Catalyst 3750 Switch Command Reference

INDEX

A

aaa accounting dot1x command 2-1
aaa authentication dot1x command 2-3
aaa authorization network command 2-5, 2-26, 2-32, 2-34, 2-36, 2-38, 2-40, 2-155, 2-331, 2-502, B-7, B-35
AAA methods 2-3
access control entries
  See ACEs
access control lists
  See ACLs
access groups
  IP 2-212
  MAC, displaying 2-623
access list, IPv6 2-286
access map configuration mode 2-347
access mode 2-807
access ports 2-807
ACEs 2-141, 2-426
ACLs
  deny 2-139
  displaying 2-484
  for non-IP protocols 2-335
  IP 2-212
  matching 2-347
  on Layer 2 interfaces 2-212
  permit 2-424
action command 2-6
address aliasing 2-395
aggregate-port learner 2-410
allowed VLANs 2-827
archive copy-sw command 2-10
archive download-sw command 2-13
archive tar command 2-17
archive upload-sw command 2-20
arp access-list command 2-22
authentication command bounce-port ignore 2-24
authentication command disable-port ignore 2-25
authentication control-direction command 2-26
authentication event command 2-28
authentication failed VLAN
  See dot1x auth-fail vlan
authentication fallback command 2-32
authentication host-mode command 2-34
authentication mac-move permit command 2-36
authentication open command 2-38
authentication order command 2-40
authentication periodic command 2-42
authentication port-control command 2-44
authentication priority command 2-46
authentication timer command 2-48
authentication violation command 2-50
auth-fail max-attempts
  See dot1x auth-fail max-attempts
auth-fail vlan
  See dot1x auth-fail vlan
auth open command 2-38
auth order command 2-40
authorization state of controlled port 2-175
auth timer command 2-48
autonegotiation of duplex mode 2-190
auto qos classify command 2-52
auto qos trust command 2-55
auto qos video command 2-58
auto qos voip command 2-61
B

BackboneFast, for STP 2-728
backup interfaces
  configuring 2-800
  displaying 2-557
boot (boot loader) command A-2
boot auto-copy-sw command 2-67
boot auto-download-sw command 2-68
boot config-file command 2-71
boot enable-break command 2-72
boot helper command 2-73
boot helper-config file command 2-74
booting
  Cisco IOS image 2-77
  displaying environment variables 2-497
  interrupting 2-68, 2-72
  manually 2-75
boot loader
  accessing A-1
  booting

    helper image 2-73
directories
  creating A-15
  displaying a list of A-7
  removing A-19
  displaying
    available commands A-12
    memory heap utilization A-13
    version A-26
environment variables
  described A-20
  displaying settings A-20
  location of A-21
  setting A-20
  unseting A-24
files
  copying A-5
deleting A-6
  displaying a list of A-7
  displaying the contents of A-4, A-16, A-23
  renaming A-17
file system
  formatting A-10
  initializing flash A-9
  running a consistency check A-11
  prompt A-1
  resetting the system A-18
boot manual command 2-75
boot private-config-file command 2-76
boot system command 2-77
BPDU filtering, for spanning tree 2-729, 2-763
BPDU guard, for spanning tree 2-731, 2-763
broadcast storm control 2-784

candidate switches
  See clusters
cat (boot loader) command A-4
Catalyst 3750G Integrated Wireless LAN Controller Switch 2-475
CDP, enabling protocol tunneling for 2-310
channel-group command 2-80
channel-protocol command 2-84
Cisco IP camera
  auto-QoS configuration 2-58
Cisco SoftPhone
  auto-QoS configuration 2-61
  trusting packets sent from 2-386
Cisco Telepresence System
  auto-QoS configuration 2-58
CISP
  See Client Information Signalling Protocol
cisp
  debug platform cisp command B-35
cisp enable command 2-85
class command 2-86
class-map command 2-89
class maps
   creating 2-89
   defining the match criteria 2-349
   displaying 2-503
class of service
   See CoS

CPU ASIC statistics, displaying 2-510
crashinfo files 2-201
critical VLAN 2-30
debug authentication B-2
debug auto qos command B-4
debug backup command B-6
debug cisp command B-7
debug cluster command B-8
debug dot1x command B-10
debug dtp command B-12
debug eap command B-13
debug etherchannel command B-14
debug ilpower command B-15
debug interface command B-16
debug ip dhcp snooping command B-17
depug ip igmp filter command B-19
depug ip igmp max-groups command B-20
depug ip igmp snooping command B-21
depug ip verify source packet command B-18
depug lacp command B-22
depug lldp packets command B-23
depug mac-notification command B-25
depug matm command B-26
depug matm move update command B-27
depug monitor command B-28
depug mvrdbg command B-29
depug nmsp command B-30
depug nvram command B-31
depug pagp command B-32
depug platform acl command B-33
depug platform backup interface command B-34
depug platform cisp command B-35
depug platform cli-redirection main command B-36
depug platform configuration command B-37, B-45
depug platform cpu-queues command B-38
depug platform device-manager command B-40
depug platform dot1x command B-41
depug platform etherchannel command B-42
depug platform fallback-bridging command B-43
depug platform forw-tcam command B-44
debug platform ip arp inspection command B-46
depug platform ip command B-56
depug platform ip dhcp command B-47
depug platform ip igmp snooping command B-48
depug platform ip multicast command B-50
depug platform ip source-guard command B-52
depug platform ip unicast command B-53
depug platform ip wccp command B-55
depug platform led command B-57
depug platform matm command B-58
depug platform messaging application command B-59
depug platform phy command B-60
depug platform pm command B-62
depug platform port-asic command B-64
depug platform port-security command B-65
depug platform qos-acl-tcam command B-66
depug platform remote-commands command B-67
depug platform resource-manager command B-68
depug platform snmp command B-69
depug platform span command B-70
depug platform stack-manager command B-71
depug platform supervisor-asic command B-72
depug platform sw-bridge command B-73
depug platform tcam command B-74
depug platform udlld command B-77
depug platform vlan command B-78
depug platform wireless-controller B-103
depug pm command B-79
depug port-security command B-81
depug qos-manager command B-82
depug spanning-tree backbonefast command B-85
depug spanning-tree bpdu command B-86
depug spanning-tree bpdu-opt command B-87
depug spanning-tree command B-83
depug spanning-tree mstp command B-88
depug spanning-tree switch command B-90
depug spanning-tree uplinkfast command B-92
depug sw-vlan command B-93
depug sw-vlan ifs command B-95
debug sw-vlan notification command  B-96
debug sw-vlan vtp command  B-98
debug udld command  B-100
define interface-range command  2-127
delete (boot loader) command  A-6
delete command 2-129
deny (ARP access-list configuration) command  2-132
deny (IPv6) command  2-134
deny command 2-139
detect mechanism, causes  2-192
DHCP snooping
   accepting untrusted packets from edge switch  2-245
   enabling
      on a VLAN  2-251
      option 82  2-243, 2-245
      trust on an interface  2-249
   error recovery timer  2-198
   rate limiting  2-248
DHCP snooping binding database
   binding file, configuring  2-241
   bindings
      adding  2-239
      deleting  2-239
   clearing database agent statistics  2-96
   database agent, configuring  2-241
   renewing  2-462
dir (boot loader) command  A-7
directories, deleting  2-129
domain name, VTP  2-865
dot1x auth-fail max-attempts  2-150
dot1x auth-fail vlan  2-151
dot1x command  2-148
dot1x control-direction command  2-153
dot1x credentials (global configuration) command  2-155
dot1x critical global configuration command  2-156
dot1x critical interface configuration command  2-158
dot1x default command  2-160
dot1x fallback command  2-161
dot1x guest-vlan command  2-162
dot1x host-mode command  2-165
dot1x initialize command  2-167
dot1x mac-auth-bypass command  2-168
dot1x max-reauth-req command  2-170
dot1x max-rq command  2-172
dot1x multiple-hosts command  2-173
dot1x pae command  2-174
dot1x port-control command  2-175
dot1x re-authenticate command  2-177
dot1x re-authentication command  2-178
dot1x reauthentication command  2-179
dot1x supplicant controlled transient command  2-180
dot1x supplicant force-multicast command  2-182
dot1x test eapol-capable command  2-183
dot1x test timeout command  2-184
dot1x timeout command  2-185
dot1x violation-mode command  2-188
   dropping packets, with ACL matches  2-6
   drop threshold, Layer 2 protocol tunneling  2-310
   DSCP-to-CoS map  2-360
   DSCP-to-DSCP-mutation map  2-360
DTP  2-808
   DTP flap
      error detection for  2-192
      error recovery timer  2-198
DTP negotiation  2-812
dual-purpose uplink ports
   displaying configurable options  2-560
duplex command  2-189
dynamic-access ports
   configuring  2-796
   restrictions  2-797
dynamic ARP inspection
   ARP ACLs
      apply to a VLAN  2-220
      define  2-22
      deny packets  2-132
display  2-488
permit packets 2-416

network-policy (global configuration) command 2-401
### Network Policies

- **network-policy command**: 2-400
- **network-policy profile (network-policy configuration) command**: 2-402
- **nmsp attachment suppress command**: 2-405
- **nmsp command**: 2-404
- **no authentication logging verbose**: 2-406
- **no dot1x logging verbose**: 2-407
- **no mab logging verbose**: 2-408
- **nongoniate, speed**: 2-773
- **nongonating DTP messaging**: 2-812

### Non-IP Protocols

- **denying**: 2-139
- **forwarding**: 2-424

### Non-IP Traffic Access Lists

- **non-IP traffic access lists**: 2-335

### Non-IP Traffic Forwarding

- **denying**: 2-139
- **permitting**: 2-424

### Normal-Range VLANs

- **non-stop forwarding**: 2-409

### No VLAN Command

- **no vlan command**: 2-850

### NSF Command

- **nsf command**: 2-409

### Online Diagnostics

- **displaying**: 2-526
  - **configured boot-up coverage level**: 2-526
  - **current scheduled tasks**: 2-526
  - **event logs**: 2-526
  - **supported test suites**: 2-526
  - **test ID**: 2-526
  - **test results**: 2-526
  - **test statistics**: 2-526

### Global Configuration Mode

- **clearing health monitoring diagnostic test schedule**: 2-95
- **clearing test-based testing schedule**: 2-144
- **setting health monitoring diagnostic testing**: 2-95
- **setting test-based testing**: 2-144

### Setting Up Health Monitoring Diagnostic Test Schedule

- **setting up health monitoring diagnostic test schedule**: 2-95
- **setting up test-based testing**: 2-144

### Health Monitoring Diagnostic Tests

- **configuring health monitoring diagnostic tests**: 2-142
- **scheduled switchover**: 2-146
  - **disabling**: 2-144
  - **enabling**: 2-144
- **scheduling**: 2-144
  - **enabling**: 2-144
  - **removing**: 2-144
- **testing, starting**: 2-146

### Per-VLAN Spanning-Tree Plus

- **configuring the power budget**: 2-438
- **configuring the power management mode**: 2-435
- **displaying controller register values**: 2-520
- **displaying power management information**: 2-670
- **logging of status**: 2-326

### PIM-DVMRP

- **configuring the power management mode**: 2-272
- **as multicast router learning method**: 2-272

### PAgP

- **See EtherChannel**
  - **pagp learn-method command**: 2-410
  - **pagp port-priority command**: 2-412
  - **password, VTP**: 2-866
  - **password-recovery mechanism, enabling and disabling**: 2-470
  - **permit (ARP access-list configuration) command**: 2-416
  - **permit (IPv6) command**: 2-418
  - **permit (MAC access-list configuration) command**: 2-424
  - **police aggregate command**: 2-429
  - **police command**: 2-427
  - **policed-DSCP map**: 2-360
  - **policy-map command**: 2-431

Preface

Audience

This guide is for the networking professional using the Cisco IOS command-line interface (CLI) to manage the Catalyst 3750 switch, hereafter referred to as the switch. Before using this guide, you should have experience working with the Cisco IOS commands and the switch software features. Before using this guide, you should have experience working with the concepts and terminology of Ethernet and local area networking.

Purpose

The Catalyst 3750 switch is supported by either the IP base image or the IP services image. The IP base image provides Layer 2+ features including access control lists (ACLs), quality of service (QoS), static routing, and the Routing Information Protocol (RIP). The IP services image provides a richer set of enterprise-class features. It includes Layer 2+ features and full Layer 3 routing (IP unicast routing, IP multicast routing, and fallback bridging). To distinguish it from the Layer 2+ static routing and RIP, the IP services image includes protocols such as the Enhanced Interior Gateway Routing Protocol (EIGRP) and Open Shortest Path First (OSPF) Protocol.

This guide provides the information that you need about the Layer 2 and Layer 3 commands that have been created or changed for use with the Catalyst 3750 switches. For information about the standard Cisco IOS Release 12.4 commands, see the Cisco IOS documentation set available on Cisco.com.

This guide does not provide procedures for configuring your switch. For detailed configuration procedures, see the software configuration guide for this release.

This guide does not describe system messages you might encounter. For more information, see the system message guide for this release.

For documentation updates, see the release notes for this release.
Conventions

This publication uses these conventions to convey instructions and information:

Command descriptions use these conventions:

- Commands and keywords are in **boldface** text.
- Arguments for which you supply values are in *italic*.
- Square brackets ([ ]) means optional elements.
- Braces ({ }) group required choices, and vertical bars ( | ) separate the alternative elements.
- Braces and vertical bars within square brackets ([{ }]) mean a required choice within an optional element.

Interactive examples use these conventions:

- Terminal sessions and system displays are in *screen* font.
- Information you enter is in **boldface screen** font.
- Nonprinting characters, such as passwords or tabs, are in angle brackets (< >).

Notes, cautions, and warnings use these conventions and symbols:

<table>
<thead>
<tr>
<th>Note</th>
<th>Means reader take note. Notes contain helpful suggestions or references to materials not contained in this manual.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caution</td>
<td>Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.</td>
</tr>
</tbody>
</table>

Filtering show Command Output

The *show* commands have optional output modifiers to filter the command output.

- **begin**—Display begins with the line that matches the *expression*.
- **exclude**—Display excludes with the line that matches the *expression*.
- **include**—Display includes with the line that matches the *expression*.
- *expression*—Expression in the output to use as a reference point.

Expressions are case sensitive. If you enter **exclude output**, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

Using the Command-Line Interface

The Catalyst 3750 switch is supported by Cisco IOS software. This chapter describes how to use the switch command-line interface (CLI) to configure software features.

- For a complete description of the commands that support these features, see Chapter 2, “Catalyst 3750 Switch Cisco IOS Commands.”
- For information on the bootloader commands, see Appendix A, “Catalyst 3750 Switch Bootloader Commands.”
- For information on the debug commands, see Appendix B, “Catalyst 3750 Switch Debug Commands.”
- For information on the show platform commands, see Appendix C, “Catalyst 3750 Switch Show Platform Commands.”
- For more information on Cisco IOS Release 12.2, see the Cisco IOS Release 12.2 Command Summary.
- For task-oriented configuration steps, see the software configuration guide for this release.

In this document, IP refers to IP version 4 (IPv4) unless there is a specific reference to IP version 6 (IPv6).

Accessing the Switch

You manage the switch stack and the stack member interfaces through the stack master. You cannot manage stack members on an individual switch basis. You can connect to the stack master through the console port of one or more stack members. Be careful with using multiple CLI sessions to the stack master. Commands you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

Note

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation. For more information about interface notations, see the “Configuring Interfaces” chapter in the software configuration guide for this release.
To debug a specific stack member, you can access it from the stack master by using the `session stack-member-number` privileged EXEC command. The stack member number is appended to the system prompt. For example, `Switch-2#` is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the stack master is `Switch`. Only the `show` and `debug` commands are available in a CLI session to a specific stack member.

### CLI Command Modes

This section describes the CLI command mode structure. Command modes support specific Cisco IOS commands. For example, the `interface interface-id` command only works when entered in global configuration mode.

These are the main command modes for the switch:
- User EXEC
- Privileged EXEC
- Global configuration
- Interface configuration
- VLAN configuration
- Line configuration

Table 1-1 lists the main command modes, how to access each mode, the prompt you see in that mode, and how to exit that mode. The prompts listed use the default name `Switch`.

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit or Access Next Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>This is the first level of access. (For the switch) Change terminal settings, perform basic tasks, and list system information.</td>
<td><code>Switch&gt;</code></td>
<td>Enter the <code>logout</code> command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To enter privileged EXEC mode, enter the <code>enable</code> command.</td>
</tr>
<tr>
<td>Privileged EXEC</td>
<td>From user EXEC mode, enter the <code>enable</code> command.</td>
<td><code>Switch#</code></td>
<td>To exit to user EXEC mode, enter the <code>disable</code> command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To enter global configuration mode, enter the <code>configure</code> command.</td>
</tr>
<tr>
<td>Global configuration</td>
<td>From privileged EXEC mode, enter the <code>configure</code> command.</td>
<td><code>Switch(config)#</code></td>
<td>To exit to privileged EXEC mode, enter the <code>exit</code> or <code>end</code> command, or press Ctrl-Z.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To enter interface configuration mode, enter the <code>interface</code> configuration command.</td>
</tr>
<tr>
<td>Interface configuration</td>
<td>From global configuration mode, specify an interface by entering the <code>interface</code> command followed by an interface identification.</td>
<td><code>Switch(config-if)#</code></td>
<td>To exit to privileged EXEC mode, enter the <code>end</code> command, or press Ctrl-Z.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To exit to global configuration mode, enter the <code>exit</code> command.</td>
</tr>
</tbody>
</table>
User EXEC Mode

After you access the device, you are automatically in user EXEC command mode. The EXEC commands available at the user level are a subset of those available at the privileged level. In general, use the user EXEC commands to temporarily change terminal settings, perform basic tests, and list system information.

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

```
Switch> ?
```

Privileged EXEC Mode

Because many of the privileged commands configure operating parameters, privileged access should be password-protected to prevent unauthorized use. The privileged command set includes those commands contained in user EXEC mode, as well as the `configure` privileged EXEC command through which you access the remaining command modes.

If your system administrator has set a password, you are prompted to enter it before being granted access to privileged EXEC mode. The password does not appear on the screen and is case sensitive.

The privileged EXEC mode prompt is the device name followed by the pound sign (#).

```
Switch#
```

Enter the `enable` command to access privileged EXEC mode:

```
Switch> enable
Switch#
```

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

```
Switch# ?
```

To return to user EXEC mode, enter the `disable` privileged EXEC command.
Global Configuration Mode

Global configuration commands apply to features that affect the device as a whole. Use the `configure` privileged EXEC command to enter global configuration mode. The default is to enter commands from the management console.

When you enter the `configure` command, a message prompts you for the source of the configuration commands:

```
Switch# configure
Configuring from terminal, memory, or network [terminal]?
```

You can specify either the terminal or NVRAM as the source of configuration commands.

This example shows you how to access global configuration mode:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (`?`) at the prompt.

```
Switch(config)# ?
```

To exit global configuration command mode and to return to privileged EXEC mode, enter the `end` or `exit` command, or press Ctrl-Z.

Interface Configuration Mode

Interface configuration commands modify the operation of the interface. Interface configuration commands always follow a global configuration command, which defines the interface type.

Use the `interface interface-id` command to access interface configuration mode. The new prompt means interface configuration mode.

```
Switch(config-if)#
```

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (`?`) at the prompt.

```
Switch(config-if)# ?
```

To exit interface configuration mode and to return to global configuration mode, enter the `exit` command. To exit interface configuration mode and to return to privileged EXEC mode, enter the `end` command, or press Ctrl-Z.

VLAN Configuration Mode

Use this mode to configure normal-range VLANs (VLAN IDs 1 to 1005) or, when VTP mode is transparent, to configure extended-range VLANs (VLAN IDs 1006 to 4094). When VTP mode is transparent, the VLAN and VTP configuration is saved in the running configuration file, and you can save it to the switch startup configuration file by using the `copy running-config startup-config` privileged EXEC command. The configurations of VLAN IDs 1 to 1005 are saved in the VLAN database if VTP is in transparent or server mode. The extended-range VLAN configurations are not saved in the VLAN database.
Enter the `vlan vlan-id` global configuration command to access config-vlan mode:

```plaintext
Switch(config)# vlan 2000
Switch(config-vlan)#
```

The supported keywords can vary but are similar to the commands available in VLAN configuration mode. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

```plaintext
Switch(config-vlan)# ?
```

For extended-range VLANs, all characteristics except the MTU size must remain at the default setting. To return to global configuration mode, enter `exit`; to return to privileged EXEC mode, enter `end`. All the commands except `shutdown` take effect when you exit config-vlan mode.

**Line Configuration Mode**

Line configuration commands modify the operation of a terminal line. Line configuration commands always follow a line command, which defines a line number. Use these commands to change terminal parameter settings line-by-line or for a range of lines.

Use the `line vty line_number [ending_line_number]` command to enter line configuration mode. The new prompt means line configuration mode. The following example shows how to enter line configuration mode for virtual terminal line 7:

```plaintext
Switch(config)# line vty 0 7
```

The supported commands can vary depending on the version of software in use. To display a comprehensive list of commands, enter a question mark (?) at the prompt.

```plaintext
Switch(config-line)# ?
```

To exit line configuration mode and to return to global configuration mode, use the `exit` command. To exit line configuration mode and to return to privileged EXEC mode, enter the `end` command, or press `Ctrl-Z`. 
aaa accounting dot1x

Use the `aaa accounting dot1x` global configuration command to enable authentication, authorization, and accounting (AAA) accounting and to create method lists defining specific accounting methods on a per-line or per-interface basis for IEEE 802.1x sessions. Use the `no` form of this command to disable IEEE 802.1x accounting.

```
aaa accounting dot1x {name | default} start-stop {broadcast group {name | radius | tacacs+} [group {name | radius | tacacs+} ...] | group {name | radius | tacacs+} [group {name | radius | tacacs+} ...]}

no aaa accounting dot1x {name | default}
```

</tr>
</tbody>
</table>

Usage Guidelines
This command requires access to a RADIUS server. We recommend that you enter the `dot1x reauthentication` interface configuration command before configuring IEEE 802.1x RADIUS accounting on an interface.

Examples
This example shows how to configure IEEE 802.1x accounting:

Switch(config)# aaa new-model
Switch(config)# aaa accounting dot1x default start-stop group radius

Note
The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa authentication</td>
<td>Specifies one or more AAA methods for use on interfaces running</td>
</tr>
<tr>
<td>dot1x</td>
<td>IEEE 802.1x.</td>
</tr>
<tr>
<td>aaa new-model</td>
<td>Enables the AAA access control model.</td>
</tr>
<tr>
<td>dot1x reauthentication</td>
<td>Enables or disables periodic reauthentication.</td>
</tr>
<tr>
<td>dot1x timeout reauth-period</td>
<td>Sets the number of seconds between re-authentication attempts.</td>
</tr>
</tbody>
</table>
aaa authentication dot1x

Use the `aaa authentication dot1x` global configuration command to specify the authentication, authorization, and accounting (AAA) method to use on ports complying with the IEEE 802.1x authentication. Use the `no` form of this command to disable authentication.

```
aaa authentication dot1x {default} method1
no aaa authentication dot1x {default}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td>Use the listed authentication method that follows this argument as the default method when a user logs in.</td>
</tr>
<tr>
<td><code>method1</code></td>
<td>Enter the <code>group radius</code> keywords to use the list of all RADIUS servers for authentication.</td>
</tr>
</tbody>
</table>

### Note

Though other keywords are visible in the command-line help strings, only the `default` and `group radius` keywords are supported.

### Defaults

No authentication is performed.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `method` argument identifies the method that the authentication algorithm tries in the given sequence to validate the password provided by the client. The only method that is truly IEEE 802.1x-compliant is the `group radius` method, in which the client data is validated against a RADIUS authentication server.

If you specify `group radius`, you must configure the RADIUS server by entering the `radius-server host` global configuration command.

Use the `show running-config` privileged EXEC command to display the configured lists of authentication methods.

### Examples

This example shows how to enable AAA and how to create an IEEE 802.1x-compliant authentication list. This authentication first tries to contact a RADIUS server. If this action returns an error, the user is not allowed access to the network.

```
Switch(config)# aaa new-model
Switch(config)# aaa authentication dot1x default group radius
```

You can verify your settings by entering the `show running-config` privileged EXEC command.
### aaa authentication dot1x

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aaa new-model</td>
<td>Enables the AAA access control model.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Displays the current operating configuration.</td>
</tr>
</tbody>
</table>
aaa authorization network

Use the `aaa authorization network` global configuration command to configure the switch to use user-RADIUS authorization for all network-related service requests, such as IEEE 802.1x aaa-user access control lists (ACLs) or VLAN assignment. Use the `no` form of this command to disable RADIUS user authorization.

```
aaa authorization network default group radius
no aaa authorization network default
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default group radius</code></td>
<td>Use the list of all RADIUS hosts in the server group as the default authorization list.</td>
</tr>
</tbody>
</table>

### Defaults

Authorization is disabled.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `aaa authorization network default group radius` global configuration command to allow the switch to download IEEE 802.1x authorization parameters from the RADIUS servers in the default authorization list. The authorization parameters are used by features such as per-user ACLs or VLAN assignment to get parameters from the RADIUS servers.

Use the `show running-config` privileged EXEC command to display the configured lists of authorization methods.

### Examples

This example shows how to configure the switch for user RADIUS authorization for all network-related service requests:

```
Switch(config)# aaa authorization network default group radius
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

### Related Commands

<table>

</tbody>
</table>
action

Use the `action` access-map configuration command to set the action for the VLAN access map entry. Use the `no` form of this command to return to the default setting.

```
action {drop | forward}
no action
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>drop</td>
<td>Drop the packet when the specified conditions are matched.</td>
</tr>
<tr>
<td>forward</td>
<td>Forward the packet when the specified conditions are matched.</td>
</tr>
</tbody>
</table>

**Defaults**

The default action is to forward packets.

**Command Modes**

Access-map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You enter access-map configuration mode by using the `vlan access-map` global configuration command. If the action is `drop`, you should define the access map, including configuring any access control list (ACL) names in match clauses, before applying the map to a VLAN, or all packets could be dropped.

In access-map configuration mode, use the `match` access-map configuration command to define the match conditions for a VLAN map. Use the `action` command to set the action that occurs when a packet matches the conditions.

The drop and forward parameters are not used in the `no` form of the command.

**Examples**

This example shows how to identify and apply a VLAN access map `vmap4` to VLANs 5 and 6 that causes the VLAN to forward an IP packet if the packet matches the conditions defined in access list `al2`:

```
Switch(config)# vlan access-map vmap4
Switch(config-access-map)# match ip address al2
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan filter vmap4 vlan-list 5-6
```

You can verify your settings by entering the `show vlan access-map` privileged EXEC command.

</tbody>
</table>
To enable smart logging for a standard or extended IP access list, use the **access-list** command in global configuration mode with the **smartlog** keyword. Matches to ACL entries are logged to a NetFlow collector. To disable smart logging for the access list, use the **no** form of this command.

```plaintext
access-list access-list-number {deny | permit} source [source-wildcard] [log [word] | smartlog]
access-list access-list-number [dynamic dynamic-name [timeout minutes]] {deny | permit} protocol source source-wildcard destination destination-wildcard [precedence precedence] [tos tos] [time-range time-range-name] [fragments] [log [word] | log-input [word] | smartlog]
```

### Syntax Description

| **smartlog** | (Optional) Sends packet flows matching the access list to a NetFlow collector when smart logging is enabled on the switch. |

### Defaults

ACL smart logging is not enabled.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>The smartlog keyword was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

For the complete syntax description of the **access-list** command without the **smartlog** keyword, see the *Cisco IOS Security Command Reference*.

When an ACL is applied to an interface, packets matching the ACL are denied or permitted based on the ACL configuration. When smart logging is enabled on the switch and an ACL includes the **smartlog** keyword, the contents of the denied or permitted packet are sent to a Flexible NetFlow collector.

You must also enable smart logging globally by entering the **logging smartlog** global configuration command.

Only port ACLs (ACLs attached to Layer 2 interfaces) support smart logging. Router ACLs or VLAN ACLs do not support smart logging. Port ACLs do not support logging.

When an ACL is applied to an interface, matching packets can be either logged or smart logged, but not both.

To remove disable smart logging of an access list, enter access-list configuration mode and enter the **no deny {source [source-wildcard] | host source | any} [smartlog]** command or the **no permit {source [source-wildcard] | host source | any} [smartlog]** command.

You can verify that smart logging is enabled in an ACL by entering the **show ip access list** privileged EXEC command.
Examples

This example shows how to configure smart logging on an extended access list, ACL 101, which allows IP traffic from the host with the IP address 172.20.10.101 to any destination. When smart logging is enabled and the ACL is attached to a Layer 2 interface, copies of packets matching this criteria are sent to the NetFlow collector.

Switch(config)# acl 101 permit ip host 10.1.1.2 any smartlog
Switch(config-if)# end

archive copy-sw

Use the `archive copy-sw` privileged EXEC command on the stack master to copy the running image from the flash memory on one stack member to the flash memory on one or more other members.

```bash
archive copy-sw [/destination-system destination-stack-member-number] [/force-reload] [leave-old-sw] [no-set-boot] [overwrite] [reload] [safe] source-stack-member-number
```

**Syntax Description**

- `/destination-system destination-stack-member-number` (Optional) The number of the member to which to copy the running image. The range is 1 to 9.
- `/force-reload` (Optional) Unconditionally force a system reload after successfully downloading the software image.
- `/leave-old-sw` (Optional) Keep the old software version after a successful download.
- `/no-set-boot` (Optional) Do not alter the setting of the BOoT environment variable to point to the new software image after it is successfully downloaded.
- `/overwrite` (Optional) Overwrite the software image in flash memory with the downloaded one.
- `/reload` (Optional) Reload the system after downloading the image unless the configuration has been changed and not been saved.
- `/safe` (Optional) Keep the current software image; do not delete it to make room for the new software image before the new image is downloaded. The current image is deleted after the download.

- `source-stack-member-number` The number of the member from which to copy the running image. The range is 1 to 9.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The current software image is not overwritten with the copied image.

Both the software image and HTML files are copied.

The new image is copied to the flash: file system.

The BOoT environment variable is changed to point to the new software image on the flash: file system.

Image names are case sensitive; the image file is provided in tar format.

**Note**

To successfully use the `archive copy-sw` privileged EXEC command, you must have downloaded from a TFTP server the images for both the member switch being added and the master. You use the `archive download-sw` privileged EXEC command to perform the download.
At least one member must be running the image that is to be copied to the switch that has incompatible software.

You can copy the image to more than one specific member by repeating the `/destination-system destination-stack-member-number` option in the command for each member to be upgraded. If you do not specify the `destination-stack-member-number`, the default is to copy the running image file to all members.

Using the `/safe` or `/leave-old-sw` option can cause the new copied image to fail if there is insufficient flash memory. If leaving the software in place would prevent the new image from fitting in flash memory due to space constraints, an error results.

If you used the `/leave-old-sw` option and did not overwrite the old image when you copied the new one, you can remove the old image by using the `delete` privileged EXEC command. For more information, see the “delete” section on page 2-129.

Use the `/overwrite` option to overwrite the image on the flash device with the copied one.

If you specify the command without the `/overwrite` option, the algorithm verifies that the new image is not the same as the one on the switch flash device or is not running on any members. If the images are the same, the copy does not occur. If the images are different, the old image is deleted, and the new one is copied.

After copying a new image, enter the `reload` privileged EXEC command to begin using the new image, or specify the `/reload` or `/force-reload` option in the `archive copy-sw` command.

You can enter one or more of these options with the `source-stack-member-number` option:

- `/destination-system destination-stack-member-number`
- `/force-reload`
- `/leave-old-sw`
- `/no-set-boot`
- `/overwrite`
- `/reload`
- `/safe`

If you enter the `source-stack-member-number` option before one of the previous options, you can enter only the `archive copy-sw source-stack-member-number` command.

These are examples of how you can enter the `archive copy-sw` command:

- To copy the running image from a member to another member and to overwrite the software image in the second member’s flash memory (if it already exists) with the copied one, enter the `archive copy-sw /destination destination-stack-member-number /overwrite source-stack-member-number` command.

- To copy the running image from a member to another member, keep the current software image, and reload the system after the image copies, enter the `archive copy-sw /destination destination-stack-member-number /safe /reload source-stack-member-number` command.
### Examples

This example shows how to copy the running image from member 6 to member 8:

```
Switch# archive copy-sw /destination-system 8 6
```

This example shows how to copy the running image from member 6 to all the other members:

```
Switch# archive copy-sw 6
```

This example shows how to copy the running image from member 5 to member 7. If the image being copied already exists on the second member’s flash memory, it can be overwritten with the copied one. The system reloads after the image is copied:

```
Switch# archive copy-sw /destination-system 7 /overwrite /force-reload 5
```

</table>
archive download-sw

The source URL alias for a local or network file system. These options are supported:

- The syntax for the secondary boot loader (BS1):
  
  `bs1:

- The syntax for the local flash file system on the standalone switch or the master:

  `flash:

  The syntax for the local flash file system on a member:

  `flash member number:

- The syntax for the FTP:

  `ftp://[username:password]@location/directory/image-name.tar

- The syntax for an HTTP server:

  `http://[username:password]@[hostname | host-ip]/[directory]/image-name.tar

- The syntax for a secure HTTP server:

  `https://[username:password]@[hostname | host-ip]/[directory]/image-name.tar

- The syntax for the Remote Copy Protocol (RCP):

  `rcp://[username@location]/directory/image-name.tar

- The syntax for the TFTP:

  `tftp://[location]/directory/image-name.tar

The `image-name.tar` is the software image to download and install on the switch.

**Defaults**

The current software image is not overwritten with the downloaded image.

Both the software image and HTML files are downloaded.

The new image is downloaded to the flash: file system.

The BOOT environment variable is changed to point to the new software image on the flash: file system.

Image names are case sensitive; the image file is provided in tar format.

Compatibility of the stack protocol version on the image to be downloaded is checked with the version on the stack.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(20)SE</td>
<td>The <code>http</code> and <code>https</code> keywords were added.</td>
</tr>
<tr>
<td>12.2(35)SE</td>
<td>The <code>allow-feature-upgrade</code> and <code>directory</code> keywords were added.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Use the /allow-feature-upgrade option to allow installation of an image with a different feature set, for example, upgrading from the IP base image to the IP services image.

Use the archive download-sw /directory command to specify a directory one time followed by a tar file or list of tar files to be downloaded instead of specifying complete paths with each tar file. For example, enter archive download-sw /directory tftp://10.1.1.10/ c3750-ipservices-tar.122-35.SE.tar c3750-iptar.122-35.SE.tar.

The /imageonly option removes the HTML files for the existing image if the existing image is being removed or replaced. Only the Cisco IOS image (without the HTML files) is downloaded.

Using the /safe or /leave-old-sw option can cause the new image download to fail if there is insufficient flash memory. If leaving the software in place prevents the new image from fitting in flash memory due to space constraints, an error results.

If you used the /leave-old-sw option and did not overwrite the old image when you downloaded the new one, you can remove the old image by using the delete privileged EXEC command. For more information, see the “delete” section on page 2-129.

Use the /no-version-check option if you want to download an image that has a different stack protocol version than the one existing on the stack. You must use this option with the /destination-system option to specify the specific member to be upgraded with the image.

Note

Use the /no-version-check option with care. All members, including the master, must have the same stack protocol version to be in the same stack. This option allows an image to be downloaded without first confirming the compatibility of its stack protocol version with the version of the stack.

You can upgrade more than one specific stack member by repeating the /destination-system option in the command for each stack member to be upgraded.

Use the /overwrite option to overwrite the image on the flash device with the downloaded one.

If you specify the command without the /overwrite option, the download algorithm verifies that the new image is not the same as the one on the switch flash device or is not running on any stack members. If the images are the same, the download does not occur. If the images are different, the old image is deleted, and the new one is downloaded.

After downloading a new image, enter the reload privileged EXEC command to begin using the new image, or specify the /reload or /force-reload option in the archive download-sw command.

Use the /directory option to specify a directory for images.

Examples

This example shows how to download a new image from a TFTP server at 172.20.129.10 and to overwrite the image on the switch:

Switch# archive download-sw /overwrite tftp://172.20.129.10/test-image.tar

This example shows how to download only the software image from a TFTP server at 172.20.129.10 to the switch:

Switch# archive download-sw /imageonly tftp://172.20.129.10/test-image.tar

This example shows how to keep the old software version after a successful download:

Switch# archive download-sw /leave-old-sw tftp://172.20.129.10/test-image.tar
This example specifies the location of two tar images without having to specify the path each time:

```
```

This example shows how to upgrade stack members 6 and 8:

```
Switch# archive download-sw /imageonly /destination-system 6 /destination-system 8 tftp://172.20.129.10/test-image.tar
```

---

<tr>
<td></td>
<td>• The syntax for an HTTP server: http://[username:password]@[hostname</td>
</tr>
<tr>
<td></td>
<td>• The syntax for a secure HTTP server: https://[username:password]@[hostname</td>
</tr>
<tr>
<td></td>
<td>• The syntax for the Remote Copy Protocol (RCP) is: rcp://[[username@location]/directory]/tar-filename.tar</td>
</tr>
<tr>
<td></td>
<td>• The syntax for the TFTP: tftp://[location]/directory]/tar-filename.tar</td>
</tr>
<tr>
<td></td>
<td>The tar-filename.tar is the tar file to be created.</td>
</tr>
</tbody>
</table>

For flash:/file-url, specify the location on the local flash file system from which the new tar file is created.

An optional list of files or directories within the source directory can be specified to write to the new tar file. If none are specified, all files and directories at this level are written to the newly created tar file.
/table source-url

Display the contents of an existing tar file to the screen.

For source-url, specify the source URL alias for the local or network file system. These options are supported:

- The syntax for the local flash file system:
  flash:
- The syntax for the FTP:
  ftp://[//username:password@location]/directory/tar-filename.tar
- The syntax for an HTTP server:
  http://[[username:password@ ]|hostname | host-ip]}/directory/image-name.tar
- The syntax for a secure HTTP server:
  https://[[username:password@ ]|hostname | host-ip]}/directory/image-name.tar
- The syntax for the RCP:
  rcp://[//username@location]/directory/tar-filename.tar
- The syntax for the TFTP:
  tftp://[//location]/directory/tar-filename.tar

The tar-filename.tar is the tar file to display.

/xtract source-url
flash://file-url [dir/file...]

Extract files from a tar file to the local file system.

For source-url, specify the source URL alias for the local file system. These options are supported:

- The syntax for the local flash file system:
  flash:
- The syntax for the FTP:
  ftp://[//username:password@location]/directory/tar-filename.tar
- The syntax for an HTTP server:
  http://[[username:password@ ]|hostname | host-ip]}/directory/image-name.tar
- The syntax for a secure HTTP server:
  https://[[username:password@ ]|hostname | host-ip]}/directory/image-name.tar
- The syntax for the RCP:
  rcp://[//username@location]/directory/tar-filename.tar
- The syntax for the TFTP:
  tftp://[//location]/directory/tar-filename.tar

The tar-filename.tar is the tar file from which to extract.

For flash://file-url [dir/file...], specify the location on the local flash file system into which the tar file is extracted. Use the dir/file... option to specify an optional list of files or directories within the tar file to be extracted. If none are specified, all files and directories are extracted.

Defaults

There is no default setting.
**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Filenames and directory names are case sensitive.

Image names are case sensitive.

**Examples**

This example shows how to create a tar file. The command writes the contents of the `new-configs` directory on the local flash device to a file named `saved.tar` on the TFTP server at 172.20.10.30:

```
Switch# archive tar /create tftp:172.20.10.30/saved.tar flash:/new_configs
```

This example shows how to display the contents of the file that is in flash memory. The contents of the tar file appear on the screen:

```
Switch# archive tar /table flash:c3750-ipservices-12-25.SEB.tar
info (219 bytes)
c3750-ipservices-mz.12-25.SEB/ (directory)
c3750-ipservices-mz.12-25.SEB (610856 bytes)
c3750-ipservices-mz.12-25.SEB/info (219 bytes)
info.ver (219 bytes)
```

This example shows how to display only the `/html` directory and its contents:

```
flash:c3750-ipservices-12-25.SEB.tar c3750-ipservices-12-25/html
c3750-ipservices-mz.12-25.SEB/html/ (directory)
c3750-ipservices-mz.12-25.SEB/html/const.htm (556 bytes)
c3750-ipservices-mz.12-25.SEB/html/xhome.htm (9373 bytes)
c3750-ipservices-mz.12-25.SEB/html/menu.css (1654 bytes)
<output truncated>
```

This example shows how to extract the contents of a tar file on the TFTP server at 172.20.10.30. This command extracts just the `new-configs` directory into the root directory on the local flash file system. The remaining files in the `saved.tar` file are ignored.

```
Switch# archive tar /xtract tftp://172.20.10.30/saved.tar flash:/new-configs
```

<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

You must specify the `/source-system-num` option to use the `/version` option. Using these options together uploads the specified image, not the running image, of a specific stack member.

Use the upload feature only if the HTML files associated with the embedded device manager have been installed with the existing image.

The files are uploaded in this sequence: the Cisco IOS image, the HTML files, and info. After these files are uploaded, the software creates the tar file.

Image names are case sensitive.

**Examples**

This example shows how to upload the currently running image on stack member 6 to a TFTP server at 172.20.140.2:

```
Switch# archive upload-sw /source-system-num 6 tftp://172.20.140.2/test-image.tar
```

**Related Commands**

**arp access-list**

Use the `arp access-list` global configuration command to define an Address Resolution Protocol (ARP) access control list (ACL) or to add clauses to the end of a previously defined list. Use the `no` form of this command to delete the specified ARP access list.

```
arp access-list acl-name

no arp access-list acl-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl-name</td>
<td>Name of the ACL.</td>
</tr>
</tbody>
</table>

**Defaults**

No ARP access lists are defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After entering the `arp access-list` command, you enter ARP access-list configuration mode, and these configuration commands are available:

- **default**: returns a command to its default setting.
- **deny**: specifies packets to reject. For more information, see the “deny (ARP access-list configuration)” section on page 2-132.
- **exit**: exits ARP access-list configuration mode.
- **no**: negates a command or returns to default settings.
- **permit**: specifies packets to forward. For more information, see the “permit (ARP access-list configuration)” section on page 2-414.

Use the `permit` and `deny` access-list configuration commands to forward and to drop ARP packets based on the specified matching criteria.

When the ARP ACL is defined, you can apply it to a VLAN by using the `ip arp inspection filter vlan` global configuration command. ARP packets containing only IP-to-MAC address bindings are compared to the ACL. All other types of packets are bridged in the ingress VLAN without validation. If the ACL permits a packet, the switch forwards it. If the ACL denies a packet because of an explicit deny statement, the switch drops the packet. If the ACL denies a packet because of an implicit deny statement, the switch compares the packet to the list of DHCP bindings (unless the ACL is `static`, which means that packets are not compared to the bindings).
Examples

This example shows how to define an ARP access list and to permit both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
```

You can verify your settings by entering the `show arp access-list` privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>
authentication command bounce-port ignore

Use the `authentication command bounce-port ignore` global configuration command on the switch stack or on a standalone switch to allow the switch to ignore a command to temporarily disable a port. Use the `no` form of this command to return to the default status.

```
authentication command bounce-port ignore
no authentication command bounce-port ignore
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The switch accepts a RADIUS Change of Authorization (CoA) `bounce port` command.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The CoA `bounce port` command causes a link flap, which triggers a DHCP renegotiation from the host. This is useful when a VLAN change occurs and the endpoint is a device such as a printer, that has no supplicant to detect the change. Use this command to configure the switch to ignore the `bounce port` command.

**Examples**
This example shows how to instruct the switch to ignore a CoA `bounce port` command:

```
Switch(config)# authentication command bounce-port ignore
```

**Related Commands**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
authentication command disable-port ignore

Use the `authentication command disable-port ignore` global configuration command on the switch stack or on a standalone switch to allow the switch to ignore a command to disable a port. Use the `no` form of this command to return to the default status.

```
authentication command disable-port ignore
no authentication command disable-port ignore
```

**Syntax Description**
The command has no arguments or keywords.

**Defaults**
The switch accepts a RADIUS Change of Authorization (CoA) `disable port` command.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The CoA `disable port` command administratively shuts down a port hosting a session, resulting in session termination. Use this command to configure the switch to ignore this command.

**Examples**
This example shows how to instruct the switch to ignore a CoA `disable port` command:
```
Switch(config)# authentication command disable-port ignore
```

**Related Commands**

<table>

authentication control-direction

Use the `authentication control-direction` interface configuration command to configure the port mode as unidirectional or bidirectional. Use the `no` form of this command to return to the default setting.

```
authentication control-direction {both | in}

no authentication control-direction
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>both</code></td>
<td>Enable bidirectional control on port. The port cannot receive packets from or send packets to the host.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Enable unidirectional control on port. The port can send packets to the host but cannot receive packets from the host.</td>
</tr>
</tbody>
</table>

**Defaults**

The port is in bidirectional mode.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `both` keyword or the `no` form of this command to return to the default setting (bidirectional mode).

**Examples**

This example shows how to enable bidirectional mode:

```
Switch(config-if)# authentication control-direction both
```

This example shows how to enable unidirectional mode:

```
Switch(config-if)# authentication control-direction in
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>15.0(1)SE</td>
<td>The <code>voice</code> keyword was added.</td>
</tr>
</tbody>
</table>
Use this command with the **fail**, **no-response**, or **event** keywords to configure the switch response for a specific action.

For **authentication-fail** events:

- If the supplicant fails authentication, the port is moved to a restricted VLAN, and an EAP success message is sent to the supplicant because it is not notified of the actual authentication failure.
  - If the EAP success message is not sent, the supplicant tries to authenticate every 60 seconds (the default) by sending an EAP-start message.
  - Some hosts (for example, devices running Windows XP) cannot implement DHCP until they receive an EAP success message.

The restricted VLAN is supported only in single host mode (the default port mode). When a port is placed in a restricted VLAN, the supplicant MAC address is added to the MAC address table. Any other MAC address on the port is treated as a security violation.

- You cannot configure an internal VLAN for Layer 3 ports as a restricted VLAN. You cannot specify the same VLAN as a restricted VLAN and as a voice VLAN.

Enable re-authentication with restricted VLANS. If re-authentication is disabled, the ports in the restricted VLANS do not receive re-authentication requests.

To start the re-authentication process, the restricted VLAN must receive a link-down event or an Extensible Authentication Protocol (EAP) logoff event from the port. If a host is connected through a hub:

- The port might not receive a link-down event when the host is disconnected.
- The port might not detect new hosts until the next re-authentication attempt occurs.

When you reconfigure a restricted VLAN as a different type of VLAN, ports in the restricted VLAN are also moved and stay in their currently authorized state.

For **no-response** events:

- If you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when it does not receive a response to its Extensible Authentication Protocol over LAN (EAPOL) request/identity frame or when EAPOL packets are not sent by the client.

- The switch maintains the EAPOL packet history. If another EAPOL packet is detected on the port during the lifetime of the link, the guest VLAN feature is disabled. If the port is already in the guest VLAN state, the port returns to the unauthorized state, and authentication restarts. The EAPOL history is cleared.

- If the switch port is moved to the guest VLAN (multihost mode), multiple non-IEEE 802.1x-capable clients are allowed access. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put in the unauthorized state in the RADIUS-configured or user-configured access VLAN, and authentication restarts.

You can configure any active VLAN except a Remote Switched Port Analyzer (RSPAN) VLAN, a primary private VLAN, or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is supported only on access ports. It is not supported on internal VLANs (routed ports) or trunk ports.

- When MAC authentication bypass is enabled on an IEEE 802.1x port, the switch can authorize clients based on the client MAC address if IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address.
  - If authorization succeeds, the switch grants the client access to the network.
If authorization fails, the switch assigns the port to the guest VLAN if one is specified. For more information, see the "Using IEEE 802.1x Authentication with MAC Authentication Bypass" section in the "Configuring IEEE 802.1x Port-Based Authentication" chapter of the software configuration guide.

For server-dead events:

- When the switch moves to the critical-authentication state, new hosts trying to authenticate are moved to the critical-authentication VLAN (or critical VLAN). This applies whether the port is in single-host, multiple-host, multi-auth, or MDA mode. Authenticated hosts remain in the authenticated VLAN, and the reauthentication timers are disabled.
- If a client is running Windows XP and the critical port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.
- If the Windows XP client is configured for DHCP and has an IP address from the DHCP server and a critical port receives an EAP-Success message, the DHCP configuration process might not re-initiate.

You can verify your settings by entering the `show authentication` privileged EXEC command.

**Examples**

This example shows how to configure the `authentication event fail` command:

```
Switch(config-if)# authentication event fail action authorize vlan 20
```

This example shows how to configure a no-response action:

```
Switch(config-if)# authentication event no-response action authorize vlan 10
```

This example shows how to configure a server-response action:

```
Switch(config-if)# authentication event server alive action reinitialize
```

This example shows how to configure a port to send both new and existing hosts to the critical VLAN when the RADIUS server is unavailable. Use this command for ports in multiple authentication (multi-auth) mode or if the voice domain of the port is in MDA mode:

```
Switch(config-if)# authentication event server dead action authorize vlan 10
```

This example shows how to configure a port to send both new and existing hosts to the critical VLAN when the RADIUS server is unavailable and if the traffic from the host is tagged with the voice VLAN to put the host in the configured voice VLAN on the port. Use this command for ports in multiple-host or multiauth mode:

```
Switch(config-if)# authentication event server dead action reinitialize vlan 10
Switch(config-if)# authentication event server dead action authorize voice
```

authentication fallback

Use the `authentication fallback` interface configuration command to configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. To return to the default setting, use the `no` form of this command.

```
authentication fallback name
```

```
no authentication fallback name
```

**Syntax Description**

- `name` Specify a web authentication fallback profile.

**Defaults**

No fallback is enabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter the `authentication port-control auto` interface configuration command before configuring a fallback method.

You can only configure web authentication as a fallback method to 802.1x or MAB, so one or both of these authentication methods should be configured for the fallback to enable.

**Examples**

This example shows how to specify a fallback profile on a port:

```
Switch(config-if)# authentication fallback profile1
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

authentication host-mode

Use the **authentication host-mode** interface configuration command to set the authorization manager mode on a port.

```
authentication host-mode [multi-auth | multi-domain | multi-host | single-host]
```

```
no authentication host-mode [multi-auth | multi-domain | multi-host | single-host]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multi-auth</td>
<td>Enable multiple-authorization mode (multiauth mode) on the port.</td>
</tr>
<tr>
<td>multi-domain</td>
<td>Enable multiple-domain mode on the port.</td>
</tr>
<tr>
<td>multi-host</td>
<td>Enable multiple-host mode on the port.</td>
</tr>
<tr>
<td>single-host</td>
<td>Enable single-host mode on the port.</td>
</tr>
</tbody>
</table>

### Defaults

Single host mode is enabled.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Single-host mode should be configured if only one data host is connected. Do not connect a voice device to authenticate on a single-host port. Voice device authorization fails if no voice VLAN is configured on the port.

Multi-domain mode should be configured if data host is connected through an IP Phone to the port. Multi-domain mode should be configured if the voice device needs to be authenticated.

Multi-auth mode should be configured to allow devices behind a hub to obtain secured port access through individual authentication. Only one voice device can be authenticated in this mode if a voice VLAN is configured.

Multi-host mode also offers port access for multiple hosts behind a hub, but multi-host mode gives unrestricted port access to the devices after the first user gets authenticated.

### Examples

This example shows how to enable **multiauth** mode on a port:

```
Switch(config-if)# authentication host-mode multi-auth
```

This example shows how to enable **multi-domain** mode on a port:

```
Switch(config-if)# authentication host-mode multi-domain
```

This example shows how to enable **multi-host** mode on a port:

```
Switch(config)# authentication host-mode multi-host
```
This example shows how to enable `single-host` mode on a port:

```
Switch(config-if)# authentication host-mode single-host
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

</table>
authentication mac-move permit

Use the `authentication mac-move permit` global configuration command to enable MAC move on a switch. Use the `no` form of this command to return to the default setting.

```
authentication mac-move permit
no authentication mac-move permit
```

Syntax Description
This command has no arguments or keywords.

Defaults
MAC move is disabled.

Command Modes
Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
The command enables authenticated hosts to move between 802.1x-enabled ports on a switch. For example, if there is a device between an authenticated host and port, and that host moves to another port, the authentication session is deleted from the first port, and the host is reauthenticated on the new port.

If MAC move is disabled, and an authenticated host moves to another port, it is not reauthenticated, and a violation error occurs.

MAC move is not supported on port-security enabled 802.1x ports. If MAC move is globally configured on the switch and a port security-enabled host moves to an 802.1x-enabled port, a violation error occurs.

Examples
This example shows how to enable MAC move on a switch:
```
Switch(config)# authentication mac-move permit
```

authentication open

Use the authentication open interface configuration command to enable or disable open access on a port. Use the no form of this command to disable open access.

```
authentication open
no authentication open
```

**Defaults**

Open access is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Open authentication must be enabled if a device requires network access before it is authenticated. A port ACL should be used to restrict host access when open authentication is enabled.

**Examples**

This example shows how to enable open access on a port:

```
Switch(config-if)# authentication open
```

This example shows how to set the port to disable open access on a port:

```
Switch(config-if)# no authentication open
```

authentication order

Use the **authentication order** interface configuration command to set the order of authentication methods used on a port.

```
authentication order [dot1x | mab] {webauth}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x</td>
<td>Add 802.1x to the order of authentication methods.</td>
</tr>
<tr>
<td>mab</td>
<td>Add MAC authentication bypass (MAB) to the order of authentication methods.</td>
</tr>
<tr>
<td>webauth</td>
<td>Add web authentication to the order of authentication methods.</td>
</tr>
</tbody>
</table>

**Command Default**
The default authentication order is **dot1x** followed by **mab** and **webauth**.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Ordering sets the order of methods that the switch attempts when trying to authenticate a new device connected to a port. If one method in the list is unsuccessful, the next method is attempted.

Each method can only be entered once. Flexible ordering is only possible between 802.1x and MAB.

Web authentication can be configured as either a standalone method or as the last method in the order after either 802.1x or MAB. Web authentication should be configured only as fallback to **dot1x** or **mab**.

**Examples**

This example shows how to add 802.1x as the first authentication method, MAB as the second method, and web authentication as the third method:

```
Switch(config-if)# authentication order dot1x mab webauth
```

This example shows how to add MAC authentication Bypass (MAB) as the first authentication method and web authentication as the second authentication method:

```
Switch(config-if)# authentication order mab webauth
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You configure the amount of time between periodic re-authentication attempts by using the `authentication timer reauthentication` interface configuration command.

**Examples**
This example shows how to enable periodic reauthentication on a port:
```
Switch(config-if)# authentication periodic
```

This example shows how to disable periodic reauthentication on a port:
```
Switch(config-if)# no authentication periodic
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

authentication port-control

Use the `authentication port-control` interface configuration command to enable manual control of the port authorization state. Use the `no` form of this command to return to the default setting.

```
authentication port-control { auto | force-authorized | force-un authorized }
```

```
no authentication port-control { auto | force-authorized | force-un authorized }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Enable IEEE 802.1x authentication on the port. The port changes to the authorized or unauthorized state based on the IEEE 802.1x authentication exchange between the switch and the client.</td>
</tr>
<tr>
<td>force-authorized</td>
<td>Disable IEEE 802.1x authentication on the port. The port changes to the authorized state without an authentication exchange. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client.</td>
</tr>
<tr>
<td>force-un authorized</td>
<td>Deny all access the port. The port changes to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.</td>
</tr>
</tbody>
</table>

### Defaults

The default setting is force-authorized.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `auto` keyword only on one of these port types:

- **Trunk port**—If you try to enable IEEE 802.1x authentication on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.

- **Dynamic ports**—A dynamic port can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x authentication on a dynamic port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, an error message appears, and the port mode does not change.

- **Dynamic-access ports**—If you try to enable IEEE 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN, an error message appears, and the VLAN configuration does not change.
• EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.
• Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, IEEE 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

To globally disable IEEE 802.1x authentication on the switch, use the `no dot1x system-auth-control` global configuration command. To disable IEEE 802.1x authentication on a specific port or to return to the default setting, use the `no authentication port-control` interface configuration command.

### Examples

This example shows how to set the port state to automatic:

```
Switch(config-if)# authentication port-control auto
```

This example shows how to set the port state to the force-authorized state:

```
Switch(config-if)# authentication port-control force-authorized
```

This example shows how to set the port state to the force-unauthorized state:

```
Switch(config-if)# authentication port-control force-unauthorized
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

</table>
authentication priority

Use the **authentication priority** interface configuration command to add an authentication method to the port-priority list.

```
auth priority [dot1x | mab] [webauth]
no auth priority [dot1x | mab] [webauth]
```

**Syntax Description**

- `dot1x` Add 802.1x to the order of authentication methods.
- `mab` Add MAC authentication bypass (MAB) to the order of authentication methods.
- `webauth` Add web authentication to the order of authentication methods.

**Command History**

<table>
<thead>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Command Modes**

Interface configuration

**Usage Guidelines**

Ordering sets the order of methods that the switch attempts when trying to authenticate a new device is connected to a port.

When configuring multiple fallback methods on a port, set web authentication (webauth) last.

Assigning priorities to different authentication methods allows a higher-priority method to interrupt an in-progress authentication method with a lower priority.

**Note**

If a client is already authenticated, it might be reauthenticated if an interruption from a higher-priority method occurs.

The default priority of an authentication method is equivalent to its position in execution-list order: 802.1x authentication, MAC authentication bypass, and web authentication. Use the `dot1x`, `mab`, and `webauth` keywords to change this default order.
Examples

This example shows how to set 802.1x as the first authentication method and web authentication as the second authentication method:

```
Switch(config-if)# authentication priority dotx webauth
```

This example shows how to set MAC authentication Bypass (MAB) as the first authentication method and web authentication as the second authentication method:

```
Switch(config-if)# authentication priority mab webauth
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

</tr>
</tbody>
</table>
authentication timer

Use the `authentication timer` interface configuration command to configure the timeout and reauthentication parameters for an 802.1x-enabled port.

```
authentication timer { [inactivity | reauthenticate] [server | am] } { restart value }
no authentication timer { [inactivity | reauthenticate] [server | am] } { restart value }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inactivity</td>
<td>Interval in seconds after which the client is unauthorized if there is no activity.</td>
</tr>
<tr>
<td>reauthenticate</td>
<td>Time in seconds after which an automatic re-authentication attempt starts.</td>
</tr>
<tr>
<td>server</td>
<td>Interval in seconds after which an attempt is made to authenticate an unauthorized port.</td>
</tr>
<tr>
<td>restart</td>
<td>Interval in seconds after which an attempt is made to authenticate an unauthorized port.</td>
</tr>
<tr>
<td>value</td>
<td>Enter a value between 1 and 65535 (in seconds).</td>
</tr>
</tbody>
</table>

### Defaults

The `inactivity`, `server`, and `restart` keywords are set to 60 seconds. The `reauthenticate` keyword is set to one hour.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If a timeout value is not configured, an 802.1x session stays authorized indefinitely. No other host can use the port, and the connected host cannot move to another port on the same switch.

### Examples

This example shows how to set the authentication inactivity timer to 60 seconds:

```
Switch(config-if)# authentication timer inactivity 60
```

This example shows how to set the reauthentication timer to 120 seconds:

```
Switch(config-if)# authentication timer restart 120
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

**auto qos classify**

Use the `auto qos classify` interface configuration command to automatically configure quality of service (QoS) classification for untrusted devices within a QoS domain. Use the `no` form of this command to return to the default setting.

```
auto qos classify [police]
no auto qos classify [police]
```

**Syntax Description**

```plaintext
police (Optional) Configure QoS policing for untrusted devices.
```

**Defaults**

Auto-QoS classify is disabled on the port.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

<table>
<thead>
<tr>
<th>Ingress Queue</th>
<th>Queue Number</th>
<th>CoS-to-Queue Map</th>
<th>Queue Weight (Bandwidth)</th>
<th>Queue (Buffer) Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRR shared</td>
<td>1</td>
<td>0, 1, 2, 3, 6, 7</td>
<td>70 percent</td>
<td>90 percent</td>
</tr>
<tr>
<td>Priority</td>
<td>2</td>
<td>4, 5</td>
<td>30 percent</td>
<td>10 percent</td>
</tr>
</tbody>
</table>

1. SRR = shaped round robin. Ingress queues support shared mode only.

Table 2-2 shows the generated auto-QoS configuration for the egress queues.

<table>
<thead>
<tr>
<th>Egress Queue</th>
<th>Queue Number</th>
<th>CoS-to-Queue Map</th>
<th>Queue Weight (Bandwidth)</th>

</tbody>
</table>
Usage Guidelines

Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the switch, the network interior, and edge devices that can classify incoming traffic for QoS.

Auto-QoS configures the switch for connectivity with a trusted interface. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packets is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration after you enable auto-QoS.

This is the policy map when the `auto qos classify` command is configured:

```
policy-map AUTOQOS-SRND4-CLASSIFY-POLICY
  class AUTOQOS_MULTIENHANCED_CONF_CLASS
    set dscp af41
  class AUTOQOS_BULK_DATA_CLASS
    set dscp af11
  class AUTOQOS_TRANSACTION_CLASS
    set dscp af21
  class AUTOQOS_SCAVANGER_CLASS
    set dscp cs1
  class AUTOQOS_SIGNALING_CLASS
    set dscp cs3
  class AUTOQOS_DEFAULT_CLASS
    set dscp default
```

This is the policy map when the `auto qos classify police` command is configured:

```
policy-map AUTOQOS-SRND4-CLASSIFY-POLICE-POLICY
  class AUTOQOS_MULTIENHANCED_CONF_CLASS
    set dscp af41
    police 5000000 8000 exceed-action drop
  class AUTOQOS_BULK_DATA_CLASS

    set dscp cs3
    police 32000 8000 exceed-action drop
  class AUTOQOS_DEFAULT_CLASS
    set dscp default
    police 10000000 8000 exceed-action policed-dscp-transmit
```
The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes AutoQoS in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the `debug auto qos` privileged EXEC command to enable auto-QoS debugging. For more information, see the `debug auto qos` command.

To disable auto-QoS on a port, use the `no auto qos trust` interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the `no auto qos trust` command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration). You can use the `no mls qos` global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified. The CoS, DSCP, and IP precedence values in the packet are not changed. Traffic is switched in pass-through mode. Packets are switched without any rewrites and classified as best effort without any policing.

### Examples

This example shows how to enable auto-QoS classification of an untrusted device and police traffic:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# auto qos classify police
```

You can verify your settings by entering the `show auto qos interface interface-id` privileged EXEC command.

auto qos trust

Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the switch, the network interior, and edge devices that can classify incoming traffic for QoS.

Auto-QoS configures the switch for connectivity with a trusted interface. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packets is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration after you enable auto-QoS.

If the port is configured with auto-QoS trust, it trusts all the packets on the port. If the packets are not marked with a DSCP or CoS value, default marking takes affect.

**Note**

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes AutoQoS in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the `debug auto qos` privileged EXEC command to enable auto-QoS debugging. For more information, see the `debug auto qos` command.

To disable auto-QoS on a port, use the `no auto qos trust` interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the `no auto qos trust` command, auto-QoS is considered

**Usage Guidelines**

Use this command to configure the QoS for trusted interfaces within the QoS domain. The QoS domain includes the switch, the network interior, and edge devices that can classify incoming traffic for QoS.

Auto-QoS configures the switch for connectivity with a trusted interface. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packets is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration after you enable auto-QoS.

If the port is configured with auto-QoS trust, it trusts all the packets on the port. If the packets are not marked with a DSCP or CoS value, default marking takes affect.

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes AutoQoS in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the `debug auto qos` privileged EXEC command to enable auto-QoS debugging. For more information, see the `debug auto qos` command.

To disable auto-QoS on a port, use the `no auto qos trust` interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the `no auto qos trust` command, auto-QoS is considered
disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration). You can use the `no mls qos` global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

### Examples

This example shows how to enable auto-QoS for a trusted interface with specific cos classification.

```console
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# auto qos trust cos
```

You can verify your settings by entering the `show auto qos interface interface-id` privileged EXEC command.

## auto qos video

Use the `auto qos video` interface configuration command on the switch stack or on a standalone switch to automatically configure quality of service (QoS) for video within a QoS domain. Use the `no` form of this command to return to the default setting.

```
auto qos video {cts | ip-camera}
```

```
no auto qos video {cts | ip-camera}
```

### Syntax Description

- `cts`  Identiy this port as connected to a Cisco TelePresence System and automatically configure QoS for video.
- `ip-camera`  Identify this port as connected to a Cisco IP camera and automatically configure QoS for video.

### Defaults

Auto-QoS video is disabled on the port.

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

**Usage Guidelines**

Use this command to configure the QoS appropriate for video traffic within the QoS domain. The QoS domain includes the switch, the network interior, and edge devices that can classify incoming traffic for QoS.

Auto-Qos configures the switch for video connectivity with a Cisco TelePresence system and a Cisco IP camera.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration after you enable auto-QoS.

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, these automatic actions occur:

- QoS is globally enabled (mls qos global configuration command), and other global configuration commands are added.
- After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes AutoQoS in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.
To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the `debug auto qos` privileged EXEC command to enable auto-QoS debugging. For more information, see the `debug auto qos` command.

To disable auto-QoS on a port, use the `no auto qos video` interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the `no auto qos video` command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration). You can use the `no mls qos` global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

**Examples**

This example shows how to enable auto-QoS for a Cisco Telepresence interface with conditional trust. The interface is trusted only if a Cisco Telepresence device is detected; otherwise, the port is untrusted.

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# auto qos video cts
```

You can verify your settings by entering the `show auto qos video interface interface-id` privileged EXEC command.

**auto qos voip**

Use the `auto qos voip` interface configuration command to automatically configure quality of service (QoS) for voice over IP (VoIP) within a QoS domain. Use the `no` form of this command to return to the default setting.

```
auto qos voip {cisco-phone | cisco-softphone | trust}
```

```
no auto qos voip [cisco-phone | cisco-softphone | trust]
```

**Syntax Description**

- `cisco-phone` Identify this port as connected to a Cisco IP Phone, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted only when the telephone is detected. This keyword is not supported on a 10-Gigabit Ethernet interface.

- `cisco-softphone` Identify this port as connected to a device running the Cisco SoftPhone, and automatically configure QoS for VoIP. This keyword is not supported on a 10-Gigabit Ethernet interface.

- `trust` Identify this port as connected to a trusted switch or router, and automatically configure QoS for VoIP. The QoS labels of incoming packets are trusted. For nonrouted ports, the CoS value of the incoming packet is trusted. For routed ports, the DSCP value of the incoming packet is trusted.

**Defaults**

When auto-QoS is enabled, it uses the ingress packet label to categorize traffic, to assign packet labels, and to configure the ingress and egress queues.

Usage Guidelines

Use this command to configure the QoS appropriate for VoIP traffic within the QoS domain. The QoS domain includes the switch, the interior of the network, and edge devices that can classify incoming traffic for QoS.

Auto-QoS configures the switch for VoIP with Cisco IP Phones on switch and routed ports and for VoIP with devices running the Cisco SoftPhone application. These releases support only Cisco IP SoftPhone Version 1.3(3) or later. Connected devices must use Cisco Call Manager Version 4 or later.

The `show auto qos` command output shows the service policy information for the Cisco IP phone.

To take advantage of the auto-QoS defaults, you should enable auto-QoS before you configure other QoS commands. You can fine-tune the auto-QoS configuration after you enable auto-QoS.

Note

The switch applies the auto-QoS-generated commands as if the commands were entered from the command-line interface (CLI). An existing user configuration can cause the application of the generated commands to fail or to be overridden by the generated commands. These actions occur without warning. If all the generated commands are successfully applied, any user-entered configuration that was not...
overridden remains in the running configuration. Any user-entered configuration that was overridden can be retrieved by reloading the switch without saving the current configuration to memory. If the generated commands fail to be applied, the previous running configuration is restored.

If this is the first port on which you have enabled auto-QoS, the auto-QoS-generated global configuration commands are executed followed by the interface configuration commands. If you enable auto-QoS on another port, only the auto-QoS-generated interface configuration commands for that port are executed.

When you enable the auto-QoS feature on the first port, these automatic actions occur:

- QoS is globally enabled (mls qos global configuration command), and other global configuration commands are added.

- When you enter the `auto qos voip cisco-phone` interface configuration command on a port at the edge of the network that is connected to a Cisco IP Phone, the switch enables the trusted boundary feature. The switch uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP Phone. When a Cisco IP Phone is detected, the ingress classification on the port is set to trust the QoS label received in the packet. The switch also uses policing to determine whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. When a Cisco IP Phone is absent, the ingress classification is set to not trust the QoS label in the packet. The switch configures ingress and egress queues on the port according to the settings in Table 2-10 and Table 2-11. The policing is applied to traffic matching the policy-map classification before the switch enables the trust boundary feature.

- When you enter the `auto qos voip cisco-softphone` interface configuration command on a port at the edge of the network that is connected to a device running the Cisco SoftPhone, the switch uses policing to decide whether a packet is in or out of profile and to specify the action on the packet. If the packet does not have a DSCP value of 24, 26, or 46 or is out of profile, the switch changes the DSCP value to 0. The switch configures ingress and egress queues on the port according to the settings in Table 2-10 and Table 2-11.

- When you enter the `auto qos voip trust` interface configuration command on a port connected to the interior of the network, the switch trusts the CoS value for nonrouted ports or the DSCP value for routed ports in ingress packets (the assumption is that traffic has already been classified by other edge devices). The switch configures the ingress and egress queues on the port according to the settings in Table 2-10 and Table 2-11.

You can enable auto-QoS on static, dynamic-access, and voice VLAN access, and trunk ports. When enabling auto-QoS with a Cisco IP Phone on a routed port, you must assign a static IP address to the IP phone.

---

**Note**

When a device running Cisco SoftPhone is connected to a switch or routed port, the switch supports only one Cisco SoftPhone application per port.

After auto-QoS is enabled, do not modify a policy map or aggregate policer that includes *AutoQoS* in its name. If you need to modify the policy map or aggregate policer, make a copy of it, and change the copied policy map or policer. To use the new policy map instead of the generated one, remove the generated policy map from the interface, and apply the new policy map.
To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the `debug auto qos` privileged EXEC command to enable auto-QoS debugging.

To disable auto-QoS on a port, use the `no auto qos voip` interface configuration command. Only the auto-QoS-generated interface configuration commands for this port are removed. If this is the last port on which auto-QoS is enabled and you enter the `no auto qos voip` command, auto-QoS is considered disabled even though the auto-QoS-generated global configuration commands remain (to avoid disrupting traffic on other ports affected by the global configuration). You can use the `no mls qos` global configuration command to disable the auto-QoS-generated global configuration commands. With QoS disabled, there is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

On a port on which the `auto qos voip` command is enabled, the queue-set ID that is generated depends on the interface:

- For a Fast Ethernet interface, auto-QoS generates queue-set 1 (which is the default).

This is the enhanced configuration for the `auto qos voip cisco-phone` command:

```bash
Switch(config)# mls qos map policed-dscp 0 10 18 to 8
Switch(config)# mls qos map cos-dscp 0 8 16 24 32 46 48 56
Switch(config)# class-map match-all AUTOQOS_VOIP_DATA_CLASS

Switch(config-pmap-c)# set dscp af11
Switch(config-pmap-c)# police 1000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_TRANSACTION_CLASS
Switch(config-pmap-c)# set dscp af21
Switch(config-pmap-c)# police 1000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_SCAVANGER_CLASS
Switch(config-pmap-c)# set dscp cs1
Switch(config-pmap-c)# police 1000000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_SIGNALING_CLASS
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 32000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_DEFAULT_CLASS
Switch(config-pmap-c)# set dscp default
Switch(config-if)# service-policy input AUTOQOS-SRND4-SOFTPHONE-POLICY

Examples

This example shows how to enable auto-QoS and to trust the QoS labels received in incoming packets when the switch or router connected to the port is a trusted device:

Switch(config)# policy-map AUTOQOS-SRND4-SOFTPHONE-POLICY
Switch(config-pmap)# class AUTOQOS_VOIP_DATA_CLASS
Switch(config-pmap-c)# set dscp ef
Switch(config-pmap-c)# police 128000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_VOIP_SIGNAL_CLASS
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 32000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_MULTIENHANCED_CONF_CLASS
Switch(config-pmap-c)# set dscp af41
Switch(config-pmap-c)# police 500000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_BULK_DATA_CLASS
Switch(config-pmap-c)# set dscp af11
Switch(config-pmap-c)# police 1000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_TRANSACTION_CLASS
Switch(config-pmap-c)# set dscp af21
Switch(config-pmap-c)# police 1000000 8000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# class AUTOQOS_SCAVANGER_CLASS
Switch(config-pmap-c)# set dscp cs1
Switch(config-pmap-c)# police 1000000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_SIGNALING_CLASS
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# police 32000 8000 exceed-action drop
Switch(config-pmap-c)# class AUTOQOS_DEFAULT_CLASS
Switch(config-pmap-c)# set dscp default
Switch(config-if)# service-policy input AUTOQOS-SRND4-SOFTPHONE-POLICY

You can verify your settings by entering the **show auto qos interface interface-id** privileged EXEC command.

**boot auto-copy-sw**

Use the `boot auto-copy-sw` global configuration command from the stack master to enable the automatic upgrade (auto-upgrade) process. It automatically upgrades a switch in version-mismatch mode by copying the running software image on any stack member or by copying a tar file image in switch stack flash memory. Use the `no` form of this command to disable the auto-upgrade process.

```
boot auto-copy-sw
no boot auto-copy-sw
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
A switch in version-mismatch mode is a switch that has a different minor version number than the version on the stack. A switch in version-mismatch mode cannot join the stack as a fully functioning member. If the stack has an image that can be copied to a switch in version-mismatch mode, the auto-upgrade process automatically copies the image from a stack member to the switch in version-mismatch mode. The switch then exits version-mismatch mode, reboots, and joins the stack as a fully functioning member.

The auto-upgrade process affects only switches in version-mismatch mode. It does not affect existing stack members.

</thead>
</table>
|                  | The default NVRAM buffer size is 512 KB. In some cases, the configuration file might be too large to save to NVRAM. Typically, this occurs when you have many switches in a switch stack. You can configure the size of the NVRAM buffer to support larger configuration files. The new NVRAM buffer size is synced to all current and new member switches.  
After you configure the NVRAM buffer size, reload the switch or switch stack.  
When you add a switch to a stack and the NVRAM size differs, the new switch syncs with the stack and reloads automatically. |

</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command works properly only from a standalone switch.

Filenames are case sensitive.

**Examples**

This example shows how to specify the name of the private configuration file to be `pconfig`:

```
Switch(config)# boot private-config-file pconfig
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show boot</code></td>
<td>Displays the settings of the boot environment variables.</td>
</tr>
</tbody>
</table>
boot system

Use the **boot system** global configuration command to specify the Cisco IOS image to load during the next boot cycle. Use the **no** form of this command to return to the default setting.

```
boot system {filesystem:/file-url ... switch {number | all}}
```

```
no boot system
```

```
no boot system switch {number | all}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filesystem:</code></td>
<td>Alias for a flash file system. Use <code>flash:</code> for the system board flash device.</td>
</tr>
<tr>
<td><code>/file-url</code></td>
<td>The path (directory) and name of a bootable image. Separate image names with a semicolon.</td>
</tr>
<tr>
<td><code>switch</code></td>
<td>Specify the switches on which the Cisco IOS image is loaded.</td>
</tr>
<tr>
<td><code>number</code></td>
<td>Specify a stack member (1 to 9, but specify one stack member only).</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Specify all stack members.</td>
</tr>
</tbody>
</table>

### Defaults

The switch attempts to automatically boot up the system by using information in the BOOT environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory.

</tr>
</tbody>
</table>

### Usage Guidelines

Filenames and directory names are case sensitive.

If you enter the **boot system filesystem:/file-url** command on the stack master, the specified software image is loaded only on the stack master during the next boot cycle.

On the stack master, use the **boot system switch number** command to specify that the software image is loaded on the specified stack member during the next boot cycle. Use the **boot system switch all** command to specify that the software image is loaded on all the stack members during the next boot cycle.
When you enter the `boot system switch number` or the `boot system switch all` command on the stack master, the stack master checks if a software image is already on the stack member (except on the stack master). If the software image does not exist on the stack member (for example, stack member 1), an error message like this appears:

```
%Command to set boot system switch all xxx on switch=1 failed
```

When you enter the `boot system switch number` command on the stack master, you can specify only one stack member for the `number` variable. Entering more than one stack member for the `number` variable is not supported.

If you are using the `archive download-sw` privileged EXEC command to maintain system images, you never need to use the `boot system` command. The `boot system` command is automatically manipulated to load the downloaded image.

This command changes the setting of the BOOT environment variable. For more information, see Appendix A, “Catalyst 3750 Switch Bootloader Commands.”

cdp forward

To specify the ingress and egress switch ports for CDP traffic, use the `cdp forward` global configuration command. To return to the default setting, use the `no` form of this command.

```
  cdp forward ingress port-id egress port-id

  no cdp forward ingress port-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ingress <code>port-id</code></td>
<td>Specifies the switch port that receives the CDP packet from an IP phone.</td>
</tr>
<tr>
<td>egress <code>port-id</code></td>
<td>Specifies the switch port that forwards the CDP packet to the Cisco TelePresence System.</td>
</tr>
</tbody>
</table>

**Defaults**

The default path for CDP packets through the switch is from any ingress port to the egress port connected to the Cisco TelePresence System.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(53)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must use only CDP-enabled phones with TelePresence E911 IP phone support.

You can connect the IP phone and codec in the Cisco TelePresence System through any two ports in a switch stack.

**Examples**

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# cdp forward ingress gigabitethernet2/0/1 egress gigabitethernet2/0/12
Switch(config)# cdp forward ingress gigabitethernet2/0/2 egress gigabitethernet2/0/13
Switch(config)# end
Switch# show running-config | include cdp

cdp forward ingress GigabitEthernet2/0/1 egress GigabitEthernet2/0/12
cdp forward ingress GigabitEthernet2/0/2 egress GigabitEthernet2/0/13
```

```
Switch# show cdp forward
Ingress     Egress     # packets # packets
            Port        forwarded dropped
-------------------------------
Gi2/0/1     Gi2/0/12    0           0
Gi2/0/2     Gi2/0/13    0           0
```

</tbody>
</table>
**channel-group**

Use the `channel-group` interface configuration command to assign an Ethernet port to an EtherChannel group, to enable an EtherChannel mode, or both. Use the `no` form of this command to remove an Ethernet port from an EtherChannel group.

```
channel-group channel-group-number mode {active | auto [non-silent]} | desirable [non-silent] | on | passive
```

```
no channel-group
```

**PAgP modes:**

```
channel-group channel-group-number mode {auto [non-silent]} | desirable [non-silent]
```

**LACP modes:**

```
channel-group channel-group-number mode {active | passive}
```

**On mode:**

```
channel-group channel-group-number mode on
```

<table>
<thead>

Usage Guidelines

For Layer 2 EtherChannels, you do not have to create a port-channel interface first by using the `interface port-channel` global configuration command before assigning a physical port to a channel group. Instead, you can use the `channel-group` interface configuration command. It automatically creates the port-channel interface when the channel group gets its first physical port if the logical interface is not already created. If you create the port-channel interface first, the channel-group-number can be the same as the port-channel-number, or you can use a new number. If you use a new number, the channel-group command dynamically creates a new port channel.

You do not have to disable the IP address that is assigned to a physical port that is part of a channel group, but we strongly recommend that you do so.

You create Layer 3 port channels by using the `interface port-channel` command followed by the `no switchport` interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group.

After you configure an EtherChannel, configuration changes that you make on the port-channel interface apply to all the physical ports assigned to the port-channel interface. Configuration changes applied to the physical port affect only the port where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface, for example, spanning-tree commands or commands to configure a Layer 2 EtherChannel as a trunk.

If you do not specify `non-silent` with the auto or desirable mode, silent is assumed. The silent mode is used when the switch is connected to a device that is not PAgP-capable and seldom, if ever, sends packets. A example of a silent partner is a file server or a packet analyzer that is not generating traffic. In this case, running PAgP on a physical port prevents that port from ever becoming operational. However, it allows PAgP to operate, to attach the port to a channel group, and to use the port for transmission. Both ends of the link cannot be set to silent.

In the on mode, an EtherChannel exists only when a port group in the on mode is connected to another port group in the on mode.

Caution

You should use care when using the on mode. This is a manual configuration, and ports on both ends of the EtherChannel must have the same configuration. If the group is misconfigured, packet loss or spanning-tree loops can occur.

A cross-stack EtherChannel supports up to two 10-Gigabit Ethernet interfaces.
Do not configure an EtherChannel in both the PAgP and LACP modes. EtherChannel groups running PAgP and LACP can coexist on the same switch or on different switches in the stack (but not in a cross-stack configuration). Individual EtherChannel groups can run either PAgP or LACP, but they cannot interoperate.

If you set the protocol by using the `channel-protocol` interface configuration command, the setting is not overridden by the `channel-group` interface configuration command.

Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

Do not configure a secure port as part of an EtherChannel or an EtherChannel port as a secure port.

For a complete list of configuration guidelines, see the “Configuring EtherChannels” chapter in the software configuration guide for this release.

**Caution**

Do not enable Layer 3 addresses on the physical EtherChannel ports. Do not assign bridge groups on the physical EtherChannel ports because it creates loops.

### Examples

This example shows how to configure an EtherChannel on a single switch. It assigns two static-access ports in VLAN 10 to channel 5 with the PAgP mode `desirable`:

```plaintext
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode desirable
Switch(config-if-range)# end
```

This example shows how to configure an EtherChannel on a single switch. It assigns two static-access ports in VLAN 10 to channel 5 with the LACP mode `active`:

```plaintext
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/1 -2
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode active
Switch(config-if-range)# end
```

This example shows how to configure a cross-stack EtherChannel. It uses LACP passive mode and assigns two ports on stack member 2 and one port on stack member 3 as static-access ports in VLAN 10 to channel 5:

```plaintext
Switch# configure terminal
Switch(config)# interface range gigabitethernet2/0/4 -5
Switch(config-if-range)# switchport mode access
Switch(config-if-range)# switchport access vlan 10
Switch(config-if-range)# channel-group 5 mode passive
Switch(config-if-range)# exit
Switch(config)# interface gigabitethernet3/0/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 10
Switch(config-if)# channel-group 5 mode passive
Switch(config-if)# exit
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

</table>
channel-protocol

Use the `channel-protocol` interface configuration command to restrict the protocol used on a port to manage channeling. Use the `no` form of this command to return to the default setting.

```
channel-protocol {lacp | pagp}

no channel-protocol
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lACP</td>
<td>Configure an EtherChannel with the Link Aggregation Control Protocol (LACP).</td>
</tr>
<tr>
<td>PAGP</td>
<td>Configure an EtherChannel with the Port Aggregation Protocol (PAgP).</td>
</tr>
</tbody>
</table>

### Defaults

No protocol is assigned to the EtherChannel.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `channel-protocol` command only to restrict a channel to LACP or PAgP. If you set the protocol by using the `channel-protocol` command, the setting is not overridden by the `channel-group` interface configuration command.

You must use the `channel-group` interface configuration command to configure the EtherChannel parameters. The `channel-group` command also can set the mode for the EtherChannel.

You cannot enable both the PAgP and LACP modes on an EtherChannel group.

PAgP and LACP are not compatible; both ends of a channel must use the same protocol.

### Examples

This example shows how to specify LACP as the protocol that manages the EtherChannel:

```
Switch(config-if)# channel-protocol lacp
```

You can verify your settings by entering the `show etherchannel [channel-group-number] protocol` privileged EXEC command.

cisp enable

Use the cisp enable global configuration command to enable Client Information Signalling Protocol (CISP) on a switch so that it acts as an authenticator to a supplicant switch.

cisp enable

no cisp enable

Syntax Description

| cisp enable | Enable CISP. |

Defaults

There is no default setting.

Command Modes

Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The link between the authenticator and supplicant switch is a trunk. When you enable VTP on both switches, the VTP domain name must be the same, and the VTP mode must be server.

When you configure VTP mode, to avoid the MD5 checksum mismatch error, verify that:

- VLANs are not configured on two different switches, which can be caused by two VTP servers in the same domain.
- Both switches have the different configuration revision numbers.

Examples

This example shows how to enable CISP:

switch(config)# cisp enable

</tr>
</thead>
<tbody>
<tr>
<td>class-map-name</td>
<td>Name of the class map.</td>
</tr>
<tr>
<td>class-default</td>
<td>System default class that matches unclassified packets.</td>
</tr>
</tbody>
</table>

### Defaults

No policy map class-maps are defined.

### Command Modes

Policy-map configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(55)SE</td>
<td>The class-default keyword was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before using the class command, you must use the policy-map global configuration command to identify the policy map and to enter policy-map configuration mode. After specifying a policy map, you can configure a policy for new classes or modify a policy for any existing classes in that policy map. You attach the policy map to a port by using the service-policy interface configuration command.

After entering the class command, you enter policy-map class configuration mode, and these configuration commands are available:

- **exit**: exits policy-map class configuration mode and returns to policy-map configuration mode.
- **no**: returns a command to its default setting.
- **police**: defines a policer or aggregate policer for the classified traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For more information, see the police and police aggregate policy-map class commands.
- **set**: specifies a value to be assigned to the classified traffic. For more information, see the set command.
- **trust**: defines a trust state for traffic classified with the class or the class-map command. For more information, see the trust command.

To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.

The class command performs the same function as the class-map global configuration command. Use the class command when a new classification, which is not shared with any other ports, is needed. Use the class-map command when the map is shared among many ports.
You can configure a default class by using the **class class-default** policy-map configuration command. Unclassified traffic (traffic that does not meet the match criteria specified in the traffic classes) is treated as default traffic.

### Examples

This example shows how to create a policy map called `policy1`. When attached to the ingress direction, it matches all the incoming traffic defined in `class1`, sets the IP Differentiated Services Code Point (DSCP) to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```bash
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

This example shows how to configure a default traffic class to a policy map:

```bash
Switch# configure terminal
Switch(config)# class-map cm-3
Switch(config-cmap)# match ip dscp 30
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
Switch(config)# class-map cm-4
Switch(config-cmap)# match ip dscp 40
Switch(config-cmap)# match protocol ip
Switch(config-cmap)# exit
Switch(config)# policy-map pm3
Switch(config-pmap)# class-class-default
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-3
Switch(config-pmap-c)# set dscp 4
Switch(config-pmap-c)# exit
Switch(config-pmap)# class cm-4
Switch(config-pmap-c)# trust cos
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

This example shows how the default traffic class is automatically placed at the end of policy-map `pm3` even though `class-default` was configured first:

```bash
Switch# show policy-map pm3
Policy Map pm3
  Class cm-3
    set dscp 4
  Class cm-4
    trust cos
  Class class-default
    set dscp 10
Switch#
```

class-map

Use the **class-map** global configuration command to create a class map to be used for matching packets to the class name you specify and to enter class-map configuration mode. Use the **no** form of this command to delete an existing class map and to return to global configuration mode.

```
class-map [match-all | match-any] class-map-name
no class-map [match-all | match-any] class-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match-all</td>
<td>(Optional) Perform a logical-AND of all matching statements under this class map. All criteria in the class map must be matched.</td>
</tr>
<tr>
<td>match-any</td>
<td>(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria must be matched.</td>
</tr>
<tr>
<td>class-map-name</td>
<td>Name of the class map.</td>
</tr>
</tbody>
</table>

**Defaults**

No class maps are defined.

If neither the **match-all** or **match-any** keyword is specified, the default is **match-all**.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to specify the name of the class for which you want to create or modify class-map match criteria and to enter class-map configuration mode.

The **class-map** command and its subcommands are used to define packet classification, marking, and aggregate policing as part of a globally named service policy applied on a per-port basis.

After you are in quality of service (QoS) class-map configuration mode, these configuration commands are available:

- **description**: describes the class map (up to 200 characters). The **show class-map** privileged EXEC command displays the description and the name of the class-map.
- **exit**: exits from QoS class-map configuration mode.
- **match**: configures classification criteria. For more information, see the **match (class-map configuration)** command.
- **no**: removes a match statement from a class map.
- **rename**: renames the current class map. If you rename a class map with a name that is already used, the message **A class-map with this name already exists** appears.
To define packet classification on a physical-port basis, only one match command per class map is supported. In this situation, the match-all and match-any keywords are equivalent.

Only one access control list (ACL) can be configured in a class map. The ACL can have multiple access control entries (ACEs).

### Examples

This example shows how to configure the class map called `class1` with one match criterion, which is an access list called `103`:

```
Switch(config)# access-list 103 permit ip any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
```

This example shows how to delete the class map `class1`:

```
Switch(config)# no class-map class1
```

You can verify your settings by entering the `show class-map` privileged EXEC command.

<td>show dot1x</td>
<td>Displays IEEE 802.1x statistics, administrative status, and operational status for the switch or for the specified port.</td>
</tr>
</tbody>
</table>
clear eap sessions

Use the `clear eap sessions` privileged EXEC command to clear Extensible Authentication Protocol (EAP) session information for the switch or for the specified port.

`clear eap sessions [credentials name [interface interface-id] | interface interface-id | method name | transport name] [credentials name | interface interface-id | transport name]` ...

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credentials name</td>
<td>Clear EAP credential information for the specified profile.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Clear EAP information for the specified interface.</td>
</tr>
<tr>
<td>method name</td>
<td>Clear EAP information for the specified method.</td>
</tr>
<tr>
<td>transport name</td>
<td>Clear EAP transport information for the specified lower level.</td>
</tr>
</tbody>
</table>

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can clear all counters by using the `clear eap sessions` command, or you can clear only the specific information by using the keywords.

**Examples**

This example shows how to clear all EAP information:

```
Switch# clear eap
```

This example shows how to clear EAP-session credential information for the specified profile:

```
Switch# clear eap sessions credential type1
```

You can verify that the information was deleted by entering the `show dot1x` privileged EXEC command.

**Related Commands**

clear ip arp inspection statistics

Use the **clear ip arp inspection statistics** privileged EXEC command to clear the dynamic Address Resolution Protocol (ARP) inspection statistics.

```
clear ip arp inspection statistics [vlan vlan-range]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-range</td>
<td>(Optional) Clear statistics for the specified VLAN or VLANs.</td>
</tr>
<tr>
<td></td>
<td>You can specify a single VLAN identified by VLAN ID number, a range of</td>
</tr>
<tr>
<td></td>
<td>VLANs separated by a hyphen, or a series of VLANs separated by a comma.</td>
</tr>
<tr>
<td></td>
<td>The range is 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the statistics for VLAN 1:

```
switch# clear ip arp inspection statistics vlan 1
```

You can verify that the statistics were deleted by entering the **show ip arp inspection statistics vlan 1** privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show inventory statistics</td>
<td>Displays statistics for forwarded, dropped, MAC validation failure, and IP</td>
</tr>
<tr>
<td></td>
<td>validation failure packets for all VLANs or the specified VLAN.</td>

</tbody>
</table>
clear ip dhcp snooping

Use the clear ip dhcp snooping privileged EXEC command to clear the DHCP snooping binding database, the DHCP snooping binding database agent statistics, or the DHCP snooping statistics counters.

clear ip dhcp snooping {binding {/* | ip-address | interface interface-id | vlan vlan-id} | database statistics | statistics}

Syntax Description

- **binding**: Clear the DHCP snooping binding database.
  - */ Clear all automatic bindings.
  - ip-address Clear the binding entry IP address.
  - interface interface-id Clear the binding input interface.
  - vlan vlan-id Clear the binding entry VLAN.
  - database statistics Clear the DHCP snooping binding database agent statistics.
  - statistics Clear the DHCP snooping statistics counter.

Defaults

No default is defined.

Command Modes

Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(37)SE</td>
<td>The statistics keyword was introduced.</td>
</tr>
<tr>
<td>12.2(44)SE</td>
<td>The */,, interface interface-id, and vlan vlan-id keywords were introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

When you enter the clear ip dhcp snooping database statistics command, the switch does not update the entries in the binding database and in the binding file before clearing the statistics.

Examples

This example shows how to clear the DHCP snooping binding database agent statistics:

```
Switch# clear ip dhcp snooping database statistics
```

You can verify that the statistics were cleared by entering the show ip dhcp snooping database privileged EXEC command.

This example shows how to clear the DHCP snooping statistics counters:

```
Switch# clear ip dhcp snooping statistics
```

You can verify that the statistics were cleared by entering the show ip dhcp snooping statistics user EXEC command.
**clear ip dhcp snooping**

</tbody>
</table>
clear ipc

Use the clear ipc privileged EXEC command to clear Interprocess Communications Protocol (IPC) statistics.

    clear ipc {queue-statistics | statistics}

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue-statistics</td>
<td>Clear the IPC queue statistics.</td>
</tr>
<tr>
<td>statistics</td>
<td>Clear the IPC statistics.</td>
</tr>
</tbody>
</table>

Defaults

No default is defined.

Command Modes

Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can clear all statistics by using the clear ipc statistics command, or you can clear only the queue statistics by using the clear ipc queue-statistics command.

Examples

This example shows how to clear all statistics:

    Switch# clear ipc statistics

This example shows how to clear only the queue statistics:

    Switch# clear ipc queue-statistics

You can verify that the statistics were deleted by entering the show ipc rpc or the show ipc session privileged EXEC command.

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ipc {rpc</td>
<td>Displays the IPC multicast routing statistics.</td>
</tr>
</tbody>
</table>
clear ipv6 dhcp conflict

Use the `clear ipv6 dhcp conflict` privileged EXEC command to clear an address conflict from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server database.

`clear ipv6 dhcp conflict { * | IPv6-address }`

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Clear all address conflicts.</td>
</tr>
<tr>
<td>IPv6-address</td>
<td>Clear the host IPv6 address that contains the conflicting address.</td>
</tr>
</tbody>
</table>

**Defaults**
No default is defined.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6 { default | vlan }` global configuration command, and reload the switch.

When you configure the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor discovery to detect clients and reports to the server through a DECLINE message. If an address conflict is detected, the address is removed from the pool, and the address is not assigned until the administrator removes the address from the conflict list.

If you use the asterisk (*) character as the address parameter, DHCP clears all conflicts.

**Examples**

This example shows how to clear all address conflicts from the DHCPv6 server database:

```
Switch# clear ipv6 dhcp conflict *
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ipv6 dhcp conflict</code></td>
<td>Displays address conflicts found by a DHCPv6 server, or reported through a DECLINE message from a client.</td>
</tr>
</tbody>
</table>
clear l2protocol-tunnel counters

Use the **clear l2protocol-tunnel counters** privileged EXEC command to clear the protocol counters in protocol tunnel ports.

```
clear l2protocol-tunnel counters [interface-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-id</td>
<td>(Optional) Specify interface (physical interface or port channel) for which protocol counters are to be cleared.</td>
</tr>
</tbody>
</table>

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to clear protocol tunnel counters on the switch or on the specified interface.

**Examples**

This example shows how to clear Layer 2 protocol tunnel counters on an interface:

```
Switch# clear l2protocol-tunnel counters gigabitethernet1/0/3
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show l2protocol-tunnel</td>
<td>Displays information about ports configured for Layer 2 protocol tunneling.</td>
</tr>
</tbody>
</table>
clear lacp

Use the `clear lacp` privileged EXEC command to clear Link Aggregation Control Protocol (LACP) channel-group counters.

```
clear lacp {channel-group-number counters | counters}
```

**Syntax Description**

- `channel-group-number` (Optional) Channel group number. The range is 1 to 48.
- `counters` Clear traffic counters.

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>channel-group-number</code> range was changed from 1 to 12 to 1 to 48.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can clear all counters by using the `clear lacp counters` command, or you can clear only the counters for the specified channel group by using the `clear lacp channel-group-number counters` command.

**Examples**

This example shows how to clear all channel-group information:

```
Switch# clear lacp counters
```

This example shows how to clear LACP traffic counters for group 4:

```
Switch# clear lacp 4 counters
```

You can verify that the information was deleted by entering the `show lacp counters` or the `show lacp 4 counters` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show lacp</code></td>
<td>Displays LACP channel-group information.</td>
</tr>
</tbody>
</table>
clear logging smartlog statistics interface

To clear smart logging counters on an interface, use the `clear logging smartlog statistics interface` command in privileged EXEC mode.

```
clear logging smartlog statistics [interface interface-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>Clears smartlog counters on the specified interface.</td>
</tr>
</tbody>
</table>

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can clear all smart logging statistics by using the `clear logging smartlog statistics` command, or you can clear only the statistics on an interface by using the `clear logging smartlog statistics interface interface-id` command.

**Examples**

This example shows how to clear all smart logging statistics:

```
Switch# clear logging smartlog statistics
```

This example shows how to clear only the smart logging statistics on the specified interface:

```
Switch# clear logging smartlog statistics interface gi1/0/1
```

You can verify that the statistics were deleted by entering the `show ipc rpc` or the `show ipc session` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show logging smartlog</td>
<td>Displays the smart logging statistics.</td>
</tr>
<tr>
<td>statistics</td>
<td></td>
</tr>
</tbody>
</table>
clear mac address-table

Use the **clear mac address-table** privileged EXEC command to delete from the MAC address table a specific dynamic address, all dynamic addresses on a particular interface, all dynamic addresses on stack members, or all dynamic addresses on a particular VLAN. This command also clears the MAC address notification global counters.

```
   clear mac address-table { dynamic [address mac-addr | interface interface-id | vlan vlan-id] | notification }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>dynamic</strong></td>
<td>Delete all dynamic MAC addresses.</td>
</tr>
<tr>
<td><strong>dynamic address</strong></td>
<td>(Optional) Delete the specified dynamic MAC address.</td>
</tr>
<tr>
<td><strong>mac-addr</strong></td>
<td></td>
</tr>
<tr>
<td><strong>dynamic interface</strong></td>
<td>(Optional) Delete all dynamic MAC addresses on the specified physical port or port channel.</td>
</tr>
<tr>
<td><strong>interface-id</strong></td>
<td></td>
</tr>
<tr>
<td><strong>dynamic vlan</strong></td>
<td>(Optional) Delete all dynamic MAC addresses for the specified VLAN. The range is 1 to 4094.</td>
</tr>
<tr>
<td><strong>vlan-id</strong></td>
<td></td>
</tr>
<tr>
<td><strong>notification</strong></td>
<td>Clear the notifications in the history table and reset the counters.</td>
</tr>
</tbody>
</table>

### Defaults

No default is defined.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(19)EA1</td>
<td>The <strong>clear mac-address-table</strong> command (with the hyphen) was replaced by the <strong>clear mac address-table</strong> command (without the hyphen).</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to remove a specific MAC address from the dynamic address table:

```
Switch# clear mac address-table dynamic address 0008.0070.0007
```

You can verify that the information was deleted by entering the **show mac address-table** privileged EXEC command.

</tbody>
</table>
clear mac address-table move update

Use the clear mac address-table move update privileged EXEC command to clear the mac address-table-move update-related counters.

```
clear mac address-table move update
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No default is defined.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear the mac address-table move update related counters.

```
switch# clear mac address-table move update
```

You can verify that the information was cleared by entering the show mac address-table move update privileged EXEC command.

**Related Commands**

</tr>
</tbody>
</table>
clear nmsp statistics

Use the **clear nmsp statistics** privileged EXEC command to clear the Network Mobility Services Protocol (NMSP) statistics. This command is available only when your switch is running the cryptographic (encrypted) software image.

### Syntax Description
This command has no arguments or keywords.

### Defaults
No default is defined.

### Command Modes
Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples
This example shows how to clear NMSP statistics:

```
Switch# clear nmsp statistics
```

You can verify that information was deleted by entering the **show nmsp statistics** privileged EXEC command.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show nmsp</td>
<td>Displays the NMSP information.</td>
</tr>
</tbody>
</table>
clear pagp

Use the clear pagp privileged EXEC command to clear Port Aggregation Protocol (PAgP) channel-group information.

    clear pagp {channel-group-number counters | counters}

**Syntax Description**

- **channel-group-number** (Optional) Channel group number. The range is 1 to 48.
- **counters** Clear traffic counters.

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

- **Release** 12.1(11)AX **Modification** This command was introduced.
- **Release** 12.2(25)SE **Modification** The channel-group-number range was changed from 1 to 12 to 1 to 48.

**Usage Guidelines**

You can clear all counters by using the clear pagp counters command, or you can clear only the counters for the specified channel group by using the clear pagp channel-group-number counters command.

**Examples**

This example shows how to clear all channel-group information:

```
Switch# clear pagp counters
```

This example shows how to clear PAgP traffic counters for group 10:

```
Switch# clear pagp 10 counters
```

You can verify that information was deleted by entering the show pagp privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show pagp</td>
<td>Displays PAgP channel-group information.</td>
</tr>
</tbody>
</table>
clear port-security

Use the clear port-security privileged EXEC command to delete from the MAC address table all secure addresses or all secure addresses of a specific type (configured, dynamic, or sticky) on the switch or on an interface.

```
clear port-security {all | configured | dynamic | sticky} [[address mac-addr | interface interface-id] [vlan {vlan-id | {access | voice}}]]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Delete all secure MAC addresses.</td>
</tr>
<tr>
<td>configured</td>
<td>Delete configured secure MAC addresses.</td>
</tr>
<tr>
<td>dynamic</td>
<td>Delete secure MAC addresses auto-learned by hardware.</td>
</tr>
<tr>
<td>sticky</td>
<td>Delete secure MAC addresses, either auto-learned or configured.</td>
</tr>
<tr>
<td>address mac-addr</td>
<td>(Optional) Delete the specified dynamic secure MAC address.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>(Optional) Delete all the dynamic secure MAC addresses on the specified physical port or VLAN.</td>
</tr>
<tr>
<td>vlan</td>
<td>(Optional) Delete the specified secure MAC address from the specified VLAN. Enter one of these options after you enter the vlan keyword:</td>
</tr>
<tr>
<td></td>
<td>• vlan-id—On a trunk port, specify the VLAN ID of the VLAN on which this address should be cleared.</td>
</tr>
<tr>
<td></td>
<td>• access—On an access port, clear the specified secure MAC address on the access VLAN.</td>
</tr>
<tr>
<td></td>
<td>• voice—On an access port, clear the specified secure MAC address on the voice VLAN.</td>
</tr>
</tbody>
</table>

**Note** The voice keyword is available only if voice VLAN is configured on a port and if that port is not the access VLAN.

### Defaults

No default is defined.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEA</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEB</td>
<td>The access and voice keywords were added.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to clear all secure addresses from the MAC address table:

```
Switch# clear port-security all
```

This example shows how to remove a specific configured secure address from the MAC address table:

```
Switch# clear port-security configured address 0008.0070.0007
```
This example shows how to remove all the dynamic secure addresses learned on a specific interface:

```
Switch# clear port-security dynamic interface gigabitethernet1/0/1
```

This example shows how to remove all the dynamic secure addresses from the address table:

```
Switch# clear port-security dynamic
```

You can verify that the information was deleted by entering the `show port-security` privileged EXEC command.

### Related Commands

<tr>
<td>igmp</td>
<td>(Optional) Clear the counter of dropped packets for IGMP and IGMP snooping.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

In this example, the protocol storm protection counter for DHCP is cleared.

```
Switch# clear psp counter dhcp
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`psp [arp</td>
<td>dhcp</td>
</tr>
<tr>
<td><code>show psp config</code></td>
<td>Displays the protocol storm protection configuration</td>
</tr>
<tr>
<td><code>show psp statistics</code></td>
<td>Displays the number of dropped packets.</td>
</tr>
</tbody>
</table>
clear spanning-tree counters

Use the `clear spanning-tree counters` privileged EXEC command to clear the spanning-tree counters.

```
clear spanning-tree counters [interface interface-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface interface-id</code></td>
<td>(Optional) Clear all spanning-tree counters on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.</td>
</tr>
</tbody>
</table>

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the `interface-id` is not specified, spanning-tree counters are cleared for all interfaces.

**Examples**

This example shows how to clear spanning-tree counters for all interfaces:

```
Switch# clear spanning-tree counters
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show spanning-tree</code></td>
<td>Displays spanning-tree state information.</td>
</tr>
</tbody>
</table>
clear spanning-tree detected-protocols

Use the clear spanning-tree detected-protocols privileged EXEC command to restart the protocol migration process (force the renegotiation with neighboring switches) on all interfaces or on the specified interface.

```
clear spanning-tree detected-protocols [interface interface-id]
```

**Syntax Description**

- `interface interface-id` (Optional) Restart the protocol migration process on the specified interface. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A switch running the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol or the Multiple Spanning Tree Protocol (MSTP) supports a built-in protocol migration mechanism that enables it to interoperate with legacy IEEE 802.1D switches. If a rapid-PVST+ switch or an MSTP switch receives a legacy IEEE 802.1D configuration bridge protocol data unit (BPDU) with the protocol version set to 0, it sends only IEEE 802.1D BPDUs on that port. A multiple spanning-tree (MST) switch can also detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (Version 3) associated with a different region, or a rapid spanning-tree (RST) BPDU (Version 2).

However, the switch does not automatically revert to the rapid-PVST+ or the MSTP mode if it no longer receives IEEE 802.1D BPDUs because it cannot learn whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. Use the clear spanning-tree detected-protocols command in this situation.

**Examples**

This example shows how to restart the protocol migration process on a port:

```
Switch# clear spanning-tree detected-protocols interface gigabitethernet2/0/1
```

This example shows how to clear the VTP counters:
```
Switch# clear vtp counters
```

You can verify that information was deleted by entering the `show vtp counters` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vtp</code></td>
<td>Displays general information about the VTP management domain, status, and counters.</td>
</tr>
</tbody>
</table>
cluster commander-address

You do not need to enter this command from a standalone cluster member switch. The cluster command switch automatically provides its MAC address to cluster member switches when these switches join the cluster. The cluster member switch adds this information and other cluster information to its running configuration file. Use the no form of this global configuration command from the cluster member switch console port to remove the switch from a cluster only during debugging or recovery procedures.

```
cluster commander-address mac-address [member number name name]
```

```
no cluster commander-address
```

Syntax Description

- **mac-address**: MAC address of the cluster command switch.
- **member number**: (Optional) Number of a configured cluster member switch. The range is 0 to 15.
- **name name**: (Optional) Name of the configured cluster up to 31 characters.

Defaults

The switch is not a member of any cluster.

Command Modes

Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command is available only on the cluster command switch.

A cluster member can have only one cluster command switch.

The cluster member switch retains the identity of the cluster command switch during a system reload by using the mac-address parameter.

You can enter the no form on a cluster member switch to remove it from the cluster during debugging or recovery procedures. You would normally use this command from the cluster member switch console port only when the member has lost communication with the cluster command switch. With normal switch configuration, we recommend that you remove cluster member switches only by entering the no cluster member n global configuration command on the cluster command switch.

When a standby cluster command switch becomes active (becomes the cluster command switch), it removes the cluster commander address line from its configuration.
**Examples**

This is partial sample output from the running configuration of a cluster member.

```
Switch(config)# show running-configuration
<output truncated>
cluster commander-address 00e0.9bc0.a500 member 4 name my_cluster
<output truncated>
```

This example shows how to remove a member from the cluster by using the cluster member console.

```
Switch # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no cluster commander-address
```

You can verify your settings by entering the `show cluster` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug cluster</td>
<td>Displays the cluster status and a summary of the cluster to which the switch belongs.</td>
</tr>
</tbody>
</table>
cluster discovery hop-count

Use the `cluster discovery hop-count` global configuration command on the cluster command switch to set the hop-count limit for extended discovery of candidate switches. Use the `no` form of this command to return to the default setting.

```
cluster discovery hop-count number
no cluster discovery hop-count
```

**Syntax Description**

- `number` Number of hops from the cluster edge that the cluster command switch limits the discovery of candidates. The range is 1 to 7.

**Defaults**

The hop count is set to 3.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is available only on the cluster command switch. This command does not operate on cluster member switches.

If the hop count is set to 1, it disables extended discovery. The cluster command switch discovers only candidates that are one hop from the edge of the cluster. The edge of the cluster is the point between the last discovered cluster member switch and the first discovered candidate switch.

**Examples**

This example shows how to set hop count limit to 4. This command is executed on the cluster command switch.

```
Switch(config)# cluster discovery hop-count 4
```

You can verify your setting by entering the `show cluster` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cluster</code></td>
<td>Displays the cluster status and a summary of the cluster to which the switch belongs.</td>
</tr>
<tr>
<td><code>show cluster candidates</code></td>
<td>Displays a list of candidate switches.</td>
</tr>
</tbody>
</table>
cluster enable

Use the **cluster enable** global configuration command on a command-capable switch to enable it as the cluster command switch, assign a cluster name, and to optionally assign a member number to it. Use the **no** form of the command to remove all members and to make the cluster command switch a candidate switch.

```
cluster enable name [command-switch-member-number]
```

```
no cluster enable
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the cluster up to 31 characters. Valid characters include only alphanumerics, dashes, and underscores.</td>
</tr>
<tr>
<td>command-switch-member-number</td>
<td>(Optional) Assign a member number to the cluster command switch of the cluster. The range is 0 to 15.</td>
</tr>
</tbody>
</table>

### Defaults

The switch is not a cluster command switch.

No cluster name is defined.

The member number is 0 when the switch is the cluster command switch.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Enter this command on any command-capable switch that is not part of any cluster. This command fails if a device is already configured as a member of the cluster.

You must name the cluster when you enable the cluster command switch. If the switch is already configured as the cluster command switch, this command changes the cluster name if it is different from the previous cluster name.

