable of dual-band (2.4- and 5-GHz) operation to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of three nonoverlapping channels. To prevent these sources of interference and improve overall network performance, you can configure band selection on the switch.

Band selection is enabled globally by default.

Band selection works by regulating probe responses to clients. It makes 5-GHz channels more attractive to clients by delaying probe responses to clients on 2.4-GHz channels.

802.11 Bands

You can configure the 802.11b/g/n (2.4-GHz) and 802.11a/n (5-GHz) bands for the controller to comply with the regulatory requirements in your country. By default, both 802.11b/g/n and 802.11a/n are enabled.

When a controller is configured to allow only 802.11g traffic, 802.11b client devices are able to successfully connect to an access point but cannot pass traffic. When you configure the controller for 802.11g traffic only, you must mark 11g rates as mandatory.

802.11n Parameter

This section provides instructions for managing 802.11n devices such as the Cisco Aironet 1140 and 3600 Series Access Points on your network. The 802.11n devices support the 2.4- and 5-GHz bands and offer high-throughput data rates.

The 802.11n high-throughput rates are available on all 802.11n access points for WLANs using WMM with no Layer 2 encryption or with WPA2/AES encryption enabled.

Note

Some Cisco 802.11n APs may intermittently emit incorrect beacon frames, which can trigger false wIPS alarms. We recommend that you ignore these alarms. The issue is observed in the following Cisco 802.11n APs: 1140, 1250, 2600, 3500, and 3600.
802.11h Parameter

802.11h informs client devices about channel changes and can limit the transmit power of those client devices.

How to Configure 802.11 Bands and Parameters

Configuring Band Selection (CLI)

SUMMARY STEPS

1. configure terminal
2. wireless client band-select cycle-count cycle_count
3. wireless client band-select cycle-threshold milliseconds
4. wireless client band-select expire suppression seconds
5. wireless client band-select expire dual-band seconds
6. wireless client band-select client-rssi client_rssi
7. end
8. wlan wlan_profile_name wlan_ID SSID_network_name band-select
9. end

### Configuring the 802.11 Bands (CLI)

You can configure 802.11 bands and parameters.

#### SUMMARY STEPS

1. configure terminal
2. ap dot11 5ghz shutdown
3. ap dot11 24ghz shutdown
4. ap dot11 {5ghz | 24ghz} beaconperiod time_unit
5. ap dot11 {5ghz | 24ghz} fragmentation threshold
6. ap dot11 {5ghz | 24ghz} dtpc
7. wireless client association limit number interval milliseconds
8. ap dot11 {5ghz | 24ghz} rate rate {disable | mandatory | supported}
9. no ap dot11 5ghz shutdown
10. no ap dot11 24ghz shutdown
11. ap dot11 24ghz dot11g
12. end

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 8</strong></td>
<td>Specifies the rate at which data can be transmitted between the controller and the client.</td>
</tr>
</tbody>
</table>
| *ap dot11 {5ghz | 24ghz} rate {disable | mandatory | supported}* | • *disabled*—Defines that the clients specify the data rates used for communication.  
• *mandatory*—Defines that the clients support this data rate in order to associate to an access point on the controller.  
• *supported*—Any associated clients that support this data rate may communicate with the access point using that rate. However, the clients are not required to be able to use this rate in order to associate.  
• *rate*—Specifies the rate at which data is transmitted. For the 802.11a and 802.11b bands, the data is transmitted at the rate of 1, 2, 5.5, 6, 9, 11, 12, 18, 24, 36, 48, or 54 Mbps. |
| **Example:** | |
| Switch(config)# *ap dot11 5ghz rate 36 mandatory* | |
| **Step 9** | Enables the 802.11a band. |
| *no ap dot11 5ghz shutdown* | **Note** The default value is enabled. |
| **Example:** | |
| Switch(config)# *no ap dot11 5ghz shutdown* | |
| **Step 10** | Enables the 802.11b band. |
| *no ap dot11 24ghz shutdown* | **Note** The default value is enabled. |
| **Example:** | |
| Switch(config)# *no ap dot11 24ghz shutdown* | |
| **Step 11** | Enables or disables 802.11g network support. |
| *ap dot11 24ghz dot11g* | The default value is enabled. You can use this command only if the 802.11b band is enabled. If you disable this feature, the 802.11b band is enabled without 802.11g support. |
| **Example:** | |
| Switch(config)# *ap dot11 24ghz dot11g* | |
| **Step 12** | Returns to privileged EXEC mode. |
| *end* | |
| **Example:** | |
| Switch(config)# *end* | |
Configuring the 802.11 Bands (GUI)

Step 1  Choose Configuration > Wireless > 802.11a/n/ac > Network or Configuration > Wireless > 802.11b/g/n > Network to open the Global Parameters page.

Step 2  Select the 802.11a/n/ac (or 802.11b/g) Network Status check box to enable the 802.11a or 802.11b/g band. To disable the band, unselect the check box. The default value is enabled. You can enable both the 802.11a and 802.11b/g bands.

Step 3  If you enabled the 802.11b/g band in Step 2, select the 802.11g Support check box if you want to enable 802.11g network support. The default value is enabled. If you disable this feature, the 802.11b band is enabled without 802.11g support.

Step 4  Specify the period at which the SSID is broadcast by the access point by entering a value between 20 and 1000 milliseconds (inclusive) in the Beacon Period text box. The default value is 100 milliseconds.

Note  The beacon period in controllers is listed in terms of milliseconds. The beacon period can also be measured in time units, where one time unit equals 1024 microseconds or 0.1024 milliseconds. If a beacon interval is listed as 100 milliseconds in a controller, it is only a rounded off value for 102.4 milliseconds. Due to hardware limitation in certain radios, even though the beacon interval is, say 100 time units, it is adjusted to 102 time units, which roughly equals 104.448 milliseconds. When the beacon period is to be represented in terms of time units, the value is adjusted to the nearest multiple of 17.

Step 5  Specify the size at which packets are fragmented by entering a value between 256 and 2346 bytes (inclusive) in the Fragmentation Threshold text box. Enter a low number for areas where communication is poor or where there is a great deal of radio interference.

Step 6  Make access points advertise their channel and transmit power level in beacons and probe responses for CCX clients. Select the DTPC Support check box. Otherwise, unselect this check box. The default value is enabled.

Client devices using dynamic transmit power control (DTPC) receive the channel and power level information from the access points and adjust their settings automatically. For example, a client device used primarily in Japan could rely on DTPC to adjust its channel and power settings automatically when it travels to Italy and joins a network there.

Note  On access points that run Cisco IOS software, this feature is called world mode.

Note  DTPC and 801.11h power constraint cannot be enabled simultaneously.

Step 7  Specify the maximum allowed clients by entering a value between 1 to 200 in the Maximum Allowed Client text box. The default value is 200.

Step 8  Use the Data Rates options to specify the rates at which data can be transmitted between the access point and the client. These data rates are available:

- 802.11a—6, 9, 12, 18, 24, 36, 48, and 54 Mbps
- 802.11b/g—1, 2, 5.5, 6, 9, 11, 12, 18, 24, 36, 48, or 54 Mbps

For each data rate, choose one of these options:

- **Mandatory**—Clients must support this data rate in order to associate to an access point on the controller.
- **Supported**—Any associated clients that support this data rate may communicate with the access point using that rate. However, the clients are not required to be able to use this rate in order to associate.
- **Disabled**—The clients specify the data rates used for communication.
### Configuring 802.11n Parameters (CLI)

#### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 {5ghz | 24ghz} dot11n`
3. `ap dot11 {5ghz | 24ghz} dot11n mcs tx rtu`
4. `wlan wlan_profile_name wlan_ID SSID_network_name wmm require`
5. `ap dot11 {5ghz | 24ghz} shutdown`
6. `{ap | no ap} dot11 {5ghz | 24 ghz} dot11n a-mpdu tx priority {all | 0-7}`
7. `no ap dot11 {5ghz | 24ghz} shutdown`
8. `ap dot11 {5ghz | 24ghz} dot11n guard-interval {any | long}`
9. `ap dot11 {5ghz | 24ghz} dot11n rifs rx`
10. `end`

<td><strong>Step 4</strong> <code>wlan wlan_profile_name wlan_ID SSID_network_name wmm require</code></td>
<td>Enables WMM on the WLAN and uses the 802.11n data rates that you configured.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# <code>wlan wlan1 25 ssid12</code></td>
<td>The <strong>require</strong> parameter requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.</td>
</tr>
<tr>
<td><strong>Switch(config-wlan)# wmm require</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> `ap dot11 {5ghz</td>
<td>24ghz} shutdown`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
</tbody>
</table>
Purpose

Command or Action

Switch(config)# ap dot11 5ghz shutdown

Step 6

{ap | no ap} dot11 {5ghz | 24 ghz} dot11n a-mpdu tx priority {all | 0-7}

Example:

Switch(config)# ap dot11 5ghz dot11n a-mpdu tx priority all

Specifies the aggregation method used for 802.11n packets. Aggregation is the process of grouping packet data frames together rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). Both A-MPDU and A-MSDU are performed in the software.

You can specify the aggregation method for various types of traffic from the access point to the clients.

The following table defines the priority levels (0-7) assigned per traffic type.

### Table 163: Traffic Type Priority Levels

<table>
<thead>
<tr>
<th>User Priority</th>
<th>Traffic Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Best effort</td>
</tr>
<tr>
<td>1</td>
<td>Background</td>
</tr>
<tr>
<td>2</td>
<td>Spare</td>
</tr>
<tr>
<td>3</td>
<td>Excellent effort</td>
</tr>
<tr>
<td>4</td>
<td>Controlled load</td>
</tr>
<tr>
<td>5</td>
<td>Video, less than 100-ms latency and jitter</td>
</tr>
<tr>
<td>6</td>
<td>Voice, less than 100-ms latency and jitter</td>
</tr>
<tr>
<td>7</td>
<td>Network control</td>
</tr>
</tbody>
</table>

You can configure each priority level independently, or you can use the all parameter to configure all of the priority levels at once. You can configure priority levels so that the traffic uses either A-MPDU transmission or A-MSDU transmission.

- When you use the `ap` command along with the other options, the traffic associated with that priority level uses A-MPDU transmission.
- When you use the `no ap` command along with the other options, the traffic associated with that priority level uses A-MSDU transmission.

Configure the priority levels to match the aggregation method used by the clients. By default, A-MPDU is enabled for priority level 0, 4 and 5 and the rest are...

**Configuring the 802.11n Parameters (GUI)**

**Step 1** Choose **Configuration > Wireless > 802.11a/n/ac or 802.11b/g/n > High Throughput (802.11n)** to open the 802.11n/ac (5 GHz or 2.4 GHz) Throughput page.

**Step 2** Select the **Enable 11n** check box to enable 802.11n support on the network. The default value is enabled.

**Step 3** Select the check boxes of the desired rates to specify the modulation and coding scheme (MCS) rates at which data can be transmitted between the access point and the client. These data rates, which are calculated for a 20-MHz channel width using a short guard interval, are available:

- 0 (7 Mbps)
- 1 (14 Mbps)
- 2 (21 Mbps)
- 3 (29 Mbps)
- 4 (43 Mbps)
- 5 (58 Mbps)
- 6 (65 Mbps)
- 7 (72 Mbps)
- 8 (14 Mbps)
• 9 (29 Mbps)
• 10 (43 Mbps)
• 11 (58 Mbps)
• 12 (87 Mbps)
• 13 (116 Mbps)
• 14 (130 Mbps)
• 15 (144 Mbps)
• 16 (22 Mbps)
• 17 (43 Mbps)
• 18 (65 Mbps)
• 19 (87 Mbps)
• 20 (130 Mbps)
• 21 (173 Mbps)
• 22 (195 Mbps)
• 23 (217 Mbps)

• Any associated clients that support the selected rates may communicate with the access point using those rates. However, the clients are not required to be able to use this rate in order to associate. The MCS settings determine the number of spatial streams, the modulation, the coding rate, and the data rate values that are used.

**Step 4**  
Click **Apply**.

**Step 5**  
Use the 802.11n data rates that you configured by enabling WMM on the WLAN as follows:

a) Choose **WLANs** to open the WLANs page.
b) Click the ID number of the WLAN for which you want to configure WMM mode.
c) When the WLANs > Edit page appears, choose the **QoS** tab to open the WLANs > Edit (Qos) page.
d) From the WMM Policy drop-down list, choose **Required** or **Allowed** to require or allow client devices to use WMM. Devices that do not support WMM cannot join the WLAN.
   
   If you choose **Allowed**, devices that cannot support WMM can join the WLAN but will not benefit from the 802.11n rates.
e) Click **Apply**.

**Step 6**  
Click **Save Configuration**.

**Note**  
To determine if an access point supports 802.11n, look at the 11n Supported text box on either the 802.11a/n (or 802.11b/g/n) Cisco APs > Configure page or the 802.11a/n (or 802.11b/g/n) AP Interfaces > Details page.
Configuring 802.11h Parameters (CLI)

SUMMARY STEPS

Configuration Examples for Band Selection, 802.11 Bands, and Parameters

Examples: Band Selection Configuration

This example shows how to set the probe cycle count and time threshold for a new scanning cycle period for band select:

Switch# configure terminal
Switch(config)# wireless client band-select cycle-count 3
Switch(config)# wireless client band-select cycle-threshold 5000
Switch(config)# end

This example shows how to set the suppression expire to the band select:

Switch# configure terminal
Switch(config)# wireless client band-select expire suppression 100
Switch(config)# end

This example shows how to set the dual band expire for the band select:
Examples: 802.11 Bands Configuration

This example shows how to configure 802.11 bands using beacon interval, fragmentation, and dynamic transmit power control:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 24ghz shutdown
Switch(config)# ap dot11 5ghz beaconperiod 500
Switch(config)# ap dot11 5ghz fragmentation 300
Switch(config)# ap dot11 5ghz dtpc
Switch(config)# wireless client association limit 50 interval 1000
Switch(config)# ap dot11 5ghz rate 36 mandatory
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)# no ap dot11 24ghz shutdown
Switch(config)# ap dot11 24ghz dot11g
Switch(config)#end
```

Examples: 802.11n Configuration

This example shows how to configure 802.11n parameters for 5-GHz band using aggregation method:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz dot11n
Switch(config)# ap dot11 5ghz dot11n mcs tx 20
Switch(config)# wlan wlan1 25 ssid12
Switch(config-wlan)# wmm require\nSwitch(config-wlan)# exit
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz dot11n a-mpdu tx priority all
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)# exit
```

This example shows how to configure the guard interval for 5-GHz band:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz dot11n
```
This example shows how to configure the RIFS for 5-GHz band:

```
Switch(config)# ap dot11 5ghz dot11n rifs rx
```

Examples: 802.11h Configuration

This example shows how to configure the access point to announce when it is switching to a new channel using restriction transmission:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz channelswitch mode 0
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)# end
```

This example shows how to configure the 802.11h power constraint for 5-GHz band:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz power-constraint 200
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)# end
```

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Aggressive Load Balancing

• You can configure aggressive load balancing only from the command-line interface.
• Aggressive load balancing is disabled by default, you must enable it manually.
• You can enable load balancing either separately or together with the band select configurations.
• When the band select is enabled on the dual-band clients, the load balancing parameter selects only the lowest load radio from 5-GHz radios. For the 2.4-GHz clients, there is no probe information of the client on 5 GHz and therefore the load balancing algorithm can only be selected between radio on 2.4 GHz.
• You can operate load balancing of clients between access points on the same switch but not for the clients between access points on the different switch.
Information for Configuring Aggressive Load Balancing Parameters

Aggressive Load Balancing

Enabling aggressive load balancing on the controller allows lightweight access points to load balance wireless clients across access points. You can enable aggressive load balancing using the controller.

When a wireless client attempts to associate to a lightweight access point, association response packets are sent to the client with an 802.11 response packet including status code 17. The code 17 indicates that the AP is busy. The AP responds with an association response bearing 'success' if the AP threshold is not met, and with code 17 (AP busy) if the AP utilization threshold is reached or exceeded and another less busy AP heard the client request.

For example, if the number of clients on AP1 is more than the number of clients on AP2 plus the load-balancing window, then AP1 is considered to be busier than AP2. When a client attempts to associate to AP1, it receives an 802.11 response packet with status code 17, indicating that the access point is busy, and the client attempts to associate to a different access point.

You can configure the controller to deny client associations up to 10 times (if a client attempted to associate 11 times, it would be allowed to associate on the 11th try). You can also enable or disable load balancing on a particular WLAN, which is useful if you want to disable load balancing for a select group of clients (such as time-sensitive voice clients).

The maximum number of client associations that the access points can support is dependent upon the following factors:

- The maximum number of client associations differs for lightweight and autonomous Cisco IOS access points.
- There may be a limit per radio and an overall limit per AP.
- AP hardware (the 16-MB APs have a lower limit than the 32-MB and higher APs)

The Client Association Limits for Lightweight Access Points are as follows:

- For 16-MB APs, the limit is 128 clients per AP. This limit is applicable to 1100 and 1200 series APs.
- For 32-MB and higher APs, there is no per-AP limit.

The maximum Client Association Limits per-radio for all of the Cisco IOS APs is 200 associations.

*Note* With 32-MB and higher lightweight Cisco IOS APs, with two radios, up to 200 + 200 = 400 associations are supported.
The maximum Client Association Limits per Autonomous Cisco IOS access point is around 80 to 127 clients per AP. This number varies depending on the following factors:

- AP model (whether it is 16 MB or 32 MB or higher)
- Cisco IOS software release
- Hardware configuration (two radios use more memory than one)
- Enabled features (WDS functionality in particular)

The per-radio limit is about 200 associations. One association will likely hit the per-AP limit first. Unlike Cisco Unified Wireless Network, autonomous Cisco IOS supports per-SSID/per-AP association limits. This limit is configured using the max-associations CLI, under dot11 SSID. The maximum number is 255 associations (which is also the default number).

# How to Configure Aggressive Load Balancing

## Configuring Aggressive Load Balancing

### SUMMARY STEPS

1. configure terminal
2. wireless load-balancing window client-count
3. wireless load-balancing denial denial-count
4. end
5. wlan wlan_profile_name wlan_ID SSID_network_name load-balance
6. end

**Monitoring Aggressive Load Balancing**

This section describes the new command for aggressive load balancing.

The following command can be used to monitor aggressive load balancing on the switch.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show wireless load-balancing</code></td>
<td>Displays the status of the load-balancing feature.</td>
</tr>
</tbody>
</table>

**Examples: Aggressive Load Balancing Configuration**

This example shows how to configure the load balancing denial count:

```
Switch# configure terminal
Switch(config)# wireless load-balancing denial-count 1
Switch(config)# end
Switch# show wireless load-balancing
```

This example shows how to configure the client window for aggressive load balancing:

```
Switch# configure terminal
Switch(config)# wireless load-balancing window 1
Switch(config)# end
Switch# show wireless load-balancing
```

This example shows how to configure load balancing on specific WLAN:

```
Switch# configure terminal
Switch(config)# wlan wlan1 25 ssid12
Switch(config-wlan)# load-balance
```
Switch(config) # end
Switch# show wireless load-balancing

# Additional References for Aggressive Load Balancing

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring Client Roaming

The following are the restrictions that you should be aware while configuring client roaming:

- Cisco Compatible Extensions (CCX) support is enabled automatically for every WLAN on the switch and cannot be disabled. The switch stores the CCX version of the client in its client database and uses it to generate and respond to CCX frames appropriately. Clients must support CCXv4 or v5 (or CCXv2 for access point assisted roaming) to utilize these roaming enhancements.

- Client roaming between 600 Series Access points is not supported.

Information About Client Roaming

The controllers deliver high-end wireless services to the clients roaming across wireless network. Now, the wireless services are integrated with the switches, thus delivering a value-added Cisco unified new mobility
architecture. This unified architecture enables client-roaming services to both wireless and wired clients with seamless, fast-roaming services.

The new mobility architecture supports fast client roaming services using logical categorization of network into Mobility Domains (MDs), Mobility Groups (MGs), Mobility Subdomains (MSDs), and Switch Peer Groups (SPGs) using systems such as Mobility Oracle (MO), Mobility Controller (MC), and Mobility Agent (MA).

- **A Mobility Domain** is the entire domain across which client roaming is supported. It is a collection of mobility groups. For example, a campus network can be considered as a mobility domain.

- **A Mobility Group** is a collection of mobility subdomains across which fast roaming is supported. The mobility group can be one or more buildings within a campus across which frequent roaming is supported.

- **A Mobility Subdomain** is an autonomous portion of the mobility domain network. Each mobility subdomain contains one mobility controller (MC) and a collection of SPGs. A subdomain is equivalent to an 802.11r key domain.

- **A Switch Peer Group** is a collection of mobility agents.

- **The Mobility Oracle** acts as the point of contact for mobility events that occur across mobility subdomains. The mobility oracle also maintains a local database of each client in the entire mobility domain, their home and current subdomain. There is only one MO for an entire mobility domain. The Cisco WLC 5700 Series Controllers can act as MO.

- **The Mobility Controller** provides mobility management services for inter-SPG roaming events. The MC sends the configuration like SPG name and SPG peer member list to all of the mobility agents under its subdomain. The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.

- **The Mobility Agent** is the component that maintains client mobility state machine for a mobile client. All APs are connected to the mobility agent.

The New mobility architecture supports seamless roaming in the following scenarios:

- **Intra-switch roaming**—The client roaming between APs managed by same mobility agent.

- **Intra-SPG roaming**—The client roaming between mobility agents in the same SPG.

- **Inter-SPG, Intra-subdomain roaming**—The client roaming between mobility agents in different SPGs within the same subdomain.

- **Inter-subdomain roaming**—The client roaming between mobility agents across a subdomain.

**Fast Roaming**

New mobility architecture supports fast roaming when clients roam within a mobility group by eliminating the need for full authentication. Security policies should be same across the switches for fast roaming.

**Local, anchor, foreign MAs and MCs**

When a client joins an MA initially and its point of attachment has not changed, that MA is referred as local or associated MA. The MC to which this MA is associated is referred as local or associated MC.

When a client roams between two MAs, the MA to which the client was previously associated is the anchor MA (point of attachment) and the MA to which the client is currently associated is the foreign or associated...
MA (point of presence). The MCs to which these MAs are associated are referred as anchor, foreign, or associated MCs, respectively.

Inter-Subnet Roaming

Multiple-controller deployments support client roaming across access points managed by controllers in the same mobility group on different subnets. This roaming is transparent to the client because the session is sustained and a tunnel between the controllers allows the client to continue using the same DHCP-assigned or client-assigned IP address as long as the session remains active. The tunnel is torn down, and the client must reauthenticate when the client sends a DHCP Discover with a 0.0.0.0 client IP address or a 169.254.*.* client auto-IP address or when the operator-set user timeout is exceeded.

Voice-over-IP Telephone Roaming

802.11 voice-over-IP (VoIP) telephones actively seek out associations with the strongest RF signal to ensure the best quality of service (QoS) and the maximum throughput. The minimum VoIP telephone requirement of 20-millisecond or shorter latency time for the roaming handover is easily met by the Cisco Unified Wireless Network (Cisco UWN) solution, which has an average handover latency of 5 or fewer milliseconds when open authentication is used. This short latency period is controlled by controllers rather than allowing independent access points to negotiate roaming handovers.

The Cisco UWN solution supports 802.11 VoIP telephone roaming across lightweight access points managed by controllers on different subnets, as long as the controllers are in the same mobility group. This roaming is transparent to the VoIP telephone because the session is sustained and a tunnel between controllers allows the VoIP telephone to continue using the same DHCP-assigned IP address as long as the session remains active. The tunnel is torn down, and the VoIP client must reauthenticate when the VoIP telephone sends a DHCP Discover with a 0.0.0.0 VoIP telephone IP address or a 169.254.*.* VoIP telephone auto-IP address or when the operator-set user timeout is exceeded.

CCX Layer 2 Client Roaming

The controller supports five CCX Layer 2 client roaming enhancements:

- Access point assisted roaming—This feature helps clients save scanning time. When a CCXv2 client associates to an access point, it sends an information packet to the new access point listing the characteristics of its previous access point. Roaming time decreases when the client recognizes and uses an access point list built by compiling all previous access points to which each client was associated and sent (unicast) to the client immediately after association. The access point list contains the channels, BSSIDs of neighbor access points that support the client’s current SSID(s), and time elapsed since disassociation.

- Enhanced neighbor list—This feature focuses on improving a CCXv4 client’s roam experience and network edge performance, especially when servicing voice applications. The access point provides its associated client information about its neighbors using a neighbor-list update unicast message.

- Enhanced neighbor list request (E2E)—The End-2-End specification is a Cisco and Intel joint program that defines new protocols and interfaces to improve the overall voice and roaming experience. It applies only to Intel clients in a CCX environment. Specifically, it enables Intel clients to request a neighbor list at will. When this occurs, the access point forwards the request to the controller. The controller receives the request and replies with the current CCX roaming sublist of neighbors for the access point to which the client is associated.
To see whether a particular client supports E2E, choose **Wireless > Clients** on the controller GUI, click the **Detail** link for the desired client, and look at the E2E Version text box in the Client Properties area.

- **Roam reason report**—This feature enables CCXv4 clients to report the reason why they roamed to a new access point. It also allows network administrators to build and monitor a roam history.
- **Directed roam request**—This feature enables the controller to send directed roam requests to the client in situations when the controller can better service the client on an access point different from the one to which it is associated. In this case, the controller sends the client a list of the best access points that it can join. The client can either honor or ignore the directed roam request. Non-CCX clients and clients running CCXv3 or below must not take any action. No configuration is required for this feature.

# How to Configure Layer 2 or Layer 3 Roaming

## Configuring Layer 2 or Layer 3 Roaming

### Before you begin

To configure the mobility agent for Layer 2 or Layer 3 roaming, the following requisites should be considered:

- SSID and security polices should be same across MAs for Layer 2 and Layer 3 roaming.
- Client VLAN ID should be same for Layer 2 roaming and different for Layer 3 roaming.
- Bridge domain ID and client VLAN IDs should be same for Layer 2 roaming. Either one or both of the bridge domain ID and client VLAN ID should be different for Layer 3 roaming.

## SUMMARY STEPS

1. `configure terminal`
2. `wlan wlan_profile_name wlan_ID SSID_network_name`
3. `no mobility anchor sticky`
4. `end`

## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters WLAN configuration mode.</td>
</tr>
<tr>
<td><code>wlan wlan_profile_name wlan_ID SSID_network_name</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>Switch(config)#wlan wlan1</code></td>
<td></td>
</tr>
</tbody>
</table>
## Configuring CCX Client Roaming Parameters (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 {5ghz | 24ghz} l2roam rf-params {default | custom min-rssi roam-hyst scan-thresh trans-time}`
3. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`ap dot11 {5ghz</td>
<td>24ghz} l2roam rf-params {default</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>Switch#ap dot11 5ghz l2roam rf-params custom -80</code></td>
<td></td>
</tr>
</tbody>
</table>

To choose the default RF parameters, enter the `default` option.
To fine-tune the RF parameters that affect client roaming, enter the `custom` option and then enter any one of the following options:

- **Minimum RSSI**—Indicates minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point.

  If the client’s average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.

  You can configure the minimum RSSI range from –80 through –90 dBm and the default is –85 dBm.

- **Hysteresis**—Indicates how much greater the signal strength of a neighboring access point must be for the client to roam to it.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>This parameter is intended to reduce the amount of roaming between access points if the client is physically located on or near the border between two access points. You can configure the hysteresis range from 3 through 20 dB and the default is 3 dB.</td>
<td></td>
</tr>
<tr>
<td>• Scan Threshold—Indicates a minimum RSSI that is allowed before the client should roam to a better access point. When the RSSI drops below the specified value, the client must be able to roam to a better access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when the RSSI is below the threshold. You can configure the RSSI range from –70 through –77 dBm and the default value is –72 dBm.</td>
<td></td>
</tr>
<tr>
<td>• Transition Time—Indicates the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client’s associated access point is below the scan threshold. The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points. You can configure the time period in the range from 1 through 10 seconds and the default time is 5 seconds.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**

**Example:**

