THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

CHAPTER 1

Using the Command-Line Interface 1

Information About Using the Command-Line Interface 1

Command Modes 1

Understanding Abbreviated Commands 3

No and Default Forms of Commands 3

CLI Error Messages 4

Configuration Logging 4

Using the Help System 4

How to Use the CLI to Configure Features 6

Configuring the Command History 6

Changing the Command History Buffer Size 6

Recalling Commands 6

Disabling the Command History Feature 7

Enabling and Disabling Editing Features 7

Editing Commands Through Keystrokes 8

Editing Command Lines That Wrap 9

Searching and Filtering Output of show and more Commands 10

Accessing the CLI on a Switch Stack 11

Accessing the CLI Through a Console Connection or Through Telnet 11

CHAPTER 2

Administering the System 13

Finding Feature Information 13

Information About Administering the Switch	13
System Time and Date Management	13
System Clock	14
Network Time Protocol	14
NTP Stratum	16
NTP Associations	16
NTP Security	16
NTP Implementation	16
NTP Version 4	17
System Name and Prompt	18
Stack System Name and Prompt	18
Default System Name and Prompt Configuration	18
DNS	18
Default DNS Settings	19
Login Banners	19
Default Banner Configuration	19
MAC Address Table	19
MAC Address Table Creation	20
MAC Addresses and VLANs	20
MAC Addresses and Switch Stacks	20
Default MAC Address Table Settings	20
ARP Table Management	21
How to Administer the Switch	21
Configuring the Time and Date Manually	21
Setting the System Clock	21
Configuring the Time Zone	22
Configuring Summer Time (Daylight Saving Time)	24
25	
Configuring a System Name	27
Setting Up DNS	28
Configuring a Message-of-the-Day Login Banner	30
Configuring a Login Banner	31
Managing the MAC Address Table	33
Changing the Address Aging Time	33
Configuring MAC Address Change Notification Traps	34

Configuring MAC Address Move Notification Traps	36
Configuring MAC Threshold Notification Traps	38
Adding and Removing Static Address Entries	41
Configuring Unicast MAC Address Filtering	42
Monitoring and Maintaining Administration of the Switch	43
Configuration Examples for Switch Administration	45
Example: Setting the System Clock	45
Examples: Configuring Summer Time	45
Example: Configuring a MOTD Banner	45
Example: Configuring a Login Banner	46
Example: Configuring MAC Address Change Notification Traps	46
Example: Configuring MAC Threshold Notification Traps	46
Example: Adding the Static Address to the MAC Address Table	46
Example: Configuring Unicast MAC Address Filtering	47
Additional References for Switch Administration	47
Feature History and Information for Switch Administration	48

CHAPTER 3

Performing Switch Setup Configuration 49

Finding Feature Information	49
Information About Performing Switch Setup Configuration	49
Switch Boot Process	50
Software Installer Features	50
Software Boot Modes	51
Installed Boot Mode	51
Bundle Boot Mode	51
Boot Mode for a Switch Stack	52
Switches Information Assignment	53
Default Switch Information	53
DHCP-Based Autoconfiguration Overview	53
DHCP Client Request Process	54
DHCP-based Autoconfiguration and Image Update	55
Restrictions for DHCP-based Autoconfiguration	55
DHCP Autoconfiguration	56
DHCP Auto-Image Update	56
DHCP Server Configuration Guidelines	56

Purpose of the TFTP Server	57
Purpose of the DNS Server	57
How to Obtain Configuration Files	58
How to Control Environment Variables	58
Common Environment Variables	59
Environment Variables for TFTP	61
Scheduled Reload of the Software Image	61
How to Perform Switch Setup Configuration	62
Configuring DHCP Autoconfiguration (Only Configuration File)	62
Configuring DHCP Auto-Image Update (Configuration File and Image)	64
Configuring the Client to Download Files from DHCP Server	68
Manually Assigning IP Information to Multiple SVIs	69
Modifying the Switch Startup Configuration	71
Specifying the Filename to Read and Write the System Configuration	71
Manually Booting the Switch	72
Booting the Switch in Installed Mode	73
Booting the Switch in Bundle Mode	75
Booting a Specific Software Image On a Switch Stack	76
Configuring a Scheduled Software Image Reload	77
Monitoring Switch Setup Configuration	79
Example: Verifying the Switch Running Configuration	79
Examples: Displaying Software Bootup in Install Mode	79
Example: Emergency Installation	81
Configuration Examples for Performing Switch Setup	82
Example: Configuring a Switch as a DHCP Server	82
Example: Configuring DHCP Auto-Image Update	83
Example: Configuring a Switch to Download Configurations from a DHCP Server	83
Examples: Scheduling Software Image Reload	84
Additional References For Performing Switch Setup	84
Feature History and Information For Performing Switch Setup Configuration	85

CHAPTER 4
Configuring Right-To-Use Licenses 87

Finding Feature Information	87
Restrictions for Configuring RTU Licenses	87
Information About Configuring RTU Licenses	88

Right-To-Use Licensing	88
Right-To-Use Image Based Licenses	88
Right-To-Use License States	89
License Activation for Switch Stacks	89
Mobility Controller Mode	90
Right-To-Use Adder AP-Count Rehosting Licenses	90
How to Configure RTU Licenses	90
Activating an Imaged Based License	90
Activating an AP-Count License	92
Obtaining an Upgrade or Capacity Adder License	92
Rehosting a License	93
Changing Mobility Mode	94
Monitoring and Maintaining RTU Licenses	95
Configuration Examples for RTU Licensing	96
Examples: Activating RTU Image Based Licenses	96
Examples: Displaying RTU Licensing Information	96
Example: Displaying RTU License Details	97
Example: Displaying RTU License Mismatch	98
Example: Displaying RTU Licensing Usage	99
Additional References for RTU Licensing	100
Feature History and Information for RTU Licensing	101

CHAPTER 5

Configuring Administrator Usernames and Passwords 103

Finding Feature Information	103
Information About Configuring Administrator Usernames and Passwords	103
Configuring Administrator Usernames and Passwords	105
Examples: Administrator Usernames and Passwords Configuration	106
Additional References for Administrator Usernames and Passwords	107
Feature History and Information For Performing Administrator Usernames and Passwords Configuration	108

CHAPTER 6

Configuring 802.11 parameters and Band Selection 109

Finding Feature Information	109
Restrictions on Band Selection, 802.11 Bands, and Parameters	109
Information About Configuring Band Selection, 802.11 Bands, and Parameters	110

Band Selection	110
802.11 Bands	110
802.11n Parameter	111
802.11h Parameter	111
How to Configure 802.11 Bands and Parameters	111
Configuring Band Selection (CLI)	111
Configuring the 802.11 Bands (CLI)	113
Configuring 802.11n Parameters (CLI)	115
Configuring 802.11h Parameters (CLI)	118
Monitoring Configuration Settings for Band Selection, 802.11 Bands, and Parameters	119
Monitoring Configuration Settings Using Band Selection and 802.11 Bands Commands	119
Example: Viewing the Configuration Settings for 5-GHz Band	119
Example: Viewing the Configuration Settings for 24-GHz Band	121
Example: Viewing the status of 802.11h Parameters	122
Example: Verifying the Band Selection Settings	122
Configuration Examples for Band Selection, 802.11 Bands, and Parameters	123
Examples: Band Selection Configuration	123
Examples: 802.11 Bands Configuration	123
Examples: 802.11n Configuration	124
Examples: 802.11h Configuration	124
Additional References for 802.11 Parameters and Band Selection	125
Feature History and Information For Performing 802.11 parameters and Band Selection Configuration	126

CHAPTER 7

Configuring Aggressive Load Balancing	127
Finding Feature Information	127
Restrictions for Aggressive Load Balancing	127
Information for Configuring Aggressive Load Balancing Parameters	128
Aggressive Load Balancing	128
How to Configure Aggressive Load Balancing	129
Configuring Aggressive Load Balancing	129
Monitoring Aggressive Load Balancing	130
Examples: Aggressive Load Balancing Configuration	131
Additional References for Aggressive Load Balancing	131

Feature History and Information For Performing Aggressive Load Balancing Configuration 132

CHAPTER 8

Configuring Client Roaming 133

Finding Feature Information 133

Restrictions for Configuring Client Roaming 133

Information About Client Roaming 134

Inter-Subnet Roaming 135

Voice-over-IP Telephone Roaming 135

CCX Layer 2 Client Roaming 135

How to Configure Layer 2 or Layer 3 Roaming 136

Configuring Layer 2 or Layer 3 Roaming 136

Configuring CCX Client Roaming Parameters (CLI) 137

Configuring Mobility Oracle 139

Configuring Mobility Controller 140

Configuring Mobility Agent 142

Monitoring Client Roaming Parameters 143

Monitoring Mobility Configurations 143

Additional References for Configuring Client Roaming 145

Feature History and Information For Performing Client Roaming Configuration 146

CHAPTER 9

Configuring Voice and Video Parameters 147

Finding Feature Information 147

Prerequisites for Voice and Video Parameters 147

Restrictions for Voice and Video Parameters 148

Information About Configuring Voice and Video Parameters 148

Call Admission Control 148

Static-Based CAC 149

Load-Based CAC 149

IOSd Call Admission Control 149

Expedited Bandwidth Requests 150

U-APSD 151

Traffic Stream Metrics 151

Information About Configuring Voice Prioritization Using Preferred Call Numbers 152

Information About EDCA Parameters 153

How to Configure Voice and Video Parameters 153

Configuring Voice Parameters (CLI)	153
Configuring Video Parameters (CLI)	157
Configuring SIP-Based CAC (CLI)	159
Configuring a Preferred Call Number (CLI)	161
Configuring EDCA Parameters (CLI)	162
Monitoring Voice and Video Parameters	164
Configuration Examples for Voice and Video Parameters	166
Example: Configuring Voice and Video	166
Additional References for Voice and Video Parameters	168
Feature History and Information For Performing Voice and Video Parameters Configuration	169

CHAPTER 10

Configuring RFID Tag Tracking	171
Finding Feature Information	171
Information About Configuring RFID Tag Tracking	171
How to Configure RFID Tag Tracking	172
Configuring RFID Tag Tracking (CLI)	172
Monitoring RFID Tag Tracking Information	173
Additional References RFID Tag Tracking	173
Feature History and Information For Performing RFID Tag Tracking Configuration	174

CHAPTER 11

Configuring Location Settings	175
Finding Feature Information	175
Information About Configuring Location Settings	175
How to Configure Location Settings	176
Configuring Location Settings (CLI)	176
Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI)	178
Modifying the NMSP Notification threshold for Clients, RFID Tags, and Rogues (CLI)	179
Monitoring Location Settings and NMSP Settings	180
Monitoring Location Settings (CLI)	180
Monitoring NMSP Settings (CLI)	180
Examples: Location Settings Configuration	181
Examples: NMSP Settings Configuration	181
Additional References for Location Settings	182
Feature History and Information For Performing Location Settings Configuration	183

CHAPTER 12**Configuring SDM Templates 185**

- Finding Feature Information 185
- Information About Configuring SDM Templates 186
 - SDM Templates 186
 - SDM Templates and Switch Stacks 187
- How to Configure SDM Templates 187
 - Configuring SDM Templates 187
 - Configuring the Switch SDM Template 187
 - Setting the SDM Template 187
- Monitoring and Maintaining SDM Templates 189
- Configuration Examples for SDM Templates 189
 - Examples: Configuring SDM Templates 189
 - Examples: Displaying SDM Templates 189
- Additional References for SDM Templates 190

Feature History and Information For System Message Logs	208

CHAPTER 14

Configuring Online Diagnostics	209
Finding Feature Information	209
Information About Configuring Online Diagnostics	209
Online Diagnostics	209
How to Configure Online Diagnostics	210
Starting Online Diagnostic Tests	210
Configuring Online Diagnostics	211
Scheduling Online Diagnostics	211
Configuring Health-Monitoring Diagnostics	212
Monitoring and Maintaining Online Diagnostics	215
Displaying Online Diagnostic Tests and Test Results	215
Configuration Examples for Online Diagnostic Tests	216
Examples: Start Diagnostic Tests	216
Example: Configure a Health Monitoring Test	216
Examples: Schedule Diagnostic Test	217
Examples: Displaying Online Diagnostics	217
Additional References for Online Diagnostics	218
Feature History and Information for Configuring Online Diagnostics	219

CHAPTER 15

Troubleshooting the Software Configuration	221
Finding Feature Information	221
Information About Troubleshooting the Software Configuration	222
Software Failure on a Switch	222
Lost or Forgotten Password on a Switch	222
Power over Ethernet Ports	222
Disabled Port Caused by Power Loss	223
Disabled Port Caused by False Link-Up	223
Ping	223
Layer 2 Traceroute	224

Layer 2 Traceroute Guidelines	224
IP Traceroute	225
Time Domain Reflector Guidelines	225
Debug Commands	226
Crashinfo Files	227
System Reports	228
Onboard Failure Logging on the Switch	228
Fan Failures	229
Possible Symptoms of High CPU Utilization	229
How to Troubleshoot the Software Configuration	229
Recovering from a Software Failure	229
Recovering from a Lost or Forgotten Password	231
Procedure with Password Recovery Enabled	233
Procedure with Password Recovery Disabled	234
Preventing Switch Stack Problems	236
Preventing Autonegotiation Mismatches	237
Troubleshooting SFP Module Security and Identification	237
Monitoring SFP Module Status	238
Executing Ping	238
Monitoring Temperature	239
Monitoring the Physical Path	239
Executing IP Traceroute	239
Running TDR and Displaying the Results	240
Redirecting Debug and Error Message Output	240
Using the show platform forward Command	240
Using the show debug command	241
Configuring OBFL	241
Verifying Troubleshooting of the Software Configuration	242
Displaying OBFL Information	242
Example: Verifying the Problem and Cause for High CPU Utilization	243
Scenarios for Troubleshooting the Software Configuration	244
Scenarios to Troubleshoot Power over Ethernet (PoE)	244
Configuration Examples for Troubleshooting Software	247
Example: Pinging an IP Host	247
Example: Performing a Traceroute to an IP Host	247

Example: Enabling All System Diagnostics	248

Preface

- [Document Conventions](#), page xv
- [Related Documentation](#), page xvii
- [Obtaining Documentation and Submitting a Service Request](#), page xvii

Document Conventions

This document uses the following conventions:

Convention	Description
<code>^</code> or <code>Ctrl</code>	Both the <code>^</code> symbol and <code>Ctrl</code> represent the Control (<code>Ctrl</code>) key on a keyboard. For example, the key combination <code>^D</code> or <code>Ctrl-D</code> means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)
bold font	Commands and keywords and user-entered text appear in bold font .
<i>Italic font</i>	Document titles, new or emphasized terms, and arguments for which you supply values are in <i>italic font</i> .
<code>Courier font</code>	Terminal sessions and information the system displays appear in <code>courier font</code> .
Bold Courier font	Bold Courier font indicates text that the user must enter.
[x]	Elements in square brackets are optional.
...	An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.
	A vertical line, called a pipe, indicates a choice within a set of keywords or arguments.
[x y]	Optional alternative keywords are grouped in brackets and separated by vertical bars.

Convention	Description
{x y}	Required alternative keywords are grouped in braces and separated by vertical bars.
[x {y z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.
< >	Nonprinting characters such as passwords are in angle brackets.
[]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

Reader Alert Conventions

This document may use the following conventions for reader alerts:

Note

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

Tip

Means *the following information will help you solve a problem*.

Caution

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Timesaver

Means *the described action saves time*. You can save time by performing the action described in the paragraph.

Warning

IMPORTANT SAFETY INSTRUCTIONS

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

SAVE THESE INSTRUCTIONS

Related Documentation

**Note**

Before installing or upgrading the switch, refer to the switch release notes.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/c/en/us/td/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.

CHAPTER

Using the Command-Line Interface

- [Information About Using the Command-Line Interface, page 1](#)
- [How to Use the CLI to Configure Features, page 6](#)

Information About Using the Command-Line Interface

Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, an SSH, or by using the browser.

When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as **show** commands, which show the current configuration status, and **clear** commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode .

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.

Table 1: Command Mode Summary

Mode	Access Method	Prompt	Exit Method	About This Mode
User EXEC	Begin a session using Telnet, SSH, or console.	Switch>	Enter logout or quit .	Use this mode to <ul style="list-style-type: none"> • Change terminal settings. • Perform basic tests. • Display system information.
Privileged EXEC	While in user EXEC mode, enter the enable command.	Switch#	Enter disable to exit.	Use this mode to verify commands that you have entered. Use a password to protect access to this mode.
Global configuration	While in privileged EXEC mode, enter the configure command.	Switch(config) #	To exit to privileged EXEC mode, enter exit or end , or press Ctrl-Z .	Use this mode to configure parameters that apply to the entire switch.
VLAN configuration	While in global configuration mode, enter the vlan <i>vlan-id</i> command.	Switch(config-vlan) #	To exit to global configuration mode, enter the exit command. To return to privileged EXEC mode, press Ctrl-Z or enter end .	Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.
Interface configuration	While in global configuration mode, enter the interface command (with a specific interface).	Switch(config-if) #		Use this mode to configure parameters for the Ethernet ports.

Mode	Access Method	Prompt	Exit Method	About This Mode
			<p>To exit to global configuration mode, enter exit.</p> <p>To return to privileged EXEC mode, press Ctrl-Z or enter end.</p>	
Line configuration	While in global configuration mode, specify a line with the line vty or line console command.	Switch(config-line)#	<p>To exit to global configuration mode, enter exit.</p> <p>To return to privileged EXEC mode, press Ctrl-Z or enter end.</p>	Use this mode to configure parameters for the terminal line.

Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the **show configuration** privileged EXEC command in an abbreviated form:

```
Switch# show conf
```

No and Default Forms of Commands

Almost every configuration command also has a **no** form. In general, use the **no** form to disable a feature or function or reverse the action of a command. For example, the **no shutdown** interface configuration command reverses the shutdown of an interface. Use the command without the keyword **no** to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a **default** form. The **default** form of a command returns the command setting to its default. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the **default** command enables the command and sets variables to their default values.

CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.

Table 2: Common CLI Error Messages

Error Message	Meaning	How to Get Help
% Ambiguous command: "show con"	You did not enter enough characters for your switch to recognize the command.	Reenter the command followed by a question mark (?) without any space between the command and the question mark. The possible keywords that you can enter with the command appear.
% Incomplete command.	You did not enter all of the keywords or values required by this command.	Reenter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.
% Invalid input detected at '^' marker.	You entered the command incorrectly. The caret (^) marks the point of the error.	Enter a question mark (?) to display all of the commands that are available in this command mode. The possible keywords that you can enter with the command appear.

Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

Note

Only CLI or HTTP changes are logged.

Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

SUMMARY STEPS

1. **help**
2. *abbreviated-command-entry* ?
3. *abbreviated-command-entry* <Tab>
4. **?**
5. *command* ?
6. *command keyword* ?

DETAILED STEPS

	Command or Action	Purpose
Step 1	help Example: Switch# help	Obtains a brief description of the help system in any command mode.
Step 2	<i>abbreviated-command-entry</i> ? Example: Switch# di? dir disable disconnect	Obtains a list of commands that begin with a particular character string.
Step 3	<i>abbreviated-command-entry</i> <Tab> Example: Switch# sh conf <tab> Switch# show configuration	Completes a partial command name.
Step 4	? Example: Switch> ?	Lists all commands available for a particular command mode.
Step 5	<i>command</i> ? Example: Switch> show ?	Lists the associated keywords for a command.
Step 6	<i>command keyword</i> ? Example: Switch(config)# cdp holdtime ? <10-255> Length of time (in sec) that receiver must keep this packet	Lists the associated arguments for a keyword.

How to Use the CLI to Configure Features

Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.

Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

SUMMARY STEPS

1. **terminal history** [*size number-of-lines*]

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal history [<i>size number-of-lines</i>] Example: Switch# terminal history size 200	Changes the number of command lines that the switch records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.

Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

SUMMARY STEPS

1. **Ctrl-P** or use the **up arrow** key
2. **Ctrl-N** or use the **down arrow** key
3. **show history**

DETAILED STEPS

	Command or Action	Purpose
Step 1	Ctrl-P or use the up arrow key	Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.
Step 2	Ctrl-N or use the down arrow key	Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.
Step 3	show history Example: Switch# show history	Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the terminal history global configuration command and the history line configuration command.

Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

SUMMARY STEPS

1. **terminal no history**

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal no history Example: Switch# terminal no history	Disables the feature during the current terminal session in privileged EXEC mode.

Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it and reenable it.

SUMMARY STEPS

1. **terminal editing**
2. **terminal no editing**

DETAILED STEPS

	Command or Action	Purpose
Step 1	terminal editing Example: Switch# terminal editing	Reenables the enhanced editing mode for the current terminal session in privileged EXEC mode.
Step 2	terminal no editing Example: Switch# terminal no editing	Disables the enhanced editing mode for the current terminal session in privileged EXEC mode.

Editing Commands Through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

**Note**

The arrow keys function only on ANSI-compatible terminals such as VT100s.

Table 3: Editing Commands

Editing Commands	Description
Ctrl-B or use the left arrow key	Moves the cursor back one character.
Ctrl-F or use the right arrow key	Moves the cursor forward one character.
Ctrl-A	Moves the cursor to the beginning of the command line.
Ctrl-E	Moves the cursor to the end of the command line.
Esc B	Moves the cursor back one word.
Esc F	Moves the cursor forward one word.
Ctrl-T	Transposes the character to the left of the cursor with the character located at the cursor.
Delete or Backspace key	Erases the character to the left of the cursor.
Ctrl-D	Deletes the character at the cursor.

Ctrl-K	Deletes all characters from the cursor to the end of the command line.
Ctrl-U or Ctrl-X	Deletes all characters from the cursor to the beginning of the command line.
Ctrl-W	Deletes the word to the left of the cursor.
Esc D	Deletes from the cursor to the end of the word.
Esc C	Capitalizes at the cursor.
Esc L	Changes the word at the cursor to lowercase.
Esc U	Capitalizes letters from the cursor to the end of the word.
Ctrl-V or Esc Q	Designates a particular keystroke as an executable command, perhaps as a shortcut.
Return key	<p>Scrolls down a line or screen on displays that are longer than the terminal screen can display.</p> <p>Note The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including show command output. You can use the Return and Space bar keystrokes whenever you see the More prompt.</p>
Space bar	Scrolls down one screen.
Ctrl-L or Ctrl-R	Redisplays the current command line if the switch suddenly sends a message to your screen.

Editing Command Lines That Wrap

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press **Ctrl-B** or the left arrow key repeatedly. You can also press **Ctrl-A** to immediately move to the beginning of the line.

Note

The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

SUMMARY STEPS

1. `access-list`
2. `Ctrl-A`
3. `Return` key

DETAILED STEPS

	Command or Action	Purpose
Step 1	access-list Example: <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 Switch(config)# \$ 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.25 Switch(config)# \$t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq Switch(config)# \$15.22.25 255.255.255.0 10.15.22.35 255.255.255.0 eq 45</pre>	<p>Displays the global configuration command entry that extends beyond one line.</p> <p>When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign (\$) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.</p>
Step 2	Ctrl-A Example: <pre>Switch(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.2\$</pre>	<p>Checks the complete syntax.</p> <p>The dollar sign (\$) appears at the end of the line to show that the line has been scrolled to the right.</p>
Step 3	Return key	<p>Execute the commands.</p> <p>The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the terminal width privileged EXEC command to set the width of your terminal.</p> <p>Use line wrapping with the command history feature to recall and modify previous complex command entries.</p>

Searching and Filtering Output of show and more Commands

You can search and filter the output for **show** and **more** commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

SUMMARY STEPS

1. `{show | more} command | {begin | include | exclude} regular-expression`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>{show more} command {begin include exclude} regular-expression</p> <p>Example:</p> <pre>Switch# show interfaces include protocol Vlan1 is up, line protocol is up Vlan10 is up, line protocol is down GigabitEthernet1/0/1 is up, line protocol is down GigabitEthernet1/0/2 is up, line protocol is up</pre>	<p>Searches and filters the output.</p> <p>Expressions are case sensitive. For example, if you enter exclude output, the lines that contain output are not displayed, but the lines that contain output appear.</p>

Accessing the CLI on a Switch Stack

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.

You manage the switch stack and the stack member interfaces through the active switch. You cannot manage stack members on an individual switch basis. You can connect to the active switch through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

**Note**

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

Accessing the CLI Through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.
- Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.

- The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.
- The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.

Information About Administering the Switch

System Time and Date Management

You can manage the system time and date on your switch using automatic configuration methods (RTC and NTP), or manual configuration methods.

**Note**

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference* on Cisco.com.

System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- NTP
- Manual configuration

The system clock can provide time to these services:

- User **show** commands
- Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is *authoritative* or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a

LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

Cisco's implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The Figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream Switch, Switch B and Switch F, respectively.

Figure 1: Typical NTP Network Configuration

If the network is isolated from the Internet, Cisco's implementation of NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Stratum

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

NTP Associations

The communications between devices running NTP (known as *associations*) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

NTP Security

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

NTP Implementation

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F, respectively.

Figure 2: Typical NTP Network Configuration

If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Version 4

NTP version 4 is implemented on the switch. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.

- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

For details about configuring NTPv4, see the *Implementing NTPv4 in IPv6* chapter of the *Cisco IOS IPv6 Configuration Guide, Release 12.4T*.

System Name and Prompt

You configure the system name on the Switch to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.4* and the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.4*.

Stack System Name and Prompt

If you are accessing a stack member through the active switch, you must use the **session** *stack-member-number* privileged EXEC command. The stack member number range is from 1 through 4. When you use this command, the stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is Switch.

Default System Name and Prompt Configuration

The default switch system name and prompt is *Switch*.

DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as **ping**, **telnet**, **connect**, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a *com* domain name, so its domain name is *cisco.com*. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as *ftp.cisco.com*.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

Default DNS Settings

Table 4: Default DNS Settings

Feature	Default Setting
DNS enable state	Enabled.
DNS default domain name	None configured.
DNS servers	No name server addresses are configured.

Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

**Note**

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.4*.

Default Banner Configuration

The MOTD and login banners are not configured.

MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the switch learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

**Note**

For complete syntax and usage information for the commands used in this section, see the command reference for this release.

MAC Address Table Creation

With multiple MAC addresses supported on all ports, you can connect any port on the switch to other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

MAC Addresses and Switch Stacks

The MAC address tables on all stack members are synchronized. At any given time, each stack member has the same copy of the address tables for each VLAN. When an address ages out, the address is removed from the address tables on all stack members. When a Switch joins a switch stack, that Switch receives the addresses for each VLAN learned on the other stack members. When a stack member leaves the switch stack, the remaining stack members age out or remove all addresses learned by the former stack member.

Default MAC Address Table Settings

The following table shows the default settings for the MAC address table.

Table 5: Default Settings for the MAC Address

Feature	Default Setting
Aging time	300 seconds
Dynamic addresses	Automatically learned

Feature	Default Setting
Static addresses	None configured

ARP Table Management

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called *address resolution*.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the **arpa** keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.4 documentation on *Cisco.com*.

How to Administer the Switch

Configuring the Time and Date Manually

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

**Note**

You must reconfigure this setting if you have manually configured the system clock before the active switch fails and a different stack member assumes the role of active switch.

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

Follow these steps to set the system clock:

SUMMARY STEPS

1. **enable**
2. Use one of the following:
 - **clock set** *hh:mm:ss day month year*
 - **clock set** *hh:mm:ss month day year*

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	Use one of the following: <ul style="list-style-type: none"> • clock set <i>hh:mm:ss day month year</i> • clock set <i>hh:mm:ss month day year</i> Example: Switch# clock set 13:32:00 23 March 2013	Manually set the system clock using one of these formats: <ul style="list-style-type: none"> • <i>hh:mm:ss</i>—Specifies the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone. • <i>day</i>—Specifies the day by date in the month. • <i>month</i>—Specifies the month by name. • <i>year</i>—Specifies the year (no abbreviation).