### Examples

This example shows how to enable the cluster command switch, name the cluster, and set the cluster command switch member number to 4.

```
Switch(config)# cluster enable Engineering-IDF4 4
```

You can verify your setting by entering the **show cluster** privileged EXEC command on the cluster command switch.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show cluster</strong></td>
<td>Displays the cluster status and a summary of the cluster to which the switch belongs.</td>
</tr>
</tbody>
</table>
cluster holdtime

Use the `cluster holdtime` global configuration command on the cluster command switch to set the duration in seconds before a switch (either the command or cluster member switch) declares the other switch down after not receiving heartbeat messages. Use the `no` form of this command to set the duration to the default value.

```
cluster holdtime holdtime-in-secs

no cluster holdtime
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>holdtime-in-secs</code></td>
<td>Duration in seconds before a switch (either a command or cluster member switch) declares the other switch down. The range is 1 to 300 seconds.</td>
</tr>
</tbody>
</table>

**Defaults**

The default holdtime is 80 seconds.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter this command with the `cluster timer` global configuration command only on the cluster command switch. The cluster command switch propagates the values to all its cluster members so that the setting is consistent among all switches in the cluster.

The holdtime is typically set as a multiple of the interval timer (`cluster timer`). For example, it takes `(holdtime-in-secs divided by the interval-in-secs)` number of heartbeat messages to be missed in a row to declare a switch down.

**Examples**

This example shows how to change the interval timer and the duration on the cluster command switch.

```
Switch(config)# cluster timer 3
Switch(config)# cluster holdtime 30
```

You can verify your settings by entering the `show cluster` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cluster</code></td>
<td>Displays the cluster status and a summary of the cluster to which the switch belongs.</td>
</tr>
</tbody>
</table>
cluster member

Use the `cluster member` global configuration command on the cluster command switch to add candidates to a cluster. Use the `no` form of the command to remove members from the cluster.

```
cluster member [n] mac-address H.H.H [password enable-password] [vlan vlan-id]

no cluster member n
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>n</code></td>
<td>The number that identifies a cluster member. The range is 0 to 15.</td>
</tr>
<tr>
<td><code>mac-address H.H.H</code></td>
<td>MAC address of the cluster member switch in hexadecimal format.</td>
</tr>
<tr>
<td><code>password enable-password</code></td>
<td>Enable password of the candidate switch. The password is not required if there is no password on the candidate switch.</td>
</tr>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) VLAN ID through which the candidate is added to the cluster by the cluster command switch. The range is 1 to 4094.</td>
</tr>
</tbody>
</table>

### Defaults

A newly enabled cluster command switch has no associated cluster members.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Enter this command only on the cluster command switch to add a candidate to or remove a member from the cluster. If you enter this command on a switch other than the cluster command switch, the switch rejects the command and displays an error message.

You must enter a member number to remove a switch from the cluster. However, you do not need to enter a member number to add a switch to the cluster. The cluster command switch selects the next available member number and assigns it to the switch that is joining the cluster.

You must enter the enable password of the candidate switch for authentication when it joins the cluster. The password is not saved in the running or startup configuration. After a candidate switch becomes a member of the cluster, its password becomes the same as the cluster command-switch password.

If a switch does not have a configured hostname, the cluster command switch appends a member number to the cluster command-switch hostname and assigns it to the cluster member switch.

If you do not specify a VLAN ID, the cluster command switch automatically chooses a VLAN and adds the candidate to the cluster.
Examples

This example shows how to add a switch as member 2 with MAC address 00E0.1E00.2222 and the password key to a cluster. The cluster command switch adds the candidate to the cluster through VLAN 3.

Switch(config)# cluster member 2 mac-address 00E0.1E00.2222 password key vlan 3

This example shows how to add a switch with MAC address 00E0.1E00.3333 to the cluster. This switch does not have a password. The cluster command switch selects the next available member number and assigns it to the switch that is joining the cluster.

Switch(config)# cluster member mac-address 00E0.1E00.3333

You can verify your settings by entering the `show cluster members` privileged EXEC command on the cluster command switch.

Related Commands

<td><code>show cluster members</code></td>
<td>Displays information about the cluster members.</td>
</tr>
</tbody>
</table>
cluster outside-interface

Use the `cluster outside-interface` global configuration command on the cluster command switch to configure the outside interface for cluster Network Address Translation (NAT) so that a member without an IP address can communicate with devices outside the cluster. Use the `no` form of this command to return to the default setting.

```
cluster outside-interface interface-id

no cluster outside-interface
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface-id</code></td>
<td>Interface to serve as the outside interface. Valid interfaces include physical interfaces, port-channels, or VLANs. The port-channel range is 1 to 48. The VLAN range is 1 to 4094.</td>
</tr>
</tbody>
</table>

### Defaults

The default outside interface is automatically selected by the cluster command switch.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Enter this command only on the cluster command switch. If you enter this command on a cluster member switch, an error message appears.

### Examples

This example shows how to set the outside interface to VLAN 1:

```
Switch(config)# cluster outside-interface vlan 1
```

You can verify your setting by entering the `show running-config` privileged EXEC command.

### Related Commands

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Displays the current operating configuration.</td>
</tr>
</tbody>
</table>
cluster run

Use the `cluster run` global configuration command to enable clustering on a switch. Use the `no` form of this command to disable clustering on a switch.

```
cluster run
no cluster run
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Clustering is enabled on all switches.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When you enter the `no cluster run` command on a cluster command switch, the cluster command switch is disabled. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the `no cluster run` command on a cluster member switch, it is removed from the cluster. Clustering is disabled, and the switch cannot become a candidate switch.

When you enter the `no cluster run` command on a switch that is not part of a cluster, clustering is disabled on this switch. This switch cannot then become a candidate switch.

**Examples**
This example shows how to disable clustering on the cluster command switch:

```
Switch(config)# no cluster run
```

You can verify your setting by entering the `show cluster` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cluster</code></td>
<td>Displays the cluster status and a summary of the cluster to which the switch belongs.</td>
</tr>
</tbody>
</table>
cluster standby-group

Use the **cluster standby-group** global configuration command to enable cluster command-switch redundancy by binding the cluster to an existing Hot Standby Router Protocol (HSRP). Entering the routing-redundancy keyword enables the same HSRP group to be used for cluster command-switch redundancy and routing redundancy. Use the **no** form of this command to return to the default setting.

```
cluster standby-group HSRP-group-name [routing-redundancy]
no cluster standby-group
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>HSRP-group-name</strong></th>
<th>Name of the HSRP group that is bound to the cluster. The group name is limited to 32 characters.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>routing-redundancy</strong></td>
<td>(Optional) Enable the same HSRP standby group to be used for cluster command-switch redundancy and routing redundancy.</td>
</tr>
</tbody>
</table>

**Defaults**

The cluster is not bound to any HSRP group.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter this command only on the cluster command switch. If you enter it on a cluster member switch, an error message appears.

The cluster command switch propagates the cluster-HSRP binding information to all cluster-HSRP capable members. Each cluster member switch stores the binding information in its NVRAM. The HSRP group name must be a valid standby group; otherwise, the command exits with an error.

The same group name should be used on all members of the HSRP standby group that is to be bound to the cluster. The same HSRP group name should also be used on all cluster-HSRP capable members for the HSRP group that is to be bound. (When not binding a cluster to an HSRP group, you can use different names on the cluster commander and the members.)

**Examples**

This example shows how to bind the HSRP group named *my_hsrp* to the cluster. This command is executed on the cluster command switch.

```
Switch(config)# cluster standby-group my_hsrp
```

This example shows how to use the same HSRP group named *my_hsrp* for routing redundancy and cluster redundancy.

```
Switch(config)# cluster standby-group my_hsrp routing-redundancy
```
This example shows the error message when this command is executed on a cluster command switch and the specified HSRP standby group does not exist:

```
Switch(config)# cluster standby-group my_hsrp
%ERROR: Standby (my_hsrp) group does not exist
```

This example shows the error message when this command is executed on a cluster member switch:

```
Switch(config)# cluster standby-group my_hsrp routing-redundancy
%ERROR: This command runs on a cluster command switch
```

You can verify your settings by entering the `show cluster` privileged EXEC command. The output shows whether redundancy is enabled in the cluster.

<table>

cluster timer

Use the **cluster timer** global configuration command on the cluster command switch to set the interval in seconds between heartbeat messages. Use the **no** form of this command to set the interval to the default value.

```
cluster timer interval-in-secs

no cluster timer
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval-in-secs</td>
<td>Interval in seconds between heartbeat messages. The range is 1 to 300 seconds.</td>
</tr>
</tbody>
</table>

**Defaults**

The interval is 8 seconds.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter this command with the **cluster holdtime** global configuration command only on the cluster command switch. The cluster command switch propagates the values to all its cluster members so that the setting is consistent among all switches in the cluster.

The holdtime is typically set as a multiple of the heartbeat interval timer (**cluster timer**). For example, it takes (holdtime-in-secs divided by the interval-in-secs) number of heartbeat messages to be missed in a row to declare a switch down.

**Examples**

This example shows how to change the heartbeat interval timer and the duration on the cluster command switch:

```
Switch(config)# cluster timer 3
Switch(config)# cluster holdtime 30
```

You can verify your settings by entering the **show cluster** privileged EXEC command.

define interface-range

Use the `define interface-range` global configuration command to create an interface-range macro. Use the `no` form of this command to delete the defined macro.

```
define interface-range macro-name interface-range

no define interface-range macro-name interface-range
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>macro-name</td>
<td>Name of the interface-range macro; up to 32 characters.</td>
</tr>
<tr>
<td>interface-range</td>
<td>Interface range; for valid values for interface ranges, see “Usage Guidelines.”</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default setting.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The macro name is a 32-character maximum character string.

A macro can contain up to five ranges.

All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs, but you can combine multiple interface types in a macro.

When entering the `interface-range`, use this format:

- `type {first-interface} - {last-interface}`
- You must add a space between the first interface number and the hyphen when entering an `interface-range`. For example, `gigabitethernet 1/0/1 - 2` is a valid range; `gigabitethernet 1/0/1-2` is not a valid range.

Valid values for `type` and `interface`:

- `vlan vlan-id- vlan-ID`, where the VLAN ID is 1 to 4094
  - VLAN interfaces must have been configured with the `interface vlan` command (the `show running-config` privileged EXEC command displays the configured VLAN interfaces). VLAN interfaces not displayed by the `show running-config` command cannot be used in `interface-ranges`.
- `port-channel port-channel-number`, where `port-channel-number` is from 1 to 48
- `fastethernet stack member/module/{first port} - {last port}`
- `gigabitethernet stack member/module/{first port} - {last port}`
For physical interfaces:

- stack member is the number used to identify the switch within the stack. The number ranges from 1 to 9 and is assigned to the switch the first time the stack member initializes.
- module is always 0.
- the range is type stack member/0/number - number (for example, gigabitethernet 1/0/1 - 2).

When you define a range, you must enter a space before the hyphen (-), for example:

```
gigabitethernet1/0/1 - 2
```

You can also enter multiple ranges. When you define multiple ranges, you must enter a space after the first entry before the comma (,). The space after the comma is optional, for example:

```
fastethernet1/0/3, gigabitethernet1/0/1 - 2
fastethernet1/0/3 -4, gigabitethernet1/0/1 - 2
```

**Examples**

This example shows how to create a multiple-interface macro:

```
Switch(config)# define interface-range macro1 fastethernet1/01 - 2, gigabitethernet1/0/1 - 2
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface range</code></td>
<td>Executes a command on multiple ports at the same time.</td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Displays the current operating configuration, including defined macros.</td>
</tr>
</tbody>
</table>
delete

Use the `delete` privileged EXEC command to delete a file or directory on the flash memory device.

```
delete [/force] [/recursive] filesystem:/file-url
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/force</code></td>
<td>(Optional) Suppress the prompt that confirms the deletion.</td>
</tr>
<tr>
<td><code>/recursive</code></td>
<td>(Optional) Delete the named directory and all subdirectories and the files contained in it.</td>
</tr>
<tr>
<td><code>filesystem:</code></td>
<td>Alias for a flash file system. The syntax for the local flash file system on the stack member or the stack master: <code>flash:</code> From the stack master, the syntax for the local flash file system on a stack member: <code>flash member number:</code></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you use the `/force` keyword, you are prompted once at the beginning of the deletion process to confirm the deletion.

If you use the `/recursive` keyword without the `/force` keyword, you are prompted to confirm the deletion of every file.

The prompting behavior depends on the setting of the `file prompt` global configuration command. By default, the switch prompts for confirmation on destructive file operations. For more information about this command, see the *Cisco IOS Command Reference for Release 12.1*.

**Examples**

This example shows how to remove the directory that contains the old software image after a successful download of a new image:

```
Switch# delete /force /recursive flash:/old-image
```

You can verify that the directory was removed by entering the `dir filesystem:` privileged EXEC command.

**Command Modes**

Privileged EXEC

**Command History**

</table>
deny (access-list configuration mode)

To enable smart logging in a named IP access list with deny conditions, use the `deny` command in access list configuration mode with the `smartlog` keyword. Matches to ACL entries are logged to a NetFlow collector. To disable smart logging for the access list, use the `no` form of this command.

```
deny {source [source-wildcard] | host source | any} [log] [smartlog]

no deny {source [source-wildcard] | host source | any} [smartlog]

deny protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [dscp tos] [precedence precedence] [tos tos] [fragments] [log] [time-range time-range-name] [smartlog]

no deny protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [dscp tos] [precedence precedence] [tos tos] [fragments] [log] [time-range time-range-name] [smartlog]
```

**Syntax Description**

- `smartlog` (Optional) Sends packet flows matching the access list to a NetFlow collector when smart logging is enabled on the switch.

**Defaults**

ACL smart logging is not enabled.

**Command Modes**

Access list configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>The <code>smartlog</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the complete syntax description of the `deny` command without the `smartlog` keyword, see the *Cisco IOS Security Command Reference*.

When an ACL is applied to an interface, packets matching the ACL are denied or permitted based on the ACL configuration. When smart logging is enabled on the switch and an ACL includes the `smartlog` keyword, the contents of the denied or permitted packet are sent to a Flexible NetFlow collector.

You must also enable smart logging globally by entering the `logging smartlog` global configuration command.

Only port ACLs (ACLs attached to Layer 2 interfaces) support smart logging. Router ACLs or VLAN ACLs do not support smart logging. Port ACLs do not support logging.

When an ACL is applied to an interface, matching packets can be either logged or smart logged, but not both.

You can verify that smart logging is enabled in an ACL by entering the `show ip access list` privileged EXEC command.
Examples

This example enables smart logging on a named access list with a deny condition:

Switch(config)# ip access-list extended test1
Switch(config-ext-nacl)# deny ip host 10.1.1.3 any smartlog

deny (ARP access-list configuration)

Use the **deny** Address Resolution Protocol (ARP) access-list configuration command to deny an ARP packet based on matches against the DHCP bindings. Use the **no** form of this command to remove the specified access control entry (ACE) from the access list.

```plaintext

```

**Syntax Description**

- **request**
  - (Optional) Define a match for the ARP request. When **request** is not specified, matching is performed against all ARP packets.

- **ip**
  - Specify the sender IP address.

- **any**
  - Deny any IP or MAC address.

- **host sender-ip**
  - Deny the specified sender IP address.

- **sender-ip sender-ip-mask**
  - Deny the specified range of sender IP addresses.

- **mac**
  - Deny the sender MAC address.

- **host sender-mac**
  - Deny a specific sender MAC address.

- **sender-mac sender-mac-mask**
  - Deny the specified range of sender MAC addresses.

- **response ip**
  - Define the IP address values for the ARP responses.

- **host target-ip**
  - Deny the specified target IP address.

- **target-ip target-ip-mask**
  - Deny the specified range of target IP addresses.

- **mac**
  - Deny the MAC address values for the ARP responses.

- **host target-mac**
  - Deny the specified target MAC address.

- **target-mac target-mac-mask**
  - Deny the specified range of target MAC addresses.

- **log**
  - (Optional) Log a packet when it matches the ACE.

**Defaults**

There are no default settings. However, at the end of the ARP access list, there is an implicit **deny ip any mac any** command.

**Command Modes**

ARP access-list configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

You can add deny clauses to drop ARP packets based on matching criteria.

Examples

This example shows how to define an ARP access list and to deny both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# deny ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
```

You can verify your settings by entering the `show arp access-list` privileged EXEC command.

deny (IPv6 access-list configuration)

Use the `deny` command in IPv6 access list configuration mode to set deny conditions for an IPv6 access list. Use the `no` form of this command to remove the deny conditions.

```
deny {protocol} {source-ipv6-prefix|prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value] [time-range name]
```

```
no deny {protocol} {source-ipv6-prefix|prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [fragments] [log] [log-input] [sequence value] [time-range name]
```

Internet Control Message Protocol

```
deny icmp {source-ipv6-prefix|prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address} [operator [port-number]] [icmp-type | icmp-code | icmp-message] [dscp value] [log] [log-input] [sequence value] [time-range name]
```

Transmission Control Protocol

```
deny tcp {source-ipv6-prefix|prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address} [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port | protocol}] [psh] [range {port | protocol}] [rst] [sequence value] [syn] [time-range name] [urg]
```

User Datagram Protocol

```
deny udp {source-ipv6-prefix|prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix|prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port | protocol}] [sequence value] [time-range name]
```

---

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.
### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>protocol</strong></td>
<td>Name or number of an Internet protocol. It can be one of the keywords <code>ahp</code>, <code>esp</code>, <code>icmp</code>, <code>ipv6</code>, <code>pcp</code>, <code>sctp</code>, <code>tcp</code>, or <code>udp</code>, or an integer in the range from 0 to 255 representing an IPv6 protocol number.</td>
</tr>
<tr>
<td><strong>source-ipv6-prefix/prefix-length</strong></td>
<td>The source IPv6 network or class of networks about which to set deny conditions. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. <strong>Note</strong> Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.</td>
</tr>
<tr>
<td><strong>any</strong></td>
<td>An abbreviation for the IPv6 prefix ::/0.</td>
</tr>
<tr>
<td><strong>host source-ipv6-address</strong></td>
<td>The source IPv6 host address for which to set deny conditions. This <code>source-ipv6-address</code> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</td>
</tr>
<tr>
<td><strong>operator [port-number]</strong></td>
<td>(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are <code>lt</code> (less than), <code>gt</code> (greater than), <code>eq</code> (equal), <code>neq</code> (not equal), and <code>range</code> (inclusive range). If the operator is positioned after the <code>source-ipv6-prefix/prefix-length</code> argument, it must match the source port. If the operator is positioned after the <code>destination-ipv6-prefix/prefix-length</code> argument, it must match the destination port. The <code>range</code> operator requires two port numbers. All other operators require one port number. The optional <code>port-number</code> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.</td>
</tr>
<tr>
<td><strong>destination-ipv6-prefix/prefix-length</strong></td>
<td>The destination IPv6 network or class of networks for which to set deny conditions. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. <strong>Note</strong> Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.</td>
</tr>
<tr>
<td><strong>host destination-ipv6-address</strong></td>
<td>The destination IPv6 host address for which to set deny conditions. This <code>destination-ipv6-address</code> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</td>
</tr>
<tr>
<td><strong>dscp value</strong></td>
<td>(Optional) Match a differentiated services code point value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</td>
</tr>
</tbody>
</table>
deny (IPv6 access-list configuration)

(Optional) Match non-initial fragmented packets where the fragment extension header contains a non-zero fragment offset. The **fragments** keyword is an option only if the protocol is **ipv6** and the **operator** arguments are not specified.

**log**

(Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages sent to the console is controlled by the **logging console** command.)

The message includes the access list name and sequence number, whether the packet was denied; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets denied in the prior 5-minute interval.

**Note** Logging is not supported for port ACLs.

**log-input**

(Optional) Provide the same function as the **log** keyword, except that the logging message also includes the receiving interface.

**sequence value**

(Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.

**time-range name**

(Optional) Specify the time range that applies to the deny statement. The name of the time range and its restrictions are specified by the **time-range** and **absolute** or **periodic** commands, respectively.

**icmp-type**

(Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by an ICMP message type. The type is a number from 0 to 255.

**icmp-code**

(Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.

**icmp-message**

(Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or an ICMP message type and code. The possible names are listed in the “Usage Guidelines” section.

**ack**

(Optional) Only for the TCP protocol: Acknowledgment (ACK) bit set.

**established**

(Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.

**fin**

(Optional) Only for the TCP protocol: Fin bit set; no more data from sender.

**neq** \{port | protocol\}

(Optional) Match only packets that are not on a given port number.

**psh**

(Optional) Only for the TCP protocol: Push function bit set.

**range** \{port | protocol\}

(Optional) Match only packets in the range of port numbers.

**rst**

(Optional) Only for the TCP protocol: Reset bit set.

**syn**

(Optional) Only for the TCP protocol: Synchronize bit set.

**urg**

(Optional) Only for the TCP protocol: Urgent pointer bit set.
Note

Although visible in the command-line help strings, the flow-label, routing, and undetermined-transport keywords are not supported.

Defaults

No IPv6 access list is defined.

Command Modes

IPv6 access list configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The deny (IPv6 access-list configuration mode) command is similar to the deny (IPv4 access-list configuration mode) command, except that it is IPv6-specific.

Use the deny (IPv6) command after the ipv6 access-list command to enter IPv6 access list configuration mode and to define the conditions under which a packet passes the access list.

Specifying IPv6 for the protocol argument matches against the IPv6 header of the packet.

By default, the first statement in an access list is number 10, and the subsequent statements are numbered in increments of 10.

You can add permit, deny, or remark statements to an existing access list without re-entering the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to show where it belongs.

Note

Every IPv6 ACL has implicit permit icmp any any nd-na, permit icmp any any nd-ns, and deny ipv6 any any statements as its last match conditions. The two permit conditions allow ICMPv6 neighbor discovery. To disallow ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any nd-ns, there must be an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Both the source-ipv6-prefix/prefix-length and destination-ipv6-prefix/prefix-length arguments are used for traffic filtering. (The source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic destination.)

The switch supports only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.

The fragments keyword is an option only if the protocol is ipv6 and the operator [port-number] arguments are not specified.
deny (IPv6 access-list configuration)

This is a list of ICMP message names:

- beyond-scope
- echo-reply
- header
- mld-query
- mld-report
- nd-ns
- no-admin
- packet-too-big
- parameter-problem
- reassembly-timeout
- renum-result
- router-advertisement
- router-solicitation
- unreachable
- destination-unreachable
- echo-request
- hop-limit
- mld-reduction
- nd-na
- next-header
- no-route
- parameter-option
- port-unreachable
- renum-command
- renum-seq-number
- router-renumbering
- time-exceeded

Examples

This example configures the IPv6 access list named CISCO and applies the access list to outbound traffic on a Layer 3 interface. The first deny entry in the list prevents all packets that have a destination TCP port number greater than 5000 from leaving the interface. The second deny entry in the list prevents all packets that have a source UDP port number less than 5000 from leaving the interface. The second deny also logs all matches to the console. The first permit entry in the list permits all ICMP packets to leave the interface. The second permit entry in the list permits all other traffic to leave the interface. The second permit entry is necessary because an implicit deny-all condition is at the end of each IPv6 access list.

```
Switch(config)# ipv6 access-list CISCO
Switch(config-ipv6-acl)# deny tcp any any gt 5000
Switch(config-ipv6-acl)# deny ::/0 lt 5000 ::/0 log
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# permit any any
Switch(config-ipv6-acl)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter CISCO out
```

deny (MAC access-list configuration)

Use the `deny` MAC access-list configuration command to prevent non-IP traffic from being forwarded if the conditions are matched. Use the `no` form of this command to remove a deny condition from the named MAC access list.

```
deny (MAC access-list configuration)

{deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} {type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp}

no {deny | permit} {any | host src-MAC-addr | src-MAC-addr mask} {any | host dst-MAC-addr | dst-MAC-addr mask} {type mask | aarp | amber | cos cos | dec-spanning | decnet-iv | diagnostic | dsm | etype-6000 | etype-8042 | lat | lavc-sca | lsap lsap mask | mop-console | mop-dump | msdos | mumps | netbios | vines-echo | vines-ip | xns-idp}
```

**Syntax Description**

- `any` : Keyword to specify to deny any source or destination MAC address.
- `host src-MAC-addr | src-MAC-addr mask` : Define a host MAC address and optional subnet mask. If the source address for a packet matches the defined address, non-IP traffic from that address is denied.
- `host dst-MAC-addr | dst-MAC-addr mask` : Define a destination MAC address and optional subnet mask. If the destination address for a packet matches the defined address, non-IP traffic to that address is denied.
- `type mask` : (Optional) Use the Ethertype number of a packet with Ethernet II or SNAP encapsulation to identify the protocol of the packet. The `type` is 0 to 65535, specified in hexadecimal. The `mask` is a mask of don’t care bits applied to the Ethertype before testing for a match.
- `aarp` : (Optional) Select Ethertype AppleTalk Address Resolution Protocol that maps a data-link address to a network address.
- `amber` : (Optional) Select EtherType DEC-Amber.
- `cos cos` : (Optional) Select a class of service (CoS) number from 0 to 7 to set priority. Filtering on CoS can be performed only in hardware. A warning message reminds the user if the cos option is configured.
- `dec-spanning` : (Optional) Select EtherType Digital Equipment Corporation (DEC) spanning tree.
- `decnet-iv` : (Optional) Select EtherType DECnet Phase IV protocol.
- `diagnostic` : (Optional) Select EtherType DEC-Diagnostic.
- `dsm` : (Optional) Select EtherType DEC-DSM.
- `etype-6000` : (Optional) Select EtherType 0x6000.
- `etype-8042` : (Optional) Select EtherType 0x8042.
- `lat` : (Optional) Select EtherType DEC-LAT.
- `lavc-sca` : (Optional) Select EtherType DEC-LAVC-SCA.
deny (MAC access-list configuration)

**lsap lsap-number mask**  
(Optional) Use the LSAP number (0 to 65535) of a packet with 802.2 encapsulation to identify the protocol of the packet.  
*mask* is a mask of *don’t care* bits applied to the LSAP number before testing for a match.

**mop-console**  
(Optional) Select EtherType DEC-MOP Remote Console.

**mop-dump**  
(Optional) Select EtherType DEC-MOP Dump.

**msdos**  
(Optional) Select EtherType DEC-MSDOS.

**mumps**  
(Optional) Select EtherType DEC-MUMPS.

**netbios**  
(Optional) Select EtherType DEC- Network Basic Input/Output System (NETBIOS).

**vines-echo**  
(Optional) Select EtherType Virtual Integrated Network Service (VINES) Echo from Banyan Systems.

**vines-ip**  
(Optional) Select EtherType VINES IP.

**xns-idp**  
(Optional) Select EtherType Xerox Network Systems (XNS) protocol suite (0 to 65535), an arbitrary Ethertype in decimal, hexadecimal, or octal.

**Note**  
Though visible in the command-line help strings, **appletalk** is not supported as a matching condition.

To filter IPX traffic, you use the *type mask* or **lsap lsap mask** keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-12.

**Table 2-12  IPX Filtering Criteria**

<table>
<thead>
<tr>
<th>IPX Encapsulation Type</th>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines
You enter MAC-access list configuration mode by using the `mac access-list extended` global configuration command.

If you use the `host` keyword, you cannot enter an address mask; if you do not use the `host` keyword, you must enter an address mask.

When an access control entry (ACE) is added to an access control list, an implied `deny-any-any` condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

For more information about named MAC extended access lists, see the software configuration guide for this release.

Examples
This example shows how to define the named MAC extended access list to deny NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is denied.

```
Switch(config-ext-macl)# deny any host 00c0.00a0.03fa netbios.
```

This example shows how to remove the deny condition from the named MAC extended access list:

```
Switch(config-ext-macl)# no deny any 00c0.00a0.03fa 0000.0000.0000 netbios.
```

This example denies all packets with Ethertype 0x4321:

```
Switch(config-ext-macl)# deny any any 0x4321 0
```

You can verify your settings by entering the `show access-lists` privileged EXEC command.

Usage Guidelines

Use these guidelines when scheduling testing:

- **test-id**—Enter the `show diagnostic content` privileged EXEC command to display the test ID list.
- **test-id-range**—Enter the `show diagnostic content` command to display the test ID list. Enter the range as integers separated by a comma and a hyphen (for example, 1,3-6 specifies test IDs 1, 3, 4, 5, and 6).
- **hh**—Enter the hours from 0 to 23.
- **mm**—Enter the minutes from 0 to 60.
- **ss**—Enter the seconds from 0 to 60.
- **milliseconds**—Enter the milliseconds from 0 to 999.
- **day**—Enter the day as a number from 0 to 20.

When entering the `diagnostic monitor switch {num} test {test-id | test-id-range | all}` command, follow these required guidelines:

- Isolate network traffic by disabling all connected ports, and do not pump test packets during the test.
- Reset the system or the test module before putting the system back into the normal operating mode.

**Note**

If you are running a diagnostic test that has the reload attribute on a switch in a stack, you could potentially partition the stack depending on your cabling configuration. To avoid partitioning your stack, you should enter the `show switch detail` privileged EXEC command to verify the stack configuration.

Examples

This example shows how to configure the specified test to run every 2 minutes:

```
Switch(config)# diagnostic monitor interval switch 1 test 1 00:02:00 0 1
```

This example shows how to run the test on the specified switch if health monitoring has not previously been enabled:

```
Switch(config)# diagnostic monitor switch 1 test 1
```

This example shows how to set the failure threshold for test monitoring on a switch:

```
Switch(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
```

This example shows how to enable generating a syslog message when any health monitoring test fails:

```
Switch(config)# diagnostic monitor syslog
```

Usage Guidelines

Use these guidelines when scheduling testing:

- `test-id`—Enter the `show diagnostic content` command to display the test ID list.
- `test-id-range`—Enter the `show diagnostic content` command to display the test ID list. Enter the range as integers separated by a comma and a hyphen (for example, 1,3-6 specifies test IDs 1, 3, 4, 5, and 6).
- `hh:mm`—Enter the time as a 2-digit number (for a 24-hour clock) for hours:minutes; the colon (:) is required.
- `mm`—Spell out the month, such as January, February... December (either upper case or lower case characters).
- `dd`—Enter the day as a 2-digit number.
- `yyyy`—Enter the year as a 4-digit number.
- `day-of-week`—Spell out the day of the week, such as Monday, Tuesday... Sunday (either upper case or lower case characters).

Examples

This example shows how to schedule diagnostic testing on a specific date and time for a specific switch:

```
Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 on january 3 2006 23:32
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time for a specific switch:

```
Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly friday 09:23
```

</table>

**Usage Guidelines**

Enter the **show diagnostic content** command to display the test ID list.

Enter the **test-id-range** as integers separated by a comma and a hyphen (for example, 1,3-6 specifies test IDs 1, 3, 4, 5, and 6).

**Examples**

This example shows how to start a diagnostic test on a specific switch:

```plaintext
Switch> diagnostic start switch 1 test 1
Switch> 06:27:50: %DIAG-6-TEST_RUNNING: Switch 1: Running TestPortAsicStackPortLoopback(ID=1) ...
(switch-1)
06:27:51: %DIAG-6-TEST_OK: Switch 1: TestPortAsicStackPortLoopback(ID=1) has completed successfully (switch-1)
```
This example shows how to start diagnostics test 2 on a switch that will disrupt normal system operation:

Switch> **diagnostic start switch 1 test 2**
Switch 1: Running test(s) 2 will cause the switch under test to reload after completion of the test list.
Switch 1: Running test(s) 2 may disrupt normal system operation
Do you want to continue? [no]: y

Switch>
16:43:29: %STACKMGR-2-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state DOWN
16:43:30: %STACKMGR-2-STACK_LINK_CHANGE: Stack Port 1 Switch 9 has changed to state DOWN
16:43:30: %STACKMGR-2-SWITCH_REMOVED: Switch 1 has been REMOVED from the stack

Switch#
16:44:35: %STACKMGR-2-STACK_LINK_CHANGE: Stack Port 1 Switch 2 has changed to state UP
16:44:37: %STACKMGR-2-STACK_LINK_CHANGE: Stack Port 2 Switch 2 has changed to state UP
16:44:45: %STACKMGR-2-SWITCH_ADDED: Switch 1 has been ADDED to the stack

Use the `dot1x` global configuration command to globally enable IEEE 802.1x authentication. Use the `no` form of this command to return to the default setting.

```
dot1x {critical {eapol | recovery delay milliseconds} | {guest-vlan supplicant} | system-auth-control}
no dot1x {critical {eapol | recovery delay} | {guest-vlan supplicant} | system-auth-control}
```

**Note**
Though visible in the command-line help strings, the `credentials name` keywords are not supported.

### Syntax Description

- **critical {eapol | recovery delay milliseconds}**
  - Configure the inaccessible authentication bypass parameters. For more information, see the `dot1x critical (global configuration)` command.
- **guest-vlan supplicant**
  - Enable optional guest VLAN behavior globally on the switch.
- **system-auth-control**
  - Enable IEEE 802.1x authentication globally on the switch.

### Defaults
IEEE 802.1x authentication is disabled, and the optional guest VLAN behavior is disabled.

### Command Modes
Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>guest-vlan supplicant</code> keywords were added.</td>
</tr>
<tr>
<td>12.2(25)SEE</td>
<td>The `critical {eapol</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must enable authentication, authorization, and accounting (AAA) and specify the authentication method list before globally enabling IEEE 802.1x authentication. A method list describes the sequence and authentication methods to be used to authenticate a user.

Before globally enabling IEEE 802.1x authentication on a switch, remove the EtherChannel configuration from the interfaces on which IEEE 802.1x authentication and EtherChannel are configured.

If you are using a device running the Cisco Access Control Server (ACS) application for IEEE 802.1x authentication with EAP-Transparent LAN Services (TLS) and with EAP-MD5 and your switch is running Cisco IOS Release 12.1(14)EA1, make sure that the device is running ACS Version 3.2.1 or later.

You can use the `guest-vlan supplicant` keywords to enable the optional IEEE 802.1x guest VLAN behavior globally on the switch. For more information, see the `dot1x guest-vlan` command.
This example shows how to globally enable IEEE 802.1x authentication on a switch:

```
Switch(config)# dot1x system-auth-control
```

This example shows how to globally enable the optional guest VLAN behavior on a switch:

```
Switch(config)# dot1x guest-vlan supplicant
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

**dot1x auth-fail max-attempts**

Use the `dot1x auth-fail max-attempts` interface configuration command to configure the maximum allowable authentication attempts before a port is moved to the restricted VLAN. To return to the default setting, use the `no` form of this command.

`dot1x auth-fail max-attempts max-attempts`

`no dot1x auth-fail max-attempts`

**Syntax Description**

| max-attempts | Specify a maximum number of authentication attempts allowed before a port is moved to the restricted VLAN. The range is 1 to 3, the default value is 3. |

**Defaults**

The default value is 3 attempts.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you reconfigure the maximum number of authentication attempts allowed by the VLAN, the change takes effect after the re-authentication timer expires.

**Examples**

This example shows how to set 2 as the maximum number of authentication attempts allowed before the port is moved to the restricted VLAN on port 3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# dot1x auth-fail max-attempts 2
Switch(config-if)# end
Switch(config)# end
Switch#
```

To verify your settings, ether the `show dot1x [interface interface-id]` privileged EXEC command.

**Related Commands**

</tbody>
</table>
dot1x auth-fail vlan

Use the **dot1x auth-fail vlan** interface configuration command to enable the restricted VLAN on a port. To return to the default setting, use the **no** form of this command.

```
dot1x auth-fail vlan vlan-id

no dot1x auth-fail vlan
```

**Syntax Description**

| **vlan-id** | Specify a VLAN in the range of 1 to 4094. |

**Defaults**

No restricted VLAN is configured.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure a restricted VLAN on ports configured as follows:

- single-host (default) mode
- auto mode for authorization

You should enable re-authentication. The ports in restricted VLANs do not receive re-authentication requests if it is disabled. To start the re-authentication process, the restricted VLAN must receive a link-down event or an Extensible Authentication Protocol (EAP) logoff event from the port. If a host is connected through a hub, the port might never receive a link-down event when that host is disconnected, and, as a result, might not detect any new hosts until the next re-authentication attempt occurs.

If the supplicant fails authentication, the port is moved to a restricted VLAN, and an EAP **success** message is sent to the supplicant. Because the supplicant is not notified of the actual authentication failure, there might be confusion about this restricted network access. An EAP success message is sent for these reasons:

- If the EAP success message is not sent, the supplicant tries to authenticate every 60 seconds (the default) by sending an EAP-start message.
- Some hosts (for example, devices running Windows XP) cannot implement DHCP until they receive an EAP success message.

A supplicant might cache an incorrect username and password combination after receiving an EAP success message from the authenticator and re-use that information in every re-authentication. Until the supplicant sends the correct username and password combination, the port remains in the restricted VLAN.

Internal VLANs used for Layer 3 ports cannot be configured as restricted VLANs.

You cannot configure a VLAN to be both a restricted VLAN and a voice VLAN. If you do this, a syslog message is generated.
When a restricted VLAN port is moved to an unauthorized state, the authentication process restarts. If the supplicant fails the authentication process again, the authenticator waits in the held state. After the supplicant has correctly re-authenticated, all IEEE 802.1x ports are reinitialized and treated as normal IEEE 802.1x ports.

When you reconfigure a restricted VLAN as a different VLAN, any ports in the restricted VLAN are also moved, and the ports stay in their currently authorized state.

When you shut down or remove a restricted VLAN from the VLAN database, any ports in the restricted VLAN are immediately moved to an unauthorized state, and the authentication process restarts. The authenticator does not wait in a held state because the restricted VLAN configuration still exists. While the restricted VLAN is inactive, all authentication attempts are counted so that when the restricted VLAN becomes active, the port is immediately placed in the restricted VLAN.

The restricted VLAN is supported only in single host mode (the default port mode). For this reason, when a port is placed in a restricted VLAN, the supplicant’s MAC address is added to the MAC address table, and any other MAC address that appears on the port is treated as a security violation.

**Examples**

This example shows how to configure a restricted VLAN on port 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# dot1x auth-fail vlan 40
Switch(config-if)# end
Switch#
```

You can verify your configuration by entering the `show dot1x [interface interface-id]` privileged EXEC command.

**Related Commands**

<tbody>
<tr>
<td><code>dot1x auth-fail max-attempts [max-attempts]</code></td>
<td>Configures the number of authentication attempts allowed before assigning a supplicant to the restricted VLAN.</td>
</tr>
<tr>
<td><code>show dot1x [interface interface-id]</code></td>
<td>Displays IEEE 802.1x status for the specified port.</td>
</tr>
</tbody>
</table>
This is an obsolete command.

Use the `dot1x control-direction` interface configuration command to enable the IEEE 802.1x authentication with the wake-on-LAN (WoL) feature and to configure the port control as unidirectional or bidirectional. Use the no form of this command to return to the default setting.

```
dot1x control-direction {both | in}
```

```
no dot1x control-direction
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>both</code></td>
<td>Enable bidirectional control on port. The port cannot receive packets from or send packets to the host.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Enable unidirectional control on port. The port can send packets to the host but cannot receive packets from the host.</td>
</tr>
</tbody>
</table>

### Defaults

The port is in bidirectional mode.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEC</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(58)SE</td>
<td>The <code>dot1x control-direction</code> interface configuration command was replaced by the <code>authentication control-direction</code> interface configuration command.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `both` keyword or the no form of this command to return to the default setting, bidirectional mode.

For more information about WoL, see the “Using IEEE 802.1x Authentication with Wake-on-LAN” section in the “Configuring IEEE 802.1x Port-Based Authentication” chapter in the software configuration guide.

### Examples

This example shows how to enable unidirectional control:

```
Switch(config-if)# dot1x control-direction in
```

This example shows how to enable bidirectional control:

```
Switch(config-if)# dot1x control-direction both
```

You can verify your settings by entering the `show dot1x all` privileged EXEC command.
The `show dot1x all` privileged EXEC command output is the same for all switches except for the port names and the state of the port. If a host is attached to the port but is not yet authenticated, a display similar to this appears:

```
Supplicant MAC 0002.b39a.9275
AuthSM State = CONNECTING
BendSM State = IDLE
PortStatus = UNAUTHORIZED
```

If you enter the `dot1x control-direction in` interface configuration command to enable unidirectional control, this appears in the `show dot1x all` command output:

```
ControlDirection = In
```

If you enter the `dot1x control-direction in` interface configuration command and the port cannot support this mode due to a configuration conflict, this appears in the `show dot1x all` command output:

```
ControlDirection = In (Disabled due to port settings)
```

### Related Commands

dot1x credentials (global configuration)

Use the `dot1x credentials` global configuration command to configure a profile on a supplicant switch.

**Syntax**
```
dot1x credentials profile
no dot1x credentials profile
```

**Syntax Description**
- `profile` Specify a profile for the supplicant switch.

**Defaults**
No profile is configured for the switch.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must have another switch set up as the authenticator for this switch to be the supplicant.

**Examples**
This example shows how to configure a switch as a supplicant:
```
Switch(config)# dot1x credentials profile
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

dot1x critical (global configuration)

Use the dot1x critical global configuration command to configure the parameters for the inaccessible authentication bypass feature, also referred to as critical authentication or the authentication, authorization, and accounting (AAA) fail policy. To return to default settings, use the no form of this command.

```
dot1x critical {eapol | recovery delay milliseconds}
```

```
no dot1x critical {eapol | recovery delay}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eapol</td>
<td>Specify that the switch sends an EAPOL-Success message when the switch puts the critical port in the critical-authentication state.</td>
</tr>
<tr>
<td>recovery delay milliseconds</td>
<td>Set the recovery delay period in milliseconds. The range is from 1 to 10000 milliseconds.</td>
</tr>
</tbody>
</table>

**Defaults**

The switch does not send an EAPOL-Success message to the host when the switch successfully authenticates the critical port by putting the critical port in the critical-authentication state.

The recovery delay period is 1000 milliseconds (1 second).

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **eapol** keyword to specify that the switch sends an EAPOL-Success message when the switch puts the critical port in the critical-authentication state.

Use the **recovery delay milliseconds** keyword to set the recovery delay period during which the switch waits to re-initialize a critical port when a RADIUS server that was unavailable becomes available. The default recovery delay period is 1000 milliseconds. A port can be re-initialized every second.

To enable inaccessible authentication bypass on a port, use the **dot1x critical** interface configuration command. To configure the access VLAN to which the switch assigns a critical port, use the **dot1x critical vlan vlan-id** interface configuration command.

**Examples**

This example shows how to set 200 as the recovery delay period on the switch:

```
Switch# dot1x critical recovery delay 200
```

You can verify your configuration by entering the **show dot1x** privileged EXEC command.

<tr>
<td>vlan vlan-id</td>
<td>Specify the access VLAN to which the switch can assign a critical port. The</td>
</tr>
<tr>
<td></td>
<td>range is from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

The inaccessible-authentication-bypass feature is disabled.
The recovery action is not configured.
The access VLAN is not configured.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEE</td>
<td>The <code>vlan vlan-id</code> keywords were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To specify the access VLAN to which the switch assigns a critical port when the port is in the critical-authentication state, use the `vlan vlan-id` keywords. The specified type of VLAN must match the type of port, as follows:

- If the critical port is an access port, the VLAN must be an access VLAN.
- If the critical port is a private VLAN host port, the VLAN must be a secondary private VLAN.
- If the critical port is a routed port, you can specify a VLAN, but this is optional.

If the client is running Windows XP and the critical port to which the client is connected is in the critical-authentication state, Windows XP might report that the interface is not authenticated.

If the Windows XP client is configured for DHCP and has an IP address from the DHCP server, receiving an EAP-Success message on a critical port might not re-initiate the DHCP configuration process.
You can configure the inaccessible authentication bypass feature and the restricted VLAN on an IEEE 802.1x port. If the switch tries to re-authenticate a critical port in a restricted VLAN and all the RADIUS servers are unavailable, the switch changes the port state to the critical authentication state, and it remains in the restricted VLAN.

You can configure the inaccessible bypass feature and port security on the same switch port.

**Examples**

This example shows how to enable the inaccessible authentication bypass feature on a port:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# dot1x critical
Switch(config-if)# end
Switch(config)# end
Switch#
```

You can verify your configuration by entering the `show dot1x [interface interface-id]` privileged EXEC command.

</table>
dot1x default

Use the `dot1x default` interface configuration command to reset the IEEE 802.1x parameters to their default values.

`dot1x default`

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
These are the default values:

- The per-port IEEE 802.1x protocol enable state is disabled (force-authorized).
- The number of seconds between re-authentication attempts is 3600 seconds.
- The periodic re-authentication is disabled.
- The quiet period is 60 seconds.
- The retransmission time is 30 seconds.
- The maximum retransmission number is 2 times.
- The host mode is single host.
- The client timeout period is 30 seconds.
- The authentication server timeout period is 30 seconds.

**Command Modes**

### dot1x fallback

Use the `dot1x fallback` interface configuration command to configure a port to use web authentication as a fallback method for clients that do not support IEEE 802.1x authentication. To return to the default setting, use the `no` form of this command.

```plaintext
dot1x fallback profile

no dot1x fallback
```

**Syntax Description**
- `profile`: Specify a fallback profile for clients that do not support IEEE 802.1x authentication.

**Defaults**
No fallback is enabled.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(35)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enter the `dot1x port-control auto` interface configuration command on a switch port before entering this command.

**Examples**
This example shows how to specify a fallback profile to a switch port that has been configured for IEEE 802.1x authentication:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# dot1x fallback profile1
Switch(config-fallback-profile)# exit
Switch(config)# end
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

dot1x guest-vlan

Use the `dot1x guest-vlan` interface configuration command to specify an active VLAN as an IEEE 802.1x guest VLAN. Use the `no` form of this command to return to the default setting.

```
dot1x guest-vlan vlan-id

no dot1x guest-vlan
```

### Syntax Description

| `vlan-id` | Specify an active VLAN as an IEEE 802.1x guest VLAN. The range is 1 to 4094. |

### Defaults

No guest VLAN is configured.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>This command was modified to change the default guest VLAN behavior.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can configure a guest VLAN on one of these switch ports:

- A static-access port that belongs to a nonprivate VLAN.
- A private-VLAN port that belongs to a secondary private VLAN. All the hosts connected to the switch port are assigned to private VLANs, whether or not the posture validation was successful. The switch determines the primary private VLAN by using the primary- and secondary-private-VLAN associations on the switch.

For each IEEE 802.1x port on the switch, you can configure a guest VLAN to provide limited services to clients (a device or workstation connected to the switch) not running IEEE 802.1x authentication. These users might be upgrading their systems for IEEE 802.1x authentication, and some hosts, such as Windows 98 systems, might not be IEEE 802.1x-capable.

When you enable a guest VLAN on an IEEE 802.1x port, the switch assigns clients to a guest VLAN when it does not receive a response to its Extensible Authentication Protocol over LAN (EAPOL) request/identity frame or when EAPOL packets are not sent by the client.

The switch maintains the EAPOL packet history. If another EAPOL packet is detected on the interface during the lifetime of the link, the guest VLAN feature is disabled. If the port is already in the guest VLAN state, the port returns to the unauthorized state, and authentication restarts. The EAPOL history is reset upon loss of link.

Before Cisco IOS Release 12.2(25)SE, the switch did not maintain the EAPOL packet history and allowed clients that failed authentication access to the guest VLAN, regardless of whether EAPOL packets had been detected on the interface. In Cisco IOS Release 12.2(25)SE, you can use the `dot1x guest-vlan supplicant` global configuration command to enable this behavior.
However, in Cisco IOS Release 12.2(25)SEE, the `dot1x guest-vlan supplicant` global configuration command is no longer supported. You can use a restricted VLAN to allow clients that failed authentication access to the network by entering the `dot1x auth-fail vlan vlan-id` interface configuration command.

Any number of non-IEEE 802.1x-capable clients are allowed access when the switch port is moved to the guest VLAN. If an IEEE 802.1x-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the RADIUS-configured or user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on IEEE 802.1x ports in single-host or multiple-hosts mode.

You can configure any active VLAN except an Remote Switched Port Analyzer (RSPAN) VLAN, a primary private VLAN, or a voice VLAN as an IEEE 802.1x guest VLAN. The guest VLAN feature is not supported on internal VLANs (routed ports) or trunk ports; it is supported only on access ports.

After you configure a guest VLAN for an IEEE 802.1x port to which a DHCP client is connected, you might need to get a host IP address from a DHCP server. You can change the settings for restarting the IEEE 802.1x authentication process on the switch before the DHCP process on the client times out and tries to get a host IP address from the DHCP server. Decrease the settings for the IEEE 802.1x authentication process (`dot1x timeout quiet-period` and `dot1x timeout tx-period` interface configuration commands). The amount to decrease the settings depends on the connected IEEE 802.1x client type.

The switch supports MAC authentication bypass. When it is enabled on an IEEE 802.1x port, the switch can authorize clients based on the client MAC address when IEEE 802.1x authentication times out while waiting for an EAPOL message exchange. After detecting a client on an IEEE 802.1x port, the switch waits for an Ethernet packet from the client. The switch sends the authentication server a RADIUS-access/request frame with a username and password based on the MAC address. If authorization succeeds, the switch grants the client access to the network. If authorization fails, the switch assigns the port to the guest VLAN if one is specified. For more information, see the “Using IEEE 802.1x Authentication with MAC Authentication Bypass” section in the “Configuring IEEE 802.1x Port-Based Authentication” chapter of the software configuration guide.

**Examples**

This example shows how to specify VLAN 5 as an IEEE 802.1x guest VLAN:

```
Switch(config-if)# dot1x guest-vlan 5
```

This example shows how to set 3 as the quiet time on the switch, to set 15 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before resending the request, and to enable VLAN 2 as an IEEE 802.1x guest VLAN when an IEEE 802.1x port is connected to a DHCP client:

```
Switch(config-if)# dot1x timeout quiet-period 3
Switch(config-if)# dot1x timeout tx-period 15
Switch(config-if)# dot1x guest-vlan 2
```

This example shows how to enable the optional guest VLAN behavior and to specify VLAN 5 as an IEEE 802.1x guest VLAN:

```
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# dot1x guest-vlan 5
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.
<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>dot1x</td>
<td>Enables the optional guest VLAN supplicant feature.</td>
</tr>
<tr>
<td></td>
<td>show dot1x [interface interface-id]</td>
<td>Displays IEEE 802.1x status for the specified port.</td>
</tr>
</tbody>
</table>
dot1x host-mode

Use the `dot1x host-mode` interface configuration command to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port. Use the `multi-domain` keyword to enable multidomain authentication (MDA) on an IEEE 802.1x-authorized port. Use the `no` form of this command to return to the default setting.

```
dot1x host-mode {multi-host | single-host | multi-domain}

no dot1x host-mode [multi-host | single-host | multi-domain]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>multi-host</th>
<th>Enable multiple-hosts mode on the switch.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>single-host</td>
<td>Enable single-host mode on the switch.</td>
</tr>
<tr>
<td></td>
<td>multi-domain</td>
<td>Enable MDA on a switch port.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is single-host mode.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced. It replaces the <code>dot1x multiple-hosts</code> interface configuration command.</td>
</tr>
<tr>
<td>12.2(35)SE</td>
<td>The <code>multi-domain</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to limit an IEEE 802.1x-enabled port to a single client or to attach multiple clients to an IEEE 802.1x-enabled port. In multiple-hosts mode, only one of the attached hosts needs to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (re-authentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network.

Use the `multi-domain` keyword to enable MDA on a port. MDA divides the port into both a data domain and a voice domain. MDA allows both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), on the same IEEE 802.1x-enabled port.

Before entering this command, make sure that the `dot1x port-control` interface configuration command is set to `auto` for the specified port.

**Examples**

This example shows how to enable IEEE 802.1x authentication globally, to enable IEEE 802.1x authentication on a port, and to enable multiple-hosts mode:

```
Switch(config)# dot1x system-auth-control
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
```
This example shows how to globally enable IEEE 802.1x authentication, to enable IEEE 802.1x authentication, and to enable MDA on the specified port:

```
Switch(config)# dot1x system-auth-control
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>show dot1x [interface interface-id]</code></td>
<td>Displays IEEE 802.1x status for the specified port.</td>
</tr>
</tbody>
</table>
dot1x initialize

Use the **dot1x initialize** privileged EXEC command to manually return the specified IEEE 802.1x-enabled port to an unauthorized state before initiating a new authentication session on the port.

**Syntax**

```plaintext
dot1x initialize [interface interface-id]
```

- **interface interface-id** (Optional) Port to be initialized.

**Defaults**

There is no default setting.

**Command Modes**

Privileged EXEC

**Command History**

- **Release** 12.1(14)EA1
  - This command was introduced.

**Usage Guidelines**

Use this command to initialize the IEEE 802.1x state machines and to set up a fresh environment for authentication. After you enter this command, the port status becomes unauthorized.

There is not a **no** form of this command.

**Examples**

This example shows how to manually initialize a port:

```
Switch# dot1x initialize interface gigabitethernet2/0/2
```

You can verify the unauthorized port status by entering the **show dot1x [interface interface-id]** privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show dot1x [interface interface-id]</strong></td>
<td>Displays IEEE 802.1x status for the specified port.</td>
</tr>
</tbody>
</table>
**dot1x mac-auth-bypass**

Use the `dot1x mac-auth-bypass` interface configuration command to enable the MAC authentication bypass feature. Use the `no` form of this command to disable MAC authentication bypass feature.

```plaintext
dot1x mac-auth-bypass [eap | timeout inactivity value]

no dot1x mac-auth-bypass
```

**Syntax Description**

- `eap` *(Optional)* Configure the switch to use Extensible Authentication Protocol (EAP) for authentication.
- `timeout inactivity value` *(Optional)* Configure the number of seconds that a connected host can be inactive before it is placed in an unauthorized state. The range is 1 to 65535.

**Defaults**

MAC authentication bypass is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(35)SE</td>
<td>The <code>timeout inactivity</code> <code>value</code> keywords were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Unless otherwise stated, the MAC authentication bypass usage guidelines are the same as the IEEE 802.1x authentication guidelines.

If you disable MAC authentication bypass from a port after the port has been authenticated with its MAC address, the port state is not affected.

If the port is in the unauthorized state and the client MAC address is not the authentication-server database, the port remains in the unauthorized state. However, if the client MAC address is added to the database, the switch can use MAC authentication bypass to re-authorize the port.

If the port is in the authorized state, the port remains in this state until re-authorization occurs.

If an EAPOL packet is detected on the interface during the lifetime of the link, the switch determines that the device connected to that interface is an IEEE 802.1x-capable supplicant and uses IEEE 802.1x authentication (not MAC authentication bypass) to authorize the interface.

Clients that were authorized with MAC authentication bypass can be re-authenticated.

For more information about how MAC authentication bypass and IEEE 802.1x authentication interact, see the “Understanding IEEE 802.1x Authentication with MAC Authentication Bypass” section and the “IEEE 802.1x Authentication Configuration Guidelines” section in the “Configuring IEEE 802.1x Port-Based Authentication” chapter of the software configuration guide.
dot1x mac-auth-bypass

Example

This example shows how to enable MAC authentication bypass and to configure the switch to use EAP for authentication:

Switch(config-if)# dot1x mac-auth-bypass eap

This example shows how to enable MAC authentication bypass and to configure the timeout if the connected host is inactive for 30 seconds:

Switch(config-if)# dot1x mac-auth-bypass timeout inactivity 30

You can verify your settings by entering the show dot1x [interface interface-id] privileged EXEC command.

Related Commands

</tbody>
</table>
**dot1x max-reauth-req**

Use the `dot1x max-reauth-req` interface configuration command to set the maximum number of times that the switch restarts the authentication process before a port changes to the unauthorized state. Use the `no` form of this command to return to the default setting.

```
dot1x max-reauth-req count

no dot1x max-reauth-req
```

**Syntax Description**

- `count`  
  Sets the number of times that switch retransmits EAPOL-Identity-Request frames to start the authentication process before the port changes to the unauthorized state. If a non-802.1x capable device is connected to a port, the switch retries two authentication attempts by default. If a guest VLAN is configured on the port, after two re-authentication attempts, the port is authorized on the guest vlan by default. The range is 1 to 10. The default is 2.

**Defaults**  
The default is 2 times.

**Command Modes**  
Interface configuration

**Command History**

<table>

**dot1x pae**

Use the `dot1x pae` interface configuration command to configure the port as an IEEE 802.1x port access entity (PAE) authenticator. Use the `no` form of this command to disable IEEE 802.1x authentication on the port.

```
dot1x pae authenticator

no dot1x pae
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The port is not an IEEE 802.1x PAE authenticator, and IEEE 802.1x authentication is disabled on the port.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `no dot1x pae` interface configuration command to disable IEEE 802.1x authentication on the port.

When you configure IEEE 802.1x authentication on a port, such as by entering the `dot1x port-control` interface configuration command, the switch automatically configures the port as an EEE 802.1x authenticator. After the `no dot1x pae` interface configuration command is entered, the Authenticator PAE operation is disabled.

**Examples**

This example shows how to disable IEEE 802.1x authentication on the port:

```
Switch(config-if)# no dot1x pae
```

You can verify your settings by entering the `show dot1x` or `show eap` privileged EXEC command.

**Related Commands**

</tr>
</tbody>
</table>
dot1x port-control

Use the `dot1x port-control` interface configuration command to enable manual control of the authorization state of the port. Use the `no` form of this command to return to the default setting.

```
dot1x port-control {auto | force-authorized | force-unauthorized}
no dot1x port-control
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Enable IEEE 802.1x authentication on the port and cause the port to change to the authorized or unauthorized state based on the IEEE 802.1x authentication exchange between the switch and the client.</td>
</tr>
<tr>
<td>force-authorized</td>
<td>Disable IEEE 802.1x authentication on the port and cause the port to transition to the authorized state without an authentication exchange. The port sends and receives normal traffic without IEEE 802.1x-based authentication of the client.</td>
</tr>
<tr>
<td>force-unauthorized</td>
<td>Deny all access through this port by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the port.</td>
</tr>
</tbody>
</table>

### Defaults

The default is force-authorized.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must globally enable IEEE 802.1x authentication on the switch by using the `dot1x system-auth-control` global configuration command before enabling IEEE 802.1x authentication on a specific port.

The IEEE 802.1x standard is supported on Layer 2 static-access ports, voice VLAN ports, and Layer 3 routed ports.

You can use the `auto` keyword only if the port is not configured as one of these:

- Trunk port—If you try to enable IEEE 802.1x authentication on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, an error message appears, and the port mode is not changed.
- Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable IEEE 802.1x authentication on a dynamic port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to dynamic, an error message appears, and the port mode is not changed.
**dot1x port-control**

- Dynamic-access ports—If you try to enable IEEE 802.1x authentication on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x authentication is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

- EtherChannel port—Do not configure a port that is an active or a not-yet-active member of an EtherChannel as an IEEE 802.1x port. If you try to enable IEEE 802.1x authentication on an EtherChannel port, an error message appears, and IEEE 802.1x authentication is not enabled.

- Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) destination ports—You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port. However, IEEE 802.1x authentication is disabled until the port is removed as a SPAN or RSPAN destination. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

To globally disable IEEE 802.1x authentication on the switch, use the `no dot1x system-auth-control` global configuration command. To disable IEEE 802.1x authentication on a specific port or to return to the default setting, use the `no dot1x port-control` interface configuration command.

**Examples**

This example shows how to enable IEEE 802.1x authentication on a port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# dot1x port-control auto
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x [interface interface-id]</code></td>
<td>Displays IEEE 802.1x status for the specified port.</td>
</tr>
</tbody>
</table>
**dot1x re-authenticate**

Use the `dot1x re-authenticate` privileged EXEC command to manually initiate a re-authentication of the specified IEEE 802.1x-enabled port.

```
dot1x re-authenticate [interface interface-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>(Optional) Stack switch number, module, and port number of the interface to re-authenticate</td>
</tr>
</tbody>
</table>

**Defaults**

There is no default setting.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command to re-authenticate a client without waiting for the configured number of seconds between re-authentication attempts (re-authperiod) and automatic re-authentication.

**Examples**

This example shows how to manually re-authenticate the device connected to a port:

```
Switch# dot1x re-authenticate interface gigabitethernet2/0/2
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

**dot1x reauthentication**

Use the `dot1x reauthentication` interface configuration command to enable periodic re-authentication of the client. Use the `no` form of this command to return to the default setting.

```
  dot1x reauthentication
  no dot1x reauthentication
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Periodic re-authentication is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced. It replaces the <code>dot1x re-authentication</code> global configuration command (with the hyphen).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You configure the amount of time between periodic re-authentication attempts by using the `dot1x timeout reauth-period` interface configuration command.

**Examples**

This example shows how to disable periodic re-authentication of the client:

```
Switch(config-if)# no dot1x reauthentication
```

This example shows how to enable periodic re-authentication and to set the number of seconds between re-authentication attempts to 4000 seconds:

```
Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

dot1x supplicant controlled transient

To control access to an 802.1x supplicant port during authentication, use the `dot1x supplicant controlled transient` command in global configuration mode. To open the supplicant port during authentication, use the `no` form of this command.

```
dot1x supplicant controlled transient

no dot1x supplicant controlled transient
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Access is allowed to 802.1x supplicant ports during authentication.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(1)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
In the default state, when you connect a supplicant switch to an authenticator switch that has BPCU guard enabled, the authenticator port could be error-disabled if it receives a Spanning Tree Protocol (STP) bridge protocol data unit (BPDU) packets before the supplicant switch has authenticated. Beginning with Cisco IOS Release 15.0(1)SE, you can control traffic exiting the supplicant port during the authentication period. Entering the `dot1x supplicant controlled transient` global configuration command temporarily blocks the supplicant port during authentication to ensure that the authenticator port does not shut down before authentication completes. If authentication fails, the supplicant port opens. Entering the `no dot1x supplicant controlled transient` global configuration command opens the supplicant port during the authentication period. This is the default behavior.

We strongly recommend using the `dot1x supplicant controlled transient` command on a supplicant switch when BPDU guard is enabled on the authenticator switch port with the `spanning-tree bpduguard enable` interface configuration command.

**Note**
If you globally enable BPDU guard on the authenticator switch by using the `spanning-tree portfast bpduguard default` global configuration command, entering the `dot1x supplicant controlled transient` command does not prevent the BPDU violation.

**Examples**
This example shows how to control access to 802.1x supplicant ports on a switch during authentication:

```
Switch(config)# dot1x supplicant controlled transient
```
### Related Commands

dot1x supplicant force-multicast

Use the `dot1x supplicant force-multicast` global configuration command to force a supplicant switch to send only multicast Extensible Authentication Protocol over LAN (EAPOL) packets whenever it receives multicast or unicast EAPOL packets. Use the `no` form of this command to return to the default setting.

```
dot1x supplicant force-multicast

no dot1x supplicant force-multicast
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The supplicant switch sends unicast EAPoL packets when it receives unicast EAPOL packets. Similarly, it sends multicast EAPOL packets when it receives multicast EAPOL packets.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Enable this command on the supplicant switch for Network Edge Access Topology (NEAT) to work in all host modes.

**Examples**
This example shows how force a supplicant switch to send multicast EAPOL packets to authenticator switch:

```
Switch(config)# dot1x supplicant force-multicast
```

**Related Commands**

<table>
<thead>

dot1x test eapol-capable

Use the `dot1x test eapol-capable` privileged EXEC command to monitor IEEE 802.1x activity on all the switch ports and to display information about the devices that are connected to the ports that support IEEE 802.1x.

`dot1x test eapol-capable [interface interface-id]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>(Optional) Port to be queried.</td>
</tr>
</tbody>
</table>

**Defaults**

There is no default setting.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to test the IEEE 802.1x capability of the devices connected to all ports or to specific ports on a switch.

There is not a `no` form of this command.

**Examples**

This example shows how to enable the IEEE 802.1x readiness check on a switch to query a port. It also shows the response received from the queried port verifying that the device connected to it is IEEE 802.1x-capable:

```
Switch# dot1x test eapol-capable interface gigabitethernet1/0/13
DOT1X_PORT_EAPOL_CAPABLE:DOT1X: MAC 00-01-02-4b-f1-a3 on gigabitethernet1/0/13 is EAPOL capable
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dot1x test timeout timeout</code></td>

</tr>
</tbody>
</table>
dot1x test timeout

Use the **dot1x test timeout** global configuration command to configure the timeout used to wait for EAPOL response from a port being queried for IEEE 802.1x readiness.

```
dot1x test timeout timeout
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Time in seconds to wait for an EAPOL response. The range is from 1 to 65535 seconds.</td>
</tr>
</tbody>
</table>

**Defaults**
The default setting is 10 seconds.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use this command to configure the timeout used to wait for EAPOL response.

There is not a **no** form of this command.

**Examples**

This example shows how to configure the switch to wait 27 seconds for an EAPOL response:

```
Switch# dot1x test timeout 27
```

You can verify the timeout configuration status by entering the **show run** privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>dot1x test eapol-capable [interface interface-id]</strong></td>
<td>Checks for IEEE 802.1x readiness on devices connected to all or to specified IEEE 802.1x-capable ports.</td>
</tr>
</tbody>
</table>
dot1x timeout

Use the dot1x timeout interface configuration command to set IEEE 802.1x timers. Use the no form of this command to return to the default setting.

```
dot1x timeout { quiet-period seconds | ratelimit-period seconds | reauth-period { seconds | server } | server-timeout seconds | supp-timeout seconds | tx-period seconds }
```

```
no dot1x timeout { quiet-period | reauth-period | server-timeout | supp-timeout | tx-period }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>quiet-period seconds</td>
<td>Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client. The range is 1 to 65535.</td>
</tr>
<tr>
<td>ratelimit-period seconds</td>
<td>Number of seconds that the switch ignores Extensible Authentication Protocol over LAN (EAPOL) packets from clients that have been successfully authenticated during this duration. The range is 1 to 65535.</td>
</tr>
</tbody>
</table>
| reauth-period { seconds | server } | Set the number of seconds between re-authentication attempts. The keywords have these meanings:  
  - seconds—Sets the number of seconds from 1 to 65535; the default is 3600 seconds.  
  - server—Sets the number of seconds as the value of the Session-Timeout RADIUS attribute (Attribute[27]). |
| server-timeout seconds | Number of seconds that the switch waits for the retransmission of packets by the switch to the authentication server.  
The range is 1 to 65535. However, we recommend a minimum setting of 30. |
| supp-timeout seconds | Number of seconds that the switch waits for the retransmission of packets by the switch to the IEEE 802.1x client. The range is 30 to 65535. |
| tx-period seconds | Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. The range is 1 to 65535. |

### Defaults

These are the default settings:

- reauth-period is 3600 seconds.
- quiet-period is 60 seconds.
- tx-period is 5 seconds.
- supp-timeout is 30 seconds.
- server-timeout is 30 seconds.
- rate-limit is 1 second.

### Command Modes

Interface configuration
**dot1x timeout**

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <strong>supp-timeout</strong> and <strong>server-timeout</strong> keywords were added, and the command was changed to the interface configuration mode.</td>
</tr>
<tr>
<td>12.2(18)SE</td>
<td>The ranges for the <strong>server-timeout</strong>, <strong>supp-timeout</strong>, and <strong>tx-period</strong> keywords were changed.</td>
</tr>
<tr>
<td>12.2(25)SEC</td>
<td>The range for <strong>tx-period</strong> keyword was changed, and the <strong>reauth-period</strong> server keywords were added.</td>
</tr>
<tr>
<td>12.2(25)SEE</td>
<td>The <strong>ratelimit-period</strong> keyword was introduced.</td>
</tr>
<tr>
<td>12.2(40)SE</td>
<td>The range for <strong>tx-period seconds</strong> is incorrect. The correct range is from 1 to 65535.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

The **dot1x timeout reauth-period** interface configuration command affects the behavior of the switch only if you have enabled periodic re-authentication by using the **dot1x reauthentication** interface configuration command.

During the quiet period, the switch does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number smaller than the default.

When the **ratelimit-period** is set to 0 (the default), the switch does not ignore EAPOL packets from clients that have been successfully authenticated and forwards them to the RADIUS server.

### Examples

This example shows how to enable periodic re-authentication and to set 4000 as the number of seconds between re-authentication attempts:

```
Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000
```

This example shows how to enable periodic re-authentication and to specify the value of the Session-Timeout RADIUS attribute as the number of seconds between re-authentication attempts:

```
Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period server
```

This example shows how to set 30 seconds as the quiet time on the switch:

```
Switch(config-if)# dot1x timeout quiet-period 30
```

This example shows how to set 45 seconds as the switch-to-authentication server retransmission time:

```
Switch(config)# dot1x timeout server-timeout 45
```

This example shows how to set 45 seconds as the switch-to-client retransmission time for the EAP request frame:

```
Switch(config-if)# dot1x timeout supp-timeout 45
```

This example shows how to set 60 as the number of seconds to wait for a response to an EAP-request/identity frame from the client before re-transmitting the request:

```
Switch(config-if)# dot1x timeout tx-period 60
```
This example shows how to set 30 as the number of seconds that the switch ignores EAPOL packets from successfully authenticated clients:

```
Switch(config-if)# dot1x timeout ratelimit-period 30
```

You can verify your settings by entering the `show dot1x` privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dot1x max-req</code></td>
<td>Sets the maximum number of times that the switch sends an EAP-request/identity frame before restarting the authentication process.</td>
</tr>
<tr>
<td><code>dot1x reauthentication</code></td>
<td>Enables periodic re-authentication of the client.</td>
</tr>
<tr>
<td><code>show dot1x</code></td>
<td>Displays IEEE 802.1x status for all ports.</td>
</tr>
</tbody>
</table>
**dot1x violation-mode**

Use the `dot1x violation-mode` interface configuration command to configure the violation modes that occur when a new device connects to a port or when a new device connects to a port after the maximum number of devices are connected to that port.

```
dot1x violation-mode {shutdown | restrict | protect}
```

```
no dot1x violation-mode
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shutdown</td>
<td>Error disables the port or the virtual port on which a new unexpected MAC address occurs.</td>
</tr>
<tr>
<td>restrict</td>
<td>Generates a syslog error when a violation error occurs.</td>
</tr>
<tr>
<td>protect</td>
<td>Silently discards packets from any new MAC addresses. This is the default setting.</td>
</tr>
</tbody>
</table>

### Defaults

By default `dot1x violation-mode protect` is enabled.

### Command Modes

Interface configuration

### Command History

```
Release     Modification
-----------  -------------
12.2(46)SE1  This command was introduced.
```

### Examples

This example shows how to configure an IEEE 802.1x-enabled port as error disabled and to shut down when a new device connects to the port:

```
Switch(config-if)# dot1x violation-mode shutdown
```

This example shows how to configure an IEEE 802.1x-enabled port to generate a system error message and change the port to restricted mode when a new device connects to the port:

```
Switch(config-if)# dot1x violation-mode restrict
```

This example shows how to configure an IEEE 802.1x-enabled port to ignore a new connected device when it is connected to the port:

```
Switch(config-if)# dot1x violation-mode protect
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x [interface interface-id]</code></td>
<td>Displays IEEE 802.1x status for the specified port.</td>
</tr>
</tbody>
</table>
**duplex**

Use the `duplex` interface configuration command to specify the duplex mode of operation for a port. Use the `no` form of this command to return the port to its default value.

```
duplex { auto | full | half }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>auto</code></td>
<td>Enable automatic duplex configuration; port automatically detects whether it should run in full- or half-duplex mode, depending on the attached device mode.</td>
</tr>
<tr>
<td><code>full</code></td>
<td>Enable full-duplex mode.</td>
</tr>
<tr>
<td><code>half</code></td>
<td>Enable half-duplex mode (only for interfaces operating at 10 or 100 Mb/s). You cannot configure half-duplex mode for interfaces operating at 1000 or 10,000 Mb/s.</td>
</tr>
</tbody>
</table>

### Defaults

The default is `auto` for Fast Ethernet and Gigabit Ethernet ports.

The default is `half` for 100BASE-x (where -x is -BX, -FX, -FX-FE, or -LX) small form-factor pluggable (SFP) modules.

Duplex options are not supported on the 1000BASE-x (where -x is -BX, -CWDM, -LX, -SX, or -ZX) SFP modules.

For information about which SFP modules are supported on your switch, see the product release notes.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(20)SE</td>
<td>Support for the <code>half</code> keyword was added for the 100BASE-FX SFP module.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not available on a 10-Gigabit Ethernet interface.

For Fast Ethernet ports, setting the port to `auto` has the same effect as specifying `half` if the attached device does not autonegotiate the duplex parameter.

For Gigabit Ethernet ports, setting the port to `auto` has the same effect as specifying `full` if the attached device does not autonegotiate the duplex parameter.

**Note**

Half-duplex mode is supported on Gigabit Ethernet interfaces if the duplex mode is `auto` and the connected device is operating at half duplex. However, you cannot configure these interfaces to operate in half-duplex mode.
Certain ports can be configured to be either full duplex or half duplex. Applicability of this command depends on the device to which the switch is attached.

If both ends of the line support autonegotiation, we highly recommend using the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, configure duplex and speed on both interfaces; do use the `auto` setting on the supported side.

If the speed is set to `auto`, the switch negotiates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

You can configure the duplex setting when the speed is set to `auto`.

⚠️ **Caution**
Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.

For guidelines on setting the switch speed and duplex parameters, see the “Configuring Interface Characteristics” chapter in the software configuration guide for this release.

### Examples
This example shows how to configure an interface for full-duplex operation:

```plaintext
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# duplex full
```

You can verify your setting by entering the `show interfaces` privileged EXEC command.

### Related Commands

</tr>
</tbody>
</table>
epm access-control open

Use the `epm access-control open` global configuration command on the switch stack or on a standalone switch to configure an open directive for ports that do not have an access control list (ACL) configured. Use the `no` form of this command to disable the open directive.

```
epm access-control open

no epm access-control open
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
The default directive applies.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(55)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use this command to configure an open directive that allows hosts without an authorization policy to access ports configured with a static ACL. If you do not configure this command, the port applies the policies of the configured ACL to the traffic. If no static ACL is configured on a port, both the default and open directives allow access to the port.

**Examples**
This example shows how to configure an open directive.

```
Switch(config)# epm access-control open
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Displays the operating configuration.</td>
</tr>
</tbody>
</table>
errdisable detect cause

To enable error-disable detection for a specific cause or for all causes, use the `errdisable detect cause` global configuration command. To disable the error-disable detection feature, use the `no` form of this command.

```
errdisable detect cause { all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | psp | security-violation shutdown vlan | sfp-config-mismatch }

no errdisable detect cause { all | arp-inspection | bpduguard | dhcp-rate-limit | dtp-flap | gbic-invalid | inline-power | l2ptguard | link-flap | loopback | pagp-flap | psp | security-violation shutdown vlan | sfp-config-mismatch }
```

For the bridge protocol data unit (BPDU) guard and port security, you can use this command to configure the switch to disable only a specific VLAN on a port instead of disabling the entire port.

When the per-VLAN error-disable feature is turned off and a BPDU guard violation occurs, the entire port is disabled. Use the `no` form of this command to disable the per-VLAN error-disable feature.

```
errdisable detect cause bpduguard shutdown vlan

no errdisable detect cause bpduguard shutdown vlan
```

### Syntax Description

- **all**
  
  Enable error detection for all error-disabled causes.

- **arp-inspection**
  
  Enable error detection for dynamic Address Resolution Protocol (ARP) inspection.

- **bpduguard shutdown vlan**
  
  Enable per-VLAN error-disable for BPDU guard.

- **dhcp-rate-limit**
  
  Enable error detection for DHCP snooping.

- **dtp-flap**
  
  Enable error detection for the Dynamic Trunking Protocol (DTP) flapping.

- **gbic-invalid**
  
  Enable error detection for an invalid Gigabit Interface Converter (GBIC) module.

  **Note**  
  This error refers to an invalid small form-factor pluggable (SFP) module on the switch.

- **inline-power**
  
  Enable error detection for inline power.

- **l2ptguard**
  
  Enable error detection for a Layer 2 protocol tunnel error-disabled cause.

- **link-flap**
  
  Enable error detection for link-state flapping.

- **loopback**
  
  Enable error detection for detected loopbacks.

- **pagp-flap**
  
  Enable error detection for the Port Aggregation Protocol (PAgP) flap error-disabled cause.

- **psp**
  
  Enable error detection for protocol storm protection.

- **security-violation shutdown vlan**
  
  Enable voice aware 802.1x security.

- **sfp-config-mismatch**
  
  Enable error detection on an SFP configuration mismatch.
**Command Default**

Detection is enabled for all causes. All causes, except for per-VLAN error disabling, are configured to shut down the entire port.

**Command Modes**

- Global configuration

<td>The security-violation shutdown vlan keywords were added.</td>
</tr>
<tr>
<td>12.2(58)SE</td>
<td>The psp keyword was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A cause (link-flap, dhcp-rate-limit, and so forth) is the reason why the error-disabled state occurred. When a cause is detected on a port, the port is placed in an error-disabled state, an operational state that is similar to a link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU, voice aware 802.1x security, guard and port-security features, you can configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you set a recovery mechanism for the cause by entering the errdisable recovery global configuration command for the cause, the port is brought out of the error-disabled state and allowed to retry the operation when all causes have timed out. If you do not set a recovery mechanism, you must enter the shutdown and then the no shutdown commands to manually change the port from the error-disabled state.

For protocol storm protection, excess packets are dropped for a maximum of two virtual ports. Virtual port error disabling using the psp keyword is not supported for EtherChannel and Flexlink interfaces.

To verify your settings, enter the show errdisable detect privileged EXEC command.

**Examples**

- This example shows how to enable error-disable detection for the link-flap error-disabled cause:

  ```
  Switch(config)# errdisable detect cause link-flap
  ```

- This command shows how to globally configure BPDU guard for per-VLAN error disable:

  ```
  Switch(config)# errdisable detect cause bpduguard shutdown vlan
  ```

- This command shows how to globally configure voice aware 802.1x security for per-VLAN error disable:

  ```
  Switch(config)# errdisable detect cause security-violation shutdown vlan
  ```
You can verify your settings by entering the `show errdisable detect` privileged EXEC command.

errdisable detect cause small-frame

Use the `errdisable detect cause small-frame` global configuration command to allow any switch port to be error disabled if incoming VLAN-tagged packets are small frames (67 bytes or less) and arrive at the minimum configured rate (the threshold). Use the `no` form of this command to return to the default setting.

```
errdisable detect cause small-frame
no errdisable detect cause small-frame
```

### Syntax Description

This command has no arguments or keywords.

### Defaults

This feature is disabled.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command globally enables the small-frame arrival feature. Use the `small violation-rate` interface configuration command to set the threshold for each port.

You can configure the port to be automatically re-enabled by using the `errdisable recovery cause small-frame` global configuration command. You configure the recovery time by using the `errdisable recovery interval interval` global configuration command.

### Examples

This example shows how to enable the switch ports to be put into the error-disabled mode if incoming small frames arrive at the configured threshold:

```
Switch(config)# errdisable detect cause small-frame
```

You can verify your setting by entering the `show interfaces` privileged EXEC command.

</tr>
</tbody>
</table>

#### Usage Guidelines

A cause (**link-flap**, **bpdu-guard**, and so forth) is defined as the reason that the error-disabled state occurred. When a cause is detected on a port, the port is placed in the error-disabled state, an operational state similar to the link-down state.

When a port is error-disabled, it is effectively shut down, and no traffic is sent or received on the port. For the BPDU guard and port-security features, you can configure the switch to shut down just the offending VLAN on the port when a violation occurs, instead of shutting down the entire port.

If you do not enable the recovery for the cause, the port stays in the error-disabled state until you enter the **shutdown** and the **no shutdown** interface configuration commands. If you enable the recovery for a cause, the port is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out.

Otherwise, you must enter the **shutdown** and then the **no shutdown** commands to manually recover a port from the error-disabled state.
This example shows how to enable the recovery timer for the BPDU guard error-disabled cause:

```
Switch(config)# errdisable recovery cause bpduguard
```

This example shows how to set the timer to 500 seconds:

```
Switch(config)# errdisable recovery interval 500
```

You can verify your settings by entering the `show errdisable recovery` privileged EXEC command.

exception crashinfo

Use the exception crashinfo global configuration command to configure the switch to create the extended crashinfo file when the Cisco IOS image fails. Use the no form of this command to disable this feature.

```
exception crashinfo
no exception crashinfo
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The switch creates the extended crashinfo file.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEC</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The basic crashinfo file includes the Cisco IOS image name and version that failed, a list of the processor registers, and a stack trace. The extended crashinfo file includes additional information that can help determine the cause of the switch failure.

If you enter the exception crashinfo global configuration command on a stack master, it configures all the stack members to create the extended crashinfo file if the Cisco IOS image on the stack members fail.

Use the no exception crashinfo global configuration command to configure the switch to not create the extended crashinfo file.

**Examples**

This example shows how to configure the switch to not create the extended crashinfo file:

```
Switch(config)# no exception crashinfo
```

You can verify your settings by entering the show running-config privileged EXEC command.

**Related Commands**

fallback profile

Use the `fallback profile` global configuration command to create a fallback profile for web authentication. To return to the default setting, use the `no` form of this command.

```
fallback profile profile

no fallback profile
```

**Syntax Description**

| profile | Specify the fallback profile for clients that do not support IEEE 802.1x authentication. |

**Defaults**

No fallback profile is configured.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(35)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The fallback profile is used to define the IEEE 802.1x fallback behavior for IEEE 802.1x ports that do not have supplicants. The only supported behavior is to fall back to web authentication.

After entering the `fallback profile` command, you enter profile configuration mode, and these configuration commands are available:

- **ip**: Create an IP configuration.
- **access-group**: Specify access control for packets sent by hosts that have not yet been authenticated.
- **admission**: Apply an IP admission rule.

**Examples**

This example shows how to create a fallback profile to be used with web authentication:

```
Switch(config)# configure terminal
Switch(config)# ip admission name rule1 proxy http
Switch(config)# fallback profile profile1
Switch(config-fallback-profile)# ip access-group default-policy in
Switch(config-fallback-profile)# ip admission rule1
Switch(config-fallback-profile)# exit
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# dot1x fallback profile1
Switch(config-if)# end
```

You can verify your settings by entering the `show running-configuration [interface interface-id]` privileged EXEC command.
### Related Commands

</tbody>
</table>
flowcontrol

Use the **flowcontrol** interface configuration command to set the receive flow-control state for an interface. When flow control **send** is operable and on for a device and it detects any congestion at its end, it notifies the link partner or the remote device of the congestion by sending a pause frame. When flow control **receive** is on for a device and it receives a pause frame, it stops sending any data packets. This prevents any loss of data packets during the congestion period.

Use the **receive off** keywords to disable flow control.

```
flowcontrol receive { desired | off | on }
```

**Note**
The switch can receive, but not send, pause frames.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive</td>
<td>Set whether the interface can receive flow-control packets from a remote device.</td>
</tr>
<tr>
<td>desired</td>
<td>Allow an interface to operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.</td>
</tr>
<tr>
<td>off</td>
<td>Turn off the ability of an attached device to send flow-control packets to an interface.</td>
</tr>
<tr>
<td>on</td>
<td>Allow an interface to operate with an attached device that is required to send flow-control packets or with an attached device that is not required to but can send flow-control packets.</td>
</tr>
</tbody>
</table>

**Defaults**
The default is **flowcontrol receive off**.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The switch does not support sending flow-control pause frames.

Note that the **on** and **desired** keywords have the same result.

When you use the **flowcontrol** command to set a port to control traffic rates during congestion, you are setting flow control on a port to one of these conditions:

- **receive on** or **desired**: The port cannot send pause frames, but can operate with an attached device that is required to or is able to send pause frames. The port can receive pause frames.
- **receive off**: Flow control does not operate in either direction. In case of congestion, no indication is given to the link partner, and no pause frames are sent or received by either device.
Table 2-13 shows the flow control results on local and remote ports for a combination of settings. The table assumes that **receive desired** has the same results as using the **receive on** keywords.

### Table 2-13 Flow Control Settings and Local and Remote Port Flow Control Resolution

<table>
<thead>
<tr>
<th>Flow Control Settings</th>
<th>Flow Control Resolution</th>
</tr>
</thead>
<tbody>
<tr>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>port-channel-number</code> range was changed from 1 to 12 to 1 to 48.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For Layer 2 EtherChannels, you do not have to create a port-channel interface first before assigning a physical port to a channel group. Instead, you can use the `channel-group` interface configuration command. It automatically creates the port-channel interface when the channel group gets its first physical port. If you create the port-channel interface first, the `channel-group-number` can be the same as the `port-channel-number`, or you can use a new number. If you use a new number, the `channel-group` command dynamically creates a new port channel.

You create Layer 3 port channels by using the `interface port-channel` command followed by the `no switchport` interface configuration command. You should manually configure the port-channel logical interface before putting the interface into the channel group.

Only one port channel in a channel group is allowed.

**Caution**

- When using a port-channel interface as a routed port, do not assign Layer 3 addresses on the physical ports that are assigned to the channel group.

**Caution**

- Do not assign bridge groups on the physical ports in a channel group used as a Layer 3 port-channel interface because it creates loops. You must also disable spanning tree.
Follow these guidelines when you use the `interface port-channel` command:

- If you want to use the Cisco Discovery Protocol (CDP), you must configure it only on the physical port and not on the port-channel interface.
- Do not configure a port that is an active member of an EtherChannel as an IEEE 802.1x port. If IEEE 802.1x is enabled on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.

For a complete list of configuration guidelines, see the “Configuring EtherChannels” chapter in the software configuration guide for this release.

### Examples

This example shows how to create a port-channel interface with a port channel number of 5:

```
Switch(config)# interface port-channel 5
```

You can verify your setting by entering the `show running-config` privileged EXEC or `show etherchannel channel-group-number detail` privileged EXEC command.

interface range

Use the `interface range` global configuration command to enter interface range configuration mode and to execute a command on multiple ports at the same time. Use the `no` form of this command to remove an interface range.

```
interface range {port-range | macro name}

no interface range {port-range | macro name}
```

**Syntax Description**

- `port-range`: Port range. For a list of valid values for `port-range`, see the “Usage Guidelines” section.
- `macro name`: Specify the name of a macro.

**Defaults**

This command has no default setting.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter interface range configuration mode, all interface parameters you enter are attributed to all interfaces within the range.

For VLANs, you can use the `interface range` command only on existing VLAN switch virtual interfaces (SVIs). To display VLAN SVIs, enter the `show running-config` privileged EXEC command. VLANs not displayed cannot be used in the `interface range` command. The commands entered under `interface range` command are applied to all existing VLAN SVIs in the range.

All configuration changes made to an interface range are saved to NVRAM, but the interface range itself is not saved to NVRAM.

You can enter the interface range in two ways:

- Specifying up to five interface ranges
- Specifying a previously defined interface-range macro

All interfaces in a range must be the same type; that is, all Fast Ethernet ports, all Gigabit Ethernet ports, all EtherChannel ports, or all VLANs. However, you can define up to five interface ranges with a single command, with each range separated by a comma.
Valid values for *port-range* type and interface:

- **vlan** *vlan-ID* - *vlan-ID*, where VLAN ID is from 1 to 4094
- **fastethernet** module/{*first port*} - {*last port*}, where module is always 0
- **gigabitethernet** stack member/module/{*first port*} - {*last port*}, where module is always 0

For physical interfaces:
- stack member is the number used to identify the switch within the stack. The number ranges from 1 to 9 and is assigned to the switch the first time the stack member initializes.
- module is always 0
- the range is *type* *stack member*/*0*/*number* - *number* (for example, *gigabitethernet1/0/1* - 2)

- **port-channel** *port-channel-number* - *port-channel-number*, where *port-channel-number* is from 1 to 48

**Note** When you use the *interface range* command with port channels, the first and last port channel number in the range must be active port channels.

When you define a range, you must enter a space between the first entry and the hyphen (-):

```plaintext
interface range gigabitethernet1/0/1 - 2
```

When you define multiple ranges, you must still enter a space after the first entry and before the comma (,):

```plaintext
interface range fastethernet1/0/1 - 2, gigabitethernet1/0/1 - 2
```

You cannot specify both a macro and an interface range in the same command.

You can also specify a single interface in *port-range*. The command is then similar to the *interface interface-id* global configuration command.

For more information about configuring interface ranges, see the software configuration guide for this release.

### Examples

This example shows how to use the *interface range* command to enter interface-range configuration mode to apply commands to two ports:

```plaintext
Switch(config)# interface range gigabitethernet1/0/1 - 2
```

This example shows how to use a port-range macro *macro1* for the same function. The advantage is that you can reuse *macro1* until you delete it.

```plaintext
Switch(config)# define interface-range macro1 gigabitethernet1/0/1 - 2
Switch(config)# interface range macro macro1
Switch(config-if-range)#
```

interface vlan

Use the **interface vlan** global configuration command to create or access a dynamic switch virtual interface (SVI) and to enter interface configuration mode. Use the **no** form of this command to delete an SVI.

```text
interface vlan vlan-id

no interface vlan vlan-id
```

### Syntax Description

**vlan-id**  
VLAN number. The range is 1 to 4094.

### Defaults

The default VLAN interface is VLAN 1.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

SVIs are created the first time that you enter the **interface vlan vlan-id** command for a particular VLAN. The **vlan-id** corresponds to the VLAN-tag associated with data frames on an ISL or IEEE 802.1Q encapsulated trunk or the VLAN ID configured for an access port.

**Note**

When you create an SVI, it does not become active until it is associated with a physical port.

If you delete an SVI by entering the **no interface vlan vlan-id** command, the deleted interface is no longer visible in the output from the **show interfaces** privileged EXEC command.

**Note**

You cannot delete the VLAN 1 interface.

You can re-instate a deleted SVI by entering the **interface vlan vlan-id** command for the deleted interface. The interface comes back up, but the previous configuration is gone.

The interrelationship between the number of SVIs configured on a switch stack and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the **sdm prefer** global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the **sdm prefer** command.
### Examples

This example shows how to create a new SVI with VLAN ID 23 and to enter interface configuration mode:

```
Switch(config)# interface vlan 23
Switch(config-if)#
```

You can verify your setting by entering the `show interfaces` and `show interfaces vlan vlan-id` privileged EXEC commands.

</tr>
</tbody>
</table>

### Usage Guidelines

You can apply named or numbered standard or extended IP access lists to an interface. To define an access list by name, use the **ip access-list** global configuration command. To define a numbered access list, use the **access list** global configuration command. You can used numbered standard access lists ranging from 1 to 99 and 1300 to 1999 or extended access lists ranging from 100 to 199 and 2000 to 2699.

You can use this command to apply an access list to a Layer 2 or Layer 3 interface. However, note these limitations for Layer 2 interfaces (port ACLs):

- You can apply an ACL to Layer 2 ports in the inbound direction only.
- You can apply only one IP ACL and one MAC ACL per interface.
- Layer 2 interfaces do not support logging; if the **log** keyword is specified in the IP ACL, it is ignored.
- An IP ACL applied to a Layer 2 interface only filters IP packets. To filter non-IP packets, use the **mac access-group** interface configuration command with MAC extended ACLs.
You can use router ACLs, input port ACLs, and VLAN maps on the same switch. However, a port ACL takes precedence over a router ACL or VLAN map.

- When an input port ACL is applied to an interface and a VLAN map is applied to a VLAN that the interface is a member of, incoming packets received on ports with the ACL applied are filtered by the port ACL. Other packets are filtered by the VLAN map.

- When an input router ACL and input port ACLs exist in an switch virtual interface (SVI), incoming packets received on ports to which a port ACL is applied are filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by the router ACL. Other packets are not filtered.

- When an output router ACL and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are filtered by the port ACL. Outgoing routed IP packets are filtered by the router ACL. Other packets are not filtered.

- When a VLAN map, input router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Incoming routed IP packets received on other ports are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

- When a VLAN map, output router ACLs, and input port ACLs exist in an SVI, incoming packets received on the ports to which a port ACL is applied are only filtered by the port ACL. Outgoing routed IP packets are filtered by both the VLAN map and the router ACL. Other packets are filtered only by the VLAN map.

You can apply IP ACLs to both outbound or inbound Layer 3 interfaces.

A Layer 3 interface can have one IP ACL applied in each direction.

You can configure only one VLAN map and one router ACL in each direction (input/output) on a VLAN interface.

For standard inbound access lists, after the switch receives a packet, it checks the source address of the packet against the access list. IP extended access lists can optionally check other fields in the packet, such as the destination IP address, protocol type, or port numbers. If the access list permits the packet, the switch continues to process the packet. If the access list denies the packet, the switch discards the packet. If the access list has been applied to a Layer 3 interface, discarding a packet (by default) causes the generation of an Internet Control Message Protocol (ICMP) Host Unreachable message. ICMP Host Unreachable messages are not generated for packets discarded on a Layer 2 interface.

For standard outbound access lists, after receiving a packet and sending it to a controlled interface, the switch checks the packet against the access list. If the access list permits the packet, the switch sends the packet. If the access list denies the packet, the switch discards the packet and, by default, generates an ICMP Host Unreachable message.

If the specified access list does not exist, all packets are passed.

---

**Examples**

This example shows how to apply IP access list 101 to inbound packets on a port:

```
Switch(config)# interface gigabitethernet 1/0/1
Switch(config-if)# ip access-group 101 in
```

You can verify your settings by entering the `show ip interface`, `show access-lists`, or `show ip access-lists` privileged EXEC command.

ip address

Use the `ip address` interface configuration command to set an IP address for the Layer 2 switch or an IP address for each switch virtual interface (SVI) or routed port on the Layer 3 switch. Use the `no` form of this command to remove an IP address or to disable IP processing.

```
ip address ip-address subnet-mask [secondary]
no ip address [ip-address subnet-mask] [secondary]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip-address</code></td>
<td>IP address.</td>
</tr>
<tr>
<td><code>subnet-mask</code></td>
<td>Mask for the associated IP subnet.</td>
</tr>
<tr>
<td><code>secondary</code></td>
<td>(Optional) Specifies that the configured address is a secondary IP address. If this keyword is omitted, the configured address is the primary IP address.</td>
</tr>
</tbody>
</table>

**Defaults**

No IP address is defined.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you remove the switch IP address through a Telnet session, your connection to the switch will be lost. Hosts can find subnet masks using the Internet Control Message Protocol (ICMP) Mask Request message. Routers respond to this request with an ICMP Mask Reply message. You can disable IP processing on a particular interface by removing its IP address with the `no ip address` command. If the switch detects another host using one of its IP addresses, it will send an error message to the console. You can use the optional keyword `secondary` to specify an unlimited number of secondary addresses. Secondary addresses are treated like primary addresses, except the system never generates datagrams other than routing updates with secondary source addresses. IP broadcasts and ARP requests are handled properly, as are interface routes in the IP routing table.

**Note**

If any router on a network segment uses a secondary address, all other devices on that same segment must also use a secondary address from the same network or subnet. Inconsistent use of secondary addresses on a network segment can very quickly cause routing loops.

When you are routing Open Shortest Path First (OSPF), ensure that all secondary addresses of an interface fall into the same OSPF area as the primary addresses.
If your switch receives its IP address from a Bootstrap Protocol (BOOTP) or a DHCP server and you remove the switch IP address by using the `no ip address` command, IP processing is disabled, and the BOOTP or the DHCP server cannot reassign the address.

A Layer 3 switch can have an IP address assigned to each routed port and SVI. The number of routed ports and SVIs that you can configure is not limited by software; however, the interrelationship between this number and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the `sdm prefer` global configuration command to reallocate system hardware resources based on templates and feature tables. For more information, see the `sdm prefer` command.

**Examples**

This example shows how to configure the IP address for the Layer 2 switch on a subnetted network:

```
Switch(config)# interface vlan 1
Switch(config-if)# ip address 172.20.128.2 255.255.255.0
```

This example shows how to configure the IP address for a port on the Layer 3 switch:

```
Switch(config)# ip multicast-routing
Switch(config)# interface gigabitethernet6/0/1
Switch(config-if)# no switchport
Switch(config-if)# ip address 172.20.128.2 255.255.255.0
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

ip admission

Use the **ip admission** interface configuration command to enable web authentication. You can also use this command in fallback-profile mode. Use the **no** form of this command to disable web authentication.

```
ip admission rule
no ip admission
```

**Syntax Description**

- **rule**: Apply an IP admission rule to the interface.

**Command Modes**

Global configuration

**Command History**

- **Release**: 12.2(35)SE
- **Modification**: This command was introduced.

**Usage Guidelines**

The **ip admission** command applies a web authentication rule to a switch port.

**Examples**

This example shows how to apply a web authentication rule to a switchport:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip admission rule1
```

This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.

```
Switch# configure terminal
Switch(config)# fallback profile profile1
Switch(config)# ip admission name rule1
Switch(config)# end
```

**Related Commands**

</thead>
<tbody>
<tr>
<td>inactivity-time</td>
<td>Starts the inactivity timer when the authenticated host does not send any traffic. If the inactivity timer expires and the host has still not sent any traffic, the web authentication sessions are terminated.</td>
</tr>
<tr>
<td>absolute-time</td>
<td>Provides the session timer. When this timer expires, the web authentication sessions are terminated.</td>
</tr>
</tbody>
</table>

**Defaults**

Web authentication is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(35)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ip admission name proxy http` command globally enables web authentication on a switch.

After you enable web authentication on a switch, use the `ip access-group in` and `ip admission web-rule` interface configuration commands to enable web authentication on a specific interface.

**Examples**

This example shows how to configure only web authentication on a switchport:

```
Switch# configure terminal
Switch(config) ip admission name http-rule proxy http
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip access-group 101 in
Switch(config-if)# ip admission rule
Switch(config-if)# end
```

This example shows how to configure IEEE 802.1x authentication with web authentication as a fallback mechanism on a switchport.

```
Switch# configure terminal
Switch(config)# ip admission name rule2 proxy http
Switch(config)# fallback profile profile1
Switch(config)# ip access group 101 in
Switch(config)# ip admission name rule2
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x fallback profile1
```
Switch(config-if)# end

</tr>
</tbody>
</table>
ip arp inspection filter vlan

Use the **ip arp inspection filter vlan** global configuration command to permit or deny Address Resolution Protocol (ARP) requests and responses from a host configured with a static IP address when dynamic ARP inspection is enabled. Use the **no** form of this command to return to the default settings.

```
ip arp inspection filter arp-acl-name vlan vlan-range [static]
no ip arp inspection filter arp-acl-name vlan vlan-range [static]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>arp-acl-name</th>
<th>ARP access control list (ACL) name.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>vlan-range</td>
<td>VLAN number or range.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td></td>
<td>static</td>
<td>(Optional) Specify <strong>static</strong> to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.</td>
</tr>
</tbody>
</table>

| Defaults                   |               | No defined ARP ACLs are applied to any VLAN. |
| Command Modes              | Global configuration |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When an ARP ACL is applied to a VLAN for dynamic ARP inspection, only the ARP packets with IP-to-MAC address bindings are compared against the ACL. If the ACL permits a packet, the switch forwards it. All other packet types are bridged in the ingress VLAN without validation.

If the switch denies a packet because of an explicit deny statement in the ACL, the packet is dropped. If the switch denies a packet because of an implicit deny statement, the packet is then compared against the list of DHCP bindings (unless the ACL is **static**, which means that packets are not compared against the bindings).

Use the **arp access-list acl-name** global configuration command to define the ARP ACL or to add clauses to the end of a predefined list.
Examples

This example shows how to apply the ARP ACL `static-hosts` to VLAN 1 for dynamic ARP inspection:

```
Switch(config)# ip arp inspection filter static-hosts vlan 1
```

You can verify your settings by entering the `show ip arp inspection vlan 1` privileged EXEC command.

</table>
ip arp inspection limit

Use the ip arp inspection limit interface configuration command to limit the rate of incoming Address Resolution Protocol (ARP) requests and responses on an interface. It prevents dynamic ARP inspection from using all of the switch resources if a denial-of-service attack occurs. Use the no form of this command to return to the default settings.

```
ip arp inspection limit { rate pps [burst interval seconds] | none }
```

Syntax Description

- **rate pps**: Specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 packets per second (pps).
- **burst interval seconds**: (Optional) Specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15 seconds.
- **none**: Specify no upper limit for the rate of incoming ARP packets that can be processed.

Defaults

The rate is 15 pps on untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second.

The rate is unlimited on all trusted interfaces.

The burst interval is 1 second.

Command Modes

Interface configuration

Command History

Release | Modification
--- | ---
12.2(20)SE | This command was introduced.

Usage Guidelines

The rate applies to both trusted and untrusted interfaces. Configure appropriate rates on trunks to process packets across multiple dynamic ARP inspection-enabled VLANs, or use the none keyword to make the rate unlimited.

After a switch receives more than the configured rate of packets every second consecutively over a number of burst seconds, the interface is placed into an error-disabled state.

Unless you explicitly configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the no ip arp inspection limit interface configuration command, the interface reverts to its default rate limit.

You should configure trunk ports with higher rates to reflect their aggregation. When the rate of incoming packets exceeds the user-configured rate, the switch places the interface into an error-disabled state. The error-disabled recovery feature automatically removes the port from the error-disabled state according to the recovery setting.
The rate limit is calculated separately on each switch in a switch stack. For a cross-stack EtherChannel, this means that the actual rate limit might be higher than the configured value. For example, if you set the rate limit to 30 pps on an EtherChannel that has one port on switch 1 and one port on switch 2, each port can receive packets at 29 pps without causing the EtherChannel to become error-disabled.

The rate of incoming ARP packets on EtherChannel ports equals the sum of the incoming rate of ARP packets from all the channel members. Configure the rate limit for EtherChannel ports only after examining the rate of incoming ARP packets on all the channel members.

### Examples

This example shows how to limit the rate of incoming ARP requests on a port to 25 pps and to set the interface monitoring interval to 5 consecutive seconds:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip arp inspection limit rate 25 burst interval 5
```

You can verify your settings by entering the `show ip arp inspection interfaces interface-id` privileged EXEC command.

### Related Commands

<table>

ip arp inspection log-buffer

Use the `ip arp inspection log-buffer` global configuration command to configure the dynamic Address Resolution Protocol (ARP) inspection logging buffer. Use the `no` form of this command to return to the default settings.

```
ip arp inspection log-buffer { entries number | logs number interval seconds }  
no ip arp inspection log-buffer { entries | logs }
```

**Syntax Description**

- `entries number`: Number of entries to be logged in the buffer. The range is 0 to 1024.
- `logs number`: Number of entries needed in the specified interval to generate system messages. For `logs number`, the range is 0 to 1024. A 0 value means that the entry is placed in the log buffer, but a system message is not generated.
- `interval seconds`: For `interval seconds`, the range is 0 to 86400 seconds (1 day). A 0 value means that a system message is immediately generated (and the log buffer is always empty).

**Defaults**

When dynamic ARP inspection is enabled, denied or dropped ARP packets are logged.

- The number of log entries is 32.
- The number of system messages is limited to 5 per second.
- The logging-rate interval is 1 second.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A value of 0 is not allowed for both the `logs` and the `interval` keywords.

The `logs` and `interval` settings interact. If the `logs number X` is greater than `interval seconds Y`, `X` divided by `Y (X/Y)` system messages are sent every second. Otherwise, one system message is sent every `Y` divided by `X (Y/X)` seconds. For example, if the `logs number` is 20 and the `interval seconds` is 4, the switch generates system messages for five entries every second while there are entries in the log buffer.

A log buffer entry can represent more than one packet. For example, if an interface receives many packets on the same VLAN with the same ARP parameters, the switch combines the packets as one entry in the log buffer and generates a system message as a single entry.

If the log buffer overflows, it means that a log event does not fit into the log buffer, and the output display for the `show ip arp inspection log` privileged EXEC command is affected. A `--` in the output display appears in place of all data except the packet count and the time. No other statistics are provided for the entry. If you see this entry in the display, increase the number of entries in the log buffer, or increase the logging rate.
The log buffer configuration applies to each stack member in a switch stack. Each stack member has the specified **logs number** entries and generates system messages at the configured rate. For example, if the interval (rate) is one entry per second, up to five system messages are generated per second in a five-member stack.

### Examples

This example shows how to configure the logging buffer to hold up to 45 entries:

```
Switch(config)# ip arp inspection log-buffer entries 45
```

This example shows how to configure the logging rate to 20 log entries per 4 seconds. With this configuration, the switch generates system messages for five entries every second while there are entries in the log buffer.

```
Switch(config)# ip arp inspection log-buffer logs 20 interval 4
```

You can verify your settings by entering the `show ip arp inspection log` privileged EXEC command.

ip arp inspection smartlog

To send the contents of packets in the dynamic Address Resolution Protocol (ARP) inspection logging buffer to a Flexible NetFlow collector, use the `ip arp inspection smartlog` command in global configuration mode. To disable dynamic ARP inspection smart logging, use the `no` form of this command.

```
ip arp inspection smartlog
no ip arp inspection smartlog
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Dynamic ARP smart logging is not enabled.

**Command Modes**
Global configuration

**Command History**
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**
Use the `ip arp inspection vlan` global configuration command to enable dynamic ARP inspection.

When dynamic ARP inspection is enabled, by default all denied or dropped ARP packets are logged. When you enable dynamic ARP inspection smart logging, the contents of these packets are sent to a configured Flexible NetFlow collector.

You can use the `ip arp inspection log-buffer` command to change the number of entries in the log buffer or to change the time period that they remain in the log buffer.

You can verify that dynamic smart logging is enabled by entering the `show ip arp inspection` privileged EXEC command.

**Examples**
This example shows how to enable dynamic ARP inspection and to enable smart logging for it on an interface:

```
Switch(config)# ip arp inspection vlan 22
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip arp inspection smartlog
```

<td>Displays dynamic ARP configuration, including whether or not smart logging is enabled for the feature.</td>
</tr>
</tbody>
</table>
ip arp inspection trust

Use the **ip arp inspection trust** interface configuration command to configure an interface trust state that determines which incoming Address Resolution Protocol (ARP) packets are inspected. Use the **no** form of this command to return to the default setting.

```
  ip arp inspection trust
  no ip arp inspection trust
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The interface is untrusted.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The switch does not check ARP packets that it receives on the trusted interface; it simply forwards the packets.

For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the **ip arp inspection vlan logging** global configuration command.

**Examples**

This example shows how to configure a port to be trusted:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# ip arp inspection trust
```

You can verify your setting by entering the **show ip arp inspection interfaces interface-id** privileged EXEC command.
### Related Commands

ip arp inspection validate

Use the **ip arp inspection validate** global configuration command to perform specific checks for dynamic Address Resolution Protocol (ARP) inspection. Use the **no** form of this command to return to the default settings.

```
ip arp inspection validate { [src-mac] [dst-mac] [ip [allow zeros]] }
```

```
no ip arp inspection validate [src-mac] [dst-mac] [ip [allow zeros]]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src-mac</td>
<td>Compare the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td>dst-mac</td>
<td>Compare the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
</tr>
<tr>
<td>ip</td>
<td>Compare the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are compared in all ARP requests and responses. Target IP addresses are checked only in ARP responses.</td>
</tr>
<tr>
<td>allow-zeros</td>
<td>Modifies the IP validation test so that ARPs with a sender address of 0.0.0.0 (ARP probes) are not denied.</td>
</tr>
</tbody>
</table>

**Defaults**

No checks are performed.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(37)SE</td>
<td>The <strong>allow-zero</strong> keyword was added.</td>
</tr>
</tbody>
</table>
Usage Guidelines

You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src-mac and dst-mac validations, and a second command enables IP validation only, the src-mac and dst-mac validations are disabled as a result of the second command.

The allow-zeros keyword interacts with ARP access control lists (ACLs) in this way:

- If you configure an ARP ACL to deny ARP probes, they are dropped even if the allow-zero keyword is specified.
- If you configure an ARP ACL that specifically permits ARP probes and configure the ip arp inspection validate ip command, ARP probes are dropped unless you enter the allow-zeros keyword.

The no form of the command disables only the specified checks. If none of the options are enabled, all checks are disabled.

Examples

This example show how to enable source MAC validation:

```
Switch(config)# ip arp inspection validate src-mac
```

You can verify your setting by entering the show ip arp inspection vlan vlan-range privileged EXEC command.

Related Commands

ip arp inspection vlan

Use the ip arp inspection vlan global configuration command to enable dynamic Address Resolution Protocol (ARP) inspection on a per-VLAN basis. Use the no form of this command to return to the default setting.

```
ip arp inspection vlan vlan-range
no ip arp inspection vlan vlan-range
```

**Syntax Description**

- **vlan-range**
  - VLAN number or range.
  - You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.

**Defaults**

ARP inspection is disabled on all VLANs.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must specify the VLANs on which to enable dynamic ARP inspection.

Dynamic ARP inspection is supported on access ports, trunk ports, EtherChannel ports, or private VLAN ports.

**Examples**

This example shows how to enable dynamic ARP inspection on VLAN 1:

```
Switch(config)# ip arp inspection vlan 1
```

You can verify your setting by entering the show ip arp inspection vlan vlan-range privileged EXEC command.

**Related Commands**

</table>
**ip arp inspection vlan logging**

Use the `ip arp inspection vlan logging` global configuration command to control the type of packets that are logged per VLAN. Use the `no` form of this command to disable this logging control.