```
Switch(config)# end
```

Returns to privileged EXEC mode. Alternatively, you can also press **Ctrl-Z** to exit global configuration mode.
Example

Configuring Mobility Oracle

SUMMARY STEPS

1. configure terminal

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Application Visibility and Control

Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition engine, and provides application-level visibility and control (QoS) in wireless networks. After the applications are recognized, the AVC feature enables you to either drop, mark, or police the data traffic.

AVC is configured by defining a class map in a QoS client policy to match a protocol.

Using AVC, we can detect more than 1000 applications. AVC enables you to perform real-time analysis and create policies to reduce network congestion, costly network link usage, and infrastructure upgrades.
You can view list of 30 applications in Top Applications in Monitor Summary section of the UI.

Traffic flows are analyzed and recognized using the NBAR2 engine at the access point. Refer to 8.0 protocol pack for the NBAR2-supported protocols or applications. The specific flow is marked with the recognized protocol or application, such as WebEx. This per-flow information can be used for application visibility using Flexible NetFlow (FNF). For more information on FNF, see the Flexible NetFlow Configuration Guide, Cisco IOS XE Release 3E (Cisco WLC 5700 Series). The same application name can also be used for control of traffic using QoS. For more information on QoS, see the QoS Configuration Guide, Cisco IOS XE Release 3E (Cisco WLC 5700 Series).

AVC QoS actions are applied with AVC filters in both upstream and downstream directions. The QoS actions supported for upstream flow are drop, mark, and police, and for downstream flow are mark and police. AVC QoS is applicable only when the application is classified correctly and matched with the class map filter in the policy map. For example, if the policy has a filter based on an application name, and the traffic has also been classified to the same application name, then the action specified for this match in the policy will be applied. For all QoS actions, refer Supported AVC Class Map and Policy Map Formats, on page 1894.

Supported AVC Class Map and Policy Map Formats

<table>

### Prerequisites for Application Visibility and Control

- The access points should be AVC capable.
- For the control part of AVC (QoS) to work, the application visibility feature with FNF has to be configured.

### Guidelines for Inter-Switch Roaming with Application Visibility and Control

Follow these guidelines to prevent clients from getting excluded due to malformed QoS policies:

- When a new QoS policy is added to the switch, a QoS policy with the same name should be added to other switch within the same roam or mobility domain.

- When a switch is loaded with a software image of a later release, the new policy formats are supported. If you have upgraded the software image from an earlier release to a later release, you should save the configuration separately. When an earlier release image is loaded, some QoS policies might show as not supported, and you should restore those QoS policies to supported policy formats.
Restrictions for Application Visibility and Control

How to Configure Application Visibility and Control

Configuring Application Visibility and Control (CLI)

To configure Application Visibility, follow these general steps:

1. Create a flow record by specifying keys and non-key fields to the flow.
2. Create an optional flow exporter by specifying the flow record as an option.
3. Create a flow monitor based on the flow record and flow exporter.
4. Configure WLAN to apply flow monitor in IPv4 input or output direction.

To configure Application Control, follow these general steps:

1. Create an AVC QoS policy.
2. Attach AVC QoS policy to the client in one of three ways: configuring WLAN, using ACS or ISE, or adding local policies.

Creating a Flow Record

By default, wireless avc basic (flow record) is available. When you click Apply from the GUI, then the record is mapped to the flow monitor.

Default flow record cannot be edited or deleted. If you require a new flow record, you need to create one and map it to the flow monitor from CLI.

SUMMARY STEPS

1. configure terminal
2. flow record flow_record_name
3. description string
4. match ipv4 protocol
5. match ipv4 source address
6. match ipv4 destination address
7. match transport source-port
8. match transport destination-port
9. match flow direction
10. match application name
11. match wireless ssid
12. collect counter bytes long
13. collect counter packets long
14. collect wireless ap mac address
15. collect wireless client mac address
16. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> flow record flow_record_name</td>
<td>Enters flow record configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# flow record record1 Switch (config-flow-record)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> description string</td>
<td>(Optional) Describes the flow record as a maximum 63-character string.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config-flow-record)# description IPv4flow</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> match ipv4 protocol</td>
<td>Specifies a match to the IPv4 protocol.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch (config-flow-record)# match ipv4 protocol</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> match ipv4 source address</td>
<td>Specifies a match to the IPv4 source address-based field.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch (config-flow-record)# match ipv4 source address</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> match ipv4 destination address</td>
<td>Specifies a match to the IPv4 destination address-based field.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch (config-flow-record)# match ipv4 destination address</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> match transport source-port</td>
<td>Specifies a match to the transport layer source-port field.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch (config-flow-record)# match transport source-port</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> match transport destination-port</td>
<td>Specifies a match to the transport layer destination-port field.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch (config-flow-record)# match transport destination-port</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> match flow direction</td>
<td>Specifies a match to the direction the flow was monitored in.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch (config-flow-record)# match flow direction</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> match application name</td>
<td>Specifies a match to the application name.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Switch (config-flow-record)# match application name</td>
<td>Note: This action is mandatory for AVC support, as this allows the flow to be matched against the application.</td>
</tr>
</tbody>
</table>

**Step 11**

match wireless ssid  
**Example:**  
Switch (config-flow-record)# match wireless ssid

Specifies a match to the SSID name identifying the wireless network.

**Step 12**

collect counter bytes long  
**Example:**  
Switch (config-flow-record)# collect counter bytes long

Specifies to collect counter fields total bytes.

**Step 13**

collect counter packets long  
**Example:**  
Switch (config-flow-record)# collect counter packets long

Specifies to collect counter fields total packets.

**Step 14**

collect wireless ap mac address  
**Example:**  
Switch (config-flow-record)# collect wireless ap mac address

Specifies to collect the BSSID with MAC addresses of the access points that the wireless client is associated with.

**Step 15**

collect wireless client mac address  
**Example:**  
Switch (config-flow-record)# collect wireless client mac address

Specifies to collect MAC address of the client on the wireless network.  
**Note:** The `collect wireless client mac address` is mandatory configuration for wireless AVC.

**Step 16**

end  
**Example:**  
Switch (config)# end

Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

---

**Creating a Flow Exporter (Optional)**

You can create a flow export to define the export parameters for a flow. This is an optional procedure for configuring flow parameters.

**SUMMARY STEPS**

1. configure terminal  
2. flow exporter flow_exporter_name  
3. description string  
4. destination {hostname | ip-address}  
5. transport udp port-value  
6. option application-table timeout seconds (optional)  
7. option usermac-table timeout seconds (optional)
## Creating a Flow Exporter (Optional)

8. `end`
9. `show flow exporter`
10. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
|      | **Example:**  
|      | Switch# configure terminal | |
| 2.   | `flow exporter flow_exporter_name` | Enters flow exporter configuration mode. |
|      | **Example:**  
|      | Switch(config)# flow exporter record1 | |
|      | Switch (config-flow-exporter)# | |
| 3.   | `description string` | Describes the flow record as a maximum 63-character string. |
|      | **Example:**  
|      | Switch(config-flow-exporter)# description IPv4flow | |
| 4.   | `destination {hostname | ip-address}` | Specifies the hostname or IPv4 address of the system to which the exporter sends data. |
|      | **Example:**  
|      | Switch (config-flow-exporter) # destination 10.99.1.4 | |
| 5.   | `transport udp port-value` | Configures a port value for the UDP protocol. |
|      | **Example:**  
|      | Switch (config-flow-exporter) # transport udp 2 | |
| 6.   | `option application-table timeout seconds (optional)` | (Optional) Specifies application table timeout option. The valid range is from 1 to 86400 seconds. |
|      | **Example:**  
|      | Switch (config-flow-exporter)# option application-table timeout 500 | |
| 7.   | `option usermac-table timeout seconds (optional)` | (Optional) Specifies wireless usermac-to-username table option. The valid range is from 1 to 86400 seconds. |
|      | **Example:**  
|      | Switch (config-flow-exporter)# option usermac-table timeout 1000 | |
| 8.   | `end` | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |
|      | **Example:**  
|      | Switch(config)# end | |
| 9.   | `show flow exporter` | Verifies your configuration. |
|      | **Example:**  
|      | Switch # show flow exporter | |
Creating a Flow Monitor

You can create a flow monitor and associate it with a flow record and a flow exporter.

SUMMARY STEPS

1. configure terminal
2. flow monitor monitor-name
3. description description
4. record record-name
5. exporter exporter-name
6. cache timeout {active | inactive} (Optional)
7. end
8. show flow monitor

DETAILED STEPS

<table>

</tbody>
</table>

### Creating AVC QoS Policy

To create AVC QoS policy, perform these general steps:

1. Create a class map with match protocol filters.
2. Create a policy map.
3. Apply a policy map to the client in one of the following ways:
   a. Apply a policy map over WLAN either from the CLI or GUI.
   b. Apply a policy map through the AAA server (ACS server or ISE) from the CLI.
      For more information, refer to the *Cisco Identity Services Engine User Guide* and *Cisco Secure Access Control System User Guide*.
   c. Apply local policies either from the CLI or GUI.

### Creating a Class Map

You need to create a class map before configuring any match protocol filter. The QoS actions such as marking, policing, and dropping can be applied to the traffic. The AVC match protocol filters are applied only for the wireless clients. Refer 8.0 protocol pack for the protocols supported.

### SUMMARY STEPS

1. configure terminal
2. class-map class-map-name
3. match protocol { application-name | attribute category category-name | attribute sub-category sub-category-name | attribute application-group application-group-name }
4. end
**DETAILED STEPS**

<tr>
<td><strong>Example:</strong></td>
<td>Switch# <code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>policy-map policy-map-name</code></td>
<td>Creates a policy map by entering the policy map name, and enters policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config)# <code>policy-map webex-policy</code> Switch(config-pmap)#</td>
<td>By default, no policy maps are defined. The default behavior of a policy map is to set the DSCP to 0 if the packet is an IP packet and to set the CoS to 0 if the packet is tagged. No policing is performed.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>To delete an existing policy map, use the <code>no policy-map policy-map-name</code> global configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`class [class-map-name</td>
<td>class-default]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-pmap)# <code>class-map webex-class</code> Switch(config-pmap-c)#</td>
<td>By default, no policy map and class maps are defined. If a traffic class has already been defined by using the <code>class-map</code> global configuration command, specify its name for <code>class-map-name</code> in this command. A <strong>class-default</strong> traffic class is predefined and can be added to any policy. It is always placed at the end of a policy map. With an implied <code>match any</code> is included in the <strong>class-default</strong> class, all packets that have not already matched the other traffic classes will match <strong>class-default</strong>.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>To delete an existing class map, use the <code>no class class-map-name</code> policy-map configuration command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>`police rate-bps burst-byte [exceed-action {drop</td>
<td>policed-dscp-transmit}]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Switch(config-pmap-c)# <code>police 100000 80000 drop</code></td>
<td>By default, no policer is defined.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>•</strong> For <code>rate-bps</code>, specify an average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>•</strong> For <code>burst-byte</code>, specify the normal burst size in bytes. The range is 8000 to 1000000.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>•</strong> (Optional) Specifies the action to take when the rates are exceeded. Use the <code>exceed-action drop</code> keywords to drop the packet. Use the <code>exceed-action policed-dscp-transmit</code> keywords to mark down the DSCP value (by using the policed-DSCP map) and to send the packet.</td>
</tr>
</tbody>
</table>
### Purpose

Command or Action | Purpose
--- | ---
| **Step 5** | **set {dscp new-dscp | cos cos-value}**<br>**Example:**<br>Switch(config-pmap-c)# set dscp 45 | **Classifies IP traffic by setting a new value in the packet.**<br>**• For** dscp **new-dscp,** enter a new DSCP value to be assigned to the classified traffic. The range is 0 to 63.

| **Step 6** | **end**<br>**Example:**<br>Switch(config)# end | **Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.**

---

**What to do next**

After creating your policy maps, attach the traffic policy or polices to an interface using the **service-policy** command.

---

**Configuring Local Policies (CLI)**

To configure local policies, complete these procedures:

1. Create a service template.<br>2. Create an interface template.<br>3. Create a parameter map.<br>4. Create a policy map.<br>5. Apply a local policy on a WLAN.

---

**Creating a Service Template (CLI)**

**SUMMARY STEPS**

1. **configure terminal**<br>2. **service-template service-template-name**<br>3. **access-group acl_list**<br>4. **vlan vlan_id**<br>5. **absolute-timer seconds**<br>6. **service-policy qos {input | output}**<br>7. **end**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

### Applying a Local Policy for a Device on a WLAN (CLI)

**Before you begin**

If the service policy contains any device type-based rules in the parameter map, ensure that the device classifier is already enabled.
You should use the **device classification** command to classify the device for it to be displayed correctly on the show command output.

**SUMMARY STEPS**

1. `configure terminal`
2. `wlan wlan-name`
3. `service-policy type control subscriber policymapname`
4. `profiling local http (optional)`
5. `profiling radius http (optional)`
6. `no shutdown`
7. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>wlan wlan-name</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# wlan wlan1</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>service-policy type control subscriber policymapname</td>

<td>Switch(config-wlan)# no shutdown</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
</tr>
<tr>
<td>Example:</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press <strong>Ctrl-Z</strong> to exit global configuration mode.</td>
</tr>
</tbody>
</table>
Configure local policies (GUI)

To configure local policies, complete these procedures:

1. Create a service template.
2. Create a policy map.
3. Apply a local policy that you have created to a WLAN.

Creating a Service Template (GUI)

**Step 1**
Choose Configuration > Security > Local Policies > Service Template to open the Service Template page.

**Step 2**
Create a new template as follows:

- a) Click New to open the Service Template > New page.
- b) In the Service Template name text box, enter the new service template name.
- c) In the VLAN ID text box, enter the VLAN identifier that has to be associated with the policy. The value ranges from 1 to 4094.
- d) In the Session timeout text box, enter the maximum amount of time, in seconds, after which a client is forced to reauthenticate. The value ranges from 1 to 65535 seconds.
- e) From the Access control list drop-down list, choose the access control list to be mapped to the policy.
- f) From the Ingress QoS drop-down list, choose the ingress QoS policy to be applied.
- g) From the Egress QoS drop-down list, choose the egress QoS policy to be applied.
- h) Click Apply to save the configuration.

**Step 3**
Edit a service template as follows:

- a) From the Service Template page, click the service template to open the Service Template > Edit page.
- b) In the VLAN ID text box, enter the VLAN identifier that has to be associated with the policy. The value ranges from 1 to 4094.
- c) In the Session timeout text box, enter the maximum amount of time, in seconds, after which a client is forced to reauthenticate. The value ranges from 1 to 65535 seconds.
- d) From the Access control list drop-down list, choose the access control list to be mapped to the policy.
- e) From the Ingress QoS drop-down list, choose the ingress QoS policy to be applied.
- f) From the Egress QoS drop-down list, choose the egress QoS policy to be applied.
- g) Click Apply to save the configuration.

**Step 4**
Remove a service template as follows:

- a) From the Service Template page, select the service template.
- b) Click Remove.
- c) Click Apply to save the configuration.
Creating a Policy Map (GUI)

Step 1  Choose **Configuration > Security > Local Policies > Policy Map** to open the **Policy Map** page.

Step 2  Create a new policy map as follows:
   a) Click **New** to open the **Policy Map > New** page.
   b) In the Policy Map name text box, enter the new policy map name.
   c) Click **Add** to open the Match Criteria area.
   d) From the Device Type drop-down list, choose the device type. The match criteria for the device type can be eq, not-eq, or regex with respect to the device type you are choosing.
   e) From the User Role drop-down list, select the match criteria as eq, not-eq, or regex and enter the user type or user group of the user, for example, student, teacher, and so on.
   f) From the Service Template drop-down list, choose the service template to be mapped to the policy.
   g) Click **Add**. The match criteria is added to the Match Criteria Lists.
   h) In the Match Criteria Lists area, click **Add** to add the match criteria to the policy.
   i) Click **Apply** to save the configuration.

Step 3  Edit a policy map as follows:
   a) In the **Policy Map** page, select the policy map that you want to edit, and click **Edit** to open the **Policy Map > Edit** page.
   b) In the Match Criteria area, choose the device type from the Device Type drop-down list. The match criteria for the device type can be eq, not-eq, or regex with respect to the device type you are choosing.
   c) In the Match Criteria area, choose the user role from the User Role drop-down list. Select the match criteria as eq, not-eq, or regex and enter the user type or user group of the user
   d) From the Service Template drop-down list, choose the service template to be mapped to the policy.
   e) Click **Ok** to save the configuration or **Cancel** to discard the configuration.
   f) Click **Add** to add more match criteria based on device type, user role, and service template to the policy.
   g) In the Match Criteria Lists area, select the match criteria and click **Move to** to move the match criteria with respect to a value entered in the row text box.
   h) Select the match criteria and click **Move up** to move the match criteria up in the list.
   i) Select the match criteria and click **Move down** to move the match criteria down in the list.
   j) Select the match criteria and click **Remove** to remove the match criteria from the policy map list.
   k) Click **Apply** to save the configuration.

Step 4  Remove a policy map as follows:
   a) From the **Policy Map** page, select the policy map.
   b) Click **Remove**.
   c) Click **Apply** to save the configuration.

Applying Local Policies to WLAN (GUI)

Step 1  Choose **Configuration > Wireless > WLAN** to open the **WLANs** page.

Step 2  Click the corresponding WLAN profile. The **WLANs > Edit** page is displayed.

Step 3  Click the **Policy-Mapping** tab.

Step 4  Check the **Device Classification** check box to enable classification based on device type.

Step 5  From the Local Subscriber Policy drop-down list, choose the policy that has to be applied for the WLAN.
Step 6  Select **Local HTTP Profiling** to enable profiling on devices based on HTTP (optional).
Step 7  Select **Radius HTTP Profiling** to enable profiling on devices based on RADIUS (optional).
Step 8  Click **Apply** to save the configuration.

---

**Configuring WLAN to Apply Flow Monitor in IPV4 Input/Output Direction**

**SUMMARY STEPS**

1. `configure terminal`
2. `wlan wlan-id`
3. `ip flow monitor monitor-name {input | output}`
4. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>wlan wlan-id</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch (config) # wlan 1</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>`ip flow monitor monitor-name {input</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>end</code>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;Switch(config)# end</td>
</tr>
</tbody>
</table>

**Configuring Application Visibility and Control (GUI)**

**Configuring Application Visibility (GUI)**

You can apply the default flow record (**wireless avc basic**) to the default flow monitor (**wireless-avc-basic**).

If you are using the flow record and flow monitor you have created, then the record name and monitor name should be same. This is specific only for configuring AVC from GUI and not for the CLI configuration.

You can use the flow monitor you have created either for upstream or downstream, or both, but ensure that you use the same record name while mapping with the flow monitor.
Step 1
Choose Configuration > Wireless > WLAN.

The WLAN page appears.

Step 2
Click on the corresponding WLAN ID to open the WLAN > Edit page and click AVC.

The Application Visibility page appears.

a) Select the Application Visibility Enabled check box to enable AVC on a WLAN.
b) In the Upstream Profile text box, enter the name of the AVC profile.
c) In the Downstream Profile text box, enter the name of the AVC profile.

To enable AVC, you need to enter the profile names for the upstream and downstream profiles. The profile names are the flow monitor names. By default, the flow monitor names (wireless-avc-basic) appear in the Upstream Profile and Downstream Profile text boxes. For the default flow monitor, the default flow record (wireless avc basic) will be taken. The default flow record is generated by the system and is available.

You can change the profile names for the upstream and downstream profiles but ensure that the same flow records are available for the flow monitors.

The upstream and downstream profiles can have different profile names but there should be flow records available for the flow monitors.

Step 3
Click Apply to apply AVC on the WLAN.

Step 4
To disable AVC on a specific WLAN, perform the following steps:
- Choose Configuration > Wireless to open the WLAN page.
- Click on the corresponding WLAN ID to open the WLAN > Edit page.
- Click AVC to open the Application Visibility page.
- Uncheck the Application Visibility Enabled check box.
- Click Apply to disable AVC on the specific WLAN.

Configuring Application Visibility and Control (GUI)

Step 1
Choose Configuration > Wireless.

Step 2
Expand the QoS node by clicking the left pane and choosing QOS-Policy.

The QOS-Policy page is displayed.

Step 3
Click Add New to create a new QoS Policy.

The Create QoS Policy page is displayed.

Step 4
Select Client from the Policy Type drop-down list.

Step 5
Select the direction into which the policy needs to be applied from the Policy Direction drop-down list.

The available options are:
- Ingress
- Egress
Step 6  In the **Policy Name** text box, specify a policy name.

Step 7  In the **Description** text box, provide a description to the policy.

Step 8  Check the **Enable Application Recognition** check box to configure the AVC class map for a client policy.

**Note** For an egress client policy, when you enable Application Recognition, the Voice, Video, and User Defined check boxes are disabled.

The following options are available:

- **Trust**—Specify a classification type for this policy.
  - **Protocol**—Allows you to choose the protocols and configure the marking and policing of the packets.
  - **Category**—Allows you to choose the category of the application, for example, browsing.
  - **Subcategory**—Allows you to choose the subcategory of the application, for example, file-sharing.
  - **Application-Group**—Allows you to choose the application group, for example, ftp-group.

- **Protocol Choice**—Choose the protocols, category, subcategory, or application group from the Available Protocols list into the Assigned Protocols to apply the marking and policing of the packets.

- **Mark**—Specify the marking label for each packet. The following options are available:
  - **DSCP**—Assigns a label to indicate the given quality of service. The range is from 0 to 63.
  - **CoS**—Matches IEEE 802.1Q class of service. The range is from 0 to 7.
  - **None**—Does not mark the packets.

- **Police (kbps)**—Specify the policing rate in kbps. This option is available when the **Policy Direction** is egress.

- **Drop**—Specify to drop the ingress packets that correspond to the chosen protocols.

**Note** You can add a maximum of five AVC classes for each client policy.

---

### Monitoring Application Visibility and Control

**Monitoring Application Visibility and Control (CLI)**

This section describes the new commands for application visibility.

The following commands can be used to monitor application visibility on the switch and access points.

**Table 171: Monitoring Application Visibility Commands on the switch**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show avc client <em>client-mac</em> top <em>n</em> application [ aggregate</td>
<td>upstream</td>
</tr>
</tbody>
</table>

---

**Consolidated Platform Configuration Guide, Cisco IOS XE 3.3SE (Catalyst 3650 Switches)**

1914
show avc wlan ssid top n application [ aggregate | upstream | downstream ]

Displays information about top "N" applications for the given SSID.

avc top user [ enable | disable ]

Enables or disables the information about top "N" application.

show avc wlan wlan-id application app name top N [ aggregate | upstream | downstream ]

Displays to know network usage information on a per user basis within an application.

Note On Catalyst 4500E Supervisor Engine 8-E, in the information about top N users that is displayed, the client's MAC address and username are not displayed. This issue occurs only within 90 seconds after the client is disconnected.

show wlan id wlan-id

Displays information whether AVC is enabled or disabled on a particular WLAN.

show flow monitor flow_monitor_name cache

Displays information about flow monitors.

show wireless client mac-address mac-address service-policy { input | output }

Displays information about policy mapped to the wireless clients.

show ip nbar protocol-discovery [ interface interface-type interface-number ] [ stats { byte-count | bit-rate | packet-count | max-bit-rate } ] [ protocol protocol-name | top-n number ]

Displays the statistics gathered by the NBAR Protocol Discovery feature.

• (Optional) Enter keywords and arguments to fine-tune the statistics displayed. For more information on each of the keywords, refer to the show ip nbar protocol-discovery command in Cisco IOS Quality of Service Solutions Command Reference.

Note When you configure NBAR, you must enable Protocol Discovery on the interface.

show policy-map target
show policy-map
show policy-map policy-name
show policy-map interface interface-type interface-number

Displays information about policy map.

Table 172: Clearing Application Visibility Statistics Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear avc client mac stats</td>
<td>Clears the statistics per client.</td>
</tr>
<tr>
<td>clear avc wlan wlan-name stats</td>
<td>Clears the statistics per WLAN.</td>
</tr>
</tbody>
</table>
Monitoring Application Visibility and Control (GUI)

You can view AVC information on a WLAN in a single shot using an AVC on WLAN pie chart on the Home page of the switch. The pie chart displays the AVC data (Aggregate - Application Cumulative usage %) of the first WLAN. In addition, the top 5 WLANs based on clients are displayed first. Click on any one of the WLANs to view the corresponding pie chart information. If AVC is not enabled on the first WLAN, then the Home page does not display the AVC pie chart.

Step 1  Choose Monitor > Controller > AVC > WLANs.

The WLANs page appears.

Step 2  Click the corresponding WLAN profile.

The Application Statistics page appears.

From the Top Applications drop-down list, choose the number of top applications you want to view and click Apply. The valid range is between 5 to 30, in multiples of 5.

a) On the Aggregate, Upstream, and Downstream tabs, you can view the application cumulative and last 90 seconds statistics and usage percent with the following fields:
   • Application name
   • Packet count
   • Byte count
   • Average packet size
   • usage (%)
Monitoring SSID and Client Policies Statistics (GUI)

Statistics are supported only for ingress policies with a maximum of five classes on wireless targets. For very large policies, statistics for ingress policies are not visible at the switch. The frequency of the statistics depends on the number of clients associated with the access point.

<table>
<thead>
<tr>
<th>Type of Statistics</th>
<th>Method</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSID Policies</td>
<td>Choose <strong>Monitor &gt; Controller &gt; Statistics &gt; QoS</strong>.</td>
<td>The QoS page is displayed with a list of SSID policies, Radio Type, and AP. Choose an SSID policy, radio, and access point from the drop-down lists and click <strong>Apply</strong> to view the statistics of the chosen SSID policy. You can view details such as match criteria, confirmed bytes, conformed rate, and exceeded rate.</td>
</tr>
<tr>
<td>Client Policies</td>
<td>Choose <strong>Monitor &gt; Clients &gt; Client Details</strong>.</td>
<td>The Clients page is displayed with a list of client MAC addresses, AP, and other details. Click the MAC address of a client and click the <strong>QoS Statistics</strong> tab. You can view details such as match criteria, confirmed bytes, conformed rate, and exceeded rate.</td>
</tr>
</tbody>
</table>

Examples: Application Visibility and Control

Examples: Application Visibility Configuration

This example shows how to create a flow record, create a flow monitor, apply the flow record to the flow monitor, and apply the flow monitor on a WLAN:

```
Switch# configure terminal
Switch(config)# flow record fr_v4
Switch(config-flow-record)# match ipv4 protocol
Switch(config-flow-record)# match ipv4 source address
Switch(config-flow-record)# match ipv4 destination address
Switch(config-flow-record)# match transport destination-port
Switch(config-flow-record)# match flow direction
Switch(config-flow-record)# match application name
Switch(config-flow-record)# match wireless ssid
Switch(config-flow-record)# collect counter bytes long
Switch(config-flow-record)# collect counter packets long
Switch(config-flow-record)# collect wireless ap mac address
Switch(config-flow-record)# collect wireless client mac address
```
Examples: Application Visibility and Control QoS Configuration

This example shows how to create class maps with apply match protocol filters for application name, category, and subcategory:

```
Switch# configure terminal
Switch(config)# class-map cat-browsing
Switch(config-cmap)# match protocol attribute category browsing
Switch(config-cmap)# end

Switch# configure terminal
Switch(config)# class-map cat-fileshare
Switch(config-cmap)# match protocol attribute category file-sharing
Switch(config-cmap)# end

Switch# configure terminal
Switch(config)# class-map match-any subcat-terminal
Switch(config-cmap)# match protocol attribute sub-category terminal
Switch(config-cmap)# end

Switch# configure terminal
Switch(config)# class-map match-any webex-meeting
Switch(config-cmap)# match protocol webex-meeting
Switch(config-cmap)# end
```

This example shows how to create policy maps and define existing class maps for upstream QoS:

```
Switch# configure terminal
Switch(config)# policy-map test-avc-up
Switch(config-pmap)# class cat-browsing
Switch(config-pmap-c)# police 150000
Switch(config-pmap-c)# set dscp 12
Switch(config-pmap-c)# end

Switch# configure terminal
Switch(config)# policy-map test-avc-up
Switch(config-pmap)# class cat-fileshare
Switch(config-pmap-c)# police 1000000
Switch(config-pmap-c)# set dscp 20
Switch(config-pmap-c)# end

Switch# configure terminal
Switch(config)# policy-map test-avc-up
```
This example shows how to create policy maps and define existing class maps for downstream QoS:

Switch# configure terminal
Switch(config)# policy-map test-avc-up
Switch(config-pmap)# class webex-meeting
Switch(config-pmap-c)# police 60000000
Switch(config-pmap-c)# set dscp 41
Switch(config-pmap-c)# end

Switch# configure terminal
Switch(config)# policy-map test-avc-down
Switch(config-pmap)# class cat-fileshare
Switch(config-pmap-c)# police 300000
Switch(config-pmap-c)# set wlan user-priority 2
Switch(config-pmap-c)# set dscp 20
Switch(config-pmap-c)# end

Switch# configure terminal
Switch(config)# policy-map test-avc-up
Switch(config-pmap)# class subcat-terminal
Switch(config-pmap-c)# police 100000
Switch(config-pmap-c)# set dscp 25
Switch(config-pmap-c)# end

This example shows how to apply defined QoS policy on a WLAN:

Switch# configure terminal
Switch(config)# wlan alpha
Switch(config-wlan)# shut
Switch(config-wlan)# end
Switch(config-wlan)# service-policy client input test-avc-up
Switch(config-wlan)# service-policy client output test-avc-down
Switch(config-wlan)# no shut
Switch(config-wlan)# end
Example: Configuring QoS Attribute for Local Profiling Policy

The following example shows how to configure QoS attribute for a local profiling policy:

```
Switch(config)# class-map type control subscriber match-all local_policy1_class
Switch(config-filter-control-classmap)# match device-type android
Switch(config)# service-template local_policy1_template
Switch(config-service-template)# vlan 40
Switch(config-service-template)# service-policy qos output local_policy1
Switch(config)# policy-map type control subscriber local_policy1
Switch(config-action-control-policymap)# 1 class local_policy1_class do-until-success
Switch(config)# activate service-template local_policy1_template
Switch(config)# wlan open_auth 9
Switch(config-wlan)# client vlan VLAN40
Switch(config-wlan)# service-policy type control subscriber local_policy1
```

CHAPTER 95

Configuring Voice and Video Parameters

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice and Video Parameters

You can confirm the following points before configuring voice and video parameters:

• Ensure that the switch has access points connected to it.
• Configure SSID.

Restrictions for Voice and Video Parameters

The following are the restrictions that you should keep in mind while configuring voice and video parameters:

• SIP CAC can be used for the 9971 Cisco phones that support TSPEC-based admission control. You can also use the phones that support Status code 17.
• SIP snooping is supported for providing voice priority to the non-TSPEC SIP phones.
• TSPEC for video CAC is not supported.

Information About Configuring Voice and Video Parameters

Three parameters on the switch affect voice and/or video quality:
• Call Admission Control
• Expedited bandwidth requests
• Unscheduled automatic power save delivery

Call Admission Control (CAC) and UAPSD are supported on Cisco Compatible Extensions (CCX) v4 and v5; however, these parameters are also supported even without CCX but on any device implementing WMM (that supports 802.1e). Expedited bandwidth requests are supported only on CCXv5.

Traffic stream metrics (TSM) can be used to monitor and report issues with voice quality.

Call Admission Control

Call Admission Control (CAC) enables an access point to maintain controlled quality of service (QoS) when the wireless LAN is experiencing congestion. The WMM protocol deployed in CCXv4 maintains QoS under differing network loads.

Two types of Over The Air (OTA) CAC are available: static-based CAC and load-based CAC.

The switch supports the following QoS policies:
• User-defined policies: You can define your own QoS policies. You can have more control over these policies than the existing metal policies.
• System-defined precious metal policies: To support backward compatibility.
  • Platinum: Used for VoIP clients.
  • Gold: Used for video clients.
  • Silver: Used for best effort traffic.
  • Bronze: Used for NRT traffic.

Static-Based CAC

Voice over WLAN applications supporting WMM and TSPEC can specify how much bandwidth or shared medium time is required to initiate a call. Bandwidth-based, or static, CAC enables the access point to determine whether it is capable of accommodating a particular call. The access point rejects the call if necessary in order to maintain the maximum allowed number of calls with acceptable quality.

The QoS setting for a WLAN determines the level of bandwidth-based CAC support. To use bandwidth-based CAC with voice applications, the WLAN must be configured for Platinum QoS. With bandwidth-based CAC, the access point bandwidth availability is determined based on the amount of bandwidth currently used by
the access point clients, to which the bandwidth requested by the Voice over WLAN applications is added. If this total exceeds a configured bandwidth threshold, the new call is rejected.

---

**Note**
You must enable admission control (ACM) for CCXv4 clients that have WMM enabled. Otherwise, bandwidth-based CAC does not operate properly for these CCXv4 clients.

---

### Load-Based CAC

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types (including that from clients), cochannel access point loads, and coallocated channel interference, for voice and video applications. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

In load-based CAC, the access point continuously measures and updates the utilization of the RF channel (that is, the mean time of bandwidth that has been exhausted), channel interference, and the additional calls that the access point can admit. The access point admits a new call only if the channel has enough unused bandwidth to support that call. By doing so, load-based CAC prevents oversubscription of the channel and maintains QoS under all conditions of WLAN loading and interference.

---

**Note**
If you disable load-based CAC, the access points start using bandwidth-based CAC.

---

### IOSd Call Admission Control

IOSd Call Admission Control (CAC) controls bandwidth availability from switch to access point.

You can configure class-based, unconditional packet marking features on your switch for CAC.

CAC is a concept that applies to voice and video traffic only—not data traffic. If an influx of data traffic oversubscribes a particular link in the network, queueing, buffering, and packet drop decisions resolve the congestion. The extra traffic is simply delayed until the interface becomes available to send the traffic, or, if traffic is dropped, the protocol or the end user initiates a timeout and requests a retransmission of the information.

Network congestion cannot be resolved in this manner when real-time traffic, sensitive to both latency and packet loss, is present, without jeopardizing the quality of service (QoS) expected by the users of that traffic. For real-time delay-sensitive traffic such as voice, it is better to deny network access under congestion conditions than to allow traffic onto the network to be dropped and delayed, causing intermittent impaired QoS and resulting in customer dissatisfaction.

CAC is therefore a deterministic and informed decision that is made before a voice call is established and is based on whether the required network resources are available to provide suitable QoS for the new call.

Based on the admit CAC CLI configuration in addition to the existing CAC algorithm, switch allows either voice or video with TSPEC or SIP snooping. The admit cac CLI is mandatory for the voice call to pass through.

If the BSSID policer is configured for the voice or video traffic, then additional checks are performed on the packets.
Exploited Bandwidth Requests

The expedited bandwidth request feature enables CCXv5 clients to indicate the urgency of a WMM traffic specifications (TSPEC) request (for example, an e911 call) to the WLAN. When the controller receives this request, it attempts to facilitate the urgency of the call in any way possible without potentially altering the quality of other TSPEC calls that are in progress.

You can apply expedited bandwidth requests to both bandwidth-based and load-based CAC. Expedited bandwidth requests are disabled by default. When this feature is disabled, the controller ignores all expedited requests and processes TSPEC requests as normal TSPEC requests.

The following table lists examples of TSPEC request handling for normal TSPEC requests and expedited bandwidth requests.

Table 173: TSPEC Request Handling Examples

<table>
<thead>
<tr>
<th>CAC Mode</th>
<th>Reserved bandwidth for voice calls</th>
<th>Usage</th>
<th>Normal TSPEC Request</th>
<th>TSPEC with Expedited Bandwidth Request</th>
</tr>
</thead>

<td>Rejected</td>
</tr>
</tbody>
</table>

For bandwidth-based CAC, the voice call bandwidth usage is per access point radio and does not take into account cochannel access points. For load-based CAC, the voice call bandwidth usage is measured for the entire channel.

Bandwidth-based CAC (consumed voice and video bandwidth) or load-based CAC (channel utilization [Pb]).

Admission control for TSPEC G711-20ms and G711-40 ms codec types are supported.

U-APSD

Unscheduled automatic power save delivery (U-APSD) is a QoS facility defined in IEEE 802.11e that extends the battery life of mobile clients. In addition to extending battery life, this feature reduces the latency of traffic flow delivered over the wireless media. Because U-APSD does not require the client to poll each individual
packet buffered at the access point, it allows delivery of multiple downlink packets by sending a single uplink trigger packet. U-APSD is enabled automatically when WMM is enabled.

Traffic Stream Metrics

In a voice-over-wireless LAN (VoWLAN) deployment, traffic stream metrics (TSM) can be used to monitor voice-related metrics on the client-access point air interface. It reports both packet latency and packet loss. You can isolate poor voice quality issues by studying these reports.

The metrics consist of a collection of uplink (client side) and downlink (access point side) statistics between an access point and a client device that supports CCX v4 or later releases. If the client is not CCX v4 or CCXv5 compliant, only downlink statistics are captured. The client and access point measure these metrics. The access point also collects the measurements every 5 seconds, prepares 90-second reports, and then sends the reports to the controller. The controller organizes the uplink measurements on a client basis and the downlink measurements on an access point basis and maintains an hour’s worth of historical data. To store this data, the controller requires 32 MB of additional memory for uplink metrics and 4.8 MB for downlink metrics.

TSM can be configured through either the GUI or the CLI on a per radio-band basis (for example, all 802.11a radios). The controller saves the configuration in flash memory so that it persists across reboots. After an access point receives the configuration from the controller, it enables TSM on the specified radio band.

This table shows the upper limit for TSM entries in different controller series.

<table>
<thead>
<tr>
<th>TSM Entries</th>
<th>5700</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX AP TSM entries</td>
<td>100</td>
</tr>
<tr>
<td>MAX Client TSM entries</td>
<td>250</td>
</tr>
<tr>
<td>MAX TSM entries</td>
<td>100*250=25000</td>
</tr>
</tbody>
</table>

Note

Once the upper limit is reached, additional TSM entries cannot be stored and sent to WCS or NCS. If client TSM entries are full and AP TSM entries are available, then only the AP entries are stored, and vice versa. This leads to partial output. TSM cleanup occurs every one hour. Entries are removed only for those APs and clients that are not in the system.

Information About Configuring Voice Prioritization Using Preferred Call Numbers

You can configure a switch to provide support for SIP calls from VoWLAN clients that do not support TSPEC-based calls. This feature is known as SIP CAC support. If bandwidth is available in the configured voice pool, the SIP call uses the normal flow and the switch allocates the bandwidth to those calls.

You can also prioritize up to six preferred call numbers. When a call comes to one of the configured preferred numbers, the switch does not check the configured maximum voice bandwidth. The switch allocates the bandwidth needed for the call, even if it exceeds the maximum bandwidth for voice configured for voice CAC. The preferred call will be rejected if bandwidth allocation exceeds 85% of the radio bandwidth. The bandwidth allocation is 85 percent of the entire bandwidth pool, not just from the maximum configured voice pool. The bandwidth allocation is the same even for roaming calls.
You must configure the following parameters before configuring voice prioritization:

- Set WLAN QoS to allow voice calls to pass through.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

Information About EDCA Parameters

Enhanced distributed channel access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality-of-service (QoS) traffic.

How to Configure Voice and Video Parameters

Configuring Voice Parameters (CLI)

Before you begin

Ensure that you have configured SIP-based CAC.

You should have created a class map for CAC before beginning this procedure.

SUMMARY STEPS

1. show wlan summary
2. show wlan wlan_id
3. configure terminal
4. policy-map policy-map name
5. class {class-name | class-default}
6. admit cac wmm-tspec
7. service-policy policy-map name
8. end
9. wlan wlan_profile_name wlan_ID SSID_network_name wlan shutdown
10. wlan wlan_profile_name wlan_ID SSID_network_name
11. wlan wlan_name call-snoop
12. wlan wlan_name service-policy input input_policy_name
13. wlan wlan_name service-policy output output_policy_name
14. wlan wlan_name service-policy input ingress_policy_name
15. wlan wlan_name service-policy output egress_policy_name
16. ap dot11 {5ghz | 24ghz} shutdown
17. ap dot11 {5ghz | 24ghz} cac voice sip
18. ap dot11 {5ghz | 24ghz} cac voice acm
19. ap dot11 {5ghz | 24ghz} cac voice max-bandwidth bandwidth
20. ap dot11 {5ghz | 24ghz} cac voice roam-bandwidth bandwidth
21. no wlan shutdown

Example:  
Switch (config-wlan) # service-policy input platinum-up | Assigns a policy map to WLAN input traffic. Ensure that you provide QoS policy to voice for input traffic. |
| Step 5 | service-policy [client] output policy-map name  
Example:  
Switch (config-wlan) # service-policy output platinum | Assigns policy map to WLAN output traffic. Ensure that you provide QoS policy to voice for output traffic. |
| Step 6 | end  
Example:  
Switch (config) # end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |
| Step 7 | show wlan {wlan-id | wlan-name}  
Example:  
Switch # show wlan qos-wlan | Verifies the configured QoS policy on the WLAN. |
| Step 8 | configure terminal  
Example:  
Switch # configure terminal | Enters global configuration mode. |
| Step 9 | ap dot11 {5ghz | 24ghz} cac {voice | video} acm  
Example:  
Switch (config) # ap dot11 5ghz cac voice acm | Enables the ACM static on the radio.  
When enabling SIP snooping, use the static CAC, not the load-based CAC. |
| Step 10 | ap dot11 {5ghz | 24ghz} cac voice sip  
Example:  
Switch (config) # ap dot11 5ghz cac voice sip | Configures SIP-based CAC. |
| Step 11 | end  
Example:  
Switch (config) # end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |
Example

Configuring a Preferred Call Number (CLI)

**Before you begin**

You must set the following parameters before configuring a preferred call number.

- Set WLAN QoS to voice.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.
- Enable SIP-based CAC.

**SUMMARY STEPS**

1. configure terminal
2. wlan wlan-name qos platinum
3. ap dot11 {5ghz | 24ghz} cac {voice | video} acm
4. wlan wlan-name
5. wireless sip preferred-call-no call_index call_number
6. no wireless sip preferred-call-no call_index
7. end

<tr>
<th>Step 5</th>
<th>wireless sip preferred-call-no call_index call_number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# wireless sip preferred-call-no 1 555333</td>
</tr>
</tbody>
</table>

**Purpose**: Adds a new preferred call.

#### Command or Action

<table>
<thead>
<tr>
<th>Step 6</th>
<th>no wireless sip preferred-call-no call_index</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# no wireless sip preferred-call-no 1</td>
</tr>
</tbody>
</table>

**Purpose**: Removes a preferred call.

#### Command or Action

<table>
<thead>
<tr>
<th>Step 7</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

**Purpose**: Returns to privileged EXEC mode. Alternatively, you can also press `Ctrl-Z` to exit global configuration mode.

---

### Example

#### Configuring EDCA Parameters (CLI)

**SUMMARY STEPS**

1. configure terminal
2. ap dot11 {5ghz | 24ghz} shutdown
3. ap dot11 {5ghz | 24ghz} edca-parameters {custom-voice | optimized-video-voice | optimized-voice | svp-voice | wmm-default}
4. show ap dot11 {5ghz | 24ghz} network
5. no ap dot11 {5ghz | 24ghz} shutdown
6. end

**DETAILED STEPS**

<td></td>
</tr>
</tbody>
</table>
| **Step 3**<br/ap dot11 {5ghz | 24ghz} edca-parameters {custom-voice | optimized-video-voice | optimized-voice | svp-voice | wmm-default}<br><br>Example:<br>Switch(config)# ap dot11 5ghz edca-parameters optimized-voice | Enables a specific EDCA parameters for the 802.11a or 802.11b/g network.  
- custom-voice—Enables custom voice parameters for the 802.11a or 802.11b/g network.  
- optimized-video-voice—Enables EDCA voice- and video-optimized parameters for the 802.11a or 802.11b/g network.  
Choose this option when both voice and video services are deployed on your network.  
- optimized-voice—Enables non-SpectraLink voice-optimized profile parameters for the 802.11a or 802.11b/g network.  
Choose this option when voice services other than SpectraLink are deployed on your network.  
- svp-voice—Enables SpectraLink voice priority parameters for the 802.11a or 802.11b/g network.  
Choose this option if SpectraLink phones are deployed on your network to improve the quality of calls.  
- wmm-default—Enables the Wi-Fi Multimedia (WMM) default parameters for the 802.11a or 802.11b/g network.  
This is the default value. Choose this option when voice or video services are not deployed on your network. |
| **Step 4**<br/show ap dot11 {5ghz | 24ghz} network<br><br>Example:<br>Switch(config)# show ap dot11 5ghz network | Displays the current status of MAC optimization for voice. |
| **Step 5**<br/no ap dot11 {5ghz | 24ghz} shutdown<br><br>Example:<br>Switch(config)# no ap dot11 5ghz shutdown | Reenables the radio network. |
| **Step 6**<br/end<br><br>Example:<br>Switch(config)# end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |
Example

Configuring EDCA Parameters (GUI)

**Step 1** Choose Configuration > Wireless > 802.11a/n/ac > EDCA Parameters or Configuration > Wireless > 802.11b/g/n > EDCA Parameters to open EDCA Parameters page.

**Step 2** Choose one of the following options from the EDCA Profile drop-down list:

- **wmm-default** — Enables the Wi-Fi Multimedia (WMM) default parameters. This is the default value. Choose this option when voice or video services are not deployed on your network.

- **svp-voice** — Enables SpectraLink voice priority parameters. Choose this option if SpectraLink phones are deployed on your network to improve the quality of calls.

- **optimized-voice** — Enables EDCA voice-optimized profile parameters. Choose this option when voice services other than SpectraLink are deployed on your network.

- **optimized-video-voice** — Enables EDCA voice- and video-optimized profile parameters. Choose this option when both voice and video services are deployed on your network.

- **custom-voice** — Enables custom voice EDCA parameters for 802.11a. The EDCA parameters under this option also match the 6.0 WMM EDCA parameters when this profile is applied.

  **Note** If you deploy video services, admission control (ACM) must be disabled.

**Step 3** If you want to enable MAC optimization for voice, select the Enable Low Latency MAC check box. Otherwise, leave this check box unselected, which is the default value. This feature enhances voice performance by controlling packet retransmits and appropriately aging out voice packets on lightweight access points, which improves the number of voice calls serviced per access point.

  **Note** We do not recommend you to enable low latency MAC. You should enable low latency MAC only if the WLAN allows WMM clients. If WMM is enabled, then low latency MAC can be used with any of the EDCA profiles.

**Step 4** Click Apply to commit your changes.

**Step 5** To reenable the radio network, choose Network under 802.11a/n or 802.11b/g/n, select the 802.11a/n/ac (or 802.11b/g/n) Network Status check box, and click Apply.

**Step 6** Click Save Configuration.

---

**Monitoring Voice and Video Parameters**

This section describes the new commands for the voice and video parameters.

The following commands can be used to monitor voice and video parameters.
Table 174: Monitoring Voice Parameters Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show ap dot11 {5ghz</td>
<td>24ghz} network`</td>
</tr>
<tr>
<td><code>show ap name ap_name dot11 24ghz tsm all</code></td>
<td>Displays the TSM voice metrics and current status of MAC optimization for voice.</td>
</tr>
<tr>
<td><code>show ap name apname cac voice</code></td>
<td>Displays the information about CAC for a particular access point.</td>
</tr>
<tr>
<td><code>show client detail client_mac</code></td>
<td>Displays the U-APSD status for a particular client.</td>
</tr>
<tr>
<td><code>show policy-map interface wireless client</code></td>
<td>Displays the video client policy details.</td>
</tr>
<tr>
<td><code>show access-list</code></td>
<td>Displays the video client dynamic access-list from the switch.</td>
</tr>
</tbody>
</table>
| `show wireless client voice diag status` | Displays information about whether voice diagnostics are enabled or disabled. If enabled, this also displays information about the clients in the watch list and the time remaining for the diagnostics of the voice call.  
  **Note** To work on voice diagnostics CLIs, you need to enter the following command: `debug voice-diagnostic mac-addr client_mac_01 client_mac_02` |
| `show wireless client voice diag tspec` | Displays the TSPEC information sent from the clients that are enabled for voice diagnostics. |
| `show wireless client voice diag qos-map` | Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed. |
| `show wireless client voice diag rssi` | Display the client’s RSSI values in the last 5 seconds when voice diagnostics is enabled. |
| `show client voice-diag roam-history` | Displays information about the last three roaming calls. The output contains the timestamp, access point associated with roaming, roaming reason, and if there is a roaming failure, reason for roaming-failure. |
| `show policy-map interface wireless mac mac-address` | Displays information about the voice and video data packet statistics. |
| `show wireless media-stream client summary` | Displays a summary of the media stream and video client information. |
| `show controllers d0 | b queue` | Displays which queue the packets are going through on an access point. |
| `show platform qos queue stats interface` | Displays which queue packets are going through from the switch. |
You can monitor the video parameters using the following commands.

**Table 175: Monitoring Video Parameters Commands**

<table>
<thead>
<tr>

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring RFID Tag Tracking

The Switch enables you to configure radio-frequency identification (RFID) tag tracking. RFID tags are small wireless devices that are affixed to assets for real-time location tracking. They operate by advertising their location using special 802.11 packets, which are processed by access points, the controller, and the location appliance.

How to Configure RFID Tag Tracking

Configuring RFID Tag Tracking (CLI)

SUMMARY STEPS

1. location rfid status
2. (Optional) no location rfid status
### Monitoring RFID Tag Tracking Information

This section describes the new commands for the RFID tag tracking Information.

The following commands can be used to monitor the RFID tag tracking Information on the switch.

#### Table 176: Monitoring RFID Tag Tracking Information Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>

---

3. `location rfid timeout seconds`

4. `location rfid mobility vendor-name name`

5. (Optional) `no location rfid mobility name`

### Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>location rfid status</code></td>
<td>Enables RFID tag tracking. By default, RFID tag tracking is enabled.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>location rfid status</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>(Optional) <code>no location rfid status</code></td>
<td>Disables RFID tag tracking.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>no location rfid status</code></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td><code>location rfid timeout seconds</code></td>
<td>Specifies a static timeout value (between 60 and 7200 seconds). The static timeout value is the amount of time that the switch maintains tags before expiring them. For example, if a tag is configured to beacon every 30 seconds, we recommend that you set the timeout value to 90 seconds (approximately three times the beacon value). The default value is 1200 seconds.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>location rfid timeout 1500</code></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>location rfid mobility vendor-name name</code></td>
<td>Enables RFID tag mobility for specific tags. When you enter the <code>location rfid mobility vendor-name</code> command, tags are unable to obtain a DHCP address for client mode when attempting to select and/or download a configuration. <strong>Note</strong> These commands can be used only for Pango tags. Therefore, the only valid entry for <code>vendor-name</code> is “pango” in all lowercase letters.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>location rfid mobility vendor-name Aerosct</code></td>
<td></td>
</tr>
<tr>
<td>5</td>
<td>(Optional) <code>no location rfid mobility name</code></td>
<td>Disables RFID tag mobility for specific tags. When you enter the <code>no location rfid mobility</code> command, tags can obtain a DHCP address. If a tag roams from one subnet to another, it obtains a new address rather than retaining the anchor state.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> Switch(config)# <code>no location rfid mobility test</code></td>
<td></td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Location Settings

The switch determines the location of client devices by gathering Received Signal Strength Indication (RSSI) measurements from access points all around the client of interest. The switch can obtain location reports from up to 16 access points for clients, RFID tags, and rogue access points.

You can configure the path loss measurement (S60) request for normal clients or calibrating clients to improve location accuracy.
How to Configure Location Settings

Configuring Location Settings (CLI)

SUMMARY STEPS

1. configure terminal
2. location plm {calibrating [multiband | uniband] | client} burst_interval
3. location rssi-half-life {calibrating-client | client | rogue-aps | tags} seconds
4. location expiry {calibrating-client | client | rogue-aps | tags} timeout
5. location algorithm {rssi-average | simple}
6. location admin-tag string
7. location civic-location identifier {identifier | host}
8. location custom-location identifier {identifier | host}
9. location geo-location identifier {identifier | host}
10. location prefer {cdp | lldp-med | static} weight priority_value
11. location rfid {status | timeout | vendor-name}
12. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>location plm {calibrating [multiband</td>
<td>uniband]</td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# location plm client 100</td>
<td>The path loss measurement request improves the location accuracy. You can configure the burst_interval parameter for the normal, noncalibrating client from zero through 3600 seconds, and the default value is 60 seconds. You can configure the path loss measurement request for calibrating clients on the associated 802.11a or 802.11b/g radio or on the associated 802.11a/b/g radio. If a client does not send probes often or sends them only on a few channels, its location cannot be updated or cannot be updated accurately. The location plm command forces clients to send more packets on all channels. When a CCXv4 (or higher) client associates, the Switch sends it a path loss measurement request, which instructs the client to transmit on the bands and channels that the access points are on (typically, channels 1, 6, and 11 for 2.4-GHz-only</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>------------------</td>
<td>---------</td>
<td></td>
</tr>
</tbody>
</table>
| **Step 3**

**location rssi-half-life** 
*{calibrating-client | client | rogue-aps | tags}* *seconds*

**Example:**
Switch(config)# location rssi-half-life calibrating-client 60

Configures the RSSI half life for the clients, calibrating clients, RFID tags, and rogue access points. You can enter the **location rssi-half-life** parameter value for the clients, calibrating clients, RFID tags, and rogue access points as 0, 1, 2, 5, 10, 20, 30, 60, 90, 120, 180, or 300 seconds, and the default value is 0 seconds. Some client devices transmit at reduced power immediately after changing channels, and RF is variable, so RSSI values might vary considerably from packet to packet. The **location rssi-half-life** command increases accuracy by averaging nonuniformly arriving data using a configurable forget period (or half life).

**Note** We recommend that you do not use or modify the **location rssi-half-life** command.

| **Step 4**

**location expiry** 
*{calibrating-client | client | rogue-aps | tags}* *timeout*

**Example:**
Switch(config)# location expiry calibrating-client 50

Configures the RSSI timeout value for the clients, calibrating clients, RFID tags, and rogue access points.

You can enter the RSSI timeout value for the clients, RFID tags, and rogue access points from 5 through 3600 seconds, and the default value is 5 seconds.

For the calibrating clients, you can enter the RSSI timeout value from 0 through 3600 seconds, and the default value is 5 seconds.

Ensuring that recent, strong RSSIs are retained by the CPU is critical to location accuracy. The **location expiry** command enables you to specify the length of time after which old RSSI averages expire.

**Note** We recommend that you do not use or modify the **location expiry** command.

| **Step 5**

**location algorithm** *{rssi-average | simple}*

**Example:**
Switch(config)# location algorithm rssi-average

Configures the algorithm used to average RSSI and signal-to-noise ratio (SNR) values.

You can enter the **location algorithm rssi-average** command to specify a more accurate algorithm but requires more CPU overhead or the **location algorithm simple** command to specify a faster algorithm that requires low CPU overhead but provides less accuracy.

**Note** We recommend that you do not use or modify the **location algorithm** command.
| Step 6 | location admin-tag string  
Example:  
Switch(config)# location admin-tag | Purpose: Sets administrative tag or site information for the location of client devices.

| Step 7 | location civic-location identifier {identifier | host}  
Example:  
Switch(config)# location civic-location identifier host | Purpose: Specifies civic location information.  
You can set the civic location identifier either as a string or host.

| Step 8 | location custom-location identifier {identifier | host}  
Example:  
Switch(config)# location custom-location identifier host | Purpose: Specifies custom location information.  
You can set the custom location identifier either as a string or host.

| Step 9 | location geo-location identifier {identifier | host}  
Example:  
Switch(config)# location geo-location identifier host | Purpose: Specifies geographical location information of the client devices.  
You can set the location identifier either as a string or host.

| Step 10 | location prefer {cdp | lldp-med | static} weight priority_value  
Example:  
Switch(config)# location prefer weight cdp 50 | Purpose: Sets location information source priority.  
You can enter the priority weight from zero through 255.

| Step 11 | location rfid {status | timeout | vendor-name}  
Example:  
Switch(config)# location rfid timeout 100 | Purpose: Configures RFID tag tracking options such as RFID tag status, RFID timeout value, and RFID tag vendor name.  
You can enter the RFID timeout value in a range from 60 and 7200 seconds.

| Step 12 | end  
Example:  
Switch(config)# end | Purpose: Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

---

### Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI)

The Network Mobility Services Protocol (NMSP) manages communication between the mobility services engine and the controller for incoming and outgoing traffic. If your application requires more frequent location updates, you can modify the NMSP notification interval (to a value between 1 and 180 seconds) for clients, active RFID tags, and rogue access points and clients.
The TCP port (16113) that the controller and mobility services engine communicate over must be open (not blocked) on any firewall that exists between the controller and the mobility services engine for NMSP to function.

**SUMMARY STEPS**

1. `configure terminal`
2. `nmsp notification interval {attachment seconds | location seconds | rssi [clients interval | rfid interval | rogues [ap | client] interval]}
3. `end`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code>&lt;br&gt;Example: <code>Switch# configure terminal</code></td>

Monitoring NMSP Settings (CLI)

This section describes the new commands for NMSP settings.

The following commands can be used to monitor NMSP settings on the switch.
Table 178: Monitoring NMSP Settings Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show nmsp attachment suppress interfaces</td>
<td>Displays the attachment suppress interfaces.</td>
</tr>
<tr>
<td>show nmsp capability</td>
<td>Displays the NMSP capabilities.</td>
</tr>
<tr>
<td>show nmsp notification interval</td>
<td>Displays the NMSP notification intervals.</td>
</tr>
<tr>
<td>show nmsp statistics connection</td>
<td>Displays the connection-specific NMSP counters.</td>
</tr>
<tr>
<td>show nmsp statistics summary</td>
<td>Displays the common NMSP counters.</td>
</tr>
<tr>
<td>show nmsp status</td>
<td>Displays the status of active NMSP connections.</td>
</tr>
<tr>
<td>show nmsp subscription detail</td>
<td>Displays all of the mobility services to which the switch is subscribed.</td>
</tr>
<tr>
<td>show nmsp subscription detail ip_addr</td>
<td>Displays details only for the mobility services subscribed to by a specific IP address.</td>
</tr>
<tr>
<td>show nmsp subscription summary</td>
<td>Displays details for all of the mobility services to which the switch is subscribed.</td>
</tr>
</tbody>
</table>

Examples: Location Settings Configuration

This example shows how to configure the path loss measurement (S60) request for calibrating client on the associated 802.11a or 802.11b/g radio:

```
Switch# configure terminal
Switch(config)# location plm calibrating uniband
Switch(config)# end
Switch# show location summary
```

This example shows how to configure the RSSI half life for a rogue access point:

```
Switch# configure terminal
Switch(config)# location rssi-half-life rogue-aps 20
Switch(config)# end
Switch# show location summary
```

Examples: NMSP Settings Configuration

This example shows how to configure the NMSP notification interval for RFID tags:

```
Switch# configure terminal
Switch(config)# nmsp notification interval rssi rfid 50
Switch(config)# end
Switch# show nmsp notification interval
```
This example shows how to configure the NMSP notification threshold for clients:

Switch# configure terminal
Switch(config)# nmsp notify-threshold 5
Switch(config)# end
Switch# show nmsp statistics summary

Monitoring Flow Control

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Flow Control

Flow control is enabled by default on the switch.

Flow control provides shim layers between WCM and Cisco IOS for a reliable IPC. Every component in WCM has a dedicated channel. Few of the components in WCM have leveraged flow control in that. There is no configuration of flow control from CLI. You can monitor the flow control for any channel.

Monitoring Flow Control

This section describes the new commands for flow control.

The following commands can be used to monitor flow control on the switch.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>

Configuring SDM Templates

- Finding Feature Information, on page 1963
- Information About Configuring SDM Templates, on page 1963
- How to Configure SDM Templates, on page 1965
- Monitoring and Maintaining SDM Templates, on page 1966
- Configuration Examples for Configuring SDM Templates, on page 1966
- Feature History and Information for Configuring SDM Templates, on page 1967

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring SDM Templates

SDM Templates

You can use SDM templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

These templates are supported on your device:

- Advanced—The advanced template is available on all supported images for this release. It maximizes system resources for features like netflow, multicast groups, security ACEs, QoS ACEs, and so on.
- VLAN—The VLAN template is available only on the LAN Base license. The VLAN template disables routing and supports the maximum number of unicast MAC addresses. It would typically be selected for a Layer 2 device.

After you change the template and the system reboots, you can use the `show sdm prefer` privileged EXEC command to verify the new template configuration. If you enter the `show sdm prefer` command before you
enter the `reload` privileged EXEC command, the `show sdm prefer` command shows the template currently in use and the template that will become active after a reload.

The default is the advanced template.

*Table 180: Approximate Number of Feature Resources Allowed by Templates*

---

**Note**

When the switch is used as a Wireless Mobility Agent, the only template allowed is the advanced template.

The tables represent approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.
SDM Templates and Switch Stacks

In a switch stack, all stack members must use the same SDM template that is stored on the active switch. When a new switch is added to a stack, the SDM configuration that is stored on the active switch overrides the template configured on an individual switch.

How to Configure SDM Templates

Configuring SDM Templates

Configuring the Switch SDM Template

Setting the SDM Template

- Feature History and Information For System Message Logs, on page 1983

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring System Message Logs

When the logging discriminator command is configured, the device may experience memory leak or crash. This usually happens during heavy syslog or debug output. The rate of the memory leak is dependent on the number of logs being produced. In extreme cases, the device may also crash. As a workaround, use the no logging discriminator command to disable the logging discriminator.

Information About Configuring System Message Logs

System Messsage Logging

By default, a switch sends the output from system messages and debug privileged EXEC commands to a logging process. Stack members can trigger system messages. A stack member that generates a system message appends its hostname in the form of hostname-n, where n is a switch, and redirects the output to the logging
process on the active switch. Though the active switch is a stack member, it does not append its hostname to system messages. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch, and in the case of a switch stack, on the active switch. If a standalone switch or the stack master fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port. In a switch stack, all stack member consoles provide the same console output.

---

**Note**

The syslog format is compatible with 4.3 BSD UNIX.

---

### System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- `seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)`
- `seq no:timestamp: %facility-severity-MNEMONIC:description`

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- `service sequence-numbers`
- `service timestamps log datetime`
- `service timestamps log datetime [localtime] [msec] [show-timezone]`
- `service timestamps log uptime`

**Table 181: System Log Message Elements**

</tbody>
</table>
Syslog Message Limits

If you enabled syslog message traps to be sent to an SNMP network management station by using the `snmp-server enable trap` global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level `warning` and numerically lower levels are stored in the history table even if syslog traps are not enabled.

When the history table is full (it contains the maximum number of message entries specified with the `logging history size` global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

The history table lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, `emergencies` equal 1, not 0, and `critical` equals 3, not 2.

Enabling Syslog Trap Messages

You can enable Syslog traps using the `snmp-server enable traps syslog` command.

After enabling Syslog traps, you have to specify the trap message severity. Use the `logging snmp-trap` command to specify the trap level. By default, the command enables severity 0 to 4. To enable all the severity level, configure the `logging snmp-trap 0 7` command.

To enable individual trap levels, configure the following commands:

- `logging snmp-trap emergencies`: Enables only severity 0 traps.
- `logging snmp-trap alert`: Enables only severity 1 traps.

Note that, along with the Syslog traps, the Syslog history should also be applied. Without this configuration, Syslog traps are not sent.

Use the `logging history informational` command to enable the Syslog history.

How to Configure System Message Logs

Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

This task is optional.

**SUMMARY STEPS**

1. `configure terminal`
2. `logging buffered [size]`
3. `logging host`
4. `logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]`
5. `end`
### 6. terminal monitor

#### DETAILLED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 | `logging buffered [size]` | Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the active switch. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes. |
|       | **Example:**<br>Switch(config)# logging buffered 8192 | |

If a standalone switch or the active switch fails, the log file is lost unless you previously saved it to flash memory. See Step 4.

**Note** Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the `show memory` privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should *not* be set to this amount.

| Step 3 | `logging host` | Logs messages to a UNIX syslog server host. |
|       | **Example:**<br>Switch(config)# logging 125.1.1.100 | |

`host` specifies the name or IP address of the host to be used as the syslog server.

To build a list of syslog servers that receive logging messages, enter this command more than once.

| Step 4 | `logging file flash:filename [max-file-size [min-file-size]] [severity-level-number | type]` | Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the active switch. |
|       | **Example:**<br>Switch(config)# logging file flash:log_msg.txt 40960 4096 3 | |

- `filename`—Enters the log message filename.
- (Optional) `max-file-size`—Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes.
- (Optional) `min-file-size`—Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.
- (Optional) `severity-level-number | type`—Specifies either the logging severity level or the logging type. The severity range is 0 to 7.
## Purpose

### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Example:

```
Step 5
Switch(config)# end
```

<table>
<thead>
<tr>
<th>Step</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td>Logs messages to a nonconsole terminal during the current session.</td>
</tr>
</tbody>
</table>

### Example:

```
Step 6
Switch# terminal monitor
```

---

## Synchronizing Log Messages

You can synchronize unsolicited messages and `debug` privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and `debug` command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and `debug` command output appear on the console after the prompt for user input is returned. Therefore, unsolicited messages and `debug` command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

### SUMMARY STEPS

1. `configure terminal`
2. `line [console | vty] line-number [ending-line-number]`
3. `logging synchronous [level [severity-level | all] | limit number-of-buffers]`
4. `end`

</tr>
<tr>
<td>• <strong>line vty line-number</strong>—Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15.</td>
</tr>
</tbody>
</table>

You can change the setting of all 16 vty lines at once by entering:

line vty 0 15

You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:

line vty 2

When you enter this command, the mode changes to line configuration.

### Step 3

**logging synchronous [level [severity-level | all] | limit number-of-buffers]**

**Example:**

Switch(config)# logging synchronous level 3 limit 1000

### Step 4

**end**

**Example:**

Switch(config)# end

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enables synchronous logging of messages.</td>
</tr>
<tr>
<td>• (Optional) <strong>level severity-level</strong>—Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2.</td>
</tr>
<tr>
<td>• (Optional) <strong>level all</strong>—Specifies that all messages are printed asynchronously regardless of the severity level.</td>
</tr>
<tr>
<td>• (Optional) <strong>limit number-of-buffers</strong>—Specifies the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.</td>
</tr>
</tbody>
</table>

### Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.
Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The logging synchronous global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return.

To reenable message logging after it has been disabled, use the logging on global configuration command. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. no logging console
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>no logging console</td>
<td>Disables message logging.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# no logging console</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>

<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

**Enabling and Disabling Time Stamps on Log Messages**

By default, log messages are not time-stamped.

This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. Use one of these commands:
   - service timestamps log uptime
   - service timestamps log datetime[msec | localtime | show-timezone]
Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed.

This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. service sequence-numbers
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>

<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message. This task is optional.

#### SUMMARY STEPS

1. configure terminal
2. logging console level
3. logging monitor level
4. logging trap level
5. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td>Example:</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**               | **logging console level**                                               |
| Example:                 | Limits messages logged to the console. By default, the console receives  |
|                         | debugging messages and numerically lower levels.                        |
| Switch(config)# logging console 3 |                                                                         |

| **Step 3**               | **logging monitor level**                                               |
| Example:                 | Limits messages logged to the terminal lines. By default, the terminal  |
|                         | receives debugging messages and numerically lower levels.              |
|                         |                                                                         |
### Purpose

#### Command or Action

Switch(config)# logging monitor 3

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limits messages logged to the syslog servers.</td>
</tr>
<tr>
<td>By default, syslog servers receive informational messages and numerically lower levels.</td>
</tr>
</tbody>
</table>

#### Step 4

**logging trap level**

**Example:**

Switch(config)# logging trap 3

#### Step 5

**end**

**Example:**

Switch(config)# end

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

### Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP. This task is optional.

#### SUMMARY STEPS

1. configure terminal
2. logging history level
3. logging history size number
4. end

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** logging history level | Changes the default level of syslog messages stored in the history file and sent to the SNMP server. |
| **Example:** | |
| Switch(config)# logging history 3 | By default, warnings, errors, critical, alerts, and emergencies messages are sent. |

| **Step 3** logging history size number | Specifies the number of syslog messages that can be stored in the history table. |
| **Example:** | The default is to store one message. The range is 0 to 500 messages. |
Logging Messages to a UNIX Syslog Daemon

This task is optional.

Note
Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX `man syslogd` command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

Before you begin
• Log in as root.
• Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

SUMMARY STEPS
1. Add a line to the file `/etc/syslog.conf`.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>Purpose</strong></td>
</tr>
<tr>
<td>Add a line to the file <code>/etc/syslog.conf</code>.</td>
<td>• <code>local7</code>—Specifies the logging facility. &lt;br&gt;• <code>debug</code>—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>local7.debug /usr/adm/logs/cisco.log</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Creates the log file. The syslog daemon sends messages at this level or at a more severe level to this file.</td>
</tr>
<tr>
<td>Enter these commands at the UNIX shell prompt.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>$ touch /var/log/cisco.log</code>&lt;br&gt;$ chmod 666 /var/log/cisco.log`</td>
<td></td>
</tr>
</tbody>
</table>

Configuration Examples for System Message Logs

Example: Stacking System Message

This example shows a partial switch system message for active switch and a stack member (hostname Switch-2):

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed state to down 2
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/1, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/2, changed state to up (Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down (Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet2/0/1, changed state to down 2 (Switch-2)
Example: Switch System Message

This example shows a partial switch system message on a switch:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state to down
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar 1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the switch while the switch is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints
How to Configure Online Diagnostics

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing:

**SUMMARY STEPS**

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | complete | minimal | non-disruptive | per-port}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Starts the diagnostic tests.</td>
</tr>
<tr>
<td>`diagnostic start switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td>Example:</td>
<td>You can specify the tests by using one of these options:</td>
</tr>
<tr>
<td><code>Switch# diagnostic start switch 2 test basic</code></td>
<td>• <code>name</code>—Enters the name of the test.</td>
</tr>
<tr>
<td></td>
<td>• <code>test-id</code>—Enters the ID number of the test.</td>
</tr>
<tr>
<td></td>
<td>• <code>test-id-range</code>—Enters the range of test IDs by using integers separated by a comma and a hyphen.</td>
</tr>
<tr>
<td></td>
<td>• <code>all</code>—Starts all of the tests.</td>
</tr>
<tr>
<td></td>
<td>• <code>basic</code>—Starts the basic test suite.</td>
</tr>
<tr>
<td></td>
<td>• <code>complete</code>—Starts the complete test suite.</td>
</tr>
<tr>
<td></td>
<td>• <code>minimal</code>—Starts the minimal bootup test suite.</td>
</tr>
<tr>
<td></td>
<td>• <code>non-disruptive</code>—Starts the non-disruptive test suite.</td>
</tr>
<tr>
<td></td>
<td>• <code>per-port</code>—Starts the per-port test suite.</td>
</tr>
</tbody>
</table>
Example

Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a switch. Use the no form of this command to remove the scheduling.

SUMMARY STEPS

1. `configure terminal`
2. `diagnostic schedule switch number test {name | test-id | test-id-range | all | basic | complete | minimal | non-disruptive | per-port} {daily | on mm dd yyyy hh:mm | port inter-port-number port-number-list | weekly day-of-week hh:mm}`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;<strong>Example:</strong>&lt;br&gt;&lt;br&gt;Switch# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**diagnostic schedule switch number test {name</td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Schedules on-demand diagnostic tests for a specific day and time. The switch number keyword is supported only on stacking switches. The range is from 1 to 4. When specifying the tests to be scheduled, use these options:&lt;br&gt;• name—Name of the test that appears in the show diagnostic content command output.&lt;br&gt;• test-id—ID number of the test that appears in the show diagnostic content command output.&lt;br&gt;• test-id-range—ID numbers of the tests that appear in the show diagnostic content command output.&lt;br&gt;• all—All test IDs.&lt;br&gt;• basic—Starts the basic on-demand diagnostic tests.&lt;br&gt;• complete—Starts the complete test suite.&lt;br&gt;• minimal—Starts the minimal bootup test suite.</td>
</tr>
</tbody>
</table>
### Command or Action

- **non-disruptive**—Starts the non-disruptive test suite.
- **per-port**—Starts the per-port test suite.

You can schedule the tests as follows:
- Daily—Use the `daily hh:mm` parameter.
- Specific day and time—Use the `on mm dd yyyy hh:mm` parameter.
- Weekly—Use the `weekly day-of-week hh:mm` parameter.

### Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a switch while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the switch to generate a syslog message because of a test failure, and enable a specific test.

By default, health monitoring is disabled, but the switch generates a syslog message when a test fails.

### SUMMARY STEPS

1. `configure terminal`
2. `diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day`
3. `diagnostic monitor syslog`
4. `diagnostic monitor threshold switch number test {name | test-id | test-id-range | all} failure count count`
5. `diagnostic monitor switch number test {name | test-id | test-id-range | all}`
6. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> `diagnostic monitor interval switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5</td>
<td>The <code>switch number</code> keyword is supported only on stacking switches. The range is from 1 to 9.</td>
</tr>
<tr>
<td></td>
<td>When specifying the tests, use one of these parameters:</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>• name</td>
<td>Name of the test that appears in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td>• test-id</td>
<td>ID number of the test that appears in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td>• test-id-range</td>
<td>ID numbers of the tests that appear in the <code>show diagnostic content</code> command output.</td>
</tr>
<tr>
<td>• all</td>
<td>All of the diagnostic tests.</td>
</tr>
</tbody>
</table>

When specifying the interval, set these parameters:

- **hh:mm:ss**—Monitoring interval in hours, minutes, and seconds. The range for `hh` is 0 to 24, and the range for `mm` and `ss` is 0 to 60.
- **milliseconds**—Monitoring interval in milliseconds (ms). The range is from 0 to 999.
- **day**—Monitoring interval in the number of days. The range is from 0 to 20.

**Step 3**

```
(diagnostic monitor syslog

Example:
Switch(config)# diagnostic monitor syslog
```

(Optional) Configures the switch to generate a syslog message when a health-monitoring test fails.

**Step 4**

```
(diagnostic monitor threshold switch number test {name | test-id | test-id-range | all} failure count count

Example:
Switch(config)# diagnostic monitor threshold switch 2 test 1 failure count 20
```

(Optional) Sets the failure threshold for the health-monitoring tests.

The `switch number` keyword is supported only on stacking switches. The range is from 1 to 9.

When specifying the tests, use one of these parameters:

- **name**—Name of the test that appears in the `show diagnostic content` command output.
- **test-id**—ID number of the test that appears in the `show diagnostic content` command output.
- **test-id-range**—ID numbers of the tests that appear in the `show diagnostic content` command output.
- **all**—All of the diagnostic tests.

The range for the failure threshold `count` is 0 to 99.

**Step 5**

```
(diagnostic monitor switch number test {name | test-id | test-id-range | all}

Example:
```

Enables the specified health-monitoring tests.

The `switch number` keyword is supported only on stacking switches. The range is from 1 to 9.
### Monitoring and Maintaining Online Diagnostics

#### Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the switch or switch stack and check the test results by using the privileged EXEC `show` commands in this table:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show diagnostic content switch [number</td>
<td>all]`</td>
</tr>
<tr>
<td><code>show diagnostic status</code></td>
<td>Displays the currently running diagnostic tests.</td>
</tr>
<tr>
<td>`show diagnostic result switch [number</td>
<td>all] [detail</td>
</tr>
<tr>
<td>`show diagnostic switch [number</td>
<td>all] [detail]`</td>
</tr>
<tr>
<td>`show diagnostic schedule switch [number</td>
<td>all]`</td>
</tr>
<tr>
<td>Command</td>
<td>Purpose</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>show diagnostic post</code></td>
<td>Displays the POST results. (The output is the same as the <code>show test post</code> command output.)</td>
</tr>
</tbody>
</table>

**Configuration Examples for Online Diagnostic Tests**

**Examples: Start Diagnostic Tests**

This example shows how to start a diagnostic test by using the test name:

```
Switch# diagnostic start switch 2 test TestInlinePwrCtlr
```

This example shows how to start all of the basic diagnostic tests:

```
Switch# diagnostic start switch 1 test all
```

**Example: Configure a Health Monitoring Test**

This example shows how to configure a health-monitoring test:

```
Switch(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Switch(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback
```

**Examples: Schedule Diagnostic Test**

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

```
Switch(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

```
Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30
```

**Examples: Displaying Online Diagnostics**

This example shows how to display on demand diagnostic settings:

```
Switch# show diagnostic ondemand settings
Test iterations = 1
```
Action on test failure = continue

This example shows how to display diagnostic events for errors:

Switch# show diagnostic events event-type error

Diagnostic events (storage for 500 events, 0 events recorded)
Number of events matching above criteria = 0
No diagnostic log entry exists.

This example shows how to display the description for a diagnostic test:

Switch# show diagnostic description switch 1 test all

DiagGoldPktTest :
The GOLD packet Loopback test verifies the MAC level loopback functionality. In this test, a GOLD packet, for which doppler provides the support in hardware, is sent. The packet loops back at MAC level and is matched against the stored packet. It is a non-disruptive test.

DiagThermalTest :
This test verifies the temperature reading from the sensor is below the yellow temperature threshold. It is a non-disruptive test and can be run as a health monitoring test.

DiagFanTest :
This test verifies all fan modules have been inserted and working properly on the board. It is a non-disruptive test and can be run as a health monitoring test.

DiagPhyLoopbackTest :
The PHY Loopback test verifies the PHY level loopback functionality. In this test, a packet is sent which loops back at PHY level and is matched against the stored packet. It is a disruptive test and cannot be run as a health monitoring test.

DiagScratchRegisterTest :
The Scratch Register test monitors the health of application-specific integrated circuits (ASICs) by writing values into registers and reading back the values from these registers. It is a non-disruptive test and can be run as a health monitoring test.

DiagPoETest :
This test checks the PoE controller functionality. This is a disruptive test and should not be performed during normal switch operation.

DiagStackCableTest :
This test verifies the stack ring loopback functionality in the stacking environment. It is a disruptive test and cannot be run as a health monitoring test.

DiagMemoryTest :
This test runs the exhaustive ASIC memory test during normal switch operation. NG3K utilizes mbist for this test. Memory test is very disruptive in nature and requires switch reboot after the test.

Switch#
This example shows how to display the boot up level:

Switch# show diagnostic bootup level

Current bootup diagnostic level: minimal

Managing Configuration Files

Prerequisites for Managing Configuration Files

- You should have at least a basic familiarity with the Cisco IOS environment and the command-line interface.
- You should have at least a minimal configuration running on your system. You can create a basic configuration file using the `setup` command.

Restrictions for Managing Configuration Files

- Many of the Cisco IOS commands described in this document are available and function only in certain configuration modes on the switch.
- Some of the Cisco IOS configuration commands are only available on certain switch platforms, and the command syntax may vary on different platforms.

Information About Managing Configuration Files

Types of Configuration Files

Configuration files contain the Cisco IOS software commands used to customize the functionality of your Cisco switch. Commands are parsed (translated and executed) by the Cisco IOS software when the system is booted (from the startup-config file) or when you enter commands at the CLI in a configuration mode.

Startup configuration files (startup-config) are used during system startup to configure the software. Running configuration files (running-config) contain the current configuration of the software. The two configuration
files can be different. For example, you may want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration using the `configure terminal` EXEC command but not save the configuration using the `copy running-config startup-config` EXEC command.

To change the running configuration, use the `configure terminal` command, as described in the Modifying the Configuration File (CLI) section. As you use the Cisco IOS configuration modes, commands generally are executed immediately and are saved to the running configuration file either immediately after you enter them or when you exit a configuration mode.

To change the startup configuration file, you can either save the running configuration file to the startup configuration using the `copy running-config startup-config` EXEC command or copy a configuration file from a file server to the startup configuration (see the Copying a Configuration File from a TFTP Server to the Switch (CLI) section for more information).

### Configuration Mode and Selecting a Configuration Source

To enter configuration mode on the switch, enter the `configure` command at the privileged EXEC prompt. The Cisco IOS software responds with the following prompt asking you to specify the terminal, memory, or a file stored on a network server (network) as the source of configuration commands:

```
Configuring from terminal, memory, or network [terminal]?
```

Configuring from the terminal allows you to enter configuration commands at the command line, as described in the following section. See the Re-executing the Configuration Commands in the Startup Configuration File (CLI) section for more information.

Configuring from the network allows you to load and execute configuration commands over the network. See the Copying a Configuration File from a TFTP Server to the Switch (CLI) section for more information.

### Configuration File Changes Using the CLI

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are not stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the `show running-config` or `more system:running-config` EXEC command. Comments are not displayed when you list the startup configuration with the `show startup-config` or `more nvram:startup-config` EXEC mode command. Comments are stripped out of the configuration file when it is loaded onto the switch. However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them.

### Location of Configuration Files

Configuration files are stored in the following locations:

- The running configuration is stored in RAM.

- On all platforms except the Class A Flash file system platforms, the startup configuration is stored in nonvolatile random-access memory (NVRAM).
• On Class A Flash file system platforms, the startup configuration is stored in the location specified by the CONFIG_FILE environment variable (see the Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI) section). The CONFIG_FILE variable defaults to NVRAM and can be a file in the following file systems:
  • nvram: (NVRAM)
  • bootflash: (internal flash memory)
  • usbflash0: (flash file system)

Copy Configuration Files from a Network Server to the Switch

You can copy configuration files from a TFTP, rcp, or FTP server to the running configuration or startup configuration of the switch. You may want to perform this function for one of the following reasons:

• To restore a backed-up configuration file.
• To use the configuration file for another switch. For example, you may add another switch to your network and want it to have a similar configuration to the original switch. By copying the file to the new switch, you can change the relevant parts rather than recreating the whole file.
• To load the same configuration commands on to all of the switches in your network so that all of the switches have similar configurations.

The `copy {ftp: | rcp: | tftp:system:running-config} EXEC` command loads the configuration files into the switch as if you were typing the commands on the command line. The switch does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration may not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, you need to copy the configuration file directly to the startup configuration (using the `copy ftp: | rcp: | tftp: nvram:startup-config` command) and reload the switch.

To copy configuration files from a server to a switch, perform the tasks described in the following sections. The protocol that you use depends on which type of server you are using. The FTP and rcp transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because the FTP and rcp transport mechanisms are built on and use the TCP/IP stack, which is connection-oriented.

Copying a Configuration File from the Switch to a TFTP Server

In some implementations of TFTP, you must create a dummy file on the TFTP server and give it read, write, and execute permissions before copying a file over it. Refer to your TFTP documentation for more information.

Copying a Configuration File from the Switch to an RCP Server

You can copy a configuration file from the switch to an RCP server.
One of the first attempts to use the network as a resource in the UNIX community resulted in the design and implementation of the remote shell protocol, which included the remote shell (rsh) and remote copy (rcp) functions. Rsh and rcp give users the ability to execute commands remotely and copy files to and from a file system residing on a remote host or server on the network. The Cisco implementation of rsh and rcp interoperates with standard implementations.

The rcp copy commands rely on the rsh server (or daemon) on the remote system. To copy files using rcp, you need not create a server for file distribution, as you do with TFTP. You need only to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, rcp creates it for you.

Although the Cisco rcp implementation emulates the functions of the UNIX rcp implementation—copying files among systems on the network—the Cisco command syntax differs from the UNIX rcp command syntax. The Cisco rcp support offers a set of copy commands that use rcp as the transport mechanism. These rcp copy commands are similar in style to the Cisco TFTP copy commands, but they offer an alternative that provides faster performance and reliable delivery of data. These improvements are possible because the rcp transport mechanism is built on and uses the TCP/IP stack, which is connection-oriented. You can use rcp commands to copy system images and configuration files from the switch to a network server and vice versa.

You also can enable rcp support to allow users on remote systems to copy files to and from the switch.

To configure the Cisco IOS software to allow remote users to copy files to and from the switch, use the ip rcmd rcp-enable global configuration command.

Restrictions

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the switch to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the copy EXEC command, if a username is specified.
2. The username set by the ip rcmd remote-username global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the switch through Telnet and was authenticated through the username command, the switch software sends the Telnet username as the remote username.
4. The switch host name.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, you can specify that user name as the remote username.

Use the ip rcmd remote-username command to specify a username for all copies. (Rcmd is a UNIX routine used at the super-user level to execute commands on a remote machine using an authentication scheme based on reserved port numbers. Rcmd stands for “remote command”). Include the username in the copy command if you want to specify a username for that copy operation only.

If you are writing to the server, the RCP server must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .hosts file for the remote user on the RCP server. For example, suppose the switch contains the following configuration lines:
hostname Switch1
ip rcmd remote-username User0

If the switch IP address translates to switch1.example.com, then the .rhosts file for User0 on the RCP server should contain the following line:

Switch1.example.com Switch1

Requirements for the RCP Username

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the switch to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the copy EXEC command, if a username is specified.
2. The username set by the ip rcmd remote-username global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the switch through Telnet and is authenticated through the userame command, the switch software sends the Telnet username as the remote username.
4. The switch host name.

For the RCP copy request to execute, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your RCP server for more information.

Copying a Configuration File from the Switch to an FTP Server

You can copy a configuration file from the switch to an FTP server.

