Text Part Number: OL-23829-01
Catalyst 4500 Series IOS Commands

New Commands
average-packet-size (netflow-lite monitor submode)
clear ip wccp
clear netflow-lite exporter statistics
clear netflow-lite monitor statistics interface
cos (netflow-lite exporter submode)
destination (netflow-lite exporter submode)
dscp (netflow-lite exporter submode)
export-protocol (netflow-lite exporter submode)
exporter (netflow-lite monitor submode)
hw-module system max-queue-limit
ip admission proxy http refresh-all
ip wccp check services all
ip wccp group-listen
ip wccp redirect
ip wccp redirect exclude in
netflow-lite exporter
netflow-lite monitor
netflow-lite sampler
options timeout (netflow-lite exporter submode)
packet-offset (netflow-lite sampler submode)
packet-rate (netflow-lite sampler submode)
packet-section size (netflow-lite sampler submode)
port-channel standalone-disable
qos account layer-all encapsulation
sampler (netflow-lite monitor submode)
show ip wccp
show netflow-lite exporter
show netflow-lite monitor
show netflow-lite sampler
source (netflow-lite exporter submode)
source-interface
source-ip-address
template data timeout (netflow-lite exporter submode)
transport udp (netflow-lite exporter submode)
transport udp load-share (netflow-lite exporter submode)
ttl (netflow-lite exporter submode)
vrf (netflow-lite exporter submode)

Revised Commands
authentication event
ip wccp
private-vlan
rep admin vlan
rep block port
rep lsl-age-timer
rep preempt delay
rep preempt segment
rep segment
rep stcn
show interfaces switchport
show vlan private-vlan

A Commands
aaa accounting dot1x default start-stop group radius
aaa accounting system default start-stop group radiusclear mac-address-table
access-group mode
access-list hardware capture mode
access-list hardware entries
access-list hardware region
action
apply
ancp client server
ancp mode client
apply
arp access-list
attach module
authentication control-direction
authentication critical recovery delay
authentication event
authentication fallback
authentication host-mode
authentication open
authentication order
authentication periodic
authentication port-control
authentication priority
authentication timer
authentication violation
auto qos voip
auto-sync
average-packet-size (netflow-lite monitor submode)

C Commands

call-home (global configuration)
call-home request
call-home send
call-home send alert-group
call-home test
channel-group
channel-protocol
cisp enable
class-map
clear counters
clear errdisable
clear hw-module slot password
clear interface gigabitethernet
clear interface vlan
clear ip access-template
clear ip arp inspection log
clear ip arp inspection statistics
clear ip dhcp snooping binding
clear ip dhcp snooping database
clear ip dhcp snooping database statistics
clear ip igmp group
clear ip mfib counters
clear ip mfib fastdrop
clear ip wccp
clear lacp counters
clear netflow-lite exporter statistics
clear netflow-lite monitor statistics interface
clear nmsp statistics
clear mac-address-table dynamic
clear pagp
clear port-security
clear pppoe intermediate-agent statistics
clear qos
clear vlan counters
clear vmps statistics
control-plane
cos (netflow-lite exporter submode)
counter

D Commands
debug adjacency
debug backup
debug condition interface
debug condition standby
debug condition vlan
debug dot1x
debug etherchnl
debug interface
debug ip dhcp snooping event
debug ip dhcp snooping packet
debug ip verify source packet
debug ipc
debug lacp
debug monitor
debug nmbs
debug nvram
debug pagp
debug platform packet protocol lacp
debug platform packet protocol pagp
debug pm
debug port-security
debug pppoe intermediate-agent
debug redundancy
debug spanning-tree
debug spanning-tree backbonefast
debug spanning-tree switch
debug spanning-tree uplinkfast
debug sw-vlan
debug sw-vlan ifs
debug sw-vlan notification
debug sw-vlan vtp
debug udld
debug vqpc
define interface-range
deny
destination (netflow-lite exporter submode)
diagnostic fpga soft-error recover
diagnostic monitor action
diagnostic start
dot1x auth-fail max-attempts
dot1x auth-fail vlan
dot1x credentials (global configuration)
dot1x critical
dot1x critical eapol
dot1x critical recovery delay
dot1x critical vlan
dot1x control-direction
dot1x guest-vlan
dot1x guest-vlan supplicant
dot1x host-mode
dot1x initialize
dot1x mac-auth-bypass
dot1x max-reauth-req
dot1x max-req
dot1x port-control
dot1x re-authenticate
dot1x re-authentication
dot1x system-auth-control
dot1x timeout
dscp (netflow-lite exporter submode)
duplex

E Commands
erase
errdisable detect
errdisable recovery
export-protocol (netflow-lite exporter submode)
extporter (netflow-lite monitor submode)

F Commands
flowcontrol

H Commands
hardware statistics
hw-module port-group
hw-module power
hw-module system max-queue-limit
hw-module uplink mode shared-backplane
hw-module uplink select

I Commands
instance
interface
interface port-channel
interface range
interface vlan
ip admission proxy http refresh-all
ip arp inspection filter vlan
ip arp inspection limit (interface)
ip arp inspection log-buffer
ip arp inspection trust
ip arp inspection validate
ip arp inspection vlan
ip arp inspection vlan logging
ip cef load-sharing algorithm
ip dhcp snooping
ip dhcp snooping binding
ip dhcp snooping database
ip dhcp snooping information option
ip dhcp snooping information option allow-untrusted
ip dhcp snooping limit rate
ip dhcp snooping trust
ip dhcp snooping vlan
ip device tracking maximum
ip igmp filter
ip igmp max-groups
ip igmp profile
ip igmp query-interval
ip igmp snooping
ip igmp snooping report-suppression
ip igmp snooping vlan
ip igmp snooping vlan explicit-tracking
ip igmp snooping vlan immediate-leave
ip igmp snooping vlan mrouter
ip igmp snooping vlan static
ip local-proxy-arp
ip mfib fastdrop
ip route-cache flow
ip source binding
ip sticky-arp
ip verify header vlan all
ip verify source
ip verify unicast source reachable-via
ip wccp
ip wccp check services all
ip wccp group-listen
ip wccp redirect
p wccp redirect exclude in
ipv6 mld snooping
ipv6 mld snooping last-listener-query-count
ipv6 mld snooping last-listener-query-interval
ipv6 mld snooping listener-message-suppression
ipv6 mld snooping robustness-variable
ipv6 mld snooping tcn
ipv6 mld snooping vlan
issu abortversion
issu acceptversion
issu commitversion
redundancy config-sync mismatched-commands
issu loadversion
issu runversion
issu set rollback-timer

**L Commands**

l2protocol-tunnel
l2protocol-tunnel cos
l2protocol-tunnel drop-threshold
l2protocol-tunnel shutdown-threshold
lacp port-priority
lacp system-priority
lldp tlv-select power-management
logging event trunk-status global (global configuration)
logging event link-status global (global configuration)
logging event link-status (interface configuration)
logging event trunk-status (interface configuration)

**M Commands**

match
mac access-list extended
mac-address-table aging-time
mac-address-table dynamic group protocols
mac address-table learning vlan
mac-address-table notification
mac-address-table static
macro apply cisco-desktop
macro apply cisco-phone
macro apply cisco-router
macro apply cisco-switch
macro auto device
macro auto execute (built-in function)
macro auto execute (remotely-defined trigger)
macro auto execute (user-defined function)
macro auto global processing
macro auto mac-address-group
macro auto processing
macro auto sticky
macro global apply cisco-global
macro global apply system-cpp
macro global description
main-cpu
match
match flow ip
mdix auto
media-type
mode
monitor session
mtu

**O Commands**

options timeout (netflow-lite exporter submode)

**N Commands**

name
netflow-lite exporter
netflow-lite monitor
netflow-lite sampler

**P Commands**

packet-offset (netflow-lite sampler submode)
packet-rate (netflow-lite sampler submode)
packet-section size (netflow-lite sampler submode)
pagp learn-method
pagp port-priority
passive-interface
permit
policy-map
port-channel load-balance
port-channel standalone-disable
port-security mac-address
port-security mac-address sticky
port-security maximum
power dc input
power efficient-ethernet auto
power inline
power inline logging global
port-security mac-address
power inline police
port-security mac-address
pppoe intermediate-agent format-type (global)
pppoe intermediate-agent (interface)
pppoe intermediate-agent limit rate
pppoe intermediate-agent trust
pppoe intermediate-agent vendor-tag strip
pppoe intermediate-agent (interface vlan-range)
pppoe intermediate-agent (interface vlan-range)
priority
private-vlan
private-vlan mapping
private-vlan synchronize

Q Commands
qos (global configuration mode)
qos (interface configuration mode)
qos account layer-all encapsulation
qos account layer2 encapsulation
qos aggregate-policer
qos cos
qos dbl
qos dscp
qos map cos
qos map dscp
qos map dscp policed
qos rewrite ip dscp
qos trust
qos vlan-based
queue-limit

R Commands
redundancy
redundancy force-switchover
redundancy reload
remote login module
remote-span
renew ip dhcp snooping database
reset
revision

S Commands
sampler (netflow-lite monitor submode)
service-policy (interface configuration)
service-policy (policy-map class)
service-policy input (control-plane)
session module
set
set cos
set dscp
set precedence
set qos-group
shape (interface configuration)
shell trigger
show netflow-lite exporter
show netflow-lite monitor
show netflow-lite sampler
snmp ifindex clear
snmp ifindex persist
snmp-server enable traps
snmp-server ifindex persist
snmp-server ifindex persist compress
snmp trap mac-notification change
source (netflow-lite exporter submode)
spanning-tree backbonefast
spanning-tree bpdufilter
spanning-tree bpduguard
spanning-tree cost
spanning-tree etherchannel guard misconfig
spanning-tree extend system-id
spanning-tree guard
spanning-tree link-type
spanning-tree loopguard default
spanning-tree mode
spanning-tree mst
spanning-tree mst configuration
spanning-tree mst forward-time
spanning-tree mst hello-time
spanning-tree mst max-age
spanning-tree mst max-hops
spanning-tree mst root
spanning-tree pathcost method
spanning-tree portfast (interface configuration mode)
spanning-tree portfast bpdufilter default
spanning-tree portfast bpduguard default
spanning-tree portfast default
spanning-tree port-priority
spanning-tree uplinkfast
spanning-tree vlan
speed
storm-control
storm-control broadcast include multicast
switchport
switchport access vlan
switchport autostate exclude
switchport block
switchport mode
switchport port-security
switchport private-vlan association trunk
switchport private-vlan host-association
switchport private-vlan mapping
switchport private-vlan trunk allowed vlan
switchport private-vlan trunk native vlan tag
switchport trunk
switchport vlan mapping
system mtu

**Show Commands**

show access-group mode interface
show adjacency
show ancp multicast
show arp access-list
show authentication
show auto install status
show auto qos
show bootflash:
show bootvar
show cable-diagnostics tdr
show call-home
show cdp neighbors
show class-map
show diagnostic content
show diagnostic result module
show diagnostic result module test
show diagnostic result module test 2

show vlan access-map
show vlan counters
show vlan dot1q tag native
show vlan group
show vlan internal usage
show vlan mapping
show vlan mtu
show vlan private-vlan
show vlan remote-span
show vmps
show vtp

T Commands

  template data timeout (netflow-lite exporter submode)
test cable-diagnostics tdr
traceroute mac
traceroute mac ip
transport udp (netflow-lite exporter submode)
trust
ttl (netflow-lite exporter submode)
tax-queue

U Commands
udld (global configuration mode)
udld (interface configuration mode)
udld reset
unidirectional
username

V Commands
verify
vlan (VLAN Database mode)
vlan access-map
vlan configuration
vlan database
vlan dot1q tag native
vlan filter
vlan group
vlan internal allocation policy
vmps reconfirm (global configuration)
vmps reconfirm (privileged EXEC)
vmps retry
vmps server
vrf (netflow-lite exporter submode)
vtp (global configuration mode)
vtp client
vtp domain
vtp password
vtp pruning
vtp server
vtp transparent
vtp v2-mode

Preface

This preface describes the audience, organization, and conventions of this publication, and provides information on how to obtain related documentation.

Audience

This publication is for experienced network administrators who are responsible for configuring and maintaining Catalyst 4500 series switches.

Organization

This publication is organized as follows:

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>Command-Line Interface</td>
<td>Describes the Catalyst 4500 series switch CLI.</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>Cisco IOS Commands for the Catalyst 4500 Series Switches</td>
<td>Lists all Catalyst 4500 series Cisco IOS commands alphabetically and provides detailed information on each command.</td>
</tr>
<tr>
<td>Appendix A</td>
<td>Abbreviations</td>
<td>Defines the acronyms used in this publication.</td>
</tr>
</tbody>
</table>

Related Documentation

The Catalyst 4500 series Cisco IOS documentation set includes these publications:

- Catalyst 4500 Series Switch Installation Guide
- Catalyst 4500 Series Switch Supervisor Engine Installation Note
- Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide
- Catalyst 4500 Series Switch Cisco IOS System Message Guide
- Release Notes for Catalyst 4500 Series Switch Software
Note

Access the Catalyst 4500 Series Switch documentation library at the URL
http://www.cisco.com/go/cat4500/docs

Other documents in the Cisco IOS documentation set include:
- Cisco IOS Release 12.2 Configuration Guides
- Cisco IOS Release 12.2 Command References

For information about MIBs, refer to this URL:

Conventions

This document uses these conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface</strong> font</td>
<td>Boldface text indicates commands and keywords that you enter literally as shown.</td>
</tr>
<tr>
<td><strong>italic</strong> font</td>
<td>Italic text indicates arguments for which you supply values.</td>
</tr>
<tr>
<td>[x]</td>
<td>Square brackets enclose an optional element (keyword or argument).</td>
</tr>
<tr>
<td></td>
<td>A vertical line indicates a choice within an optional or required set of keywords or arguments.</td>
</tr>
<tr>
<td>[x</td>
<td>y]</td>
</tr>
<tr>
<td>{x</td>
<td>y}</td>
</tr>
<tr>
<td>[x {y</td>
<td>z}]</td>
</tr>
<tr>
<td>string</td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
<tr>
<td><strong>screen</strong> font</td>
<td>Terminal sessions and information the system displays are in <strong>screen</strong> font.</td>
</tr>
<tr>
<td><strong>boldface screen</strong> font</td>
<td>Information you must enter is in <strong>boldface screen</strong> font.</td>
</tr>
<tr>
<td><strong>italic screen</strong> font</td>
<td>Arguments for which you supply values are in <strong>italic screen</strong> font.</td>
</tr>
<tr>
<td>^</td>
<td>The symbol ^ represents the key labeled Control—for example, the key combination ^D in a screen display means hold down the Control key while you press the D key.</td>
</tr>
<tr>
<td>&lt; &gt;</td>
<td>Nonprinting characters, such as passwords, are in angle brackets.</td>
</tr>
</tbody>
</table>
Conventions

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>Default responses to system prompts are in square brackets.</td>
</tr>
<tr>
<td>!, #</td>
<td>An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.</td>
</tr>
</tbody>
</table>

Notes use this convention:

**Note**

Means **reader take note**. Notes contain helpful suggestions or references to material not covered in the publication.

Cautions use this convention:

**Caution**

Means **reader be careful**. In this situation, you might do something that could result in equipment damage or loss of data.

**Notices**

The following notices pertain to this software license.

**OpenSSL/Open SSL Project**

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/).

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com).

This product includes software written by Tim Hudson (tjh@cryptsoft.com).

**License Issues**

The OpenSSL toolkit stays under a dual license, i.e. both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact openssl-core@openssl.org.

**OpenSSL License:**

Copyright © 1998-2007 The OpenSSL Project. All rights reserved.

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.
2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions, and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgment: “This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/)

4. The names “OpenSSL Toolkit” and “OpenSSL Project” must not be used to endorse or promote products derived from this software without prior written permission. For written permission, please contact openssl-core@openssl.org.

5. Products derived from this software may not be called “OpenSSL” nor may “OpenSSL” appear in their names without prior written permission of the OpenSSL Project.

6. Redistributions of any form whatsoever must retain the following acknowledgment:

   “This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (http://www.openssl.org/)”.

This product includes cryptographic software written by Eric Young (eay@cryptsoft.com). This product includes software written by Tim Hudson (tjh@cryptsoft.com).

Original SSLeay License:
Copyright © 1995-1998 Eric Young (eay@cryptsoft.com). All rights reserved.

This package is an SSL implementation written by Eric Young (eay@cryptsoft.com).

The implementation was written so as to conform with Netscapes SSL.

This library is free for commercial and non-commercial use as long as the following conditions are adhered to. The following conditions apply to all code found in this distribution, be it the RC4, RSA, lhash, DES, etc., code; not just the SSL code. The SSL documentation included with this distribution is covered by the same copyright terms except that the holder is Tim Hudson (tjh@cryptsoft.com).

Copyright remains Eric Young’s, and as such any Copyright notices in the code are not to be removed. If this package is used in a product, Eric Young should be given attribution as the author of the parts of the library used. This can be in the form of a textual message at program startup or in documentation (online or textual) provided with the package.

Redistribution and use in source and binary forms, with or without modification, are permitted provided that the following conditions are met:

1. Redistributions of source code must retain the copyright notice, this list of conditions and the following disclaimer.

2. Redistributions in binary form must reproduce the above copyright notice, this list of conditions and the following disclaimer in the documentation and/or other materials provided with the distribution.
3. All advertising materials mentioning features or use of this software must display the following acknowledgement:

“This product includes cryptographic software written by Eric Young (eay@cryptsoft.com)”.

The word ‘cryptographic’ can be left out if the routines from the library being used are not cryptography-related.

4. If you include any Windows specific code (or a derivative thereof) from the apps directory (application code) you must include an acknowledgement: “This product includes software written by Tim Hudson (tjh@cryptsoft.com)”.

THIS SOFTWARE IS PROVIDED BY ERIC YOUNG “AS IS” AND ANY EXPRESS OR IMPLIED WARRANTIES, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE ARE DISCLAIMED. IN NO EVENT SHALL THE AUTHOR OR CONTRIBUTORS BE LIABLE FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, EXEMPLARY, OR CONSEQUENTIAL DAMAGES (INCLUDING, BUT NOT LIMITED TO, PROCUREMENT OF SUBSTITUTE GOODS OR SERVICES; LOSS OF USE, DATA, OR PROFITS; OR BUSINESS INTERRUPTION) HOWEVER CAUSED AND ON ANY THEORY OF LIABILITY, WHETHER IN CONTRACT, STRICT LIABILITY, OR TORT (INCLUDING NEGLIGENCE OR OTHERWISE) ARISING IN ANY WAY OUT OF THE USE OF THIS SOFTWARE, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGE.

The license and distribution terms for any publicly available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution license [including the GNU Public License].

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What’s New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What’s New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.
Chapter 1

Command-Line Interface

This chapter provides information for understanding and using the Cisco IOS command-line interface (CLI) on the Catalyst 4500 series switch. This chapter includes the following sections:

- Getting Help, page 1-1
- How to Find Command Options, page 1-2
- Understanding Command Modes, page 1-5
- Using the No and Default Forms of Commands, page 1-6
- Using the CLI String Search, page 1-6
- Saving Configuration Changes, page 1-11

For an overview of the Catalyst 4500 series switch Cisco IOS configuration, refer to the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide.

Getting Help

To display a list of commands that you can use within a command mode, enter a question mark (?) at the system prompt. You also can display keywords and arguments for each command with this context-sensitive help feature.

Table 1-1 lists commands you can enter to get help that is specific to a command mode, a command, a keyword, or an argument.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>abbreviated-command-entry?</td>
<td>Displays a list of commands that begin with a particular character string. (Do not leave a space between the command and question mark.)</td>
</tr>
<tr>
<td>abbreviated-command-entry&lt;Tab&gt;</td>
<td>Completes a partial command name.</td>
</tr>
<tr>
<td>?</td>
<td>Lists all commands for the command mode.</td>
</tr>
<tr>
<td>command ?</td>
<td>Lists all keywords for the command. Leave a space between the command and the question mark.</td>
</tr>
<tr>
<td>command keyword ?</td>
<td>Lists all arguments for the keyword. Leave a space between the keyword and the question mark.</td>
</tr>
</tbody>
</table>
How to Find Command Options

This section provides an example of how to display syntax for a command. The syntax can consist of optional or required keywords. To display keywords for a command, enter a question mark (?) at the command prompt or after entering part of a command followed by a space. The Catalyst 4500 series switch software displays a list of available keywords along with a brief description of the keywords. For example, if you are in global configuration mode and want to see all the keywords for the arap command, you enter arap ?.

Table 1-2 shows examples of how you can use the question mark (?) to assist you in entering commands and also guides you through entering the following commands:

- interface gigabitethernet 1/1
- channel-group 1 mode auto

Table 1-2 How to Find Command Options

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch> enable                   | Enter the enable command and password to access privileged EXEC commands. You are in privileged EXEC mode when the prompt changes to Switch#.
| Switch# configure terminal       | Enter global configuration mode. You are in global configuration mode when the prompt changes to Switch(config)#. |
| Switch(config)# interface gigabitethernet ? | Enter interface configuration mode by specifying the Gigabit Ethernet interface that you want to configure using the interface gigabitethernet global configuration command. Enter a ? to display what you must enter next on the command line. In this example, you must enter an interface number from 1 to 9 in the format module-number/port-number. You are in interface configuration mode when the prompt changes to Switch(config-if)#. |
| Switch(config)# interface gigabitethernet 1/1 |  |
| Switch(config-if)#               |  |
Table 1-2  How to Find Command Options (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)#?</td>
<td>Enter a ? to display a list of all the interface configuration commands</td>
</tr>
<tr>
<td></td>
<td>available for the Gigabit Ethernet interface.</td>
</tr>
<tr>
<td>Interface configuration</td>
<td></td>
</tr>
<tr>
<td>commands:</td>
<td></td>
</tr>
<tr>
<td>access-expression</td>
<td>Build a bridge boolean access expression</td>
</tr>
<tr>
<td>apollo</td>
<td>Apollo interface subcommands</td>
</tr>
<tr>
<td>appletalk</td>
<td>Appletalk interface subcommands</td>
</tr>
<tr>
<td>arp</td>
<td>Set arp type (arpa, probe, snap) or timeout</td>
</tr>
<tr>
<td>backup</td>
<td>Modify backup parameters</td>
</tr>
<tr>
<td>bandwidth</td>
<td>Set bandwidth informational parameter</td>
</tr>
<tr>
<td>bgp-policy</td>
<td>Apply policy propagated by bgp community string</td>
</tr>
<tr>
<td>bridge-group</td>
<td>Transparent bridging interface parameters</td>
</tr>
<tr>
<td>carrier-delay</td>
<td>Specify delay for interface transitions</td>
</tr>
<tr>
<td>cdp</td>
<td>CDP interface subcommands</td>

Understanding Command Modes

The Cisco IOS user interface on the Catalyst 4500 series switch has many different modes. The commands that are available to you depend on which mode you are currently in. You can obtain a list of commands available for each command mode by entering a question mark (?) at the system prompt.

When you start a session on the Catalyst 4500 series switch, you begin in user mode, often called EXEC mode. Only a limited subset of the commands are available in EXEC mode. In order to have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From privileged EXEC mode, you can enter any EXEC command or enter global configuration mode. Most EXEC commands are one-time commands, such as show commands, which show the current status of a given item, and clear commands, which clear counters or interfaces. The EXEC commands are not saved across reboots of the Catalyst 4500 series switch.

The configuration modes provide a way for you to make changes to the running configuration. When you save changes to the configuration, the changes remain intact when the Catalyst 4500 series switch reboots. From global configuration mode, you can enter interface configuration mode, subinterface configuration mode, and other protocol-specific modes.

ROM-monitor mode is a separate mode used when the Catalyst 4500 series switch cannot boot properly. If your Catalyst 4500 series switch or access server does not find a valid system image when it is booting, or if its configuration file is corrupted at startup, the system might enter ROM-monitor mode.

Table 1-3 provides a summary of the main command modes.

<table>
<thead>
<tr>

</tbody>
</table>
Using the No and Default Forms of Commands

Almost every configuration command has a **no** form. In general, enter the **no** form to disable a function. Use the command without the keyword **no** to reenable a disabled function or to enable a function that is disabled by default. For example, IP routing is enabled by default. To disable IP routing, specify the **no ip routing** command and specify **ip routing** to reenable it. This publication provides the complete syntax for the configuration commands and describes what the **no** form of a command does.

Some configuration commands have a **default** form. The **default** form of a command returns the command setting to its default settings. Most commands are disabled by default, so the **default** form is the same as the **no** form. However, some commands are enabled by default, with variables set to certain default values. In these cases, the **default** form of the command enables the command and returns its variables to their default values.

Using the CLI String Search

The pattern in the command output is referred to as a string. The CLI string search feature allows you to search or filter any **show** or **more** command output and allows you to search and filter at --More-- prompts. This feature is useful when you need to sort through large amounts of output, or if you want to exclude output that you do not need to see.

With the search function, you can begin unfiltered output at the first line that contains a regular expression you specify. You can then specify a maximum of one filter per command or start a new search from the --More-- prompt.

A regular expression is a pattern (a phrase, number, or more complex pattern) software uses to match against **show** or **more** command output. Regular expressions are case sensitive and allow for complex matching requirements. Examples of simple regular expressions are Serial, misses, and 138. Examples of complex regular expressions are 00210..., ( is ), and [Oo]utput.

Table 1-3 Summary of Main Command Modes (continued)

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subinterface configuration</td>
<td>From interface configuration mode, specify a subinterface with an <strong>interface</strong> command.</td>
<td><strong>Switch(config-subif)#</strong></td>
<td>To exit to global configuration mode, enter the <strong>exit</strong> command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To enter privileged EXEC mode, enter the <strong>end</strong> command or press <strong>Ctrl-Z</strong>.</td>
</tr>
<tr>
<td>ROM monitor</td>
<td>From privileged EXEC mode, enter the <strong>reload</strong> EXEC command. Press the Break key during the first 60 seconds while the system is booting.</td>
<td><strong>Rommon&gt;</strong></td>
<td>To exit ROM-monitor mode, you must reload the image by entering the <strong>boot</strong> command. If you use the <strong>boot</strong> command without specifying a file or any other boot instructions, the system boots from the default Flash image (the first image in onboard Flash memory). Otherwise, you can instruct the system to boot from a specific Flash image (using the <strong>boot system flash filename</strong> command).</td>
</tr>
</tbody>
</table>

For more information on command modes, refer to the “Using the Command Line Interface” chapter of the *Configuration Fundamentals Configuration Guide*. 
You can perform three types of filtering:

- Use the **begin** keyword to begin output with the line that contains a specified regular expression.
- Use the **include** keyword to include output lines that contain a specified regular expression.
- Use the **exclude** keyword to exclude output lines that contain a specified regular expression.

You can then search this filtered output at the **--More--** prompts.

---

**Note**

The CLI string search function does not allow you to search or filter backward through previous output; filtering cannot be specified using HTTP access to the CLI.

---

**Regular Expressions**

A regular expression can be a single character that matches the same single character in the command output or multiple characters that match the same multiple characters in the command output. This section describes how to create both single-character patterns and multiple-character patterns and how to create more complex regular expressions using multipliers, alternation, anchoring, and parentheses.

**Single-Character Patterns**

The simplest regular expression is a single character that matches the same single character in the command output. You can use any letter (A-Z, a-z) or digit (0-9) as a single-character pattern. You can also use other keyboard characters (such as ! or ~) as single-character patterns, but certain keyboard characters have special meaning when used in regular expressions. Table 1-4 lists the keyboard characters that have special meaning.

