Document Conventions

This document uses the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^ or Ctrl</td>
<td>Both the ^ symbol and Ctrl represent the Control (Ctrl) key on a keyboard. For example, the key combination ^D or Ctrl-D means that you hold down the Control key while you press the D key. (Keys are indicated in capital letters but are not case sensitive.)</td>
</tr>
<tr>
<td>** font</td>
<td>Commands and keywords and user-entered text appear in ** font.</td>
</tr>
<tr>
<td>* font</td>
<td>Document titles, new or emphasized terms, and arguments for which you supply values are in * font.</td>
</tr>
<tr>
<td>Courier font</td>
<td>Terminal sessions and information the system displays appear in Courier font.</td>
</tr>
<tr>
<td>**Courier font</td>
<td>Bold Courier font indicates text that the user must enter.</td>
</tr>
<tr>
<td>[x]</td>
<td>Elements in square brackets are optional.</td>
</tr>
<tr>
<td>...</td>
<td>An ellipsis (three consecutive nonbolded periods without spaces) after a syntax element indicates that the element can be repeated.</td>
</tr>
<tr>
<td></td>
<td>A vertical line, called a pipe, indicates a choice within a set of keywords or arguments.</td>
</tr>
<tr>
<td>[x</td>
<td>y]</td>
</tr>
</tbody>
</table>
### Document Conventions

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{x</td>
<td>y}</td>
</tr>
<tr>
<td>[x {y</td>
<td>z}]</td>
</tr>
<tr>
<td>string</td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
<tr>
<td>&lt;&gt;</td>
<td>Nonprinting characters such as passwords are in angle brackets.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Default responses to system prompts are in square brackets.</td>
</tr>
<tr>
<td>!, #</td>
<td>An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.</td>
</tr>
</tbody>
</table>

### Reader Alert Conventions

This document may use the following conventions for reader alerts:

- **Note**
  - Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual.

- **Tip**
  - Means the following information will help you solve a problem.

- **Caution**
  - Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

- **Timesaver**
  - Means the described action saves time. You can save time by performing the action described in the paragraph.

- **Warning**
  - IMPORTANT SAFETY INSTRUCTIONS
    - This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What's New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What's New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS version 2.0.
Using the Command-Line Interface

Information About Using the Command-Line Interface

Command Modes

The Cisco IOS user interface is divided into many different modes. The commands available to you depend on which mode you are currently in. Enter a question mark (?) at the system prompt to obtain a list of commands available for each command mode.

You can start a CLI session through a console connection, through Telnet, a SSH, or by using the browser. When you start a session, you begin in user mode, often called user EXEC mode. Only a limited subset of the commands are available in user EXEC mode. For example, most of the user EXEC commands are one-time commands, such as show commands, which show the current configuration status, and clear commands, which clear counters or interfaces. The user EXEC commands are not saved when the switch reboots.

To have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From this mode, you can enter any privileged EXEC command or enter global configuration mode.

Using the configuration modes (global, interface, and line), you can make changes to the running configuration. If you save the configuration, these commands are stored and used when the switch reboots. To access the various configuration modes, you must start at global configuration mode. From global configuration mode, you can enter interface configuration mode and line configuration mode.

This table describes the main command modes, how to access each one, the prompt you see in that mode, and how to exit the mode.
### Table 1: Command Mode Summary

<table>
<thead>
<tr>
<th>Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
<th>About This Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC</td>
<td>Begin a session using Telnet, SSH, or console.</td>
<td>SwitchControllerDevice&gt;</td>
<td>Enter <code>logout</code> or <code>quit</code>.</td>
<td>Use this mode to • Change terminal settings. • Perform basic tests. • Display system information.</td>
</tr>
<tr>
<td>Privileged EXEC</td>
<td>While in user EXEC mode, enter the <code>enable</code> command.</td>
<td>SwitchControllerDevice#</td>
<td>Enter <code>disable</code> to exit.</td>
<td>Use this mode to verify commands that you have entered. Use a password to protect access to this mode.</td>
</tr>
<tr>
<td>Global configuration</td>
<td>While in privileged EXEC mode, enter the <code>configure</code> command.</td>
<td>SwitchControllerDevice(config)#</td>
<td>To exit to privileged EXEC mode, enter <code>exit</code> or <code>end</code>, or press Ctrl-Z.</td>
<td>Use this mode to configure parameters that apply to the entire switch.</td>
</tr>
<tr>
<td>VLAN configuration</td>
<td>While in global configuration mode, enter the <code>vlan vlan-id</code> command.</td>
<td>SwitchControllerDevice(config-if)#</td>
<td>To exit to global configuration mode, enter the <code>exit</code> command. To return to privileged EXEC mode, press Ctrl-Z or enter <code>end</code>.</td>
<td>Use this mode to configure VLAN parameters. When VTP mode is transparent, you can create extended-range VLANs (VLAN IDs greater than 1005) and save configurations in the switch startup configuration file.</td>
</tr>
<tr>
<td>Interface configuration</td>
<td>While in global configuration mode, enter the <code>interface</code> command (with a specific interface).</td>
<td>SwitchControllerDevice(config-if)#</td>
<td>To exit to global configuration mode, enter <code>exit</code>. To return to privileged EXEC mode, press Ctrl-Z or enter <code>end</code>.</td>
<td>Use this mode to configure parameters for the Ethernet ports.</td>
</tr>
</tbody>
</table>
Using the Help System

You can enter a question mark (?) at the system prompt to display a list of commands available for each command mode. You can also obtain a list of associated keywords and arguments for any command.

**SUMMARY STEPS**

1. help
2. abbreviated-command-entry ?
3. abbreviated-command-entry <Tab>
4. ?
5. command ?
6. command keyword ?

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> help</td>
<td>Obtains a brief description of the help system in any command mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# help</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> abbreviated-command-entry ?</td>
<td>Obtains a list of commands that begin with a particular character string.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# di?</td>
<td>dir disable disconnect</td>
</tr>
<tr>
<td><strong>Step 3</strong> abbreviated-command-entry &lt;Tab&gt;</td>
<td>Completes a partial command name.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# sh conf&lt;tab&gt;</td>
<td>SwitchControllerDevice# show configuration</td>
</tr>
</tbody>
</table>
### Purpose

**Command or Action**

**Step 4**

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lists all commands available for a particular command mode.</td>
</tr>
</tbody>
</table>

**Example:**

SwitchControllerDevice> ?

**Step 5**

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lists the associated keywords for a command.</td>
</tr>
</tbody>
</table>

**Example:**

SwitchControllerDevice> show ?

**Step 6**

<table>
<thead>
<tr>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lists the associated arguments for a keyword.</td>
</tr>
</tbody>
</table>

**Example:**

SwitchControllerDevice(config)# cdp holdtime ?

<10-255> Length of time (in sec) that receiver must keep this packet

### Understanding Abbreviated Commands

You need to enter only enough characters for the switch to recognize the command as unique.

This example shows how to enter the `show configuration` privileged EXEC command in an abbreviated form:

SwitchControllerDevice# show conf

### No and Default Forms of Commands

Almost every configuration command also has a no form. In general, use the no form to disable a feature or function or reverse the action of a command. For example, the no shutdown interface configuration command reverses the shutdown of an interface. Use the command without the keyword no to reenable a disabled feature or to enable a feature that is disabled by default.

Configuration commands can also have a default form. The default form of a command returns the command setting to its default. Most commands are disabled by default, so the default form is the same as the no form. However, some commands are enabled by default and have variables set to certain default values. In these cases, the default command enables the command and sets variables to their default values.

### CLI Error Messages

This table lists some error messages that you might encounter while using the CLI to configure your switch.
### Table 2: Common CLI Error Messages

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Meaning</th>
<th>How to Get Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Ambiguous command: “show con”</td>
<td>You did not enter enough characters for your switch to recognize the command.</td>
<td>Reenter the command followed by a question mark (?) without any space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Incomplete command.</td>
<td>You did not enter all of the keywords or values required by this command.</td>
<td>Reenter the command followed by a question mark (?) with a space between the command and the question mark. The possible keywords that you can enter with the command appear.</td>
</tr>
<tr>
<td>% Invalid input detected at ‘^’ marker.</td>
<td>You entered the command incorrectly. The caret (^) marks the point of the error.</td>
<td>Enter a question mark (?) to display all of the commands that are available in this command mode. The possible keywords that you can enter with the command appear.</td>
</tr>
</tbody>
</table>

### Configuration Logging

You can log and view changes to the switch configuration. You can use the Configuration Change Logging and Notification feature to track changes on a per-session and per-user basis. The logger tracks each configuration command that is applied, the user who entered the command, the time that the command was entered, and the parser return code for the command. This feature includes a mechanism for asynchronous notification to registered applications whenever the configuration changes. You can choose to have the notifications sent to the syslog.

**Note**

Only CLI or HTTP changes are logged.

### How to Use the CLI to Configure Features

#### Configuring the Command History

The software provides a history or record of commands that you have entered. The command history feature is particularly useful for recalling long or complex commands or entries, including access lists. You can customize this feature to suit your needs.
Changing the Command History Buffer Size

By default, the switch records ten command lines in its history buffer. You can alter this number for a current terminal session or for all sessions on a particular line. This procedure is optional.

SUMMARY STEPS

1. `terminal history [size number-of-lines]`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Changes the number of command lines that the switch records during the current terminal session in privileged EXEC mode. You can configure the size from 0 to 256.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><em>terminal history [size number-of-lines]</em></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice# <code>terminal history size 200</code></td>
</tr>
</tbody>
</table>

Recalling Commands

To recall commands from the history buffer, perform one of the actions listed in this table. These actions are optional.

The arrow keys function only on ANSI-compatible terminals such as VT100s.

**SUMMARY STEPS**

1. Ctrl-P or use the up arrow key
2. Ctrl-N or use the down arrow key
3. `show history`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall successively older commands.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Returns to more recent commands in the history buffer after recalling commands with Ctrl-P or the up arrow key. Repeat the key sequence to recall successively more recent commands.</td>
</tr>
</tbody>
</table>
### Step 3

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show history</code></td>
<td>Lists the last several commands that you just entered in privileged EXEC mode. The number of commands that appear is controlled by the setting of the <code>terminal history</code> global configuration command and the <code>history</code> line configuration command.</td>
</tr>
</tbody>
</table>

#### Example:
```
SwitchControllerDevice# show history
```

---

### Disabling the Command History Feature

The command history feature is automatically enabled. You can disable it for the current terminal session or for the command line. This procedure is optional.

#### SUMMARY STEPS

1. `terminal no history`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>terminal no history</code></td>
<td>Disables the feature during the current terminal session in privileged EXEC mode.</td>
</tr>
</tbody>
</table>

#### Example:
```
SwitchControllerDevice# terminal no history
```

---

### Enabling and Disabling Editing Features

Although enhanced editing mode is automatically enabled, you can disable it and reenable it.

#### SUMMARY STEPS

1. `terminal editing`
2. `terminal no editing`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>terminal editing</code></td>
<td>Reenables the enhanced editing mode for the current terminal session in privileged EXEC mode.</td>
</tr>
</tbody>
</table>

#### Example:
```
SwitchControllerDevice# terminal editing
```
### Enabling and Disabling Editing Features

**Step 2**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>terminal no editing</code></td>
<td>Disables the enhanced editing mode for the current terminal session in privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
SwitchControllerDevice# terminal no editing
```

---

### Editing Commands Through Keystrokes

The keystrokes help you to edit the command lines. These keystrokes are optional.

*Note*

The arrow keys function only on ANSI-compatible terminals such as VT100s.

---

<table>
<thead>
<tr>
<th>Editing Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl-B or use the left arrow key</td>
<td>Moves the cursor back one character.</td>
</tr>
<tr>
<td>Ctrl-F or use the right arrow key</td>
<td>Moves the cursor forward one character.</td>
</tr>
<tr>
<td>Ctrl-A</td>
<td>Moves the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl-E</td>
<td>Moves the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Esc B</td>
<td>Moves the cursor back one word.</td>
</tr>
<tr>
<td>Esc F</td>
<td>Moves the cursor forward one word.</td>
</tr>
<tr>
<td>Ctrl-T</td>
<td>Transposes the character to the left of the cursor with the character located at the cursor.</td>
</tr>
<tr>
<td>Delete or Backspace key</td>
<td>Erases the character to the left of the cursor.</td>
</tr>
<tr>
<td>Ctrl-D</td>
<td>Deletes the character at the cursor.</td>
</tr>
<tr>
<td>Ctrl-K</td>
<td>Deletes all characters from the cursor to the end of the command line.</td>
</tr>
<tr>
<td>Ctrl-U or Ctrl-X</td>
<td>Deletes all characters from the cursor to the beginning of the command line.</td>
</tr>
<tr>
<td>Ctrl-W</td>
<td>Deletes the word to the left of the cursor.</td>
</tr>
<tr>
<td>Keyboard Command</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Esc D</td>
<td>Deletes from the cursor to the end of the word.</td>
</tr>
<tr>
<td>Esc C</td>
<td>Capitalizes at the cursor.</td>
</tr>
<tr>
<td>Esc L</td>
<td>Changes the word at the cursor to lowercase.</td>
</tr>
<tr>
<td>Esc U</td>
<td>Capitalizes letters from the cursor to the end of the word.</td>
</tr>
<tr>
<td>Ctrl-V or Esc Q</td>
<td>Designates a particular keystroke as an executable command, perhaps as a shortcut.</td>
</tr>
<tr>
<td>Return key</td>
<td>Scrolls down a line or screen on displays that are longer than the terminal screen can display. <strong>Note</strong> The More prompt is used for any output that has more lines than can be displayed on the terminal screen, including <code>show</code> command output. You can use the Return and Space bar keystrokes whenever you see the More prompt.</td>
</tr>
<tr>
<td>Space bar</td>
<td>Scrolls down one screen.</td>
</tr>
<tr>
<td>Ctrl-L or Ctrl-R</td>
<td>Redisplay the current command line if the switch suddenly sends a message to your screen.</td>
</tr>
</tbody>
</table>

**Editing Command Lines That Wrap**

You can use a wraparound feature for commands that extend beyond a single line on the screen. When the cursor reaches the right margin, the command line shifts ten spaces to the left. You cannot see the first ten characters of the line, but you can scroll back and check the syntax at the beginning of the command. The keystroke actions are optional.

To scroll back to the beginning of the command entry, press `Ctrl-B` or the left arrow key repeatedly. You can also press `Ctrl-A` to immediately move to the beginning of the line.

**Note** The arrow keys function only on ANSI-compatible terminals such as VT100s.

The following example shows how to wrap a command line that extends beyond a single line on the screen.

**SUMMARY STEPS**

1. access-list
2. Ctrl-A
3. Return key
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> access-list</td>
<td>Displays the global configuration command entry that extends beyond one line. When the cursor first reaches the end of the line, the line is shifted ten spaces to the left and redisplayed. The dollar sign ($) shows that the line has been scrolled to the left. Each time the cursor reaches the end of the line, the line is again shifted ten spaces to the left.</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.255.255.255.255 SwitchControllerDevice(config)# $ 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.255.255.255.255 SwitchControllerDevice(config)# $t tcp 10.15.22.25 255.255.255.0 131.108.1.20 255.255.255.0 eq 45 SwitchControllerDevice(config)# $15.22.25 255.255.255.0 10.15.22.35 255.255.255.0 eq 45</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> Ctrl-A</td>
<td>Checks the complete syntax. The dollar sign ($) appears at the end of the line to show that the line has been scrolled to the right.</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice(config)# access-list 101 permit tcp 10.15.22.25 255.255.255.0 10.15.22.35 255.255.255.255.255</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> Return key</td>
<td>Execute the commands. The software assumes that you have a terminal screen that is 80 columns wide. If you have a different width, use the terminal width privileged EXEC command to set the width of your terminal. Use line wrapping with the command history feature to recall and modify previous complex command entries.</td>
</tr>
</tbody>
</table>

### Searching and Filtering Output of show and more Commands

You can search and filter the output for `show` and `more` commands. This is useful when you need to sort through large amounts of output or if you want to exclude output that you do not need to see. Using these commands is optional.

### SUMMARY STEPS

1. `{show | more} command | {begin | include | exclude} regular-expression`
Using the Command-Line Interface

Accessing the CLI on a Switch Stack

You can access the CLI through a console connection, through Telnet, a SSH, or by using the browser.

You manage the switch stack and the stack member interfaces through the active switch. You cannot manage stack members on an individual switch basis. You can connect to the active switch through the console port or the Ethernet management port of one or more stack members. Be careful with using multiple CLI sessions on the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible to lose track of the session from which you entered commands.

We recommend using one CLI session when managing the switch stack.

If you want to configure a specific stack member port, you must include the stack member number in the CLI command interface notation.

To debug the standby switch, use the `session standby ios` privileged EXEC command from the active switch to access the IOS console of the standby switch. To debug a specific stack member, use the `session switch stack-member-number` privileged EXEC command from the active switch to access the diagnostic shell of the stack member. For more information about these commands, see the switch command reference.

Accessing the CLI through a Console Connection or Through Telnet

Before you can access the CLI, you must connect a terminal or a PC to the switch console or connect a PC to the Ethernet management port and then power on the switch, as described in the hardware installation guide that shipped with your switch.

If your switch is already configured, you can access the CLI through a local console connection or through a remote Telnet session, but your switch must first be configured for this type of access.

You can use one of these methods to establish a connection with the switch:

- Connect the switch console port to a management station or dial-up modem, or connect the Ethernet management port to a PC. For information about connecting to the console or Ethernet management port, see the switch hardware installation guide.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>{show</td>
<td>more} command</td>
</tr>
<tr>
<td></td>
<td>{begin</td>
<td>include</td>
</tr>
</tbody>
</table>

Example:
SwitchControllerDevice# show interfaces | include protocol
Vlan1 is up, line protocol is up
Vlan10 is up, line protocol is down
GigabitEthernet1/0/1 is up, line protocol is down
GigabitEthernet1/0/2 is up, line protocol is up
• Use any Telnet TCP/IP or encrypted Secure Shell (SSH) package from a remote management station. The switch must have network connectivity with the Telnet or SSH client, and the switch must have an enable secret password configured.

  • The switch supports up to 16 simultaneous Telnet sessions. Changes made by one Telnet user are reflected in all other Telnet sessions.

  • The switch supports up to five simultaneous secure SSH sessions.

After you connect through the console port, through the Ethernet management port, through a Telnet session or through an SSH session, the user EXEC prompt appears on the management station.
Using the Web Graphical User Interface

- Prerequisites for Using the Web GUI, page 13
- Information About Using The Web GUI, page 13
- Connecting the Console Port of the Switch, page 15
- Logging On to the Web GUI, page 15
- Enabling Web and Secure Web Modes, page 15
- Configuring the Switch Web GUI, page 16

Prerequisites for Using the Web GUI

- The GUI must be used on a PC running Windows 7, Windows XP SP1 (or later releases), or Windows 2000 SP4 (or later releases).
- The switch GUI is compatible with Microsoft Internet Explorer version 10.x, Mozilla Firefox 20.x, or Google Chrome 26.x.

Information About Using The Web GUI

A web browser, or graphical user interface (GUI), is built into each switch.
You can use either the service port interface or the management interface to access the GUI. We recommend that you use the service-port interface. Click Help at the top of any page in the GUI to display online help. You might need to disable your browser's pop-up blocker to view the online help.

Web GUI Features

The switch web GUI supports the following:
The Configuration Wizard—After initial configuration of the IP address and the local username/password or auth via the authentication server (privilege 15 needed), the wizard provides a method to complete the initial
wireless configuration. Start the wizard through Configuration -> Wizard and follow the nine-step process to configure the following:

- Admin Users
- SNMP System Summary
- Management Port
- Wireless Management
- RF Mobility and Country code
- Mobility configuration
- WLANs
- 802.11 Configuration
- Set Time

The Monitor tab:

- Displays summary details of switch, clients, and access points.
- Displays all radio and AP join statistics.
- Displays air quality on access points.
- Displays list of all Cisco Discovery Protocol (CDP) neighbors on all interfaces and the CDP traffic information.
- Displays all rogue access points based on their classification-friendly, malicious, ad hoc, classified, and unclassified.

The Configuration tab:

- Enables you to configure the switch for all initial operation using the web Configuration Wizard. The wizard allows you to configure user details, management interface, and so on.
- Enables you to configure the system, internal DHCP server, management, and mobility management parameters.
- Enables you to configure the switch, WLAN, and radios.
- Enables you to configure and set security policies on your switch.
- Enables you to access the switch operating system software management commands.

The Administration tab enables you to configure system logs.
Connecting the Console Port of the Switch

Before You Begin

Before you can configure the switch for basic operations, you need to connect it to a PC that uses a VT-100 terminal emulation program (such as HyperTerminal, ProComm, Minicom, or Tip).

Step 1
Connect one end of a null-modem serial cable to the switch's RJ-45 console port and the other end to your PC's serial port.

Step 2
Plug the AC power cord into the switch and a grounded 100 to 240 VAC, 50/60-Hz electrical outlet. Turn on the power supply. The bootup script displays operating system software initialization (code download and power-on self-test verification) and basic configuration. If the switch passes the power-on self-test, the bootup script runs the configuration wizard, which prompts you for basic configuration input.

Step 3
Enter yes. Proceed with basic initial setup configuration parameters in the CLI setup wizard. Specify the IP address for the service port which is the gigabitethernet 0/0 interface. After entering the configuration parameters in the configuration wizard, you can access the Web GUI. Now, the switch is configured with the IP address for service port.

Logging On to the Web GUI

Enter the switch IP address in your browser’s address bar. For a secure connection, enter https://ip-address. For a less secure connection, enter http://ip-address.

Enabling Web and Secure Web Modes

Step 1
Choose Configuration > Switch > Management > Protocol Management > HTTP-HTTPS. The HTTP-HTTPS Configuration page appears.

Step 2
To enable web mode, which allows users to access the switch GUI using “http://ip-address,” choose Enabled from the HTTP Access drop-down list. Otherwise, choose Disabled. Web mode (HTTP) is not a secure connection.
Configuring the Switch Web GUI

The configuration wizard enables you to configure basic settings on the switch. You can run the wizard after you receive the switch from the factory or after the switch has been reset to factory defaults. The configuration wizard is available in both GUI and CLI formats.

Step 1 Connect your PC to the service port and configure an IPv4 address to use the same subnet as the switch. The switch is loaded with IOSXE image and the service port interface is configured as gigabitethernet 0/0.

Step 2 Start Internet Explorer 10 (or later), Firefox 2.0.0.11 (or later), or Google Chrome on your PC and enter the management interface IP address on the browser window. The management interface IP address is same as the gigabitethernet 0/0 (also known as service port interface). When you log in for the first time, you need to enter HTTP username and password. By default, the username is admin and the password is cisco. You can use both HTTP and HTTPS when using the service port interface. HTTPS is enabled by default and HTTP can also be enabled.

When you log in for the first time, the Accessing Cisco Switch <Model Number> <Hostname> page appears.

Step 3 On the Accessing Cisco Switch page, click the Wireless Web GUI link to access switch web GUI Home page.

Step 4 Choose Configuration > Wizard to perform all steps that you need to configure the switch initially.

The Admin Users page appears.

Step 5 On the Admin Users page, enter the administrative username to be assigned to this switch in the User Name text box and the administrative password to be assigned to this switch in the Password and Confirm Password text boxes. Click Next.

The default username is admin and the default password is cisco. You can also create a new administrator user for the switch. You can enter up to 24 ASCII characters for username and password.
The **SNMP System Summary** page appears.

**Step 6**

On the **SNMP System Summary** page, enter the following SNMP system parameters for the switch, and click **Next**:

- Customer-definable switch location in the Location text box.
- Customer-definable contact details such as phone number with names in the Contact text box.
- Choose **enabled** to send SNMP notifications for various SNMP traps or **disabled** not to send SNMP notifications for various SNMP traps from the SNMP Global Trap drop-down list.
- Choose **enabled** to send system log messages or **disabled** not to send system log messages from the SNMP Logging drop-down list.

**Note** The SNMP trap server, must be reachable through the distribution ports (and not through the gigabitethernet0/0 service or management interface).

The **Management Port** page appears.

**Step 7**

In the **Management Port** page, enter the following parameters for the management port interface (gigabitethernet 0/0) and click **Next**.

- Interface IP address that you assigned for the service port in the IP Address text box.
- Network mask address of the management port interface in the Netmask text box.
- The IPv4 Dynamic Host Configuration Protocol (DHCP) address for the selected port in the IPv4 DHCP Server text box.

The **Wireless Management** page appears.

**Step 8**

In the **Wireless Management** page, enter the following wireless interface management details, and click **Next**.

- Choose the interface—VLAN, or Ten Gigabit Ethernet from the Select Interface drop-down list.
- VLAN tag identifier, or 0 for no VLAN tag in the VLAN id text box.
- IP address of wireless management interface where access points are connected in the IP Address text box.
- Network mask address of the wireless management interface in the Netmask text box.
- DHCP IPv4 IP address in the IPv4 DHCP Server text box.

When selecting VLAN as interface, you can specify the ports as –Trunk or Access ports from the selected list displayed in the Switch Port Configuration text box.

The **RF Mobility and Country Code** page appears.

**Step 9**

In the **RF Mobility and Country Code** page, enter the RF mobility domain name in the RF Mobility text box, choose current country code from the Country Code drop-down list, and click **Next**. From the GUI, you can select only one country code.

**Note** Before configuring RF grouping parameters and mobility configuration, ensure that you refer to the relevant conceptual content and then proceed with the configuration.

The **Mobility Configuration** page with mobility global configuration settings appears.

**Step 10**

In the **Mobility Configuration** page, view and enter the following mobility global configuration settings, and click **Next**.

- Choose **Mobility Controller** or **Mobility Agent** from the Mobility Role drop-down list:
• If Mobility Agent is chosen, enter the mobility controller IP address in the Mobility Controller IP Address text box and mobility controller IP address in the Mobility Controller Public IP Address text box.

• If Mobility Controller is chosen, then the mobility controller IP address and mobility controller public IP address are displayed in the respective text boxes.

• Displays mobility protocol port number in the Mobility Protocol Port text box.

• Displays the mobility switch peer group name in the Mobility Switch Peer Group Name text box.

• Displays whether DTLS is enabled in the DTLS Mode text box.

DTLS is a standards-track Internet Engineering Task Force (IETF) protocol based on TLS.

• Displays mobility domain identifier for 802.11 radios in the Mobility Domain ID for 802.11 radios text box.

• The amount of time (in seconds) between each ping request sent to a peer switch in the Mobility Keepalive Interval (1-30) sec text box.

Valid range is from 1 to 30 seconds, and the default value is 10 seconds.

• Number of times a ping request is sent to a peer switch before the peer is considered to be unreachable in the Mobility Keepalive Count (3-20) text box.

The valid range is from 3 to 20, and the default value is 3.

• The DSCP value that you can set for the mobility switch in the Mobility Control Message DSCP Value (0-63) text box.

The valid range is 0 to 63, and the default value is 0.

• Displays the number of mobility switch peer group member configured in the Switch Peer Group Members Configured text box.

The WLANs page appears.

Step 11
In the WLANs page, enter the following WLAN configuration parameters, and click Next.

• WLAN identifier in the WLAN ID text box.

• SSID of the WLAN that the client is associated with in the SSID text box.

• Name of the WLAN used by the client in the Profile Name text box.

The 802.11 Configuration page appears.

Step 12
In the 802.11 Configuration page, check either one or both 802.11a/n/ac and 802.11b/g/n check boxes to enable the 802.11 radios, and click Next.

The Set Time page appears.

Step 13
In the Set Time page, you can configure the time and date on the switch based on the following parameters, and click Next.

• Displays current timestamp on the switch in the Current Time text box.

• Choose either Manual or NTP from the Mode drop-down list.

On using the NTP server, all access points connected to the switch, synchronizes its time based on the NTP server settings available.
• Choose date on the switch from the Year, Month, and Day drop-down list.
• Choose time from the Hours, Minutes, and Seconds drop-down list.
• Enter the time zone in the Zone text box and select the offset setting required when compared to the current time configured on the switch from the Offset drop-down list.

The Save Wizard page appears.

**Step 14**

In the Save Wizard page, you can review the configuration settings performed on the switch using these steps, and if you wish to change any configuration value, click Previous and navigate to that page. You can save the switch configuration created using the wizard only if a success message is displayed for all the wizards. If the Save Wizard page displays errors, you must recreate the wizard for initial configuration of the switch.

Information About Administering the Switch

System Time and Date Management

You can manage the system time and date on your switch using automatic configuration methods (RTC and NTP), or manual configuration methods.
System Clock

The basis of the time service is the system clock. This clock runs from the moment the system starts up and keeps track of the date and time.

The system clock can then be set from these sources:

- NTP
- Manual configuration

The system clock can provide time to these services:

- User show commands
- Logging and debugging messages

The system clock keeps track of time internally based on Coordinated Universal Time (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time appears correctly for the local time zone.

The system clock keeps track of whether the time is authoritative or not (that is, whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed.

Network Time Protocol

The NTP is designed to time-synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP Stratum

NTP uses the concept of a stratum to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not be accurate by never synchronizing to a device that is not synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

NTP Associations

The communications between devices running NTP (known as associations) are usually statically configured; each device is given the IP address of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a
LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, in that case, information flow is one-way only.

**NTP Security**

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

**NTP Implementation**

Implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

The following figure shows a typical network example using NTP. Switch A is the NTP master, with the Switch B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F, respectively.

*Figure 1: Typical NTP Network Configuration*
If the network is isolated from the Internet, NTP allows a device to act as if it is synchronized through NTP, when in fact it has learned the time by using other means. Other devices then synchronize to that device through NTP.

When multiple sources of time are available, NTP is always considered to be more authoritative. NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a publicly available version for systems running UNIX and its various derivatives is also available. This software allows host systems to be time-synchronized as well.

NTP Version 4

NTP version 4 is implemented on the switch. NTPv4 is an extension of NTP version 3. NTPv4 supports both IPv4 and IPv6 and is backward-compatible with NTPv3.

NTPv4 provides these capabilities:

- Support for IPv6.
- Improved security compared to NTPv3. The NTPv4 protocol provides a security framework based on public key cryptography and standard X509 certificates.
- Automatic calculation of the time-distribution hierarchy for a network. Using specific multicast groups, NTPv4 automatically configures the hierarchy of the servers to achieve the best time accuracy for the lowest bandwidth cost. This feature leverages site-local IPv6 multicast addresses.

System Name and Prompt

You configure the system name on the switch to identify it. By default, the system name and prompt are Switch.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

Stack System Name and Prompt

If you are accessing a stack member through the active switch, you must use the session stack-member-number privileged EXEC command. The stack member number range is from 1 through 4. When you use this command, the stack member number is appended to the system prompt. For example, Switch-2# is the prompt in privileged EXEC mode for stack member 2, and the system prompt for the switch stack is Switch.

Default System Name and Prompt Configuration

The default switch system name and prompt is Switch.

DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as ping, telnet, connect, and related Telnet support operations.
IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a *com* domain name, so its domain name is *cisco.com*. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as *ftp.cisco.com*.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

### Default DNS Settings

#### Table 4: Default DNS Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DNS enable state</td>
<td>Enabled.</td>
</tr>
<tr>
<td>DNS default domain name</td>
<td>None configured.</td>
</tr>
<tr>
<td>DNS servers</td>
<td>No name server addresses are configured.</td>
</tr>
</tbody>
</table>

### Login Banners

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner is displayed on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner is also displayed on all connected terminals. It appears after the MOTD banner and before the login prompts.

The MOTD and login banners are not configured.

### Default Banner Configuration

The MOTD and login banners are not configured.

### MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the switch learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the switch resets.
The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

**MAC Address Table Creation**

With multiple MAC addresses supported on all ports, you can connect any port on the switch to other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As devices are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

**MAC Addresses and VLANs**

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

**MAC Addresses and Switch Stacks**

The MAC address tables on all stack members are synchronized. At any given time, each stack member has the same copy of the address tables for each VLAN. When an address ages out, the address is removed from the address tables on all stack members. When a switch joins a switch stack, that switch receives the addresses for each VLAN learned on the other stack members. When a stack member leaves the switch stack, the remaining stack members age out or remove all addresses learned by the former stack member.

**Default MAC Address Table Settings**

The following table shows the default settings for the MAC address table.

<table>
<thead>
<tr>
<th>Feature</th>

ARP Table Management

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called address resolution.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the `arpa` keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

How to Administer the Switch

Configuring the Time and Date Manually

System time remains accurate through restarts and reboot, however, you can manually configure the time and date after the system is restarted.

We recommend that you use manual configuration only when necessary. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

Note

You must reconfigure this setting if you have manually configured the system clock before the active switch fails and a different stack member assumes the role of active switch.

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

SUMMARY STEPS

1. Use one of the following:
   - `clock set hh:mm:ss day month year`
   - `clock set hh:mm:ss month day year`
### Configuring the Time and Date Manually

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Sets the system clock using one of these formats:</td>
</tr>
<tr>
<td>• <code>clock set hh:mm:ss month day year</code></td>
<td>Sets the time zone.</td>
</tr>
<tr>
<td><em>Purpose Command or Action</em></td>
<td></td>
</tr>
<tr>
<td><code>clock set</code></td>
<td>Internally time is kept in Coordinated Universal Time (UTC), so this command is used only for display purposes and when the time is manually set.</td>
</tr>
<tr>
<td><code>hours-offset</code></td>
<td><em>zone</em>—Enters the name of the time zone to be displayed when standard time is in effect. The default is UTC.</td>
</tr>
<tr>
<td><code>minutes-offset</code></td>
<td><em>hours-offset</em>—Enters the hours offset from UTC.</td>
</tr>
<tr>
<td>(Optional)</td>
<td><em>minutes-offset</em>—Enters the minutes offset from UTC.</td>
</tr>
<tr>
<td></td>
<td>This available where the local time zone is a percentage of an hour different from UTC.</td>
</tr>
<tr>

</table>
### Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

#### SUMMARY STEPS

1. `configure terminal`
2. `clock summer-time zone date date month year hh:mm date month year hh:mm [offset]`
3. `clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]`
4. `end`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Example: <code>SwitchControllerDevice# configure terminal</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Configures summer time to start and end on specified days every year.</td>
</tr>
<tr>
<td><code>clock summer-time zone date date month year hh:mm date month year hh:mm [offset]</code></td>
<td>Example: <code>SwitchControllerDevice(config)# clock summer-time PDT date 10 March 2013 2:00 3 November 2013 2:00</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures summer time to start and end on the specified days every year. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. Summer time is disabled by default. If you specify <code>clock summer-time zone recurring</code> without parameters, the summer time rules default to the United States rules.</td>
</tr>
<tr>
<td><code>clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]</code></td>
<td>Example: <code>SwitchControllerDevice(config)# clock summer-time</code></td>
</tr>
</tbody>
</table>
### Configuring a System Name

**SUMMARY STEPS**

1. configure terminal
2. hostname `name`
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>

<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

---

If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

- **zone**—Specifies the name of the time zone (for example, PDT) to be displayed when summer time is in effect.
- **(Optional) week**—Specifies the week of the month (1 to 4, **first**, or **last**).
- **(Optional) day**—Specifies the day of the week (Sunday, Monday...).
- **(Optional) month**—Specifies the month (January, February...).
- **(Optional) hh:mm**—Specifies the time (24-hour format) in hours and minutes.
- **(Optional) offset**—Specifies the number of minutes to add during summer time. The default is 60.

**Step 4**

<table>
<thead>
<tr>
<th>end</th>
<th>Returns to privileged EXEC mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

<tr>
<td>SwitchControllerDevice(config)# end</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Setting Up DNS

If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the `ip domain-name` global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

### SUMMARY STEPS

1. configure terminal
2. ip domain-name name
3. ip name-server server-address1 [server-address2 ... server-address6]
4. ip domain-lookup [nsap | source-interface interface]
5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>ip domain-name</strong> name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# ip domain-name Cisco.com</td>
</tr>
<tr>
<td></td>
<td>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name). Do not include the initial period that separates an unqualified name from the domain name. At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><strong>ip name-server server-address1</strong> [server-address2 ... server-address6]</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# ip name-server 192.168.1.100 192.168.1.200 192.168.1.300</td>
</tr>
<tr>
<td></td>
<td>Specifies the address of one or more nameservers to use for name and address resolution. You can specify up to six nameservers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><strong>ip domain-lookup</strong> [nsap</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# ip domain-lookup</td>
</tr>
<tr>
<td></td>
<td>(Optional) Enables DNS-based hostname-to-address translation on your switch. This feature is enabled by default. If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><strong>end</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# end</td>
</tr>
<tr>
<td></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Configuring a Message-of-the-Day Login Banner**

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

**SUMMARY STEPS**

1. configure terminal
2. banner motd c message c
3. end
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>banner motd <code>c message c</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# banner motd <code>#</code> This is a secure site. Only authorized users are allowed. For access, contact technical support. <code>#</code></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# end</td>
</tr>
</tbody>
</table>

**Configuring a Login Banner**

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

**SUMMARY STEPS**

1. configure terminal
2. banner login `c message c`
3. end
### DETAILED STEPS

<table>

### Configuring MAC Address Move Notification Traps

When you configure MAC-move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

Beginning in privileged EXEC mode, follow these steps to configure the switch to send MAC address-move notification traps to an NMS host:

**SUMMARY STEPS**

1. configure terminal
2. snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type
3. snmp-server enable traps mac-notification move
4. mac address-table notification mac-move
5. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
|      | **Example:**  
|      | SwitchControllerDevice# configure terminal | |
| 2    | `snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type` | Specifies the recipient of the trap message.  

- `host-addr`—Specifies the name or address of the NMS.  
- `traps` (the default)—Sends SNMP traps to the host.  
- `informs`—Sends SNMP informs to the host.  
- `version`—Specifies the SNMP version to support. Version 1, the default, is not available with informs.  
- `community-string`—Specifies the string to send with the notification operation. Though you can set this string by using the `snmp-server host` command, we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command.  
- `notification-type`—Uses the `mac-notification` keyword. |
|      | **Example:**  
|      | SwitchControllerDevice(config)# snmp-server host 172.20.10.10 traps private mac-notification | |
| 3    | `snmp-server enable traps mac-notification move` | Enables the switch to send MAC address move notification traps to the NMS. |
|      | **Example:**  
|      | SwitchControllerDevice(config)# snmp-server enable traps mac-notification move | |
| 4    | `mac address-table notification mac-move` | Enables the MAC address move notification feature. |
|      | **Example:**  
|      | SwitchControllerDevice(config)# mac address-table notification mac-move | |
| 5    | `end` | Returns to privileged EXEC mode. |
|      | **Example:**  
|      | SwitchControllerDevice(config)# end | |
Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table threshold limit is reached or exceeded.

SUMMARY STEPS

1. configure terminal
2. snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type
3. snmp-server enable traps mac-notification threshold
4. mac address-table notification threshold
5. mac address-table notification threshold [limit percentage] | [interval time]
6. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** snmp-server host host-addr {traps | informs} {version {1 | 2c | 3}} community-string notification-type | Specifies the recipient of the trap message. |
| Example: SwitchControllerDevice(config)# snmp-server host 172.20.10.10 traps private mac-notification | `- host-addr—Specifies the name or address of the NMS. |
| `- traps (the default)—Sends SNMP traps to the host. |
| `- informs—Sends SNMP informs to the host. |
| `- version—Specifies the SNMP version to support. Version 1, the default, is not available with informs. |
| `- community-string—Specifies the string to send with the notification operation. You can set this string by using the `snmp-server host` command, but we recommend that you define this string by using the `snmp-server community` command before using the `snmp-server host` command. |
| `- notification-type—Uses the `mac-notification` keyword. |

| **Step 3** snmp-server enable traps mac-notification threshold | Enables MAC threshold notification traps to the NMS. |
| Example: SwitchControllerDevice(config)# snmp-server enable traps mac-notification threshold | |
### Adding and Removing Static AddressEntries

**SUMMARY STEPS**

1. configure terminal
2. mac address-table static mac-addr vlan vlan-id interface interface-id
3. end

**DETAILED STEPS**

</tbody>
</table>

**Configuration Examples for Switch Administration**

**Example: Setting the System Clock**

This example shows how to manually set the system clock:

```
SwitchControllerDevice# clock set 13:32:00 23 July 2013
```

**Examples: Configuring Summer Time**

This example (for daylight savings time) shows how to specify that summer time starts on March 10 at 02:00 and ends on November 3 at 02:00:

```
SwitchControllerDevice(config)# clock summer-time PDT recurring PST date 10 March 2013 2:00 3 November 2013 2:00
```

This example shows how to set summer time start and end dates:

```
SwitchControllerDevice(config)# clock summer-time PST date 20 March 2013 2:00 20 November 2013 2:00
```

**Example: Configuring a MOTD Banner**

This example shows how to configure a MOTD banner by using the pound sign (#) symbol as the beginning and ending delimiter:

```
SwitchControllerDevice(config)# banner motd #
```
Example: Configuring a Login Banner

This example shows how to configure a login banner by using the dollar sign ($) symbol as the beginning and ending delimiter:

```
SwitchControllerDevice(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
```

Example: Configuring MAC Address Change Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable MAC address notification traps to the NMS, enable the MAC address-change notification feature, set the interval time to 123 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```
SwitchControllerDevice(config)# snmp-server host 172.20.10.10 traps private mac-notification
SwitchControllerDevice(config)# snmp-server enable traps mac-notification change
SwitchControllerDevice(config)# mac address-table notification change interval 123
SwitchControllerDevice(config)# mac address-table notification change history-size 100
SwitchControllerDevice(config)# interface gigabitethernet1/2/1
SwitchControllerDevice(config-if)# snmp trap mac-notification change added
```
Example: Configuring MAC Threshold Notification Traps

This example shows how to specify 172.20.10.10 as the NMS, enable the MAC address threshold notification feature, set the interval time to 123 seconds, and set the limit to 78 percent:

```
SwitchControllerDevice(config)# snmp-server host 172.20.10.10 traps private mac-notification
SwitchControllerDevice(config)# snmp-server enable traps mac-notification threshold
SwitchControllerDevice(config)# mac address-table notification threshold interval 123
SwitchControllerDevice(config)# mac address-table notification threshold limit 78
```

Example: Adding the Static Address to the MAC Address Table

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

```
SwitchControllerDevice(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface gigabitethernet1/1/1
```

Example: Configuring Unicast MAC Address Filtering

This example shows how to enable unicast MAC address filtering and how to configure drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
SwitchControllerDevice(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
```

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Performing Switch Setup Configuration

Review the sections in this module before performing your initial switch configuration tasks that include IP address assignments and DHCP autoconfiguration.
Switch Boot Process

To start your switch, you need to follow the procedures in the hardware installation guide for installing and powering on the switch and setting up the initial switch configuration (IP address, subnet mask, default gateway, secret and Telnet passwords, and so forth).

The normal boot process involves the operation of the boot loader software and includes these activities:

- Locates the bootable (base) package in the bundle or installed package set.
- Performs low-level CPU initialization. It initializes the CPU registers, which control where physical memory is mapped, its quantity, its speed, and so forth.
- Performs power-on self-test (POST) for the CPU subsystem and tests the system DRAM.
- Initializes the file systems on the system board.
- Loads a default operating system software image into memory and boots up the switch.

The boot loader provides access to the file systems before the operating system is loaded. Normally, the boot loader is used only to load, decompress, and start the operating system. After the boot loader gives the operating system control of the CPU, the boot loader is not active until the next system reset or power-on.

The boot loader also provides trap-door access into the system if the operating system has problems serious enough that it cannot be used. The trap-door mechanism provides enough access to the system so that if it is necessary, you can reinstall the operating system software image by using the emergency-install command and restart the operating system.

Before you can assign switch information, make sure you have connected a PC or terminal to the console port or a PC to the Ethernet management port, and make sure you have configured the PC or terminal-emulation software baud rate and character format to match these of the switch console port:

- Baud rate default is 9600.
- Data bits default is 8.
- Stop bits default is 2 (minor).
- Parity settings default is none.

Software Installer Features

The following software installer features are supported on your switch:

- Software bundle installation on a standalone switch, a switch stack, or a subset of switches in a stack. The default is installation on all the switches if a switch stack is configured.
- In a stack of switches, Cisco recommends all switches in install mode.
- Software rollback to a previously installed package set.
- Emergency installation in the event that no valid installed packages reside on the boot flash.
• Auto-upgrade of a switch that joins the switch stack with incompatible software.
• Installation using packages on one switch as the source for installing packages on another switch in the switch stack.

**Note**
Software installation and rollback must be performed while running only in installed mode. You can use the `software expand` EXEC command to convert bundle boot mode to install mode.

---

**Software Boot Modes**

Your switch supports two modes to boot the software packages:

- Installed mode
- Bundle mode

**Related Topics**
- Examples: Displaying Software Bootup in Install Mode, on page 79
- Example: Emergency Installation, on page 80

---

**Installed Boot Mode**

You can boot your switch in installed mode by booting the software package provisioning file that resides in flash:

```
switch: boot flash:packages.conf
```

The provisioning file contains a list of software packages to boot, mount, and run. The ISO file system in each installed package is mounted to the root file system directly from flash.

**Note**
The packages and provisioning file used to boot in installed mode must reside in flash. Booting in installed mode from usbflash0: or tftp: is not supported.

**Related Topics**
- Examples: Displaying Software Bootup in Install Mode, on page 79
- Example: Emergency Installation, on page 80

---

**Bundle Boot Mode**

You can boot your switch in bundle boot mode by booting the bundle (.bin) file:

```
switch: boot flash:cat3850-universalk9.SSA.03.08.83.EMD.150-8.83.EMD.bin
```

The provisioning file contained in a bundle is used to decide which packages to boot, mount, and run. Packages are extracted from the bundle and copied to RAM. The ISO file system in each package is mounted to the root file system.
Unlike install boot mode, additional memory that is equivalent to the size of the bundle is used when booting in bundle mode.

Unlike install boot mode, bundle boot mode is available from several locations:

- flash:
- usbflash0:
- tftp:

**Note**

Auto install and smart install functionality is not supported in bundle boot mode.

**Note**

The AP image pre-download feature is not supported in bundle boot mode. For more information about the pre-download feature see the Cisco WLC 5700 Series *Preloading an Image to Access Points* chapter.

**Related Topics**

- Examples: Displaying Software Bootup in Install Mode, on page 79
- Example: Emergency Installation, on page 80

### Boot Mode for a Switch Stack

All the switches in a stack must be running in installed mode or bundle boot mode. A mixed mode stack is not supported. If a new switch tries to join the stack in a different boot mode then the active switch, the new switch is given a V-mismatch state.

If a mixed mode switch stack is booted at the same time, then all the switches except for the active switch is given a V-mismatch state. If the boot mode does not support auto-upgrade, then the switch stack members must be re-booted in the same boot mode as the active switch.

If the stack is running in installed mode, the auto-upgrade feature can be used to automatically upgrade the new switch that is attempting to join the switch stack.

The auto-upgrade feature changes the boot mode of the new switch to installed mode. If the stack is running in bundle boot mode, the auto-upgrade feature is not available. You will be required to use the bundle mode to boot the new switch so that it can join the switch stack.

This is an example of the state of a switch that attempts to join the switch stack when the boot mode is not compatible with the active switch:

```
SwitchControllerDevice# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
-----------------------------------------------
  1  Member 6400.f125.1a00  1   0  V-Mismatch
*2  Active 6400.f125.1100  1  V01  Ready
```

SwitchControllerDevice
Switches Information Assignment

You can assign IP information through the switch setup program, through a DHCP server, or manually.

Use the switch setup program if you want to be prompted for specific IP information. With this program, you can also configure a hostname and an enable secret password.

It gives you the option of assigning a Telnet password (to provide security during remote management) and configuring your switch as a command or member switch of a cluster or as a standalone switch.

The switch stack is managed through a single IP address. The IP address is a system-level setting and is not specific to the stack master or to any other stack member. You can still manage the stack through the same IP address even if you remove the stack master or any other stack member from the stack, provided there is IP connectivity.

Note
Stack members retain their IP address when you remove them from a switch stack. To avoid a conflict by having two devices with the same IP address in your network, change the IP address of the switch that you removed from the switch stack.

Use a DHCP server for centralized control and automatic assignment of IP information after the server is configured.

Note
If you are using DHCP, do not respond to any of the questions in the setup program until the switch receives the dynamically assigned IP address and reads the configuration file.

If you are an experienced user familiar with the switch configuration steps, manually configure the switch. Otherwise, use the setup program described in the Boot Process section.

DHCP-Based Autoconfiguration Overview

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one for delivering configuration parameters from a DHCP server to a device and an operation for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

During DHCP-based autoconfiguration, your switch (DHCP client) is automatically configured at startup with IP address information and a configuration file.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch. However, you need to configure the DHCP server for various lease options associated with IP addresses.

If you want to use DHCP client autoconfiguration, you need to configure a Trivial File Transfer Protocol (TFTP) server to fetch the configuration file. The DHCP client then applies the new configuration file to its running configuration.

---

**Note**

If the new configuration is downloaded to a switch that already has a configuration, the downloaded configuration is appended to the configuration file stored on the switch. (Any existing configuration is not overwritten by the downloaded one.)

---

**Note**

We recommend a redundant connection between a switch stack and the DHCP, DNS, and TFTP servers. This is to help ensure that these servers remain accessible in case one of the connected stack members is removed from the switch stack.

The DHCP server for your switch can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay device between your switch and the DHCP server. A relay device forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

### DHCP Client Request Process

When you boot up your switch, the DHCP client is invoked and requests configuration information from a DHCP server when the configuration file is not present on the switch. If the configuration file is present and the configuration includes the `ip address dhcp` interface configuration command on specific routed interfaces, the DHCP client is invoked and requests the IP address information for those interfaces.
This is the sequence of messages that are exchanged between the DHCP client and the DHCP server.

**Figure 2: DHCP Client and Server Message Exchange**

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, a lease for the IP address, and so forth) to the client in a DHCPOffer unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses configuration information received from the server. The amount of information the switch receives depends on how you configure the DHCP server.

If the configuration parameters sent to the client in the DHCPOffer unicast message are invalid (a configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOffer message (the DHCP server assigned the parameters to another client).

A DHCP client might receive offers from multiple DHCP or BOOTP servers and can accept any of the offers; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address is allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address. If the switch accepts replies from a BOOTP server and configures itself, the switch broadcasts, instead of unicasts, TFTP requests to obtain the switch configuration file.

The DHCP hostname option allows a group of switches to obtain hostnames and a standard configuration from the central management DHCP server. A client (switch) includes in its DHCPDISCOVER message an option 12 field used to request a hostname and other configuration parameters from the DHCP server. The configuration files on all clients are identical except for their DHCP-obtained hostnames.

If a client has a default hostname (the `hostname name` global configuration command is not configured or the `no hostname` global configuration command is entered to remove the hostname), the DHCP hostname option is not included in the packet when you enter the `ip address dhcp` interface configuration command. In this case, if the client receives the DHCP hostname option from the DHCP interaction while acquiring an IP address for an interface, the client accepts the DHCP hostname option and sets the flag to show that the system now has a hostname configured.
DHCP-based Autoconfiguration and Image Update

You can use the DHCP image upgrade features to configure a DHCP server to download both a new image and a new configuration file to one or more switches in a network. Simultaneous image and configuration upgrade for all switches in the network helps ensure that each new switch added to a network are synchronous with the network.

There are two types of DHCP image upgrades: DHCP autoconfiguration and DHCP auto-image update.

Restrictions for DHCP-based Autoconfiguration

- The DHCP-based autoconfiguration with a saved configuration process stops if there is not at least one Layer 3 interface in an up state without an assigned IP address in the network.
- Unless you configure a timeout, the DHCP-based autoconfiguration with a saved configuration feature tries indefinitely to download an IP address.
- The auto-install process stops if a configuration file cannot be downloaded or if the configuration file is corrupted.
- The configuration file that is downloaded from TFTP is merged with the existing configuration in the running configuration but is not saved in the NVRAM unless you enter the `write memory` or `copy running-configuration startup-configuration` privileged EXEC command. If the downloaded configuration is saved to the startup configuration, the feature is not triggered during subsequent system restarts.

DHCP Autoconfiguration

DHCP autoconfiguration downloads a configuration file to one or more switches in your network from a DHCP server. The downloaded configuration file becomes the running configuration of the switch. It does not overwrite the bootup configuration saved in the flash, until you reload the switch.

DHCP Auto-Image Update

You can use DHCP auto-image upgrade with DHCP autoconfiguration to download both a configuration and a new image to one or more switches in your network. The switch (or switches) downloading the new configuration and the new image can be blank (or only have a default factory configuration loaded).

To enable a DHCP auto-image update on the switch, the TFTP server where the image and configuration files are located must be configured with the correct option 67 (the configuration filename), option 66 (the DHCP server hostname) option 150 (the TFTP server address), and option 125 (description of the Cisco IOS image file) settings.

After you install the switch in your network, the auto-image update feature starts. The downloaded configuration file is saved in the running configuration of the switch, and the new image is downloaded and installed on the switch. When you reboot the switch, the configuration is stored in the saved configuration on the switch.

DHCP Server Configuration Guidelines

Follow these guidelines if you are configuring a device as a DHCP server:
• You should configure the DHCP server with reserved leases that are bound to each switch by the switch hardware address.

• If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:
  - IP address of the client (required)
  - Subnet mask of the client (required)
  - DNS server IP address (optional)
  - Router IP address (default gateway address to be used by the switch) (required)

• If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:
  - TFTP server name (required)
  - Boot filename (the name of the configuration file that the client needs) (recommended)
  - Hostname (optional)

• Depending on the settings of the DHCP server, the switch can receive IP address information, the configuration file, or both.

• If you do not configure the DHCP server with the lease options described previously, it replies to client requests with only those parameters that are configured. If the IP address and the subnet mask are not in the reply, the switch is not configured. If the router IP address or the TFTP server name are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not affect autoconfiguration.

• The switch can act as a DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch but are not configured.

### Purpose of the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename, the TFTP server, or if the configuration file could not be downloaded, the switch attempts to download a configuration file by using various combinations of filenames and TFTP server addresses. The files include the specified configuration filename (if any) and these files: network-config, cisconet.cfg, hostname.config, or hostname.cfg, where hostname is the switch’s current hostname. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include these files:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The network-config or the cisconet.cfg file (known as the default configuration files).
How to Obtain Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename is reserved for the switch and provided in the DHCP reply (one-file read method).
  
The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server and upon receipt, it completes its boot up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).
  
The switch receives its IP address, subnet mask, and the configuration filename from the DHCP server. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, it completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).
  
The switch receives its IP address, subnet mask, and the TFTP server address from the DHCP server. The switch sends a unicast message to the TFTP server to retrieve the network-config or ciscoconet.cfg default configuration file. (If the network-config file cannot be read, the switch reads the ciscoconet.cfg file.)
  
The default configuration file contains the hostnames-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its hostname. If the hostname is not found in the file, the switch uses the hostname in the DHCP reply. If the hostname is not specified in the DHCP reply, the switch uses the default Switch as its hostname.
After obtaining its hostname from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its hostname (hostname-config or hostname.cfg, depending on whether network-config or ciscoet.cfg was read earlier) from the TFTP server. If the ciscoet.cfg file is read, the filename of the host is truncated to eight characters.

If the switch cannot read the network-config, ciscoet.cfg, or the hostname file, it reads the router-config file. If the switch cannot read the router-config file, it reads the ciscorrtr.cfg file.

Note
The switch broadcasts TFTP server requests if the TFTP server is not obtained from the DHCP replies, if all attempts to read the configuration file through unicast transmissions fail, or if the TFTP server name cannot be resolved to an IP address.

How to Control Environment Variables

With a normally operating switch, you enter the boot loader mode only through the console connection configured for 9600 bps. Unplug the switch power cord, and press the Mode button while reconnecting the power cord. You can release the Mode button after all the amber system LEDs turn on and remain solid. The boot loader switch prompt then appears.

The switch boot loader software provides support for nonvolatile environment variables, which can be used to control how the boot loader, or any other software running on the system, operates. Boot loader environment variables are similar to environment variables that can be set on UNIX or DOS systems.

Environment variables that have values are stored in flash memory outside of the flash file system.

Each line in these files contains an environment variable name and an equal sign followed by the value of the variable. A variable has no value if it is not present; it has a value if it is listed even if the value is a null string. A variable that is set to a null string (for example, "") is a variable with a value. Many environment variables are predefined and have default values.

You can change the settings of the environment variables by accessing the boot loader or by using Cisco IOS commands. Under normal circumstances, it is not necessary to alter the setting of the environment variables.

Environment Variables for TFTP

When the switch is connected to a PC through the Ethernet management port, you can download or upload a configuration file to the boot loader by using TFTP. Make sure the environment variables in this table are configured.
### Table 7: Environment Variables for TFTP

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>DEFAULT_ROUTER</td>
<td>Specifies the IP address and subnet mask of the default gateway.</td>
</tr>
</tbody>
</table>

### Scheduled Reload of the Software Image

You can schedule a reload of the software image to occur on the switch at a later time (for example, late at night or during the weekend when the switch is used less), or you can synchronize a reload network-wide (for example, to perform a software upgrade on all switches in the network).

**Note**

A scheduled reload must take place within approximately 24 days.

You have these reload options:

- Reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 hours. You can specify the reason for the reload in a string up to 255 characters in length.

- Reload of the software to take place at the specified time (using a 24-hour clock). If you specify the month and day, the reload is scheduled to take place at the specified time and date. If you do not specify the month and day, the reload takes place at the specified time on the current day (if the specified time is later than the current time) or on the next day (if the specified time is earlier than the current time). Specifying 00:00 schedules the reload for midnight.

The `reload` command halts the system. If the system is not set to manually boot up, it reboots itself.

If your switch is configured for manual booting, do not reload it from a virtual terminal. This restriction prevents the switch from entering the boot loader mode and then taking it from the remote user’s control.

If you modify your configuration file, the switch prompts you to save the configuration before reloading. During the save operation, the system requests whether you want to proceed with the save if the `CONFIG_FILE` environment variable points to a startup configuration file that no longer exists. If you proceed in this situation, the system enters setup mode upon reload.

To cancel a previously scheduled reload, use the `reload cancel` privileged EXEC command.
How to Perform Switch Setup Configuration

Using DHCP to download a new image and a new configuration to a switch requires that you configure at least two switches. One switch acts as a DHCP and TFTP server and the second switch (client) is configured to download either a new configuration file or a new configuration file and a new image file.

Configuring DHCP Autoconfiguration (Only Configuration File)

This task describes how to configure DHCP autoconfiguration of the TFTP and DHCP settings on an existing switch in the network so that it can support the autoconfiguration of a new switch.

SUMMARY STEPS

1. configure terminal
2. ip dhcp pool poolname
3. boot filename
4. network network-number mask prefix-length
5. default-router address
6. option 150 address
7. exit
8. tftp-server flash:filename.text
9. interface interface-id
10. no switchport
11. ip address address mask
12. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ip dhcp pool poolname</td>
<td>Creates a name for the DHCP server address pool, and enters DHCP pool configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# ip dhcp pool pool</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring DHCP Autoconfiguration (Only Configuration File)

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>boot filename</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(dhcp-config)# boot config-boot.text</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Specifies the name of the configuration file that is used as a boot image.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>network network-number mask prefix-length</td>

<tr>
<td>Example:</td>
<td>SwitchControllerDevice(dhcp-config)# network 10.10.10.0 255.255.255.0</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The prefix length specifies the number of bits that comprise the address prefix. The prefix is an alternative way of specifying the network mask of the client. The prefix length must be preceded by a forward slash (/).</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>default-router address</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(dhcp-config)# default-router 10.10.10.1</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Specifies the IP address of the default router for a DHCP client.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>option 150 address</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(dhcp-config)# option 150 10.10.10.1</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Specifies the IP address of the TFTP server.</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>exit</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(dhcp-config)# exit</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Returns to global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 8</strong></td>
<td>tftp-server flash:filename.text</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# tftp-server flash:config-boot.text</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Specifies the configuration file on the TFTP server.</td>
</tr>
<tr>
<td><strong>Step 9</strong></td>
<td>interface interface-id</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# interface gigabitethernet1/0/4</td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Specifies the address of the client that will receive the configuration file.</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Step 10** | no switchport
Example:
SwitchControllerDevice(config-if)# no switchport
| Puts the interface into Layer 3 mode.

**Step 11** | ip address address mask
Example:
SwitchControllerDevice(config-if)# ip address 10.10.10.1 255.255.255.0
| Specifies the IP address and mask for the interface.

**Step 12** | end
Example:
SwitchControllerDevice(config-if)# end
| Returns to privileged EXEC mode.

### Configuring DHCP Auto-Image Update (Configuration File and Image)

This task describes DHCP autoconfiguration to configure TFTP and DHCP settings on an existing switch to support the installation of a new switch.

**Before You Begin**

You must first create a text file (for example, autoinstall_dhcp) that will be uploaded to the switch. In the text file, put the name of the image that you want to download.
### SUMMARY STEPS

1. `configure terminal`
2. `ip dhcp pool poolname`
3. `boot filename`
4. `network network-number mask prefix-length`
5. `default-router address`
6. `option 150 address`
7. `option 125 hex`
8. `copy tftp flash filename.txt`
9. `copy tftp flash imagename.bin`
10. `exit`
11. `tftp-server flash: config.text`
12. `tftp-server flash: imagename.bin`
13. `tftp-server flash: filename.txt`
14. `interface interface-id`
15. `no switchport`
16. `ip address address mask`
17. `end`
18. `copy running-config startup-config`

SwitchControllerDevice# show interfaces vlan 99
```

**Step 8**

Example:
```
SwitchControllerDevice# show ip redirects
```

---

**Modifying the Switch Startup Configuration**

**Specifying the Filename to Read and Write the System Configuration**

By default, the Cisco IOS software uses the config.text file to read and write a nonvolatile copy of the system configuration. However, you can specify a different filename, which will be loaded during the next boot cycle.

**Before You Begin**

Use a standalone switch for this task.

**SUMMARY STEPS**

1. configure terminal
2. boot flash:/file-url
3. end
4. show boot
5. copy running-config startup-config
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>

### Manually Booting the Switch

By default, the switch automatically boots up; however, you can configure it to manually boot up.

**Before You Begin**

Use a standalone switch for this task.
### SUMMARY STEPS

1. configure terminal
2. boot manual
3. end
4. show boot
5. copy running-config startup-config

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong> SwitchControllerDevice# configure terminal</td>

</tbody>
</table>
Booting the SwitchControllerDevice in Installed Mode

SUMMARY STEPS

1. `cp source_file_path destination_file_path`
2. `software expand file source_file_path`
3. `reload`
4. `boot flash:packages.conf`
5. `show version`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cp source_file_path destination_file_path</code></td>
<td>(Optional) Copies the bin file (image.bin) from the FTP or TFTP server to flash or USB flash.</td>
</tr>
<tr>
<td><code>software expand file source_file_path</code></td>
<td>Expands the bin file stored in flash, FTP, TFTP, HTTP, or HTTPS server on the booted switch. <strong>Note</strong> Ensure that the packages.conf file is available in the expanded list.</td>
</tr>
</tbody>
</table>

Example:

```
SwitchControllerDevice#
copy tftp://10.0.0.6/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:
```
### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat3k_caa-infra.SSA.03.09.37.EXP.pkg</td>
<td></td>
</tr>
<tr>
<td>21 -rw- 30389036 Dec 7 2012 05:55:44 +00:00</td>
<td></td>
</tr>
<tr>
<td>cat3k_caa-iosd-universalk9.SSA.150-9.37.EXP.pkg</td>
<td></td>
</tr>
<tr>
<td>22 -rw- 18342624 Dec 7 2012 05:55:44 +00:00</td>
<td></td>
</tr>
<tr>
<td>cat3k_caa-platform.SSA.03.09.37.EXP.pkg</td>
<td></td>
</tr>
<tr>
<td>23 -rw- 63374028 Dec 7 2012 05:55:44 +00:00</td>
<td></td>
</tr>
<tr>
<td>cat3k_caa-wcm.SSA.10.0.10.14.pkg</td>
<td></td>
</tr>
<tr>
<td>17 -rw- 1239 Dec 7 2012 05:56:29 +00:00</td>
<td></td>
</tr>
<tr>
<td>packages.conf</td>
<td></td>
</tr>
</tbody>
</table>

### Step 3

**Example:**

SwitchControllerDevice: `reload`

**Note**

You can boot the switch manually or automatically using the `packages.conf` file. If you are booting manually, you can proceed to Step 4. Otherwise, the switch boots up automatically.

### Step 4

**Example:**

switch: `boot flash:packages.conf`

**Note**

Boots the switch with the `packages.conf` file.

### Step 5

**Example:**

switch# `show version`

**Note**

Verifies that the switch is in the INSTALL mode.

### Booting the SwitchControllerDevice in Bundle Mode

There are several methods by which you can boot the switch—either by copying the bin file from the TFTP server and then boot the switch, or by booting the switch straight from flash or USB flash using the commands `boot flash:<image.bin>` or `boot usbflash0:<image.bin>`.

The following procedure explains how to boot the switch from the TFTP server in the bundle mode.
SUMMARY STEPS

1. `cp source_file_path destination_file_path`
2. `switch:BOOT=<source path of .bin file>`
3. `boot`
4. `show version`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>cp source_file_path destination_file_path</code></td>
<td>(Optional) Copies the bin file (image.bin) from the FTP or TFTP server to flash or USB flash.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# copy tftp://10.0.0.6/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>switch:BOOT=&lt;source path of .bin file&gt;</code></td>
<td>Sets the boot parameters.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice: switch:BOOT=tftp://10.0.0.2/cat3k_caa-universalk9.SSA.03.09.37.EXP.150-9.37.EXP.bin</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> <code>boot</code></td>
<td>Boots the switch.</td>
</tr>
<tr>
<td>Example: switch: boot</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> <code>show version</code></td>
<td>Verifies that the switch is in the BUNDLE mode.</td>
</tr>
<tr>
<td>Example: switch# show version</td>
<td></td>
</tr>
</tbody>
</table>

Booting a Specific Software Image On a Switch Stack

SUMMARY STEPS

1. `configure terminal`
2. `boot system switch {number | all} flash:image_file | tftp: image_file | usbflash0: image_file`
3. `end`
4. `show boot system`
5. `copy running-config startup-config`
## Detailed Steps

<tr>
<td><strong>Purpose:</strong></td>
<td>Verifies your entries.</td>
</tr>
<tr>
<td></td>
<td>The <code>boot system</code> global command changes the setting of the BOOT environment variable.</td>
</tr>
<tr>
<td></td>
<td>During the next boot cycle, the switch attempts to automatically boot up the system using information in the BOOT environment variable.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>copy running-config startup-config</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice# copy running-config startup-config</td>
</tr>
<tr>
<td><strong>Purpose:</strong></td>
<td>(Optional) Saves your entries in the configuration file.</td>
</tr>
</tbody>
</table>

## Configuring a Scheduled Software Image Reload

This task describes how to configure your switch to reload the software image at a later time.
### SUMMARY STEPS

1. configure terminal
2. copy running-config startup-config
3. reload in \([hh:]mm\) \([text]\)
4. reload slot \([stack-member-number]\)
5. reload at \(hh: mm\) \([month day | day month]\) \([text]\)
6. reload cancel
7. show reload

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> copy running-config startup-config</td>
<td>Saves your switch configuration information to the startup configuration before you use the <code>reload</code> command.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> reload in ([hh:]mm) ([text])</td>
<td>Schedules a reload of the software to take affect in the specified minutes or hours and minutes. The reload must take place within approximately 24 days. You can specify the reason for the reload in a string up to 255 characters in length.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# reload in 12 System configuration has been modified. Save? [yes/no]: y</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> reload slot ([stack-member-number])</td>
<td>Schedules a reload of the software in a switch stack.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# reload slot 6 Proceed with reload? [confirm] y</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> reload at (hh: mm) ([month day</td>
<td>day month]) ([text])</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# reload at 14:00</td>
<td></td>
</tr>
</tbody>
</table>

**Note** Use the `at` keyword only if the switch system clock has been set (through Network Time Protocol (NTP), the hardware calendar, or manually). The time is relative to the configured time zone on the switch. To schedule reloads across several switches to occur simultaneously, the time on each switch must be synchronized with NTP.
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td>reload cancel</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# reload cancel</td>
</tr>
<tr>
<td>Cancels a previously scheduled reload.</td>
<td></td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>show reload</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>show reload</td>
</tr>
<tr>
<td>Displays information about a previously scheduled reload or identifies if a reload has been scheduled on the switch.</td>
<td></td>
</tr>
</tbody>
</table>