Understanding the FTP Username and Password

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the switch to a server using FTP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the copy EXEC command, if a username is specified.
2. The username set by the ip ftp username global configuration command, if the command is configured.
3. Anonymous.

The switch sends the first valid password it encounters in the following sequence:

1. The password specified in the copy command, if a password is specified.
2. The password set by the ip ftp password command, if the command is configured.
3. The switch forms a password `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured host name, and `domain` is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the switch.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that username as the remote username.

Refer to the documentation for your FTP server for more information.

Use the `ip ftp username` and `ip ftp password` global configuration commands to specify a username and password for all copies. Include the username in the `copy` EXEC command if you want to specify a username for that copy operation only.

**Configuration Files Larger than NVRAM**

To maintain a configuration file that exceeds the size of NVRAM, you should be aware of the information in the following sections.

**Compressing the Configuration File**

The `service compress-config` global configuration command specifies that the configuration file be stored compressed in NVRAM. Once the configuration file has been compressed, the switch functions normally. When the system is booted, it recognizes that the configuration file is compressed, expands it, and proceeds normally. The `more nvram:startup-config` EXEC command expands the configuration before displaying it.

Before you compress configuration files, refer to the appropriate hardware installation and maintenance publication. Verify that your system’s ROMs support file compression. If not, you can install new ROMs that support file compression.

The size of the configuration must not exceed three times the NVRAM size. For a 128- KB size NVRAM, the largest expanded configuration file size is 384 KB.

The `service compress-config` global configuration command works only if you have Cisco IOS software Release 10.0 or later release boot ROMs. Installing new ROMs is a one-time operation and is necessary only if you do not already have Cisco IOS Release 10.0 in ROM. If the boot ROMs do not recognize a compressed configuration, the following message is displayed:

```
Boot ROMs do not support NVRAM compression Config NOT written to NVRAM
```

**Storing the Configuration in Flash Memory on Class A Flash File Systems**

On class A Flash file system switches, you can store the startup configuration in flash memory by setting the `CONFIG_FILE` environment variable to a file in internal flash memory or flash memory in a PCMCIA slot.

See the Specifying the `CONFIG_FILE` Environment Variable on Class A Flash File Systems (CLI) section for more information.

Care must be taken when editing or changing a large configuration. Flash memory space is used every time a `copy system:running-config nvram:startup-config` EXEC command is issued. Because file management for flash memory (such as optimizing free space) is not done automatically, you must pay close attention to
available flash memory. Use the `squeeze` command to reclaim used space. We recommend that you use a large-capacity Flash card of at least 20 MB.

## Loading the Configuration Commands from the Network

You can also store large configurations on FTP, RCP, or TFTP servers and download them at system startup. To use a network server to store large configurations, see the Copying a Configuration File from the Switch to a TFTP Server (CLI) and Configuring the Switch to Download Configuration Files sections for more information on these commands.

## Configuring the Switch to Download Configuration Files

You can configure the switch to load one or two configuration files at system startup. The configuration files are loaded into memory and read in as if you were typing the commands at the command line. Thus, the configuration for the switch is a mixture of the original startup configuration and the one or two downloaded configuration files.

### Network Versus Host Configuration Files

For historical reasons, the first file the switch downloads is called the network configuration file. The second file the switch downloads is called the host configuration file. Two configuration files can be used when all of the switches on a network use many of the same commands. The network configuration file contains the standard commands used to configure all of the switches. The host configuration files contain the commands specific to one particular host. If you are loading two configuration files, the host configuration file should be the configuration file you want to have precedence over the other file. Both the network and host configuration files must reside on a network server reachable via TFTP, RCP, or FTP, and must be readable.

## How to Manage Configuration File Information

### Displaying Configuration File Information (CLI)

To display information about configuration files, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `show boot`
3. `more file-url`
4. `show running-config`
5. `show startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>

</tr>
<tr>
<td>On all platforms except the Class A Flash file system platforms, the default startup-config file usually is stored in NVRAM.</td>
</tr>
<tr>
<td>On the Class A Flash file system platforms, the CONFIG_FILE environment variable points to the default startup-config file.</td>
</tr>
<tr>
<td>The CONFIG_FILE variable defaults to NVRAM.</td>
</tr>
</tbody>
</table>

---

### Modifying the Configuration File (CLI)

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are not stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the show running-config or more system:running-config EXEC commands. Comments do not display when you list the startup configuration with the show startup-config or more nvram:start-up-config EXEC mode commands. Comments are stripped out of the configuration file when it is loaded onto the switch. However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them. To configure the software using the CLI, use the following commands in privileged EXEC mode:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. configuration command
4. Do one of the following:
   - end
   - ^Z
5. copy system:running-config nvram:startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>configuration command</td>
<td>Enter the necessary configuration commands. The Cisco IOS documentation set describes configuration commands organized by technology.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# configuration command</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>Do one of the following:</td>
<td>Ends the configuration session and exits to EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• end</td>
<td>Note: When you press the Ctrl and Z keys simultaneously, ^Z is displayed to the screen.</td>
</tr>
<tr>
<td></td>
<td>• ^Z</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>copy system:running-config nvram:startup-config</td>
<td>Saves the running configuration file as the startup configuration file.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>You may also use the copy running-config startup-config command alias, but you should be aware that this command is less precise. On most platforms, this command saves the configuration to NVRAM. On the Class A Flash file system platforms, this step saves the configuration to the location specified by the CONFIG_FILE environment variable (the default CONFIG_FILE variable specifies that the file should be saved to NVRAM).</td>
</tr>
<tr>
<td></td>
<td>Switch# copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

Examples

In the following example, the switch prompt name of the switch is configured. The comment line, indicated by the exclamation mark (!), does not execute any command. The hostname command is
used to change the switch name from `switch` to `new_name`. By pressing Ctrl-Z (^Z) or entering the `end` command, the user quits configuration mode. The `copy system:running-config nvram:startup-config` command saves the current configuration to the startup configuration.

```plaintext
Switch# configure terminal
Switch(config)# The following command provides the switch host name.
Switch(config)# hostname new_name
new_name(config)# end
new_name# copy system:running-config nvram:startup-config
```

When the startup configuration is NVRAM, it stores the current configuration information in text format as configuration commands, recording only non-default settings. The memory is checksummed to guard against corrupted data.

---

### Note

Some specific commands might not get saved to NVRAM. You need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a list of these settings so that you can quickly reconfigure your switch after rebooting.

---

### Copying a Configuration File from the Switch to a TFTP Server (CLI)

To copy configuration information on a TFTP network server, complete the tasks in this section:

#### SUMMARY STEPS

1. `enable`
2. `copy system:running-config tftp: [directory]filename`
3. `copy nvram:startup-config tftp: [directory]filename`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><code>copy system:running-config tftp: [directory]filename</code></td>
</tr>
<tr>
<td><strong>Step 2</strong> copy system:running-config tftp: [directory]filename</td>
<td>Copies the running configuration file to a TFTP server.</td>
</tr>
<tr>
<td>Example: Switch# copy system:running-config tftp: //server1/topdir/file10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> copy nvram:startup-config tftp: [directory]filename</td>
<td>Copies the startup configuration file to a TFTP server.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
Examples

The following example copies a configuration file from a switch to a TFTP server:

```
Switch# copy system:running-config tftp://172.16.2.155/tokyo-confg
Write file tokyo-confg on host 172.16.2.155? [confirm] Y
Writing tokyo-confg!!! [OK]
```

What to Do Next

After you have issued the `copy` command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Copy File from the Switch to an RCP Server (CLI)

To copy a startup configuration file or a running configuration file from the switch to an RCP server, use the following commands beginning in privileged EXEC mode:

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip rcmd remote-username username`
4. `end`
5. Do one of the following:

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong> ip rcmd remote-username <strong>username</strong></td>
<td>(Optional) Changes the default remote username.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ip rcmd remote-username NetAdmin1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>(Optional) Exits global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> Do one of the following:</td>
<td></td>
</tr>
<tr>
<td>• copy system:running-config rcp:</td>
<td>• Specifies that the switch running configuration file is to be stored on an RCP server</td>
</tr>
<tr>
<td>[[[//username@]location]directory]filename]</td>
<td>or</td>
</tr>
<tr>
<td>• copy nvram:startup-config rcp:</td>
<td>• Specifies that the switch startup configuration file is to be stored on an RCP server</td>
</tr>
<tr>
<td>[[[//username@]location]directory]filename]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# copy system:running-config rcp:</td>
<td></td>
</tr>
<tr>
<td>//NetAdmin1@example.com/dir-files/file1</td>
<td></td>
</tr>
</tbody>
</table>

### Examples

#### Storing a Running Configuration File on an RCP Server

The following example copies the running configuration file named runfile2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```
Switch# copy system:running-config rcp://netadmin1@172.16.101.101/runfile2-config
Write file runfile2-config on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
Switch#
```

#### Storing a Startup Configuration File on an RCP Server

The following example shows how to store a startup configuration file on a server by using RCP to copy the file:

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin2
Switch(config)# end
Switch# copy nvram:startup-config rcp:
Remote host[]? 172.16.101.101
Name of configuration file to write [start-config]?
Write file start-config on host 172.16.101.101?[confirm] ![OK]
```
What to Do Next

After you have issued the copy EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the copy command and the current setting of the file prompt global configuration command.

Copying a Configuration File from the Switch to the FTP Server (CLI)

To copy a startup configuration file or a running configuration file from the switch to an FTP server, complete the following tasks:

SUMMARY STEPS

1. enable
2. configure terminal
3. ip ftp username username
4. ip ftp password password
5. end
6. Do one of the following:
   • copy system:running-config ftp: [[[//username [:password ]@]location]directory ]filename 
   or
   • copy nvram:startup-config ftp: [[//username [:password ]@]location]directory ]filename 

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

### Examples

**Storing a Running Configuration File on an FTP Server**

The following example copies the running configuration file named `runfile-config` to the `netadmin1` directory on the remote host with an IP address of `172.16.101.101`:

```plaintext
Switch# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/runfile-config
Write file runfile-config on host 172.16.101.101? [confirm]
Building configuration... [OK]
Connected to 172.16.101.101
Switch#
```

**Storing a Startup Configuration File on an FTP Server**

The following example shows how to store a startup configuration file on a server by using FTP to copy the file:

```plaintext
Switch# configure terminal
Switch(config)# ip ftp username netadmin2
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy nvram:startup-config ftp:
Remote host[]? 172.16.101.101
Name of configuration file to write [start-config]? Write file start-config on host 172.16.101.101?[confirm] ![OK]
```
What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Copying a Configuration File from a TFTP Server to the Switch (CLI)

To copy a configuration file from a TFTP server to the switch, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `copy tftp://location/directory/filename system:running-config`
3. `copy tftp://location/directory/filename nvram:startup-config`
4. `copy tftp://location/directory/filename flash-[n]:/directory/startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>

</tbody>
</table>
Examples
In the following example, the software is configured from the file named tokyo-config at IP address 172.16.2.155:

`Switch# copy tftp://172.16.2.155/tokyo-config system:running-config`

Configure using tokyo-config from 172.16.2.155? [confirm] Y

Booting tokyo-config from 172.16.2.155:!!! [OK - 874/16000 bytes]

What to Do Next
After you have issued the copy EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the copy command and the current setting of the file prompt global configuration command.

Copying a Configuration File from the rcp Server to the Switch (CLI)

To copy a configuration file from an rcp server to the running configuration or startup configuration, complete the following tasks:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip rcmd remote-username username`
4. `end`
5. Do one of the following:
   - `copy rcp://[[[[[[[username@]]location]]directory]]filename]system:running-config`
   - `copy rcp://[[[[[[[username@]]location]]directory]]filename]nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure terminal</td>
<td>(Optional) Enters configuration mode from the terminal. This step is required only if you override the default remote username (see Step 3).</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3 ip rcmd remote-username</td>
<td>(Optional) Specifies the remote username.</td>

</tbody>
</table>
### Examples

#### Copy RCP Running-Config

The following example copies a configuration file named host1-confg from the netadmin1 directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the switch:

```
Switch# copy rcp://netadmin1@172.16.101.101/host1-confg system:running-config
Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]
Switch# %SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

#### Copy RCP Startup-Config

The following example specifies a remote username of netadmin1. Then it copies the configuration file named host2-confg from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration.

```
Switch# configure terminal
Switch(config)# ip rcmd remote-username netadmin1
Switch(config)# end
Switch# copy rcp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-confg
Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-confg:![OK]
Switch# %SYS-5-CONFIG_NV:Non-volatile store configured from host2-config by rcp from 172.16.101.101
```
What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Copying a Configuration File from an FTP Server to the Switch (CLI)

To copy a configuration file from an FTP server to the running configuration or startup configuration, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip ftp username` *username*
4. `ip ftp password` *password*
5. `end`
6. Do one of the following:
   - `copy ftp: [///][username[:password]@]location[/directory]/filename]system:running-config`
   - `copy ftp: [///][username[:password]@]location[/directory]/filename]nvram:startup-config`

**DETAILED STEPS**

<table>

</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>(Optional) Exits global configuration mode. This step is required only if you override the default remote username or password (see Steps 3 and 4).</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

| Step 6 | Using FTP copies the configuration file from a network server to running memory or the startup configuration. |
| Do one of the following: | |
| Example: | Switch# copy ftp:nvram:startup-config |

**Examples**

**Copy FTP Running-Config**

The following example copies a host configuration file named host1-confg from the netadmin1 directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the switch:

Switch# copy ftp://netadmin1:mypass@172.16.101.101/host1-confg system:running-config
Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]

Switch# %SYS-5-CONFIG: Configured from host1-confg by ftp from 172.16.101.101

**Copy FTP Startup-Config**

The following example specifies a remote username of netadmin1. Then it copies the configuration file named host2-confg from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

Switch# configure terminal
Switch(config)# ip ftp username netadmin1
Switch(config)# ip ftp password mypass
Switch(config)# end
Switch# copy ftp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[host1-confg]? host2-confg
Configure using host2-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-confg:![OK] [OK]
Switch# %SYS-5-CONFIG_NV:Non-volatile store configured from host2-confg by ftp from 172.16.101.101
What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Maintaining Configuration Files Larger than NVRAM

To maintain a configuration file that exceeds the size of NVRAM, perform the tasks described in the following sections:

Compressing the Configuration File (CLI)

To compress configuration files, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `service compress-config`
4. `end`
5. Do one of the following:
   - Use FTP, RCP, or TFTP to copy the new configuration.
   - `configure terminal`
6. `copy system:running-config nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> service compress-config</td>
<td>Specifies that the configuration file be compressed.</td>
</tr>
<tr>
<td>Example: Switch(config)# service compress-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

**Step 5**

Do one of the following:

- Use FTP, RCP, or TFTP to copy the new configuration.
- `configure terminal`

**Example:**

Switch# configure terminal

**Step 6**

`copy system:running-config nvram:startup-config`

**Example:**

Switch(config)# copy system:running-config nvram:startup-config

---

#### Examples

The following example compresses a 129-KB configuration file to 11 KB:

Switch# configure terminal

Switch(config)# service compress-config

Switch(config)# end

Switch# copy tftp://172.16.2.15/tokyo-confg system:running-config

Configure using tokyo-confg from 172.16.2.155? [confirm] y

Booting tokyo-confg from 172.16.2.155:!!! [OK - 874/16000 bytes]

Switch# copy system:running-config nvram:startup-config

Building configuration...

Compressing configuration from 129648 bytes to 11077 bytes

[OK]

---

### Storing the Configuration in Flash Memory on Class A Flash File Systems (CLI)

To store the startup configuration in flash memory, complete the tasks in this section:

#### SUMMARY STEPS

1. `enable`
2. `copy nvram:startup-config flash-filesystem:filename`
3. `configure terminal`
4. `boot config flash-filesystem: filename`
5. `end`
6. Do one of the following:
• Use FTP, RCP, or TFTP to copy the new configuration. If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed: “[buffer overflow - file-size / buffer-size bytes].”

• configure terminal

7. `copy system:running-config nvram:start-up-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>copy nvram:start-up-config flashfilesystem:filename</code></td>
<td>Copies the current startup configuration to the new location to create the configuration file.</td>

<tr>
<td></td>
<td>• configure terminal</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
When you have finished changing the running-configuration, save the new configuration.

Example:

Step 7

Switch(config)# copy system:running-config nvram:startup-config

Examples

The following example stores the configuration file in usbflash0:

Switch# copy nvram:startup-config usbflash0:switch-config
Switch# configure terminal
Switch(config)# boot config usbflash0:switch-config
Switch(config)# end
Switch# copy system:running-config nvram:startup-config

Loading the Configuration Commands from the Network (CLI)

To use a network server to store large configurations, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
2. copy system:running-config {ftp: | rcp: | tftp:}
3. configure terminal
4. boot network {ftp:[[[//][username :password ]@]location ]/directory ]/filename ] | rcp:[[[//][username@]location ]/directory ]/filename ] | tftp:[[[//]location ]/directory ]/filename ]
5. service config
6. end
7. copy system:running-config nvram:startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**

   - enable

   * Example:

     Switch> enable

   - copy system:running-config {ftp: | rcp: | tftp:}

   * Example:

     Switch# copy system:running-config ftp:|

   Enables privileged EXEC mode.

     • Enter your password if prompted.

| **Step 2**

   - copy system:running-config {ftp: | rcp: | tftp:}

   * Example:

     Switch# copy system:running-config ftp:|

   Saves the running configuration to an FTP, RCP, or TFTP server.
### Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th>configure terminal</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# configure terminal</td>
</tr>
</tbody>
</table>

| Purpose | Enters global configuration mode. |

| Step 4 | boot network (ftp://[username:[password@]location][directory]/filename | rcp://[username@]location][directory]/filename | tftp://[location][directory]/filename) |
|--------|--------------------------------------------------|
| Example: | Switch(config)# boot network ftp://user1:guessme@example.com/dir10/file1 |

<table>
<thead>
<tr>
<th>Step 5</th>
<th>service config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# service config</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch(config)# end</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>copy system:running-config nvram:startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example:</td>
<td>Switch# copy system:running-config nvram:startup-config</td>
</tr>
</tbody>
</table>

### Copying Configuration Files from Flash Memory to the Startup or Running Configuration (CLI)

To copy a configuration file from flash memory directly to your startup configuration in NVRAM or your running configuration, enter one of the commands in Step 2:

**SUMMARY STEPS**

1. enable
2. Do one of the following:
   - copy filesystem: [partition-number]:filename nvram:start-up-config
   - copy filesystem: [partition-number]:filename system:running-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Step 2</strong></th>
<th>Do one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• <em>copy</em> filesystem: [partition-number:]filename</td>
<td>• Loads a configuration file directly into NVRAM or</td>
</tr>
<tr>
<td>nvram:startup-config</td>
<td>• Copies a configuration file to your running configuration</td>
</tr>
<tr>
<td>• <em>copy</em> filesystem: [partition-number:]filename</td>
<td>system:running-config</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Switch# copy usbflash0:4:ios-upgrade-1 nvram:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

#### Examples

The following example copies the file named ios-upgrade-1 from partition 4 of the flash memory PC Card in usbflash0 to the switch startup configurations:

```
Switch# copy usbflash0:4:ios-upgrade-1 nvram:startup-config
Copy 'ios-upgrade-1' from flash device as 'startup-config' ? [yes/no] yes
[OK]
```

### Copying Configuration Files Between Flash Memory File Systems (CLI)

On platforms with multiple flash memory file systems, you can copy files from one flash memory file system, such as internal flash memory to another flash memory file system. Copying files to different flash memory file systems lets you create backup copies of working configurations and duplicate configurations for other switches. To copy a configuration file between flash memory file systems, use the following commands in EXEC mode:

#### SUMMARY STEPS

1. enable
2. show source-filesystem:
3. *copy* source-filesystem: [partition-number:]filename dest-filesystem:[partition-number:]filename

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**  
**Example:**
```
Switch> enable
```

- Enter your password if prompted.

### Step 2

**Example:**
```
Switch# show show flash:
```

Displays the layout and contents of flash memory to verify the filename.

### Step 3

**Example:**
```
Switch# copy flash: usbflash0:
```

Copies a configuration file between flash memory devices.

- The source device and the destination device cannot be the same. For example, the `copy` `usbflash0:usbflash0:` command is invalid.

---

#### Example

The following example copies the file named running-config from partition 1 on internal flash memory to partition 1 of usbflash0 on a switch. In this example, the source partition is not specified, so the switch prompts for the partition number:

```
Switch# copy flash: usbflash0:
```

---

**System flash**

<table>
<thead>
<tr>
<th>Partition</th>
<th>Size</th>
<th>Used</th>
<th>Free</th>

<td>Direct</td>
</tr>
</tbody>
</table>

[Type ?<no> for partition directory; ? for full directory; q to abort]

Which partition? [default = 1]

System flash directory, partition 1:

- Name/status
  - 1 3142748 dirt/network/mars-test/c3600-j-mz.latest
  - 2 850 running-config

(3143728 bytes used, 1050576 available, 4194304 total)

**usbflash0** flash directory:

- Name/status
  - 1 1711088 dirt/gate/c3600-i-mz
  - 2 850 running-config

(1712068 bytes used, 2482236 available, 4194304 total)

Source file name? `running-config`

Verifying checksum for 'running-config' (file # 2)... OK

Erase flash device before writing? [confirm]

Flash contains files. Are you sure you want to erase? [confirm]

Copy 'running-config' from flash: device

as 'running-config' into usbflash0: device WITH erase? [yes/no] yes

Erasing device... eeeeeeeeeeeeeeeeeeeeee eeeeeeeeeeeeeeeeee eeeeeeeeeeeeeeeeee e...erased!

[OK - 850/4194304 bytes]

Flash device copy took 00:00:30 [hh:mm:ss]

Verifying checksum... OK (0x16)
Copying a Configuration File from an FTP Server to Flash Memory Devices (CLI)

To copy a configuration file from an FTP server to a flash memory device, complete the task in this section:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip ftp username username`
4. `ip ftp password password`
5. `end`
6. `copy ftp: [[//location]directory ]/bundle_name flash:`

**DETAILED STEPS**

<table>
<thead>

</tbody>
</table>
What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Copying a Configuration File from an RCP Server to Flash Memory Devices (CLI)

To copy a configuration file from an RCP server to a flash memory device, complete the tasks in this section:

SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip rcmd remote-username username`
4. `end`
5. `copy rcp: [[[//username@]location ]/directory] /bundle_name] flash:`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>(Optional) Enters global configuration mode. This step is required only if you override the default remote username or password (see Step 3).</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip rcmd remote-username username</td>
<td>(Optional) Specifies the remote username.</td>
</tr>
<tr>
<td>Example:</td>

Copying a Configuration File from a TFTP Server to Flash Memory Devices (CLI)

To copy a configuration file from a TFTP server to a flash memory device, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `copy tftp: [[//location ]/directory ]/bundle_name flash:`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td><code>Switch&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td><code>copy tftp: [[//location ]/directory ]/bundle_name flash:</code></td>
<td>Copies the file from a TFTP server to the flash memory device. Reply to any switch prompts for additional information or confirmation. Prompting depends on how much information you provide in the <code>copy</code> command and the current setting of the <code>file prompt</code> command.</td>
</tr>
<tr>
<td></td>
<td><code>Example:</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td><code>Switch# copy tftp:/cat3k_caa-universalk9-3.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:</code></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example shows the copying of the configuration file named switch-config from a TFTP server to the flash memory card inserted in usbflash0. The copied file is renamed new-config.

```
Switch# copy tftp:switch-config usbflash0:new-config
```

Re-executing the Configuration Commands in the Startup Configuration File (CLI)

To re-execute the commands located in the startup configuration file, complete the task in this section:

**SUMMARY STEPS**

1. `enable`
2. `configure memory`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** configure memory | Re-executes the configuration commands located in the startup configuration file. |
| **Example:**                | |
| Switch# configure memory    | |

### Clearing the Startup Configuration (CLI)

You can clear the configuration information from the startup configuration. If you reboot the switch with no startup configuration, the switch enters the Setup command facility so that you can configure the switch from scratch. To clear the contents of your startup configuration, complete the task in this section:

#### SUMMARY STEPS

1. enable
2. erase nvram

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Switch&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** erase nvram | Clears the contents of your startup configuration. |
| **Example:**            | Note For all platforms except the Class A Flash file system platforms, this command erases NVRAM. The startup configuration file cannot be restored once it has been deleted. On Class A Flash file system platforms, when you use the **erase startup-config** EXEC command, the switch erases or deletes the configuration pointed to by the CONFIG_FILE environment variable. If this variable points to NVRAM, the switch erases NVRAM. If the CONFIG_FILE environment variable specifies a flash memory device and configuration filename, the switch deletes the configuration file. That is, the switch marks the file as “deleted,” rather than erasing it. This feature allows you to recover a deleted file. |
| Switch# erase nvram   | |

For all platforms except the Class A Flash file system platforms, this command erases NVRAM. The startup configuration file cannot be restored once it has been deleted. On Class A Flash file system platforms, when you use the **erase startup-config** EXEC command, the switch erases or deletes the configuration pointed to by the CONFIG_FILE environment variable. If this variable points to NVRAM, the switch erases NVRAM. If the CONFIG_FILE environment variable specifies a flash memory device and configuration filename, the switch deletes the configuration file. That is, the switch marks the file as “deleted,” rather than erasing it. This feature allows you to recover a deleted file.
Deleting a Specified Configuration File (CLI)

To delete a specified configuration on a specific flash device, complete the task in this section:

SUMMARY STEPS

1. `enable`
2. `delete flash-filesystem:filename`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> delete flash-filesystem:filename</td>
<td>Deletes the specified configuration file on the specified flash device.</td>
</tr>
<tr>
<td><strong>Example:</strong> Switch# delete usbflash0:myconfig</td>
<td>Note: On Class A and B Flash file systems, when you delete a specific file in flash memory, the system marks the file as deleted, allowing you to later recover a deleted file using the <code>undelete</code> EXEC command. Erased files cannot be recovered. To permanently erase the configuration file, use the <code>squeeze</code> EXEC command. On Class C Flash file systems, you cannot recover a file that has been deleted. If you attempt to erase or delete the configuration file specified by the CONFIG_FILE environment variable, the system prompts you to confirm the deletion.</td>
</tr>
</tbody>
</table>

Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI)

On Class A flash file systems, you can configure the Cisco IOS software to load the startup configuration file specified by the CONFIG_FILE environment variable. The CONFIG_FILE variable defaults to NVRAM. To change the CONFIG_FILE environment variable, complete the tasks in this section:

SUMMARY STEPS

1. `enable`
3. `configure terminal`
4. `boot config dest-flash-url`
5. `end`
6. `copy system:running-config nvram:startup-config`
7. show boot

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> copy [flash-url</td>
<td>Copies the configuration file to the flash file system from which the switch loads the file on restart.</td>
</tr>
<tr>
<td>Example: Switch&gt; copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> boot config dest-flash-url</td>
<td>Sets the CONFIG_FILE environment variable. This step modifies the runtime CONFIG_FILE environment variable.</td>
</tr>
<tr>
<td>Example: Switch(config)# boot config 172.16.1.1</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Exits global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch(config)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy system:running-config nvram:startup-config</td>
<td>Saves the configuration performed in Step 3 to the startup configuration.</td>
</tr>
<tr>
<td>Example: Switch&gt; copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong> show boot</td>
<td>(Optional) Allows you to verify the contents of the CONFIG_FILE environment variable.</td>
</tr>
<tr>
<td>Example: Switch&gt; show boot</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example copies the running configuration file to the switch. This configuration is then used as the startup configuration when the system is restarted:
Switch# copy system:running-config usbflash0:config2
Switch# configure terminal
Switch(config)# boot config usbflash0:config2
Switch(config)# end
Switch# copy system:running-config nvram:startup-config [ok]
Switch# show boot
BOOST variable = usbflash0:rsp-boot-m
CONFIG_FILE variable = nvram:
Current CONFIG_FILE variable = usbflash0:config2
Configuration register is 0x010F

**What to Do Next**

After you specify a location for the startup configuration file, the `nvram:startup-config` command is aliased to the new location of the startup configuration file. The `more nvram:startup-config` EXEC command displays the startup configuration, regardless of its location. The `erase nvram:startup-config` EXEC command erases the contents of NVRAM and deletes the file pointed to by the CONFIG_FILE environment variable.

When you save the configuration using the `copy system:running-config nvram:startup-config` command, the switch saves a complete version of the configuration file to the location specified by the CONFIG_FILE environment variable and a distilled version to NVRAM. A distilled version is one that does not contain access list information. If NVRAM contains a complete configuration file, the switch prompts you to confirm your overwrite of the complete version with the distilled version. If NVRAM contains a distilled configuration, the switch does not prompt you for confirmation and proceeds with overwriting the existing distilled configuration file in NVRAM.

---

**Note**

If you specify a file in a flash device as the CONFIG_FILE environment variable, every time you save your configuration file with the `copy system:running-config nvram:startup-config` command, the old configuration file is marked as “deleted,” and the new configuration file is saved to that device. Eventually, Flash memory fills up as the old configuration files still take up memory. Use the `squeeze` EXEC command to permanently delete the old configuration files and reclaim the space.

---

**Configuring the Switch to Download Configuration Files**

You can specify an ordered list of network configuration and host configuration filenames. The Cisco IOS XE software scans this list until it loads the appropriate network or host configuration file.

To configure the switch to download configuration files at system startup, perform at least one of the tasks described in the following sections:

- Configuring the Switch to Download the Network Configuration File (CLI)
- Configuring the Switch to Download the Host Configuration File (CLI)

If the switch fails to load a configuration file during startup, it tries again every 10 minutes (the default setting) until a host provides the requested files. With each failed attempt, the switch displays the following message on the console terminal:

`Booting host-config... [timed out]`
If there are any problems with the startup configuration file, or if the configuration register is set to ignore NVRAM, the switch enters the Setup command facility.

**Configuring the Switch to Download the Network Configuration File (CLI)**

To configure the Cisco IOS software to download a network configuration file from a server at startup, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
4. `service config`
5. `end`
6. `copy system:running-config nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
| *Example:* | • Enter your password if prompted. |
| `Switch> enable` | |
| **Step 2** configure terminal | Enters global configuration mode. |
| *Example:* | `Switch(config)# configure terminal` |
| **Step 3** `boot network {ftp://[[username [password ]@]location ]directory ]filename ]` | Specifies the network configuration file to download at startup, and the protocol to be used (TFTP, RCP, or FTP).  
| *Example:* | • If you do not specify a network configuration filename,  
| `Switch(config)# boot network tftp:hostfile1` | the Cisco IOS software uses the default filename  
| | network-conf. If you omit the address, the switch  
| | uses the broadcast address.  
| | • You can specify more than one network configuration  
| | file. The software tries them in order entered until it  
| | loads one. This procedure can be useful for keeping  
| | files with different configuration information loaded  
| | on a network server. |
| **Step 4** `service config` | Enables the system to automatically load the network file on restart. |
| *Example:* | `Switch(config)# service config` |
### Configuring the Switch to Download the Host Configuration File (CLI)

To configure the Cisco IOS software to download a host configuration file from a server at startup, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. `boot host {ftp:|[//]|username:[password]@location/directory/filename} | rcp:|[//]|username@location/directory/filename} | tftp:|[//]|location/directory/filename} ` • If you do not specify a host configuration filename, the switch uses its own name to form a host configuration filename by converting the name to all lowercase letters, removing all domain information, and appending “-confg.” If no host name information

### DETAILED STEPS

Technical Assistance

The Cisco Support and Documentation website provides online resources to download documentation, software, and tools. Use these resources to install and configure the software and to troubleshoot and resolve technical issues with Cisco products and technologies. Access to most tools on the Cisco Support and Documentation website requires a Cisco.com user ID and password.

Prerequisites for Configuration Replace and Configuration Rollback

The format of the configuration files used as input by the Configuration Replace and Configuration Rollback feature must comply with standard Cisco software configuration file indentation rules as follows:

- Start all commands on a new line with no indentation, unless the command is within a configuration submode.
- Indent commands within a first-level configuration submode one space.
- Indent commands within a second-level configuration submode two spaces.
- Indent commands within subsequent submodes accordingly.

These indentation rules describe how the software creates configuration files for such commands as `show running-config` or `copy running-config destination-url`. Any configuration file generated on a Cisco device complies with these rules.

Free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration) is required.
Restrictions for Configuration Replace and Configuration Rollback

If the device does not have free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration), the configuration replace operation is not performed.

Certain Cisco configuration commands such as those pertaining to physical components of a networking device (for example, physical interfaces) cannot be added or removed from the running configuration. For example, a configuration replace operation cannot remove the `interface ethernet 0` command line from the current running configuration if that interface is physically present on the device. Similarly, the `interface ethernet 1` command line cannot be added to the running configuration if no such interface is physically present on the device. A configuration replace operation that attempts to perform these types of changes results in error messages indicating that these specific command lines failed.

In very rare cases, certain Cisco configuration commands cannot be removed from the running configuration without reloading the device. A configuration replace operation that attempts to remove this type of command results in error messages indicating that these specific command lines failed.

Information About Configuration Replace and Configuration Rollback

Configuration Archive

The Cisco IOS configuration archive is intended to provide a mechanism to store, organize, and manage an archive of Cisco IOS configuration files to enhance the configuration rollback capability provided by the `configure replace` command. Before this feature was introduced, you could save copies of the running configuration using the `copy running-config destination-url` command, storing the replacement file either locally or remotely. However, this method lacked any automated file management. On the other hand, the Configuration Replace and Configuration Rollback feature provides the capability to automatically save copies of the running configuration to the Cisco IOS configuration archive. These archived files serve as checkpoint configuration references and can be used by the `configure replace` command to revert to previous configuration states.

The `archive config` command allows you to save Cisco IOS configurations in the configuration archive using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. This functionality provides a means for consistent identification of saved Cisco IOS configuration files. You can specify how many versions of the running configuration are kept in the archive. After the maximum number of files are saved in the archive, the oldest file is automatically deleted when the next, most recent file is saved. The `show archive` command displays information for all configuration files saved in the Cisco IOS configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the `configure replace` command, can be located on the following file systems: FTP, HTTP, RCP, TFTP.
**Configuration Replace**

The **configure replace** privileged EXEC command provides the capability to replace the current running configuration with any saved Cisco IOS configuration file. This functionality can be used to revert to a previous configuration state, effectively rolling back any configuration changes that were made since the previous configuration state was saved.

When using the **configure replace** command, you must specify a saved Cisco IOS configuration as the replacement configuration file for the current running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the `copy running-config destination-url` command), or, if generated externally, the replacement file must comply with the format of files generated by Cisco IOS devices. When the **configure replace** command is entered, the current running configuration is compared with the specified replacement configuration and a set of diffs is generated. The algorithm used to compare the two files is the same as that employed by the **show archive config differences** command. The resulting diffs are then applied by the Cisco IOS parser to achieve the replacement configuration state. Only the diffs are applied, avoiding potential service disruption from reapplying configuration commands that already exist in the current running configuration. This algorithm effectively handles configuration changes to order-dependent commands (such as access lists) through a multiple pass process. Under normal circumstances, no more than three passes are needed to complete a configuration replace operation, and a limit of five passes is performed to preclude any looping behavior.

The Cisco IOS **copy source-url running-config** privileged EXEC command is often used to copy a stored Cisco IOS configuration file to the running configuration. When using the **copy source-url running-config** command as an alternative to the **configure replace target-url** privileged EXEC command, the following major differences should be noted:

- The **copy source-url running-config** command is a merge operation and preserves all of the commands from both the source file and the current running configuration. This command does not remove commands from the current running configuration that are not present in the source file. In contrast, the **configure replace target-url** command removes commands from the current running configuration that are not present in the replacement file and adds commands to the current running configuration that need to be added.

- The **copy source-url running-config** command applies every command in the source file, whether or not the command is already present in the current running configuration. This algorithm is inefficient and, in some cases, can result in service outages. In contrast, the **configure replace target-url** command only applies the commands that need to be applied—no existing commands in the current running configuration are reapplied.

- A partial configuration file may be used as the source file for the **copy source-url running-config** command, whereas a complete Cisco IOS configuration file must be used as the replacement file for the **configure replace target-url** command.

A locking feature for the configuration replace operation was introduced. When the **configure replace** command is used, the running configuration file is locked by default for the duration of the configuration replace operation. This locking mechanism prevents other users from changing the running configuration while the replacement operation is taking place, which might otherwise cause the replacement operation to terminate unsuccessfully. You can disable the locking of the running configuration by using the **no lock** keyword when issuing the **configure replace** command.

The running configuration lock is automatically cleared at the end of the configuration replace operation. You can display any locks that may be currently applied to the running configuration using the **show configuration lock** command.
Configuration Rollback

The concept of rollback comes from the transactional processing model common to database operations. In a database transaction, you might make a set of changes to a given database table. You then must choose whether to commit the changes (apply the changes permanently) or to roll back the changes (discard the changes and revert to the previous state of the table). In this context, rollback means that a journal file containing a log of the changes is discarded, and no changes are applied. The result of the rollback operation is to revert to the previous state, before any changes were applied.

The `configure replace` command allows you to revert to a previous configuration state, effectively rolling back changes that were made since the previous configuration state was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the Cisco IOS configuration rollback capability uses the concept of reverting to a specific configuration state based on a saved Cisco IOS configuration file. This concept is similar to the database idea of saving a checkpoint (a saved version of the database) to preserve a specific state.

If the configuration rollback capability is desired, you must save the Cisco IOS running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes (using the `configure replace target-url` command). Furthermore, because you can specify any saved Cisco IOS configuration file as the replacement configuration, you are not limited to a fixed number of rollbacks, as is the case in some rollback models.

Configuration Rollback Confirmed Change

The Configuration Rollback Confirmed Change feature allows configuration changes to be performed with an optional requirement that they be confirmed. If this confirmation is not received, the configuration is returned to the state prior to the changes being applied. The mechanism provides a safeguard against inadvertent loss of connectivity between a network device and the user or management application due to configuration changes.

Benefits of Configuration Replace and Configuration Rollback

- Allows you to revert to a previous configuration state, effectively rolling back configuration changes.
- Allows you to replace the current running configuration file with the startup configuration file without having to reload the switch or manually undo CLI changes to the running configuration file, therefore reducing system downtime.
- Allows you to revert to any saved Cisco IOS configuration state.
- Simplifies configuration changes by allowing you to apply a complete configuration file to the switch, where only the commands that need to be added or removed are affected.
- When using the `configure replace` command as an alternative to the `copy source-url running-config` command, increases efficiency and prevents risk of service outages by not reapplying existing commands in the current running configuration.
How to Use Configuration Replace and Configuration Rollback

Creating a Configuration Archive (CLI)

No prerequisite configuration is needed to use the `configure replace` command. Using the `configure replace` command in conjunction with the Cisco IOS configuration archive and the `archive config` command is optional but offers significant benefit for configuration rollback scenarios. Before using the `archive config` command, the configuration archive must be configured. Perform this task to configure the characteristics of the configuration archive.

SUMMARY STEPS

1. enable
2. configure terminal
3. archive
4. path url
5. maximum number
6. time-period minutes
7. end
8. archive config

Performing a Configuration Replace or Configuration Rollback Operation (CLI)

Perform this task to replace the current running configuration file with a saved Cisco IOS configuration file.

Note

You must create a configuration archive before performing this procedure. See Creating a Configuration Archive (CLI) for detailed steps. The following procedure details how to return to that archived configuration in the event of a problem with the current running configuration.

SUMMARY STEPS

1. enable
2. configure replace target-url [nolock] [list] [force] [ignore case] [revert trigger [error] [timer minutes] [time minutes]]
3. configure revert {now | timer {minutes | idle minutes}}
4. configure confirm
5. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure replace target-url [nolock] [list] [force] [ignore case] [revert trigger [error] [timer minutes] [time minutes]]</td>
<td>Replaces the current running configuration file with a saved Cisco IOS configuration file.</td>
</tr>
<tr>
<td>Example: Switch# configure replace flash: startup-config time 120</td>
<td></td>
</tr>
</tbody>
</table>

- The target-url argument is a URL (accessible by the Cisco IOS file system) of the saved Cisco IOS configuration file that is to replace the current running configuration, such as the configuration file created using the archive config command.

- The list keyword displays a list of the command lines applied by the Cisco IOS software parser during each pass of the configuration replace operation. The total number of passes performed is also displayed.

- The force keyword replaces the current running configuration file with the specified saved Cisco IOS configuration file without prompting you for confirmation.

- The time minutes keyword and argument specify the time (in minutes) within which you must enter the configure confirm command to confirm replacement of the current running configuration file. If the configure confirm command is not entered within the
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the <em>configure replace</em> command).</td>
<td></td>
</tr>
<tr>
<td><strong>•</strong> The <em>nolock</em> keyword disables the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replace operation.</td>
<td></td>
</tr>
<tr>
<td><strong>•</strong> The <em>revert trigger</em> keywords set the following triggers for reverting to the original configuration:</td>
<td></td>
</tr>
<tr>
<td></td>
<td><strong>•</strong> <em>error</em> — Reverts to the original configuration upon error.</td>
</tr>
<tr>
<td></td>
<td><strong>•</strong> <em>timer minutes</em> — Reverts to the original configuration if specified time elapses.</td>
</tr>
<tr>
<td><strong>•</strong> The <em>ignore case</em> keyword allows the configuration to ignore the case of the confirmation command.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>*configure revert { now</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><em>Switch# configure revert now</em></td>
</tr>
<tr>
<td></td>
<td>(Optional) To cancel the timed rollback and trigger the rollback immediately, or to reset parameters for the timed rollback, use the <em>configure revert</em> command in privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td><strong>•</strong> <em>now</em> — Triggers the rollback immediately.</td>
</tr>
<tr>
<td></td>
<td><strong>•</strong> <em>timer</em> — Resets the configuration revert timer.</td>
</tr>
<tr>
<td></td>
<td><strong>•</strong> Use the <em>minutes</em> argument with the <em>timer</em> keyword to specify a new revert time in minutes.</td>
</tr>
<tr>
<td></td>
<td><strong>•</strong> Use the <em>idle</em> keyword along with a time in minutes to set the maximum allowable time period of no activity before reverting to the saved configuration.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><em>configure confirm</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><em>Switch# configure confirm</em></td>
</tr>
<tr>
<td></td>
<td>(Optional) Confirms replacement of the current running configuration file with a saved Cisco IOS configuration file.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Use this command only if the <em>time seconds</em> keyword and argument of the <em>configure replace</em> command are specified.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><em>exit</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><em>Switch# exit</em></td>
</tr>
<tr>
<td></td>
<td>Exits to user EXEC mode.</td>
</tr>
</tbody>
</table>
Monitoring and Troubleshooting the Feature (CLI)

Perform this task to monitor and troubleshoot the Configuration Replace and Configuration Rollback feature.

SUMMARY STEPS

1. enable
2. show archive
3. debug archive versioning
4. debug archive config timestamp
5. exit

DETAILED STEPS

Step 1  enable

Use this command to enable privileged EXEC mode. Enter your password if prompted.

Example:

Switch> enable
Switch#

Step 2  show archive

Use this command to display information about the files saved in the Cisco IOS configuration archive.

Example:

Switch# show archive
There are currently 1 archive configurations saved.
The next archive file will be named flash:myconfiguration-2
Archive # Name
0
1 flash:myconfiguration-1 <- Most Recent
2
3
4
5
6
7
8
9
10
11
12
13
14

The following is sample output from the show archive command after several archive files of the running configuration have been saved. In this example, the maximum number of archive files to be saved is set to three.

Example:

Switch# show archive
There are currently 3 archive configurations saved.
The next archive file will be named flash:myconfiguration-8
Step 3  **debug archive versioning**

Use this command to enable debugging of the Cisco IOS configuration archive activities to help monitor and troubleshoot configuration replace and rollback.

**Example:**