<table>
<thead>
<tr>
<th>Character</th>
<th>Special Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any single character, including white space.</td>
</tr>
<tr>
<td>*</td>
<td>Matches 0 or more sequences of the pattern.</td>
</tr>
<tr>
<td>+</td>
<td>Matches 1 or more sequences of the pattern.</td>
</tr>
<tr>
<td>?</td>
<td>Matches 0 or 1 occurrences of the pattern.</td>
</tr>
<tr>
<td>^</td>
<td>Matches the beginning of the string.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of the string.</td>
</tr>
<tr>
<td>_ (underscore)</td>
<td>Matches a comma (,), left brace ({), right brace (}), left parenthesis ( ( ), right parenthesis ( ) ), the beginning of the string, the end of the string, or a space.</td>
</tr>
</tbody>
</table>

To enter these special characters as single-character patterns, remove the special meaning by preceding each character with a backslash (\). These examples are single-character patterns matching a dollar sign, an underscore, and a plus sign, respectively.

\$ \_ \+
You can specify a range of single-character patterns to match against command output. For example, you can create a regular expression that matches a string containing one of the following letters: a, e, i, o, or u. One and only one of these characters must exist in the string for pattern matching to succeed. To specify a range of single-character patterns, enclose the single-character patterns in square brackets ([ ]). For example,

```
[aeiou]
```

matches any one of the five vowels of the lowercase alphabet, while

```
[abcdABCD]
```

matches any one of the first four letters of the lower- or uppercase alphabet.

You can simplify ranges by entering only the end points of the range separated by a dash (-). Simplify the previous range as follows:

```
[a-dA-D]
```

To add a dash as a single-character pattern in your range, include another dash and precede it with a backslash:

```
[a-dA-D-]
```

You can also include a right square bracket (]) as a single-character pattern in your range. To do so, enter the following:

```
[a-dA-D][]
```

The previous example matches any one of the first four letters of the lower- or uppercase alphabet, a dash, or a right square bracket.

You can reverse the matching of the range by including a caret (^) at the start of the range. This example matches any letter except the ones listed:

```
[^a-dqsv]
```

This example matches anything except a right square bracket (]) or the letter d:

```
[^\]d
```

**Multiple-Character Patterns**

When creating regular expressions, you can also specify a pattern containing multiple characters. You create multiple-character regular expressions by joining letters, digits, or keyboard characters that do not have special meaning. For example, a4% is a multiple-character regular expression. Put a backslash in front of the keyboard characters that have special meaning when you want to remove their special meaning.

With multiple-character patterns, order is important. The regular expression a4% matches the character a followed by a 4 followed by a % sign. If the string does not have a4%, in that order, pattern matching fails. This multiple-character regular expression:

```
a.
```

uses the special meaning of the period character to match the letter a followed by any single character. With this example, the strings ab, a!, or a2 are all valid matches for the regular expression.

You can remove the special meaning of the period character by putting a backslash in front of it. In the following expression:

```
a\.
```

only the string a. matches this regular expression.
You can create a multiple-character regular expression containing all letters, all digits, all keyboard characters, or a combination of letters, digits, and other keyboard characters. These examples are all valid regular expressions:

telebit 3107 v32bis

Multipliers

You can create more complex regular expressions to match multiple occurrences of a specified regular expression by using some special characters with your single- and multiple-character patterns. Table 1-5 lists the special characters that specify “multiples” of a regular expression.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Matches 0 or more single- or multiple-character patterns.</td>
</tr>
<tr>
<td>+</td>
<td>Matches 1 or more single- or multiple-character patterns.</td>
</tr>
<tr>
<td>?</td>
<td>Matches 0 or 1 occurrences of the single- or multiple-character patterns.</td>
</tr>
</tbody>
</table>

This example matches any number of occurrences of the letter a, including none:

\[a^*\]

This pattern requires that at least one letter a in the string is matched:

\[a^+\]

This pattern matches the string bb or bab:

\[ba?b\]

This string matches any number of asterisks (*):

\[**\]

To use multipliers with multiple-character patterns, you enclose the pattern in parentheses. In the following example, the pattern matches any number of the multiple-character string ab:

\[(ab)^*\]

As a more complex example, this pattern matches one or more instances of alphanumeric pairs (but not none; that is, an empty string is not a match):

\[(A-Za-z)[0-9]+\]

The order for matches using multipliers (*, +, or ?) is to put the longest construct first. Nested constructs are matched from outside to inside. Concatenated constructs are matched beginning at the left side of the construct. Thus, the regular expression matches A9b3, but not 9Ab3 because the letters are specified before the numbers.
Alternation

Alternation allows you to specify alternative patterns to match against a string. You separate the alternative patterns with a vertical bar (|). Exactly one of the alternatives can match the string. For example, the regular expression

codex | telebit

matches the string codex or the string telebit, but not both codex and telebit.

Anchoring

You can match a regular expression pattern against the beginning or the end of the string. That is, you can specify that the beginning or end of a string contains a specific pattern. You “anchor” these regular expressions to a portion of the string using the special characters shown in Table 1-6.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches the beginning of the string.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of the string.</td>
</tr>
</tbody>
</table>

This regular expression matches a string only if the string starts with abcd:

^abcd

In contrast, this expression is in a range that matches any single letter, as long as it is not the letters a, b, c, or d:

[^abcd]

With this example, the regular expression matches a string that ends with .12:

$\.12

Contrast these anchoring characters with the special character underscore (_). The underscore matches the beginning of a string (^), the end of a string ($), parentheses (), space (), braces { }, comma (,), or underscore (_). With the underscore character, you can specify that a pattern exist anywhere in the string.

For example:

_1300_

matches any string that has 1300 somewhere in the string. The string’s 1300 can be preceded by or end with a space, brace, comma, or underscore. For example:

{1300_

matches the regular expression, but 21300 and 13000 do not.

Using the underscore character, you can replace long regular expression lists, such as the following:

^1300$ ^1300(space) (space)1300 {1300, ,1300, {1300} ,1300, (1300

with

_1300_
Parentheses for Recall

As shown in the “Multipliers” section on page 1-9, you use parentheses with multiple-character regular expressions to multiply the occurrence of a pattern. You can also use parentheses around a single- or multiple-character pattern to remember a pattern for use elsewhere in the regular expression.

To create a regular expression that recalls a previous pattern, you use parentheses to indicate a remembered specific pattern and a backslash (\) followed by an integer to reuse the remembered pattern. The integer specifies the occurrence of the parentheses in the regular expression pattern. If you have more than one remembered pattern in your regular expression, then \1 indicates the first remembered pattern, \2 indicates the second remembered pattern, and so on.

This regular expression uses parentheses for recall:

```
a(.)bc(.)\1\2
```

This regular expression matches an a followed by any character (call it character 1), followed by bc followed by any character (character 2), followed by character 1 again, followed by character 2 again. So, the regular expression can match aZbcTzT. The software remembers that character 1 is Z and character 2 is T and then uses Z and T again later in the regular expression.

Saving Configuration Changes

To save your configuration changes to your startup configuration so that they will not be lost if there is a system reload or power outage, enter the following command:

```
Switch# copy system:running-config nvram:startup-config
```

Building configuration...

It might take a minute or two to save the configuration. After the configuration has been saved, the following output appears:

```
[OK]
Switch#
```

On most platforms, this step saves the configuration to NVRAM. On the Class A Flash file system platforms, this step saves the configuration to the location specified by the CONFIG_FILE environment variable. The CONFIG_FILE environment variable defaults to NVRAM.

show platform Commands

You should use these commands only when you are working directly with your technical support representative, while troubleshooting a problem. Do not use these commands unless your technical support representative asks you to do so.

Note

The show platform commands are not described in this document.
Cisco IOS Commands for the Catalyst 4500 Series Switches

This chapter contains an alphabetical listing of Cisco IOS commands for the Catalyst 4500 series switches. For information about Cisco IOS commands that are not included in this publication, refer to Cisco IOS Release 12.2 configuration guides and command references at this URL:

#macro keywords

To specify the help string for the macro keywords, use the #macro keywords command.

#macro keywords [keyword1] [keyword2] [keyword3]

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>keyword 1</th>
<th>(Optional) Specifies a keyword that is needed while applying a macro to an interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>keyword 2</td>
<td>(Optional) Specifies a keyword that is needed while applying a macro to an interface.</td>
</tr>
<tr>
<td></td>
<td>keyword 3</td>
<td>(Optional) Specifies a keyword that is needed while applying a macro to an interface.</td>
</tr>
</tbody>
</table>

Defaults

This command has no default settings.

Command Modes

Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If you do not specify the mandatory keywords for a macro, the macro is to be considered invalid and fails when you attempt to apply it. By entering the #macro keywords command, you will receive a message indicating what you need to include to make the syntax valid.

Examples

This example shows how to specify the help string for keywords associated with a macro named test:

Switch(config)# macro name test
macro name test
Enter macro commands one per line. End with the character '@'.
#macro keywords $VLAN $MAX
switchport
@

Switch(config)# int gi1/1
Switch(config-if)# macro apply test ?
  WORD  Keyword to replace with a value e.g $VLAN, $MAX  << It is shown as help
  <cr>

aaa accounting dot1x default start-stop group radius

To enable accounting for 802.1X authentication sessions, use the `aaa accounting dot1x default start-stop group radius` command. To disable accounting, use the `no` form of this command.

```snippet
aaa accounting dot1x default start-stop group radius
no aaa accounting dot1x default start-stop group radius
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Accounting is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
802.1X accounting requires a RADIUS server.

This command enables the Authentication, Authorization, and Accounting (AAA) client’s accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

**Examples**
This example shows how to configure 802.1X accounting:

```shell
Switch(config)# aaa accounting dot1x default start-stop group radius
```

**Note**
The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

**Related Commands**

<table>
<thead>
<tr>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
802.1X accounting requires the RADIUS server.

This command enables the AAA client’s accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

**Examples**
This example shows how to generate a logoff after a switch reboots:
```
Switch(config)# aaa accounting system default start-stop group radius
```

**Note**
The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

**Related Commands**

<table>

access-group mode

To specify the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode), use the `access-group mode` command. To return to preferred port mode, use the `no` form of this command.

```
access-group mode {prefer {port | vlan} | merge}
no access-group mode {prefer {port | vlan} | merge}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefer port</td>
<td>Specifies that the PACL mode take precedence if PACLs are configured. If no PACL features are configured on the port, other features applicable to the interface are merged and applied on the interface.</td>
</tr>
<tr>
<td>prefer vlan</td>
<td>Specifies that the VLAN-based ACL mode take precedence. If no VLAN-based ACL features are configured on the port’s VLAN, the PACL features on the port are applied.</td>
</tr>
<tr>
<td>merge</td>
<td>Merges applicable ACL features before they are programmed into the hardware.</td>
</tr>
</tbody>
</table>

### Defaults

PACL override mode

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

On the Layer 2 interface, prefer port, prefer VLAN, and merge modes are supported. A Layer 2 interface can have one IP ACL applied in either direction (one inbound and one outbound).

### Examples

This example shows how to make the PACL mode on the switch take effect:
```
(config-if)# access-group mode prefer port
```

This example shows how to merge applicable ACL features:
```
(config-if)# access-group mode merge
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

Before configuring the capture mode, it is best to examine and modify your configuration to globally disable features such as DHCP snooping or IGMP snooping, and instead enable them on specific VLANs.

When changing to path managed mode, be aware that control traffic may be bridged in hardware or dropped initially until the per-vlan CAM entries are programmed in hardware.

You must ensure that any access control configuration on a member port or VLAN does not deny or drop the control packets from being forwarded to the CPU for the features which are enabled on the VLAN. If control packets are not permitted then the specific feature does not function.

**Examples**

This example shows how to configure the switch to capture control packets on VLANs that are configured to enable capturing control packets:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode vlan
Switch(config)# end
Switch#
```

This example shows how to configure the switch to capture control packets globally across all VLANs (using a static ACL):

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode global
Switch(config)# end
Switch#
```
This example shows another way to configure the switch to capture control packets globally across all VLANs:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# no access-list hardware capture mode vlan
Switch(config)# end
Switch#
access-list hardware entries

To designate how ACLs are programmed into the switch hardware, use the `access-list hardware entries` command.

```
access-list hardware entries {packed | scattered}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>packed</th>
<th>scattered</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Directs the software to use the first entry with a matching mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.</td>
<td>Directs the software to use the first entry with a free mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.</td>
</tr>
</tbody>
</table>

**Defaults**

The ACLs are programmed as packed.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Two types of hardware resources are used when ACLs are programmed: entries and masks. If one of these resources is consumed, no additional ACLs can be programmed into the hardware. If the masks are consumed, but the entries are available, change the programming algorithm from `packed` to `scattered` to make the masks available. This action allows additional ACLs to be programmed into the hardware.

The goal is to use TCAM resources more efficiently; that is, to minimize the number of masks per ACL entries. To compare TCAM utilization when using the `scattered` or `packed` algorithms, use the `show platform hardware acl statistics utilization brief` command. To change the algorithm from `packed` to `scattered`, use the `access-list hardware entries` command.

**Examples**

This example shows how to program ACLs into the hardware as packed. After they are programmed, you will need 89 percent of the masks to program only 49 percent of the ACL entries.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries packed
Switch(config)# end
Switch# 01:15:34: %SYS-5-CONFIG_I: Configured from console by console
Switch# Switch# show platform hardware acl statistics utilization brief
Entries/Total(%)  Masks/Total(%)
-----------------  ---------------
Input  Acl(PortAndVlan)  2016 / 4096 ( 49)   460 /  512 ( 89)
Input  Acl(PortOrVlan)   6 /  4096 (  0)      4 /  512 (  0)
Input  Qos(PortAndVlan)  0 /  4096 (  0)      0 /  512 (  0)
Input  Qos(PortOrVlan)   0 /  4096 (  0)      0 /  512 (  0)
```
This example shows how to reserve space (scatter) between ACL entries in the hardware. The number of masks required to program 49 percent of the entries has decreased to 49 percent.

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries scattered
Switch(config)# end
Switch# 01:39:37: %SYS-5-CONFIG_I: Configured from console by console
Switch# Switch# show platform hardware acl statistics utilization brief
Entries/Total(%)  Masks/Total(%)  
-----------------  ---------------
Input  Acl(PortAndVlan)  2016 / 4096 ( 49)   252 /  512 ( 49)
Input  Acl(PortOrVlan)   6 / 4096 (  0)     5 /  512 (  0)
Input  Qos(PortAndVlan)  0 / 4096 (  0)     0 /  512 (  0)
Input  Qos(PortOrVlan)   0 / 4096 (  0)     0 /  512 (  0)
Output Acl(PortAndVlan)  0 / 4096 (  0)     0 /  512 (  0)
Output Acl(PortOrVlan)   0 / 4096 (  0)     0 /  512 (  0)
Output Qos(PortAndVlan)  0 / 4096 (  0)     0 /  512 (  0)
Output Qos(PortOrVlan)   0 / 4096 (  0)     0 /  512 (  0)

L4Ops: used 2 out of 64
Switch#
# access-list hardware region

To modify the balance between TCAM regions in hardware, use the `access-list hardware region` command.

```bash
access-list hardware region {feature | qos} {input | output} balance {bal-num}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>feature</th>
<th>Specifies adjustment of region balance for ACLs.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>qos</td>
<td>Specifies adjustment of region balance for QoS.</td>
</tr>
<tr>
<td></td>
<td>input</td>
<td>Specifies adjustment of region balance for input ACL and QoS.</td>
</tr>
<tr>
<td></td>
<td>output</td>
<td>Specifies adjustment of region balance for output ACL and QoS.</td>
</tr>
<tr>
<td></td>
<td>balance</td>
<td>Specifies relative sizes of the PandV and PorV regions in the TCAM; valid values are between 1 and 99.</td>
</tr>
</tbody>
</table>

**Defaults**

The default region balance for each TCAM is 50.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

PandV is a TCAM region containing entries which mask in both the port and VLAN tag portions of the flow label.

PorV is a TCAM region containing entries which mask in either the port or VLAN tag portion of the flow label, but not both.

A balance of 1 allocates the minimum number of PandV region entries and the maximum number of PorV region entries. A balance of 99 allocates the maximum number of PandV region entries and the minimum number of PorV region entries. A balance of 50 allocates equal numbers of PandV and PorV region entries in the specified TCAM.

Balances for the four TCAMs can be modified independently.

**Examples**

This example shows how to enable the MAC notification trap when a MAC address is added to a port:

```bash
Switch# configure terminal
Switch(config)# access-list hardware region feature input balance 75
Switch(config)#
```
action

To specify an action to be taken when a match occurs in a VACL, use the `action` command. To remove an action clause, use the `no` form of this command.

```
action {drop | forward}

no action {drop | forward}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>drop</td>
<td>Sets the action to drop packets.</td>
</tr>
<tr>
<td>forward</td>
<td>Sets the action to forward packets to their destination.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

VLAN access-map mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In a VLAN access map, if at least one ACL is configured for a packet type (IP or MAC), the default action for the packet type is `drop` (deny).

If an ACL is not configured for a packet type, the default action for the packet type is `forward` (permit).

If an ACL for a packet type is configured and the ACL is empty or undefined, the configured action will be applied to the packet type.

**Examples**

This example shows how to define a drop action:

```
Switch(config-access-map)# action drop
```

This example shows how to define a forward action:

```
Switch(config-access-map)# action forward
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match</td>
<td>Specifies a match clause by selecting one or more ACLs for a VLAN access-map sequence.</td>
</tr>

<td>show vlan access-map</td>
<td>Displays the contents of a VLAN access map.</td>
</tr>
<tr>
<td>vlan access-map</td>
<td>Enters VLAN access-map command mode to create a VLAN access map.</td>
</tr>
</tbody>
</table>
active

To enable the destination profile, use the active command.

**active**

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default the profile is enabled upon creation.

**Examples**

This example shows how to enable the destination profile:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# active
```

**Related Commands**

**ancp client port identifier**

To create a mapping for an ANCP client to identify an interface on which ANCP should start or stop a multicast stream, use the `ancp client port identifier` command.

```
ancp client port identifier identifying name vlan vlan number interface interface
```

**Syntax Description**
- `identifying name` Identifier that is used by the ANCP server to specify an interface member of a VLAN.
- `vlan number` VLAN identifier.
- `interface` Interface member of this VLAN.

**Defaults**
This command has no default settings.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The ANCP server can use either the DHCP option 82 circuit ID or an identifier created with this command to identify the port. Use only one of the two methods; do not interchange them. If you use the DHCP option 82, the port identifier used by the ANCP server should be (in hex) 0x01060004[vlan][intf]. For example, VLAN 19 and interface Fast Ethernet 2/3 will provide 0x0106000400130203. If you use the port identifier, however, use the exact string provided on the CLI.

**Note**
This command is available only after you set the box in ANCP client mode with the `ancp mode client` configuration command.

**Examples**
This example shows how to identify interface FastEthernet 7/3 on VLAN 10 with the string NArmstrong:

```
Switch# ancp client port identifier NArmstrong vlan 10 interface FastEthernet 7/3
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ancp mode client</code></td>
<td>Sets the router to become an ANCP client.</td>
</tr>
</tbody>
</table>
ancp client server

To set the IP address of the remote ANCP server, use the **ancp client server** command.

```
ancp client server ipaddr of server interface interface
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddr of server</td>
<td>IP address of the ANCP server the client must connect with TCP.</td>
</tr>
<tr>
<td>interface</td>
<td>Interface to use for the connection.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The interface can be the direct interface connected towards the ANCP server (if only one) or a loopback interface if several interfaces are available for connecting to the server and proper routing is set. (An IP address must be configured on this interface and it should not be in shutdown state.) Along with the **ancp mode client** command, the **ancp client server** command is required in order to activate the ANCP client. Once you enter this command, the ANCP client tries to connect to the remote server.

### Examples

This example shows how to indicate to the ANCP client the IP address of the ANCP server it needs to connect to:

```
Switch# ancp client server 10.1.2.31 interface FastEthernet 2/1
```

### Related Commands

</tr>
</tbody>
</table>
ancp mode client

To set the router to become an ANCP client, use the **ancp mode client** command.

```
ancp mode client
```

**Syntax Description**

No keywords

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To fully activate ANCP, the administrator must also set the ANCP server IP address to which the ANCP client must connect.

**Examples**

This example shows how to set the router to become an ANCP client:

```
Switch# ancp mode client
```

**Related Commands**

</tr>
</tbody>
</table>
apply

To implement a new VLAN database, increment the configuration number, save the configuration number in NVRAM, and propagate the configuration number throughout the administrative domain, use the `apply` command.

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

VLAN configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The `apply` command implements the configuration changes that you made after you entered VLAN database mode and uses them for the running configuration. This command keeps you in VLAN database mode.

You cannot use this command when the switch is in the VTP client mode.

You can verify that the VLAN database changes occurred by entering the `show vlan` command from privileged EXEC mode.

Examples

This example shows how to implement the proposed new VLAN database and to recognize it as the current database:

```
Switch(config-vlan)# apply
Switch(config-vlan)#
```

attach module

To remotely connect to a specific module, use the **attach module** configuration command.

**Syntax Description**

```
attach module mod
```

- **mod**  Target module for the command.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies only to the Access Gateway Module on Catalyst 4500 series switches.

The valid values for `mod` depend on the chassis that are used. For example, if you have a Catalyst 4506 chassis, valid values for the module are from 2 to 6. If you have a 4507R chassis, valid values are from 3 to 7.

When you execute the **attach module** `mod` command, the prompt changes to Gateway#.

This command is identical in the resulting action to the **session module** `mod` and the **remote login module** `mod` commands.

**Examples**

This example shows how to remotely log in to an Access Gateway Module:

```
Switch# attach module 5
Attaching console to module 5
Type 'exit' at the remote prompt to end the session

Gateway>
```

</table>
**authentication control-direction**

To change the port control to unidirectional or bidirectional, use the `authentication control-direction` command in interface configuration mode. To return to the default setting, use the `no` form of this command.

```
authentication control-direction { both | in }
no authentication control-direction
```

**Syntax Description**

- `both` Enables bidirectional control on the port.
- `in` Enables unidirectional control on the port.

**Command Default**

`both`

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `authentication control-direction` command replaces the following dot1x command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
dot1x control-direction { both | in }
```

The IEEE 802.1X standard defines a client-server-based access control and authentication protocol that restricts unauthorized devices from connecting to a LAN through publicly accessible ports.

IEEE 802.1X controls network access by creating two distinct virtual access points at each port. One access point is an uncontrolled port; the other is a controlled port. All traffic through the single port is available to both access points. IEEE 802.1X authenticates each user device that connects to a switch port and assigns the port to a VLAN before making available any services that are offered by the switch or the LAN. Until the device authenticates, 802.1X access control allows only Extensible Authentication Protocol (EAP) over LAN (EAPOL) traffic through the port to which the device connects. After authentication succeeds, normal traffic can pass through the port.

- **Unidirectional state**—When you configure a port as unidirectional with the `dot1x control-direction` interface configuration command, the port changes to the spanning-tree forwarding state. When the unidirectional controlled port is enabled, the connected host is in sleeping mode or power-down state. The host does not exchange traffic with other devices in the network. If the host connected to the unidirectional port that cannot send traffic to the network, the host can only receive traffic from other devices in the network.

- **Bidirectional state**—When you configure a port as bidirectional with the `dot1x control-direction` interface configuration command, the port is access-controlled in both directions. In this state, the switch port sends only EAPOL.
Using the **both** keyword or using the **no** form of this command changes the port to its bidirectional default setting.

Setting the port as bidirectional enables 802.1X authentication with Wake-on-LAN (WoL).

You can verify your settings by entering the `show authentication` privileged EXEC command.

### Examples

The following example shows how to enable unidirectional control:

```
Switch(config-if)# authentication control-direction in
Switch(config-if)#
```

The following example shows how to enable bidirectional control:

```
Switch(config-if)# authentication control-direction both
Switch(config-if)#
```

The following example shows how to return to the default settings:

```
Switch(config-if)# no authentication control-direction
Switch(config-if)#
```

</tr>
</tbody>
</table>
Usage Guidelines

The **authentication event fail** command replaces the following 802.1X commands, which are deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x auth-fail max-attempts count`
- `[no] dot1x auth-fail vlan vlan`

The **authentication event fail** command is supported only for 802.1X to signal authentication failures. By default, this failure type causes the authentication method to be retried. You can configure either to authorize the port in the configured VLAN or to failover to the next authentication method. Optionally, you can specify the number of authentication retries before performing this action.

The **authentication event server** command replaces the following 802.1X commands, which are deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x critical`
- `[no] dot1x critical vlan vlan`
- `[no] dot1x critical recover action initialize`

The **authentication event server** command specifies the behavior when the AAA server becomes unreachable, ports are authorized in the specified VLAN.

The **authentication server alive action** command specifies the action to be taken once the AAA server becomes reachable again.

You can verify your settings by entering the **show authentication** privileged EXEC command.

The **authentication event no-response** command replaces the following 802.1X command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x guest-vlan vlan`

The **authentication event no-response** command specifies the action to be taken when the client does not support 802.1X.

Examples

The following example shows how to specify that when an authentication fails due to bad user credentials, the process advances to the next authentication method:

```
Switch(config-if)# authentication event fail action next-method
```

The following example shows how to specify the AAA server alive actions as reinitialize all authorized clients for authentication events:

```
Switch(config-if)# authentication event server alive action reinitialize
```

The following example shows how to specify the AAA server dead actions that authorize the port for authentication events:

```
Switch(config-if)# authentication event server dead action authorize
```

The following example shows how to specify the conditions when a client doesn’t support 802.1X to authorize the port for authentication events:

```
Switch(config-if)# authentication event authentication event no-response action authorize vlan 10
```

Switch(config-if)#

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, if 802.1X times out and if MAB fails, WebAuth is enabled.

The **authentication fallback** command replaces the following dot1x command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x fallback profile
```

The Webauth fallback feature allows you to have those clients that do not have an 802.1X supplicant and are not managed devices to fall back to the WebAuth method.

You can verify your settings with the **show authentication** privileged EXEC command.

**Examples**

This example shows how to enable WebAuth fallback and specify the fallback profile to use when failing over to WebAuth:

```
Switch(config-if)# authentication fallback fallbacktest1
Switch(config-if)#
```

This example shows how to disable WebAuth fallback:

```
Switch(config-if)# no authentication fallback fallbacktest1
Switch(config-if)#
```

authentication host-mode

To define the classification of a session that will be used to apply the access-policies in host-mode configuration, use the `authentication host-mode` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication host-mode {single-host | multi-auth | multi-domain | multi-host} [open]

[no] authentication host-mode {single-host | multi-auth | multi-domain | multi-host} [open]
```

**Syntax Description**

- **single-host**: Specifies the session as an interface session, and allows one client on the port only. This is the default host mode when enabling 802.1X.
- **multi-auth**: Specifies the session as a MAC-based session. Any number of clients are allowed on a port in data domain and only one client in voice domain, but each one is required to authenticate separately.
- **multi-domain**: Specifies the session based on a combination of MAC address and domain, with the restriction that only one MAC is allowed per domain.
- **multi-host**: Specifies the session as an interface session, but allows more than one client on the port.
- **open**: (Optional) Configures the host-mode with open policy on the port.

**Command Default**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Single-host mode classifies the session as an interface session (for example, one MAC per interface). Only one client is allowed on the port, and any policies that are downloaded for the client are applied to the whole port. A security violation is triggered if more than one client is detected.

Multi-host mode classifies the session as an interface session, but the difference with this host-mode is that it allows more than one client to attach to the port. Only the first client that is detected on the port will be authenticated and the rest will inherit the same access as the first client. The policies that are downloaded for the first client will be applied to the whole port.