## Monitoring Switch Setup Configuration

### Example: Verifying the Switch Running Configuration

```
SwitchControllerDevice# show running-config
Building configuration...

Current configuration: 1363 bytes

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring RTU Licenses

The following are the restrictions for configuring and using RTU licenses.

• AP count licenses can be ordered and pre-activated on your switch.
• Imaged based licenses can be upgraded. AP count licenses can be deactivated and moved between switches and controllers.

• To activate a permanent license, you must reboot your switch after configuring the new image level. The AP-count license does not require a reboot to activate.

• An expired image based evaluation license cannot be reactivated after reboot.

• Stack members of a switch stack must run the same license level.

• Your switch is pre-installed with the image that you ordered. If an image was not pre-ordered, then the switch is booted with a LAN base image by default.

• Adder AP-count licenses are installed in the factory.

Information About Configuring RTU Licenses

Right-To-Use Licensing

Right-to-use (RTU) licensing allows you to order and activate a specific license type and level, and then to manage license usage on your switch. The types of licenses available to order are:

• Permanent licenses—Purchased with a specific feature set with no expiration date.

• Evaluation licenses—Pre-installed on the switch and is valid for only a 90 day in-use period.

To activate a permanent or evaluation license, you are required to accept the End-User License Agreement (EULA). For the evaluation license, you are notified to purchase a permanent license or deactivate the license before the 90 day period expires.

A permanent license can be moved from one device to another. To activate a license, you must reboot your switch.

An evaluation license is a manufacturing image on your switch and is not transferable to another switch. This type of license cannot be reactivated after reboot.

Related Topics
Activating an Imaged Based License, on page 91
Examples: Activating RTU Image Based Licenses, on page 97

Right-To-Use Image Based Licenses

Right-to-use imaged licenses support a set of features based on a specific image-based license:

• LAN Base—Layer 2 features.
**Right-To-Use License States**

After you configure a specific license type and level, you can manage your licenses by monitoring the license state.

<table>
<thead>
<tr>
<th>License State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active, In Use</td>
<td>EULA was accepted and the license is in use after device reboot.</td>
</tr>
<tr>
<td>Active, Not In Use</td>
<td>EULA was accepted and the switch is ready to use when the license is enabled.</td>
</tr>
<tr>
<td>Not Activated</td>
<td>EULA was not accepted.</td>
</tr>
</tbody>
</table>

Guidelines to follow when monitoring your image based license state:

- A purchased permanent license is set to *Active, In Use* state only after a switch reboot.
- If more than one license was purchased, a reboot will activate the license with the highest feature set. For instance, the IP Services license is activated and not the LAN Base license.
- Remaining licenses purchased after switch reboot, stay in *Active, Not In Use* state.

**Note**

For the AP count license, to change the state to Active, In Use, you must first make sure that the evaluation AP count license is deactivated.

**License Activation for Switch Stacks**

Right-to-use licensing is supported on switch stacks. A switch is a set of up to nine stacking-capable switches connected through their StackWise-480 ports. You can connect only one switch type in a stack. One switch in the stack is identified as the active switch and the remaining switches are standby switches. The active switch is the switch that is activated with an RTU license and from its active console, the license level for the standby switches in the stack can be activated at the same time.

A new switch is allowed to join the switch stack if its license level matches. If there is a mismatch, then the active switch can reconfigure the license level and reboot it to allow it to join the stack.
Mobility Controller Mode

AP-count licenses are used only when the switch is in Mobility Controller mode. The MC is the gatekeeper for tracking the AP-count licenses and allows an access point to join or not.

Management of AP-count licenses is performed by the switch in mobility controller mode configurable through the CLI.

Related Topics

Changing Mobility Mode, on page 95

Right-To-Use AP-Count Licensing

Right-to-use licensing (RTU) allows you to order and activate a specific license type, and then to manage license usage on your switch.

You can order your switch with support for a specific number of adder access point count licenses, but the total number of licenses ordered should not exceed 50. You can also order your adder access point count licenses after receiving the switch.

For example, if you have ordered 50 new adder licenses, you can add only those ordered adder licenses to the switch. The licenses can be added in increments of 1, but the total number of licenses added for the switch should not exceed 50.

You can configure your switch to manage the access point count licenses and view the number of access points currently in use from the CLI.

The following are two different types of access point licenses:

1  Permanent licenses for the access points
   • Adder access point count license—You can purchase the adder license to increase the switch capacity at a later time. You can transfer the adder access point count license from one switch to another.

2  Evaluation licenses for the access points
   • You can activate these licenses to evaluate more access points before purchasing the licenses.
   • The maximum number of access points that can be evaluated is 50.
   • The evaluation period for using the access point licenses is 90 days.
   • You can activate and deactivate the evaluation licenses from the CLI.

Related Topics

Activating an AP-Count License, on page 93
Obtaining an Upgrade or Capacity Adder License, on page 93
Rehosting a License, on page 94
Right-to-Use AP-Count Evaluation Licenses

If you are considering upgrading to a license with a higher access point count, you can try an evaluation license before upgrading to a permanent version of the license. For example, if you are using a permanent license with a 10 access-point count and want to try an evaluation license with a 40-access-point count, you can try out the evaluation license for 90 days.

When an evaluation license is activated, the permanent AP-count licenses are ignored. The maximum supported licenses of 50 access points are available for 90 days.

To prevent disruptions in operation, the switch does not change licenses when an evaluation license expires. A warning expiry message is displayed daily starting five days prior to the expiry date. After 90 days, the evaluation license expires with a warning message. You must disable the evaluation license and then purchase the permanent license.

When the switch reboots after the evaluation license expiry, the license defaults to a permanent license.

Obtaining an Upgrade or Capacity Adder License, on page 93
Rehosting a License, on page 94

Right-To-Use Adder AP-Count Rehosting Licenses

Revoking a license from one device and installing it on another is called rehosting. You might want to rehost a license to change the purpose of a device.

To rehost a license, you must deactivate the adder ap-count license from one device and activate the same license on another device.

Evaluation licenses cannot be rehosted.

How to Configure RTU Licenses

Activating an Imaged Based License

SUMMARY STEPS

1. `license right-to-use activate {ipbase | ipservices | lanbase} {all | evaluation all} [slot slot-number] [acceptEULA]`
2. `reload [ LINE | at | cancel | in | slot stack-member-number | standby-cpu]`
3. `show license right-to-use usage [slot slot-number]`

## DETAILED STEPS

1. `wireless mobility controller`
2. `write memory`
3. `reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`
4. `no wireless mobility controller`
5. `write memory`
6. `reload [LINE | at | cancel | in | slot stack-member-number | standby-cpu ]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 wireless mobility controller</td>
<td>Changes a switch in Mobility Agent mode to Mobility Controller mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# wireless mobility controller</td>
<td></td>
</tr>
<tr>
<td>% Mobility role changed to Mobility Controller. Please save config and reboot the whole stack.</td>
<td></td>
</tr>
<tr>
<td>Step 2 write memory</td>
<td></td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# write memory</td>
<td></td>
</tr>
<tr>
<td>Building configuration...</td>
<td></td>
</tr>
<tr>
<td>Compressed configuration from 13870 bytes to 5390 bytes[OK]</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice#</td>
<td></td>
</tr>
</tbody>

### Configuration Examples for RTU Licensing

#### Examples: Activating RTU Image Based Licenses

This example shows how to activate an IP Services image license and accept the EULA for a specific slot:

Switch# license right-to-use activate ipservices slot 1 acceptEULA
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level

This example shows how to activate a license for evaluation:

Switch# license right-to-use activate ipservices evaluation acceptEULA
% switch-1:stack-mgr:Reboot the switch to invoke the highest activated License level

### Related Topics
- Activating an Imaged Based License, on page 91

Examples: Displaying RTU Licensing Information

This example shows the consolidated RTU licensing information from the active switch on a switch stack. All of the members in the stack have the same license level. When the evaluation AP-count license is activated, the adder AP-count licenses are ignored. The maximum number of AP-count licenses are available when evaluation is enabled.

Switch# show license right-to-use summary

<table>
<thead>
<tr>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
<th>Period left</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipservices</td>
<td>permanent</td>
<td>10</td>
<td>Lifetime</td>
</tr>
<tr>
<td>apcount</td>
<td>evaluation</td>
<td>40</td>
<td>90</td>
</tr>
</tbody>
</table>

License Level In Use: ipservices
License Level on Reboot: ipbase
Evaluation AP-Count: Enabled
Total AP Count Licenses: 50
AP Count Licenses In-use: 10
AP Count Licenses Remaining: 40

This example shows a summary of permanent and adder licenses. The evaluation AP-count license is disabled displaying the total number of activated adder AP-count licenses in the switch stack. AP-count licenses in-use mean that they are connected.

Switch# show license right-to-use summary

<table>
<thead>
<tr>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
<th>Period left</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipservices</td>
<td>permanent</td>
<td>N/A</td>
<td>Lifetime</td>
</tr>
<tr>
<td>apcount</td>
<td>base</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>apcount</td>
<td>adder</td>
<td>40</td>
<td>Lifetime</td>
</tr>
</tbody>
</table>

License Level In Use: ipservices
License Level on Reboot: ipservices eval
Evaluation AP-Count: Disabled
Total AP Count Licenses: 40
AP Count Licenses In-use: 10
AP Count Licenses Remaining: 30

This example shows the RTU default licenses. Default licenses are pre-installed and cannot be removed or transferred. If no license is activated the switch uses the default license, after a reboot.

Switch# show license right-to-use default

<table>
<thead>
<tr>
<th>Slot#</th>
<th>License Name</th>
<th>Type</th>
<th>Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ipservices</td>

</tbody>
</table>
Example: Displaying RTU License Details

This example shows all the detailed information for the RTU licenses on slot 1:

Switch# show license right-to-use detail slot 1

Index 1: License Name: ipservices
  Period left: Lifetime
  License Type: permanent
  License State: Active, In use
  License Count: Non-Counted
  License Location: Slot 1

Index 2: License Name: ipservices
  Period left: 90
  License Type: evaluation
  License State: Not Activated
  License Count: Non-Counted
  License Location: Slot 1

Index 3: License Name: ipbase
  Period left: Lifetime
  License Type: permanent
  License State: Active, Not In use
  License Count: Non-Counted
  License Location: Slot 1

Index 4: License Name: ipbase
  Period left: 90
  License Type: evaluation
  License State: Not Activated
  License Count: Non-Counted
  License Location: Slot 1

License Location: Standby Switch 1

Index 5: License Name: lanbase
  Period left: Lifetime
  License Type: permanent
  License State: Not Activated
  License Count: Non-Counted
  License Location: Slot 1

Index 6: License Name: apcount
  Period left: 90
  License Type: evaluation
  License State: Active, In use
  License Count: 50
  License Location: Slot 1

Index 7: License Name: apcount
  Period left: Lifetime
  License Type: base
  License State: Active, Not In use
  License Count: 0
  License Location: Slot 1

Index 8: License Name: apcount
  Period left: Lifetime
  License Type: adder
  License State: Active, Not In use
  License Count: 10
  License Location: Slot 1
Example: Displaying RTU License Mismatch

This example shows the license information of the switches in a stack and a mismatch state of a member switch. The member must match the active.

Switch# show switch

Switch/Stack Mac Address : 6400.f125.0c80

<table>
<thead>
<tr>
<th>Switch#</th>
<th>Role</th>
<th>Mac Address</th>
<th>Priority</th>
<th>Version</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Standby</td>
<td>6400.f125.1b00</td>
<td>1</td>
<td>0</td>
<td>Ready</td>
</tr>
<tr>
<td>*2</td>
<td>Active</td>
<td>6400.f125.0c80</td>
<td>1</td>
<td>V01</td>
<td>Ready</td>
</tr>
<tr>
<td>3</td>
<td>Member</td>
<td>6400.f125.1780</td>
<td>1</td>
<td>0</td>
<td>Lic-Mismatch</td>
</tr>
</tbody>
</table>

To resolve the license mismatch, first check the RTU license summary:

Switch# show switch right-to-use summary

Then change the license level of the mismatched switch so that it is the same license level of the active switch. This example shows that the IP Base license was activated for the member switch to match the active switch.

Switch# license right-to-use activate ipbase slot 1 acceptEULA

Example: Displaying RTU Licensing Usage

This example shows the detailed licensing usage on your switch stack. The IP Services license in Slot 1 is permanent and usage is one day. An AP-count license in Slot 2 is ready for evaluation. EULA was accepted and state shows in use, but after reboot the evaluation license will be deactivated.

Switch# show license right-to-use usage

<thead>
<tr>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.2SE</td>
<td>This feature was introduced.</td>
</tr>
</tbody>
</table>
Configuring Administrator Usernames and Passwords

• Finding Feature Information, page 103
• Information About Configuring Administrator Usernames and Passwords, page 103
• Configuring Administrator Usernames and Passwords, page 104
• Examples: Administrator Usernames and Passwords Configuration, page 106
• Additional References for Administrator Usernames and Passwords, page 107
• Feature History and Information For Performing Administrator Usernames and Passwords Configuration, page 108

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Administrator Usernames and Passwords

You can configure administrator usernames and passwords to prevent unauthorized users from reconfiguring the switch and viewing configuration information. This section provides instructions for initial configuration and for password recovery.

You can also set administrator usernames and passwords to manage and configure one or more access points that are associated with the switch.

Strong Passwords
You can set strong administrator passwords such as encrypted passwords with ASCII keys for the administrator user for managing access points.

Use the following guidelines while creating strong passwords:

- There should be at least three of the following categories—lowercase letters, uppercase letters, digits, and special characters.
- The new password should not be the same as that of the associated username and the username should not be reversed.
- The characters in the password should not be repeated more than three times consecutively.
- The password should not be `cisco`, `ocsic`, `admin`, `nimda`, or any variant obtained by changing the capitalization of letters therein, or by substituting "1" "|" or "!" for i, and/or substituting "0" for "o", and/or substituting "$" for "s".
- The maximum number of characters accepted for the username and password is 32.

**Encrypted Passwords**

You can set three types of keys for the password:

- Randomly generated key—This key is generated randomly and it is the most secure option. To export the configuration file from one system to another, the key should also be exported.
- Static key—The simplest option is to use a fixed (static) encryption key. By using a fixed key, no key management is required, but if the key is somehow discovered, the data can be decrypted by anyone with the knowledge of that key. This is not a secure option and it is called obfuscation in the CLI.
- User defined key—You can define the key by yourself. To export the configuration file from one system to another, both systems should have the same key configured.

---

**Configuring Administrator Usernames and Passwords**

**SUMMARY STEPS**

1. configure terminal
2. wireless security strong-password
3. username admin-username password {0 unencrypted_password | 7 hidden_password | unencrypted_text}
4. username admin-username secret {0 unencrypted_secret_text | 4 SHA256 encrypted_secret_text | 5 MD5 encrypted_secret_text | LINE}
5. ap mgmtuser username username password {0 unencrypted_password | 8 AES encrypted password }secret {0 unencrypted_password | 8 AES encrypted password }
6. ap dot1x username username password {0 unencrypted_password | 8 AES encrypted password }
7. end
8. ap name apname mgmtuser username usernamepassword password secret secret _text
9. ap name apname dot1x-user username password password
# Configuring Administrator Usernames and Passwords

## Detailed Steps

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example: SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td>wireless security strong-password</td>
<td>Enables strong password policy for the administrator user.</td>
</tr>
<tr>
<td></td>
<td>Example: SwitchControllerDevice(config)# wireless security strong-password</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td>username admin-username password {0 unencrypted_password</td>
<td>Enables strong password policy for the administrator user. Specifies a username and password for an administrator. The administrator can configure the switch and view the configured information.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7 hidden_password</td>
</tr>
<tr>
<td></td>
<td>Example: SwitchControllerDevice(config)# username adminuser1 password 0 Q2aek239@</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td>username admin-username secret {0 unencrypted_secret_text</td>
<td>Specifies the secret for the administrator.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4 SHA256 encrypted_secret_text</td>
</tr>
<tr>
<td></td>
<td>Example: SwitchControllerDevice(config)# username adminuser1 secret 0 Q2aek239@</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td>ap mgmtuser username username password {0 unencrypted</td>
<td>Specifies administrator username and password for managing all of the access points configured to the switch. You can also include the secret text to perform privileged access point management.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>password</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example: SwitchControllerDevice(config)# ap mgmtuser username cisco password 0 Qwci12@ secret 0 Qwci14@!</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td>ap dot1x username username password {0 unencrypted</td>
<td>Specifies the 802.1X username and password for managing all of the access points configured to the switch.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>password</td>
</tr>
<tr>
<td></td>
<td>Example: SwitchControllerDevice(config)# ap dot1x username cisco password 0 Qwci12@</td>
<td></td>
</tr>
</tbody>
</table>

### Note
- If your password is not strong enough to fulfill the strong password policy, then the password is rejected with a valid error message. For example, the following password is rejected because it is not a strong password.
- SwitchControllerDevice# ap mgmtuser username cisco password 0 abcd secret 0 1234
### Command or Action | Purpose
--- | ---
**Step 7**
| `end` | Returns to privileged EXEC mode. Alternatively, you can also press `Ctrl-Z` to exit global configuration mode. Example: `SwitchControllerDevice(config)# end`

**Step 8**
| `ap name apname mgmtuser username username password password secret secret _text` | Configures the administrator username, password, and secret text for managing a specific access point that is configured to the switch. Example: `SwitchControllerDevice# ap name APf07.55c7.7b23 mgmtuser username cisco password Qne35! secret Nzep592$`

**Step 9**
| `ap name apname dot1x-user username password password` | Configures the 802.1X username and password for a specific access point. Example: `SwitchControllerDevice# ap name APf07.55c7.7b23 dot1x-user username cisco password Qwci12@`

### Examples: Administrator Usernames and Passwords Configuration

This example shows how to configure administrator usernames and passwords with the strong password policy in configuration mode:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# wireless security strong-password
SwitchControllerDevice(config)# username adminuser1 password 0 QZekek239@
SwitchControllerDevice(config)# ap mgmtuser username cisco password Qne35! secret Nzep592$
SwitchControllerDevice(config)# end
```

This example shows how to configure administrator usernames and passwords for an access point in global EXEC mode:

```
SwitchControllerDevice# wireless security strong-password
SwitchControllerDevice# ap name APf07.55c7.7b23 mgmtuser username cisco password Qwci12@ secret Qwci14@
SwitchControllerDevice# ap name APf07.55c7.7b23 dot1x-user username cisco password Qwci12@
SwitchControllerDevice# end
```
# Additional References for Administrator Usernames and Passwords

• Additional References for 802.11 Parameters and Band Selection, page 125
• Feature History and Information For Performing 802.11 parameters and Band Selection Configuration, page 126

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions on Band Selection, 802.11 Bands, and Parameters

• Band-selection enabled WLANs do not support time-sensitive applications like voice and video because of roaming delays.

• Band selection can be used only with Cisco Aironet 1040, 1140, 1250, 1260, 3500, and the 3600 series access points.
Band selection operates only on access points that are connected to a controller. A FlexConnect access point without a controller connection does not perform band selection after a reboot.

The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running.

You can enable both band selection and aggressive load balancing on the controller. They run independently and do not impact one another.

It is not possible to enable or disable band selection and client load balancing globally through the controller GUI or CLI. You can, however, enable or disable band selection and client load balancing for a particular WLAN. Band selection and client load balancing are enabled globally by default.

---

### Information About Configuring Band Selection, 802.11 Bands, and Parameters

#### Band Selection

Band selection enables client radios that are capable of dual-band (2.4- and 5-GHz) operation to move to a less congested 5-GHz access point. The 2.4-GHz band is often congested. Clients on this band typically experience interference from Bluetooth devices, microwave ovens, and cordless phones as well as co-channel interference from other access points because of the 802.11b/g limit of three nonoverlapping channels. To prevent these sources of interference and improve overall network performance, you can configure band selection on the switch.

Band selection is enabled globally by default.

Band selection works by regulating probe responses to clients. It makes 5-GHz channels more attractive to clients by delaying probe responses to clients on 2.4-GHz channels.

#### 802.11 Bands

You can configure the 802.11b/g/n (2.4-GHz) and 802.11a/n (5-GHz) bands for the controller to comply with the regulatory requirements in your country. By default, both 802.11b/g/n and 802.11a/n are enabled.

When a controller is configured to allow only 802.11g traffic, 802.11b client devices are able to successfully connect to an access point but cannot pass traffic. When you configure the controller for 802.11g traffic only, you must mark 11g rates as mandatory.

#### 802.11n Parameter

This section provides instructions for managing 802.11n devices such as the Cisco Aironet 1140 and 3600 Series Access Points on your network. The 802.11n devices support the 2.4- and 5-GHz bands and offer high-throughput data rates.

The 802.11n high-throughput rates are available on all 802.11n access points for WLANs using WMM with no Layer 2 encryption or with WPA2/AES encryption enabled.
Some Cisco 802.11n APs may intermittently emit incorrect beacon frames, which can trigger false wIPS alarms. We recommend that you ignore these alarms. The issue is observed in the following Cisco 802.11n APs: 1140, 1250, 2600, 3500, and 3600.

802.11h Parameter

802.11h informs client devices about channel changes and can limit the transmit power of those client devices.

How to Configure 802.11 Bands and Parameters

Configuring Band Selection (CLI)

SUMMARY STEPS

1. configure terminal
2. wireless client band-select cycle-count cycle_count
3. wireless client band-select cycle-threshold milliseconds
4. wireless client band-select expire suppression seconds
5. wireless client band-select expire dual-band seconds
6. wireless client band-select client-rssi client_rssi
7. end
8. wlan wlan_profile_name wlan_ID SSID_network_name band-select
9. end

DETAILED STEPS

</tbody>
</table>
SUMMARY STEPS

1. configure terminal
2. ap dot11 5ghz shutdown
3. ap dot11 24ghz shutdown
4. ap dot11 {5ghz | 24ghz} beaconperiod time_unit
5. ap dot11 {5ghz | 24ghz} fragmentation threshold
6. ap dot11 {5ghz | 24ghz} dtpc
7. wireless client association limit number interval milliseconds
8. ap dot11 {5ghz | 24ghz} rate rate {disable | mandatory | supported}
9. no ap dot11 5ghz shutdown
10. no ap dot11 24ghz shutdown
11. ap dot11 24ghz dot11g
12. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**
SwitchControllerDevice# configure terminal

| **Step 2** ap dot11 5ghz shutdown | Disables the 802.11a band. |

**Note** You must disable the 802.11a band before configuring the 802.11a network parameters.

**Example:**
SwitchControllerDevice(config)# ap dot11 5ghz shutdown

| **Step 3** ap dot11 24ghz shutdown | Disables the 802.11b band. |

**Note** You must disable the 802.11b band before configuring the 802.11b network parameters.

**Example:**
SwitchControllerDevice(config)# ap dot11 24ghz shutdown

| **Step 4** ap dot11 {5ghz | 24ghz} beaconperiod time_unit | Specifies the rate at which the SSID is broadcast by the access point. The beacon interval is measured in time units (TUs). One TU is 1024 microseconds. You can configure the access point to send a beacon every 20 to 1000 milliseconds. |

**Example:**
SwitchControllerDevice(config)# ap dot11 5ghz beaconperiod 500

| **Step 5** ap dot11 {5ghz | 24ghz} fragmentation threshold | Specifies the size at which packets are fragmented. The threshold is a value between 256 and 2346 bytes (inclusive). Specify a low number for areas where communication is poor or where there is a great deal of radio interference. |

**Example:**
SwitchControllerDevice(config)# ap dot11 5ghz fragmentation 300
**Configuring 802.11 parameters and Band Selection**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 6</strong></td>
<td>Enables access points to advertise their channels and transmit the power levels in beacons, and probe responses.</td>
</tr>
<tr>
<td>`ap dot11 {5ghz</td>
<td>24ghz} dtpc`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>On access points that run Cisco IOS software, this feature is called world mode.</td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# ap dot11 5ghz dtpc</td>
<td>The <code>no</code> form of the command disables the 802.11a or 802.11b DTPC setting.</td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# no ap dot11 24ghz dtpc</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 7** | Specifies the maximum allowed clients that can be configured. |
| Wireless client association limit number interval milliseconds | You can configure a maximum number of association request on a single access point slot at a given interval. The range of association limit that you can configure is from one through 100. |
| **Example:** | The association request limit interval is measured between 100 to 10000 milliseconds. |
| SwitchControllerDevice(config)# wireless client association limit 50 interval 1000 |

| **Step 8** | Specifies the rate at which data can be transmitted between the controller and the client. |
| `ap dot11 {5ghz | 24ghz} rate {disable | mandatory | supported}` | |
| **Example:** | • `disabled`—Defines that the clients specify the data rates used for communication. |
| SwitchControllerDevice(config)# ap dot11 5ghz rate 36 mandatory | • `mandatory`—Defines that the clients support this data rate in order to associate to an access point on the controller. |
| | • `supported`—Any associated clients that support this data rate may communicate with the access point using that rate. However, the clients are not required to be able to use this rate in order to associate. |
| | • `rate`—Specifies the rate at which data is transmitted. For the 802.11a and 802.11b bands, the data is transmitted at the rate of 1, 2, 5.5, 6, 9, 11, 12, 18, 24, 36, 48, or 54 Mbps. |

| **Step 9** | Enables the 802.11a band. |
| `no ap dot11 5ghz shutdown` | The default value is enabled. |
| **Example:** | |
| SwitchControllerDevice(config)# no ap dot11 5ghz shutdown |

| **Step 10** | Enables the 802.11b band. |
| `no ap dot11 24ghz shutdown` | The default value is enabled. |
| **Example:** | |
| SwitchControllerDevice(config)# no ap dot11 24ghz shutdown |
Configuring 802.11n Parameters (CLI)

<td>The no form of the command disables the 802.11n support on the network.</td>
</tr>
</tbody>
</table>
### Command or Action

**Step 3**

```
ap dot11 {5ghz | 24ghz} dot11n mcs tx rtu 5ghz dot11n mcs tx 20
```

**Purpose**

Specifies the modulation and coding scheme (MCS) rates at which data can be transmitted between the access point and the client. You can set a value from 0 through 23 for the `mcs tx` parameter.

The **no** form of the command disables the MCS rates that is configured.

**Example:**

```
SwitchControllerDevice(config)# ap dot11 5ghz dot11n mcs tx 20
```

**Step 4**

```
wlan wlan_profile_name wlan_ID SSID_network_name wmm require
```

**Purpose**

Enables WMM on the WLAN and uses the 802.11n data rates that you configured.

The **require** parameter requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.

**Example:**

```
SwitchControllerDevice(config)# wlan wlan1 25 ssid12
SwitchControllerDevice(config-wlan)# wmm require
```

**Step 5**

```
ap dot11 {5ghz | 24ghz} shutdown
```

**Purpose**

Disables the network.

**Example:**

```
SwitchControllerDevice(config)# ap dot11 5ghz shutdown
```

**Step 6**

```
{ap | no ap} dot11 {5ghz | 24 ghz} dot11n a-mpdu tx priority {all | 0-7}
```

**Purpose**

Specifies the aggregation method used for 802.11n packets.

Aggregation is the process of grouping packet data frames together rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). Both A-MPDU and A-MSDU are performed in the software.

You can specify the aggregation method for various types of traffic from the access point to the clients.

The following table defines the priority levels (0-7) assigned per traffic type.

**Table 9: Traffic Type Priority Levels**

<table>
<thead>
<tr>
<th>User Priority</th>
<th>Traffic Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Best effort</td>
</tr>
<tr>
<td>1</td>
<td>Background</td>
</tr>
<tr>
<td>2</td>
<td>Spare</td>
</tr>
<tr>
<td>3</td>
<td>Excellent effort</td>
</tr>
<tr>
<td>4</td>
<td>Controlled load</td>
</tr>
<tr>
<td>5</td>
<td>Video, less than 100-ms latency and jitter</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>6</td>
<td>Voice, less than 100-ms latency and jitter</td>
</tr>
<tr>
<td>7</td>
<td>Network control</td>
</tr>
</tbody>
</table>

You can configure each priority level independently, or you can use the all parameter to configure all of the priority levels at once. You can configure priority levels so that the traffic uses either A-MPDU transmission or A-MSDU transmission.

- When you use the `ap` command along with the other options, the traffic associated with that priority level uses A-MPDU transmission.
- When you use the `no ap` command along with the other options, the traffic associated with that priority level uses A-MSDU transmission.

Configure the priority levels to match the aggregation method used by the clients. By default, A-MPDU is enabled for priority level 0, 4 and 5 and the rest are disabled. By default, A-MPDU is enabled for all priorities except 6 and 7.

| Step 7 | `no ap dot11 {5ghz | 24ghz} shutdown` |
|--------|--------------------------------------|
| **Example:** | `SwitchControllerDevice(config)# no ap dot11 5ghz shutdown` |
| **Purpose:** | Reenables the network. |

| Step 8 | `ap dot11 {5ghz | 24ghz} dot11n guard-interval {any | long}` |
|--------|-------------------------------------------------|
| **Example:** | `SwitchControllerDevice(config)# ap dot11 5ghz dot11n guard-interval long` |
| **Purpose:** | Configures the guard interval for the network. |

| Step 9 | `ap dot11 {5ghz | 24ghz} dot11n rifs rx` |
|--------|------------------------------------------|
| **Example:** | `SwitchControllerDevice(config)# ap dot11 5ghz dot11n rifs rx` |
| **Purpose:** | Configures the Reduced Interframe Space (RIFS) for the network. |

Example: Viewing the status of 802.11h Parameters

SwitchControllerDevice# show wireless dot11h
Power Constraint: 0
Channel Switch: 0
Channel Switch Mode: 0

Example: Verifying the Band Selection Settings

SwitchControllerDevice# show wireless band-select
Band Select Probe Response : per WLAN enabling
Cycle Count : 2
Cycle Threshold (millisec) : 200
Age Out Suppression (sec) : 20
Age Out Dual Band (sec) : 60
Client RSSI (dBm) : 80
Configuration Examples for Band Selection, 802.11 Bands, and Parameters

Examples: Band Selection Configuration

This example shows how to set the probe cycle count and time threshold for a new scanning cycle period for band select:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# wireless client band-select cycle-count 3
SwitchControllerDevice(config)# wireless client band-select cycle-threshold 5000
SwitchControllerDevice(config)# end
```

This example shows how to set the suppression expire to the band select:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# wireless client band-select expire suppression 100
SwitchControllerDevice(config)# end
```

This example shows how to set the dual band expire for the band select:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# wireless client band-select expire dual-band 100
SwitchControllerDevice(config)# end
```

This example shows how to set the client RSSI threshold for the band select:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# wireless client band-select client-rssi 40
SwitchControllerDevice(config)# end
```

This example shows how to configure band selection on specific WLANs:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# wlan wlan1 25 ssid12
SwitchControllerDevice(config-wlan)# band-select
SwitchControllerDevice(config)# end
```

Examples: 802.11 Bands Configuration

This example shows how to configure 802.11 bands using beacon interval, fragmentation, and dynamic transmit power control:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ap dot11 5ghz shutdown
SwitchControllerDevice(config)# ap dot11 24ghz shutdown
SwitchControllerDevice(config)# ap dot11 5ghz beacon-period 500
SwitchControllerDevice(config)# ap dot11 5ghz fragmentation 300
SwitchControllerDevice(config)# ap dot11 5ghz dtpc
SwitchControllerDevice(config)# ap dot11 24ghz dot11g
SwitchControllerDevice(config)# wireless client association limit 50 interval 1000
SwitchControllerDevice(config)# ap dot11 5ghz rate 36 mandatory
SwitchControllerDevice(config)# no ap dot11 5ghz shutdown
SwitchControllerDevice(config)# no ap dot11 24ghz shutdown
SwitchControllerDevice(config)# ap dot11 24ghz dot11g
SwitchControllerDevice(config)# end
```
Examples: 802.11n Configuration

This example shows how to configure 802.11n parameters for 5-GHz band using aggregation method:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ap dot11 5ghz dot11n
SwitchControllerDevice(config)# ap dot11 5ghz dot11n mcs tx 20
SwitchControllerDevice(config)# wlan wlan1 25 ssid12
SwitchControllerDevice(config-wlan)# wmm require\nSwitchControllerDevice(config-wlan)# exit
SwitchControllerDevice(config)# ap dot11 5ghz shutdown
SwitchControllerDevice(config)# ap dot11 5ghz dot11n a-mpdu tx priority all
SwitchControllerDevice(config)# no ap dot11 5ghz shutdown
SwitchControllerDevice(config)# exit
SwitchControllerDevice(config)# ap dot11 5ghz shutdown
SwitchControllerDevice(config)# ap dot11 5ghz dot11n guard-interval long
SwitchControllerDevice(config)# end

This example shows how to configure the guard interval for 5-GHz band:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ap dot11 5ghz dot11n
SwitchControllerDevice(config)# ap dot11 5ghz dot11n mcs tx 20
SwitchControllerDevice(config)# wlan wlan1 25 ssid12
SwitchControllerDevice(config-wlan)# wmm require\nSwitchControllerDevice(config-wlan)# exit
SwitchControllerDevice(config)# no ap dot11 5ghz shutdown
SwitchControllerDevice(config)# ap dot11 5ghz dot11n guard-interval long
SwitchControllerDevice(config)# end

This example shows how to configure the RIFS for 5-GHz band:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ap dot11 5ghz dot11n
SwitchControllerDevice(config)# ap dot11 5ghz dot11n mcs tx 20
SwitchControllerDevice(config)# wlan wlan1 25 ssid12
SwitchControllerDevice(config-wlan)# wmm require\nSwitchControllerDevice(config-wlan)# exit
SwitchControllerDevice(config)# ap dot11 5ghz shutdown
SwitchControllerDevice(config)# ap dot11 5ghz dot11n rifs rx
SwitchControllerDevice(config)# end

Examples: 802.11h Configuration

This example shows how to configure the access point to announce when it is switching to a new channel using restriction transmission:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ap dot11 5ghz channel-switch mode 0
SwitchControllerDevice(config)# no ap dot11 5ghz channel-switch mode 0
SwitchControllerDevice(config)# end

This example shows how to configure the 802.11h power constraint for 5-GHz band:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ap dot11 5ghz shutdown
SwitchControllerDevice(config)# ap dot11 5ghz power-constraint 200
SwitchControllerDevice(config)# no ap dot11 5ghz shutdown
SwitchControllerDevice(config)# end

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Restrictions for Configuring Client Roaming

The following are the restrictions that you should be aware while configuring client roaming:

• Cisco Compatible Extensions (CCX) support is enabled automatically for every WLAN on the switch and cannot be disabled. The switch stores the CCX version of the client in its client database and uses it to generate and respond to CCX frames appropriately. Clients must support CCXv4 or v5 (or CCXv2 for access point assisted roaming) to utilize these roaming enhancements.

• Client roaming between 600 Series Access points is not supported.
Information About Client Roaming

The controllers deliver high-end wireless services to the clients roaming across wireless network. Now, the wireless services are integrated with the switches, thus delivering a value-added Cisco unified new mobility architecture. This unified architecture enables client-roaming services to both wireless and wired clients with seamless, fast-roaming services.

The new mobility architecture supports fast client roaming services using logical categorization of network into Mobility Domains (MDs), Mobility Groups (MGs), Mobility Subdomains (MSDs), and Switch Peer Groups (SPGs) using systems such as Mobility Oracle (MO), Mobility Controller (MC), and Mobility Agent (MA).

- **A Mobility Domain** is the entire domain across which client roaming is supported. It is a collection of mobility groups. For example, a campus network can be considered as a mobility domain.
- **A Mobility Group** is a collection of mobility subdomains across which fast roaming is supported. The mobility group can be one or more buildings within a campus across which frequent roaming is supported.
- **A Mobility Subdomain** is an autonomous portion of the mobility domain network. Each mobility subdomain contains one mobility controller (MC) and a collection of SPGs. A subdomain is equivalent to an 802.11r key domain.
- **A Switch Peer Group** is a collection of mobility agents.
- **The Mobility Oracle** acts as the point of contact for mobility events that occur across mobility subdomains. The mobility oracle also maintains a local database of each client in the entire mobility domain, their home and current subdomain. There is only one MO for an entire mobility domain. The Cisco WLC 5700 Series Controllers or Cisco Unified Wireless Networking Solution controller can act as MO.
- **The Mobility Controller** provides mobility management services for inter-SPG roaming events. The MC sends the configuration like SPG name and SPG peer member list to all of the mobility agents under its subdomain. The Cisco WLC 5700 Series Controllers, Cisco Catalyst 3850 Switch, or Cisco Unified Wireless Networking Solution controller can act as MC. The MC has MC functionality and MA functionality that is running internally into it.
- **The Mobility Agent** is the component that maintains client mobility state machine for a mobile client. All APs are connected to the mobility agent.

The New mobility architecture supports seamless roaming in the following scenarios:

- Intra-switch roaming—The client roaming between APs managed by same mobility agent.
- Intra-SPG roaming—The client roaming between mobility agents in the same SPG.
- Inter-SPG, Intra-subdomain roaming—The client roaming between mobility agents in different SPGs within the same subdomain.
- Inter-subdomain roaming—The client roaming between mobility agents across a subdomain.

**Fast Roaming**

New mobility architecture supports fast roaming when clients roam within a mobility group by eliminating the need for full authentication. Security polices should be same across the switches for fast roaming.

**Local, anchor, foreign MAs and MCs**
When a client joins an MA initially and its point of attachment has not changed, that MA is referred as local or associated MA. The MC to which this MA is associated is referred as local or associated MC.

When a client roams between two MAs, the MA to which the client was previously associated is the anchor MA (point of attachment) and the MA to which the client is currently associated is the foreign or associated MA (point of presence). The MCs to which these MAs are associated are referred as anchor, foreign, or associated MCs, respectively.

**Inter-Subnet Roaming**

Multiple-controller deployments support client roaming across access points managed by controllers in the same mobility group on different subnets. This roaming is transparent to the client because the session is sustained and a tunnel between the controllers allows the client to continue using the same DHCP-assigned or client-assigned IP address as long as the session remains active. The tunnel is torn down, and the client must reauthenticate when the client sends a DHCP Discover with a 0.0.0.0 client IP address or a 169.254.*.* client auto-IP address or when the operator-set user timeout is exceeded.

**Voice-over-IP Telephone Roaming**

802.11 voice-over-IP (VoIP) telephones actively seek out associations with the strongest RF signal to ensure the best quality of service (QoS) and the maximum throughput. The minimum VoIP telephone requirement of 20-millisecond or shorter latency time for the roaming handover is easily met by the Cisco Unified Wireless Network (Cisco UWN) solution, which has an average handover latency of 5 or fewer milliseconds when open authentication is used. This short latency period is controlled by controllers rather than allowing independent access points to negotiate roaming handovers.

The Cisco UWN solution supports 802.11 VoIP telephone roaming across lightweight access points managed by controllers on different subnets, as long as the controllers are in the same mobility group. This roaming is transparent to the VoIP telephone because the session is sustained and a tunnel between controllers allows the VoIP telephone to continue using the same DHCP-assigned IP address as long as the session remains active. The tunnel is torn down, and the VoIP client must reauthenticate when the VoIP telephone sends a DHCP Discover with a 0.0.0.0 VoIP telephone IP address or a 169.254.*.* VoIP telephone auto-IP address or when the operator-set user timeout is exceeded.

**CCX Layer 2 Client Roaming**

The controller supports five CCX Layer 2 client roaming enhancements:

- **Access point assisted roaming**—This feature helps clients save scanning time. When a CCXv2 client associates to an access point, it sends an information packet to the new access point listing the characteristics of its previous access point. Roaming time decreases when the client recognizes and uses an access point list built by compiling all previous access points to which each client was associated and sent (unicast) to the client immediately after association. The access point list contains the channels, BSSIDs of neighbor access points that support the client’s current SSID(s), and time elapsed since disassociation.

- **Enhanced neighbor list**—This feature focuses on improving a CCXv4 client’s roam experience and network edge performance, especially when servicing voice applications. The access point provides its associated client information about its neighbors using a neighbor-list update unicast message.
• Enhanced neighbor list request (E2E)—The End-2-End specification is a Cisco and Intel joint program that defines new protocols and interfaces to improve the overall voice and roaming experience. It applies only to Intel clients in a CCX environment. Specifically, it enables Intel clients to request a neighbor list at will. When this occurs, the access point forwards the request to the controller. The controller receives the request and replies with the current CCX roaming sublist of neighbors for the access point to which the client is associated.

Note To see whether a particular client supports E2E, choose Wireless > Clients on the controller GUI, click the Detail link for the desired client, and look at the E2E Version text box in the Client Properties area.

• Roam reason report—This feature enables CCXv4 clients to report the reason why they roamed to a new access point. It also allows network administrators to build and monitor a roam history.

• Directed roam request—This feature enables the controller to send directed roam requests to the client in situations when the controller can better service the client on an access point different from the one to which it is associated. In this case, the controller sends the client a list of the best access points that it can join. The client can either honor or ignore the directed roam request. Non-CCX clients and clients running CCXv3 or below must not take any action. No configuration is required for this feature.

How to Configure Layer 2 or Layer 3 Roaming

Configuring Layer 2 or Layer 3 Roaming

Before You Begin
To configure the mobility agent for Layer 2 or Layer 3 roaming, the following requisites should be considered:

• SSID and security polices should be same across MAs for Layer 2 and Layer 3 roaming.
• Client VLAN ID should be same for Layer 2 roaming and different for Layer 3 roaming.
• Bridge domain ID and client VLAN IDs should be same for Layer 2 roaming. Either one or both of the bridge domain ID and client VLAN ID should be different for Layer 3 roaming.

SUMMARY STEPS

1. configure terminal
2. wlan wlan_profile_name wlan_ID SSID_network_name
3. no mobility anchor sticky
4. end
# Configuring Client Roaming

## Configuring CCX Client Roaming Parameters (CLI)

### SUMMARY STEPS

1. `configure terminal`
2. `ap dot11 {5ghz | 24ghz} l2roam rf-params {default | custom min-rssi roam-hyst scan-thresh trans-time}`
3. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ap dot11 {5ghz</td>
<td>24ghz} l2roam rf-params {default</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice(config)# ap dot11 5ghz l2roam rf-params custom min-rssi roam-hyst scan-thresh trans-time</td>
<td></td>
</tr>
</tbody>
</table>
### Purpose

- **Minimum RSSI**—Indicates minimum Received Signal Strength Indicator (RSSI) required for the client to associate to an access point.

  If the client’s average received signal power dips below this threshold, reliable communication is usually impossible. Therefore, clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached.

  You can configure the minimum RSSI range from –80 through –90 dBm and the default is –85 dBm.

- **Hysteresis**—Indicates how much greater the signal strength of a neighboring access point must be for the client to roam to it.

  This parameter is intended to reduce the amount of roaming between access points if the client is physically located on or near the border between two access points.

  You can configure the hysteresis range from 3 through 20 dB and the default is 3 dB.

- **Scan Threshold**—Indicates a minimum RSSI that is allowed before the client should roam to a better access point.

  When the RSSI drops below the specified value, the client must be able to roam to a better access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when the RSSI is below the threshold.

  You can configure the RSSI range from –70 through –77 dBm and the default value is –72 dBm.

- **Transition Time**—Indicates the maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client’s associated access point is below the scan threshold.

  The Scan Threshold and Transition Time parameters guarantee a minimum level of client roaming performance. Together with the highest expected client speed and roaming hysteresis, these parameters make it possible to design a wireless LAN network that supports roaming simply by ensuring a certain minimum overlap distance between access points.

  You can configure the time period in the range from 1 through 10 seconds and the default time is 5 seconds.

### Command or Action

<tr>
<td>3</td>
<td><code>wireless mobility controller peer-group switch-peer-group-name</code></td>
<td>Configures a switch peer group name. You can enter up to 31 case-sensitive ASCII printable characters for the group name. Spaces are not allowed in mobility group. <strong>Note</strong> The <strong>No</strong> form of the command deletes the switch peer group.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;SwitchControllerDevice(config)# wireless mobility controller peer-group SPG1</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td><code>wireless mobility controller peer-group switch-peer-group-name member ip ip-address {public-ip public-ip-address}</code></td>
<td>Adds a mobility group member to a switch peer group. <strong>Note</strong> The <strong>No</strong> form of the command deletes the member from the switch peer group.</td>
</tr>
<tr>
<td>Step</td>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>------</td>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>5</td>
<td><code>wireless mobility controller peer-group switch-peer-group-name multicast</code></td>
<td>Configures the multicast mode within a switch peer group.</td>
</tr>
</tbody>
</table>
| 6    | `wireless mobility controller peer-group switch-peer-group-name multicast ip peer-group-multicast-ip-addr` | Configures the multicast IP address for a switch peer group.  
**Note**: The `no` form of the command deletes the multicast IP for the switch peer group. |
| 7    | `wireless mobility controller peer-group switch-peer-group-name bridge-domain-id {id | bridge-domain-id id}` | Configures the bridge domain ID for a switch peer group.  
The default is zero.  
**Note**: The `no` form of command sets the bridge domain ID to the default value. |
| 8    | `wireless mobility group member ip ip-address [public-ip public-ip-address] [group group-name]` | Adds a mobility group member.  
**Note**: The `no` form of the command removes the member from the group. The default group name is the group name of MC. |
| 9    | `wireless mobility dscp value` | Sets the DSCP value for mobility control packet.  
You can configure the DSCP value in a range from 0 through 63. The default value is 46. |
| 10   | `wireless mobility group keepalive {count | interval}` | Configures the wireless mobility group keepalive count which is the number of keepalive retries before a member status is termed DOWN and keepalive interval which is interval between two keepalives. |
| 11   | `wireless mobility group name name` | Specifies the case sensitive wireless mobility group name which can be ASCII printable string up to 31 characters. |
### Configuring Mobility Agent

#### SUMMARY STEPS

1. configure terminal
2. wireless mobility controller ip ip-address
3. wireless mobility load-balance
4. wireless mobility load-balance threshold threshold-value
5. wireless management interface interface-name
6. end

Feature History and Information For Performing Client Roaming Configuration

<table>
<thead>
<tr>
<th>Release</th>
<th>Feature Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IOS XE 3.2SE</td>
<td>This feature was introduced.</td>
</tr>
</tbody>
</table>
Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Application Visibility and Control

Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition engine, and provides application-level visibility and control (QoS) in wireless networks. After the applications are recognized, the AVC feature enables you to either drop, mark, or police the data traffic.

