How to Configure Local Authentication and Authorization

Configuring the Switch for Local Authentication and Authorization

You can configure AAA to operate without a server by setting the switch to implement AAA in local mode. The switch then handles authentication and authorization. No accounting is available in this configuration.

Note

To secure the switch for HTTP access by using AAA methods, you must configure the switch with the **ip http authentication aaa** global configuration command. Configuring AAA authentication does not secure the switch for HTTP access by using AAA methods.

Follow these steps to configure AAA to operate without a server by setting the switch to implement AAA in local mode:

SUMMARY STEPS

- 1. enable
- 2. configure terminal
- 3. aaa new-model
- 4. aaa authentication login default local
- 5. aaa authorization exec default local
- 6. aaa authorization network default local
- **7. username** *name* [**privilege** *level*] {**password** *encryption-type password*}
- 8. end
- 9. show running-config
- 10. copy running-config startup-config

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable	Enables privileged EXEC mode.
	Example:	Enter your password if prompted.
	Device> enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	
Step 3	aaa new-model	Enables AAA.
	Example:	
	Device(config)# aaa new-model	
Step 4	aaa authentication login default local	Sets the login authentication to use the local username
	Example:	database. The default keyword applies the local user database authentication to all ports.
	Device(config)# aaa authentication login default local	•
Step 5	aaa authorization exec default local	Configures user AAA authorization, check the local
•	Example:	database, and allow the user to run an EXEC shell.
	Device(config)# aaa authorization exec default local	
Step 6	aaa authorization network default local	Configures user AAA authorization for all network-related
	Example:	service requests.
	<pre>Device(config) # aaa authorization network default local</pre>	
Step 7	<pre>username name [privilege level] {password encryption-type password}</pre>	Enters the local database, and establishes a username-based authentication system.
	Example:	Repeat this command for each user.
	Device(config) # username your_user_name privilege 1 password 7 secret567	• For <i>name</i> , specify the user ID as one word. Spaces and quotation marks are not allowed.
		• (Optional) For <i>level</i> , specify the privilege level the user has after gaining access. The range is 0 to 15.

	Command or Action	Purpose
		 Level 15 gives privileged EXEC mode access. Level 0 gives user EXEC mode access. For <i>encryption-type</i>, enter 0 to specify that an unencrypted password follows. Enter 7 to specify that a hidden password follows. For <i>password</i>, specify the password the user must enter to gain access to the switch. The password must be from 1 to 25 characters, can contain embedded spaces, and must be the last option specified in the username command.
Step 8	<pre>end Example: Device(config)# end</pre>	Returns to privileged EXEC mode.
Step 9	<pre>show running-config Example: Device# show running-config</pre>	Verifies your entries.
Step 10	copy running-config startup-config Example: Device# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Monitoring Local Authentication and Authorization

To display Local Authentication and Authorization configuration, use the **show running-config** privileged EXEC command.