Multi-domain mode classifies the session based on a combination of MAC address and domain, with the restriction that only one MAC is allowed per domain. The domain in the switching environment refers to the VLAN, and the two supported domains are the DATA domain and the voice domain. Only one client is allowed on a particular domain. So, only two clients (MACs) per port are supported. Each one is required to authenticate separately. Any policies that are downloaded for the client will be applied for that client’s MAC/IP only and will not affect the other on the same port. The clients can be authenticated using different methods (such as 802.1X for PC, MAB for IP phone, or vice versa). No restriction exists on the authentication order.
The only caveat with the above statement is that web-based authentication is only available for data devices because a user is probably operating the device and HTTP capability exists. Also, if web-based authentication is configured in MDA mode, the only form of enforcement for all types of devices is downloadable ACLs (dACL). The restriction is in place because VLAN assignment is not supported for web-based authentication. Furthermore, if you use dACLs for data devices and not for voice devices, when the user’s data falls back to webauth, voice traffic is affected by the ACL that is applied based on the fallback policy. Therefore if webauth is configured as a fallback on an MDA enabled port, dACL is the only supported enforcement method.

Multi-auth mode classifies the session as a MAC-based. No limit exists for the number of clients allowed on a port data domain. Only one client is allowed in a voice domain and each one is required to authenticate separately. Any policies that are downloaded for the client are applied for that client’s MAC or IP only and do not affect others on the same port.

The optional pre-authentication open access mode allows you to gain network access before authentication is performed. This is primarily required for the PXE boot scenario, but not limited to just that use case, where a device needs to access the network before PXE times out and downloads a bootable image possibly containing a supplicant.

The configuration related to this feature is attached to the host-mode configuration whereby the host-mode itself is significant for the control plane, while the open access configuration is significant for the data plane. Open-access configuration has absolutely no bearing on the session classification. The host-mode configuration still controls this. If the open-access is defined for single-host mode, the port still allows only one MAC address. The port forwards traffic from the start and is only restricted by what is configured on the port. Such configurations are independent of 802.1X. So, if there is no form of access-restriction configured on the port, the client devices have full access on the configured VLAN.

You can verify your settings with the `show authentication` privileged EXEC command.

### Examples

This example shows how to define the classification of a session that are used to apply the access-policies using the host-mode configuration:

```
Switch(config-if)# authentication host-mode single-host
Switch(config-if)#
```

authentication order

To specify the order in which authentication methods should be attempted for a client on an interface, use the authentication order command in interface configuration mode. To return to the default settings, use the no form of this command.

```
authentication order method1 [method2] [method3]
```

```
no authentication order
```

**Syntax Description**

- `method1` Authentication method to be attempted. The valid values are as follows:
  - `dot1x`—Adds the dot1x authentication method.
  - `mab`—Adds the MAB authentication method.
  - `webauth`—Adds the WebAuth authentication method.

- `method2` (Optional) Authentication method to be attempted. The valid values are as follows:
  - `dot1x`—Adds the dot1x authentication method.
  - `mab`—Adds the MAB authentication method.
  - `webauth`—Adds the WebAuth authentication method.

- `method3` (Optional) Authentication method to be attempted. The valid values are as follows:
  - `dot1x`—Adds the dot1x authentication method.
  - `mab`—Adds the MAB authentication method.
  - `webauth`—Adds the WebAuth authentication method.

**Command Default**

The default order is dot1x, MAB, then WebAuth.

**Command Modes**

Interface configuration mode

**Command History**

```
Release Modification
12.2(50)SG Support for this command was introduced.
```

**Usage Guidelines**

Once you enter the authentication order command, only those methods explicitly listed will run. Each method may be entered only once in the run list and no methods may be entered after you enter the webauth keyword.

Authentication methods are applied in the configured (or default) order until authentication succeeds. For authentication fails, failover to the next authentication method occurs (subject to the configuration of authentication event handling).

You can verify your settings with the show authentication privileged EXEC command.
authentication order

Examples

The following example shows how to specify the order in which authentication methods should be attempted for a client on an interface:

Switch(config-if)# authentication order mab dot1x webauth
Switch(config-if)#

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **authentication port-control** command replaces the following dot1x command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x port-control [auto | force-authorized | force-unauthorized]
```

The following guidelines apply to Ethernet switch network modules:

- The 802.1X protocol is supported on Layer 2 static-access ports.
- You can use the **auto** keyword only if the port is not configured as one of the following types:
  - Trunk port—If you try to enable 802.1X on a trunk port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to trunk, the port mode is not changed.
  - EtherChannel port—Before enabling 802.1X on the port, you must first remove it from the EtherChannel. If you try to enable 802.1X on an EtherChannel or on an active port in an EtherChannel, an error message appears, and 802.1X is not enabled. If you enable 802.1X on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.
- Switch Port Analyzer (SPAN) destination port—You can enable 802.1X on a port that is a SPAN destination port; however, 802.1X is disabled until the port is removed as a SPAN destination. You can enable 802.1X on a SPAN source port.

To globally disable 802.1X on the device, you must disable it on each port. There is no global configuration command for this task.

You can verify your settings with the `show authentication` privileged EXEC command.

The `auto` keyword allows you to send and receive only Extensible Authentication Protocol over LAN (EAPOL) frames through the port. The authentication process begins when the link state of the port transitions from down to up or when an EAPOL-start frame is received. The system requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the system through the client’s MAC address.

### Examples

The following example shows that the authentication status of the client PC will be determined by the authentication process:

```
Switch(config-if)# authentication port-control auto
Switch(config-if)#
```

| - `dot1x` | Adds the dot1x authentication method.  
| - `mab` | Adds the MAB authentication method.  
| - `webauth` | Adds the Webauth authentication method. |

### Command Default

The default order is `dot1x`, `MAB`, then `webauth`.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Configuring priorities for authentication methods allows a higher priority method (not currently running) to interrupt an authentication in progress with a lower priority method. Alternatively, if the client is already authenticated, an interrupt from a higher priority method can cause a client, which was previously authenticated using a lower priority method, to reauthenticate.

The default priority of a method is equivalent to its position in the order of execution list. If you do not configure a priority, the relative priorities (highest first) are `dot1x`, `MAB` and then `webauth`. If you enter the `authentication order` command, the default priorities are the same as the configured order.

You can verify your settings with the `show authentication` privileged EXEC command.
Examples

The following example shows how to specify the priority in which authentication methods should be attempted for a client on an interface:

```
Switch(config-if)# authentication priority mab dot1x webauth
Switch(config-if)#
```

authentication timer

To configure the authentication timer, use the `authentication timer` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication timer {{ inactivity value } | { reauthenticate { server | value } } | { restart value } }
no authentication timer {{ inactivity value } | { reauthenticate value } | { restart value } }
```

### Syntax Description

- **inactivity value**
  - Specifies the amount of time in seconds that a host is allowed to be inactive before being authorized. Range is 1 to 65535. Default is Off.
  - **Note** The inactivity value should be less than the reauthenticate timer value, but configuring the inactivity value higher than the reauthenticate timer value is not considered an error.

- **reauthenticate server**
  - Specifies that the reauthentication period value for the client should be obtained from the authentication, authorization, and accounting (AAA) server as Session-Timeout (RADIUS Attribute 27).

- **reauthenticate value**
  - Specifies the amount of time in seconds after which an automatic reauthentication is initiated. Range is 1 to 65535. Default is 3600.

- **restart value**
  - Specifies the amount of time in seconds after which an attempt is made to authenticate an unauthorized port. Range is 1 to 65535. Default is Off.

### Command Default

The default settings are as follows:
- `inactivity value`—Off.
- `reauthenticate value`—3600
- `restart value`—Off

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Reauthentication only occurs if it is enabled on the interface.

The `authentication timer reauthenticate value` command replaces the following dot1x command that is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x timeout { reauth-period seconds | quiet-period seconds | tx-period seconds | supp-timeout seconds | server-timeout seconds }
```
You should change the default values of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients or authentication servers.

During the inactivity period, the Ethernet switch network module does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number less than the default.

The `reauthenticate` keyword affects the behavior of the Ethernet switch network module only if you have enabled periodic reauthentication with the `authentication reauthentication` global configuration command.

### Examples

The following example shows how to specify that the reauthentication period value for the client should be obtained from the authentication, authorization, and accounting (AAA) server as Session-Timeout (RADIUS Attribute 27):

```
Switch(config-if)# authentication timer reauthenticate server
Switch(config-if)#
```

### Related Commands

authentication violation

Use the `authentication violation` interface configuration command to configure the violation mode: restrict, shutdown, and replace.

In single-host mode, a security violation is triggered when more than one device are detected on the data vlan. In multidomain authentication mode, a security violation is triggered when more than one device are detected on the data or voice VLAN.

Security violation cannot be triggered in multiplehost or multiauthentication mode.

```
authentication violation { restrict | shutdown | replace }
no authentication violation { restrict | shutdown | replace }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>restrict</td>
<td>Generates a syslog error when a violation error occurs.</td>
</tr>
<tr>
<td>shutdown</td>
<td>Error disables the [virtual] port on which an unexpected MAC address occurs.</td>
</tr>
<tr>
<td>replace</td>
<td>Replaces the existing host with the new host, instead of errordisabling or restricting the port.</td>
</tr>
</tbody>
</table>

### Defaults

Shut down the port. If the `restrict` keyword is configured, the port does not shutdown.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Command introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Introduced replace keyword.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When a new host is seen in single or multiple- domain modes, `replace` mode tears down the old session and authenticates the new host.

### Examples

This example shows how to configure violation mode shutdown on a switch:

```
Switch# configure terminal
Switch(config)# authentication violation shutdown
```

A port is error-disabled when a security violation triggers on shutdown mode. The following syslog messages displays:

```
%AUTHMGR-5-SECURITY_VIOLATION: Security violation on the interface <interface name>, new MAC address <mac-address> is seen.
%PM-4-ERR_DISABLE: security-violation error detected on <interface name>, putting <interface name> in err-disable state

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to configure the QoS that is appropriate for VoIP traffic within the QoS domain. The QoS domain includes the switch, the interior of the network, and the edge devices that can classify incoming traffic for QoS.

Use the `cisco-phone` keyword on the ports at the edge of the network that are connected to Cisco IP phones. The switch detects the telephone through the Cisco Discovery Protocol (CDP) and trusts the CoS labels in packets that are received from the telephone.

Use the `trust` keyword on the ports that are connected to the interior of the network. Because it is assumed that the traffic has already been classified by the other edge devices, the CoS/DSCP labels in these packets are trusted.

When you enable the auto-QoS feature on the specified interface, these actions automatically occur:

- QoS is globally enabled (`qos global configuration command`).
- DBL is enabled globally (`qos dbi` global configuration command).
- When you enter the `auto qos voip cisco-phone` interface configuration command, the trusted boundary feature is enabled. It uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP phone. When a Cisco IP phone is detected, the ingress classification on the specific interface is set to trust the CoS label that is received in the packet because some old phones do not mark DSCP. When a Cisco IP phone is absent, the ingress classification is set to not trust the CoS label in the packet.
When you enter the **auto qos voip trust** interface configuration command, the ingress classification on the specified interface is set to trust the CoS label that is received in the packet if the specified interface is configured as Layer 2 (and is set to trust DSCP if the interface is configured as Layer 3).

You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the `debug auto qos` privileged EXEC command to enable auto-QoS debugging.

To disable auto-QoS on an interface, use the `no auto qos voip` interface configuration command. When you enter this command, the switch enables standard QoS and changes the auto-QoS settings to the standard QoS default settings for that interface. This action will not change any global configuration performed by auto-QoS; the global configuration remains the same.

**Examples**

This example shows how to enable auto-QoS and to trust the CoS and DSCP labels that are received in the incoming packets when the switch or router that is connected to Gigabit Ethernet interface 1/1 is a trusted device:

```bash
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip trust
```

This example shows how to enable auto-QoS and to trust the CoS labels that are received in incoming packets when the device connected to Fast Ethernet interface 2/1 is detected as a Cisco IP phone:

```bash
Switch(config)# interface fastethernet2/1
Switch(config-if)# auto qos voip cisco-phone
```

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled on an interface on Supervisor Engines other than a Supervisor Engine 6-E:

```bash
Switch# debug auto qos
AutoQoS debugging is on
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip trust
Switch(config-if)#
00:00:56:qos
00:00:57:qos map cos 3 to dscp 26
00:00:57:qos map cos 5 to dscp 46
00:00:58:qos map dscp 32 to tx-queue 1
00:00:58:qos dbl
00:01:00:policy-map autoqos-voip-policy
00:01:00: class class-default
00:01:00: dbl
00:01:00:interface GigabitEthernet1/1
00:01:00: qos trust cos
00:01:00: tx-queue 3
00:01:00: priority high
00:01:00: shape percent 33
00:01:00: service-policy output autoqos-voip-policy
Switch(config-if)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip cisco-phone
Switch(config-if)#
00:00:55:qos
00:00:56:qos map cos 3 to dscp 26
00:00:57:qos map cos 5 to dscp 46
00:00:58:qos map dscp 32 to tx-queue 1
00:00:58:qos dbl
00:00:59:policy-map autoqos-voip-policy
```
00:00:59: class class-default
00:00:59: dbl
00:00:59: interface GigabitEthernet1/1
00:00:59: qos trust device cisco-phone
00:00:59: qos trust cos
00:00:59: tx-queue 3
00:00:59: priority high
00:00:59: bandwidth percent 33
00:00:59: service-policy output autoqos-voip-policy

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled on an interface on a Supervisor Engine 6-E:

Switch#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#interface gigabitethernet3/10
Switch(config-if)#auto qos voip trust
Switch(config-if)#
1d03h:  service-policy input AutoQos-VoIP-Input-Cos-Policy
1d03h:  service-policy output AutoQos-VoIP-Output-Policy
Switch(config-if)#interface gigabitethernet3/11
Switch(config-if)#auto qos voip
cisco-phone
Switch(config-if)#
1d03h:  qos trust device cisco-phone
1d03h:  service-policy input AutoQos-VoIP-Input-Cos-Policy
1d03h:  service-policy output AutoQos-VoIP-Output-Policy
Switch(config-if)#end
Switch#

You can verify your settings by entering the `show auto qos interface` command.

To enable automatic synchronization of the configuration files in NVRAM, use the `auto-sync` command. To disable automatic synchronization, use the `no` form of this command.

```
auto-sync {startup-config | config-register | bootvar | standard}
no auto-sync {startup-config | config-register | bootvar | standard}
```

**Syntax Description**

- **startup-config**: Specifies automatic synchronization of the startup configuration.
- **config-register**: Specifies automatic synchronization of the configuration register configuration.
- **bootvar**: Specifies automatic synchronization of the BOOTVAR configuration.
- **standard**: Specifies automatic synchronization of the startup configuration, BOOTVAR, and configuration registers.

**Defaults**

Standard automatic synchronization of all configuration files

**Command Modes**

Redundancy main-cpu mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the `no auto-sync standard` command, no automatic synchronizations occur.

**Examples**

This example shows how (from the default configuration) to enable automatic synchronization of the configuration register in the main CPU:

```
Switch# config terminal
Switch (config)# redundancy
Switch (config-r)# main-cpu
Switch (config-r-mc)# no auto-sync standard
Switch (config-r-mc)# auto-sync configure-register
Switch (config-r-mc)#
```

average-packet-size (netflow-lite monitor submode)

To specify the average packet size at the observation point in netflow-lite monitor submode, use the average-packet-size command. To delete a sampler, use the no form of this command.

```
average-packet-size average-packet-size

no average-packet-size average-packet-size
```

Syntax Description

| average-packet-size | Specifies the average packet size in bytes expected at the observation point. |

Defaults

0 bytes

Command Modes

netflow-lite exporter submode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can enter this command in physical port interface mode, port channel interface, or config VLAN mode.

The packet sampling mechanism attempts random 1-in-N sampling. Internally, 2 levels of sampling are performed. The accuracy of the first sampling level depends on the size of the packets arriving at a given interface. Use the average-packet-size parameter to tune the accuracy of the algorithm.

The system automatically determines the average packet size at an interface based on observation of input traffic and uses that value in its first level of sampling.

The algorithm requires a range of packet sizes from 64 to 9216 bytes. A value of 0 means that you want an automatic determination of average packet size.

Examples

The following example shows how to configure a monitor on a port interface Gigabit 1/3:

```
Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)# exit
```
Switch# `show netflow-lite monitor 1 interface gi1/3`

Interface GigabitEthernet1/3:

Netflow-lite Monitor-1:
- Active: TRUE
- Sampler: sampler1
- Exporter: exporter1
- Average Packet Size: 0

Statistics:
- Packets exported: 0
- Packets observed: 0
- Packets dropped: 0
- Average Packet Size observed: 64
- Average Packet Size used: 64

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

<table>

</tr>
</tbody>
</table>
bandwidth

To specify or modify the minimum bandwidth provided to a class belonging to a policy map attached to a physical port, use the `bandwidth` policy-map class command. To return to the default setting, use the `no` form of this command.

```
bandwidth {bandwidth-kbps | percent percent | remaining percent percent}
```

```
no bandwidth
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bandwidth-kbps</code></td>
<td>Amount of bandwidth in kbps assigned to the class. The range is 32 to 16000000.</td>
</tr>
<tr>
<td><code>percent percent</code></td>
<td>Percentage of available bandwidth assigned to the parent class. The range is 1 to 100.</td>
</tr>
<tr>
<td><code>remaining percent percent</code></td>
<td>Percentage of remaining bandwidth assigned to parent class. The range is 1 to 100. This command is supported only when priority queuing class is configured, and the priority queuing class is not rate-limited.</td>
</tr>
</tbody>
</table>

**Defaults**

No bandwidth is specified.

**Command Modes**

Policy-map class configuration mode

**Command History**

- **Release** 12.2(40)SG
  - This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.

**Usage Guidelines**

Use the `bandwidth` command only in a policy map attached to a physical port.

The `bandwidth` command specifies the minimum bandwidth for traffic in that class when there is traffic congestion in the switch. If the switch is not congested, the class receives more bandwidth than you specify with this command.

When queuing class is configured without any explicit bandwidth configuration, since the queue is not guaranteed any minimum bandwidth, this queue will get a share of any unallocated bandwidth on the port.

If there is no unallocated bandwidth for the new queue or if the unallocated bandwidth is not sufficient to meet the minimum configurable rate for all queues which do not have any explicit bandwidth configuration, then the policy association is rejected.
These restrictions apply to the `bandwidth` command:

- If the `percent` keyword is used, the sum of the class bandwidth percentages within a single policy map cannot exceed 100 percent. Percentage calculations are based on the bandwidth available on the port.
- The amount of bandwidth configured should be large enough to accommodate Layer 2 overhead.
- A policy map can have all the class bandwidths specified in either kbps or in percentages, but not a mix of both.

### Examples

This example shows how to set the minimum bandwidth to 2000 kbps for a class called `silver-class`. The class already exists in the switch configuration.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map polmap6
Switch(config-pmap)# class silver-class
Switch(config-pmap-c)# bandwidth 2000
Switch(config-pmap-c)# end
```

This example shows how to guarantee 30 percent of the bandwidth for `class1` and 25 percent of the bandwidth for `class2` when CBWFQ is configured. A policy map with two classes is created and is then attached to a physical port.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# bandwidth percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# bandwidth percent 25
Switch(config-pmap-c)# exit
Switch(config-pmap)# end
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy input policy1
Switch(config-if)# end
```

This example shows how bandwidth is guaranteed if low-latency queueing (LLQ) and bandwidth are configured. In this example, LLQ is enabled in a class called `voice1`.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# bandwidth remaining percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# bandwidth remaining percent 25
Switch(config-pmap-c)# exit
Switch(config-pmap)# class voice1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# end
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

call-home (global configuration)

To enter call home configuration submode, use the call-home command in global configuration mode.

call-home

Syntax Description
This command has no arguments or keywords.

Command Default
This command has no default settings.

Command Modes
Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Once you enter the call-home command, the prompt changes to Switch (cfg-call-home)#, and you have access to the call home configuration commands as follows:

- alert-group—Enables or disables an alert group. See the alert-group command.
- contact-email-addr email-address—Assigns the system contact’s e-mail address. You can enter up to 128 alphanumeric characters in e-mail address format with no spaces.
- contract-id alphanumeric—Specifies the customer contract identification for Cisco AutoNotification. You can enter up to 64 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (" ").
- copy profile source-profile target-profile—Creates a new destination profile (target-profile) with the same configuration settings as the existing profile (source-profile).
- customer-id name—Provides customer identification for Cisco AutoNotify. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (" ").
- default—Sets a command to its defaults.
- exit—Exits call home configuration mode and returns to global configuration mode.
- mail-server {ipv4-address | name} priority priority—Assigns the customer’s e-mail server address and relative priority. You can enter an IP address or a fully qualified domain name (FQDN), and assign a priority from 1 (highest) to 100 (lowest).

You can define backup e-mail servers by repeating the mail-server command and entering different priority numbers.
- no—Negates a command or set its defaults.
- phone-number +phone-number—Specifies the phone number of the contact person. The phone-number value must begin with a plus (+) prefix, and may contain only dashes (-) and numbers. You can enter up to 16 characters. If you include spaces, you must enclose your entry in quotes (" ").
call-home (global configuration)

- **profile name**—Enters call-home profile configuration mode. See the `profile` command.
- **rate-limit threshold**—Configures the call-home message rate-limit threshold; valid values are from 1 to 60 messages per minute.
- **sender [from | reply-to] email-address**—Specifies the call-home message sender’s e-mail addresses. You can enter up to 128 alphanumeric characters in e-mail address format with no spaces.
- **site-id alphanumeric**—Specifies the site identification for Cisco AutoNotify. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (“ ’ ”).
- **street-address**—Specifies the street address for the RMA part shipments. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (“ ’ ”).
- **vrf**—Specifies the VPN routing or forwarding instance name; limited to 32 characters.

**Examples**

This example shows how to configure the contact information:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# call-home
Switch(config-call-home)# contact-email-addr username@example.com
Switch(config-call-home)# phone-number +1-800-555-4567
Switch(config-call-home)# street-address "1234 Picaboo Street, Any city, Any state, 12345"
Switch(config-call-home)# customer-id Customer1234
Switch(config-call-home)# site-id Site1ManhattanNY
Switch(config-call-home)# contract-id Company1234
Switch(config-call-home)# exit
Switch(config)#
```

This example shows how to configure the call-home message rate-limit threshold:

```
Switch(config)# call-home
Switch(config-call-home)# rate-limit 50
```

This example shows how to set the call-home message rate-limit threshold to the default setting:

```
Switch(config)# call-home
Switch(config-call-home)# default rate-limit
```

This example shows how to create a new destination profile with the same configuration settings as an existing profile:

```
Switch(config)# call-home
Switch(config-call-home)# copy profile profile1 profile1a
```

This example shows how to configure the general e-mail parameters, including a primary and secondary e-mail server:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# call-home
Switch(config-call-home)# mail-server smtp.example.com priority 1
Switch(config-call-home)# mail-server 192.168.0.1 priority 2
Switch(config-call-home)# sender from username@example.com
Switch(config-call-home)# sender reply-to username@example.com
Switch(config-call-home)# exit
Switch(config)#
```
This example shows how to specify MgmtVrf as the vrf name where the call-home email message is forwarded:

```
Switch(cfg-call-home)# vrf MgmtVrf
```
call-home request

To submit information about your system to Cisco for report and analysis information from the Cisco Output Interpreter tool, use the **call-home request** command in privileged EXEC mode. An analysis report is sent by Cisco to a configured contact e-mail address.

```
call-home request { output-analysis "show-command" | config-sanity | bugs-list | command-reference | product-advisory } [ profile name ] [ ccoid user-id ]
```

**Syntax Description**

- **output-analysis “show-command”** Sends the output of the specified CLI show command for analysis. The show command must be contained in quotes (“ ”).
- **config-sanity** Specifies the type of report requested. Based on this keyword, the output of a predetermined set of commands such as the *show running-config all, show version, and show module* (standalone) or *show module switch all* (VS system) commands, is sent to Cisco for analysis.
- **bugs-list**
- **command-reference**
- **product-advisory**
- **profile name** (Optional) Specifies an existing profile to which the request is sent. If no profile is specified, the request is sent to the Cisco TAC profile.
- **ccoid user-id** (Optional) Specifies the identifier of a registered Smart Call Home user. If a user-id is specified, the resulting analysis report is sent to the e-mail address of the registered user. If no user-id is specified, the report is sent to the contact e-mail address of the device.

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The recipient profile does not need to be enabled for the call-home request. The profile should specify the e-mail address where the transport gateway is configured so that the request message can be forwarded to the Cisco TAC and the user can receive the reply from the Smart Call Home service.

Based on the keyword specifying the type of report requested, the following information is returned in response to the request:

- **config-sanity**—Information on best practices as related to the current running configuration.
- **bugs-list**—Known bugs in the running version and in the currently applied features.
- **command-reference**—Reference links to all commands in the running configuration.
- **product-advisory**—Product Security Incident Response Team (PSIRT) notices, End of Life (EOL) or End of Sales (EOS) notices, or field notices (FN) that may affect devices in your network.
### Examples

This example shows a request for analysis of a user-specified show command:

```
Switch# call-home request output-analysis "show diagnostic result module all" profile TG
```

</table>
call-home send

To execute a CLI command and e-mail the command output, use the call-home send command in privileged EXEC mode.

```
call-home send "cli-command" [email email-addr [service-number SR] | service-number SR]
```

**Syntax Description**

- **"cli-command"** Specifies a CLI command to be executed. The command output is sent by e-mail.
- **email email-addr** Specifies the e-mail address to which the CLI command output is sent. If no e-mail address is specified, the command output is sent to the Cisco TAC at attach@cisco.com.
- **service-number SR** Specifies an active TAC case number to which the command output pertains. This number is required only if no e-mail address (or a TAC e-mail address) is specified, and will appear in the e-mail subject line.

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release   Modification
12.2(52)SG   This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis
```

**Usage Guidelines**

This command causes the specified CLI command to be executed on the system. The specified CLI command must be enclosed in quotes (""), and can be any run or show command, including commands for all modules.

The command output is then sent by e-mail to the specified e-mail address. If no e-mail address is specified, the command output is sent to the Cisco TAC at attach@cisco.com. The e-mail is sent in long text format with the service number, if specified, in the subject line.

**Examples**

This example shows how to send a CLI command and have the command output e-mailed:

```
Switch# call-home send "show diagnostic result module all" email support@example.com
```

**Related Commands**

- **call-home (global configuration)** Enters call home configuration mode.
- **call-home send alert-group** Sends a specific alert group message.
- **service call-home** (refer to Cisco IOS documentation) Enables or disables Call Home.
- **show call-home** Displays call-home configuration information.
call-home send alert-group

To send a specific alert group message, use the **call-home send alert-group** command in privileged EXEC mode.