Configuring the Time Zone

Follow these steps to manually configure the time zone:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **clock timezone zone hours-offset [minutes-offset]**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	clock timezone zone hours-offset [minutes-offset] Example: Switch(config)# clock timezone AST -3 30	Sets the time zone. Internal time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set. <ul style="list-style-type: none"> • <i>zone</i>—Enters the name of the time zone to be displayed when standard time is in effect. The default is UTC. • <i>hours-offset</i>—Enters the hours offset from UTC. • (Optional) <i>minutes-offset</i>—Enters the minutes offset from UTC. This is available where the local time zone is a percentage of an hour different from UTC.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Switch# show running-config	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **clock summer-time zone date date month year hh:mm date month year hh:mm [offset]**
4. **clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]**
5. **end**
6. **show running-config**
7. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	clock summer-time zone date date month year hh:mm date month year hh:mm [offset] Example: Switch(config)# clock summer-time PDT date 10 March 2013 2:00 3 November 2013 2:00	Configures summer time to start and end on specified days every year.
Step 4	clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]] Example: Switch(config)# clock summer-time PDT recurring 10 March 2013 2:00 3 November 2013 2:00	<p>Configures summer time to start and end on the specified days every year. All times are relative to the local time zone. The start time is relative to standard time.</p> <p>The end time is relative to summer time. Summer time is disabled by default. If you specify clock summer-time zone recurring without parameters, the summer time rules default to the United States rules.</p> <p>If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.</p>

	Command or Action	Purpose
		<ul style="list-style-type: none"> • <i>zone</i>—Specifies the name of the time zone (for example, PDT) to be displayed when summer time is in effect. • (Optional) <i>week</i>— Specifies the week of the month (1 to 4, first, or last). • (Optional) <i>day</i>—Specifies the day of the week (Sunday, Monday...). • (Optional) <i>month</i>—Specifies the month (January, February...). • (Optional) <i>hh:mm</i>—Specifies the time (24-hour format) in hours and minutes. • (Optional) <i>offset</i>—Specifies the number of minutes to add during summer time. The default is 60.
Step 5	end Example: Switch(config) # end	Returns to privileged EXEC mode.
Step 6	show running-config Example: Switch# show running-config	Verifies your entries.
Step 7	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Follow these steps if summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events):

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **clock summer-time zone date** [*month date year hh:mm month date year hh:mm [offset]*] **or** **clock summer-time zone date** [*date month year hh:mm date month year hh:mm [offset]*]
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	clock summer-time zone date [<i>month date year hh:mm month date year hh:mm [offset]</i>] or clock summer-time zone date [<i>date month year hh:mm date month year hh:mm [offset]</i>]	<p>Configures summer time to start on the first date and end on the second date.</p> <p>Summer time is disabled by default.</p> <ul style="list-style-type: none"> • For <i>zone</i>, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect. • (Optional) For <i>week</i>, specify the week of the month (1 to 5 or last). • (Optional) For <i>day</i>, specify the day of the week (Sunday, Monday...). • (Optional) For <i>month</i>, specify the month (January, February...). • (Optional) For <i>hh:mm</i>, specify the time (24-hour format) in hours and minutes. • (Optional) For <i>offset</i>, specify the number of minutes to add during summer time. The default is 60.

	Command or Action	Purpose
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Switch# show running-config	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring a System Name

Follow these steps to manually configure a system name:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **hostname** *name*
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	hostname <i>name</i> Example: Switch(config)# hostname remote-users	Configures a system name. When you set the system name, it is also used as the system prompt. The default setting is Switch. The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Switch# show running-config	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Setting Up DNS

If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the **ip domain-name** global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Follow these steps to set up your switch to use the DNS:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **ip domain-name** *name*
4. **ip name-server** *server-address1* [*server-address2* ... *server-address6*]
5. **ip domain-lookup** [*nsap* | **source-interface** *interface*]
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	ip domain-name <i>name</i> Example: Switch(config)# ip domain-name Cisco.com	<p>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name). Do not include the initial period that separates an unqualified name from the domain name.</p> <p>At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</p>
Step 4	ip name-server <i>server-address1</i> [<i>server-address2</i> ... <i>server-address6</i>] Example: Switch(config)# ip name-server 192.168.1.100 192.168.1.200 192.168.1.300	<p>Specifies the address of one or more name servers to use for name and address resolution.</p> <p>You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</p>
Step 5	ip domain-lookup [<i>nsap</i> source-interface <i>interface</i>]	(Optional) Enables DNS-based hostname-to-address translation on your switch. This feature is enabled by default.

	Command or Action	Purpose
	Example: Switch(config)# ip domain-lookup	If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).
Step 6	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 7	show running-config Example: Switch# show running-config	Verifies your entries.
Step 8	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to Do Next

Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch

Follow these steps to configure a MOTD login banner:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **banner motd** *c message c*
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	banner motd <i>c message c</i> Example: Switch(config)# banner motd # This is a secure site. Only authorized users are allowed. For access, contact technical support. #	Specifies the message of the day. <i>c</i> —Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. <i>message</i> —Enters a banner message up to 255 characters. You cannot use the delimiting character in the message.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Switch# show running-config	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

Follow these steps to configure a login banner:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **banner login *c message c***
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	banner login <i>c message c</i> Example: Switch(config)# banner login \$ Access for authorized users only. Please enter your username and password. \$	Specifies the login message. <i>c</i> — Enters the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. <i>message</i> —Enters a login message up to 255 characters. You cannot use the delimiting character in the message.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Switch# show running-config	Verifies your entries.

	Command or Action	Purpose
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Managing the MAC Address Table

Changing the Address Aging Time

Follow these steps to configure the dynamic address table aging time:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mac address-table aging-time** [0 | 10-1000000] [**routed-mac** | **vlan** *vlan-id*]
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	mac address-table aging-time [0 10-1000000] [routed-mac vlan <i>vlan-id</i>]	Sets the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated.

	Command or Action	Purpose
	Example: <pre>Switch(config)# mac address-table aging-time 500 vlan 2</pre>	<p>The range is 10 to 1000000 seconds. The default is 300. You can also enter 0, which disables aging. Static address entries are never aged or removed from the table.</p> <p><i>vlan-id</i>—Valid IDs are 1 to 4094.</p>
Step 4	end Example: <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
Step 5	show running-config Example: <pre>Switch# show running-config</pre>	Verifies your entries.
Step 6	copy running-config startup-config Example: <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring MAC Address Change Notification Traps

Follow these steps to configure the switch to send MAC address change notification traps to an NMS host:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server host** *host-addr* *community-string* *notification-type* { **informs** | **traps** } { **version** { **1** | **2c** | **3** } }
{ **vrf** *vrf instance name* }
4. **snmp-server enable traps mac-notification change**
5. **mac address-table notification change**
6. **mac address-table notification change** [*interval value*] [*history-size value*]
7. **interface** *interface-id*
8. **snmp trap mac-notification change** { **added** | **removed** }
9. **end**
10. **show running-config**
11. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	snmp-server host <i>host-addr</i> <i>community-string</i> <i>notification-type</i> { informs traps } { version { 1 2c 3 } } { vrf <i>vrf instance name</i> } Example: Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification	Specifies the recipient of the trap message. <ul style="list-style-type: none"> • <i>host-addr</i>—Specifies the name or address of the NMS. • traps (the default)—Sends SNMP traps to the host. • informs—Sends SNMP informs to the host. • version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. • <i>community-string</i>—Specifies the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. • <i>notification-type</i>—Uses the mac-notification keyword. • vrf <i>vrf instance name</i>—Specifies the VPN routing/forwarding instance for this host.
Step 4	snmp-server enable traps mac-notification change Example: Switch(config)# snmp-server enable traps mac-notification change	Enables the switch to send MAC address change notification traps to the NMS.
Step 5	mac address-table notification change Example: Switch(config)# mac address-table notification change	Enables the MAC address change notification feature.
Step 6	mac address-table notification change [<i>interval value</i>] [<i>history-size value</i>]	Enters the trap interval time and the history table size.

	Command or Action	Purpose
	Example: <pre>Switch(config)# mac address-table notification change interval 123 Switch(config)# mac address-table notification change history-size 100</pre>	<ul style="list-style-type: none"> • (Optional) interval value—Specifies the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second. • (Optional) history-size value—Specifies the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1.
Step 7	interface <i>interface-id</i> Example: <pre>Switch(config)# interface gigabitethernet1/0/2</pre>	Enters interface configuration mode, and specifies the Layer 2 interface on which to enable the SNMP MAC address notification trap.
Step 8	snmp trap mac-notification change {added removed} Example: <pre>Switch(config-if)# snmp trap mac-notification change added</pre>	<p>Enables the MAC address change notification trap on the interface.</p> <ul style="list-style-type: none"> • Enables the trap when a MAC address is added on this interface. • Enables the trap when a MAC address is removed from this interface.
Step 9	end Example: <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
Step 10	show running-config Example: <pre>Switch# show running-config</pre>	Verifies your entries.
Step 11	copy running-config startup-config Example: <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

Follow these steps to configure the switch to send MAC address-move notification traps to an NMS host:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server host** *host-addr* {**traps** | **informs**} {**version** {**1** | **2c** | **3**} *community-string* *notification-type*
4. **snmp-server enable traps mac-notification move**
5. **mac address-table notification mac-move**
6. **end**
7. **show running-config**
8. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	snmp-server host <i>host-addr</i> { traps informs } { version { 1 2c 3 } <i>community-string</i> <i>notification-type</i> Example: Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification	Specifies the recipient of the trap message. <ul style="list-style-type: none"> • <i>host-addr</i>—Specifies the name or address of the NMS. • traps (the default)—Sends SNMP traps to the host. • informs—Sends SNMP informs to the host. • version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. • <i>community-string</i>—Specifies the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. • <i>notification-type</i>—Uses the mac-notification keyword.

	Command or Action	Purpose
Step 4	snmp-server enable traps mac-notification move Example: <pre>Switch(config)# snmp-server enable traps mac-notification move</pre>	Enables the switch to send MAC address move notification traps to the NMS.
Step 5	mac address-table notification mac-move Example: <pre>Switch(config)# mac address-table notification mac-move</pre>	Enables the MAC address move notification feature.
Step 6	end Example: <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
Step 7	show running-config Example: <pre>Switch# show running-config</pre>	Verifies your entries.
Step 8	copy running-config startup-config Example: <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

What to Do Next

To disable MAC address-move notification traps, use the **no snmp-server enable traps mac-notification move** global configuration command. To disable the MAC address-move notification feature, use the **no mac address-table notification mac-move** global configuration command.

You can verify your settings by entering the **show mac address-table notification mac-move** privileged EXEC commands.

Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

Follow these steps to configure the switch to send MAC address table threshold notification traps to an NMS host:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **snmp-server host** *host-addr* {**traps** | **informs**} {**version** {**1** | **2c** | **3**} *community-string* *notification-type*
4. **snmp-server enable traps mac-notification threshold**
5. **mac address-table notification threshold**
6. **mac address-table notification threshold** [*limit percentage*] | [*interval time*]
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	snmp-server host <i>host-addr</i> { traps informs } { version { 1 2c 3 } <i>community-string</i> <i>notification-type</i> Example: Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification	Specifies the recipient of the trap message. <ul style="list-style-type: none"> • <i>host-addr</i>—Specifies the name or address of the NMS. • traps (the default)—Sends SNMP traps to the host. • informs—Sends SNMP informs to the host. • version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. • <i>community-string</i>—Specifies the string to send with the notification operation. You can set this string by using the snmp-server host command, but we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. • <i>notification-type</i>—Uses the mac-notification keyword.

	Command or Action	Purpose
Step 4	snmp-server enable traps mac-notification threshold Example: <pre>Switch(config)# snmp-server enable traps mac-notification threshold</pre>	Enables MAC threshold notification traps to the NMS.
Step 5	mac address-table notification threshold Example: <pre>Switch(config)# mac address-table notification threshold</pre>	Enables the MAC address threshold notification feature.
Step 6	mac address-table notification threshold [limit percentage] [interval time] Example: <pre>Switch(config)# mac address-table notification threshold interval 123 Switch(config)# mac address-table notification threshold limit 78</pre>	Enters the threshold value for the MAC address threshold usage monitoring. <ul style="list-style-type: none"> • (Optional) limit percentage—Specifies the percentage of the MAC address table use; valid values are from 1 to 100 percent. The default is 50 percent. • (Optional) interval time—Specifies the time between notifications; valid values are greater than or equal to 120 seconds. The default is 120 seconds.
Step 7	end Example: <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode.
Step 8	show running-config Example: <pre>Switch# show running-config</pre>	Verifies your entries.
Step 9	copy running-config startup-config Example: <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

What to Do Next

Adding and Removing Static Address Entries

Follow these steps to add a static address:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mac address-table static *mac-addr* vlan *vlan-id* interface *interface-id***
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> interface <i>interface-id</i> Example: Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet 1/0/1	Adds a static address to the MAC address table. <ul style="list-style-type: none"> • <i>mac-addr</i>—Specifies the destination MAC unicast address to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface. • <i>vlan-id</i>—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094. • <i>interface-id</i>—Specifies the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels. For static multicast addresses, you can enter multiple interface IDs. For static unicast addresses, you can enter only one interface at a time, but you can enter the command multiple times with the same MAC address and VLAN ID.

	Command or Action	Purpose
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 5	show running-config Example: Switch# show running-config	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Unicast MAC Address Filtering

Follow these steps to configure the Switch to drop a source or destination unicast static address:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **mac address-table static *mac-addr* vlan *vlan-id* drop**
4. **end**
5. **show running-config**
6. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> drop Example: Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop	Enables unicast MAC address filtering and configure the switch to drop a packet with the specified source or destination unicast static address. <ul style="list-style-type: none"> • <i>mac-addr</i>—Specifies a source or destination unicast MAC address (48-bit). Packets with this MAC address are dropped. • <i>vlan-id</i>—Specifies the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	show running-config Example: Switch# show running-config	Verifies your entries.
Step 6	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Monitoring and Maintaining Administration of the Switch

Command	Purpose
clear mac address-table dynamic	Removes all dynamic entries.
clear mac address-table dynamic address <i>mac-address</i>	Removes a specific MAC address.

Command	Purpose
clear mac address-table dynamic interface <i>interface-id</i>	Removes all addresses on the specified physical port or port channel.
clear mac address-table dynamic vlan <i>vlan-id</i>	Removes all addresses on a specified VLAN.
show clock [<i>detail</i>]	Displays the time and date configuration.
show ip igmp snooping groups	Displays the Layer 2 multicast entries for all VLANs or the specified VLAN.
show mac address-table address <i>mac-address</i>	Displays MAC address table information for the specified MAC address.
show mac address-table aging-time	Displays the aging time in all VLANs or the specified VLAN.
show mac address-table count	Displays the number of addresses present in all VLANs or the specified VLAN.
show mac address-table dynamic	Displays only dynamic MAC address table entries.
show mac address-table interface <i>interface-name</i>	Displays the MAC address table information for the specified interface.
show mac address-table move update	Displays the MAC address table move update information.
show mac address-table multicast	Displays a list of multicast MAC addresses.
show mac address-table notification { <i>change</i> <i>mac-move</i> <i>threshold</i> }	Displays the MAC notification parameters and history table.
show mac address-table secure	Displays the secure MAC addresses.
show mac address-table static	Displays only static MAC address table entries.
show mac address-table vlan <i>vlan-id</i>	Displays the MAC address table information for the specified VLAN.

Configuration Examples for Switch Administration

Example: Setting the System Clock

This example shows how to manually set the system clock:

```
Switch# clock set 13:32:00 23 July 2013
```

Examples: Configuring Summer Time

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

```
Switch(config)# clock summer-time PDT recurring PST date  
10 March 2013 2:00 3 November 2013 2:00
```

This example shows how to set summer time start and end dates:

```
Switch(config)#clock summer-time PST date  
20 March 2013 2:00 20 November 2013 2:00
```

Example: Configuring a MOTD Banner

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

```
Switch(config)# banner motd #
```

```
This is a secure site. Only authorized users are allowed.  
For access, contact technical support.
```

```
#
```

```
Switch(config)#
```

This example shows the banner that appears from the previous configuration:

```
Unix> telnet 192.0.2.15
```

```
Trying 192.0.2.15...
```

```
Connected to 192.0.2.15.
```

```
Escape character is '^J'.
```

```
This is a secure site. Only authorized users are allowed.
```

```
For access, contact technical support.
```

```
User Access Verification
```

```
Password:
```

Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign (\$) symbol as the beginning and ending delimiter:

```
Switch(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
Switch(config)#
```

Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 123
Switch(config)# mac address-table notification change history-size 100
Switch(config)# interface gigabitethernet1/2/1
Switch(config-if)# snmp trap mac-notification change added
```

Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 per cent:

```
Switch(config)# snmp-server host 172.20.10.10 traps private mac-notification
Switch(config)# snmp-server enable traps mac-notification threshold
Switch(config)# mac address-table notification threshold
Switch(config)# mac address-table notification threshold interval 123
Switch(config)# mac address-table notification threshold limit 78
```

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet1/1/1
```

Example: Configuring Unicast MAC Address Filtering

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Performing Switch Setup Configuration

Review the sections in this module before performing your initial switch configuration tasks that include IP address assignments and DHCP autoconfiguration.

Switch Boot Process

To start your switch, you need to follow the procedures in the hardware installation guide for installing and powering on the switch and setting up the initial switch configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The normal boot process involves the operation of the boot loader software and includes these activities:

- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
- Initializes the file systems on the system board.
- Loads a default operating system software image into memory and boots up the switch.

The boot loader provides access to the file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door mechanism provides enough access to the system so that if it is necessary, you can reinstall the operating system software image by using the Xmodem Protocol, recover from a lost or forgotten password, and finally restart the operating system.

Before you can assign switch information, make sure you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match these of the switch console port:

- Baud rate default is 9600.
- Data bits default is 8.

Note If the data bits option is set to 8, set the parity option to none.

- Stop bits default is 2 (minor).
- Parity settings default is none.

Software Installer Features

The following software installer features are supported on your switch:

- Software bundle installation on a standalone switch, a switch stack, or a subset of switches in a stack. The default is installation on all the switches if a switch stack is configured.
- In a stack of switches, Cisco recommends all switches in install mode.
- Software rollback to a previously installed package set.
- Emergency installation in the event that no valid installed packages reside on the boot flash.
- Auto-upgrade of a switch that joins the switch stack with incompatible software.

- Installation using packages on one switch as the source for installing packages on another switch in the switch stack.

**Note**

Software installation and rollback must be performed while running only in installed mode. You can use the **software expand EXEC** command to convert bundle boot mode to install mode.

Software Boot Modes

Your switch supports two modes to boot the software packages:

- Installed mode
- Bundle mode

Related Topics

[Examples: Displaying Software Bootup in Install Mode, on page 79](#)

[Example: Emergency Installation, on page 81](#)

Installed Boot Mode

You can boot your switch in installed mode by booting the software package provisioning file that resides in flash:

```
switch: boot flash:packages.conf
```

The provisioning file contains a list of software packages to boot, mount, and run. The ISO file system in each installed package is mounted to the root file system directly from flash.

**Note**

The packages and provisioning file used to boot in installed mode must reside in flash. Booting in installed mode from usbflash0: or tftp: is not supported.

Related Topics

[Examples: Displaying Software Bootup in Install Mode, on page 79](#)

[Example: Emergency Installation, on page 81](#)

Bundle Boot Mode

You can boot your switch in bundle boot mode by booting the bundle (.bin) file:

```
switch: boot flash:cat3850-universalk9.SSA.03.08.83.EMD.150-8.83.EMD.bin
```

The provisioning file contained in a bundle is used to decide which packages to boot, mount, and run. Packages are extracted from the bundle and copied to RAM. The ISO file system in each package is mounted to the root file system.

Unlike install boot mode, additional memory that is equivalent to the size of the bundle is used when booting in bundle mode.

Unlike install boot mode, bundle boot mode is available from several locations:

- flash:
- usbflash0:
- tftp:

**Note**

Auto install and smart install functionality is not supported in bundle boot mode.

**Note**

The AP image pre-download feature is not supported in bundle boot mode. For more information about the pre-download feature see the Cisco WLC 5700 Series *Preloading an Image to Access Points* chapter.

[Example: Emergency Installation, on page 81](#)

Boot Mode for a Switch Stack

All the switches in a stack must be running in installed mode or bundle boot mode. A mixed mode stack is not supported. If a new switch tries to join the stack in a different boot mode then the active switch, the new switch is given a V-mismatch state.

If a mixed mode switch stack is booted at the same time, then all the switches except for the active switch is given a V-mismatch state. If the boot mode does not support auto-upgrade, then the switch stack members must be re-booted in the same boot mode as the active switch.

If the stack is running in installed mode, the auto-upgrade feature can be used to automatically upgrade the new switch that is attempting to join the switch stack.

The auto-upgrade feature changes the boot mode of the new switch to installed mode. If the stack is running in bundle boot mode, the auto-upgrade feature is not available. You will be required to use the bundle mode to boot the new switch so that it can join the switch stack.

This is an example of the state of a switch that attempts to join the switch stack when the boot mode is not compatible with the active switch:

```
Switch# show switch
```

```
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch#   Role   Mac Address   Priority Version   State
-----
1         Member 6400 f125.1a00 1          0          V-Mismatch
*2        Active 6400.f125.1100 1          V01        Ready
Switch
```

Switches Information Assignment

You can assign IP information through the switch setup program, through a DHCP server, or manually.

Use the switch setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

**Note**

If you are using DHCP, do not respond to any of the questions in the setup program until the switch receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the switch configuration steps, manually configure the switch. Otherwise, use the setup program described in the *Boot Process* section.

Default Switch Information

Table 6: Default Switch Information

Feature	Default Setting
IP address and subnet mask	No IP address or subnet mask are defined.
Default gateway	No default gateway is defined.
Enable secret password	No password is defined.
Hostname	The factory-assigned default hostname is Switch.
Telnet password	No password is defined.
Cluster command switch functionality	Disabled.
Cluster name	No cluster name is defined.

DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your switch (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

Note

We recommend a redundant connection between a switch stack and the DHCP, DNS, and TFTP servers. This is to help ensure that these servers remain accessible in case one of the connected stack members is removed from the switch stack.

The DHCP server for your switch can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your switch and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

DHCP Client Request Process

When you boot up your switch, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the switch. If the configuration file is present and the configuration includes the **ip address dhcp** interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.

This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

Figure 3: DHCP Client and Server Message Exchange

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the switch receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCP OFFER unicast message are invalid (a configuration error exists), the client returns a DHCP DECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCP NAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCP OFFER message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the switch accepts replies from a BOOTP server and configures itself, the switch broadcasts, instead of unicasts, TFTP requests to obtain the switch configuration file.

The DHCP hostname option allows a group of switches to obtain hostnames and a standard configuration from the central management DHCP server. A client (switch) includes in its DHCP DISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the **hostname name** global configuration command is not configured or the **no hostname** global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the **ip address dhcp** interface configuration command. In this case, if the client receives the DHCP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.

DHCP-based Autoconfiguration and Image Update

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more switches in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new switch added to a network receives the same image and configuration.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

Restrictions for DHCP-based Autoconfiguration

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.
- The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the **write memory** or **copy running-configuration startup-configuration** privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

DHCP Autoconfiguration

DHCP autoconfiguration downloads a configuration file to one or more switches in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the switch. It does not over write the bootup configuration saved in the flash, until you reload the switch.

DHCP Auto-Image Update

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more switches in your network. The switch (or switches) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

To enable a DHCP auto-image update on the switch, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the switch in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the switch, and the new image is downloaded and installed on the switch. When you reboot the switch, the configuration is stored in the saved configuration on the switch.

DHCP Server Configuration Guidelines

Follow these guidelines if you are configuring a device as a DHCP server:

- You should configure the DHCP server with reserved leases that are bound to each switch by the switch hardware address.
- If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:
 - IP address of the client (required)
 - Subnet mask of the client (required)
 - DNS server IP address (optional)
 - Router IP address (default gateway address to be used by the switch) (required)
- If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
 - TFTP server name (required)
 - Boot filename (the name of the configuration file that the client needs) (recommended)
 - Hostname (optional)
- Depending on the settings of the DHCP server, the switch can receive IP address information, the configuration file, or both.

- If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the switch is not configured. If the router IP address or the TFTP server name are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.
- The switch can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch but are not configured. (These features are not operational.)

Purpose of the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the switch attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: `network-config`, `cisconet.cfg`, `hostname.config`, or `hostname.cfg`, where *hostname* is the switch's current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The `network-config` or the `cisconet.cfg` file (known as the default configuration files).
- The `router-config` or the `ciscotr.cfg` file (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server to be used is on a different LAN from the switch, or if it is to be accessed by the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described previously), a relay must be configured to forward the TFTP packets to the TFTP server. The preferred solution is to configure the DHCP server with all the required information.

Purpose of the DNS Server

The DHCP server uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server from where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same LAN or on a different LAN from the switch. If it is on a different LAN, the switch must be able to access it through a router.

How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the switch and provided in the DHCP reply (one-file read method).

The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).

The switch receives its IP address, subnet mask, and the configuration filename from the DHCP server. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

The switch receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the `network-config` or `cisconet.cfg` default configuration file. (If the `network-config` file cannot be read, the switch reads the `cisconet.cfg` file.)

The default configuration file contains the hostnames-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the switch uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the switch uses the default *Switch* as its hostname.

After obtaining its hostname from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its hostname (*hostname-config* or *hostname.cfg*, depending on whether `network-config` or `cisconet.cfg` was read earlier) from the TFTP server. If the `cisconet.cfg` file is read, the filename of the host is truncated to eight characters.

If the switch cannot read the `network-config`, `cisconet.cfg`, or the hostname file, it reads the `router-config` file. If the switch cannot read the `router-config` file, it reads the `ciscotr.cfg` file.

Note

The switch broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

How to Control Environment Variables

With a normally operating switch, you enter the boot loader mode only through the console connection configured for 9600 bps. Unplug the switch power cord, and press the **Mode** button while reconnecting the power cord. You can release the **Mode** button after all the amber system LEDs turn on and remain solid. The boot loader switch prompt then appears.

The switch boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader, or any other software running on the system, operates. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, "") is a variable with a value. Many environment variables are predefined and have default values.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.

Common Environment Variables

This table describes the function of the most common environment variables.

Table 7: Common Environment Variables

Variable	Boot Loader Command	Cisco IOS Global Configuration Command
BOOT	<p>set BOOT <i>filesystem :/file-url ...</i></p> <p>A semicolon-separated list of executable files to try to load and execute when automatically booting.</p>	<p>boot system {<i>filesystem : /file-url ...</i> switch {<i>number</i> all} }</p> <p>Specifies the Cisco IOS image to load during the next boot cycle and the stack members on which the image is loaded. This command changes the setting of the BOOT environment variable.</p> <p>The package provisioning file, also referred to as the <i>packages.conf</i> file, is used by the system to determine which software packages to activate during boot up.</p> <ul style="list-style-type: none"> When booting in installed mode, the package provisioning file specified in the boot command is used to determine which packages to activate. For example boot flash:packages.conf. When booting in bundle mode, the package provisioning file contained in the booted bundle is used to activate the packages included in the bundle. For example, boot flash:image.bin.

Variable	Boot Loader Command	Cisco IOS Global Configuration Command
MANUAL_BOOT	set MANUAL_BOOT yes Decides whether the switch automatically or manually boots. Valid values are 1, yes, 0, and no. If it is set to no or 0, the boot loader attempts to automatically boot up the system. If it is set to anything else, you must manually boot up the switch from the boot loader mode.	boot manual Enables manually booting the switch during the next boot cycle and changes the setting of the MANUAL_BOOT environment variable. The next time you reboot the system, the switch is in boot loader mode. To boot up the system, use the boot flash: filesystem :/ file-url boot loader command, and specify the name of the bootable image.
CONFIG_FILE	set CONFIG_FILE flash:/ file-url Changes the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration.	boot config-file flash:/ file-url Specifies the filename that Cisco IOS uses to read and write a nonvolatile copy of the system configuration. This command changes the CONFIG_FILE environment variable.
SWITCH_NUMBER	set SWITCH_NUMBER stack-member-number Changes the member number of a stack member.	switch current-stack-member-number renumber new-stack-member-number Changes the member number of a stack member.
SWITCH_PRIORITY	set SWITCH_PRIORITY stack-member-number Changes the priority value of a stack member.	switch stack-member-number priority priority-number Changes the priority value of a stack member.
BAUD	set BAUD baud-rate	line console 0 speed speed-value Configures the baud rate.
ENABLE_BREAK	set ENABLE_BREAK yes/no	boot enable-break switch yes/no Enables a break to the auto-boot cycle. You have 5 seconds to enter the break command.

Environment Variables for TFTP

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.

Table 8: Environment Variables for TFTP

Variable	Description
MAC_ADDR	Specifies the MAC address of the switch. Note We recommend that you do not modify this variable. However, if you modify this variable after the boot loader is up or the value is different from the saved value, enter this command before using TFTP.
IP_ADDR	Specifies the IP address and the subnet mask for the associated IP subnet of the switch.
DEFAULT_ROUTER	Specifies the IP address and subnet mask of the default gateway.

Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the switch at a later time (for example, late at night or during the weekend when the switch is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all switches in the network).

**Note**

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.
- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The **reload** command halts the system. If the system is not set to manually boot up, it reboots itself.

If your switch is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the switch from entering the boot loader mode and then taking it from the remote user's control.

If you modify your configuration file, the switch prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the `CONFIG_FILE` environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the **reload cancel** privileged EXEC command.

How to Perform Switch Setup Configuration

Using DHCP to download a new image and a new configuration to a switch requires that you configure at least two switches. One switch acts as a DHCP and TFTP server and the second switch (client) is configured to download either a new configuration file or a new configuration file and a new image file.

Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing switch in the network so that it can support the autoconfiguration of a new switch.

SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp pool** *poolname*
3. **boot** *filename*
4. **network** *network-number mask prefix-length*
5. **default-router** *address*
6. **option 150** *address*
7. **exit**
8. **tftp-server flash:***filename.text*
9. **interface** *interface-id*
10. **no switchport**
11. **ip address** *address mask*
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example: Switch# configure terminal	

	Command or Action	Purpose
Step 2	ip dhcp pool <i>poolname</i> Example: Switch(config) # ip dhcp pool pool	Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode.
Step 3	boot <i>filename</i> Example: Switch(dhcp-config) # boot config-boot.text	Specifies the name of the configuration file that is used as a boot image.
Step 4	network <i>network-number mask prefix-length</i> Example: Switch(dhcp-config) # network 10.10.10.0 255.255.255.0	Specifies the subnet network number and mask of the DHCP address pool. Note The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).
Step 5	default-router <i>address</i> Example: Switch(dhcp-config) # default-router 10.10.10.1	Specifies the IP address of the default router for a DHCP client.
Step 6	option 150 <i>address</i> Example: Switch(dhcp-config) # option 150 10.10.10.1	Specifies the IP address of the TFTP server.
Step 7	exit Example: Switch(dhcp-config) # exit	Returns to global configuration mode.
Step 8	tftp-server flash: <i>filename.text</i> Example: Switch(config) # tftp-server flash:config-boot.text	Specifies the configuration file on the TFTP server.

	Command or Action	Purpose
Step 9	interface <i>interface-id</i> Example: Switch(config)# interface gigabitethernet1/0/4	Specifies the address of the client that will receive the configuration file.
Step 10	no switchport Example: Switch(config-if)# no switchport	Puts the interface into Layer 3 mode.
Step 11	ip address <i>address mask</i> Example: Switch(config-if)# ip address 10.10.10.1 255.255.255.0	Specifies the IP address and mask for the interface.
Step 12	end Example: Switch(config-if)# end	Returns to privileged EXEC mode.

Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing switch to support the installation of a new switch.

Before You Begin

You must first create a text file (for example, `autoinstall_dhcp`) that will be uploaded to the switch. In the text file, put the name of the image that you want to download (forexample, `c3750e-ipservices-mz.122-44.3.SE.tarc3750x-ipservices-mz.122-53.3.SE2.tar`). This image must be a tar and not a bin file.

SUMMARY STEPS

1. **configure terminal**
2. **ip dhcp pool** *poolname*
3. **boot** *filename*
4. **network** *network-number mask prefix-length*
5. **default-router** *address*
6. **option 150** *address*
7. **option 125** *hex*
8. **copy tftp flash** *filename.txt*
9. **copy tftp flash** *imagename.bin*
10. **exit**
11. **tftp-server flash:** *config.txt*
12. **tftp-server flash:** *imagename.bin*
13. **tftp-server flash:** *filename.txt*
14. **interface** *interface-id*
15. **no switchport**
16. **ip address** *address mask*
17. **end**
18. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	ip dhcp pool <i>poolname</i> Example: Switch(config)# ip dhcp pool pool1	Creates a name for the DHCP server address pool and enter DHCP pool configuration mode.
Step 3	boot <i>filename</i> Example: Switch(dhcp-config)# boot config-boot.txt	Specifies the name of the file that is used as a boot image.

	Command or Action	Purpose
Step 4	network <i>network-number mask prefix-length</i> Example: Switch(dhcp-config) # network 10.10.10.0 255.255.255.0	Specifies the subnet network number and mask of the DHCP address pool. Note The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).
Step 5	default-router <i>address</i> Example: Switch(dhcp-config) # default-router 10.10.10.1	Specifies the IP address of the default router for a DHCP client.
Step 6	option 150 <i>address</i> Example: Switch(dhcp-config) # option 150 10.10.10.1	Specifies the IP address of the TFTP server.
Step 7	option 125 <i>hex</i> Example: Switch(dhcp-config) # option 125 hex 0000.0009.0a05.08661.7574.6f69.6e73.7461.6c6c.5f64.686370	Specifies the path to the text file that describes the path to the image file.
Step 8	copy tftp flash <i>filename.txt</i> Example: Switch(config) # copy tftp flash image.bin	Uploads the text file to the switch.
Step 9	copy tftp flash <i>imagename.bin</i> Example: Switch(config) # copy tftp flash image.bin	Uploads the tar file for the new image to the switch.
Step 10	exit Example: Switch(dhcp-config) # exit	Returns to global configuration mode.

	Command or Action	Purpose
Step 11	tftp-server flash: <i>config.text</i> Example: Switch(config) # tftp-server flash:config-boot.text	Specifies the Cisco IOS configuration file on the TFTP server.
Step 12	tftp-server flash: <i>imagename.bin</i> Example: Switch(config) # tftp-server flash:image.bin	Specifies the image name on the TFTP server.
Step 13	tftp-server flash: <i>filename.txt</i> Example: Switch(config) # tftp-server flash:boot-config.text	Specifies the text file that contains the name of the image file to download
Step 14	interface <i>interface-id</i> Example: Switch(config) # interface gigabitEthernet1/0/4	Specifies the address of the client that will receive the configuration file.
Step 15	no switchport Example: Switch(config-if) # no switchport	Puts the interface into Layer 3 mode.
Step 16	ip address <i>address mask</i> Example: Switch(config-if) # ip address 10.10.10.1 255.255.255.0	Specifies the IP address and mask for the interface.
Step 17	end Example: Switch(config-if) # end	Returns to privileged EXEC mode.
Step 18	copy running-config startup-config Example: Switch(config-if) # end	(Optional) Saves your entries in the configuration file.

Configuring the Client to Download Files from DHCP Server

**Note**

You should only configure and enable the Layer 3 interface. Do not assign an IP address or DHCP-based autoconfiguration with a saved configuration.

SUMMARY STEPS

1. **configure terminal**
2. **boot host dhcp**
3. **boot host retry timeout** *timeout-value*
4. **banner config-save** ^C *warning-message* ^C
5. **end**
6. **show boot**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	boot host dhcp Example: Switch(conf)# boot host dhcp	Enables autoconfiguration with a saved configuration.
Step 3	boot host retry timeout <i>timeout-value</i> Example: Switch(conf)# boot host retry timeout 300	(Optional) Sets the amount of time the system tries to download a configuration file. Note If you do not set a timeout, the system will try indefinitely to obtain an IP address from the DHCP server.
Step 4	banner config-save ^C <i>warning-message</i> ^C Example: Switch(conf)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause You to No longer Automatically	(Optional) Creates warning messages to be displayed when you try to save the configuration file to NVRAM.

	Command or Action	Purpose
	Download Configuration Files at Reboot^C	
Step 5	end Example: Switch(config-if) # end	Returns to privileged EXEC mode.
Step 6	show boot Example: Switch# show boot	Verifies the configuration.

Manually Assigning IP Information to Multiple SVIs

This task describes how to manually assign IP information to multiple switched virtual interfaces (SVIs):

SUMMARY STEPS

1. **configure terminal**
2. **interface vlan** *vlan-id*
3. **ip address** *ip-address subnet-mask*
4. **exit**
5. **ip default-gateway** *ip-address*
6. **end**
7. **show interfaces vlan** *vlan-id*
8. **show ip redirects**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	interface vlan <i>vlan-id</i> Example: Switch(config) # interface vlan 99	Enters interface configuration mode, and enters the VLAN to which the IP information is assigned. The range is 1 to 4094.
Step 3	ip address <i>ip-address subnet-mask</i> Example: Switch(config-vlan) # ip address 10.10.10.2 255.255.255.0	Enters the IP address and subnet mask.
Step 4	exit Example: Switch(config-vlan) # exit	Returns to global configuration mode.
Step 5	ip default-gateway <i>ip-address</i> Example: Switch(config) # ip default-gateway 10.10.10.1	<p>Enters the IP address of the next-hop router interface that is directly connected to the switch where a default gateway is being configured. The default gateway receives IP packets with unresolved destination IP addresses from the switch.</p> <p>Once the default gateway is configured, the switch has connectivity to the remote networks with which a host needs to communicate.</p> <p>Note When your switch is configured to route with IP, it does not need to have a default gateway set.</p> <p>Note The switch capwap relays on default-gateway configuration to support routed access point join the switch.</p>
Step 6	end Example: Switch(config) # end	Returns to privileged EXEC mode.
Step 7	show interfaces vlan <i>vlan-id</i> Example: Switch# show interfaces vlan 99	Verifies the configured IP address.
Step 8	show ip redirects Example: Switch# show ip redirects	Verifies the configured default gateway.

Modifying the Switch Startup Configuration

Specifying the Filename to Read and Write the System Configuration

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

Before You Begin

Use a standalone switch for this task.

SUMMARY STEPS

1. **configure terminal**
2. **boot flash:/file-url**
3. **end**
4. **show boot**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	boot flash:/file-url Example: Switch(config)# boot flash:config.text	Specifies the configuration file to load during the next boot cycle. <i>file-url</i> —The path (directory) and the configuration filename. Filenames and directory names are case-sensitive.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 4	show boot Example: Switch# show boot	Verifies your entries. The boot global configuration command changes the setting of the CONFIG_FILE environment variable.

	Command or Action	Purpose
Step 5	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Manually Booting the Switch

By default, the switch automatically boots up; however, you can configure it to manually boot up.

Before You Begin

Use a standalone switch for this task.

SUMMARY STEPS

1. **configure terminal**
2. **boot manual**
3. **end**
4. **show boot**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	boot manual Example: Switch(config)# boot manual	Enables the switch to manually boot up during the next boot cycle.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 4	show boot	Verifies your entries.

	Command or Action	Purpose
	<p>Example:</p> <pre>Switch# show boot</pre>	<p>The boot manual global command changes the setting of the MANUAL_BOOT environment variable.</p> <p>The next time you reboot the system, the switch is in boot loader mode, shown by the <i>switch:</i> prompt. To boot up the system, use the boot filesystem:/file-url boot loader command.</p> <ul style="list-style-type: none"> • <i>filesystem:</i>—Uses flash: for the system board flash device. switch: boot flash: • For <i>file-url</i>—Specifies the path (directory) and the name of the bootable image. <p>Filenames and directory names are case-sensitive.</p>
Step 5	<p>copy running-config startup-config</p> <p>Example:</p> <pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

Booting the Switch in Installed Mode

SUMMARY STEPS

1. **cp** *source_file_path destination_file_path*
2. **software expand file** *source_file_path*
3. **reload**
4. **boot flash:packages.conf**
5. **show version**

DETAILED STEPS

	Command or Action	Purpose
Step 1	<p>cp <i>source_file_path destination_file_path</i></p> <p>Example:</p> <pre>Switch# copy tftp://10.0.0.6/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:</pre>	(Optional) Copies the bin file (image.bin) from the FTP or TFTP server to flash or USB flash.

	Command or Action	Purpose
Step 2	<p>software expand file <i>source_file_path</i></p> <p>Example: Expanding the bin file from the TFTP server:</p> <pre>Switch# software expand file tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin to flash: Preparing expand operation ... [1]: Downloading file tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin to active switch 1 [1]: Finished downloading file tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37. EXP.bin to active switch 1 [1]: Copying software from active switch 1 to switch 2 [1]: Finished copying software to switch 2 [1 2]: Expanding bundle cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin [1 2]: Copying package files [1 2]: Package files copied [1 2]: Finished expanding bundle cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</pre> <pre>18 -rw- 74387812 Dec 7 2012 05:55:43 +00:00 cat3k_caa-base.SSA.03.09.37.EXP.pkg 19 -rw- 2738868 Dec 7 2012 05:55:44 +00:00 cat3k_caa-drivers.SSA.03.09.37.EXP.pkg 20 -rw- 32465772 Dec 7 2012 05:55:44 +00:00 cat3k_caa-infra.SSA.03.09.37.EXP.pkg 21 -rw- 30389036 Dec 7 2012 05:55:44 +00:00 cat3k_caa-iosd-universalk9.SSA.150-9.37.EXP.pkg 22 -rw- 18342624 Dec 7 2012 05:55:44 +00:00 cat3k_caa-platform.SSA.03.09.37.EXP.pkg 23 -rw- 63374028 Dec 7 2012 05:55:44 +00:00 cat3k_caa-wcm.SSA.10.0.10.14.pkg 17 -rw- 1239 Dec 7 2012 05:56:29 +00:00 packages.conf</pre>	<p>Expands the bin file stored in flash, FTP, TFTP, HTTP, or HTTPS server on the booted switch.</p> <p>Note Ensure that the <code>packages.conf</code> file is available in the expanded list.</p>
Step 3	<p>reload</p> <p>Example: Switch: reload</p>	<p>Reloads the switch.</p> <p>Note You can boot the switch manually or automatically using the <code>packages.conf</code> file. If you are booting manually, you can proceed to Step 4. Otherwise, the switch boots up automatically.</p>
Step 4	<p>boot flash:packages.conf</p> <p>Example: switch: boot flash:packages.conf</p>	<p>Boots the switch with the <code>packages.conf</code> file.</p>

	Command or Action	Purpose																
Step 5	show version	Verifies that the switch is in the INSTALL mode.																
	Example:																	
	switch# show version																	
	<table><tr><td>Switch</td><td>Ports</td><td>Model</td><td>SW Version</td><td>SW Image</td><td>Mode</td></tr><tr><td>-----</td><td>-----</td><td>-----</td><td>-----</td><td>-----</td><td>-----</td></tr><tr><td>1</td><td>6</td><td>WS-C3850-6DS-S</td><td>03.09.26.EXP</td><td>ct3850-ipervicesk9</td><td>INSTALL</td></tr></table>		Switch	Ports	Model	SW Version	SW Image	Mode	-----	-----	-----	-----	-----	-----	1	6	WS-C3850-6DS-S	03.09.26.EXP
Switch	Ports	Model	SW Version	SW Image	Mode													
-----	-----	-----	-----	-----	-----													
1	6	WS-C3850-6DS-S	03.09.26.EXP	ct3850-ipervicesk9	INSTALL													

Booting the Switch in Bundle Mode

There are several methods by which you can boot the switch—either by copying the bin file from the TFTP server and then boot the switch, or by booting the switch straight from flash or USB flash using the commands **boot flash:<image.bin>** or **boot usbflash0:<image.bin>**.

The following procedure explains how to boot the switch from the TFTP server in the bundle mode.

SUMMARY STEPS

1. **cp source_file_path destination_file_path**
2. **switch:BOOT=<source path of .bin file>**
3. **boot**
4. **show version**

DETAILED STEPS

	Command or Action	Purpose
Step 1	cp source_file_path destination_file_path Example: <pre>Switch# copy tftp://10.0.0.6/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:</pre>	(Optional) Copies the bin file (image.bin) from the FTP or TFTP server to flash or USB flash.
Step 2	switch:BOOT=<source path of .bin file> Example: <pre>Switch: switch:BOOT=tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</pre>	Sets the boot parameters.
Step 3	boot Example: <pre>switch: boot</pre>	Boots the switch.

	Command or Action	Purpose
Step 4	show version Example: <pre>switch# show version Switch Ports Model SW Version SW Image Mode ----- 1 6 WS-C3850-6DS-S 03.09.40.EXP ct3850-ipservicesk9 BUNDLE</pre>	Verifies that the switch is in the BUNDLE mode.

Booting a Specific Software Image On a Switch Stack

By default, the switch attempts to automatically boot up the system using information in the BOOT environment variable. If this variable is not set, the switch attempts to load and execute the first executable image it can by performing a recursive, depth-first search throughout the flash file system. In a depth-first search of a directory, each encountered subdirectory is completely searched before continuing the search in the original directory. However, you can specify a specific image to boot up.

SUMMARY STEPS

1. **configure terminal**
2. **boot system switch** {*number* | **all**}
3. **end**
4. **show boot system**
5. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>Switch# configure terminal</pre>	Enters global configuration mode.
Step 2	boot system switch { <i>number</i> all }	(Optional) For switches in a stack, specifies the switch members on which the system image is loaded during the next boot cycle: <ul style="list-style-type: none"> • Use <i>number</i> to specify a stack member. (Specify only one stack member.) • Use all to specify all stack members. If you enter on a Catalyst 3750-X stack master or member, you can only specify the switch image for other Catalyst 3750-X stack members.

	Command or Action	Purpose
		<p>If you enter on a Catalyst 3750-E stack master or member, you can only specify the switch image for other Catalyst 3750-E stack members.</p> <p>If you want to specify the image for a Catalyst 3750 switch, enter this command on the Catalyst 3750 stack member.</p>
Step 3	end Example: Switch(config) # end	Returns to privileged EXEC mode.
Step 4	show boot system Example: Switch# show boot system	<p>Verifies your entries.</p> <p>The boot system global command changes the setting of the BOOT environment variable.</p> <p>During the next boot cycle, the switch attempts to automatically boot up the system using information in the BOOT environment variable.</p>
Step 5	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring a Scheduled Software Image Reload

This task describes how to configure your switch to reload the software image at a later time.

SUMMARY STEPS

1. **configure terminal**
2. **copy running-config startup-config**
3. **reload in** *[hh:]mm* *[text]*
4. **reload slot** *[stack-member-number]*
5. **reload at** *hh: mm* *[month day | day month]* *[text]*
6. **reload cancel**
7. **show reload**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	copy running-config startup-config Example: copy running-config startup-config	Saves your switch configuration information to the startup configuration before you use the reload command.
Step 3	reload in [hh:]mm [text] Example: Switch(config)# reload in 12 System configuration has been modified. Save? [yes/no]: y	Schedules a reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.
Step 4	reload slot [stack-member-number] Example: Switch(config)# reload slot 6 Proceed with reload? [confirm] y	Schedules a reload of the software in a switch stack.
Step 5	reload at hh: mm [month day day month] [text] Example: Switch(config)# reload at 14:00	Specifies the time in hours and minutes for the reload to occur. Note Use the at keyword only if the switch system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the switch. To schedule reloads across several switches to occur simultaneously, the time on each switch must be synchronized with NTP.
Step 6	reload cancel Example: Switch(config)# reload cancel	Cancels a previously scheduled reload.
Step 7	show reload Example: show reload	Displays information about a previously scheduled reload or identifies if a reload has been scheduled on the switch.

Monitoring Switch Setup Configuration

Configuration Examples for Performing Switch Setup

Example: Configuring a Switch as a DHCP Server

```
Switch# configure terminal
Switch(config)# ip dhcp pool pool1
Switch(dhcp-config)# network 10.10.10.0 255.255.255.0
Switch(dhcp-config)# boot config-boot.text
Switch(dhcp-config)# default-router 10.10.10.1
Switch(dhcp-config)# option 150 10.10.10.1
Switch(dhcp-config)# exit
Switch(config)# tftp-server flash:config-boot.text
Switch(config)# interface gigabitethernet1/0/4
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.10.10.1 255.255.255.0
Switch(config-if)# end
```

Example: Configuring a Switch to Download Configurations from a DHCP Server

This example uses a Layer 3 SVI interface on VLAN 99 to enable DHCP-based autoconfiguration with a saved configuration:

```
Switch# configure terminal
Switch(config)# boot host dhcp
Switch(config)# boot host retry timeout 300
Switch(config)# banner config-save ^C Caution - Saving Configuration File to NVRAM May Cause
  You to No longer Automatically Download Configuration Files at Reboot^C
Switch(config)# vlan 99
Switch(config-vlan)# interface vlan 99
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# show boot
BOOT path-list:
Config file:          flash:/config.text
Private Config file:  flash:/private-config.text
Enable Break:         no
Manual Boot:          no
HELPER path-list:
NVRAM/Config file
  buffer size:        32768
Timeout for Config
  Download:           300 seconds
Config Download
  via DHCP:           enabled (next boot: enabled)
Switch#
```

Examples: Scheduling Software Image Reload

This example shows how to reload the software on the switch on the current day at 7:30 p.m:

```
Switch# reload at 19:30
Reload scheduled for 19:30:00 UTC Wed Jun 5 2013 (in 2 hours and 25 minutes)
Proceed with reload? [confirm]
```

This example shows how to reload the software on the switch at a future time:

```
Switch# reload at 02:00 jun 20
Reload scheduled for 02:00:00 UTC Thu Jun 20 2013 (in 344 hours and 53 minutes)
Proceed with reload? [confirm]
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Restrictions for Configuring RTU Licenses

The following are the restrictions for configuring and using RTU licenses.

- AP count licenses can be ordered and pre-activated on your switch.

- Imaged based licenses can be upgraded. AP count licenses can be deactivated and moved between switches and controllers.
- To activate a permanent license, you must reboot your switch after configuring the new image level. The AP-count license does not require a reboot to activate.
- An expired image based evaluation license can not be reactivated after reboot.
- Stack members of a switch stack must run the same license level.
- Your switch is pre-installed with the image that you ordered. If an image was not pre-ordered, then the switch is booted with a LAN base image by default.
- Adder AP-count licenses are installed in the factory.

Information About Configuring RTU Licenses

Right-To-Use Licensing

Right-to-use (RTU) licensing allows you to order and activate a specific license type and level, and then to manage license usage on your switch. The types of licenses available to order are:

- Permanent licenses—Purchased with a specific feature set with no expiration date.
- Evaluation licenses—Pre-installed on the switch and is valid for only a 90 day in-use period.

To activate a permanent or evaluation license, you are required to accept the End-User License Agreement (EULA). For the evaluation license, you are notified to purchase a permanent license or deactivate the license before the 90 day period expires.

A permanent license can be moved from one device to another. To activate a license, you must reboot your switch.

An evaluation license is a manufacturing image on your switch and is not transferable to another switch. This type of license cannot be reactivated after reboot.

Related Topics

[Activating an Imaged Based License, on page 90](#)

[Examples: Activating RTU Image Based Licenses, on page 96](#)

Right-To-Use Image Based Licenses

Right-to-use imaged licenses support a set of features based on a specific image-based license:

- LAN Base—Layer 2 features.

- IP Base—Layer 2 and Layer 3 features.
- IP Services—Layer 2, Layer 3, and IPv6 features. (Applicable only to switches and not controllers.)

The default image based license is LAN Base.

Right-To-Use License States

After you configure a specific license type and level, you can manage your licenses by monitoring the license state.

Table 9: RTU License States

License State	Description
Active, In Use	EULA was accepted and the license is in use after device reboot.
Active, Not In Use	EULA was accepted and the switch is ready to use when the license is enabled.
Not Activated	EULA was not accepted.

Guidelines to follow when monitoring your image based license state:

- A purchased permanent license is set to *Active, In Use* state only after a switch reboot.
- If more than one license was purchased, a reboot will activate the license with the highest feature set. For instance, the IP Services license is activated and not the LAN Base license.
- Remaining licenses purchased after switch reboot, stay in **Active, Not In Use** state.

Note

For the AP count license, to change the state to Active, In Use, you must first make sure that the evaluation AP count license is deactivated.

License Activation for Switch Stacks

Right-to-use licensing is supported on switch stacks. A switch stack is a set of up to four stacking-capable switches connected through their StackWise-480 ports. You can connect only one switch type in a stack. One switch in the stack is identified as the active switch and the remaining switches are standby switches. The active switch is the switch that is activated with an RTU license and from its active console, the license level for the standby switches in the stack can be activated at the same time.

Note

A switch stack cannot contain mixed switch platforms or mixed license levels. The switches in a stack must be of the same platform and the same license.

Mobility Controller Mode

AP-count licenses are used only when the switch is in Mobility Controller mode. The MC is the gatekeeper for tracking the AP-count licenses and allows an access point to join or not.

Management of AP-count licenses is performed by the switch in mobility controller mode configurable through the CLI.

[Changing Mobility Mode, on page 94](#)

Right-To-Use Adder AP-Count Rehosting Licenses

Revoking a license from one device and installing it on another is called rehosting. You might want to rehost a license to change the purpose of a device.

To rehost a license, you must deactivate the adder ap-count license from one device and activate the same license on another device.

Evaluation licenses cannot be rehosted.

How to Configure RTU Licenses

Activating an Imaged Based License

SUMMARY STEPS

1. `license right-to-use activate {ipbase | ipservices | lanbase} {all | evaluation all} [slot slot-number] [acceptEULA]`
2. `reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu]`
3. `show license right-to-use usage [slot slot-number]`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>license right-to-use activate {ipbase ipservices lanbase} {all evaluation all} [slot slot-number] [acceptEULA]</code> Example: <pre>Switch# license right-to-use activate ipservices all acceptEULA</pre>	Activates a type of image based license. Activation can happen on all switches and also include the EULA acceptance.

	Command or Action	Purpose																																																
		Note If you do not accept EULA, the modified configuration will not take effect after reload. The default license (or a license that was not deactivated) becomes active after reload.																																																
Step 2	reload [<i>LINE</i> at cancel in slot <i>stack-member-number</i> standby-cpu] Example: Switch# reload slot 1 Proceed with reload? [confirm] y	Reloads a specific stack member to complete the activation process for the RTU adder AP-count license. Note The reminder to accept a EULA is displayed after reload if it was not accepted earlier.																																																
Step 3	show license right-to-use usage [<i>slot slot-number</i>] Example: Switch# show license right-to-use usage <table><thead><tr><th>Slot#</th><th>License Name</th><th>Type</th><th>usage-duration(y:m:d)</th><th>In-Use</th><th>EULA</th></tr></thead><tbody><tr><td>1</td><td>ipservices</td><td>permanent</td><td>0 :10 :0</td><td>yes</td><td>yes</td></tr><tr><td>1</td><td>ibase</td><td>permanent</td><td>0 :0 :0</td><td>no</td><td>no</td></tr><tr><td>1</td><td>ibase</td><td>evaluation</td><td>0 :0 :0</td><td>no</td><td>no</td></tr><tr><td>1</td><td>lanbase</td><td>permanent</td><td>0 :0 :7</td><td>no</td><td>yes</td></tr><tr><td>1</td><td>apcount</td><td>evaluation</td><td>0 :0 :0</td><td>no</td><td>no</td></tr><tr><td>1</td><td>apcount</td><td>base</td><td>0 :0 :0</td><td>no</td><td>no</td></tr><tr><td>1</td><td>apcount</td><td>adder</td><td>0 :0 :0</td><td>no</td><td>no</td></tr></tbody></table> Switch#	Slot#	License Name	Type	usage-duration(y:m:d)	In-Use	EULA	1	ipservices	permanent	0 :10 :0	yes	yes	1	ibase	permanent	0 :0 :0	no	no	1	ibase	evaluation	0 :0 :0	no	no	1	lanbase	permanent	0 :0 :7	no	yes	1	apcount	evaluation	0 :0 :0	no	no	1	apcount	base	0 :0 :0	no	no	1	apcount	adder	0 :0 :0	no	no	Displays detailed usage information.
Slot#	License Name	Type	usage-duration(y:m:d)	In-Use	EULA																																													
1	ipservices	permanent	0 :10 :0	yes	yes																																													
1	ibase	permanent	0 :0 :0	no	no																																													
1	ibase	evaluation	0 :0 :0	no	no																																													
1	lanbase	permanent	0 :0 :7	no	yes																																													
1	apcount	evaluation	0 :0 :0	no	no																																													
1	apcount	base	0 :0 :0	no	no																																													
1	apcount	adder	0 :0 :0	no	no

Obtaining an Upgrade or Capacity Adder License

You can use the capacity adder licenses to increase the number of access points supported by the switch.

SUMMARY STEPS

1. `license right-to-use {activate | deactivate} apcount {ap-number | evaluation} slot slot-num [acceptEULA]`

DETAILED STEPS

	Command or Action	Purpose
Step 1	license right-to-use {activate deactivate} apcount {ap-number evaluation} slot slot-num [acceptEULA] Example: Switch# license right to use activate apcount 5 slot 2 acceptEULA	Activates one or more adder AP-count licenses and immediately accepts the EULA.

Rehosting a License

To rehost a license, you have to deactivate the license from one switch and then activate the same license on another switch.

SUMMARY STEPS

1. **license right-to-use deactivate apcount ap-number slot slot-num [acceptEULA]**
2. **license right-to-use activate apcount ap-number slot slot-num [acceptEULA]**

DETAILED STEPS

	Command or Action	Purpose
Step 1	license right-to-use deactivate apcount ap-number slot slot-num [acceptEULA] Example: Switch# license right to use deactivate apcount 1 slot 1 acceptEULA	Deactivates the license on one switch.
Step 2	license right-to-use activate apcount ap-number slot slot-num [acceptEULA] Example: Switch# license right to use activate apcount 2 slot 2 acceptEULA	Activates the license on another switch.

Changing Mobility Mode

SUMMARY STEPS

1. **wireless mobility controller**
2. **write memory**
3. **reload** [*LINE* | **at** | **cancel** | **in** | **slot** *stack-member-number* | **standby-cpu**]
4. **no wireless mobility controller**
5. **write memory**
6. **reload** [*LINE* | **at** | **cancel** | **in** | **slot** *stack-member-number* | **standby-cpu**]

DETAILED STEPS

	Command or Action	Purpose
Step 1	wireless mobility controller Example: Switch(config)# wireless mobility controller % Mobility role changed to Mobility Controller. Please save config and reboot the whole stack.	Changes a switch in Mobility Agent mode to Mobility Controller mode.
Step 2	write memory Example: Switch# write memory Building configuration... Compressed configuration from 13870 bytes to 5390 bytes[OK] Switch#	
Step 3	reload [<i>LINE</i> at cancel in slot <i>stack-member-number</i> standby-cpu] Example: Switch# reload slot 3 Proceed with reload? [confirm] y	
Step 4	no wireless mobility controller Example: Switch(config)# no wireless mobility controller % Mobility role changed to Mobility Agent. Please save config and reboot the whole stack. Switch(config)#	Changes a switch in Mobility Controller mode to Mobility Agent mode.
Step 5	write memory	

	Command or Action	Purpose
	Example: Switch# write memory Building configuration... Compressed configuration from 13870 bytes to 5390 bytes[OK] Switch#	
Step 6	reload [<i>LINE</i> at cancel in slot <i>stack-member-number</i> standby-cpu] Example: Switch# reload slot 3 Proceed with reload? [confirm] y

Examples: Displaying RTU Licensing Information

This example shows the consolidated RTU licensing information from the active switch on a switch stack. All of the members in the stack have the same license level. When the evaluation AP-count license is activated, the adder AP-count licenses are ignored. The maximum number of AP-count licenses are available when evaluation is enabled.