```
ip arp inspection vlan vlan-range logging { acl-match { matchlog | none } | dhcp-bindings { all | none | permit } | arp-probe }
```

```
no ip arp inspection vlan vlan-range logging { acl-match | dhcp-bindings | arp-probe }
```

### Syntax Description

- **vlan-range**
  - Specify the VLANs configured for logging.
  - You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.

- **acl-match { matchlog | none }**
  - Specify that the logging of packets is based on access control list (ACL) matches.
  - The keywords have these meanings:
    - `matchlog`—Log packets based on the logging configuration specified in the access control entries (ACE). If you specify the `matchlog` keyword in this command and the `log` keyword in the `permit` or `deny` ARP access-list configuration command, Address Resolution Protocol (ARP) packets permitted or denied by the ACL are logged.
    - `none`—Do not log packets that match ACLs.

- **dhcp-bindings { permit | all | none }**
  - Specify the logging of packets is based on Dynamic Host Configuration Protocol (DHCP) binding matches.
  - The keywords have these meanings:
    - `all`—Log all packets that match DHCP bindings.
    - `none`—Do not log packets that match DHCP bindings.
    - `permit`—Log DHCP-binding permitted packets.

- **arp-probe**
  - Specify logging of packets permitted specifically because they are ARP probes.

### Defaults

All denied or all dropped packets are logged. ARP probe packets are not logged.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(37)SE</td>
<td>The <code>arp-probe</code> keyword was added.</td>
</tr>
</tbody>
</table>
**ip arp inspection vlan logging**

**Usage Guidelines**

The term *logged* means that the entry is placed into the log buffer and that a system message is generated. The *acl-match* and *dhcp-bindings* keywords merge with each other; that is, when you configure an ACL match, the DHCP bindings configuration is not disabled. Use the *no* form of the command to reset the logging criteria to their defaults. If neither option is specified, all types of logging are reset to log when ARP packets are denied. These are the options:

- **acl-match**—Logging on ACL matches is reset to log on deny.
- **dhcp-bindings**—Logging on DHCP binding matches is reset to log on deny.

If neither the *acl-match* or the *dhcp-bindings* keywords are specified, all denied packets are logged.

The implicit deny at the end of an ACL does not include the *log* keyword. This means that when you use the static keyword in the *ip arp inspection filter vlan* global configuration command, the ACL overrides the DHCP bindings. Some denied packets might not be logged unless you explicitly specify the *deny ip any mac any log* ACE at the end of the ARP ACL.

**Examples**

This example shows how to configure ARP inspection on VLAN 1 to log packets that match the *permit* commands in the ACL:

```
Switch(config)# arp access-list test1
Switch(config-arp-nacl)# permit request ip any mac any log
Switch(config-arp-nacl)# permit response ip any any mac any any log
Switch(config-arp-nacl)# exit
Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog
```

You can verify your settings by entering the *show ip arp inspection vlan vlan-range* privileged EXEC command.

ip device tracking probe

Use the ip device tracking probe global configuration command to configure the IP device tracking table for Address Resolution Protocol (ARP) probes. Use the no form of this command to disable ARP probes.

```
ip device tracking probe {count | interval | use-svi}
no ip device tracking probe {count | interval | use-svi}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count number</td>
<td>Sets the number of times that the switch sends the ARP probe. The range is</td>
</tr>
<tr>
<td></td>
<td>from 1 to 255.</td>
</tr>
<tr>
<td>interval</td>
<td>Sets the number of seconds that the switch waits for a response before</td>

<tr>
<td>seconds</td>
<td>resending the ARP probe. The range is from 30 to 1814400 seconds.</td>
</tr>
<tr>
<td>use-svi</td>
<td>Uses the switch virtual interface (SVI) IP address as source of ARP probes.</td>
</tr>
</tbody>
</table>

### Command Default

The count number is 3.
The interval is 30 seconds.
The ARP probe default source IP address is the Layer 3 interface and 0.0.0.0 for switchports.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>

<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(55)SE</td>
<td>The use-svi keyword was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **count** keyword option to set the number of times that the switch sends the ARP probe. The range is from 1 to 255.

Use the **interval** keyword option to set the number of seconds that the switch waits for a response before resending the ARP probe. The range is from 30 to 1814400 seconds.

Use the **use-svi** keyword option to configure the IP device tracking table to use the SVI IP address for ARP probes in cases when the default source ip address 0.0.0.0 for switchports is used and the ARP probes drop.

Use the **show ip device tracking all** command to display information about entries in the IP device tracking table. For more information about this command, see the Cisco IOS Security Command Reference, Release 12.4T.

### Examples

This example shows how to set SVI as the source for ARP probes:

```
Switch(config)# ip device tracking probe use-svi
Switch(config)#
```

ip dhcp snooping

Use the `ip dhcp snooping` global configuration command to globally enable DHCP snooping. Use the `no` form of this command to return to the default setting.

```
ip dhcp snooping
no ip dhcp snooping
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

DHCP snooping is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For any DHCP snooping configuration to take effect, you must globally enable DHCP snooping. DHCP snooping is not active until you enable snooping on a VLAN by using the `ip dhcp snooping vlan vlan-id` global configuration command.

**Examples**

This example shows how to enable DHCP snooping:

```
Switch(config)# ip dhcp snooping
```

You can verify your settings by entering the `show ip dhcp snooping` user EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td><code>show ip dhcp snooping binding</code></td>
<td>Displays the DHCP snooping binding information.</td>
</tr>
</tbody>
</table>
ip dhcp snooping binding

Use the **ip dhcp snooping binding** privileged EXEC command to configure the DHCP snooping binding database and to add binding entries to the database. Use the **no** form of this command to delete entries from the binding database.

```
ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id expiry seconds

no ip dhcp snooping binding mac-address vlan vlan-id ip-address interface interface-id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-address</td>
<td>Specify a MAC address.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>Specify a VLAN number. The range is 1 to 4094.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Specify an IP address.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify an interface on which to add or delete a binding entry.</td>
</tr>
<tr>
<td>expiry seconds</td>
<td>Specify the interval (in seconds) after which the binding entry is no longer valid. The range is 1 to 4294967295.</td>
</tr>
</tbody>
</table>

### Defaults

No default database is defined.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use this command when you are testing or debugging the switch.

In the DHCP snooping binding database, each database entry, also referred to a binding, has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. The database can have up to 8192 bindings.

Use the **show ip dhcp snooping binding** privileged EXEC command to display only the configured bindings. Use the **show ip source binding** privileged EXEC command to display the dynamically and statically configured bindings.

### Examples

This example shows how to generate a DHCP binding configuration with an expiration time of 1000 seconds on a port in VLAN 1:

```
Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gigabitethernet1/0/1 expiry 1000
```

You can verify your settings by entering the **show ip dhcp snooping binding** or the **show ip dhcp source binding** privileged EXEC command.

<tr>
<td><strong>timeout seconds</strong></td>
<td>Specify (in seconds) how long to wait for the database transfer process to finish before stopping. The default is 300 seconds. The range is 0 to 86400. Use 0 to define an infinite duration, which means to continue trying the transfer indefinitely.</td>
</tr>
<tr>
<td><strong>write-delay seconds</strong></td>
<td>Specify (in seconds) the duration for which the transfer should be delayed after the binding database changes. The default is 300 seconds. The range is 15 to 86400.</td>
</tr>
</tbody>
</table>

### Defaults

The URL for the database agent or binding file is not defined.

The timeout value is 300 seconds (5 minutes).

The write-delay value is 300 seconds (5 minutes).

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The DHCP snooping binding database can have up to 8192 bindings.

To ensure that the lease time in the database is accurate, we recommend that Network Time Protocol (NTP) is enabled and configured for these features:

- NTP authentication
- NTP peer and server associations
- NTP broadcast service
- NTP access restrictions
- NTP packet source IP address

If NTP is configured, the switch writes binding changes to the binding file only when the switch system clock is synchronized with NTP.

Because both NVRAM and the flash memory have limited storage capacities, we recommend that you store a binding file on a TFTP server. You must create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can first write bindings to the binding file at that URL.

Use the `ip dhcp snooping database flash[number]:/filename` command to save the DHCP snooping binding database in the stack master NVRAM. The database is not saved in a stack member NVRAM.

If you set the `ip dhcp snooping database timeout` command to 0 seconds and the database is being written to a TFTP file, if the TFTP server goes down, the database agent continues to try the transfer indefinitely. No other transfer can be initiated while this one is in progress. This might be inconsequential because if the server is down, no file can be written to it.

Use the `no ip dhcp snooping database` command to disable the agent.

Use the `no ip dhcp snooping database timeout` command to reset the timeout value.

Use the `no ip dhcp snooping database write-delay` command to reset the write-delay value.

Examples

This example shows how to store a binding file at an IP address of 10.1.1.1 that is in a directory called `directory`. A file named `file` must be present on the TFTP server.

```
Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
```

This example shows how to store a binding file called `file01.txt` in the stack master NVRAM:

```
Switch(config)# ip dhcp snooping database flash:file01.txt
```

You can verify your settings by entering the `show ip dhcp snooping database` privileged EXEC command.

ip dhcp snooping information option

Use the `ip dhcp snooping information option` global configuration command to enable DHCP option-82 data insertion. Use the `no` form of this command to disable DHCP option-82 data insertion.

```
ip dhcp snooping information option
no ip dhcp snooping information option
```

Syntax Description

This command has no arguments or keywords.

Defaults

DHCP option-82 data is inserted.

Command Modes

Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You must globally enable DHCP snooping by using the `ip dhcp snooping` global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled and a switch receives a DHCP request from a host, it adds the option-82 information in the packet. The option-82 information contains the switch MAC address (the remote ID suboption) and the port identifier, `vlan-mod-port`, from which the packet is received (circuit ID suboption). The switch forwards the DHCP request that includes the option-82 field to the DHCP server.

When the DHCP server receives the packet, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or a circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. When the client and server are on the same subnet, the server broadcasts the reply. The switch inspects the remote ID and possibly the circuit ID fields to verify that it originally inserted the option-82 data. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP host that sent the DHCP request.

Examples

This example shows how to enable DHCP option-82 data insertion:

```
Switch(config)# ip dhcp snooping information option
```

You can verify your settings by entering the `show ip dhcp snooping` user EXEC command.
### ip dhcp snooping information option

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip dhcp snooping</code></td>

ip dhcp snooping information option allow-untrusted

Use the **ip dhcp snooping information option allow-untrusted** global configuration command on an aggregation switch to configure it to accept DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch. Use the **no** form of this command to return to the default setting.

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The switch drops DHCP packets with option-82 information that are received on untrusted ports that might be connected to an edge switch.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEA</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You might want an edge switch to which a host is connected to insert DHCP option-82 information at the edge of your network. You might also want to enable DHCP security features, such as DHCP snooping, IP source guard, or dynamic Address Resolution Protocol (ARP) inspection, on an aggregation switch. However, if DHCP snooping is enabled on the aggregation switch, the switch drops packets with option-82 information that are received on an untrusted port and does not learn DHCP snooping bindings for connected devices on a trusted interface.

If the edge switch to which a host is connected inserts option-82 information and you want to use DHCP snooping on an aggregation switch, enter the **ip dhcp snooping information option allow-untrusted** command on the aggregation switch. The aggregation switch can learn the bindings for a host even though the aggregation switch receives DHCP snooping packets on an untrusted port. You can also enable DHCP security features on the aggregation switch. The port on the edge switch to which the aggregation switch is connected must be configured as a trusted port.

**Note**
Do not enter the **ip dhcp snooping information option allow-untrusted** command on an aggregation switch to which an untrusted device is connected. If you enter this command, an untrusted device might spoof the option-82 information.

**Examples**
This example shows how to configure an access switch to not check the option-82 information in untrusted packets from an edge switch and to accept the packets:

```
Switch(config)# ip dhcp snooping information option allow-untrusted
```
You can verify your settings by entering the `show ip dhcp snooping` user EXEC command.

<tr>
<td></td>
<td><code>show ip dhcp snooping binding</code></td>
<td>Displays the DHCP snooping binding information.</td>
</tr>
</tbody>
</table>
**ip dhcp snooping information option format remote-id**

Use the `ip dhcp snooping information option format remote-id` global configuration command to configure the option-82 remote-ID suboption. Use the `no` form of this command to configure the default remote-ID suboption.

```
ip dhcp snooping information option format remote-id [string ASCII-string | hostname]
no ip dhcp snooping information option format remote-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string ASCII-string</td>
<td>Specify a remote ID, using from 1 to 63 ASCII characters (no spaces).</td>
</tr>
<tr>
<td>hostname</td>
<td>Specify the switch hostname as the remote ID.</td>
</tr>
</tbody>
</table>

**Defaults**

The switch MAC address is the remote ID.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must globally enable DHCP snooping by using the `ip dhcp snooping` global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled, the default remote-ID suboption is the switch MAC address. This command allows you to configure either the switch hostname or a string of up to 63 ASCII characters (but no spaces) to be the remote ID.

**Note**

If the hostname exceeds 63 characters, it will be truncated to 63 characters in the remote-ID configuration.

**Examples**

This example shows how to configure the option-82 remote-ID suboption:

```
Switch(config)# ip dhcp snooping information option format remote-id hostname
```

You can verify your settings by entering the `show ip dhcp snooping` user EXEC command.

**Related Commands**

<table>
<thead>

</tbody>
</table>
**ip dhcp snooping limit rate**

Use the `ip dhcp snooping limit rate` interface configuration command to configure the number of DHCP messages an interface can receive per second. Use the `no` form of this command to return to the default setting.

```
ip dhcp snooping limit rate rate
no ip dhcp snooping limit rate
```

**Syntax Description**

- `rate`: The number of DHCP messages an interface can receive per second. The range is 1 to 2048.

**Defaults**

DHCP snooping rate limiting is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(18)SE</td>
<td>The range was changed to 1 to 2048.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Normally, the rate limit applies to untrusted interfaces. If you want to configure rate limiting for trusted interfaces, keep in mind that trusted interfaces might aggregate DHCP traffic on multiple VLANs (some of which might not be snooped) in the switch, and you will need to adjust the interface rate limits to a higher value.

If the rate limit is exceeded, the interface is error-disabled. If you enabled error recovery by entering the `errdisable recovery dhcp-rate-limit` global configuration command, the interface retries the operation again when all the causes have timed out. If the error-recovery mechanism is not enabled, the interface stays in the error-disabled state until you enter the `shutdown` and `no shutdown` interface configuration commands.

**Examples**

This example shows how to set a message rate limit of 150 messages per second on an interface:

```
Switch(config-if)# ip dhcp snooping limit rate 150
```

You can verify your settings by entering the `show ip dhcp snooping` user EXEC command.

ip dhcp snooping trust

Use the ip dhcp snooping trust interface configuration command to configure a port as trusted for DHCP snooping purposes. Use the no form of this command to return to the default setting.

```plaintext
ip dhcp snooping trust
no ip dhcp snooping trust
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
DHCP snooping trust is disabled.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Configure as trusted ports those that are connected to a DHCP server or to other switches or routers. Configure as untrusted ports those that are connected to DHCP clients.

**Examples**
This example shows how to enable DHCP snooping trust on a port:

```plaintext
Switch(config-if)# ip dhcp snooping trust
```

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

**Related Commands**

ip dhcp snooping verify

Use the `ip dhcp snooping verify` global configuration command to configure the switch to verify on an untrusted port that the source MAC address in a DHCP packet matches the client hardware address. Use the `no` form of this command to configure the switch to not verify the MAC addresses.

```
ip dhcp snooping verify mac-address
no ip dhcp snooping verify mac-address
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The switch verifies the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In a service-provider network, when a switch receives a packet from a DHCP client on an untrusted port, it automatically verifies that the source MAC address and the DHCP client hardware address match. If the addresses match, the switch forwards the packet. If the addresses do not match, the switch drops the packet.

**Examples**

This example shows how to disable the MAC address verification:

```
Switch(config)# no ip dhcp snooping verify mac-address
```

You can verify your settings by entering the `show ip dhcp snooping` user EXEC command.

**Related Commands**

ip dhcp snooping vlan

To enable DHCP snooping on a VLAN or to enable DHCP snooping smart logging on the VLAN, use the `ip dhcp snooping vlan` command in global configuration mode. To return to the default setting, use the `no` form of this command.

```
ip dhcp snooping vlan vlan-range [smartlog]
no ip dhcp snooping vlan vlan-range [smartlog]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-range</code></td>
<td>Specify a VLAN ID or a range of VLANs on which to enable DHCP snooping. The range is 1 to 4094. You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space.</td>
</tr>
<tr>
<td><code>smartlog</code></td>
<td>(Optional) Enables DHCP snooping smart logging for the VLAN or range of VLANs.</td>
</tr>
</tbody>
</table>

**Defaults**

DHCP snooping is disabled on all VLANs.
DHCP smart logging is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(58)SE</td>
<td>The <code>smartlog</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must first globally enable DHCP snooping by entering the `ip dhcp snooping` global configuration command before enabling DHCP snooping on a VLAN.

DHCP snooping intercepts and inspects DHCP packets entering untrusted ports and either forwards or drops the packets.

When you enable DHCP snooping smart logging, the contents of dropped packets are sent to a Flexible NetFlow collector.

You can verify the configuration by entering the `show ip dhcp snooping` user EXEC command.

**Examples**

This example shows how to enable DHCP snooping on VLAN 10:

```
Switch(config)# ip dhcp snooping vlan 10
```
This example shows how to enable DHCP snooping on VLAN 10 and then enable smart logging for packets entering the VLAN:

```
Switch(config)# ip dhcp snooping vlan 10
Switch(config)# ip dhcp snooping vlan 10 smartlog
```

This example shows how to enable DHCP snooping on a range of VLANs and then enable smart logging for packets entering the VLANs:

```
Switch(config)# ip dhcp snooping vlan 10-20
Switch(config)# ip dhcp snooping vlan 10-20 smartlog
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip dhcp snooping</strong></td>
<td>Globally enables DHCP snooping.</td>
</tr>
<tr>
<td><strong>logging smartlog</strong></td>
<td>Globally enables smart logging.</td>
</tr>
<tr>
<td><strong>show ip dhcp snooping</strong></td>
<td>Displays the DHCP snooping configuration.</td>
</tr>
</tbody>
</table>
**ip dhcp snooping vlan information option format-type circuit-id string**

Use the `ip dhcp snooping vlan information option format-type circuit-id string` interface configuration command to configure the option-82 circuit-ID suboption. Use the `no` form of this command to configure the default circuit-ID suboption.

```
ip dhcp snooping vlan vlan-id information option format-type circuit-id [override] string ASCII-string
no ip dhcp snooping vlan vlan-id information option format-type circuit-id [override] string
```

**Syntax Description**

- `vlan vlan-id` Specify the VLAN ID. The range is 1 to 4094.
- `override` (Optional) Specify an override string, using from 3 to 63 ASCII characters (no spaces).
- `string ASCII-string` Specify a circuit ID, using from 3 to 63 ASCII characters (no spaces).

**Defaults**

The switch VLAN and the port identifier, in the format `vlan-mod-port`, is the default circuit ID.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(52)SE</td>
<td>The <code>override</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must globally enable DHCP snooping by using the `ip dhcp snooping` global configuration command for any DHCP snooping configuration to take effect.

When the option-82 feature is enabled, the default circuit-ID suboption is the switch VLAN and the port identifier, in the format `vlan-mod-port`. This command allows you to configure a string of ASCII characters to be the circuit ID. When you want to override the `vlan-mod-port` format type and instead use the circuit-ID to define subscriber information, use the `override` keyword.

**Note**

When configuring a large number of circuit IDs on a switch, consider the impact of lengthy character strings on the NVRAM or flash memory. If the circuit-ID configurations, combined with other data, exceed the capacity of the NVRAM or the flash memory, an error message appears.
This example shows how to configure the option-82 circuit-ID suboption:
```
Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id string customerABC-250-0-0
```

This example shows how to configure the option-82 circuit-ID override suboption:
```
Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id override string testcustomer
```

You can verify your settings by entering the `show ip dhcp snooping` user EXEC command.

---

**Note**

The `show ip dhcp snooping` user EXEC command only displays the global command output, including a remote-ID configuration. It does not display any per-interface, per-VLAN string that you have configured for the circuit ID.

---

**Related Commands**

<table>

</tbody>
</table>
ip igmp filter

Use the `ip igmp filter` interface configuration command to control whether or not all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an Internet Group Management Protocol (IGMP) profile to the interface. Use the `no` form of this command to remove the specified profile from the interface.

```
  ip igmp filter profile number

  no ip igmp filter
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>profile number</code></td>
<td>The IGMP profile number to be applied. The range is 1 to 4294967295.</td>
</tr>
</tbody>
</table>

**Defaults**

No IGMP filters are applied.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can apply IGMP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.

An IGMP profile can be applied to one or more switch port interfaces, but one port can have only one profile applied to it.

**Examples**

This example shows how to apply IGMP profile 22 to a port:

```
Switch(config)# interface gigabitethernet1/2
Switch(config-if)# ip igmp filter 22
```

You can verify your setting by using the `show running-config` privileged EXEC command and by specifying an interface.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp profile</td>
<td>Configures the specified IGMP profile number.</td>
</tr>
<tr>
<td><code>show ip dhcp snooping statistics</code></td>
<td>Displays the characteristics of the specified IGMP profile.</td>
</tr>
<tr>
<td><code>show running-config interface interface-id</code></td>
<td>Displays the running configuration on the switch interface, including the IGMP profile (if any) that is applied to an interface.</td>
</tr>
</tbody>
</table>

**ip igmp max-groups**

Use the `ip igmp max-groups` interface configuration command to set the maximum number of Internet Group Management Protocol (IGMP) groups that a Layer 2 interface can join or to configure the IGMP throttling action when the maximum number of entries is in the forwarding table. Use the `no` form of this command to set the maximum back to the default, which is to have no maximum limit, or to return to the default throttling action, which is to drop the report.

```
ip igmp max-groups {number | action {deny | replace}}
no ip igmp max-groups {number | action}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>number</strong></td>
<td>The maximum number of IGMP groups that an interface can join. The range is 0 to 4294967294. The default is no limit.</td>
</tr>
<tr>
<td><strong>action deny</strong></td>
<td>When the maximum number of entries is in the IGMP snooping forwarding table, drop the next IGMP join report. This is the default action.</td>
</tr>
<tr>
<td><strong>action replace</strong></td>
<td>When the maximum number of entries is in the IGMP snooping forwarding table, replace the existing group with the new group for which the IGMP report was received.</td>
</tr>
</tbody>
</table>

**Defaults**

The default maximum number of groups is no limit.

After the switch learns the maximum number of IGMP group entries on an interface, the default throttling action is to drop the next IGMP report that the interface receives and to not add an entry for the IGMP group to the interface.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(19)EA1</td>
<td>The `action {deny</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command only on Layer 2 physical interfaces and on logical EtherChannel interfaces. You cannot set IGMP maximum groups for routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.

Follow these guidelines when configuring the IGMP throttling action:

- If you configure the throttling action as `deny` and set the maximum group limitation, the entries that were previously in the forwarding table are not removed but are aged out. After these entries are aged out, when the maximum number of entries is in the forwarding table, the switch drops the next IGMP report received on the interface.
- If you configure the throttling action as `replace` and set the maximum group limitation, the entries that were previously in the forwarding table are removed. When the maximum number of entries is in the forwarding table, the switch replaces a randomly selected multicast entry with the received IGMP report.
When the maximum group limitation is set to the default (no maximum), entering the `ip igmp max-groups {deny | replace}` command has no effect.

**Examples**

This example shows how to limit to 25 the number of IGMP groups that a port can join:

```
Switch(config)# interface gigabitethernet1//2
Switch(config-if)# ip igmp max-groups 25
```

This example shows how to configure the switch to replace the existing group with the new group for which the IGMP report was received when the maximum number of entries is in the forwarding table:

```
Switch(config)# interface gigabitethernet1//2
Switch(config-if)# ip igmp max-groups action replace
```

You can verify your setting by using the `show running-config` privileged EXEC command and by specifying an interface.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config interface interface-id</code></td>
<td>Displays the running configuration on the switch interface, including the maximum number of IGMP groups that an interface can join and the throttling action.</td>
</tr>
</tbody>
</table>
ip igmp profile

Use the `ip igmp profile` global configuration command to create an Internet Group Management Protocol (IGMP) profile and enter IGMP profile configuration mode. From this mode, you can specify the configuration of the IGMP profile to be used for filtering IGMP membership reports from a switchport. Use the `no` form of this command to delete the IGMP profile.

```
ip igmp profile profile number
no ip igmp profile profile number
```

**Syntax Description**

- `profile number`: The IGMP profile number being configured. The range is 1 to 4294967295.

**Defaults**

No IGMP profiles are defined. When configured, the default action for matching an IGMP profile is to deny matching addresses.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you are in IGMP profile configuration mode, you can create the profile by using these commands:

- `deny`: specifies that matching addresses are denied; this is the default condition.
- `exit`: exits from igmp-profile configuration mode.
- `no`: negates a command or resets to its defaults.
- `permit`: specifies that matching addresses are permitted.
- `range`: specifies a range of IP addresses for the profile. This can be a single IP address or a range with a start and an end address.

When entering a range, enter the low IP multicast address, a space, and the high IP multicast address.

You can apply an IGMP profile to one or more Layer 2 interfaces, but each interface can have only one profile applied to it.

**Examples**

This example shows how to configure IGMP profile 40 that permits the specified range of IP multicast addresses:

```
Switch(config)# ip igmp profile 40
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 233.1.1.1 233.255.255.255
```

You can verify your settings by using the `show ip igmp profile` privileged EXEC command.

</table>
ip igmp snooping

Use the ip igmp snooping global configuration command to globally enable Internet Group Management Protocol (IGMP) snooping on the switch or to enable it on a per-VLAN basis. Use the no form of this command to return to the default setting.

```
ip igmp snooping [vlan vlan-id]

no ip igmp snooping [vlan vlan-id]
```

### Syntax Description

- `vlan vlan-id` (Optional) Enable IGMP snooping on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.

### Defaults

- IGMP snooping is globally enabled on the switch.
- IGMP snooping is enabled on VLAN interfaces.

### Command Modes

- Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When IGMP snooping is enabled globally, it is enabled in all the existing VLAN interfaces. When IGMP snooping is globally disabled, it is disabled on all the existing VLAN interfaces.
- VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

### Examples

- This example shows how to globally enable IGMP snooping:
  ```
  Switch(config)# ip igmp snooping
  ```

- This example shows how to enable IGMP snooping on VLAN 1:
  ```
  Switch(config)# ip igmp snooping vlan 1
  ```

- You can verify your settings by entering the `show ip igmp snooping` privileged EXEC command.

ip igmp snooping querier

Use the `ip igmp snooping querier` global configuration command to globally enable the Internet Group Management Protocol (IGMP) querier function in Layer 2 networks. Use the command with keywords to enable and configure the IGMP querier feature on a VLAN interface. Use the `no` form of this command to return to the default settings.

```
ip igmp snooping querier [vlan vlan-id] [address ip-address | max-response-time response-time | query-interval interval-count | tcn query [count count | interval interval] | timer expiry | version version]

no ip igmp snooping querier [vlan vlan-id] [address | max-response-time | query-interval | tcn query { count count | interval interval } | timer expiry | version]
```

### Syntax Description

- **vlan vlan-id**
  - (Optional) Enable IGMP snooping and the IGMP querier function on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.

- **address ip-address**
  - (Optional) Specify a source IP address. If you do not specify an IP address, the querier tries to use the global IP address configured for the IGMP querier.

- **max-response-time response-time**
  - (Optional) Set the maximum time to wait for an IGMP querier report. The range is 1 to 25 seconds.

- **query-interval interval-count**
  - (Optional) Set the interval between IGMP queriers. The range is 1 to 18000 seconds.

- **tcn query [count count | interval interval]**
  - (Optional) Set parameters related to Topology Change Notifications (TCNs). The keywords have these meanings:
    - `count count`—Set the number of TCN queries to be executed during the TCN interval time. The range is 1 to 10.
    - `interval interval`—Set the TCN query interval time. The range is 1 to 255.

- **timer expiry**
  - (Optional) Set the length of time until the IGMP querier expires. The range is 60 to 300 seconds.

- **version version**
  - (Optional) Select the IGMP version number that the querier feature uses. Select 1 or 2.

### Defaults

The IGMP snooping querier feature is globally disabled on the switch.

When enabled, the IGMP snooping querier disables itself if it detects IGMP traffic from a multicast-enabled device.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEA</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Use this command to enable IGMP snooping to detect the IGMP version and IP address of a device that sends IGMP query messages, which is also called a querier.

By default, the IGMP snooping querier is configured to detect devices that use IGMP Version 2 (IGMPv2) but does not detect clients that are using IGMP Version 1 (IGMPv1). You can manually configure the max-response-time value when devices use IGMPv2. You cannot configure the max-response-time when devices use IGMPv1. (The value cannot be configured and is set to zero).

Non-RFC compliant devices running IGMPv1 might reject IGMP general query messages that have a non-zero value as the max-response-time value. If you want the devices to accept the IGMP general query messages, configure the IGMP snooping querier to run IGMPv1.

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

Examples

This example shows how to globally enable the IGMP snooping querier feature:

```
Switch(config)# ip igmp snooping querier
```

This example shows how to set the IGMP snooping querier maximum response time to 25 seconds:

```
Switch(config)# ip igmp snooping querier max-response-time 25
```

This example shows how to set the IGMP snooping querier interval time to 60 seconds:

```
Switch(config)# ip igmp snooping querier query-interval 60
```

This example shows how to set the IGMP snooping querier TCN query count to 25:

```
Switch(config)# ip igmp snooping querier tcn count 25
```

This example shows how to set the IGMP snooping querier timeout to 60 seconds:

```
Switch(config)# ip igmp snooping querier timeout expiry 60
```

This example shows how to set the IGMP snooping querier feature to version 2:

```
Switch(config)# ip igmp snooping querier version 2
```

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

ip igmp snooping report-suppression

Use the **ip igmp snooping report-suppression** global configuration command to enable Internet Group Management Protocol (IGMP) report suppression. Use the **no** form of this command to disable IGMP report suppression and to forward all IGMP reports to multicast routers.

```
ip igmp snooping report-suppression
no ip igmp snooping report-suppression
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
IGMP report suppression is enabled.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
IGMP report suppression is supported only when the multicast query has IGMPv1 and IGMPv2 reports. This feature is not supported when the query includes IGMPv3 reports.

The switch uses IGMP report suppression to forward only one IGMP report per multicast router query to multicast devices. When IGMP router suppression is enabled (the default), the switch sends the first IGMP report from all hosts for a group to all the multicast routers. The switch does not send the remaining IGMP reports for the group to the multicast routers. This feature prevents duplicate reports from being sent to the multicast devices.

If the multicast router query includes requests only for IGMPv1 and IGMPv2 reports, the switch forwards only the first IGMPv1 or IGMPv2 report from all hosts for a group to all the multicast routers. If the multicast router query also includes requests for IGMPv3 reports, the switch forwards all IGMPv1, IGMPv2, and IGMPv3 reports for a group to the multicast devices.

If you disable IGMP report suppression by entering the **no ip igmp snooping report-suppression** command, all IGMP reports are forwarded to all the multicast routers.

**Examples**
This example shows how to disable report suppression:

```
Switch(config)# no ip igmp snooping report-suppression
```

You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp snooping</td>
<td>Enables IGMP snooping on the switch or on a VLAN.</td>

</tbody>
</table>
ip igmp snooping tcn

Use the `ip igmp snooping tcn` global configuration command to configure the Internet Group Management Protocol (IGMP) Topology Change Notification (TCN) behavior. Use the `no` form of this command to return to the default settings.

```
  ip igmp snooping tcn {flood query count count | query solicit}
  no ip igmp snooping tcn {flood query count | query solicit}
```

**Syntax Description**

- `flood query count count`: Specify the number of IGMP general queries for which the multicast traffic is flooded. The range is 1 to 10.
- `query solicit`: Send an IGMP leave message (global leave) to speed the process of recovering from the flood mode caused during a TCN event.

**Defaults**

The TCN flood query count is 2.
The TCN query solicitation is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEB</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use `ip igmp snooping tcn flood query count` global configuration command to control the time that multicast traffic is flooded after a TCN event. If you set the TCN flood query count to 1 by using the `ip igmp snooping tcn flood query count` command, the flooding stops after receiving 1 general query. If you set the count to 7, the flooding of multicast traffic due to the TCN event lasts until 7 general queries are received. Groups are relearned based on the general queries received during the TCN event.

Use the `ip igmp snooping tcn query solicit` global configuration command to enable the switch to send the global leave message whether or not it is the spanning-tree root. This command also speeds the process of recovering from the flood mode caused during a TCN event.

**Examples**

This example shows how to specify 7 as the number of IGMP general queries for which the multicast traffic is flooded:

```
Switch(config)# no ip igmp snooping tcn flood query count 7
```

You can verify your settings by entering the `show ip igmp snooping` privileged EXEC command.

ip igmp snooping tcn flood

Use the **ip igmp snooping tcn flood** interface configuration command to specify multicast flooding as the Internet Group Management Protocol (IGMP) snooping spanning-tree Topology Change Notification (TCN) behavior. Use the **no** form of this command to disable the multicast flooding.

```
ip igmp snooping tcn flood
no ip igmp snooping tcn flood
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Multicast flooding is enabled on an interface during a spanning-tree TCN event.

**Command Modes**
Interface configuration

**Command History**
```
Release       Modification
12.2(25)SEB   This command was introduced.
```

**Usage Guidelines**
When the switch receives a TCN, multicast traffic is flooded to all the ports until two general queries are received. If the switch has many ports with attached hosts that are subscribed to different multicast groups, the flooding might exceed the capacity of the link and cause packet loss.

You can change the flooding query count by using the **ip igmp snooping tcn flood query count count** global configuration command.

**Examples**
This example shows how to disable the multicast flooding on an interface:
```
Switch(config)# interface gigabitethernet1/2
Switch(config-if)# no ip igmp snooping tcn flood
```

You can verify your settings by entering the **show ip igmp snooping** privileged EXEC command.

ip igmp snooping vlan immediate-leave

Use the ip igmp snooping immediate-leave global configuration command to enable Internet Group Management Protocol (IGMP) snooping immediate-leave processing on a per-VLAN basis. Use the no form of this command to return to the default setting.

```
ip igmp snooping vlan vlan-id immediate-leave

no ip igmp snooping vlan vlan-id immediate-leave
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Enable IGMP snooping and the Immediate-Leave feature on the specified VLAN. The range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>

Defaults

IGMP immediate-leave processing is disabled.

Command Modes

Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

You should configure the Immediate-Leave feature only when there is a maximum of one receiver on every port in the VLAN. The configuration is saved in NVRAM.

The Immediate-Leave feature is supported only with IGMP Version 2 hosts.

Examples

This example shows how to enable IGMP immediate-leave processing on VLAN 1:

```
Switch(config)# ip igmp snooping vlan 1 immediate-leave
```

You can verify your settings by entering the `show ip igmp snooping` privileged EXEC command.

</table>
**ip igmp snooping vlan mrouter**

Use the `ip igmp snooping mrouter` global configuration command to add a multicast router port or to configure the multicast learning method. Use the `no` form of this command to return to the default settings.

```
ip igmp snooping vlan vlan-id mrouter {interface interface-id | learn {cgmp | pim-dvmrp}}
no ip igmp snooping vlan vlan-id mrouter {interface interface-id | learn {cgmp | pim-dvmrp}}
```

**Syntax Description**

- **vlan-id**
  Enable IGMP snooping, and add the port in the specified VLAN as the multicast router port. The range is 1 to 1001 and 1006 to 4094.

- **interface interface-id**
  Specify the next-hop interface to the multicast router. The keywords have these meanings:
  - `fastethernet interface number`—a Fast Ethernet IEEE 802.3 interface.
  - `gigabitethernet interface number`—a Gigabit Ethernet IEEE 802.3z interface.
  - `port-channel interface number`—a channel interface. The range is 0 to 48.

- **learn {cgmp | pim-dvmrp}**
  Specify the multicast router learning method. The keywords have these meanings:
  - `cgmp`—Set the switch to learn multicast router ports by snooping on Cisco Group Management Protocol (CGMP) packets.
  - `pim-dvmrp`—Set the switch to learn multicast router ports by snooping on IGMP queries and Protocol-Independent Multicast-Distance Vector Multicast Routing Protocol (PIM-DVMRP) packets.

**Defaults**

By default, there are no multicast router ports.

The default learning method is `pim-dvmrp`—to snoop IGMP queries and PIM-DVMRP packets.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

The CGMP learn method is useful for reducing control traffic.

The configuration is saved in NVRAM.
Examples

This example shows how to configure a port as a multicast router port:

Switch(config)# ip igmp snooping vlan 1 mrouter interface gigabitethernet1/0/22

This example shows how to specify the multicast router learning method as CGMP:

Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp

You can verify your settings by entering the show ip igmp snooping privileged EXEC command.

ip snap forwarding

Use the **ip snap forwarding** global configuration command on the switch stack or on a standalone switch to enable forwarding of IP Version 4 (IPv4) and IP Version 6 (IPv6) frames with Subnetwork Access Protocol (SNAP) encapsulation. Use **no** form of this command to disable forwarding of these frames.

**ip snap forwarding**

**no ip snap forwarding**

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The switch does not forward IPv4 and IPv6 frames with SNAP encapsulation.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEC</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **ip snap forwarding** global configuration command to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation.

If a switch that is joining the stack does not support forwarding of IPv4 and IPv6 frames with SNAP encapsulation, all the switches in the stack do not forward the IPv4 and IPv6 frames, and this forwarding feature is disabled.

**Examples**

This example shows how to enable forwarding of IPv4 and IPv6 frames with SNAP encapsulation:

```
Switch(config)# ip snap forwarding
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show running-config</strong></td>
<td>Displays the running configuration on the switch.</td>

</table>
ip source binding

Use the **ip source binding** global configuration command to configure static IP source bindings on the switch. Use the **no** form of this command to delete static bindings.

```
ip source binding mac-address vlan vlan-id ip-address interface interface-id
no source binding mac-address vlan vlan-id ip-address interface interface-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-address</td>
<td>Specify a MAC address.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>Specify a VLAN number. The range is from 1 to 4094.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Specify an IP address.</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>Specify an interface on which to add or delete an IP source binding.</td>
</tr>
</tbody>
</table>

**Defaults**

No IP source bindings are configured.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A static IP source binding entry has an IP address, its associated MAC address, and its associated VLAN number. The entry is based on the MAC address and the VLAN number. If you modify an entry by changing only the IP address, the switch updates the entry instead creating a new one.

**Examples**

This example shows how to add a static IP source binding:

```
Switch(config)# ip source binding 0001.1234.1234 vlan 1 172.20.50.5 interface gigabitethernet1/0/1
```

This example shows how to add a static binding and then modify the IP address for it:

```
Switch(config)# ip source binding 0001.1357.0007 vlan 1 172.20.50.25 interface gigabitethernet1/0/1
Switch(config)# ip source binding 0001.1357.0007 vlan 1 172.20.50.30 interface gigabitethernet1/0/1
```

You can verify your settings by entering the **show ip source binding** privileged EXEC command.
### Related Commands

ip ssh

Use the `ip ssh` global configuration command to configure the switch to run Secure Shell (SSH) Version 1 or SSH Version 2. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the `no` form of this command to return to the default setting.

```
ip ssh version [1 | 2]
o ip ssh version [1 | 2]
```

**Syntax Description**

1. (Optional) Configure the switch to run SSH Version 1 (SSHv1).
2. (Optional) Configure the switch to run SSH Version 2 (SSHv2).

**Defaults**
The default version is the latest SSH version supported by the SSH client.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you do not enter this command or if you do not specify a keyword, the SSH server selects the latest SSH version supported by the SSH client. For example, if the SSH client supports SSHv1 and SSHv2, the SSH server selects SSHv2.

The switch supports an SSHv1 or an SSHv2 server. It also supports an SSHv1 client. For more information about the SSH server and the SSH client, see the software configuration guide for this release.

A Rivest, Shamir, and Adelman (RSA) key pair generated by an SSHv1 server can be used by an SSHv2 server and the reverse.

**Examples**
This example shows how to configure the switch to run SSH Version 2:
```
Switch(config)# ip ssh version 2
```

You can verify your settings by entering the `show ip ssh` or `show ssh` privileged EXEC command.

**Related Commands**

### ip sticky-arp (global configuration)

Use the **ip sticky-arp** global configuration command to enable sticky Address Resolution Protocol (ARP) on a switch virtual interface (SVI) that belongs to a private VLAN. Use the **no** form of this command to disable sticky ARP.

`ip sticky-arp`

`no ip sticky-arp`

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Sticky ARP is enabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Sticky ARP entries are those learned on private-VLAN SVIs. These entries do not age out.

The **ip sticky-arp** global configuration command is supported only on SVIs belonging to private VLANs.

- When you configure a private VLAN, sticky ARP is enabled on the switch (the default).

  If you enter the **ip sticky-arp interface** configuration command, it does not take effect.

  If you enter the **no ip sticky-arp interface** configuration command, you do not disable sticky ARP on an interface.

**Note**

We recommend that you use the **show arp** privileged EXEC command to display and verify private-VLAN interface ARP entries.

- If you disconnect the switch from a device and then connect it to another device with a different MAC address but with the same IP address, the ARP entry is not created, and this message appears:

  *Mar 2 00:26:06.967: %IP-3-STCKYARPOVR: Attempt to overwrite Sticky ARP entry: 20.6.2.1, hw: 0000.0602.0001 by hw: 0000.0503.0001

- If a MAC address of a device changes, you must use the **no arp ip-address** global configuration command to manually remove the private-VLAN interface ARP entries.

- Use the **arp ip-address hardware-address type** global configuration command to add a private-VLAN ARP entry.
- Use the `no sticky-arp` global configuration command to disable sticky ARP on the switch.
- Use the `no sticky-arp` interface configuration command to disable sticky ARP on an interface when sticky ARP is disabled on the switch.

**Examples**

To disable sticky ARP:

```
Switch(config)# no ip sticky-arp
```

You can verify your settings by using the `show arp` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>arp</code></td>
<td>Adds a permanent entry in the ARP table.</td>
</tr>
<tr>
<td><code>show arp</code></td>

</tbody>
</table>
ip sticky-arp (interface configuration)

Use the `ip sticky-arp` interface configuration command to enable sticky Address Resolution Protocol (ARP) on a switch virtual interface (SVI) or a Layer 3 interface. Use the `no` form of this command to disable sticky ARP.

```
ip sticky-arp
no ip sticky-arp
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Sticky ARP is enabled on private-VLAN SVIs.
Sticky ARP is disabled on Layer 3 interfaces and normal SVIs.

**Command Modes**
Interface configuration

**Command History**

<table>

<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Sticky ARP entries are those learned on SVIs and Layer 3 interfaces. These entries do not age out.
The `ip sticky-arp` interface configuration command is only supported on
- Layer 3 interfaces
- SVIs belonging to normal VLANs
- SVIs belonging to private VLANs

On a Layer 3 interface or on an SVI belonging to a normal VLAN
- Use the `sticky-arp` interface configuration command to enable sticky ARP.
- Use the `no sticky-arp` interface configuration command to disable sticky ARP.

On private-VLAN SVIs
- When you configure a private VLAN, sticky ARP is enabled on the switch (the default).
  - If you enter the `ip sticky-arp interface` configuration command, it does not take effect.
  - If you enter the `no ip sticky-arp interface` configuration command, you do not disable sticky ARP on an interface.

**Note**
We recommend that you use the `show arp` privileged EXEC command to display and verify private-VLAN interface ARP entries.
• If you disconnect the switch from a device and then connect it to another device with a different MAC address but with the same IP address, the ARP entry is not created, and this message appears:

    *Mar 2 00:26:06.967: %IP-3-STCKYARPOVR: Attempt to overwrite Sticky ARP entry:
    20.6.2.1, hw: 0000.0602.0001 by hw: 0000.0503.0001

• If a MAC address of a device changes, you must use the `no arp ip-address` global configuration command to manually remove the private-VLAN interface ARP entries.

• Use the `arp ip-address hardware-address type` global configuration command to add a private-VLAN ARP entry.

• Use the `no sticky-arp` global configuration command to disable sticky ARP on the switch.

• Use the `no sticky-arp` interface configuration command to disable sticky ARP on an interface.

**Examples**

To enable sticky ARP on a normal SVI:

    Switch(config-if)# ip sticky-arp

To disable sticky ARP on a Layer 3 interface or an SVI:

    Switch(config-if)# no ip sticky-arp

You can verify your settings by using the `show arp` privileged EXEC command.

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enable IP source guard with source IP address filtering, use the `ip verify source` interface configuration command.

To enable IP source guard with source IP and MAC address filtering, use the `ip verify source port-security` interface configuration command.

To enable IP source guard with source IP and MAC address filtering, you must enable port security on the interface.

**Examples**

This example shows how to enable IP source guard with source IP address filtering:

```
Switch(config-if)# ip verify source
```

This example shows how to enable IP source guard with source IP and MAC address filtering:

```
Switch(config-if)# ip verify source port-security
```

You can verify your settings by entering the `show ip source binding` privileged EXEC command.

**Related Commands**

ip verify source smartlog

To send the contents of all packets denied on an interface because of an IP source guard violation to a Flexible NetFlow collector, use the `ip verify source smartlog` command in interface configuration mode. To disable IP source guard smart logging, use the `no` form of this command.

```
ip verify source smartlog

no ip verify source smartlog
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

IP source guard smart logging is not enabled for the interface.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When IP source guard is enabled, all IP packets with a source address other than the specified source address or an address learned through DHCP are denied. When IP source guard smart log is enabled on an interface, the contents of the denied packet are sent to a Flexible NetFlow collector.

You can verify that IP source guard smart logging is enabled by entering the `show ip verify source` privileged EXEC command.

**Examples**

This example shows how to configure IP source guard on an interface and to enable IP source guard smart logging for the interface.

```
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# ip verify source smartlog
Switch(config-if)# end
```

**Related Commands**

<table>

</tbody>
</table>
ipv6 access-list

Use the `ipv6 access-list` global configuration command to define an IPv6 access list and to place the switch in IPv6 access list configuration mode. To remove the access list, use the `no` form of this command.

```
ipv6 access-list access-list-name

no ipv6 access-list access-list-name
```

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.

**Syntax Description**

| `access-list-name` | Name of the IPv6 access list. Names cannot contain a space or quotation mark or begin with a numeric. |

**Defaults**

No IPv6 access list is defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

The `ipv6 access-list` command is similar to the `ip access-list` command, except that it is IPv6-specific.

**Note**

IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.

See the `ipv6 access-list` and `permit (IPv6 access-list configuration)` commands for more information on filtering IPv6 traffic based on IPv6 option headers and optional, upper-layer protocol-type information. See the “Examples” section for an example of a translated IPv6 ACL configuration.
Chapter 2      Catalyst 3750 Switch Cisco IOS Commands

ipv6 access-list

Note

Every IPv6 ACL has implicit permit icmp any any nd-na, permit icmp any any nd-ns, and deny ipv6 any any statements as its last match conditions. The two permit conditions allow ICMPv6 neighbor discovery. To disallow ICMPv6 neighbor discovery and to deny icmp any any nd-na or icmp any any nd-ns, there must be an explicit deny entry in the ACL. For the implicit deny ipv6 any any statement to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data-link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Use the ipv6 traffic-filter interface configuration command with the access-list-name argument to apply an IPv6 ACL to an IPv6 interface. You can apply inbound and outbound IPv6 ACLs to Layer 3 physical interfaces or switch virtual interfaces for routed ACLs, but only inbound IPv6 ACLs to Layer 2 interfaces for port ACLs.

Note

An IPv6 ACL applied to an interface with the ipv6 traffic-filter command filters traffic that is forwarded by the switch and does not filter traffic generated by the switch.

Examples

This example puts the switch in IPv6 access list configuration mode and configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on an interface. The first ACL entry prevents all packets from the network FE80:0:0:2::/64 (packets that have the link-local prefix FE80:0:0:2 as the first 64 bits of their source IPv6 address) from leaving the interface. The second entry in the ACL permits all other traffic to leave the interface. The second entry is necessary because an implicit deny-all condition is at the end of each IPv6 ACL.

Switch(config)# ipv6 access-list list2
Switch(config-ipv6-acl)# deny FE80:0:0:2::/64 any
Switch(config-ipv6-acl)# permit any any
Switch(config-ipv6-acl)# exit
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter list2 out

Note

IPv6 ACLs that rely on the implicit deny condition or specify a deny any any statement to filter traffic should contain permit statements for link-local addresses to avoid the filtering of protocol packets. Additionally IPv6 ACLs that use deny statements to filter traffic should also use a permit any any statement as the last statement in the list.

ipv6 address dhcp

Use the `ipv6 address dhcp` interface configuration command to acquire an IPv6 address on an interface from the Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server. To remove the address from the interface, use the `no` form of this command.

```
ipv6 address dhcp [rapid-commit]
```

```
no ipv6 address dhcp [rapid-commit]
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.

**Syntax Description**
- **rapid-commit** (Optional) Allow two-message exchange method for address assignment.

**Defaults**
No default is defined.

**Command Modes**
- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command, and reload the switch.

The `ipv6 address dhcp` interface configuration command allows any interface to dynamically learn its IPv6 address by using the DHCP protocol.

The `rapid-commit` keyword enables the use of the two-message exchange for address allocation and other configuration. If it is enabled, the client includes the rapid-commit option in a solicit message.

**Examples**
This example shows how to acquire an IPv6 address and enable the rapid-commit option:

```
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# ipv6 address dhcp rapid-commit
```

You can verify your settings by using the `show ipv6 dhcp interface` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ipv6 dhcp interface</td>
<td>Displays DHCPv6 interface information.</td>
</tr>
</tbody>
</table>
**ipv6 dhcp client request vendor**

Use the `ipv6 dhcp client request` interface configuration command to configure an IPv6 client to request an option from a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server. To remove the request, use the `no` form of this command.

```
ipv6 dhcp client request vendor
```

```
no ipv6 dhcp client request vendor
```

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

No default is defined.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command, and reload the switch.

Use the `ipv6 dhcp client request vendor` interface configuration to request a vendor-specific option. When enabled, the command is checked only when an IPv6 address is acquired from DHCP. If you enter the command after the interface has acquired an IPv6 address, it does not take effect until the next time the client acquires an IPv6 address from DHCP.

**Examples**

This example shows how to enable the request vendor-specific option.

```
Switch(config)# interface gigabitethernet1/0/3
Switch(config-if)# ipv6 dhcp client request vendor-specific
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>ipv6 address dhcp</td>
<td>Acquires an IPv6 address on an interface from DHCP.</td>
</tr>
</tbody>
</table>
ipv6 dhcp ping packets

Use the *ipv6 dhcp ping packets* global configuration command to specify the number of packets a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server sends to a pool address as part of a ping operation. To prevent the server from pinging pool addresses, use the **no** form of this command.

```
ipv6 dhcp ping packets number

no ipv6 dhcp ping packets
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>The number of ping packets sent before the address is assigned to a requesting client. The range is 0 to 10.</td>
</tr>
</tbody>
</table>

**Defaults**  
The default is 0.

**Command Modes**  
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To configure the dual IPv4 and IPv6 template, enter the **sdm prefer dual-ipv4-and-ipv6** global configuration command, and reload the switch.

The DHCPv6 server pings a pool address before assigning the address to a requesting client. If the ping is unanswered, the server assumes, with a high probability, that the address is not in use and assigns the address to the requesting client.

Setting the *number* argument to 0 turns off the DHCPv6 server ping operation.

**Examples**

This example specifies two ping attempts by the DHCPv6 server before further ping attempts stop:

```
Switch(config)# ipv6 dhcp ping packets 2
```

**Related Commands**

<table>

</tbody>
</table>
ipv6 dhcp pool

Use the **ipv6 dhcp pool** global configuration command to enter Dynamic Host Configuration Protocol for IPv6 (DHCPv6) pool configuration mode. Use the **no** form of this command to return to the default settings.

```
ipv6 dhcp pool poolname

no ipv6 dhcp pool poolname
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.

**Syntax Description**

| poolname | User-defined name for the DHCPv6 pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0). |

**Defaults**
No default is defined.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>The command was introduced with the <strong>address prefix</strong>, <strong>lifetime</strong>, <strong>link-address</strong>, and <strong>vendor-specific</strong> keywords were added to the command sub-modes.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command, and reload the switch.

The **ipv6 dhcp pool** command enables the DHCPv6 pool configuration mode. These configuration commands are available:

- **address prefix** *IPv6-prefix*: sets an address prefix for address assignment. This address must be in hexadecimal, using 16-bit values between colons.
- **lifetime** *t1 t2*: sets a valid and a preferred time interval (in seconds) for the IPv6 address. The range is 5 to 4294967295 seconds. The valid default is 2 days. The preferred default is 1 day. The valid lifetime must be greater than or equal to the preferred lifetime. Specify **infinite** for no time interval.
- **link-address** *IPv6-prefix*: sets a link-address IPv6 prefix. When an address on the incoming interface or a link-address in the packet matches the specified IPv6-prefix, the server uses the configuration information pool. This address must be in hexadecimal, using 16-bit values between colons.
• **vendor-specific**: enables the DHCPv6 vendor-specific configuration mode. These configuration commands are available:
  
  – **vendor-id**: enter a vendor-specific identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295.
  
  – **suboption number**: sets vendor-specific suboption number. The range is 1 to 65535. Enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.

After you create the DHCPv6 configuration information pool, use the `ipv6 dhcp server` interface configuration command to associate the pool with a server on an interface. However, if you do not configure an information pool, you still need to use the `ipv6 dhcp server` interface configuration command to enable the DHCPv6 server function on an interface.

When you associate a DHCPv6 pool with an interface, only that pool services requests on the associated interface. The pool also services other interfaces. If you do not associate a DHCPv6 pool with an interface, it can service requests on any interface.

Not using any IPv6 address prefix means that the pool only returns configured options.

The **link-address** keyword allows matching a link-address without necessarily allocating an address. You can match the pool from multiple relays by using multiple link-address configuration commands inside a pool.

Because a longest match is performed on either the address pool information or the link information, you can configure one pool to allocate addresses and another pool on a subprefix that only returns configured options.

**Examples**

This example shows how to configure a pool called engineering with an IPv6 address prefix:

```bash
Switch# configure terminal
Switch(config)# ipv6 dhcp pool engineering
Switch(config-dhcpv6)# address prefix 2001:1000::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called testgroup with three link-address prefixes and an IPv6 address prefix:

```bash
Switch# configure terminal
Switch(config)# ipv6 dhcp pool testgroup
Switch(config-dhcpv6)# link-address 2001:1001::0/64
Switch(config-dhcpv6)# link-address 2001:1002::0/64
Switch(config-dhcpv6)# link-address 2001:2000::0/48
Switch(config-dhcpv6)# address prefix 2001:1003::0/64
Switch(config-dhcpv6)# end
```

This example shows how to configure a pool called 350 with vendor-specific options:

```bash
Switch# configure terminal
Switch(config)# ipv6 dhcp pool 350
Switch(config-dhcpv6)# vendor-specific 9
Switch(config-dhcpv6-vs)# suboption 1 address 1000:235D::1
Switch(config-dhcpv6-vs)# suboption 2 ascii "IP-Phone"
Switch(config-dhcpv6-vs)# end
```

**Related Commands**

</tbody>
</table>
ipv6 dhcp server

Use the `ipv6 dhcp server` interface configuration command to enable Dynamic Host Configuration Protocol for IPv6 (DHCPv6) service on an interface. To disable DHCPv6 service on an interface, use the `no` form of this command.

```
ipv6 dhcp server [poolname | automatic] [rapid-commit] [preference value] [allow-hint]
```

```
no ipv6 dhcp server [poolname | automatic] [rapid-commit] [preference value] [allow-hint]
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.

**Syntax Description**

- `poolname` (Optional) User-defined name for the IPv6 DHCP pool. The pool name can be a symbolic string (such as Engineering) or an integer (such as 0).
- `automatic` (Optional) Enable the server to automatically determine which pool to use when allocating addresses for a client.
- `rapid-commit` (Optional) Allow two-message exchange method.
- `preference value` (Optional) The preference value carried in the preference option in the advertise message sent by the server. The range is from 0 to 255. The preference value default is 0.
- `allow-hint` (Optional) Specify whether the server should consider client suggestions in the SOLICIT message. By default, the server ignores client hints.

**Defaults**
By default, no DHCPv6 packets are serviced on the interface.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>The command was introduced and the automatic keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `ipv6 dhcp server` interface configuration command enables DHCPv6 service on a specified interface.

The `automatic` keyword enables the system to automatically determine which pool to use when allocating addresses for a client. When an IPv6 DHCP packet is received by the server, the server determines if it was received from a DHCP relay or if it was directly received from the client. If the packet was received from a relay, the server verifies the link-address field inside the packet associated with the first relay that is closest to the client. The server matches this link-address against all address prefix and link-address configurations in IPv6 DHCP pools to find the longest prefix match. The server selects the pool associated with the longest match.
If the packet was directly received from the client, the server performs this same matching, but it uses all the IPv6 addresses configured on the incoming interface when performing the match. Once again, the server selects the longest prefix match.

The `rapid-commit` keyword enables the use of the two-message exchange.

If the `preference` keyword is configured with a value other than 0, the server adds a preference option to carry the preference value for the advertise messages. This action affects the selection of a server by the client. Any advertise message that does not include a preference option is considered to have a preference value of 0. If the client receives an advertise message with a preference value of 255, the client immediately sends a request message to the server from which the message was received.

If the `allow-hint` keyword is specified, the server allocates a valid client-suggested address in the solicit and request messages. The prefix address is valid if it is in the associated local prefix address pool and it is not assigned to a device. If the `allow-hint` keyword is not specified, the server ignores the client hint, and an address is allocated from the free list in the pool.

The DHCPv6 client, server, and relay functions are mutually exclusive on an interface. When one of these functions is already enabled and you try to configure a different function on the same interface, the switch returns one of these messages:

- Interface is in DHCP client mode
- Interface is in DHCP server mode
- Interface is in DHCP relay mode

### Examples

This example enables DHCPv6 for the pool named `testgroup`:

```
Switch(config-if)# ipv6 dhcp server testgroup
```

ipv6 mld snooping

Use the **ipv6 mld snooping** global configuration command without keywords to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN. Use the **no** form of this command to disable MLD snooping on the switch or switch stack or the VLAN.

```
ipv6 mld snooping [vlan vlan-id]
```

```
no ipv6 mld snooping [vlan vlan-id]
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

---

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>** vlan vlan-id **</td>
<td>(Optional) Enable or disable IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>

---

### Defaults

MLD snooping is globally disabled on the switch.

MLD snooping is enabled on all VLANs. However, MLD snooping must be globally enabled before VLAN snooping will take place.

---

### Command Modes

Global configuration

---

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

---

### Usage Guidelines

To configure the dual IPv4 and IPv6 template, enter the **sdm prefer dual-ipv4-and-ipv6** global configuration command and reload the switch.

When MLD snooping is globally disabled, it is disabled on all the existing VLAN interfaces. When you globally enable MLD snooping, it is enabled on all VLAN interfaces that are in the default state (enabled). VLAN configuration will override global configuration on interfaces on which MLD snooping has been disabled.

If MLD snooping is globally disabled, you cannot enable it on a VLAN. If MLD snooping is globally enabled, you can disable it on individual VLANs.

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
ipv6 mld snooping

Examples

This example shows how to globally enable MLD snooping:

Switch(config)# ipv6 mld snooping

This example shows how to disable MLD snooping on a VLAN:

Switch(config)# no ipv6 mld snooping vlan 11

You can verify your settings by entering the show ipv6 mld snooping user EXEC command.

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

In MLD snooping, the IPv6 multicast router periodically sends out queries to hosts belonging to the multicast group. If a host wants to leave a multicast group, it can silently leave or it can respond to the query with a Multicast Listener Done message (equivalent to an IGMP Leave message). When Immediate Leave is not configured (which it should not be if multiple clients for a group exist on the same port), the configured last-listener query count determines the number of MASQs that are sent before an MLD client is aged out.

When the last-listener query count is set for a VLAN, this count overrides the value configured globally. When the VLAN count is not configured (set to the default of 0), the global count is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
**ipv6 mld snooping last-listener-query-count**

**Examples**

This example shows how to globally set the last-listener query count:

```
Switch(config)# ipv6 mld snooping last-listener-query-count 1
```

This example shows how to set the last-listener query count for VLAN 10:

```
Switch(config)# ipv6 mld snooping vlan 10 last-listener-query-count 3
```

You can verify your settings by entering the `show ipv6 mld snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping last-listener-query-interval

Use the `ipv6 mld snooping last-listener-query-interval` global configuration command to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping last-listener query interval on the switch or on a VLAN. This time interval is the maximum time that a multicast router waits after issuing a Multicast Address Specific Query (MASQ) before deleting a port from the multicast group. Use the `no` form of this command to reset the query time to the default settings.

```
ipv6 mld snooping [vlan vlan-id] last-listener-query-interval integer_value
no ipv6 mld snooping [vlan vlan-id] last-listener-query-interval
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) Configure last-listener query interval on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>integer_value</code></td>
<td>Set the time period (in thousands of a second) that a multicast router to wait after issuing a MASQ before deleting a port from the multicast group. The range is 100 to 32,768. The default is 1000 (1 second),</td>
</tr>
</tbody>
</table>

**Command Default**

The default global query interval (maximum response time) is 1000 (1 second).

The default VLAN query interval (maximum response time) is 0 (the global count is used).

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

In MLD snooping, when the IPv6 multicast router receives an MLD leave message, it sends out queries to hosts belonging to the multicast group. If there are no responses from a port to a MASQ for a length of time, the router deletes the port from the membership database of the multicast address. The last listener query interval is the maximum time that the router waits before deleting a nonresponsive port from the multicast group.

When a VLAN query interval is set, this overrides the global query interval. When the VLAN interval is set at 0, the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
ipv6 mld snooping last-listener-query-interval

Examples

This example shows how to globally set the last-listener query interval to 2 seconds:

```
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
```

This example shows how to set the last-listener query interval for VLAN 1 to 5.5 seconds:

```
Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 5500
```

You can verify your settings by entering the `show ipv6 MLD snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping listener-message-suppression

Use the `ipv6 mld snooping listener-message-suppression` global configuration command to enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping listener message suppression. Use the `no` form of this command to disable MLD snooping listener message suppression.

```
ipv6 mld snooping listener-message-suppression

no ipv6 mld snooping listener-message-suppression
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Command Default**
The default is for MLD snooping listener message suppression to be disabled.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

MLD snooping listener message suppression is equivalent to IGMP snooping report suppression. When enabled, received MLDv1 reports to a group are forwarded to IPv6 multicast routers only once in every report-forward time. This prevents the forwarding of duplicate reports.

**Examples**

This example shows how to enable MLD snooping listener-message-suppression:

```
Switch(config)# ipv6 mld snooping listener-message-suppression
```

This example shows how to disable MLD snooping listener-message-suppression:

```
Switch(config)# no ipv6 mld snooping listener-message-suppression
```

You can verify your settings by entering the `show ipv6 mld snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping robustness-variable

Use the `ipv6 mld snooping robustness-variable` global configuration command to configure the number of IP version 6 (IPv6) Multicast Listener Discovery (MLD) queries that the switch sends before deleting a listener that does not respond, or enter a VLAN ID to configure on a per-VLAN basis. Use the `no` form of this command to reset the variable to the default settings.

```
ipv6 mld snooping [vlan vlan-id] robustness-variable integer_value
no ipv6 mld snooping [vlan vlan-id] robustness-variable
```

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) Configure the robustness variable on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>integer_value</code></td>
<td>The range is 1 to 3.</td>
</tr>
</tbody>
</table>

**Command Default**

The default global robustness variable (number of queries before deleting a listener) is 2.

The default VLAN robustness variable (number of queries before aging out a multicast address) is 0, which means that the system uses the global robustness variable for aging out the listener.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

Robustness is measured in terms of the number of MLDv1 queries sent with no response before a port is removed from a multicast group. A port is deleted when there are no MLDv1 reports received for the configured number of MLDv1 queries. The global value determines the number of queries that the switch waits before deleting a listener that does not respond and applies to all VLANs that do not have a VLAN value.

The robustness value configured for a VLAN overrides the global value. If the VLAN robustness value is 0 (the default), the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
Examples

This example shows how to configure the global robustness variable so that the switch sends out three queries before it deletes a listener port that does not respond:

```
Switch(config)# ipv6 mld snooping robustness-variable 3
```

This example shows how to configure the robustness variable for VLAN 1. This value overrides the global configuration for the VLAN:

```
Switch(config)# ipv6 mld snooping vlan 1 robustness-variable 1
```

You can verify your settings by entering the `show ipv6 MLD snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping tcn

Use the **ipv6 mld snooping tcn** global configuration commands to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) Topology Change Notifications (TCNs). Use the **no** form of the commands to reset the default settings.

```
ipv6 mld snooping tcn {flood query count integer_value | query solicit}
```

```
no ipv6 mld snooping tcn {flood query count integer_value | query solicit}
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Syntax Description**
- **flood query count**
  - `integer_value`
  - Set the flood query count, which is the number of queries that are sent before forwarding multicast data to only those ports requesting to receive it. The range is 1 to 10.
- **query solicit**
  - Enable soliciting of TCN queries.

**Command Default**
TCN query soliciting is disabled.
When enabled, the default flood query count is 2.

**Command Modes**
Global configuration

ipv6 mld snooping vlan

Use the `ipv6 mld snooping vlan` global configuration command to configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping parameters on the VLAN interface. Use the `no` form of this command to reset the parameters to the default settings.

```
ipv6 mld snooping vlan vlan-id [immediate-leave | mrouter interface interface-id | static ipv6-multicast-address interface interface-id]

no ipv6 mld snooping vlan vlan-id [immediate-leave | mrouter interface interface-id | static ip-address interface interface-id]
```

**Note**
This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

### Syntax Description

- **vlan vlan-id**
  
  Specify a VLAN number. The range is 1 to 1001 and 1006 to 4094.

- **immediate-leave**
  
  (Optional) Enable MLD Immediate-Leave processing on a VLAN interface. Use the `no` form of the command to disable the Immediate Leave feature on the interface.

- **mrouter interface**
  
  (Optional) Configure a multicast router port. The `no` form of the command removes the configuration.

- **static ipv6-multicast-address**
  
  (Optional) Configure a multicast group with the specified IPv6 multicast address.

- **interface interface-id**
  
  Add a Layer 2 port to the group. The mrouter or static interface can be a physical port or a `port-channel` interface in the range of 1 to 48.

### Command Default

MLD snooping Immediate-Leave processing is disabled.

By default, there are no static IPv6 multicast groups.

By default, there are no multicast router ports.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

You should only configure the Immediate-Leave feature when there is only one receiver on every port in the VLAN. The configuration is saved in NVRAM.

The `static` keyword is used for configuring the MLD member ports statically.

The configuration and the static ports and groups are saved in NVRAM.

When the IPv6 multicast router is a Catalyst 6500 switch and you are using extended VLANs (in the range 1006 to 4094), IPv6 MLD snooping must be enabled on the extended VLAN on the Catalyst 6500 switch in order for the Catalyst 3750 or Catalyst 3560 switch to receive queries on the VLAN. For normal-range VLANs (1 to 1005), it is not necessary to enable IPv6 MLD snooping on the VLAN on the Catalyst 6500 switch.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This example shows how to enable MLD Immediate-Leave processing on VLAN 1:

```
Switch(config)# ipv6 mld snooping vlan 1 immediate-leave
```

This example shows how to disable MLD Immediate-Leave processing on VLAN 1:

```
Switch(config)# no ipv6 mld snooping vlan 1 immediate-leave
```

This example shows how to configure a port as a multicast router port:

```
Switch(config)# ipv6 mld snooping vlan 1 mrouter interface gigabitethernet1/0/1
```

This example shows how to configure a static multicast group:

```
Switch(config)# ipv6 mld snooping vlan 2 static FF12::34 interface gigabitethernet1/0/2
```

You can verify your settings by entering the `show ipv6 mld snooping vlan vlan-id` user EXEC command.

ipv6 traffic-filter

Use the `ipv6 traffic-filter` interface configuration command to filter IPv6 traffic on an interface. The type and direction of traffic that you can filter depends on the image running on the switch stack. Use the `no` form of this command to disable the filtering of IPv6 traffic on an interface.

```
ipv6 traffic-filter access-list-name {in | out}
```

```
no ipv6 traffic-filter access-list-name {in | out}
```

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch stack.

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access-list-name</code></td>
<td>Specify an IPv6 access name.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Specify incoming IPv6 traffic.</td>
</tr>
<tr>
<td><code>out</code></td>
<td>Specify outgoing IPv6 traffic.</td>
</tr>
</tbody>
</table>

**Note**

The `out` keyword is not supported for Layer 2 interfaces (port ACLs).

### Defaults

Filtering of IPv6 traffic on an interface is not configured.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(35)SE</td>
<td>Support was added for inbound Layer 3 management traffic (router ACLs) in the IP services and IP base images.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

You can use the `ipv6 traffic-filter` command on physical interfaces (Layer 2 or Layer 3 ports), Layer 3 port channels, or switch virtual interfaces (SVIs).

You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces (port ACLs), or to inbound traffic on Layer 2 interfaces (router ACLs).

If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, and any router ACLs attached to the SVI of the port VLAN are ignored.
Examples

This example filters inbound IPv6 traffic on an IPv6-configured interface as defined by the access list named cisco:

```
Switch (config)# interface gigabitethernet1/0/1
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter cisco in
```

</tbody>
</table>
Use the `l2protocol-tunnel` interface configuration command to enable tunneling of Layer 2 protocols on an access port, IEEE 802.1Q tunnel port, or a port channel. You can enable tunneling for Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. You can also enable point-to-point tunneling for Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), or UniDirectional Link Detection (UDLD) packets. Use the `no` form of this command to disable tunneling on the interface.

```
[l2protocol-tunnel \[cdp | stp | vtp\] \[point-to-point \[pagp | lacp | udld\]\] \[shutdown-threshold \[cdp | stp | vtp\] \[point-to-point \[pagp | lacp | udld\]\]] \[drop-threshold \[cdp | stp | vtp\] \[point-to-point \[pagp | lacp | udld\]\]]
```

**Syntax Description**

- **I2protocol-tunnel**
  Enable point-to-multipoint tunneling of CDP, STP, and VTP packets.

- **cdp**
  (Optional) Enable tunneling of CDP, specify a shutdown threshold for CDP, or specify a drop threshold for CDP.

- **stp**
  (Optional) Enable tunneling of STP, specify a shutdown threshold for STP, or specify a drop threshold for STP.

- **vtp**
  (Optional) Enable tunneling or VTP, specify a shutdown threshold for VTP, or specify a drop threshold for VTP.

- **point-to-point**
  (Optional) Enable point-to-point tunneling of PAgP, LACP, and UDLD packets.

- **pagp**
  (Optional) Enable point-to-point tunneling of PAgP, specify a shutdown threshold for PAgP, or specify a drop threshold for PAgP.

- **lacp**
  (Optional) Enable point-to-point tunneling of LACP, specify a shutdown threshold for LACP, or specify a drop threshold for LACP.

- **udld**
  (Optional) Enable point-to-point tunneling of UDLD, specify a shutdown threshold for UDLD, or specify a drop threshold for UDLD.

- **shutdown-threshold**
  (Optional) Set a shutdown threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface is shut down.

- **drop-threshold**
  (Optional) Set a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets.

- **value**
  Specify a threshold in packets per second to be received for encapsulation before the interface shuts down, or specify the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.

**Defaults**

The default is that no Layer 2 protocol packets are tunneled.

The default is no shutdown threshold for the number of Layer 2 protocol packets.

The default is no drop threshold for the number of Layer 2 protocol packets.

**Command Modes**

Interface configuration
You must enter this command, with or without protocol types, to tunnel Layer 2 packets.

If you enter this command for a port channel, all ports in the channel must have the same configuration.

Layer 2 protocol tunneling across a service-provider network ensures that Layer 2 information is propagated across the network to all customer locations. When protocol tunneling is enabled, protocol packets are encapsulated with a well-known Cisco multicast address for transmission across the network. When the packets reach their destination, the well-known MAC address is replaced by the Layer 2 protocol MAC address.

You can enable Layer 2 protocol tunneling for CDP, STP, and VTP individually or for all three protocols.

In a service-provider network, you can use Layer 2 protocol tunneling to enhance the creation of EtherChannels by emulating a point-to-point network topology. When protocol tunneling is enabled on the service-provider switch for PAgP or LACP, remote customer switches receive the protocol data units (PDUs) and can negotiate automatic creation of EtherChannels.

To enable tunneling of PAgP, LACP, and UDLD packets, you must have a point-to-point network topology. To decrease the link-down detection time, you should also enable UDLD on the interface when you enable tunneling of PAgP or LACP packets.

You can enable point-to-point protocol tunneling for PAgP, LACP, and UDLD individually or for all three protocols.

Caution

PAgP, LACP, and UDLD tunneling is only intended to emulate a point-to-point topology. An erroneous configuration that sends tunneled packets to many ports could lead to a network failure.

Enter the `shutdown-threshold` keyword to control the number of protocol packets per second that are received on an interface before it shuts down. When no protocol option is specified with the keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a drop threshold on the interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.

When the shutdown threshold is reached, the interface is error-disabled. If you enable error recovery by entering the `errdisable recovery cause l2ptguard` global configuration command, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out. If the error recovery mechanism is not enabled for `l2ptguard`, the interface stays in the error-disabled state until you enter the `shutdown` and `no shutdown` interface configuration commands.

Enter the `drop-threshold` keyword to control the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

The configuration is saved in NVRAM.

For more information about Layer 2 protocol tunneling, see the software configuration guide for this release.
Examples

This example shows how to enable protocol tunneling for CDP packets and to configure the shutdown threshold as 50 packets per second:

Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)# l2protocol-tunnel shutdown-threshold cdp 50

This example shows how to enable protocol tunneling for STP packets and to configure the drop threshold as 400 packets per second:

Switch(config-if)# l2protocol-tunnel stp
Switch(config-if)# l2protocol-tunnel drop-threshold stp 400

This example shows how to enable point-to-point protocol tunneling for PAgP and UDLD packets and to configure the PAgP drop threshold as 1000 packets per second:

Switch(config-if)# l2protocol-tunnel point-to-point pagp
Switch(config-if)# l2protocol-tunnel point-to-point udld
Switch(config-if)# l2protocol-tunnel drop-threshold point-to-point pagp 1000

</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabled, the tunneled Layer 2 protocol packets use this CoS value.

The value is saved in NVRAM.

**Examples**

This example shows how to configure a Layer-2 protocol-tunnel CoS value of 7:

```
Switch(config)# l2protocol-tunnel cos 7
```

**Related Commands**

</tbody>
</table>
lacp port-priority

Use the `lacp port-priority` interface configuration command to configure the port priority for the Link Aggregation Control Protocol (LACP). Use the `no` form of this command to return to the default setting.

```
lacp port-priority priority
no lacp port-priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Port priority for LACP. The range is 1 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is 32768.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `lacp port-priority` interface configuration command determines which ports are bundled and which ports are put in hot-standby mode when there are more than eight ports in an LACP channel group.

An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode.

In port-priority comparisons, a numerically lower value has a higher priority: When there are more than eight ports in an LACP channel-group, the eight ports with the numerically lowest values (highest priority values) for LACP port priority are bundled into the channel group, and the lower-priority ports are put in hot-standby mode. If two or more ports have the same LACP port priority (for example, they are configured with the default setting of 65535) an internal value for the port number determines the priority.

The LACP port priorities are only effective if the ports are on the switch that controls the LACP link. See the `lacp system-priority` global configuration command for determining which switch controls the link.

Use the `show lacp internal` privileged EXEC command to display LACP port priorities and internal port number values.

For information about configuring LACP on physical ports, see the “Configuring EtherChannels” chapter in the software configuration guide for this release.
This example shows how to configure the LACP port priority on a port:

```
Switch(config)# interface gigabitethernet2/01
Switch(config-if)# lacp port-priority 1000
```

You can verify your settings by entering the `show lacp [channel-group-number] internal` privileged EXEC command.

</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `lACP system-priority` command determines which switch in an LACP link controls port priorities.

An LACP channel group can have up to 16 Ethernet ports of the same type. Up to eight ports can be active, and up to eight ports can be in standby mode. When there are more than eight ports in an LACP channel-group, the switch on the controlling end of the link uses port priorities to determine which ports are bundled into the channel and which ports are put in hot-standby mode. Port priorities on the other switch (the noncontrolling end of the link) are ignored.

In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both switches have the same LACP system priority (for example, they are both configured with the default setting of 32768), the LACP system ID (the switch MAC address) determines which switch is in control.

The `lACP system-priority` command applies to all LACP EtherChannels on the switch.

Use the `show etherchannel summary` privileged EXEC command to see which ports are in the hot-standby mode (denoted with an H port-state flag in the output display).

For more information about configuring LACP on physical ports, see the “Configuring EtherChannels” chapter in the software configuration guide for this release.

### Examples

This example shows how to set the LACP system priority:

```
Switch(config)# lACP system-priority 20000
```

You can verify your settings by entering the `show lACP sys-id` privileged EXEC command.
<table>

</table>
link state group

Use the `link state group` interface configuration command to configure a port as a member of a link-state group. Use the `no` form of this command to remove the port from the link-state group.

```
link state group [number] {upstream | downstream}
no link state group [number] {upstream | downstream}
```

**Syntax Description**

- `number` (Optional) Specify the link-state group number. The group number can be 1 to 10. The default is 1.
- `upstream` Configure a port as an upstream port for a specific link-state group.
- `downstream` Configure a port as a downstream port for a specific link-state group.

**Defaults**
The default group is group 1.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `link state group` interface configuration command to configure a port as an upstream or downstream interface for the specified link-state group. If the group number is omitted, the default group number is 1.

To enable link-state tracking, create a `link-state group`, and specify the interfaces that are assigned to the link-state group. An interface can be an aggregation of ports (an EtherChannel), a single physical port in access or trunk mode, or a routed port. In a link-state group, these interfaces are bundled together. The `downstream interfaces` are bound to the `upstream interfaces`. Interfaces connected to servers are referred to as downstream interfaces, and interfaces connected to distribution switches and network devices are referred to as upstream interfaces.

For more information about the interactions between the downstream and upstream interfaces, see the “Configuring EtherChannels and Link-State Tracking” chapter of the software configuration guide for this release.

Follow these guidelines to avoid configuration problems:

- An interface that is defined as an upstream interface cannot also be defined as a downstream interface in the same or a different link-state group. The reverse is also true.
- An interface cannot be a member of more than one link-state group.
- You can configure only ten link-state groups per switch.
Examples

This example shows how to configure the interfaces as **upstream** in group 2:

```
Switch# configure terminal
Switch(config)# interface range gigabitethernet1/0/11 - 14
Switch(config-if-range)# link state group 2 downstream
Switch(config-if-range)# end
Switch(config-if)# end
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

After entering the `location civic-location identifier id` global configuration command, you enter civic location configuration mode. In this mode, you can enter the civic location and the postal location information.

The civic-location identifier must not exceed 250 bytes.

Use the `no lldp med-tlv-select location` information interface configuration command to disable the location TLV. The location TLV is enabled by default. For more information, see the “Configuring LLDP and LLDP-MED” chapter of the software configuration guide for this release.
Examples

This example shows how to configure civic location information on the switch:

Switch(config)# location civic-location identifier 1
Switch(config-civic)# number 3550
Switch(config-civic)# primary-road-name "Cisco Way"
Switch(config-civic)# city "San Jose"
Switch(config-civic)# state CA
Switch(config-civic)# building 19
Switch(config-civic)# room C6
Switch(config-civic)# county "Santa Clara"
Switch(config-civic)# country US
Switch(config-civic)# end

You can verify your settings by entering the `show location civic-location` privileged EXEC command.

This example shows how to configure the emergency location information on the switch:

Switch (config)# location elin-location 14085553881 identifier 1

You can verify your settings by entering the `show location elin` privileged EXEC command.

<td>Specify the ID for the civic location or the elin location. The ID range is 1 to 4095.</td>
</tr>
</tbody>
</table>

**Note**

The identifier for the civic location in the LLDP-MED TLV is limited to 250 bytes or less. To avoid error messages about available buffer space during switch configuration, be sure that the total length of all civic-location information specified for each civic-location ID does not exceed 250 bytes.

**Defaults**

This command has no default setting.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After entering the location civic-location-id id interface configuration command, you enter civic location configuration mode. In this mode, you can enter the additional location information.

The civic-location identifier must not exceed 250 bytes.

You can verify your settings by entering the show location civic interface privileged EXEC command.

**Examples**

These examples show how to enter civic location information for an interface:

```
Switch(config-if)# interface gigabitethernet1/0/1
Switch(config-if)# location civic-location-id 1
Switch(config-if)# end
```
This example shows how to enter emergency location information for an interface:

```
Switch(config-if)# interface gigabitethernet1/0/1
Switch(config-if)# location elin-location-id 1
Switch(config-if)# end
```

**Examples**

This example shows how to enable spanning-tree logging:

```
Switch(config-if)# logging event spanning-tree
```
logging event power-inline-status

Use the **logging event power-inline-status** interface configuration command to enable the logging of Power over Ethernet (PoE) events. Use the **no** form of this command to disable the logging of PoE status events; however, the **no** form of this command does not disable PoE error events.

```
logging event power-inline-status
no logging event power-inline-status
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Logging of PoE events is enabled.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The **logging event power-inline-status** command is available only on PoE interfaces.

**Examples**
This example shows how to enable logging of PoE events on a port:

```
Switch(config-if)# interface gigabitethernet1/0/1
Switch(config-if)# logging event power-inline-status
```

**Related Commands**

</tr>
<tr>
<td><code>informational</code></td>
<td>Information messages (severity 6).</td>
</tr>
<tr>
<td><code>debugging</code></td>
<td>Debugging messages (severity 7).</td>
</tr>
</tbody>
</table>

**Defaults**

The minimum file size is 2048 bytes; the maximum file size is 4096 bytes. The default severity level is 7 (`debugging` messages and numerically lower levels).

**Command Modes**

Global configuration
The log file is stored in ASCII text format in an internal buffer on a standalone switch, and in the case of a switch stack, on the stack master. If a standalone switch or the stack master fails, the log is lost unless you had previously saved it to flash memory by using the `logging file flash:filename` global configuration command.

After saving the log to flash memory by using the `logging file flash:filename` global configuration command, you can use the `more flash:filename` privileged EXEC command to display its contents.

The command rejects the minimum file size if it is greater than the maximum file size minus 1024; the minimum file size then becomes the maximum file size minus 1024.

Specifying a `level` causes messages at that level and numerically lower levels to be displayed.

This example shows how to save informational log messages to a file in flash memory:

```
Switch(config)# logging file flash:logfile informational
```

You can verify your setting by entering the `show running-config` privileged EXEC command.

logging smartlog

To enable smart logging on the switch, use the logging smartlog command in global configuration mode. Smart logging sends the contents of specified dropped packets to a Cisco IOS Flexible NetFlow collector. To disable smart logging or return to the default setting, use the no form of this command.

```
logging smartlog [exporter name | packet capture size bytes]

no logging smartlog [exporter name | packet capture size bytes]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exporter name</td>
<td>(Optional) Identifies the Cisco IOS NetFlow exporter (collector) to which contents of dropped packets are sent. You must have already configured the exporter by using the flexible NetFlow CLI. If the exporter name does not exist, you receive an error message.</td>
</tr>
<tr>
<td>packet capture size</td>
<td>(Optional) Specifies the size of the smart log packet sent to the collector in the number of bytes. The range is from 64 to 1024 bytes in 4-byte increments. The default size is 64 bytes. Increasing the packet capture size decreases the number of flow records per packet.</td>
</tr>
<tr>
<td>size</td>
<td></td>
</tr>
</tbody>
</table>

**Defaults**

Smart logging is not enabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must configure a NetFlow collector before you enable smart logging. For information on configuring Cisco Flexible NetFlow, see the Cisco IOS Flexible NetFlow Configuration Guide, Release 12.4T:

You can configure smart logging of packets dropped because of DHCP snooping violations, Dynamic ARP inspection violations, IP source guard denied traffic, or ACL permitted or denied traffic for smart logging to take place.

You can verify the configuration by entering the show logging smartlog privileged EXEC command.

**Examples**

This example shows a typical smart logging configuration. It assumes that you have already used the Flexible NetFlow CLI to configure the NetFlow exporter cisco, and configures smart logging to capture the first 128 bytes of the packets.

```
Switch(config)# logging smartlog
Switch(config)# logging smartlog cisco
Switch(config)# logging smartlog packet capture size 128
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip arp inspection smartlog</code></td>
<td>Enables smart logging of dynamic ARP inspection dropped packets.</td>
</tr>
<tr>
<td><code>ip dhcp snooping vlan smartlog</code></td>
<td>Enables smart logging of IP DHCP snooping dropped packets.</td>
</tr>
<tr>
<td><code>ip verify source smartlog</code></td>
<td>Enables smart logging of IP source guard dropped packets.</td>
</tr>

<tr>
<td>in</td>
<td>Specify that the ACL is applied in the ingress direction. Outbound ACLs are not supported on Layer 2 interfaces.</td>
</tr>
</tbody>
</table>

### Defaults

No MAC ACL is applied to the interface.

### Command Modes

Interface configuration (Layer 2 interfaces only)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can apply MAC ACLs only to ingress Layer 2 interfaces. You cannot apply MAC ACLs to Layer 3 interfaces.

On Layer 2 interfaces, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC access lists. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP ACL and a MAC ACL to the interface. You can apply no more than one IP access list and one MAC access list to the same Layer 2 interface.

If a MAC ACL is already configured on a Layer 2 interface and you apply a new MAC ACL to the interface, the new ACL replaces the previously configured one.

If you apply an ACL to a Layer 2 interface on a switch, and the switch has an input Layer 3 ACL or a VLAN map applied to a VLAN that the interface is a member of, the ACL applied to the Layer 2 interface takes precedence.

When an inbound packet is received on an interface with a MAC ACL applied, the switch checks the match conditions in the ACL. If the conditions are matched, the switch forwards or drops the packet, according to the ACL.

If the specified ACL does not exist, the switch forwards all packets.

For more information about configuring MAC extended ACLs, see the “Configuring Network Security with ACLs” chapter in the software configuration guide for this release.
This example shows how to apply a MAC extended ACL named `macacl2` to an interface:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# mac access-group macacl2 in
```

You can verify your settings by entering the `show mac access-group` privileged EXEC command. You can see configured ACLs on the switch by entering the `show access-lists` privileged EXEC command.

mac access-list extended

Use the `mac access-list extended` global configuration command to create an access list based on MAC addresses for non-IP traffic. Using this command puts you in the extended MAC access-list configuration mode. Use the `no` form of this command to return to the default setting.

```
mac access-list extended name

no mac access-list extended name
```

**Syntax Description**

- `name` Assign a name to the MAC extended access list.

**Defaults**

By default, there are no MAC access lists created.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

MAC named extended lists are used with VLAN maps and class maps.

You can apply named MAC extended ACLs to VLAN maps or to Layer 2 interfaces; you cannot apply named MAC extended ACLs to Layer 3 interfaces.

Entering the `mac access-list extended` command enables the MAC access-list configuration mode. These configuration commands are available:

- **default**: sets a command to its default.
- **deny**: specifies packets to reject. For more information, see the `deny (MAC access-list configuration)` MAC access-list configuration command.
- **exit**: exits from MAC access-list configuration mode.
- **no**: negates a command or sets its defaults.
- **permit**: specifies packets to forward. For more information, see the `permit (MAC access-list configuration)` command.

For more information about MAC extended access lists, see the software configuration guide for this release.

**Examples**

This example shows how to create a MAC named extended access list named `mac1` and to enter extended MAC access-list configuration mode:

```
Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)#
```
This example shows how to delete MAC named extended access list `mac1`:

```
Switch(config)# no mac access-list extended mac1
```

You can verify your settings by entering the `show access-lists` privileged EXEC command.

**mac address-table aging-time**

Use the **mac address-table aging-time** global configuration command to set the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated. Use the **no** form of this command to return to the default setting. The aging time applies to all VLANs or a specified VLAN.

```
mac address-table aging-time {0 | 10-1000000} [vlan vlan-id]
no mac address-table aging-time {0 | 10-1000000} [vlan vlan-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>This value disables aging. Static addresses entries are never aged or removed from the table.</td>
</tr>
<tr>
<td>10-1000000</td>
<td>Aging time in seconds. The range is 10 to 1000000 seconds.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Specify the VLAN ID to which to apply the aging time. The range is 1 to 4094.</td>
</tr>
</tbody>
</table>

### Defaults

The default is 300 seconds.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(19)EA1</td>
<td>The <strong>mac-address-table aging-time</strong> command (with the hyphen) was replaced by the <strong>mac address-table aging-time</strong> command (without the hyphen).</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If hosts do not send continuously, increase the aging time to record the dynamic entries for a longer time. Increasing the time can reduce the possibility of flooding when the hosts send again.

If you do not specify a specific VLAN, this command sets the aging time for all VLANs.

### Examples

This example shows how to set the aging time to 200 seconds for all VLANs:

```
switch(config)# mac address-table aging-time 200
```

You can verify your setting by entering the **show mac address-table aging-time** privileged EXEC command.

### Related Commands

mac address-table learning vlan

Use the mac address-table learning global configuration command to enable MAC address learning on a VLAN. This is the default state. Use the no form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

```
mac address-table learning vlan vlan-id
no mac address-table learning vlan vlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Specify a single VLAN ID or a range of VLAN IDs separated by a hyphen or comma. Valid VLAN IDs are 1 to 4094. The VLAN cannot be an internal VLAN.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, MAC address learning is enabled on all VLANs.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you control MAC address learning on a VLAN, you can manage the available MAC address table space by controlling which VLANs, and therefore which ports, can learn MAC addresses.

You can disable MAC address learning on a single VLAN ID (for example, no mac address-table learning vlan 223) or on a range of VLAN IDs (for example, no mac address-table learning vlan 1-20, 15.)

Before you disable MAC address learning, be sure that you are familiar with the network topology and the switch system configuration. Disabling MAC address learning on a VLAN could cause flooding in the network. For example, if you disable MAC address learning on a VLAN with a configured switch virtual interface (SVI), the switch floods all IP packets in the Layer 2 domain. If you disable MAC address learning on a VLAN that includes more than two ports, every packet entering the switch is flooded in that VLAN domain. We recommend that you disable MAC address learning only in VLANs that contain two ports and that you use caution before disabling MAC address learning on a VLAN with an SVI.

You cannot disable MAC address learning on a VLAN that the switch uses internally. If the VLAN ID that you enter in the no mac address-table learning vlan vlan-id command is an internal VLAN, the switch generates an error message and rejects the command. To view used internal VLANs, enter the show vlan internal usage privileged EXEC command.

If you disable MAC address learning on a VLAN configured as a private VLAN primary or a secondary VLAN, the MAC addresses are still learned on the other VLAN (primary or secondary) that belongs to the private VLAN.

You cannot disable MAC address learning on an RSPAN VLAN. The configuration is not allowed.
If you disable MAC address learning on a VLAN that includes a secure port, MAC address learning is not disabled on the secure port. If you later disable port security on the interface, the disabled MAC address learning state is enabled.

To display MAC address learning status of all VLANs or a specified VLAN, enter the **show mac-address-table learning [vlan vlan-id] command**.

### Examples

This example shows how to disable MAC address learning on VLAN 2003:

```
Switch(config)# no mac address-table learning vlan 2003
```

To display MAC address learning status of all VLANs or a specified VLAN, enter the **show mac address-table learning [vlan vlan-id] command**.

### Related Commands

mac address-table move update

Use the **mac address-table move update** global configuration command to enable the MAC address-table move update feature. Use the **no** form of this command to return to the default setting.

**mac address-table move update** {receive | transmit}

**no mac address-table move update** {receive | transmit}

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>receive</th>
<th>Specify that the switch processes MAC address-table move update messages.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>transmit</td>
<td>Specify that the switch sends MAC address-table move update messages to other switches in the network if the primary link goes down and the standby link comes up.</td>
</tr>
</tbody>
</table>

**Command Modes**

Global configuration.

**Defaults**

By default, the MAC address-table move update feature is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The MAC address-table move update feature allows the switch to provide rapid bidirectional convergence if a primary (forwarding) link goes down and the standby link begins forwarding traffic.

You can configure the access switch to send the MAC address-table move update messages if the primary link goes down and the standby link comes up. You can configure the uplink switches to receive and process the MAC address-table move update messages.

**Examples**

This example shows how to configure an access switch to send MAC address-table move update messages:

```
Switch# configure terminal
Switch(conf)# mac address-table move update transmit
Switch(conf)# end
```

This example shows how to configure an uplink switch to get and process MAC address-table move update messages:

```
Switch# configure terminal
Switch(conf)# mac address-table move update receive
Switch(conf)# end
```

You can verify your settings by entering the **show mac address-table move update** privileged EXEC command.

</tr>
<tr>
<td></td>
<td>120 to 1000000 seconds. The default is 120 seconds.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, the MAC address notification, MAC move, and MAC threshold monitoring are disabled.

- The default MAC change trap interval is 1 second.
- The default number of entries in the history table is 1.
- The default MAC utilization threshold is 50 percent.
- The default time between MAC threshold notifications is 120 seconds.

<td>The <code>change</code>, <code>mac-move</code>, and <code>threshold</code> <code>[[limit percentage] interval time]</code></td>
</tr>
<tr>
<td></td>
<td>keywords were added.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The MAC address notification change feature sends Simple Network Management Protocol (SNMP) traps to the network management system (NMS) whenever a new MAC address is added or an old address is deleted from the forwarding tables. MAC change notifications are generated only for dynamic and secure MAC addresses and are not generated for self addresses, multicast addresses, or other static addresses.

When you configure the `history-size` option, the existing MAC address history table is deleted, and a new table is created.

You enable the MAC address notification change feature by using the `mac address-table notification change` command. You must also enable MAC address notification traps on an interface by using the `snmp trap mac-notification change interface configuration` command and configure the switch to send MAC address traps to the NMS by using the `snmp-server enable traps mac-notification change global configuration` command.

You can also enable traps whenever a MAC address is moved from one port to another in the same VLAN by entering the `mac address-table notification mac-move` command and the `snmp-server enable traps mac-notification move` global configuration command.

To generate traps whenever the MAC address table threshold limit is reached or exceeded, enter the `mac address-table notification threshold [limit percentage] [interval time]` command and the `snmp-server enable traps mac-notification threshold` global configuration command.

Examples

This example shows how to enable the MAC address-table change notification feature, set the interval time to 60 seconds, and set the history-size to 100 entries:

```
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 60
Switch(config)# mac address-table notification change history-size 100
```

You can verify your settings by entering the `show mac address-table notification` privileged EXEC command.

</table>
mac address-table static

Use the `mac address-table static` global configuration command to add static addresses to the MAC address table. Use the `no` form of this command to remove static entries from the table.

```
mac address-table static mac-addr vlan vlan-id interface interface-id
no mac address-table static mac-addr vlan vlan-id [interface interface-id]
```

**Syntax Description**

- `mac-addr` Destination MAC address (unicast or multicast) to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface.
- `vlan vlan-id` Specify the VLAN for which the packet with the specified MAC address is received. The range is 1 to 4094.
- `interface interface-id` Interface to which the received packet is forwarded. Valid interfaces include physical ports and port channels.

**Defaults**

No static addresses are configured.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>

mac address-table static drop

Use the `mac address-table static drop` global configuration command to enable unicast MAC address filtering and to configure the switch to drop traffic with a specific source or destination MAC address. Use the `no` form of this command to return to the default setting.

```
mac address-table static mac-addr vlan vlan-id drop
no mac address-table static mac-addr vlan vlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac-addr</code></td>
<td>Unicast source or destination MAC address. Packets with this MAC address are dropped.</td>
</tr>
<tr>
<td><code>vlan vlan-id</code></td>
<td>Specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

Unicast MAC address filtering is disabled. The switch does not drop traffic for specific source or destination MAC addresses.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Follow these guidelines when using this feature:

- Multicast MAC addresses, broadcast MAC addresses, and router MAC addresses are not supported. Packets that are forwarded to the CPU are also not supported.
- If you add a unicast MAC address as a static address and configure unicast MAC address filtering, the switch either adds the MAC address as a static address or drops packets with that MAC address, depending on which command was entered last. The second command that you entered overrides the first command.

For example, if you enter the `mac address-table static mac-addr vlan vlan-id interface interface-id` global configuration command followed by the `mac address-table static mac-addr vlan vlan-id drop` command, the switch drops packets with the specified MAC address as a source or destination.

If you enter the `mac address-table static mac-addr vlan vlan-id drop` global configuration command followed by the `mac address-table static mac-addr vlan vlan-id interface interface-id` command, the switch adds the MAC address as a static address.
**Examples**

This example shows how to enable unicast MAC address filtering and to configure the switch to drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

This example shows how to disable unicast MAC address filtering:

```
Switch(config)# no mac address-table static c2f3.220a.12f4 vlan 4
```

You can verify your setting by entering the `show mac address-table static` privileged EXEC command.

**Related Commands**

match (access-map configuration)

Use the `match` access-map configuration command to set the VLAN map to match packets against one or more access lists. Use the `no` form of this command to remove the match parameters.

```
match {ip address {name | number} [name | number]...} | {mac address {name} [name]...}
no match {ip address {name | number} [name | number]...} | {mac address {name} [name]...}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip address</code></td>
<td>Set the access map to match packets against an IP address access list.</td>
</tr>
<tr>
<td><code>mac address</code></td>
<td>Set the access map to match packets against a MAC address access list.</td>
</tr>
<tr>
<td><code>name</code></td>
<td>Name of the access list to match packets against.</td>
</tr>
<tr>
<td><code>number</code></td>
<td>Number of the access list to match packets against. This option is not valid for MAC access lists.</td>
</tr>
</tbody>
</table>

**Defaults**

The default action is to have no match parameters applied to a VLAN map.

**Command Modes**

Access-map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You enter access-map configuration mode by using the `vlan access-map` global configuration command. You must enter one access list name or number; others are optional. You can match packets against one or more access lists. Matching any of the lists counts as a match of the entry.

In access-map configuration mode, use the `match` command to define the match conditions for a VLAN map applied to a VLAN. Use the `action` command to set the action that occurs when the packet matches the conditions.

Packets are matched only against access lists of the same protocol type; IP packets are matched against IP access lists, and all other packets are matched against MAC access lists.

Both IP and MAC addresses can be specified for the same map entry.

**Examples**

This example shows how to define and apply a VLAN access map `vmap4` to VLANs 5 and 6 that will cause the interface to drop an IP packet if the packet matches the conditions defined in access list `al2`.

```
Switch(config)# vlan access-map vmap4
Switch(config-access-map)# match ip address al2
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan filter vmap4 vlan-list 5-6
```
You can verify your settings by entering the `show vlan access-map` privileged EXEC command.

Class-map configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>input-interface interface-id-list</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `match` command is used to specify which fields in the incoming packets are examined to classify the packets. Only the IP access group or the MAC access-group matching to the Ether Type/LEN are supported.

To define packet classification on a physical-port basis, only one `match` command per class map is supported. In this situation, the `match-all` and `match-any` keywords are equivalent.
For the `match ip dscp dscp-list` or the `match ip precedence ip-precedence-list` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `match ip dscp af11` command, which is the same as entering the `match ip dscp 10` command. You can enter the `match ip precedence critical` command, which is the same as entering the `match ip precedence 5` command. For a list of supported mnemonics, enter the `match ip dscp ?` or the `match ip precedence ?` command to see the command-line help strings.

Use the `input-interface interface-id-list` keyword when you are configuring an interface-level class map in a hierarchical policy map. For the `interface-id-list`, you can specify up to six entries.

### Examples

This example shows how to create a class map called `class2`, which matches all the incoming traffic with DSCP values of 10, 11, and 12:

```bash
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
```

This example shows how to create a class map called `class3`, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7:

```bash
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
```

This example shows how to delete the IP-precedence match criteria and to classify traffic using `acl1`:

```bash
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
```

This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```bash
Switch(config)# class-map match-all class4
Switch(config-cmap)# match input-interface gigabitethernet2/0/1 gigabitethernet2/0/2
Switch(config-cmap)# exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

```bash
Switch(config)# class-map match-all class4
Switch(config-cmap)# match input-interface gigabitethernet2/0/1 - gigabitethernet2/0/5
Switch(config-cmap)# exit
```

You can verify your settings by entering the `show class-map` privileged EXEC command.

mdix auto

Use the **mdix auto** interface configuration command to enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the **no** form of this command to disable auto-MDIX.

**mdix auto**

**no mdix auto**

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Auto-MDIX is enabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(18)SE</td>
<td>The default setting changed from disabled to enabled.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable auto-MDIX on an interface, you must also set the interface speed and duplex to **auto** so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed and duplex) is enabled on one or both of connected interfaces, link up occurs, even if the cable type (straight-through or crossover) is incorrect.

Auto-MDIX is supported on all 10/100 and 10/100/1000 Mb/s interfaces and on 10/100/1000BASE-TX small form-factor pluggable (SFP) module interfaces. It is not supported on 1000BASE-SX or -LX SFP module interfaces.

**Examples**

This example shows how to enable auto-MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed auto
Switch(config-if)# duplex auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

You can verify the operational state of auto-MDIX on the interface by entering the **show controllers ethernet-controller interface-id phy** privileged EXEC command.
Use the **mls qos** global configuration command to enable quality of service (QoS) for the entire switch. When the **mls qos** command is entered, QoS is enabled with the default parameters on all ports in the system. Use the **no** form of this command to reset all the QoS-related statistics and to disable the QoS features for the entire switch.

```
mls qos
no mls qos
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

QoS is disabled. There is no concept of trusted or untrusted ports because the packets are not modified (the CoS, DSCP, and IP precedence values in the packet are not changed). Traffic is switched in pass-through mode (packets are switched without any rewrites and classified as best effort without any policing).

When QoS is enabled with the **mls qos** global configuration command and all other QoS settings are set to their defaults, traffic is classified as best effort (the DSCP and CoS value is set to 0) without any policing. No policy maps are configured. The default port trust state on all ports is untrusted. The default ingress and egress queue settings are in effect.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

QoS must be globally enabled to use QoS classification, policing, mark down or drop, queueing, and traffic shaping features. You can create a policy-map and attach it to a port before entering the **mls qos** command. However, until you enter the **mls qos** command, QoS processing is disabled.

Policy-maps and class-maps used to configure QoS are not deleted from the configuration by the **no mls qos** command, but entries corresponding to policy maps are removed from the switch hardware to save system resources. To re-enable QoS with the previous configurations, use the **mls qos** command.

Toggling the QoS status of the switch with this command modifies (reallocates) the sizes of the queues. During the queue size modification, the queue is temporarily shut down during the hardware reconfiguration, and the switch drops newly arrived packets for this queue.

**Examples**

This example shows how to enable QoS on the switch:

```
Switch(config)# mls qos
```

You can verify your settings by entering the **show mls qos** privileged EXEC command.

</tr>
</thead>
<tbody>
<tr>
<td><code>show mls qos</code></td>
<td>Displays QoS information.</td>
</tr>
</tbody>
</table>
mls qos aggregate-policer

Use the `mls qos aggregate-policer` global configuration command to define policer parameters, which can be shared by multiple classes within the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the `no` form of this command to delete an aggregate policer.

```
mls qos aggregate-policer aggregate-policer-name rate-bps burst-byte exceed-action { drop | policed-dscp-transmit }
```

```
no mls qos aggregate-policer aggregate-policer-name
```

**Syntax Description**

- `aggregate-policer-name` Name of the aggregate policer referenced by the `police aggregate policy-map class configuration` command.
- `rate-bps` Specify the average traffic rate in bits per second (b/s). The range is 8000 to 1000000000.
- `burst-byte` Specify the normal burst size in bytes. The range is 8000 to 1000000.
- `exceed-action drop` When the specified rate is exceeded, specify that the switch drop the packet.
- `exceed-action policed-dscp-transmit` When the specified rate is exceeded, specify that the switch change the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then send the packet.

**Defaults**

No aggregate policers are defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Define an aggregate policer if the policer is shared with multiple classes.

Policers for a port cannot be shared with other policers for another port; traffic from two different ports cannot be aggregated for policing purposes.

The port ASIC device, which controls more than one physical port, supports 256 policers (255 user-configurable policers plus 1 policer reserved for internal use). The maximum number of user-configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port (there is no guarantee that a port will be assigned to any policer).

You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggregate policer across different policy maps.
You cannot delete an aggregate policer if it is being used in a policy map. You must first use the `no police aggregate aggregate-policer-name` policy-map class configuration command to delete the aggregate policer from all policy maps before using the `no mls qos aggregate-policer aggregate-policer-name` command.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the `burst-byte` option of the `police` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command. You configure how fast (the average rate) that the tokens are removed from the bucket by using the `rate-bps` option of the `police` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command. For more information, see the software configuration guide for this release.

### Examples

This example shows how to define the aggregate policer parameters and how to apply the policer to multiple classes in a policy map:

```
Switch(config)# mls qos aggregate-policer agg_policer1 1000000 1000000 exceed-action drop
Switch(config)# policy-map policy2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# police aggregate agg_policer1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police aggregate agg_policer1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class3
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police aggregate agg_policer2
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the `show mls qos aggregate-policer` privileged EXEC command.

</table>
Use the `mls qos cos` interface configuration command to define the default class of service (CoS) value of a port or to assign the default CoS to all incoming packets on the port. Use the `no` form of this command to return to the default setting.

```
mls qos cos {default-cos | override}
no mls qos cos {default-cos | override}
```

### Syntax Description
- `default-cos`: Assign a default CoS value to a port. If packets are untagged, the default CoS value becomes the packet CoS value. The CoS range is 0 to 7.
- `override`: Override the CoS of the incoming packets, and apply the default CoS value on the port to all incoming packets.

### Defaults
The default CoS value for a port is 0.
CoS override is disabled.

### Command Modes
Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
You can use the default value to assign a CoS and Differentiated Services Code Point (DSCP) value to all incoming packets that are untagged (if the incoming packet does not have a CoS value). You also can assign a default CoS and DSCP value to all incoming packets by using the `override` keyword.

Use the `override` keyword when all incoming packets on certain ports deserve higher or lower priority than packets entering from other ports. Even if a port is previously set to trust DSCP, CoS, or IP precedence, this command overrides the previously configured trust state, and all the incoming CoS values are assigned the default CoS value configured with the `mls qos cos` command. If an incoming packet is tagged, the CoS value of the packet is modified with the default CoS of the port at the ingress port.

### Examples
This example shows how to configure the default port CoS to 4 on a port:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos trust cos
Switch(config-if)# mls qos cos 4
```
This example shows how to assign all the packets entering a port to the default port CoS value of 4 on a port:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos cos 4
Switch(config-if)# mls qos cos override
```

You can verify your settings by entering the `show mls qos interface` privileged EXEC command.

<table>
<thead>
<tr>

</table>
Use the `mls qos dscp-mutation` interface configuration command to apply a Differentiated Services Code Point (DSCP)-to-DSCP-mutation map to a DSCP-trusted port. Use the `no` form of this command to return the map to the default settings (no DSCP mutation).

```
mls qos dscp-mutation dscp-mutation-name

no mls qos dscp-mutation dscp-mutation-name
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dscp-mutation-name</code></td>
<td>Name of the DSCP-to-DSCP-mutation map. This map was previously defined with the <code>mls qos map dscp-mutation</code> global configuration command.</td>
</tr>
</tbody>
</table>

### Defaults

The default DSCP-to-DSCP-mutation map is a null map, which maps incoming DSCPs to the same DSCP values.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If two quality of service (QoS) domains have different DSCP definitions, use the DSCP-to-DSCP-mutation map to translate one set of DSCP values to match the definition of another domain. You apply the DSCP-to-DSCP-mutation map to the receiving port (ingress mutation) at the boundary of a quality of service (QoS) administrative domain.

With ingress mutation, the new DSCP value overwrites the one in the packet, and QoS handles the packet with this new value. The switch sends the packet out the port with the new DSCP value.

You can configure multiple DSCP-to-DSCP-mutation maps on ingress ports.

You apply the map only to DSCP-trusted ports. If you apply the DSCP mutation map to an untrusted port, to class of service (CoS) or IP-precedence trusted port, the command has no immediate effect until the port becomes DSCP-trusted.

### Examples

This example shows how to define the DSCP-to-DSCP-mutation map named `dscpmutation1` and to apply the map to a port:

```
Switch(config)# mls qos map dscp-mutation dscpmutation1 10 11 12 13 to 30
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos trust dscp
Switch(config-if)# mls qos dscp-mutation dscpmutation1
```
This example show how to remove the DSCP-to-DSCP-mutation map name `dscpmutation1` from the port and to reset the map to the default:

```
Switch(config-if)# no mls qos dscp-mutation dscpmutation1
```

You can verify your settings by entering the `show mls qos maps` privileged EXEC command.

### Related Commands

</tr>
</tbody>
</table>
Use the `mls qos map` global configuration command to define the class of service (CoS)-to-Differentiated Services Code Point (DSCP) map, DSCP-to-CoS map, the DSCP-to-DSCP-mutation map, the IP-precedence-to-DSCP map, and the policed-DSCP map. Use the `no` form of this command to return to the default map.