```
Switch# debug archive versioning
Jan 9 06:46:28.419:backup_running_config
Jan 9 06:46:28.419:Current = 7
Jan 9 06:46:28.443:Writing backup file flash:myconfiguration-7
Jan 9 06:46:29.547: backup worked
```

Step 4  **debug archive config timestamp**

Use this command to enable debugging of the processing time for each integral step of a configuration replace operation and the size of the configuration files being handled.

**Example:**

```
Switch# debug archive config timestamp
Switch# configure replace flash:myconfiguration force
Timing Debug Statistics for IOS Config Replace operation:
  Time to read file usbflash0:sample_2.cfg = 0 msec (0 sec)
  Number of lines read:55
  Size of file :1054
Starting Pass 1
  Time to read file system:running-config = 0 msec (0 sec)
  Size of file :2539
  Time taken for positive rollback pass = 320 msec (0 sec)
  Time taken for negative rollback pass = 0 msec (0 sec)
  Time taken for negative incremental diffs pass = 59 msec (0 sec)
  Time taken by PI to apply changes = 0 msec (0 sec)
  Time taken for Pass 1 = 380 msec (0 sec)
Starting Pass 2
  Time to read file system:running-config = 0 msec (0 sec)
  Number of lines read:55
  Size of file :1054
  Time taken for positive rollback pass = 0 msec (0 sec)
  Time taken for negative rollback pass = 0 msec (0 sec)
  Time taken for Pass 2 = 0 msec (0 sec)
```

Step 5  **exit**
Configuration Examples for Configuration Replace and Configuration Rollback

Creating a Configuration Archive

The following example shows how to perform the initial configuration of the Cisco IOS configuration archive. In this example, flash:myconfiguration is specified as the location and filename prefix for the files in the configuration archive and a value of 10 is set as the maximum number of archive files to be saved.

```plaintext
configure terminal
!
archive
  path flash:myconfiguration
  maximum 10
end
```

Replacing the Current Running Configuration with a Saved Cisco IOS Configuration File

The following example shows how to replace the current running configuration with a saved Cisco IOS configuration file named flash:myconfiguration. The `configure replace` command interactively prompts you to confirm the operation.

```
Switch# configure replace flash:myconfiguration
This will apply all necessary additions and deletions to replace the current running configuration with the contents of the specified configuration file, which is assumed to be a complete configuration, not a partial configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
```

In the following example, the `list` keyword is specified in order to display the command lines that were applied during the configuration replace operation:

```
Switch# configure replace flash:myconfiguration list
This will apply all necessary additions and deletions to replace the current running configuration with the contents of the specified configuration file, which is assumed to be a complete configuration, not a partial configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
```
Reverting to the Startup Configuration File

The following example shows how to revert to the Cisco IOS startup configuration file using the `configure replace` command. This example also shows the use of the optional `force` keyword to override the interactive user prompt:

```
Switch# configure replace flash:startup-config force
Rollback Done
```

Performing a Configuration Replace Operation with the `configure confirm` Command

The following example shows the use of the `configure replace` command with the `time minutes` keyword and argument. You must enter the `configure confirm` command within the specified time limit to confirm replacement of the current running configuration file. If the `configure confirm` command is not entered within the specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the `configure replace` command).

```
Switch# configure replace flash:startup-config time 120
This will apply all necessary additions and deletions to replace the current running configuration with the contents of the specified configuration file, which is assumed to be a complete configuration, not a partial configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
Switch# configure confirm
```

Performing a Configuration Rollback Operation

The following example shows how to make changes to the current running configuration and then roll back the changes. As part of the configuration rollback operation, you must save the current running configuration before making changes to the file. In this example, the `archive config` command is used to save the current running configuration. The generated output of the `configure replace` command indicates that only one pass was performed to complete the rollback operation.
Before using the `archive config` command, you must configure the `path` command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.

You first save the current running configuration in the configuration archive as follows:

```
archive config
```

You then enter configuration changes as shown in the following example:

```
configure terminal
!
user netops2 password rain
user netops3 password snow
exit
```

After having made changes to the running configuration file, assume you now want to roll back these changes and revert to the configuration that existed before the changes were made. The `show archive` command is used to verify the version of the configuration to be used as a replacement file. The `configure replace` command is then used to revert to the replacement configuration file as shown in the following example:

```
Switch# show archive
There are currently 1 archive configurations saved.
The next archive file will be named flash:myconfiguration-2
Archive # Name
0
1 flash:myconfiguration-1 <- Most Recent
2
3
4
5
6
7
8
9
10
Switch# configure replace flash:myconfiguration-1
Total number of passes: 1
Rollback Done
```

Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the switch is named flash:

As viewed from the active switch, or any stack member, flash: refers to the local flash device, which is the device attached to the same switch on which the file system is being viewed. In a switch stack, each of the flash devices from the various stack members can be viewed from the active switch. The names of these flash file systems include the corresponding switch member numbers. For example, flash-3:, as viewed from the active switch, refers to the same file system as does flash: on stack member 3. Use the show file systems privileged EXEC command to list all file systems, including the flash file systems in the switch stack.

Only one user at a time can manage the software bundles and configuration files for a switch stack.

Displaying Available File Systems

To display the available file systems on your switch, use the show file systems privileged EXEC command as shown in this example for a standalone switch:

```
Switch# show file systems
File Systems:
  Size(b)  Free(b)  Type  Flags  Prefixes
  * 15998976  5135872  flash  rw  flash:
      -      -  opaque  rw  bs:
      -      -  opaque  rw  vb:
```
This example shows a switch stack. In this example, the active switch is stack member 1; the file system on stack member 2 is displayed as flash-2:, the file system on stack member 3 is displayed as flash-3: and so on up to stack member 9, displayed as flash-9: for a 9-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active switch:

```
Switch# show file systems
File Systems:
Size(b) Free(b) Type Flags Prefixes
145898496 5479424 disk rw crashinfo:crashinfo-1:

### Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the `cd filesystem` privileged EXEC command. You can set the default file system to omit the `filesystem:` argument from related commands. For example, for all privileged EXEC commands that have the optional `filesystem:` argument, the system uses the file system specified by the `cd` command.

By default, the default file system is `flash:`.

You can display the current default file system as specified by the `cd` command by using the `pwd` privileged EXEC command.

### Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefixes</td>
<td></td>
</tr>
<tr>
<td><strong>crashinfo:</strong></td>
<td>Crashinfo file.</td>

<td>TFTP network server.</td>
</tr>
<tr>
<td><strong>usbflash0:</strong></td>
<td>USB flash memory.</td>
</tr>
<tr>
<td><strong>xmodem:</strong></td>
<td>Obtain the file from a network machine by using the Xmodem protocol.</td>
</tr>
<tr>
<td><strong>ymodem:</strong></td>
<td>Obtain the file from a network machine by using the Ymodem protocol.</td>
</tr>
</tbody>
</table>
### Table 185: Commands for Displaying Information About Files

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dir [/all] filesystem:filename</code></td>
<td>Displays a list of files on a file system.</td>
</tr>
<tr>
<td><code>show file systems</code></td>
<td>Displays more information about each of the files on a file system.</td>
</tr>
<tr>
<td><code>show file information file-url</code></td>
<td>Displays information about a specific file.</td>
</tr>
<tr>
<td><code>show file descriptors</code></td>
<td>Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.</td>
</tr>
</tbody>
</table>

For example, to display a list of all files in a file system, use the `dir` privileged EXEC command:

```
switch# dir flash:
Directory of flash:/
7386 -rwx 2097152 Jan 23 2013 14:06:49 +00:00 nvram_config
7378 drwx 4096 Jan 23 2013 09:35:11 +00:00 mnt
7385 -rw- 221775876 Jan 23 2013 14:15:13 +00:00 cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
7389 -rwx 556 Jan 21 2013 20:47:30 +00:00 vlan.dat
712413184 bytes total (445063168 bytes free)
switch#
```

### Changing Directories and Displaying the Working Directory (CLI)

Beginning in privileged EXEC mode, follow these steps to change directories and to display the working directory:

**SUMMARY STEPS**

1. `dir filesystem:`
2. `cd directory_name`
3. `pwd`
4. `cd`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Displays the directories on the specified file system.</td>
</tr>
<tr>
<td><code>dir filesystem:</code></td>
<td>For <code>filesystem:/</code>, use flash: for the system board flash device.</td>
</tr>
<tr>
<td><code>Example:</code></td>
<td>To access flash partitions of switch members in a stack, use <code>flash-n</code> where <code>n</code> is the stack member number. For example, <code>flash-4</code>.</td>
</tr>
<tr>
<td><code>Switch# dir flash:</code></td>
<td></td>
</tr>
</tbody>
</table>
Creating Directories (CLI)

Beginning in privileged EXEC mode, follow these steps to create a directory:

**SUMMARY STEPS**

1. `dir filesystem`:
2. `mkdir directory_name`
3. `dir filesystem`:

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Displays the directories on the specified file system. For <code>filesystem</code>, use <code>flash:</code> for the system board flash device.</td>
</tr>
<tr>
<td><code>dir filesystem:</code></td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# <code>dir flash:</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (`/`); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons. |
| `mkdir directory_name` |  |
| Example: |  |
| Switch# `mkdir new_configs` |  |

| **Step 3** | Verifies your entry. |
| `dir filesystem:` |  |
| Example: |  |
| Switch# `dir flash:` |  |
Removing Directories

To remove a directory with all its files and subdirectories, use the `delete /force /recursive filesystem:/file-url` privileged EXEC command.

Use the `/recursive` keyword to delete the named directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.

⚠️ Caution

When directories are deleted, their contents cannot be recovered.

Copying Files

To copy a file from a source to a destination, use the `copy source-url destination-url` privileged EXEC command. For the source and destination URLs, you can use `running-config` and `startup-config` keyword shortcuts. For example, the `copy running-config startup-config` command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (`xmodem:`, `ymodem:`) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, and tftp: and have these syntaxes:

- FTP—ftp://username [:password]@location/directory]/filename
- RCP—rcp://username@location/directory]/filename
- TFTP—tftp://location/directory]/filename

Local writable file systems include flash:.

Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the `copy flash: flash:` command is invalid)

Copying Files from One Switch in a Stack to Another Switch in the Same Stack

To copy a file from one switch in a stack to another switch in the same stack, use the `flash-X:` notation, where `X` is the switch number.

To view all switches in a stack, use the `show switch` command in privileged EXEC mode, as in the following example of a 9-member switch stack:

```
Switch# show switch
```
Switch/Stack Mac Address : 0006.6f69.b580 - Local Mac Address Mac persistency wait time: Indefinite

To view all file systems available to copy on a specific switch, use the `copy` command as in the following example of a 5-member stack:

Switch# copy flash: ?

- crashinfo-1: Copy to crashinfo-1: file system
- crashinfo-2: Copy to crashinfo-2: file system
- crashinfo-3: Copy to crashinfo-3: file system
- crashinfo-4: Copy to crashinfo-4: file system
- crashinfo-5: Copy to crashinfo-5: file system
- flash-1: Copy to flash-1: file system
- flash-2: Copy to flash-2: file system
- flash-3: Copy to flash-3: file system
- flash-4: Copy to flash-4: file system
- flash-5: Copy to flash-5: file system
- flash: Copy to flash: file system
- ftp: Copy to ftp: file system
- http: Copy to http: file system
- https: Copy to https: file system
- null: Copy to null: file system
- nvram: Copy to nvram: file system
- rcp: Copy to rcp: file system
- revrcsf: Copy to revrcsf: file system
- running-config: Copy to running-config: Update (merge with) current system configuration
- scp: Copy to scp: file system
- startup-config: Copy to startup-config: Copy to startup configuration
- stby-crashinfo: Copy to stby-crashinfo: file system
- stby-flash: Copy to stby-flash: file system
- stby-nvram: Copy to stby-nvram: file system
- stby-rcsf: Copy to stby-rcsf: file system

- usbflash0: Copy to usbflash0: file system

Switch#

This example shows how to copy a config file stored in the flash partition of switch 2 to the flash partition of switch 4. It assumes that switch 2 and switch 4 are in the same stack.
Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the `delete [/force] [/recursive] [filesystem:]/file-url` privileged EXEC command.

Use the `/recursive` keyword for deleting a directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the `/force` and `/recursive` keywords for deleting old software images that were installed by using the `archive download-sw` command but are no longer needed.

If you omit the `filesystem:` option, the switch uses the default device specified by the `cd` command. For `file-url`, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

⚠️ Caution

When files are deleted, their contents cannot be recovered.

This example shows how to delete the file `myconfig` from the default flash memory device:

```
Switch# delete myconfig
```

Creating, Displaying and Extracting Files (CLI)

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:

**SUMMARY STEPS**

1. `archive tar /create destination-url flash: /file-url`
2. `archive tar /table source-url`
3. `archive tar /xtract source-url flash: /file-url [dir/file...]`
4. `more [/ascii | /binary | /ebcdic] /file-url`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>archive tar /create destination-url flash: /file-url</code></td>
<td>Creates a file and adds files to it. For destination-url, specify the destination URL alias for the local or network file system and the name of the file to create:</td>
</tr>
<tr>
<td></td>
<td>Example: <code>switch# archive tar /create tftp:172.20.10.30/saved. flash:/new-configs</code></td>
<td>• Local flash file system syntax:</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
<td></td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Displays the contents of a file. For <strong>source-url</strong>, specify the source URL alias for the local or network file system. The <code>-filename</code> is the file to display. These options are supported:</td>
<td></td>
</tr>
<tr>
<td><code>archive tar /table source-url</code></td>
<td>Displays the contents of a file. For <strong>source-url</strong>, specify the source URL alias for the local or network file system. The <code>-filename</code> is the file to display. These options are supported:</td>
<td></td>
</tr>
<tr>
<td><code>switch# archive tar /table flash: /new_configs</code></td>
<td>Displays the contents of a file. For <strong>source-url</strong>, specify the source URL alias for the local or network file system. The <code>-filename</code> is the file to display. These options are supported:</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Extracts a file into a directory on the flash file system. For <strong>source-url</strong>, specify the source URL alias for the local file system. The <code>-filename</code> is the file from which to extract files. These options are supported:</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>archive tar /xtract source-url flash:/file-url [dir/file...]</code></td>
<td>Extracts a file into a directory on the flash file system. For <strong>source-url</strong>, specify the source URL alias for the local file system. The <code>-filename</code> is the file from which to extract files. These options are supported:</td>
</tr>
<tr>
<td><code>switch# archive tar /xtract tftp:/172.20.10.30/saved. flash:/new-configs</code></td>
<td>Extracts a file into a directory on the flash file system. For <strong>source-url</strong>, specify the source URL alias for the local file system. The <code>-filename</code> is the file from which to extract files. These options are supported:</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**: `tftp://[//location]/directory[/filename].`

For `flash:/file-url [dir/file...]`, specify the location on the local flash file system from which the file is extracted. Use the `dir/file...` option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.

### Step 4

**Example**: `switch# more [ /ascii | /binary | /ebcdic ] /file-url`  

**Example**: `switch# more flash:/new-configs`

Displays the contents of any readable file, including a file on a remote file system.

CHAPTER 105

Working with Cisco IOS XE Software Bundles

- About Software Bundles and Packages, on page 2061
- Bundle and Package File Location on the Switch, on page 2061
- Upgrading Cisco IOS XE Software, on page 2062
- Additional References, on page 2070

About Software Bundles and Packages

Cisco IOS XE software bundles include a set of Cisco IOS XE package (.pkg) files. You can install the package files on the switch or you can boot the switch from the IOS XE bundle itself.

To display information about the contents of a Cisco IOS XE bundle (.bin file), use the `show software package` command in privileged EXEC mode. Use the command to display information about an individual IOS XE package (.pkg) file as well.

Bundle and Package File Location on the Switch

When the switch is running in installed mode, the Cisco IOS XE package (.pkg) files and provisioning file (packages.conf) are stored in the system board flash memory (flash:). When the switch is running in bundle mode, the booted Cisco IOS XE software bundle (.bin) file is stored in the system board flash memory (flash:) or USB flash memory (usbflash0:).

To display information about the provisioning software that is currently running on the switch, use the `show version` privileged EXEC command. In the display, check the line that begins with

```
System bundle file is....
```

When the switch is running in installed mode, this line displays the name and location of the booted Cisco IOS XE provisioning file, typically flash:packages.conf.

When the switch is running in bundle mode, this line displays the name and location of the booted Cisco IOS XE bundle file.

To display information about the Cisco IOS XE package files that are running on the switch, use the `show version running` privileged EXEC command.

When the switch is running in installed mode, this command displays information about the set of package files contained in the booted provisioning file.
When the switch is running in bundle mode, this command displays information about the set of package files contained in the booted Cisco IOS XE software bundle.

### Note
For usbflash0:, the default format is FAT16, while FAT32 format is also supported.

```
Switch# format usbflash0: ?
FAT16  FAT16 filesystem type
FAT32  FAT32 filesystem type
```

## Upgrading Cisco IOS XE Software

The method that you use to upgrade Cisco IOS XE software depends on whether the switch is running in installed mode or in bundle mode.

### Upgrading Cisco IOS XE Software: Install Mode

To upgrade the Cisco IOS XE software when the switch is running in installed mode, use the `software install` privileged EXEC command to install the packages from a new software bundle file. The software bundle can be installed from the local storage media or it can be installed over the network using TFTP or FTP.

The `software install` command expands the package files from the specified source bundle file and copies them to the local flash: storage device. When the source bundle is specified as a tftp: or ftp: URL, the bundle file is first downloaded into the switch's memory (RAM); the bundle file is not copied to local storage media.

After the package files are expanded and copied to flash: the running provisioning file (flash:packages.conf) is updated to reflect the newly installed packages, and the switch displays a reload prompt.

### Note
The `software install` command is not supported when the switch is running in bundle mode. Use the `software expand` privileged EXEC command to convert the switch from bundle mode to installed mode.

### Upgrading Cisco IOS XE Software Install Mode Example

This example shows the `software install file` command being used to expand and copy the packages from a Cisco IOS XE bundle located on a TFTP server in order to upgrade to a new image:

```
Switch# software install file
tftp://172.19.211.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
Preparing install operation ...

Added cat3k_caa-iosd-universalk9.SPA.150-1.EX.pkg
Added cat3k_caa-platform.SPA.03.02.00.SE.pkg
Added cat3k_caa-wcm.SPA.03.02.00.SE.pkg
Creating pending provisioning file
Finished installing software. New software will load on reboot.
Setting rollback timer to 45 minutes
Do you want to proceed with reload? [yes/no]:

Upgrading Cisco IOS XE Software: Bundle Mode

To upgrade the Cisco IOS XE software when the switch is running in bundle mode, follow these steps:
1. Download the bundle file to local storage media.
2. Configure the `boot system` global configuration command to point to the bundle file.
3. Reload the switch.

Upgrading Cisco IOS XE Software Bundle Mode Example

This example shows the steps to upgrade the Cisco IOS XE software on a switch that is running in bundle mode. It shows using the `copy` command to copy the bundle file to flash, configuring the boot system variable to point to the bundle file, saving a copy of the running configuration, and finally, reloading the switch.

Switch# copy tftp://172.19.211.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:
Destination filename [cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin]?
Accessing tftp://172.19.211.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin...Loading /tftpboot/cstohs/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin (via GigabitEthernet0/0):
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!! [OK - 220766688 bytes]
220766688 bytes copied in 124.330 secs (1775651 bytes/sec)
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# boot system switch all
Converting from the Bundle Running Mode to the Install Running Mode

To convert the running mode of a switch from bundle mode to installed mode, use the `software expand running` privileged EXEC command. This command expands the packages from the booted IOS XE software bundle and copies them and the provisioning file to the specified destination.

When you use the `software expand running` command to convert the switch from bundle mode to installed mode, specify the to destination as `flash`. After you execute the command, configure the `boot system` command to point to the expanded provisioning file (flash:packages.conf), then reload the switch to boot in installed mode.

### Note

The `software expand running` command is not supported when the switch is running in installed mode.

**Converting from the Bundle Running Mode to the Install Running Mode Example**

This example shows using the `software expand running to flash:` command to convert the active switch in a switch stack from the bundle running mode to the installed running mode:

```plaintext
Switch# dir flash:
Directory of flash: /
  7386 -rw-  2097152 Jan 23 2013 14:06:49 +00:00 nvram_config

  7386 -rw-  2097152 Jan 23 2013 14:06:49 +00:00 nvram_config
  7378 drwx  4096 Jan 23 2013 09:35:11 +00:00 mnt
  7385 -rw- 221775876 Jan 23 2013 14:15:13 +00:00
```
Copying IOS XE Package and Bundle Files from One Stack Member to Another

For switch stacks running in installed mode, use the `software install source switch` privileged EXEC command to install the running software packages from an existing stack member to one or more other stack members that are running different (but compatible) software packages.

Copying IOS XE Package and Bundle Files from One Stack Member to Another Example

This example shows a 2-member stack where each switch is running a different (but compatible) software package. The `software install source switch` command is used to install the packages that are currently running on the standby switch (switch 1) onto the active switch (switch 2):

```bash
Switch# show version running
Package: Base, version: 03.02.00SE, status: active
File: cat3k_caa-base.SPA.03.02.00SE.pkg, on: Switch1

Package: Drivers, version: 03.02.00.SE, status: active
File: cat3k_caa-drivers.SPA.03.02.00.SE.pkg, on: Switch1

Package: Infra, version: 03.02.00SE, status: active
File: cat3k_caa-infra.SPA.03.02.00SE.pkg, on: Switch1
Built: Wed Jan 09 22:00:56 PST 2013, by: gereddy

Package: IOS, version: 150-1.EX, status: active
File: cat3k_caa-iosd-universalk9.SPA.150-1.EX.pkg, on: Switch1
Built: Wed Jan 09 22:02:23 PST 2013, by: gereddy

Package: Platform, version: 03.02.00.SE, status: active
```
For switch stacks running in bundle mode, follow these steps to copy the bundle file from one stack member to another:

1. Use the `copy` privileged EXEC command to copy the running bundle from one switch in the stack to the other.

2. Configure the `boot system` global configuration command to point to the bundle file.

3. Reload the switch.

This example shows a 2-member stack where each switch is running a different (but compatible) software packages:

```
Switch# copy flash:cat3k_caa-universalk9.SSA.03.12.02.EZF.150-12.02.EZF.150-12.02.EZP.bin
flash-1:
Destination filename [cat3k_caa-universalk9.SSA.03.12.02.EZF.150-12.02.EZF.150-12.02.EZP.bin]?
Copy in progress...

... 220766688 bytes copied in 181.700 secs (1215007 bytes/sec)
Switch#
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# boot system switch 1
flash:cat3k_caa-universalk9.SSA.03.12.02.EZF.150-12.02.EZF.150-12.02.EZP.bin
```
Upgrading a Switch Running Incompatible Software

To upgrade a switch that is running in installed mode with software packages that are incompatible with the switch stack (also running in installed mode), use the `software auto-upgrade` privileged EXEC command to install the software packages from an existing stack member to the stack member that is running incompatible software. Upon completion of the auto-upgrade installation, the incompatible switch automatically reloads and joins the stack as a fully functioning member.

If you configure the global `software auto-upgrade enable` command, the auto-upgrade functionality is initiated automatically when a switch with incompatible software running in installed mode joins the stack that is running in installed mode. For more information, see Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches).

Upgrading a Switch Running Incompatible Software Example

This example shows a 2-member switch stack; switch 2 is the active switch and switch 1 is running incompatible software:

```
Switch# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
------------------------------------------------------------
1 Member 6400.f125.1a00 1 0 V-Mismatch
*2 Active 6400.f125.1100 1 V01 Ready
Switch#
Switch# software auto-upgrade
% Auto upgrade has been initiated for the following incompatible switches: 1
INFO level system messages will be generated to provide status information during the auto upgrade process

Switch#
*Oct 19 06:59:14.521: %INSTALLER-6-AUTO_UPGRADE_SW_INITIATED: 2 installer: Auto upgrade initiated for switch 1
*Oct 19 06:59:14.522: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Searching stack for software to upgrade switch 1
*Oct 19 06:59:14.523: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Found donor switch 2 to auto upgrade switch 1
*Oct 19 06:59:14.523: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Upgrading switch 1 with software from switch 2
*Oct 19 07:00:47.829: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Finished installing software on switch 1
*Oct 19 07:00:47.829: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Reloading switch 1 to complete the auto upgrade
```

To upgrade a switch that is running in bundle mode with a software bundle that is incompatible with the switch stack (also running in bundle mode), follow these steps:
1. Use the `copy` privileged EXEC command to copy the running bundle from one switch in the stack to the other.

2. Configure the `boot system` global configuration command to point to the bundle file.

3. Reload the switch.

This example shows a 2-member switch stack running in bundle mode; switch 2 is the active switch and switch 1 is running an incompatible bundle:

```
Switch# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
------------------------------------------------------------
 1 Member 6400.f125.1a00 1 0 V-Mismatch
*2 Active 6400.f125.1100 1 V01 Ready
Switch#
Switch# copy flash:cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash-1:
Destination filename [cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin]?

Stack is in Half ring setup; Reloading a switch might cause stack split
Proceed with reload? [confirm]
```

**Upgrading a Switch Running in Incompatible Running Mode**

When a switch running in bundle mode tries to join a stack running in installed mode, use the `software auto-upgrade` privileged EXEC command to install the incompatible switch's running packages and convert the switch to installed mode. Upon completion of the auto-upgrade running mode conversion, the incompatible switch automatically reloads and attempts to join the stack in installed mode.

**Note**

If you configure the global `software auto-upgrade enable` command, the auto-upgrade functionality is initiated automatically when a switch with incompatible software running in installed mode joins the stack that is running in installed mode. For more information, see *Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)*.

**Upgrading a Switch Running in Incompatible Running Mode Example**

This example shows a 2-member switch stack running in installed mode; switch 2 is the active switch and switch 1 is running in bundle mode:
Switch# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite

Switch#
Switch# software auto-upgrade
% Auto upgrade has been initiated for the following incompatible switches: 1
INFO level system messages will be generated to provide status information during the auto
upgrade process

Switch#
*Oct 19 07:17:16.694: %INSTALLER-6-AUTO_UPGRADE_SW_INITIATED: 2 installer: Auto upgrade
initiated for switch 1
*Oct 19 07:17:16.694: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Converting switch 1 to
installed mode by
*Oct 19 07:17:16.694: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: installing its running
software
*Oct 19 07:18:50.488: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Setting the boot var on
switch 1
*Oct 19 07:18:51.553: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Finished installing the
running software on switch 1
*Oct 19 07:18:51.553: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Reloading switch 1 to boot
in installed mode

When you use the **software auto-upgrade** command to convert an incompatible switch to installed mode,
the command installs the packages from the incompatible switch's running bundle. If, after you reload and
boot the incompatible switch in installed mode, the switch's installed packages are found to be incompatible
with the stack, you can use the **software auto-upgrade** command again. For more information, see **Cisco
IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)**.

To convert a switch that is running in installed mode and joining a stack that is running in bundle mode, follow
these steps:

1. Use the **copy** privileged EXEC command to copy the running bundle from one switch in the stack to the
other.

2. Configure the **boot system** global configuration command to point to the bundle file.

3. Reload the switch.

After reloading, the incompatible switch boots in bundle mode and joins the stack as a fully functioning
member.

This example shows a 2-member switch stack running in bundle mode; switch 2 is the active switch and
switch 1 is running in installed mode:

Switch#
Switch# copy flash:cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
flash-1:
Destination filename [cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin]?

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Related Topics
- Recovering from a Software Failure, on page 2081
Lost or Forgotten Password on a Switch

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

Note

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.

Recovering from a Lost or Forgotten Password, on page 2083

Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the Interface and Hardware Component Configuration Guide (Catalyst 3650 Switches).

Related Topics

Scenarios to Troubleshoot Power over Ethernet (PoE), on page 2094

Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE switch port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the shutdown interface configuration command, and then enter the no shutdown interface command. You can also configure automatic recovery on the switch to recover from the error-disabled state.

On a switch, the errdisable recovery cause loopback and the errdisable recovery interval seconds global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.
Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the `power inline never` interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the `shutdown` and the `no shutdown` interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the `power inline never` command.

Ping

The switch supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response (hostname is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a no-answer message is returned.
- Unknown host—If the host does not exist, an unknown host message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a destination-unreachable message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a network or host unreachable message is returned.

- Example: Pinging an IP Host, on page 2096

Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the switches in the path. When the switch detects a device in the path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The switch can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.
  
  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

  A switch is reachable from another switch when you can test connectivity by using the `ping` privileged EXEC command. All switches in the physical path must be reachable from each other.
• The maximum number of hops identified in the path is ten.

• You can enter the traceroute mac or the traceroute mac ip privileged EXEC command on a switch that is not in the physical path from the source device to the destination device. All switches in the path must be reachable from this switch.

• The traceroute mac command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

• If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

• If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

• The traceroute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the switch uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.
  • If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
  • If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

• When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

• This feature is not supported in Token Ring VLANs.

**IP Traceroute**

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your switches can participate as the source or destination of the traceroute privileged EXEC command and might or might not appear as a hop in the traceroute command output. If the switch is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate switches do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate switch is a multilayer switch that is routing a particular packet, this switch shows up as a hop in the traceroute output.

The traceroute privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.
To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP port-unreachable error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

---

**Time Domain Reflector Guidelines**

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported on 10/100/1000 copper Ethernet ports and on Multigigabit Ethernet (100Mbps/1/2.5/5/10 Gbps) ports. It is not supported on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.

- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

---

**Note**

When using the feature with Multigigabit Ethernet ports, the cable length is displayed only when an open or short condition is detected.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Switch
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Switch reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.
- The open-ended cable is not terminated.

When you run TDR, the Switch does not report accurate information in these situations:
• The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
• The link is a 10-megabit or a 100-megabit link.
• The cable is a stranded cable.
• The link partner is a Cisco IP Phone.
• The link partner is not IEEE 802.3 compliant.

Debug Commands

⚠️ Caution
Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use `debug` commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use `debug` commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased `debug` command processing overhead will affect system use.

All `debug` commands are entered in privileged EXEC mode, and most `debug` commands take no arguments.

Crashinfo Files

The crashinfo files save information that helps Cisco technical support representatives to debug problems that caused the Cisco IOS image to fail (crash). The switch generates two files at the time of the failure: full core and crashinfo.

The information in the crashinfo file includes the Cisco IOS image name and version that failed, a list of the processor registers, and a stack trace. You can provide this information to the Cisco technical support representative by using the `show tech-support` privileged EXEC command.

The file names have the following format:

```
[fullcore | crashinfo]_[process that crashed]_[date]-[timestamp]-UTC
```

From IOS, you can view the crashinfo files on each switch by using the following command:

```
Switch# dir crashinfo?
crashinfo-1: crashinfo-2: crashinfo-3: crashinfo:
Switch#
```

For example, to access the crashinfo directory for switch 1, enter

```
Switch dir crashinfo-1
```

From the ROMMON prompt, you can view the crashinfo files by using the `dir` command:

```
Switch: dir sda1
```
The following is sample output of a crashinfo file

```
Switch# dir crashinfo:
Directory of crashinfo:

145898496 bytes total (18569216 bytes free)
stack3#
```

The file name of the most recent crashinfo file is stored in last_crashinfo.
The file name of the most recent system report is stored in last_systemreport.