```
Switch# show license right-to-use summary
```

License Name	Type	Count	Period left
ipservices	permanent	10	Lifetime
apcount	evaluation	40	90

```

-----
License Level In Use: ipservices
License Level on Reboot: ipbase
Evaluation AP-Count: Enabled
Total AP Count Licenses: 50
AP Count Licenses In-use: 10

```

AP Count Licenses Remaining: 40

This example shows a summary of permanent and adder licenses. The evaluation AP-count license is disabled displaying the total number of activated adder AP-count licenses in the switch stack. AP-count licenses in-use mean that they are connected.

Switch# **show license right-to-use summary**

License Name	Type	Count	Period left
ipservices	permanent	N/A	Lifetime
apcount	base	0	
apcount	adder	40	Lifetime

License Level In Use: ipservices
 License Level on Reboot: ipservices eval
 Evaluation AP-Count: Disabled
 Total AP Count Licenses: 40
 AP Count Licenses In-use: 10
 AP Count Licenses Remaining: 30

This example shows the RTU default licenses. Default licenses are pre-installed and cannot be removed or transferred. If no license is activated the switch uses the default license, after a reboot.

Switch# **show license right-to-use default**

Slot#	License Name	Type	Count
1	ipservices	permanent	N/A
1	apcount	base	0
1	apcount	adder	10
Slot#	License Name	Type	Count
2	ipservices	permanent	N/A
2	apcount	base	0
2	apcount	adder	10
Slot#	License Name	Type	Count
3	ipservices	permanent	N/A
3	apcount	base	0
3	apcount	adder	10

Example: Displaying RTU License Details

This example shows all the detailed information for the RTU licenses on slot 1:

Switch# **show license right-to-use detail slot 1**

Index 1: License Name: ipservices
 Period left: Lifetime
 License Type: permanent
 License State: Active, In use
 License Count: Non-Counted
 License Location: Slot 1
 Index 2: License Name: ipservices
 Period left: 90
 License Type: evaluation
 License State: Not Activated
 License Count: Non-Counted

Example: Displaying RTU License Mismatch

```

Index 3: License Location: Slot 1
License Name: ipbase
Period left: Lifetime
License Type: permanent
License State: Active, Not In use
License Count: Non-Counted
License Location: Slot 1
Index 4: License Name: ipbase
Period left: 90
License Type: evaluation
License State: Not Activated
License Count: Non-Counted
License Location: Slot 1
License Location: Standby Switch 1
Index 5: License Name: lanbase
Period left: Lifetime
License Type: permanent
License State: Not Activated
License Count: Non-Counted
License Location: Slot 1
Index 6: License Name: apcount
Period left: 90
License Type: evaluation
License State: Active, In use
License Count: 50
License Location: Slot 1
Index 7: License Name: apcount
Period left: Lifetime
License Type: base
License State: Active, Not In use
License Count: 0
License Location: Slot 1
Index 8: License Name: apcount
Period left: Lifetime
License Type: adder
License State: Active, Not In use
License Count: 10
License Location: Slot 1

```

Example: Displaying RTU License Mismatch

This example shows the license information of the switches in a stack and a mismatch state of a member switch. The member must match the active.

Switch# **show switch**

Switch/Stack Mac Address : 6400.f125.0c80

Switch#	Role	Mac Address	Priority	H/W Version	Current State
1	Standby	6400.f125.1b00	1	0	Ready
*2	Active	6400.f125.0c80	1	V01	Ready
3	Member	6400.f125.1780	1	0	Lic-Mismatch

**Note**

To resolve the license mismatch, first check the RTU license summary:

```
Switch# show switch right-to-use summary
```

Then change the license level of the mismatched switched so that it is the same license level of the active switch. This example shows that the IP Base license was activated for the member switch to match the active switch.

```
Switch# license right-to-use activate ipbase slot 1 acceptEULA
```

Example: Displaying RTU Licensing Usage

This example shows the detailed licensing usage on your switch stack. The IP Services license in Slot 1 is permanent and usage is one day. An AP-count license in Slot 2 is ready for evaluation. EULA was accepted and state shows in use, but after reboot the evaluation license will be deactivated.

```
Switch# show license right-to-use usage
```

Slot#	License Name	Type	usage-duration(y:m:d)	In-Use	EULA

1	ipservices	permanent	0 :0 :1	yes	yes
1	ipservices	evaluation	0 :0 :0	no	no
1	ipbase	permanent	0 :0 :0	no	yes
1	ipbase	evaluation	0 :0 :0	no	no
1	lanbase	permanent	0 :0 :0	no	no
1	apcount	evaluation	0 :0 :0	yes	yes

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Configuring Administrator Usernames and Passwords

You can configure administrator usernames and passwords to prevent unauthorized users from reconfiguring the switch and viewing configuration information. This section provides instructions for initial configuration and for password recovery.

You can also set administrator usernames and passwords to manage and configure one or more access points that are associated with the switch.

Strong Passwords

You can set strong administrator passwords such as encrypted passwords with ASCII keys for the administrator user for managing access points.

Use the following guidelines while creating strong passwords:

- There should be at least three of the following categories—lowercase letters, uppercase letters, and digits, and special characters.

Note Special characters are not supported for username and password for GUI login.

- The new password should not be the same as that of the associated username and the username should not be reversed.
- The characters in the password should not be repeated more than three times consecutively.
- The password should not be **cisco**, **ocsic**, **admin**, **nimda**, or any variant obtained by changing the capitalization of letters therein, or by substituting "1" for "l" or "!" for "i", and/or substituting "0" for "o", and/or substituting "\$" for "s".
- The maximum number of characters accepted for the username and password is 32.

Encrypted Passwords

You can set three types of keys for the password:

- Randomly generated key—This key is generated randomly and it is the most secure option. To export the configuration file from one system to another, the key should also be exported.
- Static key—The simplest option is to use a fixed (static) encryption key. By using a fixed key, no key management is required, but if the key is somehow discovered, the data can be decrypted by anyone with the knowledge of that key. This is not a secure option and it is called obfuscation in the CLI.
- User defined key—You can define the key by yourself. To export the configuration file from one system to another, both systems should have the same key configured.

Configuring Administrator Usernames and Passwords

SUMMARY STEPS

1. **configure terminal**
2. **wireless security strong-password**
3. **username admin-username password {0 unencrypted_password | 7 hidden_password | unencrypted_text}**
4. **username admin-username secret {0 unencrypted_secret_text | 4 SHA256 encrypted_secret_text | 5 MD5 encrypted_secret_text | LINE}**
5. **ap mgmtuser username username password {0 unencrypted_password | 8 AES encrypted_password }secret {0 unencrypted_password | 8 AES encrypted_password }**
6. **ap dot1x username username password {0 unencrypted_password | 8 AES encrypted_password }**
7. **end**
8. **ap name apname mgmtuser username usernamepassword password secret secret_text**
9. **ap name apname dot1x-user username password password**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	wireless security strong-password Example: Switch(config)# wireless security strong-password	Enables strong password policy for the administrator user.
Step 3	username admin-username password {0 unencrypted_password 7 hidden_password unencrypted_text} Example: Switch(config)# username adminuser1 password 0 QZsek239@	Specifies a username and password for an administrator. The administrator can configure the switch and view the configured information.
Step 4	username admin-username secret {0 unencrypted_secret_text 4 SHA256 encrypted_secret_text 5 MD5 encrypted_secret_text LINE} Example: Switch(config)# username adminuser1 secret 0 QZsek239@	Specifies the secret for the administrator.
Step 5	ap mgmtuser username username password {0 unencrypted_password 8 AES encrypted_password }secret {0 unencrypted_password 8 AES encrypted_password }	Specifies administrator username and password for managing all of the access points configured to the switch.

	Command or Action	Purpose
	Example: <pre>Switch(config)# ap mgmtuser username cisco password 0 Qwci12@ secret 0 Qwci14@!</pre>	<p>You can also include the secret text to perform privileged access point management.</p> <p>Note If your password is not strong enough to fulfill the strong password policy, then the password is rejected with a valid error message. For example, the following password is rejected because it is not a strong password.</p> <pre>Switch# ap mgmtuser username cisco password 0 abcd secret 0 1234</pre>
Step 6	<pre>ap dot1x username <i>username</i> password {0 <i>unencrypted</i> password 8 <i>AES encrypted password</i>}</pre> Example: <pre>Switch(config)# ap dot1x username cisco password 0 Qwci12@</pre>	Specifies the 802.1X username and password for managing all of the access points configured to the switch.
Step 7	<pre>end</pre> Example: <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 8	<pre>ap name apname mgmtuser username <i>username</i> password password <i>secret</i> <i>secret _text</i></pre> Example: <pre>Switch# ap name APf0f7.55c7.7b23 mgmtuser username cisco password Qne35! secret Nzep592\$</pre>	Configures the administrator username, password, and secret text for managing a specific access point that is configured to the switch.
Step 9	<pre>ap name apname dot1x-user username password <i>password</i></pre> Example: <pre>Switch# ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qne35!</pre>	Configures the 802.1X username and password for a specific access point.

Examples: Administrator Usernames and Passwords Configuration

This example shows how to configure administrator usernames and passwords with the strong password policy in configuration mode:

```
Switch# configure terminal
Switch(config)# wireless security strong-password
Switch(config)# username adminuser1 password 0 QZsek239@
Switch(config)# ap mgmtuser username cisco password 0 Qwci12@ secret 0 Qwci14@!
Switch(config)# ap dot1x username cisco password 0 Qwci12@
Switch# end
```

This example shows how to configure administrator usernames and passwords for an access point in global EXEC mode:

```
Switch# wireless security strong-password
Switch# ap name APf0f7.55c7.7b23 mgmtuser username cisco password Qwci12@ secret Qwci14@
Switch# ap name APf0f7.55c7.7b23 dot1x-user username cisco password Qwci12@
Switch# end
```

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Restrictions on Band Selection, 802.11 Bands, and Parameters

- Band-selection enabled WLANs do not support time-sensitive applications like voice and video because of roaming delays.
- Band selection can be used only with Cisco Aironet 1040, 1140, 1250, 1260, 1550, 2600, 3500, 3600, series access points.

- Band selection operates only on access points that are connected to a controller. A FlexConnect access point without a controller connection does not perform band selection after a reboot.
- The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running.
- You can enable both band selection and aggressive load balancing on the controller. They run independently and do not impact one another.
- It is not possible to enable or disable band selection and client load balancing globally through the controller GUI or CLI. You can, however, enable or disable band selection and client load balancing for a particular WLAN. Band selection and client load balancing are enabled globally by default.

Information About Configuring Band Selection, 802.11 Bands, and Parameters

Band Selection

Band selection enables client radios that are capable of dual-band (2.4- and 5-GHz) operation to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of three nonoverlapping channels. To prevent these sources of interference and improve overall network performance, you can configure band selection on the switch.

Band selection is enabled globally by default.

Band selection works by regulating probe responses to clients. It makes 5-GHz channels more attractive to clients by delaying probe responses to clients on 2.4-GHz channels.

Note

The client RSSI value (seen as `sh cont d0 | beg RSSI`) is the average of the client packets received, and the `midRSSI` feature is the instantaneous RSSI value of the probe packets. As a result, the client RSSI is seen as weaker than the configured `midRSSI` value (7 dB delta). The 802.11b probes from the client are suppressed to push the client to associate with the 802.11a band.

802.11 Bands

You can configure the 802.11b/g/n (2.4-GHz) and 802.11a/n (5-GHz) bands for the controller to comply with the regulatory requirements in your country. By default, both 802.11b/g/n and 802.11a/n are enabled.

When a controller is configured to allow only 802.11g traffic, 802.11b client devices are able to successfully connect to an access point but cannot pass traffic. When you configure the controller for 802.11g traffic only, you must mark 11g rates as mandatory.

802.11n Parameter

This section provides instructions for managing 802.11n devices such as the Cisco Aironet 1140 and 3600 Series Access Points on your network. The 802.11n devices support the 2.4- and 5-GHz bands and offer high-throughput data rates.

The 802.11n high-throughput rates are available on all 802.11n access points for WLANs using WMM with no Layer 2 encryption or with WPA2/AES encryption enabled.

Note

Some Cisco 802.11n APs may intermittently emit incorrect beacon frames, which can trigger false wIPS alarms. We recommend that you ignore these alarms. The issue is observed in the following Cisco 802.11n APs: 1140, 1250, 2600, 3500, and 3600.

802.11h Parameter

802.11h informs client devices about channel changes and can limit the transmit power of those client devices.

How to Configure 802.11 Bands and Parameters

Configuring Band Selection (CLI)

SUMMARY STEPS

1. **configure terminal**
2. **wireless client band-select cycle-count** *cycle_count*
3. **wireless client band-select cycle-threshold** *milliseconds*
4. **wireless client band-select expire suppression** *seconds*
5. **wireless client band-select expire dual-band** *seconds*
6. **wireless client band-select client-rssi** *client_rssi*
7. **end**
8. **wlan** *wlan_profile_name* *wlan_ID* *SSID_network_name* **band-select**
9. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	wireless client band-select cycle-count <i>cycle_count</i> Example: Switch(config)# wireless client band-select cycle-count 3	Sets the probe cycle count for band select. You can enter a value between 1 and 10 for the <i>cycle_count</i> parameter.
Step 3	wireless client band-select cycle-threshold <i>milliseconds</i> Example: Switch(config)# wireless client band-select cycle-threshold 5000	Sets the time threshold for a new scanning cycle period. You can enter a value for threshold between 1 and 1000 for the <i>milliseconds</i> parameter.
Step 4	wireless client band-select expire suppression <i>seconds</i> Example: Switch(config)# wireless client band-select expire suppression 100	Sets the suppression expire to the band select. You can enter a value for suppression between 10 to 200 for the <i>seconds</i> parameter.
Step 5	wireless client band-select expire dual-band <i>seconds</i> Example: Switch(config)# wireless client band-select expire dual-band 100	Sets the dual band expire. You can enter a value for dual band between 10 and 300 for the <i>seconds</i> parameter.
Step 6	wireless client band-select client-rssi <i>client_rssi</i> Example: Switch(config)# wireless client band-select client-rssi 40	Sets the client RSSI threshold. You can enter a value for minimum dBm of a client RSSI to respond to a probe between 20 and 90 for the <i>client_rssi</i> parameter.
Step 7	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 8	wlan <i>wlan_profile_name</i> <i>wlan_ID</i> <i>SSID_network_name</i> band-select Example: Switch(config)# wlan wlan1 25 ssid12 Switch(config-wlan)# band-select	Configures band selection on specific WLANs. You can enter a value between 1 and 512 for the <i>wlan_ID</i> parameter. You can enter the up to 32 alphanumeric characters for <i>SSID_network_name</i> parameter.
Step 9	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring the 802.11 Bands (CLI)

You can configure 802.11 bands and parameters.

SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 5ghz shutdown`
3. `ap dot11 24ghz shutdown`
4. `ap dot11 {5ghz | 24ghz} beaconperiod time_unit`
5. `ap dot11 {5ghz | 24ghz} fragmentation threshold`
6. `ap dot11 {5ghz | 24ghz} dtpc`
7. `wireless client association limit number interval milliseconds`
8. `ap dot11 {5ghz | 24ghz} rate rate {disable | mandatory | supported}`
9. `no ap dot11 5ghz shutdown`
10. `no ap dot11 24ghz shutdown`
11. `ap dot11 24ghz dot11g`
12. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code> Example: <code>Switch# configure terminal</code>	Enters global configuration mode.
Step 2	<code>ap dot11 5ghz shutdown</code> Example: <code>Switch(config)# ap dot11 5ghz shutdown</code>	Disables the 802.11a band. Note You must disable the 802.11a band before configuring the 802.11a network parameters.
Step 3	<code>ap dot11 24ghz shutdown</code> Example: <code>Switch(config)# ap dot11 24ghz shutdown</code>	Disables the 802.11b band. Note You must disable the 802.11b band before configuring the 802.11b network parameters.
Step 4	<code>ap dot11 {5ghz 24ghz} beaconperiod <i>time_unit</i></code> Example: <code>Switch(config)# ap dot11 5ghz beaconperiod 500</code>	Specifies the rate at which the SSID is broadcast by the access point. The beacon interval is measured in time units (TUs). One TU is 1024 microseconds. You can configure the access point to send a beacon every 20 to 1000 milliseconds.
Step 5	<code>ap dot11 {5ghz 24ghz} fragmentation <i>threshold</i></code>	Specifies the size at which packets are fragmented.

	Command or Action	Purpose
	Example: <pre>Switch(config)# ap dot11 5ghz fragmentation 300</pre>	The threshold is a value between 256 and 2346 bytes (inclusive). Specify a low number for areas where communication is poor or where there is a great deal of radio interference.
Step 6	ap dot11 {5ghz 24ghz} dtpc Example: <pre>Switch(config)# ap dot11 5ghz dtpc</pre> <pre>Switch(config)# no ap dot11 24ghz dtpc</pre>	<p>Enables access points to advertise their channels and transmit the power levels in beacons, and probe responses.</p> <p>The default value is enabled. Client devices using dynamic transmit power control (DTPC) receive the channel and power level information from the access points and adjust their settings automatically. For example, a client device used primarily in Japan could rely on DTPC to adjust its channel and power settings automatically when it travels to Italy and joins a network there.</p> <p>Note On access points that run Cisco IOS software, this feature is called world mode.</p> <p>The no form of the command disables the 802.11a or 802.11b DTPC setting.</p>
Step 7	wireless client association limit <i>number</i> interval <i>milliseconds</i> Example: <pre>Switch(config)# wireless client association limit 50 interval 1000</pre>	<p>Specifies the maximum allowed clients that can be configured.</p> <p>You can configure a maximum number of association request on a single access point slot at a given interval. The range of association limit that you can configure is from one through 100.</p> <p>The association request limit interval is measured between 100 to 10000 milliseconds.</p>
Step 8	ap dot11 {5ghz 24ghz} rate <i>rate</i> {<i>disable</i> <i>mandatory</i> <i>supported</i>} Example: <pre>Switch(config)# ap dot11 5ghz rate 36 mandatory</pre>	<p>Specifies the rate at which data can be transmitted between the controller and the client.</p> <ul style="list-style-type: none"> • <i>disabled</i>—Defines that the clients specify the data rates used for communication. • <i>mandatory</i>—Defines that the clients support this data rate in order to associate to an access point on the controller. • <i>supported</i>—Any associated clients that support this data rate may communicate with the access point using that rate. However, the clients are not required to be able to use this rate in order to associate. • <i>rate</i>—Specifies the rate at which data is transmitted. For the 802.11a and 802.11b bands, the data is transmitted at the rate of 1, 2, 5.5, 6, 9, 11, 12, 18, 24, 36, 48, or 54 Mbps.
Step 9	no ap dot11 5ghz shutdown Example: <pre>Switch(config)# no ap dot11 5ghz shutdown</pre>	<p>Enables the 802.11a band.</p> <p>Note The default value is enabled.</p>
Step 10	no ap dot11 24ghz shutdown	Enables the 802.11b band.

	Command or Action	Purpose
	Example: Switch(config)# no ap dot11 24ghz shutdown	Note The default value is enabled.
Step 11	ap dot11 24ghz dot11g Example: Switch(config)# ap dot11 24ghz dot11g	Enables or disables 802.11g network support. The default value is enabled. You can use this command only if the 802.11b band is enabled. If you disable this feature, the 802.11b band is enabled without 802.11g support.
Step 12	end Example: Switch(config)# end	Returns to privileged EXEC mode.

Configuring 802.11n Parameters (CLI)

SUMMARY STEPS

1. configure terminal
2. ap dot11 {5ghz | 24ghz} dot11n
3. ap dot11 {5ghz | 24ghz} dot11n mcs tx rtu
4. wlanwlan_profile_name wlan_ID SSID_network_name wmm require
5. ap dot11 {5ghz | 24ghz} shutdown
6. {ap | no ap} dot11 {5ghz | 24 ghz} dot11n a-mpdu tx priority {all | 0-7}
7. no ap dot11 {5ghz | 24ghz} shutdown
8. ap dot11 {5ghz | 24ghz} dot11n guard-interval {any | long}
9. ap dot11 {5ghz | 24ghz} dot11n rifs rx
10. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	ap dot11 {5ghz 24ghz} dot11n Example: Switch(config)# ap dot11 5ghz dot11n	Enables 802.11n support on the network. The no form of the command disables the 802.11n support on the network.

	Command or Action	Purpose																
Step 3	ap dot11 {5ghz 24ghz} dot11n mcs tx <i>rtu</i> Example: Switch(config)# ap dot11 5ghz dot11n mcs tx 20	Specifies the modulation and coding scheme (MCS) rates at which data can be transmitted between the access point and the client. You can set a value from 0 through 23 for the mcs tx parameter. The no form of the command disables the MCS rates that is configured.																
Step 4	wlanwlan_profile_name wlan_ID SSID_network_name wmm require Example: Switch(config)# wlan wlan1 25 ssid12 Switch(config-wlan)# wmm require	Enables WMM on the WLAN and uses the 802.11n data rates that you configured. The require parameter requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.																
Step 5	ap dot11 {5ghz 24ghz} shutdown Example: Switch(config)# ap dot11 5ghz shutdown	Disables the network.																
Step 6	{ap no ap} dot11 {5ghz 24 ghz} dot11n a-mpdu tx priority {all 0-7} Example: Switch(config)# ap dot11 5ghz dot11n a-mpdu tx priority all	<p>Specifies the aggregation method used for 802.11n packets.</p> <p>Aggregation is the process of grouping packet data frames together rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). Both A-MPDU and A-MSDU are performed in the software.</p> <p>You can specify the aggregation method for various types of traffic from the access point to the clients.</p> <p>The following table defines the priority levels (0-7) assigned per traffic type.</p> <p>Table 10: Traffic Type Priority Levels</p> <table><tr><th>User Priority</th><th>Traffic Type</th></tr><tr><td>0</td><td>Best effort</td></tr><tr><td>1</td><td>Background</td></tr><tr><td>2</td><td>Spare</td></tr><tr><td>3</td><td>Excellent effort</td></tr><tr><td>4</td><td>Controlled load</td></tr><tr><td>5</td><td>Video, less than 100-ms latency and jitter</td></tr><tr><td>6</td><td>Voice, less than 100-ms latency and jitter</td></tr></table>	User Priority	Traffic Type	0	Best effort	1	Background	2	Spare	3	Excellent effort	4	Controlled load	5	Video, less than 100-ms latency and jitter	6	Voice, less than 100-ms latency and jitter
User Priority	Traffic Type																	
0	Best effort																	
1	Background																	
2	Spare																	
3	Excellent effort																	
4	Controlled load																	
5	Video, less than 100-ms latency and jitter																	
6	Voice, less than 100-ms latency and jitter																	

	Command or Action	Purpose		
		<table><tr><td>7</td><td>Network control</td></tr></table> <p>You can configure each priority level independently, or you can use the all parameter to configure all of the priority levels at once. You can configure priority levels so that the traffic uses either A-MPDU transmission or A-MSDU transmission.</p> <ul style="list-style-type: none">• When you use the ap command along with the other options, the traffic associated with that priority level uses A-MPDU transmission.• When you use the no ap command along with the other options, the traffic associated with that priority level uses A-MSDU transmission. <p>Configure the priority levels to match the aggregation method used by the clients. By default, A-MPDU is enabled for priority level 0, 4 and 5 and the rest are disabled. By default, A-MPDU is enabled for all priorities except 6 and 7.</p>	7	Network control
7	Network control			
Step 7	no ap dot11 {5ghz 24ghz} shutdown Example: Switch(config)# no ap dot11 5ghz shutdown	Reenables the network.		
Step 8	ap dot11 {5ghz 24ghz} dot11n guard-interval {any long} Example: Switch(config)# ap dot11 5ghz dot11n guard-interval long	Configures the guard interval for the network.		
Step 9	ap dot11 {5ghz 24ghz} dot11n rifs rx Example: Switch(config)# ap dot11 5ghz dot11n rifs rx	Configures the Reduced Interframe Space (RIFS) for the network.		
Step 10	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.		

Configuring 802.11h Parameters (CLI)

SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 5ghz shutdown`
3. `{ap | no ap} dot11 5ghz channelswitch mode switch_mode`
4. `ap dot11 5ghz power-constraint value`
5. `no ap dot11 5ghz shutdown`
6. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code> Example: <code>Switch# configure terminal</code>	Enters global configuration mode.
Step 2	<code>ap dot11 5ghz shutdown</code> Example: <code>Switch(config)# ap dot11 5ghz shutdown</code>	Disables the 802.11a network.
Step 3	<code>{ap no ap} dot11 5ghz channelswitch mode <i>switch_mode</i></code> Example: <code>Switch(config)# ap dot11 5ghz channelswitch mode 0</code>	Enables or disables the access point to announce when it is switching to a new channel. You can enter a 0 or 1 for the channelswitch parameter to specify whether transmissions are restricted until the actual channel switch (0) or are not restricted (1). The default value is disabled.
Step 4	<code>ap dot11 5ghz power-constraint <i>value</i></code> Example: <code>Switch(config)# ap dot11 5ghz power-constraint 200</code>	Configures the 802.11h power constraint value in a range from zero through 255. The default value for the value parameter is 3 dB.
Step 5	<code>no ap dot11 5ghz shutdown</code> Example: <code>Switch(config)# no ap dot11 5ghz shutdown</code>	Reenables the 802.11a network.
Step 6	<code>end</code> Example: <code>Switch(config)# end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Monitoring Configuration Settings for Band Selection, 802.11 Bands, and Parameters

Monitoring Configuration Settings Using Band Selection and 802.11 Bands Commands

This section describes the new commands for band selection and 802.11 bands.

The following commands can be used to monitor band selection, and 802.11 bands and parameters the switch.

Table 11: Monitoring Configuration Settings Using Band Selection and 802.11 Bands Commands

Command	Purpose
show ap dot11 5ghz network	Displays 802.11a bands network parameters, 802.11a operational rates, 802.11n MCS settings, and 802.11n status information.
show ap dot11 24ghz network	Displays 802.11b bands network parameters, 802.11b/g operational rates, 802.11n MCS settings, and 802.11n status information.
show wireless dot11h	Displays 802.11h configuration parameters.
show wireless band-select	Displays band select configuration settings.

Example: Viewing the Configuration Settings for 5-GHz Band

```
Switch# show ap dot11 5ghz network
802.11a Network : Enabled
11nSupport : Enabled
  802.11a Low Band : Enabled
  802.11a Mid Band : Enabled
  802.11a High Band : Enabled

802.11a Operational Rates
  802.11a 6M : Mandatory
  802.11a 9M : Supported
  802.11a 12M : Mandatory
  802.11a 18M : Supported
  802.11a 24M : Mandatory

```

Example: Viewing the status of 802.11h Parameters

```

Switch# show wireless dot11h
Power Constraint: 0
Channel Switch: 0
Channel Switch Mode: 0

```

Example: Verifying the Band Selection Settings

```

Switch# show wireless band-select
Band Select Probe Response : per WLAN enabling
Cycle Count : 2
Cycle Threshold (millisec) : 200
Age Out Suppression (sec) : 20
Age Out Dual Band (sec) : 60
Client RSSI (dBm) : 80

```

Configuration Examples for Band Selection, 802.11 Bands, and Parameters

Examples: Band Selection Configuration

This example shows how to set the probe cycle count and time threshold for a new scanning cycle period for band select:

```
Switch# configure terminal
Switch(config)# wireless client band-select cycle-count 3
Switch(config)# wireless client band-select cycle-threshold 5000
Switch(config)# end
```

This example shows how to set the suppression expire to the band select:

```
Switch# configure terminal
Switch(config)# wireless client band-select expire suppression 100
Switch(config)# end
```

This example shows how to set the dual band expire for the band select:

```
Switch# configure terminal
Switch(config)# wireless client band-select expire dual-band 100
Switch(config)# end
```

This example shows how to set the client RSSI threshold for the band select:

```
Switch# configure terminal
Switch(config)# wireless client band-select client-rssi 40
Switch(config)# end
```

This example shows how to configure band selection on specific WLANs:

```
Switch# configure terminal
Switch(config)# wlan wlan1 25 ssid12
Switch(config-wlan)# band-select
Switch(config)# end
```

Examples: 802.11 Bands Configuration

This example shows how to configure 802.11 bands using beacon interval, fragmentation, and dynamic transmit power control:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 24ghz shutdown
Switch(config)# ap dot11 5ghz beaconperiod 500
Switch(config)# ap dot11 5ghz fragmentation 300
Switch(config)# ap dot11 5ghz dtpc
Switch(config)# wireless client association limit 50 interval 1000
Switch(config)# ap dot11 5ghz rate 36 mandatory
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)# no ap dot11 24ghz shutdown
Switch(config)# ap dot11 24ghz dot11g
Switch(config)# end
```

Examples: 802.11n Configuration

This example shows how to configure 802.11n parameters for 5-GHz band using aggregation method:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz dot11n
Switch(config)# ap dot11 5ghz dot11n mcs tx 20
Switch(config)# wlan wlan1 25 ssid12
Switch(config-wlan)# wmm require\
Switch(config-wlan)# exit
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz dot11n a-mpdu tx priority all
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)#exit
```

This example shows how to configure the guard interval for 5-GHz band:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz dot11n
Switch(config)# ap dot11 5ghz dot11n mcs tx 20
Switch(config)# wlan wlan1 25 ssid12
Switch(config-wlan)# wmm require\
Switch(config-wlan)# exit
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz dot11n guard-interval long
Switch(config)#end
```

This example shows how to configure the RIFS for 5-GHz band:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz dot11n
Switch(config)# ap dot11 5ghz dot11n mcs tx 20
Switch(config)# wlan wlan1 25 ssid12
Switch(config-wlan)# wmm require\
Switch(config-wlan)# exit
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz dot11n rifs rx
Switch(config)#end
```

Examples: 802.11h Configuration

This example shows how to configure the access point to announce when it is switching to a new channel using restriction transmission:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz channelswitch mode 0
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)#end
```

This example shows how to configure the 802.11h power constraint for 5-GHz band:

```
Switch# configure terminal
Switch(config)# ap dot11 5ghz shutdown
Switch(config)# ap dot11 5ghz power-constraint 200
Switch(config)# no ap dot11 5ghz shutdown
Switch(config)#end
```

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Restrictions for Aggressive Load Balancing

- You can configure aggressive load balancing only from the command-line interface.
- Aggressive load balancing is disabled by default, you must enable it manually.
- You can enable load balancing either separately or together with the band select configurations.
- When the band select is enabled on the dual-band clients, the load balancing parameter selects only the lowest load radio from 5-GHz radios. For the 2.4-GHz clients, there is no probe information of the client on 5 GHz and therefore the load balancing algorithm can only be selected between radio on 2.4 GHz.
- You can operate load balancing of clients between access points on the same switch but not for the clients between access points on the different switch.