```
mls qos map { cos-dscp dscp1...dscp8 | dscp-cos dscp-list to cos | dscp-mutation
dscp-mutation-name in-dscp to out-dscp | ip-prec-dscp dscp1...dscp8 | policed-dscp dscp-list
to mark-down-dscp }

no mls qos map { cos-dscp | dscp-cos | dscp-mutation dscp-mutation-name | ip-prec-dscp | policed-dscp }
```

### Syntax Description

- **cos-dscp** `dscp1...dscp8`  
  Define the CoS-to-DSCP map.
  
  For `dscp1...dscp8`, enter eight DSCP values that correspond to CoS values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.

- **dscp-cos** `dscp-list to cos`  
  Define the DSCP-to-CoS map.
  
  For `dscp-list`, enter up to eight DSCP values, with each value separated by a space. The range is 0 to 63. Then enter the `to` keyword.
  
  For `cos`, enter a single CoS value to which the DSCP values correspond. The range is 0 to 7.

- **dscp-mutation** `dscp-mutation-name in-dscp to out-dscp`  
  Define the DSCP-to-DSCP-mutation map.
  
  For `dscp-mutation-name`, enter the mutation map name.
  
  For `in-dscp`, enter up to eight DSCP values, with each value separated by a space. Then enter the `to` keyword.
  
  For `out-dscp`, enter a single DSCP value.
  
  The range is 0 to 63.

- **ip-prec-dscp** `dscp1...dscp8`  
  Define the IP-precedence-to-DSCP map.
  
  For `dscp1...dscp8`, enter eight DSCP values that correspond to the IP precedence values 0 to 7. Separate each DSCP value with a space. The range is 0 to 63.

- **policed-dscp** `dscp-list to mark-down-dscp`  
  Define the policed-DSCP map.
  
  For `dscp-list`, enter up to eight DSCP values, with each value separated by a space. Then enter the `to` keyword.
  
  For `mark-down-dscp`, enter the corresponding policed (marked down) DSCP value.
  
  The range is 0 to 63.
Defaults

Table 2-14 shows the default CoS-to-DSCP map:

**Table 2-14 Default CoS-to-DSCP Map**

</tr>
<tr>
<td>7</td>
<td>56</td>
</tr>
</tbody>
</table>
The default DSCP-to-DSCP-mutation map is a null map, which maps an incoming DSCP value to the same DSCP value.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

All the maps are globally defined. All the maps, except the DSCP-to-DSCP-mutation map, are applied to all ports. The DSCP-to-DSCP-mutation map is applied to a specific port.

**Examples**

This example shows how to define the IP-precedence-to-DSCP map and to map IP-precedence values 0 to 7 to DSCP values of 0, 10, 20, 30, 40, 50, 55, and 60:

```
Switch# configure terminal
Switch(config)# mls qos map ip-prec-dscp 0 10 20 30 40 50 55 60
```

This example shows how to define the policed-DSCP map. DSCP values 1, 2, 3, 4, 5, and 6 are marked down to DSCP value 0. Marked DSCP values that not explicitly configured are not modified:

```
Switch# configure terminal
Switch(config)# mls qos map policed-dscp 1 2 3 4 5 6 to 0
```

This example shows how to define the DSCP-to-CoS map. DSCP values 20, 21, 22, 23, and 24 are mapped to CoS 1. DSCP values 10, 11, 12, 13, 14, 15, 16, and 17 are mapped to CoS 0:

```
Switch# configure terminal
Switch(config)# mls qos map dscp-cos 20 21 22 23 24 to 1
Switch(config)# mls qos map dscp-cos 10 11 12 13 14 15 16 17 to 0
```

This example shows how to define the CoS-to-DSCP map. CoS values 0 to 7 are mapped to DSCP values 0, 5, 10, 15, 20, 25, 30, and 35:

```
Switch# configure terminal
Switch(config)# mls qos map cos-dscp 0 5 10 15 20 25 30 35
```

This example shows how to define the DSCP-to-DSCP-mutation map. All the entries that are not explicitly configured are not modified (remain as specified in the null map):

```
Switch# configure terminal
Switch(config)# mls qos map dscp-mutation mutation1 1 2 3 4 5 6 7 to 10
Switch(config)# mls qos map dscp-mutation mutation1 8 9 10 11 12 13 to 10
Switch(config)# mls qos map dscp-mutation mutation1 20 21 22 to 20
Switch(config)# mls qos map dscp-mutation mutation1 0 31 32 33 34 to 30
```

You can verify your settings by entering the `show mls qos maps` privileged EXEC command.
### Related Commands

</table>
**mls qos queue-set output buffers**

Use the `mls qos queue-set output buffers` global configuration command to allocate buffers to a queue-set (four egress queues per port). Use the `no` form of this command to return to the default setting.

```
mls qos queue-set output qset-id buffers allocation1 ... allocation4
no mls qos queue-set output qset-id buffers
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>qset-id</code></td>
<td>ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.</td>
</tr>
<tr>
<td><code>allocation1</code> ... <code>allocation4</code></td>
<td>Buffer space allocation (percentage) for each queue (four values for queues 1 to 4). For <code>allocation1</code>, <code>allocation3</code>, and <code>allocation4</code>, the range is 0 to 99. For <code>allocation2</code>, the range is 1 to 100 (including the CPU buffer). Separate each value with a space.</td>
</tr>
</tbody>
</table>

**Defaults**

All allocation values are equally mapped among the four queues (25, 25, 25, 25). Each queue has 1/4 of the buffer space.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(18)SE</td>
<td>The range for <code>allocation2</code> changed from 0 to 100 to 20 to 100.</td>
</tr>
<tr>
<td>12.2(20)SE</td>
<td>The range for <code>allocation1</code>, <code>allocation3</code>, and <code>allocation4</code> changed from 0 to 100 to 0 to 99. The range for <code>allocation2</code> changed from 20 to 100 to 1 to 100.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Specify four allocation values, and separate each with a space.

Allocate buffers according to the importance of the traffic; for example, give a large percentage of the buffer to the queue with the highest-priority traffic.

To configure different classes of traffic with different characteristics, use this command with the `mls qos queue-set output qset-id threshold` global configuration command.

**Note**

The egress queue default settings are suitable for most situations. Change them only when you have a thorough understanding of the egress queues. For information about QoS, see the “Configuring QoS” chapter in the software configuration guide.
Examples

This example shows how to map a port to queue-set 2. It allocates 40 percent of the buffer space to egress queue 1 and 20 percent to egress queues 2, 3, and 4:

```
Switch(config)# mls qos queue-set output 2 buffers 40 20 20 20
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# queue-set 2
```

You can verify your settings by entering the `show mls qos interface [interface-id] buffers` or the `show mls qos queue-set` privileged EXEC command.

mls qos queue-set output threshold

Use the `mls qos queue-set output threshold` global configuration command to configure the weighted tail-drop (WTD) thresholds, to guarantee the availability of buffers, and to configure the maximum memory allocation to a queue-set (four egress queues per port). Use the `no` form of this command to return to the default setting.

```
mls qos queue-set output qset-id threshold queue-id drop-threshold1 drop-threshold2 reserved-threshold maximum-threshold
```

```
no mls qos queue-set output qset-id threshold [queue-id]
```

**Syntax Description**

- **qset-id**: ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.
- **queue-id**: Specific queue in the queue-set on which the command is performed. The range is 1 to 4.
- **drop-threshold1** / **drop-threshold2**: Two WTD thresholds expressed as a percentage of the allocated memory of the queue. The range is 1 to 3200 percent.
- **reserved-threshold**: Amount of memory to be guaranteed (reserved) for the queue and expressed as a percentage of the allocated memory. The range is 1 to 100 percent.
- **maximum-threshold**: Enable a queue in the full condition to get more buffers than are reserved for it. This is the maximum memory the queue can have before the packets are dropped. The range is 1 to 3200 percent.

**Defaults**

When quality of service (QoS) is enabled, WTD is enabled.

Table 2-17 shows the default WTD threshold settings.

<table>

</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Use the `mls qos queue-set output qset-id buffers` global configuration command to allocate a fixed number of buffers to the four queues in a queue-set.

The drop-threshold percentages can exceed 100 percent and can be up to the maximum (if the maximum threshold exceeds 100 percent).

While buffer ranges allow individual queues in the queue-set to use more of the common pool when available, the maximum number of packets for each queue is still internally limited to 400 percent, or 4 times the allocated number of buffers. One packet can use one or more buffers.

The range increased in Cisco IOS Release 12.2(25)SEE1 or later for the `drop-threshold`, `drop-threshold2`, and `maximum-threshold` parameters.

**Note**

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.

The switch uses a buffer allocation scheme to reserve a minimum amount of buffers for each egress queue, to prevent any queue or port from consuming all the buffers and depriving other queues, and to decide whether to grant buffer space to a requesting queue. The switch decides whether the target queue has not consumed more buffers than its reserved amount (under-limit), whether it has consumed all of its maximum buffers (over-limit), and whether the common pool is empty (no free buffers) or not empty (free buffers). If the queue is not over-limit, the switch can allocate buffer space from the reserved pool or from the common pool (if it is not empty). If there are no free buffers in the common pool or if the queue is over-limit, the switch drops the frame.

Examples

This example shows how to map a port to queue-set 2. It configures the drop thresholds for queue 2 to 40 and 60 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory this queue can have before packets are dropped:

```
Switch(config)# mls qos queue-set output 2 threshold 2 40 60 100 200
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# queue-set 2
```

You can verify your settings by entering the `show mls qos interface [interface-id] buffers` or the `show mls qos queue-set` privileged EXEC command.

**mls qos rewrite ip dscp**

Use the `mls qos rewrite ip dscp` global configuration command to configure the switch to change (rewrite) the Differentiated Services Code Point (DSCP) field of an incoming IP packet. Use the `no` form of this command to configure the switch to not modify (rewrite) the DSCP field of the packet and to enable DSCP transparency.

```
mls qos rewrite ip dscp
no mls qos rewrite ip dscp
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

DSCP transparency is disabled. The switch changes the DSCP field of the incoming IP packet.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

DSCP transparency affects only the DSCP field of a packet at the egress. If DSCP transparency is enabled by using the `no mls qos rewrite ip dscp` command, the switch does not modify the DSCP field in the incoming packet, and the DSCP field in the outgoing packet is the same as that in the incoming packet.

**Note**

Enabling DSCP transparency does not affect the port trust settings on IEEE 802.1Q tunneling ports.

By default, DSCP transparency is disabled. The switch modifies the DSCP field in an incoming packet, and the DSCP field in the outgoing packet is based on the quality of service (QoS) configuration, including the port trust setting, policing and marking, and the DSCP-to-DSCP mutation map.

Regardless of the DSCP transparency configuration, the switch modifies the internal DSCP value of the packet that the switch uses to generate a class of service (CoS) value representing the priority of the traffic. The switch also uses the internal DSCP value to select an egress queue and threshold.

For example, if QoS is enabled and an incoming packet has a DSCP value of 32, the switch might modify the internal DSCP value based on the policy-map configuration and change the internal DSCP value to 16. If DSCP transparency is enabled, the outgoing DSCP value is 32 (same as the incoming value). If DSCP transparency is disabled, the outgoing DSCP value is 16 because it is based on the internal DSCP value.
Examples

This example shows how to enable DSCP transparency and configure the switch to not change the DSCP value of the incoming IP packet:

Switch(config)# mls qos
Switch(config)# no mls qos rewrite ip dscp

This example shows how to disable DSCP transparency and configure the switch to change the DSCP value of the incoming IP packet:

Switch(config)# mls qos
Switch(config)# mls qos rewrite ip dscp

You can verify your settings by entering the `show running config | include rewrite` privileged EXEC command.

mls qos srr-queue input bandwidth

Use the `mls qos srr-queue input bandwidth` global configuration command to assign shaped round robin (SRR) weights to an ingress queue. The ratio of the weights is the ratio of the frequency in which the SRR scheduler dequeues packets from each queue. Use the `no` form of this command to return to the default setting.

```
mls qos srr-queue input bandwidth weight1 weight2
no mls qos srr-queue input bandwidth
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>weight1 weight2</code></td>
<td>Ratio of <code>weight1</code> and <code>weight2</code> determines the ratio of the frequency in which the SRR scheduler dequeues packets from ingress queues 1 and 2. The range is 1 to 100. Separate each value with a space.</td>
</tr>
</tbody>
</table>

**Defaults**

Weight1 and weight2 are 4 (1/2 of the bandwidth is equally shared between the two queues).

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

SRR services the priority queue for its configured weight as specified by the `bandwidth` keyword in the `mls qos srr-queue input priority-queue queue-id bandwidth` global configuration command. Then SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the `mls qos srr-queue input bandwidth weight1 weight2` global configuration command.

You specify which ingress queue is the priority queue by using the `mls qos srr-queue input priority-queue` global configuration command.

**Examples**

This example shows how to assign the ingress bandwidth for the queues in the stack. Priority queueing is disabled, and the shared bandwidth ratio allocated to queue 1 is 25/(25+75) and to queue 2 is 75/(25+75):

```
Switch(config)# mls qos srr-queue input priority-queue 2 bandwidth 0
Switch(config)# mls qos srr-queue input bandwidth 25 75
```

In this example, queue 2 has three times the bandwidth of queue 1; queue 2 is serviced three times as often as queue 1.
This example shows how to assign the ingress bandwidths for the queues in the stack. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

Switch(config)# mls qos srr-queue input priority-queue 1 bandwidth 10
Switch(config)# mls qos srr-queue input bandwidth 4 4

You can verify your settings by entering the `show mls qos interface [interface-id] queueing` or the `show mls qos input-queue` privileged EXEC command.

**mls qos srr-queue input buffers**

Use the `mls qos srr-queue input buffers` global configuration command to allocate the buffers between the ingress queues. Use the `no` form of this command to return to the default setting.

```
mls qos srr-queue input buffers percentage1 percentage2
no mls qos srr-queue input buffers
```

**Syntax Description**

| `percentage1` | Percentage of buffers allocated to ingress queues 1 and 2. The range is 0 to 100. Separate each value with a space. |

**Defaults**

Ninety percent of the buffers is allocated to queue 1, and 10 percent of the buffers is allocated to queue 2.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should allocate the buffers so that the queues can handle any incoming bursty traffic.

**Examples**

This example shows how to allocate 60 percent of the buffer space to ingress queue 1 and 40 percent of the buffer space to ingress queue 2:

```
Switch(config)# mls qos srr-queue input buffers 60 40
```

You can verify your settings by entering the `show mls qos interface [interface-id] buffers` or the `show mls qos input-queue` privileged EXEC command.

<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

The CoS assigned at the ingress port selects an ingress or egress queue and threshold.

The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state. You can assign two weighted tail-drop (WTD) threshold percentages to an ingress queue by using the `mls qos srr-queue input threshold` global configuration command.

You can map each CoS value to a different queue and threshold combination, allowing the frame to follow different behavior.

**Examples**

This example shows how to map CoS values 0 to 3 to ingress queue 1 and to threshold ID 1 with a drop threshold of 50 percent. It maps CoS values 4 and 5 to ingress queue 1 and to threshold ID 2 with a drop threshold of 70 percent:

```
Switch(config)# mls qos srr-queue input cos-map queue 1 threshold 1 0 1 2 3
Switch(config)# mls qos srr-queue input cos-map queue 1 threshold 2 4 5
Switch(config)# mls qos srr-queue input threshold 1 50 70
```

You can verify your settings by entering the `show mls qos maps` privileged EXEC command.

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The DSCP assigned at the ingress port selects an ingress or egress queue and threshold. The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state. You can assign two weighted tail-drop (WTD) threshold percentages to an ingress queue by using the `mls qos srr-queue input threshold` global configuration command.
You can map each DSCP value to a different queue and threshold combination, allowing the frame to follow different behavior.

You can map up to eight DSCP values per command.

**Examples**

This example shows how to map DSCP values 0 to 6 to ingress queue 1 and to threshold 1 with a drop threshold of 50 percent. It maps DSCP values 20 to 26 to ingress queue 1 and to threshold 2 with a drop threshold of 70 percent:

```
Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 1 0 1 2 3 4 5 6
Switch(config)# mls qos srr-queue input dscp-map queue 1 threshold 2 20 21 22 23 24 25 26
Switch(config)# mls qos srr-queue input threshold 1 50 70
```

You can verify your settings by entering the `show mls qos maps` privileged EXEC command.

mls qos srr-queue input priority-queue

Use the `mls qos srr-queue input priority-queue` global configuration command to configure the ingress priority queue and to guarantee bandwidth on the stack ring if the ring is congested. Use the `no` form of this command to return to the default setting.

```
mls qos srr-queue input priority-queue queue-id bandwidth weight

no mls qos srr-queue input priority-queue queue-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>queue-id</code></th>
<th>Ingress queue ID. The range is 1 to 2.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bandwidth weight</code></td>
<td>Bandwidth percentage of the stack ring. The range is 0 to 40.</td>
</tr>
</tbody>
</table>

**Defaults**

The priority queue is queue 2, and 10 percent of the bandwidth is allocated to it.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should use the priority queue only for traffic that needs to be expedited (for example, voice traffic, which needs minimum delay and jitter).

The priority queue is guaranteed part of the bandwidth on the stack ring, which reduces the delay and jitter under heavy network traffic on an oversubscribed stack (when there is more traffic than the backplane can carry, and the queues are full and dropping frames).

The amount of bandwidth that can be guaranteed is restricted because a large value affects the entire stack and can degrade the stack performance.

Shaped round robin (SRR) services the priority queue for its configured weight as specified by the `bandwidth` keyword in the `mls qos srr-queue input priority-queue queue-id bandwidth weight` global configuration command. Then SRR shares the remaining bandwidth with both ingress queues and services them as specified by the weights configured with the `mls qos srr-queue input bandwidth weight1 weight2` global configuration command.

To disable priority queuing, set the bandwidth weight to 0, for example, `mls qos srr-queue input priority-queue queue-id bandwidth 0`. 
Examples

This example shows how to assign the ingress bandwidths for the queues in the stack. Queue 1 is the priority queue with 10 percent of the bandwidth allocated to it. The bandwidth ratio allocated to queues 1 and 2 is 4/(4+4). SRR services queue 1 (the priority queue) first for its configured 10 percent bandwidth. Then SRR equally shares the remaining 90 percent of the bandwidth between queues 1 and 2 by allocating 45 percent to each queue:

```
Switch(config)# mls qos srr-queue input priority-queue 1 bandwidth 10
Switch(config)# mls qos srr-queue input bandwidth 4 4
```

You can verify your settings by entering the `show mls qos interface [interface-id] queueing` or the `show mls qos input-queue` privileged EXEC command.

**mls qos srr-queue input threshold**

Use the `mls qos srr-queue input threshold` global configuration command to assign weighted tail-drop (WTD) threshold percentages to an ingress queue. Use the `no` form of this command to return to the default setting.

```
mls qos srr-queue input threshold queue-id threshold-percentage1 threshold-percentage2
no mls qos srr-queue input threshold queue-id
```

**Syntax Description**

- `queue-id` ID of the ingress queue. The range is 1 to 2.
- `threshold-percentage1` Two WTD threshold percentage values. Each threshold value is a percentage of the total number of queue descriptors allocated for the queue. Separate each value with a space. The range is 1 to 100.

**Defaults**

When quality of service (QoS) is enabled, WTD is enabled.

The two WTD thresholds are set to 100 percent.

**Command Modes**

Global configuration

**Command History**

- **Release** 12.1(11)AX
  - **Modification** This command was introduced.

**Usage Guidelines**

QoS uses the CoS-to-threshold map or the DSCP-to-threshold map to decide which class of service (CoS) or Differentiated Services Code Points (DSCPs) values are mapped to threshold 1 and to threshold 2. If threshold 1 is exceeded, packets with CoS or DSCPs assigned to this threshold are dropped until the threshold is no longer exceeded. However, packets assigned to threshold 2 continue to be queued and sent as long as the second threshold is not exceeded.

Each queue has two configurable (explicit) drop threshold and one preset (implicit) drop threshold (full).

You configure the CoS-to-threshold map by using the `mls qos srr-queue input cos-map` global configuration command. You configure the DSCP-to-threshold map by using the `mls qos srr-queue input dscp-map` global configuration command.

**Examples**

This example shows how to configure the tail-drop thresholds for the two queues. The queue 1 thresholds are 50 percent and 100 percent, and the queue 2 thresholds are 70 percent and 100 percent:

```
Switch(config)# mls qos srr-queue input threshold 1 50 100
Switch(config)# mls qos srr-queue input threshold 2 70 100
```

You can verify your settings by entering the `show mls qos interface [interface-id] buffers` or the `show mls qos input-queue` privileged EXEC command.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mls qos srr-queue input bandwidth</code></td>
<td>Assigns shaped round robin (SRR) weights to an ingress queue.</td>
</tr>
<tr>
<td><code>mls qos srr-queue input buffers</code></td>
<td>Allocates the buffers between the ingress queues.</td>
</tr>
<tr>
<td><code>mls qos srr-queue input cos-map</code></td>
<td>Maps class of service (CoS) values to an ingress queue or maps CoS values to a queue and to a threshold ID.</td>
</tr>
<tr>
<td><code>mls qos srr-queue input dscp-map</code></td>
<td>Maps Differentiated Services Code Point (DSCP) values to an ingress queue or maps DSCP values to a queue and to a threshold ID.</td>
</tr>
<tr>
<td><code>mls qos srr-queue input priority-queue</code></td>
<td>Configures the ingress priority queue and guarantees bandwidth.</td>
</tr>
<tr>
<td><code>show mls qos input-queue</code></td>
<td>Displays ingress queue settings.</td>
</tr>
<tr>
<td><code>show mls qos interface buffers</code></td>
<td>Displays quality of service (QoS) information.</td>
</tr>
</tbody>
</table>
Use the `mls qos srr-queue output cos-map` global configuration command to map class of service (CoS) values to an egress queue or to map CoS values to a queue and to a threshold ID. Use the `no` form of this command to return to the default setting.

```
mls qos srr-queue output cos-map queue queue-id {cos1...cos8 | threshold threshold-id cos1...cos8} no mls qos srr-queue output cos-map
```

<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The drop-threshold percentage for threshold 3 is predefined. It is set to the queue-full state.

Note

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your quality of service (QoS) solution.

You can assign two weighted tail-drop (WTD) threshold percentages to an egress queue by using the `mls qos queue-set output qset-id threshold` global configuration command.

You can map each CoS value to a different queue and threshold combination, allowing the frame to follow different behavior.

Examples

This example shows how to map a port to queue-set 1. It maps CoS values 0 to 3 to egress queue 1 and to threshold ID 1. It configures the drop thresholds for queue 1 to 50 and 70 percent of the allocated memory, guarantees (reserves) 100 percent of the allocated memory, and configures 200 percent as the maximum memory that this queue can have before packets are dropped.

```
Switch(config)# mls qos srr-queue output cos-map queue 1 threshold 1 0 1 2 3
Switch(config)# mls qos queue-set output 1 threshold 1 50 70 100 200
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# queue-set 1
```

You can verify your settings by entering the `show mls qos maps`, the `show mls qos interface [interface-id] buffers`, or the `show mls qos queue-set` privileged EXEC command.

mls qos srr-queue output dscp-map

Use the mls qos srr-queue output dscp-map global configuration command to map Differentiated Services Code Point (DSCP) values to an egress or to map DSCP values to a queue and to a threshold ID. Use the no form of this command to return to the default setting.

```
mls qos srr-queue output dscp-map queue queue-id \{dscp1...dscp8 | threshold threshold-id dscp1...dscp8\}
```

```
no mls qos srr-queue output dscp-map
```

mls qos trust

Use the `mls qos trust` interface configuration command to configure the port trust state. Ingress traffic can be trusted, and classification is performed by examining the packet Differentiated Services Code Point (DSCP), class of service (CoS), or IP-precedence field. Use the `no` form of this command to return a port to its untrusted state.

```
mls qos trust [cos | device cisco-phone | dscp | ip-precedence]

no mls qos trust [cos | device | dscp | ip-precedence]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cos</code> (Optional) Classify an ingress packet by using the packet CoS value. For an untagged packet, use the port default CoS value.</td>
</tr>
<tr>
<td><code>device cisco-phone</code> (Optional) Classify an ingress packet by trusting the CoS or DSCP value sent from the Cisco IP Phone (trusted boundary), depending on the trust setting.</td>
</tr>
<tr>
<td><code>dscp</code> (Optional) Classify an ingress packet by using the packet DSCP value (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the default port CoS value is used.</td>
</tr>
<tr>
<td><code>ip-precedence</code> (Optional) Classify an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS is used if the packet is tagged. For an untagged packet, the port default CoS value is used.</td>
</tr>
</tbody>
</table>

<table>

<table>
<thead>
<tr>
<th>Usage Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packets entering a quality of service (QoS) domain are classified at the edge of the domain. When the packets are classified at the edge, the switch port within the QoS domain can be configured to one of the trusted states because there is no need to classify the packets at every switch within the domain. Use this command to specify whether the port is trusted and which fields of the packet to use to classify traffic.</td>
</tr>
<tr>
<td>When a port is configured with trust DSCP or trust IP precedence and the incoming packet is a non-IP packet, the CoS-to-DSCP map is used to derive the corresponding DSCP value from the CoS value. The CoS can be the packet CoS for trunk ports or the port default CoS for nontrunk ports.</td>
</tr>
</tbody>
</table>
If the DSCP is trusted, the DSCP field of the IP packet is not modified. However, it is still possible that the CoS value of the packet is modified (according to DSCP-to-CoS map).

If the CoS is trusted, the CoS field of the packet is not modified, but the DSCP can be modified (according to CoS-to-DSCP map) if the packet is an IP packet.

The trusted boundary feature prevents security problems if users disconnect their PCs from networked Cisco IP Phones and connect them to the switch port to take advantage of trusted CoS or DSCP settings. You must globally enable the Cisco Discovery Protocol (CDP) on the switch and on the port connected to the IP phone. If the telephone is not detected, trusted boundary disables the trusted setting on the switch or routed port and prevents misuse of a high-priority queue.

If you configure the trust setting for DSCP or IP precedence, the DSCP or IP precedence values in the incoming packets are trusted. If you configure the `mls qos cos override` interface configuration command on the switch port connected to the IP phone, the switch overrides the CoS of the incoming voice and data packets and assigns the default CoS value to them.

For an inter-QoS domain boundary, you can configure the port to the DSCP-trusted state and apply the DSCP-to-DSCP-mutation map if the DSCP values are different between the QoS domains.

Classification using a port trust state (for example, `mls qos trust [cos | dscp | ip-precedence]`) and a policy map (for example, `service-policy input policy-map-name`) are mutually exclusive. The last one configured overwrites the previous configuration.

Note

Cisco IOS Release 12.2(52)SE and later supports IPv6 port-based trust with the dual IPv4 and IPv6 Switch Database Management (SDM) templates. You must reload the switch with the dual IPv4 and IPv6 templates for switches running IPv6.

Examples

This example shows how to configure a port to trust the IP precedence field in the incoming packet:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos trust ip-precedence
```

This example shows how to specify that the Cisco IP Phone connected on a port is a trusted device:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos trust device cisco-phone
```

You can verify your settings by entering the `show mls qos interface` privileged EXEC command.

**mls qos vlan-based**

Use the `mls qos vlan-based` interface configuration command to enable VLAN-based quality of service (QoS) on the physical port. Use the `no` form of this command to disable this feature.

```
mls qos vlan-based

no mls qos vlan-based
```

**Syntax Description**
There are no arguments or keywords.

**Defaults**
VLAN-based QoS is disabled.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Before attaching a hierarchical policy map to a switch virtual interface (SVI), use the `mls qos vlan-based` interface configuration command on a physical port if the port is to be specified in the secondary interface level of the hierarchical policy map.

When you configure hierarchical policing, the hierarchical policy map is attached to the SVI and affects all traffic belonging to the VLAN. The individual policer in the interface-level traffic classification only affects the physical ports specified for that classification.

For detailed instructions about configuring hierarchical policy maps, see the “Classifying, Policing, and Marking Traffic by Using Hierarchical Policy Maps” section in the software configuration guide for this release.

**Examples**
This example shows how to enable VLAN-based policing on a physical port:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# mls qos vlan-based
```

You can verify your settings by entering the `show mls qos interface` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>show mls qos interface</td>
<td>Displays QoS information.</td>
</tr>
</tbody>
</table>
**monitor session**

Use the `monitor session` global configuration command to start a new Switched Port Analyzer (SPAN) session or Remote SPAN (RSPAN) source or destination session, to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS Sensor Appliance), to add or delete interfaces or VLANs to or from an existing SPAN or RSPAN session, and to limit (filter) SPAN source traffic to specific VLANs. Use the `no` form of this command to remove the SPAN or RSPAN session or to remove source or destination interfaces or filters from the SPAN or RSPAN session. For destination interfaces, the encapsulation options are ignored with the `no` form of the command.

```
monitor session session_number destination {interface interface-id [, | -] [encapsulation replicate] [ingress {dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id}]} | {remote vlan vlan-id}

monitor session session_number filter vlan vlan-id [, | -]

monitor session session_number source {interface interface-id [, | -] [both | rx | tx]} | {vlan vlan-id [, | -] [both | rx | tx]} | {remote vlan vlan-id}

no monitor session {session_number | all | local | remote}

no monitor session session_number destination {interface interface-id [, | -] [encapsulation replicate] [ingress {dot1q vlan vlan-id | isl | untagged vlan vlan-id | vlan vlan-id}]} | {remote vlan vlan-id}

no monitor session session_number filter vlan vlan-id [, | -]

no monitor session session_number source {interface interface-id [, | -] [both | rx | tx]} | {vlan vlan-id [, | -] [both | rx | tx]} | {remote vlan vlan-id}
```

**Syntax Description**

- **session_number**: Specify the session number identified with the SPAN or RSPAN session. The range is 1 to 66.
- **destination**: Specify the SPAN or RSPAN destination. A destination must be a physical port.
- **interface interface-id**: Specify the destination or source interface for a SPAN or RSPAN session. Valid interfaces are physical ports (including type, stack member, module, and port number). For `source interface port channel` is also a valid interface type, and the valid range is 1 to 48.
- **encapsulation replicate** (Optional) Specify that the destination interface replicates the source interface encapsulation method. If not selected, the default is to send packets in native form (untagged). These keywords are valid only for local SPAN. For RSPAN, the RSPAN VLAN ID overwrites the original VLAN ID; therefore, packets are always sent untagged.
- **ingress** (Optional) Enable ingress traffic forwarding.
- **dot1q vlan vlan-id**: Accept incoming packets with IEEE 802.1Q encapsulation with the specified VLAN as the default VLAN.
- **isl**: Specify ingress forwarding using ISL encapsulation.
monitor session

<table>
<thead>
<tr>
<th><strong>untagged vlan vlan-id</strong></th>
<th>Accept incoming packets with untagged encapsulation with the specified VLAN as the default VLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan vlan-id</strong></td>
<td>When used with only the <strong>ingress</strong> keyword, set default VLAN for ingress traffic.</td>
</tr>
</tbody>
</table>
| **remote vlan vlan-id** | Specify the remote VLAN for an RSPAN source or destination session. The range is 2 to 1001 and 1006 to 4094.  
The RSPAN VLAN cannot be VLAN 1 (the default VLAN) or VLAN IDs 1002 to 1005 (reserved for Token Ring and FDDI VLANs). |
| ,                  | (Optional) Specify a series of interfaces or VLANs, or separate a range of interfaces or VLANs from a previous range. Enter a space before and after the comma. |
| -                | (Optional) Specify a range of interfaces or VLANs. Enter a space before and after the hyphen. |
| **filter vlan vlan-id** | Specify a list of VLANs as filters on trunk source ports to limit SPAN source traffic to specific VLANs. The vlan-id range is 1 to 4094. |
| **source**         | Specify the SPAN or RSPAN source. A source can be a physical port, a port channel, or a VLAN. |
| **both, rx, tx**  | (Optional) Specify the traffic direction to monitor. If you do not specify a traffic direction, the source interface sends both transmitted and received traffic. |
| **source vlan vlan-id** | Specify the SPAN source interface as a VLAN ID. The range is 1 to 4094. |
| **all, local, remote** | Specify **all**, **local**, or **remote** with the **no monitor session** command to clear all SPAN and RSPAN, all local SPAN, or all RSPAN sessions. |

**Defaults**

No monitor sessions are configured.

On a source interface, the default is to monitor both received and transmitted traffic.

On a trunk interface used as a source port, all VLANs are monitored.

If **encapsulation replicate** is not specified on a local SPAN destination port, packets are sent in native form with no encapsulation tag.

Ingress forwarding is disabled on destination ports.

**Command Modes**

Global configuration

</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The **ingress {dot1q vlan vlan-id</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Traffic that enters or leaves source ports or source VLANs can be monitored by using SPAN or RSPAN. Traffic routed to source ports or source VLANs cannot be monitored.
You can set a combined maximum of two local SPAN sessions and RSPAN source sessions. You can have a total of 66 SPAN and RSPAN sessions on a switch or switch stack.

You can have a maximum of 64 destination ports on a switch stack.

If a 10-Gigabit Ethernet port is configured as a SPAN or RSPAN destination port, the line rate of the link decreases.

Each session can include multiple ingress or egress source ports or VLANs, but you cannot combine source ports and source VLANs in a single session. Each session can include multiple destination ports.

When you use VLAN-based SPAN (VSPAN) to analyze network traffic in a VLAN or set of VLANs, all active ports in the source VLANs become source ports for the SPAN or RSPAN session. Trunk ports are included as source ports for VSPAN, and only packets with the monitored VLAN ID are sent to the destination port.

You can monitor traffic on a single port or VLAN or on a series or range of ports or VLANs. You select a series or range of interfaces or VLANs by using the [, ] options.

If you specify a series of VLANs or interfaces, you must enter a space before and after the comma. If you specify a range of VLANs or interfaces, you must enter a space before and after the hyphen (-).

EtherChannel ports cannot be configured as SPAN or RSPAN destination ports. A physical port that is a member of an EtherChannel group can be used as a destination port, but it cannot participate in the EtherChannel group while it is as a SPAN destination.

A private-VLAN port cannot be configured as a SPAN destination port.

You can monitor individual ports while they participate in an EtherChannel, or you can monitor the entire EtherChannel bundle by specifying the port-channel number as the RSPAN source interface.

A port used as a destination port cannot be a SPAN or RSPAN source, nor can a port be a destination port for more than one session at a time.

You can enable IEEE 802.1x authentication on a port that is a SPAN or RSPAN destination port; however, IEEE 802.1x authentication is disabled until the port is removed as a SPAN destination. If IEEE 802.1x authentication is not available on the port, the switch returns an error message. You can enable IEEE 802.1x authentication on a SPAN or RSPAN source port.

VLAN filtering refers to analyzing network traffic on a selected set of VLANs on trunk source ports. By default, all VLANs are monitored on trunk source ports. You can use the `monitor session session_number filter vlan vlan-id` command to limit SPAN traffic on trunk source ports to only the specified VLANs.

VLAN monitoring and VLAN filtering are mutually exclusive. If a VLAN is a source, VLAN filtering cannot be enabled. If VLAN filtering is configured, a VLAN cannot become a source.

If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.

Destination ports can be configured to act in these ways:

- When you enter `monitor session session_number destination interface interface-id` with no other keywords, egress encapsulation is untagged, and ingress forwarding is not enabled.

- When you enter `monitor session session_number destination interface interface-id ingress`, egress encapsulation is untagged; ingress encapsulation depends on the keywords that follow—`dot1q`, `isl`, or `untagged`.
When you enter `monitor session session_number destination interface interface-id encapsulation replicate` with no other keywords, egress encapsulation replicates the source interface encapsulation; ingress forwarding is not enabled. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

When you enter `monitor session session_number destination interface interface-id encapsulation replicate ingress`, egress encapsulation replicates the source interface encapsulation; ingress encapsulation depends on the keywords that follow—`dot1q`, `isl`, or `untagged`. (This applies to local SPAN only; RSPAN does not support encapsulation replication.)

### Examples

This example shows how to create a local SPAN session 1 to monitor both sent and received traffic on source port 1 on stack member 1 to destination port 2 on stack member 2:

```shell
Switch(config)# monitor session 1 source interface gigabitethernet2/0/1 both
Switch(config)# monitor session 1 destination interface gigabitethernet2/0/2
```

This example shows how to delete a destination port from an existing local SPAN session:

```
Switch(config)# no monitor session 2 destination gigabitethernet2/0/2
```

This example shows how to limit SPAN traffic in an existing session only to specific VLANs:

```
Switch(config)# monitor session 1 filter vlan 100 - 110
```

This example shows how to configure RSPAN source session 1 to monitor multiple source interfaces and to configure the destination RSPAN VLAN 900.

```
Switch(config)# monitor session 1 source interface gigabitethernet2/0/1
Switch(config)# monitor session 1 source interface port-channel 2 tx
Switch(config)# monitor session 1 destination remote vlan 900
Switch(config)# end
```

This example shows how to configure an RSPAN destination session 10 in the switch receiving the monitored traffic.

```
Switch(config)# monitor session 10 source remote vlan 900
Switch(config)# monitor session 10 destination interface gigabitethernet2/0/2
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports IEEE 802.1Q encapsulation. Egress traffic replicates the source; ingress traffic uses IEEE 802.1Q encapsulation.

```
Switch(config)# monitor session 2 destination interface gigabitethernet2/0/2 encapsulation replicate ingress dot1q vlan 5
```

This example shows how to configure the destination port for ingress traffic on VLAN 5 by using a security device that does not support encapsulation. Egress traffic and ingress traffic are untagged.

```
Switch(config)# monitor session 2 destination interface gigabitethernet2/0/2 ingress untagged vlan 5
```

You can verify your settings by entering the `show monitor` privileged EXEC command. You can display SPAN and RSPAN configurations on the switch by entering the `show running-config` privileged EXEC command. SPAN information appears near the end of the output.

mvr (global configuration)

Use the mvr global configuration command without keywords to enable the multicast VLAN registration (MVR) feature on the switch. Use the command with keywords to set the MVR mode for a switch, configure the MVR IP multicast address, set the maximum time to wait for a query reply before removing a port from group membership, and to specify the MVR multicast VLAN. Use the no form of this command to return to the default settings.

```
mvr [group ip-address [count] | mode [compatible | dynamic] | querytime value | vlan vlan-id]

no mvr [group ip-address | mode [compatible | dynamic] | querytime value | vlan vlan-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group ip-address</td>
<td>Statically configure an MVR group IP multicast address on the switch. Use the no form of this command to remove a statically configured IP multicast address or contiguous addresses or, when no IP address is entered, to remove all statically configured MVR IP multicast addresses.</td>
</tr>
<tr>
<td>count</td>
<td>(Optional) Configure multiple contiguous MVR group addresses. The range is 1 to 256; the default is 1.</td>
</tr>
<tr>
<td>mode</td>
<td>(Optional) Specify the MVR mode of operation. The default is compatible mode.</td>
</tr>
<tr>
<td>compatible</td>
<td>Set MVR mode to provide compatibility with Catalyst 2900 XL and Catalyst 3500 XL switches. This mode does not allow dynamic membership joins on source ports.</td>
</tr>
<tr>
<td>dynamic</td>
<td>Set MVR mode to allow dynamic MVR membership on source ports.</td>
</tr>
<tr>
<td>querytime value</td>
<td>(Optional) Set the maximum time to wait for IGMP report memberships on a receiver port. This time applies only to receiver-port leave processing. When an IGMP query is sent from a receiver port, the switch waits for the default or configured MVR querytime for an IGMP group membership report before removing the port from multicast group membership. The value is the response time in units of tenths of a second. The range is 1 to 100; the default is 5 tenths or one-half second. Use the no form of the command to return to the default setting.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Specify the VLAN on which MVR multicast data is expected to be received. This is also the VLAN to which all the source ports belong. The range is 1 to 4094; the default is VLAN 1.</td>
</tr>
</tbody>
</table>

### Defaults

MVR is disabled by default.
The default MVR mode is compatible mode.
No IP multicast addresses are configured on the switch by default.
The default group ip address count is 0.
The default query response time is 5 tenths of or one-half second.
The default multicast VLAN for MVR is VLAN 1.

</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

A maximum of 256 MVR multicast groups can be configured on a switch.

Use the `mvr group` command to statically set up all the IP multicast addresses that will take part in MVR. Any multicast data sent to a configured multicast address is sent to all the source ports on the switch and to all receiver ports that have registered to receive data on that IP multicast address.

MVR supports aliased IP multicast addresses on the switch. However, if the switch is interoperating with Catalyst 3550 or Catalyst 3500 XL switches, you should not configure IP addresses that alias between themselves or with the reserved IP multicast addresses (in the range 224.0.0.xxx).

The `mvr querytime` command applies only to receiver ports.

If the switch MVR is interoperating with Catalyst 2900 XL or Catalyst 3500 XL switches, set the multicast mode to compatible.

When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports.

MVR can coexist with IGMP snooping on a switch.

Multicast routing and MVR cannot coexist on a switch. If you enable multicast routing and a multicast routing protocol while MVR is enabled, MVR is disabled and a warning message appears. If you try to enable MVR while multicast routing and a multicast routing protocol are enabled, the operation to enable MVR is cancelled with an Error message.

Examples

This example shows how to enable MVR:

```
Switch(config)# mvr
```

Use the `show mvr` privileged EXEC command to display the current setting for maximum multicast groups.

This example shows how to configure 228.1.23.4 as an IP multicast address:

```
Switch(config)# mvr group 228.1.23.4
```

This example shows how to configure ten contiguous IP multicast groups with multicast addresses from 228.1.23.1 to 228.1.23.10:

```
Switch(config)# mvr group 228.1.23.1 10
```

Use the `show mvr members` privileged EXEC command to display the IP multicast group addresses configured on the switch.

This example shows how to set the maximum query response time as one second (10 tenths):

```
Switch(config)# mvr querytime 10
```

This example shows how to set VLAN 2 as the multicast VLAN:

```
Switch(config)# mvr vlan 2
```

You can verify your settings by entering the `show mvr` privileged EXEC command.

</tr>
</tbody>
</table>
mvr (interface configuration)

Usage Guidelines

Configure a port as a source port if that port should be able to both send and receive multicast data bound for the configured multicast groups. Multicast data is received on all ports configured as source ports.

Receiver ports cannot be trunk ports. Receiver ports on a switch can be in different VLANs, but should not belong to the multicast VLAN.

A port that is not taking part in MVR should not be configured as an MVR receiver port or a source port. A non-MVR port is a normal switch port, able to send and receive multicast data with normal switch behavior.

When Immediate Leave is enabled, a receiver port leaves a multicast group more quickly. Without Immediate Leave, when the switch receives an IGMP leave message from a group on a receiver port, it sends out an IGMP MAC-based query on that port and waits for IGMP group membership reports. If no reports are received in a configured time period, the receiver port is removed from multicast group membership. With Immediate Leave, an IGMP MAC-based query is not sent from the receiver port on which the IGMP leave was received. As soon as the leave message is received, the receiver port is removed from multicast group membership, which speeds up leave latency.

The Immediate Leave feature should be enabled only on receiver ports to which a single receiver device is connected.

The mvr vlan group command statically configures ports to receive multicast traffic sent to the IP multicast address. A port statically configured as a member of a group remains a member of the group until statically removed. In compatible mode, this command applies only to receiver ports; in dynamic mode, it can also apply to source ports. Receiver ports can also dynamically join multicast groups by using IGMP join messages.

When operating in compatible mode, MVR does not support IGMP dynamic joins on MVR source ports. An MVR port cannot be a private-VLAN port.

Examples

This example shows how to configure a port as an MVR receiver port:

Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# mvr type receiver

Use the show mvr interface privileged EXEC command to display configured receiver ports and source ports.

This example shows how to enable Immediate Leave on a port:

Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# mvr immediate

This example shows how to add a port on VLAN 1 as a static member of IP multicast group 228.1.23.4:

Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# mvr vlan1 group 230.1.23.4

You can verify your settings by entering the show mvr members privileged EXEC command.

network-policy

Use the network-policy interface configuration command to apply a network-policy profile to an interface. Use the no form of this command to remove the policy.

    network-policy profile number

    no network-policy

Syntax Description

| profile number | Specify the network-policy profile number. |

Defaults

No network-policy profiles are applied.

Command Modes

Interface configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the network-policy profile number interface configuration command to apply a profile to an interface.

If you first configure a network-policy profile on an interface, you cannot apply the switchport voice vlan command on the interface. If switchport voice vlan vlan-id is already configured on an interface, you can apply a network-policy profile on the interface. The interface then has the voice or voice-signaling VLAN network-policy profile applied on the interface.

Examples

This example shows how to apply network-policy profile 60 to an interface:

    Switch(config)# interface_id
    Switch(config-if)# network-policy 60

```
network-policy profile profile number
no network-policy profile profile number
```

**Syntax Description**

| profile number | Specify the network-policy profile number. The range is 1 to 4294967295. |

**Defaults**

No network-policy profiles are defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the network-policy profile global configuration command to create a profile and to enter network-policy profile configuration mode.

To return to the privileged EXEC mode from the network-policy profile configuration mode, enter the exit command.

When you are in network-policy profile configuration mode, you can create the profile for voice and voice-signalling by specifying the values for VLAN, class of service (CoS), differentiated services code point (DSCP), and tagging mode.

These profile attributes are then contained in the Link Layer Discovery Protocol for Media Endpoint Devices (LLDP-MED) network-policy time-length-value (TLV).

**Examples**

This example shows how to create network-policy profile 60:

```
Switch(config)# network-policy profile 60
Switch(config-network-policy)#
```

</tbody>
</table>
Usage Guidelines

Use the **network-policy profile** command to configure the attributes of a network-policy profile.

The **voice** application type is for dedicated IP telephones and similar devices that support interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security through isolation from data applications.

The **voice-signaling** application type is for network topologies that require a different policy for voice signaling than for voice media. This application type should not be advertised if all the same network policies apply as those advertised in the **voice policy** TLV.

This example shows how to configure the voice application type for VLAN 100 with a priority 4 CoS:

```
Switch(config)# network-policy profile 1
Switch(config-network-policy)# voice vlan 100 cos 4
```

This example shows how to configure the voice application type for VLAN 100 with a DSCP value of 34:

```
Switch(config)# network-policy profile 1
Switch(config-network-policy)# voice vlan 100 dscp 34
```

This example shows how to configure the voice application type for the native VLAN with priority tagging:

```
Switch(config-network-policy)# voice vlan dot1p cos 4
```

Use the **nsf** router configuration command on the switch stack or on a standalone switch to enable and configure Cisco nonstop forwarding (NSF) for Open Shortest Path First (OSPF) or Enhanced Interior Gateway Routing Protocol (EIGRP) routing. Use the **no** form of this command to disable NSF.

```
nsf [enforce global]
no nsf
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enforce global</code></td>
<td>(Optional) Cancel OSPF NSF restart when non-NSF-aware neighbors are detected. These keywords are visible only in OSPF router configuration mode.</td>
</tr>
</tbody>
</table>

### Defaults
NSF is disabled.

The enforce global option is enabled (OSPF only)

### Command Modes
Router configuration (OSPF or EIGRP)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(35)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The **nsf** command is a router configuration command and affects all interfaces that are covered by the designated routing process. The switch supports Cisco NSF for OSPF and EIGRP protocols.

When NSF is enabled and a stack master switchover is detected, the NSF-capable routers rebuild routing information from NSF-aware or NSF-capable neighbors and do not wait for a restart.

### Examples

This example shows how to enable OSPF NSF:

```
Switch(config)# router ospf 100
Switch(config-router)# nsf
```

Use the **show ip ospf** privileged EXEC command to verify that OSPF NSF is enabled.

This example shows how to enable EIGRP NSF:

```
Switch(config)# router eigrp 1
Switch(config-router)# nsf
```

Use the **show ip protocols** privileged EXEC command to verify that EIGRP NSF is enabled.

pagp learn-method

Use the `pagp learn-method` interface configuration command to learn the source address of incoming packets received from an EtherChannel port. Use the `no` form of this command to return to the default setting.

\[
\text{pagp learn-method} \ \{\text{aggregation-port} \mid \text{physical-port}\}
\]

\[
\text{no pagp learn-method}
\]

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggregation-port</td>
<td>Specify address learning on the logical port-channel. The switch sends packets to the source using any of the ports in the EtherChannel. This setting is the default. With aggregate-port learning, it is not important on which physical port the packet arrives.</td>
</tr>
<tr>
<td>physical-port</td>
<td>Specify address learning on the physical port within the EtherChannel. The switch sends packets to the source using the same port in the EtherChannel from which it learned the source address. The other end of the channel uses the same port in the channel for a particular destination MAC or IP address.</td>
</tr>
</tbody>
</table>

### Defaults

The default is aggregation-port (logical port channel).

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The learn method must be configured the same at both ends of the link.

#### Note

The switch supports address learning only on aggregate ports even though the `physical-port` keyword is provided in the command-line interface (CLI). The `pagp learn-method` and the `pagp port-priority` interface configuration commands have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.

When the link partner to the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the `pagp learn-method physical-port` interface configuration command and to set the load-distribution method based on the source MAC address by using the `port-channel load-balance src-mac` global configuration command. Use the `pagp learn-method` interface configuration command only in this situation.
Examples

This example shows how to set the learning method to learn the address on the physical port within the EtherChannel:

```
Switch(config-if)# pagp learn-method physical-port
```

This example shows how to set the learning method to learn the address on the port-channel within the EtherChannel:

```
Switch(config-if)# pagp learn-method aggregation-port
```

You can verify your settings by entering the `show running-config` privileged EXEC command or the `show pagp channel-group-number internal` privileged EXEC command.

### Related Commands

<table>
<thead>

<tr>
<td><code>show pagp</code></td>
<td>Displays PAgP channel-group information.</td>
</tr>
<tr>
<td><code>show running-config</code></td>
<td>Displays the current operating configuration.</td>
</tr>
</tbody>
</table>
pagp port-priority

Use the **pagp port-priority** interface configuration command to select a port over which all Port Aggregation Protocol (PAgP) traffic through the EtherChannel is sent. If all unused ports in the EtherChannel are in hot-standby mode, they can be placed into operation if the currently selected port and link fails. Use the **no** form of this command to return to the default setting.

```
pagp port-priority priority

no pagp port-priority
```

### Syntax Description

- **priority**  
  A priority number ranging from 0 to 255.

### Defaults

The default is 128.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The physical port with the highest priority that is operational and has membership in the same EtherChannel is the one selected for PAgP transmission.

**Note**

The switch supports address learning only on aggregate ports even though the **physical-port** keyword is provided in the command-line interface (CLI). The **pagp learn-method** and the **pagp port-priority** interface configuration commands have no effect on the switch hardware, but they are required for PAgP interoperability with devices that only support address learning by physical ports, such as the Catalyst 1900 switch.

When the link partner to the switch is a physical learner, we recommend that you configure the switch as a physical-port learner by using the **pagp learn-method physical-port** interface configuration command and to set the load-distribution method based on the source MAC address by using the **port-channel load-balance src-mac** global configuration command. Use the **pagp learn-method** interface configuration command only in this situation.

### Examples

This example shows how to set the port priority to 200:

```
Switch(config-if)# pagp port-priority 200
```

You can verify your setting by entering the **show running-config** privileged EXEC command or the **show pagp channel-group-number internal** privileged EXEC command.

permit (access-list configuration mode)

To enable smart logging in a named IP access list with deny conditions, use the `permit` command in access list configuration mode with the `smartlog` keyword. Matches to ACL entries are logged to a NetFlow collector. To disable smart logging for the access list, use the `no` form of this command.

```
permit {source [source-wildcard] | host source | any} [log] [smartlog]

no permit {source [source-wildcard] | host source | any} [smartlog]

permit protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [dscp tos] [precedence precedence] [tos tos] [fragments] [log] [time-range time-range-name] [smartlog]

no permit protocol {source [source-wildcard] | host source | any} {destination [destination-wildcard] | host destination | any} [dscp tos] [precedence precedence] [tos tos] [fragments] [log] [time-range time-range-name] [smartlog]
```

**Syntax Description**

- `smartlog` (Optional) Sends packet flows matching the access list to a NetFlow collector when smart logging is enabled on the switch.

**Defaults**

ACL smart logging is not enabled.

**Command Modes**

Access list configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>The <code>smartlog</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the complete syntax description of the `permit` command without the `smartlog` keyword, see the `Cisco IOS Security Command Reference`.

When an ACL is applied to an interface, packets matching the ACL are denied or permitted based on the ACL configuration. When smart logging is enabled on the switch and an ACL includes the `smartlog` keyword, the contents of the denied or permitted packet are sent to a Flexible NetFlow collector.

You must also enable smart logging globally by entering the `logging smartlog` global configuration command.

Only port ACLs (ACLs attached to Layer 2 interfaces) support smart logging. Router ACLs or VLAN ACLs do not support smart logging. Port ACLs do not support logging.

When an ACL is applied to an interface, matching packets can be either logged or smart logged, but not both.

You can verify that smart logging is enabled in an ACL by entering the `show ip access list` privileged EXEC command.
This example enables smart logging on a named access list with a permit condition:

```
Switch(config)# ip access-list extended test1
Switch(config-ext-nacl)# permit ip host 10.1.1.3 any smartlog
```

</tbody>
</table>

**Defaults**

There are no default settings.

**Command Modes**

ARP access-list configuration
permit (ARP access-list configuration)

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can add permit clauses to forward ARP packets based on some matching criteria.

Examples

This example shows how to define an ARP access list and to permit both ARP requests and ARP responses from a host with an IP address of 1.1.1.1 and a MAC address of 0000.0000.abcd:

Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end

You can verify your settings by entering the `show arp access-list` privileged EXEC command.

permit (IPv6 access-list configuration)

Use the `permit` IPv6 access list configuration command to set permit conditions for an IPv6 access list. Use the `no` form of this command to remove the permit conditions.

```
permit {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] {dscp value} [fragments] [log] [log-input] [sequence value] [time-range name]
```

```
no permit {protocol} {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] {dscp value} [fragments] [log] [log-input] [sequence value] [time-range name]
```

**Note**

Although visible in the command-line help strings, the `flow-label`, `reflect`, and `routing` keywords are not supported.

**Internet Control Message Protocol**

```
permit icmp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [icmp-type [icmp-code] | icmp-message] [dscp value] [log] [log-input] [sequence value] [time-range name]
```

**Transmission Control Protocol**

```
permit tcp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [ack] [dscp value] [established] [fin] [log] [log-input] [neq {port | protocol}] [psh] [range {port | protocol}] [rst] [sequence value] [syn] [time-range name] [urg]
```

**User Datagram Protocol**

```
permit udp {source-ipv6-prefix/prefix-length | any | host source-ipv6-address} [operator [port-number]] {destination-ipv6-prefix/prefix-length | any | host destination-ipv6-address} [operator [port-number]] [dscp value] [log] [log-input] [neq {port | protocol}] [range {port | protocol}] [sequence value] [time-range name]
```

**Note**

Although visible in the command-line help strings, the `flow-label`, `reflect`, and `routing` keywords are not supported.
### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>protocol</strong></td>
<td>Name or number of an Internet protocol. It can be one of the keywords <code>ahp</code>, <code>esp</code>, <code>icmp</code>, <code>ipv6</code>, <code>pcp</code>, <code>sctp</code>, <code>tcp</code>, or <code>udp</code>, or an integer in the range from 0 to 255 representing an IPv6 protocol number.</td>
</tr>
<tr>
<td><strong>source-ipv6-prefix/prefix-length</strong></td>
<td>The source IPv6 network or class of networks for which to set permit conditions. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. <strong>Note</strong> Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and extended universal identifier (EUI)-based /128 prefixes for aggregatable global unicast and link-local host addresses.</td>
</tr>
<tr>
<td><strong>any</strong></td>
<td>An abbreviation for the IPv6 prefix ::/0.</td>
</tr>
<tr>
<td><strong>host</strong> source-ipv6-address</td>
<td>The source IPv6 host address for which to set permit conditions. This source-ipv6-address argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</td>
</tr>
<tr>
<td><strong>operator [port-number]</strong></td>
<td>(Optional) Specify an operator that compares the source or destination ports of the specified protocol. Operators are <code>lt</code> (less than), <code>gt</code> (greater than), <code>eq</code> (equal), <code>neq</code> (not equal), and <code>range</code> (inclusive range). If the operator is positioned after the source-ipv6-prefix/prefix-length argument, it must match the source port. If the operator is positioned after the destination-ipv6-prefix/prefix-length argument, it must match the destination port. The <code>range</code> operator requires two port numbers. All other operators require one port number. The optional <code>port-number</code> argument is a decimal number or the name of a TCP or a UDP port. A port number is a number from 0 to 65535. TCP port names can be used only when filtering TCP. UDP port names can be used only when filtering UDP.</td>
</tr>
<tr>
<td><strong>destination-ipv6-prefix/ prefix-length</strong></td>
<td>The destination IPv6 network or class of networks for which to set permit conditions. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons. <strong>Note</strong> Although the CLI help shows a prefix-length range of /0 to /128, the switch supports IPv6 address-matching only for prefixes in the range of /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.</td>
</tr>
<tr>
<td><strong>host</strong> destination-ipv6-address</td>
<td>The destination IPv6 host address for which to set permit conditions. This destination-ipv6-address argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</td>
</tr>
<tr>
<td><strong>dscp value</strong></td>
<td>(Optional) Match a differentiated services codepoint value against the traffic class value in the Traffic Class field of each IPv6 packet header. The acceptable range is from 0 to 63.</td>
</tr>
</tbody>
</table>
permit (IPv6 access-list configuration)

fragments (Optional) Match noninitial fragmented packets where the fragment extension header contains a nonzero fragment offset. The fragments keyword is an option only if the protocol is ipv6 and the operator [port-number] arguments are not specified.

log (Optional) Send an informational logging message to the console about the packet that matches the entry. (The level of messages logged to the console is controlled by the logging console command.)

The message includes the access list name and sequence number; whether the packet was permitted; the protocol, whether it was TCP, UDP, ICMP, or a number; and, if appropriate, the source and destination addresses and source and destination port numbers. The message is generated for the first packet that matches, and then at 5-minute intervals, including the number of packets permitted in the prior 5-minute interval.

log-input (Optional) Provide the same function as the log keyword, except that the logging message also includes the receiving interface.

timeout value (Optional) Interval of idle time (in seconds) after which a reflexive IPv6 access list times out. The acceptable range is from 1 to 4294967295. The default is 180 seconds.

sequence value (Optional) Specify the sequence number for the access list statement. The acceptable range is from 1 to 4294967295.

time-range name (Optional) Specify the time range that applies to the permit statement. The name of the time range and its restrictions are specified by the time-range and absolute or periodic commands, respectively.

icmp-type (Optional) Specify an ICMP message type for filtering ICMP packets. ICMP packets can be filtered by the ICMP message type. The type is a number from 0 to 255.

icmp-code (Optional) Specify an ICMP message code for filtering ICMP packets. ICMP packets that are filtered by the ICMP message type can also be filtered by the ICMP message code. The code is a number from 0 to 255.

icmp-message (Optional) Specify an ICMP message name for filtering ICMP packets. ICMP packets can be filtered by an ICMP message name or ICMP message type and code. The possible names are listed in the “Usage Guidelines” section.

ack (Optional) Only for the TCP protocol: acknowledgment (ACK) bit set.

established (Optional) Only for the TCP protocol: Means the connection has been established. A match occurs if the TCP datagram has the ACK or RST bits set. The nonmatching case is that of the initial TCP datagram to form a connection.

fin (Optional) Only for the TCP protocol: Fin bit set; no more data from sender.

neq {port | protocol} (Optional) Match only packets that are not on a given port number.

psh (Optional) Only for the TCP protocol: Push function bit set.

range {port | protocol} (Optional) Match only packets in the range of port numbers.

rst (Optional) Only for the TCP protocol: Reset bit set.

syn (Optional) Only for the TCP protocol: Synchronize bit set.

urg (Optional) Only for the TCP protocol: Urgent pointer bit set.
permit (IPv6 access-list configuration)

**Defaults**
No IPv6 access list is defined.

**Command Modes**
IPv6 access-list configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `permit` (IPv6 access-list configuration mode) command is similar to the `permit` (IPv4 access-list configuration mode) command, except that it is IPv6-specific.

Use the `permit` (IPv6) command after the `ipv6 access-list` command to enter IPv6 access-list configuration mode and to define the conditions under which a packet passes the access list.

Specifying IPv6 for the `protocol` argument matches against the IPv6 header of the packet.

By default, the first statement in an access list is number 10, and the subsequent statements are incremented by 10.

You can add `permit`, `deny`, or `remark` statements to an existing access list without re-entering the entire list. To add a new statement anywhere other than at the end of the list, create a new statement with an appropriate entry number that falls between two existing entry numbers to show where it belongs.

See the `ipv6 access-list` command for more information on defining IPv6 ACLs.

**Note**
Every IPv6 ACL has implicit `permit icmp any any nd-na`, `permit icmp any any nd-ns`, and `deny ipv6 any any` statements as its last match conditions. The two `permit` conditions allow ICMPv6 neighbor discovery. To disallow ICMPv6 neighbor discovery and to deny `icmp any any nd-na` or `icmp any any nd-ns`, there must be an explicit `deny` entry in the ACL. For the implicit `deny ipv6 any any` statement to take effect, an IPv6 ACL must contain at least one entry.

The IPv6 neighbor discovery process uses the IPv6 network layer service. Therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, uses a separate data link layer protocol. Therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface.

Both the `source-ipv6-prefix/prefix-length` and `destination-ipv6-prefix/prefix-length` arguments are used for traffic filtering (the source prefix filters traffic based upon the traffic source; the destination prefix filters traffic based upon the traffic destination).

The switch supports only prefixes from /0 to /64 and EUI-based /128 prefixes for aggregatable global unicast and link-local host addresses.

The `fragments` keyword is an option only if the `operator [port-number]` arguments are not specified.
This is a list of ICMP message names:

<td>router-renumbering</td>
</tr>
<tr>
<td>router-solicitation</td>
<td>time-exceeded</td>
</tr>
<tr>
<td>unreachable</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

This example configures two IPv6 access lists named OUTBOUND and INBOUND and applies both access lists to outbound and inbound traffic on a Layer 3 interface. The first and second permit entries in the OUTBOUND list permit all TCP and UDP packets from network 2001:0DB8:0300:0201::/64 to leave the interface. The deny entry in the OUTBOUND list prevents all packets from the network FE80:0:0201::/64 (packets that have the link-local prefix FE80:0:0201 as the first 64 bits of their source IPv6 address) from leaving the interface. The third permit entry in the OUTBOUND list permits all ICMP packets to exit the interface.

The permit entry in the INBOUND list permits all ICMP packets to enter the interface.

```
Switch(config)#ipv6 access-list OUTBOUND
Switch(config-ipv6-acl)# permit tcp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# permit udp 2001:0DB8:0300:0201::/64 any
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config)#ipv6 access-list INBOUND
Switch(config-ipv6-acl)# permit icmp any any
Switch(config-ipv6-acl)# exit
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# no switchport
Switch(config-if)# ipv6 address 2001::/64 eui-64
Switch(config-if)# ipv6 traffic-filter OUTBOUND out
Switch(config-if)# ipv6 traffic-filter INBOUND in
```

Given that a `permit any any` statement is not included as the last entry in the OUTBOUND or INBOUND access list, only TCP, UDP, and ICMP packets are permitted out of and into the interface (the implicit deny-all condition at the end of the access list denies all other packet types on the interface).

permit (MAC access-list configuration)

To filter IPX traffic, you use the type mask or lsap lsap-number mask keywords, depending on the type of IPX encapsulation being used. Filter criteria for IPX encapsulation types as specified in Novell terminology and Cisco IOS terminology are listed in Table 2-22.

Table 2-22  IPX Filtering Criteria

Defaults

This command has no defaults. However, the default action for a MAC-named ACL is to deny.

Command Modes

MAC access-list configuration

Command History

Release   Modification
12.1(11)AX This command was introduced.

Usage Guidelines

You enter MAC access-list configuration mode by using the mac access-list extended global configuration command.

If you use the host keyword, you cannot enter an address mask; if you do not use the any or host keywords, you must enter an address mask.
After an access control entry (ACE) is added to an access control list, an implied **deny any any** condition exists at the end of the list. That is, if there are no matches, the packets are denied. However, before the first ACE is added, the list permits all packets.

For more information about MAC-named extended access lists, see the software configuration guide for this release.

### Examples

This example shows how to define the MAC-named extended access list to allow NETBIOS traffic from any source to MAC address 00c0.00a0.03fa. Traffic matching this list is allowed.

```
Switch(config-ext-macl)# permit any host 00c0.00a0.03fa netbios
```

This example shows how to remove the permit condition from the MAC-named extended access list:

```
Switch(config-ext-macl)# no permit any 00c0.00a0.03fa 0000.0000.0000 netbios
```

This example permits all packets with Ethertype 0x4321:

```
Switch(config-ext-macl)# permit any any 0x4321 0
```

You can verify your settings by entering the `show access-lists` privileged EXEC command.

### Related Commands

police

Use the `police` policy-map class configuration command to define a policer for classified traffic. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the `no` form of this command to remove an existing policer.

```
police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]
```

```
no police rate-bps burst-byte [exceed-action {drop | policed-dscp-transmit}]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rate-bps</code></td>
<td>Specify the average traffic rate in bits per second (b/s). The range is 8000 to 100000000.</td>
</tr>
<tr>
<td><code>burst-byte</code></td>
<td>Specify the normal burst size in bytes. The range is 8000 to 1000000.</td>
</tr>
<tr>
<td><code>exceed-action</code></td>
<td>(Optional) When the specified rate is exceeded, specify that the switch drop the packet.</td>
</tr>
<tr>
<td><code>policed-dscp-transmit</code></td>
<td>(Optional) When the specified rate is exceeded, specify that the switch changes the Differentiated Services Code Point (DSCP) of the packet to that specified in the policed-DSCP map and then sends the packet.</td>
</tr>
</tbody>
</table>

### Defaults

No policers are defined.

### Command Modes

Policy-map class configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When configuring hierarchical policy maps, you can only use the `police` policy-map command in a secondary interface-level policy map.

The port ASIC device, which controls more than one physical port, supports 256 policers (255 user-configurable policers plus 1 policer reserved for internal use). The maximum number of user-configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port. There is no guarantee that a port will be assigned to any policer.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.

Policing uses a token-bucket algorithm. You configure the bucket depth (the maximum burst that is tolerated before the bucket overflows) by using the `burst-byte` option of the `police` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command. You configure how quickly (the average rate) the tokens are removed from the bucket by using the `rate-bps` option of the `police` policy-map class configuration command or the `mls qos aggregate-policer` global configuration command. For more information, see the software configuration guide for this release.
Policy maps that have the `police aggregate` command fail when applied to a 10-Gigabit Ethernet interface.

### Examples

This example shows how to configure a policer that drops packets if traffic exceeds 1 Mb/s average rate with a burst size of 20 KB. The DSCPs of incoming packets are trusted, and there is no packet modification.

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action drop
Switch(config-pmap-c)# exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Switch(config)# policy-map policy2
Switch(config-pmap)# class class2
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

police aggregate

Use the **police aggregate** policy-map class configuration command to apply an aggregate policer to multiple classes in the same policy map. A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded. Use the **no** form of this command to remove the specified policer.

```
police aggregate aggregate-policer-name
no police aggregate aggregate-policer-name
```

**Syntax Description**

| aggregate-policer-name | Name of the aggregate policer. |

**Defaults**

No aggregate policers are defined.

**Command Modes**

Policy-map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The port ASIC device, which controls more than one physical port, supports 256 policers (255 user-configurable policers plus 1 policer reserved for internal use). The maximum number of user-configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port. There is no guarantee that a port will be assigned to any policer.

You set aggregate policer parameters by using the **mls qos aggregate-policer** global configuration command. You apply an aggregate policer to multiple classes in the same policy map; you cannot use an aggregate policer across different policy maps.

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Policy maps that use the **police aggregate** command fail when applied to a 10-Gigabit Ethernet interface.

You cannot configure aggregate policers in hierarchical policy maps.
This example shows how to define the aggregate policer parameters and to apply the policer to multiple classes in a policy map:

```
Switch(config)# mls qos aggregate-policer agg_policer1 10000 1000000 exceed-action drop
Switch(config)# policy-map policy2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# police aggregate agg_policer1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police aggregate agg_policer1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class3
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police aggregate agg_policer2
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the `show mls qos aggregate-policer` privileged EXEC command.

### Related Commands

</table>
policy-map

Use the **policy-map** global configuration command to create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode. Use the no form of this command to delete an existing policy map and to return to global configuration mode.

```
policy-map policy-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>policy-map-name</strong></td>
<td>Name of the policy map.</td>
</tr>
</tbody>
</table>

**Defaults**

No policy maps are defined.

The default behavior is to set the Differentiated Services Code Point (DSCP) to 0 if the packet is an IP packet and to set the class of service (CoS) to 0 if the packet is tagged. No policing is performed.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>Support for policy maps on SVIs was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After entering the **policy-map** command, you enter policy-map configuration mode, and these configuration commands are available:

- **class**: defines the classification match criteria for the specified class map. For more information, see the “class” section on page 2-86.
- **description**: describes the policy map (up to 200 characters).
- **exit**: exits policy-map configuration mode and returns you to global configuration mode.
- **no**: removes a previously defined policy map.
- **rename**: renames the current policy map.

To return to global configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Before configuring policies for classes whose match criteria are defined in a class map, use the **policy-map** command to specify the name of the policy map to be created, added to, or modified. Entering the **policy-map** command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.

You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the **class-map** global configuration and **match** class-map configuration commands. You define packet classification on a physical-port basis.
Only one policy map per ingress port or SVI is supported. You can apply the same policy map to multiple physical ports or SVIs.

You can apply a nonhierarchical policy maps to physical ports or to SVIs. However, you can only apply a hierarchical policy map to SVIs.

A hierarchical policy map has two levels. The first level, the VLAN level, specifies the actions to be taken against a traffic flow on an SVI. The second level, the interface level, specifies the actions to be taken against the traffic on the physical ports that belong to the SVI and are specified in the interface-level policy map.

In a primary VLAN-level policy map, you can only configure the trust state or set a new DSCP or IP precedence value in the packet. In a secondary interface-level policy map, you can only configure individual policers on physical ports that belong to the SVI.

After the hierarchical policy map is attached to an SVI, an interface-level policy map cannot be modified or removed from the hierarchical policy map. A new interface-level policy map also cannot be added to the hierarchical policy map. If you want these changes to occur, the hierarchical policy map must first be removed from the SVI.

For more information about hierarchical policy maps, see the “Policing on SVIs” section in the “Configuring QoS” chapter of the software configuration guide for this release.

**Examples**

This example shows how to create a policy map called `policy1`. When attached to the ingress port, it matches all the incoming traffic defined in `class1`, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic exceeding the profile is marked down to a DSCP value gotten from the policed-DSCP map and then sent.

```bash
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

This example shows how to configure multiple classes in a policy map called `policymap2`:

```bash
Switch(config)# policy-map policymap2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap-c)# police 100000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 100000 20000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class3
Switch(config-pmap-c)# set dscp 0 (no policer)
Switch(config-pmap-c)# exit
```
This example shows how to create a hierarchical policy map and attach it to an SVI:

```plaintext
Switch(config)# class-map cm-non-int
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# exit
Switch(config)# class-map cm-non-int-2
Switch(config-cmap)# match access-group 102
Switch(config-cmap)# exit
Switch(config)# class-map cm-test-int
Switch(config-cmap)# match input-interface gigabitethernet2/0/2 - gigabitethernet2/0/3
Switch(config-cmap)# exit
Switch(config)# policy-map pm-test-int
Switch(config-pmap)# class cm-test-int
Switch(config-pmap-c)# police 18000000 8000 exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map pm-test-pm-2
Switch(config-pmap)# class cm-non-int
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap)# class cm-non-int-2
Switch(config-pmap-c)# set dscp 15
Switch(config-pmap-c)# service-policy pm-test-int
Switch(config-pmap-c)# end
Switch(config-cmap)# exit
Switch(config)# interface vlan 10
Switch(config-if)# service-policy input pm-test-pm-2
```

This example shows how to delete `policymap2`:

```plaintext
Switch(config)# no policy-map policymap2
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

power inline

Use the `power inline` interface configuration command to configure the power management mode on the Power over Ethernet (PoE) ports. Use the `no` form of this command to return to the default settings.

```
  power inline { auto [max max-wattage] | never | police [action log] | static [max max-wattage] }

  no power inline { auto | never | police | static }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>auto</code></td>
<td>Enable powered-device detection. If enough power is available, automatically allocate power to the PoE port after device detection.</td>
</tr>
<tr>
<td><code>max max-wattage</code></td>
<td>(Optional) Limit the power allowed on the port. The range is 4000 to 15400 milli- watts. If no value is specified, the maximum is allowed.</td>
</tr>

<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>static</code> and <code>max max-wattage</code> options were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is supported only on PoE-capable ports. If you enter this command on a port that does not support PoE, this error message appears:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# power inline auto

% Invalid input detected at '^' marker.
```

In a switch stack, this command is supported on all ports in the stack that support PoE.

All PoE-capable switch ports are IEEE 802.3 af-compliant.

Use the `max max-wattage` option to disallow higher-power powered devices. With this configuration, when the powered device sends Cisco Discovery Protocol (CDP) messages requesting more power than the maximum wattage, the switch removes power from the port. If the powered-device IEEE class maximum is greater than the maximum wattage, the switch does not power the device. The power is reclaimed into the global power budget.
The switch never powers any Class 0 or Class 3 device if the **power inline max max-wattage** command is configured for less than 15.4 W.

If the switch denies power to a powered device (the powered device requests more power through CDP messages or if the IEEE class maximum is greater than the maximum wattage), the PoE port is in a power-deny state. The switch generates a system message, and the Oper column in the **show power inline** user EXEC command output shows **power-deny**.

Use the **power inline static max max-wattage** command to give a port high priority. The switch reserves power for the static port when it is configured rather than upon device discovery. The switch reserves the power on a static port even when there is no connected device and whether or not the port is in a shutdown or in a no shutdown state. The switch allocates the configured maximum wattage to the port, and the amount is never adjusted through the IEEE class or by CDP messages from the powered device. Because power is pre-allocated, any powered device that uses less than or equal to the maximum wattage is guaranteed power when it is connected to a static port. However, if the powered device IEEE class is greater than the maximum wattage, the switch does not supply power to it. If the switch learns through CDP messages that the powered device needs more than the maximum wattage, the powered device is shut down.

If the switch cannot pre-allocate power when a port is in static mode (for example, because the entire power budget is already allocated to other auto or static ports), this message appears: Command rejected: power inline static: pwr not available. The port configuration remains unchanged.

When you configure a port by using the **power inline auto** or the **power inline static** interface configuration command, the port autonegotiates by using the configured speed and duplex settings. This is necessary to determine the power requirements of the connected device (whether or not it is a powered device). After the power requirements have been determined, the switch hardcodes the interface by using the configured speed and duplex settings without resetting the interface.

When you configure a port by using the **power inline never** command, the port reverts to the configured speed and duplex settings.

If a port has a Cisco powered device connected to it, you should not use the **power inline never** command to configure the port. A false link-up can occur on the port, placing it into an error-disabled state.

**Examples**

This example shows how to enable detection of a powered device and to automatically power a PoE port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# power inline auto
```

This example shows how to configure a PoE port to allow a Class 1 or a Class 2 powered device:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# power inline auto max 7000
```

This example shows how to disable powered-device detection and to not power a PoE port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# power inline never
```

You can verify your settings by entering the **show power inline** user EXEC command.

**Defaults**
The default power on each Power over Ethernet (PoE) port is 15400 milliwatts.

**Command Modes**

- Global configuration
- Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEC</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When Cisco powered devices are connected to PoE ports, the switch uses Cisco Discovery Protocol (CDP) to determine the *actual* power consumption of the devices, and the switch adjusts the power budget accordingly. This does not apply to IEEE third-party powered devices. For these devices, when the switch grants a power request, the switch adjusts the power budget according to the powered-device IEEE classification. If the powered device is a Class 0 (class status unknown) or a Class 3, the switch budgets 15400 milliwatts for the device, regardless of the actual amount of power needed. If the powered device reports a higher class than its actual consumption or does not support power classification (defaults to Class 0), the switch can power fewer devices because it uses the IEEE class information to track the global power budget.

By using the `power inline consumption wattage` configuration command, you can override the default power requirement specified by the IEEE classification. The difference between what is mandated by the IEEE classification and what is actually needed by the device is reclaimed into the global power budget for use by additional devices. You can then extend the switch power budget and use it more effectively.

For example, if the switch budgets 15400 milliwatts on each PoE port, you can connect only 24 Class 0 powered devices. If your Class 0 device power requirement is actually 5000 milliwatts, you can set the consumption wattage to 5000 milliwatts and connect up to 48 devices. The total PoE output power available on a 24-port or 48-port switch is 370,000 milliwatts.
You should carefully plan your switch power budget and make certain not to oversubscribe the power supply.

When you enter the `power inline consumption default wattage` or the `no power inline consumption default` global configuration command, or the `power inline consumption wattage` or the `no power inline consumption interface configuration command, this caution message appears.

```
%CAUTION: Interface interface-id: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation.
```

When you manually configure the power budget, you must also consider the power loss over the cable between the switch and the powered device.

For more information about the IEEE power classifications, see the “Configuring Interface Characteristics” chapter in the software configuration guide for this release.

This command is supported only on PoE-capable ports. If you enter this command on a switch or port that does not support PoE, an error message appears.

In a switch stack, this command is supported on all switches or ports in the stack that support PoE.

**Examples**

By using the global configuration command, this example shows how to configure the switch to budget 5000 milliwatts to each PoE port:

```
Switch(config)# power inline consumption default 5000
%CAUTION: Interface Gi1/0/1: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation.
```

By using the interface configuration command, this example shows how to configure the switch to budget 12000 milliwatts to the powered device connected to a specific PoE port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# power inline consumption 12000
%CAUTION: Interface Gi1/0/2: Misconfiguring the 'power inline consumption/allocation' command may cause damage to the switch and void your warranty. Take precaution not to oversubscribe the power supply. Refer to documentation.
```

You can verify your settings by entering the `show power inline consumption` privileged EXEC command.

power rps

Use the power rps user EXEC command on the switch stack or on a standalone switch to configure and manage the Cisco Redundant Power System 2300, also referred to as the RPS 2300, connected to the switch stack or a standalone switch.

```
power rps switch-number {name {string | serialnumber} | port rps-port-id {mode {active | standby} {priority priority}}}
```

**Note**
The power rps command is supported only on the Catalyst 3750v2 switches.

### Syntax Description

- **switch-number**: Specify the stack member to which the RPS 2300 is connected. The range is 1 to 9, depending on the switch member numbers in the stack. This parameter is available only on Catalyst 3750v2 switches.

- **name {string | serialnumber}**: Set the RPS name:
  - Enter a string to specify the name such as port1 or “port 1”. Using quotation marks before and after the name is optional, but you must use quotation marks if you want to include spaces in the port name. The name can have up to 16 characters.
  - Enter the serialnumber keyword to configure the switch to use the RPS serial number as the name.

- **port rps-port-id**: Specify the RPS port. The range is from 1 to 6.

- **mode {active | standby}**: Set the RPS port mode:
  - active—The RPS can provide power to a switch when the switch internal power supply cannot.
  - standby—The RPS is not providing power to a switch.

- **priority priority**: Set the priority of the RPS port. The range is from 1 to 6.
  - A value of 1 assigns highest priority to a port and its connected device.
  - A value of 6 assigns lowest priority to a port and its connected device.

### Defaults

The RPS name is not configured.
The RPS ports are in **active** mode.
The RPS port priority is 6.

### Command Modes

User EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The `power rps` command applies only to an RPS 2300 connected to a Catalyst 3750v2 standalone switch or a switch stack.

When configuring an RPS 2300 connected to a stack member, you must specify the member before entering the name or serial number of the RPS.

In a standalone switch, the name applies to the connected redundant power system. In a switch stack, the name applies to the redundant power system ports connected to the specified switch. For example, if a stack of nine switches is connected to three redundant power systems and you enter the `power rps 1 name “abc”` command, the name of the redundant power system connected to switch 1 is `abc`, and the names of the other redundant power systems are not changed.

If you do not want the RPS to provide power to a switch connected to the specified RPS port but do not want to disconnect the RPS cable between the switch and the redundant power system, use the `power rps switch-number port rps-port-id mode standby` command.

You can configure the priority of an RPS 2300 port from 1 to 6. A value of 1 assigns highest priority to a port and its connected device. A value of 6 assigns lowest priority to a port and its connected device.

If multiple switches connected to the RPS 2300 need power, the RPS 2300 powers those with the highest priority. It applies any other available power to the lower-priority switches.

The `no power rps` user EXEC command is not supported.

- To return to the default name setting (no name is configured), use the `power rps switch-number port rps-port-id name` global configuration command with no space between the quotation marks.
- To return to the default RPS port mode, use the `power rps switch-number port rps-port-id active` command.
- To return to the default RPS port priority, use the `power rps switch-number port rps-port-id priority` command.

Examples

This example shows how to configure the name of the RPS 2300 that is connected to a switch stack as a string:

```
Switch> power rps 2 name RPS_Accounting
```

This example shows how to configure the name of the RPS 2300 that is connected to a switch as the serial number:

```
Switch> power rps name serialnumber
```

This example shows how to configure the mode of RPS port 1 as standby on a switch:

```
Switch> power rps port 1 mode standby
```

This example shows how to configure the priority of RPS port 3 with a priority value of 4 on a switch:

```
Switch> power rps 1 port 3 priority 4
```

You can verify your settings by entering the `show env power` or the `show env rps` privileged EXEC command.

priority-queue

Use the **priority-queue** interface configuration command to enable the egress expedite queue on a port. Use the **no** form of this command to return to the default setting.

```
priority-queue out
no priority-queue out
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>out</code></td>
<td>Enable the egress expedite queue.</td>
</tr>
</tbody>
</table>

### Defaults

The egress expedite queue is disabled.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you configure the **priority-queue out** command, the shaped round robin (SRR) weight ratios are affected because there is one fewer queue participating in SRR. This means that `weight1` in the **srr-queue bandwidth shape** or the **srr-queue bandwidth shape** interface configuration command is ignored (not used in the ratio calculation). The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced.

Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights:

- If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1.
- If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode.
- If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services the queue in shared mode.

### Examples

This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights.

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth shape 30 20 25 25
Switch(config-if)# priority-queue out
```
This example shows how to disable the egress expedite queue after the SRR shaped and shared weights are configured. The shaped mode overrides the shared mode.

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# srr-queue bandwidth shape 25 0 0 0
Switch(config-if)# srr-queue bandwidth share 30 20 25 25
Switch(config-if)# no priority-queue out
```

You can verify your settings by entering the `show mls qos interface interface-id queueing` or the `show running-config` privileged EXEC command.

<tr>
<td></td>
<td>isolated</td>
<td>Designate the VLAN as a community VLAN.</td>
</tr>
<tr>
<td></td>
<td>primary</td>
<td>Designate the VLAN as a community VLAN.</td>
</tr>
</tbody>
</table>

**Defaults**
The default is to have no private VLANs configured.

**Command Modes**
VLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Before configuring private VLANs, you must disable VTP (VTP mode transparent). After you configure a private VLAN, you should not change the VTP mode to client or server.

VTP does not propagate private-VLAN configuration. You must manually configure private VLANs on all switches in the Layer 2 network to merge their Layer 2 databases and to prevent flooding of private-VLAN traffic.

You cannot include VLAN 1 or VLANs 1002 to 1005 in the private-VLAN configuration. Extended VLANs (VLAN IDs 1006 to 4094) can be configured in private VLANs.

You can `associate` a secondary (isolated or community) VLAN with only one primary VLAN. A primary VLAN can have one isolated VLAN and multiple community VLANs associated with it.

- A secondary VLAN cannot be configured as a primary VLAN.
- The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.
If you delete either the primary or secondary VLANs, the ports associated with the VLAN become inactive.

A **community** VLAN carries traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

An **isolated** VLAN is used by isolated ports to communicate with promiscuous ports. It does not carry traffic to other community ports or isolated ports with the same primary VLAN domain.

A **primary** VLAN is the VLAN that carries traffic from a gateway to customer end stations on private ports.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The **private-vlan** commands do not take effect until you exit from VLAN configuration mode.

Do not configure private-VLAN ports as EtherChannels. While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.

Do not configure a private VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN.

Do not configure a private VLAN as a voice VLAN.

Do not configure fallback bridging on switches with private VLANs.

Although a private VLAN contains more than one VLAN, only one STP instance runs for the entire private VLAN. When a secondary VLAN is associated with the primary VLAN, the STP parameters of the primary VLAN are propagated to the secondary VLAN.

For information about configuring host ports and promiscuous ports, see the **switchport mode private-vlan** command.

For more information about private-VLAN interaction with other features, see the software configuration guide for this release.

**Examples**

This example shows how to configure VLAN 20 as a primary VLAN, VLAN 501 as an isolated VLAN, and VLANs 502 and 503 as community VLANs, and to associate them in a private VLAN:

```
Switch# configure terminal
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# exit
Switch(config)# vlan 501
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 502
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 503
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# exit
Switch(config)# vlan 20
Switch(config-vlan)# private-vlan association 501-503
Switch(config-vlan)# end
```

You can verify your setting by entering the **show vlan private-vlan** or **show interfaces status** privileged EXEC command.
### Related Commands

private-vlan mapping

Use the **private-vlan mapping** interface configuration command on a switch virtual interface (SVI) to create a mapping between a private-VLAN primary and secondary VLANs so that both VLANs share the same primary VLAN SVI. Use the **no** form of this command to remove private-VLAN mappings from the SVI.

```
private-vlan mapping {[add | remove] secondary-vlan-list}
no private-vlan mapping
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>secondary-vlan-list</td>
<td>Specify one or more secondary VLANs to be mapped to the primary VLAN SVI.</td>

<td>add</td>
<td>(Optional) Map the secondary VLAN to the primary VLAN SVI.</td>
</tr>
<tr>
<td>remove</td>
<td>(Optional) Remove the mapping between the secondary VLAN and the primary VLAN SVI.</td>
</tr>
</tbody>
</table>

### Defaults

The default is to have no private VLAN SVI mapping configured.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The switch must be in VTP transparent mode when you configure private VLANs.

The SVI of the primary VLAN is created at Layer 3.

Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.

Traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.

A secondary VLAN can be mapped to only one primary SVI. IF you configure the primary VLAN as a secondary VLAN, all SVIs specified in this command are brought down.

If you configure a mapping between two VLANs that do not have a valid Layer 2 private-VLAN association, the mapping configuration does not take effect.
This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

```
Switch# configure terminal
Switch# interface vlan 18
Switch(config-if)# private-vlan mapping 20
Switch(config-vlan)# end
```

This example shows how to permit routing of secondary VLAN traffic from secondary VLANs 303 to 305 and 307 through VLAN 20 SVI:

```
Switch# configure terminal
Switch# interface vlan 20
Switch(config-if)# private-vlan mapping 303-305, 307
Switch(config-vlan)# end
```

You can verify your setting by entering the `show interfaces private-vlan mapping` privileged EXEC command.

### Related Commands

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td><code>show interfaces private-vlan mapping</code></td>
<td>Display private-VLAN mapping information for the VLAN SVIs.</td>
</tr>
</tbody>
</table>
To control the rate at which protocol packets are sent to the switch, use the `psp` global configuration command to specify the upper threshold for the packet flow rate. The supported protocols are Address Resolution Protocol (ARP), ARP snooping, Dynamic Host Configuration Protocol (DHCP) v4, DHCP snooping, Internet Group Management Protocol (IGMP), and IGMP snooping. To disable protocol storm protection, use the `no` version of the command.

```
psp {arp | dhcp | igmp} pps value
no psp {arp | dhcp | igmp}
```

**Syntax Description**

- **arp**: Set protocol packet flow rate for ARP and ARP snooping.
- **dhcp**: Set protocol packet flow rate for DHCP and DHCP snooping.
- **igmp**: Set protocol packet flow rate for IGMP and IGMP snooping.
- **pps value**: Specify the threshold value for the number of packets per second. If the traffic exceeds this value, protocol storm protection is enforced. The range is from 5 to 50 packets per second.

**Defaults**

Protocol storm protection is disabled by default.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(58)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To set error-disable detection protocol storm protection, use the `errdisable detect cause psp` global configuration command.

When protocol storm protection is configured, a counter records the number of dropped packets. To see the number of dropped packets for a specific protocol, use the `show psp statistics {arp | dhcp | igmp}` privileged EXEC command. To see the number of dropped packets for all protocols, use the `show psp statistics all` command. To clear the counter for a protocol, use the `clear psp counter {arp | dhcp | igmp}` command.

**Related Commands**

queue-set

Use the queue-set interface configuration command to map a port to a queue-set. Use the no form of this command to return to the default setting.

```
queue-set qset-id
no queue-set qset-id
```

**Syntax Description**

- `qset-id`: ID of the queue-set. Each port belongs to a queue-set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.

**Defaults**

The queue-set ID is 1.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For information about automatic generation of the queue-set ID with the auto qos voip command, see the “Usage Guidelines” section for the auto qos voip command.

**Examples**

This example shows how to map a port to queue-set 2:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# queue-set 2
```

You can verify your settings by entering the show mls qos interface [interface-id] buffers privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>

</table>
radius-server dead-criteria

Use the **radius-server dead-criteria** global configuration command to configure the conditions that determine when a RADIUS server is considered unavailable or dead. Use the **no** form of this command to return to the default settings.

```
radius-server dead-criteria [time seconds [tries number] | tries number]
```

```
no radius-server dead-criteria [time seconds [tries number] | tries number]
```

**Syntax Description**

- **time seconds** (Optional) Set the time in seconds during which the switch does not need to get a valid response from the RADIUS server. The range is from 1 to 120 seconds.
- **tries number** (Optional) Set the number of times that the switch does not get a valid response from the RADIUS server before the server is considered unavailable. The range is from 1 to 100.

**Defaults**

The switch dynamically determines the **seconds** value that is from 10 to 60 seconds.

The switch dynamically determines the **tries** value that is from 10 to 100.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

We recommend that you configure the **seconds** and **number** parameters as follows:

- Use the **radius-server timeout seconds** global configuration command to specify the time in seconds during which the switch waits for a RADIUS server to respond before the IEEE 802.1x authentication times out. The switch dynamically determines the default **seconds** value that is from 10 to 60 seconds.
- Use the **radius-server retransmit retries** global configuration command to specify the number of times the switch tries to reach the radius servers before considering the servers to be unavailable. The switch dynamically determines the default **tries** value that is from 10 to 100.
- The **seconds** parameter is less than or equal to the number of retransmission attempts times the time in seconds before the IEEE 802.1x authentication times out.
- The **tries** parameter should be the same as the number of retransmission attempts.

**Examples**

This example shows how to configure 60 as the **time** and 10 as the number of **tries**, the conditions that determine when a RADIUS server is considered unavailable.

```
Switch(config)# radius-server dead-criteria time 60 tries 10
```

You can verify your settings by entering the **show running-config** privileged EXEC command.

radius-server host

Use the `radius-server host` global configuration command to configure the RADIUS server parameters, including the RADIUS accounting and authentication. Use the `no` form of this command to return to the default settings.

```
radius-server host ip-address [acct-port udp-port] [auth-port udp-port] [test username name [idle-time time] [ignore-acct-port] [ignore-auth-port]] [key string]
```

The `radius-server host ip-address` command configures the RADIUS server parameters. The `no` form of this command returns to the default settings.

**Syntax Description**

- **ip-address** Specify the IP address of the RADIUS server.
- **acct-port udp-port** (Optional) Specify the UDP port for the RADIUS accounting server. The range is from 0 to 65536.
- **auth-port udp-port** (Optional) Specify the UDP port for the RADIUS authentication server. The range is from 0 to 65536.
- **test username name** (Optional) Enable automatic server testing of the RADIUS server status, and specify the username to be used.
- **idle-time time** (Optional) Set the interval of time in minutes after which the switch sends test packets to the server. The range is from 1 to 35791 minutes.
- **ignore-acct-port** (Optional) Disables testing on the RADIUS-server accounting port.
- **ignore-auth-port** (Optional) Disables testing on the RADIUS-server authentication port.
- **key string** (Optional) Specify the authentication and encryption key for all RADIUS communication between the switch and the RADIUS daemon. The key is a text string that must match the encryption key used on the RADIUS server. Always configure the key as the last item in this command. Leading spaces are ignored, but spaces within and at the end of the key are used. If there are spaces in your key, do not enclose the key in quotation marks unless the quotation marks are part of the key.

**Defaults**

The UDP port for the RADIUS accounting server is 1646.
The UDP port for the RADIUS authentication server is 1645.
Automatic server testing is disabled.
The idle time is 60 minutes (1 hour).
When the automatic testing is enabled, testing occurs on the accounting and authentication UDP ports.
The authentication and encryption key (*string*) is not configured.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
**radius-server host**

**Usage Guidelines**

We recommend that you configure the UDP port for the RADIUS accounting server and the UDP port for the RADIUS authentication server to nondefault values.

Use the `test username name` keywords to enable automatic server testing of the RADIUS server status and to specify the username to be used.

You can configure the authentication and encryption key by using the `radius-server host ip-address key string` or the `radius-server key {0 string | 7 string | string}` global configuration command. Always configure the key as the last item in this command.

**Examples**

This example shows how to configure 1500 as the UDP port for the accounting server and 1510 as the UDP port for the authentication server:

```
Switch(config)# radius-server host 1.1.1.1 acct-port 1500 auth-port 1510
```

This example shows how to configure the UDP port for the accounting server and the authentication server, enable automated testing of the RADIUS server status, specify the username to be used, and configure a key string:

```
Switch(config)# radius-server host 1.1.1.2 acct-port 800 auth-port 900 test username aaafail idle-time 75 key abc123
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

</tr>
</tbody>
</table>
rcommand

Use the **rcommand** user EXEC command on the switch stack or on the cluster command switch to start a Telnet session and to execute commands on a cluster member switch from the cluster command switch or the switch stack. To end the session, enter the **exit** command.

\[
\text{rcommand} \{ n \mid \text{commander} \mid \text{mac-address} \ hw-addr \}
\]

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( n )</td>
<td>Provide the number that identifies a cluster member. The range is 0 to 15.</td>
</tr>
<tr>
<td>( \text{commander} )</td>
<td>Provide access to the cluster command switch from a cluster member switch.</td>
</tr>
<tr>
<td>( \text{mac-address} \ hw-addr )</td>
<td>MAC address of the cluster member switch.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is available only on the cluster command switch stack or cluster command switch.

If the switch is the cluster command switch but the cluster member switch \( n \) does not exist, an error message appears. To get the switch number, enter the **show cluster members** privileged EXEC command on the cluster command switch.

You can use this command to access a cluster member switch from the cluster command-switch prompt or to access a cluster command switch from the member-switch prompt.

For Catalyst 2900 XL, 3500 XL, 2950, 2960, 2970, 3550, 3560, and 3750 switches, the Telnet session accesses the member-switch command-line interface (CLI) at the same privilege level as on the cluster command switch. For example, if you execute this command at user level on the cluster command switch, the cluster member switch is accessed at user level. If you use this command on the cluster command switch at privileged level, the command accesses the remote device at privileged level. If you use an intermediate enable-level lower than **privileged**, access to the cluster member switch is at user level.

For Catalyst 1900 and 2820 switches running standard edition software, the Telnet session accesses the menu console (the menu-driven interface) if the cluster command switch is at privilege level 15. If the cluster command switch is at privilege level 1, you are prompted for the password before being able to access the menu console. Cluster command switch privilege levels map to the cluster member switches running standard edition software as follows:

- If the cluster command switch privilege level is from 1 to 14, the cluster member switch is accessed at privilege level 1.
- If the cluster command switch privilege level is 15, the cluster member switch is accessed at privilege level 15.

The Catalyst 1900 and 2820 CLI is available only on switches running Enterprise Edition Software.
This command will not work if the vty lines of the cluster command switch have access-class configurations.

You are not prompted for a password because the cluster member switches inherited the password of the cluster command switch when they joined the cluster.

**Examples**

This example shows how to start a session with member 3. All subsequent commands are directed to member 3 until you enter the `exit` command or close the session.

```
Switch# rcommand 3
Switch-3# show version
Cisco Internet Operating System Software ...
...
Switch-3# exit
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cluster members</code></td>
<td>Displays information about the cluster members.</td>
</tr>
</tbody>
</table>
reload

Use the `reload` privileged EXEC command to reload the stack member and to put a configuration change into effect.

```
reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>LINE</code></td>
<td>Specify the reason for the reload.</td>
</tr>
<tr>
<td><code>at</code></td>
<td>Specify the time in hh:mm for the reload to occur.</td>
</tr>
<tr>
<td><code>cancel</code></td>
<td>Cancel the pending reload.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Specify a time interval in mmm or hh:mm for reloads to occur.</td>
</tr>
<tr>
<td><code>slot stack-member-number</code></td>
<td>Save the changes on the specified stack member and restart it.</td>
</tr>
<tr>
<td><code>standby-cpu</code></td>
<td>Reload the standby route processor (RP).</td>
</tr>
</tbody>
</table>

**Defaults**

Immediately reloads the stack member and puts a configuration change into effect.

**Command Modes**

Privilege EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If there is more than one switch in the switch stack, and you enter the `reload slot stack-member-number` command, you are not prompted to save the configuration.

**Examples**

This example shows how to reload the switch stack:

```
Switch(config)# reload
System configuration has been modified. Save? [yes/no]: y
Proceed to reload the whole Stack? [confirm] y
```

This example shows how to reload a specific stack member:

```
Switch(config)# reload slot 6
Proceed with reload? [confirm] y
```

This example shows how to reload a single-switch switch stack (there is only one member switch):

```
Switch(config)# reload slot 3
System configuration has been modified. Save? [yes/no]: y
Proceed to reload the whole Stack? [confirm] y
```
## Related Commands

</tbody>
</table>
remote command

Use the **remote command** privileged EXEC command to monitor all or specified stack members.

```
remote command {all | stack-member-number} LINE
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Apply to all stack members.</td>
</tr>
<tr>
<td>stack-member-number</td>
<td>Specify the stack member. The range is 1 to 9.</td>
</tr>
<tr>
<td>LINE</td>
<td>Specify the command to execute.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The commands (such as `debug`, `show`, or `clear`) you use in the LINE command-to-execute string apply to a specific stack member or to the switch stack.

**Examples**

This example shows how to execute the `undebug` command on the switch stack:

```
Switch(config)# remote command all undebug all
Switch :1 :
-------------
All possible debugging has been turned off
Switch :5 :
-------------
All possible debugging has been turned off
Switch :9 :
-------------
All possible debugging has been turned off
```

This example shows how to execute the `debug udld event` command on stack member 5:

```
Switch(config)# remote command 5 undebug all
Switch :5 :
-------------
UDLD events debugging is on
```

**Related Commands**

<tr>
<td>show switch</td>
<td>Displays information about the switch stack and its stack members.</td>
</tr>
</tbody>
</table>
remote-span

Use the `remote-span` VLAN configuration command to configure a VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN. Use the `no` form of this command to remove the RSPAN designation from the VLAN.

```
remote-span
no remote-span
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No RSPAN VLANs are defined.

**Command Modes**
VLAN configuration (config-VLAN)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can configure RSPAN VLANs only in config-VLAN mode (entered by using the `vlan` global configuration command), not the VLAN configuration mode entered by using the `vlan database` privileged EXEC command.

If VLAN Trunking Protocol (VTP) is enabled, the RSPAN feature is propagated by VTP for VLAN-IDs that are lower than 1005. If the RSPAN VLAN ID is in the extended range, you must manually configure intermediate switches (those in the RSPAN VLAN between the source switch and the destination switch).

Before you configure the RSPAN `remote-span` command, use the `vlan` (global configuration) command to create the VLAN.

The RSPAN VLAN has these characteristics:

- No MAC address learning occurs on it.
- RSPAN VLAN traffic flows only on trunk ports.
- Spanning Tree Protocol (STP) can run in the RSPAN VLAN, but it does not run on RSPAN destination ports.

When an existing VLAN is configured as an RSPAN VLAN, the VLAN is first deleted and then recreated as an RSPAN VLAN. Any access ports are made inactive until the RSPAN feature is disabled.
Examples

This example shows how to configure a VLAN as an RSPAN VLAN.

```
Switch(config)# vlan 901
Switch(config-vlan)# remote-span
```

This example shows how to remove the RSPAN feature from a VLAN.

```
Switch(config)# vlan 901
Switch(config-vlan)# no remote-span
```

You can verify your settings by entering the `show vlan remote-span` user EXEC command.

### Related Commands

</tbody>
</table>
renew ip dhcp snooping database

Use the `renew ip dhcp snooping database` privileged EXEC command to renew the DHCP snooping binding database.

```
renew ip dhcp snooping database [{flash[number]:/filename | ftp://user:password@host/filename | nvram:/filename | rcp://user@host/filename | tftp://host/filename}] [validation none]
```

**Syntax Description**

- `flash[number]:/filename` (Optional) Specify that the database agent or the binding file is in the flash memory. Use the `number` parameter to specify the stack member number of the stack master. The range for `number` is 1 to 9.

  **Note**
  
  `- ftp://user:password@host/filename` (Optional) Specify that the database agent or the binding file is on an FTP server.

  `- nvram:/filename` (Optional) Specify that the database agent or the binding file is in the NVRAM.

  `- rcp://user@host/filename` (Optional) Specify that the database agent or the binding file is on a Remote Control Protocol (RCP) server.

  `- tftp://host/filename` (Optional) Specify that the database agent or the binding file is on a TFTP server.

- `validation none` (Optional) Specify that the switch does not verify the cyclic redundancy check (CRC) for the entries in the binding file specified by the URL.

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a URL, the switch tries to read the file from the configured URL.

**Examples**

This example shows how to renew the DHCP snooping binding database without checking CRC values in the file:

```
Switch# renew ip dhcp snooping database validation none
```

You can verify your settings by entering the `show ip dhcp snooping database` privileged EXEC command.
Related Commands

<table>
<thead>
<tr>

</tbody>
</table>
reserved-only

Use the **reserved-only** DHCP pool configuration mode command to allocate only reserved addresses in the Dynamic Host Configuration Protocol (DHCP) address pool. Use the **no** form of the command to return to the default.

```
reserved-only

no reserved-only
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The default is to not restrict pool addresses

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Entering the **reserved-only** command restricts assignments from the DHCP pool to preconfigured reservations. Unreserved addresses that are part of the network or on pool ranges are not offered to the client, and other clients are not served by the pool.

By entering this command, users can configure a group of switches with DHCP pools that share a common IP subnet and that ignore requests from clients of other switches.

To access DHCP pool configuration mode, enter the **ip dhcp pool name** global configuration command.

**Examples**
This example shows how to configure the DHCP pool to allocate only reserved addresses:

```
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp pool test1
Switch(dhcp-config)# reserved-only
```

You can verify your settings by entering the **show ip dhcp pool** privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip dhcp pool</td>
<td>Displays the DHCP address pools.</td>
</tr>
</tbody>
</table>
rmon collection stats

Use the rmon collection stats interface configuration command to collect Ethernet group statistics, which include usage statistics about broadcast and multicast packets, and error statistics about cyclic redundancy check (CRC) alignment errors and collisions. Use the no form of this command to return to the default setting.

```
rmon collection stats index [owner name]
no rmon collection stats index [owner name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Remote Network Monitoring (RMON) collection control index. The range is 1 to 65535.</td>
</tr>
<tr>
<td>owner name</td>
<td>(Optional) Owner of the RMON collection.</td>
</tr>
</tbody>
</table>

**Defaults**

The RMON statistics collection is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The RMON statistics collection command is based on hardware counters.

**Examples**

This example shows how to collect RMON statistics for the owner root:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# rmon collection stats 2 owner root
```

You can verify your setting by entering the show rmon statistics privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show rmon statistics</td>
<td>Displays RMON statistics.</td>
</tr>
</tbody>
</table>
### sdm prefer

Use the `sdm prefer` global configuration command to configure the template used in Switch Database Management (SDM) resource allocation. You can use a template to allocate system resources to best support the features being used in your application. Use a template to provide maximum system usage for unicast routing or for VLAN configuration, to change an aggregator template (Catalyst 3750-12S only) to a desktop template, or to select the dual IPv4 and IPv6 template to support IPv6 forwarding. Use the `no` form of this command to return to the default template.

```
  sdm prefer {access | default | dual-ipv4-and-ipv6 {default | routing | vlan} | routing | vlan} 
    [desktop] 
  no sdm prefer
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access</td>
<td>Provide maximum system usage for access control lists (ACLs). Use this template if you have a large number of ACLs.</td>
</tr>
<tr>
<td>default</td>
<td>Sets the switch to use the default template. On Catalyst 3750-12S switches, use with the <code>desktop</code> keyword to set the switch to the default desktop template. (Use the <code>no sdm prefer</code> command to set a desktop switch to the default desktop template or to set an aggregator switch to the default aggregator template.)</td>
</tr>
<tr>
<td>dual-ipv4-and-ipv6 {default</td>
<td>routing</td>
</tr>
<tr>
<td></td>
<td>• default—Provide balance to IPv4 and IPv6 Layer 2 and Layer 3 functionality.</td>
</tr>
<tr>
<td></td>
<td>• routing—Provide maximum system usage for IPv4 and IPv6 routing, including IPv4 policy-based routing.</td>
</tr>
<tr>
<td></td>
<td>• vlan—Provide maximum system usage for IPv4 and IPv6 VLANs.</td>
</tr>
<tr>
<td>routing</td>
<td>Provide maximum system usage for unicast routing. You would typically use this template for a router or aggregator in the middle of a network.</td>
</tr>
<tr>
<td>vlan</td>
<td>Provide maximum system usage for VLANs. This template maximizes system resources for use as a Layer 2 switch with no routing.</td>
</tr>
<tr>
<td>desktop</td>
<td>Use only on a Catalyst 3750-12S switch (where aggregator templates are the default) to select the desktop <code>default</code>, <code>routing</code>, or <code>vlan</code> template.</td>
</tr>
</tbody>
</table>

#### Defaults

The default template provides a balance to all features.

#### Command Modes

Global configuration

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The aggregator templates were added.</td>
</tr>
<tr>
<td>12.2(25)SEA</td>
<td>The dual-ipv4-and-ipv6 templates were added.</td>
</tr>
</tbody>
</table>
You must reload the switch for the configuration to take effect. If you enter the `show sdm prefer` command before you enter the `reload` privileged EXEC command, the `show sdm prefer` command shows the template currently in use and the template that will become active after a reload.

Desktop switches support only desktop templates; an aggregator switch (Catalyst 3750-12S) supports both desktop and aggregator templates. On an aggregator switch, if you do not enter the desktop keyword, the aggregator templates are selected.

All stack members use the same SDM desktop or aggregator template, stored on the stack master. When a new switch member is added to a stack, as with the switch configuration file and VLAN database file, the SDM configuration that is stored on the master overrides the template configured on an individual switch.

To route IPv6 packets in a stack of switches, all switches in the stack should be running the IP services image. The IPv6 packets are routed in hardware across the stack, as long as the packet does not have exceptions (IPv6Options) and the switches have not run out of hardware resources.

If a member cannot support the template that is running on the master switch, the switch goes into SDM mismatch mode, the master switch does not attempt to change the SDM template, and the switch cannot be a functioning member of the stack.

- If the master switch is a Catalyst 3750-12S, and you change the template from an aggregator template to a desktop template and reload the switch, the entire stack operates with the selected desktop template. This could cause configuration losses if the number of ternary content addressable memory (TCAM) entries exceeds the desktop template sizes.

- If you change the template on a Catalyst 3750-12S master from a desktop template to an aggregator template and reload the switch, any desktop switches that were part of the stack go into SDM mismatch mode.

- If you add a Catalyst 3750-12S switch that is running the aggregator template to a stack that has a desktop switch as the master, the stack operates with the desktop template selected on the master. This could cause configuration losses on the Catalyst 3750-12S member if the number of TCAM entries on it exceeds desktop template sizes.

For more information about stacking, see the “Managing Switch Stacks” chapter in the software configuration guide.

The access template maximizes system resources for access control lists (ACLs) as required to accommodate a large number of ACLs.

The default templates balance the use of system resources.

Use the `sdm prefer vlan [desktop]` global configuration command only on switches intended for Layer 2 switching with no routing. When you use the VLAN template, no system resources are reserved for routing entries, and any routing is done through software. This overloads the CPU and severely degrades routing performance.

Do not use the routing template if you do not have routing enabled on your switch. Entering the `sdm prefer routing [desktop]` global configuration command prevents other features from using the memory allocated to unicast routing in the routing template.

### Usage Guidelines

**Release** | **Modification**
--- | ---
12.2(25)SED | The access templates were added.
12.2(25)SEE | The dual-ipv4-and-ipv6 routing template was added.
Do not use the ipv4-and-ipv6 templates if you do not plan to enable IPv6 routing on the switch. Entering the `sdm prefer ipv4-and-ipv6 {default | routing | vlan} [desktop]` global configuration command divides resources between IPv4 and IPv6, limiting those allocated to IPv4 forwarding.

Table 2-23 lists the approximate number of each resource supported in each of the IPv4-only templates for a desktop or aggregator switch. The values in the template are based on eight routed interfaces and approximately one thousand VLANs and represent the approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.

<table>
<thead>
<tr>
<th>Table 2-23</th>

1. IPv6 policy-based routing is not supported in this release.

### Examples

This example shows how to configure the access template on a desktop switch:

```
Switch(config)# sdm prefer access
Switch(config)# exit
Switch# reload
```

This example shows how to configure the routing template on a desktop switch:

```
Switch(config)# sdm prefer routing
Switch(config)# exit
Switch# reload
```

This example shows how to configure the desktop routing template on an aggregator switch:

```
Switch(config)# sdm prefer routing desktop
Switch(config)# exit
Switch# reload
```

This example shows how to configure the dual IPv4-and-IPv6 default template on a desktop switch:

```
Switch(config)# sdm prefer dual-ipv4-and-ipv6 default
Switch(config)# exit
Switch# reload
```

This example shows how to change a switch template to the default template. On an aggregator switch, this is the default aggregator template; on a desktop switch, this is the default desktop template.

```
Switch(config)# no sdm prefer
Switch#(config)# exit
Switch# reload
```

This example shows how to configure the desktop default template on an aggregator switch:

```
Switch(config)# sdm prefer default desktop
Switch(config)# exit
Switch# reload
```

You can verify your settings by entering the `show sdm prefer` privileged EXEC command.

service password-recovery

Use the `service password-recovery` global configuration command to enable the password-recovery mechanism (the default). This mechanism allows an end user with physical access to the switch to hold down the **Mode** button and interrupt the bootup process while the switch is powering up and to assign a new password. Use the `no` form of this command to disable part of the password-recovery functionality. When the password-recovery mechanism is disabled, interrupting the bootup process is allowed only if the user agrees to set the system back to the default configuration.