Using AVC, we can detect more than 1000 applications. AVC enables you to perform real-time analysis and create policies to reduce network congestion, costly network link usage, and infrastructure upgrades.

Note
You can view list of 30 applications in Top Applications in Monitor Summary section of the UI.
Restrictions for Application Visibility and Control

- AVC is supported only on the following access points:
  - Cisco Aironet 1260 Series Access Points
  - Cisco Aironet 1600 Series Access Points
  - Cisco Aironet 2600 Series Access Point
  - Cisco Aironet 2600 Series Wireless Access Points
  - Cisco Aironet 2700 Series Access Point
  - Cisco Aironet 3500 Series Access Points
  - Cisco Aironet 3600 Series Access Points

- AVC is not supported on Cisco Aironet 702W, 702I (128 M memory), and 1530 Series Access Points.

- Dropping or marking of the data traffic (control part) is not supported for software Release 3.3.
- Dropping or marking of the data traffic (control part) is supported in software Release 3E.
- Multicast traffic classification is not supported.
- Only the applications that are recognized with App visibility can be used for applying QoS control.
- IPv6 including ICMPv6 traffic classifications are not supported.
- Datalink is not supported for NetFlow fields for AVC.

- The following commands are not supported for AVC flow records:
  - \texttt{collect flow username}
  - \texttt{collect interface \{ input | output\}}
  - \texttt{collect wireless client ipv4 address}
  - \texttt{match interface \{ input | output\}}
  - \texttt{match transport igmp type}

- The template timeout cannot be modified on exporters configured with AVC. Even if the template timeout value is configured to a different value, only the default value of 600 seconds is used.

- For the username information in the AVC-based record templates, ensure that you configure the options \texttt{records} to get the user MAC address to username mapping.

- The total number of flows for which downstream AVC QoS supported per client is 1000.
- The maximum number of flows supported for Catalyst 3850 Series Switch is 48 K.

- Google shares resources among several of their services because of which for some of the traffic it is not possible to say it is unique to one application. Therefore we added google-services for traffic that cannot be distinguished. The behavior you experience is expected.
How to Configure Application Visibility and Control

Configuring Application Visibility and Control (GUI)

You can apply the default flow record (`wireless avc basic`) to the default flow monitor (`wireless-avc-basic`). If you are using the flow record and flow monitor you have created, then the record name and monitor name should be same. This is specific only for configuring AVC from GUI and not for the CLI configuration.

You can use the flow monitor you have created either for upstream or downstream, or both, but ensure that you use the same record name while mapping with the flow monitor.

---

**Step 1**

Choose Configuration > Wireless > WLAN. The WLAN page appears.

**Step 2**

Click on the corresponding WLAN ID to open the WLAN > Edit page and click AVC. The Application Visibility page appears.

  a) Select the Application Visibility Enabled check box to enable AVC on a WLAN.
  b) In the Upstream Profile text box, enter the name of the AVC profile.
  c) In the Downstream Profile text box, enter the name of the AVC profile.

To enable AVC, you need to enter the profile names for the upstream and downstream profiles. The profile names are the flow monitor names. By default, the flow monitor names (`wireless-avc-basic`) appear in the Upstream Profile and Downstream Profile text boxes. For the default flow monitor, the default flow record (`wireless avc basic`) will be taken. The default flow record is generated by the system and is available.

You can change the profile names for the upstream and downstream profiles but ensure that the same flow records are available for the flow monitors.

The upstream and downstream profiles can have different profile names but there should be flow records available for the flow monitors.

**Step 3**

Click Apply to apply AVC on the WLAN.

**Step 4**

To disable AVC on a specific WLAN, perform the following steps:

  * Choose Configuration > Wireless > WLAN to open the WLAN page.
  * Click on the corresponding WLAN ID to open the WLAN > Edit page.
  * Click AVC to open the Application Visibility page.
  * Uncheck the Application Visibility Enabled check box.
  * Click Apply to disable AVC on the specific WLAN.
# Monitoring Application Visibility and Control

## Monitoring Application Visibility and Control (CLI)

This section describes the new commands for application visibility. The following commands can be used to monitor application visibility on the switch and access points.

### Table 16: Monitoring Application Visibility Commands on the switch

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show avc client client-mac top n application [aggregate</td>
<td>upstream</td>
</tr>
<tr>
<td>`show avc wlan ssid top n application [aggregate</td>
<td>upstream</td>
</tr>
<tr>
<td>`avc top user[enable</td>
<td>disable]`</td>
</tr>
<tr>
<td>`show avc wlan wlan-id application app name topN [aggregate</td>
<td>upstream</td>
</tr>
<tr>
<td><code>show wlan id wlan-id</code></td>
<td>Displays information whether AVC is enabled or disabled on a particular WLAN.</td>
</tr>
<tr>
<td><code>show flow monitor flow_monitor_name cache</code></td>
<td>Displays information about flow monitors.</td>
</tr>
<tr>
<td>`show wireless client mac-address mac-address service-policy { input</td>
<td>output }`</td>
</tr>
</tbody>
</table>
show ip nbar protocol-discovery[interface interface-type interface-number] [stats byte-count | bit-rate | packet-count | max-bit-rate] [protocol protocol-name | top-number]

Displays the statistics gathered by the NBAR Protocol Discovery feature.

- (Optional) Enter keywords and arguments to fine-tune the statistics displayed. For more information on each of the keywords, refer to the show ip nbar protocol-discovery command in Cisco IOS Quality of Service Solutions Command Reference.

Note When you configure NBAR, you must enable Protocol Discovery on the interface.

show policy-map target
show policy-map
show policy-map policy-name
show policy-map interface interface-type interface-number

Displays information about policy map.

Table 17: Clearing Application Visibility Statistics Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear avc client mac stats</td>
<td>Clears the statistics per client.</td>
</tr>
<tr>
<td>clear avc wlan wlan-name stats</td>
<td>Clears the statistics per WLAN.</td>
</tr>
</tbody>
</table>

Monitoring Application Visibility and Control (GUI)

You can view AVC information on a WLAN in a single shot using a AVC on WLAN pie chart on the Home page of the switch. The pie chart displays the AVC data (Aggregate - Application Cumulative usage %) of the first WLAN. In addition, the top 5 WLANs based on clients are displayed first. Click on any one of the WLANs to view the corresponding pie chart information. If AVC is not enabled on the first WLAN, then the Home page does not display the AVC pie chart.

Step 1 Choose Monitor > Controller > AVC > WLANs.
The WLANs page appears.

Step 2 Click the corresponding WLAN profile.
The Application Statistics page appears.
From the Top Applications drop-down list, choose the number of top applications you want to view and click Apply.
The valid range is between 5 to 30, in multiples of 5.
a) On the Aggregate, Upstream, and Downstream tabs, you can view the application cumulative and last 90 seconds statistics and usage percent with the following fields:

- Application name
- Packet count
- Byte count
- Average packet size
- usage (%)

**Step 3**  
Choose Monitor > Clients > Client Details > Clients.  
The Clients page appears.

**Step 4**  
Click Client MAC Address and then click AVC Statistics tab.  
The Application Visibility page appears.

a) On the Aggregate, Upstream, and Downstream tabs, you can view the application cumulative and last 90 seconds statistics and usage percent with the following fields:

- Application name
- Packet count
- Byte count
- Average packet size
- usage (%)

---

**Examples: Application Visibility and Control**

**Examples: Application Visibility Configuration**

This example shows how to create a flow record, create a flow monitor, apply the flow record to the flow monitor, and apply the flow monitor on a WLAN:

```
SwitchControllerDevice# configure terminal  
SwitchControllerDevice(config)# flow record fr_v4  
SwitchControllerDevice(config-flow-record)# match ipv4 protocol  
SwitchControllerDevice(config-flow-record)# match ipv4 source address  
SwitchControllerDevice(config-flow-record)# match ipv4 destination address  
SwitchControllerDevice(config-flow-record)# match transport destination-port  
SwitchControllerDevice(config-flow-record)# match flow direction  
SwitchControllerDevice(config-flow-record)# match application name  
SwitchControllerDevice(config-flow-record)# match wireless ssid  
SwitchControllerDevice(config-flow-record)# collect counter bytes long  
SwitchControllerDevice(config-flow-record)# collect counter packets long  
SwitchControllerDevice(config-flow-record)# collect wireless ap mac address  
SwitchControllerDevice(config-flow-record)# collect wireless client mac address
```
SwitchControllerDevice(config)# end

SwitchControllerDevice# configure terminal
SwitchControllerDevice# flow monitor fm_v4
SwitchControllerDevice(config-flow-monitor)# record fr_v4
SwitchControllerDevice(config-flow-monitor)# cache timeout active 1800
SwitchControllerDevice(config)# end

SwitchControllerDevice(config)# wlan wlan1
SwitchControllerDevice(config-wlan)# ip flow monitor fm_v4 input
SwitchControllerDevice(config-wlan)# ip flow mon fm_v4 output
SwitchControllerDevice(config)# end

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Prerequisites for Voice and Video Parameters

You can confirm the following points before configuring voice and video parameters:

- Ensure that the switch has access points connected to it.
- Configure SSID.

Restrictions for Voice and Video Parameters

The following are the restrictions that you should keep in mind while configuring voice and video parameters:
• SIP CAC can be used for the 9971 Cisco phones that support TSPEC-based admission control. You can also use the phones that support Status code 17.

• SIP snooping is supported for providing voice priority to the non-TSPEC SIP phones.

• TSPEC for video CAC is not supported.

Information About Configuring Voice and Video Parameters

Three parameters on the switch affect voice and/or video quality:

• Call Admission Control

• Expedited bandwidth requests

• Unscheduled automatic power save delivery

Call Admission Control (CAC) and UAPSD are supported on Cisco Compatible Extensions (CCX) v4 and v5; however, these parameters are also supported even without CCX but on any device implementing WMM (that supports 802.1e). Expedited bandwidth requests are supported only on CCXv5.

Traffic stream metrics (TSM) can be used to monitor and report issues with voice quality.

Call Admission Control

Call Admission Control (CAC) enables an access point to maintain controlled quality of service (QoS) when the wireless LAN is experiencing congestion. The WMM protocol deployed in CCXv4 maintains QoS under differing network loads.

Two types of Over The Air (OTA) CAC are available: static-based CAC and load-based CAC.

The switch supports the following QoS policies:

• User-defined policies: You can define your own QoS policies. You can have more control over these policies than the existing metal policies.

• System-defined precious metal policies: To support backward compatibility.

  • Platinum: Used for VoIP clients.
  • Gold: Used for video clients.
  • Silver: Used for best effort traffic.
  • Bronze: Used for NRT traffic.

Static-Based CAC

Voice over WLAN applications supporting WMM and TSPEC can specify how much bandwidth or shared medium time is required to initiate a call. Bandwidth-based, or static, CAC enables the access point to determine whether it is capable of accommodating a particular call. The access point rejects the call if necessary in order to maintain the maximum allowed number of calls with acceptable quality.
The QoS setting for a WLAN determines the level of bandwidth-based CAC support. To use bandwidth-based CAC with voice applications, the WLAN must be configured for Platinum QoS. With bandwidth-based CAC, the access point bandwidth availability is determined based on the amount of bandwidth currently used by the access point clients, to which the bandwidth requested by the Voice over WLAN applications is added. If this total exceeds a configured bandwidth threshold, the new call is rejected.

**Note**
You must enable admission control (ACM) for CCXv4 clients that have WMM enabled. Otherwise, bandwidth-based CAC does not operate properly for these CCXv4 clients.

### Load-Based CAC

Load-based CAC incorporates a measurement scheme that takes into account the bandwidth consumed by all traffic types (including that from clients), cochannel access point loads, and coallocated channel interference, for voice and video applications. Load-based CAC also covers the additional bandwidth consumption resulting from PHY and channel impairment.

In load-based CAC, the access point continuously measures and updates the utilization of the RF channel (that is, the mean time of bandwidth that has been exhausted), channel interference, and the additional calls that the access point can admit. The access point admits a new call only if the channel has enough unused bandwidth to support that call. By doing so, load-based CAC prevents oversubscription of the channel and maintains QoS under all conditions of WLAN loading and interference.

**Note**
If you disable load-based CAC, the access points start using bandwidth-based CAC.

### IOSd Call Admission Control

IOSd Call Admission Control (CAC) controls bandwidth availability from switch to access point.

You can configure class-based, unconditional packet marking features on your switch for CAC.

CAC is a concept that applies to voice and video traffic only—not data traffic. If an influx of data traffic oversubscribes a particular link in the network, queueing, buffering, and packet drop decisions resolve the congestion. The extra traffic is simply delayed until the interface becomes available to send the traffic, or, if traffic is dropped, the protocol or the end user initiates a timeout and requests a retransmission of the information.

Network congestion cannot be resolved in this manner when real-time traffic, sensitive to both latency and packet loss, is present, without jeopardizing the quality of service (QoS) expected by the users of that traffic. For real-time delay-sensitive traffic such as voice, it is better to deny network access under congestion conditions than to allow traffic onto the network to be dropped and delayed, causing intermittent impaired QoS and resulting in customer dissatisfaction.

CAC is therefore a deterministic and informed decision that is made before a voice call is established and is based on whether the required network resources are available to provide suitable QoS for the new call.

Based on the admit CAC CLI configuration in addition to the existing CAC algorithm, switch allows either voice or video with TSPEC or SIP snooping. The **admit cac** CLI is mandatory for the voice call to pass through.
If the BSSID policer is configured for the voice or video traffic, then additional checks are performed on the packets.

## Expedited Bandwidth Requests

The expedited bandwidth request feature enables CCXv5 clients to indicate the urgency of a WMM traffic specifications (TSPEC) request (for example, an e911 call) to the WLAN. When the controller receives this request, it attempts to facilitate the urgency of the call in any way possible without potentially altering the quality of other TSPEC calls that are in progress.

You can apply expedited bandwidth requests to both bandwidth-based and load-based CAC. Expedited bandwidth requests are disabled by default. When this feature is disabled, the controller ignores all expedited requests and processes TSPEC requests as normal TSPEC requests.

The following table lists examples of TSPEC request handling for normal TSPEC requests and expedited bandwidth requests.

### Table 18: TSPEC Request Handling Examples

<table>
<thead>
<tr>
<th>CAC Mode</th>
<th>Reserved bandwidth for voice calls(^1)</th>
<th>Usage(^2)</th>
<th>Normal TSPEC Request</th>
<th>TSPEC with Expedited Bandwidth Request</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth-based CAC</td>
<td>75% (default setting)</td>
<td>Less than 75%</td>
<td>Admitted</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Between 75% and 90%</td>
<td>Rejected</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(reserved bandwidth for voice calls exhausted)</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>More than 90%</td>
<td>Rejected</td>
<td>Rejected</td>
</tr>
<tr>
<td>Load-based CAC</td>
<td></td>
<td>Less than 75%</td>
<td>Admitted</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Between 75% and 85%</td>
<td>Rejected</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(reserved bandwidth for voice calls exhausted)</td>
<td></td>

<td></td>
<td>More than 85%</td>
<td>Rejected</td>
<td>Rejected</td>
</tr>
</tbody>
</table>

\(^1\) For bandwidth-based CAC, the voice call bandwidth usage is per access point radio and does not take into account cochannel access points. For load-based CAC, the voice call bandwidth usage is measured for the entire channel.

\(^2\) Bandwidth-based CAC (consumed voice and video bandwidth) or load-based CAC (channel utilization [Pb]).

---

**Note**

Admission control for TSPEC G711-20ms and G711-40 ms codec types are supported.
U-APSD

Unscheduled automatic power save delivery (U-APSD) is a QoS facility defined in IEEE 802.11e that extends the battery life of mobile clients. In addition to extending battery life, this feature reduces the latency of traffic flow delivered over the wireless media. Because U-APSD does not require the client to poll each individual packet buffered at the access point, it allows delivery of multiple downlink packets by sending a single uplink trigger packet. U-APSD is enabled automatically when WMM is enabled.

Traffic Stream Metrics

In a voice-over-wireless LAN (VoWLAN) deployment, traffic stream metrics (TSM) can be used to monitor voice-related metrics on the client-access point air interface. It reports both packet latency and packet loss. You can isolate poor voice quality issues by studying these reports.

The metrics consist of a collection of uplink (client side) and downlink (access point side) statistics between an access point and a client device that supports CCX v4 or later releases. If the client is not CCX v4 or CCXv5 compliant, only downlink statistics are captured. The client and access point measure these metrics. The access point also collects the measurements every 5 seconds, prepares 90-second reports, and then sends the reports to the controller. The controller organizes the uplink measurements on a client basis and the downlink measurements on an access point basis and maintains an hour’s worth of historical data. To store this data, the controller requires 32 MB of additional memory for uplink metrics and 4.8 MB for downlink metrics.

TSM can be configured through either the GUI or the CLI on a per radio-band basis (for example, all 802.11a radios). The controller saves the configuration in flash memory so that it persists across reboots. After an access point receives the configuration from the controller, it enables TSM on the specified radio band.

This table shows the upper limit for TSM entries in different controller series.

<table>
<thead>
<tr>
<th>TSM Entries</th>
<th>5700</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX AP TSM entries</td>
<td>100</td>
</tr>
<tr>
<td>MAX Client TSM entries</td>
<td>250</td>
</tr>
<tr>
<td>MAX TSM entries</td>
<td>100*250=25000</td>
</tr>
</tbody>
</table>

Once the upper limit is reached, additional TSM entries cannot be stored and sent to WCS or NCS. If client TSM entries are full and AP TSM entries are available, then only the AP entries are stored, and vice versa. This leads to partial output. TSM cleanup occurs every one hour. Entries are removed only for those APs and clients that are not in the system.
Information About Configuring Voice Prioritization Using Preferred Call Numbers

You can configure a switch to provide support for SIP calls from VoWLAN clients that do not support TSPEC-based calls. This feature is known as SIP CAC support. If bandwidth is available in the configured voice pool, the SIP call uses the normal flow and the switch allocates the bandwidth to those calls.

You can also prioritize up to six preferred call numbers. When a call comes to one of the configured preferred numbers, the switch does not check the configured maximum voice bandwidth. The switch allocates the bandwidth needed for the call, even if it exceeds the maximum bandwidth for voice configured for voice CAC. The preferred call will be rejected if bandwidth allocation exceeds 85% of the radio bandwidth. The bandwidth allocation is 85 percent of the entire bandwidth pool, not just from the maximum configured voice pool. The bandwidth allocation is the same even for roaming calls.

You must configure the following parameters before configuring voice prioritization:

- Set WLAN QoS to allow voice calls to pass through.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

Information About EDCA Parameters

Enhanced distributed channel access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality-of-service (QoS) traffic.

How to Configure Voice and Video Parameters

Configuring Voice Parameters (CLI)

Before You Begin

Ensure that you have configured SIP-based CAC.

You should have created a class map for CAC before beginning this procedure.

15. wlan wlan_name service-policy output egress_policy_name
16. ap dot11 {5ghz | 24ghz} shutdown
17. ap dot11 {5ghz | 24ghz} cac voice sip
18. ap dot11 {5ghz | 24ghz} cac voice acm
19. ap dot11 {5ghz | 24ghz} cac voice max-bandwidth bandwidth
20. ap dot11 {5ghz | 24ghz} cac voice roam-bandwidth bandwidth
21. no wlan shutdown
22. no ap dot11 {5ghz | 24ghz} shutdown
23. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Specifies all of the WLANs configured on the switch.</td>
</tr>
<tr>
<td>show wlan summary</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice# show wlan summary</td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2** | Specifies the WLAN that you plan to modify. For voice over WLAN, ensure that the WLAN is configured for WMM and the QoS level is set to Platinum. |
| show wlan wlan_id |         |
| Example:          |         |
| SwitchControllerDevice# show wlan 25 |         |

| **Step 3** | Enters global configuration mode. |
| configure terminal |         |
| Example:           |         |
| SwitchControllerDevice# configure terminal |         |

<p>| <strong>Step 4</strong> | Enters policy map configuration mode. |
| policy-map policy-map name |         |</p>
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Example: 
SwitchControllerDevice(config)# policy-map test_2000  
SwitchControllerDevice(config-pmap)# | Creates or modifies a policy map that can be attached to one or more interfaces to specify a service policy. In WLAN, you need to configure service-policy for these commands to take effect. |
| **Step 5** class \{class-name | class-default\} | Enters policy class map configuration mode. Specifies the name of the class whose policy you want to create or change. Specifies the name of the class whose policy you want to create or change. You can also create a system default class for unclassified packets. |
| Example: 
SwitchControllerDevice(config-pmap)# class test_1000  
SwitchControllerDevice(config-pmap-c)# | | |
| **Step 6** admit cac wmm-tspec | (Optional) Admits the request for Call Admission Control (CAC) for policy map. |
| Example: 
SwitchControllerDevice(config-pmap-c)# admit cac wmm-tspec  
SwitchControllerDevice(config-pmap-c)# | | |
| **Step 7** service-policy policy-map name | Configures the QoS service policy. |
| Example: 
SwitchControllerDevice(config-pmap-c)# service-policy test_2000  
SwitchControllerDevice(config-pmap-c)# | | |
| **Step 8** end | Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. |
| Example: 
SwitchControllerDevice(config)# end | | |
| **Step 9** wlan wlan_profile_name wlan_ID SSID_network_name wlan shutdown | Disables all WLANs with WMM enabled prior to changing the video parameters. |
| Example: 
SwitchControllerDevice(config)# wlan wlan1  
SwitchControllerDevice(config-wlan)# wlan shutdown | | |
| **Step 10** wlan wlan_profile_name wlan_ID SSID_network_name | Disables all WLANs with WMM enabled prior to changing the voice parameters. |
| Example: 
SwitchControllerDevice(config)# wlan wlan1  
SwitchControllerDevice(config-wlan)# wlan shutdown | | |
| **Step 11** wlan wlan_name call-snoop | Enables the call-snooping on a particular WLAN. |
| Example: 
SwitchControllerDevice(config)# wlan wlan1 call-snoop | | |

Configuring Video Parameters (CLI)

SUMMARY STEPS

1. show wlan summary
2. show wlan wlan_id
3. configure terminal
4. policy-map policy-map name
5. class {class-name | class-default}
6. admit cac wmm-tspec
7. service-policy policy-map name
8. end
9. wlan wlan_profile_name
10. ap dot11 {5ghz | 24ghz} shutdown
11. ap dot11 {5ghz | 24ghz} cac video acm
12. ap dot11 {5ghz | 24ghz} cac video load-based
13. ap dot11 {5ghz | 24ghz} cac video max-bandwidth bandwidth
14. ap dot11 {5ghz | 24ghz} cac video roam-bandwidth bandwidth
15. no wlan shutdown wlan_id
16. no ap dot11 {5ghz | 24ghz} shutdown
17. end

DETAILED STEPS

<table>
<thead>
<tr>

### Configuring SIP-Based CAC (CLI)

SIP CAC controls the total number of SIP calls that can be made.
SUMMARY STEPS

1. configure terminal
2. wlan wlan-name
3. call-snoop
4. service-policy [client] input policy-map name
5. service-policy [client] output policy-map name
6. end
7. show wlan {wlan-id | wlan-name}
8. configure terminal
9. ap dot11 {5ghz | 24ghz} cac {voice | video} acm
10. ap dot11 {5ghz | 24ghz} cac voice sip
11. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>wlan wlan-name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config)# wlan qos-wlan SwitchControllerDevice(config-wlan)#</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>call-snoop</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config-wlan)# call-snoop</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>service-policy [client] input policy-map name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config-wlan)# service-policy input platinum-up</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>service-policy [client] output policy-map name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config-wlan)# service-policy output platinum</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>end</td>
</tr>
<tr>
<td><strong>Example:</strong></td>

</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# show wlan qos-wlan</td>
<td></td>
</tr>
<tr>
<td><strong>Step 8</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 9</strong> ap dot11 {5ghz</td>
<td>24ghz} cac {voice</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# ap dot11 5ghz cac voice acm</td>
<td></td>
</tr>
<tr>
<td><strong>Step 10</strong> ap dot11 {5ghz</td>
<td>24ghz} cac voice sip</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# ap dot11 5ghz cac voice sip</td>
<td></td>
</tr>
<tr>
<td><strong>Step 11</strong> end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

## Configuring a Preferred Call Number (CLI)

**Before You Begin**

You must set the following parameters before configuring a preferred call number.

- Set WLAN QoS to voice.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.
- Enable SIP-based CAC.
**SUMMARY STEPS**

1. configure terminal
2. wlan wlan-name qos platinum
3. ap dot11 {5ghz | 24ghz} cac {voice | video} acm
4. wlan wlan-name
5. wireless sip preferred-call-no call_index call_number
6. no wireless sip preferred-call-no call_index
7. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice# configure terminal</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>wlan wlan-name qos platinum</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# wlan wlan1 SwitchControllerDevice(config-wlan)# qos platinum</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>ap dot11 {5ghz</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# ap dot11 5ghz cac voice acm</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>wlan wlan-name</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# wlan wlan1 SwitchControllerDevice(config-wlan)# call-snoop</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>wireless sip preferred-call-no call_index call_number</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# wireless sip preferred-call-no 1 555333</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>no wireless sip preferred-call-no call_index</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# no wireless sip preferred-call-no 1</td>
</tr>
<tr>
<td><strong>Step 7</strong></td>
<td>end</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# end</td>
</tr>
</tbody>
</table>

Purpose:
- Enters global configuration mode.
- Sets QoS to voice on a particular WLAN.
- Enables the static ACM on the radio.
- When enabling SIP snooping, use the static CAC, not the load-based CAC.
- Enables the call-snooping feature for a particular WLAN.
- Adds a new preferred call.
- Removes a preferred call.
- Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.
Configuring EDCA Parameters (CLI)

SUMMARY STEPS

1. configure terminal
2. ap dot11 \{5ghz | 24ghz \} shutdown
3. ap dot11 \{5ghz | 24ghz\} edca-parameters \{custom-voice | optimized-video-voice | optimized-voice |svp-voice | wmm-default\}
4. show ap dot11 \{5ghz | 24ghz\} network
5. no ap dot11 \{5ghz | 24ghz\} shutdown
6. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ap dot11 {5ghz</td>
<td>24ghz } shutdown</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice(config)# ap dot11 5ghz shutdown</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ap dot11 {5ghz</td>
<td>24ghz} edca-parameters {custom-voice</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice(config)# ap dot11 5ghz edca-parameters optimized-voice</td>
<td>• custom-voice—Enables custom voice parameters for the 802.11a or 802.11b/g network.</td>
</tr>
<tr>
<td></td>
<td>• optimized-video-voice—Enables EDCA voice- and video-optimized parameters for the 802.11a or 802.11b/g network. Choose this option when both voice and video services are deployed on your network.</td>
</tr>
<tr>
<td></td>
<td>• optimized-voice—Enables non-SpectraLink voice-optimized profile parameters for the 802.11a or 802.11b/g network. Choose this option when voice services other than SpectraLink are deployed on your network.</td>
</tr>
<tr>
<td></td>
<td>•svp-voice—Enables SpectraLink voice priority parameters for the 802.11a or 802.11b/g network.</td>
</tr>
</tbody>
</table>
Monitoring Voice and Video Parameters

This section describes the new commands for the voice and video parameters. The following commands can be used to monitor voice and video parameters.

Table 19: Monitoring Voice Parameters Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ap dot11 {5ghz</td>
<td>24ghz} network</td>
</tr>
<tr>
<td>show ap name ap_name dot11 24ghz tsm all</td>
<td>Displays the TSM voice metrics and current status of MAC optimization for voice.</td>
</tr>
<tr>
<td>show ap name apname cac voice</td>
<td>Displays the information about CAC for a particular access point.</td>
</tr>
<tr>
<td>show client detail client_mac</td>
<td>Displays the U-APSD status for a particular client.</td>
</tr>
<tr>
<td>show policy-map interface wireless client</td>
<td>Displays the video client policy details.</td>
</tr>
</tbody>
</table>
### Monitoring Voice and Video Parameters

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show access-list</strong></td>
<td>Displays the video client dynamic access-list from the switch.</td>
</tr>
<tr>
<td><strong>show wireless client voice diag status</strong></td>
<td>Displays information about whether voice diagnostics are enabled or disabled. If enabled, this also displays information about the clients in the watch list and the time remaining for the diagnostics of the voice call. <strong>Note</strong> To work on voice diagnostics CLIs, you need to enter the following command: <code>debug voice-diagnostic mac-addr client_mac_01 client_mac_02</code></td>
</tr>
<tr>
<td><strong>show wireless client voice diag tspec</strong></td>
<td>Displays the TSPEC information sent from the clients that are enabled for voice diagnostics.</td>
</tr>
<tr>
<td><strong>show wireless client voice diag qos-map</strong></td>
<td>Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed.</td>
</tr>
<tr>
<td><strong>show wireless client voice diag rssi</strong></td>
<td>Display the client's RSSI values in the last 5 seconds when voice diagnostics is enabled.</td>
</tr>
<tr>
<td><strong>show client voice-diag roam-history</strong></td>
<td>Displays information about the last three roaming calls. The output contains the timestamp, access point associated with roaming, roaming reason, and if there is a roaming failure, reason for roaming-failure.</td>
</tr>
<tr>
<td><strong>show policy-map interface wireless mac mac-address</strong></td>
<td>Displays information about the voice and video data packet statistics.</td>
</tr>
<tr>
<td><strong>show wireless media-stream client summary</strong></td>
<td>Displays a summary of the media stream and video client information.</td>
</tr>
<tr>
<td>**show controllers d0</td>
<td>b queue**</td>
</tr>
<tr>
<td><strong>show platform qos queue stats interface</strong></td>
<td>Displays which queue packets are going through from the switch.</td>
</tr>
</tbody>
</table>

You can monitor the video parameters using the following commands.

**Table 20: Monitoring Video Parameters Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show ap join stats summary ap_mac</strong></td>
<td>Displays the last join error detail for a specific access point.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td><code>show ip igmp snooping wireless mgid</code></td>
<td>Displays the TSM voice metrics and current status of MAC optimization for voice.</td>
</tr>
<tr>
<td><code>show wireless media-stream multicast-direct state</code></td>
<td>Displays the media stream multicast-direct parameters.</td>
</tr>
<tr>
<td><code>show wireless media-stream group summary</code></td>
<td>Displays the summary of the media stream and client information.</td>
</tr>
<tr>
<td><code>show wireless media-stream group detail group_name</code></td>
<td>Displays the details of a specific media-stream group.</td>
</tr>
<tr>
<td><code>show wireless media-stream client summary group_name</code></td>
<td>Displays the details for a set of media-stream clients.</td>
</tr>
<tr>
<td><code>show wireless media-stream client detail group_name</code></td>
<td>Displays the details for a set of media-stream clients.</td>
</tr>
<tr>
<td>`show ap dot11 {5ghz</td>
<td>24ghz} media-stream rr`</td>
</tr>
<tr>
<td><code>show wireless media-stream message details</code></td>
<td>Displays information about the message configuration.</td>
</tr>
<tr>
<td>`show ap name ap-name auto-rf dot11 5ghz</td>
<td>i Util`</td>
</tr>
<tr>
<td>`show controllers d0</td>
<td>b queue`</td>
</tr>
<tr>
<td>`show controllers d1</td>
<td>b queue`</td>
</tr>
<tr>
<td>`show cont d1</td>
<td>b Media`</td>
</tr>
<tr>
<td><code>show capwap mcast mgid all</code></td>
<td>Displays information about all of the multicast groups and their corresponding multicast group identifications (MGIDs) associated to the access point.</td>
</tr>
<tr>
<td><code>show capwap mcast mgid id id</code></td>
<td>Displays information about all of the video clients joined to the multicast group in a specific MGID.</td>
</tr>
</tbody>
</table>

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring RFID Tag Tracking

The SwitchControllerDevice enables you to configure radio-frequency identification (RFID) tag tracking. RFID tags are small wireless devices that are affixed to assets for real-time location tracking. They operate by advertising their location using special 802.11 packets, which are processed by access points, the controller, and the location appliance.
**How to Configure RFID Tag Tracking**

### Configuring RFID Tag Tracking (CLI)

#### SUMMARY STEPS

1. `location rfid status`
2. (Optional) `no location rfid status`
3. `location rfid timeout seconds`
4. `location rfid mobility vendor-name name`
5. (Optional) `no location rfid mobility name`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
| `location rfid status` | Enables RFID tag tracking.<br>By default, RFID tag tracking is enabled. |
| **Example:**
| SwitchControllerDevice(config)# location rfid status | |
| **Step 2**
| (Optional) `no location rfid status` | Disables RFID tag tracking. |
| **Example:**
| SwitchControllerDevice(config)# no location rfid status | |
| **Step 3**
| `location rfid timeout seconds` | Specifies a static timeout value (between 60 and 7200 seconds).<br>The static timeout value is the amount of time that the switch maintains tags before expiring them. For example, if a tag is configured to beacon every 30 seconds, we recommend that you set the timeout value to 90 seconds (approximately three times the beacon value). The default value is 1200 seconds. |
| **Example:**
| SwitchControllerDevice(config)# location rfid timeout 1500 | |
| **Step 4**
| `location rfid mobility vendor-name name` | Enables RFID tag mobility for specific tags. When you enter the `location rfid mobility vendor-name` command, tags are unable to obtain a DHCP address for client mode when attempting to select and/or download a configuration.<br>Note: These commands can be used only for Pango tags. Therefore, the only valid entry for `vendor_name` is “pango” in all lowercase letters. |
| **Example:**
| SwitchControllerDevice(config)# location rfid mobility vendor-name Aerosct | |
| **Step 5**
| (Optional) `no location rfid mobility name` | Disables RFID tag mobility for specific tags. When you enter the `no location rfid mobility` command, tags can obtain a DHCP address. If a tag roams from one subnet to another, it obtains a new address rather than retaining the anchor state. |
| **Example:**
| SwitchControllerDevice(config)# no location rfid mobility test | |
Monitoring RFID Tag Tracking Information

This section describes the new commands for the RFID tag tracking Information.
The following commands can be used to monitor the RFID tag tracking Information on the switch.

*Table 21: Monitoring RFID Tag Tracking Information Commands*

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show location rfid config</code></td>
<td>Displays the current configuration for RFID tag tracking.</td>
</tr>
<tr>
<td><code>show location rfid detail mac_address</code></td>
<td>Displays the detailed information for a specific RFID tag.</td>
</tr>
<tr>
<td><code>show location rfid summary</code></td>
<td>Displays a list of all RFID tags currently connected to the switch.</td>
</tr>
<tr>
<td><code>show location rfid client</code></td>
<td>Displays a list of RFID tags that are associated to the switch as clients.</td>
</tr>
</tbody>
</table>

Information About Configuring Location Settings

The switch determines the location of client devices by gathering Received Signal Strength Indication (RSSI) measurements from access points all around the client of interest. The switch can obtain location reports from up to 16 access points for clients, RFID tags, and rogue access points.

You can configure the path loss measurement (S60) request for normal clients or calibrating clients to improve location accuracy.
How to Configure Location Settings

Configuring Location Settings (CLI)

SUMMARY STEPS

1. `configure terminal`
2. `location plm {calibrating [multiband | uniband] | client burst_interval`
3. `location rssi-half-life {calibrating-client | client | rogue-aps | tags} seconds`
4. `location expiry {calibrating-client | client | rogue-aps | tags} timeout`
5. `location algorithm {rssi-average | simple}`
6. `location admin-tag string`
7. `location civic-location identifier {identifier | host}`
8. `location custom-location identifier {identifier | host}`
9. `location geo-location identifier {identifier | host}`
10. `location prefer {cdp | lldp-med | static} weight priority_value`
11. `location rfid {status | timeout | vendor-name}`
12. `end`

<tr>
<td><strong>Example:</strong></td>
<td><code>SwitchControllerDevice(config)# location plm client 100</code></td>
</tr>
</tbody>
</table>

Enters global configuration mode.

Configures the path loss measurement (S60) request for calibrating clients or non-calibrating.

The path loss measurement request improves the location accuracy. You can configure the `burst_interval` parameter for the normal, non-calibrating client from zero through 3600 seconds, and the default value is 60 seconds.

If a client does not send probes often or sends them only on a few channels, its location cannot be updated or cannot be updated accurately. The `location plm` command forces clients to send more packets on all channels. When a CCXv4 (or higher) client associates, the SwitchControllerDevice sends it a path loss measurement request, which instructs the client to transmit on the bands and channels that the access points are on (typically, channels 1,
Step 3

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`location rssi-half-life {calibrating-client</td>
<td>client</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# location rssi-half-life calibrating-client 60</td>
</tr>
</tbody>
</table>

Note We recommend that you do not use or modify the `location rssi-half-life` command.

Step 4

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`location expiry {calibrating-client</td>
<td>client</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# location expiry calibrating-client 50</td>
</tr>
</tbody>
</table>

Note We recommend that you do not use or modify the `location expiry` command.

Step 5

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`location algorithm {rssi-average</td>
<td>simple}`</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# location algorithm rssi-average</td>
</tr>
</tbody>
</table>

Note We recommend that you do not use or modify the `location algorithm` command.