- The load balancing uses an existing association denial mechanism based on the number of client on the radio and the band select is implemented by the distributed probe response suppression on the access point only.

Information for Configuring Aggressive Load Balancing Parameters

Aggressive Load Balancing

Enabling aggressive load balancing on the controller allows lightweight access points to load balance wireless clients across access points. You can enable aggressive load balancing using the controller.

When a wireless client attempts to associate to a lightweight access point, association response packets are sent to the client with an 802.11 response packet including status code 17. The code 17 indicates that the AP is busy. The AP responds with an association response bearing 'success' if the AP threshold is not met, and with code 17 (AP busy) if the AP utilization threshold is reached or exceeded and another less busy AP heard the client request.

For example, if the number of clients on AP1 is more than the number of clients on AP2 plus the load-balancing window, then AP1 is considered to be busier than AP2. When a client attempts to associate to AP1, it receives an 802.11 response packet with status code 17, indicating that the access point is busy, and the client attempts to associate to a different access point.

You can configure the controller to deny client associations up to 10 times (if a client attempted to associate 11 times, it would be allowed to associate on the 11th try). You can also enable or disable load balancing on a particular WLAN, which is useful if you want to disable load balancing for a select group of clients (such as time-sensitive voice clients).

Note

Voice Client does not authenticate when delay is configured more than 300 ms. To avoid this configure a Central-Auth, Local Switching WLAN with CCKM, configure a Parent Router between AP and WLC with a delay of 600 ms (300 ms UP and 300 ms DOWN and try associating the voice client

The maximum number of client associations that the access points can support is dependent upon the following factors:

- The maximum number of client associations differs for lightweight and autonomous Cisco IOS access points.
- There may be a limit per radio and an overall limit per AP.
- AP hardware (the 16-MB APs have a lower limit than the 32-MB and higher APs)

The Client Association Limits for Lightweight Access Points are as follows:

- For 16-MB APs, the limit is 128 clients per AP. This limit is applicable to 1100 and 1200 series APs.
- For 32-MB and higher APs, there is no per-AP limit.

The maximum Client Association Limits per-radio for all of the Cisco IOS APs is 200 associations.

**Note**

With 32-MB and higher lightweight Cisco IOS APs, with two radios, up to $200 + 200 = 400$ associations are supported.

The maximum Client Association Limits per Autonomous Cisco IOS access point is around 80 to 127 clients per AP. This number varies depending on the following factors:

- AP model (whether it is 16 MB or 32 MB or higher)
- Cisco IOS software release
- Hardware configuration (two radios use more memory than one)
- Enabled features (WDS functionality in particular)

The per-radio limit is about 200 associations. One association will likely hit the per-AP limit first. Unlike Cisco Unified Wireless Network, autonomous Cisco IOS supports per-SSID/per-AP association limits. This limit is configured using the max-associations CLI, under dot11 SSID. The maximum number is 255 associations (which is also the default number).

**Note**

For a FlexConnect AP the association is locally handled. The load-balancing decisions are taken at the Cisco WLC. A FlexConnect AP initially responds to the client before knowing the result of calculations at the Cisco WLC. Load-balancing doesn't take effect when the FlexConnect AP is in standalone mode.

FlexConnect AP does not send (re)association response with status 17 for Load-Balancing as Local mode APs do; instead, it first sends (re)association with status 0 (success) and then deauth with reason 5.

How to Configure Aggressive Load Balancing

Configuring Aggressive Load Balancing

SUMMARY STEPS

1. **configure terminal**
2. **wireless load-balancing window** *client-count*
3. **wireless load-balancing denial** *denial-count*
4. **end**
5. **wlan** *wlan_profile_name wlan_ID SSID_network_name* **load-balance**
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	wireless load-balancing window <i>client-count</i> Example: Switch(config)# wireless load-balancing window 1	Sets the client window for aggressive load balancing. You can enter a value between 0 and 20 for the <i>client_count</i> parameter.
Step 3	wireless load-balancing denial <i>denial-count</i> Example: Switch(config)# wireless load-balancing denial-count 1	Sets the denial count for load balancing. You can enter a value between 0 and 10 for the <i>denial_count</i> parameter.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 5	wlan <i>wlan_profile_name</i> <i>wlan_ID</i> <i>SSID_network_name</i> load-balance Example: Switch(config)# wlan wlan1 25 ssid12 Switch(config-wlan)# load-balance	Enables or disables aggressive load balancing on specific WLANs. You can enter a value between 1 and 512 for the <i>wlan_ID</i> parameter. You can enter the up to 32 alphanumeric characters for <i>SSID_network_name</i> parameter.
Step 6	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Monitoring Aggressive Load Balancing

This section describes the new command for aggressive load balancing.

The following command can be used to monitor aggressive load balancing on the switch.

Table 12: Monitoring Aggressive Load Balancing Command

Command	Purpose
show wireless load-balancing	Displays the status of the load-balancing feature.

Examples: Aggressive Load Balancing Configuration

This example shows how to configure the load balancing denial count:

```
Switch# configure terminal
Switch(config)# wireless load-balancing denial-count 1
Switch(config)# end
Switch# show wireless load-balancing
```

This example shows how to configure the client window for aggressive load balancing:

```
Switch# configure terminal
Switch(config)# wireless load-balancing window 1
Switch(config)# end
Switch# show wireless load-balancing
```

This example shows how to configure load balancing on specific WLAN:

```
Switch# configure terminal
Switch(config)# wlan wlan1 25 ssid12
Switch(config-wlan)# load-balance
Switch(config)# end
Switch# show wireless load-balancing
```

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Restrictions for Configuring Client Roaming

The following are the restrictions that you should be aware while configuring client roaming:

- Cisco Compatible Extensions (CCX) support is enabled automatically for every WLAN on the switch and cannot be disabled. The switch stores the CCX version of the client in its client database and uses it to generate and respond to CCX frames appropriately. Clients must support CCXv4 or v5 (or CCXv2 for access point assisted roaming) to utilize these roaming enhancements.
- Client roaming between 600 Series Access points is not supported.

Information About Client Roaming

The controllers deliver high-end wireless services to the clients roaming across wireless network. Now, the wireless services are integrated with the switches, thus delivering a value-added Cisco unified new mobility architecture. This unified architecture enables client-roaming services to both wireless and wired clients with seamless, fast- roaming services.

The new mobility architecture supports fast client roaming services using logical categorization of network into Mobility Domains (MDs), Mobility Groups (MGs), Mobility Subdomains (MSDs), and Switch Peer Groups (SPGs) using systems such as Mobility Oracle (MO), Mobility Controller (MC), and Mobility Agent (MA).

- A **Mobility Domain** is the entire domain across which client roaming is supported. It is a collection of mobility groups. For example, a campus network can be considered as a mobility domain.
- A **Mobility Group** is a collection of mobility subdomains across which fast roaming is supported. The mobility group can be one or more buildings within a campus across which frequent roaming is supported.
- A **Mobility Subdomain** is an autonomous portion of the mobility domain network. Each mobility subdomain contains one mobility controller (MC) and a collection of SPGs. A subdomain is equivalent to an 802.11r key domain.
- A **Switch Peer Group** is a collection of mobility agents.
- The **Mobility Oracle** acts as the point of contact for mobility events that occur across mobility subdomains. The mobility oracle also maintains a local database of each client in the entire mobility domain, their home and current subdomain. There is only one MO for an entire mobility domain. The Cisco WLC 5700 Series Controllers or Cisco Unified Wireless Networking Solution controller can act as MO.
- The **Mobility Controller** provides mobility management services for inter-SPG roaming events. The MC sends the configuration like SPG name and SPG peer member list to all of the mobility agents under its subdomain. The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.
- The **Mobility Agent** is the component that maintains client mobility state machine for a mobile client. All APs are connected to the mobility agent.

The New mobility architecture supports seamless roaming in the following scenarios:

- Intra-switch roaming—The client roaming between APs managed by same mobility agent.
- Intra-SPG roaming—The client roaming between mobility agents in the same SPG.
- Inter-SPG, Intra-subdomain roaming—The client roaming between mobility agents in different SPGs within the same subdomain.
- Inter-subdomain roaming—The client roaming between mobility agents across a subdomain.

Fast Roaming

New mobility architecture supports fast roaming when clients roam within a mobility group by eliminating the need for full authentication. Security policies should be same across the switches for fast roaming.

Local, anchor, foreign MAs and MCs

When a client joins an MA initially and its point of attachment has not changed, that MA is referred as local or associated MA. The MC to which this MA is associated is referred as local or associated MC.

When a client roams between two MAs, the MA to which the client was previously associated is the anchor MA (point of attachment) and the MA to which the client is currently associated is the foreign or associated MA (point of presence). The MCs to which these MAs are associated are referred as anchor, foreign, or associated MCs, respectively.

Inter-Subnet Roaming

Multiple-controller deployments support client roaming across access points managed by controllers in the same mobility group on different subnets. This roaming is transparent to the client because the session is sustained and a tunnel between the controllers allows the client to continue using the same DHCP-assigned or client-assigned IP address as long as the session remains active. The tunnel is torn down, and the client must reauthenticate when the client sends a DHCP Discover with a 0.0.0.0 client IP address or a 169.254.*.* client auto-IP address or when the operator-set user timeout is exceeded.

Voice-over-IP Telephone Roaming

802.11 voice-over-IP (VoIP) telephones actively seek out associations with the strongest RF signal to ensure the best quality of service (QoS) and the maximum throughput. The minimum VoIP telephone requirement of 20-millisecond or shorter latency time for the roaming handover is easily met by the Cisco Wireless solution, which has an average handover latency of 5 or fewer milliseconds when open authentication is used. This short latency period is controlled by controllers rather than allowing independent access points to negotiate roaming handovers.

The Cisco Wireless solution supports 802.11 VoIP telephone roaming across lightweight access points managed by controllers on different subnets, as long as the controllers are in the same mobility group. This roaming is transparent to the VoIP telephone because the session is sustained and a tunnel between controllers allows the VoIP telephone to continue using the same DHCP-assigned IP address as long as the session remains active. The tunnel is torn down, and the VoIP client must reauthenticate when the VoIP telephone sends a DHCP Discover with a 0.0.0.0 VoIP telephone IP address or a 169.254.*.* VoIP telephone auto-IP address or when the operator-set user timeout is exceeded.

CCX Layer 2 Client Roaming

The controller supports five CCX Layer 2 client roaming enhancements:

- Access point assisted roaming—This feature helps clients save scanning time. When a CCXv2 client associates to an access point, it sends an information packet to the new access point listing the characteristics of its previous access point. Roaming time decreases when the client recognizes and uses an access point list built by compiling all previous access points to which each client was associated and sent (unicast) to the client immediately after association. The access point list contains the channels, BSSIDs of neighbor access points that support the client's current SSID(s), and time elapsed since disassociation.
- Enhanced neighbor list—This feature focuses on improving a CCXv4 client's roam experience and network edge performance, especially when servicing voice applications. The access point provides its associated client information about its neighbors using a neighbor-list update unicast message.

- Enhanced neighbor list request (E2E)—The End-2-End specification is a Cisco and Intel joint program that defines new protocols and interfaces to improve the overall voice and roaming experience. It applies only to Intel clients in a CCX environment. Specifically, it enables Intel clients to request a neighbor list at will. When this occurs, the access point forwards the request to the controller. The controller receives the request and replies with the current CCX roaming sublist of neighbors for the access point to which the client is associated.

Note To see whether a particular client supports E2E, choose **Wireless > Clients** on the controller GUI, click the **Detail** link for the desired client, and look at the E2E Version text box in the Client Properties area.

- Roam reason report—This feature enables CCXv4 clients to report the reason why they roamed to a new access point. It also allows network administrators to build and monitor a roam history.
- Directed roam request—This feature enables the controller to send directed roam requests to the client in situations when the controller can better service the client on an access point different from the one to which it is associated. In this case, the controller sends the client a list of the best access points that it can join. The client can either honor or ignore the directed roam request. Non-CCX clients and clients running CCXv3 or below must not take any action. No configuration is required for this feature.

How to Configure Layer 2 or Layer 3 Roaming

Configuring Layer 2 or Layer 3 Roaming

Before You Begin

To configure the mobility agent for Layer 2 or Layer 3 roaming, the following requisites should be considered:

- SSID and security policies should be same across MAs for Layer 2 and Layer 3 roaming.
- Client VLAN ID should be same for Layer 2 roaming and different for Layer 3 roaming.
- Bridge domain ID and client VLAN IDs should be same for Layer 2 roaming. Either one or both of the bridge domain ID and client VLAN ID should be different for Layer 3 roaming.

SUMMARY STEPS

1. **configure terminal**
2. **wlan *wlan_profile_name* wlan_ID SSID_network_name**
3. **no mobility anchor sticky**
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	wlan wlan_profile_name wlan_ID SSID_network_name Example: Switch(config)# wlan wlan1	Enters WLAN configuration mode.
Step 3	no mobility anchor sticky Example: Switch(config-wlan)# no mobility anchor sticky	(Optional) Disables Layer 2 anchoring.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring CCX Client Roaming Parameters (CLI)

SUMMARY STEPS

1. **configure terminal**
2. **ap dot11 {5ghz | 24ghz} l2roam rf-params {default | custom min-rssi roam-hyst scan-thresh trans-time}**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	ap dot11 {5ghz 24ghz} l2roam rf-params {default custom min-rssi roam-hyst scan-thresh trans-time}	Configures CCX Layer 2 client roaming parameters. To choose the default RF parameters, enter the default option. To fine-tune the RF parameters that affect client roaming, enter the custom option and then enter any one of the following options:

	Command or Action	Purpose
	<p>Example:</p> <pre>Switch#ap dot11 5ghz 12roam rf-params custom -80</pre>	<ul style="list-style-type: none"> • Minimum RSSI—Indicates minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point. If the client's average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached. You can configure the minimum RSSI range from –50 through –90 dBm and the default value is –85 dBm. • Hysteresis—Indicates how much greater the signal strength of a neighboring access point must be for the client to roam to it. This parameter is intended to reduce the amount of roaming between access points if the client is physically located on or near the border between two access points. You can configure the hysteresis range from 3 through 20 dB and the default is 3 dB. • Scan Threshold—Indicates a minimum RSSI that is allowed before the client should roam to a better access point. When the RSSI drops below the specified value, the client must be able to roam to a better access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when the RSSI is below the threshold. You can configure the RSSI range from –50 through –90 dBm and the default value is –72 dBm. • Transition Time—Indicates the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client's associated access point is below the scan threshold. The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points. You can configure the time period in the range from 1 through 5 seconds and the default time is 5 seconds.
Step 3	<p>end</p> <p>Example:</p> <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring Mobility Oracle

SUMMARY STEPS

1. `configure terminal`
2. `wireless mobility oracle`
3. `end`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>configure terminal</code> Example: <code>Switch# configure terminal</code>	Enters global configuration mode.
Step 2	<code>wireless mobility oracle</code> Example: <code>Switch(config)# wireless mobility oracle</code>	Enables mobility oracle on the controller.
Step 3	<code>end</code> Example: <code>Switch(config)# end</code>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring Mobility Controller

SUMMARY STEPS

1. **configure terminal**
2. **wireless mobility controller**
3. **wireless mobility controller peer-group** *switch-peer-group-name*
4. **wireless mobility controller peer-group** *switch-peer-group-name* **member ip** *ip-address* {**public-ip** *public-ip-address*}
5. **wireless mobility controller peer-group** *switch-peer-group-name* **multicast**
6. **wireless mobility controller peer-group** *switch-peer-group-name* **multicast ip** *peer-group-multicast-ip-addr*
7. **wireless mobility controller peer-group** *switch-peer-group-name* **bridge-domain-id** *id*
8. **wireless mobility group member ip** *ip-address* [**public-ip** *public-ip-address*] [**group** *group-name*]
9. **wireless mobility dscp** *value*
10. **wireless mobility group keepalive** {*count* | *interval*}
11. **wireless mobility group name** *name*
12. **wireless mobility oracle ip** *mo-ip-address*
13. **wireless management interface** *interface-name*
14. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	wireless mobility controller Example: Switch(config)# wireless mobility controller	Enables wireless mobility controller.
Step 3	wireless mobility controller peer-group <i>switch-peer-group-name</i> Example: Switch(config)# wireless mobility controller peer-group SPG1	Configures a switch peer group name. You can enter up to 31 case-sensitive ASCII printable characters for the group name. Spaces are not allowed in mobility group. Note The No form of the command deletes the switch peer group.
Step 4	wireless mobility controller peer-group <i>switch-peer-group-name</i> member ip <i>ip-address</i> { public-ip <i>public-ip-address</i> }	Adds a mobility group member to a switch peer group. Note The No form of the command deletes the member from the switch peer group.

	Command or Action	Purpose
	Example: <pre>Switch(config)# wireless mobility controller peer-group SPG1 member ip 10.0.0.1</pre>	
Step 5	wireless mobility controller peer-group <i>switch-peer-group-name multicast</i> Example: <pre>Switch(config)# wireless mobility controller peer-group SPG1 multicast</pre>	Configures the multicast mode within a switch peer group.
Step 6	wireless mobility controller peer-group <i>switch-peer-group-name multicast ip</i> <i>peer-group-multicast-ip-addr</i> Example: <pre>Switch(config)# wireless mobility controller peer-group SPG1 multicast ip 10.0.0.4</pre>	Configures the multicast IP address for a switch peer group. Note The No form of the command deletes the multicast IP for the switch peer group.
Step 7	wireless mobility controller peer-group <i>switch-peer-group-name bridge-domain-id</i> <i>id</i> Example: <pre>Switch(config)# wireless mobility controller peer-group SPG1 bridge-domain-id 10.0.0.5</pre>	Configures the bridge domain ID for a switch peer group. The default is zero. Note The No form of command sets the bridge domain ID to the default value.
Step 8	wireless mobility group member ip <i>ip-address</i> [public-ip <i>public-ip-address</i>] [group <i>group-name</i>] Example: <pre>Switch(config)# wireless mobility group member ip 10.0.0.1</pre>	Adds a mobility group member. Note The No form of the command removes the member from the group. The default group name is the group name of MC.
Step 9	wireless mobility dscp <i>value</i> Example: <pre>Switch(config)# wireless mobility dscp 46</pre>	Sets the DSCP value for mobility control packet. You can configure the DSCP value in a range from 0 through 63. The default value is 46.
Step 10	wireless mobility group keepalive { <i>count</i> <i>interval</i> } Example: <pre>Switch(config)# wireless mobility group keepalive count</pre>	Configures the wireless mobility group keepalive count which is the number of keepalive retries before a member status is termed DOWN and keepalive interval which is interval between two keepalives.
Step 11	wireless mobility group name <i>name</i> Example: <pre>Switch(config)# wireless mobility group name group1</pre>	Specifies the case sensitive wireless mobility group name which can be ASCII printable string up to 31 characters.

	Command or Action	Purpose
Step 12	wireless mobility oracle ip <i>ipmo-ip-address</i> Example: Switch(config)# wireless mobility oracle ip 10.0.0.5	Configures the mobility oracle IP address.
Step 13	wireless management interface <i>interface-name</i> Example: Switch(config)# wireless management interface Vlan21	Configures the wireless management interface.
Step 14	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring Mobility Agent

SUMMARY STEPS

1. **configure terminal**
2. **wireless mobility controller ip** *ip-address*
3. **wireless mobility load-balance**
4. **wireless mobility load-balance threshold** *threshold -value*
5. **wireless management interface** *interface-name*
6. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	wireless mobility controller ip <i>ip-address</i> Example: Switch(config)# wireless mobility controller ip 10.10.10.20	Sets the IP address of the mobility controller.
Step 3	wireless mobility load-balance	Configures wireless mobility load balancing.

	Command or Action	Purpose
	Example: Switch(config)# wireless mobility load-balance	
Step 4	wireless mobility load-balance threshold <i>threshold</i> -value Example: Switch(config)# wireless mobility load-balance threshold 100	Configures the number of clients that can be local or anchored on the MA. You can configure the threshold value in a range from 100 to 2000. The default value is 1000.
Step 5	wireless management interface <i>interface-name</i> Example: Switch(config)# wireless management interface Vlan21	Configures wireless management interface for the mobility agent.
Step 6	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Monitoring Client Roaming Parameters

This section describes the new commands for the client parameters.

The following commands can be used to monitor the client roaming parameters on the switch.

Table 13: Monitoring Client Roaming Parameters Commands

Command	Purpose
show ap dot11 {5ghz 24ghz} l2roam rf-param	Displays the current RF parameters configured for client roaming for the 802.11a or 802.11b/g network.
show ap dot11 {5ghz 24ghz} l2roam statistics	Displays the CCX Layer 2 client roaming statistics for the 802.11a or 802.11b/g network.
show ap dot11 {5ghz 24ghz} l2roam mac-address <i>mac-address</i> statistics	Displays the CCX Layer 2 client roaming statistics for a particular access point.

Monitoring Mobility Configurations

This section describes the new commands for monitoring mobility configurations.

The following command can be used to monitor mobility configurations on the Mobility Oracle, Mobility Controller, and Mobility Agent.

Table 14: Monitoring Mobility Configuration Commands on the Mobility Controller and Mobility Agent

Command	Purpose
show wireless mobility summary	Displays the summary information for the Mobility Controller and Mobility Agent.
show wireless mobility statistics	Displays mobility statistics.
show wireless mobility dtls connections	Displays established DTLS connections.

Table 15: Monitoring Mobility Configuration Commands on the Mobility Oracle

Command	Purpose
show wireless mobility oracle summary	Displays the status of the Mobility Controllers known to the Mobility Oracle.
show wireless mobility oracle client summary	Displays the information of a list of clients in the Mobility Oracle database.
show wireless mobility oracle client detail <i>client -mac-address</i>	Displays the detailed information of a particular client in the Mobility Oracle database.
show wireless mobility oracle <i>mc-ip</i>	Displays the information of a list of clients in the Mobility Oracle database that are anchored or associated to a specified Mobility Controller.

Table 16: Monitoring Mobility Configuration Commands on the Mobility Controller

Command	Purpose
show wireless mobility controller client summary	Displays a list of clients in the subdomain.
show wireless mobility controller client <i>mac-address detail</i>	Displays detailed information for a client in a subdomain.
show wireless mobility agent <i>ma-ip client summary</i>	Displays a list of clients anchored or associated to a specified Mobility Agent.
show wireless mobility ap-list	Displays the list of Cisco APs known to the mobility group.

Table 17: Monitoring Mobility Configuration Commands on the Mobility Agent

Command	Purpose
show wireless mobility load-balance summary	Displays the summary of mobility load-balance properties.

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Prerequisites for Voice and Video Parameters

You can confirm the following points before configuring voice and video parameters:

- Ensure that the switch has access points connected to it.
- Configure SSID.

Restrictions for Voice and Video Parameters

The following are the restrictions that you should keep in mind while configuring voice and video parameters:

- SIP CAC can be used for the 9971 Cisco phones that support TSPEC-based admission control. You can also use the phones that support Status code 17.
- SIP snooping is supported for providing voice priority to the non-TSPEC SIP phones.
- TSPEC for video CAC is not supported.
- Cisco 792x IP phones that are admitted as non-WMM devices with 11K enabled will experience audio problems with the phones.

**Note**

Disable 11K for voice WLAN for all 792x Cisco IP phones that are admitted as non-WMM devices with 11K enabled. Upgrade the firmware on Cisco Unified Call Manager to 1.4.5 to resolve this issue. Refer to the Cisco Unified Call Manager configuration guide for more information.

Information About Configuring Voice and Video Parameters

Three parameters on the switch affect voice and/or video quality:

- Call Admission Control
- Expedited bandwidth requests
- Unscheduled automatic power save delivery

Call Admission Control (CAC) and UAPSD are supported on Cisco Compatible Extensions (CCX) v4 and v5; however, these parameters are also supported even without CCX but on any device implementing WMM (that supports 802.1e). Expedited bandwidth requests are supported only on CCXv5.

Traffic stream metrics (TSM) can be used to monitor and report issues with voice quality.

Call Admission Control

Call Admission Control (CAC) enables an access point to maintain controlled quality of service (QoS) when the wireless LAN is experiencing congestion. The WMM protocol deployed in CCXv4 maintains QoS under differing network loads.

Two types of Over The Air (OTA) CAC are available: static-based CAC and load-based CAC.

The switch supports the following QoS policies:

- User-defined policies: You can define your own QoS policies. You can have more control over these policies than the existing metal policies.
- System-defined precious metal policies: To support backward compatibility.
 - Platinum: Used for VoIP clients.

- Gold: Used for video clients.
- Silver: Used for best effort traffic.
- Bronze: Used for NRT traffic.

Static-Based CAC

Voice over WLAN applications supporting WMM and TSPEC can specify how much bandwidth or shared medium time is required to initiate a call. Bandwidth-based, or static, CAC enables the access point to determine whether it is capable of accommodating a particular call. The access point rejects the call if necessary in order to maintain the maximum allowed number of calls with acceptable quality.

The QoS setting for a WLAN determines the level of bandwidth-based CAC support. To use bandwidth-based CAC with voice applications, the WLAN must be configured for Platinum QoS. With bandwidth-based CAC, the access point bandwidth availability is determined based on the amount of bandwidth currently used by the access point clients, to which the bandwidth requested by the Voice over WLAN applications is added. If this total exceeds a configured bandwidth threshold, the new call is rejected.

**Note**

You must enable admission control (ACM) for CCXv4 clients that have WMM enabled. Otherwise, bandwidth-based CAC does not operate properly for these CCXv4 clients.

Load-Based CAC

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types (including that from clients), cochannel access point loads, and coallocated channel interference, for voice and video applications. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

In load-based CAC, the access point continuously measures and updates the utilization of the RF channel (that is, the mean time of bandwidth that has been exhausted), channel interference, and the additional calls that the access point can admit. The access point admits a new call only if the channel has enough unused bandwidth to support that call. By doing so, load-based CAC prevents oversubscription of the channel and maintains QoS under all conditions of WLAN loading and interference.

**Note**

If you disable load-based CAC, the access points start using bandwidth-based CAC.

IOSd Call Admission Control

IOSd Call Admission Control (CAC) controls bandwidth availability from switch to access point.

You can configure class-based, unconditional packet marking features on your switch for CAC.