```
call-home send alert-group {configuration | diagnostic module number | inventory} [profile profile-name]
```

**Syntax Description**

- **configuration** Sends the configuration alert-group message to the destination profile.
- **diagnostic module number** Sends the diagnostic alert-group message to the destination profile for a specific module number.
- **inventory** Sends the inventory call-home message.
- **profile profile-name** (Optional) Specifies the name of the destination profile.

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the module number, you can enter the number of the module.

If you do not specify the **profile profile-name**, the message is sent to all subscribed destination profiles.

Only the configuration, diagnostic, and inventory alert groups can be manually sent. The destination profile need not be subscribed to the alert group.

**Examples**

This example shows how to send the configuration alert-group message to the destination profile:

```
Switch# call-home send alert-group configuration
```

This example shows how to send the diagnostic alert-group message to the destination profile for a specific module number:

```
Switch# call-home send alert-group diagnostic module 3
```

This example shows how to send the diagnostic alert-group message to all destination profiles for a specific module number:

```
Switch# call-home send alert-group diagnostic module 3 profile Ciscotacl
```

This example shows how to send the inventory call-home message:

```
Switch# call-home send alert-group inventory
```

<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command sends a test message to the specified destination profile. If you enter test message text, you must enclose the text in quotes (""") if it contains spaces. If you do not enter a message, a default message is sent.

**Examples**

This example shows how to manually send a Call Home test message:

```
switch# call-home test "test of the day" profile Ciscotac1
```

**Related Commands**

- **call-home (global configuration)**
  Enters call home configuration mode.

- **call-home send alert-group**
  Sends a specific alert group message.

- **service call-home** (refer to Cisco IOS documentation)
  Enables or disables Call Home.

- **show call-home**
  Displays call-home configuration information.
channel-group

To assign and configure an EtherChannel interface to an EtherChannel group, use the **channel-group** command. To remove a channel group configuration from an interface, use the **no** form of this command.

```
channel-group number mode {active | on | auto [non-silent]} | {passive | desirable [non-silent]}
```

no channel-group

**Syntax Description**

- `number` Specifies the channel-group number; valid values are from 1 to 64.
- `mode` Specifies the EtherChannel mode of the interface.
- `active` Enables LACP unconditionally.
- `on` Forces the port to channel without PAgP.
- `auto` Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not initiate PAgP packet negotiation.
- `non-silent` (Optional) Used with the auto or desirable mode when traffic is expected from the other device.
- `passive` Enables LACP only if an LACP device is detected.
- `desirable` Places a port into an active negotiating state, in which the port initiates negotiations with other ports by sending PAgP packets.

**Defaults**

No channel groups are assigned.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Support for LACP was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You do not have to create a port-channel interface before assigning a physical interface to a channel group. If a port-channel interface has not been created, it is automatically created when the first physical interface for the channel group is created.

If a specific channel number is used for the PAgP-enabled interfaces of a channel group, that same channel number cannot be used for configuring a channel that has LACP-enabled interfaces or vice versa.

You can also create port channels by entering the **interface port-channel** command. This will create a Layer 3 port channel. To change the Layer 3 port channel into a Layer 2 port channel, use the **switchport** command before you assign physical interfaces to the channel group. A port channel cannot be changed from Layer 3 to Layer 2 or vice versa when it contains member ports.

You do not have to disable the IP address that is assigned to a physical interface that is part of a channel group, but we recommend that you do so.
Any configuration or attribute changes that you make to the port-channel interface are propagated to all interfaces within the same channel group as the port channel (for example, configuration changes are also propagated to the physical interfaces that are not part of the port channel, but are part of the channel group).

You can create in on mode a usable EtherChannel by connecting two port groups together.

**Caution**

Do not enable Layer 3 addresses on the physical EtherChannel interfaces. Do not assign bridge groups on the physical EtherChannel interfaces because it creates loops.

**Examples**

This example shows how to add Gigabit Ethernet interface 1/1 to the EtherChannel group that is specified by port-channel 45:

```
Switch(config-if)# channel-group 45 mode on
Creating a port-channel interface Port-channel45
Switch(config-if)#
```

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface port-channel</td>
<td>Accesses or creates a port-channel interface.</td>
</tr>
<tr>
<td>show interfaces port-channel (refer to Cisco IOS documentation)</td>
<td>Displays the information about the Fast EtherChannel.</td>
</tr>
</tbody>
</table>
channel-protocol

To enable LACP or PAgP on an interface, use the `channel-protocol` command. To disable the protocols, use the `no` form of this command.

```
channel-protocol {lacp | pagp}
no channel-protocol {lacp | pagp}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lacp</td>
<td>Enables LACP to manage channeling.</td>
</tr>
<tr>
<td>pagp</td>
<td>Enables PAgP to manage channeling.</td>
</tr>
</tbody>
</table>

### Defaults

PAgP

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on systems that are configured with a Supervisor Engine I.

You can also select the protocol using the `channel-group` command.

If the interface belongs to a channel, the `no` form of this command is rejected.

All ports in an EtherChannel must use the same protocol; you cannot run two protocols on one module.

PAgP and LACP are not compatible; both ends of a channel must use the same protocol.

You can manually configure a switch with PAgP on one side and LACP on the other side in the `on` mode.

You can change the protocol at any time, but this change causes all existing EtherChannels to reset to the default channel mode for the new protocol. You can use the `channel-protocol` command to restrict anyone from selecting a mode that is not applicable to the selected protocol.

Configure all ports in an EtherChannel to operate at the same speed and duplex mode (full duplex only for LACP mode).

For a complete list of guidelines, refer to the “Configuring EtherChannel” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide*.

### Examples

This example shows how to select LACP to manage channeling on the interface:

```
Switch(config-if)# channel-protocol lacp
Switch(config-if)#
```

**cisp enable**

Use the `cisp enable` global configuration command to enable Client Information Signalling Protocol (CISP) on a switch.

```plaintext
cisp enable
no cisp enable
```

---

**Syntax Description**

- `cisp enable`: Enable CISP.

**Defaults**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enable the CISP protocol (with the global `cisp enable` command) on both the authenticator and supplicant switch. The CISP protocol is crucial because it conveys the client information from the supplicant switch to the authenticator switch thereby providing access for the clients of the supplicant switch through the authenticator switch.

**Examples**

This example shows how to enable CISP:

```plaintext
switch(config)# cisp enable
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tr>
</tbody>
</table>
class

To specify the name of the class whose traffic policy you want to create or change, use the `class` policy-map configuration command. To delete an existing class from a policy map, use the `no` form of this command.

```
class class-name

no class class-name
```

### Syntax Description

**class-name**
Name of the predefined traffic class for which you want to configure or modify a traffic policy. The class was previously created through the `class-map` command.

### Defaults

No classes are defined; except for the class-default.

### Command Modes

Policy-map configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before using the `class` command, you must create a class map for matching packets to the class by using the `class-map` global configuration command. You also must use the `policy-map` global configuration command to identify the policy map and to enter policy-map configuration mode. After specifying a policy map, you can configure a traffic policy for new classes or modify a traffic policy for any existing classes in that policy map. The class name that you specify with the `class` command in the policy map ties the characteristics for that class (its policy) to the class map and its match criteria, as configured through the `class-map` global configuration command. You attach the policy map to a port by using the `service-policy (interface configuration)` configuration command.

After you enter the `class` command, the switch enters policy-map class configuration mode, and these configuration commands are available:

- `bandwidth` Specifies or modifies the minimum bandwidth provided to a class belonging to a policy map. For more information, see the `bandwidth` command. This command is available on the Supervisor Engine 6-E and the Catalyst 4900M chassis.
- `dbl` Enables dynamic buffer limiting for traffic hitting this class. For details on `dbl` parameters refer to the `show qos dbl` command.
- `exit` Exits policy-map class configuration mode and returns to policy-map configuration mode.
- `no` Returns a command to its default setting.
- `police` Configures a single-rate policer, an aggregate policer, or a two-rate traffic policer that uses the committed information rate (CIR) and the peak information rate (PIR) for a class of traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For
more information, see the `police` command. For more information about the two-rate policer, see the `police (two rates)` and the `police (percent)` command. The two-rate traffic policer is supported on a Supervisor Engine 6-E and the Catalyst 4900M chassis.

- **priority** Enables the strict priority queue for a class of traffic. For more information, see the `priority` command. This command is supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

- **service-policy (policy-map class)** Creates a service policy as a quality of service (QoS) policy within a policy map (called a hierarchical service policy). For more information, see the `service-policy (policy-map class)` command. This command is effective only in a hierarchical policy map attached to an interface.

- **set** Classifies IP traffic by setting a class of service (CoS), a Differentiated Services Code Point (DSCP) or IP-precedence in the packet. For more information, see the `set` command.

- **shape (class-based queueing)** Sets the token bucket committed information rate (CIR) in a policy map. For more information, see the `shape (class-based queueing)` command. This command is supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

- **trust** Defines a trust state for a traffic class. For more information, see the `trust` command. This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

The switch supports up to 256 classes, including the default class, in a policy map. Packets that fail to meet any of the matching criteria are classified as members of the default traffic class. You configure the default traffic class by specifying `class-default` as the class name in the `class` policy-map class configuration command. You can manipulate the default traffic class (for example, set policies to police or to shape it) just like any other traffic class, but you cannot delete it.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.

### Examples

This example shows how to create a policy map called `policy1`. When attached to an ingress port, the policy matches all the inbound traffic defined in `class1`, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mbps and bursts of 20 KB. Traffic exceeding the profile is marked down to a DSCP value obtained from the policed-DSCP map and then sent.

```
Switch# configure terminal
Switch(config)# class-map class1
Switch(config-cmap)# exit
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set ip dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# interface fastethernet1/0/4
Switch(config-if)# service-policy input policy1
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

</tbody>
</table>
To create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode, use the `class-map` global configuration command. To delete an existing class map and to return to global configuration mode, use the `no` form of this command.

```
class-map [match-all | match-any] class-map-name
```

```
no class-map [match-all | match-any] class-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match-all</td>
<td>(Optional) Perform a logical-AND of all matching under this class map. All criteria in the class map must be matched.</td>
</tr>
<tr>
<td>match-any</td>
<td>(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria in the class map must be matched.</td>
</tr>
<tr>
<td>class-map-name</td>
<td>Name of the class map.</td>
</tr>
</tbody>
</table>

**Defaults**

No class maps are defined.

If neither the `match-all` nor the `match-any` keyword is specified, the default is **match-all**.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to specify the name of the class for which you want to create or modify class-map match criteria and to enter class-map configuration mode. Packets are checked against the match criteria configured for a class map to decide if the packet belongs to that class. If a packet matches the specified criteria, the packet is considered a member of the class and is forwarded according to the quality of service (QoS) specifications set in the traffic policy.

After you enter the `class-map` command, the switch enters class-map configuration mode, and these configuration commands are available:

- **description** Describes the class map (up to 200 characters). The `show class-map` privileged EXEC command displays the description and the name of the class map.
- **exit** Exits from QoS class-map configuration mode.
- **match** Configures classification criteria. For more information, see the `match (class-map configuration)` command.
- **no** Removes a match statement from a class map.
**Examples**

This example shows how to configure the class map called class1 with one match criterion, which is an access list called 103:

```
Switch# configure terminal
Switch(config)# access-list 103 permit any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
Switch#
```

This example shows how to delete the class1 class map:

```
Switch# configure terminal
Switch(config)# no class-map class1
Switch#
```

You can verify your settings by entering the `show class-map` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>

clear counters

To clear the interface counters, use the **clear counters** command.

```
clear counters [{FastEthernet interface_number} | {GigabitEthernet interface_number} | {null interface_number} | {port-channel number} | {vlan vlan_id}]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>FastEthernet</strong></td>
<td>(Optional) Specifies the Fast Ethernet interface; valid values are from 1 to 9.</td>
</tr>
<tr>
<td><strong>GigabitEthernet</strong></td>
<td>(Optional) Specifies the Gigabit Ethernet interface; valid values are from 1 to 9.</td>
</tr>
<tr>
<td><strong>null interface_number</strong></td>
<td>(Optional) Specifies the null interface; the valid value is 0.</td>
</tr>
<tr>
<td><strong>port-channel number</strong></td>
<td>(Optional) Specifies the channel interface; valid values are from 1 to 64.</td>
</tr>
<tr>
<td><strong>vlan vlan_id</strong></td>
<td>(Optional) Specifies the VLAN; valid values are from 1 to 4096.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command clears all the current interface counters from all the interfaces unless you specify an interface.

**Note**

This command does not clear the counters that are retrieved using SNMP, but only those seen when you enter the **show interface counters** command.

### Examples

This example shows how to clear all the interface counters:

```
Switch# clear counters
Clear "show interface" counters on all interfaces [confirm] y
Switch#
```

This example shows how to clear the counters on a specific interface:

```
Switch# clear counters vlan 200
Clear "show interface" counters on this interface [confirm] y
Switch#
```
### clear counters

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface counters (refer to Cisco IOS documentation)</td>
<td>Displays interface counter information.</td>
</tr>
</tbody>
</table>
clear energywise neighbors

Use the clear energywise neighbors privileged EXEC command to delete the EnergyWise neighbor tables.

```
clear energywise neighbors
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No default is defined.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to delete the neighbor tables:

```
Switch# clear energywise neighbors
Cleared all non static energywise neighbors
```

You can verify that the tables were deleted by entering the show energywise neighbors privileged EXEC command.

**Note**
The clear energywise neighbors command clears all discovered neighbors.

**Related Commands**

clear errdisable

To re-enable error-disabled VLANs on an interface, use the `clear errdisable` command.

```
clear errdisable interface {name} vlan [range]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface name</code></td>
<td>Specifies the interface of the VLAN(s) to recover.</td>
</tr>
<tr>
<td><code>vlan</code></td>
<td>Specifies all VLANs on the interface be recovered.</td>
</tr>
<tr>
<td><code>range</code></td>
<td>(Optional) Specifies the VLAN range to be recovered.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a VLAN range is not specified, all VLANs on the specified interface are re-enabled. The `clear errdisable` command recovers the disabled VLANs on an interface.

Clearing the error-disabled state from a virtual port does not change the link state of the physical port, and it does not affect other VLAN ports on the physical port. It does post an event to STP, and spanning tree goes through its normal process of bringing that VLAN port to the appropriate blocking or forwarding state.

**Examples**

This example shows how to re-enable a range of disabled VLANs on an interface:

```
Switch# clear errdisable interface ethernet2 vlan 10-15
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</thead>
<tbody>
<tr>
<td>errdisable detect</td>
<td>Enables error-disable detection.</td>
</tr>
<tr>
<td>show errdisable detect</td>
<td>Displays the error-disable detection status.</td>
</tr>
<tr>
<td>show interfaces status</td>
<td>Displays the interface status or a list of interfaces in error-disabled state.</td>
</tr>
<tr>
<td>switchport port-security</td>
<td>Enables port security on an interface.</td>
</tr>
</tbody>
</table>
clear hw-module slot password

To clear the password on an intelligent line module, use the clear hw-module slot password command.

```
clear hw-module slot slot_num password
```

**Syntax Description**

| slot_num | Slot on a line module. |

**Defaults**

The password is not cleared.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You only need to change the password once unless the password is reset.

**Examples**

This example shows how to clear the password from slot 5 on a line module:

```
Switch# clear hw-module slot 5 password
Switch#
```

**Related Commands**

```
Release Modification
12.1(19)EW  Support for this command was introduced on the Catalyst 4500 series switch.
```

**Examples**
This example shows how to clear the contents of the log buffer:

```
Switch# clear ip arp inspection log
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>arp access-list</code></td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>
</tr>

<td><code>show ip arp inspection log</code></td>
<td>Displays the status of the log buffer.</td>
</tr>
</tbody>
</table>
clear ip arp inspection statistics

To clear the dynamic ARP inspection statistics, use the `clear ip arp inspection statistics` command.

```
clear ip arp inspection statistics [vlan vlan-range]
```

**Syntax Description**

- `vlan vlan-range`  
  (Optional) Specifies the VLAN range.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(19)EW  
  Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to clear the DAI statistics from VLAN 1 and how to verify the removal:

```
Switch# clear ip arp inspection statistics vlan 1
Switch# show ip arp inspection statistics vlan 1

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Forwarded</th>
<th>Dropped</th>
<th>DHCP Drops</th>
<th>ACL Drops</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>

</tbody>
</table>
clear ip dhcp snooping binding

To clear the DHCP snooping binding, use the clear ip dhcp snooping binding command.

    clear ip dhcp snooping binding [*] [ip-address] [vlan vlan_num] [interface interface_num]

Syntax Description

*                              (Optional) Clears all DHCP snooping binding entries.
ip-address                    (Optional) IP address for the DHCP snooping binding entries.
     vlan vlan_num            (Optional) Specifies a VLAN.
    interface interface_num  (Optional) Specifies an interface.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

Release    Modification
12.2(44)SG Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

These commands are mainly used to clear DHCP snooping binding entries.

DHCP snooping is enabled on a VLAN only if both the global snooping and the VLAN snooping are enabled.

Examples

This example shows how to clear all the DHCP snoop binding entries:

    Switch#clear ip dhcp snooping binding *
    Switch#

This example shows how to clear a specific DHCP snoop binding entry:

    Switch#clear ip dhcp snooping binding 1.2.3.4
    Switch#

This example shows how to clear all the DHCP snoop binding entries on the GigabitEthernet interface 1/1:

    Switch#clear ip dhcp snooping binding interface gigabitEthernet 1/1
    Switch#

This example shows how to clear all the DHCP snoop binding entries on VLAN 40:

    Switch#clear ip dhcp snooping binding vlan 40
    Switch#

</tbody>
</table>
clear ip igmp group

To delete the IGMP group cache entries, use the `clear ip igmp group` command.

```
clear ip igmp group [{fastethernet mod/port} | {GigabitEthernet mod/port} | {host_name | group_address} | {Loopback interface_number} | {null interface_number} | {port-channel number} | {vlan vlan_id}]
```

**Syntax Description**

- **fastethernet** (Optional) Specifies the Fast Ethernet interface.
- **mod/port** (Optional) Number of the module and port.
- **GigabitEthernet** (Optional) Specifies the Gigabit Ethernet interface.
- **host_name** (Optional) Hostname, as defined in the DNS hosts table or with the `ip host` command.
- **group_address** (Optional) Address of the multicast group in four-part, dotted notation.
- **Loopback interface_number** (Optional) Specifies the loopback interface; valid values are from 0 to 2,147,483,647.
- **null interface_number** (Optional) Specifies the null interface; the valid value is 0.
- **port-channel number** (Optional) Specifies the channel interface; valid values are from 1 to 64.
- **vlan vlan_id** (Optional) Specifies the VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The IGMP cache contains a list of the multicast groups of which hosts on the directly connected LAN are members.

To delete all the entries from the IGMP cache, enter the `clear ip igmp group` command with no arguments.

**Examples**

This example shows how to clear the entries for a specific group from the IGMP cache:

```
Switch# clear ip igmp group 224.0.255.1
Switch#
```
This example shows how to clear the IGMP group cache entries from a specific interface:

Switch# `clear ip igmp group gigabitethernet 2/2`
Switch#

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip host</code> (refer to Cisco IOS documentation)</td>
<td>Defines a static host name-to-address mapping in the host cache.</td>
</tr>
<tr>
<td><code>show ip igmp groups</code> (refer to Cisco IOS documentation)</td>
<td>Displays the multicast groups with receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP), use the <code>show ip igmp groups</code> command in EXEC mode.</td>
</tr>
<tr>
<td><code>show ip igmp interface</code></td>
<td>Displays the information about the IGMP-interface status and configuration.</td>
</tr>
</tbody>
</table>
clear ip igmp snooping membership

To clear the explicit host-tracking database, use the **clear ip igmp snooping membership** command.

```
clear ip igmp snooping membership [vlan vlan_id]
```

**Syntax Description**

```
vlan vlan_id (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release Modification
12.1(20)EW Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

By default, the explicit host tracking database maintains a maximum of 1-KB entries. After you reach this limit, no additional entries can be created in the database. To create more entries, you will need to delete the database with the **clear ip igmp snooping statistics vlan** command.

**Examples**

This example shows how to display the IGMP snooping statistics for VLAN 25:

```
Switch# clear ip igmp snooping membership vlan 25
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp snooping vlan explicit-tracking</td>
<td>Enables per-VLAN explicit host tracking.</td>
</tr>
<tr>
<td>show ip igmp snooping membership</td>
<td>Displays host membership information.</td>
</tr>
</tbody>
</table>
clear ip mfib counters

To clear the global MFIB counters and the counters for all active MFIB routes, use the `clear ip mfib counters` command.

```
clear ip mfib counters
```

Syntax Description
This command has no arguments or keywords.

Defaults
This command has no default settings.

Command Modes
Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Examples
This example shows how to clear all the active MFIB routes and global counters:
```
Switch# clear ip mfib counters
Switch#
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip mfib</td>
<td>Displays all active Multicast Forwarding Information Base (MFIB) routes.</td>
</tr>
</tbody>
</table>
clear ip mfib fastdrop

To clear all the MFIB fast-drop entries, use the `clear ip mfib fastdrop` command.

```
clear ip mfib fastdrop
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If new fast-dropped packets arrive, the new fast-drop entries are created.

**Examples**
This example shows how to clear all the fast-drop entries:

```
Switch# clear ip mfib fastdrop
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip mfib fastdrop</td>
<td>Enables MFIB fast drop.</td>
</tr>
<tr>
<td>show ip mfib fastdrop</td>
<td>Displays all currently active fast-drop entries and shows whether fast drop is enabled.</td>
</tr>
</tbody>
</table>
clear ip wccp

To remove Web Cache Communication Protocol (WCCP) statistics (counts) maintained on the switch for a particular service, use the clear ip wccp command in privileged EXEC mode.

```
clear ip wccp [vrf vrf-name {web-cache | service-number}] [web-cache | service-number]
```

### Syntax Description

- **web-cache**  
  (Optional) Directs the router to remove statistics for the web cache service.

- **service-number**  
  (Optional) Number of the cache service to be removed. The number can be from 0 to 99.

### Defaults

No default behavior or values.

### Command Modes

Privileged EXEC (#)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>This command was introduced on Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `show ip wccp` and `show ip wccp detail` commands to display WCCP statistics.

Use the `clear ip wccp` command to clear the WCCP counters for all WCCP services in all VRFs.

### Examples

The following example shows how to clear all statistics associated with the web cache service:

```
Switch# clear ip wccp web-cache
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip wccp</td>
<td>Enables support of the specified WCCP service for participation in a service group.</td>
</tr>
<tr>
<td>show ip wccp</td>
<td>Displays global statistics related to the WCCP.</td>
</tr>
</tbody>
</table>
clear lacp counters

To clear the statistics for all the interfaces belonging to a specific channel group, use the clear lacp counters command.

```
clear lacp [channel-group] counters
```

**Syntax Description**

| Channel-group | (Optional) Channel-group number; valid values are from 1 to 64. |

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I.

If you do not specify a channel group, all channel groups are cleared.

If you enter this command for a channel group that contains members in PAgP mode, the command is ignored.

**Examples**

This example shows how to clear the statistics for a specific group:

```
Switch# clear lacp 1 counters
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show lacp</td>
<td>Displays LACP information.</td>
</tr>
</tbody>
</table>
clear mac-address-table

To clear the global counter entries from the Layer 2 MAC address table, use the clear mac-address-table command.

```
clear mac-address-table {dynamic [address mac_addr] | [interface interface]} [vlan vlan_id] | notification
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Specifies dynamic entry types.</td>
</tr>
<tr>
<td>address mac_addr</td>
<td>(Optional) Specifies the MAC address.</td>
</tr>
<tr>
<td>interface interface</td>
<td>(Optional) Specifies the interface and clears the entries associated with it; valid values are FastEthernet and GigabitEthernet.</td>
</tr>
<tr>
<td>vlan vlan_id</td>
<td>(Optional) Specifies the VLANs; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>notification</td>
<td>Specifies MAC change notification global counters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for MAC address notification global counters added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the clear mac-address-table dynamic command with no arguments to remove all dynamic entries from the table.

The clear mac-address-table notification command only clears the global counters which are displayed with the show mac-address-table notification command. It does not clear the global counters and the history table of the CISCO-MAC-NATIFICATION-MIB.

**Examples**

This example shows how to clear all the dynamic Layer 2 entries for a specific interface (gi1/1):

```
Switch# clear mac-address-table dynamic interface gi1/1
Switch#
```

This example shows how to clear the MAC address notification counters:

```
Switch# clear mac-address-table notification
Switch#
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear mac-address-table dynamic</td>
<td>Clears the dynamic address entries from the Layer 2 MAC address table.</td>
</tr>
<tr>
<td>mac-address-table aging-time</td>
<td>Configures the aging time for entries in the Layer 2 table.</td>
</tr>
<tr>
<td>mac-address-table notification</td>
<td>Enables MAC address notification on a switch.</td>
</tr>
<tr>
<td>main-cpu</td>
<td>Enters the main CPU submode and manually synchronize the configurations on the two supervisor engines.</td>
</tr>
<tr>
<td>show mac-address-table address</td>
<td>Displays the information about the MAC-address table.</td>
</tr>
<tr>
<td>snmp-server enable traps</td>
<td>Enables SNMP notifications.</td>
</tr>
</tbody>
</table>
clear mac-address-table dynamic

To clear the dynamic address entries from the Layer 2 MAC address table, use the `clear mac-address-table dynamic` command.

```
clear mac-address-table dynamic [{address mac_addr} | {interface interface}] [vlan vlan_id]
```

**Syntax Description**

- `address mac_addr` (Optional) Specifies the MAC address.
- `interface interface` (Optional) Specifies the interface and clears the entries associated with it; valid values are FastEthernet and GigabitEthernet.
- `vlan vlan_id` (Optional) Specifies the VLANs; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the `clear mac-address-table dynamic` command with no arguments to remove all dynamic entries from the table.

**Examples**

This example shows how to clear all the dynamic Layer 2 entries for a specific interface (gi1/1):

```
Switch# clear mac-address-table dynamic interface gi1/1
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac-address-table aging-time</code></td>
<td>Configures the aging time for entries in the Layer 2 table.</td>

<tr>
<td><code>main-cpu</code></td>
<td>Enters the main CPU submode and manually synchronize the configurations on the two supervisor engines.</td>
</tr>
<tr>
<td><code>show mac-address-table address</code></td>
<td>Displays the information about the MAC-address table.</td>
</tr>
</tbody>
</table>
clear netflow-lite exporter statistics

To clear the collector statistics, use the `clear netflow-lite exporter statistics` command.

```
clear netflow-lite exporter exporter-name statistics
```

**Syntax Description**

- `exporter-name` Specifies an exporter.

**Defaults**

None

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Command introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to clear statistics of a packet sampler at a monitor:

```
Switch# clear netflow-lite exporter el statistics
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

<tbody>
<tr>
<td>clear netflow-lite monitor statistics interface</td>
<td>Clears statistics of a packet sampler at a monitor.</td>
</tr>
</tbody>
</table>
clear netflow-lite monitor statistics interface

To clear statistics of a packet sampler at a monitor, use the clear netflow-lite monitor statistics interface command.

```
clear netflow-lite monitor statistics interface vlan-id
```

**Syntax Description**

- `vlan-id` Specifies an interface.

**Defaults**

None

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Command introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

The following examples show how to clear statistics of a packet sampler at a monitor:

```
Switch# clear netflow-lite monitor 1 statistics int gi1/1
Switch# clear netflow-lite monitor 1 statistics vlan 10
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear netflow-lite exporter statistics</td>
<td>Clear the collector statistics.</td>
</tr>
</tbody>
</table>
clear nmsp statistics

To clear the Network Mobility Services Protocol (NMSP) statistics, use the `clear nmsp statistics` command. This command is available only when your switch is running the cryptographic (encrypted) software image.