```
Switch#
```

### System Reports

When a switch crashes, a system report is automatically generated for each switch in the switch stack. The system report file captures all the trace buffers, and other system-wide logs found on the switch. System reports are located in the crashinfo directory in the following format:

```
system-report_[switch number]_[date]_[timestamp]-UTC.gz
```

After a switch crash, you should check if a system report file was generated. The name of the most recently generated system report file is stored in the last_systemreport file under the crashinfo directory. The system report and crashinfo files assist TAC when troubleshooting your issue.

### Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the switch. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot switch problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the switch and small form-factor pluggable (SFP) modules. The switch stores this information in the flash memory:
• CLI commands—Record of the OBFL CLI commands that are entered on a standalone switch or a switch stack member.
• Environment data—Unique device identifier (UDI) information for a standalone switch or a stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
• Message—Record of the hardware-related system messages generated by a standalone switch or a stack member.
• Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone switch or a stack member.
• Temperature—Temperature of a standalone switch or a stack member.
• Uptime data—Time when a standalone switch or a stack member starts, the reason the switch restarts, and the length of time the switch has been running since it last restarted.
• Voltage—System voltages of a standalone switch or a stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP). When the switch is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the switch fails, contact your Cisco technical support representative to find out how to retrieve the data.

Related Topics
- Configuring OBFL, on page 2091
- Displaying OBFL Information, on page 2092

Fan Failures

By default, the feature is disabled. When more than one of the fans fails in a field-replaceable unit (FRU) or in a power supply, the switch does not shut down, and this error message appears:

```
Multiple fan(FRU/PS) failure detected. System may get overheated. Change fan quickly.
```

The switch might overheat and shut down. To enable the fan failures feature, enter the `system env fan-fail-action shut` privileged EXEC command. If more than one fan in the switch fails, the switch automatically shuts down, and this error message appears:

```
Faulty (FRU/PS) fans detected, shutting down system!
```

After the first fan shuts down, if the switch detects a second fan failure, the switch waits for 20 seconds before it shuts down.

To restart the switch, it must be power cycled.

Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:
• Spanning tree topology changes
• EtherChannel links brought down due to loss of communication
• Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
• UDLD flapping
• IP SLAs failures because of SLAs responses beyond an acceptable threshold
• DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

How to Troubleshoot the Software Configuration

Recovering from a Software Failure

Before you begin
This recovery procedure requires that you have physical access to the switch.
This procedure uses boot loader commands and TFTP to recover from a corrupted or incorrect image file.

<table>
<thead>
<tr>
<th>Step 1</th>
<th>From your PC, download the software image file (image.bin) from Cisco.com.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Load the software image to your TFTP server.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Connect your PC to the switch Ethernet management port.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Unplug the switch power cord.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Press the Mode button, and at the same time, reconnect the power cord to the switch.</td>
</tr>
<tr>
<td>Step 6</td>
<td>From the bootloader (ROMMON) prompt, ensure that you can ping your TFTP server.</td>
</tr>
<tr>
<td>a) Set the IP address</td>
<td><code>switch: set IP_ADDR ip_address subnet_mask</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>switch: set IP_ADDR 192.0.2.123/255.255.255.0</code></td>
</tr>
<tr>
<td>b) Set the default router IP address</td>
<td><code>switch: set DEFAULT_ROUTER ip_address</code></td>
</tr>
<tr>
<td>Example:</td>
<td><code>switch: set DEFAULT_ROUTER 192.0.2.1</code></td>
</tr>
<tr>
<td>c) Verify that you can ping the TFTP server</td>
<td><code>switch: ping ip_address_of_TFTP_server</code></td>
</tr>
</tbody>
</table>
| Example: | ```switch: ping 192.0.2.15```  
ping 192.0.2.1 with 32 bytes of data...  
Host 192.0.2.1 is alive.  
switch: |

Step 7 Verify that you have a recovery image in your recovery partition (sda9:).
This recovery image is required for recovery using the emergency-install feature.

**Example:**

```
switch: dir sda9:
Directory of sda9: /
    2 drwx 1024 .
    2 drwx 1024 ..
    11 -rw- 18923068 c3850-recovery.bin

36939776 bytes available (20830208 bytes used)
switch:
```

**Step 8**

From the bootloader (ROMMON) prompt, initiate the emergency-install feature that assists you in recovering the software image on your switch.

**WARNING:** The emergency install command will erase your entire boot flash!

**Example:**

```
Switch# emergency-install
tftp://192.0.2.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin

The bootflash will be erased during install operation, continue (y/n)? y
Starting emergency recovery
(tftp://192.0.2.47/cat3k/cat3k_caa-universalk9.SPA.03.02.00.SE.150-1.EX.bin)...

Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

---

**Note**

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

---

**SUMMARY STEPS**

1. Connect a terminal or PC to the switch.
2. Set the line speed on the emulation software to 9600 baud.
3. Power off the standalone switch or the entire switch stack.
4. Reconnect the power cord to the or the active switch. Within 15 seconds, press the Mode button while the System LED is still flashing green. Continue pressing the Mode button until all the system LEDs turn on and remain solid; then release the Mode button.
5. After recovering the password, reload the switch or the active switch.
6. Power on the remaining switches in the stack.

---

**DETAILED STEPS**

**Step 1** Connect a terminal or PC to the switch.

- Connect a terminal or a PC with terminal-emulation software to the switch console port. If you are recovering the password for a switch stack, connect to the console port of the active switch or
• Connect a PC to the Ethernet management port. If you are recovering the password for a switch stack, connect to the Ethernet management port of a stack member.

Step 2  Set the line speed on the emulation software to 9600 baud.

Step 3  Power off the standalone switch or the entire switch stack.

Step 4  Reconnect the power cord to the or the active switch. Within 15 seconds, press the Mode button while the System LED is still flashing green. Continue pressing the Mode button until all the system LEDs turn on and remain solid; then release the Mode button.

```
Switch:  
Xmodem file system is available.  
Base ethernet MAC Address: 20:37:06:4d:e9:80  
Verifying bootloader digital signature.
```

The system has been interrupted prior to loading the operating system software, console will be reset to 9600 baud rate.

Proceed to the Procedure with Password Recovery Enabled section, and follow the steps.

Step 5  After recovering the password, reload the switch or the active switch.

On a switch:

```
Switch> reload  
Proceed with reload? [confirm] y
```

On the active switch:

```
Switch> reload slot <stack-active-member-number>  
Proceed with reload? [confirm] y
```

Step 6  Power on the remaining switches in the stack.

---

**Related Topics**

[Lost or Forgotten Password on a Switch](#), on page 2074

**Procedure with Password Recovery Enabled**

If the password-recovery operation is enabled, this message appears:

---

Step 1  Initialize the flash file system.

```
Switch: flash_init
```

Step 2  Ignore the startup configuration with the following command:

```
Switch: SWITCH_IGNORE_STARTUP_CFG=1
```
Step 3   Boot the switch with the packages.conf file from flash.

Switch: boot flash:packages.conf

Step 4   Terminate the initial configuration dialog by answering No.

Would you like to enter the initial configuration dialog? [yes/no]: No

Step 5   At the switch prompt, enter privileged EXEC mode.

Switch> enable
Switch#

Step 6   Copy the startup configuration to running configuration.

Switch# copy startup-config running-config Destination filename [running-config]?

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

Step 7   Enter global configuration mode and change the enable password.

Switch# configure terminal
Switch(config)#

Step 8   Write the running configuration to the startup configuration file.

Switch# copy running-config startup-config

Step 9   Confirm that manual boot mode is enabled.

Switch# show boot

BOOT variable = flash:packages.conf;
Manual Boot = yes
Enable Break = yes

Step 10  Reload the switch.

Switch# reload

Step 11  Return the Bootloader parameters (previously changed in Steps 2 and 3) to their original values.

Switch: switch: SWITCH_IGNORE_STARTUP_CFG=0

Step 12  Boot the switch with the packages.conf file from flash.
Switch: boot flash:packages.conf

Step 13 After the switch boots up, disable manual boot on the switch.

Switch(config)# no boot manual

Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

Caution

Returning the switch to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup switch and VLAN configuration files.

- If you enter n (no), the normal boot process continues as if the Mode button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

  Press Enter to continue........

- If you enter y (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

Step 1 Choose to continue with password recovery and delete the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? Y

Step 2 Display the contents of flash memory:

Switch: dir flash:

The switch file system appears.

Directory of flash:/
  .
  .
Step 3  Boot up the system:
Switch: boot

You are prompted to start the setup program. To continue with password recovery, enter N at the prompt:

Continue with the configuration dialog? [yes/no]: N

Step 4  At the switch prompt, enter privileged EXEC mode:
Switch> enable

Step 5  Enter global configuration mode:
Switch# configure terminal

Step 6  Change the password:
Switch(config)# enable secret password

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 7  Return to privileged EXEC mode:
Switch(config)# exit
Switch#

Note      Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized.

Step 8  Write the running configuration to the startup configuration file:
Switch# copy running-config startup-config

The new password is now in the startup configuration.

Step 9  You must now reconfigure the switch. If the system administrator has the backup switch and VLAN configuration files available, you should use those.

---

**Preventing Switch Stack Problems**

To prevent switch stack problems, you should do the following:
• Make sure that the switches that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.

• Press the Mode button on a stack member until the Stack mode LED is on. The last two port LEDs on the switch should be green. Depending on the switch model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.

• We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

• Manually assigning stack member numbers according to the placement of the switches in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the switches have manually assigned numbers if you add, remove, or rearrange switches later. Use the switch current-stack-member-number renumber new-stack-member-number global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new switch functions with the exact same configuration as the replaced switch. This is also assuming the new switch is using the same member number as the replaced switch.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.
3. Power on the switches.

**Preventing Autonegotiation Mismatches**

The IEEE 802.3ab autonegotiation protocol manages the switch settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

• A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.

• A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize switch performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

• Let both ports autonegotiate both speed and duplex.

• Manually set the speed and duplex parameters for the ports on both ends of the connection.
If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the switch, the switch software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

The security error message references the GBIC_SECURITY facility. The switch supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the switch, and replace it with a Cisco module. After inserting a Cisco SFP module, use the `errdisable recovery cause gbic-invalid` global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the switch brings the interface out of the error-disabled state and retries the operation.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.

Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the `show interfaces transceiver` privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module.

Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all switches.

Though other protocol keywords are available with the `ping` command, they are not supported in this release.

Use this command to ping another device on the network from the switch:
**Monitoring Temperature**

The switch monitors the temperature conditions and uses the temperature information to control the fans.

Use the `show env temperature status` privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the switch (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the `system env temperature threshold yellow value` global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds.

**Monitoring the Physical Path**

You can monitor the physical path that a packet takes from a source device to a destination device.

### Table 186: Monitoring the Physical Path

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code> actually-tracetroutemac [interface interface-id] [source-mac-address] [interface interface-id] [destination-mac-address] [vlan vlan-id] [detail]</code></td>
<td>Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.</td>
</tr>
<tr>
<td>` actually-tracetroutemac ip [source-ip-address</td>
<td>source-hostname] [destination-ip-address</td>
</tr>
</tbody>
</table>

### Executing IP Traceroute

#### Note

Though other protocol keywords are available with the `traceroute` privileged EXEC command, they are not supported in this release.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>traceroute ip host</code></td>
<td>Traces the path that packets take through the network.</td>
</tr>
</tbody>
</table>

Switch# traceroute ip 192.51.100.1

**Purpose**

Pings are remote host through IP or by supplying the hostname or network address.

Switch# ping 172.20.52.3

### Related Topics

- Ping, on page 2075
- Example: Pinging an IP Host, on page 2096
Running TDR and Displaying the Results

When you run TDR on an interface, you can run it on the active switch or a stack member.

To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command.

To display the results, enter the `show cable-diagnostics tdr interface interface-id` privileged EXEC command.

Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note**

Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

Using the show platform forward Command

The output from the `show platform forward` privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the switch application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

Configuring OBFL

**Caution**

We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.
• To enable OBFL, use the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command. On switches, the range for `switch-number` is from 1 to 9. Use the `message level level` parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.

• To copy the OBFL data to the local network or a specific file system, use the `copy onboard switch switch-number url url-destination` privileged EXEC command.

• To disable OBFL, use the `no hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

• To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the `clear onboard switch switch-number` privileged EXEC command.

• In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

• You can enable or disable OBFL on a member switch from the active switch.

## Verifying Troubleshooting of the Software Configuration

### Displaying OBFL Information

*Table 187: Commands for Displaying OBFL Information*

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show onboard switch switch-number clilog</code></td>
<td>Displays the OBFL CLI commands that were entered on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>Switch# show onboard switch 1 clilog</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number environment</code></td>
<td>Displays the UDI information for a standalone switch or the specified stack members and for all the connected FRU devices: the PID, the VID, and the serial number.</td>
</tr>
<tr>
<td><code>Switch# show onboard switch 1 environment</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number message</code></td>
<td>Displays the hardware-related messages generated by a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>Switch# show onboard switch 1 message</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number counter</code></td>
<td>Displays the counter information on a standalone switch or the specified stack members.</td>
</tr>
<tr>
<td><code>Switch# show onboard switch 1 counter</code></td>
<td></td>
</tr>
<tr>
<td><code>show onboard switch switch-number temperature</code></td>
<td>Displays the temperature of a standalone switch or the specified switch stack members.</td>
</tr>
<tr>
<td><code>Switch# show onboard switch 1 temperature</code></td>
<td></td>
</tr>
</tbody>
</table>
**Command** | **Purpose**
--- | ---
`show onboard switch switch-number uptime` | Displays the time when a standalone switch or the specified stack members start, the reason the standalone switch or specified stack members restart, and the length of time that the standalone switch or specified stack members have been running since they last restarted.

Switch# show onboard switch 1 uptime

---

`show onboard switch switch-number voltage` | Displays the system voltages of a standalone switch or the specified stack members.

Switch# show onboard switch 1 voltage

---

`show onboard switch switch-number status` | Displays the status of a standalone switch or the specified stack members.

Switch# show onboard switch 1 status

**Related Topics**

- Configuring OBFL, on page 2091

**Example: Verifying the Problem and Cause for High CPU Utilization**

To determine if high CPU utilization is a problem, enter the `show processes cpu sorted` privileged EXEC command. Note the underlined information in the first line of the output example.

```
Switch# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.
### Table 188: Troubleshooting CPU Utilization Problems

<table>
<thead>
<tr>
<th>Type of Problem</th>
<th>Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt percentage value is almost as high as total CPU utilization value.</td>
<td>The CPU is receiving too many packets from the network.</td>
<td>Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.”</td>
</tr>
<tr>
<td>Total CPU utilization is greater than 50% with minimal time spent on interrupts</td>
<td>One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.</td>
<td>Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”</td>
</tr>
</tbody>
</table>

### Scenarios for Troubleshooting the Software Configuration

### Scenarios to Troubleshoot Power over Ethernet (PoE)

#### Table 189: Power over Ethernet Troubleshooting Scenarios

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only one port does not have PoE. Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.</td>
<td>Verify that the powered device works on another PoE port. Use the <code>show run</code>, or <code>show interface status</code> user EXEC commands to verify that the port is not shut down or error-disabled. <strong>Note</strong>  Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional. Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host. Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters. Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on. If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the <code>show inline power</code> command to verify the amount of available power.</td>
</tr>
</tbody>
</table>
### Scenarios to Troubleshoot Power over Ethernet (PoE)

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>No PoE on all ports or a group of ports. Trouble is on all switch ports. Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</td>
<td>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch.</td>
</tr>
<tr>
<td></td>
<td>If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch.</td>
</tr>
<tr>
<td></td>
<td>Use the <code>show log</code> privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes.</td>
</tr>
<tr>
<td></td>
<td>If there are no alarms, use the <code>show interface status</code> command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the <code>shut</code> and <code>no shut</code> interface configuration commands to reenable the ports.</td>
</tr>
<tr>
<td></td>
<td>Use the <code>show env power</code> and <code>show power inline</code> privileged EXEC commands to review the PoE status and power budget (available PoE).</td>
</tr>
<tr>
<td></td>
<td>Review the running configuration to verify that <code>power inline never</code> is not configured on the ports.</td>
</tr>
<tr>
<td></td>
<td>Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the <code>shut</code> and <code>no shut</code> interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected.</td>
</tr>
<tr>
<td></td>
<td>Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port.</td>
</tr>
<tr>
<td></td>
<td>Use the <code>show power inline</code> privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on.</td>
</tr>
<tr>
<td></td>
<td>If a powered device can power on when only one powered device is connected to the switch, enter the <code>shut</code> and <code>no shut</code> interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the <code>show interface status</code> and <code>show power inline</code> privileged EXEC commands to monitor inline power statistics and port status.</td>
</tr>
<tr>
<td></td>
<td>If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</td>
</tr>
<tr>
<td>Symptom or Problem</td>
<td>Possible Cause and Solution</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td>Cisco IP Phone disconnects or resets. After working normally, a Cisco phone or wireless access point intermittently reloads or disconnects from PoE.</td>
<td>Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads. Verify that the cable length is not more than 100 meters from the switch port to the powered device. Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs. Notice whether any error messages appear at the same time a disconnect occurs. Use the <code>show log</code> privileged EXEC command to review error messages. Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.) Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.</td>
</tr>
<tr>
<td>Non-Cisco powered device does not work on Cisco PoE switch. A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.</td>
<td>Use the <code>show power inline</code> command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it. Use the <code>show interface status</code> command to verify that the switch detects the connected powered device. Use the <code>show log</code> command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or <code>inrush</code>) current that exceeds a current-limit threshold for the port.</td>
</tr>
</tbody>
</table>

</table>
Example: Enabling All System Diagnostics

Because debugging output takes priority over other network traffic, and because the `debug all` privileged EXEC command generates more output than any other `debug` command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific `debug` commands.  

This command disables all-system diagnostics:

```
Switch# debug all
```

The `no debug all` privileged EXEC command disables all diagnostic output. Using the `no debug all` command is a convenient way to ensure that you have not accidentally left any `debug` commands enabled.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VideoStream

Make sure that the multicast feature is enabled. We recommend configuring IP multicast on the controller with multicast-multicast mode.

Check for the IP address on the client machine. The machine should have an IP address from the respective VLAN.

Verify that the access points have joined the controllers.

Restrictions for Configuring VideoStream

IGMP snooping is required to switch ON for this MC2UC feature to be functional.
Information about VideoStream

The IEEE 802.11 wireless multicast delivery mechanism does not provide a reliable way to acknowledge lost or corrupted packets. The multicast frame packets are sent at a predetermined rate irrespective of the wireless client optimal data rate. As a result, if any multicast packet is lost in the air, it is not sent again which may cause an IP multicast stream unviewable. Also if the packets are delivered faster, the packets get congested.

The VideoStream feature makes the IP multicast stream delivery reliable over the air, by converting the multicast frame to a unicast frame over the air. Each VideoStream client acknowledges receiving a video IP multicast stream.

How to Configure VideoStream

Configuring Multicast-Direct Globally for Media-Stream

SUMMARY STEPS

1. configure terminal
2. wireless multicast
3. IP igmp snooping
4. IP igmp snooping querier
5. wireless media-stream multicast-direct
6. wireless media-stream message
7. wireless media-stream group<name><startIp><endIp>
8. end

</tbody>
</table>
Configuring VideoStream GUI

Complete the following steps to configure VideoStream using GUI.

**Step 1**
Configure the multicast feature by following these steps:

a) Choose *Wireless > MediaStream > General*.

b) Select or unselect the **Multicast Direct feature** check box. The default value is disabled.

**Note**
Enabling the multicast direct feature does not automatically reset the existing client state. The wireless clients must rejoin the multicast stream after enabling the multicast direct feature on the controller.

c) In the **Session Message Config** area, select **Session announcement State** check box to enable the session announcement mechanism. If the session announcement state is enabled, clients are informed each time a controller is not able to serve the multicast direct data to the client.

d) In the **Session announcement URL** text box, enter the URL where the client can find more information when an error occurs during the multicast media stream transmission.

e) In the **Session announcement e-mail** text box, enter the e-mail address of the person who can be contacted.

f) In the **Session announcement Phone** text box, enter the phone number of the person who can be contacted.

g) In the **Session announcement Note** text box, enter a reason as to why a particular client cannot be served with a multicast media.

h) Click **Apply**.

**Step 2**
Add a media stream by following these steps:

a) Choose *Wireless > Media Stream > Streams* to open the Media Stream page.

b) Click **Add New** to configure a new media stream. The **Media Stream > New page** appears.

**Note**
The Stream Name, Multicast Destination Start IP Address (IPv4 or IPv6), and Multicast Destination End IP Address (IPv4 or IPv6) text boxes are mandatory. You must enter information in these text boxes.

c) In the **Stream Name** text box, enter the media stream name. The stream name can be up to 64 characters.

d) In the **Multicast Destination Start IP Address (IPv4 or IPv6)** text box, enter the start (IPv4 or IPv6) address of the multicast media stream.

e) In the **Multicast Destination End IP Address (IPv4 or IPv6)** text box, enter the end (IPv4 or IPv6) address of the multicast media stream.
**Example:**

Note Ensure that the Multicast Destination Start and End IP addresses are of the same type, that is both addresses should be of either IPv4 or IPv6 type.

f) In the **Maximum Expected Bandwidth** text box, enter the maximum expected bandwidth that you want to assign to the media stream. The values can range between 1 to 35000 kbps.

**Example:**

Note We recommend that you use a template to add a media stream to the controller.

g) From the Select from Predefined Templates drop-down list under Resource Reservation Control (RRC) Parameters, choose one of the following options to specify the details about the resource reservation control:

- Very Coarse (below 300 kbps)
- Coarse (below 500 kbps)
- Ordinary (below 750 kbps)
- Low (below 1 Mbps)
- Medium (below 3 Mbps)
- High (below 5 Mbps)

Note When you select a predefined template from the drop-down list, the following text boxes under the Resource Reservation Control (RRC) Parameters list their default values that are assigned with the template.

- **Average Packet Size (100-1500 bytes)**—Specifies the average packet size. The value can be in the range of 100 to 1500 bytes. The default value is 1200.
- **RRC Periodic update**—Enables the RRC (Resource Reservation Control Check) Periodic update. By default, this option is enabled. RRC periodically updates the admission decision on the admitted stream according to the correct channel load. As a result, it may deny certain low priority admitted stream requests.
- **RRC Priority (1-8)**—Specifies the priority bit set in the media stream. The priority can be any number between 1 and 8. The larger the value means the higher the priority is. For example, a priority of 1 is the lowest value and a value of 8 is the highest value. The default priority is 4. The low priority stream may be denied in the RRC periodic update.
- **Traffic Profile Violation**—Specifies the action to perform in case of a violation after a re-RRC. Choose an action from the drop-down list. The possible values are as follows:
  - **Drop**—Specifies that a stream is dropped on periodic reevaluation.
  - **Fallback**—Specifies that a stream is demoted to Best Effort class on periodic reevaluation.

The default value is drop.

h) Click **Apply**.

**Step 3**

Enable the media stream for multicast-direct by following these steps:

a) Choose **WLANs > WLAN ID** to open the **WLANs > Edit** page.

b) Click the **QoS** tab and select Gold (Video) from the Quality of Service (QoS) drop-down list.

c) Click **Apply**.
Step 4  Set the EDCA parameters to voice and video optimized (optional) by following these steps:
   a) Choose Wireless > 802.11a/n/ac or 802.11b/g/n > EDCA Parameters.
   b) From the EDCA Profile drop-down list, choose the Voice and Video Optimized option.
   c) Click Apply.

Step 5  Enable the admission control on a band for video (optional) by following these steps:
   Note   Keep the voice bandwidth allocation to a minimum for better performance.
   a) Choose Wireless > 802.11a/n/ac or 802.11b/g/n > Media to open the 802.11a/n (5 GHZ) or 802.11b/g/n > Media page.
   b) Click the Video tab.
   c) Select the Admission Control (ACM) check box to enable bandwidth-based CAC for this radio band. The default value is disabled.
   d) Click Apply

Step 6  Configure the video bandwidth by following these steps:
   Note   The template bandwidth that is configured for a media stream should be more than the bandwidth for the source media stream. The voice configuration is optional. Keep the voice bandwidth allocation to a minimum for better performance.
   a) Disable all WMM WLANs.
   b) Choose Wireless > 802.11a/n/ac or 802.11b/g/n > Media to open the 802.11a/n/ac (5 GHZ) or 802.11b/g/n > Media page.
   c) Click the Video tab.
   d) Select the Admission Control (ACM) check box to enable the video CAC for this radio band. The default value is disabled.
   e) In the Max RF Bandwidth field, enter the percentage of the maximum bandwidth allocated to clients for video applications on this radio band. Once the client reaches the value specified, the access point rejects new requests on this radio band.
       The range is 5 to 85%. The default value is 9%.
   f) Click Apply.
   g) Reenable all WMM WLANs and click Apply.

Step 7  Configure the media bandwidth by following these steps:
   a) Choose Wireless > 802.11a/n/ac or 802.11b/g/n > Media to open the 802.11a (or 802.11b) > Media > Parameters page.
   b) Click the Media tab to open the Media page.
   c) Select the Unicast Video Redirect check box to enable Unicast Video Redirect. The default value is disabled.
   d) In the Maximum Media Bandwidth (0-85%) text box, enter the percentage of the maximum bandwidth to be allocated for media applications on this radio band. Once the client reaches a specified value, the access point rejects new calls on this radio band.
       The default value is 85%; valid values are from 0% to 85%.
   e) In the Client Minimum Phy Rate text box, enter the minimum transmission data rate to the client. If the transmission data rate is below the phy rate, either the video will not start or the client may be classified as a bad client. The bad client video can be demoted for better effort QoS or subject to denial.
   f) In the Maximum Retry Percent (0-100%) text box, enter the percentage of maximum retries that are allowed. The default value is 80. If it exceeds 80, either the video will not start or the client might be classified as a bad client. The bad client video can be demoted for better effort QoS or subject to denial.
g) Select the Multicast Direct Enable check box to enable the Multicast Direct Enable field. The default value is enabled.

h) From the Max Streams per Radio drop-down list, choose the maximum number of streams allowed per radio from the range 0 to 20. The default value is set to No-limit. If you choose No-limit, there is no limit set for the number of client subscriptions.

i) From the Max Streams per Client drop-down list, choose the maximum number of streams allowed per client from the range 0 to 20. The default value is set to No-limit. If you choose No-limit, there is no limit set for the number of client subscriptions.

j) Select the Best Effort QoS Admission check box to enable best-effort QoS admission.

k) Click Apply.

Step 8
Enable a WLAN by following these steps:

a) Choose WLANS > WLAN ID. The WLANs > Edit page appears.

b) Select the Status check box.

c) Click Apply.

Step 9
Enable the 802.11 a/n/ac or 802.11 b/g/n network by following these steps:

a) Choose Wireless > 802.11a/n/ac or 802.11b/g/n > Network.

b) Select the 802.11a or 802.11b/g Network Status check box to enable the network status.

c) Click Apply.

Step 10
Verify that the clients are associated with the multicast groups and group IDs by following these steps:

a) Choose Monitor > Clients. The Clients page appears.

b) Check if the 802.11a/n/ac or 802.11b/g/n network clients have the associated access points.

c) Choose Monitor > Multicast. The Multicast Groups page appears.

d) Select the MGID check box for the VideoStream to the clients.

e) Click MGID. The Multicast Group Detail page appears. Check the Multicast Status details.

- Feature History and Information for VTP, on page 2140

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VTP

Before you create VLANs, you must decide whether to use the VLAN Trunking Protocol (VTP) in your network. Using VTP, you can make configuration changes centrally on one or more switches and have those changes automatically communicated to all the other switches in the network. Without VTP, you cannot send information about VLANs to other switches.

VTP is designed to work in an environment where updates are made on a single switch and are sent through VTP to other switches in the domain. It does not work well in a situation where multiple updates to the VLAN database occur simultaneously on switches in the same domain, which would result in an inconsistency in the VLAN database.

The switch supports a total of 4094 VLANs. However, the number of configured features affects the usage of the switch hardware. If the switch is notified by VTP of a new VLAN and the switch is already using the maximum available hardware resources, it sends a message that there are not enough hardware resources.
available and shuts down the VLAN. The output of the `show vlan` user EXEC command shows the VLAN in a suspended state.

You can enable or disable VTP per port by entering the `[no] vtp` interface configuration command. When you disable VTP on trunking ports, all VTP instances for that port are disabled. You cannot set VTP to off for the MST database and on for the VLAN database on the same port.

When you globally set VTP mode to off, it applies to all the trunking ports in the system. However, you can specify on or off on a per-VTP instance basis. For example, you can configure the switch as a VTP server for the VLAN database but with VTP off for the MST database.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch or switch stack and that this trunk port is connected to the trunk port of another switch. Otherwise, the switch cannot receive any VTP advertisements.

**Related Topics**
- VTP Advertisements, on page 2121
- Adding a VTP Client Switch to a VTP Domain (CLI), on page 2135
- VTP Domain, on page 2119
- VTP Modes, on page 2120

**Restrictions for VTP**

The following are restrictions for a VTP:
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

⚠️ **Caution**

Before adding a VTP client switch to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other switches in the VTP domain. Switches in a VTP domain always use the VLAN configuration of the switch with the highest VTP configuration revision number. If you add a switch that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.

**Information About VTP**

**VTP**

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP minimizes misconfigurations and configuration inconsistencies that can cause several problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

VTP functionality is supported across the stack, and all switches in the stack maintain the same VLAN and VTP configuration inherited from the active switch. When a switch learns of a new VLAN through VTP messages or when a new VLAN is configured by the user, the new VLAN information is communicated to all switches in the stack.
When a switch joins the stack or when stacks merge, the new switches get VTP information from the active switch.

**VTP Domain**

A VTP domain (also called a VLAN management domain) consists of one switch or several interconnected switches or switch stacks under the same administrative responsibility sharing the same VTP domain name. A switch can be in only one VTP domain. You make global VLAN configuration changes for the domain.

By default, the switch is in the VTP no-management-domain state until it receives an advertisement for a domain over a trunk link (a link that carries the traffic of multiple VLANs) or until you configure a domain name. Until the management domain name is specified or learned, you cannot create or modify VLANs on a VTP server, and VLAN information is not propagated over the network.

If the switch receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The switch then ignores advertisements with a different domain name or an earlier configuration revision number.

---

**Note**

Before adding a VTP client switch to a VTP domain, always verify that its VTP configuration revision number is lower than the configuration revision number of the other switches in the VTP domain. Switches in a VTP domain always use the VLAN configuration of the switch with the highest VTP configuration revision number. If you add a switch that has a revision number higher than the revision number in the VTP domain, it can erase all VLAN information from the VTP server and VTP domain.

---

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all switches in the VTP domain. VTP advertisements are sent over all IEEE trunk connections, including IEEE 802.1Q. VTP dynamically maps VLANs with unique names and internal index associates across multiple LAN types. Mapping eliminates excessive device administration required from network administrators.

If you configure a switch for VTP transparent mode, you can create and modify VLANs, but the changes are not sent to other switches in the domain, and they affect only the individual switch. However, configuration changes made when the switch is in this mode are saved in the switch running configuration and can be saved to the switch startup configuration file.

## VTP Modes

### Table 193: VTP Modes

<table>
<thead>
<tr>
<th>VTP Mode</th>
<th>Description</th>
</tr>
</thead>
</table>
| **VTP server** | In VTP server mode, you can create, modify, and delete VLANs, and specify other configuration parameters (such as the VTP version) for the entire VTP domain. VTP servers advertise their VLAN configurations to other switches in the same VTP domain and synchronize their VLAN configurations with other switches based on advertisements received over trunk links.  
  
  VTP server is the default mode.  
  
  In VTP server mode, VLAN configurations are saved in NVRAM. If the switch detects a failure while writing a configuration to NVRAM, VTP mode automatically changes from server mode to client mode. If this happens, the switch cannot be returned to VTP server mode until the NVRAM is functioning. |
| **VTP client** | A VTP client functions like a VTP server and transmits and receives VTP updates on its trunks, but you cannot create, change, or delete VLANs on a VTP client. VLANs are configured on another switch in the domain that is in server mode.  
  
  In VTP versions 1 and 2 in VTP client mode, VLAN configurations are not saved in NVRAM. In VTP version 3, VLAN configurations are saved in NVRAM in client mode. |
VTP Mode | Description
--- | ---
VTP transparent | VTP transparent switches do not participate in VTP. A VTP transparent switch does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2 or version 3, transparent switches do forward VTP advertisements that they receive from other switches through their trunk interfaces. You can create, modify, and delete VLANs on a switch in VTP transparent mode. When the switch is in VTP transparent mode, the VTP and VLAN configurations are saved in NVRAM, but they are not advertised to other switches. In this mode, VTP mode and domain name are saved in the switch running configuration, and you can save this information in the switch startup configuration file by using the `copy running-config startup-config` privileged EXEC command. In a switch stack, the running configuration and the saved configuration are the same for all switches in a stack.

VTP off | A switch in VTP off mode functions in the same manner as a VTP transparent switch, except that it does not forward VTP advertisements on trunks.

**Related Topics**
- [Prerequisites for VTP](#)
- [Configuring VTP Mode (CLI)](#)

**VTP Advertisements**

Each switch in the VTP domain sends periodic global configuration advertisements from each trunk port to a reserved multicast address. Neighboring switches receive these advertisements and update their VTP and VLAN configurations as necessary.

Because trunk ports send and receive VTP advertisements, you must ensure that at least one trunk port is configured on the switch stack and that this trunk port is connected to the trunk port of another switch. Otherwise, the switch cannot receive any VTP advertisements.

VTP advertisements distribute this global domain information:

- VTP domain name
- VTP configuration revision number
- Update identity and update timestamp
- MD5 digest VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
• Frame format

VTP advertisements distribute this VLAN information for each configured VLAN:
• VLAN IDs (including IEEE 802.1Q)
• VLAN name
• VLAN type
• VLAN state
• Additional VLAN configuration information specific to the VLAN type

In VTP version 3, VTP advertisements also include the primary server ID, an instance number, and a start index.

**Related Topics**
- Prerequisites for VTP, on page 2117

## VTP Version 2

If you use VTP in your network, you must decide which version of VTP to use. By default, VTP operates in version 1.

VTP version 2 supports these features that are not supported in version 1:
• Token Ring support—VTP version 2 supports Token Ring Bridge Relay Function (TrBRF) and Token Ring Concentrator Relay Function (TrCRF) VLANs.
• Unrecognized Type-Length-Value (TLV) support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM when the switch is operating in VTP server mode.
• Version-Dependent Transparent Mode—In VTP version 1, a VTP transparent switch inspects VTP messages for the domain name and version and forwards a message only if the version and domain name match. Although VTP version 2 supports only one domain, a VTP version 2 transparent switch forwards a message only when the domain name matches.
• Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the MD5 digest on a received VTP message is correct, its information is accepted.

**Related Topics**
- Enabling the VTP Version (CLI), on page 2131

## VTP Version 3

VTP version 3 supports these features that are not supported in version 1 or version 2:
• Enhanced authentication—You can configure the authentication as hidden or secret. When hidden, the secret key from the password string is saved in the VLAN database file, but it does not appear in plain text in the configuration. Instead, the key associated with the password is saved in hexadecimal format.
in the running configuration. You must reenter the password if you enter a takeover command in the domain. When you enter the `secret` keyword, you can directly configure the password secret key.

- Support for extended range VLAN (VLANs 1006 to 4094) database propagation—VTP versions 1 and 2 propagate only VLANs 1 to 1005.

  Note  
  VTP pruning still applies only to VLANs 1 to 1005, and VLANs 1002 to 1005 are still reserved and cannot be modified.

- Support for any database in a domain—In addition to propagating VTP information, version 3 can propagate Multiple Spanning Tree (MST) protocol database information. A separate instance of the VTP protocol runs for each application that uses VTP.

- VTP primary server and VTP secondary servers—A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to its NVRAM.

By default, all devices come up as secondary servers. You can enter the `vtp primary` privileged EXEC command to specify a primary server. Primary server status is only needed for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers. Primary server status is lost if the device reloads or domain parameters change, even when a password is configured on the switch.

- [Enabling the VTP Version (CLI)](page2131) on page 2131

## VTP Pruning

VTP pruning increases network available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to reach the destination devices. Without VTP pruning, a switch floods broadcast, multicast, and unknown unicast traffic across all trunk links within a VTP domain even though receiving switches might discard them. VTP pruning is disabled by default.

VTP pruning blocks unneeded flooded traffic to VLANs on trunk ports that are included in the pruning-eligible list. Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning eligible switch trunk ports. If the VLANs are configured as pruning-ineligible, the flooding continues. VTP pruning is supported in all VTP versions.

*Figure 99: Flooding Traffic without VTP Pruning*

VTP pruning is disabled in the switched network. Port 1 on Switch A and Port 2 on Switch D are assigned to the Red VLAN. If a broadcast is sent from the host connected to Switch A, Switch A floods the broadcast and every switch in the network receives it, even though Switches C, E, and F have no ports in the Red VLAN.
VTP pruning is enabled in the switched network. The broadcast traffic from Switch A is not forwarded to Switches C, E, and F because traffic for the Red VLAN has been pruned on the links shown (Port 5 on Switch B and Port 4 on Switch D).

Enabling VTP pruning on a VTP server enables pruning for the entire management domain. Making VLANs pruning-eligible or pruning-ineligible affects pruning eligibility for those VLANs on that trunk only (not on all switches in the VTP domain).

VTP pruning takes effect several seconds after you enable it. VTP pruning does not prune traffic from VLANs that are pruning-ineligible. VLAN 1 and VLANs 1002 to 1005 are always pruning-ineligible; traffic from these VLANs cannot be pruned. Extended-range VLANs (VLAN IDs higher than 1005) are also pruning-ineligible.

**Related Topics**
- Enabling VTP Pruning (CLI), on page 2133

## VTP and Switch Stacks

VTP configuration is the same in all members of a switch stack. When the switch stack is in VTP server, client, or transparent mode, all switches in the stack carry the same VTP configuration.

- When a switch joins the stack, it inherits the VTP and VLAN properties of the active switch.
- All VTP updates are carried across the stack.
• When VTP mode is changed in a switch in the stack, the other switches in the stack also change VTP mode, and the switch VLAN database remains consistent.

VTP version 3 functions the same on a standalone switch or a stack except when the switch stack is the primary server for the VTP database. In this case, the MAC address of the active switch is used as the primary server ID. If the active switch reloads or is powered off, a new active switch is elected.

• If you do not configure the persistent MAC address feature, when the new active switch is elected, it sends a takeover message using the current stack MAC address.

---

**Note**
By default the persistent MAC address is on.

---

**VTP Configuration Guidelines**

**VTP Configuration Requirements**

When you configure VTP, you must configure a trunk port so that the switch can send and receive VTP advertisements to and from other switches in the domain.

**VTP Settings**

The VTP information is saved in the VTP VLAN database. When VTP mode is transparent, the VTP domain name and mode are also saved in the switch running configuration file, and you can save it in the switch startup configuration file by entering the `copy running-config startup-config` privileged EXEC command. You must use this command if you want to save VTP mode as transparent, even if the switch resets.

When you save VTP information in the switch startup configuration file and reboot the switch, the switch configuration is selected as follows:

• If the VTP mode is transparent in the startup configuration and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.

• If the VTP mode or domain name in the startup configuration do not match the VLAN database, the domain name and VTP mode and configuration for VLAN IDs 1 to 1005 use the VLAN database information.

**Domain Names for Configuring VTP**

When configuring VTP for the first time, you must always assign a domain name. You must configure all switches in the VTP domain with the same domain name. Switches in VTP transparent mode do not exchange VTP messages with other switches, and you do not need to configure a VTP domain name for them.
If the NVRAM and DRAM storage is sufficient, all switches in a VTP domain should be in VTP server mode.

Note

Do not configure a VTP domain if all switches are operating in VTP client mode. If you configure the domain, it is impossible to make changes to the VLAN configuration of that domain. Make sure that you configure at least one switch in the VTP domain for VTP server mode.

Caution

Passwords for the VTP Domain

You can configure a password for the VTP domain, but it is not required. If you do configure a domain password, all domain switches must share the same password and you must configure the password on each switch in the management domain. Switches without a password or with the wrong password reject VTP advertisements.

If you configure a VTP password for a domain, a switch that is booted without a VTP configuration does not accept VTP advertisements until you configure it with the correct password. After the configuration, the switch accepts the next VTP advertisement that uses the same password and domain name in the advertisement.

If you are adding a new switch to an existing network with VTP capability, the new switch learns the domain name only after the applicable password has been configured on it.

Caution

When you configure a VTP domain password, the management domain does not function properly if you do not assign a management domain password to each switch in the domain.

VTP Version

Follow these guidelines when deciding which VTP version to implement:

• All switches in a VTP domain must have the same domain name, but they do not need to run the same VTP version.

• A VTP version 2-capable switch can operate in the same VTP domain as a switch running VTP version 1 if version 2 is disabled on the version 2-capable switch (version 2 is disabled by default).

• If a switch running VTP version 1, but capable of running VTP version 3 advertisements, it automatically moves to VTP version 2.

• If a switch running VTP version 3 is connected to a switch running VTP version 1, the VTP version 1 switch moves to VTP version 2, and the VTP version 3 switch sends scaled-down versions of the VTP packets so that the VTP version 2 switch can update its database.

• A switch running VTP version 3 cannot move to version 1 or 2 if it has extended VLANs.
• Do not enable VTP version 2 on a switch unless all of the switches in the same VTP domain are version-2-capable. When you enable version 2 on a switch, all of the version-2-capable switches in the domain enable version 2. If there is a version 1-only switch, it does not exchange VTP information with switches that have version 2 enabled.

• Cisco recommends placing VTP version 1 and 2 switches at the edge of the network because they do not forward VTP version 3 advertisements.

• If there are TrBRF and TrCRF Token Ring networks in your environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly. To run Token Ring and Token Ring-Net, disable VTP version 2.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must configure these VLANs manually on each device. VTP version 3 supports extended-range VLANs and support for extended range VLAN database propagation.

• When a VTP version 3 device trunk port receives messages from a VTP version 2 device, it sends a scaled-down version of the VLAN database on that particular trunk in VTP version 2 format. A VTP version 3 device does not send VTP version 2-formatted packets on a trunk unless it first receives VTP version 2 packets on that trunk port.

• When a VTP version 3 device detects a VTP version 2 device on a trunk port, it continues to send VTP version 3 packets, in addition to VTP version 2 packets, to allow both kinds of neighbors to coexist on the same trunk.

• A VTP version 3 device does not accept configuration information from a VTP version 2 or version 1 device.

• Two VTP version 3 regions can only communicate in transparent mode over a VTP version 1 or version 2 region.

• Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.

• VTP version 1 and version 2 do not propagate configuration information for extended range VLANs (VLANs 1006 to 4094). You must manually configure these VLANs on each device.

• If you configure the switch for VTP client mode, the switch does not create the VLAN database file (vlan.dat). If the switch is then powered off, it resets the VTP configuration to the default. To keep the VTP configuration with VTP client mode after the switch restarts, you must first configure the VTP domain name before the VTP mode.

⚠️

Caution

If all switches are operating in VTP client mode, do not configure a VTP domain name. If you do, it is impossible to make changes to the VLAN configuration of that domain. Therefore, make sure you configure at least one switch as a VTP server.

How to Configure VTP

Configuring VTP Mode (CLI)

You can configure VTP mode as one of these:

- VTP server mode—In VTP server mode, you can change the VLAN configuration and have it propagated throughout the network.

- VTP client mode—In VTP client mode, you cannot change its VLAN configuration. The client switch receives VTP updates from a VTP server in the VTP domain and then modifies its configuration accordingly.

- VTP transparent mode—In VTP transparent mode, VTP is disabled on the switch. The switch does not send VTP updates and does not act on VTP updates received from other switch. However, a VTP transparent switch running VTP version 2 does forward received VTP advertisements on its trunk links.

- VTP off mode—VTP off mode is the same as VTP transparent mode except that VTP advertisements are not forwarded.

When you configure a domain name, it cannot be removed; you can only reassign a switch to a different domain.

SUMMARY STEPS

1. configure terminal
2. vtp domain domain-name
3. vtp mode {client | server | transparent | off} {vlan | mst | unknown}
4. vtp password password
5. end
6. show vtp status
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  | configure terminal |
  | Example:
  | Switch# configure terminal |
| **Step 2**
  | vtp domain domain-name |
  | Example:
  | Switch(config)# vtp domain eng_group |
  | Configures the VTP administrative-domain name. The name can be 1 to 32 characters. All switches operating in VTP server or client mode under the same administrative responsibility must be configured with the same domain name. |
Purpose

Command or Action | Purpose
--- | ---
This command is optional for modes other than server mode. VTP server mode requires a domain name. If the switch has a trunk connection to a VTP domain, the switch learns the domain name from the VTP server in the domain. You should configure the VTP domain before configuring other VTP parameters.

**Step 3**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| vtp mode \{client | server | transparent | off\} \{vlan | mst | unknown\} | Configures the switch for VTP mode (client, server, transparent, or off).  
  * vlan—The VLAN database is the default if none are configured.  
  * mst—The multiple spanning tree (MST) database.  
  * unknown—An unknown database type. |

**Example:**

Switch(config)# vtp mode server

**Step 4**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>vtp password <em>password</em></td>
<td>(Optional) Sets the password for the VTP domain. The password can be 8 to 64 characters. If you configure a VTP password, the VTP domain does not function properly if you do not assign the same password to each switch in the domain.</td>
</tr>
</tbody>
</table>

**Example:**

Switch(config)# vtp password mypassword

**Step 5**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

Switch(config)# end

**Step 6**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp status</td>
<td>Verifies your entries in the <em>VTP Operating Mode</em> and the <em>VTP Domain Name</em> fields of the display.</td>
</tr>
</tbody>
</table>

**Example:**

Switch# show vtp status

**Step 7**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| copy running-config startup-config | (Optional) Saves the configuration in the startup configuration file.  
Only VTP mode and domain name are saved in the switch running configuration and can be copied to the startup configuration file. |

**Example:**

Switch# copy running-config startup-config

Configuring a VTP Version 3 Primary Server (CLI)

When you configure a VTP server as a VTP primary server, the takeover operation starts.

SUMMARY STEPS

1. `vtp primary [vlan | mst] [force]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>`vtp primary [vlan</td>
<td>mst] [force]`</td>
</tr>
</tbody>
</table>

- **(Optional) vlan**—Selects the VLAN database as the takeover feature. This is the default.
- **(Optional) mst**—Selects the multiple spanning tree (MST) database as the takeover feature.
- **(Optional) force**—Overwrites the configuration of any conflicting servers. If you do not enter force, you are prompted for confirmation before the takeover.

Example:

Step 1 configuration to the domain. If the switch password is configured as hidden, you are prompted to reenter the password.