```
  service password-recovery

  no service password-recovery
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The password-recovery mechanism is enabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

As a system administrator, you can use the `no service password-recovery` command to disable some of the functionality of the password recovery feature by allowing an end user to reset a password only by agreeing to return to the default configuration.

To use the password-recovery procedure, a user with physical access to the switch holds down the **Mode** button while the unit powers up and for a second or two after the LED above port 1X turns off. When the button is released, the system continues with initialization.

If the password-recovery mechanism is disabled, this message appears:

```
The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?
```
If the user chooses not to reset the system to the default configuration, the normal bootup process continues, as if the Mode button had not been pressed. If you choose to reset the system to the default configuration, the configuration file in flash memory is deleted, and the VLAN database file, flash:vlans.dat (if present), is deleted. If you use the no service password-recovery command to control end user access to passwords, we recommend that you save a copy of the config file in a location away from the switch in case the end user uses the password recovery procedure and sets the system back to default values. Do not keep a backup copy of the config file on the switch.

If the switch is operating in VTP transparent mode, we recommend that you also save a copy of the vlan.dat file in a location away from the switch.

When you enter the service password-recovery or no service password-recovery command on the stack master, it is propagated throughout the stack and applied to all switches in the stack.

You can verify if password recovery is enabled or disabled by entering the show version privileged EXEC command.

**Examples**

This example shows how to disable password recovery on a switch or switch stack so that a user can only reset a password by agreeing to return to the default configuration.

```
Switch(config)# no service-password recovery
Switch(config)# exit
```

**Related Commands**

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>show version</td>
<td>Displays version information for the hardware and firmware.</td>
</tr>
</tbody>
</table>
service-policy

Use the `service-policy` interface configuration command to apply a policy map defined by the `policy-map` command to the input of a physical port or a switch virtual interface (SVI). Use the `no` form of this command to remove the policy map and port association.

```
service-policy input policy-map-name

no service-policy input policy-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input policy-map-name</code></td>
<td>Apply the specified policy map to the input of a physical port or an SVI.</td>
</tr>
</tbody>
</table>

**Note**

Though visible in the command-line help strings, the **history** keyword is not supported, and you should ignore the statistics that it gathers. The **output** keyword is also not supported.

**Defaults**

No policy maps are attached to the port.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>A policy map can now be applied to a physical port or an SVI.</td>
</tr>
<tr>
<td>12.2(25)SED</td>
<td>Hierarchical policy-maps can now be applied to an SVI.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only one policy map per ingress port is supported.

Policy maps can be configured on physical ports or on SVIs. When VLAN-based quality of service (QoS) is disabled by using the `no mls qos vlan-based` interface configuration command on a physical port, you can configure a port-based policy map on the port. If VLAN-based QoS is enabled by using the `mls qos vlan-based` interface configuration command on a physical port, the switch removes the previously configured port-based policy map. After a hierarchical policy map is configured and applied on an SVI, the interface-level policy map takes effect on the interface.

You can apply a policy map to incoming traffic on a physical port or on an SVI. You can configure different interface-level policy maps for each class defined in the VLAN-level policy map. For more information about hierarchical policy maps, see the “Configuring QoS” chapter in the software configuration guide for this release.

Classification using a port trust state (for example, `mls qos trust [cos | dscp | ip-precedence]`) and a policy map (for example, `service-policy input policy-map-name`) are mutually exclusive. The last one configured overwrites the previous configuration.

Policy maps that use the `police aggregate` command fail when applied to a 10-Gigabit Ethernet interface.
Examples

This example shows how to apply `plcmap1` to an physical ingress port:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# service-policy input plcmap1

This example shows how to remove `plcmap2` from a physical port:

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# no service-policy input plcmap2

This example shows how to apply `plcmap1` to an ingress SVI when VLAN-based QoS is enabled:

Switch(config)# interface vlan 10
Switch(config-if)# service-policy input plcmap1

This example shows how to create a hierarchical policy map and attach it to an SVI:

Switch# enable
Switch(config)# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list 101 permit ip any any
Switch(config)# class-map cm-1
Switch(config-cmap)# match access 101
Switch(config-cmap)# exit
Switch(config)# exit
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map cm-interface-1
Switch(config-cmap)# match input gigabitethernet3/0/1 - gigabitethernet3/0/2
Switch(config-cmap)# exit
Switch(config)# policy-map port-plcmap
Switch(config-pmap)# class-map cm-interface-1
Switch(config-pmap-c)# police 900000 9000 exc policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map vlan-plcmap
Switch(config-pmap)# class-map cm-1
Switch(config-pmap-c)# set dscp 7
Switch(config-pmap-c)# service-policy port-plcmap-1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class-map cm-2
Switch(config-pmap-c)# match ip dscp 2
Switch(config-pmap-c)# service-policy port-plcmap-1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class-map cm-3
Switch(config-pmap-c)# match ip dscp 3
Switch(config-pmap-c)# service-policy port-plcmap-2
Switch(config-pmap-c)# exit
Switch(config-pmap)# class-map cm-4
Switch(config-pmap-c)# trust dscp
Switch(config-pmap)# exit
Switch(config)# interface vlan 10
Switch(config-if)#
Switch(config-if)# ser input vlan-plcmap
Switch(config-if)# exit
Switch(config)# exit

You can verify your settings by entering the `show running-config` privileged EXEC command.

</table>
session

Use the `session` privileged EXEC command on the stack master to access a specific stack member or to access the controller on a Catalyst 3750G Integrated Wireless LAN Controller Switch.

```
  session stack-member-number [processor 1]
```

**Syntax Description**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stack-member-number</code></td>
<td>Specify the member number. The range is 1 to 9.</td>
</tr>
<tr>
<td><code>processor 1</code></td>
<td>(Optional) Specify the destination processor for the session, that is, the embedded controller in the Catalyst 3750G Integrated Wireless LAN Controller Switch. Entering this keyword puts you in the controller CLI.</td>
</tr>
</tbody>
</table>

**Defaults**

No default is defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)FZ</td>
<td>The <code>processor</code> keyword was added for Catalyst 3750G Integrated Wireless LAN Controller Switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you access the member, its member number is appended to the system prompt.

Use the `session` command from the master to access a member switch.

Use the `session` command with `processor 1` from the master or a standalone switch to access the internal controller. A standalone switch is always member 1.

Use the `processor 1` keyword to change to the controller command-line interface. See the *Cisco Wireless LAN Controller Configuration Guide Release 4.0* for controller configuration information.

**Examples**

This example shows how to access member 6:

```
Switch(config)# session 6
Switch-6#
```

This example shows how to access the controller on member 2, which is a Catalyst 3750G wireless LAN controller switch (standalone or stack master):

```
Switch# session 2 processor 1
(Cisco Controller)
User:
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reload</code></td>
<td>Reloads the member and puts a configuration change into effect.</td>
</tr>
<tr>
<td><code>switch</code></td>
<td>Changes the member priority value.</td>
</tr>
<tr>
<td><code>switch renumber</code></td>
<td>Changes the member number.</td>
</tr>
<tr>
<td><code>show switch</code></td>
<td>Displays information about the stack and its members.</td>
</tr>
</tbody>
</table>
set

Use the `set` policy-map class configuration command to classify IP traffic by setting a Differentiated Services Code Point (DSCP) or an IP-precedence value in the packet. Use the `no` form of this command to remove traffic classification.

```
set {dscp new-dscp | [ip] precedence new-precedence}
```

```
no set {dscp new-dscp | [ip] precedence new-precedence}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dscp new-dscp</td>
<td>New DSCP value assigned to the classified traffic. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value.</td>
</tr>
<tr>
<td>[ip] precedence new-precedence</td>
<td>New IP-precedence value assigned to the classified traffic. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.</td>
</tr>
</tbody>
</table>

**Defaults**

No traffic classification is defined.

**Command Modes**

Policy-map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>ip dscp new-dscp</code> keyword was changed to <code>dscp new-dscp</code>.</td>
</tr>
<tr>
<td></td>
<td>The <code>set dscp new-dscp</code> command replaces the <code>set ip dscp new-dscp</code> command.</td>
</tr>
<tr>
<td>12.2(25)SEC</td>
<td>The <code>ip</code> keyword is optional.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you have used the `set ip dscp` policy-map class configuration command, the switch changes this command to `set dscp` in the switch configuration. If you enter the `set ip dscp` policy-map class configuration command, this setting appears as `set dscp` in the switch configuration.

You can use the `set ip precedence` policy-map class configuration command or the `set precedence` policy-map class configuration command. This setting appears as `set ip precedence` in the switch configuration.

The `set` command is mutually exclusive with the `trust` policy-map class configuration command within the same policy map.

For the `set dscp new-dscp` or the `set ip precedence new-precedence` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `set dscp af11` command, which is the same as entering the `set dscp 10` command. You can enter the `set ip precedence critical` command, which is the same as entering the `set ip precedence 5` command. For a list of supported mnemonics, enter the `set dscp ?` or the `set ip precedence ?` command to see the command-line help strings.
To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

### Examples

This example shows how to assign DSCP 10 to all FTP traffic without any policers:

```bash
Switch(config)# policy-map policy_ftp
Switch(config-pmap)# class ftp_class
Switch(config-pmap-c)# set dscp 10
Switch(config-pmap)# exit
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

</table>
**setup**

Use the **setup** privileged EXEC command to configure the switch with its initial configuration.

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you use the **setup** command, make sure that you have this information:

- IP address and network mask
- Password strategy for your environment
- Whether the switch will be used as the cluster command switch and the cluster name

When you enter the **setup** command, an interactive dialog, called the System Configuration Dialog, appears. It guides you through the configuration process and prompts you for information. The values shown in brackets next to each prompt are the default values last set by using either the **setup** command facility or the **configure** privileged EXEC command.

Help text is provided for each prompt. To access help text, press the question mark (?) key at a prompt.

To return to the privileged EXEC prompt without making changes and without running through the entire System Configuration Dialog, press **Ctrl-C**.

When you complete your changes, the setup program shows you the configuration command script that was created during the setup session. You can save the configuration in NVRAM or return to the setup program or the command-line prompt without saving it.

**Examples**

This is an example of output from the **setup** command:

```
Switch# setup
--- System Configuration Dialog ---
Continue with configuration dialog? [yes/no]: yes

At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.

Basic management setup configures only enough connectivity for management of the system, extended setup will ask you to configure each interface on the system.
```
Would you like to enter basic management setup? [yes/no]: yes
Configuring global parameters:
Enter host name [Switch]: host-name

The enable secret is a password used to protect access to privileged EXEC and configuration modes. This password, after entered, becomes encrypted in the configuration.
Enter enable secret: enable-secret-password

The enable password is used when you do not specify an enable secret password, with some older software versions, and some boot images.
Enter enable password: enable-password

The virtual terminal password is used to protect access to the router over a network interface.
Enter virtual terminal password: terminal-password

Configure SNMP Network Management? [no]: yes
Community string [public]:

Current interface summary
Any interface listed with OK? value “NO” does not have a valid configuration

<table>
<thead>
<tr>
<th>Interface</th>
<th>IP-Address</th>
<th>OK? Method Status</th>
<th>Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vlan1</td>
<td>172.20.135.202</td>
<td>YES NVRAM</td>
<td>up</td>
</tr>
<tr>
<td>GigabitEthernet6/0/1</td>
<td>unassigned</td>
<td>YES unset</td>
<td>up</td>
</tr>
<tr>
<td>GigabitEthernet6/0/2</td>
<td>unassigned</td>
<td>YES unset</td>
<td>down</td>
</tr>
</tbody>
</table>
<output truncated>
Port-channel1         | unassigned      | YES unset         | up       |
|                      |                 |                   | down     |

Enter interface name used to connect to the management network from the above interface summary: vlan1

Configuring interface vlan1:
Configure IP on this interface? [yes]: yes
IP address for this interface: ip_address
Subnet mask for this interface [255.0.0.0]: subnet_mask

Would you like to enable as a cluster command switch? [yes/no]: yes
Enter cluster name: cluster-name

The following configuration command script was created:

```
hostname host-name
enable secret 5 $1$LiBw$0Xc1wyT.PXPkuhFwgyhV10
enable password enable-password
line vty 0 15
password terminal-password
snmp-server community public
!
no ip routing
!
interface GigabitEthernet6/0/1
no ip address
!
interface GigabitEthernet6/0/2
no ip address
!```
cluster enable cluster-name
!
end
Use this configuration? [yes/no]: yes
!
[0] Go to the IOS command prompt without saving this config.

[1] Return back to the setup without saving this config.

[2] Save this configuration to nvram and exit.

Enter your selection [2]:

setup express

Use the setup express global configuration command to enable Express Setup mode. Use the no form of this command to disable Express Setup mode.

```
setup express
no setup express
```

Syntax Description
This command has no arguments or keywords.

Defaults
Express Setup is enabled.

Command Modes
Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

When Express Setup is enabled on a new (unconfigured) switch, pressing the Mode button for 2 seconds activates Express Setup. You can access the switch through an Ethernet port by using the IP address 10.0.0.1 and then can configure the switch with the web-based Express Setup program or the command-line interface (CLI)-based setup program.

When you press the Mode button for 2 seconds on a configured switch, the LEDs above the Mode button start blinking. If you press the Mode button for a total of 10 seconds, the switch configuration is deleted, and the switch reboots. The switch can then be configured like a new switch, either through the web-based Express Setup program or the CLI-based setup program.

Note
As soon as you make any change to the switch configuration (including entering no at the beginning of the CLI-based setup program), configuration by Express Setup is no longer available. You can only run Express Setup again by pressing the Mode button for 10 seconds. This deletes the switch configuration and reboots the switch.

If Express Setup is active on the switch, entering the write memory or copy running-configuration startup-configuration privileged EXEC commands deactivates Express Setup. The IP address 10.0.0.1 is no longer valid on the switch, and your connection using this IP address ends.

The primary purpose of the no setup express command is to prevent someone from deleting the switch configuration by pressing the Mode button for 10 seconds.
This example shows how to enable Express Setup mode:

```
Switch(config)# setup express
```

You can verify that Express Setup mode is enabled by pressing the Mode button:
- On an unconfigured switch, the LEDs above the Mode button turn solid green after 3 seconds.
- On a configured switch, the mode LEDs begin blinking after 2 seconds and turn solid green after 10 seconds.

⚠️ **Caution**

If you hold the Mode button down for a total of 10 seconds, the configuration is deleted, and the switch reboots.

This example shows how to disable Express Setup mode:

```
Switch(config)# no setup express
```

You can verify that Express Setup mode is disabled by pressing the Mode button. The mode LEDs do not turn solid green or begin blinking green if Express Setup mode is not enabled on the switch.

### Related Commands

show access-lists

Use the show access-lists privileged EXEC command to display access control lists (ACLs) configured on the switch.

```
show access-lists [name | number | hardware counters | ipc]
```

**Syntax Description**

- **name** *(Optional) Name of the ACL.*
- **number** *(Optional) ACL number. The range is 1 to 2699.*
- **hardware counters** *(Optional) Display global hardware ACL statistics for switched and routed packets.*
- **ipc** *(Optional) Display Interprocess Communication (IPC) protocol access-list configuration download information.*
- **expression** Expression in the output to use as a reference point.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <strong>ipc</strong> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The switch supports only IP standard and extended access lists. Therefore, the allowed numbers are only 1 to 199 and 1300 to 2699.

This command also displays the MAC ACLs that are configured.

**Note**

Though visible in the command-line help strings, the **rate-limit** keywords are not supported.
Examples

This is an example of output from the `show access-lists` command:

Switch# `show access-lists`
Standard IP access list 1
   10 permit 1.1.1.1
   20 permit 2.2.2.2
   30 permit any
   40 permit 0.255.255.255, wildcard bits 12.0.0.0
Standard IP access list videowizard_1-1-1-1
   10 permit 1.1.1.1
Standard IP access list videowizard_10-10-10-10
   10 permit 10.10.10.10
Extended IP access list 121
   10 permit ahp host 10.10.10.10 host 20.20.10.10 precedence routine
Extended IP access list CMP-NAT-ACL
   Dynamic Cluster-HSRP deny ip any any
   10 deny ip any host 19.19.11.11
   20 deny ip any host 10.11.12.13
   Dynamic Cluster-NAT permit ip any any
   10 permit ip host 10.99.100.128 any
   20 permit ip host 10.46.22.128 any
   30 permit ip host 10.45.101.64 any
   40 permit ip host 10.45.20.64 any
   50 permit ip host 10.213.43.128 any
   60 permit ip host 10.91.28.64 any
   70 permit ip host 10.99.75.128 any
   80 permit ip host 10.38.49.0 any

This is an example of output from the `show access-lists hardware counters` command:

Switch# `show access-lists hardware counters`

show archive status

Use the show archive status privileged EXEC command to display the status of a new image being downloaded to a switch with the HTTP or the TFTP protocol.

```
show archive status
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you use the archive download-sw privileged EXEC command to download an image to a TFTP server, the output of the archive download-sw command shows the status of the download.

If you do not have a TFTP server, you can use Network Assistant or the embedded device manager to download the image by using HTTP. The show archive status command shows the progress of the download.

**Examples**

These are examples of output from the show archive status command:

```
Switch# show archive status
IDLE: No upgrade in progress

Switch# show archive status
LOADING: Upgrade in progress

Switch# show archive status
EXTRACT: Extracting the image

Switch# show archive status
VERIFY: Verifying software

Switch# show archive status
RELOAD: Upgrade completed. Reload pending
```

**Related Commands**

show arp access-list

Use the show arp access-list EXEC command to display detailed information about Address Resolution Protocol (ARP) access control (lists).

```
show arp access-list [acl-name]
```

**Syntax Description**

| acl-name     | (Optional) Name of the ACL. |

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the `show arp access-list` command:

```
Switch# show arp access-list
ARP access list rose
  permit ip 10.101.1.1 0.0.0.255 mac any
  permit ip 20.3.1.0 0.0.0.255 mac any
```

**Related Commands**

</table>
**show authentication**

Use the **show authentication** EXEC command to display information about authentication manager events on the switch.

```plaintext
show authentication {interface interface-id | registrations | sessions [session-id session-id] [handle handle] [interface interface-id] [mac mac] [method method] | statistics [summary]}
```

**Syntax Description**

- **interface interface-id** (Optional) Display all of the authentication manager details for the specified interface.
- **method method** (Optional) Displays all clients authorized by a specified authentication method (dot1x, mab, or webauth)
- **registrations** (Optional) Display authentication manager registrations
- **sessions** (Optional) Display detail of the current authentication manager sessions (for example, client devices). If you do not enter any optional specifiers, all current active sessions are displayed. You can enter the specifiers singly or in combination to display a specific session (or group of sessions).
- **session-id session-id** (Optional) Specify an authentication manager session.
- **handle handle** (Optional) Specify a range from 1 to 4294967295.
- **mac mac** (Optional) Display authentication manager information for a specified MAC address.
- **statistics** (Optional) Display authentication statistics in detail.
- **summary** (Optional) Display authentication statistics summary.

**Command Default**

This command has no default settings.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Table 2-25 describes the significant fields shown in the output of the **show authentication** command.

**Note**

The possible values for the status of sessions are shown below. For a session in terminal state, *Authz Success* or *Authz Failed* is displayed along with *No methods* if no method has provided a result.
Table 2-25  *show authentication Command Output*

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle</td>
<td>The session has been initialized and no methods have run yet.</td>
</tr>
<tr>
<td>Running</td>
<td>A method is running for this session.</td>
</tr>
<tr>
<td>No methods</td>
<td>No method has provided a result for this session.</td>
</tr>
<tr>
<td>Authc Success</td>
<td>A method has resulted in authentication success for this session.</td>
</tr>
<tr>
<td>Authc Failed</td>
<td>A method has resulted in authentication fail for this session.</td>
</tr>
<tr>
<td>Authz Success</td>
<td>All features have been successfully applied for this session.</td>
</tr>
<tr>
<td>Authz Failed</td>
<td>A feature has failed to be applied for this session.</td>
</tr>
</tbody>
</table>

Table 2-26 lists the possible values for the state of methods. For a session in a terminal state, *Authc Success, Authc Failed, or Failed over* are displayed. *Failed over* means that an authentication method ran and then failed over to the next method, which did not provide a result. *Not run* appears for sessions that synchronized on standby.

Table 2-26  *State Method Values*

<table>
<thead>
<tr>
<th>Method State</th>
<th>State Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not run</td>
<td>Terminal</td>
<td>The method has not run for this session.</td>
</tr>
<tr>
<td>Running</td>
<td>Intermediate</td>
<td>The method is running for this session.</td>
</tr>
<tr>
<td>Failed over</td>
<td>Terminal</td>
<td>The method has failed and the next method is expected to provide a result.</td>
</tr>
<tr>
<td>Authc Success</td>
<td>Terminal</td>
<td>The method has provided a successful authentication result for the session.</td>
</tr>
<tr>
<td>Authc Failed</td>
<td>Terminal</td>
<td>The method has provided a failed authentication result for the session.</td>
</tr>
</tbody>
</table>

The output of the *show authentication sessions interface* command shows fields for *Security Policy* and *Security Status*. These fields apply only if Media Access Control Security (MACsec) is supported and enabled. This switch does not support MACsec.

**Examples**

This is an example the *show authentication registrations* command:

```
Switch# show authentication registrations
Auth Methods registered with the Auth Manager:
  Handle  Priority  Name
  3        0         dot1x
  2        1         mab
  1        2         webauth
```

The is an example of the *show authentication interface interface-id* command:

```
Switch# show authentication interface gigabitethernet1/0/23
Client list:
  MAC Address  Domain  Status  Handle  Interface
  000e.84af.59bd  DATA  Authz Success  0xE0000000  GigabitEthernet1/0/23
Available methods list:
  Handle  Priority  Name
```

3 0 dot1x
Runnable methods list:
Handle Priority Name
3 0 dot1x

This is an example of the `show authentication sessions` command:

```
Switch# show authentication sessions
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address</th>
<th>Method</th>
<th>Domain</th>
<th>Status</th>
<th>Session ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi3/45</td>
<td>(unknown)</td>
<td>N/A</td>
<td>DATA</td>
<td>Authz Failed</td>
<td>09081404000007003651EC</td>
</tr>
<tr>
<td>Gi3/46</td>
<td>(unknown)</td>
<td>N/A</td>
<td>DATA</td>
<td>Authz Success</td>
<td>0908140400000800057C274</td>
</tr>
</tbody>
</table>

This is an example of the `show authentication sessions` command for a specified interface:

```
Switch# show authentication sessions int gigabitethernet 3/0/46
```

```
Interface:  GigabitEthernet3/0/46
MAC Address:  Unknown
IP Address:  Unknown
Status:  Authz Success
Domain:  DATA
Oper host mode:  multi-host
Oper control dir:  both
Authorized By:  Guest Vlan
Vlan Policy:  4094
Session timeout:  N/A
Idle timeout:  N/A
Common Session ID:  09081404000000800057C274
Acct Session ID:  0x0000000A
Handle:  0xCC000008
Runnable methods list:
Method   State
dot1x    Failed over
```

This is an example of the `show authentication sessions` command for a specified MAC address:

```
Switch# show authentication sessions mac 000e.84af.59bd
```

```
Interface: GigabitEthernet3/0/46
MAC Address:  000e.84af.59bd
Status:  Authz Success
Domain:  DATA
Oper host mode:  single-host
Authorized By:  Authentication Server
Vlan Policy:  10
Handle:  0xE0000000
Runnable methods list:
Method State
dot1x Authc Success
```

This is an example of the `show authentication session method` command for a specified method:

```
Switch# show authentication sessions method mab
```

```
No Auth Manager contexts match supplied criteria
```

```
Switch# show authentication sessions method dot1x
```

```
MAC Address Domain Status Handle Interface
000e.84af.59bd DATA Authz Success 0xE0000000 GigabitEthernet1/23
```

show auto qos

To display the quality of service (QoS) commands entered on the interfaces on which automatic QoS (auto-QoS) is enabled, use the show auto qos command in EXEC mode.

    show auto qos [interface [interface-id]]

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface [id]</td>
<td>(Optional) Display auto-QoS information for the specified port or for all ports. Valid interfaces include physical ports.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(4)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(20)SE</td>
<td>The information in the command output changed, and the user guidelines were updated.</td>
</tr>
<tr>
<td>12.2(40)SE</td>
<td>The information in the command output changed.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The show auto qos command output shows only the auto-QoS command entered on each interface. The show auto qos interface interface-id command output shows the auto-QoS command entered on a specific interface.

Use the show running-config privileged EXEC command to display the auto-QoS configuration and the user modifications.

The show auto qos command output also shows the service policy information for the Cisco IP phone.

To display information about the QoS configuration that might be affected by auto-QoS, use one of these commands:

- show mls qos
- show mls qos maps cos-dscp
- show mls qos interface [interface-id] [buffers | queueing]
- show mls qos maps [cos-dscp | cos-input-q | cos-output-q | dscp-cos | dscp-input-q | dscp-output-q]
- show mls qos input-queue
- show running-config
Examples

This is an example of output from the `show auto qos` command after the `auto qos voip cisco-phone` and the `auto qos voip cisco-softphone` interface configuration commands are entered:

```
Switch# show auto qos
GigabitEthernet2/0/4
auto qos voip cisco-softphone

GigabitEthernet2/0/5
auto qos voip cisco-phone

GigabitEthernet2/0/6
auto qos voip cisco-phone
```

This is an example of output from the `show auto qos interface interface-id` command when the `auto qos voip cisco-phone` interface configuration command is entered:

```
Switch# show auto qos interface gigabitethernet 2/0/5
GigabitEthernet2/0/5
auto qos voip cisco-phone
```

This is an example of output from the `show running-config` privileged EXEC command when the `auto qos voip cisco-phone` and the `auto qos voip cisco-softphone` interface configuration commands are entered:

```
Switch# show running-config

**show boot**

Use the **show boot** privileged EXEC command to display the settings of the boot environment variables.

```
show boot
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the **show boot** command. Table 2-27 describes each field in the display.

```
Switch# show boot
BOOT path-list :flash:/image
Config file    :flash:/config.text
Private Config file :flash:/private-config.text
Enable Break   :no
Manual Boot    :yes
HELPER path-list : 
Auto upgrade   :yes
-------------------
```

For switch stacks, information is shown for each switch in the stack.

**Table 2-27  show boot Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOT path-list</td>
<td>Displays a semicolon separated list of executable files to try to load and execute when automatically booting up. If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot up with the first bootable file that it can find in the flash file system.</td>
</tr>
<tr>
<td>Config file</td>
<td>Displays the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.</td>
</tr>
<tr>
<td>Private Config file</td>
<td>Displays the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.</td>
</tr>
<tr>
<td>Enable Break</td>
<td>Displays whether a break during booting up is enabled or disabled. If it is set to yes, on, or 1, you can interrupt the automatic bootup process by pressing the Break key on the console after the flash file system is initialized.</td>
</tr>
</tbody>
</table>
**Manual Boot**
Displays whether the switch automatically or manually boots up. If it is set to no or 0, the bootloader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the bootloader mode.

**Helper path-list**
Displays a semicolon separated list of loadable files to dynamically load during the bootloader initialization. Helper files extend or patch the functionality of the bootloader.

**Auto upgrade**
Displays whether the switch stack is set to automatically copy its software version to an incompatible switch so that it can join the stack.

A switch in version-mismatch mode is a switch that has a different stack protocol version than the version on the stack. Switches in version-mismatch mode cannot join the stack. If the stack has an image that can be copied to a switch in version-mismatch mode, and if the `boot auto-copy-sw` feature is enabled, the stack automatically copies the image from another stack member to the switch in version-mismatch mode. The switch then exits version-mismatch mode, reboots, and joins the stack.

**Table 2-27 show boot Field Descriptions**

<tbody>
<tr>
<td>T2.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10/100 ports, 10-Gigabit module ports, or on SFP module ports. For more information about TDR, see the software configuration guide for this release.

**Examples**

This is an example of output from the `show cable-diagnostics tdr interface interface-id` command on a switch other than a Catalyst 3750G-24PS or 3750G-48PS switch:

```
Switch# show cable-diagnostics tdr interface gigabitethernet1/0/2
TDR test last run on: March 01 20:15:40
Interface Speed Local pair Pair length Remote pair Pair status
--------- ----- ---------- ------------------ ----------- --------------------
Gi1/0/2  auto Pair A     0    +/- 2  meters N/A         Open
         Pair B     0    +/- 2  meters N/A         Open
         Pair C     0    +/- 2  meters N/A         Open
         Pair D     0    +/- 2  meters N/A         Open
```

This is an example of output from the `show cable-diagnostics tdr interface interface-id` command on a Catalyst 3750G-24PS or 3750G-48PS switch:

```
Switch# show cable-diagnostics tdr interface gigabitethernet1/0/2
TDR test last run on: March 01 20:15:40
Interface Speed Local pair Pair length Remote pair Pair status
--------- ----- ---------- ------------------ ----------- --------------------
Gi1/0/2  auto Pair A     0    +/- 4 meters N/A         Open
         Pair B     0    +/- 4 meters N/A         Open
         Pair C     0    +/- 4 meters N/A         Open
         Pair D     0    +/- 4 meters N/A         Open
```
Table 2-28 lists the descriptions of the fields in the `show cable-diagnostics tdr` command output.

### Table 2-28  
**Fields Descriptions for the show cable-diagnostics tdr Command Output**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Interface on which TDR was run.</td>
</tr>
<tr>
<td>Speed</td>
<td>Speed of connection.</td>
</tr>
<tr>
<td>Local pair</td>
<td>Name of the pair of wires that TDR is testing on the local interface.</td>
</tr>
</tbody>
</table>
| Pair length  | Location on the cable where the problem is, with respect to your switch. TDR can only find the location in one of these cases:  
  - The cable is properly connected, the link is up, and the interface speed is 1000 Mb/s.  
  - The cable is open.  
  - The cable has a short. |
| Remote pair  | Name of the pair of wires to which the local pair is connected. TDR can learn about the remote pair only when the cable is properly connected and the link is up. |
| Pair status  | The status of the pair of wires on which TDR is running:  
  - Normal—The pair of wires is properly connected.  
  - Not completed—The test is running and is not completed.  
  - Not supported—The interface does not support TDR.  
  - Open—The pair of wires is open.  
  - Shorted—The pair of wires is shorted.  
  - ImpedanceMis—The impedance is mismatched.  
  - Short/Impedance Mismatched—The impedance mismatched or the cable is short.  
  - InProgress—The diagnostic test is in progress |

This is an example of output from the `show interfaces interface-id` command when TDR is running:

```
Switch# show interfaces gigabitethernet1/0/2
Switch# show interfaces gigabitethernet0/2
gigabitethernet1/0/2 is up, line protocol is up (connected: TDR in Progress)
```

This is an example of output from the `show cable-diagnostics tdr interface interface-id` command when TDR is not running:

```
Switch# show cable-diagnostics tdr interface gigabitethernet1/0/2
% TDR test was never issued on Gi1/0/2
```

If an interface does not support TDR, this message appears:

```
% TDR test is not supported on switch 1
```

### Related Commands

**show cdp forward**

To display the CDP forwarding table, use the `show cdp forward` command in EXEC mode.

```
show cdp forward [entry | forward | interface interface-id | neighbor | traffic]
```

**Syntax Description**

- **entry** (Optional) Displays information about a specific neighbor entry.
- **forward** (Optional) Displays the CDP forwarding information.
- **interface interface-id** (Optional) Displays the CDP interface status and configuration.
- **neighbor** (Optional) Displays the CDP neighbor entries.
- **traffic** (Optional) Displays the CDP statistics.

**Command Modes**

Use EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(53)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show cdp forward` command output shows the number of CDP packets forwarded on each ingress-port- to-egress-port mapping and the statistics for forwarded and dropped packets.

**Examples**

```
Switch# show cdp forward
Ingress Port| Egress Port| # packets forwarded | # packets dropped
-------------|-----------|---------------------|------------------|
Gi2/0/2      | Gi2/0/13  | 0                   | 0                |
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdp forward</td>
<td>Configures the ingress and egress switch ports for CDP traffic.</td>
</tr>
</tbody>
</table>
**show cisp**

Use the `show cisp` privileged EXEC command to display CISP information for a specified interface.

```
show cisp {interface interface-id | clients | summary}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clients</td>
<td>(Optional) Display CISP client details</td>
</tr>
<tr>
<td>interface interface-id</td>
<td>(Optional) Display CISP information about the specified interface. Valid interfaces include physical ports and port channels.</td>
</tr>
<tr>
<td>summary</td>
<td>(Optional) Display</td>
</tr>
<tr>
<td>expression</td>
<td>Expression in the output to use as a reference point.</td>
</tr>
</tbody>
</table>

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows output from the `show cisp interface` command:

```
WS-C3750E-48TD#show cisp interface fast 0
CISP not enabled on specified interface
```

This example shows output from the `show cisp summary` command:

```
CISP is not running on any interface
```

</table>
show class-map

Use the **show class-map** EXEC command to display quality of service (QoS) class maps, which define the match criteria to classify traffic.

```
show class-map [class-map-name]
```

**Syntax Description**
- `class-map-name` (Optional) Display the contents of the specified class map.

**Command Modes**
- User EXEC
- Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the **show class-map** command:

```
Switch# show class-map
Class Map match-all videowizard_10-10-10-10 (id 2)
     Match access-group name videowizard_10-10-10-10

Class Map match-any class-default (id 0)
     Match any

Class Map match-all dscp5 (id 3)
     Match ip dscp 5
```

**Related Commands**

<tr>
<td><strong>match (class-map configuration)</strong></td>
<td>Defines the match criteria to classify traffic.</td>
</tr>
</tbody>
</table>
show cluster

Use the show cluster EXEC command to display the cluster status and a summary of the cluster to which the switch belongs. This command can be entered on the cluster command switch and cluster member switches.

show cluster

Syntax Description
This command has no arguments or keywords.

Command Modes
User EXEC
Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
If you enter this command on a switch that is not a cluster member, the error message Not a management cluster member appears.

On a cluster member switch, this command displays the identity of the cluster command switch, the switch member number, and the state of its connectivity with the cluster command switch.

On a cluster command switch stack or cluster command switch, this command displays the cluster name and the total number of members. It also shows the cluster status and time since the status changed. If redundancy is enabled, it displays the primary and secondary command-switch information.

Examples
This is an example of output when the show cluster command is entered on the cluster command switch:

```
Switch# show cluster
Command switch for cluster "Ajang"
    Total number of members: 7
    Status: 1 members are unreachable
    Time since last status change: 0 days, 0 hours, 2 minutes
    Redundancy: Enabled
        Standby command switch: Member 1
        Standby Group: Ajang_standby
        Standby Group Number: 110
    Heartbeat interval: 8
    Heartbeat hold-time: 80
    Extended discovery hop count: 3
```

This is an example of output when the show cluster command is entered on a cluster member switch:

```
Switch1> show cluster
Member switch for cluster "hapuna"
    Member number: 3
    Management IP address: 192.192.192.192
    Command switch mac address: 0000.0c07.ac14
    Heartbeat interval: 8
    Heartbeat hold-time: 80
```
This is an example of output when the `show cluster` command is entered on a cluster member switch that is configured as the standby cluster command switch:

```
Switch# show cluster
Member switch for cluster "hapuna"
    Member number:                  3 (Standby command switch)
    Management IP address:          192.192.192.192
    Command switch mac address:     0000.0c07.ac14
    Heartbeat interval:             8
    Heartbeat hold-time:            80
```

This is an example of output when the `show cluster` command is entered on the cluster command switch that has lost connectivity with member 1:

```
Switch# show cluster
Command switch for cluster "Ajang"
    Total number of members:        7
    Status:                         1 members are unreachable
    Time since last status change:  0 days, 0 hours, 5 minutes
    Redundancy:                     Disabled
    Heartbeat interval:             8
    Heartbeat hold-time:            80
    Extended discovery hop count:   3
```

This is an example of output when the `show cluster` command is entered on a cluster member switch that has lost connectivity with the cluster command switch:

```
Switch# show cluster
Member switch for cluster "hapuna"
    Member number:                  <UNKNOWN>
    Management IP address:          192.192.192.192
    Command switch mac address:     0000.0c07.ac14
    Heartbeat interval:             8
    Heartbeat hold-time:            80
```

**Related Commands**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
show cluster candidates

Use the show cluster candidates EXEC command to display a list of candidate switches.

    show cluster candidates [detail | mac-address H.H.H.]

Syntax Description

detail (Optional) Display detailed information for all candidates.

mac-address H.H.H. (Optional) MAC address of the cluster candidate.

Command Modes

User EXEC
Privileged EXEC

Command History

Release  Modification
12.1(11)AX  This command was introduced.

Usage Guidelines

This command is available only on the cluster command switch stack or cluster command switch.

If the switch is not a cluster command switch, the command displays an empty line at the prompt.

The SN in the display means switch member number. If E appears in the SN column, it means that the switch is discovered through extended discovery. If E does not appear in the SN column, it means that the switch member number is the upstream neighbor of the candidate switch. The hop count is the number of devices the candidate is from the cluster command switch.

Examples

This is an example of output from the show cluster candidates command:

    Switch# show cluster candidates

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Name</th>
<th>Device Type</th>
<th>PortIf</th>
<th>FEC</th>
<th>Hops</th>
<th>SN</th>
<th>PortIf</th>

<td>0</td>
<td>Fa0/9</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This is an example of output from the show cluster candidates command that uses the MAC address of a cluster member switch directly connected to the cluster command switch:

    Switch# show cluster candidates mac-address 00d0.7961.c4c0

Device "Tahiti-12" with mac address number 00d0.7961.c4c0
Device type: cisco WS-C3750-12T
Upstream MAC address: 00d0.796d.2f00 (Cluster Member 0)
Local port: Gi6/0/1  FEC number:
Upstream port: Gi6/0/11  FEC Number:
Hops from cluster edge: 1
    Hops from command device: 1
This is an example of output from the `show cluster candidates` command that uses the MAC address of a cluster member switch three hops from the cluster edge:

```
Switch# show cluster candidates mac-address 0010.7bb6.1cc0
Device 'Ventura' with mac address number 0010.7bb6.1cc0
  Device type:          cisco WS-C2912MF-XL
  Upstream MAC address: 0010.7bb6.1cd4
  Local port:           Fa2/1    FEC number:     
  Upstream port:        Fa0/24   FEC Number:     
  Hops from cluster edge: 3
  Hops from command device: -
```

This is an example of output from the `show cluster candidates detail` command:

```
Switch# show cluster candidates detail
Device 'Tahiti-12' with mac address number 00d0.7961.c4c0
  Device type:          cisco WS-C3512-XL
  Upstream MAC address: 00d0.796d.2f00 (Cluster Member 1)
  Local port:           Fa0/3    FEC number:     
  Upstream port:        Fa0/13   FEC Number:     
  Hops from cluster edge: 1
  Hops from command device: 2
Device '1900_Switch' with mac address number 00e0.1e7e.be80
  Device type:          cisco 1900
  Upstream MAC address: 00d0.796d.2f00 (Cluster Member 2)
  Local port:           3        FEC number: 0
  Upstream port:        Fa0/11   FEC Number:     
  Hops from cluster edge: 1
  Hops from command device: 2
Device 'Surfers-24' with mac address number 00e0.1e9f.7a00
  Device type:          cisco WS-C2924-XL
  Upstream MAC address: 00d0.796d.2f00 (Cluster Member 3)
  Local port:           Fa0/5    FEC number:     
  Upstream port:        Fa0/3    FEC Number:     
  Hops from cluster edge: 1
  Hops from command device: 2
```

show controllers ethernet-controller

Use the show controllers ethernet-controller privileged EXEC command without keywords to display per-interface send and receive statistics read from the hardware. Use with the phy keyword to display the interface internal registers or the port-asic keyword to display information about the port ASIC.

```
show controllers ethernet-controller [interface-id] [phy [detail]] [port-asic {configuration | statistics}] [fastethernet 0]
```

**Syntax Description**

- **interface-id**: The physical interface (including type, stack member, module, and port number).
- **phy**: (Optional) Display the status of the internal registers on the switch physical layer device (PHY) for the device or the interface. This display includes the operational state of the automatic medium-dependent interface crossover (auto-MDIX) feature on an interface.
- **detail**: (Optional) Display details about the PHY internal registers.
- **port-asic**: (Optional) Display information about the port ASIC internal registers.
- **configuration**: Display port ASIC internal register configuration.
- **statistics**: Display port ASIC statistics, including the Rx/Sup Queue and miscellaneous statistics.

**Command Modes**

Privileged EXEC (only supported with the interface-id keywords in user EXEC mode)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(20)SE</td>
<td>The display was enhanced to show the XENPAK module serial EEPROM contents.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This display without keywords provides traffic statistics, basically the RMON statistics for all interfaces or for the specified interface.

When you enter the phy or port-asic keywords, the displayed information is useful primarily for Cisco technical support representatives troubleshooting the switch.

**Examples**

This is an example of output from the show controllers ethernet-controller command for an interface. Table 2-29 lists the Transmit fields, and Table 2-30 lists the Receive fields.

```
Switch# show controllers ethernet-controller gigabitethernet6/0/1
Transmit GigabitEthernet6/0/1   Receive
  0 Bytes     0 Bytes
  0 Unicast frames 0 Unicast frames
  0 Multicast frames 0 Multicast frames
  0 Broadcast frames 0 Broadcast frames
  0 Too old frames 0 Unicast bytes
  0 Deferred frames 0 Multicast bytes
  0 MTU exceeded frames 0 Broadcast bytes
  0 1 collision frames 0 Alignment errors
```
show controllers ethernet-controller

</tbody>
</table>
### Table 2-30  Receive Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCS errors</td>
<td>The total number of frames received on an interface that have a valid length (in bytes) but do not have the correct FCS values.</td>
</tr>
<tr>
<td>Oversize frames</td>
<td>The number of frames received on an interface that are larger than the maximum allowed frame size.</td>
</tr>
<tr>
<td>Undersize frames</td>
<td>The number of frames received on an interface that are smaller than 64 bytes.</td>
</tr>
<tr>
<td>Collision fragments</td>
<td>The number of collision fragments received on an interface.</td>
</tr>
<tr>
<td>Minimum size frames</td>
<td>The total number of frames that are the minimum frame size.</td>
</tr>
<tr>
<td>65 to 127 byte frames</td>
<td>The total number of frames that are from 65 to 127 bytes.</td>
</tr>
<tr>
<td>128 to 255 byte frames</td>
<td>The total number of frames that are from 128 to 255 bytes.</td>
</tr>
<tr>
<td>256 to 511 byte frames</td>
<td>The total number of frames that are from 256 to 511 bytes.</td>
</tr>
<tr>
<td>512 to 1023 byte frames</td>
<td>The total number of frames that are from 512 to 1023 bytes.</td>
</tr>
<tr>
<td>1024 to 1518 byte frames</td>
<td>The total number of frames that are from 1024 to 1518 bytes.</td>
</tr>
<tr>
<td>Overrun frames</td>
<td>The total number of overrun frames received on an interface.</td>
</tr>
<tr>
<td>Pause frames</td>
<td>The number of pause frames received on an interface.</td>
</tr>
<tr>
<td>Symbol error frames</td>
<td>The number of frames received on an interface that have symbol errors.</td>
</tr>
<tr>
<td>Invalid frames, too large</td>
<td>The number of frames received that were larger than maximum allowed MTU size (including the FCS bits and excluding the frame header) and that have either an FCS error or an alignment error.</td>
</tr>
<tr>
<td>Valid frames, too large</td>
<td>The number of frames received on an interface that are larger than the maximum allowed frame size.</td>
</tr>
<tr>
<td>Invalid frames, too small</td>
<td>The number of frames received that are smaller than 64 bytes (including the FCS bits and excluding the frame header) and that have either an FCS error or an alignment error.</td>
</tr>
<tr>
<td>Valid frames, too small</td>
<td>The number of frames received on an interface that are smaller than 64 bytes (or 68 bytes for VLAN-tagged frames) and that have valid FCS values. The frame size includes the FCS bits but excludes the frame header bits.</td>
</tr>
<tr>
<td>Too old frames</td>
<td>The number of frames dropped on the ingress port because the packet aged out.</td>
</tr>
<tr>
<td>Valid oversize frames</td>
<td>The number of frames received on an interface that are larger than the maximum allowed frame size and have valid FCS values. The frame size includes the FCS value but does not include the VLAN tag.</td>
</tr>
<tr>
<td>System FCS error frames</td>
<td>The total number of frames received on an interface that have a valid length (in bytes) but that do not have the correct FCS values.</td>
</tr>
<tr>
<td>RxPortFifoFull drop frames</td>
<td>The total number of frames received on an interface that are dropped because the ingress queue is full.</td>
</tr>
</tbody>
</table>

This is an example of output from the `show controllers ethernet-controller phy` command for a specific interface:

```
Switch# show controllers ethernet-controller gigabitethernet1/0/2 phy
Control Register : 0001 0001 0100 0000
Control STATUS   : 0111 1001 0100 1001

```
This is an example of output from the `show controllers ethernet-controller tengigabitethernet1/0/1 phy` command for the 10-Gigabit Ethernet interface. It shows the XENPAK module serial EEPROM contents.

For information about the EEPROM map and the field descriptions for the display, see the XENPAK multisource agreement (MSA) at these sites:

- [http://www.xenpak.org/MSA/XENPAK_MSA_R2.1.pdf](http://www.xenpak.org/MSA/XENPAK_MSA_R2.1.pdf)

To determine which version of the XENPAK documentation to read, check the `XENPAK MSA Version supported` field in the display. Version 2.1 is 15 hexadecimal, and Version 3.0 is 1e hexadecimal.

```
Switch# show controllers ethernet-controller tengigabitethernet1/0/1 phy

</tbody>
</table>
show controllers power inline

Use the `show controllers power inline` command in EXEC mode to display the values in the registers of the specified Power over Ethernet (PoE) controller.

```
show controllers power inline [instance] [module switch-number]
```

**Syntax Description**

- `instance` (Optional) Power controller instance, where each instance corresponds to four ports. See the “Usage Guidelines” section for more information. If no instance is specified, information for all instances appear.
- `module switch number` (Optional) Limit the display to ports on the specified stack member. The switch number is 1 to 9.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the Catalyst 3750-48PS switches, the `instance` range is 0 to 11.

For the Catalyst 3750-24PS switches, the `instance` range is 0 to 5.

For the Catalyst 3750G-48PS switches, the `instance` range is 0 to 2. For instances other than 0 to 2, the switches provide no output.

For the Catalyst 3750G-24PS switches, the `instance` range is 0 to 1. For instances other than 0 to 1, the switches provide no output.

Though visible on all switches, this command is valid only for PoE switches. It provides no information for switches that do not support PoE.

The output provides information that might be useful for Cisco technical support representatives troubleshooting the switch.
This is an example of output from the `show controllers power inline` command on a switch other than a Catalyst 3750G-48PS or 3750G-24PS switch:

```
Switch# show controllers power inline
Module 1, Controller Instance 0, Address 0x40
  Interrupt Reg 0x0 = 0x0
  Intr Mask Reg 0x1 = 0xF6
  Power Event Reg 0x2 = 0x0

show diagnostic

Use the **show diagnostic** command in EXEC mode to view the test results of the online diagnostics and to list the supported test suites.

```
show diagnostic content switch [num | all]
show diagnostic post
show diagnostic result switch [num | all] [detail | test {test-id | test-id-range | all} [detail]]
show diagnostic schedule switch [num | all]
show diagnostic status
show diagnostic switch [num | all] [detail]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>Display test information including test ID, test attributes, and supported coverage test levels for each test and for all modules.</td>
</tr>
<tr>
<td>switch num</td>
<td>Specify the switch number. The range is from 1 to 9.</td>
</tr>
<tr>
<td>switch all</td>
<td>Specify all of the switches in the switch stack.</td>
</tr>
<tr>
<td>post</td>
<td>Display the power-on self-test (POST) results; the command output is the same as the <strong>show post</strong> command.</td>
</tr>
<tr>

</tr>
<tr>
<td>test-id-range</td>
<td>Range of identification numbers for tests; see the “Usage Guidelines” section for additional information.</td>
</tr>
<tr>
<td>all</td>
<td>All the tests.</td>
</tr>
<tr>
<td>schedule</td>
<td>Displays the current scheduled diagnostic tasks.</td>
</tr>
<tr>
<td>status</td>
<td>Displays the test status.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

- User EXEC
- Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

If you do not enter a switch `num`, information for all switches is displayed.

In the command output, the possible testing results are as follows:

- Passed (.)
- Failed (F)
- Unknown (U)

**Examples**

This example shows how to display the online diagnostics that are configured on a switch:

```
Switch# show diagnostic content switch 3

Switch 3:
Diagnostics test suite attributes:
  B/* - Basic ondemand test / NA
  P/V/* - Per port test / Per device test / NA
  D/N/* - Disruptive test / Non-disruptive test / NA
  S/* - Only applicable to standby unit / NA
  X/* - Not a health monitoring test / NA
  F/* - Fixed monitoring interval test / NA
  E/* - Always enabled monitoring test / NA
  A/I - Monitoring is active / Monitoring is inactive
  R/* - Switch will reload after test list completion / NA
  P/* - will partition stack / NA

<table>
<thead>
<tr>
<th>Test Name</th>
<th>attributes</th>
<th>Test Interval</th>
<th>Thresholds</th>
</tr>
</thead>
<tbody>
<tr>
<td>1) TestPortAsicStackPortLoopback</td>
<td>B<em>N</em>*<strong>A</strong></td>
<td>00:01:00.00</td>
<td>n/a</td>
</tr>
<tr>
<td>2) TestPortAsicLoopback</td>
<td>B<em>D</em>X**IR*</td>
<td>not configured</td>
<td>n/a</td>
</tr>
<tr>
<td>3) TestPortAsicCam</td>
<td>B<em>D</em>X**IR*</td>
<td>not configured</td>
<td>n/a</td>
</tr>
<tr>
<td>4) TestPortAsicRingLoopback</td>
<td>B<em>D</em>X**IR*</td>
<td>not configured</td>
<td>n/a</td>
</tr>
<tr>
<td>5) TestMicRingLoopback</td>
<td>B<em>D</em>X**IR*</td>
<td>not configured</td>
<td>n/a</td>
</tr>
<tr>
<td>6) TestPortAsicMem</td>
<td>B<em>D</em>X**IR*</td>
<td>not configured</td>
<td>n/a</td>
</tr>
</tbody>
</table>
```

This example shows how to display the online diagnostic results for a switch:

```
Switch# show diagnostic result switch 1

Switch 1: SerialNo :
Overall diagnostic result: PASS
Test results: (. = Pass, F = Fail, U = Untested)
1) TestPortAsicStackPortLoopback --> .
2) TestPortAsicLoopback --> .
3) TestPortAsicCam --> .
4) TestPortAsicRingLoopback --> .
5) TestMicRingLoopback --> .
6) TestPortAsicMem --> .
```
This example shows how to display the online diagnostic test status:

Switch# `show diagnostic status`

<BU> - Bootup Diagnostics, <HM> - Health Monitoring Diagnostics,
<OD> - OnDemand Diagnostics, <SCH> - Scheduled Diagnostics

<table>
<thead>
<tr>
<th>Card</th>
<th>Description</th>
<th>Current Running Test</th>
<th>Run by</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>N/A</td>
<td>N/A</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>TestPortAsicStackPortLoopback</td>
<td>&lt;OD&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TestPortAsicLoopback</td>
<td>&lt;OD&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TestPortAsicCam</td>
<td>&lt;OD&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TestPortAsicRingLoopback</td>
<td>&lt;OD&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TestMicRingLoopback</td>
<td>&lt;OD&gt;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TestPortAsicMem</td>
<td>&lt;OD&gt;</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>N/A</td>
<td>N/A</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>N/A</td>
<td>N/A</td>
<td></td>
</tr>
</tbody>
</table>

Switch#

This example shows how to display the online diagnostic test schedule for a switch:

Switch# `show diagnostic schedule switch 1`

Current Time = 14:39:49 PST Tue Jul 5 2005
Diagnostic for Switch 1:
Schedule #1:
To be run daily 12:00
Test ID(s) to be executed: 1.

</table>
show dot1q-tunnel

Use the **show dot1q-tunnel** command in EXEC mode to display information about IEEE 802.1Q tunnel ports.

```
show dot1q-tunnel [interface interface-id]
```

**Syntax Description**
- `interface interface-id` (Optional) Specify the interface for which to display IEEE 802.1Q tunneling information. Valid interfaces include physical ports and port channels.

**Command Modes**
- User EXEC
- Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**
These are examples of output from the **show dot1q-tunnel** command:

```
Switch# show dot1q-tunnel
dot1q-tunnel mode LAN Port(s)
-----------------------------
Gi1/0/1
Gi1/0/2
Gi1/0/3
Gi1/0/6
Po2

Switch# show dot1q-tunnel interface gigabitethernet1/0/1
dot1q-tunnel mode LAN Port(s)
-----------------------------
Gi1/0/1
```

**Related Commands**

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <code>all</code> keyword was added.</td>
</tr>
<tr>
<td>12.2(25)SED</td>
<td>The display was expanded to include <code>auth-fail-vlan</code> in the authorization state machine state and port status fields.</td>
</tr>
<tr>
<td>12.2(25)SEE</td>
<td>The command syntax was changed, and the command output was modified.</td>
</tr>
<tr>
<td>12.2(35)SE</td>
<td>The display was expanded to include the status of a port that is configured as both a host and an IP phone (a Cisco IP phone or phone from another manufacturer).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a port, global parameters and a summary appear. If you specify a port, details for that port appear.

If the port control is configured as unidirectional or bidirectional control and this setting conflicts with the switch configuration, the `show dot1x [all | interface interface-id]` privileged EXEC command output has this information:

```
ControlDirection = In (Inactive)
```

**Examples**

This is an example of output from the `show dot1x` command:

```
Switch# show dot1x
Sysauthcontrol  Enabled
Dot1x Protocol Version 2
Critical Recovery Delay 100
Critical EAPOL  Disabled
```
This is an example of output from the `show dot1x all` command:

```
Switch# show dot1x all
Sysauthcontrol   Enabled
Dot1x Protocol Version    2
Critical Recovery Delay  100
Critical EAPOL    Disabled

Dot1x Info for GigabitEthernet1/0/1
-----------------------------------
  PAE                       = AUTHENTICATOR
  PortControl               = AUTO
  ControlDirection          = Both
  HostMode                  = SINGLE_HOST
  Violation Mode            = PROTECT
  ReAuthentication          = Disabled
  QuietPeriod               = 60
  ServerTimeout             = 30
  SuppTimeout               = 30
  ReAuthPeriod              = 3600 (Locally configured)
  ReAuthMax                 = 2
  MaxReq                    = 2
  TxPeriod                  = 30
  RateLimitPeriod           = 0

<output truncated>
```

This is an example of output from the `show dot1x all summary` command:

```
Interface       PAE     Client          Status
--------------------------------------------------------
  Gi2/0/1         AUTH    none            UNAUTHORIZED
  Gi2/0/2         AUTH    00a0.c9b8.0072  AUTHORIZED
  Gi2/0/3         AUTH    none            UNAUTHORIZED
```

This is an example of output from the `show dot1x interface interface-id` command:

```
Switch# show dot1x interface gigabitethernet1/0/2
Dot1x Info for GigabitEthernet1/0/2
-----------------------------------
  PAE                       = AUTHENTICATOR
  PortControl               = AUTO
  ControlDirection          = In
  HostMode                  = SINGLE_HOST
  ReAuthentication          = Disabled
  QuietPeriod               = 60
  ServerTimeout             = 30
  SuppTimeout               = 30
  ReAuthPeriod              = 3600 (Locally configured)
  ReAuthMax                 = 2
  MaxReq                    = 2
  TxPeriod                  = 30
  RateLimitPeriod           = 0
```

This is an example of output from the `show dot1x interface interface-id details` command:

```
Switch# show dot1x interface gigabitethernet1/0/2 details
Dot1x Info for GigabitEthernet1/0/2
-----------------------------------
  PAE                       = AUTHENTICATOR
  PortControl               = AUTO
  ControlDirection          = Both
  HostMode                  = SINGLE_HOST
  ReAuthentication          = Disabled
  QuietPeriod               = 60
```
ServerTimeout = 30
SuppTimeout = 30
ReAuthPeriod = 3600 (Locally configured)
ReAuthMax = 2
MaxReq = 2
TxPeriod = 30
RateLimitPeriod = 0

Dot1x Authenticator Client List Empty

This is an example of output from the `show dot1x` command when a port is assigned to a guest VLAN and the host mode changes to multiple-hosts mode:

```
Switch# show dot1x interface gigabitethernet1/0/1 details
Dot1x Info for GigabitEthernet1/0/1
-----------------------------------
PAE = AUTHENTICATOR
PortControl = AUTO
ControlDirection = Both
HostMode = SINGLE_HOST
ReAuthentication = Enabled
QuietPeriod = 60
ServerTimeout = 30
SuppTimeout = 30
ReAuthPeriod = 3600 (Locally configured)
ReAuthMax = 2
MaxReq = 2
TxPeriod = 30
RateLimitPeriod = 0
Guest-Vlan = 182

Dot1x Authenticator Client List Empty

Port Status = AUTHORIZED
Authorized By = Guest-Vlan
Operational HostMode = MULTI_HOST
Vlan Policy = 182
```

This is an example of output from the `show dot1x` command when a port is configured as both a host and an IP phone (a Cisco IP phone or phone from another manufacturer). The HostMode field shows `MULTI-DOMAIN`.

```
Switch# show dot1x interface gigabitEthernet 2/0/3 details
Dot1x Info for GigabitEthernet2/0/3
-----------------------------------
PAE = AUTHENTICATOR
PortControl = AUTO
ControlDirection = Both
HostMode = MULTI_DOMAIN
ReAuthentication = Disabled
QuietPeriod = 60
ServerTimeout = 30
SuppTimeout = 30
ReAuthPeriod = 3600 (Locally configured)
ReAuthMax = 2
MaxReq = 2
TxPeriod = 1
RateLimitPeriod = 0
Mac-Auth-Bypass = Enabled
Critical-Auth = Enabled
Critical Recovery Action = Reinitialize
Critical-Auth VLAN = 10
Guest-Vlan = 15
```
Dot1x Authenticator Client List

Domain = DATA
Supplicant = 0000.aaaa.bbbb
Auth SM State = AUTHENTICATED
Auth BEND SM Stat = IDLE
Port Status = AUTHORIZED
Authentication Method = MAB
Vlan Policy = 20

This is an example of output from the `show dot1x interface interface-id statistics` command. Table 2-32 describes the fields in the display.

Switch# `show dot1x interface gigabitethernet1/0/2 statistics`
Dot1x Authenticator Port Statistics for GigabitEthernet1/0/2

**show dtp**

Use the `show dtp` privileged EXEC command to display Dynamic Trunking Protocol (DTP) information for the switch or for a specified interface.

```
show dtp [interface interface-id]
```

**Syntax Description**

- `interface` (Optional) Display port security settings for the specified interface. Valid interfaces include physical ports (including type, stack member, module, and port number).

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the `show dtp` command:

```
Switch# show dtp
Global DTP information
    Sending DTP Hello packets every 30 seconds
    Dynamic Trunk timeout is 300 seconds
    21 interfaces using DTP
```

This is an example of output from the `show dtp interface` command:

```
Switch# show dtp interface gigabitethernet1/0/1
DTP information for GigabitEthernet1/0/1:
    TOS/TAS/TNS: ACCESS/AUTO/ACCESS
    TOT/TAT/TNT: NATIVE/NEGOTIATE/NATIVE
    Neighbor address 1: 000943A7D081
    Neighbor address 2: 000000000000
    Hello timer expiration (sec/state): 1/RUNNING
    Access timer expiration (sec/state): never/STOPPED
    Negotiation timer expiration (sec/state): never/STOPPED
    Multidrop timer expiration (sec/state): never/STOPPED
    FSM state: S2:ACCESS
    # times multi & trunk 0
    Enabled: yes
    In STP: no

Statistics
----------
    3160 packets received (3160 good)
    0 packets dropped
        0 nonegotiate, 0 bad version, 0 domain mismatches, 0 bad TLVs, 0 other
    6320 packets output (6320 good)
        3160 native, 3160 software encap isl, 0 isl hardware native
        0 output errors
        0 trunk timeouts
    1 link ups, last link up on Mon Mar 01 1993, 01:02:29
    0 link downs
```

show eap

Use the **show eap** privileged EXEC command to display Extensible Authentication Protocol (EAP) registration and session information for the switch or for the specified port.

```
show eap {{ registrations [method [name] | transport [name]] } | { sessions [credentials name [interface interface-id] | interface interface-id | method name | transport name]} } [credentials name | interface interface-id | transport name]
```

**Syntax Description**

- **registrations**: Display EAP registration information.
- **method name**: (Optional) Display EAP method registration information.
- **transport name**: (Optional) Display EAP transport registration information.
- **sessions**: Display EAP session information.
- **credentials name**: (Optional) Display EAP method registration information.
- **interface interface-id**: Note (Optional) Display the EAP information for the specified port (including type, stack member, module, and port number).

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you use the **show eap registrations** privileged EXEC command with these keywords, the command output shows this information:

- None—All the lower levels used by EAP and the registered EAP methods.
- **method name** keyword—The specified method registrations.
- **transport name** keyword—The specific lower-level registrations.

When you use the **show eap sessions** privileged EXEC command with these keywords, the command output shows this information:

- None—All active EAP sessions.
- **credentials name** keyword—The specified credentials profile.
- **interface interface-id** keyword—The parameters for the specified interface.
- **method name** keyword—The specified EAP method.
- **transport name** keyword—The specified lower layer.
Examples

This is an example of output from the **show eap registrations** command:

```
Switch# show eap registrations
Registered EAP Methods:
  Method   Type     Name
    4     Peer     MD5

Registered EAP Lower Layers:
  Handle   Type          Name
    2     Authenticator  Dot1x-Authenticator
    1     Authenticator  MAB
```

This is an example of output from the **show eap registrations transport** command:

```
Switch# show eap registrations transport all
Registered EAP Lower Layers:
  Handle   Type          Name
    2     Authenticator  Dot1x-Authenticator
    1     Authenticator  MAB
```

This is an example of output from the **show eap sessions** command:

```
Switch# show eap sessions
Role:          Authenticator      Decision:            Fail
Lower layer:   Dot1x-Authenticator  Interface:               Gi1/0/1
Current method: None          Method state:            Uninitialised
Retransmission count: 0 (max: 2)     Timer:                   Authenticator
ReqId Retransmit (timeout: 30s, remaining: 2s)

<td>Display the switch power status.</td>
</tr>
<tr>
<td>rps</td>
<td>Display whether an RPS 300 Redundant Power System (RPS 300), Cisco RPS675 Redundant Power System (RPS 675), or the Cisco Redundant Power System 2300 (RPS 2300) is connected to the switch.</td>
</tr>
<tr>
<td>rps all</td>
<td>(Optional) Display all the redundant power systems that are connected to the standalone switch or the switch stack. These keywords are available only on Catalyst 3750v2 switches.</td>
</tr>
<tr>
<td>rps detail</td>
<td>(Optional) Display the details about the redundant power systems that are connected to the switch or the switch stack. These keywords are available only on Catalyst 3750v2 switches.</td>
</tr>
<tr>
<td>rps switch [switch-number]</td>
<td>(Optional) Display the redundant power systems that are connected to each switch in the stack or to the specified switch. For <code>switch-number</code>, the range is 1 to 9, depending on the switch member numbers in the stack. These keywords are available only on Catalyst 3750v2 switches.</td>
</tr>
<tr>
<td>stack [switch-number]</td>
<td>Note Display all environmental status for each switch in the stack or for the specified switch. The range is 1 to 9, depending on the switch member numbers in the stack.</td>
</tr>
<tr>
<td>temperature status</td>
<td>(Optional) Display the switch temperature status.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(20)SE3</td>
<td>The <code>temperature status</code> keyword was added.</td>
</tr>
<tr>
<td>12.2(50)SE1</td>
<td>The `rps [ all</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `session` privileged EXEC command to access information from a specific switch other than the master.
Use the `show env stack [switch-number]` command to display information about any switch in the stack from any member switch.

Use with the `stack` keyword to show all information for the stack or for a specified switch in the stack.

Though visible on all switches, the `show env temperature status` command is valid only for the Catalyst 3750G-48TS, 3750G-48PS, 3750G-24TS-1U, and 3750G-24PS switches. If you enter this command on these switches, the command output shows the switch temperature states and the threshold levels. If you enter the command on a switch other than these four switches, the output field shows `Not Applicable`.

On a Catalyst 3750G-48PS or 3750G-24PS switch, you can also use the `show env temperature` command to display the switch temperature status. The command output shows the green and yellow states as `OK` and the red state as `FAULTY`. If you enter the `show env all` command on this switch, the command output is the same as the `show env temperature status` command output.

For more information about the threshold levels, see the software configuration guide for this release.

**Examples**

This is an example of output from the `show env all` command entered from the master switch or a standalone switch:

```
Switch# show env all
FAN is OK
TEMPERATURE is OK
Temperature Value: 33 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 56 Degree Celsius
Red Threshold    : 66 Degree Celsius
---------
1 Built-in
---------

SW  PID                 Serial#     Status           Sys Pwr  PoE Pwr  Watts

---  -------------   ----------------  -----------  ---------

Switch# show env fan
FAN is OK

Switch# show env rps
SW  Status          RPS Name          RPS Serial#  RPS Port#
---  -------------   ----------------  -----------  ---------
3  Active          CiscoRPS          CAT1050VGF3  3

RPS Name: CiscoRPS
State: Active
PID: FWR-RPS2300
Serial#: CAT1050VGF3
Fan: Good
Temperature: Green

RPS Power Supply A: Present
  PID : C3K-PWR-750WAC
  Serial#: DTH1050M04E
  System Power : Good
  PoE Power : Good
  Watts : 300/420 (System/PoE)
```

This is an example of output from the `show env all` command entered from the master switch or a standalone switch:

```
Switch# show env all
FAN is OK
TEMPERATURE is OK
Temperature Value: 33 Degree Celsius
Temperature State: GREEN
Yellow Threshold : 56 Degree Celsius
Red Threshold    : 66 Degree Celsius
---------
1 Built-in
---------

SW  PID                 Serial#     Status           Sys Pwr  PoE Pwr  Watts
---  ------------------  ----------  ---------------  -------  -------  -----
1  Built-in

SW  Status          RPS Name          RPS Serial#  RPS Port#
---  -------------   ----------------  -----------  ---------

Switch# show env fan
FAN is OK

Switch# show env rps
SW  Status          RPS Name          RPS Serial#  RPS Port#
---  -------------   ----------------  -----------  ---------
3  Active          CiscoRPS          CAT1050VGF3  3

</table>

This is an example of output from the show env stack command:

Switch# show env stack
SWITCH: 1
  FAN is OK
  TEMPERATURE is OK
  POWER is OK
  RPS is NOT PRESENT
SWITCH: 2
  FAN is OK
  TEMPERATURE is OK
  POWER is OK
  RPS is NOT PRESENT
SWITCH: 3
  FAN is OK
  TEMPERATURE is OK
  POWER is OK
  RPS is NOT PRESENT
This example shows how to display information about stack member 3 from the master switch:

Switch# `show env stack 3`
SWITCH: 3
FAN is OK
TEMPERATURE is OK
POWER is OK
RPS is NOT PRESENT

This example shows how to display the temperature value, state, and the threshold values. Table 2-33 describes the temperature states in the command output.

Switch# `show env temperature status`
Temperature Value: 28 Degree Celsius
Temperature State: GREEN
Yellow Threshold: 70 Degree Celsius
Red Threshold: 75 Degree Celsius

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>The switch temperature is in the normal operating range.</td>
</tr>
<tr>
<td>Yellow</td>
<td>The temperature is in the warning range. You should check the external temperature around the switch.</td>
</tr>
<tr>
<td>Red</td>
<td>The temperature is in the critical range. The switch might not run properly if the temperature is in this range.</td>
</tr>
</tbody>
</table>
show errdisable detect

Use the `show errdisable detect` command in EXEC mode to display error-disabled detection status.

```
show errdisable detect
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(37)SE</td>
<td>A mode column was added to the <code>show errdisable detect</code> output.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A displayed `gbic-invalid` error reason refers to an invalid small form-factor pluggable (SFP) module. The error-disable reasons in the command output are listed in alphabetical order. The mode column shows how error disable is configured for each feature.

You can configure error-disabled detection in these modes:

- **port mode**—The entire physical port is error disabled if a violation occurs.
- **vlan mode**—The VLAN is error disabled if a violation occurs.
- **port/vlan mode**—The entire physical port is error disabled on some ports and per-VLAN error disabled on other ports.

**Examples**

This is an example of output from the `show errdisable detect` command:

```
Switch# show errdisable detect
ErrDisable Reason     Detection Mode
----------------------  ------ -----
arp-inspection        Enabled port
bpduguard            Enabled vlan
channel-misconfig     Enabled port
community-limit       Enabled port
dhcp-rate-limit       Enabled port
dtp-flap              Enabled port
gbic-invalid         Enabled port
inline-power          Enabled port
invalid-policy        Enabled port
l2ptguard             Enabled port
link-flap             Enabled port
loopback              Enabled port
lsgroup               Enabled port
pagp-flap             Enabled port
psecure-violation     Enabled port/vlan
security-violation   Enabled port
sfp-config-mismat     Enabled port
```
**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>

</tr>
</tbody>
</table>
show errdisable flap-values

Use the `show errdisable flap-values` command in EXEC mode to display conditions that cause an error to be recognized for a cause.

```
show errdisable flap-values
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

- User EXEC
- Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `Flaps` column in the display shows how many changes to the state within the specified time interval will cause an error to be detected and a port to be disabled. For example, the display shows that an error will be assumed and the port shut down if three Dynamic Trunking Protocol (DTP)-state (port mode access/trunk) or Port Aggregation Protocol (PAgP) flap changes occur during a 30-second interval, or if 5 link-state (link up/down) changes occur during a 10-second interval.

```
ErrDisable Reason | Flaps | Time (sec) |
------------------|-------|------------|
pagp-flap         | 3     | 30         |
dtp-flap          | 3     | 30         |
link-flap         | 5     | 10         |
```

**Examples**

This is an example of output from the `show errdisable flap-values` command:

```
Switch# show errdisable flap-values
ErrDisable Reason | Flaps | Time (sec) |
------------------|-------|------------|
pagp-flap         | 3     | 30         |
dtp-flap          | 3     | 30         |
link-flap         | 5     | 10         |
```

</tbody>
</table>
show errdisable recovery

Use the `show errdisable recovery` command in EXEC mode to display the error-disabled recovery timer information.

```
show errdisable recovery
```

**Syntax Description**
This command has no arguments or keywords.

**Command Modes**
User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
A `gbic-invalid error-disable` reason refers to an invalid small form-factor pluggable (SFP) module interface.

**Examples**
This is an example of output from the `show errdisable recovery` command:

```
Switch# show errdisable recovery
ErrDisable Reason     Timer Status
--------------------- ---------------
udld                  Disabled
bpduguard            Disabled
security-violation   Disabled
channel-misconfig    Disabled
vmps                 Disabled
pagp-flap            Disabled
dtp-flap             Disabled
link-flap            Enabled
12ptguard            Disabled
psecure-violation    Disabled
gbic-invalid         Disabled
dhcp-rate-limit      Disabled
unicast-flood        Disabled
storm-control        Disabled
arp-inspection       Disabled
loopback             Disabled

Timer interval: 300 seconds

Interfaces that will be enabled at the next timeout:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Errdisable reason</th>
<th>Time left(sec)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/0/2</td>
<td>link-flap</td>
<td>279</td>
</tr>
</tbody>
</table>
Though visible in the output, the unicast-flood field is not valid.

show etherchannel

Use the `show etherchannel` command in EXEC mode to display EtherChannel information for a channel.

```
show etherchannel [channel-group-number {detail | port | port-channel | protocol | summary}] [{detail | load-balance | port | port-channel | protocol | summary}]
```

**Syntax Description**

- `channel-group-number` (Optional) Number of the channel group. The range is 1 to 48.
- `detail` Display detailed EtherChannel information.
- `load-balance` Display the load-balance or frame-distribution scheme among ports in the port channel.
- `port` Display EtherChannel port information.
- `port-channel` Display port-channel information.
- `protocol` Display the protocol that is being used in the EtherChannel.
- `summary` Display a one-line summary per channel-group.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <code>protocol</code> keyword was added.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>channel-group-number</code> range was changed from 1 to 12 to 1 to 48.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a `channel-group`, all channel groups are displayed.

In the output, the Passive port list field is displayed only for Layer 3 port channels. This field means that the physical port, which is still not up, is configured to be in the channel group (and indirectly is in the only port channel in the channel group).

**Examples**

This is an example of output from the `show etherchannel 1 detail` command:

```
Switch# show etherchannel 1 detail
Group state = L2
Ports: 2  Maxports = 16
Port-channels: 1  Max Port-channels = 16
Protocol:  LACP
          Ports in the group:
          -------------------
          Port: Gi1/0/1
          -------------
          Port state = Up Mstr In-Bndl
          Channel group = 1  Mode = Active  Gcchange = -
          Port-channel = Po1  QC = -  Pseudo port-channel = Po1
```
Port index  = 0      Load = 0x00    Protocol = LACP

Flags:  S - Device is sending Slow LACPDU   F - Device is sending fast LACPDU
        A - Device is in active mode.   P - Device is in passive mode.

**show flowcontrol**

Use the `show flowcontrol` command in EXEC mode to display the flow control status and statistics.

```
show flowcontrol [interface interface-id | module number]
```

**Syntax Description**

- **interface interface-id** (Optional) Display the flow control status and statistics for a specific interface.
- **module number** (Optional) Display the flow control status and statistics for all interfaces on the specified stack member switch. The range is 1 to 9. This option is not available if you have entered a specific interface ID.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display the flow control status and statistics on the switch or for a specific interface.

Use the `show flowcontrol` command to display information about all the switch interfaces. For a standalone switch, the output from the `show flowcontrol` command is the same as the output from the `show flowcontrol module number` command.

Use the `show flowcontrol interface interface-id` command to display information about a specific interface.

**Examples**

This is an example of output from the `show flowcontrol` command.

```
Switch# show flowcontrol
Port   Send FlowControl Receive FlowControl RxPause TxPause
       admin  oper     admin  oper
--------- ------- -------- -------- ------- -------
Gi2/0/1 Unsupp.  Unsupp. off  off  0       0
Gi2/0/2 desired off  off  0       0
Gi2/0/3 desired off  off  0       0
<output truncated>
```

This is an example of output from the `show flowcontrol interface interface-id` command:

```
Switch# show flowcontrol gigabitethernet2/0/2
Port   Send FlowControl Receive FlowControl RxPause TxPause
       admin  oper     admin  oper
--------- ------- -------- -------- ------- -------
Gi2/0/2 desired off  off  0       0
```
## show flowcontrol

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies only to 10-Gigabit Ethernet interfaces.

**Examples**

This is an example of output from the `show idprom interface tengigabitethernet1/0/1` command for the 10-Gigabit Ethernet interface. It shows the XENPAK module serial EEPROM contents.

For information about the EEPROM map and the field descriptions for the display, see the XENPAK multisource agreement (MSA) at these sites:

- [http://www.xenpak.org/MSA/XENPAK_MSA_R2.1.pdf](http://www.xenpak.org/MSA/XENPAK_MSA_R2.1.pdf)

To determine which version of the XENPAK documentation to read, check the `XENPAK MSA Version supported` field in the display. Version 2.1 is 15 hexadecimal, and Version 3.0 is 1E hexadecimal (not shown in the example).

```
Switch# show idprom interface tengigabitethernet1/0/1
TenGigabitEthernet1/0/1 (gpn:472, port-number:1)
-----------------------------------------------------------
XENPAK Serial EEPROM Contents:

show interfaces

Use the show interfaces privileged EXEC command to display the administrative and operational status of all interfaces or a specified interface.

```
show interfaces [interface-id | vlan vlan-id] [accounting | capabilities [module number] |
counters | description | etherchannel | flowcontrol | private-vlan mapping | pruning | stats |
status [err-disabled] | switchport [backup | module number] | transceiver
{tengigabitethernet interface-id} | properties | detail [module number] | trunk]
```

**Syntax Description**

- **interface-id** (Optional) Valid interfaces include physical ports (including type, stack member, module, and port number) and port channels. The port-channel range is 1 to 48.
- **vlan vlan-id** (Optional) VLAN identification. The range is 1 to 4094.
- **accounting** (Optional) Display accounting information on the interface, including active protocols and input and output packets and octets.
  - **Note** The display shows only packets processed in software; hardware-switched packets do not appear.
- **capabilities** (Optional) Display the capabilities of all interfaces or the specified interface, including the features and options that you can configure on the interface. Though visible in the command line help, this option is not available for VLAN IDs.
- **module number** Note (Optional) Display capabilities, switchport configuration, or transceiver characteristics (depending on preceding keyword) of all interfaces on the specified stack member. The range is 1 to 9. This option is not available if you enter a specific interface ID.
- **counters** (Optional) See the show interfaces counters command.
- **description** (Optional) Display the administrative status and description set for an interface.
- **etherchannel** (Optional) Display interface EtherChannel information.
- **flowcontrol** (Optional) Display interface flowcontrol information.
- **private-vlan mapping** (Optional) Display private-VLAN mapping information for the VLAN switch virtual interfaces (SVIs). This keyword is available only if your switch is running the IP services image, formerly known as the enhanced multilayer image (EMI).
- **pruning** (Optional) Display interface trunk VTP pruning information.
- **stats** (Optional) Display the input and output packets by switching path for the interface.
- **status** (Optional) Display the status of the interface. A status of unsupported in the Type field means that a non-Cisco small form-factor pluggable (SFP) module is inserted in the module slot.
- **err-disabled** (Optional) Display interfaces in error-disabled state.
- **switchport** (Optional) Display the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.
- **backup** (Optional) Display Flex Link backup interface configuration and status for the specified interface or all interfaces on the stack.
- **tengigabitethernet** Display the status of a connected ten-gigabit module.
show interfaces

<td>The calibration keyword was removed.</td>
</tr>
<tr>
<td>12.2(44)SE</td>
<td>Added the tengigabitethernet interface-id transceiver detail keywords.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The show interfaces capabilities command with different keywords has these results:

- Use the show interfaces capabilities module number command to display the capabilities of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output.
- Use the show interfaces interface-id capabilities to display the capabilities of the specified interface.
- Use the show interfaces capabilities (with no module number or interface ID) to display the capabilities of all interfaces in the stack.

Note
Use the show interfaces switchport module number command to display the switch port characteristics of all interfaces on that switch in the stack. If there is no switch with that module number in the stack, there is no output. Though visible in the command-line help strings, the crb, fair-queue, irb, mac-accounting, precedence, random-detect, rate-limit, and shape keywords are not supported.

Examples

This is an example of output from the show interfaces command for an interface on stack member 3:

Switch# show interfaces gigabitethernet3/0/2
GigabitEthernet3/0/2 is down, line protocol is down
   Hardware is Gigabit Ethernet, address is 0009.43a7.d085 (bia 0009.43a7.d085)
   MTU 1500 bytes, BW 10000 Kbit, DLY 1000 usec,
   reliability 255/255, txload 1/255, rxload 1/255
   Encapsulation ARPA, loopback not set
   Keepalive set (10 sec)
Auto-duplex, Auto-speed
input flow-control is off, output flow-control is off
ARP type: ARPA, ARP Timeout 04:00:00 Last input never, output never, output hang never
Last clearing of "show interfaces" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue :0/40 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
  2 packets input, 1040 bytes, 0 no buffer
  Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
  0 watchdog, 0 multicast, 0 pause input
  0 input packets with dribble condition detected
  4 packets output, 1040 bytes, 0 underruns
  0 output errors, 0 collisions, 3 interface resets
  0 babbles, 0 late collision, 0 deferred
  0 lost carrier, 0 no carrier, 0 PAUSE output
  0 output buffer failures, 0 output buffers swapped out

This is an example of output from the **show interfaces accounting** command.

Switch# **show interfaces accounting**

This is an example of output from the `show interfaces interface description` command when the interface has been described as `Connects to Marketing` by using the `description` interface configuration command.

```
Switch# show interfaces gigabitethernet1/0/2 description
Interface Status Protocol Description
Gi1/0/2 up     down Connects to Marketing
```

This is an example of output from the `show interfaces etherchannel` command when port channels are configured on the switch:

```
Switch# show interfaces etherchannel
----
Port-channel1: Age of the Port-channel = 03d:20h:17m:29s
  Logical slot/port = 10/1 Number of ports = 0
  GC = 0x00000000 HotStandBy port = null
  Port state = Port-channel Ag-Not-Inuse

Port-channel2: Age of the Port-channel = 03d:20h:17m:29s
  Logical slot/port = 10/2 Number of ports = 0
  GC = 0x00000000 HotStandBy port = null
  Port state = Port-channel Ag-Not-Inuse

Port-channel3: Age of the Port-channel = 03d:20h:17m:29s
  Logical slot/port = 10/3 Number of ports = 0
  GC = 0x00000000 HotStandBy port = null
  Port state = Port-channel Ag-Not-Inuse
```

This is an example of output from the `show interfaces private-vlan mapping` command when the private-VLAN primary VLAN is VLAN 10 and the secondary VLANs are VLANs 501 and 502:

```
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
--------- -------------- -----------------
vlan10    501            isolated
vlan10    502            community
```

This is an example of output from the `show interfaces interface-id pruning` command when pruning is enabled in the VTP domain:

```
Switch# show interfaces gigabitethernet1/0/2 pruning
Port Vlans pruned for lack of request by neighbor
Gi1/0/2  3,4

Port Vlans traffic requested of neighbor
Gi1/0/2  1-3
```

This is an example of output from the `show interfaces stats` command for a specified VLAN interface.

```
Switch# show interfaces vlan 1 stats
Switching path Pkts In Chars In Pkts Out Chars Out
  Processor 1165354 136205310 570800 91731594
  Route cache 0 0 0 0
  Total 1165354 136205310 570800 91731594
```
This is an example of partial output from the `show interfaces status` command. It displays the status of all interfaces.

```
Switch# show interfaces status
1/0/1                      connected    routed     a-half  a-100  10/100BaseTX
Fa1/0/2                      notconnect   121,40       auto   auto  10/100BaseTX
Fa1/0/3                      notconnect   1            auto   auto  10/100BaseTX
Fa1/0/4                      notconnect   18           auto   auto  Not Present
Fa1/0/5                      connected    121           a-full a-1000 10/100BaseTX
Fa1/0/6                      connected    122,11       a-full a-1000 10/100BaseTX
<output truncated>
Gi1/0/1                      notconnect   1            auto   auto  10/100/1000BaseTX
Gi1/0/2                      notconnect   1            auto   auto  unsupported
```

These are examples of output from the `show interfaces status` command for a specific interface when private VLANs are configured. Port 2 is configured as a private-VLAN host port. It is associated with primary VLAN 20 and secondary VLAN 25.

```
Switch# show interfaces fastethernet1/0/2 status
Port      Name               Status       Vlan       Duplex  Speed Type
Fa1/0/2    connected        20,25       a-full  a-100  10/100BaseTX
```

In this example, port 3 is configured as a private-VLAN promiscuous port. The display shows only the primary VLAN 20.

```
Switch# show interfaces fastethernet1/0/3 status
Port      Name               Status       Vlan       Duplex  Speed Type
Fa1/0/3    connected        20          a-full  a-100  10/100BaseTX
```

This is an example of output from the `show interfaces status err-disabled` command. It displays the status of interfaces in the error-disabled state.

```
Switch# show interfaces status err-disabled
Port      Name               Status       Reason
Gi2/0/26  err-disabled      gbic-invalid
```

This is an example of output from the `show interfaces switchport` command for a port. Table 2-34 describes the fields in the display.

```
Private VLAN trunks are not supported in this release, so those fields are not applicable.
```

```
Switch# show interfaces gigabitethernet1/0/1 switchport
Name: Gi1/0/1
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: static access
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Voice VLAN: none
Administrative private-vlan host-association:10 (VLAN0010) 502 (VLAN0502)
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
```
Capture Mode Disabled
Capture VLANs Allowed: ALL

Protected: false
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled

Voice VLAN: none (Inactive)
Appliance trust: none

Table 2-34 show interfaces switchport Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Displays the port name.</td>
</tr>
<tr>
<td>Switchport</td>
<td>Displays the administrative and operational status of the port. In this display, the port is in switchport mode.</td>

<td>Displays the operational private-VLAN status.</td>
</tr>
<tr>
<td>Appliance trust</td>
<td>Displays the class of service (CoS) setting of the data packets of the IP phone.</td>
</tr>
</tbody>
</table>

This is an example of output from the `show interfaces switchport` command for a port configured as a private VLAN promiscuous port. The primary VLAN 20 is mapped to secondary VLANs 25, 30, and 35:

```
Switch# show interfaces gigabitethernet1/0/2 switchport
Name: Gi1/0/1/2
Switchport: Enabled
Administrative Mode: private-vlan promiscuous
Operational Mode: private-vlan promiscuous
```
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: 20 (VLAN0020) 25 (VLAN0025) 30 (VLAN0030) 35 (VLAN0035)
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANS: none
Administrative private-vlan trunk private VLANS: none
Operational private-vlan:
20 (VLAN0020) 25 (VLAN0025)
30 (VLAN0030)
35 (VLAN0035)

This is an example of output from the `show interfaces switchport backup` command:

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa1/0/1</td>
<td>Fa1/0/2</td>
<td>Active Up/Backup Standby</td>
</tr>
<tr>
<td>Fa3/0/3</td>
<td>Fa4/0/5</td>
<td>Active Down/Backup Up</td>
</tr>
<tr>
<td>Po1</td>
<td>Po2</td>
<td>Active Standby/Backup Up</td>
</tr>
</tbody>
</table>
```

This is an example of output from the `show interfaces switchport backup` command. In this example, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

```
Switch(config)#interface gigabitEthernet 2/0/6
Switch(config-if)#switchport backup interface gigabitEthernet 2/0/8 prefer vlan 60,100-120
```

When both interfaces are up, Gi2/0/8 forwards traffic for VLANs 60, 100 to 120, and Gi2/0/6 forwards traffic for VLANs 1 to 50.

```
Switch#show interfaces switchport backup
Switch Backup Interface Pairs:
<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet2/0/6</td>
<td>GigabitEthernet2/0/8</td>
<td>Active Down/Backup Up</td>
</tr>
</tbody>
</table>
```

Vlans on Interface Gi 2/0/6: 1-50
Vlans on Interface Gi 2/0/8: 60, 100-120

When a Flex Link interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Link pair. In this example, if interface Gi2/0/6 goes down, Gi2/0/8 carries all VLANs of the Flex Link pair.

```
Switch#show interfaces switchport backup
Switch Backup Interface Pairs:
<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet2/0/6</td>
<td>GigabitEthernet2/0/8</td>
<td>Active Down/Backup Up</td>
</tr>
</tbody>
</table>
```

Vlans on Interface Gi 2/0/6: 1-50
Vlans on Interface Gi 2/0/8: 1-50, 60, 100-120
When a Flex Link interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi2/0/6 comes up, then VLANs preferred on this interface are blocked on the peer interface Gi2/0/8 and forwarded on Gi2/0/6.

Switch# show interfaces switchport backup
Switch Backup Interface Pairs:

<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet2/0/6</td>
<td>GigabitEthernet2/0/8</td>
<td>Active Down/Backup Up</td>
</tr>
</tbody>
</table>

Vlans on Interface Gi2/0/6: 1-50
Vlans on Interface Gi2/0/8: 60, 100-120

This is an example of output from the show interfaces interface-id pruning command:

Switch# show interfaces gigabitethernet1/0/2 pruning
Port Vlans pruned for lack of request by neighbor

This is an example of output from the show interfaces interface-id trunk command. It displays trunking information for the port.

Switch# show interfaces gigabitethernet1/0/2 trunk
Port Mode Encapsulation Status Native vlan
Gi1/0/1 auto negotiate trunking 1

Port Vlans allowed on trunk
Gi1/0/1 1-4094

Port Vlans allowed and active in management domain
Gi1/0/1 1-4

Port Vlans in spanning tree forwarding state and not pruned
Gi1/0/1 1-4

This is an example of output from the show interfaces interface-id transceiver properties command:

Switch# show interfaces gigabitethernet1/0/2 transceiver properties
Name : Gi1/0/2
Administrative Speed: auto
Operational Speed: auto
Administrative Duplex: auto
Administrative Power Inline: enable
Operational Duplex: auto
Administrative Auto-MDIX: off
Operational Auto-MDIX: off

This is an example of output from the show interfaces interface-id transceiver detail command:

Switch# show interfaces gigabitethernet2/0/3 transceiver detail
ITU Channel not available (Wavelength not available),
Transceiver is externally calibrated.
mA: milliamperes, dBm: decibels (milliwatts), N/A: not applicable.
++: high alarm, +: high warning, -: low warning, --: low alarm.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are uncalibrated.

<table>

# show interfaces counters

Use the `show interfaces counters` privileged EXEC command to display various counters for the switch or for a specific interface.

```
show interfaces [interface-id | vlan vlan-id] counters [errors | etherchannel | module switch-number | protocol status | trunk]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-id</td>
<td>(Optional) ID of the physical interface</td>
</tr>
<tr>

<td>12.2(25)SE</td>
<td>The <code>etherchannel</code> and <code>protocol status</code> keywords were added. The <code>broadcast</code>, <code>multicast</code>, and <code>unicast</code> keywords were removed.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

If you do not enter any keywords, all counters for all interfaces are included.

### Note

Though visible in the command-line help string, the `vlan vlan-id` keyword is not supported.

## Examples

This is an example of partial output from the `show interfaces counters` command. It displays all counters for the switch.

```
Switch# show interfaces counters
Port | InOctets | InUcastPkts | InMcastPkts | InBcastPkts | InOctets | InUcastPkts | InMcastPkts | InBcastPkts |
-----|----------|-------------|-------------|-------------|----------|-------------|-------------|-------------|
Gi1/0/1 | 0       | 0           | 0           | 0           | 0        | 0           | 0           | 0           |
Gi1/0/2 | 0       | 0           | 0           | 0           | 0        | 0           | 0           | 0           |
```

<output truncated>
This is an example of partial output from the `show interfaces counters module` command for stack member 2. It displays all counters for the specified switch in the stack.

```
Switch# show interfaces counters module 2
Port     InOctets  InUcastPkts  InMcastPkts  InBcastPkts
Fa2/0/1  520       2           0           0
Fa2/0/2  520       2           0           0
Fa2/0/3  520       2           0           0
Fa2/0/4  520       2           0           0
Fa2/0/5  520       2           0           0
Fa2/0/6  520       2           0           0
Fa2/0/7  520       2           0           0
Fa2/0/8  520       2           0           0
<output truncated>
```

This is an example of partial output from the `show interfaces counters protocol status` command for all interfaces.

```
Switch# show interfaces counters protocol status
Protocols allocated:

<output truncated>
```

## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces</code></td>
<td>Displays additional interface characteristics.</td>
</tr>
</tbody>
</table>
show inventory

Use the show inventory command in EXEC mode to display product identification (PID) information for the hardware.

    show inventory [entity-name | raw]

**Syntax Description**

<table>
<thead>
<tr>
<th>entity-name</th>
<th>(Optional) Display the specified entity. For example, enter the interface (such as gigabitethernet1/0/1) into which a small form-factor pluggable (SFP) module is installed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>raw</td>
<td>(Optional) Display every entity in the device.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEC</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command is case sensitive. With no arguments, the show inventory command produces a compact dump of all identifiable entities that have a product identifier. The compact dump displays the entity location (slot identity), entity description, and the unique device identifier (UDI) (PID, VID, and SN) of that entity.

**Note**

If there is no PID, no output appears when you enter the show inventory command.

**Examples**

This is example output from the show inventory command:

```
Switch# show inventory
NAME: "5", DESCR: "WS-C3750G-12S"
PID: WS-C3750G-12S-S   , VID: E0   , SN: CAT0749R204
```
show ip arp inspection

Use the **show ip arp inspection** privileged EXEC command to display the configuration and the operating state of dynamic Address Resolution Protocol (ARP) inspection or the status of this feature for all VLANs or for the specified interface or VLAN.

**show ip arp inspection [interfaces [interface-id] | log | statistics [vlan vlan-range] | vlan vlan-range]**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>interfaces [interface-id]</strong></td>
<td>(Optional) Display the trust state and the rate limit of ARP packets for the specified interface or all interfaces. Valid interfaces include physical ports and port channels.</td>
</tr>
<tr>
<td><strong>log</strong></td>
<td>(Optional) Display the configuration and contents of the dynamic ARP inspection log buffer.</td>
</tr>
<tr>
<td><strong>statistics [vlan vlan-range]</strong></td>
<td>(Optional) Display statistics for forwarded, dropped, MAC validation failure, IP validation failure, access control list (ACL) permitted and denied, and DHCP permitted and denied packets for the specified VLAN. If no VLANs are specified or if a range is specified, display information only for VLANs with dynamic ARP inspection enabled (active). You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td><strong>vlan vlan-range</strong></td>
<td>(Optional) Display the configuration and the operating state of dynamic ARP inspection for the specified VLAN. If no VLANs are specified or if a range is specified, display information only for VLANs with dynamic ARP inspection enabled (active). You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
</tbody>
</table>

OL-26659-01
If the log buffer overflows, it means that a log event does not fit into the log buffer, and the display for the `show ip arp inspection log` privileged EXEC command is affected. A -- in the display appears in place of all data except the packet count and the time. No other statistics are provided for the entry. If you see this entry in the display, increase the number of entries in the log buffer, or increase the logging rate in the `ip arp inspection log-buffer` global configuration command.

This is an example of output from the `show ip arp inspection statistics` command. It shows the statistics for packets that have been processed by dynamic ARP inspection for all active VLANs.

```
Switch# show ip arp inspection statistics
Vlan      Forwarded        Dropped     DHCP Drops      ACL Drops
----      ---------        -------     ----------      ---------
 5              3           4618           4605              4
2000              0              0              0              0

Vlan   DHCP Permits    ACL Permits   Source MAC Failures
----   ------------    -----------   -------------------
 5              0             12                     0
2000              0              0                     0

Vlan   Dest MAC Failures   IP Validation Failures   Invalid Protocol Data
----   -----------------   ----------------------   ---------------------
 5                   0                        9 3
2000                   0                        0 0
```

For the `show ip arp inspection statistics` command, the switch increments the number of forwarded packets for each ARP request and response packet on a trusted dynamic ARP inspection port. The switch increments the number of ACL or DHCP permitted packets for each packet that is denied by source MAC, destination MAC, or IP validation checks, and the switch increments the appropriate failure count.

This is an example of output from the `show ip arp inspection statistics vlan 5` command. It shows statistics for packets that have been processed by dynamic ARP for VLAN 5.

```
Switch# show ip arp inspection statistics vlan 5
Vlan      Forwarded        Dropped     DHCP Drops      ACL Drops
----      ---------        -------     ----------      ---------
 5              3           4618           4605              4

Vlan   DHCP Permits    ACL Permits   Source MAC Failures
----   ------------    -----------   -------------------
 5              0             12                     0

Vlan   Dest MAC Failures   IP Validation Failures
----   -----------------   ----------------------
 5                   0                        9

Vlan   IP Validation Failures Invalid Protocol Data
----   ----------------------   ---------------------
 5                   0                        3
```

This is an example of output from the `show ip arp inspection vlan 5` command. It shows the configuration and the operating state of dynamic ARP inspection for VLAN 5.

```
Switch# show ip arp inspection vlan 5
Source Mac Validation :Enabled
Destination Mac Validation :Enabled
IP Address Validation :Enabled

Vlan     Configuration    Operation   ACL Match    Static ACL
----     -------------    ---------   ---------    0
 5     Enabled          Active      second             No

Vlan     ACL Logging    DHCP Logging
----     0             0

Vlan     ACL-Match
----     All
```

</table>
**show ip dhcp snooping**

Use the `show ip dhcp snooping` command in EXEC mode to display the DHCP snooping configuration.

```
show ip dhcp snooping
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEE</td>
<td>The command output was updated to show the global suboption configuration.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays only the results of global configuration. Therefore, in this example, the circuit ID suboption appears in its default format of `vlan-mod-port`, even if a string is configured for the circuit ID.

**Examples**

This is an example of output from the `show ip dhcp snooping` command:

```
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled
DHCP snooping is configured on following VLANs: 40-42
Insertion of option 82 is enabled
    circuit-id format: vlan-mod-port
    remote-id format: string
Option 82 on untrusted port is allowed
Verification of hwaddr field is enabled

Interface                        Trusted Rate limit (pps)
--------------------------------- ------ -----------------------
GigabitEthernet1/0/1             yes    unlimited
GigabitEthernet1/0/2             yes    unlimited
GigabitEthernet2/0/3             no     2000
GigabitEthernet2/0/4             yes    unlimited
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip dhcp snooping binding</code></td>
<td>Displays the DHCP snooping binding information.</td>
</tr>
</tbody>
</table>
show ip dhcp snooping binding

Use the `show ip dhcp snooping binding` command in EXEC mode to display the DHCP snooping binding database and configuration information for all interfaces on a switch.

```
show ip dhcp snooping binding [ip-address] [mac-address] [interface interface-id] [vlan vlan-id]
```

**Syntax Description**

- `ip-address` (Optional) Specify the binding entry IP address.
- `mac-address` (Optional) Specify the binding entry MAC address.
- `interface interface-id` (Optional) Specify the binding input interface.
- `vlan vlan-id` (Optional) Specify the binding entry VLAN.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(18)SE</td>
<td>The <code>dynamic</code> and <code>static</code> keywords were removed.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show ip dhcp snooping binding` command output shows only the dynamically configured bindings. Use the `show ip source binding` privileged EXEC command to display the dynamically and statically configured bindings in the DHCP snooping binding database.

If DHCP snooping is enabled and an interface changes to the down state, the switch does not delete the statically configured bindings.

**Examples**

This example shows how to display the DHCP snooping binding entries for a switch:

```
Switch# show ip dhcp snooping binding
MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
01:02:03:04:05:06   10.1.2.150       9837        dhcp-snooping  20    GigabitEthernet2/0/1
00:D0:B7:1B:35:DE   10.1.2.151       237         dhcp-snooping  20    GigabitEthernet2/0/2
Total number of bindings: 2
```

This example shows how to display the DHCP snooping binding entries for a specific IP address:

```
Switch# show ip dhcp snooping binding 10.1.2.150
MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
01:02:03:04:05:06   10.1.2.150       9810        dhcp-snooping  20    GigabitEthernet2/0/1
Total number of bindings: 1
```
This example shows how to display the DHCP snooping binding entries for a specific MAC address:

Switch# show ip dhcp snooping binding 0102.0304.0506

MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
01:02:03:04:05:06   10.1.2.150       9788        dhcp-snooping  20    GigabitEthernet2/0/2

Total number of bindings: 1

This example shows how to display the DHCP snooping binding entries on a port:

Switch# show ip dhcp snooping binding interface gigabitethernet2/0/2

MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
00:30:94:C2:EF:35   10.1.2.151       290         dhcp-snooping  20    GigabitEthernet2/0/2

Total number of bindings: 1

This example shows how to display the DHCP snooping binding entries on VLAN 20:

Switch# show ip dhcp snooping binding vlan 20

MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
01:02:03:04:05:06   10.1.2.150       9747        dhcp-snooping  20    GigabitEthernet2/0/1
00:00:00:00:00:02   10.1.2.151       65          dhcp-snooping  20    GigabitEthernet2/0/2

Total number of bindings: 2

Table 2-35 describes the fields in the show ip dhcp snooping binding command output:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MacAddress</td>
<td>Client hardware MAC address</td>
</tr>
<tr>
<td>IpAddress</td>
<td>Client IP address assigned from the DHCP server</td>
</tr>
<tr>
<td>Lease(sec)</td>
<td>Remaining lease time for the IP address</td>
</tr>
<tr>
<td>Type</td>
<td>Binding type</td>
</tr>
<tr>
<td>VLAN</td>
<td>VLAN number of the client interface</td>
</tr>
<tr>
<td>Interface</td>
<td>Interface that connects to the DHCP client host</td>
</tr>
<tr>
<td>Total number of bindings</td>
<td>Total number of bindings configured on the switch</td>
</tr>
</tbody>
</table>

**Note**: The command output might not show the total number of bindings. For example, if 200 bindings are configured on the switch and you stop the display before all the bindings appear, the total number does not change.

</tbody>
</table>

**Usage Guidelines**

In a switch stack, all statistics are generated on the stack master. If a new stack master is elected, the statistics counters reset.

**Examples**

This is an example of output from the `show ip dhcp snooping statistics` command:

```
Switch# show ip dhcp snooping statistics
Packets Forwarded                         = 0
Packets Dropped                           = 0
Packets Dropped From untrusted ports      = 0
```

This is an example of output from the `show ip dhcp snooping statistics detail` command:

```
Switch# show ip dhcp snooping statistics detail
Packets Processed by DHCP Snooping         = 0
Packets Dropped Because
  IDB not known                           = 0
  Queue full                              = 0
  Interface is in errdisabled             = 0
  Rate limit exceeded                     = 0
  Received on untrusted ports             = 0
  Nonzero giaddr                          = 0
  Source mac not equal to chaddr          = 0
  Binding mismatch                        = 0
  Insertion of opt82 fail                 = 0
  Interface Down                          = 0
  Unknown output interface                = 0
  Reply output port equal to input port   = 0
  Packet denied by platform               = 0
```
Table 2-36 shows the DHCP snooping statistics and their descriptions:

<table>
<thead>
<tr>
<th>DHCP Snooping Statistic</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Packets Processed by DHCP Snooping</td>
<td>Total number of packets handled by DHCP snooping, including forwarded and dropped packets.</td>
</tr>
<tr>
<td>Packets Dropped Because IDB not known</td>
<td>Number of errors when the input interface of the packet cannot be determined.</td>
</tr>
<tr>
<td>Queue full</td>
<td>Number of errors when an internal queue used to process the packets is full. This might happen if DHCP packets are received at an excessively high rate and rate limiting is not enabled on the ingress ports.</td>
</tr>
<tr>
<td>Interface is in errdisabled</td>
<td>Number of times a packet was received on a port that has been marked as error disabled. This might happen if packets are in the processing queue when a port is put into the error-disabled state and those packets are subsequently processed.</td>
</tr>
<tr>
<td>Rate limit exceeded</td>
<td>Number of times the rate limit configured on the port was exceeded and the interface was put into the error-disabled state.</td>
</tr>
<tr>
<td>Received on untrusted ports</td>
<td>Number of times a DHCP server packet (OFFER, ACK, NAK, or LEASEQUERY) was received on an untrusted port and was dropped.</td>
</tr>
<tr>
<td>Nonzero giaddr</td>
<td>Number of times the relay agent address field (giaddr) in the DHCP packet received on an untrusted port was not zero, or the <code>no ip dhcp snooping information option allow-untrusted</code> global configuration command is not configured and a packet received on an untrusted port contained option-82 data.</td>
</tr>
<tr>
<td>Source mac not equal to chaddr</td>
<td>Number of times the client MAC address field of the DHCP packet (chaddr) does not match the packet source MAC address and the <code>ip dhcp snooping verify mac-address</code> global configuration command is configured.</td>
</tr>
<tr>
<td>Binding mismatch</td>
<td>Number of times a RELEASE or DECLINE packet was received on a port that is different than the port in the binding for that MAC address-VLAN pair. This indicates someone might be trying to spoof the real client, or it could mean that the client has moved to another port on the switch and issued a RELEASE or DECLINE. The MAC address is taken from the chaddr field of the DHCP packet, not the source MAC address in the Ethernet header.</td>
</tr>
<tr>
<td>Insertion of opt82 fail</td>
<td>Number of times the option-82 insertion into a packet failed. The insertion might fail if the packet with the option-82 data exceeds the size of a single physical packet on the internet.</td>
</tr>
<tr>
<td>Interface Down</td>
<td>Number of times the packet is a reply to the DHCP relay agent, but the SVI interface for the relay agent is down. This is an unlikely error that occurs if the SVI goes down between sending the client request to the DHCP server and receiving the response.</td>
</tr>
<tr>
<td>Unknown output interface</td>
<td>Number of times the output interface for a DHCP reply packet cannot be determined by either option-82 data or a lookup in the MAC address table. The packet is dropped. This can happen if option 82 is not used and the client MAC address has aged out. If IPSG is enabled with the port-security option and option 82 is not enabled, the MAC address of the client is not learned, and the reply packets will be dropped.</td>
</tr>
</tbody>
</table>
Table 2-36  DHCP Snooping Statistics (continued)

<table>
<thead>
<tr>
<th>DHCP Snooping Statistic</th>
<th>Description</th>
</tr>

**Examples**

These are examples of output from the `show ip igmp profile` privileged EXEC command, with and without specifying a profile number. If no profile number is entered, the display includes all profiles configured on the switch.

```
Switch# show ip igmp profile 40
IGMP Profile 40
   permit
      range 233.1.1.1 233.255.255.255

Switch# show ip igmp profile
IGMP Profile 3
   range 230.9.9.0 230.9.9.0
IGMP Profile 4
   permit
      range 229.9.9.0 229.255.255.255
```

show ip igmp snooping

Use the **show ip igmp snooping** command in EXEC mode to display the Internet Group Management Protocol (IGMP) snooping configuration of the switch or the VLAN.

```
show ip igmp snooping [groups | mrouter | querier] [vlan vlan-id]
```

<table>

<td>The groups keyword was added. The <code>show ip igmp snooping groups</code> command replaced the <code>show ip igmp snooping multicast</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display snooping configuration for the switch or for a specific VLAN.

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

**Examples**

This is an example of output from the `show ip igmp snooping vlan 1` command. It shows snooping characteristics for a specific VLAN.

```
Switch# show ip igmp snooping vlan 1
Global IGMP Snooping configuration:
-------------------------------
IGMP snooping       :Enabled
IGMPv3 snooping (minimal) :Enabled
Report suppression :Enabled
TCN solicit query   :Disabled
TCN flood query count :2
Last member query interval : 100

Vlan 1:
--------
IGMP snooping       :Enabled
Immediate leave    :Disabled
Multicast router learning mode : pim-dvmrp
Source only learning age timer : 10
CGMP interoperability mode : IGMP_ONLY
Last member query interval : 100
```
This is an example of output from the `show ip igmp snooping` command. It displays snooping characteristics for all VLANs on the switch.

```
Switch# show ip igmp snooping
Global IGMP Snooping configuration:
-----------------------------------------------------
IGMP snooping                 : Enabled
IGMPv3 snooping (minimal)    : Enabled
Report suppression           : Enabled
TCN solicit query            : Disabled
TCN flood query count        : 2
Last member query interval   : 100

Vlan 1:
--------
IGMP snooping                  : Enabled
Immediate leave                : Disabled
Multicast router learning mode : pim-dvmrp
Source only learning age timer : 10
CGMP interoperability mode     : IGMP_ONLY
Last member query interval     : 100

Vlan 2:
--------
IGMP snooping                  : Enabled
Immediate leave                : Disabled
Multicast router learning mode : pim-dvmrp
Source only learning age timer : 10
CGMP interoperability mode     : IGMP_ONLY
Last member query interval     : 333
<output truncated>
```

show ip igmp snooping groups

Use the `show ip igmp snooping groups` privileged EXEC command to display the Internet Group Management Protocol (IGMP) snooping multicast table for the switch or the multicast information. Use with the `vlan` keyword to display the multicast table for a specified multicast VLAN or specific multicast information.

```
show ip igmp snooping groups [count] [dynamic] [user] [vlan vlan-id [ip_address]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>count</code></td>
<td>(Optional) Display the total number of entries for the specified command options instead of the actual entries.</td>
</tr>
<tr>
<td><code>dynamic</code></td>
<td>(Optional) Display entries learned by IGMP snooping.</td>
</tr>
<tr>
<td><code>user</code></td>
<td>Optional) Display only the user-configured multicast entries.</td>
</tr>
<tr>
<td><code>vlan</code></td>
<td>(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>vlan-id</code></td>
<td>(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>ip_address</code></td>
<td>(Optional) Display characteristics of the multicast group with the specified group IP address.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

```
Release       Modification
12.2(18)SE     This command was introduced. It replaced the show ip igmp snooping multicast command.
```

**Usage Guidelines**

Use this command to display multicast information or the multicast table.

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

**Examples**

This is an example of output from the `show ip igmp snooping groups` command without any keywords. It displays the multicast table for the switch.

```
Switch# show ip igmp snooping groups
Vlan  Group         Type Version  Port List
-----------------------------------------------
1     224.1.4.4      igmp     v2     Fa1/0/11
1     224.1.4.5      igmp     v2     Fa1/0/11
2     224.0.1.40     igmp     v2     Fa1/0/15
```

This is an example of output from the `show ip igmp snooping groups count` command. It displays the total number of multicast groups on the switch.

```
Switch# show ip igmp snooping groups count
Total number of multicast groups: 2
```
This is an example of output from the `show ip igmp snooping groups dynamic` command. It shows only the entries learned by IGMP snooping.

```
Switch# show ip igmp snooping groups vlan 1 dynamic
Vlan | Group | Type | Version | Port List
--- | --- | --- | --- | ---
104 | 224.1.4.2 | igmp | v2 | Gi2/0/1, 1/0/15
104 | 224.1.4.3 | igmp | v2 | Gi2/0/1, 1/0/15
```

This is an example of output from the `show ip igmp snooping groups vlan vlan-id ip-address` command. It shows the entries for the group with the specified IP address.