```
clear nmsp statistics
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
No default is defined.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear NMSP statistics:

```
Switch# clear nmsp statistics
Switch#
```

You can verify that information was deleted by entering the `show nmsp statistics` command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show nmsp</code></td>
<td>Displays the NMSP information.</td>
</tr>
</tbody>
</table>
clear pagp

To clear the port-channel information, use the `clear pagp` command.

```
clear pagp {group-number | counters}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-number</code></td>
<td>Channel-group number; valid values are from 1 to 64.</td>
</tr>
<tr>
<td><code>counters</code></td>
<td>Clears traffic filters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the port-channel information for a specific group:

```
Switch# clear pagp 32
Switch#
```

This example shows how to clear all the port-channel traffic filters:

```
Switch# clear pagp counters
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show pagp</code></td>
<td>Displays information about the port channel.</td>
</tr>
</tbody>
</table>
clear port-security

To delete all configured secure addresses or a specific dynamic or sticky secure address on an interface from the MAC address table, use the `clear port-security` command.

```
clear port-security dynamic [address mac-addr [vlan vlan-id]] | [interface interface-id] [vlan access | voice]
```

**Syntax Description**

- **dynamic**: Deletes all the dynamic secure MAC addresses.
- **address mac-addr** (Optional): Deletes the specified secure MAC address.
- **vlan vlan-id** (Optional): Deletes the specified secure MAC address from the specified VLAN.
- **interface interface-id** (Optional): Deletes the secure MAC addresses on the specified physical port or port channel.
- **vlan access** (Optional): Deletes the secure MAC addresses from access VLANs.
- **vlan voice** (Optional): Deletes the secure MAC addresses from voice VLANs.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Usage Guidelines**

If you enter the `clear port-security all` command, the switch removes all the dynamic secure MAC addresses from the MAC address table.

You can clear sticky and static secure MAC addresses one at a time with the `no switchport port-security mac-address` command.

If you enter the `clear port-security dynamic interface interface-id` command, the switch removes all the dynamic secure MAC addresses on an interface from the MAC address table.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>

<tr>
<td>12.2(31)SG</td>
<td>Add support for sticky port security.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to remove all the dynamic secure addresses from the MAC address table:

```
Switch# clear port-security dynamic
```

This example shows how to remove a dynamic secure address from the MAC address table:

```
Switch# clear port-security dynamic address 0008.0070.0007
```
This example shows how to remove all the dynamic secure addresses learned on a specific interface:

```
Switch# clear port-security dynamic interface gigabitethernet0/1
```

You can verify that the information was deleted by entering the `show port-security` command.

<table>
<thead>
<tr>
<th>Command</th>

<tr>
<td><code>switchport port-security</code></td>
<td>Enables port security on an interface.</td>
</tr>
</tbody>
</table>
clear pppoe intermediate-agent statistics

To clear PPPoE Intermediate Agent statistics (packet counters), use the clear pppoe intermediate-agent statistics command.

clear pppoe intermediate-agent statistics

**Syntax Description**
This command has no arguments.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear PPPoE Intermediate Agent statistics:

```
Switch# clear pppoe intermediate-agent statistics
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show pppoe intermediate-agent interface</td>
<td>Displays PPPoE Intermediate Agent statistics (packet counters).</td>
</tr>
</tbody>
</table>
clear qos

To clear the global and per-interface aggregate QoS counters, use the **clear qos** command.

```
clear qos [aggregate-policer [name] | interface {fastethernet | GigabitEthernet} {mod/interface} | vlan vlan_num | port-channel number]
```

**Syntax Description**

- **aggregate-policer name** (Optional) Specifies an aggregate policer.
- **interface** (Optional) Specifies an interface.
- **fastethernet** (Optional) Specifies the Fast Ethernet 802.3 interface.
- **GigabitEthernet** (Optional) Specifies the Gigabit Ethernet 802.3z interface.
- **mod/interface** (Optional) Number of the module and interface.
- **vlan vlan_num** (Optional) Specifies a VLAN.
- **port-channel number** (Optional) Specifies the channel interface; valid values are from 1 to 64.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

This command is not supported on a Catalyst 4900M chassis running Supervisor Engine 6-E.

**Note**

When you enter the **clear qos** command, the way that the counters work is affected and the traffic that is normally restricted could be forwarded for a short period of time.

The **clear qos** command resets the interface QoS policy counters. If no interface is specified, the **clear qos** command resets the QoS policy counters for all interfaces.

**Examples**

This example shows how to clear the global and per-interface aggregate QoS counters for all the protocols:

```
Switch# clear qos
Switch#
```

This example shows how to clear the specific protocol aggregate QoS counters for all the interfaces:

```
Switch# clear qos aggregate-policer
Switch#
```
### clear qos

#### Related Commands

</tbody>
</table>
clear vlan counters

To clear the software-cached counter values to start from zero again for a specified VLAN or all existing VLANs, use the `clear vlan counters` command.

```
clear vlan [vlan-id] counters
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>(Optional) VLAN number; see the “Usage Guidelines” section for valid values.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a `vlan-id` value; the software-cached counter values for all the existing VLANs are cleared.

**Examples**

This example shows how to clear the software-cached counter values for a specific VLAN:

```
Switch# clear vlan 10 counters
Clear "show vlan" counters on this vlan [confirm] y
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td><code>show vlan counters</code></td>
<td>Displays VLAN counter information.</td>
</tr>
</tbody>
</table>
clear vmps statistics

To clear the VMPS statistics, use the clear vmps statistics command.

```
clear vmps statistics
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear the VMPS statistics:

```
Switch# clear vmps statistics
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vmps</td>
<td>Displays VMPS information.</td>
</tr>
<tr>
<td>vmps reconfirm (privileged EXEC)</td>
<td>Changes the reconfirmation interval for the VLAN Query Protocol (VQP) client.</td>
</tr>
</tbody>
</table>
**control-plane**

To enter control-plane configuration mode, which allows users to associate or modify attributes or parameters (such as a service policy) that are associated with the control plane of the device, use the `control-plane` command.

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Default service police named “system-cpp-policy” is attached.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(50)SG</td>
<td>Support on Supervisor 6-E and Catalyst 4900M was introduced.</td>
</tr>
<tr>
<td>12.2(52)XO</td>
<td>Support on Supervisor 6L-E introduced.</td>
</tr>
<tr>
<td>12.2(54)XO</td>
<td>Support on Catalyst 4948-E introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After you enter the `control-plane` command, you can define control plane services for your route processor. For example, you can associate a service policy with the control plane to police all traffic that is destined to the control plane.

**Examples**

These examples show how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specified rate:

```
Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet
! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet
! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet
! Define class-map "telnet-class."
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map control-plane
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 32000 1000 conform transmit exceed drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
! Define aggregate control plane service for the active Route Processor.
Switch(config)# macro global apply system-cpp
Switch(config)# control-plane
Switch(config-cp)# service-policy input system-cpp-policy
```
Switch(config-cp)# exit

### Related Commands

</table>
**cos (netflow-lite exporter submode)**

To specify a cos value for the NetFlow-lite collector, use the `cos` command. To delete the value, use the `no` form of this command.

```
    cos cos-value
    no cos cos-value
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>cos-value</code></th>
<th>Specifies a cos value for the NetFlow-lite collector. Valid values from 0 to 7.</th>
</tr>
</thead>
</table>

**Defaults**

0

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This options allows you to set the cos value of VLAN tags for packet samples exported by the fpga alone.

**Examples**

This example shows how to specify a cos value for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter

```
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
Network Protocol Configuration:
  Destination IP address: 5.5.5.6
  Source IP Address: 5.5.5.5
  VRF label:
  DSCP: 0x20
  TTL: 128
  COS: 7
Transport Protocol Configuration:
```

Transport Protocol: UDP
Destination Port: 8188
Source Port: 61670
Export Protocol Configuration:
  Export Protocol: netflow-v9
  Template data timeout: 60
  Options sampler-table timeout: 1800
  Options interface-table timeout: 1800
Exporter Statistics:
  Packets Exported: 0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

### Related Commands

</tr>
</tbody>
</table>
counter

Note
Supervisor Engine 6-E and 6L-E do not support Layer 2 interface counters.

To assign counters to a Layer 3 interface, use the counter interface command. To remove a counter assignment, use the no form of this command.

```
counter {ipv4 | ipv6 | ipv4 ipv6 separate}
```

```
no counter
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv4</td>
<td>Enables collection of IPv4 statistics only.</td>
</tr>
<tr>
<td>ipv6</td>
<td>Enables collection of IPv6 statistics only.</td>
</tr>
<tr>
<td>ipv4 ipv6 separate</td>
<td>Enables collection of IPv4 and IPv6 statistics and displays them individually.</td>
</tr>
</tbody>
</table>

Defaults
Not enabled

Command Modes
Interface configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Support added for IPv4 and IPv6 counters.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Entering the counter command without keywords displays the statistics as a sum.
The total number of switch ports that can possess transmit and receive counters is 4092.
When you change a Layer 3 port assigned with a counter to a Layer 2 port, the hardware counters are cleared. This action is similar to entering the no counter command.

Examples
The following example shows how to enable counters on interface VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# counter ipv4
Switch(config-if)# end
Switch#
00:17:15: %SYS-5-CONFIG_I: Configured from console by console
Switch# show run interface vlan 1
Building configuration...
```
Current configuration : 63 bytes
!
interface Vlan1
 ip address 10.0.0.1 255.0.0.0
counter ipv4
dend

Note
To remove the counter assignment, use the no counter command.

If you have already assigned the maximum number of counters, the counter command fails, displaying the following error message:

Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa3/2
Switch(config-if)# no switchport
Switch(config-if)# counter ipv6
Counter resource exhausted for interface fa3/2
Switch(config-if)# end
Switch#
00:24:18: %SYS-5-CONFIG_I: Configured from console by console

In this situation, you must release a counter from another interface so the new interface can use it.
**dbl**

To enable active queue management on a transmit queue used by a class of traffic, use the **dbl** command. Use the **no** form of this command to return to the default setting.

```
dbl
no dbl
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
Active queue management is disabled.

**Command Modes**
Policy-map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support added on Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The semantics of the DBL configuration is similar to the (W)RED algorithm. The **dbl** command can operate alone on class-default; otherwise, it requires you to configure the **bandwidth** or **shape** commands on the class.

**Examples**
This example shows how to enable **dbl** action in a class:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# dbl
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

**Related Commands**

</table>
**debug adjacency**

To display information about the adjacency debugging, use the `debug adjacency` command. To disable debugging output, use the `no` form of this command.

```
debug adjacency [ipc]
```

```
no debug adjacency
```

**Syntax Description**

- `ipc` (Optional) Displays the IPC entries in the adjacency database.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the information in the adjacency database:

```
Switch# debug adjacency
4d02h: ADJ: add 172.20.52.36 (GigabitEthernet1/1) via ARP will expire: 04:00:00
4d02h: ADJ: add 172.20.52.36 (GigabitEthernet1/1) via ARP will expire: 04:00:00

<td>GigabitEthernet</td>
<td>Limits the debugging to Gigabit Ethernet interfaces.</td>
</tr>
<tr>
<td>null</td>
<td>Limits the debugging to null interfaces; the valid value is 0.</td>
</tr>
<tr>
<td>interface_num</td>
<td>Limits the debugging to port-channel interfaces; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>port-channel</td>
<td>Limits the debugging to port-channel interfaces; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>interface-num</td>
<td>Limits the debugging to port-channel interfaces; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>vlan</td>
<td>Specifies the VLAN interface number; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>vlan_id</td>
<td></td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to limit the debugging output to VLAN interface 1:

```
Switch# debug condition interface vlan 1
Condition 2 set
Switch# undebug condition interface
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>debug interface</code></td>
<td>Abbreviates the entry of the <code>debug condition interface</code> command.</td>
</tr>

<td><code>undebug condition interface</code></td>
<td>Disables interface related activities.</td>
</tr>
</tbody>
</table>
debug condition standby

To limit the debugging output for the standby state changes, use the `debug condition standby` command. To disable the debugging output, use the `no` form of this command.

```
debug condition standby {fastethernet mod/port | GigabitEthernet mod/port | port-channel interface-num | vlan vlan_id group-number}
```

```
no debug condition standby {fastethernet mod/port | GigabitEthernet mod/port | port-channel interface-num | vlan vlan_id group-number}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastethernet</td>
<td>Limits the debugging to Fast Ethernet interfaces.</td>
</tr>
<tr>
<td>mod/port</td>
<td>Number of the module and port.</td>
</tr>
<tr>
<td>GigabitEthernet</td>
<td>Limits the debugging to Gigabit Ethernet interfaces.</td>
</tr>
<tr>
<td>port-channel</td>
<td>Limits the debugging output to port-channel interfaces; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>interface-num</td>
<td></td>
</tr>
<tr>
<td>vlan</td>
<td>Limits the debugging of a condition on a VLAN interface; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>vlan_id</td>
<td></td>
</tr>
<tr>
<td>group-number</td>
<td>VLAN group number; valid values are from 0 to 255.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you attempt to remove the only condition set, you will be prompted with a message asking if you want to abort the removal operation. You can enter `n` to abort the removal or `y` to proceed with the removal. If you remove the only condition set, an excessive number of debugging messages might occur.

### Examples

This example shows how to limit the debugging output to group 0 in VLAN 1:

```
Switch# debug condition standby vlan 1 0
Condition 3 set
Switch#
```
This example shows the display if you try to turn off the last standby debug condition:

```
Switch# no debug condition standby vlan 1 0
This condition is the last standby condition set.
Removing all conditions may cause a flood of debugging messages to result, unless specific debugging flags are first removed.

Proceed with removal? [yes/no]: n
% Operation aborted
Switch#
```

</tbody>
</table>
debug condition vlan

To limit the VLAN debugging output for a specific VLAN, use the `debug condition vlan` command. To disable the debugging output, use the `no` form of this command.

```
debug condition vlan {vlan_id}
no debug condition vlan {vlan_id}
```

**Syntax Description**
- `vlan_id`: Number of the VLAN; valid values are from 1 to 4096.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you attempt to remove the only VLAN condition set, you will be prompted with a message asking if you want to abort the removal operation. You can enter `n` to abort the removal or `y` to proceed with the removal. If you remove the only condition set, it could result in the display of an excessive number of messages.

**Examples**
This example shows how to limit the debugging output to VLAN 1:

```
Switch# debug condition vlan 1
Condition 4 set
Switch#
```

This example shows the message that is displayed when you attempt to disable the last VLAN debug condition:

```
Switch# no debug condition vlan 1
This condition is the last vlan condition set.
Removing all conditions may cause a flood of debugging messages to result, unless specific debugging flags are first removed.
Proceed with removal? [yes/no]: n
% Operation aborted
Switch#
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>undebug condition vlan</code></td>
<td>(same as no debug condition vlan)</td>
</tr>
</tbody>
</table>

Disables debugging output.
**debug dot1x**

To enable the debugging for the 802.1X feature, use the `debug dot1x` command. To disable the debugging output, use the `no` form of this command.

```
dot1x { all | errors | events | packets | registry | state-machine }
```

```
no debug dot1x { all | errors | events | packets | registry | state-machine }
```

**Syntax Description**

- **all**: Enables the debugging of all conditions.
- **errors**: Enables the debugging of print statements guarded by the `dot1x` error flag.
- **events**: Enables the debugging of print statements guarded by the `dot1x` events flag.
- **packets**: All incoming `dot1x` packets are printed with packet and interface information.
- **registry**: Enables the debugging of print statements guarded by the `dot1x` registry flag.
- **state-machine**: Enables the debugging of print statements guarded by the `dot1x` registry flag.

**Defaults**

Debugging is disabled.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(2c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable the 802.1X debugging for all conditions:

```
Switch# debug dot1x all
Switch#
```

**Related Commands**

- `show dot1x`: Displays `dot1x` information.
- `undebug dot1x` (same as `no debug dot1x`): Disables debugging output.
**debug etherchnl**

To debug EtherChannel, use the `debug etherchnl` command. To disable the debugging output, use the `no` form of this command.

```
debug etherchnl [all | detail | error | event | idb | linecard]
no debug etherchnl
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>all</th>
<th>(Optional) Displays all EtherChannel debug messages.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>detail</td>
<td>(Optional) Displays the detailed EtherChannel debug messages.</td>
</tr>
<tr>
<td></td>
<td>error</td>
<td>(Optional) Displays the EtherChannel error messages.</td>
</tr>
<tr>
<td></td>
<td>event</td>
<td>(Optional) Displays the detailed EtherChannel event messages.</td>
</tr>
<tr>
<td></td>
<td>idb</td>
<td>(Optional) Displays the PAgP IDB messages.</td>
</tr>
<tr>
<td></td>
<td>linecard</td>
<td>(Optional) Displays the SCP messages to the module.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- Debug is disabled.
- All messages are displayed.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a keyword, all debug messages are displayed.

**Examples**

This example shows how to display all the EtherChannel debug messages:

```
Switch# debug etherchnl
PAgP Shim/FEC debugging is on
22:46:30:FEC:returning agport Po15 for port (Fa2/1)
22:46:31:FEC:returning agport Po15 for port (Fa4/14)
22:46:33:FEC:comparing GC values of Fa2/25 Fa2/15 flag = 1 1
22:46:33:FEC:pagp_switch_choose_unique:Fa2/25, port Fa2/15 in agport Po3 is incompatible
Switch#
```

This example shows how to display the EtherChannel IDB debug messages:

```
Switch# debug etherchnl idb
Agport idb related debugging is on
Switch#
```
debug etherchnl

This example shows how to disable the debugging:

```
Switch# no debug etherchnl
Switch#
```

<table>

<td>(same as no debug etherchnl)</td>
<td></td>
</tr>
</tbody>
</table>
debug interface

To abbreviate the entry of the debug condition interface command, use the debug interface command. To disable debugging output, use the no form of this command.

```
debug interface {FastEthernet mod/port | GigabitEthernet mod/port | null | port-channel interface-num | vlan vlan_id}
```

```
no debug interface {FastEthernet mod/port | GigabitEthernet mod/port | null | port-channel interface-num | vlan vlan_id}
```

<table>
<thead>
<tr>

</table>
debug pm

To debug the port manager (PM) activity, use the `debug pm` command. To disable the debugging output, use the `no` form of this command.

```
debug pm {all | card | cookies | etherchnl | messages | port | registry | scp | sm | span | split | vlan | vp}
```

```
no debug pm {all | card | cookies | etherchnl | messages | port | registry | scp | sm | span | split | vlan | vp}
```

**Syntax Description**

- `all` Displays all PM debugging messages.
- `card` Debugs the module-related events.
- `cookies` Enables the internal PM cookie validation.
- `etherchnl` Debugs the EtherChannel-related events.
- `messages` Debugs the PM messages.
- `port` Debugs the port-related events.
- `registry`Debugs the PM registry invocations.
- `scp` Debugs the SCP module messaging.
- `sm` Debugs the state machine-related events.
- `span` Debugs the spanning-tree-related events.
- `split` Debugs the split-processor.
- `vlan` Debugs the VLAN-related events.
- `vp` Debugs the virtual port-related events.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to turn on packet debugging:

```
Switch# debug pppoe intermediate-agent packet
PPPOE IA Packet debugging is on
```

```
*Sep 2 06:12:56.133: PPPOE_IA: Process new PPPOE packet, Message type: PADI, input interface: Gi3/7, vlan : 2 MAC da: ffff.ffff.ffff, MAC sa: aabb.cc00.0000
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPOE packet from input interface (GigabitEthernet3/4)
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPOE packet from input interface (GigabitEthernet3/8)
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPOE packet, Message type: PADO, input interface: Gi3/4, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPOE packet, Message type: PADO, input interface: Gi3/8, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: aabb.cc80.0000
*Sep 2 06:12:56.137: PPPOE_IA: received new PPPOE packet from input interface (GigabitEthernet3/7)
*Sep 2 06:12:56.137: PPPOE_IA: Process new PPPOE packet, Message type: PADS, input interface: Gi3/7, vlan : 2 MAC da: 001d.e64c.6512, MAC sa: aabb.cc00.0000
*Sep 2 06:12:56.145: PPPOE_IA: received new PPPOE packet from input interface (GigabitEthernet3/4)
```

This example shows how to turn off packet debugging:

```
Switch# no debug pppoe intermediate-agent packet
PPPOE IA Packet debugging is off
```
### debug pppoe intermediate-agent

<table>

</thead>
<tbody>
<tr>
<td>pppoe intermediate-agent</td>
<td>Enables the PPPoE Intermediate Agent feature on an interface.</td>
</tr>
<tr>
<td>pppoe intermediate-agent limit rate</td>
<td>Limits the rate of the PPPoE Discovery packets arriving on an interface.</td>
</tr>
<tr>
<td>pppoe intermediate-agent trust</td>
<td>Sets the trust configuration of an interface.</td>
</tr>
</tbody>
</table>
debug redundancy

To debug supervisor engine redundancy, use the `debug redundancy` command. To disable the debugging output, use the `no` form of this command.

```
debug redundancy {errors | fsm | kpa | msg | progression | status | timer}
```

```
no debug redundancy
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errors</td>
<td>Enables the redundancy facility for error debugging.</td>
</tr>
<tr>
<td>fsm</td>
<td>Enables the redundancy facility for FSM event debugging.</td>
</tr>
<tr>
<td>kpa</td>
<td>Enables the redundancy facility for keepalive debugging.</td>
</tr>
<tr>
<td>msg</td>
<td>Enables the redundancy facility for messaging event debugging.</td>
</tr>
<tr>
<td>progression</td>
<td>Enables the redundancy facility for progression event debugging.</td>
</tr>
<tr>
<td>status</td>
<td>Enables the redundancy facility for status event debugging.</td>
</tr>
<tr>
<td>timer</td>
<td>Enables the redundancy facility for timer event debugging.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to debug the redundancy facility timer event debugging:

```
Switch# debug redundancy timer
Redundancy timer debugging is on
Switch#
```
debug spanning-tree

To debug the spanning tree activities, use the `debug spanning-tree` command. To disable the debugging output, use the `no` form of this command.

```
default spanning-tree { all | backbonefast | bpdu | bpdu-opt | etherchannel | config | events | exceptions | general | ha | mstp | pvst+ | root | snmp | switch | synchronization | uplinkfast }
no default spanning-tree { all | bpdu | bpdu-opt | etherchannel | config | events | exceptions | general | mst | pvst+ | root | snmp }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>

</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to debug the spanning-tree PVST+:

```
Switch# debug spanning-tree pvst+
Spanning Tree PVST+ debugging is on
Switch#
```
## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>undebug spanning-tree</code></td>
<td>Disables debugging output.</td>
</tr>
</tbody>
</table>

The `undebug spanning-tree` command is similar to the `no debug spanning-tree` command.
debug spanning-tree backbonefast

To enable debugging of the spanning tree BackboneFast events, use the debug spanning-tree backbonefast command. To disable the debugging output, use the no form of this command.

```
debug spanning-tree backbonefast [detail | exceptions]

no debug spanning-tree backbonefast
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>(Optional) Displays the detailed BackboneFast debugging messages.</td>
</tr>
<tr>
<td>exceptions</td>
<td>(Optional) Enables the debugging of spanning tree BackboneFast exceptions.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is supported only on the supervisor engine and enterable only from the Catalyst 4500 series switch console.

### Examples

This example shows how to enable the debugging and to display the detailed spanning tree BackboneFast debugging information:

```
Switch# debug spanning-tree backbonefast detail
Spanning Tree backbonefast detail debugging is on
Switch#
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>undebug spanning-tree backbonefast</td>
<td>Disables debugging output.</td>
</tr>
</tbody>
</table>

(same as no debug spanning-tree backbonefast)
**debug spanning-tree switch**

To enable the switch shim debugging, use the `debug spanning-tree switch` command. To disable the debugging output, use the `no` form of this command.

```
debug spanning-tree switch { all | errors | general | pm | rx { decode | errors | interrupt | process } | state | tx { decode } }
```

```
no debug spanning-tree switch { all | errors | general | pm | rx { decode | errors | interrupt | process } | state | tx { decode } }
```

### Syntax Description

- **all**: Displays all the spanning-tree switch shim debugging messages.
- **errors**: Enables the debugging of switch shim errors or exceptions.
- **general**: Enables the debugging of general events.
- **pm**: Enables the debugging of port manager events.
- **rx**: Displays the received BPDU-handling debugging messages.
- **decode**: Enables the debugging of the decode-received packets of the spanning-tree switch shim.
- **errors**: Enables the debugging of the receive errors of the spanning-tree switch shim.
- **interrupt**: Enables the shim ISR receive BPDU debugging on the spanning-tree switch.
- **process**: Enables the process receive BPDU debugging on the spanning-tree switch.
- **state**: Enables the debugging of the state changes on the spanning-tree port.
- **tx**: Enables the transmit BPDU debugging on the spanning-tree switch shim.
- **decode** (Optional): Enables the decode-transmitted packets debugging on the spanning-tree switch shim.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is supported only on the supervisor engine and enterable only from the switch console.
This example shows how to enable the transmit BPDU debugging on the spanning tree switch shim:

```plaintext
Switch# debug spanning-tree switch tx
Spanning Tree Switch Shim transmit bpdu debugging is on
*Sep 30 08:47:33: SP: STP SW: TX: bpdu of type ieee-st size 92 on FastEthernet5/9 303
*Sep 30 08:47:33: SP: STP SW: TX: bpdu of type ieee-st size 92 on FastEthernet5/9 304
*Sep 30 08:47:33: SP: STP SW: TX: bpdu of type ieee-st size 92 on FastEthernet5/9 305
*Sep 30 08:47:33: SP: STP SW: TX: bpdu of type ieee-st size 92 on FastEthernet5/9 349
*Sep 30 08:47:33: SP: STP SW: TX: bpdu of type ieee-st size 92 on FastEthernet5/9 351
*Sep 30 08:47:33: SP: STP SW: TX: bpdu of type ieee-st size 92 on FastEthernet5/9 801
<... output truncated...>
Switch#
```

debug spanning-tree uplinkfast

To enable the debugging of the spanning-tree UplinkFast events, use the `debug spanning-tree uplinkfast` command. To disable the debugging output, use the `no` form of this command.

```
debug spanning-tree uplinkfast [exceptions]

no debug spanning-tree uplinkfast
```

**Syntax Description**

- `exceptions` (Optional) Enables the debugging of the spanning tree UplinkFast exceptions.

**Defaults**

This command has no default settings.

**Command Modes**

- Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

debug sw-vlan

To debug the VLAN manager activities, use the **debug sw-vlan** command. To disable the debugging output, use the **no** form of this command.

```
debug sw-vlan {badpmcookies | events | management | packets | registries}
no debug sw-vlan {badpmcookies | events | management | packets | registries}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>badpmcookies</td>
<td>Displays the VLAN manager incidents of bad port manager cookies.</td>
</tr>
<tr>
<td>events</td>
<td>Debugs the VLAN manager events.</td>
</tr>
<tr>
<td>management</td>
<td>Debugs the VLAN manager management of internal VLANs.</td>
</tr>
<tr>
<td>packets</td>
<td>Debugs the packet handling and encapsulation processes.</td>
</tr>
<tr>
<td>registries</td>
<td>Debugs the VLAN manager registries.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to debug the software VLAN events:

```
Switch# debug sw-vlan events
vlan manager events debugging is on
Switch#
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>undebug sw-vlan (same as no debug sw-vlan)</td>
<td>Disables debugging output.</td>
</tr>
</tbody>
</table>
debug sw-vlan ifs

To enable the VLAN manager Cisco IOS file system (IFS) error tests, use the `debug sw-vlan ifs` command. To disable the debugging output, use the `no` form of this command.

```
depug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

```
no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

**Syntax Description**

- `open` Enables the VLAN manager IFS debugging of errors in an IFS file-open operation.
- `read` Debugs the errors that occurred when the IFS VLAN configuration file was open for reading.
- `write` Debugs the errors that occurred when the IFS VLAN configuration file was open for writing.
- `{1 | 2 | 3 | 4}` Determines the file-read operation. See the “Usage Guidelines” section for information about operation levels.
- `write` Debugs the errors that occurred during an IFS file-write operation.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following are four types of file read operations:

- **Operation 1**—Reads the file header, which contains the header verification word and the file version number.
- **Operation 2**—Reads the main body of the file, which contains most of the domain and VLAN information.
- **Operation 3**—Reads TLV descriptor structures.
- **Operation 4**—Reads TLV data.