```
Switch# vtp primary vlan force
```

Related Topics

VTP Settings, on page 2125

Enabling the VTP Version (CLI)

VTP version 2 and version 3 are disabled by default.

- When you enable VTP version 2 on a switch, every VTP version 2-capable switch in the VTP domain enables version 2. To enable VTP version 3, you must manually configure it on each switch.

- With VTP versions 1 and 2, you can configure the version only on switches in VTP server or transparent mode. If a switch is running VTP version 3, you can change to version 2 when the switch is in client mode if no extended VLANs exist, and no hidden password was configured.

Caution: VTP version 1 and VTP version 2 are not interoperable on switches in the same VTP domain. Do not enable VTP version 2 unless every switch in the VTP domain supports version 2.
- In TrCRF and TrBRF Token Ring environments, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly. For Token Ring and Token Ring-Net media, disable VTP version 2.

Caution

In VTP version 3, both the primary and secondary servers can exist on an instance in the domain.

SUMMARY STEPS

1.  configure terminal
2.  vtp version {1 | 2 | 3}
3.  end
4.  show vtp status
5.  copy running-config startup-config

<td>Step 1 configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 vtp version {1 | 2 | 3} | Enables the VTP version on the switch. The default is VTP version 1. |
| Example:                        |                                              |
| Switch(config)# vtp version 2   |                                              |

| Step 3 end                      | Returns to privileged EXEC mode.             |
| Example:                        |                                              |
| Switch(config)# end             |                                              |

| Step 4 show vtp status          | Verifies that the configured VTP version is enabled. |
| Example:                        |                                              |
| Switch# show vtp status         |                                              |

| Step 5 copy running-config startup-config | (Optional) Saves the configuration in the startup configuration file. |
| Example:                                  |                                              |
| Switch# copy running-config startup-config |                                              |
Enabling VTP Pruning (CLI)

Pruning increases available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to access the destination devices. You can only enable VTP pruning on a switch in VTP server mode.

With VTP versions 1 and 2, when you enable pruning on the VTP server, it is enabled for the entire VTP domain. In VTP version 3, you must manually enable pruning on each switch in the domain.

Only VLANs included in the pruning-eligible list can be pruned. By default, VLANs 2 through 1001 are pruning-eligible on trunk ports. Reserved VLANs and extended-range VLANs cannot be pruned.

Before you begin

VTP pruning is not designed to function in VTP transparent mode. If one or more switches in the network are in VTP transparent mode, you should do one of these actions:

- Turn off VTP pruning in the entire network.
- Turn off VTP pruning by making all VLANs on the trunk of the switch upstream to the VTP transparent switch pruning ineligible.

To configure VTP pruning on an interface, use the `switchport trunk pruning vlan` interface configuration command. VTP pruning operates when an interface is trunking. You can set VLAN pruning-eligibility, whether or not VTP pruning is enabled for the VTP domain, whether or not any given VLAN exists, and whether or not the interface is currently trunking.

**SUMMARY STEPS**

1. `configure terminal`
2. `vtp pruning`
3. `end`
4. `show vtp status`

**DETAILED STEPS**

<table>

</tr>
<tr>
<td><strong>Example:</strong></td>
<td>By default, pruning is disabled. You need to enable pruning on only one switch in VTP server mode.</td>
</tr>
</tbody>
</table>
### Configuring VTP on a Per-Port Basis (CLI)

With VTP version 3, you can enable or disable VTP on a per-port basis. You can enable VTP only on ports that are in trunk mode. Incoming and outgoing VTP traffic are blocked, not forwarded.

**SUMMARY STEPS**

1. configure terminal
2. interface `interface-id`
3. vtp
4. end
5. show running-config interface `interface-id`
6. show vtp status

### Adding a VTP Client Switch to a VTP Domain (CLI)

Follow these steps to verify and reset the VTP configuration revision number on a switch *before* adding it to a VTP domain.

**Before you begin**

Before adding a VTP client to a VTP domain, always verify that its VTP configuration revision number is *lower* than the configuration revision number of the other switches in the VTP domain. Switches in a VTP domain always use the VLAN configuration of the switch with the highest VTP configuration revision number. With VTP versions 1 and 2, adding a switch that has a revision number higher than the revision number in the VTP domain can erase all VLAN information from the VTP server and VTP domain. With VTP version 3, the VLAN information is not erased.

You can use the `vtp mode transparent` global configuration command to disable VTP on the switch and then to change its VLAN information without affecting the other switches in the VTP domain.

**SUMMARY STEPS**

1. show vtp status
2. configure terminal
3. \texttt{vtp domain domain-name}  
4. \texttt{end}  
5. \texttt{show vtp status}  
6. \texttt{configure terminal}  
7. \texttt{vtp domain domain-name}  
8. \texttt{end}  
9. \texttt{show vtp status}

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 1    | \texttt{show vtp status} | Checks the VTP configuration revision number.  
Example:  
\texttt{Switch\# show vtp status}  
If the number is 0, add the switch to the VTP domain.  
If the number is greater than 0, follow these substeps:  
- Write down the domain name.  
- Write down the configuration revision number.  
- Continue with the next steps to reset the switch configuration revision number. |
| 2    | \texttt{configure terminal} | Enters the global configuration mode.  
Example:  
\texttt{Switch\# configure terminal} |
| 3    | \texttt{vtp domain domain-name} | Changes the domain name from the original one displayed in Step 1 to a new name.  
Example:  
\texttt{Switch(config)\# vtp domain domain123} |
| 4    | \texttt{end} | Returns to privileged EXEC mode. The VLAN information on the switch is updated and the configuration revision number is reset to 0.  
Example:  
\texttt{Switch(config)\# end} |
| 5    | \texttt{show vtp status} | Verifies that the configuration revision number has been reset to 0.  
Example:  
\texttt{Switch\# show vtp status} |
| 6    | \texttt{configure terminal} | Enters global configuration mode.  
Example:  
\texttt{Switch\# configure terminal} |
To configure a default domain name on a switch, follow these steps:

1. **Enter the default domain name** on the switch:
   ```
   Switch# configure terminal
   Switch(config)# vtp domain domain012
   ```

2. **Return to privileged EXEC mode** and update the VLAN information on the switch:
   ```
   Switch(config)# end
   ```

3. **Verify the domain name** and configuration revision number:
   ```
   Switch# show vtp status
   ```

## Monitoring VTP

This section describes commands used to display and monitor the VTP configuration.

You monitor VTP by displaying VTP configuration information: the domain name, the current VTP revision, and the number of VLANs. You can also display statistics about the advertisements sent and received by the switch.

### Table 194: VTP Monitoring Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vtp counters</code></td>
<td>Displays counters about VTP messages that have been sent and received.</td>
</tr>
<tr>
<td><code>show vtp devices [conflict]</code></td>
<td>Displays information about all VTP version 3 devices in the domain. Conflicts are VTP version 3 devices with conflicting primary servers. The <code>show vtp devices</code> command does not display information when the switch is in transparent or off mode.</td>
</tr>
</tbody>
</table>
### Configuration Examples for VTP

#### Example: Configuring a Switch as the Primary Server

This example shows how to configure a switch as the primary server for the VLAN database (the default) when a hidden or secret password was configured:

```
Switch# vtp primary vlan
Enter VTP password: mypassword
This switch is becoming Primary server for vlan feature in the VTP domain

VTP Database Conf Switch ID       Primary Server Revision System Name
--------------------------------- ----------------- ------------- -------------------
VLANDB     Yes  00d0.00b8.1400=00d0.00b8.1400 1   stp7