CAC is a concept that applies to voice and video traffic only—not data traffic. If an influx of data traffic oversubscribes a particular link in the network, queueing, buffering, and packet drop decisions resolve the congestion. The extra traffic is simply delayed until the interface becomes available to send the traffic, or, if

traffic is dropped, the protocol or the end user initiates a timeout and requests a retransmission of the information.

Network congestion cannot be resolved in this manner when real-time traffic, sensitive to both latency and packet loss, is present, without jeopardizing the quality of service (QoS) expected by the users of that traffic. For real-time delay-sensitive traffic such as voice, it is better to deny network access under congestion conditions than to allow traffic onto the network to be dropped and delayed, causing intermittent impaired QoS and resulting in customer dissatisfaction.

CAC is therefore a deterministic and informed decision that is made before a voice call is established and is based on whether the required network resources are available to provide suitable QoS for the new call.

Based on the admit CAC CLI configuration in addition to the existing CAC algorithm, switch allows either voice or video with TSPEC or SIP snooping. The **admit cac** CLI is mandatory for the voice call to pass through.

If the BSSID policer is configured for the voice or video traffic, then additional checks are performed on the packets.

Expedited Bandwidth Requests

The expedited bandwidth request feature enables CCXv5 clients to indicate the urgency of a WMM traffic specifications (TSPEC) request (for example, an e911 call) to the WLAN. When the controller receives this request, it attempts to facilitate the urgency of the call in any way possible without potentially altering the quality of other TSPEC calls that are in progress.

You can apply expedited bandwidth requests to both bandwidth-based and load-based CAC. Expedited bandwidth requests are disabled by default. When this feature is disabled, the controller ignores all expedited requests and processes TSPEC requests as normal TSPEC requests.

The following table lists examples of TSPEC request handling for normal TSPEC requests and expedited bandwidth requests.

Table 18: TSPEC Request Handling Examples

CAC Mode	Reserved bandwidth for voice calls ¹	Usage ²	Normal TSPEC Request	TSPEC with Expedited Bandwidth Request
Bandwidth-based CAC	75% (default setting)	Less than 75%	Admitted	Admitted
		Between 75% and 90% (reserved bandwidth for voice calls exhausted)	Rejected	Admitted
		More than 90%	Rejected	Rejected
Load-based CAC		Less than 75%	Admitted	Admitted
		Between 75% and 85% (reserved bandwidth for voice calls exhausted)	Rejected	Admitted
		More than 85%	Rejected	Rejected

¹ For bandwidth-based CAC, the voice call bandwidth usage is per access point radio and does not take into account cochannel access points. For load-based CAC, the voice call bandwidth usage is measured for the entire channel.

² Bandwidth-based CAC (consumed voice and video bandwidth) or load-based CAC (channel utilization [Pb]).

**Note**

Admission control for TSPEC G711-20ms and G711-40 ms codec types are supported.

U-APSD

Unscheduled automatic power save delivery (U-APSD) is a QoS facility defined in IEEE 802.11e that extends the battery life of mobile clients. In addition to extending battery life, this feature reduces the latency of traffic flow delivered over the wireless media. Because U-APSD does not require the client to poll each individual packet buffered at the access point, it allows delivery of multiple downlink packets by sending a single uplink trigger packet. U-APSD is enabled automatically when WMM is enabled.

Traffic Stream Metrics

In a voice-over-wireless LAN (VoWLAN) deployment, traffic stream metrics (TSM) can be used to monitor voice-related metrics on the client-access point air interface. It reports both packet latency and packet loss. You can isolate poor voice quality issues by studying these reports.

The metrics consist of a collection of uplink (client side) and downlink (access point side) statistics between an access point and a client device that supports CCX v4 or later releases. If the client is not CCX v4 or CCXv5 compliant, only downlink statistics are captured. The client and access point measure these metrics. The access

point also collects the measurements every 5 seconds, prepares 90-second reports, and then sends the reports to the controller. The controller organizes the uplink measurements on a client basis and the downlink measurements on an access point basis and maintains an hour's worth of historical data. To store this data, the controller requires 32 MB of additional memory for uplink metrics and 4.8 MB for downlink metrics.

TSM can be configured through either the GUI or the CLI on a per radio-band basis (for example, all 802.11a radios). The controller saves the configuration in flash memory so that it persists across reboots. After an access point receives the configuration from the controller, it enables TSM on the specified radio band.

This table shows the upper limit for TSM entries in different controller series.

TSM Entries	5700
MAX AP TSM entries	100
MAX Client TSM entries	250
MAX TSM entries	100*250=25000

**Note**

Once the upper limit is reached, additional TSM entries cannot be stored and sent to WCS or NCS. If client TSM entries are full and AP TSM entries are available, then only the AP entries are stored, and viceversa. This leads to partial output. TSM cleanup occurs every one hour. Entries are removed only for those APs and clients that are not in the system.

Information About Configuring Voice Prioritization Using Preferred Call Numbers

You can configure a switch to provide support for SIP calls from VoWLAN clients that do not support TSPEC-based calls. This feature is known as SIP CAC support. If bandwidth is available in the configured voice pool, the SIP call uses the normal flow and the switch allocates the bandwidth to those calls.

You can also prioritize up to six preferred call numbers. When a call comes to one of the configured preferred numbers, the switch does not check the configured maximum voice bandwidth. The switch allocates the bandwidth needed for the call, even if it exceeds the maximum bandwidth for voice configured for voice CAC. The preferred call will be rejected if bandwidth allocation exceeds 85% of the radio bandwidth. The bandwidth allocation is 85 percent of the entire bandwidth pool, not just from the maximum configured voice pool. The bandwidth allocation is the same even for roaming calls.

You must configure the following parameters before configuring voice prioritization:

- Set WLAN QoS to allow voice calls to pass through.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

Information About EDCA Parameters

Enhanced distributed channel access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality-of-service (QoS) traffic.

How to Configure Voice and Video Parameters

Configuring Voice Parameters (CLI)

Before You Begin

Ensure that you have configured SIP-based CAC.

You should have created a class map for CAC before beginning this procedure.

SUMMARY STEPS

1. **show wlan summary**
2. **show wlan** *wlan_id*
3. **configure terminal**
4. **policy-map** *policy-map name*
5. **class** {*class-name* | **class-default**}
6. **admit cac wmm-tspec**
7. **service-policy** *policy-map name*
8. **end**
9. **wlan** *wlan_profile_name* *wlan_ID* *SSID_network_name* **wlan shutdown**
10. **wlan** *wlan_profile_name* *wlan_ID* *SSID_network_name*
11. **wlan** *wlan_name* **call-snoop**
12. **wlan** *wlan_name* **service-policy input** *input_policy_name*
13. **wlan** *wlan_name* **service-policy output** *ouput_policy_name*
14. **wlan** *wlan_name* **service-policy input** *ingress_policy_name*
15. **wlan** *wlan_name* **service-policy output** *egress_policy_name*
16. **ap dot11** {*5ghz* | *24ghz*} **shutdown**
17. **ap dot11** {*5ghz* | *24ghz*} **cac voice sip**
18. **ap dot11** {*5ghz* | *24ghz*} **cac voice acm**
19. **ap dot11** {*5ghz* | *24ghz*} **cac voice max-bandwidth** *bandwidth*
20. **ap dot11** {*5ghz* | *24ghz*} **cac voice roam-bandwidth** *bandwidth*
21. **no wlan shutdown**
22. **no ap dot11** {*5ghz* | *24ghz*} **shutdown**
23. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	show wlan summary Example: Switch# show wlan summary	Specifies all of the WLANs configured on the switch.
Step 2	show wlan wlan_id Example: Switch# show wlan 25	Specifies the WLAN that you plan to modify. For voice over WLAN, ensure that the WLAN is configured for WMM and the QoS level is set to Platinum.
Step 3	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 4	policy-map policy-map name Example: Switch(config)# policy-map test_2000 Switch(config-pmap)#	Enters policy map configuration mode. Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy. In WLAN, you need to configure service-policy for these commands to take effect.
Step 5	class {class-name class-default} Example: Switch(config-pmap)# class test_1000 Switch(config-pmap-c)#	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Specifies the name of the class whose policy you want to create or change. You can also create a system default class for unclassified packets.
Step 6	admit cac wmm-tspec Example: Switch(config-pmap-c)# admit cac wmm-tspec Switch(config-pmap-c)#	(Optional) Admits the request for Call Admission Control (CAC) for policy map.
Step 7	service-policy policy-map name Example: Switch(config-pmap-c)# service-policy test_2000 Switch(config-pmap-c)#	Configures the QoS service policy.
Step 8	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 9	wlan wlan_profile_name wlan_ID SSID_network_name wlan shutdown	Disables all WLANs with WMM enabled prior to changing the video parameters.

	Command or Action	Purpose
	Example: Switch(config)# wlan wlan1 Switch(config-wlan)# wlan shutdown	
Step 10	wlan wlan_profile_name wlan_ID SSID_network_name Example: Switch(config)# wlan wlan1 Switch(config-wlan)# wlan shutdown	Disables all WLANs with WMM enabled prior to changing the voice parameters.
Step 11	wlan wlan_name call-snoop Example: Switch(config)# wlan wlan1 call-snoop	Enables the call-snooping on a particular WLAN.
Step 12	wlan wlan_name service-policy input input_policy_name Example: Switch(config)# wlan wlan1 Switch(config-wlan)# service-policy input platinum-up	Configures input SSID policy on a particular WLAN to voice.
Step 13	wlan wlan_name service-policy output output_policy_name Example: Switch(config)# wlan wlan1 Switch(config-wlan)# service-policy output platinum	Configures output SSID policy on a particular WLAN to voice.
Step 14	wlan wlan_name service-policy input ingress_policy_name Example: Switch(config)# wlan wlan1 Switch(config-wlan)# service-policy input policy1	Configures ingress SSID policy on a particular WLAN as user-defined policy.
Step 15	wlan wlan_name service-policy output egress_policy_name Example: Switch(config)# wlan wlan1 Switch(config-wlan)# service-policy output policy2	Configures egress SSID policy on a particular WLAN as user-defined policy.
Step 16	ap dot11 {5ghz 24ghz} shutdown Example:	Disables the radio network. Switch(config)# ap dot11 5ghz shutdown

	Command or Action	Purpose
Step 17	ap dot11 {5ghz 24ghz} cac voice sip Example: Switch(config) # ap dot11 5ghz cac voice sip	Enables or disables SIP IOSd CAC for the 802.11a or 802.11b/g network.
Step 18	ap dot11 {5ghz 24ghz} cac voice acm Example: Switch(config) # ap dot11 5ghz cac voice acm	Enables or disables bandwidth-based voice CAC for the 802.11a or 802.11b/g network.
Step 19	ap dot11 {5ghz 24ghz} cac voice max-bandwidth bandwidth Example: Switch(config) # ap dot11 5ghz cac voice max-bandwidth 85	Sets the percentage of maximum bandwidth allocated to clients for voice applications on the 802.11a or 802.11b/g network. The bandwidth range is 5 to 85%, and the default value is 75%. Once the client reaches the value specified, the access point rejects new videos on this network.
Step 20	ap dot11 {5ghz 24ghz} cac voice roam-bandwidth bandwidth Example: Switch(config) # ap dot11 5ghz cac voice roam-bandwidth 10	Sets the percentage of maximum allocated bandwidth reserved for roaming voice clients. The bandwidth range is 0 to 25%, and the default value is 6%. The switch reserves this much bandwidth from the maximum allocated bandwidth for roaming voice clients.
Step 21	no wlan shutdown Example: Switch(config-wlan) # no wlan shutdown	Reenables all WLANs with WMM enabled.
Step 22	no ap dot11 {5ghz 24ghz} shutdown Example: Switch(config) # no ap dot11 5ghz shutdown	Reenables the radio network.
Step 23	end Example: Switch(config) # end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring Video Parameters (CLI)

SUMMARY STEPS

1. **show wlan summary**
2. **show wlan** *wlan_id*
3. **configure terminal**
4. **policy-map** *policy-map name*
5. **class** {*class-name* | **class-default**}
6. **admit cac wmm-tspec**
7. **service-policy** *policy-map name*
8. **end**
9. **wlan***wlan_profile_name*
10. **ap dot11** {*5ghz* | *24ghz*} **shutdown**
11. **ap dot11** {*5ghz* | *24ghz*} **cac video acm**
12. **ap dot11** {*5ghz* | *24ghz*} **cac video load-based**
13. **ap dot11** {*5ghz* | *24ghz*} **cac video max-bandwidth** *bandwidth*
14. **ap dot11** {*5ghz* | *24ghz*} **cac video roam-bandwidth** *bandwidth*
15. **no wlan shutdown** *wlan_id*
16. **no ap dot11** {*5ghz* | *24ghz*} **shutdown**
17. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	show wlan summary Example: Switch# show wlan summary	Specifies all of the WLANs configured on the switch.
Step 2	show wlan <i>wlan_id</i> Example: Switch# show wlan 25	Specifies the WLAN that you plan to modify.
Step 3	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 4	policy-map <i>policy-map name</i> Example: Switch(config)# policy-map test_2000 Switch(config-pmap)#	Enters policy map configuration mode. Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy. In WLAN, you need to configure service-policy for these commands to take effect.

	Command or Action	Purpose
Step 5	class { <i>class-name</i> class-default } Example: Switch(config-pmap)# class test_1000 Switch(config-pmap-c)#	Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Specifies the name of the class whose policy you want to create or change. You can also create a system default class for unclassified packets.
Step 6	admit cac wmm-tspec Example: Switch(config-pmap-c)# admit cac wmm-tspec Switch(config-pmap-c)#	(Optional) Admits the request for Call Admission Control (CAC) for policy map.
Step 7	service-policy <i>policy-map name</i> Example: Switch(config-pmap-c)# service-policy test_2000 Switch(config-pmap-c)#	Configures the QoS service policy.
Step 8	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 9	wlan <i>wlan_profile_name</i> Example: Switch(config)# wlan wlan1 Switch(config-wlan)# wlan shutdown	Disables all WLANs with WMM enabled prior to changing the video parameters.
Step 10	ap dot11 {5ghz 24ghz} shutdown Example: Switch(config)# ap dot11 5ghz shutdown	Disables the radio network.
Step 11	ap dot11 {5ghz 24ghz} cac video acm Example: Switch(config)# ap dot11 5ghz cac video acm	Enables or disables bandwidth-based video CAC for the 802.11a or 802.11b/g network.
Step 12	ap dot11 {5ghz 24ghz} cac video load-based Example: Switch(config)# ap dot11 5ghz cac video load-based	Configures the load-based CAC method. If you do not enter this command, then the default static CAC is applied.
Step 13	ap dot11 {5ghz 24ghz} cac video max-bandwidth <i>bandwidth</i> Example: Switch(config)# ap dot11 5ghz cac video max-bandwidth 20	Sets the percentage of maximum bandwidth allocated to clients for video applications on the 802.11a or 802.11b/g network. The bandwidth range is 5 to 85%, and the default value is 75%. The default value is 0, which means no bandwidth request control. The sum of the voice bandwidth and video bandwidth

	Command or Action	Purpose
		should not exceed 85% or configured maximum media bandwidth.
Step 14	ap dot11 {5ghz 24ghz} cac video roam-bandwidth <i>bandwidth</i> Example: Switch(config)# ap dot11 5ghz cac video roam-bandwidth 9	Sets the percentage of maximum allocated bandwidth reserved for roaming clients for video. The bandwidth range is 0 to 25%, and the default value is 0%.
Step 15	no wlan shutdown <i>wlan_id</i> Example: Switch(config-wlan)# no wlan shutdown 25	Reenables all WLANs with WMM enabled.
Step 16	no ap dot11 {5ghz 24ghz} shutdown Example: Switch(config)# no ap dot11 5ghz shutdown	Reenables the radio network.
Step 17	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring SIP-Based CAC (CLI)

SIP CAC controls the total number of SIP calls that can be made.

SUMMARY STEPS

1. **configure terminal**
2. **wlan *wlan-name***
3. **call-snoop**
4. **service-policy [client] input *policy-map name***
5. **service-policy [client] output *policy-map name***
6. **end**
7. **show wlan {*wlan-id* | *wlan-name*}**
8. **configure terminal**
9. **ap dot11 {5ghz | 24ghz} cac {voice | video} acm**
10. **ap dot11 {5ghz | 24ghz} cac voice sip**
11. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	wlan wlan-name Example: Switch(config)# wlan qos-wlan Switch(config-wlan)#	Enters WLAN configuration submode.
Step 3	call-snoop Example: Switch(config-wlan)# call-snoop	Enables the call-snooping feature for a particular WLAN.
Step 4	service-policy [client] input policy-map name Example: Switch(config-wlan)# service-policy input platinum-up	Assigns a policy map to WLAN input traffic. Ensure that you provide QoS policy to voice for input traffic.
Step 5	service-policy [client] output policy-map name Example: Switch(config-wlan)# service-policy output platinum	Assigns policy map to WLAN output traffic. Ensure that you provide QoS policy to voice for output traffic.
Step 6	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Step 7	show wlan {wlan-id wlan-name} Example: Switch# show wlan qos-wlan	Verifies the configured QoS policy on the WLAN.
Step 8	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 9	ap dot11 {5ghz 24ghz} cac {voice video} acm Example: Switch(config)# ap dot11 5ghz cac voice acm	Enables the ACM static on the radio. When enabling SIP snooping, use the static CAC, not the load-based CAC.
Step 10	ap dot11 {5ghz 24ghz} cac voice sip Example: Switch(config)# ap dot11 5ghz cac voice sip	Configures SIP-based CAC.

	Command or Action	Purpose
Step 11	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring a Preferred Call Number (CLI)

Before You Begin

You must set the following parameters before configuring a preferred call number.

- Set WLAN QoS to voice.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.
- Enable SIP-based CAC.

SUMMARY STEPS

1. **configure terminal**
2. **wlan *wlan-name* qos platinum**
3. **ap dot11 {5ghz | 24ghz} cac {voice | video} acm**
4. **wlan *wlan-name***
5. **wireless sip preferred-call-no *call_index* *call_number***
6. **no wireless sip preferred-call-no *call_index***
7. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	wlan <i>wlan-name</i> qos platinum Example: Switch(config)# wlan wlan1 Switch(config-wlan)# qos platinum	Sets QoS to voice on a particular WLAN.
Step 3	ap dot11 {5ghz 24ghz} cac {voice video} acm	Enables the static ACM on the radio.

	Command or Action	Purpose
	Example: Switch(config)# ap dot11 5ghz cac voice acm	When enabling SIP snooping, use the static CAC, not the load-based CAC.
Step 4	wlan wlan-name Example: Switch(config)# wlan wlan1 Switch(config-wlan)# call-snoop	Enables the call-snooping feature for a particular WLAN.
Step 5	wireless sip preferred-call-no call_index call_number Example: Switch(config)# wireless sip preferred-call-no 1 555333	Adds a new preferred call.
Step 6	no wireless sip preferred-call-no call_index Example: Switch(config)# no wireless sip preferred-call-no 1	Removes a preferred call.
Step 7	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring EDCA Parameters (CLI)

SUMMARY STEPS

1. configure terminal
2. ap dot11 {5ghz | 24ghz } shutdown
3. ap dot11 {5ghz | 24ghz} edca-parameters {custom-voice | optimized-video-voice | optimized-voice | svp-voice | wmm-default}
4. show ap dot11 {5ghz | 24ghz} network
5. no ap dot11 {5ghz | 24ghz} shutdown
6. end

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	ap dot11 {5ghz 24ghz} shutdown Example: Switch(config)# ap dot11 5ghz shutdown	Disables the radio network.
Step 3	ap dot11 {5ghz 24ghz} edca-parameters {custom-voice optimized-video-voice optimized-voice svp-voice wmm-default} Example: Switch(config)# ap dot11 5ghz edca-parameters optimized-voice	<p>Enables a specific EDCA parameters for the 802.11a or 802.11b/g network.</p> <ul style="list-style-type: none"> • custom-voice—Enables custom voice parameters for the 802.11a or 802.11b/g network. • optimized-video-voice—Enables EDCA voice- and video-optimized parameters for the 802.11a or 802.11b/g network. Choose this option when both voice and video services are deployed on your network. • optimized-voice—Enables non-SpectraLink voice-optimized profile parameters for the 802.11a or 802.11b/g network. Choose this option when voice services other than SpectraLink are deployed on your network. • svp-voice—Enables SpectraLink voice priority parameters for the 802.11a or 802.11b/g network. Choose this option if SpectraLink phones are deployed on your network to improve the quality of calls. • wmm-default—Enables the Wi-Fi Multimedia (WMM) default parameters for the 802.11a or 802.11b/g network. This is the default value. Choose this option when voice or video services are not deployed on your network.
Step 4	show ap dot11 {5ghz 24ghz} network Example: Switch(config)# show ap dot11 5ghz network	Displays the current status of MAC optimization for voice.
Step 5	no ap dot11 {5ghz 24ghz} shutdown Example: Switch(config)# no ap dot11 5ghz shutdown	Reenables the radio network.

	Command or Action	Purpose
Step 6	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Monitoring Voice and Video Parameters

This section describes the new commands for the voice and video parameters.

The following commands can be used to monitor voice and video parameters.

Table 19: Monitoring Voice Parameters Commands

Command	Purpose
show ap dot11 {5ghz 24ghz} network	Displays the radio-based statistics for voice.
show ap name <i>ap_name</i> dot11 24ghz tsm all	Displays the TSM voice metrics and current status of MAC optimization for voice.
show ap name <i>apname</i> cac voice	Displays the information about CAC for a particular access point.
show client detail <i>client_mac</i>	Displays the U-APSD status for a particular client.
show policy-map interface wireless client	Displays the video client policy details.
show access-list	Displays the video client dynamic access-list from the switch.
show wireless client voice diag status	<p>Displays information about whether voice diagnostics are enabled or disabled. If enabled, this also displays information about the clients in the watch list and the time remaining for the diagnostics of the voice call.</p> <p>Note To work on voice diagnostics CLIs, you need to enter the following command: debug voice-diagnostic mac-addr <i>client_mac_01</i> <i>client_mac_02</i></p>
show wireless client voice diag tspec	Displays the TSPEC information sent from the clients that are enabled for voice diagnostics.

show wireless client voice diag qos-map	Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed.
show wireless client voice diag rssi	Display the client's RSSI values in the last 5 seconds when voice diagnostics is enabled.
show client voice-diag roam-history	Displays information about the last three roaming calls. The output contains the timestamp, access point associated with roaming, roaming reason, and if there is a roaming failure, reason for roaming-failure.
show policy-map interface wireless mac <i>mac-address</i>	Displays information about the voice and video data packet statistics.
show wireless media-stream client summary	Displays a summary of the media stream and video client information.
show controllers d0 b queue	Displays which queue the packets are going through on an access point.
show platform qos queue stats <i>interface</i>	Displays which queue packets are going through from the switch.

You can monitor the video parameters using the following commands.

Table 20: Monitoring Video Parameters Commands

Command	Purpose
show ap join stats summary <i>ap_mac</i>	Displays the last join error detail for a specific access point.
show ip igmp snooping wireless mgid	Displays the TSM voice metrics and current status of MAC optimization for voice.
show wireless media-stream multicast-direct state	Displays the media stream multicast-direct parameters.
show wireless media-stream group summary	Displays the summary of the media stream and client information.
show wireless media-stream group detail <i>group_name</i>	Displays the details of a specific media-stream group.
show wireless media-stream client summary	Displays the details for a set of media-stream clients.

show wireless media-stream client detail <i>group_name</i>	Displays the details for a set of media-stream clients.
show ap dot11 {5ghz 24ghz} media-stream rrc	Display the details of media stream.
show wireless media-stream message details	Displays information about the message configuration.
show ap name <i>ap-name</i> auto-rf dot11 5ghz i Util	Displays the details of channel utilization.
show controllers d0 b queue	Displays which queue the packets are going through on an access point based on 2.4- and 5-GHz bands.
show controllers d1 b queue	Displays which queue the packets are going through on an access point based on 2.4- and 5-GHz bands.
show cont d1 b Media	Displays the video metric details on the band A or B.
show capwap mcast mgid all	Displays information about all of the multicast groups and their corresponding multicast group identifications (MGIDs) associated to the access point.
show capwap mcast mgid id <i>id</i>	Displays information about all of the video clients joined to the multicast group in a specific MGID.

Configuration Examples for Voice and Video Parameters

Example: Configuring Voice and Video

Configuring Egress SSID Policy for Voice and Video

The following example shows how to create and configure an egress SSID policy for voice and video:

```

table-map egress_ssid_tb
  map from 24 to 24
  map from 34 to 34
  map from 46 to 46
  default copy

class-map match-any voice
  match dscp ef
class-map match-any video
  match dscp af41

policy-map ssid-cac
  class class-default
    shape average 25000000
    set dscp dscp table egress_ssid_tb
    queue-buffers ratio 0
    service-policy ssid-child-cac

policy-map ssid-child-cac
  class voice
    priority level 1

```

```
    police 5000000
      conform-action transmit
      exceed-action drop
      admit cac wmm-tspec
      rate 1000
      wlan-up 6 7
  class video
    priority level 2
    police 10000000
      conform-action transmit
      exceed-action drop
      admit cac wmm-tspec
      rate 3000
      wlan-up 4 5
```

Configuring Ingress SSID Policy for Voice and Video

The following example shows how to create and configure an ingress SSID policy for voice and video:

```
table-map up_to_dscp
  map from 0 to 0
  map from 1 to 8
  map from 2 to 8
  map from 3 to 0
  map from 4 to 34
  map from 5 to 34
  map from 6 to 46
  map from 7 to 48
  default copy

policy-map ingress_ssid
  class class-default
    set dscp wlan user-priority table up_to_dscp
```

Configuring Egress Port Policy Voice and Video

The following example shows how to create and configure an egress port policy for voice and video:

```
policy-map port_child_policy
  class non-client-nrt-class
    bandwidth remaining ratio 10

  class voice
    priority level 1
    police rate 3000000

  class video
    priority level 2
    police rate 4000000
```

Applying Ingress and Egress SSID policies for Voice and Video on a WLAN

The following example shows how to apply ingress and egress SSID policies for voice and video on a WLAN:

```
wlan voice_video 1 voice_video
  service-policy input ingress_ssid
  service-policy output ssid-cac
```

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Configuring RFID Tag Tracking

The Switch enables you to configure radio-frequency identification (RFID) tag tracking. RFID tags are small wireless devices that are affixed to assets for real-time location tracking. They operate by advertising their location using special 802.11 packets, which are processed by access points, the controller, and the location appliance.

How to Configure RFID Tag Tracking

Configuring RFID Tag Tracking (CLI)

SUMMARY STEPS

1. **location rfid status**
2. (Optional) **no location rfid status**
3. **location rfid timeout** *seconds*
4. **location rfid mobility vendor-name** *name*
5. (Optional) **no location rfid mobility** *name*

DETAILED STEPS

	Command or Action	Purpose
Step 1	location rfid status Example: Switch(config)# location rfid status	Enables RFID tag tracking. By default, RFID tag tracking is enabled.
Step 2	(Optional) no location rfid status Example: Switch(config)# no location rfid status	Disables RFID tag tracking.
Step 3	location rfid timeout <i>seconds</i> Example: Switch(config)# location rfid timeout 1500	Specifies a static timeout value (between 60 and 7200 seconds). The static timeout value is the amount of time that the switch maintains tags before expiring them. For example, if a tag is configured to beacon every 30 seconds, we recommend that you set the timeout value to 90 seconds (approximately three times the beacon value). The default value is 1200 seconds.
Step 4	location rfid mobility vendor-name <i>name</i> Example: Switch(config)# location rfid mobility vendor-name Aerosct	Enables RFID tag mobility for specific tags. When you enter the location rfid mobility vendor-name command, tags are unable to obtain a DHCP address for client mode when attempting to select and/or download a configuration. Note These commands can be used only for Pango tags. Therefore, the only valid entry for vendor_name is “pango” in all lowercase letters.
Step 5	(Optional) no location rfid mobility <i>name</i> Example: Switch(config)# no location rfid mobility test	Disables RFID tag mobility for specific tags. When you enter the no location rfid mobility command, tags can obtain a DHCP address. If a tag roams from one subnet to another, it obtains a new address rather than retaining the anchor state.

Monitoring RFID Tag Tracking Information

This section describes the new commands for the RFID tag tracking Information.

The following commands can be used to monitor the RFID tag tracking Information on the switch.

Table 21: Monitoring RFID Tag Tracking Information Commands

Command	Purpose
show location rfid config	Displays the current configuration for RFID tag tracking.
show location rfid detail <i>mac_address</i>	Displays the detailed information for a specific RFID tag.
show location rfid summary	Displays a list of all RFID tags currently connected to the switch.
show location rfid client	Displays a list of RFID tags that are associated to the switch as clients.

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Configuring Location Settings

The switch determines the location of client devices by gathering Received Signal Strength Indication (RSSI) measurements from access points all around the client of interest. The switch can obtain location reports from up to 16 access points for clients, RFID tags, and rogue access points.

You can configure the path loss measurement (S60) request for normal clients or calibrating clients to improve location accuracy.