**Examples**

This example shows how to debug the TLV data errors during a file-read operation:

```
Switch# debug sw-vlan ifs read 4
vlan manager ifs read # 4 errors debugging is on
Switch#
```
debug sw-vlan ifs

### Related Commands

</table>
debug sw-vlan notification

To enable the debugging of the messages that trace the activation and deactivation of the ISL VLAN IDs, use the **debug sw-vlan notification** command. To disable the debugging output, use the **no** form of this command.

```
debug sw-vlan notification | accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange

no debug sw-vlan notification | accfwdchange | allowedvlancfgchange | fwdchange | linkchange | modechange | pruningcfgchange | statechange
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accfwdchange</td>
<td>Enables the VLAN manager notification of aggregated access interface STP forward changes.</td>
</tr>
<tr>
<td>allowedvlancfgchange</td>
<td>Enables the VLAN manager notification of changes to allowed VLAN configuration.</td>
</tr>
<tr>
<td>fwdchange</td>
<td>Enables the VLAN manager notification of STP forwarding changes.</td>
</tr>
<tr>
<td>linkchange</td>
<td>Enables the VLAN manager notification of interface link state changes.</td>
</tr>
<tr>
<td>modechange</td>
<td>Enables the VLAN manager notification of interface mode changes.</td>
</tr>
<tr>
<td>pruningcfgchange</td>
<td>Enables the VLAN manager notification of changes to pruning configuration.</td>
</tr>
<tr>
<td>statechange</td>
<td>Enables the VLAN manager notification of interface state changes.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to debug the software VLAN interface mode change notifications:

```
Switch# debug sw-vlan notification modechange
vlan manager port mode change notification debugging is on
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>undebug sw-vlan notification</td>
<td>(same as no debug sw-vlan notification)</td>
</tr>
</tbody>

debug sw-vlan vtp

To enable the debugging of messages to be generated by the VTP protocol code, use the `debug sw-vlan vtp` command. To disable the debugging output, use the `no` form of this command.

```
debug sw-vlan vtp {events | packets | pruning [packets | xmit] | xmit}
no debug sw-vlan vtp {events | packets | pruning [packets | xmit] | xmit}
```

**Syntax Description**

- **events**: Displays the general-purpose logic flow and detailed VTP debugging messages generated by the VTP_LOG_RUNTIME macro in the VTP code.
- **packets**: Displays the contents of all incoming VTP packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer, except for pruning packets.
- **pruning**: Enables the debugging message to be generated by the pruning segment of the VTP protocol code.
- **packets**: (Optional) Displays the contents of all incoming VTP pruning packets that have been passed into the VTP code from the Cisco IOS VTP platform-dependent layer.
- **xmit**: (Optional) Displays the contents of all outgoing VTP packets that the VTP code will request that the Cisco IOS VTP platform-dependent layer to send.
- **xmit**: Displays the contents of all outgoing VTP packets that the VTP code will request that the Cisco IOS VTP platform-dependent layer to send; does not include pruning packets.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release**: 12.1(8a)EW
- **Modification**: Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

If you do not enter any more parameters after entering `pruning`, the VTP pruning debugging messages are displayed.

**Examples**

This example shows how to debug the software VLAN outgoing VTP packets:

```
Switch# debug sw-vlan vtp xmit
vtp xmit debugging is on
Switch#
```

**Related Commands**

- `undebug sw-vlan vtp` (same as no debug `sw-vlan vtp`): Disables debugging output.
**debug udld**

To enable the debugging of UDLD activity, use the `debug udld` command. To disable the debugging output, use the `no` form of this command.

```
debug udld {events | packets | registries}
```

```
no debug udld {events | packets | registries}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>events</code></td>
<td>Enables the debugging of UDLD process events as they occur.</td>
</tr>
<tr>
<td><code>packets</code></td>
<td>Enables the debugging of the UDLD process as it receives packets from the packet queue and attempts to transmit packets at the request of the UDLD protocol code.</td>
</tr>
<tr>
<td><code>registries</code></td>
<td>Enables the debugging of the UDLD process as it processes registry upcalls from the UDLD process-dependent module and other feature modules.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported only on the supervisor engine and enterable only from the switch console.

**Examples**

This example shows how to debug the UDLD events:

```
Switch# debug udld events
UDLD events debugging is on
Switch#
```

This example shows how to debug the UDLD packets:

```
Switch# debug udld packets
UDLD packets debugging is on
Switch#
```

This example shows how to debug the UDLD registry events:

```
Switch# debug udld registries
UDLD registries debugging is on
Switch#
```

define interface-range

To create a macro of interfaces, use the define interface-range command.

    define interface-range macro-name interface-range

Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>macro-name</td>
<td>Name of the interface range macro; up to 32 characters.</td>
</tr>
<tr>
<td>interface-range</td>
<td>List of valid ranges when specifying interfaces; see the “Usage Guidelines” section.</td>
</tr>
</tbody>
</table>

Defaults

This command has no default settings.

Command Modes

Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The macro name is a character string of up to 32 characters. A macro can contain up to five ranges. An interface range cannot span modules.

When entering the interface-range, use these formats:

- `interface-type {mod}/[first-interface] - {last-interface}
- `interface-type {mod}/[first-interface] - {last-interface}

The valid values for interface-type are as follows:

- FastEthernet
- GigabitEthernet
- Vlan `vlan_id

Examples

This example shows how to create a multiple-interface macro:

    Switch(config)# define interface-range macro1 gigabitethernet 4/1-6, fastethernet 2/1-5
    Switch(config)#

<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Deny clauses can be added to forward or drop ARP packets based on some matching criteria.

Examples

This example shows a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This example shows how to deny both requests and responses from this host:

```plaintext
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# deny ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
Switch# show arp access-list
ARP access list static-hosts
  deny ip host 1.1.1.1 mac host 0000.0000.abcd
Switch#
```

Related Commands

destination (netflow-lite exporter submode)

To specify a destination address in netflow-lite submode, use the `destination` command. To delete an exporter, use the `no` form of this command.

```
destination destination-address
no destination destination-address
```

**Syntax Description**

- `destination-address`: Specifies a destination address of a NetFlow-lite collector.

**Defaults**

None

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

One of the mandatory parameters for a minimally configured exporter along with the source Layer 3 interface and the UDP destination port of the collector.

**Examples**

This example shows how to specify a destination address in netflow-lite submode:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter

```
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
    Network Protocol Configuration:
        Destination IP address: 5.5.5.6
        Source IP Address: 5.5.5.5
        VRF label:
        DSCP: 0x20
        TTL: 128
        COS: 7
```
Transport Protocol Configuration:
- Transport Protocol: UDP
- Destination Port: 8188
- Source Port: 61670

Export Protocol Configuration:
- Export Protocol: netflow-v9
- Template data timeout: 60
- Options sampler-table timeout: 1800
- Options interface-table timeout: 1800

Packets Exported: 0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

destination address

To configure the destination e-mail address or URL to which Call Home messages will be sent, use the destination address command.

```
destination address {email email-address | http url}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>email email-address</td>
<td>Specifies the destination e-mail address in 1 to 200 characters.</td>
</tr>
<tr>
<td>http url</td>
<td>Specifies the destination HTTP URL in 2 to 200 characters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the profile command in call-home configuration mode.

When entering the https:// destination URL for the secure server, you must also configure a trustpoint CA.

**Examples**

This example shows how to set the destination to the e-mail address callhome@cisco.com:

```
Switch(config)# call-home
Switch(config-call-home)# profile cisco
Switch(config-call-home-profile)# destination address email callhome@cisco.com
```

</tbody>
</table>
**destination message-size-limit bytes**

To configure a maximum destination message size for the destination profile, use the `destination message-size-limit bytes` command.

```
destination message-size-limit bytes
```

### Syntax Description

This command has no arguments or keywords.

### Defaults

3145728 bytes

### Command Modes

`cfg-call-home-profile`

### Command History

**Release** | **Modification**
---|---
12.2(52)SG | Support was introduced on the Catalyst 4500 series switches.

### Usage Guidelines

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

### Examples

This example shows how to configure the maximum message size for the destination profile as 3000000:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# destination message-size-limit 3000000
```

</tr>
</tbody>
</table>
To configure a preferred message format, use the `destination preferred-msg-format` command.

```
destination preferred-msg-format {long-text | short-text | xml}
```

**Syntax Description**
- `long-text`: Sends the message in long-text format.
- `short-text`: Sends the message in short-text format.
- `xml`: Sends the message in XML format.

**Defaults**
- xml

**Command Modes**
- cfg-call-home-profile

**Command History**

<table>
<thead>

diagnostic fpga soft-error recover

To configure the SEU behavior, use the `diagnostic fpga soft-error recover` command. To return to the default setting, use the `no` form of this command.

```
diagnostic fpga soft-error recover {conservative | aggressive}
no diagnostic fpga soft-error recover
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conservative</td>
<td>Dictates that the supervisor engine does not reload. Rather it issues a console error message once an hour. You should reload the supervisor engine at the next maintenance window.</td>
</tr>
<tr>
<td>aggressive</td>
<td>Dictates that the supervisor engine reloads immediately and automatically. A crashdump is generated, allowing you to identify the SEU event as the cause of the reload.</td>
</tr>
</tbody>
</table>

**Defaults**

A switch exhibits the default SEU behavior when this command is not configured. On redundant switches that have reached SSO, the default behavior is aggressive. In all other switches, the default behavior is conservative.

**Command Modes**

Global config mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(53)SG3,</td>
<td>Support for this command was provided on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG,</td>
<td></td>
</tr>
<tr>
<td>15.0(2)SG</td>
<td></td>
</tr>
<tr>
<td>XE 3.1.1SG</td>
<td></td>
</tr>
<tr>
<td>12.2(53)SG6</td>
<td>Support for the <strong>conservative</strong> option was added.</td>
</tr>
<tr>
<td>15.0(2)SG2</td>
<td></td>
</tr>
<tr>
<td>XE 3.3.0SG</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

SEU events on the system FPGAs result in a potentially unstable switch. The only recovery is to reload the affected supervisor engine. However, SEU events may be harmless, so you might want to delay the reload until a maintenance window, to avoid impacting users. Alternatively, you might want to force an immediate reload to avoid an instance where the switch crashes or drops traffic because of the SEU.

**Examples**

This example shows how to configure the SEU behavior as conservative:

```
Switch(config)# diagnostic fpga soft-error recover conservative
```

This example shows how to revert to the default behavior:

```
Switch(config)# no diagnostic fpga soft-error recover
```
diagnostic monitor action

To direct the action of the switch when it detects a packet memory failure, use the `diagnostic monitor action` command.

```
    diagnostic monitor action [conservative | normal | aggressive]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conservative</td>
<td>(Optional) Specifies that the bootup SRAM diagnostics log all failures and remove all affected buffers from the hardware operation. The ongoing SRAM diagnostics will log events, but will take no other action.</td>
</tr>
<tr>
<td>normal</td>
<td>(Optional) Specifies that the SRAM diagnostics operate as in conservative mode, except that an ongoing failure resets the supervisor engine; allows for the bootup tests to map out the affected memory.</td>
</tr>
<tr>
<td>aggressive</td>
<td>(Optional) Specifies that the SRAM diagnostics operate as in normal mode, except that a bootup failure only logs failures and does not allow the supervisor engine to come online; allows for either a redundant supervisor engine or network-level redundancy to take over.</td>
</tr>
</tbody>
</table>

**Defaults**

normal mode

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `conservative` keyword when you do not want the switch to reboot so that the problem can be fixed.

Use the `aggressive` keyword when you have redundant supervisor engines, or when network-level redundancy has been provided.

**Examples**

This example shows how to configure the switch to initiate an RPR switchover when an ongoing failure occurs:

```
Switch# configure terminal
Switch (config)# diagnostic monitor action normal
```

**Related Commands**

<table>

<td>Displays the module-based diagnostic test results.</td>
</tr>
</tbody>
</table>
**diagnostic start**

To run the specified diagnostic test, use the **diagnostic start** command.

```
diagnostic start {module num} {test test-id} [port num]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module num</td>
<td>Module number.</td>
</tr>
<tr>
<td>test</td>
<td>Specifies a test to run.</td>
</tr>
<tr>
<td>test-id</td>
<td>Specifies an identification number for the test to be run; can be the cable diagnostic test-id, or the <strong>cable-tdr</strong> keyword.</td>
</tr>
<tr>
<td>port num</td>
<td>(Optional) Specifies the interface port number.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to run the specified diagnostic test at the specified module:

```
This exec command starts the TDR test on specified interface
Switch# diagnostic start module 1 test cable-tdr port 3
diagnostic start module 1 test cable-tdr port 3
module 1: Running test(s) 5 Run interface level cable diags
module 1: Running test(s) 5 may disrupt normal system operation
Do you want to continue? [no]: yes
yes
Switch#
2d16h: %DIAG-6-TEST_RUNNING: module 1: Running online-diag-tdr(ID=5) ...
2d16h: %DIAG-6-TEST_OK: module 1: online-diag-tdr(ID=5) has completed successfully
Switch#
```

**Note**

The **show cable-diagnostic tdr** command displays the results of a TDR test. The test results will not be available until approximately 1 minute after the test starts. If you enter the **show cable-diagnostic tdr** command within 1 minute of the test starting, you may see a “TDR test is in progress on interface...” message.

</table>
**dot1x control-direction**

To enable unidirectional port control on a per-port basis on a switch, use the `dot1x control-direction` command. Use the `no` form of this command to disable unidirectional port control.

```
  dot1x control-direction [in | both]
  no dot1x control-direction
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>in</td>
<td>(Optional) Specifies controlling in-bound traffic on a port.</td>
<td>Switch(config-if)# dot1x control-direction in</td>
</tr>
<tr>
<td>both</td>
<td>(Optional) Specifies controlling both in-bound and out-bound traffic on a port.</td>
<td>Switch(config-if)#</td>
</tr>
</tbody>
</table>

**Defaults**

Both in-bound and out-bound traffic will be controlled.

**Command Modes**

Interface configuration mode

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x control-direction</td>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can manage remote systems using unidirectional control. Unidirectional control enables you to turn on systems remotely using a specific Ethernet packet, known as a magic packet.

Using unidirectional control enables you to remotely manage systems using 802.1X ports. In the past, the port became unauthorized after the systems was turned off. In this state, the port only allowed the receipt and transmission of EAPoL packets. Therefore, there was no way for the unidirectional control magic packet to reach the host and without being turned on there was no way for the system to authenticate and open the port.

**Examples**

This example shows how to enable unidirectional control on incoming packets:

```
Switch(config-if)# dot1x control-direction in
Switch(config-if)#
```

**Related Commands**

**dot1x credentials (global configuration)**

Use the `dot1x credentials` global configuration command to configure a profile on a supplicant switch.

```
dot1x credentials profile
no dot1x credentials profile
```

**Syntax Description**

- `profile` Specify a profile for the supplicant switch.

**Defaults**

No profile is configured for the switch.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must have another switch set up as the authenticator for this switch to be the supplicant.

**Examples**

This example shows how to configure a switch as a supplicant:

```
Switch(config)# dot1x credentials profile
```

You can verify your settings by entering the `show running-config` privileged EXEC command.

</table>
dot1x critical

To enable the 802.1X critical authentication on a port, use the `dot1x critical` command. To return to the default setting, use the `no` form of this command.

```
dot1x critical
no dot1x critical
```

**Syntax Description**
This command has no keywords or variables.

**Defaults**
Critical authentication is disabled.

**Command Modes**
Interface configuration mode

**Command History**

</table>
dot1x critical recovery delay

To set the time interval between port reinitializations, use the `dot1x critical recovery delay` command. To return to the default setting, use the `no` form of this command.

```
dot1x critical recovery delay delay-time

no dot1x critical recovery delay
```

**Syntax Description**

- `delay-time` Specified the interval between port reinitializations when AAA transition occurs; valid values are from 1 to 10,000 milliseconds.

**Defaults**

- Delay time is set to 100 milliseconds.

**Command Modes**

- Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set the 802.1x critical recovery delay time to 500:

```
Switch(config-if)# dot1x critical recovery delay 500
```

**Related Commands**

<table>
<thead>
<tr>

<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
To assign a critically authenticated port to a specific VLAN, use the **dot1x critical vlan** command. To return to the default setting, use the **no** form of this command.

```plaintext
dot1x critical vlan vlan-id

no dot1x critical vlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>Syntax</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>(Optional) Specifies the VLANs; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

Critical authentication is disabled on a ports VLAN.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The type of VLAN specified must match the type of the port. If the port is an access port, the VLAN must be a regular VLAN. If the port is a private-VLAN host port, the VLAN must be the secondary VLAN of a valid private-VLAN domain. If the port is a routed port, no VLAN may be specified.

This command is not supported on platforms such as Layer 3 switches that do not include the Critical Auth VLAN subsystem.

**Examples**

This example shows how to enable 802.1x critical authentication on a ports VLAN:

```
Switch(config-if)# dot1x critical vlan 350
Switch(config-if)#
```

**Related Commands**

</table>
dot1x guest-vlan

To enable a guest VLAN on a per-port basis, use the **dot1x guest-vlan** command. To return to the default setting, use the **no** form of this command.

```
dot1x guest-vlan vlan-id
no dot1x guest-vlan vlan-id
```

**Syntax Description**
- `vlan-id` Specifies a VLAN in the range of 1 to 4094.

**Defaults**
This command has no default settings.; the guest VLAN feature is disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for secondary VLAN as the configured guest VLAN ID was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Guest VLANs can be configured only on ports that are statically configured as access ports or private VLAN host ports. Statically configured access ports can be configured with regular VLANs as guest VLANs; statically configured private VLAN host ports can be configured with secondary private VLANs as guest VLANs.

**Examples**
This example shows how to enable a guest VLAN on Fast Ethernet interface 4/3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x guest-vlan 26
Switch(config-if)# end
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>dot1x max-reauth-req</strong></td>
<td>Sets the maximum number of times that the switch will retransmit an EAP-Request/Identity frame to the client before restarting the authentication process.</td>
</tr>
<tr>
<td><strong>show dot1x</strong></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x guest-vlan supplicant**

To place an 802.1X-capable supplicant (host) into a guest VLAN, use the `dot1x guest-vlan supplicant` global configuration command. To return to the default setting, use the `no` form of this command.

```
dot1x guest-vlan supplicant
no dot1x guest-vlan supplicant
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

802.1X-capable hosts are not put into a guest VLAN.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

With Cisco Release 12.2(25) EWA, you can use the `dot1x guest-vlan supplicant` command to place an 802.1X-capable host into a guest VLAN. Prior to Cisco Release 12.2(25)EWA, you could only place non-802.1X capable hosts into a guest VLAN.

When guest VLAN supplicant behavior is enabled, the Catalyst 4500 series switch does not maintain EAPOL packet history. The switch allows clients that fail 802.1X authentication to access a guest VLAN, whether or not EAPOL packets have been detected on the interface.

**Examples**

This example shows how to place an 802.1X-capable supplicant (host) into a guest VLAN:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dot1x system-auth-control</code></td>
<td>Enables 802.1X authentication on the switch.</td>
</tr>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x host-mode**

Use the `dot1x host-mode` interface configuration command on the switch stack or on a standalone switch to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port. Use the `multi-domain` keyword to enable multidomain authentication (MDA) on an IEEE 802.1x-authorized port. Use the `no` form of this command to return to the default setting.

```
dot1x host-mode {multi-host | single-host | multi-domain}
```

**Syntax Description**

- **multi-host** Enables multiple-hosts mode on the switch.
- **single-host** Enables single-host mode on the switch.
- **multi-domain** Enables MDA on a switch port.

**Defaults**

The default is single-host mode.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(37)SG</td>
<td>Added support for multiple domains.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to limit an IEEE 802.1x-enabled port to a single client or to attach multiple clients to an IEEE 802.1x-enabled port. In multiple-hosts mode, only one of the attached hosts needs to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (re-authentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network.

Use the `multi-domain` keyword to enable MDA on a port. MDA divides the port into both a data domain and a voice domain. MDA allows both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), on the same IEEE 802.1x-enabled port.

Before entering this command, make sure that the `dot1x port-control` interface configuration command is set to `auto` for the specified port.

You can assign both voice and data VLAN dynamically from the ACS server. No additional configuration is required to enable dynamic VLAN assignment on the switch. To enable VLAN assignment, you must configure the Cisco ACS server. For details on configuring the ACS server for voice VLAN assignment, refer to the “Cisco ACS Configuration for VLAN Assignment” section in the Catalyst 4500 Series Switch Software Configuration Guide—Release, 12.2(52)SG.
Examples

This example shows how to enable IEEE 802.1x authentication and to enable multiple-hosts mode:

Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet6/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
Switch(config-if)# end
Switch#

This example shows how to enable MDA and to allow both a host and a voice device on the port:

Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet6/1
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

## Related Commands

<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x initialize**

To unauthorized an interface before reinitializing 802.1X, use the `dot1x initialize` command.

```
dot1x initialize interface
```

**Syntax Description**

- `interface` Number of the interface.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(2c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to initialize state machines and to set up the environment for fresh authentication.

**Examples**

This example shows how to initialize the 802.1X state machines on an interface:

```
Switch# dot1x initialize
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x mac-auth-bypass**

To enable the 802.1X MAC address bypassing on a switch, use the `dot1x mac-auth-bypass` command. Use the `no` form of this command to disable MAC address bypassing.

```
  dot1x mac-auth-bypass [eap]
  no dot1x mac-auth-bypass [eap]
```

**Syntax Description**

- **eap** *(Optional)* Specifies using EAP MAC address authentication.

**Defaults**

There is no default setting.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The removal of the `dot1x mac-auth-bypass` configuration from a port does not affect the authorization or authentication state of a port. If the port is in unauthenticated state, it remains unauthenticated, and if MAB is active, the authentication will revert back to the 802.1X Authenticator. If the port is authorized with a MAC address, and the MAB configuration is removed the port remains authorized until re-authentication takes place. When re-authentication occurs the MAC address is removed in favor of an 802.1X supplicant, which is detected on the wire.

**Examples**

This example shows how to enable EAP MAC address authentication:

```
Switch(config-if)# dot1x mac-auth-bypass
```

Switch(config-if)#
**dot1x max-reauth-req**

To set the maximum number of times that the switch will retransmit an EAP-Request/Identity frame to the client before restarting the authentication process, use the `dot1x max-reauth-req` command. To return to the default setting, use the `no` form of this command.

```
dot1x max-reauth-req count
no dot1x max-reauth-req
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Number of times that the switch retransmits EAP-Request/Identity frames before restarting the authentication process; valid values are from 1 to 10.</td>
</tr>
</tbody>
</table>

**Defaults**

The switch sends a maximum of two retransmissions.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers. This setting impacts the wait before a non-dot1x-capable client is admitted to the guest VLAN, if one is configured.

You can verify your settings by entering the `show dot1x` privileged EXEC command.

**Examples**

This example shows how to set 5 as the number of times that the switch retransmits an EAP-Request/Identity frame before restarting the authentication process:

```
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
dot1x max-req

To set the maximum number of times that the switch retransmits an Extensible Authentication Protocol (EAP)-Request frame of types other than EAP-Request/Identity to the client before restarting the authentication process, use the **dot1x max-req** command. To return to the default setting, use the **no** form of this command.

```
dot1x max-req count

no dot1x max-req
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>count</strong></td>
<td>Number of times that the switch retransmits EAP-Request frames of types other than EAP-Request/Identity before restarting the authentication process; valid values are from 1 to 10.</td>
</tr>
</tbody>
</table>

**Defaults**

The switch sends a maximum of two retransmissions.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>

dot1x port-control

To enable manual control of the authorization state on a port, use the `dot1x port-control` command. To return to the default setting, use the `no` form of this command.

```
dot1x port-control {auto | force-authorized | force-unauthorized}
no dot1x port-control {auto | force-authorized | force-unauthorized}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>auto</code></td>
<td>Enables 802.1X authentication on the interface and causes the port to transition to the authorized or unauthorized state based on the 802.1X authentication exchange between the switch and the client.</td>
</tr>
<tr>
<td><code>force-authorized</code></td>
<td>Disables 802.1X authentication on the interface and causes the port to transition to the authorized state without any authentication exchange required. The port transmits and receives normal traffic without 802.1X-based authentication of the client.</td>
</tr>
<tr>
<td><code>force-unauthorized</code></td>
<td>Denies all access through the specified interface by forcing the port to transition to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the interface.</td>
</tr>
</tbody>
</table>

**Defaults**

The port 802.1X authorization is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The 802.1X protocol is supported on both the Layer 2 static-access ports and the Layer 3-routed ports. You can use the `auto` keyword only if the port is not configured as follows:

- Trunk port—If you try to enable 802.1X on a trunk port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to trunk, the port mode is not changed.
- Dynamic ports—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1X on a dynamic port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to dynamic, the port mode is not changed.
- EtherChannel port—Before enabling 802.1X on the port, you must first remove it from the EtherChannel. If you try to enable 802.1X on an EtherChannel or on an active port in an EtherChannel, an error message appears, and 802.1X is not enabled. If you enable 802.1X on an inactive port of an EtherChannel, the port does not join the EtherChannel.
Switch Port Analyzer (SPAN) destination port—You can enable 802.1X on a port that is a SPAN destination port; however, 802.1X is disabled until the port is removed as a SPAN destination. You can enable 802.1X on a SPAN source port.

To globally disable 802.1X on the switch, you must disable it on each port. There is no global configuration command for this task.

**Examples**

This example shows how to enable 802.1X on Gigabit Ethernet 1/1:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# dot1x port-control auto
Switch#
```

You can verify your settings by using the `show dot1x all` or `show dot1x interface int` commands to show the port-control status. An enabled status indicates that the port-control value is set either to `auto` or to `force-unauthorized`.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x re-authenticate**

To manually initiate a reauthentication of all 802.1X-enabled ports or the specified 802.1X-enabled port, use the `dot1x re-authenticate` command.

```
dot1x re-authenticate [interface interface-id]
```

**Syntax Description**

Syntax:

```
dot1x re-authenticate [interface interface-id]
```

**interface interface-id** (Optional) Module and port number of the interface.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command to reauthenticate a client without waiting for the configured number of seconds between reauthentication attempts (re-authperiod) and automatic reauthentication.

**Examples**

This example shows how to manually reauthenticate the device connected to Gigabit Ethernet interface 1/1:

```
Switch# dot1x re-authenticate interface gigabitethernet1/1
Starting reauthentication on gigabitethernet1/1
Switch#
```
**dot1x re-authentication**

To enable the periodic reauthentication of the client, use the `dot1x re-authentication` command. To return to the default setting, use the `no` form of this command.

```
dot1x re-authentication
```

```
no dot1x re-authentication
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The periodic reauthentication is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You configure the amount of time between the periodic reauthentication attempts by using the `dot1x timeout re-authperiod` global configuration command.

**Examples**

This example shows how to disable the periodic reauthentication of the client:

```
Switch(config-if)# no dot1x re-authentication
Switch(config-if)#
```

This example shows how to enable the periodic reauthentication and set the number of seconds between the reauthentication attempts to 4000 seconds:

```
Switch(config-if)# dot1x re-authentication
Switch(config-if)# dot1x timeout re-authperiod 4000
Switch#
```

You can verify your settings by entering the `show dot1x` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
dot1x system-auth-control

To enable 802.1X authentication on the switch, use the dot1x system-auth-control command. To disable 802.1X authentication on the system, use the no form of this command.

```
dot1x system-auth-control
no dot1x system-auth-control
```

Syntax Description
This command has no arguments or keywords.