```
Switch# show ip igmp snooping groups vlan 104 224.1.4.2
Vlan | Group | Type | Version | Port List
--- | --- | --- | --- | ---
104 | 224.1.4.2 | igmp | v2 | Gi2/0/1, 1/0/15
```

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display multicast router ports on the switch or for a specific VLAN.

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in IGMP snooping.

When multicast VLAN registration (MVR) is enabled, the `show ip igmp snooping mrouter` command displays MVR multicast router information and IGMP snooping information.

**Examples**

This is an example of output from the `show ip igmp snooping mrouter` command. It shows how to display multicast router ports on the switch.

```
Switch# show ip igmp snooping mrouter
Vlan    ports
----    -----                
1        Gi2/0/1(dynamic)
```

<tbody>
<tr>
<td><code>detail</code></td>
<td>Optional) Display detailed IGMP querier information.</td>
</tr>
<tr>
<td><code>vlan vlan-id [detail]</code></td>
<td>Optional) Display IGMP querier information for the specified VLAN. The range is 1 to 1001 and 1006 to 4094. Use the <code>detail</code> keyword to display detailed information.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEA</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ip igmp snooping querier` command to display the IGMP version and the IP address of a detected device, also called a querier, that sends IGMP query messages. A subnet can have multiple multicast routers but has only one IGMP querier. In a subnet running IGMPv2, one of the multicast routers is elected as the querier. The querier can be a Layer 3 switch.

The `show ip igmp snooping querier` command output also shows the VLAN and the interface on which the querier was detected. If the querier is the switch, the output shows the Port field as `Router`. If the querier is a router, the output shows the port number on which the querier is learned in the Port field.

The `show ip igmp snooping querier` command is similar to the `show ip igmp snooping querier detail` command. However, the `show ip igmp snooping querier` command displays only the device IP address most recently detected by the switch querier.

The `show ip igmp snooping querier detail` command displays the device IP address most recently detected by the switch querier and this additional information:

- The elected IGMP querier in the VLAN
- The configuration and operational information pertaining to the switch querier (if any) that is configured in the VLAN

**Examples**

This is an example of output from the `show ip igmp snooping querier` command:

```
Switch# show ip igmp snooping querier
Vlan | IP Address | IGMP Version | Port
1    | 172.20.50.11 | v3           | Gi1/0/1
2    | 172.20.40.20 | v2           | Router
```
This is an example of output from the `show ip igmp snooping querier detail` command:

Switch# `show ip igmp snooping querier detail`

<table>
<thead>
<tr>
<th>Vlan</th>
<th>IP Address</th>
<th>IGMP Version</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1.1.1.1</td>
<td>v2</td>
<td>Fa8/0/1</td>
</tr>
</tbody>
</table>

Global IGMP switch querier status

```
admin state : Enabled
admin version : 2
source IP address : 0.0.0.0
query-interval (sec) : 60
max-response-time (sec) : 10
querier-timeout (sec) : 120
tcn query count : 2
tcn query interval (sec) : 10
```

Vlan 1: IGMP switch querier status

```
elected querier is 1.1.1.1 on port Fa8/0/1
admin state : Enabled
admin version : 2
source IP address : 10.1.1.65
query-interval (sec) : 60
max-response-time (sec) : 10
querier-timeout (sec) : 120
tcn query count : 2
tcn query interval (sec) : 10
operational state : Non-Querier
operational version : 2
tcn query pending count : 0
```

### Related Commands

show ip source binding

Use the `show ip source binding` command in EXEC mode to display the IP source bindings on the switch.

```
show ip source binding [ip-address] [mac-address] [dhcp-snooping | static] [interface interface-id] [vlan vlan-id]
```

**Syntax Description**

- `ip-address` (Optional) Display IP source bindings for a specific IP address.
- `mac-address` (Optional) Display IP source bindings for a specific MAC address.
- `dhcp-snooping` (Optional) Display IP source bindings that were learned by DHCP snooping.
- `static` (Optional) Display static IP source bindings.
- `interface interface-id` (Optional) Display IP source bindings on a specific interface.
- `vlan vlan-id` (Optional) Display IP source bindings on a specific VLAN.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show ip source binding` command output shows the dynamically and statically configured bindings in the DHCP snooping binding database.

Use the `show ip dhcp snooping binding` privileged EXEC command to display only the dynamically configured bindings.

**Examples**

This is an example of output from the `show ip source binding` command:

```
Switch# show ip source binding
MacAddress   IpAddress    Lease(sec)  Type        VLAN  Interface
------------  -----------  ----------  -----------  ----  ---------------------
00:00:00:0A:00:0B  11.0.0.1  infinite    static     10    GigabitEthernet1/0/1
00:00:00:0A:00:0A  11.0.0.2  10000       dhcp-snooping  10    GigabitEthernet1/0/1
```

</tbody>
</table>
```

In the previous example, this is the IP source guard configuration:

- On the Gigabit Ethernet 1 interface, DHCP snooping is enabled on VLANs 10 to 20. For VLAN 10, IP source guard with IP address filtering is configured on the interface, and a binding exists on the interface. For VLANs 11 to 20, the second entry shows that a default port access control lists (ACLs) is applied on the interface for the VLANs on which IP source guard is not configured.
- The Gigabit Ethernet 2 interface is configured as trusted for DHCP snooping.
- On the Gigabit Ethernet 3 interface, DHCP snooping is not enabled on the VLANs to which the interface belongs.
- On the Gigabit Ethernet 4 interface, IP source guard with source IP and MAC address filtering is enabled, and static IP source bindings are configured on VLANs 10 and 11. For VLANs 12 to 20, the default port ACL is applied on the interface for the VLANs on which IP source guard is not configured.
- On the Gigabit Ethernet 5 interface, IP source guard with source IP and MAC address filtering is enabled and configured with a static IP binding, but port security is disabled. The switch cannot filter source MAC addresses.
This is an example of output on an interface on which IP source guard is disabled:

```
Switch# show ip verify source gigabitethernet1/0/6
IP source guard is not configured on the interface gi1/0/6.
```

</tbody>
</table>
show ipc

Use the show ipc command in EXEC mode to display Interprocess Communications Protocol (IPC) configuration, status, and statistics on a switch stack or a standalone switch.

```
show ipc {mcast {appclass | groups | status} | nodes | ports [open] | queue | rpc | session {all | rx | tx} [verbose] | status [cumlulative] | zones}
```

### Syntax Description

- **mcast {appclass | groups | status}**
  - Display the IPC multicast routing information. The keywords have these meanings:
    - `appclass`—Display the IPC multicast application classes.
    - `groups`—Display the IPC multicast groups.
    - `status`—Display the IPC multicast routing status.

- **nodes**
  - Display participating nodes.

- **ports [open]**
  - Display local IPC ports. The keyword has this meaning:
    - `open`—(Optional) Display only the open ports.

- **queue**
  - Display the contents of the IPC transmission queue.

- **rpc**
  - Display the IPC remote-procedure statistics.

- **session {all | rx | tx}**
  - Display the IPC session statistics (available only in privileged EXEC mode). The keywords have these meanings:
    - `all`—Display all the session statistics.
    - `rx`—Display the sessions statistics for traffic that the switch receives.
    - `tx`—Display the sessions statistics for traffic that the switch forwards.

- **verbose**
  - (Optional) Display detailed statistics (available only in privileged EXEC mode).

- **status [cumlulative]**
  - Display the status of the local IPC server. The keyword has this meaning:
    - `cumlulative`—(Optional) Display the status of the local IPC server since the switch was started or restarted.

- **zones**
  - Display the participating IPC zones. The switch supports a single IPC zone.

### Command Modes

- User EXEC
- Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>

</tr>
</tbody>
</table>
Examples

This example shows how to display the IPC routing status:

```
Switch# show ipc mcast status
          IPC Mcast Status
                    Tx    Rx
Total Frames          0    0
Total control Frames  0    0
Total Frames dropped  0    0
Total control Frames dropped 0    0
Total Reliable messages 0    0
Total Reliable messages acknowledged 0    0
Total Out of Band Messages 0    0
Total Out of Band messages acknowledged 0    0
Total No Mcast groups  0    0
Total Retries          0    0
Total OOB Retries      0    0
Total flushes          0    0
```

This example shows how to display the participating nodes:

```
Switch# show ipc nodes
There is 1 node in this IPC realm.

ID   Type       Name           Last Sent Last Heard
10000 Local IPC Master     0      0
```

This example shows how to display the local IPC ports:

```
Switch# show ipc ports
There are 8 ports defined.

Port ID     Type     Name                            (current/peak/total)
There are 8 ports defined.
10000.1     unicast IPC Master:Zone
10000.2     unicast IPC Master:Echo
10000.3     unicast IPC Master:Control
10000.4     unicast IPC Master:Init
10000.5     unicast FIB Master:DFS.process_level.msgs
10000.6     unicast FIB Master:DFS.interrupt.msgs
10000.7     unicast MDFS RP:Statistics
  port_index = 0  seat_id = 0x10000  last sent = 0  last heard = 0 0/2/159
10000.8     unicast Slot 1 :MDFS.control.RIL
  port_index = 0  seat_id = 0x10000  last sent = 0  last heard = 0 0/0/0

RPC packets:current/peak/total 0/1/4
```

This example shows how to display the contents of the IPC retransmission queue:

```
Switch# show ipc queue
There are 0 IPC messages waiting for acknowledgement in the transmit queue.
There are 0 IPC messages waiting for a response.
There are 0 IPC messages waiting for additional fragments.
There are 0 IPC messages currently on the IPC inboundQ.
Messages currently in use     :     3
Message cache size            :   1000
Maximum message cache usage   :   1000
```
show ipc

```
0 times message cache crossed       5000 [max]
Emergency messages currently in use :         0
There are 2 messages currently reserved for reply msg.
Inbound message queue depth 0
Zone inbound message queue depth 0

This example shows how to display all the IPC session statistics:

Switch# show ipc session all
Tx Sessions:
Port ID      Type       Name
10000.7      Unicast    MDFS RP:Statistics
              port_index = 0  type = Unreliable   last sent = 0     last heard = 0
              Msgs requested = 180  Msgs returned = 180
10000.8      Unicast    Slot 1 :MDFS.control.RIL
              port_index = 0  type = Reliable      last sent = 0     last heard = 0
              Msgs requested = 0    Msgs returned = 0

Rx Sessions:
Port ID      Type       Name
10000.7      Unicast    MDFS RP:Statistics
              port_index = 0  seat_id = 0x10000    last sent = 0     last heard = 0
              No of msgs requested = 180   Msgs returned = 180
10000.8      Unicast    Slot 1 :MDFS.control.RIL
              port_index = 0  seat_id = 0x10000    last sent = 0     last heard = 0
              No of msgs requested = 0    Msgs returned = 0
```

This example shows how to display the status of the local IPC server:

Switch# show ipc status cumulative

```
IPC System Status
Time last IPC stat cleared :never
This processor is the IPC master server.
Do not drop output of IPC frames for test purposes.

1000 IPC Message Headers Cached.

show ipv6 access-list

Use the `show ipv6 access-list` command in EXEC mode to display the contents of all current IPv6 access lists.

```
show ipv6 access-list [access-list-name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access-list-name</code></td>
<td>(Optional) Name of access list.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show ipv6 access-list` command provides output similar to the `show ip access-list` command, except that it is IPv6-specific.

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

**Note**

This command is available only if and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Examples**

The following output from the `show ipv6 access-list` command shows IPv6 access lists named inbound and outbound:

```
Switch# show ipv6 access-list
IPv6 access list inbound
    permit tcp any any eq bgp (8 matches) sequence 10
    permit tcp any any eq telnet (15 matches) sequence 20
    permit udp any any sequence 30
```

Table 2-37 describes the significant fields shown in the display.

show ipv6 dhcp conflict

Use the `show ipv6 dhcp conflict` privileged EXEC command to display address conflicts found by a Dynamic Host Configuration Protocol for IPv6 (DHCPv6) server when addresses are offered to the client.

```
show ipv6 dhcp conflict
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command, and reload the switch.

When you configure the DHCPv6 server to detect conflicts, it uses ping. The client uses neighbor discovery to detect clients and reports to the server through a DECLINE message. If an address conflict is detected, the address is removed from the pool, and the address is not assigned until the administrator removes the address from the conflict list.

**Note**

This command is available only if and you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Examples**

This is an example of the output from the `show ipv6 dhcp conflict` command:

```
Switch# show ipv6 dhcp conflict
Pool 350, prefix 2001:1005::/48
  2001:1005::10
```

**Related Commands**

show ipv6 mld snooping

Use the **show ipv6 mld snooping** command in EXEC mode to display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping configuration of the switch or the VLAN.

```
show ipv6 mld snooping [vlan vlan-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan</strong></td>
<td>(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display MLD snooping configuration for the switch or for a specific VLAN.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Examples**

This is an example of output from the **show ipv6 mld snooping vlan** command. It shows snooping characteristics for a specific VLAN.

```
Switch# show ipv6 mld snooping vlan 100
Global MLD Snooping configuration:
-----------------------------------------------
MLD snooping : Enabled
MLDv2 snooping (minimal) : Enabled
Listener message suppression : Enabled
TCN solicit query : Disabled
TCN flood query count : 2
Robustness variable : 3
Last listener query count : 2
Last listener query interval : 1000
Vlan 100:
--------
MLD snooping : Disabled
MLDv1 immediate leave : Disabled
 Explicit host tracking : Enabled
 Multicast router learning mode : pim-dvmrp
 Robustness variable : 3
 Last listener query count : 2
```
This is an example of output from the `show ipv6 mld snooping` command. It displays snooping characteristics for all VLANs on the switch.

```
Switch# show ipv6 mld snooping
Global MLD Snooping configuration:
-------------------------------------------
MLD snooping                  : Enabled
MLDv2 snooping (minimal)      : Enabled
Listener message suppression  : Enabled
TCN solicit query             : Disabled
TCN flood query count         : 2
Robustness variable           : 3
Last listener query count     : 2
Last listener query interval  : 1000

Vlan 1:
-------
MLD snooping                  : Disabled
MLDv1 immediate leave         : Disabled
Explicit host tracking        : Enabled
Multicast router learning mode: pim-dvmrp
Robustness variable           : 1
Last listener query count     : 2
Last listener query interval  : 1000

Vlan 951:
--------
MLD snooping                  : Disabled
MLDv1 immediate leave         : Disabled
Explicit host tracking        : Enabled
Multicast router learning mode: pim-dvmrp
Robustness variable           : 3
Last listener query count     : 2
Last listener query interval  : 1000
<output truncated>
```

</tr>
<tr>
<td>dynamic</td>
<td>(Optional) Display MLD snooping learned group information.</td>
</tr>
<tr>
<td>user</td>
<td>(Optional) Display MLD snooping user-configured group information.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display IPv6 multicast address information.

You can enter an IPv6 multicast address only after you enter a VLAN ID.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

Use the `dynamic` keyword to display information only about groups that are learned. Use the `user` keyword to display information only about groups that have been configured.

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Examples**

This is an example of output from the `show snooping address` command:

```
Switch# show ipv6 mld snooping address
Vlan Group    Type Version Port List
----------------------------------------
2  FF12::3 user    F0/0/2, Gi2/0/2, Gi3/0/1,Gi3/0/3
```
This is an example of output from the `show snooping address count` command:

```
Switch# show ipv6 mld snooping address count
Total number of multicast groups: 2
```

This is an example of output from the `show snooping address user` command:

```
Switch# show ipv6 mld snooping address user
Vlan Group  Type Version Port List
-------------------------------------------------------------
2        FF12::3 user    v2        Fa1/0/2, Gi2/0/2, Gi3/0/1, Gi4/0/3
```

</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display MLD snooping router ports for the switch or for a specific VLAN.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

To configure the dual IPv4 and IPv6 template, enter the **sdm prefer dual-ipv4-and-ipv6** global configuration command and reload the switch.

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.

**Examples**

This is an example of output from the **show ipv6 mld snooping mrouter** command. It displays snooping characteristics for all VLANs on the switch that are participating in MLD snooping.

```
Switch# show ipv6 mld snooping mrouter
Vlan  ports
----  -----  
  2   Gi1/0/11(dynamic)
  72  Gi1/0/11(dynamic)
 200  Gi1/0/11(dynamic)
```

This is an example of output from the **show ipv6 mld snooping mrouter vlan** command. It shows multicast router ports for a specific VLAN.

```
Switch# show ipv6 mld snooping mrouter vlan 100
Vlan  ports
----  -----  
  2   Gi1/0/11(dynamic)
```

show ipv6 mld snooping querier

Use the `show ipv6 mld snooping querier` command in EXEC mode to display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping querier-related information most recently received by the switch or the VLAN.

```
show ipv6 mld snooping querier [vlan vlan-id] [detail]
```

**Syntax Description**

- `vlan vlan-id` (Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.
- `detail` (Optional) Display MLD snooping detailed querier information for the switch or for the VLAN.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ipv6 mld snooping querier` command to display the MLD version and IPv6 address of a detected device that sends MLD query messages, which is also called a *querier*. A subnet can have multiple multicast routers but has only one MLD querier. The querier can be a Layer 3 switch.

The `show ipv6 mld snooping querier` command output also shows the VLAN and interface on which the querier was detected. If the querier is the switch, the output shows the `Port` field as `Router`. If the querier is a router, the output shows the port number on which the querier is learned in the `Port` field.

The output of the `show ipv6 mld snooping querier vlan` command displays the information received in response to a query message from an external or internal querier. It does not display user-configured VLAN values, such as the snooping robustness variable on the particular VLAN. This querier information is used only on the MASQ message that is sent by the switch. It does not override the user-configured robustness variable that is used for aging out a member that does not respond to query messages.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

To configure the dual IPv4 and IPv6 template, enter the `sdm prefer dual-ipv4-and-ipv6` global configuration command and reload the switch.

**Note**

This command is available only if you have configured a dual IPv4 and IPv6 Switch Database Management (SDM) template on the switch.
Examples

This is an example of output from the `show ipv6 mld snooping querier` command:

```
Switch# show ipv6 mld snooping querier
Vlan  IP Address               MLD Version Port
-------------------------------------------------------------
2     FE80::201:C9FF:FE40:6000 v1     Gi3/0/1
```

This is an example of output from the `show ipv6 mld snooping querier detail` command:

```
Switch# show ipv6 mld snooping querier detail
Vlan  IP Address               MLD Version Port
-------------------------------------------------------------
2     FE80::201:C9FF:FE40:6000 v1     Gi3/0/1
```

This is an example of output from the `show ipv6 mld snooping querier vlan` command:

```
Switch# show ipv6 mld snooping querier vlan 2
IP address : FE80::201:C9FF:FE40:6000
MLD version : v1
Port : Gi3/0/1
Max response time : 1000s
```

show ipv6 route updated

Use the `show ipv6 route updated` command in EXEC mode to display the current contents of the IPv6 routing table.

```
show ipv6 route [protocol] updated [boot-up][hh:mm | day{month [hh:mm]}] [{hh:mm | day{month [hh:mm]}]}
```

### Syntax Description

- **protocol** (Optional) Displays routes for the specified routing protocol using any of these keywords:
  - bgp
  - isis
  - ospf
  - rip

  or displays routes for the specified type of route using any of these keywords:
  - connected
  - local
  - static
  - interface interface id

- **boot-up** Display the current contents of the IPv6 routing table.

- **hh:mm** Enter the time as a 2-digit number for a 24-hour clock. Make sure to use the colons (:). For example, enter 13:32.

- **day** Enter the day of the month. The range is from 1 to 31.

- **month** Enter the month in upper case or lower case letters. You can enter the full name of the month, such as *January* or *august*, or the first three letters of the month, such as *jan* or *Aug*.

<td><strong>show ipv6 route</strong></td>
<td>Displays the current contents of the IPv6 routing table.</td>
</tr>
</tbody>
</table>
show l2protocol-tunnel

Use the `show l2protocol-tunnel` command in EXEC mode to display information about Layer 2 protocol tunnel ports. Displays information for interfaces with protocol tunneling enabled.

```
show l2protocol-tunnel [interface interface-id] [summary]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>(Optional) Specify the interface for which protocol tunneling information appears. Valid interfaces are physical ports and port channels; the port channel range is 1 to 48.</td>
</tr>
<tr>
<td>summary</td>
<td>(Optional) Display only Layer 2 protocol summary information.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After enabling Layer 2 protocol tunneling on an access or IEEE 802.1Q tunnel port by using the `l2protocol-tunnel interface configuration` command, you can configure some or all of these parameters:

- Protocol type to be tunneled
- Shutdown threshold
- Drop threshold

If you enter the `show l2protocol-tunnel [interface interface-id]` command, only information about the active ports on which all the parameters are configured appears.

If you enter the `show l2protocol-tunnel summary` command, only information about the active ports on which some or all of the parameters are configured appears.

**Examples**

This is an example of output from the `show l2protocol-tunnel` command:

```
Switch# show l2protocol-tunnel
COS for Encapsulated Packets: 5
Drop Threshold for Encapsulated Packets: 0

Port    Protocol Shutdown Drop Encapsulation Decapsulation Drop
        Threshold Threshold Counter     Counter       Counter

</tbody>
</table>
show lacp

Use the show lacp command in EXEC mode to display Link Aggregation Control Protocol (LACP) channel-group information.

```
show lacp [channel-group-number] { counters | internal | neighbor | sys-id }
```

### Syntax Description

- **channel-group-number** (Optional) Number of the channel group. The range is 1 to 48.
- **counters** Display traffic information.
- **internal** Display internal information.
- **neighbor** Display neighbor information.
- **sys-id** Display the system identifier that is being used by LACP. The system identifier is made up of the LACP system priority and the switch MAC address.

### Command Modes

- User EXEC
- Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The channel-group-number range was changed from 1 to 12 to 1 to 48.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can enter any show lacp command to display the active channel-group information. To display specific channel information, enter the show lacp command with a channel-group number.

If you do not specify a channel group, information for all channel groups appears.

You can enter the channel-group-number option to specify a channel group for all keywords except sys-id.

### Examples

This is an example of output from the show lacp counters command. Table 2-38 describes the fields in the display.

```
Switch# show lacp counters

<table>
<thead>
<tr>
<th>Port</th>
<th>LACPDUs</th>
<th>Marker</th>
<th>Marker Response</th>
<th>LACPDUs</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

Channel group:1
Gi2/0/1 | 19      | 10     | 0    | 0    | 0    | 0    | 0    | 0   |
Gi2/0/2 | 14      | 6      | 0    | 0    | 0    | 0    | 0    | 0   |
```
Table 2-38  show lacp counters Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LACPDUs Sent and Recv</td>
<td>The number of LACP packets sent and received by a port.</td>
</tr>
<tr>
<td>Marker Sent and Recv</td>
<td>The number of LACP marker packets sent and received by a port.</td>
</tr>
<tr>
<td>Marker Response Sent and Recv</td>
<td>The number of LACP marker response packets sent and received by a port.</td>
</tr>
<tr>
<td>LACPDUs Pkts and Err</td>
<td>The number of unknown and illegal packets received by LACP for a port.</td>
</tr>
</tbody>
</table>

This is an example of output from the `show lacp internal` command:

```
Switch# show lacp 1 internal
Flags: S - Device is requesting Slow LACPDU
       F - Device is requesting Fast LACPDU
       A - Device is in Active mode       P - Device is in Passive mode

</tbody>
</table>
```

Table 2-39 describes the fields in the display:

Table 2-39  show lacp internal Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>State of the specific port. These are the allowed values:</td>
</tr>
<tr>
<td></td>
<td>• ——Port is in an unknown state.</td>
</tr>
<tr>
<td></td>
<td>• <strong>bndl</strong>—Port is attached to an aggregator and bundled with other ports.</td>
</tr>
<tr>
<td></td>
<td>• <strong>susp</strong>—Port is in a suspended state; it is not attached to any aggregator.</td>
</tr>
<tr>
<td></td>
<td>• <strong>hot-sby</strong>—Port is in a hot-standby state.</td>
</tr>
<tr>
<td></td>
<td>• <strong>indiv</strong>—Port is incapable of bundling with any other port.</td>
</tr>
<tr>
<td></td>
<td>• <strong>indep</strong>—Port is in an independent state (not bundled but able to switch data traffic. In this case, LACP is not running on the partner port).</td>
</tr>
<tr>
<td></td>
<td>• <strong>down</strong>—Port is down.</td>
</tr>
<tr>
<td>LACP Port Priority</td>
<td>Port priority setting. LACP uses the port priority to put ports in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.</td>
</tr>
</tbody>
</table>
Table 2-39  show lacp internal Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin Key</td>
<td>Administrative key assigned to this port. LACP automatically generates an administrative key value as a hexadecimal number. The administrative key defines the ability of a port to aggregate with other ports. A port’s ability to aggregate with other ports is determined by the port physical characteristics (for example, data rate and duplex capability) and configuration restrictions that you establish.</td>
</tr>
<tr>
<td>Oper Key</td>
<td>Runtime operational key that is being used by this port. LACP automatically generates this value as a hexadecimal number.</td>
</tr>
<tr>
<td>Port Number</td>
<td>Port number.</td>
</tr>
</tbody>
</table>
| Port State    | State variables for the port, encoded as individual bits within a single octet with these meanings:  
|               | • bit0: LACP_Activity  
|               | • bit1: LACP_Timeout  
|               | • bit2: Aggregation  
|               | • bit3: Synchronization  
|               | • bit4: Collecting  
|               | • bit5: Distributing  
|               | • bit6: Defaulted  
|               | • bit7: Expired  
| Note          | In the list above, bit7 is the MSB and bit0 is the LSB. |

This is an example of output from the show lacp neighbor command:

Switch# show lacp neighbor
Flags: S - Device is sending Slow LACPDU  
P - Device is sending Fast LACPDU  
A - Device is in Active mode  
P - Device is in Passive mode

Channel group 3 neighbors

Partner’s information:

<table>
<thead>
<tr>
<th>Port</th>
<th>Partner</th>
<th>Partner System ID</th>
<th>Partner Port Number</th>
<th>Partner Age</th>
<th>Partner Flags</th>
</tr>
</thead>
<tbody>
<tr>

show link state group

Use the `show link state group` privileged EXEC command to display the link-state group information.

```
show link state group [number] [detail]
```

**Syntax Description**

- `number` (Optional) Number of the link-state group.
- `detail` (Optional) Specify that detailed information appears.

**Defaults**

There is no default.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show link state group` command to display the link-state group information. Enter this command without keywords to display information about all link-state groups. Enter the group number to display information specific to the group.

Enter the `detail` keyword to display detailed information about the group. The output for the `show link state group detail` command displays only those link-state groups that have link-state tracking enabled or that have upstream or downstream interfaces (or both) configured. If there is no link-state group configuration for a group, it is not shown as enabled or disabled.

**Examples**

This is an example of output from the `show link state group 1` command:

```
Switch# show link state group 1
Link State Group: 1  Status: Enabled, Down
```

This is an example of output from the `show link state group detail` command:

```
Switch# show link state group detail
(Up):Interface up  (Dwn):Interface Down  (Dis):Interface disabled
Link State Group: 1 Status: Enabled, Down
Upstream Interfaces : Gi1/0/15(Dwn) Gi1/0/16(Dwn)
Downstream Interfaces : Gi1/0/11(Dis) Gi1/0/12(Dis) Gi1/0/13(Dis) Gi1/0/14(Dis)

Link State Group: 2 Status: Enabled, Down
Upstream Interfaces : Gi1/0/15(Dwn) Gi1/0/16(Dwn) Gi1/0/17(Dwn)
Downstream Interfaces : Gi1/0/11(Dis) Gi1/0/12(Dis) Gi1/0/13(Dis) Gi1/0/14(Dis)

(Up):Interface up (Dwn):Interface Down (Dis):Interface disabled
```

</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `show location` command to display location information for an endpoint.

### Examples

This is an example of output from the `show location civic-location` command that displays location information for an interface:

```
Switch# show location civic interface gigabitethernet2/0/1
Civic location information
--------------------------
Identifier : 1
County     : Santa Clara
Street number : 3550
Building   : 19
Room       : C6
Primary road name : Cisco Way
City       : San Jose
State      : CA
Country    : US
```
This is an example of output from the `show location civic-location` command that displays all the civic location information:

```
Switch# show location civic-location static
Civic location information
-------------------------------
Identifier      : 1
County          : Santa Clara
Street number   : 3550
Building        : 19
Room            : C6
Primary road name: Cisco Way
City            : San Jose
State           : CA
Country         : US
Ports           : Gi2/0/1
-------------------------------
Identifier      : 2
Street number   : 24568
Street number suffix: West
Landmark        : Golden Gate Bridge
Primary road name: 19th Ave
City            : San Francisco
Country         : US
-------------------------------
```

This is an example of output from the `show location elin-location` command that displays the emergency location information:

```
Switch# show location elin-location identifier 1
Elin location information
-------------------------------
Identifier : 1
Elin       : 14085553881
Ports      : Gi2/0/2
-------------------------------
```

This is an example of output from the `show location elin static` command that displays all emergency location information:

```
Switch# show location elin static
Elin location information
-------------------------------
Identifier : 1
Elin       : 14085553881
Ports      : Gi2/0/2
-------------------------------
Identifier : 2
Elin       : 18002228999
-------------------------------
```

### Related Commands

</tbody>
</table>
show logging smartlog

To display smart logging information, use the `show logging smartlog` command in privileged EXEC mode.

```
show logging smartlog [event-ids | events | statistics {interface interface-id | summary}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Command Default</th>
<th>Command Modes</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>event-ids</code></td>
<td>There is no default.</td>
<td>Privileged EXEC</td>

<td></td>
<td></td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>summary</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Syntax Description**

- **event-ids**: (Optional) Displays the IDs and names of smart log events. The NetFlow collector uses the event IDs to identify each event.
- **events**: (Optional) Displays descriptions of smart log events. The display shows the last 10 smart logging events.
- **statistics**: (Optional) Displays smart log statistics.
- **interface interface-id**: Displays smart log statistics for the specified interface.
- **summary**: Displays a summary of the smart log event statistics.

**Command History**

- **Release**: 12.2(58)SE
- **Modification**: This command was introduced.

**Usage Guidelines**

You can configure smart logging of packets dropped because of DHCP snooping violations, Dynamic ARP inspection violations, IP source guard denied traffic, or ACL permitted or denied traffic. The packet contents are sent to the identified Cisco IOS NetFlow collector.

The statistics counters reflect the number of packets that have been sent to the collector by smart logging.

**Examples**

This is an example of output from the `show logging smartlog events` command. The output shows the last 10 smart logging events.

```
Switch #show logging smartlog events

show mac access-group

Use the **show mac access-group** command in EXEC mode to display the MAC access control lists (ACLs) configured for an interface or a switch.

**show mac access-group** [interface *interface-id*]

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td><em>interface-id</em> <em>(Optional)</em> Display the MAC ACLs configured on a specific interface. Valid interfaces are physical ports and port channels; the port-channel range is 1 to 48 (available only in privileged EXEC mode).</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the **show mac-access group** command. Port 2 has the MAC access list *macl_e1* applied; no MAC ACLs are applied to other interfaces.

Switch# **show mac access-group**
Interface GigabitEthernet1/0/1:
  Inbound access-list is not set
Interface GigabitEthernet1/0/2:
  Inbound access-list is macl_e1
Interface GigabitEthernet1/0/3:
  Inbound access-list is not set
Interface GigabitEthernet1/0/4:
  Inbound access-list is not set

<output truncated>

This is an example of output from the **show mac access-group interface** command:

Switch# **show mac access-group interface gigabitethernet1/0/1**
Interface GigabitEthernet1/0/1:
  Inbound access-list is macl_e1

show mac address-table dynamic

Use the **show mac address-table dynamic** command in EXEC mode to display only dynamic MAC address table entries.

```
show mac address-table dynamic [address mac-address] [interface interface-id] [vlan vlan-id]
```

**Syntax Description**

- `address mac-address`  (Optional) Specify a 48-bit MAC address; the valid format is H.H.H (available in privileged EXEC mode only).
- `interface interface-id`  (Optional) Specify an interface to match; valid interfaces include physical ports and port channels.
- `vlan vlan-id`  (Optional) Display entries for a specific VLAN; the range is 1 to 4094.

**Command Modes**

User EXEC
Privileged EXEC

show mac address-table learning

Use the `show mac address-table learning` command in EXEC mode to display the status of MAC address learning for all VLANs or the specified VLAN.

```
show mac address-table learning [vlan vlan-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) Display information for a specific VLAN. The range is 1 to 4094.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show mac address-table learning` command without any keywords to display configured VLANs and whether MAC address learning is enabled or disabled on them. The default is that MAC address learning is enabled on all VLANs. Use the command with a specific VLAN ID to display the learning status on an individual VLAN.

**Note**

**Examples**

This is an example of output from the `show mac address-table learning` command showing that MAC address learning is disabled on VLAN 200:

```
Switch# show mac address-table learning
VLAN   Learning Status
----   ---------------
1      yes
100    yes
200    no
```

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac address-table learning vlan</code></td>
<td>Enables or disables MAC address learning on a VLAN.</td>
</tr>
</tbody>
</table>
**show mac address-table move update**

Use the `show mac address-table move update` command in EXEC mode to display the MAC address-table move update information on the switch.

```plaintext
show mac address-table move update
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SED</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the `show mac address-table move update` command:

```plaintext
Switch# show mac address-table move update
Switch-ID : 010b.4630.1780
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 1023/8320

</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(19)EA1</td>
<td>The <code>show mac-address-table notification</code> command (with the hyphen) was replaced by the <code>show mac address-table notification</code> command (without the hyphen).</td>
</tr>
<tr>
<td>12.2(40)SE</td>
<td>The <code>change</code>, <code>mac-move</code>, and <code>threshold</code> keywords were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show mac address-table notification change` command without keywords to see if the MAC address change notification feature is enabled or disabled, the MAC notification interval, the maximum number of entries allowed in the history table, and the history table contents.

Use the `interface` keyword to display the notifications for all interfaces. If the `interface-id` is included, only the flags for that interface appear.
show mac address-table notification

This is an example of output from the `show mac address-table notification change` command:

```
Switch# show mac address-table notification change
MAC Notification Feature is Enabled on the switch
Interval between Notification Traps : 60 secs
Number of MAC Addresses Added : 4
Number of MAC Addresses Removed : 4
Number of Notifications sent to NMS : 3
Maximum Number of entries configured in History Table : 100
Current History Table Length : 3
MAC Notification Traps are Enabled

<tr>
<td><code>show mac address-table vlan</code></td>
<td>Displays the MAC address table information for the specified VLAN.</td>
</tr>
</tbody>
</table>
**show mac address-table static**

Use the `show mac address-table static` command in EXEC mode to display only static MAC address table entries.

```
show mac address-table static [address mac-address] [interface interface-id] [vlan vlan-id]
```

**Syntax Description**

- **address mac-address**  (Optional) Specify a 48-bit MAC address; the valid format is H.H.H (available in privileged EXEC mode only).
- **interface interface-id**  (Optional) Specify an interface to match; valid interfaces include physical ports and port channels.
- **vlan vlan-id**  (Optional) Display addresses for a specific VLAN. The range is 1 to 4094.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

show mls qos

Use the `show mls qos` command in EXEC mode to display global quality of service (QoS) configuration information.

```
show mls qos
```

### Syntax Description

This command has no arguments or keywords.

### Command Modes

- User EXEC
- Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

This is an example of output from the `show mls qos` command when QoS is enabled and DSCP transparency is enabled:

```
Switch# show mls qos
QoS is enabled
QoS ip packet dscp rewrite is enabled
```
show mls qos aggregate-policer

Use the `show mls qos aggregate-policer` command in EXEC mode to display the quality of service (QoS) aggregate policer configuration.

```
show mls qos aggregate-policer [aggregate-policer-name]
```

**Syntax Description**

| Syntax Description | aggregate-policer-name | (Optional) Display the policer configuration for the specified name. |

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded.

**Examples**

This is an example of output from the `show mls qos aggregate-policer` command:

```
Switch# show mls qos aggregate-policer policer1
aggregate-policer policer1 1000000 2000000 exceed-action drop
Not used by any policy map
```

**Related Commands**

### Usage Guidelines

During classification, QoS uses the mapping tables to represent the priority of the traffic and to derive a corresponding class of service (CoS) or Differentiated Services Code Point (DSCP) value from the received CoS, DSCP, or IP precedence value.

The policed-DSCP, DSCP-to-CoS, and the DSCP-to-DSCP-mutation maps appear as a matrix. The d1 column specifies the most-significant digit in the DSCP. The d2 row specifies the least-significant digit in the DSCP. The intersection of the d1 and d2 values provides the policed-DSCP, the CoS, or the mutated-DSCP value. For example, in the DSCP-to-CoS map, a DSCP value of 43 corresponds to a CoS value of 5.

The DSCP input queue threshold and the DSCP output queue threshold maps appear as a matrix. The d1 column specifies the most-significant digit of the DSCP number. The d2 row specifies the least-significant digit in the DSCP number. The intersection of the d1 and the d2 values provides the queue ID and threshold ID. For example, in the DSCP input queue threshold map, a DSCP value of 43 corresponds to queue 2 and threshold 1 (02-01).

The CoS input queue threshold and the CoS output queue threshold maps show the CoS value in the top row and the corresponding queue ID and threshold ID in the second row. For example, in the CoS input queue threshold map, a CoS value of 5 corresponds to queue 2 and threshold 1 (2-1).
Examples

This is an example of output from the `show mls qos maps` command:

```
Switch# show mls qos maps
Policed-dscp map:
  d1 :  d2 0 1 2 3 4 5 6 7 8 9

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the **show mls qos queue-set** command:

```
Switch# show mls qos queue-set
Queueset: 1
Queue : 1   2   3   4
        --------- --------- --------- ---------
buffers:  25  25  25  25
threshold1: 100 200 100 100
threshold2: 100 200 100 100
reserved:  50  50  50  50
maximum:  400 400 400 400

Queueset: 2
Queue : 1   2   3   4
        --------- --------- --------- ---------
buffers:  25  25  25  25
threshold1: 100 200 100 100
threshold2: 100 200 100 100

</tbody>
</table>
show mls qos vlan

Use the `show mls qos vlan` command in EXEC mode to display the policy maps attached to a switch virtual interface (SVI).

    show mls qos vlan vlan-id

**Syntax Description**

| `vlan-id` | Specify the VLAN ID of the SVI to display the policy maps. The range is 1 to 4094. |

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The output from the `show mls qos vlan` command is meaningful only when VLAN-based quality of service (QoS) is enabled and when hierarchical policy maps are configured.

**Examples**

This is an example of output from the `show mls qos vlan` command:

```
Switch# show mls qos vlan 10
Vlan10
Attached policy-map for Ingress:pm-test-pm-2
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy-map</td>
<td>Creates or modifies a policy map that can be attached to multiple ports and enters policy-map configuration mode.</td>

</tbody>
</table>
show monitor

Use the `show monitor` command in EXEC mode to display information about all Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) sessions on the switch.

```
show monitor [session {session_number | all | local | range list | remote}]
```

**Syntax Description**

- **session** *(Optional) Display information about specified SPAN sessions.*
- **session_number** Specify the number of the SPAN or RSPAN session. The range is 1 to 66.
- **all** Display all SPAN sessions.
- **local** Display only local SPAN sessions.
- **range list** Display a range of SPAN sessions, where `list` is the range of valid sessions, either a single session or a range of sessions described by two numbers, the lower one first, separated by a hyphen. Do not enter any spaces between comma-separated parameters or in hyphen-specified ranges.
  
  **Note** This keyword is available only in privileged EXEC mode.
- **remote** Display only remote SPAN sessions.
- **detail** *(Optional) Display detailed information about the specified sessions.*

**Command Modes**

- User EXEC
- Privileged EXEC

**Command History**

- **Release** | **Modification**
  - 12.1(11)AX | This command was introduced.
  - 12.1(14)EA1 | The `range list` and `detail` keywords were added.

**Usage Guidelines**

Use the command with keywords to show a specific session, all sessions, all local sessions, or all remote sessions.

The output is the same for the `show monitor` command and the `show monitor session all` command.

**Examples**

This is an example of output for the `show monitor` command:

```
Switch# show monitor
Session 1
--------
Type : Local Session
Source Ports :
RX Only : Fa4/0/1
Both : Fa4/0/2-3,Fa4/0/5-6
Destination Ports : Fa4/0/20
Encapsulation : Replicate
Ingress : Disabled
```
Session 2
---------
Type: Remote Source Session
Source VLANs:
  TX Only: 10
  Both: 1-9
Dest RSPAN VLAN: 105

This is an example of output for the `show monitor` command for local SPAN source session 1:

```
Switch# show monitor session 1
Session 1
---------
Type: Local Session
Source Ports:
  RX Only: Fa4/0/1
  Both: Fa4/0/2-3, Fa4/0/5-6
Destination Ports: Fa4/0/20
Encapsulation: Replicate
Ingress: Disabled
```

This is an example of output for the `show monitor session all` command when ingress traffic forwarding is enabled:

```
Switch# show monitor session all
Session 1
---------
Type: Local Session
Source Ports:
  Both: Fa4/0/2
Destination Ports: Fa4/0/3
Encapsulation: Native
Ingress: Enabled, default VLAN = 5
Ingress encap: DOT1Q

Session 2
---------
Type: Local Session
Source Ports:
  Both: Fa4/0/8
Destination Ports: Fa4/0/2
Encapsulation: Replicate
Ingress: Enabled, default VLAN = 4
Ingress encap: Untagged
```

show mvr

Use the `show mvr` privileged EXEC command without keywords to display the current Multicast VLAN Registration (MVR) global parameter values.

```
show mvr
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The command information includes whether or not MVR is enabled, the MVR multicast VLAN, the maximum query response time, the number of multicast groups, and the MVR mode (dynamic or compatible).

**Examples**

This is an example of output from the `show mvr` command. The maximum number of multicast groups is fixed at 256. The MVR mode is either compatible (for interoperability with Catalyst 2900 XL and Catalyst 3500 XL switches) or dynamic (where operation is consistent with IGMP snooping operation and dynamic MVR membership on source ports is supported).

```
Switch# show mvr
MVR Running: TRUE
MVR multicast VLAN: 1
MVR Max Multicast Groups: 256
MVR Current multicast groups: 0
MVR Global query response time: 5 (tenths of sec)
MVR Mode: compatible
```

**Related Commands**

<table>

<td>Displays all ports that are members of an MVR multicast group or, if there are no members, means the group is inactive.</td>
</tr>
</tbody>
</table>
show mvr interface

Use the show mvr interface privileged EXEC command without keywords to display the Multicast VLAN Registration (MVR) receiver and source ports.

```
show mvr interface [interface-id [members [vlan vlan-id]]]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-id</td>
<td>(Optional) Display MVR type, status, and Immediate Leave setting for the interface.</td>
</tr>
<tr>
<td>members</td>
<td>(Optional) Display all MVR groups to which the specified interface belongs.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Display all MVR group members on this VLAN. The range is 1 to 4094.</td>
</tr>
</tbody>
</table>

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If the entered port identification is a non-MVR port or a source port, the command returns an error message. For receiver ports, it displays the port type, per port status, and Immediate-Leave setting.

If you enter the members keyword, all MVR group members on the interface appear. If you enter a VLAN ID, all MVR group members in the VLAN appear.

Use the command with keywords to display MVR parameters for a specific receiver port.

### Examples

This is an example of output from the show mvr interface command:

```
Switch# show mvr interface
Port       Type          Status          Immediate Leave
----------  -------------  -------------  ----------------
G1/1/0/1    SOURCE       ACTIVE/UP      DISABLED
G1/1/0/2    RECEIVER     ACTIVE/DOWN    DISABLED
```

In the preceding display, Status is defined as follows:

- **Active** means the port is part of a VLAN.
- **Up/Down** means that the port is forwarding/nonforwarding.
- **Inactive** means that the port is not yet part of any VLAN.

This is an example of output from the show mvr interface command for a specified port:

```
Switch# show mvr interface gigabitethernet1/0/2
Type: RECEIVER Status: ACTIVE Immediate Leave: DISABLED
```
This is an example of output from the `show mvr interface interface-id members` command:

```
Switch# show mvr interface gigabitethernet1/0/2 members
  239.255.0.0   DYNAMIC ACTIVE
  239.255.0.1   DYNAMIC ACTIVE
  239.255.0.2   DYNAMIC ACTIVE
  239.255.0.3   DYNAMIC ACTIVE
  239.255.0.4   DYNAMIC ACTIVE
  239.255.0.5   DYNAMIC ACTIVE
  239.255.0.6   DYNAMIC ACTIVE
  239.255.0.7   DYNAMIC ACTIVE
  239.255.0.8   DYNAMIC ACTIVE
  239.255.0.9   DYNAMIC ACTIVE
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>

<td>Configures MVR ports.</td>
</tr>
<tr>
<td><strong>show mvr</strong></td>
<td>Displays the global MVR configuration on the switch.</td>
</tr>
<tr>
<td><strong>show mvr members</strong></td>
<td>Displays all receiver ports that are members of an MVR multicast group.</td>
</tr>
</tbody>
</table>
show mvr members

Use the `show mvr members` privileged EXEC command to display all receiver and source ports that are currently members of an IP multicast group.

```
show mvr members [ip-address]
```

**Syntax Description**

- `ip-address` (Optional) The IP multicast address. If the address is entered, all receiver and source ports that are members of the multicast group appear. If no address is entered, all members of all Multicast VLAN Registration (MVR) groups are listed. If a group has no members, the group is listed as Inactive.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show mvr members` command applies to receiver and source ports. For MVR-compatible mode, all source ports are members of all multicast groups.

**Examples**

This is an example of output from the `show mvr members` command:

```
Switch# show mvr members
MVR Group IP   Status   Members
-------------   ------   -------
239.255.0.1     ACTIVE   Gi1/0/1(d), Gi1/0/2(s)
239.255.0.2     INACTIVE None
239.255.0.3     INACTIVE None
239.255.0.4     INACTIVE None
239.255.0.5     INACTIVE None
239.255.0.6     INACTIVE None
239.255.0.7     INACTIVE None
239.255.0.8     INACTIVE None
239.255.0.9     INACTIVE None
239.255.0.10    INACTIVE None
<output truncated>
```

This is an example of output from the `show mvr members ip-address` command. It displays the members of the IP multicast group with that address:

```
Switch# show mvr members 239.255.0.2
239.255.003.--22     ACTIVE   Gi1/0/1(d), Gi1/0/2(d), Gi1/0/3(d), Gi1/0/4(d), Gi1/0/5(s)
```

<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>channel-group-number</code> range was changed from 1 to 12 to 1 to 48.</td>
</tr>
<tr>
<td>12.2(46)SE</td>
<td>The <code>dual-active</code> keyword was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can enter any `show pagp` command to display the active channel-group information. To display the nonactive information, enter the `show pagp` command with a channel-group number.

### Examples

This is an example of output from the `show pagp 1 counters` command:

```
Switch# show pagp 1 counters
        Information            Flush
Port    Sent Recv Sent Recv
--------------------------------------
Channel group: 1
              Gi1/0/1  45  42    0    0
              Gi1/0/2  45  41    0    0
```
This is an example of output from the `show pagp 1 internal` command:

```
Switch# show pagp 1 internal
Flags:  S - Device is sending Slow hello.  C - Device is in Consistent state.
       A - Device is in Auto mode.
Timers:  H - Hello timer is running.  Q - Quit timer is running.
       S - Switching timer is running.  I - Interface timer is running.

Channel group 1

<td>clear pagp</td>
<td>Clears PAgP channel-group information.</td>
</tr>
</tbody>
</table>
show policy-map

Use the show policy-map command in EXEC mode to display quality of service (QoS) policy maps, which define classification criteria for incoming traffic.

```
show policy-map [policy-map-name [class class-map-name]]
```

### Syntax Description

- **policy-map-name** (Optional) Display the specified policy-map name.
- **class class-map-name** (Optional) Display QoS policy actions for a individual class.

### Command Modes

- User EXEC
- Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Though visible in the command-line help string, the **control-plane** and **interface** keywords are not supported, and the statistics shown in the display should be ignored.

Policy maps can include policers that specify the bandwidth limitations and the action to take if the limits are exceeded.

### Examples

This is an example of output from the show policy-map command:

```
Switch# show policy-map
Policy Map videowizard_policy2
 class videowizard_10-10-10-10
   set dscp 34
   police 100000000 2000000 exceed-action drop

Policy Map mypolicy
 class dscp5
   set dscp 6
```

### Related Commands

</tbody>
</table>
show port-security

Use the **show port-security** privileged EXEC command to display port-security settings for an interface or for the switch.

```
show port-security [interface interface-id] [address | vlan]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>(Optional) Display port security settings for the specified interface.</td>
</tr>
<tr>
<td></td>
<td>Valid interfaces include physical ports (including type, stack member, module, and port number).</td>
</tr>
<tr>
<td>address</td>
<td>(Optional) Display all secure MAC addresses on all ports or a specified port.</td>
</tr>
<tr>
<td>vlan</td>
<td>(Optional) Display port security settings for all VLANs on the specified interface. This keyword is visible only on interfaces that have the switchport mode set to trunk.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <strong>vlan</strong> keyword was added (visible only on trunk ports).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the command without keywords, the output includes the administrative and operational status of all secure ports on the switch.

If you enter an *interface-id*, the command displays port security settings for the interface.

If you enter the *address* keyword, the command displays the secure MAC addresses for all interfaces and the aging information for each secure address.

If you enter an *interface-id* and the *address* keyword, the command displays all the MAC addresses for the interface with aging information for each secure address. You can also use this command to display all the MAC addresses for an interface even if you have not enabled port security on it.

If you enter the *vlan* keyword, the command displays the configured maximum and the current number of secure MAC addresses for all VLANs on the interface. This option is visible only on interfaces that have the switchport mode set to trunk.

**Examples**

This is an example of the output from the **show port-security** command:

```
Switch# show port-security
Secure Port MaxSecureAddr CurrentAddr SecurityViolation Security Action
             (Count)   (Count)   (Count)                  
G1/1/0/1     1           0          0                        Shutdown

Total Addresses in System (excluding one mac per port) : 1
Max Addresses limit in System (excluding one mac per port) : 6272
```
This is an example of output from the `show port-security interface interface-id` command:

```
Switch# show port-security interface gigabitethernet1/0/1
Port Security : Enabled
Port status : SecureUp
Violation mode : Shutdown
Maximum MAC Addresses : 1
Total MAC Addresses : 0
Configured MAC Addresses : 0
Aging time : 0 mins
Aging type : Absolute
SecureStatic address aging : Disabled
Security Violation count : 0
```

This is an example of output from the `show port-security address` command:

```
Switch# show port-security address
Secure Mac Address Table
-------------------------------------------------------------------
Vlan    Mac Address       Type                Ports   Remaining Age (mins)

**show power inline**

Use the `show power inline` command in EXEC mode to display the Power over Ethernet (PoE) status for the specified PoE port or for all PoE ports.

```
show power inline [[interface-id | consumption] | module switch-number]
```

**Syntax Description**

- `interface-id` (Optional) Display PoE-related power management information for the specified interface.
- `consumption` (Optional) Display the power allocated to devices connected to PoE ports.
- `module switch-number` Note (Optional) Limit the display to ports on the specified stack member. The switch number is 1 to 9.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEC</td>
<td>The <code>consumption</code> keywords were added.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the `show power inline` command. In the display, port 2 is configured as static; power has been pre-allocated to this port, but no powered device is connected. Port 6 is a static port in the power-deny state because its maximum wattage is configured for 10 W. The connected powered device has a reported class maximum wattage for a Class 0 or Class 3 device. Table 2-41 describes the output fields.

```
Switch# show power inline

Module  Available  Used  Remaining
--------  --------  ------  --------
         (Watts)  (Watts)  (Watts)
1  370.0      114.9       255.1
2  370.0       34.3       335.

Interface  Admin  Oper  Power  Device  Class Max
          Oper  (Watts)
------------------
Fa1/0/1     auto  on  6.3  IP Phone 7910  n/a  15.4

<td>The <strong>routing</strong> keyword was added for the dual IPv4 and IPv6 template.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you change the SDM template by using the **sdm prefer** global configuration command, you must reload the switch for the configuration to take effect. If you enter the **show sdm prefer** command before you enter the **reload** privileged EXEC command, the **show sdm prefer** command shows the template currently in use and the template that will become active after a reload.

The numbers displayed for each template represent an approximate maximum number for each feature resource. The actual number might vary, depending on the actual number of other features configured.
This is an example of output from the **show sdm prefer** command, displaying the template in use:

```
Switch# show sdm prefer
The current template is "desktop default" template.
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

number of unicast mac addresses: 6K
number of igmp groups + multicast routes: 1K
number of unicast routes: 8K
    number of directly connected hosts: 6K
    number of indirect routes: 2K
number of policy based routing aces: 0
number of qos aces: 512
number of security aces: 1K
```

This is a sample output from the **show sdm prefer routing** command entered on an aggregator switch:

```
Switch# show sdm prefer routing
"aggregate routing" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

number of unicast mac addresses: 6K
number of igmp groups + multicast routes: 1K
number of unicast routes: 20K
    number of directly connected hosts: 6K
    number of indirect routes: 14K
number of policy based routing aces: 512
number of qos aces: 512
number of security aces: 1K
```

This is an example of output from the **show sdm prefer routing** command entered on a desktop switch:

```
Switch# show sdm prefer routing
"desktop routing" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

number of unicast mac addresses: 3K
number of igmp groups + multicast routes: 1K
number of unicast routes: 11K
    number of directly connected hosts: 3K
    number of indirect routes: 8K
number of policy based routing aces: 512
number of qos aces: 512
number of security aces: 1K
```

This is an example of output from the **show sdm prefer dual-ipv4-and-ipv6 default** command entered on a desktop switch:

```
Switch# show sdm prefer dual-ipv4-and-ipv6 default
"desktop IPv4 and IPv6 default" template:
The selected template optimizes the resources in
the switch to support this level of features for
8 routed interfaces and 1024 VLANs.

number of unicast mac addresses: 2K
number of IPv4 IGMP groups + multicast routes: 1K
number of IPv4 unicast routes: 3K
    number of directly-connected IPv4 hosts: 2K
```
show sdm prefer

This is an example of output from the `show sdm prefer` command when you have configured a new template but have not reloaded the switch:

```
Switch# show sdm prefer
The current template is "desktop routing" template.
The selected template optimizes the resources in the switch to support this level of features for 8 routed interfaces and 1024 VLANs.

number of unicast mac addresses:         3K
number of igmp groups + multicast routes: 1K
number of unicast routes:                11K
    number of directly connected hosts:    3K
    number of indirect routes:             8K
number of qos aces:                      512
number of security aces:                 1K

On next reload, template will be "desktop vlan" template.
```

show setup express

Use the `show setup express` privileged EXEC command to display if Express Setup mode is active on the switch.

```
show setup express
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

No default is defined.

**Command Modes**

Privileged EXEC

show spanning-tree

Use the `show spanning-tree` command in EXEC mode to display spanning-tree state information.

```
show spanning-tree [bridge-group] [active [detail] | backbonefast | blockedports | bridge | detail [active] | inconsistentports | interface interface-id | mst | pathcost method | root | summary [totals] | uplinkfast | vlan vlan-id]
show spanning-tree bridge-group [active [detail] | blockedports | bridge | detail [active] | inconsistentports | interface interface-id | root | summary]
show spanning-tree vlan vlan-id [active [detail] | blockedports | bridge | detail [active] | inconsistentports | interface interface-id | root | summary]
show spanning-tree {vlan vlan-id | bridge-group} bridge [address | detail | forward-time | hello-time | id | max-age | priority [system-id] | protocol]
show spanning-tree {vlan vlan-id | bridge-group} root [address | cost | detail | forward-time | hello-time | id | max-age | port | priority [system-id]
show spanning-tree interface interface-id [active [detail] | cost | detail [active] | inconsistency | portfast | priority | rootcost | state]
show spanning-tree mst [configuration [digest]] | [instance-id [detail] | interface interface-id [detail]]
```

**Syntax Description**

- `bridge-group` (Optional) Specify the bridge group number. The range is 1 to 255.
- `active [detail]` (Optional) Display spanning-tree information only on active interfaces (available only in privileged EXEC mode).
- `backbonefast` (Optional) Display spanning-tree BackboneFast status.
- `blockedports` (Optional) Display blocked port information (available only in privileged EXEC mode).
- `bridge [address | detail | forward-time | hello-time | id | max-age | priority [system-id] | protocol]` (Optional) Display status and configuration of this switch (optional keywords available only in privileged EXEC mode).
- `detail [active]` (Optional) Display a detailed summary of interface information (active keyword available only in privileged EXEC mode).
- `inconsistentports` (Optional) Display inconsistent port information (available only in privileged EXEC mode).
- `interface interface-id [active [detail] | cost | detail [active] | inconsistency | portfast | priority | rootcost | state]` (Optional) Display spanning-tree information for the specified interface (all options except `portfast` and `state` available only in privileged EXEC mode). Enter each interface separated by a space. Ranges are not supported. Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.
mst [configuration [digest]] [instance-id [detail | interface interface-id [detail]]]

(Optional) Display the multiple spanning-tree (MST) region configuration and status (available only in privileged EXEC mode).

The keywords have these meanings:

- **digest**—(Optional) Display the MD5 digest included in the current MST configuration identifier (MSTCI). Two separate digests, one for standard and one for prestandard switches, appear (available only in privileged EXEC mode).

  The terminology was updated for the implementation of the IEEE standard, and the txholdcount field was added.

  The new master role appears for boundary ports.

  The word *pre-standard* or *Pre-STD* appears when an IEEE standard bridge sends prestandard BPDUs on a port.

  The word *pre-standard (config)* or *Pre-STD-Cf* appears when a port has been configured to transmit prestandard BPDUs and no prestandard BPU has been received on that port.

  The word *pre-standard (rcvd)* or *Pre-STD-Rx* appears when a prestandard BPU has been received on a port that has not been configured to transmit prestandard BPDUs.

  A *dispute* flag appears when a designated port receives inferior designated information until the port returns to the forwarding state or ceases to be designated.

- **instance-id**—You can specify a single instance ID, a range of IDs separated by a hyphen, or a series of IDs separated by a comma. The range is 1 to 4094. The display shows the number of currently configured instances.

- **interface interface-id**—(Optional) Valid interfaces include physical ports, VLANs, and port channels. The VLAN range is 1 to 4094. The port-channel range is 1 to 48.

- **detail**—(Optional) Display detailed information for the instance or interface.

pathcost method

(Optional) Display the default path cost method (available only in privileged EXEC mode).

root [address | cost | detail | forward-time | hello-time | id | max-age | port | priority [system-id]]

(Optional) Display root switch status and configuration (all keywords available only in privileged EXEC mode).

summary [totals]

(Optional) Display a summary of port states or the total lines of the spanning-tree state section. The words *IEEE Standard* identify the MST version running on a switch.

uplinkfast

(Optional) Display spanning-tree UplinkFast status.

vlan vlan-id [active [detail | backbonefast | blockedports | bridge [address | detail | forward-time | hello-time | id | max-age | priority [system-id | protocol]

(Optional) Display spanning-tree information for the specified VLAN (some keywords available only in privileged EXEC mode). You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
**Command Modes**

User EXEC  
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <code>mst</code> keyword and options were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the ```vlan-id``` variable is omitted, the command applies to the spanning-tree instance for all VLANs.

**Examples**

This is an example of output from the ```show spanning-tree active``` command:

```
Switch# show spanning-tree active  
VLAN0001  
  Spanning tree enabled protocol ieee  
  Root ID  Priority 32768  
    Address 0001.42e2.cdd0  
    Cost 3038  
    Port 24 (GigabitEthernet2/0/1)  
    Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec  
  Bridge ID Priority 49153 (priority 49152 sys-id-ext 1)  
    Address 0003.fd63.9580  
    Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec  
    Aging Time 300  
  Uplinkfast enabled  
  Interface Role Sts Cost Prio.Nbr Type  
  ---------------- ---- --- -------- -------- --------------------------------  
  Gi2/0/1 Root FWD 3019 128.24 P2p  
<output truncated>
```

This is an example of output from the ```show spanning-tree detail``` command:

```
Switch# show spanning-tree detail  
VLAN0001 is executing the ieee compatible Spanning Tree protocol  
  Bridge Identifier has priority 49152, sysid 1, address 0003.fd63.9580  
  Configured hello time 2, max age 20, forward delay 15  
  Current root has priority 32768, address 0001.42e2.cdd0  
  Root port is 1 (GigabitEthernet2/0/1), cost of root path is 3038  
  Topology change flag not set, detected flag not set  
  Number of topology changes 0 last change occurred 1d16h ago  
  Times: hold 1, topology change 35, notification 2  
    hello 2, max age 20, forward delay 15  
  Timers: hello 0, topology change 0, notification 0, aging 300  
  Uplinkfast enabled  
  Port 1 (GigabitEthernet2/0/1) of VLAN0001 is forwarding  
    Port path cost 3019, Port priority 128, Port Identifier 128.24.  
    Designated root has priority 32768, address 0001.42e2.cdd0  
    Designated bridge has priority 32768, address 00d0.bbf5.c680  
    Designated port id is 128.25, designated path cost 19  
    Timers: message age 2, forward delay 0, hold 0  
    Number of transitions to forwarding state: 1  
    Link type is point-to-point by default  
    BPDU: sent 0, received 72364  
<output truncated>
This is an example of output from the `show spanning-tree interface interface-id` command:

```
Switch# show spanning-tree interface gigabitethernet2/0/1
Vlan  Role Sts Cost  Prio.Nbr Type
  ------------  ---- --- --------- -------- --------------------------------
  VLAN0001      Root FWD 3019  128.24   P2p
```

```
Switch# show spanning-tree mst configuration

</table>
show storm-control

Use the `show storm-control` command in EXEC mode to display broadcast, multicast, or unicast storm control settings on the switch or on the specified interface or to display storm-control history.

```
show storm-control [interface-id] [broadcast | multicast | unicast]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface-id</code></td>
<td>(Optional) Interface ID for the physical port (including type, stack member, module, and port number).</td>
</tr>
<tr>
<td><code>broadcast</code></td>
<td>(Optional) Display broadcast storm threshold setting.</td>
</tr>
<tr>
<td><code>multicast</code></td>

</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter an `interface-id`, the storm control thresholds appear for the specified interface.
If you do not enter an `interface-id`, settings appear for one traffic type for all ports on the switch.
If you do not enter a traffic type, settings appear for broadcast storm control.

**Examples**

This is an example of a partial output from the `show storm-control` command when no keywords are entered. Because no traffic-type keyword was entered, the broadcast storm control settings appear.

```
Switch# show storm-control
Interface   Filter State Upper  Lower  Current
----------  --------------  ------  ------  -------
G1/0/1      Forwarding   20 pps  10 pps  5 pps
G1/0/2      Forwarding   50.00% 40.00%  0.00%
<output truncated>
```
This is an example of output from the `show storm-control` command for a specified interface. Because no traffic-type keyword was entered, the broadcast storm control settings appear.

```
Switch# show storm-control gigabitethernet 1/0/1
```

<table>
<thead>
<tr>
<th>Interface</th>

</tbody>
</table>

#### Usage Guidelines

This command displays these states:

- **Waiting**—A switch is booting up and waiting for communication from other switches in the stack. The switch has not yet determined whether or not it is a stack master.

  Stack members not participating in a stack master election remain in the waiting state until the stack master is elected and ready.
• Initializing—A switch has determined whether its stack master status. If it is not the stack master, it is receiving its system- and interface-level configuration from the stack master and loading it.

• Ready—The member has completed loading the system- and interface-level configurations and can forward traffic.

• Master Re-Init—The state immediately after a master re-election and a different member is elected master. The new master is re-initializing its configuration. This state applies only to the new master.

• Ver Mismatch—A switch in version mismatch mode. Version-mismatch mode is when a switch joining the stack has a different stack protocol minor version number than the master.

• SDM Mismatch—A switch in Switch Database Management (SDM) mismatch mode. SDM mismatch is when a member does not support the SDM template running on the master.

• Provisioned—The state of a preconfigured switch before it becomes an active member of a stack, or the state of a member after it has left the stack. The MAC address and the priority number in the display are always 0 for the provisioned switch.

A typical state transition for a member (including a master) booting up is Waiting -> Initializing -> Ready.

A typical state transition for a member becoming a master after a master election is Ready -> Master Re-Init -> Ready.

A typical state transition for a member in version mismatch mode is Waiting -> Ver Mismatch.

You can use the `show switch` command to identify whether the provisioned switch exists in the stack.

The `show running-config` and the `show startup-config` privileged EXEC commands do not provide this information.

The display also includes stack MAC-persistency wait-time if persistent MAC address is enabled.

### Examples

This example shows summary stack information:

```
Switch# show switch
Switch#  Role    Mac Address     Priority     State
--------  --------  --------------  -----------  ------
  6       Member    0003.e31a.1e00     1         Ready
*8       Master    0003.e31a.1200     1         Ready
  2       Member    0000.000.0000      0         Provisioned
```

This example shows detailed stack information:

```
Switch# show switch detail
Switch/Stack Mac Address : 0013.c4db.7e00
Mac persistency wait time: 4 mins

Switch#  Role    Mac Address     Priority Version State
--------  --------  --------------  -----------  ------
*1       Master    0013.c4db.7e00     1      0       Ready
  2       Member    0000.000.0000      0      0       Provisioned
  6       Member    0003.e31a.1e00     1      0       Ready

Stack Port Status             Neighbors
Switch#  Port 1   Port 2           Port 1   Port 2
--------  --------  -----------  --------  --------
  1       Ok        Down             6        None
  6       Down      Ok               None       1
```
This example shows the member 6 summary information:

```
Switch# show switch 6
```

```
<table>
<thead>
<tr>
<th>Current</th>
<th>Role</th>
<th>Mac Address</th>
<th>Priority</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>switch renumber</td>
<td>Changes the member number.</td>
</tr>
</tbody>
</table>
show system mtu

Use the **show system mtu** privileged EXEC command to display the global maximum transmission unit (MTU) or maximum packet size set for the switch.

```
show system mtu
```

**Syntax Description**
This command has no arguments or keywords.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you have used the **system mtu** or **system mtu jumbo** global configuration command to change the MTU setting, the new setting does not take effect until you reset the switch.

The system MTU refers to ports operating at 10/100 Mb/s; the system jumbo MTU refers to Gigabit ports; the system routing MTU refers to routed ports.

**Examples**
This is an example of output from the **show system mtu** command:

```
Switch# show system mtu
System MTU size is 1500 bytes
System Jumbo MTU size is 1550 bytes
Routing MTU size is 1500 bytes.
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>system mtu</td>
<td>Sets the MTU size for the Fast Ethernet, Gigabit Ethernet, or routed ports.</td>
</tr>
</tbody>
</table>
### show udld

Use the `show udld` command in EXEC mode to display UniDirectional Link Detection (UDLD) administrative and operational status for all ports or the specified port.

```
show udld [interface-id]
```

#### Syntax Description

<table>
<thead>
<tr>
<th><code>interface-id</code></th>
<th>(Optional) ID of the interface and port number. Valid interfaces include physical ports and VLANs. The VLAN range is 1 to 4094.</th>
</tr>
</thead>
</table>

#### Command Modes

- User EXEC
- Privileged EXEC

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

If you do not enter an `interface-id`, administrative and operational UDLD status for all interfaces appear.

#### Examples

This is an example of output from the `show udld interface-id` command. For this display, UDLD is enabled on both ends of the link, and UDLD detects that the link is bidirectional. Table 2-44 describes the fields in this display.

```
Switch# show udld gigabitethernet2/0/1
Interface gi2/0/1
---
Port enable administrative configuration setting: Follows device default
Port enable operational state: Enabled
Current bidirectional state: Bidirectional
Current operational state: Advertisement - Single Neighbor detected
Message interval: 60
Time out interval: 5
   Entry 1
      Expiration time: 146
      Device ID: 1
      Current neighbor state: Bidirectional
      Device name: Switch-A
      Port ID: Gi2/0/1
      Neighbor echo 1 device: Switch-B
      Neighbor echo 1 port: Gi2/0/2
      Message interval: 5
      CDP Device name: Switch-A
```
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>The interface on the local device configured for UDLD.</td>
</tr>
<tr>
<td>Port enable administrative configuration setting</td>
<td>How UDLD is configured on the port. If UDLD is enabled or disabled, the port enable configuration setting is the same as the operational enable state. Otherwise, the enable operational setting depends on the global enable setting.</td>
</tr>
<tr>
<td>Port enable operational state</td>
<td>Operational state that shows whether UDLD is actually running on this port.</td>
</tr>
<tr>
<td>Current bidirectional state</td>
<td>The bidirectional state of the link. An unknown state appears if the link is down or if it is connected to an UDLD-incapable device. A bidirectional state appears if the link is a normal two-way connection to a UDLD-capable device. All other values mean miswiring.</td>
</tr>
<tr>
<td>Current operational state</td>
<td>The current phase of the UDLD state machine. For a normal bidirectional link, the state machine is most often in the Advertisement phase.</td>
</tr>
<tr>
<td>Message interval</td>
<td>How often advertisement messages are sent from the local device. Measured in seconds.</td>
</tr>
<tr>
<td>Time out interval</td>
<td>The time period, in seconds, that UDLD waits for echoes from a neighbor device during the detection window.</td>
</tr>
<tr>
<td>Entry 1</td>
<td>Information from the first cache entry, which contains a copy of echo information received from the neighbor.</td>
</tr>
<tr>
<td>Expiration time</td>
<td>The amount of time in seconds remaining before this cache entry is aged out.</td>
</tr>
<tr>
<td>Device ID</td>
<td>The neighbor device identification.</td>
</tr>
<tr>
<td>Current neighbor state</td>
<td>The neighbor’s current state. If both the local and neighbor devices are running UDLD normally, the neighbor state and local state should be bidirectional. If the link is down or the neighbor is not UDLD-capable, no cache entries appear.</td>
</tr>
<tr>
<td>Device name</td>
<td>The device name or the system serial number of the neighbor. The system serial number appears if the device name is not set or is set to the default (Switch).</td>
</tr>
<tr>
<td>Port ID</td>
<td>The neighbor port ID enabled for UDLD.</td>
</tr>
<tr>
<td>Neighbor echo 1 device</td>
<td>The device name of the neighbors’ neighbor from which the echo originated.</td>
</tr>
<tr>
<td>Neighbor echo 1 port</td>
<td>The port number ID of the neighbor from which the echo originated.</td>
</tr>
<tr>
<td>Message interval</td>
<td>The rate, in seconds, at which the neighbor is sending advertisement messages.</td>
</tr>
<tr>
<td>CDP device name</td>
<td>The CDP device name or the system serial number. The system serial number appears if the device name is not set or is set to the default (Switch).</td>
</tr>
</tbody>
</table>

```
show vlan

Use the **show vlan** command in EXEC mode to display the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) on the switch.

```
show vlan [brief | dot1q tag native | id vlan-id | internal usage | mtu | name vlan-name | private-vlan [type] | remote-span | summary]
```

**Syntax Description**

- **brief** (Optional) Display one line for each VLAN with the VLAN name, status, and its ports.
- **dot1q tag native** (Optional) Display the IEEE 802.1Q native VLAN tagging status.
- **id vlan-id** (Optional) Display information about a single VLAN identified by VLAN ID number. For **vlan-id**, the range is 1 to 4094.
- **internal usage** (Optional) Display a list of VLANs being used internally by the switch. These VLANs are always from the extended range (VLAN IDs 1006 to 4094), and you cannot create VLANs with these IDs by using the **vlan** global configuration command until you remove them from internal use.
- **mtu** (Optional) Display a list of VLANs and the minimum and maximum transmission unit (MTU) sizes configured on ports in the VLAN.
- **name vlan-name** (Optional) Display information about a single VLAN identified by VLAN name. The VLAN name is an ASCII string from 1 to 32 characters.
- **private-vlan** (Optional) Display information about configured private VLANs, including primary and secondary VLAN IDs, type (community, isolated, or primary) and ports belonging to the private VLAN. This keyword is only supported if your switch is running the IP services image.
- **type** (Optional) Display only private VLAN ID and type.
- **remote-span** (Optional) Display information about Remote SPAN (RSPAN) VLANs.
- **summary** (Optional) Display VLAN summary information.

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(20)SE</td>
<td>The <strong>mtu</strong> and <strong>private-vlan</strong> keywords were added.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <strong>dot1q tag native</strong> keywords were added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the **show vlan mtu** command output, the MTU_Mismatch column shows whether all the ports in the VLAN have the same MTU. When yes appears in this column, it means that the VLAN has ports with different MTUs, and packets that are switched from a port with a larger MTU to a port with a smaller MTU might be dropped. If the VLAN does not have an SVI, the hyphen (-) symbol appears in the SVI_MTU column. If the MTU-Mismatch column displays yes, the names of the port with the MinMTU and the port with the MaxMTU appear.
If you try to associate a private VLAN secondary VLAN with a primary VLAN before you define the secondary VLAN, the secondary VLAN is not included in the `show vlan private-vlan` command output.

In the `show vlan private-vlan type` command output, a type displayed as `normal` means a VLAN that has a private VLAN association but is not part of the private VLAN. For example, if you define and associate two VLANs as primary and secondary VLANs and then delete the secondary VLAN configuration without removing the association from the primary VLAN, the VLAN that was the secondary VLAN is shown as `normal` in the display. In the `show vlan private-vlan` output, the primary and secondary VLAN pair is shown as `non-operational`.

**Note**
Though visible in the command-line help string, the `ifindex` keyword is not supported.

### Examples

This is an example of output from the `show vlan` command. Table 2-45 describes the fields in the display.

```
Switch# show vlan
VLAN Name   Status    Ports
--- ----------- -------------------------------
1  default    active    Fa1/0/1, Fa1/0/2, Fa1/0/3

Remote SPAN VLAN

Disabled
This is an example of output from the `show vlan internal usage` command. It shows that VLANs 1025 and 1026 are being used as internal VLANs for Fast Ethernet routed ports 23 and 24 on stack member 1. If you want to use one of these VLAN IDs, you must first shut down the routed port, which releases the internal VLAN, and then create the extended-range VLAN. When you start up the routed port, another internal VLAN number is assigned to it.

```
Switch# show vlan internal usage
VLAN Usage
---- -------------
1025 FastEthernet1/0/23
1026 FastEthernet1/0/24
```

</thead>
<tbody>
<tr>
<td>T2.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

This is an example of output from the `show vlan access-map` command:

```
Switch# show vlan access-map
Vlan access-map "SecWiz" 10
  Match clauses:
    ip address: SecWiz_Gi0_3_in_ip
    ip address: SecWiz_Fa10_3_in_ip
  Action:
    forward
```

### Related Commands

</tbody>
</table>

### Examples

This is an example of output from the `show vmps` command:

```
Switch# show vmps
VQP Client Status:
------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server:

Reconfirmation status
---------------------
VMPS Action: other
VMPS domain server:
```

This is an example of output from the `show vmps statistics` command. Table 2-46 describes each field in the display.

```
Switch# show vmps statistics
VMPS Client Statistics
----------------------
VQP Queries: 0
VQP Responses: 0
VMPS Changes: 0
VQP Shutdowns: 0
VQP Denied: 0
VQP Wrong Domain: 0
VQP Wrong Version: 0
VQP Insufficient Resource: 0
```
Table 2-46  show vmps statistics Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VQP Queries</td>
<td>Number of queries sent by the client to the VMPS.</td>
</tr>
<tr>
<td>VQP Responses</td>
<td>Number of responses sent to the client from the VMPS.</td>
</tr>
<tr>
<td>VMPS Changes</td>
<td>Number of times that the VMPS changed from one server to another.</td>
</tr>
<tr>
<td>VQP Shutdowns</td>
<td>Number of times the VMPS sent a response to shut down the port. The client disables the port and removes all dynamic addresses on this port from the address table. You must administratively re-enable the port to restore connectivity.</td>
</tr>
<tr>
<td>VQP Denied</td>
<td>Number of times the VMPS denied the client request for security reasons. When the VMPS response denies an address, no frame is forwarded to or from the workstation with that address (broadcast or multicast frames are delivered to the workstation if the port has been assigned to a VLAN). The client keeps the denied address in the address table as a blocked address to prevent more queries from being sent to the VMPS for each new packet received from this workstation. The client ages the address if no new packets are received from this workstation on this port within the aging time period.</td>
</tr>
<tr>
<td>VQP Wrong Domain</td>
<td>Number of times the management domain in the request does not match the one for the VMPS. Any previous VLAN assignments of the port are not changed. This response means that the server and the client have not been configured with the same VTP management domain.</td>
</tr>
<tr>
<td>VQP Wrong Version</td>
<td>Number of times the version field in the query packet contains a value that is higher than the version supported by the VMPS. The VLAN assignment of the port is not changed. The switches send only VMPS Version 1 requests.</td>
</tr>
<tr>
<td>VQP Insufficient Resource</td>
<td>Number of times the VMPS is unable to answer the request because of a resource availability problem. If the retry limit has not yet been reached, the client repeats the request with the same server or with the next alternate server, depending on whether the per-server retry count has been reached.</td>

show vtp

Use the show vtp command in EXEC mode to display general information about the VLAN Trunking Protocol (VTP) management domain, status, and counters.

```
show vtp {counters | devices [conflicts] | interface [interface-id] | password | status}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>counters</td>
<td>Display the VTP statistics for the switch.</td>
</tr>
<tr>
<td>password</td>
<td>Display the configured VTP password.</td>
</tr>
<tr>
<td>devices</td>
<td>Display information about all VTP version 3 devices in the domain. This</td>
</tr>
<tr>
<td></td>
<td>keyword applies only if the switch is not running VTP version 3.</td>
</tr>
<tr>
<td>conflicts</td>
<td>(Optional) Display information about VTP version 3 devices that have</td>
</tr>
<tr>
<td></td>
<td>conflicting primary servers. This command is ignored when the switch is in</td>
</tr>
<tr>
<td></td>
<td>VTP transparent or VPT off mode.</td>
</tr>
<tr>
<td>interface</td>
<td>Display VTP status and configuration for all interfaces or the specified</td>
</tr>
<tr>
<td></td>
<td>interface. The interface-id can be a physical interface or a port channel.</td>
</tr>
<tr>
<td>status</td>
<td>Display general information about the VTP management domain status.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The password keyword was added.</td>
</tr>
<tr>
<td>12.2(52)SE</td>
<td>The devices and interface keywords were added for VTP version 3.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the show vtp password command when the switch is running VTP version 3, the display follows these rules:

- If the password password global configuration command did not specify the hidden keyword and encryption is not enabled on the switch, the password appears in clear text.
- If the password password command did not specify the hidden keyword and encryption is enabled on the switch, the encrypted password appears.
- If the password password command included the hidden keyword, the hexadecimal secret key is displayed.

**Examples**

This is an example of output from the show vtp devices command. A Yes in the Conflict column means that the responding server is in conflict with the local server for the feature; that is, when two switches in the same domain do not have the same primary server for a database.

```
Switch# show vtp devices
Retrieving information from the VTP domain. Waiting for 5 seconds.
VTP Database Conf switch ID Primary Server Revision System Name
```

Catalyst 3750 Switch Command Reference
This is an example of output from the `show vtp counters` command. Table 2-47 describes the fields in the display.

```
Switch# show vtp counters

VTP statistics:
Summary advertisements received : 0
Subset advertisements received : 0
Request advertisements received : 0
Summary advertisements transmitted : 6970
Subset advertisements transmitted : 0
Request advertisements transmitted : 0
Number of config revision errors : 0
Number of config digest errors : 0
Number of V1 summary errors : 0

VTP pruning statistics:

</tbody>
</table>
**Table 2-48  show vtp counters Field Descriptions (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of configuration revision errors</td>
<td>Number of revision errors. Whenever you define a new VLAN, delete an existing one, suspend or resume an existing VLAN, or modify the parameters on an existing VLAN, the configuration revision number of the switch increments. Revision errors increment whenever the switch receives an advertisement whose revision number matches the revision number of the switch, but the MD5 digest values do not match. This error means that the VTP password in the two switches is different or that the switches have different configurations. These errors mean that the switch is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.</td>
</tr>
<tr>
<td>Number of configuration digest errors</td>
<td>Number of MD5 digest errors. Digest errors increment whenever the MD5 digest in the summary packet and the MD5 digest of the received advertisement calculated by the switch do not match. This error usually means that the VTP password in the two switches is different. To solve this problem, make sure the VTP password on all switches is the same. These errors mean that the switch is filtering incoming advertisements, which causes the VTP database to become unsynchronized across the network.</td>
</tr>
<tr>
<td>Number of V1 summary errors</td>
<td>Number of Version 1 errors. Version 1 summary errors increment whenever a switch in VTP V2 mode receives a VTP Version 1 frame. These errors mean that at least one neighboring switch is either running VTP Version 1 or VTP Version 2 with V2-mode disabled. To solve this problem, change the configuration of the switches in VTP V2-mode to disabled.</td>
</tr>
<tr>
<td>Join Transmitted</td>
<td>Number of VTP pruning messages sent on the trunk.</td>
</tr>
<tr>
<td>Join Received</td>
<td>Number of VTP pruning messages received on the trunk.</td>
</tr>
<tr>
<td>Summary Advts Received from non-pruning-capable device</td>
<td>Number of VTP summary messages received on the trunk from devices that do not support pruning.</td>
</tr>
</tbody>
</table>

This is an example of output from the `show vtp status` command for a switch running VTP version 2. Table 2-48 describes the fields in the display.

```
Switch# show vtp status
VTP Version       : 2
Configuration Revision : 0
Maximum VLANs supported locally : 1005
Number of existing VLANs : 45
VTP Operating Mode : Transparent
VTP Domain Name : shared_testbed1
VTP Pruning Mode : Disabled
VTP V2 Mode : Disabled
VTP Traps Generation : Enabled
MD5 digest : 0x3A 0x29 0x86 0x39 0x84 0x5D 0x58 0xD7
```
This is an example of output from the `show vtp status` command for a switch running VTP version 3.

```
Switch# show vtp status
VTP Version capable : 1 to 3
VTP version running : 3
VTP Domain Name : Cisco
VTP Pruning Mode : Disabled
VTP Traps Generation : Disabled
Device ID : 0021.1bcd.c700
```
show vtp

</tbody>
</table>
show vtp
shutdown

Use the **shutdown** interface configuration command to disable an interface. Use the **no** form of this command to restart a disabled interface.

```
shutdown

no shutdown
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The port is enabled (not shut down).

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The **shutdown** command causes a port to stop forwarding. You can enable the port with the **no shutdown** command.

The **no shutdown** command has no effect if the port is a static-access port assigned to a VLAN that has been deleted, suspended, or shut down. The port must first be a member of an active VLAN before it can be re-enabled.

The **shutdown** command disables all functions on the specified interface.

This command also marks the interface as unavailable. To see if an interface is disabled, use the **show interfaces** privileged EXEC command. An interface that has been shut down is shown as administratively down in the display.

**Examples**
These examples show how to disable and re-enable a port:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# shutdown

Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# no shutdown
```

You can verify your settings by entering the **show interfaces** privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show interfaces</strong></td>
<td>Displays the statistical information specific to all interfaces or to a specific interface.</td>
</tr>
</tbody>
</table>
shutdown vlan

Use the `shutdown vlan` global configuration command to shut down (suspend) local traffic on the specified VLAN. Use the `no` form of this command to restart local traffic on the VLAN.

```
shutdown vlan vlan-id
no shutdown vlan vlan-id
```

**Syntax Description**

| `vlan-id` | ID of the VLAN to be locally shut down. The range is 2 to 1001. VLANs defined as default VLANs under the VLAN Trunking Protocol (VTP), as well as extended-range VLANs (greater than 1005) cannot be shut down. The default VLANs are 1 and 1002 to 1005. |

**Defaults**

No default is defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `shutdown vlan` command does not change the VLAN information in the VTP database. The command shuts down local traffic, but the switch still advertises VTP information.

**Examples**

This example shows how to shut down traffic on VLAN 2:

```
Switch(config)# shutdown vlan 2
```

You can verify your setting by entering the `show vlan` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>shutdown</code> (VLAN configuration mode)</td>
<td>Shuts down local traffic on the VLAN when in VLAN configuration mode (accessed by the <code>vlan vlan-id</code> global configuration command).</td>
</tr>
</tbody>
</table>
small-frame violation rate

Use the **small-frame violation rate pps** interface configuration command to configure the rate (threshold) for an interface to be error disabled when it receives VLAN-tagged packets that are small frames (67 bytes or less) at the specified rate. Use the no form of this command to return to the default setting.

```
small-frame violation rate pps
no small-frame violation rate pps
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pps</td>
<td>Specify the threshold at which an interface receiving small frames will be error disabled. The range is 1 to 10,000 packets per second (pps).</td>
</tr>
</tbody>
</table>

**Defaults**

This feature is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command enables the rate (threshold) for a port to be error disabled when it receives small frames. Small frames are considered packets that are 67 frames or less.

Use the `errdisable detect cause small-frame` global configuration command to globally enable the small-frames threshold for each port.

You can configure the port to be automatically re-enabled by using the `errdisable recovery cause small-frame` global configuration command. You configure the recovery time by using the `errdisable recovery interval` interval global configuration command.

**Examples**

This example shows how to enable the small-frame arrival rate feature so that the port is error disabled if incoming small frames arrived at 10,000 pps.

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# small-frame violation rate 10000
```

You can verify your setting by entering the `show interfaces` privileged EXEC command.
<table>
<thead>
<tr>

</table>
snmp-server enable traps

Use the `snmp-server enable traps` global configuration command to enable the switch to send Simple Network Management Protocol (SNMP) notifications for various traps or inform requests to the network management system (NMS). Use the `no` form of this command to return to the default setting.

```
```

```
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bgp</code></td>
<td>(Optional) Enable Border Gateway Protocol (BGP) state-change traps.</td>
</tr>
</tbody>
</table>
| `bridge [newroot] [topologychange]` | (Optional) Generate STP bridge MIB traps. The keywords have these meanings:  
  - `newroot`—(Optional) Enable SNMP STP Bridge MIB new root traps.  
  - `topologychange`—(Optional) Enable SNMP STP Bridge MIB topology change traps. |
| `cluster` | (Optional) Enable cluster traps. |
| `config` | (Optional) Enable SNMP configuration traps. |
| `copy-config` | (Optional) Enable SNMP copy-configuration traps. |
| `cpu threshold` | (Optional) Allow CPU-related traps. |
### snmp-server enable traps

**Syntax:**
```
snmp-server enable traps
```

**Description:**
This command enables the specified traps.

#### dot1x

**Syntax:**
```
dot1x [auth-fail-vlan | guest-vlan | no-auth-fail-vlan | no-guest-vlan]
```

**Description:**
Enables IEEE 802.1x traps. The keywords have these meanings:
- **auth-fail-vlan** — Generate a trap when the port moves to the configured restricted VLAN.
- **guest-vlan** — Generate a trap when the port moves to the configured guest VLAN.
- **no-auth-fail-vlan** — Generate a trap when a port tries to enter the restricted VLAN, but cannot because the restricted VLAN is not configured.
- **no-guest-vlan** — Generate a trap when a port tries to enter the guest VLAN, but cannot because the guest VLAN is not configured.

**Note:** When the `snmp-server enable traps dot1x` command is entered (without any other keywords specified), all the IEEE 802.1x traps are enabled.

#### entity

**Syntax:**
```
entity
```

**Description:**
Enables SNMP entity traps.

#### envmon

**Syntax:**
```
environ [fan | shutdown | status | supply | temperature]
```

**Description:**
Enables SNMP environmental traps. The keywords have these meanings:
- **fan** — Enable fan traps.
- **shutdown** — Enable environmental monitor shutdown traps.
- **status** — Enable SNMP environmental status-change traps.
- **supply** — Enable environmental monitor power-supply traps.
- **temperature** — Enable environmental monitor temperature traps.

#### errdisable

**Syntax:**
```
errdisable [notification-rate value]
```

**Description:**
Enables errdisable traps. Use `notification-rate` keyword to set the maximum value of errdisable traps sent per minute. The range is 0 to 10000; the default is 0 (no limit imposed; a trap is sent at every occurrence).

#### flash

**Syntax:**
```
flash [insertion | removal]
```

**Description:**
Enables SNMP FLASH notifications. The keywords have these meanings:
- **insertion** — Generate a trap when a switch (flash) is inserted into a stack, either physically or because of a power cycle or reload.
- **removal** — Generate a trap when a switch (flash) is removed from a stack, either physically or because of a power cycle or reload.

#### fru-ctrl

**Syntax:**
```
fru-ctrl
```

**Description:**
Generates entity field-replaceable unit (FRU) control traps. In the stack, this trap refers to the insertion or removal of a switch in the stack.

#### hsrp

**Syntax:**
```
hsp
```

**Description:**
Enables Hot Standby Router Protocol (HSRP) traps.

#### ipmulticast

**Syntax:**
```
ipmulticast
```

**Description:**
Enables IP multicast routing traps.

#### mac-notification

**Syntax:**
```
mac-notification
```

**Description:**
Enables MAC address notification traps.

#### change

**Syntax:**
```
change
```

**Description:**
Enables MAC address change notification traps.

#### move

**Syntax:**
```
move
```

**Description:**
Enables MAC address move notification traps.

#### threshold

**Syntax:**
```
threshold
```

**Description:**
Enables MAC address table threshold traps.

#### msdp

**Syntax:**
```
msdp
```

**Description:**
Enables Multicast Source Discovery Protocol (MSDP) traps.
### snmp-server enable traps

**ospf** *(cisco-specific | errors | lsa | rate-limit | retransmit | state-change)*

(Optional) Enable Open Shortest Path First (OSPF) traps. The keywords have these meanings:
- **cisco-specific**—(Optional) Enable Cisco-specific traps.
- **errors**—(Optional) Enable error traps.
- **lsa**—(Optional) Enable link-state advertisement (LSA) traps.
- **rate-limit**—(Optional) Enable rate-limit traps.
- **retransmit**—(Optional) Enable packet-retransmit traps.
- **state-change**—(Optional) Enable state-change traps.

**pim** *(invalid-pim-message | neighbor-change | rp-mapping-change)*

(Optional) Enable Protocol-Independent Multicast (PIM) traps. The keywords have these meanings:
- **invalid-pim-message**—(Optional) Enable invalid PIM message traps.
- **neighbor-change**—(Optional) Enable PIM neighbor-change traps.
- **rp-mapping-change**—(Optional) Enable rendezvous point (RP)-mapping change traps.

**port-security** *(trap-rate value)*

(Optional) Enable port security traps. Use the **trap-rate** keyword to set the maximum number of port-security traps sent per second. The range is from 0 to 1000; the default is 0 (no limit imposed; a trap is sent at every occurrence).

**power-ethernet** *(group name | police)*

(Optional) Enable power-over-Ethernet traps. The keywords have these meanings:
- **group name**—Enable inline power group-based traps for the specified group number or list.
- **police**—Enable inline power policing traps.

**rtr**

(Optional) Enable SNMP Response Time Reporter traps.

**snmp** *(authentication | coldstart | linkdown | linkup | warmstart)*

(Optional) Enable SNMP traps. The keywords have these meanings:
- **authentication**—(Optional) Enable authentication trap.
- **coldstart**—(Optional) Enable cold start trap.
- **linkdown**—(Optional) Enable linkdown trap.
- **linkup**—(Optional) Enable linkup trap.
- **warmstart**—(Optional) Enable warmstart trap.

**stackwise**

(Optional) Enable SNMP stackwise traps.

**storm-control** *(trap-rate value)*

(Optional) Enable storm-control traps. Use the **trap-rate** keyword to set the maximum number of storm-control traps sent per minute. The range is 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence).

**stpx**

(Optional) Enable SNMP STPX MIB traps. The keywords have these meanings:
- **inconsistency**—(Optional) Enable SNMP STPX MIB Inconsistency Update traps.
- **root-inconsistency**—(Optional) Enable SNMP STPX MIB Root Inconsistency Update traps.
- **loop-inconsistency**—(Optional) Enable SNMP STPX MIB Loop Inconsistency Update traps.
snmp-server enable traps

**Note**

The `snmp-server enable informs` global configuration command is not supported. To enable the sending of SNMP inform notifications, use the `snmp-server enable traps` global configuration command combined with the `snmp-server host host-addr informs` global configuration command.

**Defaults**

The sending of SNMP traps is disabled.

**Command Modes**

Global configuration

**Command History**

</tr>
</tbody>
</table>

**Usage Guidelines**

Specify the host (NMS) that receives the traps by using the `snmp-server host` global configuration command. If no trap types are specified, all types are sent.

When supported, use the `snmp-server enable traps` command to enable sending of traps or informs.

**Note**

Informs are not supported in SNMPv1.

To enable more than one type of trap, you must enter a separate `snmp-server enable traps` command for each trap type.

**syslog**  (Optional) Enable SNMP syslog traps.

**tty**  (Optional) Send TCP connection traps. This is enabled by default.

**vlan-membership**  (Optional) Enable SNMP VLAN membership traps.

**vlandelete**  (Optional) Enable SNMP VLAN-deleted traps.

**vtp**  (Optional) Enable VLAN Trunking Protocol (VTP) traps.
To set the CPU threshold notification types and values, use the `process cpu threshold type` global configuration command.

**Examples**

This example shows how to send VTP traps to the NMS:

```
Switch(config)# snmp-server enable traps vtp
```

You can verify your setting by entering the `show vtp status` or the `show running-config` privileged EXEC command.

**Related Commands**

</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Displays the running configuration on the switch.</td>
</tr>
<tr>
<td><code>snmp-server host</code></td>
<td>Specifies the host that receives SNMP traps.</td>
</tr>
</tbody>
</table>
snmp-server host

Use the `snmp-server host` global configuration command to specify the recipient (host) of a Simple Network Management Protocol (SNMP) notification operation. Use the `no` form of this command to remove the specified host.

```
snmp-server host host-addr [informs | traps] [version {1 | 2c | 3 [auth | noauth | priv]}] [vrf vrf-instance] {community-string [notification-type]}
```

```
no snmp-server host host-addr [informs | traps] [version {1 | 2c | 3 [auth | noauth | priv]}] [vrf vrf-instance] community-string
```

### Syntax Description

<table>
<thead>
<tr>
<th><code>host-addr</code></th>
<th>Name or Internet address of the host (the targeted recipient).</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>udp-port port</code></td>
<td>(Optional) Configure the User Datagram Protocol (UDP) port number of the host to receive the traps. The range is 0 to 65535.</td>
</tr>
<tr>
<td>`informs</td>
<td>traps`</td>
</tr>
<tr>
<td>`version 1</td>
<td>2c</td>
</tr>
</tbody>
</table>

These keywords are supported:

- **1**—SNMPv1. This option is not available with informs.
- **2c**—SNMPv2C.
- **3**—SNMPv3. These optional keywords can follow the Version 3 keyword:
  - **auth** (Optional). Enables Message Digest 5 (MD5) and Secure Hash Algorithm (SHA) packet authentication.
  - **noauth** (Default). The noAuthNoPriv security level. This is the default if the `[auth | noauth | priv]` keyword choice is not specified.
  - **priv** (Optional). Enables Data Encryption Standard (DES) packet encryption (also called `privacy`).

**Note** The `priv` keyword is available only when the cryptographic (encrypted) software image is installed.

| `vrf vrf-instance` | (Optional) Virtual private network (VPN) routing instance and name for this host. |
| `community-string` | Password-like community string sent with the notification operation. Though you can set this string by using the `snmp-server host` command, we recommend that you define this string by using the `snmp-server community` global configuration command before using the `snmp-server host` command. |

**Note** The `@` symbol is used for delimiting the context information. Avoid using the `@` symbol as part of the SNMP community string when configuring this command.
**notification-type** (Optional) Type of notification to be sent to the host. If no type is specified, all notifications are sent. The notification type can be one or more of the these keywords:

- **bgp**—Send Border Gateway Protocol (BGP) state change traps. This keyword is available only when the IP services image is installed on the stack master.
- **bridge**—Send SNMP Spanning Tree Protocol (STP) bridge MIB traps.
- **cluster**—Send cluster member status traps.
- **config**—Send SNMP configuration traps.
- **copy-config**—Send SNMP copy configuration traps.
- **cpu threshold**—Allow CPU-related traps.
- **entity**—Send SNMP entity traps.
- **envmon**—Send environmental monitor traps.
- **errdisable**—Send SNMP errdisable notifications.
- **flash**—Send SNMP FLASH notifications.
- **fru-ctrl**—Send entity FRU control traps. In the switch stack, this trap refers to the insertion or removal of a switch in the stack.
- **hsrp**—Send SNMP Hot Standby Router Protocol (HSRP) traps.
- **ipmulticast**—Send SNMP IP multicast routing traps.
- **mac-notification**—Send SNMP MAC notification traps.
- **msdp**—Send SNMP Multicast Source Discovery Protocol (MSDP) traps.
- **ospf**—Send Open Shortest Path First (OSPF) traps.
- **pim**—Send SNMP Protocol-Independent Multicast (PIM) traps.
- **port-security**—Send SNMP port-security traps.
- **rtr**—Send SNMP Response Time Reporter traps.
- **snmp**—Send SNMP-type traps.
- **storm-control**—Send SNMP storm-control traps.
- **stpx**—Send SNMP STP extended MIB traps.
- **syslog**—Send SNMP syslog traps.
- **tty**—Send TCP connection traps.
- **udp-port** *port*—Configure the User Datagram Protocol (UDP) port number of the host to receive the traps. The range is from 0 to 65535.
- **vlan-membership**—Send SNMP VLAN membership traps.
- **vlancreate**—Send SNMP VLAN-created traps.
- **vlandelete**—Send SNMP VLAN-deleted traps.
- **vtp**—Send SNMP VLAN Trunking Protocol (VTP) traps.
### snmp-server host

This command is disabled by default. No notifications are sent.

If you enter this command with no keywords, the default is to send all trap types to the host. No informs are sent to this host.

If no version keyword is present, the default is Version 1.

If Version 3 is selected and no authentication keyword is entered, the default is the noauth (noAuthNoPriv) security level.

### Command Modes

</tr>
</tbody>
</table>

### Usage Guidelines

SNMP notifications can be sent as traps or inform requests. Traps are unreliable because the receiver does not send acknowledgments when it receives traps. The sender cannot determine if the traps were received. However, an SNMP entity that receives an inform request acknowledges the message with an SNMP response PDU. If the sender never receives the response, the inform request can be sent again. Thus, informs are more likely to reach their intended destinations.

However, informs consume more resources in the agent and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request must be held in memory until a response is received or the request times out. Traps are also sent only once, but an inform might be retried several times. The retries increase traffic and contribute to a higher overhead on the network.

If you do not enter an snmp-server host command, no notifications are sent. To configure the switch to send SNMP notifications, you must enter at least one snmp-server host command. If you enter the command with no keywords, all trap types are enabled for the host. To enable multiple hosts, you must enter a separate snmp-server host command for each host. You can specify multiple notification types in the command for each host.

If a local user is not associated with a remote host, the switch does not send informs for the auth (authNoPriv) and the priv (authPriv) authentication levels.

When multiple snmp-server host commands are given for the same host and kind of notification (trap or inform), each succeeding command overwrites the previous command. Only the last snmp-server host command is in effect. For example, if you enter an snmp-server host inform command for a host and then enter another snmp-server host inform command for the same host, the second command replaces the first.
The `snmp-server host` command is used with the `snmp-server enable traps` global configuration command. Use the `snmp-server enable traps` command to specify which SNMP notifications are sent globally. For a host to receive most notifications, at least one `snmp-server enable traps` command and the `snmp-server host` command for that host must be enabled. Some notification types cannot be controlled with the `snmp-server enable traps` command. For example, some notification types are always enabled. Other notification types are enabled by a different command.

The `no snmp-server host` command with no keywords disables traps, but not informs, to the host. To disable informs, use the `no snmp-server host informs` command.

**Examples**

This example shows how to configure a unique SNMP community string named `comaccess` for traps and prevent SNMP polling access with this string through access-list 10:

```bash
Switch(config)# snmp-server community comaccess ro 10
Switch(config)# snmp-server host 172.20.2.160 comaccess
Switch(config)# access-list 10 deny any
```

This example shows how to send the SNMP traps to the host specified by the name `myhost.cisco.com`. The community string is defined as `comaccess`:

```bash
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com comaccess snmp
```

This example shows how to enable the switch to send all traps to the host `myhost.cisco.com` by using the community string `public`:

```bash
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

**Related Commands**

<table>

<tr>
<td><code>snmp-server enable traps</code></td>
<td>Enables SNMP notification for various trap types or inform requests.</td>
</tr>
</tbody>
</table>
snmp trap mac-notification change

Use the `snmp trap mac-notification change` interface configuration command to enable the Simple Network Management Protocol (SNMP) MAC address change notification trap on a specific Layer 2 interface. Use the `no` form of this command to return to the default setting.

```
snmp trap mac-notification change {added | removed}
no snmp trap mac-notification change {added | removed}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>added</code></td>
<td>Enable the MAC notification trap when a MAC address is added on this interface.</td>
</tr>
<tr>
<td><code>removed</code></td>
<td>Enable the MAC notification trap when a MAC address is removed from this interface.</td>
</tr>
</tbody>
</table>

**Defaults**

By default, the traps for both address addition and address removal are disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(40)SE</td>
<td>The word <code>change</code> was added to the command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Even though you enable the notification trap for a specific interface by using the `snmp trap mac-notification change` command, the trap is generated only when you enter the `snmp-server enable traps mac-notification change` and the `mac address-table notification change` global configuration commands.

**Examples**

This example shows how to enable the MAC notification trap when a MAC address is added to a port:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# snmp trap mac-notification change added
```

You can verify your settings by entering the `show mac address-table notification change interface privileged EXEC` command.

</tbody>
</table>
spanning-tree backbonefast

Use the `spanning-tree backbonefast` global configuration command to enable the BackboneFast feature. Use the `no` form of the command to return to the default setting.

```
spanning-tree backbonefast
no spanning-tree backbonefast
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

BackboneFast is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure the BackboneFast feature for rapid PVST+ or for multiple spanning-tree (MST) mode, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

BackboneFast starts when a root port or blocked port on a switch receives inferior BPDUs from its designated switch. An inferior BPU identifies a switch that declares itself as both the root bridge and the designated switch. When a switch receives an inferior BPU, it means that a link to which the switch is not directly connected (an indirect link) has failed (that is, the designated switch has lost its connection to the root switch. If there are alternate paths to the root switch, BackboneFast causes the maximum aging time on the interfaces on which it received the inferior BPU to expire and allows a blocked port to move immediately to the listening state. BackboneFast then transitions the interface to the forwarding state. For more information, see the software configuration guide for this release.

Enable BackboneFast on all supported switches to allow the detection of indirect link failures and to start the spanning-tree reconfiguration sooner.

**Examples**

This example shows how to enable BackboneFast on the switch:

```
Switch(config)# spanning-tree backbonefast
```

You can verify your setting by entering the `show spanning-tree summary` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

| Defaults | BPDU filtering is disabled. |

| Command Modes | Interface configuration |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

| Usage Guidelines | You can enable the BPDU filtering feature when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode. |

⚠️ **Caution**

Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

You can globally enable BPDU filtering on all Port Fast-enabled interfaces by using the `spanning-tree portfast bpdufilter default` global configuration command.

You can use the `spanning-tree bpdufilter` interface configuration command to override the setting of the `spanning-tree portfast bpdufilter default` global configuration command.

<table>
<thead>
<tr>
<th>Examples</th>
<th>This example shows how to enable the BPDU filtering feature on a port:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>Switch(config)# interface gigabitethernet2/0/1</code></td>
</tr>
<tr>
<td></td>
<td><code>Switch(config-if)# spanning-tree bpdufilter enable</code></td>
</tr>
</tbody>
</table>

You can verify your setting by entering the `show running-config` privileged EXEC command.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show running-config</td>
<td>Displays the current operating configuration.</td>
</tr>
<tr>
<td>spanning-tree portfast (global configuration)</td>
<td>Globally enables the BPDU filtering or the BPDU guard feature on Port Fast-enabled interface or enables the Port Fast feature on all nontrunking interfaces.</td>
</tr>
<tr>
<td>spanning-tree portfast (interface configuration)</td>
<td>Enables the Port Fast feature on an interface and all its associated VLANs.</td>
</tr>
</tbody>
</table>
spanning-tree bpduguard

Use the **spanning-tree bpduguard** interface configuration command to put an interface in the error-disabled state when it receives a bridge protocol data unit (BPDU). Use the **no** form of this command to return to the default setting.

```
spanning-tree bpduguard { disable | enable }
no spanning-tree bpduguard
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disable BPDU guard on the specified interface.</td>
</tr>
<tr>
<td>enable</td>
<td>Enable BPDU guard on the specified interface.</td>
</tr>
</tbody>
</table>

### Defaults

BPDU guard is disabled.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an interface from being included in the spanning-tree topology.

You can enable the BPDU guard feature when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode.

You can globally enable BPDU guard on all Port Fast-enabled interfaces by using the **spanning-tree portfast bpduguard default** global configuration command.

You can use the **spanning-tree bpduguard** interface configuration command to override the setting of the **spanning-tree portfast bpduguard default** global configuration command.

### Examples

This example shows how to enable the BPDU guard feature on a port:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# spanning-tree bpduguard enable
```

You can verify your setting by entering the **show running-config** privileged EXEC command.
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Displays the current operating configuration.</td>
</tr>
<tr>

<tr>
<td><code>spanning-tree portfast (interface configuration)</code></td>
<td>Enables the Port Fast feature on an interface and all its associated VLANs.</td>
</tr>
</tbody>
</table>
spanning-tree cost

Use the spanning-tree cost interface configuration command to set the path cost for spanning-tree calculations. If a loop occurs, spanning tree considers the path cost when selecting an interface to place in the forwarding state. Use the no form of this command to return to the default setting.

```
spanning-tree [vlan vlan-id] cost cost
no spanning-tree [vlan vlan-id] cost
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) VLAN range associated with a spanning-tree instance. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</td>
</tr>
<tr>
<td>cost</td>
<td>Path cost. The range is 1 to 200000000, with higher values meaning higher costs.</td>
</tr>
</tbody>
</table>

**Defaults**
The default path cost is computed from the interface bandwidth setting. These are the IEEE default path cost values:

- 1000 Mb/s—4
- 100 Mb/s—19
- 10 Mb/s—100

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The value for the vlan-id variable was changed.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you configure the cost, higher values represent higher costs.

If you configure an interface with both the spanning-tree vlan vlan-id cost cost command and the spanning-tree cost cost command, the spanning-tree vlan vlan-id cost cost command takes effect.

**Examples**

This example shows how to set the path cost to 250 on a port:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# spanning-tree cost 250
```

This example shows how to set a path cost to 300 for VLANs 10, 12 to 15, and 20:

```
Switch(config-if)# spanning-tree vlan 10,12-15,20 cost 300
```

You can verify your settings by entering the show spanning-tree interface interface-id privileged EXEC command.
<table>
<thead>

spanning-tree etherchannel guard misconfig

Use the `spanning-tree etherchannel guard misconfig` global configuration command to display an error message when the switch detects an EtherChannel misconfiguration. Use the `no` form of this command to disable the feature.

```
spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

EtherChannel guard is enabled on the switch.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the switch detects an EtherChannel misconfiguration, this error message appears:

```
PM-4-ERR_DISABLE: Channel-misconfig error detected on [chars], putting [chars] in err-disable state.
```

To show switch ports that are in the misconfigured EtherChannel, use the `show interfaces status err-disabled` privileged EXEC command. To verify the EtherChannel configuration on a remote device, use the `show etherchannel summary` privileged EXEC command on the remote device.

When a port is in the error-disabled state because of an EtherChannel misconfiguration, you can bring it out of this state by entering the `errdisable recovery cause channel-misconfig` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands.

**Examples**

This example shows how to enable the EtherChannel guard misconfiguration feature:

```
Switch(config)# spanning-tree etherchannel guard misconfig
```

You can verify your settings by entering the `show spanning-tree summary` privileged EXEC command.
<table>
<thead>
<tr>

spanning-tree extend system-id

Use the `spanning-tree extend system-id` global configuration command to enable the extended system ID feature.

```
spanning-tree extend system-id
```

**Note**
Though visible in the command-line help strings, the `no` version of this command is not supported. You cannot disable the extended system ID feature.

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The extended system ID is enabled.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The switch supports the IEEE 802.1t spanning-tree extensions. Some of the bits previously used for the switch priority are now used for the extended system ID (VLAN identifier for the per-VLAN spanning-tree plus [PVST+] and rapid PVST+ or as an instance identifier for the multiple spanning tree [MST]).

The spanning tree uses the extended system ID, the switch priority, and the allocated spanning-tree MAC address to make the bridge ID unique for each VLAN or multiple spanning-tree instance. Because the switch stack appears as a single switch to the rest of the network, all switches in the stack use the same bridge ID for a given spanning tree. If the stack master fails, the stack members recalculate their bridge IDs of all running spanning trees based on the new MAC address of the stack master.

Support for the extended system ID affects how you manually configure the root switch, the secondary root switch, and the switch priority of a VLAN. For more information, see the “`spanning-tree mst root`” and the “`spanning-tree vlan`” sections.

If your network consists of switches that do not support the extended system ID and switches that do support it, it is unlikely that the switch with the extended system ID support will become the root switch. The extended system ID increases the switch priority value every time the VLAN number is greater than the priority of the connected switches.