Step 6

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>location admin-tag string</code></td>
<td>Sets administrative tag or site information for the location of client devices.</td>

</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# location prefer weight cdp 50</td>
<td><strong>Step 11</strong> location rfd {status</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# location rfd timeout 100</td>
<td><strong>Step 12</strong> end Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

### Modifying the NMSP Notification Interval for Clients, RFID Tags, and Rogues (CLI)

The Network Mobility Services Protocol (NMSP) manages communication between the mobility services engine and the controller for incoming and outgoing traffic. If your application requires more frequent location updates, you can modify the NMSP notification interval (to a value between 1 and 180 seconds) for clients, active RFID tags, and rogue access points and clients.
The TCP port (16113) that the controller and mobility services engine communicate over must be open (not blocked) on any firewall that exists between the controller and the mobility services engine for NMSP to function.

SUMMARY STEPS

1. configure terminal
2. nmsp notification interval {attachment seconds | location seconds | rssi [clients interval | rfid interval | rogues [ap | client ] interval]}
3. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 nmsp notification interval {attachment seconds</td>
<td>location seconds</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# nmsp notification interval rssi rfid 50</td>
<td></td>
</tr>
<tr>
<td>Step 3 end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Modifying the NMSP Notification threshold for Clients, RFID Tags, and Rogues (CLI)

SUMMARY STEPS

1. configure terminal
2. location notify-threshold {clients | rogues ap | tags } threshold
3. end
DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>

<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td>location notify-threshold {clients</td>
<td>rogues ap</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# location notify-threshold clients 5</td>
<td>You can enter the RSSI threshold value from zero through 10 db.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td>end</td>
<td>Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Monitoring Location Settings and NMSP Settings

Monitoring Location Settings (CLI)

This section describes the new commands for location settings. The following commands can be used to monitor location settings on the switch.

Table 22: Monitoring Location Settings Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show location summary</td>
<td>Displays the current location configuration values.</td>
</tr>
<tr>
<td>show location statistics rfid</td>
<td>Displays the location-based RFID statistics.</td>
</tr>
<tr>
<td>show location detail client_mac_addr</td>
<td>Displays the RSSI table for a particular client.</td>
</tr>
</tbody>
</table>

Monitoring NMSP Settings (CLI)

This section describes the new commands for NMSP settings. The following commands can be used to monitor NMSP settings on the switch.
Table 23: Monitoring NMSP Settings Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td></td>
<td>switch is subscribed.</td>
</tr>
<tr>
<td>show nmsp subscription detail ip_addr</td>
<td>Displays details only for the mobility services</td>
</tr>
<tr>
<td></td>
<td>subscribed to by a specific IP address.</td>
</tr>
<tr>
<td>show nmsp subscription summary</td>
<td>Displays details for all of the mobility services</td>
</tr>
<tr>
<td></td>
<td>to which the switch is subscribed.</td>
</tr>
</tbody>
</table>

Examples: Location Settings Configuration

This example shows how to configure the path loss measurement (S60) request for calibrating client on the associated 802.11a or 802.11b/g radio:

```bash
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# location plm calibrating uniband
SwitchControllerDevice(config)# end
SwitchControllerDevice# show location summary
```

This example shows how to configure the RSSI half life for a rogue access point:

```bash
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# location rssi-half-life rogue-aps 20
SwitchControllerDevice(config)# end
SwitchControllerDevice# show location summary
```

Examples: NMSP Settings Configuration

This example shows how to configure the NMSP notification interval for RFID tags:

```bash
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# nmsp notification interval rssi rfid 50
```
SwitchControllerDevice(config)# end
SwitchControllerDevice# show nmsp notification interval

This example shows how to configure the NMSP notification threshold for clients:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# nmsp notify-threshold 5
SwitchControllerDevice(config)# end
SwitchControllerDevice# show nmsp statistics summary

---

Finding Feature Information

Your software release may not support all of the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Flow Control

Flow control is enabled by default on the switch.

Flow control provides shim layers between WCM and Cisco IOS for a reliable IPC. Every component in WCM has a dedicated channel. Few of the components in WCM have leveraged flow control in that. There is no configuration of flow control from CLI. You can monitor the flow control for any channel.

Monitoring Flow Control

This section describes the new commands for flow control.

The following commands can be used to monitor flow control on the switch.
Table 24: Monitoring Flow Control

<table>
<thead>
<tr>
<th>Command</th>

Information About Configuring SDM Templates

SDM Templates

You can use SDM templates to configure system resources to optimize support for specific features, depending on how your device is used in the network. You can select a template to provide maximum system usage for some functions.

These templates are supported on your device:

- Advanced—The advanced template is available on all supported images for this release. It maximizes system resources for features like netflow, multicast groups, security ACEs, QoS ACEs, and so on.
- VLAN—The VLAN template is available only on the LAN Base license. The VLAN template disables routing and supports the maximum number of unicast MAC addresses. It would typically be selected for a Layer 2 device.

After you change the template and the system reboots, you can use the `show sdm prefer` privileged EXEC command to verify the new template configuration. If you enter the `show sdm prefer` command before you enter the `reload` privileged EXEC command, the `show sdm prefer` command shows the template currently in use and the template that will become active after a reload.

The default is the advanced template.

Table 25: Approximate Number of Feature Resources Allowed by Templates

<table>
<thead>
<tr>
<th>Resource</th>
<th>Advanced</th>
<th>VLAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of VLANs</td>
<td>4094</td>
<td>4094</td>
</tr>
<tr>
<td>Unicast MAC addresses</td>
<td>32 K</td>
<td>32 K</td>
</tr>
<tr>
<td>Overflow unicast MAC addresses</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IGMP groups and multicast routes</td>
<td>4 K</td>
<td>4 K</td>
</tr>
<tr>
<td>Overflow IGMP groups and multicast routes</td>
<td>512</td>
<td>512</td>
</tr>
<tr>
<td>Directly connected routes</td>
<td>32 K</td>
<td>32 K</td>
</tr>
<tr>
<td>Indirectly connected IP hosts</td>
<td>8 K</td>
<td>8 K</td>
</tr>
<tr>
<td>Policy-based routing ACEs</td>
<td>1024</td>
<td>0</td>
</tr>
<tr>
<td>QoS classification ACEs</td>
<td>3 K</td>
<td>3 K</td>
</tr>
<tr>
<td>Security ACEs</td>
<td>3 K</td>
<td>3 K</td>
</tr>
</tbody>
</table>
When the switch is used as a Wireless Mobility Agent, the only template allowed is the advanced template.

The tables represent approximate hardware boundaries set when a template is selected. If a section of a hardware resource is full, all processing overflow is sent to the CPU, seriously impacting switch performance.

**SDM Templates and Switch Stacks**

In a switch stack, all stack members must use the same SDM template that is stored on the active switch. When a new switch is added to a stack, the SDM configuration that is stored on the active switch overrides the template configured on an individual switch.

**How to Configure SDM Templates**

**Configuring SDM Templates**

**Configuring the Switch SDM Template**

**Setting the SDM Template**

**SUMMARY STEPS**

1. configure terminal
2. sdm prefer { advanced | vlan }
3. end
4. reload
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: Switch&gt; configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> sdm prefer { advanced</td>
<td>vlan }</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# sdm prefer advanced</td>
<td></td>
</tr>
</tbody>
</table>
|  • advanced — Supports advanced features such as Netflow.  
  • vlan — Maximizes VLAN configuration on the switch with no routing supported in hardware. | |
| **Step 3** end | Returns to privileged EXEC mode. |
| Example: SwitchControllerDevice(config)# end | |
| **Step 4** reload | Reloads the operating system. |
| Example: SwitchControllerDevice# reload | |

### Monitoring and Maintaining SDM Templates

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show sdm prefer</td>
<td>Displays the SDM template in use.</td>
</tr>
<tr>
<td>reload</td>
<td>Reloads the switch to activate the newly configured SDM template.</td>
</tr>
<tr>
<td>no sdm prefer</td>
<td>Sets the default SDM template.</td>
</tr>
</tbody>
</table>
### Configuration Examples for Configuring SDM Templates

#### Examples: Configuring SDM Templates

This example shows how to configure the VLAN template:

```plaintext
SwitchControllerDevice(config)# sdm prefer vlan
SwitchControllerDevice(config)# exit
SwitchControllerDevice# reload
  Proceed with reload? [confirm]
```

#### Examples: Displaying SDM Templates

This is an example output showing the advanced template information:

```plaintext
SwitchControllerDevice# show sdm prefer
Showing SDM Template Info
This is the Advanced template.
Number of VLANs: 4094
Unicast MAC addresses: 32768
Overflow Unicast MAC addresses: 512
IGMP and Multicast groups: 8192
Overflow IGMP and Multicast groups: 512
Directly connected routes: 32768
Indirect routes: 8192
Security Access Control Entries: 3072
QoS Access Control Entries: 2816
Policy Based Routing ACEs: 1024
Netflow ACEs: 1024
Input Microflow policer ACEs: 256
Output Microflow policer ACEs: 256
Flow SPAN ACEs: 256
Tunnels: 256
Control Plane Entries: 512
Input Netflow flows: 8192
Output Netflow flows: 16384
These numbers are typical for L2 and IPv4 features.
Some features such as IPv6, use up double the entry size; so only half as many entries can be created.
```

This is an example output showing the VLAN template information:

```plaintext
SwitchControllerDevice# show sdm prefer vlan
Showing SDM Template Info
This is the VLAN template for a typical Layer 2 network.
Number of VLANs: 4094
Unicast MAC addresses: 32768
Overflow Unicast MAC addresses: 512
IGMP and Multicast groups: 8192
Overflow IGMP and Multicast groups: 512
Directly connected routes: 32768
```
Indirect routes: 8192
Security Access Control Entries: 3072
QoS Access Control Entries: 3072
Policy Based Routing ACEs: 0
Netflow ACEs: 1024
Input Microflow policer ACEs: 0
Output Microflow policer ACEs: 0
Flow SPAN ACEs: 256
Tunnels: 0
Control Plane Entries: 512
Input Netflow flows: 16384
Output Netflow flows: 8192

These numbers are typical for L2 and IPv4 features. Some features such as IPv6, use up double the entry size; so only half as many entries can be created.

Information About Configuring System Message Logs

System Message Logging

By default, a switch sends the output from system messages and debug privileged EXEC commands to a logging process. Stack members can trigger system messages. A stack member that generates a system message
appends its hostname in the form of hostname-n, where n is a switch range from 1 to 4, and redirects the output to the logging process on the active switch. Though the active switch is a stack member, it does not append its hostname to system messages. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages appear on the active consoles after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on a standalone switch, and in the case of a switch stack, on the active switch. If a standalone switch or the stack master fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet, through the console port, or through the Ethernet management port. In a switch stack, all stack member consoles provide the same console output.

Note

The syslog format is compatible with 4.3 BSD UNIX.

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Depending on the switch, messages appear in one of these formats:

• seq no:timestamp: %facility-severity-MNEMONIC:description (hostname-n)
• seq no:timestamp: %facility-severity-MNEMONIC:description

The part of the message preceding the percent sign depends on the setting of these global configuration commands:

• service sequence-numbers
• service timestamps log datetime
• service timestamps log datetime [localtime] [msec] [show-timezone]
• service timestamps log uptime
Table 26: System Log Message Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seq no:</td>
<td>Stamps log messages with a sequence number only if the service sequence-numbers global configuration command is configured.</td>
</tr>
<tr>
<td>timestamp formats:</td>
<td></td>
</tr>
<tr>
<td>mm/dd h:mm:ss</td>
<td>Date and time of the message or event. This information appears only if the service timestamps log [datetime</td>
</tr>
<tr>

</tr>
<tr>
<td>Logging buffer size</td>
<td>4096 bytes.</td>
</tr>
<tr>
<td>Logging history size</td>
<td>1 message.</td>
</tr>
</tbody>
</table>
### Syslog Message Limits

If you enabled syslog message traps to be sent to an SNMP network management station by using the `snmp-server enable trap` global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level `warning` and numerically lower levels are stored in the history table even if syslog traps are not enabled.

When the history table is full (it contains the maximum number of message entries specified with the `logging history size` global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

The history table lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, `emergencies` equal 1, not 0, and `critical` equals 3, not 2.

### How to Configure System Message Logs

#### Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

This task is optional.
### SUMMARY STEPS

1. configure terminal
2. logging buffered [size]
3. logging host
4. logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type]
5. end
6. terminal monitor

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

SwitchControllerDevice# configure terminal

| **Step 2** logging buffered [size] | Logs messages to an internal buffer on the switch or on a standalone switch or, in the case of a switch stack, on the active switch. The range is 4096 to 2147483647 bytes. The default buffer size is 4096 bytes. |

**Example:**

SwitchControllerDevice(config)# logging buffered 8192

**Note** Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the `show memory` privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should not be set to this amount.

| **Step 3** logging host | Logs messages to a UNIX syslog server host. |

**Example:**

SwitchControllerDevice(config)# logging 125.1.1.100

**host** specifies the name or IP address of the host to be used as the syslog server. To build a list of syslog servers that receive logging messages, enter this command more than once.

| **Step 4** logging file flash: filename [max-file-size [min-file-size]] [severity-level-number | type] | Stores log messages in a file in flash memory on a standalone switch or, in the case of a switch stack, on the active switch. |

**Example:**

SwitchControllerDevice(config)# logging file flash:log_msg.txt 40960 4096 3

- `filename`—Enters the log message filename.
- (Optional) `max-file-size`—Specifies the maximum logging file size. The range is 4096 to 2147483647. The default is 4096 bytes.
- (Optional) `min-file-size`—Specifies the minimum logging file size. The range is 1024 to 2147483647. The default is 2048 bytes.
- (Optional) `severity-level-number | type`—Specifies either the logging severity level or the logging type. The severity range is 0 to 7.
Synchronizing Log Messages

You can synchronize unsolicited messages and debug privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and debug command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or is printed. Unsolicited messages and debug command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and debug command output are not interspersed with solicited device output and prompts. After the unsolicited messages appear, the console again displays the user prompt.

This task is optional.

SUMMARY STEPS

1. configure terminal
2. line [console | vty] line-number [ending-line-number]
3. logging synchronous [level [severity-level | all] | limit number-of-buffers]
4. end

DETAILED STEPS

<table>
<thead>
<tr>

<td>line vty 2</td>
</tr>
<tr>
<td></td>
<td>When you enter this command, the mode changes to line configuration.</td>
</tr>
<tr>
<td></td>
<td>Enables synchronous logging of messages.</td>
</tr>
<tr>
<td><strong>Step 3</strong> logging synchronous [level [severity-level</td>
<td>all]</td>
</tr>
<tr>
<td>Example:</td>
<td>(Optional) level severity-level—Specifies the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2.</td>
</tr>
<tr>
<td></td>
<td>(Optional) level all—Specifies that all messages are printed asynchronously regardless of the severity level.</td>
</tr>
<tr>
<td></td>
<td>(Optional) limit number-of-buffers—Specifies the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.</td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
</tbody>
</table>

**Disabling Message Logging**

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.
Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages appear on the console as soon as they are produced, often appearing in the middle of command output.

The **logging synchronous** global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press **Return**.

To reenable message logging after it has been disabled, use the **logging on** global configuration command. This task is optional.

**SUMMARY STEPS**

1. configure terminal
2. no logging console
3. end

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| Example:
  
  SwitchControllerDevice# configure terminal |                               |
| **Step 2** no logging console    | Disables message logging.    |
| Example:
  
  SwitchControllerDevice(config)# no logging console |                               |
| **Step 3** end                   | Returns to privileged EXEC mode. |
| Example:
  
  SwitchControllerDevice(config)# end |                               |

**Enabling and Disabling Time Stamps on Log Messages**

By default, log messages are not time-stamped.

This task is optional.
SUMMARY STEPS

1. configure terminal
2. Use one of these commands:
   • service timestamps log uptime
   • service timestamps log datetime[msec | localtime | show-timezone]
3. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> Use one of these commands:</td>
<td>Enables log time stamps.</td>
</tr>
<tr>
<td>• service timestamps log uptime</td>
<td>• log uptime—Enables time stamps on log messages, showing the time since the system was rebooted.</td>
</tr>
<tr>
<td>• service timestamps log datetime[msec</td>
<td>localtime</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# service timestamps log uptime</td>
<td></td>
</tr>
<tr>
<td>or SwitchControllerDevice(config)# service timestamps log datetime</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Enabling and Disabling Sequence Numbers in Log Messages

If there is more than one log message with the same time stamp, you can display messages with sequence numbers to view these messages. By default, sequence numbers in log messages are not displayed. This task is optional.
Defining the Message Severity Level

Limit messages displayed to the selected device by specifying the severity level of the message.
This task is optional.

SUMMARY STEPS

1. configure terminal
2. logging console level
3. logging monitor level
4. logging trap level
5. end
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**
configure terminal | Enters global configuration mode. |
| Example:
SwitchControllerDevice# configure terminal | |
| **Step 2**
logging console *level* | Limits messages logged to the console. |
| Example:
SwitchControllerDevice(config)# logging console 3 | By default, the console receives debugging messages and numerically lower levels. |
| **Step 3**
logging monitor *level* | Limits messages logged to the terminal lines. |
| Example:
SwitchControllerDevice(config)# logging monitor 3 | By default, the terminal receives debugging messages and numerically lower levels. |
| **Step 4**
logging trap *level* | Limits messages logged to the syslog servers. |
| Example:
SwitchControllerDevice(config)# logging trap 3 | By default, syslog servers receive informational messages and numerically lower levels. |
| **Step 5**
end | Returns to privileged EXEC mode. |
| Example:
SwitchControllerDevice(config)# end | |

### Limiting Syslog Messages Sent to the History Table and to SNMP

This task explains how to limit syslog messages that are sent to the history table and to SNMP.
This task is optional.
SUMMARY STEPS

1. configure terminal
2. logging history level
3. logging history size number
4. end

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 2 logging history level</td>
<td>Changes the default level of syslog messages stored in the history file and sent to the SNMP server. By default, warnings, errors, critical, alerts, and emergencies messages are sent.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# logging history 3</td>
<td></td>
</tr>
<tr>
<td>Step 3 logging history size number</td>
<td>Specifies the number of syslog messages that can be stored in the history table. The default is to store one message. The range is 0 to 500 messages.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# logging history size 200</td>
<td></td>
</tr>
<tr>
<td>Step 4 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

Logging Messages to a UNIX Syslog Daemon

This task is optional.

Note

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX man syslogd command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.
Before You Begin

- Log in as root.
- Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server.

SUMMARY STEPS

1. Add a line to the file /etc/syslog.conf.
2. Enter these commands at the UNIX shell prompt.
3. Make sure the syslog daemon reads the new changes.

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Add a line to the file /etc/syslog.conf.</td>
</tr>
</tbody>
</table>
| Example: | • **local7**—Specifies the logging facility.  
| | • **debug**—Specifies the syslog level. The file must already exist, and the syslog daemon must have permission to write to it. |
| **Step 2** | Enter these commands at the UNIX shell prompt. |
| Example: | Creates the log file. The syslog daemon sends messages at this level or at a more severe level to this file. |
| | $ touch /var/log/cisco.log |
| | $ chmod 666 /var/log/cisco.log |
| **Step 3** | Make sure the syslog daemon reads the new changes. |
| Example: | For more information, see the **man syslog.conf** and **man syslogd** commands on your UNIX system. |
| | $ kill -HUP `cat /etc/syslog.pid` |
## Monitoring and Maintaining System Message Logs

### Monitoring Configuration Archive Logs

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`show archive log config all [number [end-number]]</td>
<td>user username [session number] number [end-number]</td>
</tr>
</tbody>
</table>

### Configuration Examples for System Message Logs

#### Example: Stacking System Message

This example shows a partial switch system message for active switch and a stack member (hostname Switch-2):

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed state to down

*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

#### Example: Switch System Message

This example shows a partial switch system message on a switch:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
```

*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Configuring Online Diagnostics

Online Diagnostics

With online diagnostics, you can test and verify the hardware functionality of the switch while the switch is connected to a live network.
The online diagnostics contain packet switching tests that check different hardware components and verify the data path and the control signals.

The online diagnostics detect problems in these areas:

- Hardware components
- Interfaces (Ethernet ports and so forth)
- Solder joints

Online diagnostics are categorized as on-demand, scheduled, or health-monitoring diagnostics. On-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or at specified times when the switch is connected to a live network; and health-monitoring runs in the background with user-defined intervals. By default, the health-monitoring test runs for every 30 seconds.

After you configure online diagnostics, you can manually start diagnostic tests or display the test results. You can also see which tests are configured for the switch or switch stack and the diagnostic tests that have already run.

# How to Configure Online Diagnostics

## Starting Online Diagnostic Tests

After you configure diagnostic tests to run on the switch, use the `diagnostic start` privileged EXEC command to begin diagnostic testing.

After starting the tests, you cannot stop the testing process.

Use this privileged EXEC command to manually start online diagnostic testing:

### SUMMARY STEPS

1. `diagnostic start switch number test {name | test-id | test-id-range | all | basic | complete | minimal | non-disruptive | per-port}

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Starts the diagnostic tests.</td>
</tr>
<tr>
<td>`diagnostic start switch number test {name</td>
<td>test-id</td>
</tr>
<tr>
<td></td>
<td>• <code>name</code>—Enters the name of the test.</td>
</tr>
<tr>
<td></td>
<td>• <code>test-id</code>—Enters the ID number of the test.</td>
</tr>
<tr>
<td></td>
<td>• <code>test-id-range</code>—Enters the range of test IDs by using integers separated by a comma and a hyphen.</td>
</tr>
</tbody>
</table>

Example:

```
SwitchControllerDevice# diagnostic start switch 2 test basic
```
### Configuring Online Diagnostics

You must configure the failure threshold and the interval between tests before enabling diagnostic monitoring.

### Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis for a switch. Use the no form of this command to remove the scheduling.

#### SUMMARY STEPS

1. **configure terminal**

2. **diagnostic schedule switch number test {name | test-id | test-id-range | all | basic | complete | minimal | non-disruptive | per-port} {daily | on mm dd yyyy hh:mm | port inter-port-number port-number-list | weekly day-of-week hh:mm}**

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> diagnostic schedule switch number test {name</td>
<td>test-id</td>
</tr>
</tbody>
</table>
### Configuring Health-Monitoring Diagnostics

You can configure health-monitoring diagnostic testing on a switch while it is connected to a live network. You can configure the execution interval for each health-monitoring test, enable the switch to generate a syslog message because of a test failure, and enable a specific test.

By default, health monitoring is disabled, but the switch generates a syslog message when a test fails.

### SUMMARY STEPS

1. configure terminal
2. diagnostic monitor interval switch number test \{name | test-id | test-id-range | all\} hh:mm:ss milliseconds day
3. diagnostic monitor syslog
4. diagnostic monitor threshold switch number test \{name | test-id | test-id-range | all\} failure count count
5. diagnostic monitor switch number test \{name | test-id | test-id-range | all\}
6. end
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| configure terminal | Example:  
SwitchControllerDevice# configure terminal |
| **Step 2** | Configures the health-monitoring interval of the specified tests.  
The **switch number** keyword is supported only on stacking switches. The range is from 1 to 9.  
When specifying the tests, use one of these parameters:  
- **name**—Name of the test that appears in the **show diagnostic content** command output.  
- **test-id**—ID number of the test that appears in the **show diagnostic content** command output.  
- **test-id-range**—ID numbers of the tests that appear in the **show diagnostic content** command output.  
- **all**—All of the diagnostic tests.  
When specifying the interval, set these parameters:  
- **hh:mm:ss**—Monitoring interval in hours, minutes, and seconds. The range for **hh** is 0 to 24, and the range for **mm** and **ss** is 0 to 60.  
- **milliseconds**—Monitoring interval in milliseconds (ms). The range is from 0 to 999.  
- **day**—Monitoring interval in the number of days. The range is from 0 to 20.  |
| diagnostic monitor interval switch number test {name | test-id | test-id-range | all} hh:mm:ss milliseconds day | Example:  
SwitchControllerDevice(config)# diagnostic monitor interval switch 2 test 1 12:30:00 750 5 |
| **Step 3** | (Optional) Configures the switch to generate a syslog message when a health-monitoring test fails. |
| diagnostic monitor syslog | Example:  
SwitchControllerDevice(config)# diagnostic monitor syslog |
| **Step 4** | (Optional) Sets the failure threshold for the health-monitoring tests.  
The **switch number** keyword is supported only on stacking switches. The range is from 1 to 9.  
When specifying the tests, use one of these parameters:  
- **name**—Name of the test that appears in the **show diagnostic content** command output.  |
| diagnostic monitor threshold switch number test {name | test-id | test-id-range | all} failure count count | Example:  
SwitchControllerDevice(config)# diagnostic monitor threshold switch 2 test 1 failure count 20 |
### Command or Action | Purpose
---|---
| | • test-id—ID number of the test that appears in the show diagnostic content command output.
| | • test-id-range—ID numbers of the tests that appear in the show diagnostic content command output.
| | • all—All of the diagnostic tests.

#### Step 5
**diagnostic monitor switch number test {name | test-id | test-id-range | all}**

Enables the specified health-monitoring tests.

The switch number keyword is supported only on stacking switches. The range is from 1 to 9.

When specifying the tests, use one of these parameters:

- **name**—Name of the test that appears in the show diagnostic content command output.
- **test-id**—ID number of the test that appears in the show diagnostic content command output.
- **test-id-range**—ID numbers of the tests that appear in the show diagnostic content command output.
- **all**—All of the diagnostic tests.

#### Example:
```
SwitchControllerDevice(config)# diagnostic monitor switch 2 test 1
```

#### Step 6
**end**

Returns to privileged EXEC mode.

#### Example:
```
SwitchControllerDevice(config)# end
```

---

### Monitoring and Maintaining Online Diagnostics

#### Displaying Online Diagnostic Tests and Test Results

You can display the online diagnostic tests that are configured for the switch or switch stack and check the test results by using the privileged EXEC show commands in this table:
Table 28: Commands for Diagnostic Test Configuration and Results

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show diagnostic content switch [number</td>
<td>all]</td>
</tr>
<tr>
<td>show diagnostic status</td>
<td>Displays the currently running diagnostic tests.</td>
</tr>
<tr>
<td>show diagnostic result switch [number</td>
<td>all] [detail</td>
</tr>
<tr>
<td>show diagnostic switch [number</td>
<td>all] [detail]</td>
</tr>
<tr>
<td>show diagnostic schedule switch [number</td>
<td>all]</td>
</tr>
<tr>
<td>show diagnostic post</td>
<td>Displays the POST results. (The output is the same as the show post command output.)</td>
</tr>
</tbody>
</table>

Configuration Examples for Online Diagnostic Tests

Examples: Start Diagnostic Tests

This example shows how to start a diagnostic test by using the test name:

SwitchControllerDevice# diagnostic start switch 2 test TestInlinePwrCtlr

This example shows how to start all of the basic diagnostic tests:

SwitchControllerDevice# diagnostic start switch 1 test all

Example: Configure a Health Monitoring Test

This example shows how to configure a health-monitoring test:

SwitchControllerDevice(config)# diagnostic monitor threshold switch 1 test 1 failure count
Examples: Schedule Diagnostic Test

This example shows how to schedule diagnostic testing for a specific day and time on a specific switch:

```
SwitchControllerDevice(config)# diagnostic schedule test DiagThermalTest on June 3 2013 22:25
```

This example shows how to schedule diagnostic testing to occur weekly at a certain time on a specific switch:

```
SwitchControllerDevice(config)# diagnostic schedule switch 1 test 1,2,4-6 weekly saturday 10:30
```

Examples: Displaying Online Diagnostics

This example shows how to display on demand diagnostic settings:

```
SwitchControllerDevice# show diagnostic ondemand settings
Test iterations = 1
Action on test failure = continue
```

This example shows how to display diagnostic events for errors:

```
SwitchControllerDevice# show diagnostic events event-type error
Diagnostic events (storage for 500 events, 0 events recorded)
Number of events matching above criteria = 0
No diagnostic log entry exists.
```

This example shows how to display the description for a diagnostic test:

```
SwitchControllerDevice# show diagnostic description switch 1 test all
DiagGoldPktTest :
The GOLD packet Loopback test verifies the MAC level loopback functionality. In this test, a GOLD packet, for which doppler provides the support in hardware, is sent. The packet loops back at MAC level and is matched against the stored packet. It is a non-disruptive test.

DiagThermalTest :
This test verifies the temperature reading from the sensor is below the yellow temperature threshold. It is a non-disruptive test and can be run as a health monitoring test.

DiagFanTest :
This test verifies all fan modules have been inserted and working properly on the board. It is a non-disruptive test and can be run as a health monitoring test.

DiagPhyLoopbackTest :
The PHY Loopback test verifies the PHY level loopback functionality. In this test, a packet is sent which loops back at PHY level and is matched against the stored packet. It is a non-disruptive test.
```
disruptive test and cannot be run as a health monitoring test.

DiagScratchRegisterTest:
The Scratch Register test monitors the health of application-specific integrated circuits (ASICs) by writing values into registers and reading back the values from these registers. It is a non-disruptive test and can be run as a health monitoring test.

DiagPoETest:
This test checks the PoE controller functionality. This is a disruptive test and should not be performed during normal switch operation.

DiagStackCableTest:
This test verifies the stack ring loopback functionality in the stacking environment. It is a disruptive test and cannot be run as a health monitoring test.

DiagMemoryTest:
This test runs the exhaustive ASIC memory test during normal switch operation. NG3K utilizes mbist for this test. Memory test is very disruptive in nature and requires switch reboot after the test.

SwitchControllerDevice#

This example shows how to display the boot up level:

SwitchControllerDevice# show diagnostic bootup level
Current bootup diagnostic level: minimal
SwitchControllerDevice#

Managing Configuration Files

- Prerequisites for Managing Configuration Files, page 223
- Restrictions for Managing Configuration Files, page 223
- Information About Managing Configuration Files, page 224
- How to Manage Configuration File Information, page 230
- Additional References, page 263

Prerequisites for Managing Configuration Files

- You should have at least a basic familiarity with the Cisco IOS environment and the command-line interface.
- You should have at least a minimal configuration running on your system. You can create a basic configuration file using the `setup` command.

Restrictions for Managing Configuration Files

- Many of the Cisco IOS commands described in this document are available and function only in certain configuration modes on the switch.
- Some of the Cisco IOS configuration commands are only available on certain switch platforms, and the command syntax may vary on different platforms.
Information About Managing Configuration Files

Types of Configuration Files

Configuration files contain the Cisco IOS software commands used to customize the functionality of your Cisco switch. Commands are parsed (translated and executed) by the Cisco IOS software when the system is booted (from the startup-config file) or when you enter commands at the CLI in a configuration mode.

Startup configuration files (startup-config) are used during system startup to configure the software. Running configuration files (running-config) contain the current configuration of the software. The two configuration files can be different. For example, you may want to change the configuration for a short time period rather than permanently. In this case, you would change the running configuration using the `configure terminal` EXEC command but not save the configuration using the `copy running-config startup-config` EXEC command.

To change the running configuration, use the `configure terminal` command, as described in the Modifying the Configuration File (CLI) section. As you use the Cisco IOS configuration modes, commands generally are executed immediately and are saved to the running configuration file either immediately after you enter them or when you exit a configuration mode.

To change the startup configuration file, you can either save the running configuration file to the startup configuration using the `copy running-config startup-config` EXEC command or copy a configuration file from a file server to the startup configuration (see the Copying a Configuration File from a TFTP Server to the Switch (CLI) section for more information).

Configuration Mode and Selecting a Configuration Source

To enter configuration mode on the switch, enter the `configure` command at the privileged EXEC prompt. The Cisco IOS software responds with the following prompt asking you to specify the terminal, memory, or a file stored on a network server (network) as the source of configuration commands:

```plaintext
Configuring from terminal, memory, or network [terminal]?
```

Configuring from the terminal allows you to enter configuration commands at the command line, as described in the following section. See the Re-executing the Configuration Commands in the Startup Configuration File (CLI) section for more information.

Configuring from the network allows you to load and execute configuration commands over the network. See the Copying a Configuration File from a TFTP Server to the Switch (CLI) section for more information.

Configuration File Changes Using the CLI

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are *not* stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the `show running-config` or `more system:running-config` EXEC command. Comments are not displayed when you list the startup configuration with the `show startup-config` or `more nvram:startup-config` EXEC mode command. Comments are stripped out of the configuration file when it is loaded onto the switch.
However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them.

**Location of Configuration Files**

Configuration files are stored in the following locations:

- The running configuration is stored in RAM.
- On all platforms except the Class A Flash file system platforms, the startup configuration is stored in nonvolatile random-access memory (NVRAM).
- On Class A Flash file system platforms, the startup configuration is stored in the location specified by the CONFIG_FILE environment variable (see the Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI) section). The CONFIG_FILE variable defaults to NVRAM and can be a file in the following file systems:
  - `nvram`: (NVRAM)
  - `bootflash`: (internal flash memory)
  - `usbflash0`: (flash file system)

**Copy Configuration Files from a Network Server to the Switch**

You can copy configuration files from a TFTP, rcp, or FTP server to the running configuration or startup configuration of the switch. You may want to perform this function for one of the following reasons:

- To restore a backed-up configuration file.
- To use the configuration file for another switch. For example, you may add another switch to your network and want it to have a similar configuration to the original switch. By copying the file to the new switch, you can change the relevant parts rather than recreating the whole file.
- To load the same configuration commands on to all of the switches in your network so that all of the switches have similar configurations.

The `copy {ftp: | rcp: | tftp:system:running-config} EXEC command loads the configuration files into the switch as if you were typing the commands on the command line. The switch does not erase the existing running configuration before adding the commands. If a command in the copied configuration file replaces a command in the existing configuration file, the existing command is erased. For example, if the copied configuration file contains a different IP address in a particular command than the existing configuration, the IP address in the copied configuration is used. However, some commands in the existing configuration may not be replaced or negated. In this case, the resulting configuration file is a mixture of the existing configuration file and the copied configuration file, with the copied configuration file having precedence.

To restore a configuration file to an exact copy of a file stored on a server, you need to copy the configuration file directly to the startup configuration (using the `copy ftp:| rcp:| tftp: nvram:startup-config` command) and reload the switch.

To copy configuration files from a server to a switch, perform the tasks described in the following sections.
The protocol that you use depends on which type of server you are using. The FTP and rcp transport mechanisms provide faster performance and more reliable delivery of data than TFTP. These improvements are possible because the FTP and rcp transport mechanisms are built on and use the TCP/IP stack, which is connection-oriented.

**Copying a Configuration File from the SwitchControllerDevice to a TFTP Server**

In some implementations of TFTP, you must create a dummy file on the TFTP server and give it read, write, and execute permissions before copying a file over it. Refer to your TFTP documentation for more information.

**Copying a Configuration File from the Switch to an RCP Server**

You can copy a configuration file from the switch to an RCP server.

One of the first attempts to use the network as a resource in the UNIX community resulted in the design and implementation of the remote shell protocol, which included the remote shell (rsh) and remote copy (rcp) functions. Rsh and rcp give users the ability to execute commands remotely and copy files to and from a file system residing on a remote host or server on the network. The Cisco implementation of rsh and rcp interoperates with standard implementations.

The rcp copy commands rely on the rsh server (or daemon) on the remote system. To copy files using rcp, you need not create a server for file distribution, as you do with TFTP. You need only to have access to a server that supports the remote shell (rsh). (Most UNIX systems support rsh.) Because you are copying a file from one place to another, you must have read permission on the source file and write permission on the destination file. If the destination file does not exist, rcp creates it for you.

Although the Cisco rcp implementation emulates the functions of the UNIX rcp implementation—copying files among systems on the network—the Cisco command syntax differs from the UNIX rcp command syntax. The Cisco rcp support offers a set of copy commands that use rcp as the transport mechanism. These rcp copy commands are similar in style to the Cisco TFTP copy commands, but they offer an alternative that provides faster performance and reliable delivery of data. These improvements are possible because the rcp transport mechanism is built on and uses the TCP/IP stack, which is connection-oriented. You can use rcp commands to copy system images and configuration files from the switch to a network server and vice versa.

You also can enable rcp support to allow users on remote systems to copy files to and from the switch.

To configure the Cisco IOS software to allow remote users to copy files to and from the switch, use the **ip rcmd rcp-enable** global configuration command.

**Restrictions**

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the switch to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the copy EXEC command, if a username is specified.

2. The username set by the **ip rcmd remote-username** global configuration command, if the command is configured.

3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the switch through Telnet and was authenticated through the **username** command, the switch software sends the Telnet username as the remote username.
The switch host name.

For the RCP copy request to execute successfully, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, you can specify that user name as the remote username.

Use the `ip rcmd remote-username` command to specify a username for all copies. (Rcmd is a UNIX routine used at the super-user level to execute commands on a remote machine using an authentication scheme based on reserved port numbers. Rcmd stands for "remote command"). Include the username in the `copy` command if you want to specify a username for that copy operation only.

If you are writing to the server, the RCP server must be properly configured to accept the RCP write request from the user on the switch. For UNIX systems, you must add an entry to the .rhosts file for the remote user on the RCP server. For example, suppose the switch contains the following configuration lines:

```
hostname SwitchControllerDevice1
ip rcmd remote-username User0
```

If the switch IP address translates to switch1.example.com, then the .rhosts file for User0 on the RCP server should contain the following line:

```
SwitchControllerDevice1.example.com SwitchControllerDevice1
```

**Requirements for the RCP Username**

The RCP protocol requires a client to send a remote username on each RCP request to a server. When you copy a configuration file from the switch to a server using RCP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the `copy` EXEC command, if a username is specified.
2. The username set by the `ip rcmd remote-username` global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the switch through Telnet and is authenticated through the `username` command, the switch software sends the Telnet username as the remote username.
4. The switch host name.

For the RCP copy request to execute, an account must be defined on the network server for the remote username. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your RCP server for more information.

**Copying a Configuration File from the Switch to an FTP Server**

You can copy a configuration file from the switch to an FTP server.
Understanding the FTP Username and Password

The FTP protocol requires a client to send a remote username and password on each FTP request to a server. When you copy a configuration file from the switch to a server using FTP, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The username specified in the `copy` EXEC command, if a username is specified.
2. The username set by the `ip ftp username` global configuration command, if the command is configured.
3. Anonymous.

The switch sends the first valid password it encounters in the following sequence:

1. The password specified in the `copy` command, if a password is specified.
2. The password set by the `ip ftp password` command, if the command is configured.
3. The switch forms a password `username@switchname.domain`. The variable `username` is the username associated with the current session, `switchname` is the configured host name, and `domain` is the domain of the switch.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the switch. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more information.

Use the `ip ftp username` and `ip ftp password` global configuration commands to specify a username and password for all copies. Include the username in the `copy` EXEC command if you want to specify a username for that copy operation only.

Configuration Files Larger than NVRAM

To maintain a configuration file that exceeds the size of NVRAM, you should be aware of the information in the following sections.

Compressing the Configuration File

The `service compress-config` global configuration command specifies that the configuration file be stored compressed in NVRAM. Once the configuration file has been compressed, the switch functions normally. When the system is booted, it recognizes that the configuration file is compressed, expands it, and proceeds normally. The `more nvram:startup-config` EXEC command expands the configuration before displaying it.

Before you compress configuration files, refer to the appropriate hardware installation and maintenance publication. Verify that your system’s ROMs support file compression. If not, you can install new ROMs that support file compression.

The size of the configuration must not exceed three times the NVRAM size. For a 128-KB size NVRAM, the largest expanded configuration file size is 384 KB.
The `service compress-config` global configuration command works only if you have Cisco IOS software Release 10.0 or later release boot ROMs. Installing new ROMs is a one-time operation and is necessary only if you do not already have Cisco IOS Release 10.0 in ROM. If the boot ROMs do not recognize a compressed configuration, the following message is displayed:

```
Boot ROMs do not support NVRAM compression Config NOT written to NVRAM
```

### Storing the Configuration in Flash Memory on Class A Flash File Systems

On class A Flash file system switches, you can store the startup configuration in flash memory by setting the `CONFIG_FILE` environment variable to a file in internal flash memory or flash memory in a PCMCIA slot.

See the Specifying the `CONFIG_FILE` Environment Variable on Class A Flash File Systems (CLI) section for more information.

Care must be taken when editing or changing a large configuration. Flash memory space is used every time a `copy system:running-config nvram:startup-config` EXEC command is issued. Because file management for flash memory (such as optimizing free space) is not done automatically, you must pay close attention to available flash memory. Use the `squeeze` command to reclaim used space. We recommend that you use a large-capacity Flash card of at least 20 MB.

### Loading the Configuration Commands from the Network

You can also store large configurations on FTP, RCP, or TFTP servers and download them at system startup. To use a network server to store large configurations, see the Copying a Configuration File from the SwitchControllerDevice to a TFTP Server (CLI) and Configuring the Switch to Download Configuration Files sections for more information on these commands.

### Configuring the Switch to Download Configuration Files

You can configure the switch to load one or two configuration files at system startup. The configuration files are loaded into memory and read in as if you were typing the commands at the command line. Thus, the configuration for the switch is a mixture of the original startup configuration and the one or two downloaded configuration files.

### Network Versus Host Configuration Files

For historical reasons, the first file the switch downloads is called the network configuration file. The second file the switch downloads is called the host configuration file. Two configuration files can be used when all of the switches on a network use many of the same commands. The network configuration file contains the standard commands used to configure all of the switches. The host configuration files contain the commands specific to one particular host. If you are loading two configuration files, the host configuration file should be the configuration file you want to have precedence over the other file. Both the network and host configuration files must reside on a network server reachable via TFTP, RCP, or FTP, and must be readable.
How to Manage Configuration File Information

Displaying Configuration File Information (CLI)

To display information about configuration files, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
2. show boot
3. more file-url
4. show running-config
5. show startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

  • Enter your password if prompted.

  Example:
  
  SwitchControllerDevice> enable

<table>
<thead>
<tr>
<th>Step 2</th>
<th>show boot</th>
<th>Lists the contents of the BOOT environment variable (if set), the name of</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>the configuration file pointed to by the CONFIG_FILE environment</td>
</tr>
<tr>
<td></td>
<td></td>
<td>variable, and the contents of the BOOTLDR environment variable.</td>
</tr>
</tbody>
</table>

  Example:
  
  SwitchControllerDevice# show boot

| Step 3 | more file-url               | Displays the contents of a specified file.                             |

  Example:
  
  SwitchControllerDevice# more 10.1.1.1

<table>
<thead>
<tr>
<th>Step 4</th>
<th>show running-config</th>
<th>Displays the contents of the running configuration file. (Command alias</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>for the <code>more system:running-config</code> command.)</td>
</tr>
</tbody>
</table>

  Example:
  
  SwitchControllerDevice# show running-config

<table>
<thead>
<tr>
<th>Step 5</th>
<th>show startup-config</th>
<th>Displays the contents of the startup configuration file. (Command alias</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>for the <code>more nvram:startup-config</code> command.)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>On all platforms except the Class A Flash file system platforms, the default</td>
</tr>
<tr>
<td></td>
<td></td>
<td>startup-config file usually is stored in NVRAM.</td>
</tr>
</tbody>
</table>
Modifying the Configuration File (CLI)

The Cisco IOS software accepts one configuration command per line. You can enter as many configuration commands as you want. You can add comments to a configuration file describing the commands you have entered. Precede a comment with an exclamation point (!). Because comments are not stored in NVRAM or in the active copy of the configuration file, comments do not appear when you list the active configuration with the `show running-config` or `more system:running-config` EXEC commands. Comments do not display when you list the startup configuration with the `show startup-config` or `more nvram:startup-config` EXEC mode commands. Comments are stripped out of the configuration file when it is loaded onto the switch.

However, you can list the comments in configuration files stored on a File Transfer Protocol (FTP), Remote Copy Protocol (RCP), or Trivial File Transfer Protocol (TFTP) server. When you configure the software using the CLI, the software executes the commands as you enter them. To configure the software using the CLI, use the following commands in privileged EXEC mode:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `configuration command`
4. Do one of the following:
   - `end`
   - `^Z`
5. `copy system:running-config nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
</tbody>
</table>

Example:

```bash
SwitchControllerDevice> enable
```

• Enter your password if prompted.
<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configuration command</td>
<td>Enter the necessary configuration commands. The Cisco IOS documentation set describes configuration commands organized by technology.</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# configuration command</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Do one of the following:</td>
<td>Ends the configuration session and exits to EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• end</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• ^Z</td>
<td>Note: When you press the Ctrl and Z keys simultaneously, ^Z is displayed to the screen.</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# end</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>copy system:running-config nvram:startup-config</td>
<td>Saves the running configuration file as the startup configuration file. You may also use the copy running-config startup-config command alias, but you should be aware that this command is less precise. On most platforms, this command saves the configuration to NVRAM. On the Class A Flash file system platforms, this step saves the configuration to the location specified by the CONFIG_FILE environment variable (the default CONFIG_FILE variable specifies that the file should be saved to NVRAM).</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice# copy system:running-config nvram:startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

In the following example, the switch prompt name of the switch is configured. The comment line, indicated by the exclamation mark (!), does not execute any command. The hostname command is used to change the switch name from switch to new_name. By pressing Ctrl-Z (^Z) or entering the end command, the user quits configuration mode. The copy system:running-config nvram:startup-config command saves the current configuration to the startup configuration.

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# !The following command provides the switch host name.
SwitchControllerDevice(config)# hostname new_name
new_name(config)# end
new_name# copy system:running-config nvram:startup-config
```
When the startup configuration is NVRAM, it stores the current configuration information in text format as configuration commands, recording only non-default settings. The memory is checksummed to guard against corrupted data.

Note
Some specific commands might not get saved to NVRAM. You need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a list of these settings so that you can quickly reconfigure your switch after rebooting.

Copying a Configuration File from the SwitchControllerDevice to a TFTP Server (CLI)

To copy configuration information on a TFTP network server, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `copy system:running-config tftp: [[[//location ]/directory ]/filename ]`
3. `copy nvram:startup-config tftp: [[[//location ]/directory ]/filename ]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>copy system:running-config tftp: [[[//location ]/directory ]/filename ]</code></td>
<td>Copies the running configuration file to a TFTP server.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice# copy system:running-config tftp: //server1/topdir/file10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>copy nvram:startup-config tftp: [[[//location ]/directory ]/filename ]</code></td>
<td>Copies the startup configuration file to a TFTP server.</td>

<tr>
<td>SwitchControllerDevice# copy nvram:startup-config tftp: //server1/1stdir/file10</td>
<td></td>
</tr>
</tbody>
</table>
Examples
The following example copies a configuration file from a switch to a TFTP server:

SwitchControllerDevice# copy system:running-config tftp://172.16.2.155/tokyo-config
Write file tokyo-config on host 172.16.2.155? [confirm] Y
Writing tokyo-config!!! [OK]

What to Do Next
After you have issued the copy command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the copy command and the current setting of the file prompt global configuration command.

Copying a Configuration File from the SwitchControllerDevice to an RCP Server (CLI)
To copy a startup configuration file or a running configuration file from the switch to an RCP server, use the following commands beginning in privileged EXEC mode:

SUMMARY STEPS
1. enable
2. configure terminal
3. ip rcmd remote-username username
4. end
5. Do one of the following:
   • copy system:running-config rcp: [///[username@]location ]directory ]filename ]
   • copy nvram:startup-config rcp: [///[username@]location ]directory ]filename ]

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SwitchControllerDevice&gt; enable</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>SwitchControllerDevice# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>
### Step 3

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip rcmd remote-username <em>username</em></td>
<td>(Optional) Changes the default remote username.</td>
</tr>
</tbody>
</table>

**Example:**

SwitchControllerDevice(config)# ip rcmd remote-username NetAdmin1

---

### Step 4

**Example:**

SwitchControllerDevice(config)# end

---

### Step 5

**Do one of the following:**

- **copy system:running-config rcp:**
  ```
  [[[username@]location ]directory ]filename ]
  ```

- **copy nvram:startup-config rcp:**
  ```
  [[[username@]location ]directory ]filename ]
  ```

**Example:**

SwitchControllerDevice# copy system:running-config rcp: //NetAdmin1@example.com/dir-files/file1

---

### Examples

#### Storing a Running Configuration File on an RCP Server

The following example copies the running configuration file named runfile2-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

SwitchControllerDevice# copy system:running-config rcp://netadmin1@172.16.101.101/runfile2-config
Write file runfile2-config on host 172.16.101.101? [confirm]
Building configuration... [OK]
Connected to 172.16.101.101
SwitchControllerDevice#

#### Storing a Startup Configuration File on an RCP Server

The following example shows how to store a startup configuration file on a server by using RCP to copy the file:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ip rcmd remote-username netadmin2
SwitchControllerDevice(config)# end
SwitchControllerDevice# copy nvram:startup-config rcp:
Remote host[]? 172.16.101.101
Name of configuration file to write [start-config]?
Write file start-config on host 172.16.101.101?[confirm]
! [OK]

What to Do Next

After you have issued the copy EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the copy command and the current setting of the file prompt global configuration command.

Copying a Configuration File from the Switch to the FTP Server (CLI)

To copy a startup configuration file or a running configuration file from the switch to an FTP server, complete the following tasks:

**SUMMARY STEPS**

1. enable
2. configure terminal
3. ip ftp username username
4. ip ftp password password
5. end
6. Do one of the following:
   - copy system:running-config ftp: [///[username :password @]location]/directory ]/filename ]
   - or
   - copy nvram:startup-config ftp: [///[username :password @]location]/directory ]/filename ]

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | enable | Enables privileged EXEC mode.  
| Example: | SwitchControllerDevice> enable |  
| | configure terminal | Enters global configuration mode on the switch. |
| Example: | SwitchControllerDevice# configure terminal |
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 3</strong></td>
<td>ip ftp username <em>username</em></td>
</tr>
<tr>
<td>Optional</td>
<td>Specifies the default remote username.</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# ip ftp username NetAdmin1</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>ip ftp password <em>password</em></td>
</tr>
<tr>
<td>Optional</td>
<td>Specifies the default password.</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# ip ftp password adminpassword</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>end</td>
</tr>
<tr>
<td>Optional</td>
<td>Exits global configuration mode. This step is required only if you override the default remote username or password (see Steps 2 and 3).</td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# end</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>Do one of the following:</td>
</tr>
<tr>
<td>• copy system:running-config ftp: [[[//username [::password ]@]location][directory ][filename ]</td>
<td>Copies the running configuration or startup configuration file to the specified location on the FTP server.</td>
</tr>
<tr>
<td>• copy nvram:startup-config ftp: [[[//username [::password ]@]location][directory ][filename ]</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>SwitchControllerDevice# copy system:running-config ftp:</td>
</tr>
</tbody>
</table>

### Examples

**Storing a Running Configuration File on an FTP Server**

The following example copies the running configuration file named runfile-config to the netadmin1 directory on the remote host with an IP address of 172.16.101.101:

```
SwitchControllerDevice# copy system:running-config ftp://netadmin1:mypass@172.16.101.101/runfile-config
Write file runfile-config on host 172.16.101.101?[confirm] Building configuration...[OK]
Connected to 172.16.101.101
SwitchControllerDevice#
```
Storing a Startup Configuration File on an FTP Server

The following example shows how to store a startup configuration file on a server by using FTP to copy the file:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ip ftp username netadmin2
SwitchControllerDevice(config)# ip ftp password mypass
SwitchControllerDevice(config)# end
SwitchControllerDevice# copy nvram:startup-config ftp:
Remote host[]? 172.16.101.101
Name of configuration file to write [start-config]? Write file start-config on host 172.16.101.101?[confirm]
! [OK]

What to Do Next

After you have issued the copy EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the copy command and the current setting of the file prompt global configuration command.

Copying a Configuration File from a TFTP Server to the Switch (CLI)

To copy a configuration file from a TFTP server to the switch, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
2. copy tftp: [[///location]/directory]/filename system:running-config
3. copy tftp: [[///location]/directory]/filename nvram:startup-config
4. copy tftp: [[///location]/directory]/filename[flash-[n]:/directory/startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>
Step 2: Copy a configuration file from a TFTP server to the running configuration.

**Example:**
```
SwitchControllerDevice# copy tftp://server1/dir10/datasource system:running-config
```

Step 3: Copy a configuration file from a TFTP server to the startup configuration.

**Example:**
```
SwitchControllerDevice# copy tftp://server1/dir10/datasource nvram:startup-config
```

Step 4: Copy a configuration file from a TFTP server to the startup configuration.

**Example:**
```
SwitchControllerDevice# copy tftp://server1/dir10/datasource flash:[n]:/directory/startup-config
```

**Examples**

In the following example, the software is configured from the file named tokyo-confg at IP address 172.16.2.155:

```
SwitchControllerDevice# copy tftp://172.16.2.155/tokyo-confg system:running-config
Configure using tokyo-confg from 172.16.2.155? [confirm] Y
Booting tokyo-confg from 172.16.2.155:!!! [OK - 874/16000 bytes]
```

**What to Do Next**

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

**Copying a Configuration File from the rcp Server to the Switch (CLI)**

To copy a configuration file from an rcp server to the running configuration or startup configuration, complete the following tasks:
### SUMMARY STEPS

1. enable
2. configure terminal
3. ip rcmd remote-username <username>
4. end
5. Do one of the following:
   - `copy rcp://[username@]location/directory/filename]system:running-config`
   - `copy rcp://[username@]location/directory/filename]nvram:startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>SwitchControllerDevice&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>(Optional) Enters configuration mode from the terminal. This step is required only if you override the default remote username (see Step 3).</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>SwitchControllerDevice# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> ip rcmd remote-username &lt;username&gt;</td>
<td>(Optional) Specifies the remote username.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>SwitchControllerDevice(config)# ip rcmd remote-username NetAdmin1</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> end</td>
<td>(Optional) Exits global configuration mode. This step is required only if you override the default remote username (see Step 2).</td>

<td></td>
</tr>
<tr>
<td><code>SwitchControllerDevice(config)# end</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> Do one of the following:</td>
<td>Copies the configuration file from an rcp server to the running configuration or startup configuration.</td>
</tr>
<tr>
<td>- <code>copy rcp://[username@]location/directory/filename]system:running-config</code></td>
<td></td>
</tr>
<tr>
<td>- <code>copy rcp://[username@]location/directory/filename]nvram:startup-config</code></td>
<td></td>
</tr>
</tbody>
</table>
### Examples

#### Copy RCP Running-Config

The following example copies a configuration file named host1-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the switch:

```
SwitchControllerDevice# copy rcp://netadmin1@172.16.101.101/host1-config system:running-config
Connected to 172.16.101.101
Loading 1112 byte file host1-config: ![OK]
```

#### Copy RCP Startup-Config

The following example specifies a remote username of netadmin1. Then it copies the configuration file named host2-config from the netadmin1 directory on the remote server with an IP address of 172.16.101.101 to the startup configuration.

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ip rcmd remote-username netadmin1
SwitchControllerDevice(config)# end
SwitchControllerDevice# copy rcp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file[rtr2-config]? host2-config
Configure using host2-config from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config: ![OK]
```

### What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.
Copying a Configuration File from an FTP Server to the Switch (CLI)

To copy a configuration file from an FTP server to the running configuration or startup configuration, complete the tasks in this section:

SUMMARY STEPS

1. enable
2. configure terminal
3. ip ftp username username
4. ip ftp password password
5. end
6. Do one of the following:

DETAILED STEPS

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>
### Purpose

Command or Action | Purpose
--- | ---

**Step 5**

| end | (Optional) Exits global configuration mode. This step is required only if you override the default remote username or password (see Steps 3 and 4). |

**Example:**

```
SwitchControllerDevice(config)# end
```

**Step 6**

<table>
<thead>
<tr>
<th>Do one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>copy ftp:</strong></td>
</tr>
</tbody>
</table>
| ```
//[username]:password@location/directory
filename
``` |
| **copy ftp:** | |
| ```
//[username]:password@location/directory
filename
``` |

**Example:**

```
SwitchControllerDevice# copy ftp:nvram:startup-config
```

### Examples

#### Copy FTP Running-Config

The following example copies a host configuration file named `host1-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101, and loads and runs the commands on the switch:

```
SwitchControllerDevice# copy ftp://netadmin1:mypass@172.16.101.101/host1-config system:running-config
Configure using host1-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-config:![OK]
SwitchControllerDevice#
%SYS-5-CONFIG: Configured from host1-config by ftp from 172.16.101.101
```

#### Copy FTP Startup-Config

The following example specifies a remote username of `netadmin1`. Then it copies the configuration file named `host2-config` from the `netadmin1` directory on the remote server with an IP address of 172.16.101.101 to the startup configuration:

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# ip ftp username netadmin1
SwitchControllerDevice(config)# ip ftp password mypass
SwitchControllerDevice(config)# end
SwitchControllerDevice# copy ftp: nvram:startup-config
Address of remote host [255.255.255.255]? 172.16.101.101
Name of configuration file(host1-config)? host2-config
Configure using host2-config from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host2-config: ![OK]
```
What to Do Next

After you have issued the `copy` EXEC command, you may be prompted for additional information or for confirmation of the action. The prompt displayed depends on how much information you provide in the `copy` command and the current setting of the `file prompt` global configuration command.

Maintaining Configuration Files Larger than NVRAM

To maintain a configuration file that exceeds the size of NVRAM, perform the tasks described in the following sections:

Compressing the Configuration File (CLI)

To compress configuration files, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `service compress-config`
4. `end`
5. Do one of the following:
   - Use FTP, RCP, or TFTP to copy the new configuration.
   - `configure terminal`
6. `copy system:running-config nvram:startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>

</tr>
<tr>
<td>SwitchControllerDevice(config)# copy system:running-config nvram:startup-config</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Examples**

The following example compresses a 129-KB configuration file to 11 KB:

SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# service compress-config
SwitchControllerDevice(config)# end
SwitchControllerDevice# copy tftp://172.16.2.15/tokyo-config system:running-config
Configure using tokyo-config from 172.16.2.155? [confirm] y
Booting tokyo-config from 172.16.2.155:!!! [OK - 874/16000 bytes]
SwitchControllerDevice# copy system:running-config nvram:startup-config
Building configuration...
Compressing configuration from 129648 bytes to 11077 bytes [OK]
Storing the Configuration in Flash Memory on Class A Flash File Systems (CLI)

To store the startup configuration in flash memory, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
2. copy nvram:startup-config flash-filesystem:filename
3. configure terminal
4. boot config flash-filesystem: filename
5. end
6. Do one of the following:
   - Use FTP, RCP, or TFTP to copy the new configuration. If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed: “[buffer overflow - file-size / buffer-size bytes].”
   - configure terminal
7. copy system:running-config nvram:startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>SwitchControllerDevice&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Copies the current startup configuration to the new location to create the configuration file.</td>
</tr>
<tr>
<td>copy nvram:startup-config flash-filesystem:filename</td>

<tr>
<td>Example:</td>
<td>SwitchControllerDevice(config)# boot config usbflash0:switch-config</td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
---|---
**Step 5** | end
Example:
SwitchControllerDevice(config)# end
Exits global configuration mode.

**Step 6** | Do one of the following:
- Use FTP, RCP, or TFTP to copy the new configuration. If you try to load a configuration that is more than three times larger than the NVRAM size, the following error message is displayed: "[buffer overflow - file-size /buffer-size bytes]."
- configure terminal
Example:
SwitchControllerDevice# configure terminal
Enters the new configuration.

**Step 7** | copy system:running-config nvram:startup-config
Example:
SwitchControllerDevice(config)# copy system:running-config nvram:startup-config
When you have finished changing the running-configuration, save the new configuration.

### Examples
The following example stores the configuration file in usbflash0:

```
SwitchControllerDevice# copy nvram:startup-config usbflash0:switch-config
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# boot config usbflash0:switch-config
SwitchControllerDevice(config)# end
SwitchControllerDevice# copy system:running-config nvram:startup-config
```

### Loading the Configuration Commands from the Network (CLI)
To use a network server to store large configurations, complete the tasks in this section:
SUMMARY STEPS

1. enable
2. copy system:running-config {ftp: | rcp: | tftp:}
3. configure terminal
4. boot network {ftp:[[[//username [password ]@]location ]/directory ]/filename ] | rcp:[[[//username@]location ]/directory ]/filename ] | tftp:[[[//location ]/directory ]/filename ]}
5. service config
6. end
7. copy system:running-config nvram:startup-config

<tr>
<td>SwitchControllerDevice&gt; enable</td>
<td>Enter your password if prompted.</td>
</tr>
</tbody>
</table>

| **Step 2**        |         |
| Do one of the following: |         |
| - `copy filesystem: [partition-number]:[filename] nvram:startup-config` | Loads a configuration file directly into NVRAM or |
| - `copy filesystem: [partition-number]:[filename] system:running-config` | Copies a configuration file to your running configuration |
Copying Configuration Files Between Flash Memory File Systems (CLI)

On platforms with multiple flash memory file systems, you can copy files from one flash memory file system, such as internal flash memory to another flash memory file system. Copying files to different flash memory file systems lets you create backup copies of working configurations and duplicate configurations for other switches. To copy a configuration file between flash memory file systems, use the following commands in EXEC mode:

**SUMMARY STEPS**

1. `enable`
2. `show source-filesystem:
3. `copy source-filesystem: [partition-number:]filename ] dest-filesystem:[partition-number:]filename ]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>show source-filesystem: </code></td>
<td>Displays the layout and contents of flash memory to verify the filename.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice# show flash:</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following example copies the file named `ios-upgrade-1` from partition 4 of the flash memory PC Card in `usbflash0` to the switch startup configurations:

SwitchControllerDevice# copy usbflash0:4:ios-upgrade-1 nvram:startup-config
Copy 'ios-upgrade-1' from flash device as 'startup-config' ? [yes/no] yes
[OK]
Managing Configuration Files

Copying a Configuration File from an FTP Server to Flash Memory Devices (CLI)

To copy a configuration file from an FTP server to a flash memory device, complete the task in this section:
### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `ip ftp username username`
4. `ip ftp password password`
5. `end`
6. `copy ftp: [[//location]/directory]/bundle_name flash:

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice&gt; enable</td>
<td>• Enter your password if prompted.</td>

</tbody>
</table>

---

### Copying a Configuration File from a TFTP Server to Flash Memory Devices (CLI)

To copy a configuration file from a TFTP server to a flash memory device, complete the tasks in this section:

**SUMMARY STEPS**

1. `enable`
2. `copy tftp: [[[//location] [directory] /bundle_name] flash:`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice&gt; <code>enable</code></td>
<td></td>
</tr>
</tbody>
</table>

| **Step 2**        | Copies the file from a TFTP server to the flash memory device. Reply to any switch prompts for additional information or confirmation. Prompting depends on how much information you provide in the `copy` command and the current setting of the `file prompt` command. |
| `copy tftp: [[[//location] [directory] /bundle_name] flash:` |         |
| Example:          |         |
| SwitchControllerDevice# `copy tftp://cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:` |         |
Examples

The following example shows the copying of the configuration file named switch-config from a TFTP server to the flash memory card inserted in usbflash0. The copied file is renamed new-config.

SwitchControllerDevice#
copy tftp:switch-config usbflash0:new-config

Re-executing the Configuration Commands in the Startup Configuration File (CLI)

To re-execute the commands located in the startup configuration file, complete the task in this section:

SUMMARY STEPS

1. enable
2. configure memory

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>SwitchControllerDevice&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2 configure memory</td>
<td>Re-executes the configuration commands located in the startup configuration file.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>SwitchControllerDevice# configure memory</td>
<td></td>
</tr>
</tbody>
</table>

Clearing the Startup Configuration (CLI)

You can clear the configuration information from the startup configuration. If you reboot the switch with no startup configuration, the switch enters the Setup command facility so that you can configure the switch from scratch. To clear the contents of your startup configuration, complete the task in this section:
SUMMARY STEPS

1. enable
2. erase nvram

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Example:** | |
| SwitchControllerDevice> enable | |

| **Step 2** erase nvram | Clears the contents of your startup configuration. |
| **Example:** | For all platforms except the Class A Flash file system platforms, this command erases NVRAM. The startup configuration file cannot be restored once it has been deleted. On Class A Flash file system platforms, when you use the erase startup-config EXEC command, the switch erases or deletes the configuration pointed to by the CONFIG_FILE environment variable. If this variable points to NVRAM, the switch erases NVRAM. If the CONFIG_FILE environment variable specifies a flash memory device and configuration filename, the switch deletes the configuration file. That is, the switch marks the file as "deleted," rather than erasing it. This feature allows you to recover a deleted file. |
| **SwitchControllerDevice# erase nvram** | |

Deleting a Specified Configuration File (CLI)

To delete a specified configuration on a specific flash device, complete the task in this section:

SUMMARY STEPS

1. enable
2. delete flash-filesystem:filename

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1** enable | Enables privileged EXEC mode.  
• Enter your password if prompted. |
| **Example:** | |
| SwitchControllerDevice> enable | |
Managing Configuration Files

### Specifying the CONFIG_FILE Environment Variable on Class A Flash File Systems (CLI)

On Class A flash file systems, you can configure the Cisco IOS software to load the startup configuration file specified by the CONFIG_FILE environment variable. The CONFIG_FILE variable defaults to NVRAM. To change the CONFIG_FILE environment variable, complete the tasks in this section:

**SUMMARY STEPS**

1. enable
3. configure terminal
4. boot config dest-flash-url
5. end
6. copy system:running-config nvram:startup-config
7. show boot

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> SwitchControllerDevice&gt; enable</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> copy [flash-url</td>
<td>ftp-url</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Example:**  
SwitchControllerDevice# `copy system:running-config nvram:startup-config` | **Step 3**  
configure terminal | Enters global configuration mode. |
| **Example:**  
SwitchControllerDevice# `configure terminal` | **Step 4**  
boot config *dest-flash-url* | Sets the CONFIG_FILE environment variable. This step modifies the runtime CONFIG_FILE environment variable. |
| **Example:**  
SwitchControllerDevice(config)# `boot config 172.16.1.1` | **Step 5**  
end | Exits global configuration mode. |
| **Example:**  
SwitchControllerDevice(config)# `end` | **Step 6**  
**copy system:running-config nvram:startup-config** | Saves the configuration performed in Step 3 to the startup configuration. |
| **Example:**  
SwitchControllerDevice# `copy system:running-config nvram:startup-config` | **Step 7**  
show boot | (Optional) Allows you to verify the contents of the CONFIG_FILE environment variable. |
| **Example:**  
SwitchControllerDevice# `show boot` |  |

### Examples

The following example copies the running configuration file to the switch. This configuration is then used as the startup configuration when the system is restarted:

```
SwitchControllerDevice# `copy system:running-config usbflash0:config2`
SwitchControllerDevice# `configure terminal`
SwitchControllerDevice(config)# `boot config usbflash0:config2`
SwitchControllerDevice(config)# `end`
SwitchControllerDevice# `copy system:running-config nvram:startup-config`
[ok]
SwitchControllerDevice# `show boot`
BOOT variable = usbflash0:rsp-boot-m
CONFIG_FILE variable = nvram:
```
What to Do Next

After you specify a location for the startup configuration file, the `nvram:startup-config` command is aliased to the new location of the startup configuration file. The `more nvram:startup-config` EXEC command displays the startup configuration, regardless of its location. The `erase nvram:startup-config` EXEC command erases the contents of NVRAM and deletes the file pointed to by the CONFIG_FILE environment variable.

When you save the configuration using the `copy system:running-config nvram:startup-config` command, the switch saves a complete version of the configuration file to the location specified by the CONFIG_FILE environment variable and a distilled version to NVRAM. A distilled version is one that does not contain access list information. If NVRAM contains a complete configuration file, the switch prompts you to confirm your overwrite of the complete version with the distilled version. If NVRAM contains a distilled configuration, the switch does not prompt you for confirmation and proceeds with overwriting the existing distilled configuration file in NVRAM.

Note

If you specify a file in a flash device as the CONFIG_FILE environment variable, every time you save your configuration file with the `copy system:running-config nvram:startup-config` command, the old configuration file is marked as "deleted," and the new configuration file is saved to that device. Eventually, Flash memory fills up as the old configuration files still take up memory. Use the `squeeze` EXEC command to permanently delete the old configuration files and reclaim the space.

Configuring the Switch to Download Configuration Files

You can specify an ordered list of network configuration and host configuration filenames. The Cisco IOS XE software scans this list until it loads the appropriate network or host configuration file.

To configure the switch to download configuration files at system startup, perform at least one of the tasks described in the following sections:

- Configuring the Switch to Download the Network Configuration File (CLI)
- Configuring the Switch to Download the Host Configuration File (CLI)

If the switch fails to load a configuration file during startup, it tries again every 10 minutes (the default setting) until a host provides the requested files. With each failed attempt, the switch displays the following message on the console terminal:

`Booting host-config... [timed out]

If there are any problems with the startup configuration file, or if the configuration register is set to ignore NVRAM, the switch enters the Setup command facility.

Configuring the Switch to Download the Network Configuration File (CLI)

To configure the Cisco IOS software to download a network configuration file from a server at startup, complete the tasks in this section:
SUMMARY STEPS

1. enable
2. configure terminal
3. boot network {ftp://[[username[:password]@]location[/directory/]filename] | rcp://[[username@]location[/directory/]filename] | tftp://[[location[/directory/]filename]}
4. service config
5. end
6. copy system:running-config nvram:startup-config

### Configuring the Switch to Download the Host Configuration File (CLI)

To configure the Cisco IOS software to download a host configuration file from a server at startup, complete the tasks in this section:

#### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `boot host {ftp://[[username [password ]@]location ]/directory ]/filename ] | rcp://[[username@]location ]/directory ]/filename ] | tftp://[[location ]/directory ]/filename ]`
4. `service config`
5. `end`
6. `copy system:running-config nvram:startup-config`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1 | `enable`          | Enables privileged EXEC mode.  
|        |                   | - Enter your password if prompted. |
|        | `configure terminal` | Enters global configuration mode. |
| Step 2 | `boot host {ftp://[[username [password ]@]location ]/directory ]/filename ] | rcp://[[username@]location ]/directory ]/filename ] | tftp://[[location ]/directory ]/filename ]` | Specifies the host configuration file to download at startup, and the protocol to be used (FTP, RCP, or TFTP):  
|        |                   | - If you do not specify a host configuration filename, the switch uses its own name to form a host configuration filename by... |
### Purpose

Converting the name to all lowercase letters, removing all domain information, and appending "-confg." If no host name information is available, the software uses the default host configuration filename switch-confg. If you omit the address, the switch uses the broadcast address.

- You can specify more than one host configuration file. The Cisco IOS software tries them in order entered until it loads one. This procedure can be useful for keeping files with different configuration information loaded on a network server.

### Step 4

**service config**

Enables the system to automatically load the host file upon restart.

**Example:**

```bash
SwitchControllerDevice(config)# service config
```

### Step 5

**end**

Exits global configuration mode.

**Example:**

```bash
SwitchControllerDevice(config)# end
```

### Step 6

**copy system:running-config nvram:startup-config**

Saves the running configuration to the startup configuration file.

**Example:**

```bash
SwitchControllerDevice# copy system:running-config nvram:startup-config
```

### Example

In the following example, a switch is configured to download the host configuration file named hostfile1 and the network configuration file named networkfile1. The switch uses TFTP and the broadcast address to obtain the file:

```bash
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)# boot host tftp:hostfile1
SwitchControllerDevice(config)# boot network tftp:networkfile1
SwitchControllerDevice(config)# service config
SwitchControllerDevice(config)# end
SwitchControllerDevice# copy system:running-config nvram:startup-config
```

Configuration Replace and Configuration Rollback

Prerequisites for Configuration Replace and Configuration Rollback

The format of the configuration files used as input by the Configuration Replace and Configuration Rollback feature must comply with standard Cisco software configuration file indentation rules as follows:

- Start all commands on a new line with no indentation, unless the command is within a configuration submode.
- Indent commands within a first-level configuration submode one space.
- Indent commands within a second-level configuration submode two spaces.
- Indent commands within subsequent submodes accordingly.

These indentation rules describe how the software creates configuration files for such commands as show running-config or copy running-config destination-url. Any configuration file generated on a Cisco device complies with these rules.

Free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration) is required.
Restrictions for Configuration Replace and Configuration Rollback

If the device does not have free memory larger than the combined size of the two configuration files (the current running configuration and the saved replacement configuration), the configuration replace operation is not performed.

Certain Cisco configuration commands such as those pertaining to physical components of a networking device (for example, physical interfaces) cannot be added or removed from the running configuration. For example, a configuration replace operation cannot remove the `interface ethernet 0` command line from the current running configuration if that interface is physically present on the device. Similarly, the `interface ethernet 1` command line cannot be added to the running configuration if no such interface is physically present on the device. A configuration replace operation that attempts to perform these types of changes results in error messages indicating that these specific command lines failed.

In very rare cases, certain Cisco configuration commands cannot be removed from the running configuration without reloading the device. A configuration replace operation that attempts to remove this type of command results in error messages indicating that these specific command lines failed.

Information About Configuration Replace and Configuration Rollback

Configuration Archive

The Cisco IOS configuration archive is intended to provide a mechanism to store, organize, and manage an archive of Cisco IOS configuration files to enhance the configuration rollback capability provided by the `configure replace` command. Before this feature was introduced, you could save copies of the running configuration using the `copy running-config destination-url` command, storing the replacement file either locally or remotely. However, this method lacked any automated file management. On the other hand, the Configuration Replace and Configuration Rollback feature provides the capability to automatically save copies of the running configuration to the Cisco IOS configuration archive. These archived files serve as checkpoint configuration references and can be used by the `configure replace` command to revert to previous configuration states.

The `archive config` command allows you to save Cisco IOS configurations in the configuration archive using a standard location and filename prefix that is automatically appended with an incremental version number (and optional timestamp) as each consecutive file is saved. This functionality provides a means for consistent identification of saved Cisco IOS configuration files. You can specify how many versions of the running configuration are kept in the archive. After the maximum number of files are saved in the archive, the oldest file is automatically deleted when the next, most recent file is saved. The `show archive` command displays information for all configuration files saved in the Cisco IOS configuration archive.

The Cisco IOS configuration archive, in which the configuration files are stored and available for use with the `configure replace` command, can be located on the following file systems: FTP, HTTP, RCP, TFTP.
Configuration Replace

The `configure replace` privileged EXEC command provides the capability to replace the current running configuration with any saved Cisco IOS configuration file. This functionality can be used to revert to a previous configuration state, effectively rolling back any configuration changes that were made since the previous configuration state was saved.

When using the `configure replace` command, you must specify a saved Cisco IOS configuration as the replacement configuration file for the current running configuration. The replacement file must be a complete configuration generated by a Cisco IOS device (for example, a configuration generated by the `copy running-config destination-url` command), or, if generated externally, the replacement file must comply with the format of files generated by Cisco IOS devices. When the `configure replace` command is entered, the current running configuration is compared with the specified replacement configuration and a set of diffs is generated. The algorithm used to compare the two files is the same as that employed by the `show archive config differences` command. The resulting diffs are then applied by the Cisco IOS parser to achieve the replacement configuration state. Only the diffs are applied, avoiding potential service disruption from reapplying configuration commands that already exist in the current running configuration. This algorithm effectively handles configuration changes to order-dependent commands (such as access lists) through a multiple pass process. Under normal circumstances, no more than three passes are needed to complete a configuration replace operation, and a limit of five passes is performed to preclude any looping behavior.

The Cisco IOS `copy source-url running-config` privileged EXEC command is often used to copy a stored Cisco IOS configuration file to the running configuration. When using the `copy source-url running-config` command as an alternative to the `configure replace target-url` privileged EXEC command, the following major differences should be noted:

- The `copy source-url running-config` command is a merge operation and preserves all of the commands from both the source file and the current running configuration. This command does not remove commands from the current running configuration that are not present in the source file. In contrast, the `configure replace target-url` command removes commands from the current running configuration that are not present in the replacement file and adds commands to the current running configuration that need to be added.