Defaults
The 802.1X authentication is disabled.

Command Modes
Global configuration mode

Command History
Release Modification
12.1(12c)EW Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines
You must enable dot1x system-auth-control if you want to use the 802.1X access controls on any port on the switch. You can then use the dot1x port-control auto command on each specific port on which you want the 802.1X access controls to be used.

Examples
This example shows how to enable 802.1X authentication:

```
Switch(config)# dot1x system-auth-control
Switch(config)#
```

Related Commands
<table>
<thead>

<tr>
<td>show dot1x</td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
dot1x timeout

To set the reauthentication timer, use the `dot1x timeout` command. To return to the default setting, use the `no` form of this command.

```plaintext
dot1x timeout {reauth-period {seconds | server} | quiet-period seconds | tx-period seconds | supp-timeout seconds | server-timeout seconds}

no dot1x timeout {reauth-period | quiet-period | tx-period | supp-timeout | server-timeout}
```

**Syntax Description**

- `reauth-period` _seconds_  
  Number of seconds between reauthentication attempts; valid values are from 1 to 65535. See the “Usage Guidelines” section for more information.

- `reauth-period` _server_  
  Number of seconds between reauthentication attempts; valid values are from 1 to 65535 as derived from the Session-Timeout RADIUS attribute. See the “Usage Guidelines” section for more information.

- `quiet-period` _seconds_  
  Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client; valid values are from 0 to 65535 seconds.

- `tx-period` _seconds_  
  Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request; valid values are from 1 to 65535 seconds.

- `supp-timeout` _seconds_  
  Number of seconds that the switch waits for the retransmission of EAP-Request packets; valid values are from 30 to 65535 seconds.

- `server-timeout` _seconds_  
  Number of seconds that the switch waits for the retransmission of packets by the back-end authenticator to the authentication server; valid values are from 30 to 65535 seconds.

**Defaults**

The default settings are as follows:
- Reauthentication period is 3600 seconds.
- Quiet period is 60 seconds.
- Transmission period is 30 seconds.
- Supplicant timeout is 30 seconds.
- Server timeout is 30 seconds.

<td>12.2(25)EWA</td>
<td>Support for selecting the reauthentication timer from the “server” was added.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The periodic reauthentication must be enabled before entering the `dot1x timeout re-authperiod` command. Enter the `dot1x re-authentication` command to enable periodic reauthentication.

Examples

This example shows how to set 60 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x timeout tx-period 60
Switch(config-if)# end
Switch#
```

You can verify your settings by entering the `show dot1x` privileged EXEC command.

This example shows how to set up the switch to use a reauthentication timeout derived from a Session-Timeout attribute taken from the RADIUS Access-Accept message received when a host successfully authenticates via 802.1X:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x timeout reauth-period server
Switch(config-if)# end
Switch#
```

</tr>
</tbody>
</table>

**Examples**

This example shows how to specify a cos value for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter

```
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
Network Protocol Configuration:
Destination IP address: 5.5.5.6
Source IP Address: 5.5.5.5
VRF label:
DSCP: 0x20

</table>
To configure the duplex operation on an interface, use the `duplex` command. To return to the default setting, use the `no` form of this command.

```
duplex { auto | full | half }
no duplex
```

### Syntax Description

- **auto**: Specifies the autonegotiation operation.
- **full**: Specifies the full-duplex operation.
- **half**: Specifies the half-duplex operation.

### Defaults

Half-duplex operation

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 12.1(8a)EW | Support for this command was introduced on the Catalyst 4500 series switch.

### Usage Guidelines

Table 2-1 lists the supported command options by interface.

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Supported Syntax</th>
<th>Default Setting</th>
<th>Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100-Mbps module</td>
<td>duplex [half</td>
<td>full]</td>
<td>half</td>
</tr>
<tr>
<td>100-Mbps fiber modules</td>
<td>duplex [half</td>
<td>full]</td>
<td>half</td>
</tr>
<tr>
<td>Gigabit Ethernet Interface</td>
<td>Not supported.</td>
<td>Not supported.</td>
<td>Gigabit Ethernet interfaces are set to <code>full</code> duplex.</td>
</tr>
<tr>
<td>10/100/1000</td>
<td>duplex [half</td>
<td>full]</td>
<td></td>
</tr>
</tbody>
</table>
If the transmission speed on a 16-port RJ-45 Gigabit Ethernet port is set to 1000, the duplex mode is set to full. If the transmission speed is changed to 10 or 100, the duplex mode stays at full. You must configure the correct duplex mode on the switch when the transmission speed changes to 10 or 100 from 1000 Mbps.

**Caution**
Changing the interface speed and duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table 2-2 describes the system performance for different combinations of the duplex and speed modes. The specified duplex command that is configured with the specified speed command produces the resulting action shown in the table.

<table>
<thead>
<tr>
<th>duplex Command</th>

energywise (global configuration)

Use the `energywise` global configuration command to enable and configure EnergyWise on an entity. Use the `no` form of this command to disable EnergyWise on the entity and remove the EnergyWise configuration.

```
energywise { importance importance | keywords word,word,... | level level | management tcp-port-number | name name | neighbor hostname | ip-address udp-port-number | role role }

no energywise { importance | keywords | level | management | name | neighbor | role }
```

**Syntax Description**

- **importance importance**  Sets the importance of the entity.
  The range is from 1 to 100.

- **keywords word,word,...** Assigns at least one keyword for the entity.
  When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.
  For the `word` value:
  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **level level**  Sets the power level of the entity.
  The only valid value is 10.

- **management tcp-port-number**  Specifies the TCP port that connects to the management station.
  The range is from 1 to 65000.

- **name name**  Specifies the EnergyWise-specific entity name.
  For the `name` value:
  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **neighbor hostname | ip-address udp-port-number**  Assigns a static neighbor.
  - Hostname (`hostname`) or IP address (`ip-address`).
  - UDP port (`udp-port-number`) that sends and receives queries. The range is from 1 to 65000.

- **role role**  Specifies the role of the entity in the EnergyWise domain. For example, lobby.b20.
  For the `role` value:
  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.
energywise (global configuration)

**Defaults**

The importance is 1.
No keywords are defined.
The power level is 10.
The `tcp-port-number` is 43440.
The name is the hostname.
No neighbors are assigned.
The role is the model number.

**Command Modes**

Configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you add an entity to a domain, EnergyWise is enabled on the entity and its PoE ports.

**Examples**

This example shows how to enable EnergyWise, assign the entity to a domain, and set the password:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# energywise importance 50
Switch(config)# energywise keywords lab1,devlab
Switch(config)# energywise management 60500
Switch(config)# energywise name Entity01
Switch(config)# energywise neighbor 4500-21 43440
Switch(config)# energywise role role.lobbyaccess
Switch(config)# end
```

**Related Commands**

</tr>
</thead>
<tbody>
<tr>
<td><code>show energywise</code></td>
<td>Displays the EnergyWise settings and status.</td>
</tr>
</tbody>
</table>
energywise (interface configuration)

Use the `energywise` interface configuration command to configure EnergyWise on the power over Ethernet (PoE) port. Use the `no` form of this command to disable EnergyWise on the port and remove the EnergyWise configuration.

```
energywise [importance importance | keywords word,word,... | level level [recurrence at minute
hour day_of_month month day_of_week] | name name | role role]

no energywise
```

### Syntax Description

- **importance importance** (Optional) Sets the importance of the port.
  - The range is from 1 to 100.

- **keywords word,word,...** (Optional) Assigns at least one keyword for the port.
  - When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.
  - For the `word` value:
    - You can enter alphanumeric characters and symbols such as #, %, ! or &.
    - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **level level** (Optional) Sets the power level of the port.
  - The only valid values are 0 and 10.

- **recurrence importance importance at minute hour day_of_month month day_of_week** (Optional) Schedules the power-on or power-off recurrence.
  - **importance importance**—Sets the importance of the port in the domain.
    - The range is from 1 to 100.
  - **minute**—The range is from 0 to 59. Use * for the wildcard.
  - **hour**—The range is from 0 to 23. Use * for the wildcard.
  - **day_of_month**—The range is from 1 to 31. Use * for the wildcard.
  - **month**—The range is from 1 to 12. You can also enter `jan`, `feb`, `mar`, `apr`, and so on. Use * for the wildcard.
  - **day_of_week**—The range is from 0 to 7 (0 and 7 both represent Sunday). Use * for the wildcard.

**Note** The specified times are local times based on the PoE-entity time zone.

**Note** If the day of the month and day of the week are both specified, (that is, are not wildcards), the recurrence is executed when either field matches the current time.

**Note** Recurrence takes effect within the minute specified, rather than exactly on the minute; it could occur as much as 60 seconds late.
energywise (interface configuration)

name name  (Optional) Specifies the EnergyWise-specific port name.

For the name value:

- You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

role role  (Optional) Specifies the role of the port in the domain. For example, lobbyport.

For the role value:

- You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

Defaults

The importance is 1.
No keywords are defined.
The power level is 10.
The name is the short version of the interface name; for example, Gi1.2 for Gigabit Ethernet 1/2.

Command Modes

Interface Configuration

Command History

Release Modification

12.2(52)SG  This command was introduced.

Usage Guidelines

To return the importance and level values to the default settings, use the default energywise importance and the default energywise level commands.

Examples

This example shows how to enable and configure EnergyWise on the PoE port:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.2
Switch(config)# interface Gi1.2
Switch(config-if)# energywise level 10 recurrence importance 90 at 0 8 ** *
Switch(config-if)# energywise level 0 recurrence importance 90 at 0 20 ** *
Switch(config-if)# energywise importance 50
Switch(config-if)# energywise name lobbyInterface.3
Switch(config-if)# energywise role role.lobbyaccess
Switch(config-if)# end

Note  Recurrence takes effect within the minute specified, rather than exactly on the minute; it could occur as much as 60-seconds late.

Usage Guidelines
To power on or power off ports, enter the `energywise query {keywords word,word,... | name name} set level level` command.

⚠️ Caution
Use this query with care because it affects the entity on which you enter the command and other devices in the domain that match the query criteria.

Examples
These examples show how to filter with the entity name:

Switch# `energywise query importance 100 name phone* collect usage`
EnergyWise query, timeout is 3 seconds:

<table>
<thead>
<tr>
<th>Host</th>
<th>Name</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.2.2.21</td>
<td>phone</td>

epm access control

To configure access control, use the `epm access control [open | default]` command.

```
epm access control [open | default]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>open</td>
<td>Specifies open access control.</td>
</tr>
<tr>
<td>default</td>
<td>Specifies default access control.</td>
</tr>
</tbody>
</table>

**Defaults**

If the `epm access control` command is not configured, the behavior defaults to the `epm access control default` command. Nothing is nvgened.

**Command Modes**

Configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the `epm access control` command, it is nvgen’d.

If no ACLs are downloaded from the ACS server when a host is authenticated, the host is restricted by the port ACLs and do not receive additional permissions. In such a scenario, if you enter the `epm access control open` command, a `permit ip host any` entry is created for the host after authentication. This entry is created only if no ACLs are downloaded from the ACS.

The `epm access control open` command is particularly useful in authentication open mode. Traffic from a host is allowed to pass even before the host is authenticated. This traffic is restricted by the port ACL. In such a scenario, if no ACLs are downloaded from the ACS, the host will not receive any additional permissions. Even after authentication, the host is still restricted by the port ACL. If `epm access control open` is configured, complete access is granted upon authentication.

If `epm access control default` is configured and no ACL is downloaded, port ACL is the only ACL on the port. This is how access control functioned prior to Cisco IOS Release 12.2(54)SG.

**Examples**

The following example shows how to enable open access control:

```
Switch(config)# epm access control open
```

The following example shows how to enable default access control:

```
Switch(config)# epm access control default
```

# erase

To erase a file system, use the `erase` command.

```
 erase [/all [non-default | nvram:] | cat4000_flash | nvram: | startup-config]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/all nvram:</td>
<td>Erases everything in nvram:</td>
</tr>
<tr>
<td>/all non-default</td>
<td>Erases files and configuration in nonvolatile storage including nvram:, bootflash:, cat4000_flash:, and crashinfo: of the local supervisor engine. Resets the Catalyst 4500 series switch to the factory default settings.</td>
</tr>
<tr>
<td>Note</td>
<td>This command option is intended to work only on a standalone supervisor engine.</td>
</tr>
<tr>
<td>cat4000_flash:</td>
<td>Erases the VLAN database configuration file.</td>
</tr>
<tr>
<td>nvram:</td>
<td>Erases the startup-config and private-config file in NVRAM.</td>
</tr>
<tr>
<td>startup-config:</td>
<td>Erases the startup-config and private-config file in NVRAM.</td>
</tr>
</tbody>
</table>

## Defaults

This command has no default settings.

## Command Modes

Privileged EXEC mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

**Caution**

When you use the `erase` command to erase a file system, you cannot recover the files in the file system.

In addition to the command options shown above, options with the prefix slave that are used to identify nvram: and flash (such as slavenvram: and slavecat4000_flash:) appear in the command help messages on the dual supervisor engine redundancy switch.

The `erase nvram:` command replaces the `write erase` and the `erase startup-config` commands. This command erases both the startup-config and the private-config file.

The `erase /all nvram:` command erases all files in nvram: in addition to startup-config file and private-config file.

The `erase cat4000_flash:` command erases the VLAN database configuration file.

The `erase /all non-default` command facilitates the work of a manufacturing facility and repair center. It erases the configuration and states stored in the nonvolatile storage and resets the Catalyst 4500 series switch to the factory default settings. The default settings include those mentioned in the Cisco IOS library as well as those set by the `erase /all non-default` command (vtp mode=transparent, and the ROMMON variables: ConfigReg=0x2101, PS1= “rommon ! >” and EnableAutoConfig=1).
For the default settings, refer to these guides:

- *Cisco IOS Configuration Fundamentals Configuration Guide*, Release 12.2, at this URL:
- *Cisco IOS Configuration Fundamentals Configuration Command Reference*, Release 12.2, at this URL:

⚠️ **Caution**

The `erase /all non-default` command can erase Cisco IOS images in bootflash:. Ensure that a Cisco IOS image can be copied back to the bootflash: (such as, from a accessible TFTP server or a flash card inserted in slot0:) (available on most chassis models), or that the switch can boot from a image stored in an accessible network server.

---

### Examples

This example shows how to erase the files and configuration in a nonvolatile storage and reset the switch to factory default settings:

```
Switch# erase /all non-default
Switch#
```

Erasing nvram:
Erasing `cat4000_flash`:
Clearing crashinfo::data
Clearing the last power failure timestamp
Clearing all ROMMON variables
Setting default ROMMON variables:
  `ConfigReg=0x2101`  
  `PS1=rommon !>`
Setting `vtp mode` to transparent
%WARNING! Please reboot the system for the changes to take effect

```
Switch#  
00:01:48: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
Switch#
```

This example shows how to erase the contents in nvram.

```
Switch# erase /all nvram:
```

Erasing the nvram filesystem will remove all files! Continue? [confirm]  
[OK]
Erase of nvram: complete

```
Switch#  
00:38:10: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
Switch#
```

This example shows how to erase filesystem `cat4000_flash`.

```
Switch# erase cat4000_flash:
```

Erasing the `cat4000Flash` filesystem will remove all files! Continue? [confirm]  
[OK]
Erase of `cat4000Flash`: complete

```
Switch#  
```

errdisable detect

To enable error-disable detection, use the `errdisable detect` command. To disable the error-disable detection feature, use the `no` form of this command.

```
errdisable detect cause {all | arp-inspection [action shutdown vlan] | bpduguard shutdown vlan | dhcp-rate-limit [action shutdown vlan] | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap}

no errdisable detect cause {all | arp-inspection [action shutdown vlan] | bpduguard shutdown vlan | dhcp-rate-limit [action shutdown vlan] | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap}
```

### Syntax Description

</tr>
</tbody>
</table>

### Defaults

All error-disable causes are detected.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A cause (dtp-flap, link-flap, pagp-flap) is defined as the reason why the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in error-disabled state (an operational state that is similar to link-down state).

You must enter the `shutdown` command and then the `no shutdown` command to recover an interface manually from the error-disable state.
To prevent the port from shutting down, you can use the `shutdown vlan` option to shut down just the offending VLAN on the port where the violation occurred. This option is available for the following three causes: bpduguard, arp-inspection, and dhcp-rate-limit. You can use the `clear errdisable` command to recover disabled VLANs on a port.

**Examples**

This example shows how to enable error-disable detection for the link-flap error-disable cause:

```
Switch(config)# errdisable detect cause link-flap
Switch(config)#
```

This example shows how to enable per-VLAN error-disable detection for BPDU guard:

```
Switch(config)# errdisable detect cause bpduguard shutdown vlan
Switch(config)#
```

This example shows how to disable error-disable detection for DAI:

```
Switch(config)# no errdisable detect cause arp-inspection
Switch(config)#
```

```
Switch# show errdisable detect
ErrDisable Reason   Detection Mode
-----------------    -------- ------
arip-inspection    Enabled  port
bpduguard          Enabled  vlan
channel-misconfig  Enabled  port
dhcp-rate-limit    Enabled  port
dtp-flap           Enabled  port
gbic-invalid       Enabled  port
psecure-violation  Enabled  port/vlan
Switch#
```

</tr>
</tbody>
</table>
errdisable recovery

**Defaults**

Error disable recovery is disabled.

The recovery interval is set to 300 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for the storm-control feature.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A cause (bpduguard, dtp-flap, link-flap, pagp-flap, udld) is defined as the reason why the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in error-disabled state (an operational state that is similar to the link-down state). If you do not enable error-disable recovery for the cause, the interface stays in the error-disabled state until a shutdown and no shutdown occurs. If you enable recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry operation again once all the causes have timed out.

You must enter the `shutdown` command and then the `no shutdown` command to recover an interface manually from error disable.

**Examples**

This example shows how to enable the recovery timer for the BPDU guard error disable cause:

```
Switch(config)# errdisable recovery cause bpduguard
Switch(config)#
```

This example shows how to set the timer to 300 seconds:

```
Switch(config)# errdisable recovery interval 300
Switch(config)#
```

This example shows how to enable the errdisable recovery for arp-inspection:

```
Switch(config)# errdisable recovery cause arp-inspection
Switch(config)# end
Switch# show errdisable recovery
ErrDisable Reason    Timer Status
-----------------    --------------
udld                Disabled
bpduguard           Disabled
security-violation  Disabled
channel-misconfig   Disabled
vmps                Disabled
pagp-flap           Disabled
dtp-flap            Disabled
link-flap           Disabled
l2ptguard           Disabled
psecure-violation   Disabled
gbic-invalid        Disabled
dhcp-rate-limit     Disabled
unicast-flood       Disabled
storm-control       Disabled
arp-inspection      Enabled
```
Timer interval: 300 seconds

Interfaces that will be enabled at the next timeout:

Switch#

<table>

</tbody>
</table>
export-protocol (netflow-lite exporter submode)

To specify the export protocol for the NetFlow-lite collector, use the `export-protocol` command. To delete the value, use the `no` form of this command.

```
export-protocol {netflow-v9 | ipfix}
no export-protocol {netflow-v9 | ipfix}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>netflow-v9</td>
<td>Specifies export format of Netflow V9.</td>
</tr>
<tr>
<td>ipfix</td>
<td>Specifies export format of Netflow V10 or IPFIX.</td>
</tr>
</tbody>
</table>

**Defaults**

netflow-v9

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default the export protocol is Netflow V9. IPFIX or Netflow V10 is a newer export format. They support variable length encoding that allows for more efficient packaging of packet samples according to the actual packet section bytes extracted from the original sampled packet.

**Examples**

This example shows how to specify the export protocol for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter
Switch# `show netflow-lite exporter exporter1`
Netflow-lite Exporter exporter1:
  Network Protocol Configuration:
    Destination IP address:   5.5.5.6
    Source IP Address:        5.5.5.5
    VRF label:
    DSCP:                     0x20
    TTL:                      128
    COS:                      7

flow control

To configure a Gigabit Ethernet interface to send or receive pause frames, use the `flowcontrol` command. To disable the flow control setting, use the `no` form of this command.

```
flowcontrol {receive | send} {off | on | desired}
no flowcontrol {receive | send} {off | on | desired}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive</td>
<td>Specifies that the interface processes pause frames.</td>
</tr>
<tr>
<td>send</td>
<td>Specifies that the interface sends pause frames.</td>
</tr>
<tr>
<td>off</td>
<td>Prevents a local port from receiving and processing pause frames from remote ports or from sending pause frames to remote ports.</td>
</tr>
<tr>
<td>on</td>
<td>Enables a local port to receive and process pause frames from remote ports or send pause frames to remote ports.</td>
</tr>
<tr>
<td>desired</td>
<td>Obtains predictable results whether a remote port is set to on, off, or desired.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings for Gigabit Ethernet interfaces are as follows:

- Sending pause frames is off—Non-oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Non-oversubscribed Gigabit Ethernet interfaces.
- Sending pause frames is on—Oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Oversubscribed Gigabit Ethernet interfaces.

Table 2-3 shows the default settings for the modules.

**Table 2-3 Default Module Settings**

</tbody>
</table>

**Command Modes**

Interface configuration mode

**Command History**

- **Release** 12.1(8a)EW: Support for this command was introduced on the Catalyst 4500 series switch.
Usage Guidelines

The pause frames are special packets that signal a source to stop sending frames for a specific period of time because the buffers are full.

Table 2-4 describes the guidelines for using the different configurations of the send and receive keywords with the flowcontrol command.

Table 2-4  
Keyword Configurations for send and receive

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>

hardware statistics

To enable TCAM hardware statistics in your ACLs use the `hardware statistics` command. To disable TCAM hardware statistics, use the `no` form of this command.

```
    hardware statistics
    no hardware statistics
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Hardware statistics is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Introduced support on Supervisor Engine 6-E and the Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The Supervisor Engine 6-E and Catalyst 4900 M chassis TCAM hardware do not have sufficient hardware statistics entries for every classification/QoS cam entry. Therefore, the statistics for each cam entry needs to be enabled as needed.

**Examples**
This example shows how to enable TCAM hardware statistics in your ACLs ace:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)#ip access-list extended myv4
Switch(config-ext-nacl)#permit ip any any
Switch(config-ext-nacl)#hardware statistics
Switch(config-ext-nacl)#end
```

**Related Commands**

</table>
hw-module port-group

To select either Gigabit Ethernet or 10-Gigabit Ethernet interfaces on your module, use the `hw-module port-group` command.

```
hw-module module number port-group number select [gigabitethernet | tengigabitethernet]
```

**Syntax Description**

- **module**
  - Specifies a line module.
- **number**
  - Specifies a module which supports TwinGig converter.
- **port-group number**
  - Port group number on a switch.
- **select**
  - Specifies an interface type; valid values are Gigabit Ethernet and 10-Gigabit Ethernet.
- **gigabitethernet**
  - (Optional) Specifies Gigabit Ethernet.
- **tengigabitethernet**
  - (Optional) Specifies 10-Gigabit Ethernet.

**Defaults**

10 Gigabit.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for TwinGig converter module introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Support for this command is available on the Cisco Catalyst 4500 modules that support TwinGig converter modules, such as the Supervisor Engine 6-E and WS-X4606-10GE-E.

**Examples**

This example shows how to select Gigabit Ethernet interfaces on a WS-X4606-10GE-E using the TwinGig Converter:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# hw-module module 1 port-group 1 select gigabitethernet
Switch(config)# exit
```

Use the `show interfaces status` command to display your configuration.

**Related Commands**

</tr>
</tbody>
</table>
**hw-module power**

To turn the power off on a slot or line module, use the `no hw-module power` command. To turn the power back on, use the `hw-module power` command.

```
hw-module [slot | module] number power

no hw-module [slot | module] number power
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slot</td>
<td>(Optional) Specifies a slot on a chassis.</td>
</tr>
<tr>
<td>module</td>
<td>(Optional) Specifies a line module.</td>
</tr>
<tr>
<td>number</td>
<td>Slot or module number.</td>
</tr>
</tbody>
</table>

**Defaults**

After a boot up, the power is on.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>

</thead>
<tbody>
<tr>
<td><code>clear hw-module slot password</code></td>
<td>Clears the password on an intelligent line module.</td>
</tr>
</tbody>
</table>
hw-module system max-queue-limit

To enable user to change the queue limit for all interfaces globally use the `hw-module system max-queue-limit` command. To cancel the global setting, use the `no` form of the command.

Note

This command is supported on Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E, and Catalyst 4948E-F.

```
hw-module system max-queue-limit max-queue-limit
no hw-module system max-queue-limit max-queue-limit
```

Syntax Description

```
max-queue-limit
```

Specifies the queue limit for all interfaces. Valid values are from 1024 to 8184. This parameter must be a multiple of 8.

Defaults

Not enabled by default

Command Modes

Global configuration mode

Command History

```
Release     Modification
15.0(2)SG1  Support for this command was introduced on the Catalyst 4500 series switch.
```

Usage Guidelines

This command allows you to change the queue limit for all interfaces globally rather than apply a policy with a queue limit to all the interfaces.

For a standalone supervisor engine, you must reboot the engine after applying this command. For a redundant supervisor engine, you must enter the `redundancy reload shelf` command to enforce a reboot on both the supervisor engines.

This is a global configuration command. It can be overridden by the per port, per class, `queue-limit` command.

Examples

This example shows how to set the queue limit globally to 1024:

```
Switch> enable
Switch# configure terminal
Switch(config)# hw-module system max-queue-limit 1024
Switch(config)# exit
Switch# reload  (for standalone supervisors)
Switch# redundancy reload shelf  (for redundant supervisors in SSO mode)
or
Switch# redundancy force-switchover  (followed by another redundancy force-switchover, for redundant supervisors in RPR mode)
```
hw-module uplink mode shared-backplane

To change the uplink mode so that you can use all four 10-Gigabit Ethernet ports as blocking ports on the Supervisor Engine 6-E and Catalyst 4900 M chassis when operating in redundant mode, use the **hw-module uplink mode shared-backplane** command. To disable shared-backplane uplink mode, use the **no** form of the command.

```
hw-module uplink mode shared-backplane
no hw-module uplink mode shared-backplane
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
Only two 10-Gigabit Ethernet ports or four 1-Gigabit Ethernet ports can be used on the supervisor engine.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When changing the uplink mode using the **hw-module uplink mode shared-backplane** command, you must reload the system. A message is printed on the console to reflect this.

**Examples**
This example shows how to enable shared-backplane uplink mode:

```
Switch(config)# hw-module uplink mode shared-backplane
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

This example shows how to disable shared-backplane uplink mode:

```
Switch(config)# no hw-module uplink mode shared-backplane
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

This example shows how to display the current state of uplink-mode:

```
Switch# show hw-module uplink
Active uplink mode configuration is Default
(will be Shared-backplane after next reload)
A reload of active supervisor is required to apply the new configuration.
```
### Related Commands

<table>

<td>(Optional) Specifies the Gigabit Ethernet uplinks.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Specifies all uplinks (10-Gigabit Ethernet and Gigabit Ethernet).</td>
</tr>
</tbody>
</table>

**Defaults**

tengigabitethernet

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Support for the <strong>all</strong> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On a Supervisor Engine V-10GE (WS-X4516-10GE) in a 10-slot chassis (Catalyst 4510R and 4510R-E), if a startup configuration with a new uplink mode is copied into flash memory and the system is power cycled, the system will not come up with the new uplink mode. After copying the startup configuration with the new uplink mode into flash memory, the uplink mode must be changed to the new uplink mode through the command interface before the system is power cycled. This ensures that the system comes up in the new uplink mode.

Supervisor Engine V-10GE and Supervisor Engine II+10GE support 10-Gigabit Ethernet and Gigabit Ethernet uplink ports. On the Supervisor Engine II+10GE, all uplink ports are always available. Similarly, when a Supervisor Engine V-10GE is plugged into a W-C4503, W-4506, or W-4507R chassis, all uplink ports are always available. When a Supervisor Engine V-10GE is plugged into a W-4510R chassis, you can choose to use the 10-Gigabit Ethernet uplink ports, the Gigabit Ethernet uplink ports, or all uplink ports. If you choose to use all uplink ports, then the tenth slot will support only the WS-X4302-GB switching linecard. Be aware that this command takes effect only after a reload (after you have executed the **redundancy reload shelf** command).

Because the uplink selection is programmed into hardware during initialization, changing the active uplinks requires saving the configuration and reloading the switch. When you are configuring a change to the uplinks, the system responds with a message informing you that the switch must be reloaded and suggesting the appropriate command (depending on redundancy mode) to reload the switch.

If you select the **all** keyword, ensure that the tenth slot is either empty or has a WS-X4302-GB switching module.

A no form of this command does not exist. To undo the configuration, you must configure the uplinks.
hw-module uplink select

Examples

This example shows how to select the Gigabit Ethernet uplinks:

```
Switch(config)# hw-module uplink select gigabitethernet
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

Note

The Gigabit Ethernet uplinks will be active after the next reload.