</table>
spanning-tree guard

Use the **spanning-tree guard** interface configuration command to enable root guard or loop guard on all the VLANs associated with the selected interface. Root guard restricts which interface is allowed to be the spanning-tree root port or the path-to-the root for the switch. Loop guard prevents alternate or root ports from becoming designated ports when a failure creates a unidirectional link. Use the **no** form of this command to return to the default setting.

```
spanning-tree guard {loop | none | root}
```

```
no spanning-tree guard
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>loop</td>
<td>Enable loop guard.</td>
</tr>
<tr>
<td>none</td>
<td>Disable root guard or loop guard.</td>
</tr>
<tr>
<td>root</td>
<td>Enable root guard.</td>
</tr>
</tbody>
</table>

**Defaults**

Root guard is disabled.

Loop guard is configured according to the **spanning-tree loopguard default** global configuration command (globally disabled).

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can enable root guard or loop guard when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode.

When root guard is enabled, if spanning-tree calculations cause an interface to be selected as the root port, the interface transitions to the root-inconsistent (blocked) state to prevent the customer’s switch from becoming the root switch or being in the path to the root. The root port provides the best path from the switch to the root switch.

When the **no spanning-tree guard** or the **no spanning-tree guard none** command is entered, root guard is disabled for all VLANs on the selected interface. If this interface is in the root-inconsistent (blocked) state, it automatically transitions to the listening state.

Do not enable root guard on interfaces that will be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and prevented from reaching the forwarding state. The UplinkFast feature is not available when the switch is operating in the rapid-PVST+ or MST mode.

Loop guard is most effective when it is configured on the entire switched network. When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send bridge protocol data units (BPDUs) on root or alternate
ports. When the switch is operating in MST mode, BPDUs are not sent on nonboundary interfaces if the interface is blocked by loop guard in all MST instances. On a boundary interface, loop guard blocks the interface in all MST instances.

To disable root guard or loop guard, use the `spanning-tree guard none` interface configuration command. You cannot enable both root guard and loop guard at the same time.

You can override the setting of the `spanning-tree loopguard default` global configuration command by using the `spanning-tree guard loop` interface configuration command.

### Examples

This example shows how to enable root guard on all the VLANs associated with the specified port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# spanning-tree guard root
```

This example shows how to enable loop guard on all the VLANs associated with the specified port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# spanning-tree guard loop
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

spanning-tree link-type

Use the **spanning-tree link-type** interface configuration command to override the default link-type setting, which is determined by the duplex mode of the interface, and to enable rapid spanning-tree transitions to the forwarding state. Use the **no** form of this command to return to the default setting.

```
spanning-tree link-type { point-to-point | shared }
```

**Syntax Description**
- **point-to-point**: Specify that the link type of an interface is point-to-point.
- **shared**: Specify that the link type of an interface is shared.

**Defaults**
The switch derives the link type of an interface from the duplex mode. A full-duplex interface is considered a point-to-point link, and a half-duplex interface is considered a shared link.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can override the default setting of the link type by using the **spanning-tree link-type** command. For example, a half-duplex link can be physically connected point-to-point to a single interface on a remote switch running the Multiple Spanning Tree Protocol (MSTP) or the rapid per-VLAN spanning-tree plus (rapid-PVST+) protocol and be enabled for rapid transitions.

**Examples**
This example shows how to specify the link type as shared (regardless of the duplex setting) and to prevent rapid transitions to the forwarding state:

```
Switch(config-if)# spanning-tree link-type shared
```

You can verify your setting by entering the **show spanning-tree mst interface interface-id** or the **show spanning-tree interface interface-id** privileged EXEC command.

spanning-tree loopguard default

Use the spanning-tree loopguard default global configuration command to prevent alternate or root ports from becoming designated ports because of a failure that leads to a unidirectional link. Use the no form of this command to return to the default setting.

spanning-tree loopguard default

no spanning-tree loopguard default

Syntax Description
This command has no arguments or keywords.

Defaults
Loop guard is disabled.

Command Modes
Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
You can enable the loop guard feature when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode.

Loop guard is most effective when it is configured on the entire switched network. When the switch is operating in PVST+ or rapid-PVST+ mode, loop guard prevents alternate and root ports from becoming designated ports, and spanning tree does not send bridge protocol data units (BPDUs) on root or alternate ports. When the switch is operating in MST mode, BPDUs are not sent on nonboundary interfaces if the interface is blocked by loop guard in all MST instances. On a boundary interface, loop guard blocks the interface in all MST instances.

Loop guard operates only on interfaces that the spanning tree identifies as point-to-point.

You can override the setting of the spanning-tree loopguard default global configuration command by using the spanning-tree guard loop interface configuration command.

Examples

This example shows how to globally enable loop guard:

Switch(config)# spanning-tree loopguard default

You can verify your settings by entering the show running-config privileged EXEC command.

spanning-tree mode

Use the **spanning-tree mode** global configuration command to enable per-VLAN spanning-tree plus (PVST+), rapid PVST+, or multiple spanning tree (MST) on your switch. Use the **no** form of this command to return to the default setting.

```
spanning-tree mode { mst | pvst | rapid-pvst }
no spanning-tree mode
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>mst</strong></td>
<td>Enable MST and Rapid Spanning Tree Protocol (RSTP) (based on IEEE 802.1s and IEEE 802.1w).</td>
</tr>
<tr>
<td><strong>pvst</strong></td>
<td>Enable PVST+ (based on IEEE 802.1D).</td>
</tr>
<tr>
<td><strong>rapid-pvst</strong></td>
<td>Enable rapid PVST+ (based on IEEE 802.1w).</td>
</tr>
</tbody>
</table>

### Defaults

The default mode is PVST+.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <strong>mst</strong> and <strong>rapid-pvst</strong> keywords were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The switch supports PVST+, rapid PVST+, and MSTP, but only one version can be active at any time: All VLANs run PVST+, all VLANs run rapid PVST+, or all VLANs run MSTP. All stack members run the same version of spanning-tree.

When you enable the MST mode, RSTP is automatically enabled.

⚠️ **Caution** Changing spanning-tree modes can disrupt traffic because all spanning-tree instances are stopped for the previous mode and restarted in the new mode.

### Examples

This example shows to enable MST and RSTP on the switch:

```
Switch(config)# spanning-tree mode mst
```

This example shows to enable rapid PVST+ on the switch:

```
Switch(config)# spanning-tree mode rapid-pvst
```

You can verify your setting by entering the **show running-config** privileged EXEC command.
### Related Commands

<td>Displays the current operating configuration.</td>
</tr>
</tbody>
</table>
spanning-tree mst configuration

Use the `spanning-tree mst configuration` global configuration command to enter multiple spanning-tree (MST) configuration mode through which you configure the MST region. Use the `no` form of this command to return to the default settings.

```
spanning-tree mst configuration
no spanning-tree mst configuration
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The default mapping is that all VLANs are mapped to the common and internal spanning-tree (CIST) instance (instance 0). The default name is an empty string. The revision number is 0.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEC</td>
<td>The <code>instance-id range</code> changed to 1 to 4094.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `spanning-tree mst configuration` command enables the MST configuration mode. These configuration commands are available:

- **abort**: exits the MST region configuration mode without applying configuration changes.
- **exit**: exits the MST region configuration mode and applies all configuration changes.
- **instance instance-id vlan vlan-range**: maps VLANs to an MST instance. The range for the `instance-id` is 1 to 4094. The range for `vlan-range` is 1 to 4094. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma.
- **name name**: sets the configuration name. The `name` string has a maximum length of 32 characters and is case sensitive.
- **no**: negates the `instance`, `name`, and `revision` commands or sets them to their defaults.
- **private-vlan**: Though visible in the command-line help strings, this command is not supported.
- **revision version**: sets the configuration revision number. The range is 0 to 65535.
- **show [current | pending]**: displays the current or pending MST region configuration.

In MST mode, the switch stack supports up to 65 MST instances. The number of VLANs that can be mapped to a particular MST instance is unlimited.
When you map VLANs to an MST instance, the mapping is incremental, and VLANs specified in the command are added to or removed from the VLANs that were previously mapped. To specify a range, use a hyphen; for example, instance 1 vlan 1-63 maps VLANs 1 to 63 to MST instance 1. To specify a series, use a comma; for example, instance 1 vlan 10, 20, 30 maps VLANs 10, 20, and 30 to MST instance 1.

All VLANs that are not explicitly mapped to an MST instance are mapped to the common and internal spanning tree (CIST) instance (instance 0) and cannot be unmapped from the CIST by using the no form of the command.

For two or more switches to be in the same MST region, they must have the same VLAN mapping, the same configuration revision number, and the same name.

### Examples

This example shows how to enter MST configuration mode, map VLANs 10 to 20 to MST instance 1, name the region region1, set the configuration revision to 1, display the pending configuration, apply the changes, and return to global configuration mode:

```
Switch# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 10-20
Switch(config-mst)# name region1
Switch(config-mst)# revision 1
Switch(config-mst)# show pending
Pending MST configuration
Name      [region1]
Revision  1
Instance  Vlans Mapped
---------  ---------------------
0         1-9,21-4094
1         10-20
---------
```

```
Switch(config-mst)# exit
Switch(config)#
```

This example shows how to add VLANs 1 to 100 to the ones already mapped (if any) to instance 2, to move VLANs 40 to 60 that were previously mapped to instance 2 to the CIST instance, to add VLAN 10 to instance 10, and to remove all the VLANs mapped to instance 2 and map them to the CIST instance:

```
Switch(config-mst)# instance 2 vlan 1-100
Switch(config-mst)# no instance 2 vlan 40-60
Switch(config-mst)# instance 10 vlan 10
Switch(config-mst)# no instance 2
```

You can verify your settings by entering the show pending MST configuration command.

<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree mst config</td>
<td>Displays the MST region configuration.</td>
</tr>
</tbody>
</table>
spanning-tree mst cost

Use the `spanning-tree mst cost` interface configuration command to set the path cost for multiple spanning-tree (MST) calculations. If a loop occurs, spanning tree considers the path cost when selecting an interface to put in the forwarding state. Use the `no` form of this command to return to the default setting.

```
spanning-tree mst instance-id cost cost
no spanning-tree mst instance-id cost
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>instance-id</code></td>
<td>Range of spanning-tree instances. You can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</td>
</tr>
<tr>
<td><code>cost</code></td>
<td>Path cost is 1 to 200000000, with higher values meaning higher costs.</td>
</tr>
</tbody>
</table>

**Defaults**

The default path cost is computed from the interface bandwidth setting. These are the IEEE default path cost values:

- 1000 Mb/s—20000
- 100 Mb/s—200000
- 10 Mb/s—2000000

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEC</td>
<td>The <code>instance-id</code> range changed to 1 to 4094.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you configure the cost, higher values represent higher costs.

**Examples**

This example shows how to set a path cost of 250 on a port associated with instances 2 and 4:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# spanning-tree mst 2,4 cost 250
```

You can verify your settings by entering the `show spanning-tree mst interface interface-id` privileged EXEC command.

spanning-tree mst forward-time

Use the `spanning-tree mst forward-time` global configuration command to set the forward-delay time for all multiple spanning-tree (MST) instances. The forwarding time specifies how long each of the listening and learning states last before the interface begins forwarding. Use the `no` form of this command to return to the default setting.

```
spanning-tree mst forward-time seconds

no spanning-tree mst forward-time
```

**Syntax Description**

- `seconds` Length of the listening and learning states. The range is 4 to 30 seconds.

**Defaults**

The default is 15 seconds.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Changing the `spanning-tree mst forward-time` command affects all spanning-tree instances.

**Examples**

This example shows how to set the spanning-tree forwarding time to 18 seconds for all MST instances:

```
Switch(config)# spanning-tree mst forward-time 18
```

You can verify your setting by entering the `show spanning-tree mst` privileged EXEC command.

**Related Commands**

</tbody>
</table>
spanning-tree mst hello-time

Use the **spanning-tree mst hello-time** global configuration command to set the interval between hello bridge protocol data units (BPDUs) sent by root switch configuration messages. Use the **no** form of this command to return to the default setting.

```
spanning-tree mst hello-time seconds

no spanning-tree mst hello-time
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Interval between hello BPDUs sent by root switch configuration messages. The range is 1 to 10 seconds.</td>
</tr>
</tbody>
</table>

### Defaults

The default is 2 seconds.

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

After you set the **spanning-tree mst max-age seconds** global configuration command, if a switch does not receive BPDUs from the root switch within the specified interval, the switch recomputes the spanning-tree topology. The **max-age** setting must be greater than the **hello-time** setting.

Changing the **spanning-tree mst hello-time** command affects all spanning-tree instances.

### Examples

This example shows how to set the spanning-tree hello time to 3 seconds for all multiple spanning-tree (MST) instances:

```
Switch(config)# spanning-tree mst hello-time 3
```

You can verify your setting by entering the **show spanning-tree mst** privileged EXEC command.

spanning-tree mst max-hops

Use the `spanning-tree mst max-hops` global configuration command to set the number of hops in a region before the bridge protocol data unit (BPDU) is discarded and the information held for an interface is aged. Use the `no` form of this command to return to the default setting.

```
spanning-tree mst max-hops hop-count
no spanning-tree mst max-hops
```

**Syntax Description**

`hop-count` Number of hops in a region before the BPDU is discarded. The range is 1 to 255 hops.

**Defaults**

The default is 20 hops.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEC</td>
<td>The <code>hop-count</code> range changed to 1 to 255.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The root switch of the instance always sends a BPDU (or M-record) with a cost of 0 and the hop count set to the maximum value. When a switch receives this BPDU, it decrements the received remaining hop count by one and propagates the decremented count as the remaining hop count in the generated M-records. A switch discards the BPDU and ages the information held for the interface when the count reaches 0.

Changing the `spanning-tree mst max-hops` command affects all spanning-tree instances.

**Examples**

This example shows how to set the spanning-tree max-hops to 10 for all multiple spanning-tree (MST) instances:

```
Switch(config)# spanning-tree mst max-hops 10
```

You can verify your setting by entering the `show spanning-tree mst` privileged EXEC command.
<table>
<thead>
<tr>

</tr>
<tr>
<td><code>spanning-tree mst max-age</code></td>
<td>Sets the interval between messages that the spanning tree receives from the root switch.</td>
</tr>
</tbody>
</table>
spanning-tree mst port-priority

Use the `spanning-tree mst port-priority` interface configuration command to configure an interface priority. If a loop occurs, the Multiple Spanning Tree Protocol (MSTP) can find the interface to put in the forwarding state. Use the `no` form of this command to return to the default setting.

```
spanning-tree mst instance-id port-priority priority
no spanning-tree mst instance-id port-priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-id</td>
<td>Range of spanning-tree instances. You can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.</td>
</tr>
<tr>
<td>priority</td>
<td>The range is 0 to 240 in increments of 16. Valid priority values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. The lower the number, the higher the priority.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is 128.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SEC</td>
<td>The <code>instance-id</code> range changed to 1 to 4094.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can assign higher priority values (lower numerical values) to interfaces that you want selected first and lower priority values (higher numerical values) that you want selected last. If all interfaces have the same priority value, the multiple spanning tree (MST) puts the interface with the lowest interface number in the forwarding state and blocks other interfaces.

If your switch is a member of a switch stack, you must use the `spanning-tree mst [instance-id] cost cost` interface configuration command instead of the `spanning-tree mst [instance vlan-id] port-priority priority` interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values to interfaces that you want selected last.

**Examples**

This example shows how to increase the likelihood that the interface associated with spanning-tree instances 20 and 22 is placed into the forwarding state if a loop occurs:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# spanning-tree mst 20,22 port-priority 0
```

You can verify your settings by entering the `show spanning-tree mst interface interface-id` privileged EXEC command.

spanning-tree mst pre-standard

Use the `spanning-tree mst pre-standard` interface configuration command to configure a port to send only prestandard bridge protocol data units (BPDUs).

```
spanning-tree mst pre-standard

no spanning-tree mst pre-standard
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

The default state is automatic detection of prestandard neighbors.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEC</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The port can accept both prestandard and standard BPDUs. If the neighbor types are mismatched, only the common and internal spanning tree (CIST) runs on this interface.

**Note**

If a switch port is connected to a switch running prestandard Cisco IOS software, you must use the `spanning-tree mst pre-standard` interface configuration command on the port. If you do not configure the port to send only prestandard BPDUs, the Multiple STP (MSTP) performance might diminish.

When the port is configured to automatically detect prestandard neighbors, the `prestandard` flag always appears in the `show spanning-tree mst` commands.

**Examples**

This example shows how to configure a port to send only prestandard BPDUs:

```
Switch(config-if)# spanning-tree mst pre-standard
```

You can verify your settings by entering the `show spanning-tree mst` privileged EXEC command.

spanning-tree mst priority

Use the `spanning-tree mst priority` global configuration command to set the switch priority for the specified spanning-tree instance. Use the `no` form of this command to return to the default setting.

`spanning-tree mst instance-id priority priority`

`no spanning-tree mst instance-id priority`

**Syntax Description**

| instance-id | Range of spanning-tree instances. You can specify a single instance, a range of instances separated by a hyphen, or a series of instances separated by a comma. The range is 0 to 4094.
| priority | Set the switch priority for the specified spanning-tree instance. This setting affects the likelihood that the switch is selected as the root switch. A lower value increases the probability that the switch is selected as the root switch.

The range is 0 to 61440 in increments of 4096. Valid priority values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440. All other values are rejected.

**Defaults**

The default is 32768.

**Command Modes**

Global configuration

**Command History**

<td>(Optional) Set the interval between hello bridge protocol data units (BPDUs) sent by the root switch configuration messages. The range is 1 to 10 seconds. This keyword is available only for MST instance 0.</td>
</tr>
</tbody>
</table>

**Defaults**

- The primary root switch priority is 24576.
- The secondary root switch priority is 28672.
- The hello time is 2 seconds.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `spanning-tree mst instance-id root` command only on backbone switches.

When you enter the `spanning-tree mst instance-id root` command, the software tries to set a high enough priority to make this switch the root of the spanning-tree instance. Because of the extended system ID support, the switch sets the switch priority for the instance to 24576 if this value will cause this switch to become the root for the specified instance. If any root switch for the specified instance has a switch priority lower than 24576, the switch sets its own priority to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value.)
When you enter the `spanning-tree mst instance-id root secondary` command, because of support for the extended system ID, the software changes the switch priority from the default value (32768) to 28672. If the root switch fails, this switch becomes the next root switch (if the other switches in the network use the default switch priority of 32768 and are therefore unlikely to become the root switch).

**Examples**

This example shows how to configure the switch as the root switch for instance 10 with a network diameter of 4:

```
Switch(config)# spanning-tree mst 10 root primary diameter 4
```

This example shows how to configure the switch as the secondary root switch for instance 10 with a network diameter of 4:

```
Switch(config)# spanning-tree mst 10 root secondary diameter 4
```

You can verify your settings by entering the `show spanning-tree mst instance-id` privileged EXEC command.

**Related Commands**

spanning-tree port-priority

Use the `spanning-tree port-priority` interface configuration command to configure an interface priority. If a loop occurs, spanning tree can find the interface to put in the forwarding state. Use the `no` form of this command to return to the default setting.

```
spanning-tree [vlan vlan-id] port-priority priority

no spanning-tree [vlan vlan-id] port-priority
```

**Syntax Description**

- **vlan vlan-id**: (Optional) VLAN range associated with a spanning-tree instance. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.
- **priority**: Number from 0 to 240, in increments of 16. Valid values are 0, 16, 32, 48, 64, 80, 96, 112, 128, 144, 160, 176, 192, 208, 224, and 240. All other values are rejected. The lower the number, the higher the priority.

**Defaults**

The default is 128.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(5)M</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA</td>
<td>The value for the <code>vlan-id</code> variable was changed. The priority range values changed.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the variable `vlan-id` is omitted, the command applies to the spanning-tree instance associated with VLAN 1.

You can set the priority on a VLAN that has no interfaces assigned to it. The setting takes effect when you assign the interface to the VLAN.

If you configure an interface with both the `spanning-tree vlan vlan-id port-priority priority` command and the `spanning-tree port-priority priority` command, the `spanning-tree vlan vlan-id port-priority priority` command takes effect.

If your switch is a member of a switch stack, you must use the `spanning-tree [vlan vlan-id] cost cost` interface configuration command instead of the `spanning-tree [vlan vlan-id] port-priority priority` interface configuration command to select an interface to put in the forwarding state. Assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last.
**Examples**

This example shows how to increase the likelihood that a port will be put in the forwarding state if a loop occurs:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# spanning-tree vlan 20 port-priority 0
```

This example shows how to set the port-priority value on VLANs 20 to 25:

```
Switch(config-if)# spanning-tree vlan 20-25 port-priority 0
```

You can verify your settings by entering the `show spanning-tree interface interface-id` privileged EXEC command.

</table>
spanning-tree portfast (global configuration)

Use the `spanning-tree portfast` global configuration command to globally enable bridge protocol data unit (BPDU) filtering on Port Fast-enabled interfaces, the BPDU guard feature on Port Fast-enabled interfaces, or the Port Fast feature on all nontrunking interfaces. The BPDU filtering feature prevents the switch interface from sending or receiving BPDUs. The BPDU guard feature puts Port Fast-enabled interfaces that receive BPDUs in an error-disabled state. Use the `no` form of this command to return to the default settings.

```plaintext
spanning-tree portfast {bpdufilter default | bpduguard default | default}
no spanning-tree portfast {bpdufilter default | bpduguard default | default}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bpdufilter default</code></td>
<td>Globally enable BPDU filtering on Port Fast-enabled interfaces and prevent the switch interface connected to end stations from sending or receiving BPDUs.</td>
</tr>
<tr>
<td><code>bpduguard default</code></td>
<td>Globally enable the BPDU guard feature on Port Fast-enabled interfaces and place the interfaces that receive BPDUs in an error-disabled state.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>Globally enable the Port Fast feature on all nontrunking interfaces. When the Port Fast feature is enabled, the interface changes directly from a blocking state to a forwarding state without making the intermediate spanning-tree state changes.</td>
</tr>
</tbody>
</table>

**Defaults**
The BPDU filtering, the BPDU guard, and the Port Fast features are disabled on all interfaces unless they are individually configured.

**Command Modes**
Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can enable these features when the switch is operating in the per-VLAN spanning-tree plus (PVST+) rapid-PVST+, or the multiple spanning-tree (MST) mode.

Use the `spanning-tree portfast bpdufilter default` global configuration command to globally enable BPDU filtering on interfaces that are Port Fast-enabled (the interfaces are in a Port Fast-operational state). The interfaces still send a few BPDUs at link-up before the switch begins to filter outbound BPDUs. You should globally enable BPDU filtering on a switch so that hosts connected to switch interfaces do not receive BPDUs. If a BPDU is received on a Port Fast-enabled interface, the interface loses its Port Fast-operational status and BPDU filtering is disabled.

You can override the `spanning-tree portfast bpdufilter default` global configuration command by using the `spanning-tree bpdufilter` interface configuration command.
Enabling BPDU filtering on an interface is the same as disabling spanning tree on it and can result in spanning-tree loops.

Use the `spanning-tree portfast bpduguard default` global configuration command to globally enable BPDU guard on interfaces that are in a Port Fast-operational state. In a valid configuration, Port Fast-enabled interfaces do not receive BPDUs. Receiving a BDU on a Port Fast-enabled interface signals an invalid configuration, such as the connection of an unauthorized device, and the BPDU guard feature puts the interface in the error-disabled state. The BPDU guard feature provides a secure response to invalid configurations because you must manually put the interface back in service. Use the BPDU guard feature in a service-provider network to prevent an access port from participating in the spanning tree.

You can override the `spanning-tree portfast bpduguard default` global configuration command by using the `spanning-tree bpduguard` interface configuration command.

Use the `spanning-tree portfast default` global configuration command to globally enable the Port Fast feature on all nontrunking interfaces. Configure Port Fast only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation. A Port Fast-enabled interface moves directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-delay time.

You can override the `spanning-tree portfast default` global configuration command by using the `spanning-tree portfast` interface configuration command. You can use the `no spanning-tree portfast default` global configuration command to disable Port Fast on all interfaces unless they are individually configured with the `spanning-tree portfast` interface configuration command.

Examples

This example shows how to globally enable the BPDU filtering feature:

```
Switch(config)# spanning-tree portfast bpdufilter default
```

This example shows how to globally enable the BPDU guard feature:

```
Switch(config)# spanning-tree portfast bpduguard default
```

This example shows how to globally enable the Port Fast feature on all nontrunking interfaces:

```
Switch(config)# spanning-tree portfast default
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

</tbody>
</table>
spanning-tree portfast (interface configuration)

Use the `spanning-tree portfast` interface configuration command to enable the Port Fast feature on an interface in all its associated VLANs. When the Port Fast feature is enabled, the interface changes directly from a blocking state to a forwarding state without making the intermediate spanning-tree state changes. Use the `no` form of this command to return to the default setting.

```
spanning-tree portfast [disable | trunk]

no spanning-tree portfast
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>(Optional) Disable the Port Fast feature on the specified interface.</td>
</tr>
<tr>
<td>trunk</td>
<td>(Optional) Enable the Port Fast feature on a trunking interface.</td>
</tr>
</tbody>
</table>

| Defaults | The Port Fast feature is disabled on all interfaces; however, it is automatically enabled on dynamic-access ports. |

| Command Modes | Interface configuration |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

| Usage Guidelines | Use this feature only on interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt switch and network operation. |

To enable Port Fast on trunk ports, you must use the `spanning-tree portfast trunk` interface configuration command. The `spanning-tree portfast` command is not supported on trunk ports.

You can enable this feature when the switch is operating in the per-VLAN spanning-tree plus (PVST+), rapid-PVST+, or the multiple spanning-tree (MST) mode.

This feature affects all VLANs on the interface.

An interface with the Port Fast feature enabled is moved directly to the spanning-tree forwarding state without the standard forward-time delay.

You can use the `spanning-tree portfast default` global configuration command to globally enable the Port Fast feature on all nontrunking interfaces. However, the `spanning-tree portfast` interface configuration command can override the global setting.

If you configure the `spanning-tree portfast default` global configuration command, you can disable Port Fast on an interface that is not a trunk interface by using the `spanning-tree portfast disable` interface configuration command.
Examples

This example shows how to enable the Port Fast feature on a port:

```
Switch(config)# interface gigabitethernet2/0/2
Switch(config-if)# spanning-tree portfast
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

spanning-tree transmit hold-count

Use the `spanning-tree transmit hold-count` global configuration command to configure the number of bridge protocol data units (BPDUs) sent every second. Use the `no` form of this command to return to the default setting.

```
spanning-tree transmit hold-count [value]
no spanning-tree transmit hold-count [value]
```

**Syntax Description**

| value | (Optional) Number of BPDUs sent every second. The range is 1 to 20. |

**Defaults**

The default is 6.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SEC</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Increasing the transmit hold-count value can have a significant impact on CPU utilization when the switch is in rapid-per-VLAN spanning-tree plus (rapid-PVST+) mode. Decreasing this value might slow down convergence. We recommend using the default setting.

**Examples**

This example shows how to set the transmit hold count to 8:

```
Switch(config)# spanning-tree transmit hold-count 8
```

You can verify your setting by entering the `show spanning-tree mst` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>

</tbody>
</table>
spanning-tree uplinkfast

Use the `spanning-tree uplinkfast` global configuration command to accelerate the choice of a new root port when a link or switch fails or when the spanning tree reconfigures itself. Use the `no` form of this command to return to the default setting.

```
spanning-tree uplinkfast [max-update-rate pkts-per-second]
no spanning-tree uplinkfast [max-update-rate]
```

**Syntax Description**

| Syntax Description | max-update-rate pkts-per-second | (Optional) The number of packets per second at which update packets are sent. The range is 0 to 32000. |

**Defaults**

UplinkFast is disabled.
The update rate is 150 packets per second.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <code>max-update-rate</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command only on access switches.

You can configure the UplinkFast feature for rapid PVST+ or for multiple spanning-tree (MST) mode, but the feature remains disabled (inactive) until you change the spanning-tree mode to PVST+.

When you enable UplinkFast, it is enabled for the entire switch and cannot be enabled for individual VLANs.

When you enable or disable UplinkFast, cross-stack UplinkFast (CSUF) also is automatically enabled or disabled on all nonstack port interfaces. CSUF accelerates the choice of a new root port when a link or switch fails or when spanning tree reconfigures itself.

When UplinkFast is enabled, the switch priority of all VLANs is set to 49152. If you change the path cost to a value less than 3000 and you enable UplinkFast or UplinkFast is already enabled, the path cost of all interfaces and VLAN trunks is increased by 3000 (if you change the path cost to 3000 or above, the path cost is not altered). The changes to the switch priority and the path cost reduces the chance that a switch will become the root switch.

When UplinkFast is disabled, the switch priorities of all VLANs and path costs of all interfaces are set to default values if you did not modify them from their defaults.

When spanning tree detects that the root port has failed, UplinkFast immediately changes to an alternate root port, changing the new root port directly to forwarding state. During this time, a topology change notification is sent.
Do not enable the root guard on interfaces that will be used by the UplinkFast feature. With UplinkFast, the backup interfaces (in the blocked state) replace the root port in the case of a failure. However, if root guard is also enabled, all the backup interfaces used by the UplinkFast feature are placed in the root-inconsistent state (blocked) and prevented from reaching the forwarding state.

If you set the max-update-rate to 0, station-learning frames are not generated, so the spanning-tree topology converges more slowly after a loss of connectivity.

Examples

This example shows how to enable UplinkFast:

```
Switch(config)# spanning-tree uplinkfast
```

You can verify your setting by entering the `show spanning-tree summary` privileged EXEC command.

<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The value for the <code>vlan-id</code> variable was changed.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Disabling the STP causes the VLAN to stop participating in the spanning-tree topology. Interfaces that are administratively down remain down. Received BPDUs are forwarded like other multicast frames. The VLAN does not detect and prevent loops when STP is disabled.

You can disable the STP on a VLAN that is not currently active and verify the change by using the `show running-config` or the `show spanning-tree vlan vlan-id` privileged EXEC command. The setting takes effect when the VLAN is activated.

When disabling or re-enabling the STP, you can specify a range of VLANs that you want to disable or enable.

When a VLAN is disabled and then enabled, all assigned VLANs continue to be its members. However, all spanning-tree bridge parameters are returned to their previous settings (the last setting before the VLAN was disabled).

You can enable spanning-tree options on a VLAN that has no interfaces assigned to it. The setting takes effect when you assign interfaces to it.

When setting the `max-age seconds`, if a switch does not receive BPDUs from the root switch within the specified interval, it recomputes the spanning-tree topology. The `max-age` setting must be greater than the `hello-time` setting.

The `spanning-tree vlan vlan-id root` command should be used only on backbone switches.

When you enter the `spanning-tree vlan vlan-id root` command, the software checks the switch priority of the current root switch for each VLAN. Because of the extended system ID support, the switch sets the switch priority for the specified VLAN to 24576 if this value will cause this switch to become the root for the specified VLAN. If any root switch for the specified VLAN has a switch priority lower than 24576, the switch sets its own priority for the specified VLAN to 4096 less than the lowest switch priority. (4096 is the value of the least-significant bit of a 4-bit switch priority value.)

When you enter the `spanning-tree vlan vlan-id root secondary` command, because of support for the extended system ID, the software changes the switch priority from the default value (32768) to 28672. If the root switch should fail, this switch becomes the next root switch (if the other switches in the network use the default switch priority of 32768, and therefore, are unlikely to become the root switch).

**Examples**

This example shows how to disable the STP on VLAN 5:

```
Switch(config)# no spanning-tree vlan 5
```

You can verify your setting by entering the `show spanning-tree` privileged EXEC command. In this instance, VLAN 5 does not appear in the list.

This example shows how to set the spanning-tree forwarding time to 18 seconds for VLANs 20 and 25:

```
Switch(config)# spanning-tree vlan 20,25 forward-time 18
```
This example shows how to set the spanning-tree hello-delay time to 3 seconds for VLANs 20 to 24:

```
Switch(config)# spanning-tree vlan 20-24 hello-time 3
```

This example shows how to set spanning-tree max-age to 30 seconds for VLAN 20:

```
Switch(config)# spanning-tree vlan 20 max-age 30
```

This example shows how to reset the `max-age` parameter to the default value for spanning-tree instance 100 and 105 to 108:

```
Switch(config)# no spanning-tree vlan 100, 105-108 max-age
```

This example shows how to set the spanning-tree priority to 8192 for VLAN 20:

```
Switch(config)# spanning-tree vlan 20 priority 8192
```

This example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:

```
Switch(config)# spanning-tree vlan 10 root primary diameter 4
```

This example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:

```
Switch(config)# spanning-tree vlan 10 root secondary diameter 4
```

You can verify your settings by entering the `show spanning-tree vlan vlan-id` privileged EXEC command.

</tr>
<tr>
<td>12.2(20)SE1</td>
<td>Support for the 10, 100, and 1000 keywords with the auto keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot configure speed on the 10-Gigabit Ethernet ports.

Except for the 1000BASE-T SFP modules, if an SFP module port is connected to a device that does not support autonegotiation, you can configure the speed to not negotiate (nonegotiate).

If the speed is set to `auto`, the switch negociates with the device at the other end of the link for the speed setting and then forces the speed setting to the negotiated value. The duplex setting remains as configured on each end of the link, which could result in a duplex setting mismatch.

If both ends of the line support autonegotiation, we highly recommend the default autonegotiation settings. If one interface supports autonegotiation and the other end does not, do use the `auto` setting on the supported side, but set the duplex and speed on the other side.

**Caution**

Changing the interface speed and duplex mode configuration might shut down and re-enable the interface during the reconfiguration.
For guidelines on setting the switch speed and duplex parameters, see the “Configuring Interface Characteristics” chapter in the software configuration guide for this release.

**Examples**

This example shows how to set the speed on a port to 100 Mb/s:

```text
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed 100
```

This example shows how to set a port to autonegotiate at only 10 Mb/s:

```text
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed auto 10
```

This example shows how to set a port to autonegotiate at only 10 or 100 Mb/s:

```text
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# speed auto 10 100
```

You can verify your settings by entering the `show interfaces` privileged EXEC command.

srr-queue bandwidth limit

Use the `srr-queue bandwidth limit` interface configuration command to limit the maximum output on a port. Use the `no` form of this command to return to the default setting.

```
srr-queue bandwidth limit weight1
no srr-queue bandwidth limit
```

**Syntax Description**

| weight1 | Percentage of the port speed to which the port should be limited. The range is 10 to 90. |

**Defaults**

The port is not rate limited and is set to 100 percent.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you configure this command to 80 percent, the port is idle 20 percent of the time. The line rate drops to 80 percent of the connected speed. These values are not exact because the hardware adjusts the line rate in increments of six.

This command is not available on a 10-Gigabit Ethernet interface.

**Note**

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your quality of service (QoS) solution.

**Examples**

This example shows how to limit a port to 800 Mb/s:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth limit 80
```

You can verify your settings by entering the `show mls qos interface [interface-id] queueing` privileged EXEC command.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mls qos queue-set output buffers</td>
<td>Allocates buffers to the queue-set.</td>
</tr>
<tr>
<td>mls qos srr-queue output cos-map</td>
<td>Maps class of service (CoS) values to egress queue or maps CoS values to a queue and to a threshold ID.</td>

</tr>
</tbody>
</table>
srr-queue bandwidth shape

Use the **srr-queue bandwidth shape** interface configuration command to assign the shaped weights and to enable bandwidth shaping on the four egress queues mapped to a port. Use the **no** form of this command to return to the default setting.

```
srr-queue bandwidth shape weight1 weight2 weight3 weight4

no srr-queue bandwidth shape
```

**Syntax Description**

- **weight1 weight2** Specify the weights to specify the percentage of the port that is shaped. The inverse ratio \(1/weight\) specifies the shaping bandwidth for this queue.
- **weight3 weight4** Separate each value with a space. The range is 0 to 65535.

**Defaults**

Weight1 is set to 25. Weight2, weight3, and weight4 are set to 0, and these queues are in shared mode.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In shaped mode, the queues are guaranteed a percentage of the bandwidth, and they are rate-limited to that amount. Shaped traffic does not use more than the allocated bandwidth even if the link is idle. Use shaping to smooth bursty traffic or to provide a smoother output over time.

The shaped mode overrides the shared mode.

If you configure a shaped queue weight to 0 by using the **srr-queue bandwidth shape** interface configuration command, this queue participates in shared mode. The weight specified with the **srr-queue bandwidth share** command is ignored, and the weights specified with the **srr-queue bandwidth share** interface configuration command for a queue come into effect.

When configuring queues for the same port for both shaping and sharing, make sure that you configure the lowest numbered queue for shaping.

This command is not available on a 10-Gigabit Ethernet interface.

**Note**

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.
Examples

This example shows how to configure the queues for the same port for both shaping and sharing. Because the weight ratios for queues 2, 3, and 4 are set to 0, these queues operate in shared mode. The bandwidth weight for queue 1 is 1/8, which is 12.5 percent. Queue 1 is guaranteed this bandwidth and limited to it; it does not extend its slot to the other queues even if the other queues have no traffic and are idle. Queues 2, 3, and 4 are in shared mode, and the setting for queue 1 is ignored. The bandwidth ratio allocated for the queues in shared mode is 4/(4+4+4), which is 33 percent:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth shape 8 0 0 0
Switch(config-if)# srr-queue bandwidth share 4 4 4 4
```

You can verify your settings by entering the `show mls qos interface [interface-id] queueing` privileged EXEC command.

</tr>
<tr>
<td>srr-queue bandwidth share</td>
<td>Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.</td>
</tr>
</tbody>
</table>
srr-queue bandwidth share

Use the `srr-queue bandwidth share` interface configuration command switch to assign the shared weights and to enable bandwidth sharing on the four egress queues mapped to a port. The ratio of the weights is the ratio of frequency in which the shaped round robin (SRR) scheduler dequeues packets from each queue. Use the `no` form of this command to return to the default setting.

```
srr-queue bandwidth share weight1 weight2 weight3 weight4

no srr-queue bandwidth share
```

**Syntax Description**

<table>
<thead>
<tr>
<th>weight1</th>
<th>weight2</th>
<th>weight3</th>
<th>weight4</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The ratios of `weight1`, `weight2`, `weight3`, and `weight4` specify the ratio of the frequency in which the SRR scheduler dequeues packets. Separate each value with a space. The range is 1 to 255.

**Defaults**

Weight1, weight2, weight3, and weight4 are 25 (1/4 of the bandwidth is allocated to each queue).

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The absolute value of each weight is meaningless, and only the ratio of parameters is used.

In shared mode, the queues share the bandwidth among them according to the configured weights. The bandwidth is guaranteed at this level but not limited to it. For example, if a queue empties and does not require a share of the link, the remaining queues can expand into the unused bandwidth and share it among themselves.

If you configure a shaped queue weight to 0 by using the `srr-queue bandwidth shape` interface configuration command, this queue participates in SRR shared mode. The weight specified with the `srr-queue bandwidth shape` command is ignored, and the weights specified with the `srr-queue bandwidth share` interface configuration command for a queue take effect.

When configuring queues for the same port for both shaping and sharing, make sure that you configure the lowest numbered queue for shaping.

**Note**

The egress queue default settings are suitable for most situations. You should change them only when you have a thorough understanding of the egress queues and if these settings do not meet your QoS solution.
This example shows how to configure the weight ratio of the SRR scheduler running on an egress port. Four queues are used. The bandwidth ratio allocated for each queue in shared mode is \(1/(1+2+3+4)\), \(2/(1+2+3+4)\), \(3/(1+2+3+4)\), and \(4/(1+2+3+4)\), which is 10 percent, 20 percent, 30 percent, and 40 percent for queues 1, 2, 3, and 4. This means that queue 4 has four times the bandwidth of queue 1, twice the bandwidth of queue 2, and one-and-a-third times the bandwidth of queue 3.

```plaintext
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# srr-queue bandwidth share 1 2 3 4
```

You can verify your settings by entering the `show mls qos interface [interface-id] queueing` privileged EXEC command.

stack-mac persistent timer

Use the stack-mac persistent timer global configuration command on the switch stack to enable the persistent MAC address feature. When this feature is enabled, if the stack master changes, the stack MAC address does not change for approximately 4 minutes, for an indefinite time period, or for a configured time value. If the previous stack master rejoins the stack during this period, the stack continues to use its MAC address as the stack MAC address, even if it is now a stack member. Use the no form of this command to disable the persistent MAC address feature.

```
stack-mac persistent timer [0 | time-value]
no stack-mac persistent timer
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>(Optional) Enter to continue using the MAC address of the current stack master after a new stack master takes over.</td>
</tr>
<tr>
<td>time-value</td>
<td>(Optional) Set the time period in minutes before the stack MAC address changes to that of the new stack master. The range is 1 to 60 minutes. When no value is entered, the default is 4 minutes. We recommend that you configure an explicit value for this command.</td>
</tr>
</tbody>
</table>

**Command Default**

Persistent MAC address is disabled. The MAC address of the stack is always that of the stack master. When the command is entered with no value, the default time before the MAC address changes is four minutes. We recommend that you configure an explicit value for this command.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(35)SE</td>
<td>The time-value variable was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The MAC address of the switch stack is determined by the MAC address of the stack master. In the default state (persistent MAC address disabled), if a new switch becomes stack master, the stack MAC address changes to the MAC address of the new stack master.

When persistent MAC address is enabled, the stack MAC address does not change for a time period. During that time, if the previous stack master rejoins the stack as a stack member, the stack retains its MAC address for as long as that switch is in the stack. If the previous stack master does not rejoin the stack during the specified time period, the switch stack takes the MAC address of the new stack master as the stack MAC address.
You can set the time period to be from 0 to 60 minutes.

- If you enter the command with no value, the default delay is 4 minutes.
- If you enter 0, the stack continues to use the current stack MAC address until you enter the `no stack-mac persistent timer` command.
- If you enter a time delay of 1 to 60 minutes, the stack MAC address of the previous stack master is used until the configured time period expires or until you enter the `no stack-mac persistent timer` command.

**Note**

When you enter the `stack-mac persistent timer` command with or without keywords, a message appears warning that traffic might be lost if the old master MAC address appears elsewhere in the network domain. You should use this feature cautiously.

If you enter the `no stack-mac persistent timer` command after a switchover, before the time expires, the switch stack moves to the current stack master MAC address.

If the whole stack reloads, when it comes back up, the MAC address of the stack master is the stack MAC address.

**Examples**

This example shows how to configure the persistent MAC address feature, with the warning messages for each configuration. It also shows how to verify the configuration:

```
Switch(config)# stack-mac persistent timer
WARNING: Use of an explicit timer value with the command is recommended
WARNING: Default value of 4 minutes is being used.
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.

Switch(config)# stack-mac persistent timer 0
WARNING: Stack MAC persistency timer value of 0 means that, after a
WARNING: master switchover, the current stack-mac will continue
WARNING: to be used indefinitely.
WARNING: The Network Administrators must make sure that the old
WARNING: stack-mac does not appear elsewhere in this network
WARNING: domain. If it does, user traffic may be blackholed.

Switch(config)# stack-mac persistent timer 7
WARNING: The stack continues to use the base MAC of the old Master
WARNING: as the stack MAC after a master switchover until the MAC
WARNING: persistency timer expires. During this time the Network
WARNING: Administrators must make sure that the old stack-mac does
WARNING: not appear elsewhere in this network domain. If it does,
WARNING: user traffic may be blackholed.

Switch(config)# end
Switch# show switch
Switch/Stack Mac Address : 0016.4727.a900
Mac persistency wait time: 7 mins

<table>
<thead>

**level level**

Specify the rising and falling suppression levels as a percentage of total bandwidth of the port.

- *level*—Rising suppression level, up to two decimal places. The range is 0.00 to 100.00. Block the flooding of storm packets when the value specified for *level* is reached.

- *level-low*—(Optional) Falling suppression level, up to two decimal places. The range is 0.00 to 100.00. This value must be less than or equal to the rising suppression value. If you do not configure a falling suppression level, it is set to the rising suppression level.

<table>
<thead>
<tr>
<th>level bps bps</th>
<th>Specify the rising and falling suppression levels as a rate in bits per second at which traffic is received on the port.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <em>bps</em>—Rising suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. Block the flooding of storm packets when the value specified for <em>bps</em> is reached.</td>
</tr>
<tr>
<td></td>
<td>• <em>bps-low</em>—(Optional) Falling suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. This value must be equal to or less than the rising suppression value.</td>
</tr>
</tbody>
</table>

You can use metric suffixes such as k, m, and g for large number thresholds.

<table>
<thead>
<tr>
<th>level pps pps</th>
<th>Specify the rising and falling suppression levels as a rate in packets per second at which traffic is received on the port.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• <em>pps</em>—Rising suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. Block the flooding of storm packets when the value specified for <em>pps</em> is reached.</td>
</tr>
<tr>
<td></td>
<td>• <em>pps-low</em>—(Optional) Falling suppression level, up to 1 decimal place. The range is 0.0 to 10000000000.0. This value must be equal to or less than the rising suppression value.</td>
</tr>
</tbody>
</table>

You can use metric suffixes such as k, m, and g for large number thresholds.
action {shutdown | trap}  

Action taken when a storm occurs on a port. The default action is to filter traffic and to not send an Simple Network Management Protocol (SNMP) trap.

The keywords have these meanings:

- **shutdown**—Disables the port during a storm.
- **trap**—Sends an SNMP trap when a storm occurs.

**Defaults**  
Broadcast, multicast, and unicast storm control are disabled.

The default action is to filter traffic and to not send an SNMP trap.

**Command Modes**  
Interface configuration

**Command History**  

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <strong>level</strong> level [.level] options were replaced with the <strong>level</strong> {level [level-low] [pps pps-low]</td>
</tr>
</tbody>
</table>

**Usage Guidelines**  

The storm-control suppression level can be entered as a percentage of total bandwidth of the port, as a rate in packets per second at which traffic is received, or as a rate in bits per second at which traffic is received.

When specified as a percentage of total bandwidth, a suppression value of 100 percent means that no limit is placed on the specified traffic type. A value of **level 0 0** means that all broadcast, multicast, or unicast traffic on that port is blocked. Storm control is enabled only when the rising suppression level is less than 100 percent. If no other storm-control configuration is specified, the default action is to filter the traffic causing the storm and to send no SNMP traps.

**Note**  
When the storm control threshold for multicast traffic is reached, all multicast traffic except control traffic, such as bridge protocol data unit (BDPU) and Cisco Discovery Protocol (CDP) frames, are blocked. However, the switch does not differentiate between routing updates, such as Open Shortest Path First (OSPF) and regular multicast data traffic, so both types of traffic are blocked.

The **trap** and **shutdown** options are independent of each other.

If you configure the action to be taken as shutdown (the port is error-disabled during a storm) when a packet storm is detected, you must use the **no shutdown** interface configuration command to bring the interface out of this state. If you do not specify the **shutdown** action, specify the action as **trap** (the switch generates a trap when a storm is detected).

When a storm occurs and the action is to filter traffic, if the falling suppression level is not specified, the switch blocks all traffic until the traffic rate drops below the rising suppression level. If the falling suppression level is specified, the switch blocks traffic until the traffic rate drops below this level.
Storm control is supported on physical interfaces. You can also configure storm control on an EtherChannel. When storm control is configured on an EtherChannel, the storm control settings propagate to the EtherChannel physical interfaces.

When a broadcast storm occurs and the action is to filter traffic, the switch blocks only broadcast traffic. For more information, see the software configuration guide for this release.

**Examples**

This example shows how to enable broadcast storm control with a 75.5-percent rising suppression level:

```
Switch(config-if)# storm-control broadcast level 75.5
```

This example shows how to enable unicast storm control on a port with a 87-percent rising suppression level and a 65-percent falling suppression level:

```
Switch(config-if)# storm-control unicast level 87 65
```

This example shows how to enable multicast storm control on a port with a 2000-packets-per-second rising suppression level and a 1000-packets-per-second falling suppression level:

```
Switch(config-if)# storm-control multicast level pps 2k 1k
```

This example shows how to enable the `shutdown` action on a port:

```
Switch(config-if)# storm-control action shutdown
```

You can verify your settings by entering the `show storm-control` privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>

</table>
switch

Use the `switch` privileged EXEC on a stack member to disable or enable the specified StackWise port on the member.

```
switch stack-member-number stack port port-number {disable | enable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>stack-member-number</code></td>
</tr>
<tr>
<td><code>stack port port-number</code></td>
</tr>
<tr>
<td><code>disable</code></td>
</tr>
<tr>
<td><code>enable</code></td>
</tr>
</tbody>
</table>

**Defaults**
The StackWise port is enabled.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

**Note**

Be careful when using the `switch stack-member-number stack port port-number disable` command. When you disable the StackWise port, the stack operates at half or full bandwidth.

A stack is in the *full-ring state* when all members are connected through the StackWise ports and are in the ready state.

The stack is in the *partial-ring state* when

- All members are connected through their StackWise stack ports, but some are not in the ready state.
- Some members are not connected through the StackWise stack ports.

If you enter the `switch stack-member-number stack port port-number disable` privileged EXEC command and

- The stack is in the full-ring state, you can disable only one StackWise port. This message appears:
  ```
  Enabling/disabling a stack port may cause undesired stack changes. Continue?[confirm]
  ```

- The stack is in the partial-ring state, you cannot disable the port. This message appears:
  ```
  Disabling stack port not allowed with current stack configuration.
  ```

**Examples**

This example shows how to disable StackWise port 2 on member 4:

```
switch# switch 4 stack port 2 disable
```
### Related Commands

<table>

</tbody>
</table>
switch priority

Use the `switch priority` global configuration command on the stack master to change the stack member priority value.

```
switch stack-member-number priority new-priority-value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stack-member-number</td>
<td>Specify the current stack member number. The range is 1 to 9.</td>
</tr>
<tr>
<td>priority new-priority-value</td>
<td>Specify the new stack member priority value. The range is 1 to 15.</td>
</tr>
</tbody>
</table>

**Defaults**

The default priority value is 1.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The new priority value is a factor during a stack-master re-election. Therefore, changing the priority value does not change the stack master immediately.

**Examples**

This example shows how to change the priority value of stack member 6 to 9:

```
Switch(config)# switch 6 priority 9
Changing the Switch Priority of Switch Number 6 to 9
Do you want to continue?[confirm]
```

**Related Commands**

</table>
switch provision

Use the switch provision global configuration command on the stack master to provision (to supply a configuration to) a new switch before it joins the switch stack. Use the no form of this command to delete all configuration information associated with the removed switch (a stack member that has left the stack).

```
switch stack-member-number provision type
no switch stack-member-number provision
```

Syntax Description

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stack-member-number</td>
<td>Specify the stack member number. The range is 1 to 9.</td>
</tr>
<tr>
<td>provision type</td>
<td>Specify the switch type of the new switch before it joins the stack.</td>
</tr>
<tr>
<td></td>
<td>For type, enter the model number of a supported switch that is listed in the command-line help strings.</td>
</tr>
</tbody>
</table>

Defaults

The switch is not provisioned.

Command Modes

Global configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To avoid receiving an error message, you must remove the specified switch from the switch stack before using the no form of this command to delete a provisioned configuration.

To change the switch type, you must also remove the specified switch from the switch stack. You can change the stack member number of a provisioned switch that is physically present in the switch stack if you do not also change the switch type.

If the switch type of the provisioned switch does not match the switch type in the provisioned configuration on the stack, the switch stack applies the default configuration to the provisioned switch and adds it to the stack. The switch stack displays a message when it applies the default configuration.

Provisioned information appears in the running configuration of the switch stack. When you enter the copy running-config startup-config privileged EXEC command, the provisioned configuration is saved in the startup configuration file of the switch stack.

Caution

When you use this command, memory is allocated for the provisioned configuration. When a new switch type is configured, the previously allocated memory is not fully released. Therefore, do not use this command more than approximately 200 times, or the switch will run out of memory and unexpected behavior will result.
Examples

This example shows how to provision a Catalyst 3750G-12S switch with a stack member number of 2 for the switch stack. The `show running-config` command output shows the interfaces associated with the provisioned switch:

```
Switch(config)# switch 2 provision WS-C3750G-12S
Switch(config)# end
Switch# show running-config | include switch 2
!
interface GigabitEthernet2/0/1
!
interface GigabitEthernet2/0/2
!
interface GigabitEthernet2/0/3
<output truncated>
```

You also can enter the `show switch` user EXEC command to display the provisioning status of the switch stack.

This example shows how to delete all configuration information about a stack member 5 when the switch is removed from the stack:

```
Switch(config)# no switch 5 provision
```

You can verify that the provisioned switch is added to or removed from the running configuration by entering the `show running-config` privileged EXEC command.

Related Commands

<table>

</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config</code></td>
<td>Displays the current operating configuration.</td>
</tr>
<tr>
<td><code>show switch</code></td>
<td>Displays information about the switch stack and its stack members.</td>
</tr>
</tbody>
</table>
**switch renumber**

Use the `switch renumber` global configuration command on the stack master to change the stack member number.

```
switch current-stack-member-number renumber new-stack-member-number
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>current-stack-member-number</code></td>
<td>Specify the current stack member number. The range is 1 to 9.</td>
</tr>
<tr>
<td><code>renumber</code></td>
<td></td>
</tr>
<tr>
<td><code>new-stack-member-number</code></td>
<td>Specify the new stack member number for the stack member. The range is 1 to 9.</td>
</tr>
</tbody>
</table>

**Defaults**

The default stack member number is 1.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If another stack member is already using the member number that you just specified, the stack master assigns the lowest available number when you reload the stack member.

**Note**

If you change the number of a stack member, and no configuration is associated with the new stack member number, that stack member loses its current configuration and resets to its default configuration. For more information about stack member numbers and configurations, see the software configuration guide.

Do not use the `switch current-stack-member-number renumber new-stack-member-number` command on a provisioned switch. If you do, the command is rejected.

Use the `reload slot current stack member number` privileged EXEC to reload the stack member and to apply this configuration change.

**Examples**

This example shows how to change the member number of stack member 6 to 7:

```
Switch(config)# switch 6 renumber 7
WARNING:Changing the switch number may result in a configuration change for that switch.
The interface configuration associated with the old switch number will remain as a provisioned configuration.
Do you want to continue?[confirm]
```
### Switch Renumber

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
switchport

Use the `switchport` interface configuration command with no keywords to put an interface that is in Layer 3 mode into Layer 2 mode for Layer 2 configuration. Use the `no` form of this command to put an interface in Layer 3 mode.

```
switchport

no switchport
```

Use the `no switchport` command (without parameters) to set the interface to the routed-interface status and to erase all Layer 2 configurations. You must use this command before assigning an IP address to a routed port.

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

By default, all interfaces are in Layer 2 mode.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Entering the `no switchport` command shuts the port down and then re-enables it, which might generate messages on the device to which the port is connected.

When you put an interface that is in Layer 2 mode into Layer 3 mode (or the reverse), the previous configuration information related to the affected interface might be lost, and the interface is returned to its default configuration.

**Note**

If an interface is configured as a Layer 3 interface, you must first enter this `switchport` command with no keywords to configure the interface as a Layer 2 port. Then you can enter additional switchport commands with keywords, as shown on the pages that follow.
Examples

This example shows how to cause an interface to cease operating as a Layer 2 port and become a Cisco-routed port:

Switch(config-if)# no switchport

This example shows how to cause the port interface to cease operating as a Cisco-routed port and convert to a Layer 2 switched interface:

Switch(config-if)# switchport

Note

The `switchport` command without keywords is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

You can verify the switchport status of an interface by entering the `show running-config` privileged EXEC command.

Related Commands

<table>
<thead>
<tr>

<tr>
<td><code>show running-config</code></td>
<td>Displays the current operating configuration.</td>
</tr>
</tbody>
</table>
switchport access

Use the switchport access interface configuration command to configure a port as a static-access or dynamic-access port. If the switchport mode is set to access, the port operates as a member of the specified VLAN. If set to dynamic, the port starts discovery of VLAN assignment based on the incoming packets it receives. Use the no form of this command to reset the access mode to the default VLAN for the switch.

```
switchport access vlan {vlan-id | dynamic}
no switchport access vlan
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-id</td>
<td>Configure the interface as a static access port with the VLAN ID of the access mode VLAN; the range is 1 to 4094.</td>
</tr>
<tr>
<td>vlan dynamic</td>
<td>Specify that the access mode VLAN is dependent on the VLAN Membership Policy Server (VMPS) protocol. The port is assigned to a VLAN based on the source MAC address of a host (or hosts) connected to the port. The switch sends every new MAC address received to the VMPS server to get the VLAN name to which the dynamic-access port should be assigned. If the port already has a VLAN assigned and the source has already been approved by the VMPS, the switch forwards the packet to the VLAN.</td>
</tr>
</tbody>
</table>

### Defaults

The default access VLAN and trunk interface native VLAN is a default VLAN corresponding to the platform or interface hardware.

A dynamic-access port is initially a member of no VLAN and receives its assignment based on the packet it receives.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The no switchport access command resets the access mode VLAN to the appropriate default VLAN for the device.

The port must be in access mode before the switchport access vlan command can take effect.

An access port can be assigned to only one VLAN.

The VMPS server (such as a Catalyst 6000 series switch) must be configured before a port is configured as dynamic.
These restrictions apply to dynamic-access ports:

- The software implements the VLAN Query Protocol (VQP) client, which can query a VMPS such as a Catalyst 6000 series switch. The Catalyst 3750 switches are not VMPS servers. The VMPS server must be configured before a port is configured as dynamic.

- Use dynamic-access ports only to connect end stations. Connecting them to switches or routers (that use bridging protocols) can cause a loss of connectivity.

- Configure the network so that STP does not put the dynamic-access port into an STP blocking state. The Port Fast feature is automatically enabled on dynamic-access ports.

- Dynamic-access ports can only be in one VLAN and do not use VLAN tagging.

- Dynamic-access ports cannot be configured as
  - Members of an EtherChannel port group (dynamic-access ports cannot be grouped with any other port, including other dynamic ports).
  - Source or destination ports in a static address entry.
  - Monitor ports.

### Examples

This example shows how to change a switched port interface that is operating in access mode to operate in VLAN 2 instead of the default VLAN:

```
Switch(config-if)# switchport access vlan 2
```

You can verify your setting by entering the `show interfaces interface-id switchport` privileged EXEC command and examining information in the Administrative Mode and Operational Mode rows.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces switchport</code></td>

</tbody>
</table>
switchport autostate exclude

Use the `switchport autostate exclude` interface configuration command to exclude an interface from the VLAN interface (switch virtual interface) line-state up or down calculation. Use the `no` form of this command to return to the default setting.

```
switchport autostate exclude
no switchport autostate exclude
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

All ports in the VLAN are included in the VLAN interface link-up calculation.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(46)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the `switchport autostate exclude` command on a Layer 2 access or trunk port belonging to an SVI.

A VLAN interface (SVI) is up if ports are forwarding traffic in the associated VLAN. When all ports on a VLAN are down or blocking, the SVI is down. For the SVI line state to be up, at least one port in the VLAN must be up and forwarding. You can use the `switchport autostate exclude` command to exclude a port from the SVI interface line-state up-or-down calculation. For example, you might exclude a monitoring port from the calculations so that the VLAN is not considered up when only the monitoring port is active.

When you enter the `switchport autostate exclude` command on a port, the command applies to all VLANs that are enabled on the port.

You can verify the autostate mode of an interface by entering the `show interface interface-id switchport` privileged EXEC command. If the mode has not been set, the autostate mode does not appear.

**Examples**

This example shows how to configure autostate exclude on an interface and to verify the configuration:

```
Switch(config)#interface gigabitethernet 1/0/1
Switch(config-if)# switchport autostate exclude
Switch(config-if)# end
Switch# show interface gigabitethernet1/0/1 switchport
Name: G1/0/1
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: down
Administrative Trunking Encapsulation: negotiate
Negotiation of Trunking: On
```

This example shows how to configure autostate exclude on an interface and to verify the configuration:
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings: none
Operational private-vlan: none
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Autostate mode exclude

</tr>
</tbody>
</table>

**Usage Guidelines**

With Flex Links configured, one link acts as the primary interface and forwards traffic, while the other interface is in standby mode, ready to begin forwarding traffic if the primary link shuts down. The interface being configured is referred to as the active link; the specified interface is identified as the backup link. The feature provides an alternative to the Spanning Tree Protocol (STP), allowing users to turn off STP and still retain basic link redundancy.

- This command is available only for Layer 2 interfaces.
- You can configure only one Flex Link backup link for any active link, and it must be a different interface from the active interface.
- An interface can belong to only one Flex Link pair. An interface can be a backup link for only one active link. An active link cannot belong to another Flex Link pair.
- A backup link does not have to be the same type (Fast Ethernet or Gigabit Ethernet, for instance) as the active link. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.
- Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links, and you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.
- If STP is configured on the switch, Flex Links do not participate in STP in all valid VLANs. If STP is not running, be sure that there are no loops in the configured topology.

**Examples**

This example shows how to configure two interfaces as Flex Links:

```
Switch# configure terminal
Switch(conf)# interface fastethernet1/0/1
Switch(conf-if)# switchport backup interface fastethernet1/0/2
Switch(conf-if)# end
```

This example shows how to configure the Fast Ethernet interface to always preempt the backup:

```
Switch# configure terminal
Switch(conf)# interface fastethernet1/0/1
Switch(conf-if)# switchport backup interface fastethernet1/0/2 preemption forced
Switch(conf-if)# end
```

This example shows how to configure the Fast Ethernet interface preemption delay time:

```
Switch# configure terminal
Switch(conf)# interface fastethernet1/0/1
Switch(conf-if)# switchport backup interface fastethernet1/0/2 preemption delay 150
Switch(conf-if)# end
```
This example shows how to configure the Fast Ethernet interface as the MMU primary VLAN:

```
Switch# configure terminal
Switch(config)# interface fastethernet1/0/1
Switch(config-if)# switchport backup interface fastethernet1/0/2 mmu primary vlan 1021
Switch(config-if)# end
```

You can verify your setting by entering the `show interfaces switchport backup` privileged EXEC command.

The following example shows how to configure preferred VLANs:

```
Switch(config)# interface gigabitethernet 1/0/6
Switch(config-if)# switchport backup interface gigabitethernet 1/0/8 prefer vlan 60,100-120
```

You can verify your setting by entering the `show interfaces switchport backup` privileged EXEC command.

In the following example, VLANs 60, and 100 to 120 are configured on the switch:

```
Switch(config)# interface gigabitEthernet 1/0/6
Switch(config-if)# switchport backup interface gigabitEthernet 1/0/8 prefer vlan 60,100-120
```

When both interfaces are up, Gi1/0/6 forwards traffic for VLANs 1 to 50, and Gi1/0/8 forwards traffic for VLANs 60 and 100 to 120.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface        Backup Interface        State
------------------------------------------------------------------------
GigabitEthernet1/0/6    GigabitEthernet1/0/8    Active Down/Backup Up
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Link interface goes down (LINK_DOWN), VLANs preferred on this interface are moved to the peer interface of the Flex Link pair. In this example, if interface Gi1/0/6 goes down, Gi1/0/8 carries all VLANs of the Flex Link pair.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
Active Interface        Backup Interface        State
------------------------------------------------------------------------
GigabitEthernet1/0/6    GigabitEthernet1/0/8    Active Down/Backup Up
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```
When a Flex Link interface comes up, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Gi1/0/6 comes up, VLANs preferred on this interface are blocked on the peer interface Gi1/0/8 and forwarded on Gi1/0/6.

Switch# show interfaces switchport backup
Switch Backup Interface Pairs:

<table>
<thead>
<tr>
<th>Active Interface</th>
<th>Backup Interface</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet1/0/6</td>
<td>GigabitEthernet1/0/8</td>
<td>Active Up/Backup Up</td>
</tr>
</tbody>
</table>

Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120

This example shows how to configure multicast fast-convergence on interface Gi1/0/11:

Switch# configure terminal
Switch(config)# interface gigabitEthernet 1/0/11
Switch(config-if)# switchport backup interface gigabitEthernet 1/0/12 multicast fast-convergence
Switch(config-if)# end

You can verify your setting by entering the show interfaces switchport backup detail privileged EXEC command.

Switch# show interfaces switchport backup detail

switchport block

Use the switchport block interface configuration command to prevent unknown multicast or unicast packets from being forwarded. Use the no form of this command to allow forwarding unknown multicast or unicast packets.

```
switchport block {multicast | unicast}

no switchport block {multicast | unicast}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

By default, all traffic with unknown MAC addresses is sent to all ports. You can block unknown multicast or unicast traffic on protected or nonprotected ports. If unknown multicast or unicast traffic is not blocked on a protected port, there could be security issues.

With multicast traffic, the port blocking feature blocks only pure Layer 2 packets. Multicast packets that contain IPv4 or IPv6 information in the header are not blocked.

Blocking unknown multicast or unicast traffic is not automatically enabled on protected ports; you must explicitly configure it.

For more information about blocking packets, see the software configuration guide for this release.

### Examples

This example shows how to block unknown unicast traffic on an interface:

```
Switch(config-if)# switchport block unicast
```

You can verify your setting by entering the show interfaces interface-id switchport privileged EXEC command.

switchport host

Use the `switchport host` interface configuration command to optimize a Layer 2 port for a host connection. The no form of this command has no affect on the system.

```
switchport host
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The default is for the port to not be optimized for a host connection.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
To optimize the port for a host connection, the `switchport host` command sets switch port mode to access, enables spanning tree Port Fast, and disables channel grouping. Only an end station can accept this configuration.

Because spanning tree Port Fast is enabled, you should enter the `switchport host` command only on ports that are connected to a single host. Connecting other switches, hubs, concentrators, or bridges to a fast-start port can cause temporary spanning-tree loops.

Enable the `switchport host` command to decrease the time that it takes to start up packet forwarding.

**Examples**
This example shows how to optimize the port configuration for a host connection:

```
Switch(config-if)# switchport host
switchport mode will be set to access
spanning-tree portfast will be enabled
channel group will be disabled
Switch(config-if)#
```

You can verify your setting by entering the `show interfaces interface-id switchport` privileged EXEC command.

**Related Commands**

</tr>
<tr>
<td>dynamic desirable</td>
<td>Set the interface trunking mode dynamic parameter to desirable to specify that the interface actively attempt to convert the link to a trunk link.</td>
</tr>
<tr>
<td>private-vlan</td>
<td>See the <code>switchport mode private-vlan</code> command.</td>
</tr>
<tr>
<td>trunk</td>
<td>Set the port to trunk unconditionally. The port is a trunking VLAN Layer 2 interface. The port sends and receives encapsulated (tagged) frames that identify the VLAN of origination. A trunk is a point-to-point link between two switches or between a switch and a router.</td>
</tr>
</tbody>
</table>

**Defaults**

The default mode is `dynamic auto`.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>

<td>The <code>private-vlan</code> keyword was added.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>dot1q-tunnel</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A configuration that uses the `access`, `dot1q-tunnel`, or `trunk` keywords takes effect only when you configure the port in the appropriate mode by using the `switchport mode` command. The static-access and trunk configuration are saved, but only one configuration is active at a time.

When you enter `access` mode, the interface changes to permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not agree to the change.

When you enter `trunk` mode, the interface changes to permanent trunking mode and negotiates to convert the link into a trunk link even if the interface connecting to it does not agree to the change.
When you enter **dynamic auto** mode, the interface converts the link to a trunk link if the neighboring interface is set to **trunk** or **desirable** mode.

When you enter **dynamic desirable** mode, the interface becomes a trunk interface if the neighboring interface is set to **trunk**, **desirable**, or **auto** mode.

To autonegotiate trunking, the interfaces must be in the same VLAN Trunking Protocol (VTP) domain. Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations. To avoid this, you should configure interfaces connected to devices that do not support DTP to not forward DTP frames, which turns off DTP.

- If you do not intend to trunk across those links, use the `switchport mode access` interface configuration command to disable trunking.

- To enable trunking to a device that does not support DTP, use the `switchport mode trunk` and `switchport nonegotiate` interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

When you enter **dot1q-tunnel**, the port is set unconditionally as an IEEE 802.1Q tunnel port.

Access ports, trunk ports, and tunnel ports are mutually exclusive.

Any IEEE 802.1Q encapsulated IP packets received on a tunnel port can be filtered by MAC access control lists (ACLs), but not by IP ACLs. This is because the switch does not recognize the protocol inside the IEEE 802.1Q header. This restriction applies to router ACLs, port ACLs, and VLAN maps.

Configuring a port as an IEEE 802.1Q tunnel port has these limitations:

- IP routing and fallback bridging are not supported on tunnel ports.

- Tunnel ports do not support IP ACLs.

- If an IP ACL is applied to a trunk port in a VLAN that includes tunnel ports, or if a VLAN map is applied to a VLAN that includes tunnel ports, packets received from the tunnel port are treated as non-IP packets and are filtered with MAC access lists.

- Layer 3 quality of service (QoS) ACLs and other QoS features related to Layer 3 information are not supported on tunnel ports.

For more information about configuring IEEE 802.1Q tunnel ports, see the software configuration guide for this release.

The IEEE 802.1x feature interacts with switchport modes in these ways:

- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.

- If you try to enable IEEE 802.1x on a port set to **dynamic auto** or **dynamic desirable**, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to **dynamic auto** or **dynamic desirable**, the port mode is not changed.

- If you try to enable IEEE 802.1x on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

### Examples

This example shows how to configure a port for access mode:

```
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# switchport mode access
```
This example shows how set the port to dynamic desirable mode:

```bash
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# switchport mode dynamic desirable
```

This example shows how to configure a port for trunk mode:

```bash
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# switchport mode trunk
```

This example shows how to configure a port as an IEEE 802.1Q tunnel port:

```bash
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# switchport mode dot1q-tunnel
```

You can verify your settings by entering the `show interfaces interface-id switchport` privileged EXEC command and examining information in the Administrative Mode and Operational Mode rows.

switchport mode private-vlan

Use the `switchport mode private-vlan` interface configuration command to configure a port as a promiscuous or host private VLAN port. Use the `no` form of this command to reset the mode to the appropriate default for the device.

```
switchport mode private-vlan {host | promiscuous}
no switchport mode private-vlan
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Configure the interface as a private-VLAN host port. Host ports belong to private-VLAN secondary VLANs and are either community ports or isolated ports, depending on the VLAN that they belong to.</td>
</tr>
<tr>
<td>promiscuous</td>
<td>Configure the interface as a private-VLAN promiscuous port. Promiscuous ports are members of private-VLAN primary VLANs.</td>
</tr>
</tbody>
</table>

### Defaults

The default private-VLAN mode is neither host nor promiscuous.

The default switchport mode is `dynamic auto`. 

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A private-VLAN host or promiscuous port cannot be a Switched Port Analyzer (SPAN) destination port. If you configure a SPAN destination port as a private-VLAN host or promiscuous port, the port becomes inactive.

Do not configure private VLAN on ports with these other features:

- Dynamic-access port VLAN membership
- Dynamic Trunking Protocol (DTP)
- Port Aggregation Protocol (PAgP)
- Link Aggregation Control Protocol (LACP)
- Multicast VLAN Registration (MVR)
- Voice VLAN

A private-VLAN port cannot be a SPAN destination port.

While a port is part of the private-VLAN configuration, any EtherChannel configuration for it is inactive.

A private-VLAN port cannot be a secure port and should not be configured as a protected port.

For more information about private-VLAN interaction with other features, see the software configuration guide for this release.
We strongly recommend that you enable spanning tree Port Fast and bridge-protocol-data-unit (BPDU) guard on isolated and community host ports to prevent STP loops due to misconfigurations and to speed up STP convergence.

If you configure a port as a private-VLAN host port and you do not configure a valid private-VLAN association by using the `switchport private-vlan host-association` interface configuration command, the interface becomes inactive.

If you configure a port as a private-VLAN promiscuous port and you do not configure a valid private VLAN mapping by using the `switchport private-vlan mapping` interface configuration command, the interface becomes inactive.

### Examples

This example shows how to configure an interface as a private-VLAN host port and associate it to primary VLAN 20. The interface is a member of secondary isolated VLAN 501 and primary VLAN 20.

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 20 501
Switch(config-if)# end
```

When you configure a port as a private VLAN host port, you should also enable BPDU guard and Port Fast by using the `spanning-tree portfast bpduguard default` global configuration command and the `spanning-tree portfast` interface configuration command.

```
Switch(config)# spanning-tree portfast bpduguard default
Switch(config)# spanning-tree portfast
```

This example shows how to configure an interface as a private VLAN promiscuous port and map it to a private VLAN. The interface is a member of primary VLAN 20 and secondary VLANs 501 to 503 are mapped to it.

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 20 501-503
Switch(config-if)# end
```

You can verify private VLAN switchport mode by using the `show interfaces interface-id switchport` privileged EXEC command.

### Related Commands

<table>
<thead>

</table>
switchport nonegotiate

Use the **switchport nonegotiate** interface configuration command to specify that Dynamic Trunking Protocol (DTP) negotiation packets are not sent on the Layer 2 interface. The switch does not engage in DTP negotiation on this interface. Use the **no** form of this command to return to the default setting.

```
switchport nonegotiate
no switchport nonegotiate
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The default is to use DTP negotiation to learn the trunking status.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **no** form of the **switchport nonegotiate** command removes **nonegotiate** status.

This command is valid only when the interface switchport mode is access or trunk (configured by using the **switchport mode access** or the **switchport mode trunk** interface configuration command). This command returns an error if you attempt to execute it in **dynamic** (**auto** or **desirable**) mode.

Internetworking devices that do not support DTP might forward DTP frames improperly and cause misconfigurations. To avoid this, you should turn off DTP by using the **switchport no negotiate** command to configure the interfaces connected to devices that do not support DTP to not forward DTP frames.

When you enter the **switchport nonegotiate** command, DTP negotiation packets are not sent on the interface. The device does or does not trunk according to the **mode** parameter: **access** or **trunk**.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking on a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.
Examples

This example shows how to cause a port to refrain from negotiating trunking mode and to act as a trunk or access port (depending on the mode set):

Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# switchport nonegotiate

You can verify your setting by entering the `show interfaces interface-id switchport` privileged EXEC command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces switchport</code></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.</td>
</tr>
<tr>
<td><code>switchport mode</code></td>
<td>Configures the VLAN membership mode of a port.</td>
</tr>
</tbody>
</table>
switchport port-security

Use the `switchport port-security` interface configuration command without keywords to enable port security on the interface. Use the keywords to configure secure MAC addresses, sticky MAC address learning, a maximum number of secure MAC addresses, or the violation mode. Use the `no` form of this command to disable port security or to set the parameters to their default states.

```
switchport port-security [mac-address mac-address [vlan {vlan-id | {access | voice}}] | mac-address sticky [mac-address | vlan {vlan-id | {access | voice}}] | maximum value [vlan {vlan-list | {access | voice}}]]

no switchport port-security [mac-address mac-address [vlan {vlan-id | {access | voice}}] | mac-address sticky [mac-address | vlan {vlan-id | {access | voice}}] | maximum value [vlan {vlan-list | {access | voice}}]]

switchport port-security [aging] [violation {protect | restrict | shutdown | shutdown vlan}]

no switchport port-security [aging] [violation {protect | restrict | shutdown | shutdown vlan}]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>

</tr>
<tr>
<td>maximum value</td>
<td>(Optional) Set the maximum number of secure MAC addresses for the interface. The maximum number of secure MAC addresses that you can configure on a switch stack is set by the maximum number of available MAC addresses allowed in the system. This number is determined by the active Switch Database Management (SDM) template. For more information, see the <code>sdm prefer</code> global configuration command. This number represents the total of available MAC addresses, including those used for other Layer 2 functions and any other secure MAC addresses configured on interfaces. The default setting is 1.</td>
</tr>
</tbody>
</table>
switchport port-security

Defaults

The default is to disable port security.

When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1.

The default violation mode is shutdown.

Sticky learning is disabled.

Command Modes

Interface configuration
A secure port has the following limitations:

- A secure port can be an access port or a trunk port; it cannot be a dynamic access port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot be a private VLAN port.
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel port group.
- You cannot configure static secure or sticky secure MAC addresses in the voice VLAN.
- When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.
- Voice VLAN is supported only on access ports and not on trunk ports.
- When you enter a maximum secure address value for an interface, if the new value is greater than the previous value, the new value overrides the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.
- The switch does not support port security aging of sticky secure MAC addresses.

A security violation occurs when the maximum number of secure MAC addresses are in the address table and a station whose MAC address is not in the address table attempts to access the interface or when a station whose MAC address is configured as a secure MAC address on another secure port attempts to access the interface.

When a secure port is in the error-disabled state, you can bring it out of this state by entering the `errdisable recovery cause psecure-violation` global configuration command. You can manually re-enable the port by entering the `shutdown` and `no shutdown` interface configuration commands or by using the `clear errdisable interface` privileged EXEC command.

Setting a maximum number of addresses to one and configuring the MAC address of an attached device ensures that the device has the full bandwidth of the port.

When you enter a maximum secure address value for an interface, this occurs:

- If the new value is greater than the previous value, the new value overrides the previously configured value.
- If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.
Sticky secure MAC addresses have these characteristics:

- When you enable sticky learning on an interface by using the `switchport port-security mac-address sticky` interface configuration command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses and adds all sticky secure MAC addresses to the running configuration.

- If you disable sticky learning by using the `no switchport port-security mac-address sticky` interface configuration command or the running configuration is removed, the sticky secure MAC addresses remain part of the running configuration but are removed from the address table. The addresses that were removed can be dynamically reconfigured and added to the address table as dynamic addresses.

- When you configure sticky secure MAC addresses by using the `switchport port-security mac-address sticky mac-address` interface configuration command, these addresses are added to the address table and the running configuration. If port security is disabled, the sticky secure MAC addresses remain in the running configuration.

- If you save the sticky secure MAC addresses in the configuration file, when the switch restarts or the interface shuts down, the interface does not need to relearn these addresses. If you do not save the sticky secure addresses, they are lost. If sticky learning is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

- If you disable sticky learning and enter the `switchport port-security mac-address sticky mac-address` interface configuration command, an error message appears, and the sticky secure MAC address is not added to the running configuration.

### Examples

This example shows how to enable port security on a port and to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```plaintext
Switch(config)# interface gigabitethernet 2/0/2
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
```

This example shows how to configure a secure MAC address and a VLAN ID on a port:

```plaintext
Switch(config)# interface gigabitethernet 2/0/2
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address mac-address vlan 3
```

This example shows how to enable sticky learning and to enter two sticky secure MAC addresses on a port:

```plaintext
Switch(config)# interface gigabitethernet 2/0/2
Switch(config-if)# switchport port-security port-security mac-address sticky
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.4141
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.000f
```

This example show how to configure a port to shut down only the VLAN if a violation occurs:

```plaintext
Switch(config)# interface gigabitethernet 2/0/2
Switch(config-if)# switchport port-security violation shutdown vlan
```

You can verify your settings by using the `show port-security` privileged EXEC command.

<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>static</code></td>
<td>Enable aging for statically configured secure addresses on this port.</td>
</tr>
<tr>
<td><code>time time</code></td>
<td>Specify the aging time for this port. The range is 0 to 1440 minutes. If the time is 0, aging is disabled for this port.</td>
</tr>
<tr>
<td><code>type</code></td>
<td>Set the aging type.</td>
</tr>
<tr>
<td><code>absolute</code></td>
<td>Set absolute aging type. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.</td>
</tr>
<tr>
<td><code>inactivity</code></td>
<td>Set the inactivity aging type. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period.</td>
</tr>
</tbody>
</table>

**Defaults**

The port security aging feature is disabled. The default time is 0 minutes.
The default aging type is absolute.
The default static aging behavior is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that port.
To allow limited time access to particular secure addresses, set the aging type as `absolute`. When the aging time lapses, the secure addresses are deleted.
To allow continuous access to a limited number of secure addresses, set the aging type as `inactivity`. This removes the secure address when it become inactive, and other addresses can become secure.
To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the statically configured secure address by using the `no switchport port-security aging static` interface configuration command.
**Examples**

This example sets the aging time as 2 hours for absolute aging for all the secure addresses on the port:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# switchport port-security aging time 120
```

This example sets the aging time as 2 minutes for inactivity aging type with aging enabled for configured secure addresses on the port:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport port-security aging time 2
Switch(config-if)# switchport port-security aging type inactivity
Switch(config-if)# switchport port-security aging static
```

This example shows how to disable aging for configured secure addresses:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# no switchport port-security aging static
```

</table>
switchport priority extend

Use the `switchport priority extend` interface configuration command to set a port priority for the incoming untagged frames or the priority of frames received by the IP phone connected to the specified port. Use the `no` form of this command to return to the default setting.

```
switchport priority extend {cos value | trust}
no switchport priority extend
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cos value</td>
<td>Set the IP phone port to override the IEEE 802.1p priority received from the PC or the attached device with the specified class of service (CoS) value. The range is 0 to 7. Seven is the highest priority. The default is 0.</td>
</tr>
<tr>
<td>trust</td>
<td>Set the IP phone port to trust the IEEE 802.1p priority received from the PC or the attached device.</td>
</tr>
</tbody>
</table>

### Defaults

The default port priority is set to a CoS value of 0 for untagged frames received on the port.

### Command Modes

Interface configuration

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When voice VLAN is enabled, you can configure the switch to send the Cisco Discovery Protocol (CDP) packets to instruct the IP phone how to send data packets from the device attached to the access port on the Cisco IP Phone. You must enable CDP on the switch port connected to the Cisco IP Phone to send the configuration to the Cisco IP Phone. (CDP is enabled by default globally and on all switch interfaces.)

You should configure voice VLAN on switch access ports. You can configure a voice VLAN only on Layer 2 ports.

Before you enable voice VLAN, we recommend that you enable quality of service (QoS) on the switch by entering the `mls qos` global configuration command and configure the port trust state to trust by entering the `mls qos trust cos` interface configuration command.

### Examples

This example shows how to configure the IP phone connected to the specified port to trust the received IEEE 802.1p priority:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport priority extend trust
```

You can verify your settings by entering the `show interfaces interface-id switchport` privileged EXEC command.
### switchport priority extend

<td>One or more secondary (isolated or community) VLANs to be mapped to the primary VLAN.</td>
</tr>
<tr>
<td>host-association</td>
<td>Define a private-VLAN association for a community or isolated host port.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is to have no private-VLAN association or mapping configured.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Private-VLAN association or mapping has no effect on the port unless the port has been configured as a private-VLAN host or promiscuous port by using the `switchport mode private-vlan { host | promiscuous }` interface configuration command.

If the port is in private-VLAN host or promiscuous mode but the VLANs do not exist, the command is allowed, but the port is made inactive.

The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private-VLAN ID or a hyphenated range of private-VLAN IDs. The list can contain one isolated VLAN and multiple community VLANs.
You can map a promiscuous port to only one primary VLAN. If you enter the `switchport private-vlan mapping` command on a promiscuous port that is already mapped to a primary and secondary VLAN, the primary VLAN mapping is overwritten.

You can add or remove secondary VLANs from promiscuous port private-VLAN mappings by using the `add` and `remove` keywords.

Entering the `switchport private-vlan association host` command has the same effect as entering the `switchport private-vlan host-association` interface configuration command.

Entering the `switchport private-vlan association mapping` command has the same effect as entering the `switchport private-vlan mapping` interface configuration command.

### Examples

This example shows how to configure an interface as a private VLAN host port and associate it with primary VLAN 20 and secondary VLAN 501:

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 20 501
Switch(config-if)# end
```

This example shows how to configure an interface as a private-VLAN promiscuous port and map it to a primary VLAN and secondary VLANs:

```
Switch# configure terminal
Switch(config)# interface fastethernet 1/0/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 20 501-502
Switch(config-if)# end
```

You can verify private-VLAN mapping by using the `show interfaces private-vlan mapping` privileged EXEC command. You can verify private VLANs and interfaces configured on the switch stack by using the `show vlan private-vlan` privileged EXEC command.

switchport protected

Use the `switchport protected` interface configuration command to isolate unicast, multicast, and broadcast traffic at Layer 2 from other protected ports on the same switch. Use the `no` form of this command to disable protection on the port.

```
switchport protected

no switchport protected
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

No protected port is defined. All ports are nonprotected.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The switchport protection feature is local to the switch; communication between protected ports on the same switch is possible only through a Layer 3 device. To prevent communication between protected ports on different switches, you must configure the protected ports for unique VLANs on each switch and configure a trunk link between the switches. A protected port is different from a secure port. A protected port does not forward any traffic (unicast, multicast, or broadcast) to any other port that is also a protected port. Data traffic cannot be forwarded between protected ports at Layer 2; only control traffic, such as PIM packets, is forwarded because these packets are processed by the CPU and forwarded in software. All data traffic passing between protected ports must be forwarded through a Layer 3 device. Because a switch stack represents a single logical switch, Layer 2 traffic is not forwarded between any protected ports in the switch stack, whether they are on the same or different switches in the stack. Port monitoring does not work if both the monitor and monitored ports are protected ports.

**Examples**

This example shows how to enable a protected port on an interface:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport protected
```

You can verify your settings by entering the `show interfaces interface-id switchport` privileged EXEC command.
### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces switchport</code></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port, including port blocking and port protection settings.</td>

<tr>
<td><code>switchport block</code></td>
<td>Prevents unknown multicast or unicast traffic on the interface.</td>
</tr>
</tbody>
</table>
switchport trunk

Use the `switchport trunk` interface configuration command to set the trunk characteristics when the interface is in trunking mode. Use the `no` form of this command to reset a trunking characteristic to the default.

```
switchport trunk {allowed vlan vlan-list | encapsulation {dot1q | isl | negotiate} | native vlan vlan-id | pruning vlan vlan-list}
```

```
no switchport trunk {allowed vlan | encapsulation | native vlan | {pruning vlan}}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>allowed vlan vlan-list</code></td>
<td>Set the list of allowed VLANs that can receive and send traffic on this interface in tagged format when in trunking mode. See the following <code>vlan-list</code> format. The <code>none</code> keyword is not valid. The default is all.</td>
</tr>
<tr>
<td><code>encapsulation dot1q</code></td>
<td>Set the encapsulation format on the trunk port to IEEE 802.1Q. With this format, the switch supports simultaneous tagged and untagged traffic on a port.</td>
</tr>
<tr>
<td><code>encapsulation isl</code></td>
<td>Set the encapsulation format on the trunk port to Inter-Switch Link (ISL). The switch encapsulates all received and sent packets with an ISL header and filters native frames received from an ISL trunk port.</td>
</tr>
<tr>
<td><code>encapsulation negotiate</code></td>
<td>Specify that if Dynamic Inter-Switch Link (DISL) and Dynamic Trunking Protocol (DTP) negotiation do not resolve the encapsulation format, ISL is the selected format.</td>
</tr>
<tr>
<td><code>native vlan vlan-id</code></td>
<td>Set the native VLAN for sending and receiving untagged traffic when the interface is in IEEE 802.1Q trunking mode. The range is 1 to 4094.</td>
</tr>
<tr>
<td><code>pruning vlan vlan-list</code></td>
<td>Set the list of VLANs that are eligible for VTP pruning when in trunking mode. The <code>all</code> keyword is not valid.</td>
</tr>
</tbody>
</table>

The `vlan-list` format is `all | none | [add | remove | except] vlan-atom [,vlan-atom...]` where:

- **all** specifies all VLANs from 1 to 4094. This keyword is not allowed on commands that do not permit all VLANs in the list to be set at the same time.
- **none** means an empty list. This keyword is not allowed on commands that require certain VLANs to be set or at least one VLAN to be set.
- **add** adds the defined list of VLANs to those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLANs (VLAN IDs greater than 1005) are valid in some cases.

**Note** You can add extended-range VLANs to the allowed VLAN list, but not to the pruning-eligible VLAN list.

Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

- **remove** removes the defined list of VLANs from those currently set instead of replacing the list. Valid IDs are from 1 to 1005; extended-range VLAN IDs are valid in some cases.

**Note** You can remove extended-range VLANs from the allowed VLAN list, but you cannot remove them from the pruning-eligible list.
Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

- **except** lists the VLANs that should be calculated by inverting the defined list of VLANs. (VLANs are added except the ones specified.) Valid IDs are from 1 to 1005. Separate nonconsecutive VLAN IDs with a comma; use a hyphen to designate a range of IDs.

- **vlan-atom** is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

### Defaults

The default encapsulation is **negotiate**.

VLAN 1 is the default native VLAN ID on the port.

The default for all VLAN lists is to include all VLANs.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.1(14)EA1</td>
<td>The <strong>allowed vlan vlan-list</strong> add, remove, and except keywords were modified to accept the VLAN1 and VLANs 1002 to 1005 values.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

**Encapsulation:**

- The **switchport trunk encapsulation** command is supported only for platforms and interface hardware that can support both ISL and IEEE 802.1Q formats.

- You cannot configure one end of the trunk as an IEEE 802.1Q trunk and the other end as an ISL or nontrunk port. However, you can configure one port as an ISL trunk and a different port on the same switch as an IEEE 802.1Q trunk.

- If you enter the **negotiate** keywords and DTP negotiation does not resolve the encapsulation format, ISL is the selected format. The **no** form of the command resets the trunk encapsulation format to the default.

- The **no** form of the **encapsulation** command resets the encapsulation format to the default.

**Native VLANs:**

- All untagged traffic received on an IEEE 802.1Q trunk port is forwarded with the native VLAN configured for the port.

- If a packet has a VLAN ID that is the same as the sending-port native VLAN ID, the packet is sent without a tag; otherwise, the switch sends the packet with a tag.

- The **no** form of the **native vlan** command resets the native mode VLAN to the appropriate default VLAN for the device.
Allowed VLAN:

- To reduce the risk of spanning-tree loops or storms, you can disable VLAN 1 on any individual VLAN trunk port by removing VLAN 1 from the allowed list. When you remove VLAN 1 from a trunk port, the interface continues to send and receive management traffic, for example, Cisco Discovery Protocol (CDP), Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), Dynamic Trunking Protocol (DTP), and VLAN Trunking Protocol (VTP) in VLAN 1.
- The `no` form of the `allowed vlan` command resets the list to the default list, which allows all VLANs.

Trunk pruning:

- The pruning-eligible list applies only to trunk ports.
- Each trunk port has its own eligibility list.
- If you do not want a VLAN to be pruned, remove it from the pruning-eligible list. VLANs that are pruning-ineligible receive flooded traffic.
- VLAN 1, VLANs 1002 to 1005, and extended-range VLANs (VLANs 1006 to 4094) cannot be pruned.

**Examples**

This example shows how to cause a port configured as a switched interface to encapsulate in IEEE 802.1Q trunking format regardless of its default trunking format in trunking mode:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk encapsulation dot1q
```

This example shows how to configure VLAN 3 as the default for the port to send all untagged traffic:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk native vlan 3
```

This example shows how to add VLANs 1, 2, 5, and 6 to the allowed list:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk allowed vlan add 1,2,5,6
```

This example shows how to remove VLANs 3 and 10 to 15 from the pruning-eligible list:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport trunk pruning vlan remove 3,10-15
```

You can verify your settings by entering the `show interfaces interface-id switchport` privileged EXEC command.

**Related Commands**

switchport voice detect

Use the `switchport voice detect` interface configuration command to detect and recognize a Cisco IP phone. Use the `no` form of this command to return to the default setting.

```
  switchport voice detect cisco-phone [full-duplex]
  no switchport voice detect cisco-phone [full-duplex]
```

**Syntax Description**

- **cisco-phone**: Configure the switch to detect and recognize a Cisco IP phone.
- **full-duplex** *(optional)*: Configure the switch to only accept a full-duplex Cisco IP phone.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(37)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to detect and recognize a Cisco IP phone. The Cisco IP phone must be powered by the switch with Power over Ethernet (PoE). If the phone is powered externally, the switch port is disabled.

**Examples**

This example shows how to enable switch port voice detect on the switch:

```
Switch(config)# interface fastetheren 1/0/1
Switch(config-if)# switchport voice detect cisco-phone
```

This example shows how to disable switch port voice detect on the switch:

```
Switch(config)# interface fastetheren 1/0/1
Switch(config-if)# no switchport voice detect cisco-phone
```

You can verify your settings by entering the `show run interfaces interface-id` privileged EXEC command.

**Related Commands**

No related commands.
**switchport voice vlan**

Use the `switchport voice vlan` interface configuration command to configure voice VLAN on the port. Use the `no` form of this command to return to the default setting.

```
switchport voice vlan {vlan-id | dot1p | none | untagged}
```

```
no switchport voice vlan
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Specify the VLAN to be used for voice traffic. The range is 1 to 4094. By default, the IP phone forwards the voice traffic with an IEEE 802.1Q priority of 5.</td>
</tr>
<tr>
<td><code>dot1p</code></td>
<td>Configure the switch to use IEEE 802.1p priority tagging and use VLAN 0 (the native VLAN). By default, the Cisco IP phone forwards the voice traffic with an IEEE 802.1p priority of 5 and drops all voice and data traffic tagged with VLAN 0.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Do not instruct the IP telephone about the voice VLAN. The telephone uses the configuration from the telephone key pad.</td>
</tr>
<tr>
<td><code>untagged</code></td>
<td>Configure the telephone to send untagged voice traffic. This is the default for the telephone.</td>
</tr>
</tbody>
</table>

### Defaults

The switch default is not to automatically configure the telephone (**none**).

The telephone default is not to tag frames. The switch drops all traffic tagged with VLAN ID 0.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You should configure voice VLAN on Layer 2 access ports.

You must enable Cisco Discovery Protocol (CDP) on the switchport connected to the Cisco IP phone for the switch to send configuration information to the phone. CDP is enabled by default globally and on the interface.

Before you enable voice VLAN, we recommend that you enable quality of service (QoS) on the switch by entering the `mls qos` global configuration command and configure the port trust state to trust by entering the `mls qos trust cos` interface configuration command.

When you enter a VLAN ID, the IP phone forwards voice traffic in IEEE 802.1Q frames, tagged with the specified VLAN ID. The switch puts IEEE 802.1Q voice traffic in the voice VLAN.

When you select `dot1q`, `none`, or `untagged`, the switch puts the indicated voice traffic in the access VLAN.

When you enter the `switchport voice vlan dot1q` command, the switch can receive 802.1Q priority voice and data traffic tagged with VLAN 0.
In all configurations, the voice traffic carries a Layer 2 IP precedence value. The default is 5 for voice traffic.

When you enable port security on an interface that is also configured with a voice VLAN, set the maximum allowed secure addresses on the port to two. When the port is connected to a Cisco IP phone, the IP phone requires one MAC address. The Cisco IP phone address is learned on the voice VLAN, but is not learned on the access VLAN. If you connect a single PC to the Cisco IP phone, no additional MAC addresses are required. If you connect more than one PC to the Cisco IP phone, you must configure enough secure addresses to allow one for each PC and one for the Cisco IP phone.

If any type of port security is enabled on the access VLAN, dynamic port security is automatically enabled on the voice VLAN.

You cannot configure static secure MAC addresses in the voice VLAN.

A voice-VLAN port cannot be a private-VLAN port.

The Port Fast feature is automatically enabled when voice VLAN is configured. When you disable voice VLAN, the Port Fast feature is not automatically disabled.

**Examples**

This example shows how to configure VLAN 2 as the voice VLAN for the port:

```
Switch(config)# interface gigabitethernet1/0/2
Switch(config-if)# switchport voice vlan 2
```

You can verify your settings by entering the `show interfaces interface-id switchport` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces interface-id switchport</code></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>

</tbody>
</table>
**system env temperature threshold yellow**

Use the `system env temperature threshold yellow` global configuration command to configure the difference between the yellow and red temperature thresholds which determines the value of yellow threshold. Use the no form of this command to return to the default value.

```
  system env temperature threshold yellow value
  no system env temperature threshold yellow value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>value</th>
<th>Specify the difference between the yellow and red threshold values (in Celsius). The range is 10 to 25. The default value is 10.</th>
</tr>
</thead>
</table>

**Defaults**

These are the default values:

<table>
<thead>
<tr>
<th>Switch</th>
<th>Difference between Yellow and Red</th>
<th>Red¹</th>
</tr>
</thead>
<tbody>
<tr>
<td>Catalyst 3750G-48TS</td>
<td>10°C</td>
<td>66°C</td>
</tr>
<tr>
<td>Catalyst 3750G-48PS</td>
<td>10°C</td>
<td>68°C</td>
</tr>
<tr>
<td>Catalyst 3750G-24TS-1U</td>
<td>10°C</td>
<td>65°C</td>
</tr>
<tr>
<td>Catalyst 3750G-24PS</td>
<td>10°C</td>
<td>61°C</td>
</tr>
</tbody>
</table>

¹. You cannot configure the red temperature threshold.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Though visible on all switches, this command is only valid on these switches:

- Catalyst 3750G-48TS
- Catalyst 3750G-48PS
- Catalyst 3750G-24TS-1U
- Catalyst 3750G-24PS

You cannot configure the green and red thresholds but can configure the yellow threshold. Use the `system env temperature threshold yellow value` global configuration command to specify the difference between the yellow and red thresholds and to configure the yellow threshold. For example, if
the red threshold is 66 degrees C and you want to configure the yellow threshold as 51 degrees C, set the difference between the thresholds as 15 by using the `system env temperature threshold yellow 15` command.

### Note
The internal temperature sensor in the switch measures the internal system temperature and might vary ±5 degrees C.

### Examples
This example sets 15 as the difference between the yellow and red thresholds:

```
Switch(config)# system env temperature threshold yellow 15
Switch(config)#
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show env temperature status</code></td>
<td>Displays the temperature status and threshold levels.</td>
</tr>
</tbody>
</table>
Use the **system mtu** global configuration command to set the maximum packet size or maximum transmission unit (MTU) size for Gigabit Ethernet ports, for routed ports, or for Fast Ethernet (10/100) ports. Use the **no** form of this command to restore the global MTU value to its default value.

```
system mtu {bytes | jumbo bytes | routing bytes}
```

```
no system mtu
```

### Syntax Description

**bytes**
Set the system MTU for ports that are set to 10 or 100 Mb/s. The range is 1500 to 1998 bytes. This is the maximum MTU received at 10/100-Mb/s Ethernet switch ports.

**jumbo bytes**
Set the system jumbo MTU for Gigabit Ethernet ports operating at 1000 Mb/s or greater. The range is 1500 to 9000 bytes. This is the maximum MTU received at the physical port for Gigabit Ethernet ports.

**routing bytes**
Set the maximum MTU for routed packets. You can also set the maximum MTU to be advertised by the routing protocols that support the configured MTU size. The range is 1500 bytes to the system MTU value. The system routing MTU is the maximum MTU for routed packets and is also the maximum MTU that the switch advertises in routing updates for protocols such as OSPF.

### Defaults

The default MTU size for all ports is 1500 bytes. However, if you configure a different value for the system MTU, that configured value becomes the default MTU size for routed ports when it is applied following a switch reset.

### Command Modes

Global configuration

### Command History

<table>

<tr>
<td>12.2(25)SEC</td>
<td>The <strong>bytes</strong> range is now 1500 to 1998.</td>
</tr>
<tr>
<td>12.2(25)SED</td>
<td>The <strong>routing bytes</strong> keywords were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you use this command to change the system MTU or jumbo MTU size, you must reset the switch before the new configuration takes effect. The **system mtu routing** command does not require a switch reset to take effect.

The system MTU setting is saved in the switch environmental variable in NVRAM and becomes effective when the switch reloads. Unlike the system MTU routing configuration, the MTU settings you enter with the **system mtu** and **system mtu jumbo** commands are not saved in the switch IOS configuration file, even if you enter the **copy running-config startup-config** privileged EXEC.

command. Therefore, if you use TFTP to configure a new switch by using a backup configuration file and want the system MTU to be other than the default, you must explicitly configure the **system mtu** and **system mtu jumbo** settings on the new switch and then reload the switch.

Gigabit Ethernet ports operating at 1000 Mb/s are not affected by the **system mtu** command, and 10/100-Mb/s ports are not affected by the **system mtu jumbo** command.

You can use the **system mtu routing** command to configure the MTU size on routed ports.

---

**Note**

You cannot configure a routing MTU size that exceeds the system MTU size. If you change the system MTU size to a value smaller than the currently configured routing MTU size, the configuration change is accepted, but not applied until the next switch reset. When the configuration change takes effect, the routing MTU size defaults to the new system MTU size.

If you enter a value that is outside the range for the specific type of switch, the value is not accepted.

---

**Note**

The switch does not support setting the MTU on a per-interface basis.

The size of frames that can be received by the switch CPU is limited to 1998 bytes, regardless of the value entered with the **system mtu** command. Although forwarded or routed frames are usually not received by the CPU, some packets (for example, control traffic, SNMP, Telnet, and routing protocols) are sent to the CPU.

Because the switch does not fragment packets, it drops:

- switched packets larger than the packet size supported on the **egress** interface
- routed packets larger than the routing MTU value

For example, if the **system mtu** value is 1998 bytes and the **system mtu jumbo** value is 5000 bytes, packets up to 5000 bytes can be received on interfaces operating at 1000 Mb/s. However, although a packet larger than 1998 bytes can be received on an interface operating at 1000 Mb/s, if its destination interface is operating at 10 or 100 Mb/s, the packet is dropped.

---

**Examples**

This example shows how to set the maximum jumbo packet size for Gigabit Ethernet ports operating at 1000 Mb/s or greater to 1800 bytes:

```
Switch(config)# system mtu jumbo 1800
Switch(config)# exit
Switch# reload
```

You can verify your setting by entering the **show system mtu** privileged EXEC command.

---

**Related Commands**

test cable-diagnostics tdr

Use the **test cable-diagnostics tdr** privileged EXEC command to run the Time Domain Reflector (TDR) feature on an interface.

```
   test cable-diagnostics tdr interface interface-id
```

**Syntax Description**

- `interface-id` Specify the interface on which to run TDR.

**Defaults**

There is no default.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

TDR is supported only on 10/100/100 copper Ethernet ports. It is not supported on 10/100 ports, 10-Gigabit module ports, or on SFP module ports. For more information about TDR, see the software configuration guide for this release.

After you run TDR by using the **test cable-diagnostics tdr interface interface-id** command, use the **show cable-diagnostics tdr interface interface-id** privileged EXEC command to display the results.

**Examples**

This example shows how to run TDR on an interface:

```
Switch# test cable-diagnostics tdr interface gigabitethernet1/0/2
TDR test started on interface Gi1/0/2
A TDR test can take a few seconds to run on an interface
Use 'show cable-diagnostics tdr' to read the TDR results.
```

If you enter the **test cable-diagnostics tdr interface interface-id** command on an interface that has a link status of up and a speed of 10 or 100 Mb/s, these messages appear:

```
Switch# test cable-diagnostics tdr interface gigabitethernet1/0/3
TDR test on Gi1/0/3 will affect link state and traffic
TDR test started on interface Gi1/0/3
A TDR test can take a few seconds to run on an interface
Use 'show cable-diagnostics tdr' to read the TDR results.
```

**Related Commands**

Use the **traceroute mac** privileged EXEC command to display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.

```
traceroute mac [interface interface-id] {source-mac-address} [interface interface-id] {destination-mac-address} [vlan vlan-id] [detail]
```

### Syntax Description

- **interface interface-id**
  (Optional) Specify an interface on the source or destination switch.

- **source-mac-address**
  Specify the MAC address of the source switch in hexadecimal format.

- **destination-mac-address**
  Specify the MAC address of the destination switch in hexadecimal format.

- **vlan vlan-id**
  (Optional) Specify the VLAN on which to trace the Layer 2 path that the packets take from the source switch to the destination switch. Valid VLAN IDs are 1 to 4094.

- **detail**
  (Optional) Specify that detailed information appears.

### Defaults

There is no default.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

For Layer 2 traceroute to function properly, Cisco Discovery Protocol (CDP) must be enabled on all the switches in the network. Do not disable CDP.

When the switch detects a device in the Layer 2 path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

Layer 2 traceroute supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and an error message appears.

The **traceroute mac** command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN. If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.
Examples

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201
Source 0000.0201.0601 found on con6[switch_mmodel] (2.2.6.6)
con6 (2.2.6.6) :Gi0/0/1 => Gi0/0/3
con5 (2.2.5.5) : Gi0/0/3 => Gi0/0/1
con1 (2.2.1.1) : Gi0/0/1 => Gi0/0/2
con2 (2.2.2.2) : Gi0/0/2 => Gi0/0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed
```

This example shows how to display the Layer 2 path by using the `detail` keyword:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201 detail
Source 0000.0201.0601 found on con6[switch_mmodel] (2.2.6.6)
con6 /switch_mmodel/ 2.2.6.6 :
   Gi0/2 [auto, auto] => Gi0/3 [auto, auto]
con5 / switch_mmodel / 2.2.5.5 :
   Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
con1 / switch_mmodel / 2.2.1.1 :
   Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 /switch_mmodel / 2.2.2.2 :
   Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination switches:

```
Switch# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3 0000.0201.0201
Source 0000.0201.0601 found on con6[switch_mmodel] (2.2.6.6)
con6 (2.2.6.6) :Gi0/1 => Gi0/3
con5 (2.2.5.5) : Gi0/3 => Gi0/1
con1 (2.2.1.1) : Gi0/1 => Gi0/2
con2 (2.2.2.2) : Gi0/2 => Gi0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows the Layer 2 path when the switch is not connected to the source switch:

```
Switch# traceroute mac 0000.0201.0501 0000.0201.0201 detail
Source not directly connected, tracing source ..... Source 0000.0201.0501 found on con5[switch_mmodel] (2.2.5.5)
con5 / switch_mmodel / 2.2.5.5 :
   Gi0/1 [auto, auto] => Gi0/3 [auto, auto]
con1 / switch_mmodel / 2.2.1.1 :
   Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
con2 / switch_mmodel / 2.2.2.2 :
   Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows the Layer 2 path when the switch cannot find the destination port for the source MAC address:

```
Switch# traceroute mac 0000.0011.1111 0000.0201.0201
Error:Source Mac address not found.
Layer2 trace aborted.
```
This example shows the Layer 2 path when the source and destination devices are in different VLANs:

```
Switch# traceroute mac 0000.0201.0601 0000.0301.0201
Error: Source and destination macs are on different vlans.
Layer2 trace aborted.
```

This example shows the Layer 2 path when the destination MAC address is a multicast address:

```
Switch# traceroute mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address
```

This example shows the Layer 2 path when source and destination switches belong to multiple VLANs:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201
Error: Mac found on multiple vlans.
Layer2 trace aborted.
```

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

For Layer 2 tracercoute to function properly, Cisco Discovery Protocol (CDP) must be enabled on all the switches in the network. Do not disable CDP.

When the switch detects an device in the Layer 2 path that does not support Layer 2 tracercoute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.

The tracercoute mac ip command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and an error message appears.
The Layer 2 traceroute feature is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

### Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the `detail` keyword:

```plaintext
Switch# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac ......
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / switch_mmodel / 2.2.6.6 :
  GI0/1 [auto, auto] => GI0/3 [auto, auto]
con5 / switch_mmodel / 2.2.5.5 :
  Fa0/3 [auto, auto] => GI0/1 [auto, auto]
con1 / switch_mmodel / 2.2.1.1 :
  GI0/1 [auto, auto] => GI0/2 [auto, auto]
con2 / switch_mmodel / 2.2.2.2 :
  GI0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```plaintext
Switch# traceroute mac ip con6 con2
Translating IP to mac ......
2.2.66.66 => 0000.0201.0601
2.2.22.22 => 0000.0201.0201

Source 0000.0201.0601 found on con6
con6 (2.2.6.6) : GI0/1 => GI0/3
con5 (2.2.5.5 ) : GI0/3 => GI0/1
con1 (2.2.1.1 ) : GI0/1 => GI0/2
con2 (2.2.2.2 ) : GI0/2 => Fa0/1
Destination 0000.0201.0201 found on con2
Layer 2 trace completed
```

This example shows the Layer 2 path when ARP cannot associate the source IP address with the corresponding MAC address:

```plaintext
Switch# traceroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace aborted.
```

### Related Commands

trust

Use the `trust` policy-map class configuration command to define a trust state for traffic classified through the `class` policy-map configuration or the `class-map` global configuration command. Use the `no` form of this command to return to the default setting.

```
trust [cos | dscp | ip-precedence]

no trust [cos | dscp | ip-precedence]
```

**Syntax Description**
- `cos` (Optional) Classify an ingress packet by using the packet class of service (CoS) value. For an untagged packet, the port default CoS value is used.
- `dscp` (Optional) Classify an ingress packet by using the packet Differentiated Services Code Point (DSCP) values (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS value is used if the packet is tagged. If the packet is untagged, the default port CoS value is used to map CoS to DSCP.
- `ip-precedence` (Optional) Classify an ingress packet by using the packet IP-precedence value (most significant 3 bits of 8-bit service-type field). For a non-IP packet, the packet CoS value is used if the packet is tagged. If the packet is untagged, the port default CoS value is used to map CoS to DSCP.

**Defaults**
The action is not trusted. If no keyword is specified when the command is entered, the default is `dscp`.

**Command Modes**
Policy-map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use this command to distinguish the quality of service (QoS) trust behavior for certain traffic from other traffic. For example, incoming traffic with certain DSCP values can be trusted. You can configure a class map to match and trust the DSCP values in the incoming traffic.

Trust values set with this command supersede trust values set with the `mls qos trust` interface configuration command.

The `trust` command is mutually exclusive with `set` policy-map class configuration command within the same policy map.

If you specify `trust cos`, QoS uses the received or default port CoS value and the CoS-to-DSCP map to generate a DSCP value for the packet.

If you specify `trust dscp`, QoS uses the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS uses the received CoS value; for non-IP packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP value for the packet is derived from the CoS-to-DSCP map.
If you specify trust ip-precedence, QoS uses the IP precedence value from the ingress packet and the IP-precedence-to-DSCP map. For non-IP packets that are tagged, QoS uses the received CoS value; for non-IP packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP for the packet is derived from the CoS-to-DSCP map.

To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.