- The `copy source-url running-config` command applies every command in the source file, whether or not the command is already present in the current running configuration. This algorithm is inefficient and, in some cases, can result in service outages. In contrast, the `configure replace target-url` command only applies the commands that need to be applied—no existing commands in the current running configuration are reapplied.

- A partial configuration file may be used as the source file for the `copy source-url running-config` command, whereas a complete Cisco IOS configuration file must be used as the replacement file for the `configure replace target-url` command.

A locking feature for the configuration replace operation was introduced. When the `configure replace` command is used, the running configuration file is locked by default for the duration of the configuration replace operation. This locking mechanism prevents other users from changing the running configuration while the replacement operation is taking place, which might otherwise cause the replacement operation to terminate unsuccessfully. You can disable the locking of the running configuration by using the `no lock` keyword when issuing the `configure replace` command.

The running configuration lock is automatically cleared at the end of the configuration replace operation. You can display any locks that may be currently applied to the running configuration using the `show configuration lock` command.
Configuration Rollback

The concept of rollback comes from the transactional processing model common to database operations. In a database transaction, you might make a set of changes to a given database table. You then must choose whether to commit the changes (apply the changes permanently) or to roll back the changes (discard the changes and revert to the previous state of the table). In this context, rollback means that a journal file containing a log of the changes is discarded, and no changes are applied. The result of the rollback operation is to revert to the previous state, before any changes were applied.

The `configure replace` command allows you to revert to a previous configuration state, effectively rolling back changes that were made since the previous configuration state was saved. Instead of basing the rollback operation on a specific set of changes that were applied, the Cisco IOS configuration rollback capability uses the concept of reverting to a specific configuration state based on a saved Cisco IOS configuration file. This concept is similar to the database idea of saving a checkpoint (a saved version of the database) to preserve a specific state.

If the configuration rollback capability is desired, you must save the Cisco IOS running configuration before making any configuration changes. Then, after entering configuration changes, you can use that saved configuration file to roll back the changes (using the `configure replace` command). Furthermore, because you can specify any saved Cisco IOS configuration file as the replacement configuration, you are not limited to a fixed number of rollbacks, as is the case in some rollback models.

Configuration Rollback Confirmed Change

The Configuration Rollback Confirmed Change feature allows configuration changes to be performed with an optional requirement that they be confirmed. If this confirmation is not received, the configuration is returned to the state prior to the changes being applied. The mechanism provides a safeguard against inadvertent loss of connectivity between a network device and the user or management application due to configuration changes.

Benefits of Configuration Replace and Configuration Rollback

- Allows you to revert to a previous configuration state, effectively rolling back configuration changes.
- Allows you to replace the current running configuration file with the startup configuration file without having to reload the switch or manually undo CLI changes to the running configuration file, therefore reducing system downtime.
- Allows you to revert to any saved Cisco IOS configuration state.
- Simplifies configuration changes by allowing you to apply a complete configuration file to the switch, where only the commands that need to be added or removed are affected.
- When using the `configure replace` command as an alternative to the `copy source-url running-config` command, increases efficiency and prevents risk of service outages by not reapplying existing commands in the current running configuration.
How to Use Configuration Replace and Configuration Rollback

Creating a Configuration Archive (CLI)

No prerequisite configuration is needed to use the `configure replace` command. Using the `configure replace` command in conjunction with the Cisco IOS configuration archive and the `archive config` command is optional but offers significant benefit for configuration rollback scenarios. Before using the `archive config` command, the configuration archive must be configured. Perform this task to configure the characteristics of the configuration archive.

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `archive`
4. `path url`
5. `maximum number`
6. `time-period minutes`
7. `end`
8. `archive config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>SwitchControllerDevice&gt; enable</code></td>
<td>Enter your password if prompted.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>

</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>SwitchControllerDevice(config)# archive</code></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Step 4</th>
<th>path url</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the location and filename prefix for the files in the Cisco IOS configuration archive.</td>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config-archive)# path flash:myconfiguration</td>
</tr>
</tbody>
</table>

**Note** If a directory is specified in the path instead of file, the directory name must be followed by a forward slash as follows: path flash:/directory/. The forward slash is not necessary after a filename; it is only necessary when specifying a directory.

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Step 5</th>
<th>maximum number</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Sets the maximum number of archive files of the running configuration to be saved in the Cisco IOS configuration archive.</td>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config-archive)# maximum 14</td>
</tr>
</tbody>
</table>

**Note** Before using this command, you must configure the path command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Step 6</th>
<th>time-period minutes</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Optional) Sets the time increment for automatically saving an archive file of the current running configuration in the Cisco IOS configuration archive.</td>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice(config-archive)# time-period 1440</td>
</tr>
</tbody>
</table>

**Note** Before using this command, you must configure the path command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.

<table>
<thead>
<tr>
<th>Purpose</th>
<th>Step 7</th>
<th>end</th>
</tr>

<th>Purpose</th>
<th>Step 8</th>
<th>archive config</th>
</tr>
</thead>
<tbody>
<tr>
<td>Saves the current running configuration file to the configuration archive.</td>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice# archive config</td>
</tr>
</tbody>
</table>

**Note** The path command must be configured before using this command.

---

**Performing a Configuration Replace or Configuration Rollback Operation (CLI)**

Perform this task to replace the current running configuration file with a saved Cisco IOS configuration file.
You must create a configuration archive before performing this procedure. See Creating a Configuration Archive (CLI) for detailed steps. The following procedure details how to return to that archived configuration in the event of a problem with the current running configuration.

SUMMARY STEPS

1. enable
2. configure replace target-url [nolock] [list] [force] [ignore case] [revert trigger [error ]|time minutes] [time minutes]
3. configure revert { now | timer {minutes | idle minutes} }
4. configure confirm
5. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice&gt; enable</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td>Step 2 configure replace target-url [nolock] [list] [force] [ignore case] [revert trigger [error ]</td>
<td>time minutes]</td>
</tr>
<tr>
<td>Example: SwitchControllerDevice# configure replace flash: startup-config time 120</td>
<td>• The target-url argument is a URL (accessible by the Cisco IOS file system) of the saved Cisco IOS configuration file that is to replace the current running configuration, such as the configuration file created using the archive config command.</td>
</tr>
<tr>
<td></td>
<td>• The list keyword displays a list of the command lines applied by the Cisco IOS software parser during each pass of the configuration replace operation. The total number of passes performed is also displayed.</td>
</tr>
<tr>
<td></td>
<td>• The force keyword replaces the current running configuration file with the specified saved Cisco IOS configuration file without prompting you for confirmation.</td>
</tr>
<tr>
<td></td>
<td>• The time minutes keyword and argument specify the time (in minutes) within which you must enter the configure confirm command to confirm replacement of the current running configuration file. If the configure confirm command is not entered within the specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the configure replace command).</td>
</tr>
<tr>
<td></td>
<td>• The nolock keyword disables the locking of the running configuration file that prevents other users from changing the running configuration during a configuration replace operation.</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td><strong>configure revert</strong> { now</td>
<td>timer {minutes</td>

<td>Example:</td>
</tr>
<tr>
<td>SwitchControllerDevice# configure revert now</td>
<td>SwitchControllerDevice# configure confirm</td>
</tr>
</tbody>
</table>

**Monitoring and Troubleshooting the Feature (CLI)**

Perform this task to monitor and troubleshoot the Configuration Replace and Configuration Rollback feature.
SUMMARY STEPS

1. enable
2. show archive
3. debug archive versioning
4. debug archive config timestamp
5. exit

DETAILED STEPS

Step 1  enable
Use this command to enable privileged EXEC mode. Enter your password if prompted.

Example:
SwitchControllerDevice> enable
SwitchControllerDevice#

Step 2  show archive
Use this command to display information about the files saved in the Cisco IOS configuration archive.

Example:
SwitchControllerDevice# show archive
There are currently 1 archive configurations saved.
The next archive file will be named flash:myconfiguration-2
Archive # Name
0
1  flash:myconfiguration-1 <- Most Recent
2
3
4
5
6
7
8
9
10
11
12
13
14

The following is sample output from the show archive command after several archive files of the running configuration have been saved. In this example, the maximum number of archive files to be saved is set to three.

Example:
SwitchControllerDevice# show archive
There are currently 3 archive configurations saved.
The next archive file will be named flash:myconfiguration-8
Archive # Name
0
1  :Deleted
2  :Deleted
3  :Deleted
4  :Deleted
**Step 3** debug archive versioning
Use this command to enable debugging of the Cisco IOS configuration archive activities to help monitor and troubleshoot configuration replace and rollback.

**Example:**

```
SwitchControllerDevice# debug archive versioning
Jan 9 06:46:28.419:backup_running_config
Jan 9 06:46:28.419:Current = 7
Jan 9 06:46:28.443:Writing backup file flash:myconfiguration-7
Jan 9 06:46:29.547: backup worked
```

**Step 4** debug archive config timestamp
Use this command to enable debugging of the processing time for each integral step of a configuration replace operation and the size of the configuration files being handled.

**Example:**

```
SwitchControllerDevice# debug archive config timestamp
SwitchControllerDevice# configure replace flash:myconfiguration force
Timing Debug Statistics for IOS Config Replace operation:
  Time to read file usbflash0:sample_2.cfg = 0 msec (0 sec)
  Number of lines read:55
  Size of file :1054
Starting Pass 1
  Time to read file system:running-config = 0 msec (0 sec)
  Number of lines read:93
  Size of file :2539
  Time taken for positive rollback pass = 320 msec (0 sec)
  Time taken for negative rollback pass = 0 msec (0 sec)
  Time taken for negative incremental diffs pass = 59 msec (0 sec)
  Time taken by PI to apply changes = 0 msec (0 sec)
  Time taken for Pass 1 = 380 msec (0 sec)
Starting Pass 2
  Time to read file system:running-config = 0 msec (0 sec)
  Number of lines read:55
  Size of file :1054
  Time taken for positive rollback pass = 0 msec (0 sec)
  Time taken for negative rollback pass = 0 msec (0 sec)
  Time taken for Pass 2 = 0 msec (0 sec)
Total number of passes:1
Rollback Done
```

**Step 5** exit
Use this command to exit to user EXEC mode.

**Example:**

```
SwitchControllerDevice# exit
SwitchControllerDevice>
```

---
Configuration Examples for Configuration Replace and Configuration Rollback

Creating a Configuration Archive

The following example shows how to perform the initial configuration of the Cisco IOS configuration archive. In this example, flash:myconfiguration is specified as the location and filename prefix for the files in the configuration archive and a value of 10 is set as the maximum number of archive files to be saved.

```
configure terminal
!
archive
    path flash:myconfiguration
    maximum 10
end
```

Replacing the Current Running Configuration with a Saved Cisco IOS Configuration File

The following example shows how to replace the current running configuration with a saved Cisco IOS configuration file named flash:myconfiguration. The `configure replace` command interactively prompts you to confirm the operation.

```
SwitchControllerDevice# configure replace flash:myconfiguration
This will apply all necessary additions and deletions
to replace the current running configuration with the
contents of the specified configuration file, which is
assumed to be a complete configuration, not a partial
configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
```

In the following example, the `list` keyword is specified in order to display the command lines that were applied during the configuration replace operation:

```
SwitchControllerDevice# configure replace flash:myconfiguration list
This will apply all necessary additions and deletions
to replace the current running configuration with the
contents of the specified configuration file, which is
assumed to be a complete configuration, not a partial
configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
!Pass 1
!List of Commands:
no snmp-server community public ro
snmp-server community mystring ro
end
Total number of passes: 1
Rollback Done
```
Reverting to the Startup Configuration File

The following example shows how to revert to the Cisco IOS startup configuration file using the `configure replace` command. This example also shows the use of the optional `force` keyword to override the interactive user prompt:

```
SwitchControllerDevice# configure replace flash:startup-config force
Total number of passes: 1
Rollback Done
```

Performing a Configuration Replace Operation with the `configure confirm` Command

The following example shows the use of the `configure replace` command with the `time minutes` keyword and argument. You must enter the `configure confirm` command within the specified time limit to confirm replacement of the current running configuration file. If the `configure confirm` command is not entered within the specified time limit, the configuration replace operation is automatically reversed (in other words, the current running configuration file is restored to the configuration state that existed prior to entering the `configure replace` command).

```
SwitchControllerDevice# configure replace flash:startup-config time 120
This will apply all necessary additions and deletions
to replace the current running configuration with the
contents of the specified configuration file, which is
assumed to be a complete configuration, not a partial
configuration. Enter Y if you are sure you want to proceed. ? [no]: Y
Total number of passes: 1
Rollback Done
SwitchControllerDevice# configure confirm
```

The following example shows the use of the `configure revert` command with the `timer` keyword. You must enter the `configure revert` command to cancel the timed rollback and trigger the rollback immediately, or to reset parameters for the timed rollback.

```
SwitchControllerDevice# configure revert timer 100
```

Performing a Configuration Rollback Operation

The following example shows how to make changes to the current running configuration and then roll back the changes. As part of the configuration rollback operation, you must save the current running configuration before making changes to the file. In this example, the `archive config` command is used to save the current running configuration. The generated output of the `configure replace` command indicates that only one pass was performed to complete the rollback operation.

Before using the `archive config` command, you must configure the `path` command to specify the location and filename prefix for the files in the Cisco IOS configuration archive.
You first save the current running configuration in the configuration archive as follows:

```
archive config
```

You then enter configuration changes as shown in the following example:

```
configure terminal
!
user netops2 password rain
user netops3 password snow
exit
```

After having made changes to the running configuration file, assume you now want to roll back these changes and revert to the configuration that existed before the changes were made. The `show archive` command is used to verify the version of the configuration to be used as a replacement file. The `configure replace` command is then used to revert to the replacement configuration file as shown in the following example:

```
SwitchControllerDevice# show archive
There are currently 1 archive configurations saved.  
The next archive file will be named flash:myconfiguration-2
Archive # Name
 0               
 1   flash:myconfiguration-1 <- Most Recent
 2               
 3               
 4               
 5               
 6               
 7               
 8               
 9               
10              
SwitchControllerDevice# configure replace flash:myconfiguration-1
Total number of passes: 1
Rollback Done
```

Information About the Flash File System

The flash file system is a single flash device on which you can store files. It also provides several commands to help you manage software bundles and configuration files. The default flash file system on the switch is named flash:

As viewed from the active switch, or any stack member, flash: refers to the local flash device, which is the device attached to the same switch on which the file system is being viewed. In a switch stack, each of the flash devices from the various stack members can be viewed from the active switch. The names of these flash file systems include the corresponding switch member numbers. For example, flash-3:, as viewed from the active switch, refers to the same file system as does flash: on stack member 3. Use the show file systems privileged EXEC command to list all file systems, including the flash file systems in the switch stack.

Only one user at a time can manage the software bundles and configuration files for a switch stack.
Displaying Available File Systems

To display the available file systems on your switch, use the `show file systems` privileged EXEC command as shown in this example for a standalone switch:

```
SwitchControllerDevice# show file systems
File Systems:
+ Size(b)  Free(b)  Type        Flags Prefixes
+ 15998976 5135872 flash  rw        flash:
    -    - opaque  rw bs:
    -    - opaque  rw vb:
    524288  520138 nvram  rw        nvram:
    -    - network  rw tftp:
    -    - opaque  rw null:
    -    - opaque  ro xmodem:
    -    - opaque  ro ymodem:
```

This example shows a switch stack. In this example, the active switch is stack member 1; the file system on stack member 2 is displayed as flash-2; the file system on stack member 3 is displayed as flash-3; and so on up to stack member 9, displayed as flash-9: for a 9-member stack. The example also shows the crashinfo directories and a USB flash drive plugged into the active switch:

```
SwitchControllerDevice# show file systems
File Systems:
+ Size(b)  Free(b)  Type        Flags Prefixes
+ 145898496 5479424 disk  rw        crashinfo:crashinfo-1:
    248512512  85983232 disk  rw        crashinfo-2:stby-crashinfo:
    146014208  17301504 disk  rw        crashinfo-3:
    146014208  1572864 disk  rw        crashinfo-4:
    248512512  30932992 disk  rw        crashinfo-5:

</table>
### Setting the Default File System

You can specify the file system or directory that the system uses as the default file system by using the `cd filesystem` privileged EXEC command. You can set the default file system to omit the `filesystem:` argument from related commands. For example, for all privileged EXEC commands that have the optional `filesystem:` argument, the system uses the file system specified by the `cd` command.

By default, the default file system is `flash:`.

You can display the current default file system as specified by the `cd` command by using the `pwd` privileged EXEC command.

### Displaying Information About Files on a File System

You can view a list of the contents of a file system before manipulating its contents. For example, before copying a new configuration file to flash memory, you might want to verify that the file system does not already contain a configuration file with the same name. Similarly, before copying a flash configuration file to another location, you might want to verify its filename for use in another command. To display information about files on a file system, use one of the privileged EXEC commands listed in the following table.
### Table 30: Commands for Displaying Information About Files

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dir [/all] filesystem:filename</code></td>
<td>Displays a list of files on a file system.</td>
</tr>
<tr>
<td><code>show file systems</code></td>
<td>Displays more information about each of the files on a file system.</td>
</tr>
<tr>
<td><code>show file information file-url</code></td>
<td>Displays information about a specific file.</td>
</tr>
<tr>
<td><code>show file descriptors</code></td>
<td>Displays a list of open file descriptors. File descriptors are the internal representations of open files. You can use this command to see if another user has a file open.</td>
</tr>
</tbody>
</table>

For example, to display a list of all files in a file system, use the `dir` privileged EXEC command:

```
switch# dir flash:
Directory of flash:/
7386 -rwx 2097152 Jan 23 2013 14:06:49 +00:00 nvram_config
7378 drwx 4096 Jan 23 2013 09:35:11 +00:00 mnt
7385 -rw- 221775876 Jan 23 2013 14:15:13 +00:00 cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
7389 -rwx 556 Jan 21 2013 20:47:30 +00:00 vlan.dat
712413184 bytes total (445063168 bytes free)
switch#
```

### Changing Directories and Displaying the Working Directory (CLI)

Beginning in privileged EXEC mode, follow these steps to change directories and to display the working directory:

**SUMMARY STEPS**

1. `dir filesystem:
2. `cd` directory_name
3. `pwd`
4. `cd`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>dir filesystem:</code></td>
<td>Displays the directories on the specified file system.</td>
</tr>
</tbody>
</table>
### Creating Directories (CLI)

Beginning in privileged EXEC mode, follow these steps to create a directory:

#### SUMMARY STEPS

1. `dir filesystem:`
2. `mkdir directory_name`
3. `dir filesystem:`

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dir filesystem:</code></td>
<td>Displays the directories on the specified file system. For <code>filesystem:</code> use <code>flash:</code> for the system board flash device.</td>
</tr>
</tbody>
</table>

#### Example:

```
SwitchControllerDevice# dir flash:
```

To access flash partitions of switch members in a stack, use `flash-n` where `n` is the stack member number. For example, `flash-4`.

Navigates to the specified directory.

#### Example:

```
SwitchControllerDevice# cd directory_name
```

The command example shows how to navigate to the directory named `new_configs`.

#### Example:

```
SwitchControllerDevice# cd new_configs
```

Navigates to the default directory.

#### Example:

```
SwitchControllerDevice# cd
```

Displays the working directory.

#### Example:

```
SwitchControllerDevice# pwd
```
<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong> mkdir <code>directory_name</code></td>
<td>Creates a new directory. Directory names are case sensitive and are limited to 45 characters between the slashes (/); the name cannot contain control characters, spaces, slashes, quotes, semicolons, or colons.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice# mkdir new_configs</td>
</tr>
<tr>
<td><strong>Step 3</strong> dir <code>filesystem:</code></td>
<td>Verifies your entry.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>SwitchControllerDevice# dir flash:</td>
</tr>
</tbody>
</table>

### Removing Directories

To remove a directory with all its files and subdirectories, use the `delete /force /recursive filesystem:/file-url` privileged EXEC command.

Use the `/recursive` keyword to delete the named directory and all subdirectories and the files contained in it.

Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process.

For `filesystem`, use `flash:` for the system board flash device. For `file-url`, enter the name of the directory to be deleted. All of the files in the directory and the directory are removed.

**Caution**

When directories are deleted, their contents cannot be recovered.

### Copying Files

To copy a file from a source to a destination, use the `copy source-url destination-url` privileged EXEC command. For the source and destination URLs, you can use `running-config` and `startup-config` keyword shortcuts. For example, the `copy running-config startup-config` command saves the currently running configuration file to the NVRAM section of flash memory to be used as the configuration during system initialization.

You can also copy from special file systems (xmodem:, ymodem:) as the source for the file from a network machine that uses the Xmodem or Ymodem protocol.

Network file system URLs include ftp:, rcp:, and tftp: and have these syntaxes:

- FTP—ftp: [[/username [:password]@location]/directory]/filename
- RCP—rcp:[[/username@location]/directory]/filename
- TFTP—tftp:[[/location]/directory]/filename

Local writable file systems include flash:. 

---

**Working with the Flash File System**

**Removing Directories**

**Copying Files**
Some invalid combinations of source and destination exist. Specifically, you cannot copy these combinations:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the \texttt{copy \textit{flash}: \textit{flash}:} command is invalid)

### Copying Files from One SwitchControllerDevice in a Stack to Another SwitchControllerDevice in the Same Stack

To copy a file from one switch in a stack to another switch in the same stack, use the \texttt{\textit{flash-}X:} notation, where \textit{X} is the switch number.

To view all switches in a stack, use the \texttt{show switch} command in privileged EXEC mode, as in the following example of a 9-member switch stack:

```
SwitchControllerDevice# show switch
Switch/Stack Mac Address : 0006.f6b9.b580 - Local Mac Address Mac persistency wait time:
Indefinite

<table>
<thead>
<tr>
<th>Switch#</th>
<th>Role</th>
<th>Mac Address</th>
<th>Priority</th>
<th>Version</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>*1</td>
<td>Active</td>
<td>0006.f6b9.b580</td>
<td>15</td>
<td>P3B</td>
<td>Ready</td>
</tr>
<tr>
<td>2</td>
<td>Standby</td>
<td>0006.f6ba.0c80</td>
<td>14</td>
<td>P3B</td>
<td>Ready</td>
</tr>
<tr>
<td>3</td>
<td>Member</td>
<td>0006.f6ba.3300</td>

<td>1</td>
<td>P5B</td>
<td>Ready</td>
</tr>
</tbody>
</table>
```

To view all file systems available to copy on a specific switch, use the \texttt{copy} command as in the following example of a 5-member stack:

```
SwitchControllerDevice# copy \textit{flash:} ?
crashinfo-1: Copy to crashinfo-1: file system
crashinfo-2: Copy to crashinfo-2: file system
crashinfo-3: Copy to crashinfo-3: file system
crashinfo-4: Copy to crashinfo-4: file system
crashinfo-5: Copy to crashinfo-5: file system
crashinfo: Copy to crashinfo: file system
flash-1: Copy to flash-1: file system
flash-2: Copy to flash-2: file system
flash-3: Copy to flash-3: file system
flash-4: Copy to flash-4: file system
flash-5: Copy to flash-5: file system
flash: Copy to flash: file system
ftp: Copy to ftp: file system
http: Copy to http: file system
https: Copy to https: file system
null: Copy to null: file system
nvram: Copy to nvram: file system
rcp: Copy to rcp: file system
revrcsf: Copy to revrcsf: file system
running-config Update (merge with) current system configuration
scp: Copy to scp: file system
startup-config Copy to startup configuration
stby-crashinfo: Copy to stby-crashinfo: file system
stby-flash: Copy to stby-flash: file system
stby-nvram: Copy to stby-nvram: file system
stby-rcsf: Copy to stby-rcsf: file system
```
This example shows how to copy a config file stored in the flash partition of switch 2 to the flash partition of switch 4. It assumes that switch 2 and switch 4 are in the same stack.

SwitchControllerDevice# copy flash-2:config.txt flash-4:config.txt

Deleting Files

When you no longer need a file on a flash memory device, you can permanently delete it. To delete a file or directory from a specified flash device, use the `delete [/force] [/recursive] [filesystem:]file-url privileged EXEC command.

Use the `/recursive` keyword for deleting a directory and all subdirectories and the files contained in it. Use the `/force` keyword to suppress the prompting that confirms a deletion of each file in the directory. You are prompted only once at the beginning of this deletion process. Use the `/force` and `/recursive` keywords for deleting old software images that were installed by using the `archive download-sw` command but are no longer needed.

If you omit the `filesystem:` option, the switch uses the default device specified by the `cd` command. For `file-url`, you specify the path (directory) and the name of the file to be deleted.

When you attempt to delete any files, the system prompts you to confirm the deletion.

⚠️ Caution

When files are deleted, their contents cannot be recovered.

This example shows how to delete the file `myconfig` from the default flash memory device:

SwitchControllerDevice# delete myconfig

Creating, Displaying and Extracting Files (CLI)

You can create a file and write files into it, list the files in a file, and extract the files from a file as described in the next sections.

Beginning in privileged EXEC mode, follow these steps to create a file, display the contents, and extract it:
### SUMMARY STEPS

1. `archive tar /create destination-url flash: /file-url`
2. `archive tar /table source-url`
3. `archive tar /xtract source-url flash:/file-url [dir/file...]`
4. `more [ /ascii | /binary | /ebcdic] /file-url`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Creates a file and adds files to it. For destination-url, specify the destination URL alias for the local or network file system and the name of the file to create:</td>
</tr>
<tr>
<td><code>archive tar /create destination-url flash: /file-url</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> switch# archive tar /create tftp:172.20.10.30/saved. flash:/new-configs</td>
<td>Creates a file and adds files to it. For destination-url, specify the destination URL alias for the local or network file system and the name of the file to create:</td>
</tr>
<tr>
<td></td>
<td>• Local flash file system syntax:</td>
</tr>
<tr>
<td></td>
<td>• FTP syntax:</td>
</tr>
<tr>
<td></td>
<td>• RCP syntax:</td>
</tr>
<tr>
<td></td>
<td>• TFTP syntax:</td>
</tr>
<tr>
<td></td>
<td>For flash:/file-url, specify the location on the local flash file system in which the new file is created. You can also specify an optional list of files or directories within the source directory to add to the new file. If none are specified, all files and directories at this level are written to the newly created file.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Displays the contents of a file. For source-url, specify the source URL alias for the local or network file system. The -filename is the file to display. These options are supported:</td>
</tr>
<tr>
<td><code>archive tar /table source-url</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> switch# archive tar /table flash: /new_configs</td>
<td>Displays the contents of a file. For source-url, specify the source URL alias for the local or network file system. The -filename is the file to display. These options are supported:</td>
</tr>
<tr>
<td></td>
<td>• Local flash file system syntax:</td>
</tr>
<tr>
<td></td>
<td>• FTP syntax:</td>
</tr>
<tr>
<td></td>
<td>• RCP syntax:</td>
</tr>
<tr>
<td></td>
<td>• TFTP syntax:</td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>You can also limit the file displays by specifying a list of files or directories after the file. Only those files appear. If none are specified, all files and directories appear.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 3**

archive tar /xtract source-url

flash:/file-url [dir/file...]

**Example:**

switch# archive tar /xtract

tftp://172.20.10.30/saved.

flash:/new-configs

Extracts a file into a directory on the flash file system.

For source-url, specify the source URL alias for the local file system. The -filename is the file from which to extract files. These options are supported:

- Local flash file system syntax:
  
  flash:

- FTP syntax:
  
  ftp://[username[:password]@location]/directory/-filename.

- RCP syntax:
  
  rcp://[username@location]/directory/-filename.

- TFTP syntax:
  
  tftp://[location]/directory/-filename.

For flash:/file-url [dir/file...], specify the location on the local flash file system from which the file is extracted. Use the dir/file... option to specify a list of files or directories within the file to be extracted. If none are specified, all files and directories are extracted.

**Step 4**

more [/ascii | /binary | /ebcdic]

/file-url

**Example:**

switch# more

flash:/new-configs

Displays the contents of any readable file, including a file on a remote file system.

CHAPTER 20

Working with Cisco IOS XE Software Bundles

- About Software Bundles and Packages, page 295
- Bundle and Package File Location on the Switch, page 295
- Upgrading Cisco IOS XE Software, page 296
- Additional References, page 304

About Software Bundles and Packages

Cisco IOS XE software bundles include a set of Cisco IOS XE package (.pkg) files. You can install the package files on the switch or you can boot the switch from the IOS XE bundle itself.

To display information about the contents of a Cisco IOS XE bundle (.bin file), use the `show software package` command in privileged EXEC mode. Use the command to display information about an individual IOS XE package (.pkg) file as well.

Bundle and Package File Location on the Switch

When the switch is running in installed mode, the Cisco IOS XE package (.pkg) files and provisioning file (packages.conf) are stored in the system board flash memory (flash:). When the switch is running in bundle mode, the booted Cisco IOS XE software bundle (.bin) file is stored in the system board flash memory (flash:) or USB flash memory (usbflash0:).

To display information about the provisioning software that is currently running on the switch, use the `show version` privileged EXEC command. In the display, check the line that begins with

```
System bundle file is....
```

When the switch is running in installed mode, this line displays the name and location of the booted Cisco IOS XE provisioning file, typically flash:packages.conf.

When the switch is running in bundle mode, this line displays the name and location of the booted Cisco IOS XE bundle file.

To display information about the Cisco IOS XE package files that are running on the switch, use the `show version running` privileged EXEC command.
When the switch is running in installed mode, this command displays information about the set of package files contained in the booted provisioning file.

When the switch is running in bundle mode, this command displays information about the set of package files contained in the booted Cisco IOS XE software bundle.

Note

For usbflash0:, the default format is FAT16, while FAT32 format is also supported.

SwitchControllerDevice# format usbflash0: ?
FAT16  FAT16  filesystem type
FAT32  FAT32  filesystem type

Upgrading Cisco IOS XE Software

The method that you use to upgrade Cisco IOS XE software depends on whether the switch is running in installed mode or in bundle mode.

Upgrading Cisco IOS XE Software: Install Mode

To upgrade the Cisco IOS XE software when the switch is running in installed mode, use the software install privileged EXEC command to install the packages from a new software bundle file. The software bundle can be installed from the local storage media or it can be installed over the network using TFTP or FTP.

The software install command expands the package files from the specified source bundle file and copies them to the local flash: storage device. When the source bundle is specified as a tftp: or ftp: URL, the bundle file is first downloaded into the switch's memory (RAM); the bundle file is not copied to local storage media.

After the package files are expanded and copied to flash: the running provisioning file (flash:packages.conf) is updated to reflect the newly installed packages, and the switch displays a reload prompt.

Note

The software install command is not supported when the switch is running in bundle mode. Use the software expand privileged EXEC command to convert the switch from bundle mode to installed mode.

Upgrading Cisco IOS XE Software Install Mode Example

This example shows the software install file command being used to expand and copy the packages from a Cisco IOS XE bundle located on a TFTP server in order to upgrade to a new image:

SwitchControllerDevice# software install file tftp://172.19.211.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
Preparing install operation ... [1]: Downloading file tftp://172.19.211.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin to active switch 1
[1]: Finished downloading file tftp://172.19.211.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin to active switch 1
[1]: Starting install operation
[1]: Expanding bundle cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
[1]: Copying package files
Upgrading Cisco IOS XE Software: Bundle Mode

To upgrade the Cisco IOS XE software when the switch is running in bundle mode, follow these steps:

1. Download the bundle file to local storage media.
2. Configure the `boot system` global configuration command to point to the bundle file.
3. Reload the switch.

Upgrading Cisco IOS XE Software Bundle Mode Example

This example shows the steps to upgrade the Cisco IOS XE software on a switch that is running in bundle mode. It shows using the `copy` command to copy the bundle file to flash; configuring the boot system variable to point to the bundle file, saving a copy of the running configuration, and finally, reloading the switch.

SwitchControllerDevice# copy
ftp://172.19.211.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash:

SwitchControllerDevice# configure terminal

SwitchControllerDevice(config)# boot system switch all

SwitchControllerDevice(config)# end

SwitchControllerDevice#
Converting from the Bundle Running Mode to the Install Running Mode

To convert the running mode of a switch from bundle mode to installed mode, use the `software expand running` privileged EXEC command. This command expands the packages from the booted IOS XE software bundle and copies them and the provisioning file to the specified destination.

When you use the `software expand running` command to convert the switch from bundle mode to installed mode, specify the `to` destination as `flash`. After you execute the command, configure the `boot system` command to point to the expanded provisioning file (flash:packages.conf), then reload the switch to boot in installed mode.

**Note**
The `software expand running` command is not supported when the switch is running in installed mode.

Converting from the Bundle Running Mode to the Install Running Mode Example

This example shows using the `software expand running to` command to convert the active switch in a switch stack from the bundle running mode to the installed running mode:

SwitchControllerDevice# dir flash:
Directory of flash:/

Copying IOS XE Package and Bundle Files from One Stack Member to Another

For switch stacks running in installed mode, use the `software install source switch` privileged EXEC command to install the running software packages from an existing stack member to one or more other stack members that are running different (but compatible) software packages.

Copying IOS XE Package and Bundle Files from One Stack Member to Another Example

This example shows a 2-member stack where each switch is running a different (but compatible) software package. The `software install source switch` command is used to install the packages that are currently running on the standby switch (switch 1) onto the active switch (switch 2):

SwitchControllerDevice# show version running
Package: Base, version: 03.02.00SE, status: active
File: cat3k_caa-base.SPA.03.02.00SE.pkg, on: Switch1

Package: Drivers, version: 03.02.00.SE, status: active
File: cat3k_caa-drivers.SPA.03.02.00.SE.pkg, on: Switch1

Package: Infra, version: 03.02.00SE, status: active
File: cat3k_caa-infra.SPA.03.02.00SE.pkg, on: Switch1
Built: Wed Jan 09 22:00:56 PST 2013, by: gereddy

Package: IOS, version: 150-1.EX, status: active
File: cat3k_caa-iosd-universalk9.SPA.150-1.EX.pkg, on: Switch1
Built: Wed Jan 09 22:02:23 PST 2013, by: gereddy

Package: Platform, version: 03.02.00.SE, status: active
File: cat3k_caa-platform.SPA.03.02.00.SE.pkg, on: Switch1
Built: Wed Jan 09 22:01:46 PST 2013, by: gereddy

[2]: Do you want to proceed with reload? [yes/no]:

For switch stacks running in bundle mode, follow these steps to copy the bundle file from one stack member to another:

1. Use the copy privileged EXEC command to copy the running bundle from one switch in the stack to the other.

2. Configure the boot system global configuration command to point to the bundle file.

3. Reload the switch.

This example shows a 2-member stack where each switch is running a different (but compatible) software packages:

```
SwitchControllerDevice# copy
flash:cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin flash-1:

```

**Upgrading a SwitchControllerDevice Running Incompatible Software**

To upgrade a switch that is running in installed mode with software packages that are incompatible with the switch stack (also running in installed mode), use the software auto-upgrade privileged EXEC command to install the software packages from an existing stack member to the stack member that is running incompatible software. Upon completion of the auto-upgrade installation, the incompatible switch automatically reloads and joins the stack as a fully functioning member.
If you configure the global software auto-upgrade enable command, the auto-upgrade functionality is initiated automatically when a switch with incompatible software running in installed mode joins the stack that is running in installed mode. For more information, see Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches).

**Upgrading a SwitchControllerDevice Running Incompatible Software Example**

This example shows a 2-member switch stack; switch 2 is the active switch and switch 1 is running incompatible software:

```
SwitchControllerDevice# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
-----------------------------------------------
1 Member 6400.f125.1a00 1 0 V-Mismatch
*2 Active 6400.f125.1100 1 V01 Ready
SwitchControllerDevice#
SwitchControllerDevice# software auto-upgrade
INFO level system messages will be generated to provide status information during the auto upgrade process

SwitchControllerDevice#* Oct 19 06:59:14.521: %INSTALLER-6-AUTO_UPGRADE_SW_INITIATED: 2 installer: Auto upgrade initiated for switch 1
* Oct 19 06:59:14.522: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Searching stack for software to upgrade switch 1
* Oct 19 06:59:14.523: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Found donor switch 2 to auto upgrade switch 1
* Oct 19 06:59:14.523: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Upgrading switch 1 with software from switch 2
* Oct 19 07:00:47.829: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Finished installing software on switch 1
* Oct 19 07:00:47.829: %INSTALLER-6-AUTO_UPGRADE_SW: 2 installer: Reloading switch 1 to complete the auto upgrade
```

To upgrade a switch that is running in bundle mode with a software bundle that is incompatible with the switch stack (also running in bundle mode), follow these steps:

1. Use the copy privileged EXEC command to copy the running bundle from one switch in the stack to the other.
2. Configure the boot system global configuration command to point to the bundle file.
3. Reload the switch.

This example shows a 2-member switch stack running in bundle mode; switch 2 is the active switch and switch 1 is running an incompatible bundle:

```
SwitchControllerDevice# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
-----------------------------------------------
1 Member 6400.f125.1a00 1 0 V-Mismatch
*2 Active 6400.f125.1100 1 V01 Ready
```
Upgrading a Switch Running in Incompatible Running Mode

When a switch running in bundle mode tries to join a stack running in installed mode, use the `software auto-upgrade` privileged EXEC command to install the incompatible switch's running packages and convert the switch to installed mode. Upon completion of the auto-upgrade running mode conversion, the incompatible switch automatically reloads and attempts to join the stack in installed mode.

Note
If you configure the global `software auto-upgrade enable` command, the auto-upgrade functionality is initiated automatically when a switch with incompatible software running in installed mode joins the stack that is running in installed mode. For more information, see Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches).

Upgrading a SwitchControllerDevice Running in Incompatible Running Mode Example

This example shows a 2-member switch stack running in installed mode; switch 2 is the active switch and switch 1 is running in bundle mode:

```
SwitchControllerDevice# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
---------------------------------------------
1 Member 6400.f125.1a00 1 0 V-Mismatch
*2 Active 6400.f125.1100 1 01 Ready

SwitchControllerDevice# show switch
Switch/Stack Mac Address : 6400.f125.1100 - Local Mac Address
Mac persistency wait time: Indefinite
H/W Current
Switch# Role Mac Address Priority Version State
---------------------------------------------
1 Member 6400.f125.1a00 1 0 V-Mismatch
*2 Active 6400.f125.1100 1 01 Ready

SwitchControllerDevice# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchControllerDevice(config)# boot system switch 1
flash:cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
SwitchControllerDevice(config)# end
SwitchControllerDevice# reload slot 1
Stack is in Half ring setup; Reloading a switch might cause stack split
Proceed with reload? [confirm]
```

INFO level system messages will be generated to provide status information during the auto upgrade process.
When you use the `software auto-upgrade` command to convert an incompatible switch to installed mode, the command installs the packages from the incompatible switch's running bundle. If, after you reload and boot the incompatible switch in installed mode, the switch's installed packages are found to be incompatible with the stack, you can use the `software auto-upgrade` command again. For more information, see [Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)](https://www.cisco.com/c/en/us/td/docs/ios-xe/release_3se/ios-cfg_ref/ol-27590-02.html).

To convert a switch that is running in installed mode and joining a stack that is running in bundle mode, follow these steps:

1. **Use the `copy` privileged EXEC command to copy the running bundle from one switch in the stack to the other.**
2. **Configure the `boot system` global configuration command to point to the bundle file.**
3. **Reload the switch.**

After reloading, the incompatible switch boots in bundle mode and joins the stack as a fully functioning member.

This example shows a 2-member switch stack running in bundle mode; switch 2 is the active switch and switch 1 is running in installed mode:

```
SwitchControllerDevice# copy
SwitchControllerDevice# configure terminal
SwitchControllerDevice# boot system switch 1
```

```
SwitchControllerDevice# reload slot 1
System Management Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)

Troubleshooting the Software Configuration

This chapter describes how to identify and resolve software problems related to the Cisco IOS software on the switch. Depending on the nature of the problem, you can use the command-line interface (CLI), Device Manager, or Network Assistant to identify and solve problems.