How to Configure Location Settings

Configuring Location Settings (CLI)

SUMMARY STEPS

1. **configure terminal**
2. **location plm** {**calibrating** [**multiband** | **uniband**] | **client** *burst_interval*}
3. **location rssi-half-life** {**calibrating-client** | **client** | **rogue-aps** | **tags** } *seconds*
4. **location expiry** {**calibrating-client** | **client** | **rogue-aps** | **tags** } *timeout*
5. **location algorithm** {**rssi-average** | **simple**}
6. **location admin-tag** *string*
7. **location civic-location identifier** {*identifier* | **host**}
8. **location custom-location identifier** {*identifier* | **host**}
9. **location geo-location identifier** {*identifier* | **host**}
10. **location prefer** {**cdp** | **lldp-med** | **static**} **weight** *priority_value*
11. **location rfid** {**status** | **timeout** | **vendor-name**}
12. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	location plm { calibrating [multiband uniband] client <i>burst_interval</i> }	<p>Configures the path loss measurement (S60) request for calibrating clients or non-calibrating.</p> <p>The path loss measurement request improves the location accuracy. You can configure the burst_interval parameter for the normal, noncalibrating client from zero through 3600 seconds, and the default value is 60 seconds.</p> <p>You can configure the path loss measurement request for calibrating clients on the associated 802.11a or 802.11b/g radio or on the associated 802.11a/b/g radio.</p> <p>If a client does not send probes often or sends them only on a few channels, its location cannot be updated or cannot be updated accurately. The location plm command forces clients to send more packets on all channels. When a CCXv4 (or higher) client associates, the Switch sends it a path loss measurement request, which instructs the client to transmit on the bands and channels that the access points are on (typically, channels 1, 6, and 11 for 2.4-GHz-only access points) at a configurable interval (such as 60 seconds) indefinitely.</p>

	Command or Action	Purpose
Step 3	location rssi-half-life { calibrating-client client rogue-aps tags } <i>seconds</i> Example: <pre>Switch(config)# location rssi-half-life calibrating-client 60</pre>	<p>Configures the RSSI half life for the clients, calibrating clients, RFID tags, and rogue access points.</p> <p>You can enter the location rssi-half-life parameter value for the clients, calibrating clients, RFID tags, and rogue access points as 0, 1, 2, 5, 10, 20, 30, 60, 90, 120, 180, or 300 seconds, and the default value is 0 seconds.</p> <p>Some client devices transmit at reduced power immediately after changing channels, and RF is variable, so RSSI values might vary considerably from packet to packet. The location rssi-half-life command increases accuracy by averaging nonuniformly arriving data using a configurable forget period (or half life).</p> <p>Note We recommend that you do not use or modify the location rssi-half-life command.</p>
Step 4	location expiry { calibrating-client client rogue-aps tags } <i>timeout</i> Example: <pre>Switch(config)# location expiry calibrating-client 50</pre>	<p>Configures the RSSI timeout value for the clients, calibrating clients, RFID tags, and rogue access points.</p> <p>You can enter the RSSI timeout value for the clients, RFID tags, and rogue access points from 5 through 3600 seconds, and the default value is 5 seconds.</p> <p>For the calibrating clients, you can enter the RSSI timeout value from 0 through 3600 seconds, and the default value is 5 seconds.</p> <p>Ensuring that recent, strong RSSIs are retained by the CPU is critical to location accuracy. The location expiry command enables you to specify the length of time after which old RSSI averages expire.</p> <p>Note We recommend that you do not use or modify the location expiry command.</p>
Step 5	location algorithm { rssi-average simple } Example: <pre>Switch(config)# location algorithm rssi-average</pre>	<p>Configures the algorithm used to average RSSI and signal-to-noise ratio (SNR) values.</p> <p>You can enter the location algorithm rssi-average command to specify a more accurate algorithm but requires more CPU overhead or the location algorithm simple command to specify a faster algorithm that requires low CPU overhead but provides less accuracy.</p> <p>Note We recommend that you do not use or modify the location algorithm command.</p>
Step 6	location admin-tag <i>string</i> Example: <pre>Switch(config)# location admin-tag</pre>	<p>Sets administrative tag or site information for the location of client devices.</p>
Step 7	location civic-location identifier { <i>identifier</i> <i>host</i> } Example: <pre>Switch(config)# location civic-location identifier host</pre>	<p>Specifies civic location information.</p> <p>You can set the civic location identifier either as a string or host.</p>

	Command or Action	Purpose
Step 8	location custom-location identifier <i>{identifier host}</i> Example: <pre>Switch(config)# location custom-location identifier host</pre>	Specifies custom location information. You can set the custom location identifier either as a string or host.
Step 9	location geo-location identifier <i>{identifier host}</i> Example: <pre>Switch(config)# location geo-location identifier host</pre>	Specifies geographical location information of the client devices. You can set the location identifier either as a string or host.
Step 10	location prefer <i>{cdp lldp-med static}</i> weight <i>priority_value</i> Example: <pre>Switch(config)# location prefer weight cdp 50</pre>	Sets location information source priority. You can enter the priority weight from zero through 255.
Step 11	location rfid <i>{status timeout vendor-name}</i> Example: <pre>Switch(config)# location rfid timeout 100</pre>	Configures RFID tag tracking options such as RFID tag status, RFID timeout value, and RFID tag vendor name. You can enter the RFID timeout value in a range from 60 and 7200 seconds.
Step 12	end Example: <pre>Switch(config)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI)

The Network Mobility Services Protocol (NMSP) manages communication between the mobility services engine and the controller for incoming and outgoing traffic. If your application requires more frequent location updates, you can modify the NMSP notification interval (to a value between 1 and 180 seconds) for clients, active RFID tags, and rogue access points and clients.

Note

The TCP port (16113) that the controller and mobility services engine communicate over must be open (not blocked) on any firewall that exists between the controller and the mobility services engine for NMSP to function.

SUMMARY STEPS

1. **configure terminal**
2. **nmosp notification interval** {attachment *seconds* | location *seconds* | rssi [clients *interval* | rfid *interval* | rogues [ap | client] *interval*]}
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	nmosp notification interval {attachment <i>seconds</i> location <i>seconds</i> rssi [clients <i>interval</i> rfid <i>interval</i> rogues [ap client] <i>interval</i>]} Example: Switch(config)# nmosp notification interval rssi rfid 50	Sets the NMSP notification interval value for clients, RFID tags, and rogue clients and access points. You can enter the NMSP notification interval value for RSSI measurement from 1 through 180 seconds.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Modifying the NMSP Notification threshold for Clients, RFID Tags, and Rogues (CLI)

SUMMARY STEPS

1. **configure terminal**
2. **location notify-threshold** {clients | rogues ap | tags } *threshold*
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	location notify-threshold {clients rogues ap tags } threshold Example: Switch(config)# location notify-threshold clients 5	Configures the NMSP notification threshold for clients, RFID tags, and rogue clients and access points. You can enter the RSSI threshold value from zero through 10 db.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Monitoring Location Settings and NMSP Settings

Monitoring Location Settings (CLI)

This section describes the new commands for location settings.

The following commands can be used to monitor location settings on the switch.

Table 22: Monitoring Location Settings Commands

Command	Purpose
show location summary	Displays the current location configuration values.
show location statistics rfid	Displays the location-based RFID statistics.
show location detail client_mac_addr	Displays the RSSI table for a particular client.

Monitoring NMSP Settings (CLI)

This section describes the new commands for NMSP settings.

The following commands can be used to monitor NMSP settings on the switch.

Table 23: Monitoring NMSP Settings Commands

Command	Purpose
show nmsp attachment suppress interfaces	Displays the attachment suppress interfaces.
show nmsp capability	Displays the NMSP capabilities.
show nmsp notification interval	Displays the NMSP notification intervals.
show nmsp statistics connection	Displays the connection-specific NMSP counters.
show nmsp statistics summary	Displays the common NMSP counters.
show nmsp status	Displays the status of active NMSP connections.
show nmsp subscription detail	Displays all of the mobility services to which the switch is subscribed.
show nmsp subscription detail <i>ip_addr</i>	Displays details only for the mobility services subscribed to by a specific IP address.
show nmsp subscription summary	Displays details for all of the mobility services to which the switch is subscribed.

Examples: Location Settings Configuration

This example shows how to configure the path loss measurement (S60) request for calibrating client on the associated 802.11a or 802.11b/g radio:

```
Switch# configure terminal
Switch(config)# location plm calibrating uniband
Switch(config)# end
Switch# show location summary
```

This example shows how to configure the RSSI half life for a rouge access point:

```
Switch# configure terminal
Switch(config)# location rssi-half-life rogue-aps 20
Switch(config)# end
Switch# show location summary
```

Examples: NMSP Settings Configuration

This example shows how to configure the NMSP notification interval for RFID tags:

```
Switch# configure terminal
Switch(config)# nmsp notification interval rssi rfid 50
```

```
Switch(config)# end
Switch# show nmosp notification interval
```

This example shows how to configure the NMSP notification threshold for clients:

```
Switch# configure terminal
Switch(config)# nmosp notify-threshold 5
Switch(config)# end
Switch# show nmosp statistics summary
```

Information About Configuring SDM Templates

SDM Templates

You can use SDM templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

These templates are supported on your device:

- **Advanced**—The advanced template is available on all supported images for this release. It maximizes system resources for features like netflow, multicast groups, security ACEs, QoS ACEs, and so on.
- **VLAN**—The VLAN template is available only on the LAN Base license. The VLAN template disables routing and supports the maximum number of unicast MAC addresses. It would typically be selected for a Layer 2 device.

After you change the template and the system reboots, you can use the **show sdm prefer** privileged EXEC command to verify the new template configuration. If you enter the **show sdm prefer** command before you enter the **reload** privileged EXEC command, the **show sdm prefer** command shows the template currently in use and the template that will become active after a reload.

The default is the advanced template.

Table 24: Approximate Number of Feature Resources Allowed by Templates

Resource	Advanced	VLAN
Number of VLANs	4094	4094
Unicast MAC addresses	32 K	32 K
Overflow unicast MAC addresses	512	512
IGMP groups and multicast routes	4 K	4 K
Overflow IGMP groups and multicast routes	512	512
• Directly connected routes	32 K	32 K
• Indirectly connected IP hosts	8 K	8 K
Policy-based routing ACEs	1024	0
QoS classification ACEs	3 K	3 K
Security ACEs	3 K	3 K

Resource	Advanced	VLAN
Netflow ACEs	1024	1024
Input Microflow policer ACEs:	256 K	0
Output Microflow policer ACEs:	256 K	0
FSPAN ACEs	256	256
Control Plane Entries:	512	512
Input Netflow flows:	8 K	8 K
Output Netflow flows:	16 K	16 K

**Note**

When the switch is used as a Wireless Mobility Agent, the only template allowed is the advanced template.

The tables represent approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.

SDM Templates and Switch Stacks

In a switch stack, all stack members must use the same SDM template that is stored on the active switch. When a new switch is added to a stack, the SDM configuration that is stored on the active switch overrides the template configured on an individual switch.

You can use the **show switch** privileged EXEC command to see if any stack members are in SDM mismatch mode.

How to Configure SDM Templates

Configuring SDM Templates

Configuring the Switch SDM Template

Setting the SDM Template

Follow these steps to use the SDM template to maximize feature usage:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **sdm prefer { advanced | vlan }**
4. **end**
5. **reload**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	sdm prefer { advanced vlan } Example: Switch(config)# sdm prefer advanced	Specifies the SDM template to be used on the switch. The keywords have these meanings: <ul style="list-style-type: none"> • advanced —Supports advanced features such as Netflow. • vlan —Maximizes VLAN configuration on the switch with no routing supported in hardware. <p>Note The no sdm prefer command and a default template is not supported.</p>
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.
Step 5	reload Example: Switch# reload	Reloads the operating system.

Monitoring and Maintaining SDM Templates

Command	Purpose
show sdm prefer	Displays the SDM template in use.
reload	Reloads the switch to activate the newly configured SDM template.
no sdm prefer	Sets the default SDM template.

Configuration Examples for SDM Templates

Examples: Configuring SDM Templates

This example shows how to configure the VLAN template:

```
Switch(config)# sdm prefer vlan
Switch(config)# exit
Switch# reload
Proceed with reload? [confirm]
```

Examples: Displaying SDM Templates

This is an example output showing the advanced template information:

```
Switch# show sdm prefer

Showing SDM Template Info

This is the Advanced template.
Number of VLANs: 4094
Unicast MAC addresses: 32768
Overflow Unicast MAC addresses: 512
IGMP and Multicast groups: 8192
Overflow IGMP and Multicast groups: 512
Directly connected routes: 32768
Indirect routes: 8192
Security Access Control Entries: 3072
QoS Access Control Entries: 2816
Policy Based Routing ACEs: 1024
Netflow ACEs: 1024
Input Microflow policer ACEs: 256
Output Microflow policer ACEs: 256
Flow SPAN ACEs: 256
Tunnels: 256
Control Plane Entries: 512
Input Netflow flows: 8192
Output Netflow flows: 16384
These numbers are typical for L2 and IPv4 features.
```

Some features such as IPv6, use up double the entry size;
so only half as many entries can be created.

Switch#

This is an example output showing the VLAN template information:

Switch# **show sdm prefer vlan**

Showing SDM Template Info

This is the VLAN template for a typical Layer 2 network.

Number of VLANs:	4094
Unicast MAC addresses:	32768
Overflow Unicast MAC addresses:	512
IGMP and Multicast groups:	8192
Overflow IGMP and Multicast groups:	512
Directly connected routes:	32768
Indirect routes:	8192
Security Access Control Entries:	3072
QoS Access Control Entries:	3072
Policy Based Routing ACEs:	0
Netflow ACEs:	1024
Input Microflow policer ACEs:	0
Output Microflow policer ACEs:	0
Flow SPAN ACEs:	256
Tunnels:	0
Control Plane Entries:	512
Input Netflow flows:	16384
Output Netflow flows:	8192

These numbers are typical for L2 and IPv4 features.
Some features such as IPv6, use up double the entry size;
so only half as many entries can be created.

Switch#

Information About Configuring System Message Logs

System Message Logging

By default, a switch sends the output from system messages and **debug** privileged EXEC commands to a logging process. Stack members can trigger system messages. A stack member that generates a system message

appends its hostname in the form of `hostname-n`, where `n` is a switch range from 1 to 4, and redirects the output to the logging process on the active switch. Though the active switch is a stack member, it does not append its hostname to system messages. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch, and in the case of a switch stack, on the active switch. If a standalone switch or the stack master fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port. In a switch stack, all stack member consoles provide the same console output.

**Note**

The syslog format is compatible with 4.3 BSD UNIX.

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

- *seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)*
- *seq no:timestamp: %facility-severity-MNEMONIC:description*

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

- **service sequence-numbers**
- **service timestamps log datetime**
- **service timestamps log datetime [localtime] [msec] [show-timezone]**
- **service timestamps log uptime**

Table 25: System Log Message Elements

Element	Description
<i>seq no:</i>	Stamps log messages with a sequence number only if the service sequence-numbers global configuration command is configured.
<i>timestamp</i> formats: <i>mm/dd h h:mm:ss</i> or <i>hh:mm:ss</i> (short uptime) or <i>d h</i> (long uptime)	Date and time of the message or event. This information appears only if the service timestamps log [datetime log] global configuration command is configured.
<i>facility</i>	The facility to which the message refers (for example, SNMP, SYS, and so forth).
<i>severity</i>	Single-digit code from 0 to 7 that is the severity of the message.
<i>MNEMONIC</i>	Text string that uniquely describes the message.
<i>description</i>	Text string containing detailed information about the event being reported.
<i>hostname-n</i>	Hostname of a stack member and its switch number in the stack. Though the active switch is a stack member, it does <i>not</i> append its hostname to system messages.

Default System Message Logging Settings

Table 26: Default System Message Logging Settings

Feature	Default Setting
System message logging to the console	Enabled.
Console severity	Debugging.
Logging file configuration	No filename specified.
Logging buffer size	4096 bytes.
Logging history size	1 message.

Feature	Default Setting
Time stamps	Disabled.
Synchronous logging	Disabled.
Logging server	Disabled.
Syslog server IP address	None configured.
Server facility	Local7
Server severity	Informational.

Syslog Message Limits

If you enabled syslog message traps to be sent to an SNMP network management station by using the **snmp-server enable trap** global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level **warning** and numerically lower levels are stored in the history table even if syslog traps are not enabled.

When the history table is full (it contains the maximum number of message entries specified with the **logging history size** global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

The history table lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, *emergencies* equal 1, not 0, and *critical* equals 3, not 2.

How to Configure System Message Logs

Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **logging buffered** *[size]*
3. **logging** *host*
4. **logging file flash:** *filename* *[max-file-size [min-file-size]]* *[severity-level-number | type]*
5. **end**
6. **terminal monitor**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	logging buffered <i>[size]</i> Example: Switch(config)# logging buffered 8192	<p>Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the active switch. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes.</p> <p>If a standalone switch or the active switch fails, the log file is lost unless you previously saved it to flash memory. See Step 4.</p> <p>Note Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should <i>not</i> be set to this amount.</p>
Step 3	logging <i>host</i> Example: Switch(config)# logging 125.1.1.100	<p>Logs messages to a UNIX syslog server host.</p> <p><i>host</i> specifies the name or IP address of the host to be used as the syslog server.</p> <p>To build a list of syslog servers that receive logging messages, enter this command more than once.</p>
Step 4	logging file flash: <i>filename</i> <i>[max-file-size [min-file-size]]</i> <i>[severity-level-number type]</i> Example: Switch(config)# logging file flash:log_msg.txt 40960 4096 3	<p>Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the active switch.</p> <ul style="list-style-type: none"> • <i>filename</i>—Enters the log message filename. • (Optional) max-file-size —Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes. • (Optional) <i>min-file-size</i>—Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes. • (Optional) <i>severity-level-number type</i>—Specifies either the logging severity level or the logging type. The severity range is 0 to 7.

	Command or Action	Purpose
Step 5	end Example: Switch(config) # end	Returns to privileged EXEC mode.
Step 6	terminal monitor Example: Switch# terminal monitor	Logs messages to a nonconsole terminal during the current session. Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.

Synchronizing Log Messages

You can synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **line** [**console** | **vty**] *line-number* [*ending-line-number*]
3. **logging synchronous** [**level** [*severity-level* | **all**] | **limit** *number-of-buffers*]
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	<p>line [console vty] <i>line-number</i> [<i>ending-line-number</i>]</p> <p>Example:</p> <pre>Switch(config)# line console</pre>	<p>Specifies the line to be configured for synchronous logging of messages.</p> <ul style="list-style-type: none"> • console—Specifies configurations that occur through the switch console port or the Ethernet management port. • line vty line-number—Specifies which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15. <p>You can change the setting of all 16 vty lines at once by entering:</p> <pre>line vty 0 15</pre> <p>You can also change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter:</p> <pre>line vty 2</pre> <p>When you enter this command, the mode changes to line configuration.</p>
Step 3	<p>logging synchronous [level [<i>severity-level</i> all] limit <i>number-of-buffers</i>]</p> <p>Example:</p> <pre>Switch(config)# logging synchronous level 3 limit 1000</pre>	<p>Enables synchronous logging of messages.</p> <ul style="list-style-type: none"> • (Optional) level severity-level—Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2. • (Optional) level all—Specifies that all messages are printed asynchronously regardless of the severity level. • (Optional) limit number-of-buffers—Specifies the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.
Step 4	<p>end</p> <p>Example:</p> <pre>Switch(config)# end</pre>	<p>Returns to privileged EXEC mode.</p>

Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The **logging synchronous** global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press **Return**.

To reenable message logging after it has been disabled, use the **logging on** global configuration command. This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **no logging console**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	no logging console Example: Switch(config)# no logging console	Disables message logging.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.

Enabling and Disabling Time Stamps on Log Messages

By default, log messages are not time-stamped.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. Use one of these commands:
 - **service timestamps log uptime**
 - **service timestamps log datetime[msec | localtime | show-timezone]**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	Use one of these commands: <ul style="list-style-type: none"> • service timestamps log uptime • service timestamps log datetime[msec localtime show-timezone] Example: Switch(config)# service timestamps log uptime or Switch(config)# service timestamps log datetime	Enables log time stamps. <ul style="list-style-type: none"> • log uptime—Enables time stamps on log messages, showing the time since the system was rebooted. • log datetime—Enables time stamps on log messages. Depending on the options selected, the time stamp can include the date, time in milliseconds relative to the local time zone, and the time zone name.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.

Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **service sequence-numbers**
3. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	service sequence-numbers Example: Switch(config)# service sequence-numbers	Enables sequence numbers.
Step 3	end Example: Switch(config)# end	Returns to privileged EXEC mode.

Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message.
This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **logging console *level***
3. **logging monitor *level***
4. **logging trap *level***
5. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	logging console <i>level</i> Example: Switch(config)# logging console 3	Limits messages logged to the console. By default, the console receives debugging messages and numerically lower levels.
Step 3	logging monitor <i>level</i> Example: Switch(config)# logging monitor 3	Limits messages logged to the terminal lines. By default, the terminal receives debugging messages and numerically lower levels.
Step 4	logging trap <i>level</i> Example: Switch(config)# logging trap 3	Limits messages logged to the syslog servers. By default, syslog servers receive informational messages and numerically lower levels.
Step 5	end Example: Switch(config)# end	Returns to privileged EXEC mode.

Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP.

This task is optional.

SUMMARY STEPS

1. **configure terminal**
2. **logging history *level***
3. **logging history size *number***
4. **end**

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters global configuration mode.
Step 2	logging history level Example: Switch(config)# logging history 3	Changes the default level of syslog messages stored in the history file and sent to the SNMP server. By default, warnings, errors, critical, alerts, and emergencies messages are sent.
Step 3	logging history size number Example: Switch(config)# logging history size 200	Specifies the number of syslog messages that can be stored in the history table. The default is to store one message. The range is 0 to 500 messages.
Step 4	end Example: Switch(config)# end	Returns to privileged EXEC mode.

Logging Messages to a UNIX Syslog Daemon

This task is optional.

**Note**

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX **man syslogd** command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

Before You Begin

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

SUMMARY STEPS

1. Add a line to the file `/etc/syslog.conf`.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

DETAILED STEPS

	Command or Action	Purpose
Step 1	Add a line to the file <code>/etc/syslog.conf</code> . Example: <code>local7.debug /usr/adm/logs/cisco.log</code>	<ul style="list-style-type: none"> • local7—Specifies the logging facility. • debug—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it.
Step 2	Enter these commands at the UNIX shell prompt. Example: <code>\$ touch /var/log/cisco.log</code> <code>\$ chmod 666 /var/log/cisco.log</code>	Creates the log file. The syslog daemon sends messages at this level or at a more severe level to this file.
Step 3	Make sure the syslog daemon reads the new changes. Example: <code>\$ kill -HUP `cat /etc/syslog.pid`</code>	For more information, see the man syslog.conf and man syslogd commands on your UNIX system.

Monitoring and Maintaining System Message Logs

Monitoring Configuration Archive Logs

Command	Purpose
show archive log config {all number [end-number] user username [session number] number [end-number] statistics} [provisioning]	Displays the entire configuration log or the log for specified parameters.

Configuration Examples for System Message Logs

Example: Stacking System Message

This example shows a partial switch system message for active switch and a stack member (hostname *Switch-2*):

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed
state to down 2
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar  1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/1, changed state to up (Switch-2)
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet2/0/2, changed state to up (Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
(Switch-2)
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet2/0/1, changed
state to down 2 (Switch-2)
```

Example: Switch System Message

This example shows a partial switch system message on a switch:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet0/1, changed state
to down 2
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar  1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the Switch while the Switch is connected to a live network.

The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the Switch is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the Switch or switch stack and the diagnostic tests that have already run.

How to Configure Online Diagnostics

Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the Switch, use the **diagnostic start** privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing:

SUMMARY STEPS

1. **diagnostic start switch *number* test {*name* | *test-id* | *test-id-range* | all | basic | complete | minimal | non-disruptive | per-port}**

DETAILED STEPS

	Command or Action	Purpose
Step 1	diagnostic start switch <i>number</i> test {<i>name</i> <i>test-id</i> <i>test-id-range</i> all basic complete minimal non-disruptive per-port} Example: <pre>Switch# diagnostic start switch 2 test basic</pre>	<p>Starts the diagnostic tests.</p> <p>The switch <i>number</i> keyword is supported only on stacking Switch. The range is from 1 to 4.</p> <p>You can specify the tests by using one of these options:</p> <ul style="list-style-type: none"> • <i>name</i>—Enters the name of the test. • <i>test-id</i>—Enters the ID number of the test. • <i>test-id-range</i>—Enters the range of test IDs by using integers separated by a comma and a hyphen.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • all—Starts all of the tests. • basic— Starts the basic test suite. • complete—Starts the complete test suite. • minimal—Starts the minimal bootup test suite. • non-disruptive—Starts the non-disruptive test suite. • per-port—Starts the per-port test suite.

Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a Switch. Use the **no** form of this command to remove the scheduling.

SUMMARY STEPS

1. **configure terminal**
2. **diagnostic schedule switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all** | **basic** | **complete** | **minimal** | **non-disruptive** | **per-port**} {**daily** | **on** *mm dd yyyy hh:mm* | **port** *inter-port-number port-number-list* | **weekly** *day-of-week hh:mm*}

DETAILED STEPS

	Command or Action	Purpose
Step 1	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 2	diagnostic schedule switch <i>number</i> test { <i>name</i> <i>test-id</i> <i>test-id-range</i> all basic complete minimal non-disruptive per-port } { daily on <i>mm dd yyyy hh:mm</i> port <i>inter-port-number port-number-list</i> weekly <i>day-of-week hh:mm</i> }	Schedules on-demand diagnostic tests for a specific day and time. The switch <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 4. When specifying the tests to be scheduled, use these options:

Command or Action	Purpose
<p>Example:</p> <pre>Switch(config)# diagnostic schedule switch 3 test 1-5 on July 3 2013 23:10</pre>	<ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All test IDs. • basic—Starts the basic on-demand diagnostic tests. • complete—Starts the complete test suite. • minimal—Starts the minimal bootup test suite. • non-disruptive—Starts the non-disruptive test suite. • per-port—Starts the per-port test suite. <p>You can schedule the tests as follows:</p> <ul style="list-style-type: none"> • Daily—Use the daily <i>hh:mm</i> parameter. • Specific day and time—Use the on <i>mm dd yyyy hh:mm</i> parameter. • Weekly—Use the weekly <i>day-of-week hh:mm</i> parameter.

Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a Switch while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the Switch to generate a syslog message because of a test failure, and enable a specific test. Use the **no** form of this command to disable testing.

By default, health monitoring is disabled, but the Switch generates a syslog message when a test fails.

Follow these steps to configure and enable the health-monitoring diagnostic tests:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **diagnostic monitor interval switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all**} *hh:mm:ss* *milliseconds* *day*
4. **diagnostic monitor syslog**
5. **diagnostic monitor threshold switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all**} **failure count** *count*
6. **diagnostic monitor switch** *number* **test** {*name* | *test-id* | *test-id-range* | **all**}
7. **end**
8. **show running-config**
9. **copy running-config startup-config**

DETAILED STEPS

	Command or Action	Purpose
Step 1	enable Example: Switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: Switch# configure terminal	Enters the global configuration mode.
Step 3	diagnostic monitor interval switch <i>number</i> test { <i>name</i> <i>test-id</i> <i>test-id-range</i> all } <i>hh:mm:ss</i> <i>milliseconds</i> <i>day</i> Example: Switch(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5	<p>Configures the health-monitoring interval of the specified tests.</p> <p>The switch <i>number</i> keyword is supported only on stacking switches. The range is from 1 to 4.</p> <p>When specifying the tests, use one of these parameters:</p> <ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All of the diagnostic tests. <p>When specifying the interval, set these parameters:</p> <ul style="list-style-type: none"> • <i>hh:mm:ss</i>—Monitoring interval in hours, minutes, and seconds. The range for <i>hh</i> is 0 to 24, and the range for <i>mm</i> and <i>ss</i> is 0 to 60.

	Command or Action	Purpose
		<ul style="list-style-type: none"> • <i>milliseconds</i>—Monitoring interval in milliseconds (ms). The range is from 0 to 999. • <i>day</i>—Monitoring interval in the number of days. The range is from 0 to 20.
Step 4	diagnostic monitor syslog Example: <pre>Switch(config)# diagnostic monitor syslog</pre>	(Optional) Configures the switch to generate a syslog message when a health-monitoring test fails.
Step 5	diagnostic monitor threshold switch <i>number test {name test-id test-id-range </i> all} failure count count Example: <pre>Switch(config)# diagnostic monitor threshold switch 2 test 1 failure count 20</pre>	<p>(Optional) Sets the failure threshold for the health-monitoring tests. The switch number keyword is supported only on stacking switches. The range is from 1 to 4.</p> <p>When specifying the tests, use one of these parameters:</p> <ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All of the diagnostic tests. <p>The range for the failure threshold <i>count</i> is 0 to 99.</p>
Step 6	diagnostic monitor switch number test <i>{name test-id test-id-range all}</i> Example: <pre>Switch(config)# diagnostic monitor switch 2 test 1</pre>	<p>Enables the specified health-monitoring tests. The switch number keyword is supported only on stacking switches. The range is from 1 to 9.</p> <p>When specifying the tests, use one of these parameters:</p> <ul style="list-style-type: none"> • <i>name</i>—Name of the test that appears in the show diagnostic content command output. • <i>test-id</i>—ID number of the test that appears in the show diagnostic content command output. • <i>test-id-range</i>—ID numbers of the tests that appear in the show diagnostic content command output. • all—All of the diagnostic tests.

	Command or Action	Purpose
Step 7	end Example: Switch(config) # end	Returns to privileged EXEC mode.
Step 8	show running-config Example: Switch# show running-config	Verifies your entries.
Step 9	copy running-config startup-config Example: Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

What to Do Next

Use the **no diagnostic monitor interval test***test-id* | *test-id-range* } global configuration command to change the interval to the default value or to zero. Use the **no diagnostic monitor syslog** command to disable generation of syslog messages when a health-monitoring test fails. Use the **diagnostic monitor threshold test***test-id* | *test-id-range* } **failure count** command to remove the failure threshold.

Monitoring and Maintaining Online Diagnostics

Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the Switch or Switch stack and check the test results by using the privileged EXEC **show** commands in this table:

Table 27: Commands for Diagnostic Test Configuration and Results

Command	Purpose
show diagnostic content switch [<i>number</i> all]	Displays the online diagnostics configured for a switch. The switch [<i>number</i> all] parameter is supported only on stacking switches.
show diagnostic status	Displays the currently running diagnostic tests.

Command	Purpose
show diagnostic result switch [<i>number</i> all] [detail test { <i>name</i> <i>test-id</i> <i>test-id-range</i> all } [detail]]	Displays the online diagnostics test results. The switch [<i>number</i> all] parameter is supported only on stacking switches.
show diagnostic switch [<i>number</i> all] [detail]	Displays the online diagnostics test results. The switch [<i>number</i> all] parameter is supported only on stacking switches.
show diagnostic schedule switch [<i>number</i> all]	Displays the online diagnostics test schedule. The switch [<i>number</i> all] parameter is supported only on stacking switches.
show diagnostic post	Displays the POST results. (The output is the same as the show post command output.)

Configuration Examples for Online Diagnostic Tests

Examples: Start Diagnostic Tests

This example shows how to start a diagnostic test by using the test name:

```
Switch# diagnostic start switch 2 test TestInlinePwrCtrlr
```

This example shows how to start all of the basic diagnostic tests:

```
Switch# diagnostic start switch 1 test all
```

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

```
Switch(config)# diagnostic monitor threshold switch 1 test 1 failure count 50
Switch(config)# diagnostic monitor interval switch 1 test TestPortAsicStackPortLoopback
```

Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

```
Switch(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

```
Switch(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30
```

Examples: Displaying Online Diagnostics

This example shows how to display on demand diagnostic settings:

```
Switch# show diagnostic ondemand settings
```

```
Test iterations = 1
Action on test failure = continue
```

This example shows how to display diagnostic events for errors:

```
Switch# show diagnostic events event-type error
```

```
Diagnostic events (storage for 500 events, 0 events recorded)
Number of events matching above criteria = 0
```

```
No diagnostic log entry exists.
```

This example shows how to display the description for a diagnostic test:

```
Switch# show diagnostic description switch 1 test all
```

```
DiagGoldPktTest :
    The GOLD packet Loopback test verifies the MAC level loopback
    functionality. In this test, a GOLD packet, for which doppler
    provides the support in hardware, is sent. The packet loops back
    at MAC level and is matched against the stored packet. It is a non
    -disruptive test.

DiagThermalTest :
    This test verifies the temperature reading from the sensor is below the yellow
    temperature threshold. It is a non-disruptive test and can be run as a health
    monitoring test.

DiagFanTest :
    This test verifies all fan modules have been inserted and working properly on the
    board
    It is a non-disruptive test and can be run as a health monitoring test.

DiagPhyLoopbackTest :
    The PHY Loopback test verifies the PHY level loopback
    functionality. In this test, a packet is sent which loops back
    at PHY level and is matched against the stored packet. It is a
    disruptive test and cannot be run as a health monitoring test.

DiagScratchRegisterTest :
    The Scratch Register test monitors the health of application-specific
    integrated circuits (ASICs) by writing values into registers and reading
    back the values from these registers. It is a non-disruptive test and can
    be run as a health monitoring test.
```

```

DiagPoETest :
    This test checks the PoE controller functionality. This is a disruptive test
    and should not be performed during normal switch operation.

DiagStackCableTest :
    This test verifies the stack ring loopback functionality
    in the stacking environment. It is a disruptive test and
    cannot be run as a health monitoring test.

DiagMemoryTest :
    This test runs the exhaustive ASIC memory test during normal switch operation
    NG3K utilizes mbist for this test. Memory test is very disruptive
    in nature and requires switch reboot after the test.

Switch#

```

This example shows how to display the boot up level:

```

Switch# show diagnostic bootup level

Current bootup diagnostic level: minimal

Switch#

```

Feature History and Information for Configuring Online Diagnostics

Release	Modification
Cisco IOS XE 3.2SE	This feature was introduced.

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to <http://www.cisco.com/go/cfn>. An account on Cisco.com is not required.

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Related Topics

[Recovering from a Software Failure, on page 229](#)

Lost or Forgotten Password on a Switch

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

Note

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.

Related Topics

[Recovering from a Lost or Forgotten Password, on page 231](#)

Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

- a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
- an IEEE 802.3af-compliant powered device
- an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the *Interface and Hardware Component Configuration Guide (Catalyst 3850 Switches)*.

Related Topics

[Scenarios to Troubleshoot Power over Ethernet \(PoE\), on page 244](#)

Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE Switch port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the **shutdown** interface configuration command, and then enter the **no shutdown** interface command. You can also configure automatic recovery on the Switch to recover from the error-disabled state.

On a Switch, the **errdisable recovery cause loopback** and the **errdisable recovery interval seconds** global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the **power inline never** interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the **shutdown** and the **no shutdown** interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the **power inline never** command.

Ping

The Switch supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response (*hostname* is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a *no-answer* message is returned.
- Unknown host—If the host does not exist, an *unknown host* message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a *destination-unreachable* message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a *network or host unreachable* message is returned.

[Example: Pinging an IP Host, on page 247](#)

Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the Switch in the path. When the Switch detects a device in the path that does not support Layer 2 traceroute, the Switch continues to send Layer 2 trace queries and lets them time out.

The Switch can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.
If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.
- A Switch is reachable from another Switch when you can test connectivity by using the **ping** privileged EXEC command. All Switch in the physical path must be reachable from each other.
- The maximum number of hops identified in the path is ten.
- You can enter the **traceroute mac** or the **traceroute mac ip** privileged EXEC command on a Switch that is not in the physical path from the source device to the destination device. All Switch in the path must be reachable from this switch.
- The **traceroute mac** command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.
- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.
- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.
- The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the Switch uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.
 - If an ARP entry exists for the specified IP address, the Switch uses the associated MAC address and identifies the physical path.
 - If an ARP entry does not exist, the Switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.

- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.
- This feature is not supported in Token Ring VLANs.

IP Traceroute

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your Switch can participate as the source or destination of the **traceroute** privileged EXEC command and might or might not appear as a hop in the **traceroute** command output. If the Switch is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate Switch do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate Switch is a multilayer Switch that is routing a particular packet, this Switch shows up as a hop in the traceroute output.

The **traceroute** privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP *port-unreachable* error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

Time Domain Reflector Guidelines

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported only on 10/100/1000 copper Ethernet ports. It is not supported on 10-Gigabit Ethernet ports and on SFP module ports.

TDR can detect these cabling problems:

- Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.
- Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire.

If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

Use TDR to diagnose and resolve cabling problems in these situations:

- Replacing a Switch
- Setting up a wiring closet
- Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Switch reports accurate information in these situations:

- The cable for the gigabit link is a solid-core cable.
- The open-ended cable is not terminated.

When you run TDR, the Switch does not report accurate information in these situations:

- The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
- The link is a 10-megabit or a 100-megabit link.
- The cable is a stranded cable.
- The link partner is a Cisco IP Phone.
- The link partner is not IEEE 802.3 compliant.

Debug Commands

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

All **debug** commands are entered in privileged EXEC mode, and most **debug** commands take no arguments.

In a switch stack, when you enable debugging, it is enabled only on the stack master. To enable debugging on a stack member, you must start a session from the stack master by using the **session switch-number** privileged EXEC command. Then, enter the **debug** command at the command-line prompt of the stack member.

Crashinfo Files

The crashinfo files save information that helps Cisco technical support representatives to debug problems that caused the Cisco IOS image to fail (crash). The switch generates two files at the time of the failure: full core and crashinfo.

The information in the crashinfo file includes the Cisco IOS image name and version that failed, a list of the processor registers, and a stack trace. You can provide this information to the Cisco technical support representative by using the **show tech-support** privileged EXEC command.

The file names have the following format:

```
[fullcore | crashinfo]_[process that crashed]_[date]-[timestamp]-UTC
```

From IOS, you can view the crashinfo files on each switch by using the following command:

```
Switch# dir crashinfo?
crashinfo-1: crashinfo-2: crashinfo-3: crashinfo:
Switch#
```

For example, to access the crashinfo directory for switch 1, enter

```
Switch dir crashinfo-1
```

From the ROMMON prompt, you can view the crashinfo files by using the **dir** command:

```
Switch: dir sdal
```

The following is sample output of a crashinfo file

```
Switch# dir crashinfo:
```

```
Directory of crashinfo:/
```

```

System Reports

When a switch crashes, a system report is automatically generated for each switch in the switch stack. The system report file captures all the trace buffers, and other system-wide logs found on the switch. System reports are located in the crashinfo directory in the following format:

`system-report_[switch number]_[date]-[timestamp]-UTC.gz`

After a switch crash, you should check if a system report file was generated. The name of the most recently generated system report file is stored in the `last_systemreport` file under the crashinfo directory. The system report and crashinfo files assist TAC when troubleshooting your issue.

Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the Switch. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot Switch problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the Switch and small form-factor pluggable (SFP) modules. The Switch stores this information in the flash memory:

- CLI commands—Record of the OBFL CLI commands that are entered on a standalone Switch or a switch stack member.
- Environment data—Unique device identifier (UDI) information for a standalone Switch or a switch stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
- Message—Record of the hardware-related system messages generated by a standalone Switch or a switch stack member.
- Power over Ethernet (PoE)—Record of the power consumption of PoE ports on a standalone Switch or a switch stack member.
- Temperature—Temperature of a standalone Switch or a switch stack member.
- Uptime data—Time when a standalone Switch or a switch stack member starts, the reason the Switch restarts, and the length of time the Switch has been running since it last restarted.
- Voltage—System voltages of a standalone Switch or a switch stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP).

When the Switch is running, you can retrieve the OBFL data by using the **show logging onboard** privileged EXEC commands. If the Switch fails, contact your Cisco technical support representative to find out how to retrieve the data.

When an OBFL-enabled Switch is restarted, there is a 10-minute delay before logging of new data begins.

Related Topics

[Configuring OBFL, on page 241](#)

[Displaying OBFL Information, on page 242](#)

Fan Failures

By default, the feature is disabled. When more than one of the fans fails in a field-replaceable unit (FRU) or in a power supply, the Switch does not shut down, and this error message appears:

```
Multiple fan(FRU/PS) failure detected. System may get overheated. Change fan quickly.
```

The Switch might overheat and shut down.

To enable the fan failures feature, enter the **system env fan-fail-action shut** privileged EXEC command. If more than one fan in the Switch fails, the Switch automatically shuts down, and this error message appears:

```
Faulty (FRU/PS) fans detected, shutting down system!
```

After the first fan shuts down, if the Switch detects a second fan failure, the Switch waits for 20 seconds before it shuts down.

To restart the Switch, it must be power cycled.

Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

Note

How to Troubleshoot the Software Configuration

Recovering from a Software Failure

Before You Begin

This recovery procedure requires that you have physical access to the switch.

This procedure uses boot loader commands and TFTP to recover from a corrupted or incorrect image file.

-
- Step 1** From your PC, download the software image file (*image.bin*) from Cisco.com.
- Step 2** Load the software image to your TFTP server.
- Step 3** Connect your PC to the switch Ethernet management port.
- Step 4** Unplug the switch power cord.
- Step 5** Press the **Mode** button, and at the same time, reconnect the power cord to the switch.
- Step 6** From the bootloader (ROMMON) prompt, ensure that you can ping your TFTP server.
- a) Set the IP address **switch: set IP_ADDR ip_address subnet_mask**

Example:

```
switch: set IP_ADDR 192.0.2.123/255.255.255.0
```

- b) Set the default router IP address **switch: set DEFAULT_ROUTER ip_address**

Example:

```
switch: set DEFAULT_ROUTER 192.0.2.1
```

- c) Verify that you can ping the TFTP server **switch: ping ip_address_of_TFTP_server**

Example:

```
switch: ping 192.0.2.15
ping 192.0.2.1 with 32 bytes of data...
Host 192.0.2.1 is alive.
switch:
```

- Step 7** Verify that you have a recovery image in your recovery partition (sda9:).
This recovery image is required for recovery using the emergency-install feature.

Example:

```
switch: dir sda9:
Directory of sda9:/

 2  drwx  1024      .
 2  drwx  1024     ..
11  -rw- 18923068  c3850-recovery.bin

36939776 bytes available (20830208 bytes used)
switch:
```

- Step 8** From the bootloader (ROMMON) prompt, initiate the emergency-install feature that assists you in recovering the software image on your switch.

WARNING: The emergency install command will erase your entire boot flash!

Example:

```
Switch#
emergency-install
tftp://192.0.2.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
```

```
The bootflash will be erased during install operation, continue (y/n)?y
Starting emergency recovery
(tftp://192.0.2.47/cat3k/cat3k_caa-universalk9.SPA.03.02.00.SE.150-1.EX.bin)...
```

```

Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

**Note**

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

SUMMARY STEPS

1. Connect a terminal or PC to the switch.
2. Set the line speed on the emulation software to 9600 baud.
3. Power off the standalone switch or the entire switch stack.
4. Reconnect the power cord to the or the active switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid; then release the **Mode** button.
5. After recovering the password, reload the switch or the active switch .
6. Power on the remaining switches in the stack.

DETAILED STEPS

Step 1 Connect a terminal or PC to the switch.

- Connect a terminal or a PC with terminal-emulation software to the switch console port. If you are recovering the password for a switch stack, connect to the console port of the active switch or
- Connect a PC to the Ethernet management port. If you are recovering the password for a switch stack, connect to the Ethernet management port of a stack member .

Step 2 Set the line speed on the emulation software to 9600 baud.

Step 3 Power off the standalone switch or the entire switch stack.

Step 4 Reconnect the power cord to the or the active switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid; then release the **Mode** button.

•

```
Switch:
Xmodem file system is available.
Base ethernet MAC Address: 20:37:06:4d:e9:80
Verifying bootloader digital signature.
```

```
The system has been interrupted prior to loading the operating
system software, console will be reset to 9600 baud rate.
```

proceed to the *Procedure with Password Recovery Enabled* section, and follow the steps.

Step 5 After recovering the password, reload the switch or the active switch .

On a switch:

```
Switch> reload
Proceed with reload? [confirm] y
```

On the active switch:

```
Switch> reload slot <stack-active-member-number>
Proceed with reload? [confirm] y
```

Step 6 Power on the remaining switches in the stack.

Related Topics

[Lost or Forgotten Password on a Switch, on page 222](#)

Procedure with Password Recovery Enabled

If the password-recovery operation is enabled, this message appears:

Step 1 Initialize the flash file system.

```
Switch: flash_init
```

Step 2 Ignore the startup configuration with the following command:

```
Switch: SWITCH_IGNORE_STARTUP_CFG=1
```

Step 3 Boot the switch with the *packages.conf* file from flash.

```
Switch: boot flash:packages.conf
```

Step 4 Terminate the initial configuration dialog by answering **No**.

```
Would you like to enter the initial configuration dialog? [yes/no]: No
```

Step 5 At the switch prompt, enter privileged EXEC mode.

```
Switch> enable
Switch#
```

Step 6 Copy the startup configuration to running configuration.

```
Switch# copy startup-config running-config Destination filename [running-config]?
```

Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

Step 7 Enter global configuration mode and change the **enable** password.

```
Switch# configure terminal
Switch(config)#
```

Step 8 Write the running configuration to the startup configuration file.

```
Switch# copy running-config startup-config
```

Step 9 Confirm that manual boot mode is enabled.

```
Switch# show boot

BOOT variable = flash:packages.conf;
Manual Boot = yes
Enable Break = yes
```

Step 10 Reload the switch.

```
Switch# reload
```

Step 11 Return the Bootloader parameters (previously changed in Steps 2 and 3) to their original values.

```
Switch: switch: SWITCH_IGNORE_STARTUP_CFG=0
```

Step 12 Boot the switch with the *packages.conf* file from flash.

```
Switch: boot flash:packages.conf
```

Step 13 After the switch boots up, disable manual boot on the switch.

```
Switch(config)# no boot manual
```

Procedure with Password Recovery Disabled

If the password-recovery mechanism is disabled, this message appears:

```
The password-recovery mechanism has been triggered, but
is currently disabled. Access to the boot loader prompt
through the password-recovery mechanism is disallowed at
this point. However, if you agree to let the system be
reset back to the default system configuration, access
```

to the boot loader prompt can still be allowed.
Would you like to reset the system back to the default configuration (y/n)?

Caution

Returning the Switch to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup Switch and VLAN configuration files.

- If you enter **n** (no), the normal boot process continues as if the **Mode** button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

Press Enter to continue.....

- If you enter **y** (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

Step 1 Choose to continue with password recovery and delete the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? **y**

Step 2 Display the contents of flash memory:

Switch: **dir flash:**

The Switch file system appears.

```
Directory of flash:/
.
.
.i'
15494 drwx      4096  Jan 1 2000 00:20:20 +00:00  kirch
15508 -rw-    258065648  Sep 4 2013 14:19:03 +00:00
cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
162196684
```

Step 3 Boot up the system:

Switch: **boot**

You are prompted to start the setup program. To continue with password recovery, enter **N** at the prompt:

Continue with the configuration dialog? [yes/no]: **N**

Step 4 At the Switch prompt, enter privileged EXEC mode:

Switch> **enable**

Step 5 Enter global configuration mode:

```
Switch# configure terminal
```

Step 6 Change the password:

```
Switch(config)# enable secret password
```

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 7 Return to privileged EXEC mode:

```
Switch(config)# exit  
Switch#
```

Note Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized.

Step 8 Write the running configuration to the startup configuration file:

```
Switch# copy running-config startup-config
```

The new password is now in the startup configuration.

Step 9 You must now reconfigure the Switch. If the system administrator has the backup Switch and VLAN configuration files available, you should use those.

Preventing Switch Stack Problems

To prevent switch stack problems, you should do the following:

- Make sure that the Switch that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.
- Press the **Mode** button on a stack member until the Stack mode LED is on. The last two port LEDs on the Switch should be green. Depending on the Switch model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.
- We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.
- Manually assigning stack member numbers according to the placement of the Switch in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the Switch have manually assigned numbers if you add, remove, or rearrange Switch later. Use the **switch current-stack-member-number renumber new-stack-member-number** global configuration command to manually assign a stack member number.

If you replace a stack member with an identical model, the new Switch functions with the exact same configuration as the replaced Switch. This is also assuming the new Switch is using the same member number as the replaced Switch.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

- 1 Power off the newly created switch stacks.
- 2 Reconnect them to the original switch stack through their StackWise Plus ports.
- 3 Power on the Switch.

For the commands that you can use to monitor the switch stack and its members, see the *Displaying Switch Stack Information* section.

Preventing Autonegotiation Mismatches

The IEEE 802.3ab autonegotiation protocol manages the Switch settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize Switch performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

**Note**

If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

Troubleshooting SFP Module Security and Identification

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the Switch, the Switch software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.

**Note**

The security error message references the GBIC_SECURITY facility. The Switch supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the Switch, and replace it with a Cisco module. After inserting a Cisco SFP module, use the **errdisable recovery cause gbic-invalid** global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the Switch brings the interface out of the error-disabled state and retries the operation. For more information about the **errdisable recovery** command, see the command reference for this release.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinsert the SFP module. If it continues to fail, the SFP module might be defective.

Monitoring SFP Module Status

You can check the physical or operational status of an SFP module by using the **show interfaces transceiver** privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module. For more information, see the **show interfaces transceiver** command in the command reference for this release.

Executing Ping

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all Switch.

**Note**

Though other protocol keywords are available with the **ping** command, they are not supported in this release.

Use this command to ping another device on the network from the Switch:

Command	Purpose
ping ip <i>host</i> <i>address</i> Switch# ping 172.20.52.3	Pings a remote host through IP or by supplying the hostname or network address.

Related Topics

[Ping, on page 223](#)

[Example: Pinging an IP Host, on page 247](#)

Monitoring Temperature

The Switch monitors the temperature conditions and uses the temperature information to control the fans.

Use the **show env temperature status** privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the Switch (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the **system env temperature threshold yellow value** global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds. For more information, see the command reference for this release.

Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device by using one of these privileged EXEC commands:

Table 28: Monitoring the Physical Path

Command	Purpose
tracetroute mac [interface <i>interface-id</i>] <i>{source-mac-address}</i> [interface <i>interface-id</i>] <i>{destination-mac-address}</i> [vlan <i>vlan-id</i>] [detail]	Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.
tracetroute mac ip <i>{source-ip-address source-hostname}</i> <i>{destination-ip-address destination-hostname}</i> [detail]	Displays the Layer 2 path taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname.

Executing IP Traceroute

Note

Though other protocol keywords are available with the **traceroute** privileged EXEC command, they are not supported in this release.

Command	Purpose
traceroute ip <i>host</i> Switch# traceroute ip 192.51.100.1	Traces the path that packets take through the network.

Related Topics

[IP Traceroute](#) , on page 225

[Example: Performing a Traceroute to an IP Host](#) , on page 247

Running TDR and Displaying the Results

To run TDR, enter the **test cable-diagnostics tdr interface *interface-id*** privileged EXEC command.

To display the results, enter the **show cable-diagnostics tdr interface *interface-id*** privileged EXEC command.

Redirecting Debug and Error Message Output

By default, the network server sends the output from **debug** commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

**Note**

Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

For more information about system message logging, see *Configuring System Message Logging*.

When stack members generate a system error message, the active switch displays the error message to all stack members. The syslog resides on the active switch.

**Note**

Make sure to save the syslog to flash memory so that the syslog is not lost if the active switch fails.

Related Topics

[Debug Commands](#), on page 226

Using the show platform forward Command

The output from the **show platform forward** privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the Switch application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

Using the show debug command

The **show debug** command is entered in privileged EXEC mode. This command displays all debug options available on the switch.

To view all conditional debug options run the command **show debug condition**. The commands can be listed by selecting either a condition identifier *<1-1000>* or *all* conditions.

To disable debugging, use the **no debug all** command.

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

For more information, see *Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 16.1 (Catalyst 3850 Switches)*.

Configuring OBFL

Caution

We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.

- To enable OBFL, use the **hw-switch switch** *[switch-number]* **logging onboard** **[message level level]** global configuration command. On switches, the range for *switch-number* is from 1 to 9. Use the **message level level** parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.
- To copy the OBFL data to the local network or a specific file system, use the **copy onboard switch** *switch-number url url-destination* privileged EXEC command.
- To disable OBFL, use the **no hw-switch switch** *[switch-number]* **logging onboard** **[message level]** global configuration command.
- To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the **clear onboard switch** *switch-number* privileged EXEC command.
- In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the **hw-switch switch** *[switch-number]* **logging onboard** **[message level level]** global configuration command.
- You can enable or disable OBFL on a member switch from the active switch.

For more information about the commands in this section, see the command reference for this release.

[Onboard Failure Logging on the Switch, on page 228](#)

[Configuring OBFL, on page 241](#)

Example: Verifying the Problem and Cause for High CPU Utilization

To determine if high CPU utilization is a problem, enter the **show processes cpu sorted** privileged EXEC command. Note the underlined information in the first line of the output example.

```
Switch# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...
<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.

Table 30: Troubleshooting CPU Utilization Problems

Type of Problem	Cause	Corrective Action
Interrupt percentage value is almost as high as total CPU utilization value.	The CPU is receiving too many packets from the network.	Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on “Analyzing Network Traffic.”
Total CPU utilization is greater than 50% with minimal time spent on interrupts.	One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.	Identify the unusual event, and troubleshoot the root cause. See the section on “Debugging Active Processes.”

Scenarios for Troubleshooting the Software Configuration

Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 31: Power over Ethernet Troubleshooting Scenarios

Symptom or Problem	Possible Cause and Solution
Only one port does not have PoE. Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.	<p>Verify that the powered device works on another PoE port.</p> <p>Use the show run, or show interface status user EXEC commands to verify that the port is not shut down or error-disabled.</p> <p>Note Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional.</p> <p>Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host.</p> <p>Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters.</p> <p>Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on.</p> <p>If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the show inline power command to verify the amount of available power.</p>

Symptom or Problem	Possible Cause and Solution
<p>No PoE on all ports or a group of ports.</p> <p>Trouble is on all switch ports.</p> <p>Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.</p>	<p>If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch.</p> <p>If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch.</p> <p>Use the show log privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes.</p> <p>If there are no alarms, use the show interface status command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the shut and no shut interface configuration commands to reenable the ports.</p> <p>Use the show env power and show power inline privileged EXEC commands to review the PoE status and power budget (available PoE).</p> <p>Review the running configuration to verify that power inline never is not configured on the ports.</p> <p>Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the shut and no shut interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected.</p> <p>Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port.</p> <p>Use the show power inline privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on.</p> <p>If a powered device can power on when only one powered device is connected to the switch, enter the shut and no shut interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the show interface status and show power inline privileged EXEC commands to monitor inline power statistics and port status.</p> <p>If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.</p>

Symptom or Problem	Possible Cause and Solution
<p>Cisco IP Phone disconnects or resets.</p> <p>After working normally, a Cisco phone or wireless access point intermittently reloads or disconnects from PoE.</p>	<p>Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloads.</p> <p>Verify that the cable length is not more than 100 meters from the switch port to the powered device.</p> <p>Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs.</p> <p>Notice whether any error messages appear at the same time a disconnect occurs. Use the show log privileged EXEC command to review error messages.</p> <p>Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.)</p> <p>Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.</p>
<p>Non-Cisco powered device does not work on Cisco PoE switch.</p> <p>A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.</p>	<p>Use the show power inline command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it.</p> <p>Use the show interface status command to verify that the switch detects the connected powered device.</p> <p>Use the show log command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or <i>inrush</i>) current that exceeds a current-limit threshold for the port.</p>

Configuration Examples for Troubleshooting Software

Example: Pinging an IP Host

This example shows how to ping an IP host:

```
Switch# ping 172.20.52.3
```

```
Type escape sequence to abort.  
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds:  
!!!!  
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms  
Switch#
```

Table 32: Ping Output Display Characters

Character	Description
!	Each exclamation point means receipt of a reply.
.	Each period means the network server timed out while waiting for a reply.
U	A destination unreachable error PDU was received.
C	A congestion experienced packet was received.
I	User interrupted test.
?	Unknown packet type.
&	Packet lifetime exceeded.

To end a ping session, enter the escape sequence (**Ctrl-^ X** by default). Simultaneously press and release the **Ctrl**, **Shift**, and **6** keys and then press the **X** key.

Related Topics

[Ping, on page 223](#)

[Executing Ping, on page 238](#)

Example: Performing a Traceroute to an IP Host

This example shows how to perform a **traceroute** to an IP host:

```
Switch# traceroute ip 192.0.2.10
```

```
Type escape sequence to abort.  
Tracing the route to 192.0.2.10
```

```

1 192.0.2.1 0 msec 0 msec 4 msec
2 192.0.2.203 12 msec 8 msec 0 msec
3 192.0.2.100 4 msec 0 msec 0 msec
4 192.0.2.10 0 msec 4 msec 0 msec

```

The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

Table 33: Traceroute Output Display Characters

Character	Description
*	The probe timed out.
?	Unknown packet type.
A	Administratively unreachable. Usually, this output means that an access list is blocking traffic.
H	Host unreachable.
N	Network unreachable.
P	Protocol unreachable.
Q	Source quench.
U	Port unreachable.

To end a trace in progress, enter the escape sequence (**Ctrl-^ X** by default). Simultaneously press and release the **Ctrl**, **Shift**, and **6** keys and then press the **X** key.

Example: Enabling All System Diagnostics

Caution

Because debugging output takes priority over other network traffic, and because the **debug all** privileged EXEC command generates more output than any other **debug** command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific **debug** commands.

This command disables all-system diagnostics:

```
Switch# debug all
```

The **no debug all** privileged EXEC command disables all diagnostic output. Using the **no debug all** command is a convenient way to ensure that you have not accidentally left any **debug** commands enabled.