**Examples**

This example shows how to define a port trust state to trust incoming DSCP values for traffic classified with class1:

```
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

<td>The range for the <code>message-timer-interval</code> was changed from 7 to 90 seconds</td>
</tr>
<tr>
<td></td>
<td>to 1 to 90 seconds.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD detects unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and due to misconnected interfaces on fiber-optic links. For information about normal and aggressive modes, see the “Understanding UDLD” section in the software configuration guide for this release.

If you change the message time between probe packets, you are making a trade-off between the detection speed and the CPU load. By decreasing the time, you can make the detection-response faster but increase the load on the CPU.

This command affects fiber-optic interfaces only. Use the `udld` interface configuration command to enable UDLD on other interface types.

You can use these commands to reset an interface shut down by UDLD:

- The `udld reset` privileged EXEC command to reset all interfaces shut down by UDLD
- The `shutdown` and `no shutdown` interface configuration commands
- The `no udld enable` global configuration command followed by the `udld { aggressive | enable }` global configuration command to re-enable UDLD globally.
• The no udld port interface configuration command followed by the udld port or udld port aggressive interface configuration command to re-enable UDLD on the specified interface.

• The errdisable recovery cause udld and errdisable recovery interval interval global configuration commands to automatically recover from the UDLD error-disabled state.

Examples

This example shows how to enable UDLD on all fiber-optic interfaces:

```
Switch(config)# udld enable
```

You can verify your setting by entering the show udld privileged EXEC command.

</tbody>
</table>
udld port

Use the `udld port` interface configuration command to enable the UniDirectional Link Detection (UDLD) on an individual interface or prevent a fiber-optic interface from being enabled by the `udld` global configuration command. Use the `no` form of this command to return to the `udld` global configuration command setting or to disable UDLD if entered for a nonfiber-optic port.

```
udld port [aggressive]

no udld port [aggressive]
```

### Syntax Description

**aggressive**  
Enable UDLD in aggressive mode on the specified interface.

### Defaults

On fiber-optic interfaces, UDLD is not enabled, not in aggressive mode, and not disabled. For this reason, fiber-optic interfaces enable UDLD according to the state of the `udld enable` or `udld aggressive` global configuration command.

On nonfiber-optic interfaces, UDLD is disabled.

### Command Modes

Interface configuration

<tr>
<td>12.2(20)SE</td>
<td>The <code>disable</code> keyword was removed.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A UDLD-capable port cannot detect a unidirectional link if it is connected to a UDLD-incapable port of another switch.

UDLD supports two modes of operation: normal (the default) and aggressive. In normal mode, UDLD detects unidirectional links due to misconnected interfaces on fiber-optic connections. In aggressive mode, UDLD also detects unidirectional links due to one-way traffic on fiber-optic and twisted-pair links and due to misconnected interfaces on fiber-optic links. For information about normal and aggressive modes, see the “Configuring UDLD” chapter in the software configuration guide for this release.

To enable UDLD in normal mode, use the `udld port` interface configuration command. To enable UDLD in aggressive mode, use the `udld port aggressive` interface configuration command.

Use the `no udld port` command on fiber-optic ports to return control of UDLD to the `udld enable` global configuration command or to disable UDLD on nonfiber-optic ports.

Use the `udld port aggressive` command on fiber-optic ports to override the setting of the `udld enable` or `udld aggressive` global configuration command. Use the `no` form on fiber-optic ports to remove this setting and to return control of UDLD enabling to the `udld` global configuration command or to disable UDLD on nonfiber-optic ports.
You can use these commands to reset an interface shut down by UDLD:

- The **udld reset** privileged EXEC command to reset all interfaces shut down by UDLD
- The **shutdown** and **no shutdown** interface configuration commands
- The **no udld enable** global configuration command followed by the **udld {aggressive | enable}** global configuration command to re-enable UDLD globally
- The **no udld port** interface configuration command followed by the **udld port or udld port aggressive** interface configuration command to re-enable UDLD on the specified interface
- The **errdisable recovery cause udld** and **errdisable recovery interval interval** global configuration commands to automatically recover from the UDLD error-disabled state

### Examples

This example shows how to enable UDLD on an port:

Switch(config)# interface gigabitethernet6/0/1
Switch(config-if)# udld port

This example shows how to disable UDLD on a fiber-optic interface despite the setting of the **udld** global configuration command:

Switch(config)# interface gigabitethernet6/0/1
Switch(config-if)# no udld port

You can verify your settings by entering the **show running-config** or the **show udld interface** privileged EXEC command.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tr>
<td><strong>udld reset</strong></td>
<td>Resets all interfaces shut down by UDLD and permits traffic to again pass through.</td>
</tr>
</tbody>
</table>
udld reset

Use the **udld reset** privileged EXEC command to reset all interfaces disabled by the UniDirectional Link Detection (UDLD) and permit traffic to begin passing through them again (though other features, such as spanning tree, Port Aggregation Protocol (PAgP), and Dynamic Trunking Protocol (DTP) still have their normal effects, if enabled).

**Syntax Description**  This command has no arguments or keywords.

**Command Modes**  Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**  If the interface configuration is still enabled for UDLD, these ports begin to run UDLD again and are disabled for the same reason if the problem has not been corrected.

**Examples**  This example shows how to reset all interfaces disabled by UDLD:

```
Switch# udld reset
1 ports shutdown by UDLD were reset.
```

You can verify your setting by entering the **show udld** privileged EXEC command.

</tbody>
</table>
Use the `vlan` global configuration command to add a VLAN and to enter the config-vlan mode. Use the `no` form of this command to delete the VLAN. Configuration information for normal-range VLANs (VLAN IDs 1 to 1005) is always saved in the VLAN database. When VLAN Trunking Protocol (VTP) mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005), and the VTP mode, domain name, and the VLAN configuration are saved in the switch running configuration file. You can save configurations in the switch startup configuration file by entering the `copy running-config startup-config` privileged EXEC command.

```plaintext
vlan vlan-id

no vlan vlan-id
```

**Syntax Description**

- `vlan-id` 
  ID of the VLAN to be added and configured. For `vlan-id`, the range is 1 to 4094. You can enter a single VLAN ID, a series of VLAN IDs separated by commas, or a range of VLAN IDs separated by hyphens.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must use the `vlan vlan-id` global configuration command to add extended-range VLANs (VLAN IDs 1006 to 4094). Before configuring VLANs in the extended range, you must use the `vtp transparent` global configuration or VLAN configuration command to put the switch in VTP transparent mode. Extended-range VLANs are not learned by VTP and are not added to the VLAN database, but when VTP mode is transparent, VTP mode and domain name and all VLAN configurations are saved in the running configuration, and you can save them in the switch startup configuration file.

When you save the VLAN and VTP configurations in the startup configuration file and reboot the switch, the configuration is selected in these ways:

- If both the VLAN database and the configuration file show the VTP mode as transparent and the VTP domain names match, the VLAN database is ignored. The VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the VTP mode is server, or if the startup VTP mode or domain names do not match the VLAN database, the VTP mode and the VLAN configuration for the first 1005 VLANs use the VLAN database information.

If you try to create an extended-range VLAN when the switch is not in VTP transparent mode, the VLAN is rejected, and you receive an error message.
If you enter an invalid VLAN ID, you receive an error message and do not enter config-vlan mode.

Entering the `vlan` command with a VLAN ID enables config-vlan mode. When you enter the VLAN ID of an existing VLAN, you do not create a new VLAN, but you can modify VLAN parameters for that VLAN. The specified VLANs are added or modified when you exit the config-vlan mode. Only the `shutdown` command (for VLANs 1 to 1005) takes effect immediately.

These configuration commands are available in config-vlan mode. The `no` form of each command returns the characteristic to its default state.

**Note** Although all commands are visible, the only VLAN configuration commands that are supported on extended-range VLANs are `mtu mtu-size`, `private-vlan`, and `remote-span`. For extended-range VLANs, all other characteristics must remain at the default state.

- `are are-number`: defines the maximum number of all-routes explorer (ARE) hops for this VLAN. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7. If no value is entered, 0 is assumed to be the maximum.

- `backupcrf`: specifies the backup CRF mode. This keyword applies only to TrCRF VLANs.
  - `enable` backup CRF mode for this VLAN.
  - `disable` backup CRF mode for this VLAN (the default).

- `bridge {bridge-number|type}`: specifies the logical distributed source-routing bridge, the bridge that interconnects all logical rings having this VLAN as a parent VLAN in FDDI-NET, Token Ring-NET, and TrBRF VLANs. The range is 0 to 15. The default bridge number is 0 (no source-routing bridge) for FDDI-NET, TrBRF, and Token Ring-NET VLANs. The `type` keyword applies only to TrCRF VLANs and is one of these:
  - `srb` (source-route bridging)
  - `srt` (source-route transparent) bridging VLAN

- `exit`: applies changes, increments the VLAN database revision number (VLANs 1 to 1005 only), and exits config-vlan mode.

- `media`: defines the VLAN media type. See Table 2-50 for valid commands and syntax for different media types.

  **Note** The switch supports only Ethernet ports. You configure only FDDI and Token Ring media-specific characteristics for VLAN Trunking Protocol (VTP) global advertisements to other switches. These VLANs are locally suspended.

  - `ethernet` is Ethernet media type (the default).
  - `fdi` is FDDI media type.
  - `fd-net` is FDDI network entity title (NET) media type.
  - `tokenring` is Token Ring media type if the VTP v2 mode is disabled, or TrCRF if the VTP Version 2 (v) mode is enabled.
  - `tr-net` is Token Ring network entity title (NET) media type if the VTP v2 mode is disabled or TrBRF media type if the VTP v2 mode is enabled.

- `mtu mtu-size`: specifies the maximum transmission unit (MTU) (packet size in bytes). The range is 1500 to 18190. The default is 1500 bytes.
- name **vlan-name**: names the VLAN with an ASCII string from 1 to 32 characters that must be unique within the administrative domain. The default is VLANxxxx where xxxx represents four numeric digits (including leading zeros) equal to the VLAN ID number.

- **no**: negates a command or returns it to the default setting.

- parent **parent-vlan-id**: specifies the parent VLAN of an existing FDDI, Token Ring, or TrCRF VLAN. This parameter identifies the TrBRF to which a TrCRF belongs and is required when defining a TrCRF. The range is 0 to 1005. The default parent VLAN ID is 0 (no parent VLAN) for FDDI and Token Ring VLANs. For both Token Ring and TrCRF VLANs, the parent VLAN ID must already exist in the database and be associated with a Token Ring-NET or TrBRF VLAN.

- **private-vlan**: configure the VLAN as a private VLAN community, isolated, or primary VLAN or configure the association between private-VLAN primary and secondary VLANs. For more information, see the **private-vlan** command.

- remote-span: configure the VLAN as a Remote SPAN (RSPAN) VLAN. When the RSPAN feature is added to an existing VLAN, the VLAN is first deleted and is then recreated with the RSPAN feature. Any access ports are deactivated until the RSPAN feature is removed. If VTP is enabled, the new RSPAN VLAN is propagated by VTP for VLAN-IDs that are lower than 1024. Learning is disabled on the VLAN. See the **remote-span** command for more information.

- ring **ring-number**: defines the logical ring for an FDDI, Token Ring, or TrCRF VLAN. The range is 1 to 4095. The default for Token Ring VLANs is 0. For FDDI VLANs, there is no default.

- said **said-value**: specifies the security association identifier (SAID) as documented in IEEE 802.10. The range is 1 to 4294967294, and the number must be unique within the administrative domain. The default value is 100000 plus the VLAN ID number.

- shutdown: shuts down VLAN switching on the VLAN. This command takes effect immediately. Other commands take effect when you exit config-vlan mode.

- state: specifies the VLAN state:
  - **active** means the VLAN is operational (the default).
  - **suspend** means the VLAN is suspended. Suspended VLANs do not pass packets.

- ste **ste-number**: defines the maximum number of spanning-tree explorer (STE) hops. This keyword applies only to TrCRF VLANs. The range is 0 to 13. The default is 7.

- stp type: defines the spanning-tree type for FDDI-NET, Token Ring-NET, or TrBRF VLANs. For FDDI-NET VLANs, the default STP type is **ieee**. For Token Ring-NET VLANs, the default STP type is **ibm**. For FDDI and Token Ring VLANs, the default is no type specified.
  - **ieee** for IEEE Ethernet STP running source-route transparent (SRT) bridging.
  - **ibm** for IBM STP running source-route bridging (SRB).
  - **auto** for STP running a combination of source-route transparent bridging (IEEE) and source-route bridging (IBM).

- **tb-vlan1 tb-vlan1-id** and **tb-vlan2 tb-vlan2-id**: specifies the first and second VLAN to which this VLAN is translationally bridged. Translational VLANs translate FDDI or Token Ring to Ethernet, for example. The range is 0 to 1005. If no value is specified, 0 (no transitional bridging) is assumed.
Table 2-50  **Valid Commands and Syntax for Different Media Types**

<table>
<thead>
<tr>
<th>Media Type</th>
<th>Valid Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet</td>
<td>`name vlan-name, media ethernet, state {suspend</td>
</tr>
<tr>
<td>FDDI</td>
<td>`name vlan-name, media fddi, state {suspend</td>

<tr>
<td>FDDI-NET</td>
<td>`name vlan-name, media fd-net, state {suspend</td>
</tr>
<tr>
<td>Token Ring</td>
<td>VTP v1 mode is enabled. `name vlan-name, media tokenring, state {suspend</td>
</tr>
<tr>
<td>Token Ring concentrator relay function (TrCRF)</td>
<td>VTP v2 mode is enabled. `name vlan-name, media tokenring, state {suspend</td>
</tr>
<tr>
<td>Token Ring-NET</td>
<td>VTP v1 mode is enabled. `name vlan-name, media tr-net, state {suspend</td>
</tr>
<tr>
<td>Token Ring bridge relay function (TrBRF)</td>
<td>VTP v2 mode is enabled. `name vlan-name, media tr-net, state {suspend</td>
</tr>
</tbody>
</table>

Table 2-51 describes the rules for configuring VLANs.

Table 2-51  **VLAN Configuration Rules**

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP v2 mode is enabled, and you are configuring a TrCRF VLAN media type.</td>
<td>Specify a parent VLAN ID of a TrBRF that already exists in the database. Specify a ring number. Do not leave this field blank. Specify unique ring numbers when TrCRF VLANs have the same parent VLAN ID. Only one backup concentrator relay function (CRF) can be enabled.</td>
</tr>
<tr>
<td>VTP v2 mode is enabled, and you are configuring VLANs other than TrCRF media type.</td>
<td>Do not specify a backup CRF.</td>
</tr>
</tbody>
</table>
This example shows how to add an Ethernet VLAN with default media characteristics. The default includes a `vlan-name` of `VLANxxx`, where `xxx` represents four numeric digits (including leading zeros) equal to the VLAN ID number. The default `media` option is `ethernet`; the `state` option is `active`. The default `said-value` variable is 100000 plus the VLAN ID; the `mtu-size` variable is 1500; the `stp-type` option is `ieee`. When you enter the `exit` config-vlan configuration command, the VLAN is added if it did not already exist; otherwise, this command does nothing.

This example shows how to create a new VLAN with all default characteristics and enter config-vlan mode:

```
Switch(config)# vlan 200
Switch(config-vlan)# exit
Switch(config)#
```

This example shows how to create a new extended-range VLAN with all the default characteristics, to enter config-vlan mode, and to save the new VLAN in the switch startup configuration file:

```
Switch(config)# vtp mode transparent
Switch(config)# vlan 2000
Switch(config-vlan)# end
Switch# copy running-config startup config
```

You can verify your setting by entering the `show vlan` privileged EXEC command.

### Table 2-51  VLAN Configuration Rules (continued)

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>VTP v2 mode is enabled, and you are configuring a TrBRF VLAN media type.</td>
<td>Specify a bridge number. Do not leave this field blank.</td>
</tr>
<tr>
<td>VTP v1 mode is enabled.</td>
<td>No VLAN can have an STP type set to auto. This rule applies to Ethernet, FDDI, FDDI-NET, Token Ring, and Token Ring-NET VLANs.</td>
</tr>
<tr>
<td>Add a VLAN that requires translational bridging (values are not set to zero).</td>
<td>The translational bridging VLAN IDs that are used must already exist in the database. The translational bridging VLAN IDs that a configuration points to must also contain a pointer to the original VLAN in one of the translational bridging parameters (for example, Ethernet points to FDDI, and FDDI points to Ethernet). The translational bridging VLAN IDs that a configuration points to must be different media types than the original VLAN (for example, Ethernet can point to Token Ring). If both translational bridging VLAN IDs are configured, these VLANs must be different media types (for example, Ethernet can point to FDDI and Token Ring).</td>
</tr>
</tbody>
</table>

### Examples

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vlan</td>
<td>Displays the parameters for all configured VLANs or one VLAN (if the VLAN ID or name is specified) in the administrative domain.</td>
</tr>
</tbody>
</table>
The `vlan access-map` command is used to create or modify a VLAN map entry for VLAN packet filtering. This entry changes the mode to the VLAN access-map configuration. Use the `no` form of this command to delete a VLAN map entry. Use the `vlan filter` interface configuration command to apply a VLAN map to one or more VLANs.

```
vlan access-map name [number]
no vlan access-map name [number]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>Name of the VLAN map.</td>
</tr>
<tr>
<td><code>number</code></td>
<td>(Optional) The sequence number of the map entry that you want to create or modify (0 to 65535). If you are creating a VLAN map and the sequence number is not specified, it is automatically assigned in increments of 10, starting from 10. This number is the sequence to insert to, or delete from, a VLAN access-map entry.</td>
</tr>
</tbody>
</table>

**Defaults**

There are no VLAN map entries and no VLAN maps applied to a VLAN.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In global configuration mode, use this command to create or modify a VLAN map. This entry changes the mode to VLAN access-map configuration, where you can use the `match` access-map configuration command to specify the access lists for IP or non-IP traffic to match and use the `action` command to set whether a match causes the packet to be forwarded or dropped.

In VLAN access-map configuration mode, these commands are available:

- **action**: sets the action to be taken (forward or drop).
- **default**: sets a command to its defaults
- **exit**: exits from VLAN access-map configuration mode
- **match**: sets the values to match (IP address or MAC address).
- **no**: negates a command or set its defaults

When you do not specify an entry number (sequence number), it is added to the end of the map.

There can be only one VLAN map per VLAN and it is applied as packets are received by a VLAN.

You can use the `no vlan access-map name [number]` command with a sequence number to delete a single entry.
In global configuration mode, use the `vlan filter` interface configuration command to apply the map to one or more VLANs.

For more information about VLAN map entries, see the software configuration guide for this release.

### Examples

This example shows how to create a VLAN map named `vac1` and apply matching conditions and actions to it. If no other entries already exist in the map, this will be entry 10.

```plaintext
Switch(config)# vlan access-map vac1
Switch(config-access-map)# match ip address acl1
Switch(config-access-map)# action forward
```

This example shows how to delete VLAN map `vac1`:

```plaintext
Switch(config)# no vlan access-map vac1
```

### Related Commands

</table>
**vlan dot1q tag native**

Use the `vlan dot1q tag native` global configuration command to enable tagging of native VLAN frames on all IEEE 802.1Q trunk ports. Use the `no` form of this command to return to the default setting.

```
  vlan dot1q tag native

  no vlan dot1q tag native
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The IEEE 802.1Q native VLAN tagging is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabled, native VLAN packets going out all IEEE 802.1Q trunk ports are tagged. When disabled, native VLAN packets going out all IEEE 802.1Q trunk ports are not tagged.

You can use this command with the IEEE 802.1Q tunneling feature. This feature operates on an edge switch of a service-provider network and expands VLAN space by using a VLAN-in-VLAN hierarchy and tagging the tagged packets. You must use IEEE 802.1Q trunk ports for sending packets to the service-provider network. However, packets going through the core of the service-provider network might also be carried on IEEE 802.1Q trunks. If the native VLANs of an IEEE 802.1Q trunks match the native VLAN of a tunneling port on the same switch, traffic on the native VLAN is not tagged on the sending trunk port. This command ensures that native VLAN packets on all IEEE 802.1Q trunk ports are tagged.

For more information about IEEE 802.1Q tunneling, see the software configuration guide for this release.

**Examples**

This example shows how to enable IEEE 802.1Q tagging on native VLAN frames:

```
Switch# configure terminal
Switch (config)# vlan dot1q tag native
Switch (config)# end
```

You can verify your settings by entering the `show vlan dot1q tag native` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vlan dot1q tag native</code></td>
<td>Displays IEEE 802.1Q native VLAN tagging status.</td>

vlan filter

Use the vlan filter global configuration command to apply a VLAN map to one or more VLANs. Use the no form of this command to remove the map.

```
vlan filter mapname vlan-list {list | all}
no vlan filter mapname vlan-list {list | all}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mapname</td>
<td>Name of the VLAN map entry.</td>
</tr>
<tr>
<td>list</td>
<td>The list of one or more VLANs in the form tt, uu-vv, xx, yy-zz, where spaces around commas and dashes are optional. The range is 1 to 4094.</td>
</tr>
<tr>
<td>all</td>
<td>Remove the filter from all VLANs.</td>
</tr>
</tbody>
</table>

**Defaults**

There are no VLAN filters.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To avoid accidentally dropping too many packets and disabling connectivity in the middle of the configuration process, we recommend that you completely define the VLAN access map before applying it to a VLAN.

For more information about VLAN map entries, see the software configuration guide for this release.

**Examples**

This example applies VLAN map entry map1 to VLANs 20 and 30:

```
Switch(config)# vlan filter map1 vlan-list 20, 30
```

This example shows how to delete VLAN map entry mac1 from VLAN 20:

```
Switch(config)# no vlan filter map1 vlan-list 20
```

You can verify your settings by entering the show vlan filter privileged EXEC command.
## vlan filter

</table>
vmps reconfirm (privileged EXEC)

Use the `vmps reconfirm` privileged EXEC command to immediately send VLAN Query Protocol (VQP) queries to reconfirm all dynamic VLAN assignments with the VLAN Membership Policy Server (VMPS).

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No default is defined.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to immediately send VQP queries to the VMPS:

```
Switch# vmps reconfirm
```

You can verify your setting by entering the `show vmps` privileged EXEC command and examining the VMPS Action row of the Reconfirmation Status section. The `show vmps` command shows the result of the last time the assignments were reconfirmed either because the reconfirmation timer expired or because the `vmps reconfirm` command was entered.

**Related Commands**

</tr>
</tbody>
</table>
vmps reconfirm (global configuration)

Use the `vmps reconfirm` global configuration command to change the reconfirmation interval for the VLAN Query Protocol (VQP) client. Use the `no` form of this command to return to the default setting.

```
vmps reconfirm interval

no vmps reconfirm
```

**Syntax Description**

| interval | Reconfirmation interval for VQP client queries to the VLAN Membership Policy Server (VMPS) to reconfirm dynamic VLAN assignments. The range is 1 to 120 minutes. |

**Defaults**

The default reconfirmation interval is 60 minutes.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set the VQP client to reconfirm dynamic VLAN entries every 20 minutes:

```
Switch(config)# vmps reconfirm 20
```

You can verify your setting by entering the `show vmps` privileged EXEC command and examining information in the Reconfirm Interval row.

**Related Commands**

</table>
vmps retry

Use the `vmps retry` global configuration command to configure the per-server retry count for the VLAN Query Protocol (VQP) client. Use the `no` form of this command to return to the default setting.

```
vmps retry count
no vmps retry
```

**Syntax Description**

`count`  
Number of attempts to contact the VLAN Membership Policy Server (VMPS) by the client before querying the next server in the list. The range is 1 to 10.

**Defaults**

The default retry count is 3.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set the retry count to 7:

```
Switch(config)# vmps retry 7
```

You can verify your setting by entering the `show vmps` privileged EXEC command and examining information in the Server Retry Count row.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vmps</code></td>
<td>Displays VQP and VMPS information.</td>
</tr>
</tbody>
</table>
vmps server

Use the `vmps server` global configuration command to configure the primary VLAN Membership Policy Server (VMPS) and up to three secondary servers. Use the `no` form of this command to remove a VMPS server.

```
vmps server ipaddress [primary]
no vmps server [ipaddress]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddress</td>
<td>IP address or hostname of the primary or secondary VMPS servers. If you specify a hostname, the Domain Name System (DNS) server must be configured.</td>
</tr>
<tr>
<td>primary</td>
<td>(Optional) Decides whether primary or secondary VMPS servers are being configured.</td>
</tr>
</tbody>
</table>

**Defaults**

No primary or secondary VMPS servers are defined.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The first server entered is automatically selected as the primary server whether or not `primary` is entered. The first server address can be overridden by using `primary` in a subsequent command.

If a member switch in a cluster configuration does not have an IP address, the cluster does not use the VMPS server configured for that member switch. Instead, the cluster uses the VMPS server on the command switch, and the command switch proxies the VMPS requests. The VMPS server treats the cluster as a single switch and uses the IP address of the command switch to respond to requests.

When using the `no` form without specifying the `ipaddress`, all configured servers are deleted. If you delete all servers when dynamic-access ports are present, the switch cannot forward packets from new sources on these ports because it cannot query the VMPS.

**Examples**

This example shows how to configure the server with IP address 191.10.49.20 as the primary VMPS server. The servers with IP addresses 191.10.49.21 and 191.10.49.22 are configured as secondary servers:

```
Switch(config)# vmps server 191.10.49.20 primary
Switch(config)# vmps server 191.10.49.21
Switch(config)# vmps server 191.10.49.22
```
This example shows how to delete the server with IP address 191.10.49.21:

```
Switch(config)# no vmps server 191.10.49.21
```

You can verify your setting by entering the `show vmps` privileged EXEC command and examining information in the VMPS Domain Server row.

<table>

</tbody>
</table>
vtp (global configuration)

Use the `vtp` global configuration command to set or modify the VLAN Trunking Protocol (VTP) configuration characteristics. Use the `no` form of this command to remove the settings or to return to the default settings.

```
vtp {domain domain-name | file filename | interface name [only] | mode {client | off | server | transparent} [mst | unknown | vlan] | password password [hidden | secret] | pruning | version number}
novtp {file | interface | mode {client | off | server | transparent} [mst | unknown | vlan] | password | pruning | version}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain domain-name</td>
<td>Specify the VTP domain name, an ASCII string from 1 to 32 characters that identifies the VTP administrative domain for the switch. The domain name is case sensitive.</td>
</tr>
<tr>
<td>file filename</td>
<td>Specify the Cisco IOS file system file where the VTP VLAN configuration is stored.</td>
</tr>
<tr>
<td>interface name</td>
<td>Specify the name of the interface providing the VTP ID updated for this device.</td>
</tr>
<tr>
<td>only</td>
<td>(Optional) Use only the IP address of this interface as the VTP IP updater.</td>
</tr>
<tr>
<td>mode</td>
<td>Specify the VTP device mode as client, server, or transparent.</td>
</tr>
<tr>
<td>client</td>
<td>Place the switch in VTP client mode. A switch in VTP client mode is enabled for VTP, and can send advertisements, but does not have enough nonvolatile storage to store VLAN configurations. You cannot configure VLANs on the switch. When a VTP client starts up, it does not send VTP advertisements until it receives advertisements to initialize its VLAN database.</td>
</tr>
<tr>
<td>off</td>
<td>Place the switch in VTP off mode. A switch in off VTP off mode functions the same as a VTP transparent device except that it does not forward VTP advertisements on trunk ports.</td>
</tr>
<tr>
<td>server</td>
<td>Place the switch in VTP server mode. A switch in VTP server mode is enabled for VTP and sends advertisements. You can configure VLANs on the switch. The switch can recover all the VLAN information in the current VTP database from nonvolatile storage after reboot.</td>
</tr>
<tr>
<td>transparent</td>
<td>Place the switch in VTP transparent mode. A switch in VTP transparent mode is disabled for VTP, does not send advertisements or learn from advertisements sent by other devices, and cannot affect VLAN configurations on other devices in the network. The switch receives VTP advertisements and forwards them on all trunk ports except the one on which the advertisement was received. When VTP mode is transparent, the mode and domain name are saved in the switch running configuration file, and you can save them in the switch startup configuration file by entering the <code>copy running-config startup config</code> privileged EXEC command.</td>
</tr>
<tr>
<td>mst</td>
<td>(Optional) Set the mode for the multiple spanning tree (MST) VTP database (only VTP version 3).</td>
</tr>
<tr>
<td>unknown</td>
<td>(Optional) Set the mode for unknown VTP databases (only VTP version 3).</td>
</tr>
</tbody>
</table>
### vtp (global configuration)

#### vlan
(Optional) Set the mode for VLAN VTP database. This is the default (only VTP version 3).

#### password **password**
Set the administrative domain password for the generation of the 16-byte secret value used in MD5 digest calculation to be sent in VTP advertisements and to validate received VTP advertisements. The password can be an ASCII string from 1 to 32 characters. The password is case sensitive.

#### hidden
(Optional) Specify that the key generated from the password string is saved in the VLAN database file. When the **hidden** keyword is not specified, the password string is saved in clear text. When the **hidden** password is entered, you need to reenter the password to issue a command in the domain. This keyword is supported only in VTP version 3.

#### secret
(Optional) Allow the user to directly configure the password secret key (only VTP version 3).

#### pruning
Enable VTP pruning on the switch.

#### version **number**
Set VTP version to version 1, version 2, or version 3.

---

**Defaults**

The default filename is **flash:vlan.dat**.

The default mode is server mode and the default database is VLAN.

In VTP version 3, for the MST database, the default mode is transparent.

No domain name or password is defined.

No password is configured.

Pruning is disabled.

The default version is Version 1.

<td>The <strong>mode off</strong> keyword was added, support was added for VTP version 3, and the password <strong>hidden</strong> and <strong>secret</strong> keywords and the mode database keywords (<strong>vlan</strong>, <strong>mst</strong>, and <strong>unknown</strong>) were added with VTP version 3.</td>
</tr>
</tbody>
</table>
Usage Guidelines

When you save VTP mode, domain name, and VLAN configurations in the switch startup configuration file and reboot the switch, the VTP and VLAN configurations are selected by these conditions:

- If both the VLAN database and the configuration file show the VTP mode as transparent and the VTP domain names match, the VLAN database is ignored. The VTP and VLAN configurations in the startup configuration file are used. The VLAN database revision number remains unchanged in the VLAN database.
- If the startup VTP mode is server mode, or the startup VTP mode or domain names do not match the VLAN database, VTP mode and VLAN configuration for the first 1005 VLANs are selected by VLAN database information, and VLANs greater than 1005 are configured from the switch configuration file.

The `vtp file filename` cannot be used to load a new database; it renames only the file in which the existing database is stored.

Follow these guidelines when configuring a VTP domain name:

- The switch is in the no-management-domain state until you configure a domain name. While in the no-management-domain state, the switch does not send any VTP advertisements even if changes occur to the local VLAN configuration. The switch leaves the no-management-domain state after it receives the first VTP summary packet on any port that is trunking or after you configure a domain name by using the `vtp domain` command. If the switch receives its domain from a summary packet, it resets its configuration revision number to 0. After the switch leaves the no-management-domain state, it cannot be configured to re-enter it until you clear the NVRAM and reload the software.
- Domain names are case-sensitive.
- After you configure a domain name, it cannot be removed. You can only reassign it to a different domain.

Follow these guidelines when setting VTP mode:

- The `no vtp mode` command returns the switch to VTP server mode.
- The `vtp mode server` command is the same as `no vtp mode` except that it does not return an error if the switch is not in client or transparent mode.
- If the receiving switch is in client mode, the client switch changes its configuration to duplicate the configuration of the server. If you have switches in client mode, be sure to make all VTP or VLAN configuration changes on a switch in server mode. If the receiving switch is in server mode or transparent mode, the switch configuration is not changed.
- Switches in transparent mode do not participate in VTP. If you make VTP or VLAN configuration changes on a switch in transparent mode, the changes are not propagated to other switches in the network.
- If you change the VTP or VLAN configuration on a switch that is in server mode, that change is propagated to all the switches in the same VTP domain.
- The `vtp mode transparent` command disables VTP from the domain but does not remove the domain from the switch.
- In VTP versions 1 and 2, the VTP mode must be transparent for you to add extended-range VLANs or for VTP and VLAN information to be saved in the running configuration file. VTP supports extended-range VLANs in client and server mode and saved them in the VLAN database.
- With VTP versions 1 and 2, if extended-range VLANs are configured on the switch and you attempt to set the VTP mode to server or client, you receive an error message, and the configuration is not allowed. Changing VTP mode is allowed with extended VLANs in VTP version 3.
- VTP can be set to either server or client mode only when dynamic VLAN creation is disabled.
- The `vtp mode off` command sets the device to off. The `no vtp mode off` command resets the device to the VTP server mode.

Follow these guidelines when setting a VTP password:
- Passwords are case sensitive. Passwords should match on all switches in the same domain.
- When you use the `no vtp password` form of the command, the switch returns to the no-password state.
- The `hidden` and `secret` keywords are supported only in VTP version 3. If you convert from VTP version 2 to VTP version 3, you must remove the `hidden` or `secret` keyword before the conversion.

Follow these guidelines when setting VTP pruning:
- VTP pruning removes information about each pruning-eligible VLAN from VTP updates if there are no stations belonging to that VLAN.
- If you enable pruning on the VTP server, it is enabled for the entire management domain for VLAN IDs 1 to 1005.
- Only VLANs in the pruning-eligible list can be pruned.
- Pruning is supported with VTP Version 1 and Version 2.

Follow these guidelines when setting the VTP version:
- Toggling the Version 2 (v2) mode state modifies parameters of certain default VLANs.
- Each VTP switch automatically detects the capabilities of all the other VTP devices. To use Version 2, all VTP switches in the network must support Version 2; otherwise, you must configure them to operate in VTP Version 1 mode.
- If all switches in a domain are VTP Version 2-capable, you need only to configure Version 2 on one switch; the version number is then propagated to the other Version-2 capable switches in the VTP domain.
- If you are using VTP in a Token Ring environment, VTP Version 2 must be enabled.
- If you are configuring a Token Ring bridge relay function (TrBRF) or Token Ring concentrator relay function (TrCRF) VLAN media type, you must use Version 2.
- If you are configuring a Token Ring or Token Ring-NET VLAN media type, you must use Version 1.
- In VTP version 3, all database VTP information is propagated across the VTP domain, not only VLAN database information.
- Two VTP version 3 regions can only communicate over a VTP version 1 or VTP version 2 region in transparent mode.

You cannot save password, pruning, and version configurations in the switch configuration file.

**Examples**

This example shows how to rename the filename for VTP configuration storage to `vtpfilename`:

```
Switch(config)# vtp file vtpfilename
```

This example shows how to clear the device storage filename:

```
Switch(config)# no vtp file vtpconfig
```

Clearing device storage filename.
This example shows how to specify the name of the interface providing the VTP updater ID for this device:

```
Switch(config)# vtp interface gigabitethernet
```

This example shows how to set the administrative domain for the switch:

```
Switch(config)# vtp domain OurDomainName
```

This example shows how to place the switch in VTP transparent mode:

```
Switch(config)# vtp mode transparent
```

This example shows how to configure the VTP domain password:

```
Switch(config)# vtp password ThisIsOurDomain’sPassword
```

This example shows how to enable pruning in the VLAN database:

```
Switch(config)# vtp pruning
Pruning switched ON
```

This example shows how to enable Version 2 mode in the VLAN database:

```
Switch(config)# vtp version 2
```

You can verify your settings by entering the `show vtp status` privileged EXEC command.

<table>

</tbody>
</table>
vtp (interface configuration)

Use the `vtp` interface configuration command to enable the VLAN Trunking Protocol (VTP) on a per-port basis. Use the `no` form of this command to disable VTP on the interface.

```
vtp
no vtp
```

**Note**
This command is supported only when the switch is running the LAN base image and VTP version 3.

**Syntax Description**
This command has no keywords or arguments.

**Command Default**
This command has no default settings.

**Command Modes**
Interface configuration.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Enter this command only interfaces that are switchport in trunk mode.

This command is supported only on switches configured for VTP version 3.

**Examples**
This example shows how to enable VTP on an interface:

```
Switch(config-if)# vtp
```

This example shows how to disable VTP on an interface:

```
Switch(config-if)# no vtp
```

vtp primary

Use the **vtp primary** privileged EXEC command to configure a switch as the VLAN Trunking Protocol (VTP) primary server.

```
vtp primary [mst | vlan] [force]
```

There is no **no** form of the command.

**Note**

This command is supported only when the switch is running VTP version 3.

**Note**

Although visible in the command line help, the **vtp {password password | pruning | version number}** commands are not supported.

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>mst</th>
<th>(Optional) Configure the switch as the primary VTP server for the multiple spanning tree (MST) feature.</th>

<td>vlan</td>
<td>(Optional) Configure the switch as the primary VTP server for VLANs.</td>
</tr>
<tr>
<td></td>
<td>force</td>
<td>(Optional) Configure the switch to not check for conflicting devices when configuring the primary server.</td>
</tr>
</tbody>
</table>

**Defaults**

The switch is a VTP secondary server.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported only on switches configured for VTP version 3.

A VTP primary server updates the database information and sends updates that are honored by all devices in the system. A VTP secondary server can only back up the updated VTP configurations received from the primary server to NVRAM.

By default, all devices come up as secondary servers. Primary server status is needed only for database updates when the administrator issues a takeover message in the domain. You can have a working VTP domain without any primary servers.

Primary server status is lost if the device reloads or domain parameters change.
Examples

This example shows how to configure the switch as the primary VTP server for VLANs:

Switch# vtp primary vlan
Setting device to VTP TRANSPARENT mode.

You can verify your settings by entering the `show vtp status` privileged EXEC command.

Catalyst 3750 Switch Bootloader Commands

During normal bootloader operation, you are not presented with the bootloader command-line prompt. You gain access to the bootloader command line if the switch is set to manually boot up, if an error occurs during power-on self test (POST) DRAM testing, or if an error occurs while loading the operating system (a corrupted Cisco IOS image). You can also access the bootloader if you have lost or forgotten the switch password.

Note

The default switch configuration allows an end user with physical access to the switch to recover from a lost password by interrupting the bootup process while the switch is powering up and then entering a new password. The password recovery disable feature allows the system administrator to protect access to the switch password by disabling part of this functionality and allowing the user to interrupt the bootup process only by agreeing to set the system back to the default configuration. With password recovery disabled, the user can still interrupt the bootup process and change the password, but the configuration file (config.text) and the VLAN database file (vlan.dat) are deleted. For more information, see the software configuration guide for this release.

You can access the bootloader through a switch console connection at 9600 bps.

Unplug the switch power cord, and press the switch Mode button while reconnecting the power cord. You can release the Mode button a second or two after the LED above port 1X goes off. You should then see the bootloader Switch: prompt. The bootloader performs low-level CPU initialization, performs POST, and loads a default operating system image into memory.
**boot**

Use the `boot` bootloader command to load and boot up an executable image and to enter the command-line interface.

```
boot [-post | -n | -p | flag] filesystem:/file-url ...
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-post</code></td>
<td>(Optional) Run the loaded image with an extended or comprehensive power-on self-test (POST). Using this keyword causes POST to take longer to complete.</td>
</tr>
<tr>
<td><code>-n</code></td>
<td>(Optional) Pause for the Cisco IOS debugger immediately after launching.</td>
</tr>
<tr>
<td><code>-p</code></td>
<td>(Optional) Pause for the JTAG debugger right after loading the image.</td>
</tr>
<tr>
<td><code>filesystem:</code></td>
<td>Alias for a flash file system. Use <code>flash:</code> for the system board flash device.</td>
</tr>
<tr>
<td><code>file-url</code></td>
<td>(Optional) Path (directory) and name of a bootable image. Separate image names with a semicolon.</td>
</tr>
</tbody>
</table>

**Defaults**

The switch attempts to automatically boot up the system by using information in the BOOT environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory.

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the `boot` command without any arguments, the switch attempts to automatically boot up the system by using the information in the BOOT environment variable, if any. If you supply an image name for the `file-url` variable, the `boot` command attempts to boot up the specified image.

When you set bootloader `boot` command options, they are executed immediately and apply only to the current bootloader session. These settings are not saved for the next bootup operation.

Filenames and directory names are case sensitive.

**Examples**

This example shows how to boot up the switch using the `new-image.bin` image:

```
switch: boot flash:/new-images/new-image.bin
```

After entering this command, you are prompted to start the setup program.
### Related Commands

</tbody>
</table>
copy

Use the copy bootloader command to copy a file from a source to a destination.

```
copy [-b block-size] filesystem:/source-file-url filesystem:/destination-file-url
```

### Syntax Description

- `-b block-size` (Optional) This option is used only for internal development and testing.
- `filesystem:` Alias for a flash file system. Use `flash:` for the system board flash device.
- `/source-file-url` Path (directory) and filename (source) to be copied.
- `/destination-file-url` Path (directory) and filename of the destination.

### Defaults

The default block size is 4 KB.

### Command Modes

Bootloader

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Filenames and directory names are case sensitive.

Directory names are limited to 45 characters between the slashes (`/`); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 45 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

If you are copying a file to a new directory, the directory must already exist.

### Examples

This example shows how to copy a file at the root:

```
switch: copy flash:test1.text flash:test4.text
```

File "flash:test1.text" successfully copied to "flash:test4.text"

You can verify that the file was copied by entering the `dir filesystem:` bootloader command.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

delete

Use the `delete` bootloader command to delete one or more files from the specified file system.

```
delete filesystem;/file-url ...
```

**Syntax Description**

- `filesystem:` Alias for a flash file system. Use `flash:` for the system board flash device.
- `/file-url` Path (directory) and filename to delete. Separate each filename with a space.

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Filenames and directory names are case sensitive.

The switch prompts you for confirmation before deleting each file.

**Examples**

This example shows how to delete two files:

```
switch: delete flash:test2.text flash:test5.text
Are you sure you want to delete "flash:test2.text" (y/n)?y
File "flash:test2.text" deleted
Are you sure you want to delete "flash:test5.text" (y/n)?y
File "flash:test5.text" deleted
```

You can verify that the files were deleted by entering the `dir flash:` bootloader command.

**Related Commands**

flash_init

Use the **flash_init** bootloader command to initialize the flash file system.

**flash_init**

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The flash file system is automatically initialized during normal system operation.

**Command Modes**
Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
During the normal bootup process, the flash file system is automatically initialized.

Use this command to manually initialize the flash file system. For example, you use this command during the recovery procedure for a lost or forgotten password.
format

Use the format bootloader command to format the specified file system and destroy all data in that file system.

format filesystem:

**Syntax Description**

| filesystem: | Alias for a flash file system. Use flash: for the system board flash device. |

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

Use this command with care; it destroys all data on the file system and renders your system unusable.
### fsck

Use the **fsck** bootloader command to check the file system for consistency.

```
fsck [-test | -f] filesystem:
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-test</code></td>
<td>(Optional) Initialize the file system code and perform extra POST on flash memory. An extensive, nondestructive memory test is performed on every byte that makes up the file system.</td>
</tr>
<tr>
<td><code>-f</code></td>
<td>(Optional) Initialize the file system code and perform a fast file consistency check. Cyclic redundancy checks (CRCs) in the flashfs sectors are not checked.</td>
</tr>
<tr>
<td><code>filesystem:</code></td>
<td>Alias for a flash file system. Use <strong>flash:</strong> for the system board flash device.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Defaults</th>
<th>No file system check is performed.</th>
</tr>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>switch: fsck -test flash:</code></td>
</tr>
</tbody>
</table>
**help**

Use the **help** bootloader command to display the available commands.

```plaintext
help
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use the question mark (?) to display a list of available bootloader commands.
Use the **memory** bootloader command to display memory heap utilization information.

```
memory
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display memory heap utilization information:

```
switch: memory
Text: 0x00700000 - 0x0071cf24 (0x0001cf24 bytes)
Rotext: 0x00000000 - 0x00000000 (0x00000000 bytes)
Data: 0x00071cf24 - 0x000723a0c (0x00006ae8 bytes)
Bss: 0x00072529c - 0x000746f94 (0x000021cf8 bytes)
Stack: 0x000746f94 - 0x000756f94 (0x000010000 bytes)
Heap: 0x000756f98 - 0x000800000 (0x000a9068 bytes)
```

Bottom heap utilization is 22 percent.
Top heap utilization is 0 percent.
Total heap utilization is 22 percent.
Total bytes: 0xa9068 (692328)
Bytes used: 0x26888 (157832)
Bytes available: 0x827e0 (534496)

Alternate heap utilization is 0 percent.
Total alternate heap bytes: 0x6fd000 (7327744)
Alternate heap bytes used: 0x0 (0)
Alternate heap bytes available: 0x6fd000 (7327744)

**Table A-2** describes the fields in the display.

**Table A-2 memory Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>Heap</td>
<td>Beginning and ending address of the area in memory that memory is dynamically allocated to and freed from.</td>
</tr>
</tbody>
</table>
### mkdir

Use the `mkdir` bootloader command to create one or more new directories on the specified file system.

```
mkdir filesystem:/directory-url ...
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filesystem:</code></td>
<td>Alias for a flash file system. Use <code>flash:</code> for the system board flash device.</td>
</tr>
<tr>
<td><code>directory-url</code></td>
<td>Name of the directories to create. Separate each directory name with a space.</td>
</tr>
</tbody>
</table>

#### Command Modes

- **Bootloader**

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

Directory names are case sensitive.

Directory names are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

#### Examples

This example shows how to make a directory called Saved_Configs:

```
switch: mkdir flash:Saved_Configs
Directory 'flash:Saved_Configs' created
```

This example shows how to make two directories:

```
switch: mkdir flash:Saved_Configs1 flash:Test
Directory 'flash:Saved_Configs1' created
Directory 'flash:Test' created
```

You can verify that the directory was created by entering the `dir filesystem:` bootloader command.

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dir</code></td>
<td>Displays a list of files and directories on the specified file system.</td>

<tr>
<td><code>rmdir</code></td>
<td>Removes one or more directories from the specified file system.</td>
</tr>
</tbody>
</table>
more

Use the **more** bootloader command to display the contents of one or more files.

```
more filesystem:file-url ...
```

**Syntax Description**

- **filesystem:** Alias for a flash file system. Use **flash:** for the system board flash device.
- **file-url** Path (directory) and name of the files to display. Separate each filename with a space.

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Filenames and directory names are case sensitive.

If you specify a list of files, the contents of each file appears sequentially.

**Examples**

This example shows how to display the contents of two files:

```
switch: more flash:/new-images/info flash:env_vars
version_suffix: image-version
version_directory: image-name
c3750-ipservices-mz.122-25.SE8
image_name:image-name.bin
ios_image_file_size: 6398464
total_image_file_size: 8133632
image_feature: IP|LAYER_3|PLUS|MIN_DRAM_MEG=128switch-family
info_end:
BAUD=57600
MANUAL_BOOT=no
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat</td>
<td>Displays the contents of one or more files.</td>
</tr>
<tr>
<td>type</td>
<td>Displays the contents of one or more files.</td>
</tr>
</tbody>
</table>
rename

Use the `rename` bootloader command to rename a file.

```
rename filesystem:source-file-url filesystem:destination-file-url
```

**Syntax Description**

- `filesystem:` Alias for a flash file system. Use `flash:` for the system board flash device.
- `source-file-url` Original path (directory) and filename.
- `destination-file-url` New path (directory) and filename.

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Filenames and directory names are case sensitive.

Directory names are limited to 45 characters between the slashes (`/`); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Filenames are limited to 45 characters; the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

**Examples**

This example shows a file named `config.text` being renamed to `config1.text`:

```
switch: rename flash:config.text flash:config1.text
```

You can verify that the file was renamed by entering the `dir filesystem:` bootloader command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>copy</code></td>
<td>Copies a file from a source to a destination.</td>
</tr>
</tbody>
</table>
reset

Use the reset bootloader command to perform a hard reset on the system. A hard reset is similar to power-cycling the switch, clearing the processor, registers, and memory.

reset

Syntax Description

This command has no arguments or keywords.

Command Modes

Bootloader

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to reset the system:

```
switch: reset
Are you sure you want to reset the system (y/n)? y
System resetting...
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boot</td>
<td>Loads and boots up an executable image and enters the command-line interface.</td>
</tr>
</tbody>
</table>
rmdir

Use the **rmdir** bootloader command to remove one or more empty directories from the specified file system.

```
rmdir filesystem:directory-url ...
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>filesystem:</strong></th>
<th>Alias for a flash file system. Use flash: for the system board flash device.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>directory-url</strong></td>
<td>Path (directory) and name of the empty directories to remove. Separate each directory name with a space.</td>
</tr>
</tbody>
</table>

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Directory names are case sensitive and limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, deletes, slashes, quotes, semicolons, or colons.

Before removing a directory, you must first delete all the files in the directory.

The switch prompts you for confirmation before deleting each directory.

**Examples**

This example shows how to remove a directory:

```
switch: rmdir flash:Test
```

You can verify that the directory was deleted by entering the **dir filesystem** bootloader command.

**Related Commands**

<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>dir</strong></td>
<td>Displays a list of files and directories on the specified file system.</td>
</tr>
<tr>
<td><strong>mkdir</strong></td>
<td>Creates one or more new directories on the specified file system.</td>
</tr>
</tbody>
</table>
**set**

Use the `set` bootloader command to set or display environment variables, which can be used to control the bootloader or any other software running on the switch.

```
set variable value
```

### Syntax Description

<table>
<thead>
<tr>
<th>variable</th>
<th>Use one of these keywords for <code>variable</code> and <code>value</code>:</th>
</tr>
</thead>
<tbody>
<tr>
<td>MANUAL_BOOT</td>
<td>Decides whether the switch automatically or manually boots up.</td>
</tr>
<tr>
<td>Valid values are 1, yes, 0, and no. If it is set to no or 0, the bootloader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the bootloader mode.</td>
<td></td>
</tr>
<tr>
<td>BOOT filesystem:/file-url</td>
<td>A semicolon-separated list of executable files to try to load and execute when automatically booting up.</td>
</tr>
<tr>
<td>If the BOOT environment variable is not set, the system attempts to load and execute the first executable image it can find by using a recursive, depth-first search through the flash: file system. If the BOOT variable is set but the specified images cannot be loaded, the system attempts to boot up the first bootable file that it can find in the flash file system.</td>
<td></td>
</tr>
<tr>
<td>ENABLE_BREAK</td>
<td>Decides whether the automatic bootup process can be interrupted by using the Break key on the console.</td>
</tr>
<tr>
<td>Valid values are 1, yes, on, 0, no, and off. If it is set to 1, yes, or on, you can interrupt the automatic bootup process by pressing the Break key on the console after the flash file system has initialized.</td>
<td></td>
</tr>
<tr>
<td>HELPER filesystem:/file-url</td>
<td>A semicolon-separated list of loadable files to dynamically load during the bootloader initialization. Helper files extend or patch the functionality of the bootloader.</td>
</tr>
<tr>
<td>PS1 prompt</td>
<td>A string that is used as the command-line prompt in bootloader mode.</td>
</tr>
<tr>
<td>CONFIG_FILE flash:/file-url</td>
<td>The filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.</td>
</tr>
<tr>
<td>BAUD rate</td>
<td>The rate in bits per second (bps) used for the console. The Cisco IOS software inherits the baud rate setting from the bootloader and continues to use this value unless the configuration file specifies another setting. The range is from 0 to 4294967295 bps. Valid values are 50, 75, 110, 150, 300, 600, 1200, 1800, 2000, 2400, 3600, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 56000, 57600, 115200, and 128000. The most commonly used values are 300, 1200, 2400, 9600, 19200, 57600, and 115200.</td>
</tr>
<tr>
<td>HELPER_CONFIG_FILE filesystem:/file-url</td>
<td>The name of the configuration file to be used by the Cisco IOS helper image. If this is not set, the file specified by the CONFIG_FILE environment variable is used by all versions of Cisco IOS that are loaded, including the helper image. This variable is used only for internal development and testing.</td>
</tr>
</tbody>
</table>
The environment variables have these default values:

- **MANUAL_BOOT**: No (0)
- **BOOT**: Null string
- **ENABLE_BREAK**: No (Off or 0) (the automatic bootup process cannot be interrupted by pressing the Break key on the console).
- **HELPER**: No default value (helper files are not automatically loaded).
- **PS1**: switch:
- **CONFIG_FILE**: config.text
- **BAUD**: 9600 bps
- **HELPER_CONFIG_FILE**: No default value (no helper configuration file is specified).
- **SWITCH_NUMBER**: 1
- **SWITCH_PRIORITY**: 1

**Note**

Environment variables that have values are stored in the flash file system in various files. The format of these files is that each line contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not listed in this file; it has a value if it is listed in the file even if the value is a null string. A variable that is set to a null string (for example, “ ”) is a variable with a value. Many environment variables are predefined and have default values.

**Command Modes**

Bootloader

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Environment variables are case sensitive and must be entered as documented.

Environment variables that have values are stored in flash memory outside of the flash file system. Under normal circumstances, it is not necessary to alter the setting of the environment variables.

The **MANUAL_BOOT** environment variable can also be set by using the `boot manual` global configuration command.

The **BOOT** environment variable can also be set by using the `boot system filesystem:/file-url` global configuration command.

The **ENABLE_BREAK** environment variable can also be set by using the `boot enable-break` global configuration command.

The **HELPER** environment variable can also be set by using the `boot helper filesystem:/file-url` global configuration command.

The **CONFIG_FILE** environment variable can also be set by using the `boot config-file flash:/file-url` global configuration command.

The **HELPER_CONFIG_FILE** environment variable can also be set by using the `boot helper-config-file filesystem:/file-url` global configuration command.
The HELPER_CONFIG_FILE environment variable can also be set by using the `boot helper-config-file filesystem:file-url` global configuration command.

The SWITCH_NUMBER environment variable can also be set by using the `switch current-stack-member-number renumber new-stack-member-number` global configuration command.

The SWITCH_PRIORITY environment variable can also be set by using the `switch stack-member-number priority priority-number` global configuration command.

The bootloader prompt string (PS1) can be up to 120 printable characters except the equal sign (=).

### Examples

This example shows how to change the bootloader prompt:

```
switch: set PS1 loader:
loader:
```

You can verify your setting by using the `set` bootloader command.

Usage Guidelines

Under normal circumstances, it is not necessary to alter the setting of the environment variables.

The MANUAL_BOOT environment variable can also be reset by using the `no boot manual` global configuration command.

The BOOT environment variable can also be reset by using the `no boot system` global configuration command.

The ENABLE_BREAK environment variable can also be reset by using the `no boot enable-break` global configuration command.

The HELPER environment variable can also be reset by using the `no boot helper` global configuration command.

The CONFIG_FILE environment variable can also be reset by using the `no boot config-file` global configuration command.

The HELPER_CONFIG_FILE environment variable can also be reset by using the `no boot helper-config-file` global configuration command.

The bootloader prompt string (PS1) can be up to 120 printable characters except the equal sign (=).

Examples

This example shows how to reset the prompt string to its previous setting:

```
switch: unset PS1
switch:
```

```
Catalyst 3750 Switch Debug Commands

This appendix describes the debug privileged EXEC commands that have been created or changed for use with the Catalyst 3750 switch. These commands are helpful in diagnosing and resolving internetworking problems and should be enabled only under the guidance of Cisco technical support staff.

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use the debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use the debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.
debug authentication

Use the debug authentication privileged EXEC command to enable debugging of the authentication settings on an interface. Use the no form of this command to disable debugging.

```
  debug authentication { all | errors | events | sync | feature [all] [acct] [auth_fail_vlan] [auth_policy] [autocfg] [critical] [dhcp] [guest_vlan] [mab_pm] [mda] [multi_auth] [switch_pm] [switch_sync] [vlan_assign] [voice] [webauth] [all | errors | events] }
```

```
  no debug authentication { all | errors | events | sync | feature [all] [acct] [auth_fail_vlan] [auth_policy] [autocfg] [critical] [dhcp] [guest_vlan] [mab_pm] [mda] [multi_auth] [switch_pm] [switch_sync] [vlan_assign] [voice] [webauth] [all | errors | events] }
```

</table>

**Usage Guidelines**
The `undebug authentication` command is the same as the `no debug authentication` command. When you enable debugging, it is enabled only on the stack master.

To enable debugging on a stack member, you can start a session from the stack master by using the `session switch-number` privileged EXEC command and then entering the `debug authentication` command at the command-line prompt of the stack member. You also can use the `remote command stack-member-number line` privileged EXEC command on the stack master switch to enable debugging on a stack member.

</table>
**debug auto qos**

Use the `debug auto qos` privileged EXEC command to enable debugging of the automatic quality of service (auto-QoS) feature. Use the `no` form of this command to disable debugging.

```
  debug auto qos
  no debug auto qos
```

**Syntax Description**

This command has no keywords or arguments.

**Defaults**

Auto-QoS debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(18)SE</td>
<td>The <code>debug auto qos</code> command replaced the <code>debug autoqos</code> command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging *before* you enable auto-QoS. You enable debugging by entering the `debug auto qos` privileged EXEC command.

The `undebug auto qos` command is the same as the `no debug auto qos` command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the `session switch-number` privileged EXEC command. Then enter the `debug` command at the command-line prompt of the stack member. You also can use the `remote command stack-member-number LINE` privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

**Examples**

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled:

```
Switch# debug auto qos
AutoQoS debugging is on
Switch(config)# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# auto qos voip cisco-phone

</tbody>
</table>

**Note**

Though visible in the command-line help strings, the `redundancy` keyword is not supported.

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

```
Release      Modification
-------------------------------
12.1(11)AX    This command was introduced.
12.1(14)EA1   The `authsm`, `backend`, `besm`, `core`, and `reauthsm` keywords were removed.
              The `errors`, `events`, `packets registry`, and `state-machine` keywords were added.
12.2(25)SEE   The `feature` keyword was added.
```

**Usage Guidelines**

The `undebug dot1x` command is the same as the `no debug dot1x` command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the `session switch-number` privileged EXEC command. Then enter the `debug` command at the command-line prompt of the stack member. You also can use the `remote command stack-member-number LINE` privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

</tbody>
</table>
debug etherchannel

Use the **debug etherchannel** privileged EXEC command to enable debugging of the EtherChannel/PAgP shim. This shim is the software module that is the interface between the Port Aggregation Protocol (PAgP) software module and the port manager software module. Use the **no** form of this command to disable debugging.

```
 debug etherchannel [all | detail | error | event | idb]

 no debug etherchannel [all | detail | error | event | idb]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Display all EtherChannel debug messages.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Display detailed EtherChannel debug messages.</td>

<tr>
<td>error</td>
<td>(Optional) Display EtherChannel error debug messages.</td>
</tr>
<tr>
<td>event</td>
<td>(Optional) Debug major EtherChannel event messages.</td>
</tr>
<tr>
<td>idb</td>
<td>(Optional) Display PAgP interface descriptor block debug messages.</td>
</tr>
</tbody>
</table>

**Note**

Though visible in the command-line help strings, the **linecard** keyword is not supported.

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a keyword, all debug messages appear.

The **undebug etherchannel** command is the same as the **no debug etherchannel** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session switch-number** privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack master. You also can use the **remote command stack-member-number LINE** privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

**Related Commands**

<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show debugging</td>
<td>Displays information about the types of debugging that are enabled.</td>
</tr>
<tr>
<td>show etherchannel</td>
<td>Displays EtherChannel information for the channel.</td>
</tr>
</tbody>
</table>
**debug ilpower**

Use the `debug ilpower` privileged EXEC command to enable debugging of the power controller and Power over Ethernet (PoE) system. Use the `no` form of this command to disable debugging.

```
debug ilpower {cdp | controller | event | ha | port | powerman | registries}
no debug ilpower {cdp | controller | event | ha | port | powerman | registries}
```

### Syntax Description

- `cdp` Display PoE Cisco Discovery Protocol (CDP) debug messages.
- `controller` Display PoE controller debug messages.
- `event` Display PoE event debug messages.
- `ha` Display PoE high-availability messages.
- `port` Display PoE port manager debug messages.
- `powerman` Display PoE power management debug messages.
- `registries` Display PoE registries debug messages.

### Defaults

Debugging is disabled.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>

<td>This command was introduced.</td>
</tr>
<tr>
<td>12.2(25)SE</td>
<td>The <code>cdp</code>, <code>ha</code>, and <code>powerman</code> keywords were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is supported only on PoE-capable switches.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the `session switch-number` privileged EXEC command. Then enter the `debug` command at the command-line prompt of the stack member. You also can use the `remote command stack-member-number LINE` privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

debug interface

Use the `debug interface` privileged EXEC command to enable debugging of interface-related activities. Use the `no` form of this command to disable debugging.

```
displays debug interface { interface-id | null interface-number | port-channel port-channel-number | vlan vlan-id }
no displays debug interface { interface-id | null interface-number | port-channel port-channel-number | vlan vlan-id }
```

### Syntax Description

- `interface-id`  
  Display debug messages for the specified physical port, identified by type switch number/module number/port, for example `gigabitethernet 1/0/2`.

- `null interface-number`  
  Display debug messages for null interfaces. The `interface-number` is always 0.

- `port-channel port-channel-number`  
  Display debug messages for the specified EtherChannel port-channel interface. The `port-channel-number` range is 1 to 48.

- `vlan vlan-id`  
  Display debug messages for the specified VLAN. The `vlan-id` range is 1 to 4094.

### Defaults

Debugging is disabled.

### Command Modes

Privileged EXEC

debug platform cpu-queues

Use the `debug platform cpu-queues` privileged EXEC command to enable debugging of platform central processing unit (CPU) receive queues. Use the `no` form of this command to disable debugging.

```
debug platform cpu-queues { broadcast-q | cbt-to-spt-q | cpuhub-q | host-q | icmp-q | igmp-snooping-q | layer2-protocol-q | logging-q | remote-console-q | routing-protocol-q | rpffail-q | software-fwd-q | stp-q }

no debug platform cpu-queues { broadcast-q | cbt-to-spt-q | cpuhub-q | host-q | icmp-q | igmp-snooping-q | layer2-protocol-q | logging-q | remote-console-q | routing-protocol-q | rpffail-q | software-fwd-q | stp-q }
```

**Syntax Description**

- **broadcast-q**
  Display debug messages about packets received by the broadcast queue.

- **cbt-to-spt-q**
  Display debug messages about packets received by the core-based tree to shortest-path tree (cbt-to-spt) queue.

- **cpuhub-q**
  Display debug messages about packets received by the CPU heartbeat queue.

- **host-q**
  Display debug messages about packets received by the host queue.

- **icmp-q**
  Display debug messages about packets received by the Internet Control Message Protocol (ICMP) queue.

- **igmp-snooping-q**
  Display debug messages about packets received by the Internet Group Management Protocol (IGMP)-snooping queue.

- **layer2-protocol-q**
  Display debug messages about packets received by the Layer 2 protocol queue.

- **logging-q**
  Display debug messages about packets received by the logging queue.

- **remote-console-q**
  Display debug messages about packets received by the remote console queue.

- **routing-protocol-q**
  Display debug messages about packets received by the routing protocol queue.

- **rpffail-q**
  Display debug messages about packets received by the reverse path forwarding (RFP) failure queue.

- **software-fwd-q**
  Debug packets received by the software forwarding queue.

- **stp-q**
  Debug packets received by the Spanning Tree Protocol (STP) queue.

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>

debug platform fallback-bridging

Use the `debug platform fallback-bridging` privileged EXEC command to enable debugging of the platform-dependent fallback bridging manager. Use the `no` form of this command to disable debugging.

```
default platform fallback-bridging [error | retry | rpc {events | messages}]

no debug platform fallback-bridging [error | retry | rpc {events | messages}]
```

**Syntax Description**

- **error** (Optional) Display fallback bridging manager error condition messages.
- **retry** (Optional) Display fallback bridging manager retry messages.
- **rpc {events | messages}** (Optional) Display fallback bridging debugging information. The keywords have these meanings:
  - **events**—Display remote procedure call (RPC) events.
  - **messages**—Display RPC messages.

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>

</table>
debug platform ip igmp snooping

Use the `debug platform ip igmp snooping` privileged EXEC command to enable debugging of platform-dependent Internet Group Management Protocol (IGMP) snooping. Use the `no` form of this command to disable debugging.

```
debug platform ip igmp snooping { all | di | error | event | group | mgmt | pak | retry | rpc | warn }
debug platform ip igmp snooping pak { ip-address | error | ipopt | leave | query | report | rx | svi | tx }
debug platform ip igmp snooping rpc [ cfg | l3mm | misc | vlan ]
no debug platform ip igmp snooping { all | di | error | event | group | mgmt | pak | retry | rpc | warn }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Display all IGMP snooping debug messages.</td>
</tr>
<tr>
<td>di</td>
<td>Display IGMP snooping destination index (di) coordination remote procedure call (RPC) debug messages.</td>
</tr>
<tr>
<td>error</td>
<td>Display IGMP snooping error messages.</td>
</tr>
<tr>
<td>event</td>
<td>Display IGMP snooping event debug messages.</td>
</tr>
<tr>
<td>group</td>
<td>Display IGMP snooping group debug messages.</td>
</tr>
<tr>
<td>mgmt</td>
<td>Display IGMP snooping management debug messages.</td>
</tr>
</tbody>
</table>
| pak { ip-address | error | ipopt | leave | query | report | rx | svi | tx } | Display IGMP snooping packet event debug messages. The keywords have these meanings:  
- `ip-address`—IP address of the IGMP group.  
- `error`—Display IGMP snooping packet error debug messages.  
- `ipopt`—Display IGMP snooping IP bridging options debug messages.  
- `leave`—Display IGMP snooping leave debug messages.  
- `query`—Display IGMP snooping query debug messages.  
- `report`—Display IGMP snooping report debug messages.  
- `rx`—Display IGMP snooping received packet debug messages.  
- `svi`—Display IGMP snooping switched virtual interface (SVI) packet debug messages.  
- `tx`—Display IGMP snooping sent packet debug messages. |
| retry    | Display IGMP snooping retry debug messages. |
debug platform ip igmp snooping

rpc [cfg | l3mm | misc | vlan]  Display IGMP snooping remote procedure call (RPC) event debug messages.
The keywords have these meanings:
  • cfg—(Optional) Display IGMP snooping RPC debug messages.
  • l3mm—(Optional) IGMP snooping Layer 3 multicast router group RPC debug messages.
  • misc—(Optional) IGMP snooping miscellaneous RPC debug messages.
  • vlan—(Optional) IGMP snooping VLAN assert RPC debug messages.
warn  Display IGMP snooping warning messages.

Defaults  Debugging is disabled.

Command Modes  Privileged EXEC

debug platform pm

Use the debug platform pm privileged EXEC command to enable debugging of the platform-dependent port manager software module. Use the no form of this command to disable debugging.

```
debug platform pm { all | counters | errdisable | etherchnl | exceptions | hpm-events | idb-events | if-numbers | ios-events | link-status | platform | pm-events | pm-span | pm-vectors [detail] | rpc [general | oper-info | state | vectors | vp-events] | soutput-vectors | stack-manager | sync | vlans }

no debug platform pm { all | counters | errdisable | etherchnl | exceptions | hpm-events | idb-events | if-numbers | ios-events | link-status | platform | pm-events | pm-span | pm-vectors [detail] | rpc [general | oper-info | state | vectors | vp-events] | soutput-vectors | stack-manager | sync | vlans }
```

**Syntax Description**

- **all**
  Display all port-manager debug messages.

- **counters**
  Display counters for remote procedure call (RPC) debug messages.

- **errdisable**
  Display error-disabled related-events debug messages.

- **etherchnl**
  Display EtherChannel related-events debug messages.

- **exceptions**
  Display system exception debug messages.

- **hpm-events**
  Display platform port-manager event debug messages.

- **idb-events**
  Display interface descriptor block (IDB) related-events debug messages.

- **if-numbers**
  Display interface-number translation-event debug messages.

- **ios-events**
  Display Cisco IOS event debug messages.

- **link-status**
  Display interface link-detection event debug messages.

- **platform**
  Display port-manager function-event debug messages.

- **pm-events**
  Display port manager event debug messages.

- **pm-span**
  Display port manager Switched Port Analyzer (SPAN) event debug messages.

- **pm-vectors [detail]**
  Display port-manager vector-related-event debug messages. The keyword has this meaning:
  - **detail**—Display vector-function details.

- **rpc [general | oper-info | state | vectors | vp-events]**
  Display RPC related-event debug messages. The keywords have these meanings:
  - **general**—(Optional) Display RPC general events.
  - **oper-info**—(Optional) Display operational- and informational-related RPC messages.
  - **state**—(Optional) Display administrative- and operational-related RPC messages.
  - **vectors**—(Optional) Display vector-related RPC messages.
  - **vp-events**—(Optional) Display virtual ports related-events RP messages.

- **soutput-vectors**
  Display IDB output vector event debug messages.

- **stack-manager**
  Display stack-manager related-events debug messages.

Use the `debug platform port-asic` privileged EXEC command to enable debugging of the port application-specific integrated circuit (ASIC) driver. Use the `no` form of this command to disable debugging.

```
deploy platform port-asic {interrupt | periodic | read | stack | write}
```

```
no debug platform port-asic {interrupt | periodic | read | stack | write}
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interrupt</td>
<td>Display port-ASIC interrupt-related function debug messages.</td>
</tr>
<tr>
<td>periodic</td>
<td>Display port-ASIC periodic-function-call debug messages.</td>
</tr>
<tr>
<td>read</td>
<td>Display port-ASIC read debug messages.</td>
</tr>
<tr>
<td>stack</td>
<td>Display stacking-related function debug messages.</td>
</tr>
<tr>
<td>write</td>
<td>Display port-ASIC write debug messages.</td>
</tr>
</tbody>
</table>

 Defaults

Debugging is disabled.

Command Modes

Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The `undebug platform port-asic` command is the same as the `no debug platform port-asic` command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the `session switch-number` privileged EXEC command. Then enter the `debug` command at the command-line prompt of the stack member. You also can use the `remote command stack-member-number LINE` privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

</table>
debug pm

Use the `debug pm` privileged EXEC command to enable debugging of port manager (PM) activity. The port manager is a state machine that controls all the logical and physical interfaces. All features, such as VLANs, UniDirectional Link Detection (UDLD), and so forth, work with the port manager to provide switch functions. Use the `no` form of this command to disable debugging.

```
debug pm { all | assert | card | etherchnl | hatable | messages | port | redundancy | registry | sm | span | split | vlan | vp }
no debug pm { all | assert | card | etherchnl | hatable | messages | port | redundancy | registry | sm | span | split | vlan | vp }
```

Syntax Description

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Display all PM debug messages.</td>
</tr>
<tr>
<td>assert</td>
<td>Display assert debug messages.</td>
</tr>
<tr>
<td>card</td>
<td>Display line-card related-events debug messages.</td>
</tr>
<tr>
<td>etherchnl</td>
<td>Display EtherChannel related-events debug messages.</td>

</table>
debug port-security

Use the debug port-security privileged EXEC command to enable debugging of the allocation and states of the port security subsystem. Use the no form of this command to disable debugging.

debug port-security

no debug port-security

Syntax Description
This command has no arguments or keywords.

Defaults
Debugging is disabled.

Command Modes
Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
The undebug port-security command is the same as the no debug port-security command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session switch-number privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command stack-member-number LINE privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

</table>
debug sw-vlan ifs

Use the debug sw-vlan ifs privileged EXEC command to enable debugging of the VLAN manager IOS file system (IFS) error tests. Use the no form of this command to disable debugging.

```
debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

**Syntax Description**

- **open {read | write}**
  - Display VLAN manager IFS file-open operation debug messages. The keywords have these meanings:
    - **read**—Display VLAN manager IFS file-read operation debug messages.
    - **write**—Display VLAN manager IFS file-write operation debug messages.

- **read {1 | 2 | 3 | 4}**
  - Display file-read operation debug messages for the specified error test (1, 2, 3, or 4).

- **write**
  - Display file-write operation debug messages.

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **undebug sw-vlan ifs** command is the same as the **no debug sw-vlan ifs** command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session switch-number privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command** stack-member-number LINE privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

When selecting the file read operation, Operation **1** reads the file header, which contains the header verification word and the file version number. Operation **2** reads the main body of the file, which contains most of the domain and VLAN information. Operation **3** reads type length version (TLV) descriptor structures. Operation **4** reads TLV data.

| Syntax Description | events | packets | pruning [packets | xmit] | redundancy | xmit |
|--------------------|--------|---------|-----------------|------------|------|
|                    | Display debug messages for general-purpose logic flow and detailed VTP messages generated by the VTP_LOG_RUNTIME macro in the VTP code. | Display debug messages for the contents of all incoming VTP packets that have been passed into the VTP code from the IOS VTP platform-dependent layer, except for pruning packets. | Display debug messages generated by the pruning segment of the VTP code. The keywords have these meanings:  
  • packets—(Optional) Display debug messages for the contents of all incoming VTP pruning packets that have been passed into the VTP code from the IOS VTP platform-dependent layer.  
  • xmit—(Optional) Display debug messages for the contents of all outgoing VTP packets that the VTP code requests the IOS VTP platform-dependent layer to send. | Display debug messages for VTP redundancy. | Display debug messages for the contents of all outgoing VTP packets that the VTP code requests the IOS VTP platform-dependent layer to send, except for pruning packets. |

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **undebug sw-vlan vtp** command is the same as the **no debug sw-vlan vtp** command.  

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the **session switch-number** privileged EXEC command. Then enter the **debug** command at the command-line prompt of the stack member. You also can use the **remote command stack-member-number LINE** privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.
If no further parameters are entered after the **pruning keyword**, VTP pruning debugging messages appear. They are generated by the VTP_PRUNING_LOG_NOTICE, VTP_PRUNING_LOG_INFO, VTP_PRUNING_LOG_DEBUG, VTP_PRUNING_LOG_ALERT, and VTP_PRUNING_LOG_WARNING macros in the VTP pruning code.

</tbody>
</table>
debug udld

Use the debug udld privileged EXEC command to enable debugging of the UniDirectional Link Detection (UDLD) feature. Use the no form of this command to disable UDLD debugging.

```
db ug udld {events | packets | registries}
no debug udld {events | packets | registries}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>events</th>
<th>packets</th>
<th>registries</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display debug messages for UDLD process events as they occur.</td>
<td>Display debug messages for the UDLD process as it receives packets from the packet queue and tries to send them at the request of the UDLD protocol code.</td>
<td>Display debug messages for the UDLD process as it processes registry calls from the UDLD process-dependent module and other feature modules.</td>
<td></td>
</tr>
</tbody>
</table>

### Defaults

Debugging is disabled.

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The undebug udld command is the same as the no debug udld command.

When you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you can start a session from the stack master by using the session switch-number privileged EXEC command. Then enter the debug command at the command-line prompt of the stack member. You also can use the remote command stack-member-number LINE privileged EXEC command on the stack master switch to enable debugging on a member switch without first starting a session.

For debug udld events, these debugging messages appear:

- General UDLD program logic flow
- State machine state changes
- Program actions for the set and clear ErrDisable state
- Neighbor cache additions and deletions
- Processing of configuration commands
- Processing of link-up and link-down indications
For **debug udld packets**, these debugging messages appear:

- General packet processing program flow on receipt of an incoming packet
- Indications of the contents of the various pieces of packets received (such as type length versions [TLVs]) as they are examined by the packet reception code
- Packet transmission attempts and the outcome

For **debug udld registries**, these categories of debugging messages appear:

- Sub-block creation
- Fiber-port status changes
- State change indications from the port manager software
- MAC address registry calls

debug platform wireless-controller
This appendix describes the `show platform` privileged EXEC commands that have been created or changed for use with the Catalyst 3750 switch. These commands display information helpful in diagnosing and resolving internetworking problems and should be used only under the guidance of Cisco technical support staff.
show platform acl

Use the show platform acl privileged EXEC command to display platform-dependent access control list (ACL) manager information.

```
show platform acl [interface interface-id | label label-number [detail] | statisticsasic-number | usageasic-number [summary] | vlanvlan-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>Display per-interface ACL manager information for the specified interface. The interface can be a physical interface or a VLAN.</td>
</tr>
<tr>
<td>label label-number [detail]</td>
<td>Display per-label ACL manager information. The label-number range is 0 to 255. The keyword has this meaning:</td>
</tr>
<tr>
<td>statisticsasic-number</td>
<td>Display per-ASIC ACL manager information. The asic-number is the port ASIC number, either 0 or 1.</td>
</tr>
<tr>
<td>usageasic-number [summary]</td>
<td>Display per-ASIC ACL usage information. The keyword has this meaning:</td>
</tr>
<tr>
<td>vlanvlan-id</td>
<td>Display per-VLAN ACL manager information. The vlan-id range is from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform backup interface

Use the show platform backup interface privileged EXEC command to display platform-dependent backup information used in a Flex Links configuration.

```
show platform backup interface [interface-id | dummyQ]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-id</td>
<td>(Optional) Display backup information for all interfaces or the specified interface. The interface can be a physical interface or a port channel.</td>
</tr>
<tr>
<td>dummyQ</td>
<td>(Optional) Display dummy queue information.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform configuration

Use the show platform configuration privileged EXEC command to display platform-dependent configuration-manager related information.

```
show platform configuration { config-output | default | running | startup }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config-output</td>
<td>Display the output of the last auto-configuration application.</td>
</tr>
<tr>
<td>default</td>
<td>Display whether or not the system is running the default configuration.</td>
</tr>
<tr>
<td>running</td>
<td>Display a snapshot of the backed-up running configuration on the local switch.</td>
</tr>
<tr>
<td>startup</td>
<td>Display a snapshot of the backed-up startup configuration on the local switch.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>

</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform etherchannel

Use the `show platform etherchannel` privileged EXEC command to display platform-dependent EtherChannel information.

```
show platform etherchannel [flags | time-stamps]
```

### Syntax Description

- **flags**
  - Display EtherChannel port flags.
- **time-stamps**
  - Display EtherChannel time stamps.

### Command Modes

- Privileged EXEC

### Command History

- **Release**
  - **Modification**
  
  | 12.1(11)AX | This command was introduced. |

### Usage Guidelines

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform forward

Use the **show platform forward** privileged EXEC command for an interface to specify how the hardware would forward a frame that matches the specified parameters.

```
show platform forward interface-id [vlan vlan-id] src-mac dst-mac [13protocol-id] [ipv6 | sap | snap] [cos cos] [ip src-ip dst-ip [frag field] [dscp dscp] [l4protocol-id | icmp icmp-type icmp-code | igmp igmp-version igmp-type | sctp src-port dst-port | tcp src-port dst-port flags | udp src-port dst-port]]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-id</td>
<td>The input physical interface, the port on which the packet comes in to the switch.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Input VLAN ID. The range is 1 to 4094. If not specified, and the input interface is not a routed port, the default is 1.</td>
</tr>
<tr>
<td>src-mac</td>
<td>48-bit source MAC address.</td>
</tr>
<tr>
<td>dst-mac</td>
<td>48-bit destination MAC address.</td>
</tr>
<tr>
<td>13protocol-id</td>
<td>(Optional) The Layer 3 protocol used in the packet. The number is a value 0 to 65535.</td>
</tr>
<tr>
<td>ipv6</td>
<td>(Optional) IPv6 frame.</td>
</tr>
<tr>
<td>sap</td>
<td>(Optional) Service access point (SAP) encapsulation type.</td>
</tr>
<tr>
<td>snap</td>
<td>(Optional) Subnetwork Access Protocol (SNAP) encapsulation type.</td>
</tr>
<tr>
<td>cos cos</td>
<td>(Optional) Class of service (CoS) value of the frame. The range is 0 to 7.</td>
</tr>
<tr>
<td>ip src-ip dst-ip</td>
<td>(Optional, but required for IP packets) Source and destination IP addresses in dotted decimal notation.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

**Examples**

For examples of the `show platform forward` command output displays and what they mean, see the “Troubleshooting” chapter of the software configuration guide for this release.
show platform frontend-controller

Use the `show platform frontend-controller` privileged EXEC command to display counter and status information for the front-end controller manager and subordinate applications and to display the hardware and software information for the front-end controller.

```
show platform frontend-controller { buffer | generic | manager number | subordinate number | version number }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>buffer</code></td>
<td>Display the last 1024 bytes sent from the manager to the subordinate and the reverse.</td>
</tr>
<tr>
<td><code>generic</code></td>
<td>Display the generic counters that do not specifically apply to the manager or subordinate.</td>
</tr>
<tr>
<td><code>manager number</code></td>
<td>Display the counters for the manager and the subordinate specified by <code>number</code>. See the “Usage Guidelines” section for the <code>number</code> range.</td>
</tr>
<tr>
<td><code>subordinate number</code></td>
<td>Display the subordinate status and the counters for the subordinate specified by <code>number</code>. See the “Usage Guidelines” section for the <code>number</code> range.</td>
</tr>
<tr>
<td><code>version number</code></td>
<td>Display the hardware and software version information for the subordinate status specified by <code>number</code>. See the “Usage Guidelines” section for the <code>number</code> range.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)SE3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On the Catalyst 3750G-48TS and 3750G-48PS switches, the subordinate number range is 0 to 2.

On the Catalyst 3750G-24TS-1U and 3750G-24PS switches, the subordinate number range is 0 to 1.

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

**Note**

This command is supported only on Catalyst 3750G-48TS, 3750G-48PS, 3750G-24TS-1U, and 3750G-24PS switches.
show platform ip igmp snooping

Use the `show platform ip igmp snooping` privileged EXEC command to display platform-dependent Internet Group Management Protocol (IGMP) snooping information.

```
show platform ip igmp snooping {all | control [di] | counters | flood [vlan vlan-id] | group ip-address | hardware | retry [count | local [count] | remote [count]]}
```

**Syntax Description**

- **all**: Display all IGMP snooping platform IP multicast information.
- **control [di]**: Display IGMP snooping control entries. The keyword has this meaning:
  - **di**—(Optional) Display IGMP snooping control destination index entries.
- **counters**: Display IGMP snooping counters.
- **flood [vlan vlan-id]**: Display IGMP snooping flood information. The keyword has this meaning:
  - **vlan vlan-id**—(Optional) Display flood information for the specified VLAN. The range is 1 to 4094.
- **group ip-address**: Display the IGMP snooping multicast group information, where `ip-address` is the IP address of the group.
- **hardware**: Display IGMP snooping information loaded into hardware.
- **retry [count | local [count]]**: Display IGMP snooping retry information. The keywords have these meanings:
  - **count**—(Optional) Display only the retry count.
  - **local**—(Optional) Display local retry entries.
- **remote [count]**: Display remote entries. The keyword has this meaning:
  - **count**—(Optional) Display only the remote count.

**Command Modes**

Privileged EXEC

**Command History**

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform ip multicast

Use the show platform ip multicast privileged EXEC command to display platform-dependent IP multicast tables and other information.

```
show platform ip multicast acl-full-info | counters | groups | hardware [detail] | interfaces | locks | mdfs-routes | mroute-retry | retry | vrf | trace
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl-full-info</td>
<td>Display IP multicast routing access-control list (ACL) information, in particular the number of outgoing VLANs for which router ACLs at the output cannot be applied in hardware.</td>
</tr>
<tr>
<td>counters</td>
<td>Display IP multicast counters and statistics.</td>
</tr>
<tr>
<td>groups</td>
<td>Display IP multicast routes per group.</td>
</tr>
<tr>
<td>hardware [detail]</td>
<td>Display IP multicast routes loaded into hardware. The optional detail keyword is used to show port members in the destination index and route index.</td>
</tr>
<tr>
<td>interfaces</td>
<td>Display IP multicast interfaces.</td>
</tr>
<tr>
<td>locks</td>
<td>Display IP multicast destination-index locks.</td>
</tr>
<tr>
<td>mdfs-routes</td>
<td>Display multicast distributed fast switching (MDFS) IP multicast routes.</td>
</tr>
<tr>
<td>mroute-retry</td>
<td>Display the IP multicast route retry queue.</td>
</tr>
<tr>
<td>retry</td>
<td>Display the IP multicast routes in the retry queue.</td>
</tr>
<tr>
<td>vrf</td>
<td>Display the VPN routing and forwarding instance.</td>
</tr>
<tr>
<td>trace</td>
<td>Display the IP multicast trace buffer.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

</tr>
<tr>
<td>12.2(40)SE</td>
<td>The vrf keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
# show platform ip unicast

Use the `show platform ip unicast` privileged EXEC command to display platform-dependent IP unicast routing information.

```
show platform ip unicast [adjacency | cef-idb | counts | dhcp | failed {adjacency | arp [A.B.C.D] | route} | loadbalance | mpaths | proxy | route | standby | statistics | table | trace]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjacency</td>
<td>Display the platform adjacency database.</td>
</tr>
<tr>
<td>cef-idb</td>
<td>Display platform information corresponding to Cisco Express Forwarding (CEF) interface descriptor block.</td>
</tr>
<tr>
<td>counts</td>
<td>Display the counts for the Layer 3 unicast databases.</td>
</tr>
<tr>
<td>dhcp</td>
<td>Display the DHCP system dynamic addresses.</td>
</tr>
<tr>
<td>failed</td>
<td>Display the hardware resource failures. The keywords have these meanings:</td>
</tr>
<tr>
<td>adjacency</td>
<td>Display the adjacency entries that failed to be programmed in hardware.</td>
</tr>
<tr>
<td>arp [A.B.C.D]</td>
<td>Display the Address Resolution Protocol (ARP) deletions due to failure and retries.</td>
</tr>
<tr>
<td>route</td>
<td>(Optional) Prefix of the ARP entries to display.</td>
</tr>
<tr>
<td>loadbalance</td>
<td>Display the platform loadbalance database.</td>
</tr>
<tr>
<td>mpaths</td>
<td>Display the Layer 3 unicast routing multipath adjacency database.</td>
</tr>
<tr>
<td>proxy</td>
<td>Display the platform proxy ARP database.</td>
</tr>
<tr>
<td>route</td>
<td>Display the platform route database.</td>
</tr>
<tr>
<td>standby</td>
<td>Display the platform standby information.</td>
</tr>
<tr>
<td>statistics</td>
<td>Display the Layer 3 unicast routing accumulated statistics.</td>
</tr>
<tr>
<td>table</td>
<td>Display the platform IP version 4 (IPv4) information.</td>
</tr>
<tr>
<td>trace</td>
<td>Display the platform event trace logs.</td>
</tr>
</tbody>
</table>

## Command Modes

- Privileged EXEC

</tr>
</tbody>
</table>

## Usage Guidelines

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

**Note**

Though visible in the command-line help strings, the `proxy` and `table` keywords are not supported.
show platform ip unicast vrf compaction

Use the show platform ip unicast vrf compaction privileged EXEC command to display the compaction request queues and compaction status.

```
show platform ip unicast vrf compaction
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</table>

Usage Guidelines
You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform ip wccp

Use the show platform ip wccp privileged EXEC command to display platform-dependent Web Cache Communication Protocol (WCCP) information.

```
show platform ip wccp {detail | label}
```

**Syntax Description**
- **detail**: Display the platform WCCP details.
- **label**: Display the platform WCCP labels.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.

**Note**
This command is available only if your switch is running the IP services image.
show platform ipc trace

Use the show platform ipc trace privileged EXEC command to display platform-dependent Interprocess Communication (IPC) Protocol trace log information.

show platform ipc trace

Syntax Description
This command has no arguments or keywords.

Command Modes
Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform ipv6 unicast

Use the `show platform ipv6 unicast` privileged EXEC command to display platform-dependent IPv6 unicast routing information. This command is available only if the stack is running the IP services image.

```
show platform ipv6 unicast [adjacency [ipv6-prefix] | backwalk {adjacency | loadbalance} | compress ipv6-prefix/prefix length | interface | loadbalance | mpath | retry {adjacency | route} | route [ipv6-prefix/prefix length | tcam] [detail] | statistics | table [detail] | trace]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjacency</td>
<td>Display IPv6 adjacency information for the switch or for the specified IPv6 network.</td>
</tr>
<tr>
<td>ipv6-prefix</td>
<td>(Optional) The IPv6 network to be displayed. This argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.</td>
</tr>
<tr>
<td>backwalk</td>
<td>Display IPv6 backwalk information.</td>
</tr>
<tr>
<td>adjacency</td>
<td>Display adjacency backwalk information.</td>
</tr>
<tr>
<td>loadbalance</td>
<td>Display backwalk load balance information.</td>
</tr>
<tr>
<td>compress</td>
<td>Display IPv6 prefix compression information.</td>
</tr>
<tr>
<td>ipv6-prefix</td>
<td>The IPv6 network.</td>
</tr>
<tr>
<td>/prefix</td>
<td>The length of the IPv6 network prefix. A decimal value from 0 to 128 that shows how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.</td>
</tr>
<tr>
<td>interface</td>
<td>Display IPv6 interface information.</td>
</tr>
<tr>
<td>loadbalance</td>
<td>Display IPv6 loadbalance information</td>
</tr>
<tr>
<td>mpath</td>
<td>Display IPv6 multipath information</td>
</tr>
<tr>
<td>retry</td>
<td>Display IPv6 retry information.</td>
</tr>
<tr>
<td>adjacency</td>
<td>Display IPv6 adjacency retry information.</td>
</tr>
<tr>
<td>route</td>
<td>Display IPv6 route retry information.</td>
</tr>
<tr>
<td>route</td>
<td>Display IPv6 route information.</td>
</tr>
<tr>
<td>tcam</td>
<td>(Optional) Display the IPv6 TCAM route table information.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Display detailed IPv6 route information.</td>
</tr>
<tr>
<td>statistics</td>
<td>Display IPv6 accumulated statistics.</td>
</tr>
<tr>
<td>table</td>
<td>Display IPv6 unicast table information.</td>
</tr>
<tr>
<td>trace</td>
<td>Display IPv6 unicast traces.</td>
</tr>
</tbody>
</table>

**Command Modes**

- Privileged EXEC

Usage Guidelines

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform layer4op

Use the `show platform layer4op` privileged EXEC command to display platform-dependent Layer 4 operator information.

```
show platform layer4op [acl | pacl [port-asic] | qos [port-asic]] {and-or | map | or-and | vcu}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Display access control list (ACL) Layer 4 operators information.</td>
</tr>
</tbody>
</table>
| pacl [port-asic] | Display port ACL Layer 4 operators information. The keyword has this meaning:  
  - `port-asic`—(Optional) Port ASIC number. |
| qos [port-asic] | Display quality of service (QoS) Layer 4 operators information. The keyword has this meaning:  
  - `port-asic`—(Optional) QoS port ASIC number. |
| and-or  | Display AND-OR registers information. |
| map     | Display select map information. |
| or-and  | Display OR-AND registers information. |
| vcu     | Display value compare unit (V CU) register information. |

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform mac-address-table

Use the `show platform mac-address-table` privileged EXEC command to display platform-dependent MAC address table information.

```
show platform mac-address-table [aging-array | hash-table | mac-address mac-address] [vlan vlan-id]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aging-array</td>
<td>(Optional) Display the MAC address table aging array.</td>
</tr>
<tr>
<td>hash-table</td>
<td>(Optional) Display the MAC address table hash table.</td>
</tr>
<tr>
<td>mac-address mac-address</td>
<td>(Optional) Display the MAC address table MAC address information, where <code>mac-address</code> is the 48-bit hardware address.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Display information for the specified VLAN. The range is 1 to 4094.</td>
</tr>
</tbody>
</table>

**Command Modes**

- Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform messaging

Use the `show platform messaging` privileged EXEC command to display platform-dependent application and performance message information.

```
show platform messaging { application [ incoming | outgoing | summary ] | hiperf [ class-number ] }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`application [ incoming</td>
<td>outgoing</td>
</tr>
<tr>
<td><code>hiperf [ class-number ]</code></td>
<td>Display outgoing high-performance message information. Specify the <code>class-number</code> option to display information about high-performance messages for this class number. The range is 0 to 36.</td>
</tr>
</tbody>
</table>

Command Modes

Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform monitor

Use the `show platform monitor` privileged EXEC command to display platform-dependent Switched Port Analyzer (SPAN) information.

```
show platform monitor [session session-number]
```

**Syntax Description**

- `session` (Optional) Display SPAN information for the specified SPAN session. The range is 1 to 66.

**Command Modes**

Privileged EXEC

**Command History**

- **Release** 12.1(11)AX  This command was introduced.

**Usage Guidelines**

You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform mvr table

Use the `show platform mvr table` privileged EXEC command to display the platform-dependent Multicast VLAN Registration (MVR) multi-expansion descriptor (MED) group mapping table.

```
show platform mvr table
```

**Syntax Description**
This command has no arguments or keywords.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You should use this command only when you are working directly with a technical support representative while troubleshooting a problem. Do not use this command unless a technical support representative asks you to do so.
show platform pm

Use the `show platform pm` privileged EXEC command to display platform-dependent port-manager information.

```
show platform pm {counters | group-masks | idbs {active-idbs | deleted-idbs} | if-numbers | link-status | platform-block | port-info interface-id | stack-view | vlan {info | line-state}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>counters</td>
<td>Display module counters information.</td>
</tr>
<tr>
<td>group-masks</td>
<td>Display EtherChannel group masks information.</td>
</tr>
<tr>
<td>idbs {active-idbs</td>
<td>deleted-idbs}</td>
</tr>
<tr>
<td></td>
<td>• active-idbs—Display active IDB information.</td>
</tr>
<tr>
<td></td>
<td>• deleted-idbs—Display deleted and leaked IDB information.</td>
</tr>
<tr>
<td>if-numbers</td>
<td>Display interface numbers information.</td>
</tr>
<tr>
<td>link-status</td>
<td>Display local port link status information.</td>
</tr>
<tr>
<td>platform-block</td>
<td>Display platform port block information.</td>
</tr>
<tr>
<td>port-info interface-id</td>
<td>Display port administrative and operation fields for the specified interface.</td>
</tr>
<tr>
<td>stack-view</td>
<td>Display status information for the stack.</td>
</tr>
<tr>
<td>vlan {info</td>
<td>line-state}</td>
</tr>
<tr>
<td></td>
<td>• info—Display information for active VLANs.</td>
</tr>
<tr>
<td></td>
<td>• line-state—Display line-state information.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)AX</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.
show platform port-asic

Use the `show platform port-asic` privileged EXEC command to display platform-dependent port ASIC register information.

```
show platform port-asic [cpu-queue-map-table [asic number | port number [asic number]]]

dest-map index number]

etherchannel-info [asic number | port number [asic number]]]

exception [asic number | port number [asic number]]

global-status [asic number | port number [asic number]]

learning [asic number | port number [asic number]]

mac-info [asic number | port number [asic number]]

mvid [asic number]

packet-info-ram [asic number | index number [asic number]]

port-info [asic number | port number [asic number]]

prog-parser [asic number | port number [asic number]]

receive [buffer-queue | port-fifo | supervisor-sram] [asic number | port number [asic number]]

span [vlan-id [asic number] | [asic number]

stack [control | dest-map | learning | messages | mvid | prog-parser | span | stats [asic number | port number [asic number]]

stats [drop | enqueue | miscellaneous | supervisor] [asic number | port number [asic number]]

transmit [port-fifo | queue | supervisor-sram] [asic number | port number [asic number]]

vct [asic number | port number [asic number]]

version]
```

### Syntax Description

- **cpu-queue-map-table [asic number | port number [asic number]]**: Display the CPU queue-map table entries. The keywords have these meanings:
  - **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
  - **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27.

- **dest-map index number**
  - Display destination-map information for the specified index. The range is 0 to 65535.

- **etherchannel-info [asic number | port number [asic number]]**
  - Display the contents of the EtherChannel information register. The keywords have these meanings:
    - **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
    - **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
### exception [asic number | port number [asic number]]
Display the exception-index register information. The keywords have these meanings:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

### global-status [asic number | port number [asic number]]
Display global and interrupt status. The keywords have these meanings:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

### learning [asic number | port number [asic number]]
Display entries in the learning cache. The keywords have these meanings:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

### mac-info [asic number | port number [asic number]]
Display the contents of the MAC information register. The keywords have these meanings:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

### mvid [asic number]
Display the mapped VLAN ID table. The keyword has this meaning:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.

### packet-info-ram [asic number | index number [asic number]]
Display the packet information RAM. The keywords have these meanings:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **index number**—(Optional) Display information for the specified packet RAM index number and ASIC number. The range is 0 to 63.
### show platform port-asic

#### port-info [asic number] [port number]
Display port information register values. The keywords have these meanings:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

#### prog-parser [asic number] [port number]
Display the programmable parser tables. The keywords have these meanings:
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

#### receive [buffer-queue] [port-fifo] [supervisor-sram] [asic number] [port number]
Display receive information. The keywords have these meanings:
- **buffer-queue**—Display the buffer queue information.
- **port-fifo**—Display the port-FIFO information.
- **supervisor-sram**—Display the supervisor static RAM (SRAM) information.
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

#### span [vlan-id] [asic number]
Display the Switched Port Analyzer (SPAN)-related information. The keywords have these meanings:
- **vlan-id**—(Optional) Display information for the specified VLAN. The range is 0 to 1023.
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
### show platform port-asic

#### stack {control | dest-map | learning | messages | mvid | prog-parser | span | stats [asic number | port number [asic number]]}

Display stack-related information. The keywords have these meanings:
- **control**—Display stack control-status register information.
- **dest-map**—Display destination-map information.
- **learning**—Display entries in the learning-cache.
- **messages**—Display the stack-message register information.
- **mvid**—Display entries in the mapped VLAN-ID table.
- **prog-parser**—Display the programmable parser tables.
- **span**—Display SPAN-related information.
- **stats**—Display raw statistics for the port ASIC.
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.

**Note**
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

#### stats {drop | enqueue | miscellaneous | supervisor} [asic number | port number [asic number]]

Display raw statistics for the port ASIC. The keywords have these meanings:
- **drop**—Display drop statistics.
- **enqueue**—Display enqueue statistics.
- **miscellaneous**—Display miscellaneous statistics.
- **supervisor**—Display supervisor statistics.
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

#### transmit {port-fifo | queue | supervisor-sram} [asic number | port number [asic number]]

Display transmit information. The keywords have these meanings:
- **port-fifo**—Display the contents of the port-FIFO information register.
- **queue**—Display the contents of the queue information register.
- **supervisor-sram**—Display supervisor SRAM information.
- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.
**vct [asic number | port number [asic number]]**

Display the VLAN compression table entries for the specified ASIC or for the specified port and ASIC. The keywords have these meanings:

- **asic number**—(Optional) Display information for the specified ASIC. The range is 0 to 1.
- **port number**—(Optional) Display information for the specified port and ASIC number. The range is 0 to 27, where 0 is the supervisor and 1 to 25 are the ports.

**version**

Display version and device type information for port ASICS.

---

**Command Modes**

Privileged EXEC

show platform qos

Use the show platform qos privileged EXEC command to display platform-dependent quality of service (QoS) information.

```
show platform qos {label asic number | policer {parameters asic number |
port alloc number asic number}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label asic number</td>
<td>Display QoS label maps for the specified ASIC. (Optional) For asic number,</td>
</tr>
<tr>

</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.
**show platform resource-manager**

Use the `show platform resource-manager` privileged EXEC command to display platform-dependent resource-manager information.

```
show platform resource-manager { dm [index number] | erd [index number] | mad [index number] | med [index number] | mod | msm [hash-table [vlan vlan-id]] | mac-address mac-address [vlan vlan-id]] | sd [index number] | vld [index number]}
```

| Syntax Description | `dm [index number]` | Display the destination map. The keyword has this meaning:
| | | • `index number`—(Optional) Display the specified index. The range is 0 to 65535. |
| | `erd [index number]` | Display the equal-cost-route descriptor table for the specified index. The keyword has this meaning:
| | | • `index number`—(Optional) Display the specified index. The range is 0 to 65535. |
| | `mad [index number]` | Display the MAC-address descriptor table for the specified index. The keyword has this meaning:
| | | • `index number`—(Optional) Display the specified index. The range is 0 to 65535. |
| | `med [index number]` | Display the multi-expansion descriptor table for the specified index. The keyword has this meaning:
| | | • `index number`—(Optional) Display the specified index. The range is 0 to 65535. |
| | `mod` | Display the resource-manager module information. |
| | `msm [hash-table [vlan vlan-id]] | mac-address mac-address [vlan vlan-id]]` | Display the MAC-address descriptor table and the station descriptor table information. The keywords have these meanings:
| | | • `hash-table [vlan vlan-id]`—Display the hash table for all VLANs or the specified VLAN. The range is 1 to 4094. |
| | | • `mac-address mac-address [vlan vlan-id]`—Display the MAC-address descriptor table for the specified MAC address represented by the 48-bit hardware address for all VLANs or the specified VLAN. The range is 1 to 4094. |
| | `sd [index number]` | Display the station descriptor table for the specified index. The keyword has this meaning:
| | | • `index number`—(Optional) Display the specified index. The range is 0 to 65535. |
| | `vld [index number]` | Display the VLAN-list descriptor table for the specified index. The keyword has this meaning:
| | | • `index number`—(Optional) Display the specified index. The range is 0 to 65535. |

| Command Modes | Privileged EXEC |
show platform resource-manager

### Command History

**Usage Guidelines**

You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.
show platform stack manager

Use the `show platform stack manager` privileged EXEC command to display platform-dependent stack information.

```
show platform stack manager [all | counters | trace [sdp [reverse] | state [reverse]]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Display all information for the entire switch stack.</td>
</tr>
<tr>
<td>counters</td>
<td>Display the stack manager counters.</td>
</tr>
</tbody>
</table>
| trace [sdp [reverse]] | Display trace information. The keywords have these meanings:
|               | • `sdp`—(Optional) Display Stack Discovery Protocol (SDP) information. |
|               | • `reverse`—(Optional) Display trace information in reverse chronological order (from recent to older chronological sequence). |
| trace [state [reverse]] | Display trace information. The keywords have these meanings:
|               | • `state`—(Optional) Display stack state machine information. |
|               | • `reverse`—(Optional) Display trace information in reverse chronological order (from recent to older chronological sequence). |

</tr>
<tr>
<td>12.2(50)SE</td>
<td>The command syntax changed from <code>show platform stack-manager</code> to <code>show platform stack stack manager</code>.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

The summary information about the switch stack shows these states:

- **Waiting**—A switch is booting up and waiting for communication from other switches in the stack. The switch has not yet determined whether or not it is a stack master.
  - Stack members not participating in a stack master election remain in the waiting state until the stack master is elected and ready.
- **Initializing**—A switch has determined whether its stack master status. If it is not the stack master, it is receiving its system- and interface-level configuration from the stack master and loading it.
- **Ready**—The member has completed loading the system- and interface-level configurations and can forward traffic.
- **Master Re-Init**—The state immediately after a master re-election and a different member is elected master. The new master is re-initializing its configuration. This state applies only to the new master.
• Ver Mismatch—A switch in version mismatch mode. Version-mismatch mode is when a switch joining the stack has a different stack protocol minor version number than the master.

A typical state transition for a stack member (including a stack master) booting up is Waiting -> Initializing -> Ready.

A typical state transition for a stack member to a stack master after a master election is Ready -> Master Re-Init -> Ready.

A typical state transition for a stack member in version mismatch mode is Waiting -> Ver Mismatch.
show platform stack ports

Use the `show platform stack ports` privileged EXEC command to display platform-dependent stack information.

```
show platform stack ports {buffer | history}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>Display the StackWise port link and sync state events.</td>
</tr>
<tr>
<td>history</td>
<td>Display the StackWise port history.</td>
</tr>
</tbody>
</table>

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

**Note**

This is an example of the `show platform stack port buffer` command output:

```
Switch# show platform stack ports buffer
                           Stack Debug Event Data Trace
==============================================================================
Event type LINK: Link status change
Event type RAC: RAC changes to Not OK
Event type SYNC: Sync changes to Not OK
==============================================================================
Event    Stack           Stack PCS Info              Ctrl-Status  Loopback   Cable
Count    Port                                                     IOS / HW   length
=========  =====  ===================================  ===========  ========  ========
Event type: LINK OK Stack Port 1
0000000011   1    FF08FF00 860302A5 AA55FFFF FFFFFFFF   1CE61CE6     Yes/Yes  No cable

</tr>
</tbody>
</table>
show platform tb

Use the **show platform tb** privileged EXEC command to display platform-dependent trusted-boundary information during a stack master change to a new stack master.

```
show platform tb
```

**Syntax Description**

This command has no arguments or keywords.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(14)EA1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

**Examples**

This is an example of output from the **show platform tb** command:

```
Switch# show platform tb
Print TB sub-block information
(Fa1/0/2) device:(Cisco phone)
/* current interfaces with TB enabled, and the trust device type */

Current master switch:(Yes)
/* Is this switch the current master switch? */

New elected master     :(No)
/* Is the master switch-over occurred and this is the new master switch? */

Master ready           :(No)
/* Is the Master switch in ready state? */

HULC TB process on      :(No)
/* Is the TB platform process currently running? */

CDP stable timer ON     :(No)(360 secs)
/* Is the CDP stable timer running? After the CDP stable timer expired, CDP neighbors of all the TB enabled interfaces will be verified to make sure the replacement of IP phone and PC did not happen during the master switch-over. */

Print TB residue trust ports information
/* The interfaces with TB enabled right before master switch-over. */

Print port CDP neighbor information
/* Is the CDP message still received after switch-over? */

HULC TB is not detecting CDP events
/* Currently, this switch is not detecting any CDP event. */
```
show platform tcam

Use the **show platform tcam** privileged EXEC command to display platform-dependent ternary content addressable memory (TCAM) driver information.

**show platform tcam**

<table>

Show Platform TCAM

Usage Guidelines
You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

Note
Though visible in the command-line help strings, the usage keyword is not supported.
**show platform vlan**

Use the `show platform vlan` privileged EXEC command to display platform-dependent VLAN information.

```
show platform vlan {misc | mvid | prune | refcount | rpc {receive | transmit}}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>misc</td>
<td>Display miscellaneous VLAN module information.</td>
</tr>
<tr>
<td>mvid</td>
<td>Display the mapped VLAN ID (MVID) allocation information.</td>
</tr>
<tr>
<td>prune</td>
<td>Display the stack pruning database.</td>
</tr>
<tr>
<td>refcount</td>
<td>Display the VLAN lock module-wise reference counts.</td>
</tr>
</tbody>
</table>
| rpc {receive | transmit} | Display remote procedure call (RPC) messages. The keywords have these meanings:
  - **receive**—Display received information.
  - **transmit**—Display sent information. |

### Command Modes

Privileged EXEC

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.
show platform wireless-controller

Use the `show platform wireless-controller` privileged EXEC command to display information about the internal wireless controller in a Catalyst 3750G Integrated Wireless LAN Controller Switch.

```
show platform wireless-controller [management-info | status | summary] [switch-number]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>management-info</td>
<td>(Optional) Display information about the management interface of the wireless controller.</td>
</tr>
<tr>
<td>status</td>
<td>(Optional) Display wireless controller status information.</td>
</tr>
<tr>
<td>summary</td>
<td>(Optional) Display wireless controller summary information.</td>
</tr>
<tr>
<td>switch-number</td>
<td>(Optional) Display wireless controller information for the specified stack member. The range is from 1 to 9.</td>
</tr>
</tbody>
</table>

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)FZ</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You should use this command only when you are working directly with your technical support representative while troubleshooting a problem. Do not use this command unless your technical support representative asks you to do so.

Enter the `show platform wireless-controller` commands to determine the stack number of the switch or switches in the stack that contain the integrated wireless LAN controller. The command outputs also display the MAC address and IP address of the controller to be used in accessing and configuring the controller.

This command applies only to the Catalyst 3750G Wireless Controller Switch.

### Examples

This is an example of output from the `show platform wireless-controller` privileged EXEC command with no keywords:

```
Switch# show platform wireless-controller
Wireless Controller in Switch 2
Operational Status of the Controller : operational
Service VLAN : 4095
Service Port Mac Address : 000b.8540.3783
Service IP Address : 127.0.1.2
Management IP Address : 22.2.2.2
Management VLAN : 7
Software Version : 3.3.0.3
Keepalive Version(controller/switch) : 1/1
Keepalives Missed : 0
Controller accepts http/https : 0/1
Controller's Status Line : up
Watchdog resets of Controller : 0
Controller resets total : 0
```
Unacknowledged control messages : 0

Wireless Controller in Switch 3
Operational Status of the Controller : operational
Service VLAN : 4095
Service Port Mac Address : 000b.8540.33e3
Service IP Address : 127.0.1.3
Management IP Address : 8.8.8.8
Management VLAN : 8
Software Version : 3.3.0.3
Keepalive Version(controller/switch) : 1/1
Keepalives Missed : 0
Controller accepts http/https : 0/1
Controller’s Status Line : up
Watchdog resets of Controller : 0
Controller resets total : 0
Unacknowledged control messages : 0

This is an example of output from the show platform wireless-controller management-info command:

Switch# show platform wireless-controller management-info

<table>
<thead>
<tr>
<th>sw vlan</th>
<th>ip</th>
<th>gateway</th>
<th>http</th>
<th>https</th>
<th>mac</th>
<th>version</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>22.2.2.2/24</td>
<td>22.2.2.1</td>
<td>0</td>
<td>1</td>
<td>000b.8540.3783</td>
<td>3.3.0.3</td>
</tr>
<tr>
<td>3</td>
<td>8.8.8.8/24</td>
<td>8.8.8.1</td>
<td>0</td>
<td>1</td>
<td>000b.8540.33e3</td>
<td>3.3.0.3</td>
</tr>
</tbody>
</table>

This is an example of output from the show platform wireless-controller status command:

Switch# show platform wireless-controller status 1

<table>
<thead>
<tr>
<th>Switch</th>
<th>Service IP</th>
<th>Management IP</th>
<th>SW Version</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>127.0.1.2</td>
<td>22.2.2.2</td>
<td>3.3.0.3</td>
<td>operational</td>
</tr>
<tr>
<td>3</td>
<td>127.0.1.3</td>
<td>8.8.8.8</td>
<td>3.3.0.3</td>
<td>operational</td>
</tr>
</tbody>
</table>

This is an example of output from the show platform wireless-controller summary command:

Switch# show platform wireless-controller summary

<table>
<thead>
<tr>
<th>Switch</th>
<th>Status</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>up</td>
<td>operational</td>
</tr>
<tr>
<td>3</td>
<td>up</td>
<td>operational</td>
</tr>
</tbody>
</table>