Additional troubleshooting information, such as LED descriptions, is provided in the hardware installation guide.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest caveats and feature information, see Bug Search Tool and the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the feature information table at the end of this module.

Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Information About Troubleshooting the Software Configuration

Software Failure on a Switch

Switch software can be corrupted during an upgrade by downloading the incorrect file to the switch, and by deleting the image file. In all of these cases, the switch does not pass the power-on self-test (POST), and there is no connectivity.

Related Topics

Recovering from a Software Failure, on page 315

Lost or Forgotten Password on a Switch

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.

Note

On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message reminds you to return to the default configuration during the recovery process.

Recovering from a Lost or Forgotten Password, on page 317

Power over Ethernet Ports

A Power over Ethernet (PoE) switch port automatically supplies power to one of these connected devices if the switch detects that there is no power on the circuit:

• a Cisco pre-standard powered device (such as a Cisco IP Phone or a Cisco Aironet Access Point)
• an IEEE 802.3af-compliant powered device
• an IEEE 802.3at-compliant powered device

A powered device can receive redundant power when it is connected to a PoE switch port and to an AC power source. The device does not receive redundant power when it is only connected to the PoE port.

After the switch detects a powered device, the switch determines the device power requirements and then grants or denies power to the device. The switch can also detect the real-time power consumption of the device by monitoring and policing the power usage.

For more information, see the "Configuring PoE" chapter in the Interface and Hardware Component Configuration Guide (Catalyst 3850 Switches).
Related Topics

Scenarios to Troubleshoot Power over Ethernet (PoE), on page 330

Disabled Port Caused by Power Loss

If a powered device (such as a Cisco IP Phone 7910) that is connected to a PoE switch port and powered by an AC power source loses power from the AC power source, the device might enter an error-disabled state. To recover from an error-disabled state, enter the `shutdown` interface configuration command, and then enter the `no shutdown` interface command. You can also configure automatic recovery on the switch to recover from the error-disabled state.

On a switch, the `errdisable recovery cause loopback` and the `errdisable recovery interval seconds` global configuration commands automatically take the interface out of the error-disabled state after the specified period of time.

Disabled Port Caused by False Link-Up

If a Cisco powered device is connected to a port and you configure the port by using the `power inline never` interface configuration command, a false link-up can occur, placing the port into an error-disabled state. To take the port out of the error-disabled state, enter the `shutdown` and the `no shutdown` interface configuration commands.

You should not connect a Cisco powered device to a port that has been configured with the `power inline never` command.

Ping

The switch supports IP ping, which you can use to test connectivity to remote hosts. Ping sends an echo request packet to an address and waits for a reply. Ping returns one of these responses:

- Normal response—The normal response (hostname is alive) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a no-answer message is returned.
- Unknown host—If the host does not exist, an unknown host message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a destination-unreachable message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a network or host unreachable message is returned.

Example: Pinging an IP Host, on page 333
Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. Traceroute finds the path by using the MAC address tables of the switches in the path. When the switch detects a device in the path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The switch can only identify the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

Layer 2 Traceroute Guidelines

- Cisco Discovery Protocol (CDP) must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.

  If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

- A switch is reachable from another switch when you can test connectivity by using the `ping` privileged EXEC command. All switches in the physical path must be reachable from each other.

- The maximum number of hops identified in the path is ten.

- You can enter the `traceroute mac` or the `traceroute mac ip` privileged EXEC command on a switch that is not in the physical path from the source device to the destination device. All switches in the path must be reachable from this switch.

- The `traceroute mac` command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.

  If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.

  If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.

- The `traceroute mac ip` command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the switch uses the Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

  * If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.

  * If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.
When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

- This feature is not supported in Token Ring VLANs.

**IP Traceroute**

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Your switches can participate as the source or destination of the traceroute privileged EXEC command and might or might not appear as a hop in the traceroute command output. If the switch is the destination of the traceroute, it is displayed as the final destination in the traceroute output. Intermediate switches do not show up in the traceroute output if they are only bridging the packet from one port to another within the same VLAN. However, if the intermediate switch is a multilayer switch that is routing a particular packet, this switch shows up as a hop in the traceroute output.

The traceroute privileged EXEC command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends an Internet Control Message Protocol (ICMP) time-to-live-exceeded message to the sender. Traceroute finds the address of the first hop by examining the source address field of the ICMP time-to-live-exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the time-to-live-exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host (or until the maximum TTL is reached).

To learn when a datagram reaches its destination, traceroute sets the UDP destination port number in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram destined to itself containing a destination port number that is unused locally, it sends an ICMP port-unreachable error to the source. Because all errors except port-unreachable errors come from intermediate hops, the receipt of a port-unreachable error means that this message was sent by the destination port.

- Example: Performing a Traceroute to an IP Host, on page 333

**Time Domain Reflector Guidelines**

You can use the Time Domain Reflector (TDR) feature to diagnose and resolve cabling problems. When running TDR, a local device sends a signal through a cable and compares the reflected signal to the initial signal.

TDR is supported on 10/100/1000 copper Ethernet ports and on Multigigabit Ethernet (100Mbps/1/2.5/5/10 Gbps) ports. It is not supported on SFP module ports.

TDR can detect these cabling problems:
• Open, broken, or cut twisted-pair wires—The wires are not connected to the wires from the remote device.

• Shorted twisted-pair wires—The wires are touching each other or the wires from the remote device. For example, a shorted twisted pair can occur if one wire of the twisted pair is soldered to the other wire. If one of the twisted-pair wires is open, TDR can find the length at which the wire is open.

Note

When using the feature with Multigigabit Ethernet ports, the cable length is displayed only when an open or short condition is detected.

Use TDR to diagnose and resolve cabling problems in these situations:

• Replacing a Switch
• Setting up a wiring closet
• Troubleshooting a connection between two devices when a link cannot be established or when it is not operating properly

When you run TDR, the Switch reports accurate information in these situations:

• The cable for the gigabit link is a solid-core cable.
• The open-ended cable is not terminated.

When you run TDR, the Switch does not report accurate information in these situations:

• The cable for the gigabit link is a twisted-pair cable or is in series with a solid-core cable.
• The link is a 10-megabit or a 100-megabit link.
• The cable is a stranded cable.
• The link partner is a Cisco IP Phone.
• The link partner is not IEEE 802.3 compliant.

Debug Commands

Caution

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use debug commands only to troubleshoot specific problems or during troubleshooting sessions with Cisco technical support staff. It is best to use debug commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased debug command processing overhead will affect system use.

All debug commands are entered in privileged EXEC mode, and most debug commands take no arguments.

Crashinfo Files

The crashinfo files save information that helps Cisco technical support representatives to debug problems that caused the Cisco IOS image to fail (crash). The switch generates two files at the time of the failure: full core and crashinfo.

The information in the crashinfo file includes the Cisco IOS image name and version that failed, a list of the processor registers, and a stack trace. You can provide this information to the Cisco technical support representative by using the `show tech-support` privileged EXEC command.

The file names have the following format:

```
[fullcore | crashinfo]_[process that crashed]_[date]_[timestamp]-UTC
```

From IOS, you can view the crashinfo files on each switch by using the following command:

```
SwitchControllerDevice# dir crashinfo?
```

For example, to access the crashinfo directory for switch 1, enter

```
SwitchControllerDevice dir crashinfo-1
```

From the ROMMON prompt, you can view the crashinfo files by using the `dir` command:

```
SwitchControllerDevice: dir sda1
```

The following is sample output of a crashinfo file

```
Directory of crashinfo:

```
SwitchControllerDevice#
```

System Management Configuration Guide, Cisco IOS XE Release 3SE (Catalyst 3850 Switches)
System Reports

When a switch crashes, a system report is automatically generated for each switch in the switch stack. The system report file captures all the trace buffers, and other system-wide logs found on the switch. System reports are located in the crashinfo directory in the following format:

```
system-report_[switch number]_[date]-[timestamp]-UTC.gz
```

After a switch crash, you should check if a system report file was generated. The name of the most recently generated system report file is stored in the last_systemreportfile under the crashinfo directory. The system report and crashinfo files assist TAC when troubleshooting your issue.

Onboard Failure Logging on the Switch

You can use the onboard failure logging (OBFL) feature to collect information about the switch. The information includes uptime, temperature, and voltage information and helps Cisco technical support representatives to troubleshoot switch problems. We recommend that you keep OBFL enabled and do not erase the data stored in the flash memory.

By default, OBFL is enabled. It collects information about the switch and small form-factor pluggable (SFP) modules. The switch stores this information in the flash memory:

- **CLI commands**—Record of the OBFL CLI commands that are entered on a standalone switch or a switch stack member.
- **Environment data**—Unique device identifier (UDI) information for a standalone switch or a stack member and for all the connected FRU devices: the product identification (PID), the version identification (VID), and the serial number.
- **Message**—Record of the hardware-related system messages generated by a standalone switch or a stack member.
- **Power over Ethernet (PoE)**—Record of the power consumption of PoE ports on a standalone switch or a stack member.
- **Temperature**—Temperature of a standalone switch or a stack member.
- **Uptime data**—Time when a standalone switch or a stack member starts, the reason the switch restarts, and the length of time the switch has been running since it last restarted.
- **Voltage**—System voltages of a standalone switch or a stack member.

You should manually set the system clock or configure it by using Network Time Protocol (NTP). When the switch is running, you can retrieve the OBFL data by using the `show logging onboard` privileged EXEC commands. If the switch fails, contact your Cisco technical support representative to find out how to retrieve the data.

Related Topics

- Configuring OBFL, on page 326
- Displaying OBFL Information, on page 327
Fan Failures

By default, the feature is disabled. When more than one of the fans fails in a field-replaceable unit (FRU) or in a power supply, the switch does not shut down, and this error message appears:

Multiple fan(FRU/PS) failure detected. System may get overheated. Change fan quickly.

The switch might overheat and shut down.

To enable the fan failures feature, enter the `system env fan-fail-action shut` privileged EXEC command. If more than one fan in the switch fails, the switch automatically shuts down, and this error message appears:

Faulty (FRU/PS) fans detected, shutting down system!

After the first fan shuts down, if the switch detects a second fan failure, the switch waits for 20 seconds before it shuts down.

To restart the switch, it must be power cycled.

Possible Symptoms of High CPU Utilization

Excessive CPU utilization might result in these symptoms, but the symptoms might also result from other causes:

- Spanning tree topology changes
- EtherChannel links brought down due to loss of communication
- Failure to respond to management requests (ICMP ping, SNMP timeouts, slow Telnet or SSH sessions)
- UDLD flapping
- IP SLAs failures because of SLAs responses beyond an acceptable threshold
- DHCP or IEEE 802.1x failures if the switch does not forward or respond to requests

How to Troubleshoot the Software Configuration

Recovering from a Software Failure

Before You Begin

This recovery procedure requires that you have physical access to the switch.
This procedure uses boot loader commands and TFTP to recover from a corrupted or incorrect image file.

### Step 1
From your PC, download the software image file (*image.bin*) from Cisco.com.

### Step 2
Load the software image to your TFTP server.

### Step 3
Connect your PC to the switch Ethernet management port.

### Step 4
Unplug the switch power cord.

### Step 5
Press the *Mode* button, and at the same time, reconnect the power cord to the switch.

### Step 6
From the bootloader (ROMMON) prompt, ensure that you can ping your TFTP server.

   a) Set the IP address `switch: set IP_ADDR ip_address subnet_mask`

   **Example:**
   
   ```
   switch: set IP_ADDR 192.0.2.123/255.255.255.0
   ```

   b) Set the default router IP address `switch: set DEFAULT_ROUTER ip_address`

   **Example:**
   
   ```
   switch: set DEFAULT_ROUTER 192.0.2.1
   ```

   c) Verify that you can ping the TFTP server `switch: ping ip_address_of_TFTP_server`

   **Example:**
   
   ```
   switch: ping 192.0.2.15
   ping 192.0.2.1 with 32 bytes of data...
   Host 192.0.2.1 is alive.
   switch:
   ```

### Step 7
Verify that you have a recovery image in your recovery partition (sda9:).
This recovery image is required for recovery using the emergency-install feature.

**Example:**

```
switch: dir sda9:
Directory of sda9:
  2 drwx 1024 .
  2 drwx 1024 ..
  11 -rw- 18923068 c3850-recovery.bin
36939776 bytes available (20830208 bytes used)
switch:
```

### Step 8
From the bootloader (ROMMON) prompt, initiate the emergency-install feature that assists you in recovering the software image on your switch.

**WARNING:** The emergency install command will erase your entire boot flash!

**Example:**

```cisco
Switch# emergency-install
tftp://192.0.2.47/cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
The bootflash will be erased during install operation, continue (y/n)? y
Starting emergency recovery (tftp://192.0.2.47/cat3k/cat3k_caa-universalk9.SPA.03.02.00.SE.150-1.EX.bin)...
```

Recovering from a Lost or Forgotten Password

The default configuration for the switch allows an end user with physical access to the switch to recover from a lost password by interrupting the boot process during power-on and by entering a new password. These recovery procedures require that you have physical access to the switch.
On these switches, a system administrator can disable some of the functionality of this feature by allowing an end user to reset a password only by agreeing to return to the default configuration. If you are an end user trying to reset a password when password recovery has been disabled, a status message shows this during the recovery process.

SUMMARY STEPS

1. Connect a terminal or PC to the switch.
2. Set the line speed on the emulation software to 9600 baud.
3. Power off the standalone switch or the entire switch stack.
4. Reconnect the power cord to the or the active switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid; then release the **Mode** button.
5. After recovering the password, reload the switch or the active switch.
6. Power on the remaining switches in the stack.

DETAILED STEPS

**Step 1**  
Connect a terminal or PC to the switch.
- Connect a terminal or a PC with terminal-emulation software to the switch console port. If you are recovering the password for a switch stack, connect to the console port of the active switch or
- Connect a PC to the Ethernet management port. If you are recovering the password for a switch stack, connect to the Ethernet management port of a stack member.

**Step 2**  
Set the line speed on the emulation software to 9600 baud.

**Step 3**  
Power off the standalone switch or the entire switch stack.

**Step 4**  
Reconnect the power cord to the or the active switch. Within 15 seconds, press the **Mode** button while the System LED is still flashing green. Continue pressing the **Mode** button until all the system LEDs turn on and remain solid; then release the **Mode** button.

```
Switch:
Xmodem file system is available.
Base ethernet MAC Address: 20:37:06:4d:e9:80
Verifying bootloader digital signature.
```

The system has been interrupted prior to loading the operating system software, console will be reset to 9600 baud rate.

Proceed to the *Procedure with Password Recovery Enabled* section, and follow the steps.

**Step 5**  
After recovering the password, reload the switch or the active switch.
On a switch:
Switch> reload
Proceed with reload? [confirm] y

On the active switch:
Switch> reload slot <stack-active-member-number>
Proceed with reload? [confirm] y

---

**Step 6**

Power on the remaining switches in the stack.

---

**Related Topics**

Lost or Forgotten Password on a Switch, on page 308

---

**Procedure with Password Recovery Enabled**

If the password-recovery operation is enabled, this message appears:

---

**Step 1**

Initialize the flash file system.

SwitchControllerDevice: flash_init

---

**Step 2**

Ignore the startup configuration with the following command:

SwitchControllerDevice: SWITCH_IGNORE_STARTUP_CFG=1

---

**Step 3**

Boot the switch with the packages.conf file from flash.

SwitchControllerDevice: boot flash:packages.conf

---

**Step 4**

Terminate the initial configuration dialog by answering No.

Would you like to enter the initial configuration dialog? [yes/no]: No

---

**Step 5**

At the switch prompt, enter privileged EXEC mode.

SwitchControllerDevice> enable
Switch#

---

**Step 6**

Copy the startup configuration to running configuration.

SwitchControllerDevice# copy startup-config running-config Destination filename [running-config]?
Press Return in response to the confirmation prompts. The configuration file is now reloaded, and you can change the password.

**Step 7** Enter global configuration mode and change the `enable` password.

```
SwitchControllerDevice# configure terminal
SwitchControllerDevice(config)#
```

**Step 8** Write the running configuration to the startup configuration file.

```
SwitchControllerDevice# copy running-config startup-config
```

**Step 9** Confirm that manual boot mode is enabled.

```
SwitchControllerDevice# show boot

BOOT variable = flash:packages.conf;
Manual Boot = yes
Enable Break = yes
```

**Step 10** Reload the switch.

```
SwitchControllerDevice# reload
```

**Step 11** Return the Bootloader parameters (previously changed in Steps 2 and 3) to their original values.

```
SwitchControllerDevice: switch: SWITCH_IGNORE_STARTUP_CFG=0
```

**Step 12** Boot the switch with the `packages.conf` file from flash.

```
SwitchControllerDevice: boot flash:packages.conf
```

**Step 13** After the switch boots up, disable manual boot on the switch.

```
SwitchControllerDevice(config)# no boot manual
```

---

**Procedure with Password Recovery Disabled**

If the password-recovery mechanism is disabled, this message appears:

```
The password-recovery mechanism has been triggered, but is currently disabled. Access to the boot loader prompt through the password-recovery mechanism is disallowed at this point. However, if you agree to let the system be reset back to the default system configuration, access
```
to the boot loader prompt can still be allowed.

Would you like to reset the system back to the default configuration (y/n)?

---

**Caution**

Returning the switch to the default configuration results in the loss of all existing configurations. We recommend that you contact your system administrator to verify if there are backup switch and VLAN configuration files.

- If you enter **n** (no), the normal boot process continues as if the **Mode** button had not been pressed; you cannot access the boot loader prompt, and you cannot enter a new password. You see the message:

  Press Enter to continue........

- If you enter **y** (yes), the configuration file in flash memory and the VLAN database file are deleted. When the default configuration loads, you can reset the password.

---

**Step 1**

Choose to continue with password recovery and delete the existing configuration:

Would you like to reset the system back to the default configuration (y/n)? **Y**

**Step 2**

Display the contents of flash memory:

SwitchControllerDevice: **dir flash:**

The switch file system appears.

```
Directory of flash:/
.
.
.
15494 drwx 4096 Jan 1 2000 00:20:20 +00:00 kirch
15508 -rw- 258065648 Sep 4 2013 14:19:03 +00:00 cat3k_caa-universalk9.SSA.03.12.02.EZP.150-12.02.EZP.150-12.02.EZP.bin
162196684
```

**Step 3**

Boot up the system:

SwitchControllerDevice: **boot**

You are prompted to start the setup program. To continue with password recovery, enter **N** at the prompt:

```
Continue with the configuration dialog? [yes/no]: N
```

**Step 4**

At the switch prompt, enter privileged EXEC mode:

SwitchControllerDevice> **enable**
Step 5  Enter global configuration mode:
SwitchControllerDevice# configure terminal

Step 6  Change the password:
SwitchControllerDevice(config)# enable secret password

The secret password can be from 1 to 25 alphanumeric characters, can start with a number, is case sensitive, and allows spaces but ignores leading spaces.

Step 7  Return to privileged EXEC mode:
SwitchControllerDevice(config)# exit
SwitchControllerDevice#

Note  Before continuing to Step 9, power on any connected stack members and wait until they have completely initialized.

Step 8  Write the running configuration to the startup configuration file:
SwitchControllerDevice# copy running-config startup-config

The new password is now in the startup configuration.

Step 9  You must now reconfigure the switch. If the system administrator has the backup switch and VLAN configuration files available, you should use those.

Preventing Switch Stack Problems

To prevent switch stack problems, you should do the following:

• Make sure that the switches that you add to or remove from the switch stack are powered off. For all powering considerations in switch stacks, see the “Switch Installation” chapter in the hardware installation guide.

• Press the Mode button on a stack member until the Stack mode LED is on. The last two port LEDs on the switch should be green. Depending on the switch model, the last two ports are either 10/100/1000 ports or small form-factor pluggable (SFP) module. If one or both of the last two port LEDs are not green, the stack is not operating at full bandwidth.

• We recommend using only one CLI session when managing the switch stack. Be careful when using multiple CLI sessions to the active switch. Commands that you enter in one session are not displayed in the other sessions. Therefore, it is possible that you might not be able to identify the session from which you entered a command.

• Manually assigning stack member numbers according to the placement of the switches in the stack can make it easier to remotely troubleshoot the switch stack. However, you need to remember that the switches have manually assigned numbers if you add, remove, or rearrange switches later. Use the switch current-stack-member-number renumber new-stack-member-number global configuration command to manually assign a stack member number.
If you replace a stack member with an identical model, the new switch functions with the exact same configuration as the replaced switch. This is also assuming the new switch is using the same member number as the replaced switch.

Removing powered-on stack members causes the switch stack to divide (partition) into two or more switch stacks, each with the same configuration. If you want the switch stacks to remain separate, change the IP address or addresses of the newly created switch stacks. To recover from a partitioned switch stack, follow these steps:

1. Power off the newly created switch stacks.
2. Reconnect them to the original switch stack through their StackWise Plus ports.
3. Power on the switches.

**Preventing Autonegotiation Mismatches**

The IEEE 802.3ab autonegotiation protocol manages the switch settings for speed (10 Mb/s, 100 Mb/s, and 1000 Mb/s, excluding SFP module ports) and duplex (half or full). There are situations when this protocol can incorrectly align these settings, reducing performance. A mismatch occurs under these circumstances:

- A manually set speed or duplex parameter is different from the manually set speed or duplex parameter on the connected port.
- A port is set to autonegotiate, and the connected port is set to full duplex with no autonegotiation.

To maximize switch performance and ensure a link, follow one of these guidelines when changing the settings for duplex and speed:

- Let both ports autonegotiate both speed and duplex.
- Manually set the speed and duplex parameters for the ports on both ends of the connection.

**Note**

If a remote device does not autonegotiate, configure the duplex settings on the two ports to match. The speed parameter can adjust itself even if the connected port does not autonegotiate.

**Troubleshooting SFP Module Security and Identification**

Cisco small form-factor pluggable (SFP) modules have a serial EEPROM that contains the module serial number, the vendor name and ID, a unique security code, and cyclic redundancy check (CRC). When an SFP module is inserted in the switch, the switch software reads the EEPROM to verify the serial number, vendor name and vendor ID, and recompute the security code and CRC. If the serial number, the vendor name or vendor ID, the security code, or CRC is invalid, the software generates a security error message and places the interface in an error-disabled state.
The security error message references the GBIC_SECURITY facility. The switch supports SFP modules and does not support GBIC modules. Although the error message text refers to GBIC interfaces and modules, the security messages actually refer to the SFP modules and module interfaces.

If you are using a non-Cisco SFP module, remove the SFP module from the switch, and replace it with a Cisco module. After inserting a Cisco SFP module, use the errdisable recovery cause gbic-invalid global configuration command to verify the port status, and enter a time interval for recovering from the error-disabled state. After the elapsed interval, the switch brings the interface out of the error-disabled state and retries the operation.

If the module is identified as a Cisco SFP module, but the system is unable to read vendor-data information to verify its accuracy, an SFP module error message is generated. In this case, you should remove and reinser the SFP module. If it continues to fail, the SFP module might be defective.

**Monitoring SFP Module Status**

You can check the physical or operational status of an SFP module by using the show interfaces transceiver privileged EXEC command. This command shows the operational status, such as the temperature and the current for an SFP module on a specific interface and the alarm status. You can also use the command to check the speed and the duplex settings on an SFP module.

**Executing Ping**

If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or have IP routing configured to route between those subnets.

IP routing is disabled by default on all switches.

**Note**

Though other protocol keywords are available with the ping command, they are not supported in this release.

Use this command to ping another device on the network from the switch:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ping ip host</td>
<td>address</td>
</tr>
<tr>
<td>SwitchControllerDevice# ping 172.20.52.3</td>
<td></td>
</tr>
</tbody>
</table>

**Related Topics**

Ping, on page 309

Example: Pinging an IP Host, on page 333
Monitoring Temperature

The switch monitors the temperature conditions and uses the temperature information to control the fans. Use the `show env temperature status` privileged EXEC command to display the temperature value, state, and thresholds. The temperature value is the temperature in the switch (not the external temperature). You can configure only the yellow threshold level (in Celsius) by using the `system env temperature threshold yellow value` global configuration command to set the difference between the yellow and red thresholds. You cannot configure the green or red thresholds.

Monitoring the Physical Path

You can monitor the physical path that a packet takes from a source device to a destination device.

### Table 31: Monitoring the Physical Path

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>`tracetroutemac [interface interface-id]</td>
<td>Displays the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address.</td>
</tr>
<tr>
<td>{source-mac-address} [interface interface-id]</td>
<td></td>
</tr>
<tr>
<td>{destination-mac-address} [vlan vlan-id]</td>
<td></td>
</tr>
<tr>
<td>[detail]</td>
<td></td>
</tr>
<tr>
<td>`tracetroutemac ip {source-ip-address</td>
<td></td>
</tr>
<tr>
<td>source-hostname} {destination-ip-address</td>
<td></td>
</tr>
<tr>
<td>destination-hostname} [detail]</td>
<td></td>
</tr>
</tbody>
</table>

Executing IP Traceroute

Though other protocol keywords are available with the `traceroute` privileged EXEC command, they are not supported in this release.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>traceroute ip host</code></td>
<td>Traces the path that packets take through the network.</td>
</tr>
<tr>
<td>SwitchControllerDevice#</td>
<td></td>
</tr>
<tr>
<td>traceroute ip 192.51.100.1</td>
<td></td>
</tr>
</tbody>
</table>

Related Topics

- IP Traceroute, on page 311
- Example: Performing a Traceroute to an IP Host, on page 333
Running TDR and Displaying the Results

When you run TDR on an interface, you can run it on the active switch or a stack member. To run TDR, enter the `test cable-diagnostics tdr interface interface-id` privileged EXEC command. To display the results, enter the `show cable-diagnostics tdr interface interface-id` privileged EXEC command.

Redirecting Debug and Error Message Output

By default, the network server sends the output from `debug` commands and system error messages to the console. If you use this default, you can use a virtual terminal connection to monitor debug output instead of connecting to the console port or the Ethernet management port.

Possible destinations include the console, virtual terminals, internal buffer, and UNIX hosts running a syslog server. The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX and its derivatives.

Be aware that the debugging destination you use affects system overhead. When you log messages to the console, very high overhead occurs. When you log messages to a virtual terminal, less overhead occurs. Logging messages to a syslog server produces even less, and logging to an internal buffer produces the least overhead of any method.

Related Topics

"Debug Commands," on page 312

Using the `show platform forward` Command

The output from the `show platform forward` privileged EXEC command provides some useful information about the forwarding results if a packet entering an interface is sent through the system. Depending upon the parameters entered about the packet, the output provides lookup table results and port maps used to calculate forwarding destinations, bitmaps, and egress information.

Most of the information in the output from the command is useful mainly for technical support personnel, who have access to detailed information about the switch application-specific integrated circuits (ASICs). However, packet forwarding information can also be helpful in troubleshooting.

Configuring OBFL

We recommend that you do not disable OBFL and that you do not remove the data stored in the flash memory.
• To enable OBFL, use the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command. On switches, the range for `switch-number` is from 1 to 9. Use the `message level level` parameter to specify the severity of the hardware-related messages that the switch generates and stores in the flash memory.

• To copy the OBFL data to the local network or a specific file system, use the `copy onboard switch switch-number url url-destination` privileged EXEC command.

• To disable OBFL, use the `no hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

• To clear all the OBFL data in the flash memory except for the uptime and CLI command information, use the `clear onboard switch switch-number` privileged EXEC command.

• In a switch stack, you can enable OBFL on a standalone switch or on all stack members by using the `hw-switch switch [switch-number] logging onboard [message level level]` global configuration command.

• You can enable or disable OBFL on a member switch from the active switch.

## Example: Verifying the Problem and Cause for High CPU Utilization

To determine if high CPU utilization is a problem, enter the `show processes cpu sorted` privileged EXEC command. Note the underlined information in the first line of the output example.

```
SwitchControllerDevice# show processes cpu sorted
CPU utilization for five seconds: 8%/0%; one minute: 7%; five minutes: 8%
PID Runtime(ms) Invoked uSecs 5Sec 1Min 5Min TTY Process
309 42289103 752750 56180 1.75% 1.20% 1.22% 0 RIP Timers
140 8820183 4942081 1784 0.63% 0.37% 0.30% 0 HRPC qos request
100 3427318 16150534 212 0.47% 0.14% 0.11% 0 HRPC pm-counters
192 3093252 14081112 219 0.31% 0.14% 0.11% 0 Spanning Tree
143 8 37 216 0.15% 0.01% 0.00% 0 Exec
...<output truncated>
```

This example shows normal CPU utilization. The output shows that utilization for the last 5 seconds is 8%/0%, which has this meaning:

- The total CPU utilization is 8 percent, including both time running Cisco IOS processes and time spent handling interrupts.
- The time spent handling interrupts is zero percent.
### Table 33: Troubleshooting CPU Utilization Problems

<table>
<thead>
<tr>
<th>Type of Problem</th>
<th>Cause</th>
<th>Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt percentage value is almost as high as total CPU utilization value.</td>
<td>The CPU is receiving too many packets from the network.</td>
<td>Determine the source of the network packet. Stop the flow, or change the switch configuration. See the section on &quot;Analyzing Network Traffic.&quot;</td>
</tr>
<tr>
<td>Total CPU utilization is greater than 50% with minimal time spent on interrupts.</td>
<td>One or more Cisco IOS process is consuming too much CPU time. This is usually triggered by an event that activated the process.</td>
<td>Identify the unusual event, and troubleshoot the root cause. See the section on &quot;Debugging Active Processes.&quot;</td>
</tr>
</tbody>
</table>
Scenarios for Troubleshooting the Software Configuration

Scenarios to Troubleshoot Power over Ethernet (PoE)

Table 34: Power over Ethernet Troubleshooting Scenarios

<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Only one port does not have PoE.</td>
<td>Verify that the powered device works on another PoE port. Use the <code>show run</code>, or <code>show interface status</code> user EXEC commands to verify that the port is not shut down or error-disabled.</td>
</tr>
<tr>
<td>Trouble is on only one switch port. PoE and non-PoE devices do not work on this port, but do on other ports.</td>
<td><strong>Note</strong> Most switches turn off port power when the port is shut down, even though the IEEE specifications make this optional. Verify that the Ethernet cable from the powered device to the switch port is good: Connect a known good non-PoE Ethernet device to the Ethernet cable, and make sure that the powered device establishes a link and exchanges traffic with another host. Verify that the total cable length from the switch front panel to the powered device is not more than 100 meters. Disconnect the Ethernet cable from the switch port. Use a short Ethernet cable to connect a known good Ethernet device directly to this port on the switch front panel (not on a patch panel). Verify that it can establish an Ethernet link and exchange traffic with another host, or ping the port VLAN SVI. Next, connect a powered device to this port, and verify that it powers on. If a powered device does not power on when connected with a patch cord to the switch port, compare the total number of connected powered devices to the switch power budget (available PoE). Use the <code>show inline power</code> command to verify the amount of available power.</td>
</tr>
</tbody>
</table>
### Symptom or Problem

No PoE on all ports or a group of ports.

Trouble is on all switch ports. Nonpowered Ethernet devices cannot establish an Ethernet link on any port, and PoE devices do not power on.

### Possible Cause and Solution

If there is a continuous, intermittent, or reoccurring alarm related to power, replace the power supply if possible it is a field-replaceable unit. Otherwise, replace the switch.

If the problem is on a consecutive group of ports but not all ports, the power supply is probably not defective, and the problem could be related to PoE regulators in the switch.

Use the `show log` privileged EXEC command to review alarms or system messages that previously reported PoE conditions or status changes.

If there are no alarms, use the `show interface status` command to verify that the ports are not shut down or error-disabled. If ports are error-disabled, use the `shut` and `no shut` interface configuration commands to reenable the ports.

Use the `show env power` and `show power inline` privileged EXEC commands to review the PoE status and power budget (available PoE).

Review the running configuration to verify that `power inline never` is not configured on the ports.

Connect a nonpowered Ethernet device directly to a switch port. Use only a short patch cord. Do not use the existing distribution cables. Enter the `shut` and `no shut` interface configuration commands, and verify that an Ethernet link is established. If this connection is good, use a short patch cord to connect a powered device to this port and verify that it powers on. If the device powers on, verify that all intermediate patch panels are correctly connected.

Disconnect all but one of the Ethernet cables from switch ports. Using a short patch cord, connect a powered device to only one PoE port. Verify the powered device does not require more power than can be delivered by the switch port.

Use the `show power inline` privileged EXEC command to verify that the powered device can receive power when the port is not shut down. Alternatively, watch the powered device to verify that it powers on.

If a powered device can power on when only one powered device is connected to the switch, enter the `shut` and `no shut` interface configuration commands on the remaining ports, and then reconnect the Ethernet cables one at a time to the switch PoE ports. Use the `show interface status` and `show power inline` privileged EXEC commands to monitor inline power statistics and port status.

If there is still no PoE at any port, a fuse might be open in the PoE section of the power supply. This normally produces an alarm. Check the log again for alarms reported earlier by system messages.
<table>
<thead>
<tr>
<th>Symptom or Problem</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco IP Phone disconnects or resets. After working normally, a Cisco phone or wireless access point intermittently reloads or disconnects from PoE.</td>
<td>Verify all electrical connections from the switch to the powered device. Any unreliable connection results in power interruptions and irregular powered device functioning such as erratic powered device disconnects and reloaded. Verify that the cable length is not more than 100 meters from the switch port to the powered device. Notice what changes in the electrical environment at the switch location or what happens at the powered device when the disconnect occurs. Notice whether any error messages appear at the same time a disconnect occurs. Use the <code>show log</code> privileged EXEC command to review error messages. Verify that an IP phone is not losing access to the Call Manager immediately before the reload occurs. (It might be a network problem and not a PoE problem.) Replace the powered device with a non-PoE device, and verify that the device works correctly. If a non-PoE device has link problems or a high error rate, the problem might be an unreliable cable connection between the switch port and the powered device.</td>
</tr>
<tr>
<td>Non-Cisco powered device does not work on Cisco PoE switch. A non-Cisco powered device is connected to a Cisco PoE switch, but never powers on or powers on and then quickly powers off. Non-PoE devices work normally.</td>
<td>Use the <code>show power inline</code> command to verify that the switch power budget (available PoE) is not depleted before or after the powered device is connected. Verify that sufficient power is available for the powered device type before you connect it. Use the <code>show interface status</code> command to verify that the switch detects the connected powered device. Use the <code>show log</code> command to review system messages that reported an overcurrent condition on the port. Identify the symptom precisely: Does the powered device initially power on, but then disconnect? If so, the problem might be an initial surge-in (or <code>inrush</code>) current that exceeds a current-limit threshold for the port.</td>
</tr>

Configuration Examples for Troubleshooting Software

Example: Pinging an IP Host

This example shows how to ping an IP host:

SwitchControllerDevice# ping 172.20.52.3

Type escape sequence to abort.
Sending 5, 100-byte ICMP Echoes to 172.20.52.3, timeout is 2 seconds: !!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
SwitchControllerDevice#

Table 35: Ping Output Display Characters

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
<td>Each exclamation point means receipt of a reply.</td>
</tr>
<tr>
<td>.</td>
<td>Each period means the network server timed out while waiting for a reply.</td>
</tr>
<tr>
<td>U</td>
<td>A destination unreachable error PDU was received.</td>

Example: Performing a Traceroute to an IP Host

This example shows how to perform a traceroute to an IP host:

SwitchControllerDevice# traceroute ip 192.0.2.10

Type escape sequence to abort.
Tracing the route to 192.0.2.10
The display shows the hop count, the IP address of the router, and the round-trip time in milliseconds for each of the three probes that are sent.

Table 36: Traceroute Output Display Characters

<table>
<thead>
<tr>

Example: Enabling All System Diagnostics

Caution

Because debugging output takes priority over other network traffic, and because the debug all privileged EXEC command generates more output than any other debug command, it can severely diminish switch performance or even render it unusable. In virtually all cases, it is best to use more specific debug commands.
This command disables all-system diagnostics:

```
SwitchControllerDevice# debug all
```

The `no debug all` privileged EXEC command disables all diagnostic output. Using the `no debug all` command is a convenient way to ensure that you have not accidentally left any `debug` commands enabled.