Do you want to continue (y/n) [n]? y
```

### Where to Go Next

After configuring VTP, you can configure the following:
- VLANs
- VLAN groups
- VLAN trunking
- Voice VLANs

---

<table>

- Feature History and Information for VLANs, on page 2160

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLANs

The following are prerequisites and considerations for configuring VLANs:

- Before you create VLANs, you must decide whether to use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration for your network.

- If you plan to configure many VLANs on the switch and to not enable routing, you can set the Switch Database Management (SDM) feature to the VLAN template, which configures system resources to support the maximum number of unicast MAC addresses.

- Switches running the LAN Base feature set support only static routing on SVIs.

- A VLAN should be present in the switch to be able to add it to the VLAN group.
Restrictions for VLANs

The following are restrictions for VLANs:

- The switch supports per-VLAN spanning-tree plus (PVST+) or rapid PVST+ with a maximum of 128 spanning-tree instances. One spanning-tree instance is allowed per VLAN.
- The switch supports IEEE 802.1Q trunking methods for sending VLAN traffic over Ethernet ports.
- Configuring an interface VLAN router's MAC address is not supported. The interface VLAN already has an MAC address assigned by default.
- Private VLANs are not supported on the switch.
- You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

Information About VLANs

Logical Networks

A VLAN is a switched network that is logically segmented by function, project team, or application, without regard to the physical locations of the users. VLANs have the same attributes as physical LANs, but you can group end stations even if they are not physically located on the same LAN segment. Any switch port can belong to a VLAN, and unicast, broadcast, and multicast packets are forwarded and flooded only to end stations in the VLAN. Each VLAN is considered a logical network, and packets destined for stations that do not belong to the VLAN must be forwarded through a router or a switch supporting fallback bridging. In a switch stack, VLANs can be formed with ports across the stack. Because a VLAN is considered a separate logical network, it contains its own bridge Management Information Base (MIB) information and can support its own implementation of spanning tree.
VLANs are often associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Interface VLAN membership on the switch is assigned manually on an interface-by-interface basis. When you assign switch interfaces to VLANs by using this method, it is known as interface-based, or static, VLAN membership.

Traffic between VLANs must be routed.

The switch can route traffic between VLANs by using switch virtual interfaces (SVIs). An SVI must be explicitly configured and assigned an IP address to route traffic between VLANs.

**Supported VLANs**

The switch supports VLANs in VTP client, server, and transparent modes. VLANs are identified by a number from 1 to 4094. VLAN 1 is the default VLAN and is created during system initialization. VLAN IDs 1002 through 1005 are reserved for Token Ring and FDDI VLANs. All of the VLANs except 1002 to 1005 are available for user configuration.

There are 3 VTP versions: VTP version 1, version 2, and version 3. All VTP versions support both normal and extended range VLANs, but only with VTP version 3, does the switch propagate extended range VLAN configuration information. When extended range VLANs are created in VTP versions 1 and 2, their configuration information is not propagated. Even the local VTP database entries on the switch are not updated, but the extended range VLANs configuration information is created and stored in the running configuration file.

You can configure up to 4094 VLANs on the switch.

**Related Topics**

Creating or Modifying an Ethernet VLAN (CLI), on page 2147
Deleting a VLAN (CLI), on page 2150
You configure a port to belong to a VLAN by assigning a membership mode that specifies the kind of traffic the port carries and the number of VLANs to which it can belong.

When a port belongs to a VLAN, the switch learns and manages the addresses associated with the port on a per-VLAN basis.

### Table 195: Port Membership Modes and Characteristics

<table>
<thead>
<tr>
<th>Membership Mode</th>
<th>VLAN Membership Characteristics</th>
<th>VTP Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static-access</td>
<td>A static-access port can belong to one VLAN and is manually assigned to that VLAN.</td>
<td>VTP is not required. If you do not want VTP to globally propagate information, set the VTP mode to transparent. To participate in VTP, there must be at least one trunk port on the switch or the switch stack connected to a trunk port of a second switch or switch stack.</td>
</tr>
<tr>
<td>Trunk (IEEE 802.1Q)</td>
<td>A trunk port is a member of all VLANs by default, including extended-range VLANs, but membership can be limited by configuring the allowed-VLAN list. You can also modify the pruning-eligible list to block flooded traffic to VLANs on trunk ports that are included in the list.</td>
<td>VTP is recommended but not required. VTP maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs on a network-wide basis. VTP exchanges VLAN configuration messages with other switches over trunk links.</td>
</tr>
<tr>
<td>Voice VLAN</td>
<td>A voice VLAN port is an access port attached to a Cisco IP Phone, configured to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone.</td>
<td>VTP is not required; it has no effect on a voice VLAN.</td>
</tr>
</tbody>
</table>

VLAN Configuration Files

Configurations for VLAN IDs 1 to 1005 are written to the vlan.dat file (VLAN database), and you can display them by entering the `show vlan` privileged EXEC command. The vlan.dat file is stored in flash memory. If the VTP mode is transparent, they are also saved in the switch running configuration file.

In a switch stack, the whole stack uses the same vlan.dat file and running configuration. On some switches, the vlan.dat file is stored in flash memory on the active switch.

You use the interface configuration mode to define the port membership mode and to add and remove ports from VLANs. The results of these commands are written to the running-configuration file, and you can display the file by entering the `show running-config` privileged EXEC command.

When you save VLAN and VTP information (including extended-range VLAN configuration information) in the startup configuration file and reboot the switch, the switch configuration is selected as follows:

- If the VTP mode is transparent in the startup configuration, and the VLAN database and the VTP domain name from the VLAN database matches that in the startup configuration file, the VLAN database is ignored (cleared), and the VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode or domain name in the startup configuration does not match the VLAN database, the domain name and VTP mode and configuration for the VLAN IDs 1 to 1005 use the VLAN database information.
- In VTP versions 1 and 2, if VTP mode is server, the domain name and VLAN configuration for VLAN IDs 1 to 1005 use the VLAN database information. VTP version 3 also supports VLANs 1006 to 4094.

Normal-Range VLAN Configuration Guidelines

Normal-range VLANs are VLANs with IDs from 1 to 1005.

Follow these guidelines when creating and modifying normal-range VLANs in your network:

- Normal-range VLANs are identified with a number between 1 and 1001. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs.
- VLAN configurations for VLANs 1 to 1005 are always saved in the VLAN database. If the VTP mode is transparent, VTP and VLAN configurations are also saved in the switch running configuration file.
- If the switch is in VTP server or VTP transparent mode, you can add, modify or remove configurations for VLANs 2 to 1001 in the VLAN database. (VLAN IDs 1 and 1002 to 1005 are automatically created and cannot be removed.)
- Extended-range VLANs created in VTP transparent mode are not saved in the VLAN database and are not propagated. VTP version 3 supports extended range VLAN (VLANs 1006 to 4094) database propagation in VTP server mode.
- Before you can create a VLAN, the switch must be in VTP server mode or VTP transparent mode. If the switch is a VTP server, you must define a VTP domain or VTP will not function.
- The switch does not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration through VTP.
- The switch supports 128 spanning tree instances. If a switch has more active VLANs than supported spanning-tree instances, spanning tree can be enabled on 128 VLANs and is disabled on the remaining
If you have already used all available spanning-tree instances on a switch, adding another VLAN anywhere in the VTP domain creates a VLAN on that switch that is not running spanning-tree. If you have the default allowed list on the trunk ports of that switch (which is to allow all VLANs), the new VLAN is carried on all trunk ports. Depending on the topology of the network, this could create a loop in the new VLAN that would not be broken, particularly if there are several adjacent switches that all have run out of spanning-tree instances. You can prevent this possibility by setting allowed lists on the trunk ports of switches that have used up their allocation of spanning-tree instances.

If the number of VLANs on the switch exceeds the number of supported spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your switch to map multiple VLANs to a single spanning-tree instance.

* When a switch in a stack learns a new VLAN or deletes or modifies an existing VLAN (either through VTP over network ports or through the CLI), the VLAN information is communicated to all stack members.

* When a switch joins a stack or when stacks merge, VTP information (the vlan.dat file) on the new switches will be consistent with the active switch.

### Extended-Range VLAN Configuration Guidelines

Extended-range VLANs are VLANs with IDs from 1006 to 4094.

Follow these guidelines when creating extended-range VLANs:

* VLAN IDs in the extended range are not saved in the VLAN database and are not recognized by VTP unless the switch is running VTP version 3.

* You cannot include extended-range VLANs in the pruning eligible range.

* For VTP version 1 or 2, you can set the VTP mode to transparent in global configuration mode. You should save this configuration to the startup configuration so that the switch boots up in VTP transparent mode. Otherwise, you lose the extended-range VLAN configuration if the switch resets. If you create extended-range VLANs in VTP version 3, you cannot convert to VTP version 1 or 2.

* When the maximum number of spanning-tree instances are on the switch, spanning tree is disabled on any newly created VLANs. If the number of VLANs on the switch exceeds the maximum number of spanning-tree instances, we recommend that you configure the IEEE 802.1s Multiple STP (MSTP) on your switch to map multiple VLANs to a single spanning-tree instance.

* In a switch stack, the whole stack uses the same running configuration and saved configuration, and extended-range VLAN information is shared across the stack.

How to Configure VLANs

How to Configure Normal-Range VLANs

You can set these parameters when you create a new normal-range VLAN or modify an existing VLAN in the VLAN database:

- VLAN ID
- VLAN name
- VLAN type
  - Ethernet
  - Fiber Distributed Data Interface [FDDI]
  - FDDI network entity title [NET]
  - TrBRF or TrCRF
  - Token Ring
  - Token Ring-Net
- VLAN state (active or suspended)
- Maximum transmission unit (MTU) for the VLAN
- Security Association Identifier (SAID)
- Bridge identification number for TrBRF VLANs
- Ring number for FDDI and TrCRF VLANs
- Parent VLAN number for TrCRF VLANs
- Spanning Tree Protocol (STP) type for TrCRF VLANs
- VLAN number to use when translating from one VLAN type to another

You can cause inconsistency in the VLAN database if you attempt to manually delete the vlan.dat file. If you want to modify the VLAN configuration, follow the procedures in this section.

Creating or Modifying an Ethernet VLAN (CLI)

Before you begin

With VTP version 1 and 2, if the switch is in VTP transparent mode, you can assign VLAN IDs greater than 1006, but they are not added to the VLAN database.

The switch supports only Ethernet interfaces. Because FDDI and Token Ring VLANs are not locally supported, you only configure FDDI and Token Ring media-specific characteristics for VTP global advertisements to other switches.
Although the switch does not support Token Ring connections, a remote device with Token Ring connections could be managed from one of the supported switches. Switches running VTP Version 2 advertise information about these Token Ring VLANs:

- Token Ring TrBRF VLANs
- Token Ring TrCRF VLANs

**SUMMARY STEPS**

1. `configure terminal`
2. `vlan vlan-id`
3. `name vlan-name`
4. `media { ethernet | fd-net | fddi | tokenring | trn-net }`
5. `remote-span`
6. `end`
7. `show vlan {name vlan-name | id vlan-id}`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> vlan vlan-id</td>
<td>Enters a VLAN ID, and enters VLAN configuration mode. Enter a new VLAN ID to create a VLAN, or enter an existing VLAN ID to modify that VLAN.</td>
</tr>
<tr>
<td>Example: Switch(config)# vlan 20</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> name vlan-name</td>
<td>(Optional) Enters a name for the VLAN. If no name is entered for the VLAN, the default is to append the <code>vlan-id</code></td>

<td>• ring—Sets the ring number value for FDDI or Token Ring type VLANs.</td>
<td></td>
</tr>
<tr>
<td>• said—Sets the IEEE 802.10 SAID value.</td>
<td></td>
</tr>
<tr>
<td>• shutdown—Shuts down the VLAN switching.</td>
<td></td>
</tr>
<tr>
<td>• state—Sets the operational VLAN state to active or suspended.</td>
<td></td>
</tr>
<tr>
<td>• ste—Sets the maximum number of Spanning Tree Explorer (STE) hops for the VLAN.</td>
<td></td>
</tr>
<tr>
<td>• stp—Sets the Spanning Tree characteristics of the VLAN.</td>
<td></td>
</tr>
</tbody>
</table>

Step 4  media { ethernet | fd-net | fddi | tokenring | trn-net }
Example:
Switch(config-vlan)# media ethernet

Configures the VLAN media type. Command options include:
• ethernet—Sets the VLAN media type as Ethernet.
• fd-net—Sets the VLAN media type as FDDI net.
• fddi—Sets the VLAN media type as FDDI.
• tokenring—Sets the VLAN media type as Token Ring.
• trn-net—Sets the VLAN media type as Token Ring net.

### Deleting a VLAN (CLI)

When you delete a VLAN from a switch that is in VTP server mode, the VLAN is removed from the VLAN database for all switches in the VTP domain. When you delete a VLAN from a switch that is in VTP transparent mode, the VLAN is deleted only on that specific switch or a switch stack.

You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.

⚠️ **Caution**

When you delete a VLAN, any ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.

### SUMMARY STEPS

1. configure terminal
2. no vlan vlan-id
3. end
4. show vlan brief
**DETAILED STEPS**

**Assigning Static-Access Ports to a VLAN (CLI)**

You can assign a static-access port to a VLAN without having VTP globally propagate VLAN configuration information by disabling VTP (VTP transparent mode).

If you assign an interface to a VLAN that does not exist, the new VLAN is created.

**SUMMARY STEPS**

1. configure terminal
2. interface interface-id
3. switchport mode access
4. switchport access vlan vlan-id
5. end
6. show running-config interface interface-id
7. show interfaces interface-id switchport
# Assigning Static-Access Ports to a VLAN (CLI)

How to Configure Extended-Range VLANs

Extended-range VLANs enable service providers to extend their infrastructure to a greater number of customers. The extended-range VLAN IDs are allowed for any **switchport** commands that allow VLAN IDs.

With VTP version 1 or 2, extended-range VLAN configurations are not stored in the VLAN database, but because VTP mode is transparent, they are stored in the switch running configuration file, and you can save the configuration in the startup configuration file. Extended-range VLANs created in VTP version 3 are stored in the VLAN database.

You can change only the MTU size and the remote SPAN configuration state on extended-range VLANs; all other characteristics must remain at the default state.

Creating an Extended-Range VLAN (CLI)

**SUMMARY STEPS**

1. configure terminal
2. vlan vlan-id
3. remote-span
4. exit
5. interface vlan
6. ip mtu mtu-size
7. end
8. show vlan id vlan-id
9. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> vlan vlan-id</td>
<td>Enters an extended-range VLAN ID and enters VLAN configuration mode. The range is 1006 to 4094.</td>
</tr>
<tr>
<td>Example: Switch(config)# vlan 2000 Switch(config-vlan)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> remote-span</td>
<td>(Optional) Configures the VLAN as the RSPAN VLAN.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-vlan)# remote-span</td>
</tr>
</tbody>
</table>

### Step 4

**exit**

**Example:**

Switch(config-vlan)# exit
Switch(config)#

Returns to configuration mode.

### Step 5

**interface vlan**

**Example:**

Switch(config)# interface vlan 200
Switch(config-if)#

Enters the interface configuration mode for the selected VLAN.

### Step 6

**ip mtu mtu-size**

**Example:**

Switch(config-if)# ip mtu 1024
Switch(config-if)#

(Optional) Modifies the VLAN by changing the MTU size. You can configure the MTU size between 68 to 1500 bytes.

**Note** Although all VLAN commands appear in the CLI help, only the **ip mtu mtu-size** and **remote-span** commands are supported for extended-range VLANs.

### Step 7

**end**

**Example:**

Switch(config)# end

Returns to privileged EXEC mode.

### Step 8

**show vlan id vlan-id**

**Example:**

Switch# show vlan id 2000

Verifies that the VLAN has been created.

### Step 9

**copy running-config startup-config**

**Example:**

Switch# copy running-config startup-config

Saves your entries in the switch startup configuration file. To save an extended-range VLAN configuration, you need to save the VTP transparent mode configuration and the extended-range VLAN configuration in the switch startup configuration file. Otherwise, if the switch resets, it will default to VTP server mode, and the extended-range VLAN IDs will not be saved.

**Note** This step is not required for VTP version 3 because VLANs are saved in the VLAN database.
How to Configure VLANs (GUI)

Creating Layer2 VLAN (GUI)

To create a Layer2 VLAN using the switch web UI, you must follow the steps defined in this procedure.

Step 1

To create a Layer2 VLAN, choose Configuration > Controller > System > VLAN > Layer2 VLAN.

The VLAN Layer2 page appears. You must provide values for all parameters listed in the Layer2 page.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>VLAN tag identifier, or 0 for no VLAN tag.</td>
</tr>
<tr>
<td>Name</td>
<td>VLAN name.</td>
</tr>
<tr>
<td>State</td>
<td>VLAN state. Values are the following:</td>
</tr>
<tr>
<td></td>
<td>• Active</td>
</tr>
<tr>
<td></td>
<td>• Suspended</td>
</tr>
</tbody>
</table>

Step 2

Click Apply.

Creating Layer3 Interface (GUI)

To create a Layer3 interface using the switch web UI, you must follow the steps defined in this procedure.

Step 1

To create a Layer3 interface, choose Configuration > Controller > System > VLAN > Layer3 Interface.

The Layer3 interface page appears. You must provide values for all parameters listed in the window.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Description for the Layer3 interface.</td>
</tr>
<tr>
<td>DHCP Relay Information</td>
<td>Information on controller built-in DHCP relay agents.</td>
</tr>
<tr>
<td>IP Address</td>
<td>IP address/subnet mask of the VLAN SVI (Switch Virtual Interface).</td>
</tr>
<tr>
<td>Mask Address</td>
<td>Mask address of the DHCP server.</td>
</tr>
<tr>
<td>IPv6 Address</td>
<td>IPv6 address of the DHCP server.</td>
</tr>
<tr>
<td>IPv4 DHCP Server</td>
<td>IPv4 address of the DHCP server.</td>
</tr>
<tr>
<td>IPv6 DHCP Server</td>
<td>IPv6 address of the DHCP server.</td>
</tr>
</tbody>
</table>
Viewing Layer2 VLAN (GUI)

You can view the details of the Layer2 VLANs configured in the switch interface using the web UI.

Procedure

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>The Layer2 VLAN page appears, listing the following details of the Layer2 VLANs in the switch.</td>
</tr>
<tr>
<td>Choose Configuration &gt; Controller &gt; System &gt; VLAN &gt; Layer2 VLAN.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>Displays VLAN tag identifier.</td>
</tr>
<tr>
<td>Name</td>
<td>VLAN name.</td>
</tr>
<tr>
<td>State</td>
<td>VLAN state. Values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Active</td>
</tr>
<tr>
<td></td>
<td>• Suspended</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit.</td>
</tr>
</tbody>
</table>

Viewing Layer3 Interface (GUI)

You can view the details of the Layer3 interfaces configured in the switch interface using the web UI.

Choose Configuration > Controller > System > VLAN > Layer3 Interface.

The Layer2 VLAN page appears, listing the following details of the Layer3 interfaces in the switch.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Name</td>
<td>Layer3 interface name.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the Layer3 interface. Values are the following:</td>
</tr>
<tr>
<td></td>
<td>• Up</td>
</tr>
<tr>
<td></td>
<td>• Down</td>
</tr>
<tr>
<td>Protocol</td>
<td>Protocol used for Layer3 interface.</td>
</tr>
<tr>
<td>IP Address</td>
<td>IP address used for Layer3 security and mobility managers.</td>
</tr>
</tbody>
</table>

Removing Layer2 VLAN (GUI)

To remove a Layer2 VLANs using the switch web UI, you must:
Step 1  Choose Configuration > Controller > System > VLAN > Layer2 VLAN.  
The Layer2 VLAN page appears, listing the following details of the Layer2 VLANs associated with the switch.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN ID</td>
<td>Displays VLAN tag identifier.</td>
</tr>
<tr>
<td>Name</td>
<td>VLAN name.</td>
</tr>
</tbody>
</table>
| State     | VLAN state. Values are as follows: 
  • Active 
  • Suspended |
| MTU       | Maximum transmission unit. |

Step 2  Check the checkbox of the Layer2 VLAN you need to delete from the Layer2 VLANs displayed in the Layer2 VLAN list.  
You will receive a confirmation message confirming deletion of the selected Layer2 VLAN.

Step 3  Click Ok.

Removing Layer3 Interface (GUI)

To remove a Layer3 interface using the switch web UI, you must:

Step 1  Choose Configuration > Controller > System > VLAN > Layer3 Interface.  
The Layer3 interface page appears, listing the following details of the Layer3 interfaces associated with the switch.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface Name</td>
<td>Layer3 interface name.</td>
</tr>
</tbody>
</table>
| Status          | Status of the Layer3 interface. Values are the following: 
  • Up 
  • Down |
| Protocol        | Protocol used for Layer3 interface. |
| IP Address      | IP address used for Layer3 security and mobility managers. |

Step 2  Check the checkbox of the Layer3 interfaces you need to delete from the Layer3 interfaces displayed in the Layer3 interfaces.  
You will receive a confirmation message confirming deletion of the selected Layer3 interface.

Step 3  Click Ok.
Monitoring VLANs

Table 196: Privileged EXEC show Commands

<table>
<thead>
<tr>

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLAN Groups

A VLAN should be present in the switch to be able to add it to the VLAN group.

Restrictions for VLAN Groups

The number of VLANs mapped to a VLAN group is not limited by Cisco IOS Software Release. But if the number of VLANs in a VLAN group exceed the recommended value of 32, the mobility behavior is unexpected and in the VLAN group, L2 multicast breaks for some VLANs. So it is the responsibility of the administrator to configure feasible number of VLANs in a VLAN group. When a VLAN is added to a VLAN group mapped to a WLAN which already has 32 VLANs, a warning is generated. But when a new VLAN group is mapped to a WLAN with more than 32 VLANs, an error is generated.

For expected behavior of the VLAN group, the VLANs mapped in the group must be present in the switch. The static IP client behavior is not supported.
Information About VLAN Groups

Whenever a wireless client connects to a wireless network (WLAN), the client is placed in a VLAN that is associated with the WLAN. In a large venue such as an auditorium, a stadium, or a conference room where there are numerous wireless clients, having only a single WLAN to accommodate many clients might be a challenge.

The VLAN group feature uses a single WLAN that can support multiple VLANs. The clients can get assigned to one of the configured VLANs. This feature maps a WLAN to a single VLAN or multiple VLANs using the VLAN groups. When a wireless client associates to the WLAN, the VLAN is derived by an algorithm based on the MAC address of the wireless client. A VLAN is assigned to the client and the client gets the IP address from the assigned VLAN. This feature also extends the current AP group architecture and AAA override architecture, where the AP groups and AAA override can override a VLAN or a VLAN group to which the WLAN is mapped.

Removing VLAN Group (CLI)

SUMMARY STEPS

1. configure terminal
2. vlan group WORD vlan-list vlan-ID
3. no vlan group WORD vlan-list vlan-ID
4. end

DETAILED STEPS

Step 1  configure terminal
Example:
Switch# configure terminal
Enters global command mode.

Step 2  vlan group WORD vlan-list vlan-ID
Example:
Switch(config)#vlan group vlangrp1 vlan-list 91-95
Creates a VLAN group with the given group name (vlangrp1) and adds all the VLANs listed in the command. The VLAN list ranges from 1 to 4096 and the recommended number of VLANs in a group is 32.

Step 3  no vlan group WORD vlan-list vlan-ID
Example:
Switch(config)#no vlan group vlangrp1 vlan-list 91-95
Removes the VLAN group with the given group name (vlangrp1).

Step 4  end
Example:
Switch(config)#end
Exits the global configuration mode and returns to privileged EXEC mode. Alternatively, press CTRL-Z to exit the global configuration mode.

Creating VLAN Groups (GUI)

To create a VLAN group using the switch web UI, you must:

Step 1  Choose Configuration > Controller > System > VLAN > VLAN Group.
The VLAN Group page appears. You must provide values for all parameters listed in the VLAN Group window.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Group Name</td>
<td>Group name for the VLANs.</td>
</tr>
<tr>
<td>VLAN List</td>
<td>The VLAN list to configure the mesh access point (MAP) access port.</td>
</tr>
</tbody>
</table>

Step 2 Click Apply.

**Adding a VLAN Group to WLAN (CLI)**

**SUMMARY STEPS**

1. configure terminal
2. wlan *WORD* *number*
3. client vlan *WORD*
4. end

<td>Switch(config-wlan)#end</td>
</tr>
</tbody>
</table>

**Adding a VLAN Group to WLAN (GUI)**

To add a VLAN group to WLAN using the switch web UI, you must follow the steps defined in this procedure.

**Step 1** To add a VLAN group to a WLAN, choose Configuration > Wireless > WLANs > WLAN Profile > General. The general parameter page of the WLAN group appears.
Step 2   Select the VLAN group values listed in the **Interface/Interface Group** drop-down list to associate the selected WLAN profile to a VLAN group.

Step 3   Click **Apply**.

---

**Removing VLAN Groups (GUI)**

To remove a VLAN groups using the switch web UI, you must:

Step 1   Choose **Configuration > Controller > System > VLAN > VLAN Group**.

The VLAN Group page appears, listing the following details of the VLAN groups associated with the switch.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Group Name</td>
<td>Group name for the VLANs.</td>
</tr>
<tr>
<td>VLAN List</td>
<td>The VLAN list to configure the mesh access point (MAP) access port.</td>
</tr>
</tbody>
</table>

Step 2   Check the checkbox of the VLAN group you need to delete from the VLAN group names displayed in the VLAN group list.

You will receive a confirmation message confirming deletion of the selected VLAN group.

Step 3   Click **Ok**.

---

**Viewing VLANs in VLAN Groups (CLI)**

<table>
<thead>
<tr>

<tr>
<td>show vlan group group-name &lt;group_name&gt;</td>
<td>Displays the specified VLAN group details.</td>
</tr>
<tr>
<td>show wireless vlan group &lt;group_name&gt;</td>
<td>Displays the specified wireless VLAN group details.</td>
</tr>
</tbody>
</table>

**Viewing VLAN Groups (GUI)**

To view a VLAN groups using the switch web UI, you must:

Step 1   Choose **Configuration > Controller > System > VLAN > VLAN Group**.

The VLAN Group page appears, listing the following details of the VLAN groups associated with the switch.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN Group Name</td>
<td>Group name for the VLANs.</td>
</tr>
<tr>
<td>VLAN List</td>
<td>The VLAN list to configure the mesh access point (MAP) access port.</td>
</tr>
</tbody>
</table>
Step 2  Click Apply.

Where to Go Next

After configuring VLAN groups, you can configure the following:

- VLANs
- VLAN Trunking Protocol (VTP)
- VLAN trunks
- Voice VLANs

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for VLAN Trunks

The IEEE 802.1Q trunks impose these limitations on the trunking strategy for a network:

• In a network of Cisco switches connected through IEEE 802.1Q trunks, the switches maintain one spanning-tree instance for each VLAN allowed on the trunks. Non-Cisco devices might support one spanning-tree instance for all VLANs.

When you connect a Cisco switch to a non-Cisco device through an IEEE 802.1Q trunk, the Cisco switch combines the spanning-tree instance of the VLAN of the trunk with the spanning-tree instance of the non-Cisco IEEE 802.1Q switch. However, spanning-tree information for each VLAN is maintained by Cisco switches separated by a cloud of non-Cisco IEEE 802.1Q switches. The non-Cisco IEEE 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

• Make sure the native VLAN for an IEEE 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
• Disabling spanning tree on the native VLAN of an IEEE 802.1Q trunk without disabling spanning tree on every VLAN in the network can potentially cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an IEEE 802.1Q trunk or disable spanning tree on every VLAN in the network. Make sure your network is loop-free before disabling spanning tree.

Restrictions for VLAN Trunks

The following are restrictions for VLAN trunks:

• Dynamic Trunking Protocol (DTP) is not supported on tunnel ports.

• The switch does not support Layer 3 trunks; you cannot configure subinterfaces or use the encapsulation keyword on Layer 3 interfaces. The switch does support Layer 2 trunks and Layer 3 VLAN interfaces, which provide equivalent capabilities.

• You cannot have a switch stack containing a mix of Catalyst 3850 and Catalyst 3650 switches.

Information About VLAN Trunks

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet switch interfaces and another networking device such as a router or a switch. Ethernet trunks carry the traffic of multiple VLANs over a single link, and you can extend the VLANs across an entire network.

The following trunking encapsulations are available on all Ethernet interfaces:

• IEEE 802.1Q—Industry-standard trunking encapsulation.

Trunking Modes

Ethernet trunk interfaces support different trunking modes. You can set an interface as trunking or nontrunking or to negotiate trunking with the neighboring interface. To autonegotiate trunking, the interfaces must be in the same VTP domain.

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a Point-to-Point Protocol (PPP). However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations.

Allowed VLANs on a Trunk

By default, a trunk port sends traffic to and receives traffic from all VLANs. All VLAN IDs, 1 to 4094, are allowed on each trunk. However, you can remove VLANs from the allowed list, preventing traffic from those VLANs from passing over the trunk.

To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), DTP, and VTP in VLAN 1.

If a trunk port with VLAN 1 disabled is converted to a nontrunk port, it is added to the access VLAN. If the access VLAN is set to 1, the port will be added to VLAN 1, regardless of the switchport trunk allowed setting. The same is true for any VLAN that has been disabled on the port.

A trunk port can become a member of a VLAN if the VLAN is enabled, if VTP knows of the VLAN, and if the VLAN is in the allowed list for the port. When VTP detects a newly enabled VLAN and the VLAN is in the allowed list for a trunk port, the trunk port automatically becomes a member of the enabled VLAN. When
VTP detects a new VLAN and the VLAN is not in the allowed list for a trunk port, the trunk port does not become a member of the new VLAN.

# Load Sharing on Trunk Ports

Load sharing divides the bandwidth supplied by parallel trunks connecting switches. To avoid loops, STP normally blocks all but one parallel link between switches. Using load sharing, you divide the traffic between the links according to which VLAN the traffic belongs.

You configure load sharing on trunk ports by using STP port priorities or STP path costs. For load sharing using STP port priorities, both load-sharing links must be connected to the same switch. For load sharing using STP path costs, each load-sharing link can be connected to the same switch or to two different switches.

## Network Load Sharing Using STP Priorities

When two ports on the same switch form a loop, the switch uses the STP port priority to decide which port is enabled and which port is in a blocking state. You can set the priorities on a parallel trunk port so that the port carries all the traffic for a given VLAN. The trunk port with the higher priority (lower values) for a VLAN is forwarding traffic for that VLAN. The trunk port with the lower priority (higher values) for the same VLAN remains in a blocking state for that VLAN. One trunk port sends or receives all traffic for the VLAN.

*Figure 102: Load Sharing by Using STP Port Priorities*

This figure shows two trunks connecting supported switches.

- VLANs 8 through 10 are assigned a port priority of 16 on Trunk 1.
- VLANs 3 through 6 retain the default port priority of 128 on Trunk 1.
- VLANs 3 through 6 are assigned a port priority of 16 on Trunk 2.
- VLANs 8 through 10 retain the default port priority of 128 on Trunk 2.

Trunk 1 carries traffic for VLANs 8 through 10, and Trunk 2 carries traffic for VLANs 3 through 6. If the active trunk fails, the trunk with the lower priority takes over and carries the traffic for all of the VLANs. No duplication of traffic occurs over any trunk port.

**Related Topics**
- Configuring Load Sharing Using STP Port Priorities (CLI), on page 2180
Network Load Sharing Using STP Path Cost

You can configure parallel trunks to share VLAN traffic by setting different path costs on a trunk and associating the path costs with different sets of VLANs, blocking different ports for different VLANs. The VLANs keep the traffic separate and maintain redundancy in the event of a lost link.

Figure 102: Load-Sharing Trunks with Traffic Distributed by Path Cost

Trunk ports 1 and 2 are configured as 100BASE-T ports. These VLAN path costs are assigned:

- VLANs 2 through 4 are assigned a path cost of 30 on Trunk port 1.
- VLANs 8 through 10 retain the default 100BASE-T path cost on Trunk port 1 of 19.
- VLANs 8 through 10 are assigned a path cost of 30 on Trunk port 2.
- VLANs 2 through 4 retain the default 100BASE-T path cost on Trunk port 2 of 19.

Related Topics

Configuring Load Sharing Using STP Path Cost (CLI), on page 2184

Feature Interactions

Trunking interacts with other features in these ways:

- A trunk port cannot be a secure port.
- Trunk ports can be grouped into EtherChannel port groups, but all trunks in the group must have the same configuration. When a group is first created, all ports follow the parameters set for the first port to be added to the group. If you change the configuration of one of these parameters, the switch propagates the setting that you entered to all ports in the group:
  - Allowed-VLAN list.
  - STP port priority for each VLAN.
  - STP Port Fast setting.
  - Trunk status:
    - If one port in a port group ceases to be a trunk, all ports cease to be trunks.

- We recommend that you configure no more than 24 trunk ports in Per VLAN Spanning Tree (PVST) mode and no more than 40 trunk ports in Multiple Spanning Tree (MST) mode.
• If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

• A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x on a dynamic port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, the port mode is not changed.

How to Configure VLAN Trunks

To avoid trunking misconfigurations, configure interfaces connected to devices that do not support DTP to not forward DTP frames, that is, to turn off DTP.

• If you do not intend to trunk across those links, use the switchport mode access interface configuration command to disable trunking.

• To enable trunking to a device that does not support DTP, use the switchport mode trunk and switchport nonegotiate interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

Configuring an Ethernet Interface as a Trunk Port

Configuring a Trunk Port (CLI)

Because trunk ports send and receive VTP advertisements, to use VTP you must ensure that at least one trunk port is configured on the switch and that this trunk port is connected to the trunk port of a second switch. Otherwise, the switch cannot receive any VTP advertisements.

Before you begin

By default, an interface is in Layer 2 mode. The default mode for Layer 2 interfaces is switchport mode dynamic auto. If the neighboring interface supports trunking and is configured to allow trunking, the link is a Layer 2 trunk or, if the interface is in Layer 3 mode, it becomes a Layer 2 trunk when you enter the switchport interface configuration command.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode {dynamic {auto | desirable} | trunk}
4. switchport access vlan vlan-id
5. switchport trunk native vlan vlan-id
6. end
7. show interfaces interface-id switchport
8. show interfaces interface-id trunk
9. copy running-config startup-config
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
  - `configure terminal`  
  **Example:**  
  Switch# configure terminal | Enters the global configuration mode. |
| **Step 2**
  - `interface interface-id`  
  **Example:**  
  Switch(config)# interface gigabitethernet1/0/2 | Specifies the port to be configured for trunking, and enters interface configuration mode. |
| **Step 3**
  - `switchport mode {dynamic {auto | desirable} | trunk}`  
  **Example:**  
  Switch(config-if)# switchport mode dynamic desirable | Configures the interface as a Layer 2 trunk (required only if the interface is a Layer 2 access port or tunnel port or to specify the trunking mode). |
  |  | • **dynamic auto**—Sets the interface to a trunk link if the neighboring interface is set to trunk or desirable mode. This is the default. |
  |  | • **dynamic desirable**—Sets the interface to a trunk link if the neighboring interface is set to trunk, desirable, or auto mode. |
  |  | • **trunk**—Sets the interface in permanent trunking mode and negotiate to convert the link to a trunk link even if the neighboring interface is not a trunk interface. |
| **Step 4**
  - `switchport access vlan vlan-id`  
  **Example:**  
  Switch(config-if)# switchport access vlan 200 | (Optional) Specifies the default VLAN, which is used if the interface stops trunking. |
| **Step 5**
  - `switchport trunk native vlan vlan-id`  
  **Example:**  
  Switch(config-if)# switchport trunk native vlan 200 | Specifies the native VLAN for IEEE 802.1Q trunks. |
| **Step 6**
  - `end`  
  **Example:**  
  Switch(config)# end | Returns to privileged EXEC mode. |
Defining the Allowed VLANs on a Trunk (CLI)

VLAN 1 is the default VLAN on all trunk ports in all Cisco switches, and it has previously been a requirement that VLAN 1 always be enabled on every trunk link. You can use the VLAN 1 minimization feature to disable VLAN 1 on any individual VLAN trunk link so that no user traffic (including spanning-tree advertisements) is sent or received on VLAN 1.

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. switchport mode trunk
4. switchport trunk allowed vlan { word | add | all | except | none | remove} vlan-list
5. end
6. show interfaces interface-id switchport
7. copy running-config startup-config

### Configuring the Native VLAN for Untagged Traffic (CLI)

A trunk port configured with IEEE 802.1Q tagging can receive both tagged and untagged traffic. By default, the switch forwards untagged traffic in the native VLAN configured for the port. The native VLAN is VLAN 1 by default.

The native VLAN can be assigned any VLAN ID.

If a packet has a VLAN ID that is the same as the outgoing port native VLAN ID, the packet is sent untagged; otherwise, the switch sends the packet with a tag.

#### SUMMARY STEPS

1. `configure terminal`
2. `interface interface-id`
3. `switchport trunk native vlan vlan-id`
4. `end`
5. `show interfaces interface-id switchport`
6. `copy running-config startup-config`

### Configuring Trunk Ports for Load Sharing

#### Configuring Load Sharing Using STP Port Priorities (CLI)

If your switch is a member of a switch stack, you must use the `spanning-tree [vlan vlan-id] cost cost` interface configuration command instead of the `spanning-tree [vlan vlan-id] port-priority priority` interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.

These steps describe how to configure a network with load sharing using STP port priorities.

**SUMMARY STEPS**

1. `configure terminal`
2. `vtp domain domain-name`
3. `vtp mode server`
4. `end`
5. `show vtp status`
6. `show vlan`
7. `configure terminal`
8. `interface interface-id`
9. `switchport mode trunk`
10. `end`
11. `show interfaces interface-id switchport`
12. Repeat the above steps on Switch A for a second port in the switch or switch stack.
13. Repeat the above steps on Switch B to configure the trunk ports that connect to the trunk ports configured on Switch A.
14. `show vlan`
15. `configure terminal`
16. `interface interface-id`
17. `spanning-tree vlan vlan-range port-priority priority-value`
18. `exit`
19. `interface interface-id`
20. `spanning-tree vlan vlan-range port-priority priority-value`
21. `end`
22. `show running-config`
23. `copy running-config startup-config`

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice VLANs

The following are the prerequisites for voice VLANs:

- Voice VLAN configuration is only supported on switch access ports; voice VLAN configuration is not supported on trunk ports.

\[\text{Note}\]

Trunk ports can carry any number of voice VLANs, similar to regular VLANs. The configuration of voice VLANs is not supported on trunk ports.

- Before you enable voice VLAN, enable QoS on the switch by entering the \text{trust device cisco-phone} interface configuration command. If you use the auto QoS feature, these settings are automatically configured.
• You must enable CDP on the switch port connected to the Cisco IP Phone to send the configuration to the phone. (CDP is globally enabled by default on all switch interfaces.)

Restrictions for Voice VLANs

You cannot configure static secure MAC addresses in the voice VLAN.

Information About Voice VLAN

Voice VLANs

The voice VLAN feature enables access ports to carry IP voice traffic from an IP phone. When the switch is connected to a Cisco 7960 IP Phone, the phone sends voice traffic with Layer 3 IP precedence and Layer 2 class of service (CoS) values, which are both set to 5 by default. Because the sound quality of an IP phone call can deteriorate if the data is unevenly sent, the switch supports quality of service (QoS) based on IEEE 802.1p CoS. QoS uses classification and scheduling to send network traffic from the switch in a predictable manner.

The Cisco 7960 IP Phone is a configurable device, and you can configure it to forward traffic with an IEEE 802.1p priority. You can configure the switch to trust or override the traffic priority assigned by a Cisco IP Phone.

Figure 104: Cisco 7960 IP Phone Connected to a Switch

This network configuration is one way to connect a Cisco 7960 IP Phone.

The Cisco IP Phone contains an integrated three-port 10/100 switch. The ports provide dedicated connections to these devices:

• Port 1 connects to the switch or other voice-over-IP (VoIP) device.
• Port 2 is an internal 10/100 interface that carries the IP phone traffic.
• Port 3 (access port) connects to a PC or other device.
Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the switch to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the switch in any of these ways:

- In the voice VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN, untagged (no Layer 2 CoS priority value)

In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

Related Topics
- Configuring Cisco IP Phone Voice Traffic (CLI), on page 2193
- Monitoring Voice VLAN, on page 2196

Cisco IP Phone Data Traffic

The switch can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone. You can configure Layer 2 access ports on the switch to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

- Monitoring Voice VLAN, on page 2196

Voice VLAN Configuration Guidelines

- Because a Cisco 7960 IP Phone also supports a connection to a PC or other device, a port connecting the switch to a Cisco IP Phone can carry mixed traffic. You can configure a port to decide how the Cisco IP Phone carries voice traffic and data traffic.
• The voice VLAN should be present and active on the switch for the IP phone to correctly communicate on the voice VLAN. Use the `show vlan` privileged EXEC command to see if the VLAN is present (listed in the display). If the VLAN is not listed, create the voice VLAN.

• The Power over Ethernet (PoE) switches are capable of automatically providing power to Cisco pre-standard and IEEE 802.3af-compliant powered devices if they are not being powered by an AC power source.

• The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

• If the Cisco IP Phone and a device attached to the phone are in the same VLAN, they must be in the same IP subnet. These conditions indicate that they are in the same VLAN:
  • They both use IEEE 802.1p or untagged frames.
  • The Cisco IP Phone uses IEEE 802.1p frames, and the device uses untagged frames.
  • The Cisco IP Phone uses untagged frames, and the device uses IEEE 802.1p frames.
  • The Cisco IP Phone uses IEEE 802.1Q frames, and the voice VLAN is the same as the access VLAN.

• The Cisco IP Phone and a device attached to the phone cannot communicate if they are in the same VLAN and subnet but use different frame types because traffic in the same subnet is not routed (routing would eliminate the frame type difference).

• Voice VLAN ports can also be these port types:
  • Dynamic access port.
  • IEEE 802.1x authenticated port.

  **Note**  If you enable IEEE 802.1x on an access port on which a voice VLAN is configured and to which a Cisco IP Phone is connected, the phone loses connectivity to the switch for up to 30 seconds.

• Protected port.

• A source or destination port for a SPAN or RSPAN session.

• Secure port.

  **Note**  When you enable port security on an interface that is also configured with a voice VLAN, you must set the maximum allowed secure addresses on the port to two plus the maximum number of secure addresses allowed on the access VLAN. When the port is connected to a Cisco IP Phone, the phone requires up to two MAC addresses. The phone address is learned on the voice VLAN and might also be learned on the access VLAN. Connecting a PC to the phone requires additional MAC addresses.
How to Configure Voice VLAN

Configuring Cisco IP Phone Voice Traffic (CLI)

You can configure a port connected to the Cisco IP Phone to send CDP packets to the phone to configure the way in which the phone sends voice traffic. The phone can carry voice traffic in IEEE 802.1Q frames for a specified voice VLAN with a Layer 2 CoS value. It can use IEEE 802.1p priority tagging to give voice traffic a higher priority and forward all voice traffic through the native (access) VLAN. The Cisco IP Phone can also send untagged voice traffic or use its own configuration to send voice traffic in the access VLAN. In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5).

SUMMARY STEPS

1. configure terminal
2. interface interface-id
3. trust device cisco-phone
4. switchport voice vlan {vlan-id | dot1p | none | untagged}
5. end
6. Use one of the following:
   • show interfaces interface-id switchport
   • show running-config interface interface-id
7. copy running-config startup-config

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| `Switch(config-if)# switchport voice vlan dot1p` | **vlan-id**—Configures the phone to forward all voice traffic through the specified VLAN. By default, the Cisco IP Phone forwards the voice traffic with an IEEE 802.1Q priority of 5. Valid VLAN IDs are 1 to 4094.  
**dot1p**—Configures the switch to accept voice and data IEEE 802.1p priority frames tagged with VLAN ID 0 (the native VLAN). By default, the switch drops all voice and data traffic tagged with VLAN 0. If configured for 802.1p the Cisco IP Phone forwards the traffic with an IEEE 802.1p priority of 5.  
**none**—Allows the phone to use its own configuration to send untagged voice traffic.  
**untagged**—Configures the phone to send untagged voice traffic. |

### Step 5
**end**

**Example:**

`Switch(config-if)# end`

Returns to privileged EXEC mode.

### Step 6
Use one of the following:

- `show interfaces interface-id switchport`
- `show running-config interface interface-id`

**Example:**

`Switch# show interfaces gigabitethernet1/0/1 switchport`

or

`Switch# show running-config interface gigabitethernet1/0/1`

Verifies your voice VLAN entries or your QoS and voice VLAN entries.

### Step 7
**copy running-config startup-config**

**Example:**

`Switch# copy running-config startup-config`

(Optional) Saves your entries in the configuration file.

---

**Related Topics**

Configuring the Priority of Incoming Data Frames (CLI)

You can connect a PC or other device to a Cisco IP Phone port. To process tagged data traffic (in IEEE 802.1Q or IEEE 802.1p frames), you can configure the switch to send CDP packets to instruct the phone how to send data packets from the device attached to the access port on the Cisco IP Phone. The PC can generate packets with an assigned CoS value. You can configure the phone to not change (trust) or to override (not trust) the priority of frames arriving on the phone port from connected devices.

Follow these steps to set the priority of data traffic received from the non-voice port on the Cisco IP Phone:

**SUMMARY STEPS**

1. `configure terminal`
2. `interface interface-id`
3. `switchport priority extend {cos value | trust}`
4. `end`
5. `show interfaces interface-id switchport`
6. `copy running-config startup-config`

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring DHCP for WLANs

- To be able to use the DHCP option 82, you must configure DHCP on Cisco IOS software. By default, DHCP option 82 is enabled for all clients. You can control the wireless client behavior using the WLAN suboptions.

- It is recommended to enable dhcp snooping on the Switches irrespective of the DHCP address requirement being checked or unchecked on the WLAN. This avoids any client connectivity issues when DHCP snooping is not turned on.

This example shows how to enable DHCP snooping on the Switches:

```
Switch(config)# ip dhcp snooping 136, 139
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping trust
Switch(config)# ip dhcp snooping trust
```
Restrictions for Configuring DHCP for WLANs

• If you override the DHCP server in a WLAN, you must ensure that you configure the underlying Cisco IOS configuration to make sure that the DHCP server is reachable.

• WLAN DHCP override works only if DHCP service is enabled on the switch.

You can configure DHCP service in the following ways:

• Configuring the DHCP pool on the switch.

• Configuring a DHCP relay agent on the SVI. Note: the VLAN of the SVI must be mapped to the WLAN where DHCP override is configured.

Information About the Dynamic Host Configuration Protocol

You can configure WLANs to use the same or different Dynamic Host Configuration Protocol (DHCP) servers or no DHCP server. Two types of DHCP servers are available: internal and external.
Internal DHCP Servers

The switches contain an internal DHCP server. This server is typically used in branch offices that do not already have a DHCP server. The wireless network generally contains a maximum of 10 access points or fewer, with the access points on the same IP subnet as the switch. The internal server provides DHCP addresses to wireless clients, direct-connect access points, and DHCP requests that are relayed from access points. Only lightweight access points are supported. When you want to use the internal DHCP server, you must set the management interface IP address of the switch as the DHCP server IP address.

DHCP option 43 is not supported on the internal server. Therefore, the access point must use an alternative method to locate the management interface IP address of the switch, such as local subnet broadcast, Domain Name System (DNS), or priming.

An internal DHCP server pool only serves the wireless clients of that switch, not clients of other switches. Also, an internal DHCP server can serve only wireless clients, not wired clients.

When clients use the internal DHCP server of the switch, IP addresses are not preserved across reboots. As a result, multiple clients can be assigned with the same IP address. To resolve any IP address conflicts, clients must release their existing IP address and request a new one. Wired guest clients are always on a Layer 2 network connected to a local or foreign switch.

---

Note

DHCPv6 is not supported in the internal DHCP servers.

External DHCP Servers

The operating system is designed to appear as a DHCP Relay to the network and as a DHCP server to clients with industry-standard external DHCP servers that support DHCP Relay, which means that each switch appears as a DHCP Relay agent to the DHCP server and as a DHCP server at the virtual IP address to wireless clients.

Because the switch captures the client IP address that is obtained from a DHCP server, it maintains the same IP address for that client during intra switch, inter switch, and inter-subnet client roaming.

---

Note

External DHCP servers can support DHCPv6.

DHCP Assignments

You can configure DHCP on a per-interface or per-WLAN basis. We recommend that you use the primary DHCP server address that is assigned to a particular interface.

You can assign DHCP servers for individual interfaces. You can configure the management interface, AP-manager interface, and dynamic interface for a primary and secondary DHCP server, and you can configure the service-port interface to enable or disable DHCP servers. You can also define a DHCP server on a WLAN. In this case, the server overrides the DHCP server address on the interface assigned to the WLAN.

Security Considerations

For enhanced security, we recommend that you require all clients to obtain their IP addresses from a DHCP server. To enforce this requirement, you can configure all WLANs with a DHCP Addr. Assignment Required setting, which disallows client static IP addresses. If DHCP Addr. Assignment Required is selected, clients must obtain an IP address via DHCP. Any client with a static IP address is not allowed on the network. The switch monitors DHCP traffic because it acts as a DHCP proxy for the clients.

Note

WLANs that support management over wireless must allow management (device-servicing) clients to obtain an IP address from a DHCP server.

If slightly less security is tolerable, you can create WLANs with DHCP Addr. Assignment Required disabled. Clients then have the option of using a static IP address or obtaining an IP address from a designated DHCP server.

Note

DHCP Addr. Assignment Required is not supported for wired guest LANs.

You can create separate WLANs with DHCP Addr. Assignment Required configured as disabled. This is applicable only if DHCP proxy is enabled for the switch. You must not define the primary/secondary configuration DHCP server you should disable the DHCP proxy. These WLANs drop all DHCP requests and force clients to use a static IP address. These WLANs do not support management over wireless connections.

Information About DHCP Option 82

DHCP option 82 provides additional security when DHCP is used to allocate network addresses. It enables the switch to act as a DHCP relay agent to prevent DHCP client requests from untrusted sources. You can configure the switch to add option 82 information to DHCP requests from clients before forwarding the requests to the DHCP server.
The access point forwards all DHCP requests from a client to the switch. The switch adds the DHCP option 82 payload and forwards the request to the DHCP server. The payload can contain the MAC address or the MAC address and SSID of the access point, depending on how you configure this option.

Any DHCP packets that already include a relay agent option are dropped at the switch.

For DHCP option 82 to operate correctly, DHCP proxy must be enabled.

#### Information About DHCP Scopes

Switches have built-in DHCP relay agents. However, when you desire network segments that do not have a separate DHCP server, the switches can have built-in DHCP scopes that assign IP addresses and subnet masks to wireless clients. Typically, one switch can have one or more DHCP scopes that each provide a range of IP addresses.

DHCP scopes are needed for internal DHCP to work. Once DHCP is defined on the switch, you can then point the primary DHCP server IP address on the management, AP-manager, and dynamic interfaces to the switch’s management interface.

How to Configure DHCP for WLANs

Configuring DHCP for WLANs (CLI)

Use this procedure to configure the following DHCP parameters on a WLAN:

- DHCP Option 82 Payload
- DHCP Required
- DHCP Override

Before you begin

- You must have admin privileges for configuring the WLAN.
- To configure the DHCP override, you must have the IP address of the DHCP server.

SUMMARY STEPS

1. configure terminal
2. shutdown
3. wlan profile-name
4. ip dhcp opt82 {ascii | format {add-ssid | ap-ethmac} | rid}
5. ip dhcp required
6. ip dhcp server ip-address
7. no shutdown
8. end
9. show wlan wlan-name

Configuring WLAN Security

• Finding Feature Information, on page 2211
• Prerequisites for Layer 2 Security, on page 2211
• Information About AAA Override, on page 2212
• How to Configure WLAN Security, on page 2212
• Additional References, on page 2220
• Feature Information about WLAN Layer 2 Security, on page 2221

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Layer 2 Security

WLANs with the same SSID must have unique Layer 2 security policies so that clients can make a WLAN selection based on information advertised in beacon and probe responses. The available Layer 2 security policies are as follows:

• None (open WLAN)

• Static WEP or 802.1X

   Because static WEP and 802.1X are both advertised by the same bit in beacon and probe responses, they cannot be differentiated by clients. Therefore, they cannot both be used by multiple WLANs with the same SSID.

• WPA/WPA2
Although WPA and WPA2 cannot be used by multiple WLANs with the same SSID, you can configure two WLANs with the same SSID with WPA/TKIP with PSK and Wi-Fi Protected Access (WPA) /Temporal Key Integrity Protocol (TKIP) with 802.1X, or with WPA/TKIP with 802.1X or WPA/AES with 802.1X.

### Configuring Layer 2 Parameters (GUI)

#### Before you begin

- You must have administrator privileges.

#### Step 1

Click **Configuration > WLAN >**. The **WLANs** page appears.

#### Step 2

Click the WLANs profile of the WLAN you want to configure. The **WLANs > Edit >** page appears.

#### Step 3

Click the **Security > Layer 2 >** tab.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| Layer2 Security | Layer2 security for the selected WLAN. Values are the following:  
  - None—No Layer 2 security selected.  
  - WPA+WPA2—Wi-Fi Protected Access.  
  - 802.1X—WEP 802.1X data encryption type. For information on these settings, see the Layer 2 802.1X Parameters topic.  
  - Static WEP—Static WEP encryption parameters.  
  - Static WEP + 802.1x—Both Static WEP and 802.1X parameters. |
| MAC Filtering   | MAC address filtering. You can locally configure clients by their MAC addresses in the **MAC Filters > New page**. Otherwise, configure the clients on a RADIUS server.  
  **Note** MAC Filtering is also known as MAC Authentication By Pass (MAB). |
| Fast Transition | Check box to enable or disable a fast transition between access points. |
| Over the DS     | Check box to enable or disable a fast transition over a distributed system. |
| Reassociation Timeout | Time in seconds after which a fast transition reassociation times out. |
To configure the **WPA + WPA2** parameters, provide the following details:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WPA Policy</td>
<td>Check box to enable or disable WPA policy.</td>
</tr>
<tr>
<td>WPA Encryption</td>
<td>WPA2 encryption type: TKIP or AES. Available only if the WPA policy is enabled.</td>
</tr>
<tr>

</tr>
<tr>
<td>Authentication Key Management</td>
<td>The rekeying mechanism parameter. Values are the following:</td>
</tr>
<tr>
<td></td>
<td>• 802.1X</td>
</tr>
<tr>
<td></td>
<td>• CCKM</td>
</tr>
<tr>
<td></td>
<td>• PSK</td>
</tr>
<tr>
<td></td>
<td>• 802.1x + CCKM</td>
</tr>
</tbody>
</table>

| PSK Format                 | Enabled when you select the PSK value for Authentication Key Management. Choose ASCII or the HEX format and enter the preshared key. |

To configure **802.1x** parameters, provide the following details:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11 data encryption</td>
<td>WEP 802.11 data encryption type.</td>
</tr>
<tr>
<td>Type</td>
<td>Security type.</td>
</tr>
<tr>
<td>Key size</td>
<td>Key size. Values are the following:</td>
</tr>
<tr>
<td></td>
<td>• None</td>
</tr>
<tr>
<td></td>
<td>• 40 bits</td>
</tr>
<tr>
<td></td>
<td>• 104 bits</td>
</tr>
</tbody>
</table>

The third-party AP WLAN (17) can only be configured with 802.1X encryption. Drop-down configurable 802.1X parameters are not available for this WLAN.

To specify **Static WEP**, configure the following parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11 Data Encryption</td>
<td>Static WEP encryption type.</td>
</tr>
<tr>
<td>Current Key</td>

CHAPTER 116

Configuring Access Point Groups

• Finding Feature Information, on page 2223
• Prerequisites for Configuring AP Groups, on page 2223
• Restrictions for Configuring Access Point Groups, on page 2224
• Information About Access Point Groups, on page 2224
• How to Configure Access Point Groups, on page 2225
• Additional References, on page 2228
• Feature History and Information for Access Point Groups, on page 2229

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information Table at the end of this document.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Configuring AP Groups

The following are the prerequisites for creating access point groups on a switch:

• The required access control list (ACL) must be defined on the router that serves the VLAN or subnet.

• Multicast traffic is supported with access point group VLANs. However, if the client roams from one access point to another, the client might stop receiving multicast traffic, unless IGMP snooping is enabled.

Related Topics

Restrictions for Configuring Access Point Groups, on page 2224
Restrictions for Configuring Access Point Groups

- Suppose that the interface mapping for a WLAN in the AP group table is the same as the WLAN interface. If the WLAN interface is changed, the interface mapping for the WLAN in the AP group table also changes to the new WLAN interface.

  Suppose that the interface mapping for a WLAN in the AP group table is different from the one defined for the WLAN. If the WLAN interface is changed, then the interface mapping for the WLAN in the AP group table does not change to the new WLAN interface.

- If you clear the configuration on the switch, all of the access point groups disappear except for the default access point group “default-group,” which is created automatically.

- The default access point group can have up to 16 WLANs associated with it. The WLAN IDs for the default access point group must be less than or equal to 16. If a WLAN with an ID greater than 16 is created in the default access point group, the WLAN SSID will not be broadcasted. All WLAN IDs in the default access point group must have an ID that is less than or equal to 16. WLANs with IDs greater than 16 can be assigned to custom access point groups.

Information About Access Point Groups

After you create up to 512 WLANs on the switch, you can selectively publish them (using access point groups) to different access points to better manage your wireless network. In a typical deployment, all users on a WLAN are mapped to a single interface on the switch. Therefore, all users that are associated with that WLAN are on the same subnet or VLAN. However, you can choose to distribute the load among several interfaces or to a group of users based on specific criteria such as individual departments (such as Marketing) by creating access point groups. Additionally, these access point groups can be configured in separate VLANs to simplify network administration.

Figure 106: Access Point Groups

In the figure, three configured dynamic interfaces are mapped to three different VLANs (VLAN 61, VLAN 62, and VLAN 63). Three access point groups are defined, and each is a member of a different VLAN, but all are members of the same SSID. A client within the wireless SSID is assigned an IP address from the VLAN subnet on which its access point is a member. For example, any user that associates with an access point that is a member of access point group VLAN 61 is assigned an IP address from that subnet.

In the figure, the switch internally treats roaming between access points as a Layer 3 roaming event. In this way, WLAN clients maintain their original IP addresses.

After all access points have joined the switch, you can create access point groups and assign up to 16 WLANs to each group. Each access point advertises only the enabled WLANs that belong to its access point group. The access point does not advertise disabled WLANs in its access point group or WLANs that belong to another group.
How to Configure Access Point Groups

Creating Access Point Groups

Before you begin

You must have administrator privileges to perform this operation.
SUMMARY STEPS

1. configure terminal
2. ap group ap-group-name
3. wlan wlan-name
4. (Optional) vlan vlan-name
5. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Creates an access point group.</td>
</tr>
<tr>
<td>ap group ap-group-name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# ap group my-ap-group</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Associates the AP group to a WLAN.</td>
</tr>
<tr>
<td>wlan wlan-name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-apgroup)# wlan wlan-name</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>Assigns the access point group to a VLAN.</td>
</tr>
<tr>
<td>(Optional) vlan vlan-name</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config-apgroup)# vlan test-vlan</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Switch(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Example

This example shows how to create an AP group:

```
Switch# configure terminal
Switch(config-apgroup)# ap group test-ap-group-16
Switch(config-wlan-apgroup)# wlan test-ap-group-16
Switch(config-wlan-apgroup)# vlan VLAN1300
```