This example shows how to select the Gigabit Ethernet uplinks in a redundant system in SSO mode:

```
Switch(config)# hw-module uplink select gigabitethernet
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration
Switch(config)# exit
Switch#
```

Note

The Gigabit Ethernet uplinks will be active after the next reload of the chassis/shelf. Use the `redundancy reload shelf` command to reload the chassis/shelf.

This example shows how to select the Gigabit Ethernet uplinks in a redundant system in RPR mode:

```
Switch(config)# hw-module uplink select gigabitethernet
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

Note

The Gigabit Ethernet uplinks will be active on a switchover or reload of the active supervisor engine.

This example shows how to select all the uplinks in a redundant system in SSO mode:

```
Switch(config)# hw-module uplink select all
Warning: This configuration mode may disable slot10.
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration.
Switch(config)# exit
Switch#
```

Note

If you select the `all` keyword, only the Drome board will be supported in the tenth slot of the supervisor engine.

Related Commands

</thead>
<tbody>
<tr>
<td><code>show hw-module uplink</code></td>
<td>Displays hardware-module uplink information.</td>
</tr>
</tbody>
</table>
instance

To map a VLAN or a set of VLANs to an MST instance, use the `instance` command. To return the VLANs to the common instance default, use the `no` form of this command.

```
instance instance-id {vlans vlan-range}

no instance instance-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-id</td>
<td>MST instance to which the specified VLANs are mapped; valid values are from 0 to 15.</td>
</tr>
<tr>
<td>vlans</td>
<td>Specifies the number of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

Mapping is disabled.

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The mapping is incremental, not absolute. When you enter a range of VLANs, this range is added or removed to the existing ones.

Any unmapped VLAN is mapped to the CIST instance.

**Examples**

This example shows how to map a range of VLANs to instance 2:
```
Switch(config-mst)# instance 2 vlans 1-100
Switch(config-mst)#
```

This example shows how to map a VLAN to instance 5:
```
Switch(config-mst)# instance 5 vlans 1100
Switch(config-mst)#
```

This example shows how to move a range of VLANs from instance 2 to the CIST instance:
```
Switch(config-mst)# no instance 2 vlans 40-60
Switch(config-mst)#
```

This example shows how to move all the VLANs mapped to instance 2 back to the CIST instance:
```
Switch(config-mst)# no instance 2
Switch(config-mst)#
```
<table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces</code></td>
<td>Displays interface information.</td>
</tr>
</tbody>
</table>
interface port-channel

To access or create a port-channel interface, use the **interface port-channel** command.

```
interface port-channel channel-group
```

**Syntax Description**

| channel-group | Port-channel group number; valid values are from 1 to 64. |

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You do not have to create a port-channel interface before assigning a physical interface to a channel group. A port-channel interface is created automatically when the channel group gets its first physical interface, if it is not already created.

You can also create the port channels by entering the **interface port-channel** command. This will create a Layer 3 port channel. To change the Layer 3 port channel into a Layer 2 port channel, use the **switchport** command before you assign the physical interfaces to the channel group. A port channel cannot be changed from Layer 3 to Layer 2 or vice versa when it contains member ports.

Only one port channel in a channel group is allowed.

**Caution**

The Layer 3 port-channel interface is the routed interface. Do not enable Layer 3 addresses on the physical Fast Ethernet interfaces.

If you want to use CDP, you must configure it only on the physical Fast Ethernet interface and not on the port-channel interface.

**Examples**

This example creates a port-channel interface with a channel-group number of 64:

```
Switch(config)# interface port-channel 64
Switch(config)#
```

<tr>
<td>macro name</td>
<td>Specifies the name of a macro.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

- Global configuration mode
- Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the interface range command on the existing VLAN SVIs only. To display the VLAN SVIs, enter the show running config command. The VLANs that are not displayed cannot be used in the interface range command.

The values that are entered with the interface range command are applied to all the existing VLAN SVIs.

Before you can use a macro, you must define a range using the define interface-range command.

All configuration changes that are made to a port range are saved to NVRAM, but the port ranges that are created with the interface range command do not get saved to NVRAM.

You can enter the port range in two ways:

- Specifying up to five port ranges
- Specifying a previously defined macro

You can either specify the ports or the name of a port-range macro. A port range must consist of the same port type, and the ports within a range cannot span the modules.

You can define up to five port ranges on a single command; separate each range with a comma.

When you define a range, you must enter a space between the first port and the hyphen (-):

    interface range gigabitethernet 5/1 -20, gigabitethernet4/5 -20.
Use these formats when entering the port-range:

- `interface-type {mod}/{first-port} - {last-port}`
- `interface-type {mod} / {first-port} - {last-port}`

Valid values for `interface-type` are as follows:

- FastEthernet
- GigabitEthernet
- Vlan `vlan_id`

You cannot specify both a macro and an interface range in the same command. After creating a macro, you can enter additional ranges. If you have already entered an interface range, the CLI does not allow you to enter a macro.

You can specify a single interface in the `port-range` value. This makes the command similar to the `interface interface-number` command.

### Examples

This example shows how to use the `interface range` command to interface to FE 5/18 - 20:

```
Switch(config)# interface range fastethernet 5/18 - 20
Switch(config-if)#
```

This command shows how to run a port-range macro:

```
Switch(config)# interface range macro macro1
Switch(config-if)#
```

interface vlan

To create or access a Layer 3 switch virtual interface (SVI), use the `interface vlan` command. To delete an SVI, use the `no` form of this command.

```
interface vlan vlan_id
no interface vlan vlan_id
```

**Syntax Description**

| `vlan_id` | Number of the VLAN; valid values are from 1 to 4094. |

**Defaults**

Fast EtherChannel is not specified.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The SVIs are created the first time that you enter the `interface vlan vlan_id` command for a particular VLAN. The `vlan_id` value corresponds to the VLAN tag that is associated with the data frames on an ISL or 802.1Q-encapsulated trunk or the VLAN ID that is configured for an access port. A message is displayed whenever a VLAN interface is newly created, so you can check that you entered the correct VLAN number.

If you delete an SVI by entering the `no interface vlan vlan_id` command, the associated interface is forced into an administrative down state and marked as deleted. The deleted interface will no longer be visible in a `show interface` command.

You can reinstate a deleted SVI by entering the `interface vlan vlan_id` command for the deleted interface. The interface comes back up, but much of the previous configuration will be gone.

**Examples**

This example shows the output when you enter the `interface vlan vlan_id` command for a new VLAN number:

```
Switch(config)# interface vlan 23
% Creating new VLAN interface.
Switch(config)#
```
ip admission proxy http refresh-all

To ensure that you see a customized WebAuth login page with the same name in the switch system directory as a same-named prior login page, use the `ip admission proxy http refresh-all` command.

`ip admission proxy http [success | failure | refresh-all | login [expired | page]]`

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>Successful authentication proxy.</td>
</tr>
<tr>
<td>failure</td>
<td>Failed authentication proxy.</td>
</tr>
<tr>
<td>refresh-all</td>
<td>Refresh all custom html pages.</td>
</tr>
<tr>
<td>login expired</td>
<td>Specify expired webpage</td>
</tr>
<tr>
<td>login page</td>
<td>Specify customized login webpage</td>
</tr>
</tbody>
</table>

### Defaults
If you do not enter this command, if any of the customized web-based authentication page files with the file of same name have been changed, you see the old login page rather than the new file.

### Command Modes
Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
You should enter this command whenever the customized web-based authentication page has been changed in the system directory.

### Examples
This example shows how to enter this command:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip admission proxy http [success | failure | refresh-all | login]
Switch(config)# end
Switch#

<The new html page is observed.>
```
ip arp inspection filter vlan

To permit ARPs from hosts that are configured for static IP when DAI is enabled and to define an ARP access list and apply it to a VLAN, use the `ip arp inspection filter vlan` command. To disable this application, use the `no` form of this command.

```
ip arp inspection filter arp-acl-name vlan vlan-range [static]

no ip arp inspection filter arp-acl-name vlan vlan-range [static]
```

**Syntax Description**

- `arp-acl-name`: Access control list name.
- `vlan-range`: VLAN number or range; valid values are from 1 to 4094.
- `static`: (Optional) Specifies that the access control list should be applied statically.

**Defaults**

No defined ARP ACLs are applied to any VLAN.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When an ARP access control list is applied to a VLAN for dynamic ARP inspection, the ARP packets containing only the IP-to-Ethernet MAC bindings are compared against the ACLs. All other packet types are bridged in the incoming VLAN without validation.

This command specifies that the incoming ARP packets are compared against the ARP access control list, and the packets are permitted only if the access control list permits them.

If the access control lists deny the packets because of explicit denies, the packets are dropped. If the packets are denied because of an implicit deny, they are then matched against the list of DHCP bindings if the ACL is not applied statically.

**Examples**

This example shows how to apply the ARP ACL static hosts to VLAN 1 for DAI:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection filter static-hosts vlan 1
Switch(config)# end
Switch# show ip arp inspection vlan 1
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
```
### Vlan Configuration

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Configuration</th>
<th>Operation</th>
<th>ACL Match</th>
<th>Static ACL</th>

</tbody>
</table>
ip arp inspection limit (interface)

To limit the rate of incoming ARP requests and responses on an interface and prevent DAI from consuming all of the system’s resources in the event of a DoS attack, use the `ip arp inspection limit` command. To release the limit, use the `no` form of this command.

```
ip arp inspection limit {rate pps | none} [burst interval seconds]
no ip arp inspection limit
```

**Syntax Description**

- **rate pps**: Specifies an upper limit on the number of incoming packets processed per second. The rate can range from 1 to 10000.
- **none**: Specifies no upper limit on the rate of the incoming ARP packets that can be processed.
- **burst interval seconds**: (Optional) Specifies the consecutive interval in seconds over which the interface is monitored for the high rate of the ARP packets. The interval is configurable from 1 to 15 seconds.

**Defaults**

The rate is set to 15 packets per second on the untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second.

The rate is unlimited on all the trusted interfaces.

The burst interval is set to 1 second by default.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(20)EW</td>
<td>Added support for interface monitoring.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The trunk ports should be configured with higher rates to reflect their aggregation. When the rate of the incoming packets exceeds the user-configured rate, the interface is placed into an error-disabled state. The error-disable timeout feature can be used to remove the port from the error-disabled state. The rate applies to both the trusted and nontrusted interfaces. Configure appropriate rates on trunks to handle the packets across multiple DAI-enabled VLANs or use the `none` keyword to make the rate unlimited.

The rate of the incoming ARP packets on the channel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for the channel ports only after examining the rate of the incoming ARP packets on the channel members.

After a switch receives more than the configured rate of packets every second consecutively over a period of burst seconds, the interface is placed into an error-disabled state.
### Examples

This example shows how to limit the rate of the incoming ARP requests to 25 packets per second:

```
Switch# config terminal
Switch(config)# interface fa6/3
Switch(config-if)# ip arp inspection limit rate 25
Switch(config-if)# end
```

```
Switch# show ip arp inspection interfaces fastEthernet 6/3
Interface        Trust State     Rate (pps)
---------------  -----------     ----------
Fa6/3            Trusted                 25
```

This example shows how to limit the rate of the incoming ARP requests to 20 packets per second and to set the interface monitoring interval to 5 consecutive seconds:

```
Switch# config terminal
Switch(config)# interface fa6/1
Switch(config-if)# ip arp inspection limit rate 20 burst interval 5
Switch(config-if)# end
```

### Related Commands

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip arp inspection</code></td>
<td>Displays the status of dynamic ARP inspection for a specific range of VLANs.</td>
</tr>
</tbody>
</table>
ip arp inspection log-buffer

To configure the parameters that are associated with the logging buffer, use the ip arp inspection log-buffer command. To disable the parameters, use the no form of this command.

```
ip arp inspection log-buffer { entries number | logs number interval seconds }
no ip arp inspection log-buffer { entries | logs }
```

### Syntax Description

| entries number | Number of entries from the logging buffer; the range is from 0 to 1024. |
| logs number   | Number of entries to be logged in an interval; the range is from 0 to 1024. A 0 value indicates that entries should not be logged out of this buffer. |
| interval seconds | Logging rate; the range is from 0 to 86400 (1 day). A 0 value indicates an immediate log. |

### Defaults

When dynamic ARP inspection is enabled, denied, or dropped, the ARP packets are logged.

The number of entries is set to 32.

The number of logging entries is limited to 5 per second.

The interval is set to 1.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The first dropped packet of a given flow is logged immediately. The subsequent packets for the same flow are registered but are not logged immediately. Registering these packets is done in a log buffer that is shared by all the VLANs. Entries from this buffer are logged on a rate-controlled basis.

### Examples

This example shows how to configure the logging buffer to hold up to 45 entries:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection log-buffer entries 45
Switch(config)# end
Switch# show ip arp inspection log
Total Log Buffer Size : 45
Syslog rate : 5 entries per 1 seconds.
No entries in log buffer.
Switch#
```
This example shows how to configure the logging rate to 10 logs per 3 seconds:

```
Switch(config)# ip arp inspection log-buffer logs 10 interval 3
Switch(config)# end
Switch# show ip arp inspection log
Total Log Buffer Size : 45
Syslog rate : 10 entries per 3 seconds.
No entries in log buffer.
Switch#
```

<table>

</tr>
</tbody>
</table>
ip arp inspection trust

To set a per-port configurable trust state that determines the set of interfaces where incoming ARP packets are inspected, use the **ip arp inspection trust** command. To make the interfaces untrusted, use the **no** form of this command.

```plaintext
ip arp inspection trust
no ip arp inspection trust
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to configure an interface to be trusted:

```
Switch# config terminal
Switch(config)# interface fastEthernet 6/3
Switch(config-if)# ip arp inspection trust
Switch(config-if)# end
```

To verify the configuration, use the show form of this command:

```
Switch# show ip arp inspection interfaces fastEthernet 6/3
Interface        Trust State     Rate (pps)     Burst Interval
----------------  -----------     ----------     ---------------
Fa6/3            Trusted               None                   1
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tbody>
<tr>
<td>show ip arp inspection</td>
<td>Displays the status of dynamic ARP inspection for a specific range of VLANs.</td>
</tr>
</tbody>
</table>
ip arp inspection validate

To perform specific checks for ARP inspection, use the `ip arp inspection validate` command. To disable checks, use the `no` form of this command.

```
ip arp inspection validate [src-mac] [dst-mac] [ip]
no ip arp inspection validate [src-mac] [dst-mac] [ip]
```

**Syntax Description**

- **src-mac** (Optional) Checks the source MAC address in the Ethernet header against the sender’s MAC address in the ARP body. This checking is done against both ARP requests and responses.
  
  **Note** When `src-mac` is enabled, packets with different MAC addresses are classified as invalid and are dropped.

- **dst-mac** (Optional) Checks the destination MAC address in the Ethernet header against the target MAC address in ARP body. This checking is done for ARP responses.
  
  **Note** When `dst-mac` is enabled, the packets with different MAC addresses are classified as invalid and are dropped.

- **ip** (Optional) Checks the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses.
  
  The sender IP addresses are checked in all ARP requests and responses and target IP addresses are checked only in ARP responses.

**Defaults**

Checks are disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabling the checks, specify at least one of the keywords (`src-mac`, `dst-mac`, and `ip`) on the command line. Each command overrides the configuration of the previous command. If a command enables `src` and `dst mac` validations, and a second command enables IP validation only, the `src` and `dst mac` validations are disabled as a result of the second command.

The `no` form of this command disables only the specified checks. If none of the check options are enabled, all the checks are disabled.
This example shows how to enable the source MAC validation:

```plaintext
Switch(config)# ip arp inspection validate src-mac
Switch(config)# end
Switch# show ip arp inspection vlan 1
```

```
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
```

```
Vlan     Configuration    Operation   ACL Match          Static ACL
----     -------------    ---------   ---------          ----------
 1     Enabled          Active
Vlan     ACL Logging      DHCP Logging
----     -----------      ------------
 1     Deny             Deny
```

</tr>
</tbody>
</table>
### ip arp inspection vlan

To enable dynamic ARP inspection (DAI) on a per-VLAN basis, use the `ip arp inspection vlan` command. To disable DAI, use the `no` form of this command.

```
ip arp inspection vlan vlan-range
no ip arp inspection vlan vlan-range
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-range</code></td>
<td>VLAN number or range; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

#### Defaults

ARP inspection is disabled on all VLANs.

#### Command Modes

Global configuration mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

You must specify on which VLANs to enable DAI. DAI may not function on the configured VLANs if they have not been created or if they are private.

#### Examples

This example shows how to enable DAI on VLAN 1:

```
Switch# configure terminal
Switch(config)# ip arp inspection vlan 1
Switch(config)# end
Switch# show ip arp inspection vlan 1
Source Mac Validation : Disabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
Vlan     Configuration    Operation   ACL Match    Static ACL
--------    -------------    ---------   ---------    ---------
1     Enabled          Active
Vlan     ACL Logging    DHCP Logging
--------    -----------    ------------
1     Deny            Deny
Switch#
```

This example shows how to disable DAI on VLAN 1:

```
Switch# configure terminal
Switch(config)# no ip arp inspection vlan 1
Switch(config)#
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>arp access-list</strong></td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>

<tr>
<td><strong>show ip arp inspection</strong></td>
<td>Displays the status of dynamic ARP inspection for a specific range of VLANs.</td>
</tr>
</tbody>
</table>
ip arp inspection vlan logging

To control the type of packets that are logged, use the `ip arp inspection vlan logging` command. To disable this logging control, use the `no` form of this command.

```
ip arp inspection vlan vlan-range logging {acl-match {matchlog | none} | dhcp-bindings {permit | all | none}}

no ip arp inspection vlan vlan-range logging {acl-match | dhcp-bindings}
```

**Syntax Description**

- `vlan-range`  Number of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1 to 4094.
- `acl-match`   Specifies the logging criteria for packets that are dropped or permitted based on ACL matches.
- `matchlog`    Specifies that logging of packets matched against ACLs is controlled by the `matchlog` keyword in the permit and deny access control entries of the ACL.
  
  **Note**  By default, the `matchlog` keyword is not available on the ACEs. When the keyword is used, denied packets are not logged. Packets are logged only when they match against an ACE that has the `matchlog` keyword.
- `none`        Specifies that ACL-matched packets are not logged.
- `dhcp-bindings`  Specifies the logging criteria for packets dropped or permitted based on matches against the DHCP bindings.
- `permit`      Specifies logging when permitted by DHCP bindings.
- `all`         Specifies logging when permitted or denied by DHCP bindings.
- `none`        Prevents all logging of packets permitted or denied by DHCP bindings.

**Defaults**

All denied or dropped packets are logged.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `acl-match` and `dhcp-bindings` keywords merge with each other. When you set an ACL match configuration, the DHCP bindings configuration is not disabled. You can use the `no` form of this command to reset some of the logging criteria to their defaults. If you do not specify either option, all the logging types are reset to log on when the ARP packets are denied. The two options that are available to you are as follows:

- **acl-match**—Logging on ACL matches is reset to log on deny
- **dhcp-bindings**—Logging on DHCP binding compared is reset to log on deny
Examples

This example shows how to configure an ARP inspection on VLAN 1 to add packets to a log on matching against the ACLs with the `logging` keyword:

```
Switch# config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog
Switch(config)# end
Switch# show ip arp inspection vlan 1
```

```
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
Vlan     Configuration    Operation   ACL Match          Static ACL
----     -------------    ---------   ---------          ----------
1     Enabled          Active
Vlan     ACL Logging      DHCP Logging
----     -----------      ------------
1     Acl-Match        Deny
Switch#
```

ip cef load-sharing algorithm

To configure the load-sharing hash function so that the source TCP/UDP port, the destination TCP/UDP port, or both ports can be included in the hash in addition to the source and destination IP addresses, use the **ip cef load-sharing algorithm** command. To revert back to the default, which does not include the ports, use the **no** form of this command.

```
ip cef load-sharing algorithm {include-ports {source source | destination dest} | original | tunnel | universal}
no ip cef load-sharing algorithm {include-ports {source source | destination dest} | original | tunnel | universal}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>include-ports</strong></td>
<td>Specifies the algorithm that includes the Layer 4 ports.</td>
</tr>
<tr>
<td><strong>source source</strong></td>
<td>Specifies the source port in the load-balancing hash functions.</td>
</tr>
<tr>
<td><strong>destination dest</strong></td>
<td>Specifies the destination port in the load-balancing hash. Uses the source and destination in hash functions.</td>
</tr>
<tr>
<td><strong>original</strong></td>
<td>Specifies the original algorithm; not recommended.</td>
</tr>
<tr>
<td><strong>tunnel</strong></td>
<td>Specifies the algorithm for use in tunnel-only environments.</td>
</tr>
<tr>
<td><strong>universal</strong></td>
<td>Specifies the default Cisco IOS load-sharing algorithm.</td>
</tr>
</tbody>
</table>

**Defaults**

Default load-sharing algorithm is disabled.

**Note**

This option does not include the source or destination port in the load-balancing hash.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The original algorithm, tunnel algorithm, and universal algorithm are routed through the hardware. For software-routed packets, the algorithms are handled by the software. The **include-ports** option does not apply to the software-switched traffic.

**Examples**

This example shows how to configure the IP CEF load-sharing algorithm that includes Layer 4 ports:

```
Switch(config)# ip cef load-sharing algorithm include-ports
Switch(config)#
```
This example shows how to configure the IP CEF load-sharing algorithm that includes Layer 4 tunneling ports:

```
Switch(config)# ip cef load-sharing algorithm include-ports tunnel
Switch(config)#
```

<tr>
<td>12.2(37)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable IP port security with IP-MAC filters on a Layer 2 access port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastethernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 1
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# ip verify source tracking port-security
Switch(config-if)# end
```

You can verify your settings by entering the `show ip verify source` privileged EXEC command.

**Related Commands**

<table>

</table>
ip dhcp snooping

To enable DHCP snooping globally, use the `ip dhcp snooping` command. To disable DHCP snooping, use the `no` form of this command.

```
ip dhcp snooping
no ip dhcp snooping
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
DHCP snooping is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enable DHCP snooping globally before you can use DHCP snooping on a VLAN.

**Examples**
This example shows how to enable DHCP snooping:
```
Switch(config)# ip dhcp snooping
Switch(config)#
```

This example shows how to disable DHCP snooping:
```
Switch(config)# no ip dhcp snooping
Switch(config)#
```

**Related Commands**

</tbody>
</table>
ip dhcp snooping binding

To set up and generate a DHCP binding configuration to restore bindings across reboots, use the `ip dhcp snooping binding` command. To disable the binding configuration, use the `no` form of this command.

```
ip dhcp snooping binding mac-address vlan vlan-# ip-address interface interface expiry seconds
no ip dhcp snooping binding mac-address vlan vlan-# ip-address interface interface
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-address</td>
<td>Specifies a MAC address.</td>
</tr>
<tr>
<td>vlan vlan-#</td>
<td>Specifies a valid VLAN number.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Specifies an IP address.</td>
</tr>
<tr>
<td>interface interface</td>
<td>Specifies an interface type and number.</td>
</tr>
<tr>
<td>expiry seconds</td>
<td>Specifies the interval (in seconds) after which binding is no longer valid.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>

</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Whenever a binding is added or removed using this command, the binding database is marked as changed and a write is initiated.

**Examples**

This example shows how to generate a DHCP binding configuration on interface gigabitethernet1/1 in VLAN 1 with an expiration time of 1000 seconds:

```
Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gi1/1 expiry 1000
Switch#
```

ip dhcp snooping database

To store the bindings that are generated by DHCP snooping, use the `ip dhcp snooping database` command. To either reset the timeout, reset the write-delay, or delete the agent specified by the URL, use the `no` form of this command.

```
ip dhcp snooping database {url | timeout seconds | write-delay seconds}
```

```
no ip dhcp snooping database {timeout | write-delay}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| `url`    | Specifies the URL in one of the following forms:  
  - `tftp://<host>/<filename>`  
  - `ftp://<user>:<password>@<host>/<filename>`  
  - `rcp://<user>@<host>/<filename>`  
  - `nvram:/<filename>`  
  - `bootflash:/<filename>` |

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| `timeout seconds` | Specifies when to abort the database transfer process after a change to the binding database.  
  The minimum value of the delay is 15 seconds. 0 is defined as an infinite duration. |

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>write-delay seconds</code></td>
<td>Specifies the duration for which the transfer should be delayed after a change to the binding database.</td>
</tr>
</tbody>
</table>

**Defaults**

- The timeout value is set to 300 seconds (5 minutes).
- The write-delay value is set to 300 seconds.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You need to create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can write the set of bindings for the first time at the URL.

**Note**

Because both NVRAM and bootflash have limited storage capacity, using TFTP or network-based files is recommended. If you use flash to store the database file, new updates (by the agent) result in the creation of new files (flash fills quickly). In addition, due to the nature of the file system used on the flash, a large number of files causes access to be considerably slowed. When a file is stored in a remote location accessible through TFTP, an RPR/SSO standby supervisor engine can take over the binding list when a switchover occurs.
ip dhcp snooping database

Examples

This example shows how to store a database file with the IP address 10.1.1.1 within a directory called directory. A file named file must be present on the TFTP server.

Switch# config terminal
Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
Switch(config)# end
Switch# show ip dhcp snooping database
Agent URL : tftp://10.1.1.1/directory/file
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : Yes
Delay Timer Expiry : Not Running
Abort Timer Expiry : Not Running

Last Succeeded Time : None
Last Failed Time : None
Last Failed Reason : No failure recorded.

Total Attempts : 1    Startup Failures : 0
Successful Transfers : 0    Failed Transfers : 0
Successful Reads : 0    Failed Reads : 0
Successful Writes : 0    Failed Writes : 0
Media Failures : 0

</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added <strong>remote-id</strong> keyword to support option 82 enhancement.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the hostname is longer than 63 characters it is truncated to 63 characters in the remote ID.

**Examples**

This example shows how to enable DHCP option 82 data insertion:

```
Switch(config)# ip dhcp snooping information option
Switch(config)#
```

This example shows how to disable DHCP option 82 data insertion:

```
Switch(config)# no ip dhcp snooping information option
Switch(config)#
```

This example shows how to configure the hostname as the remote ID:

```
Switch(config)# ip dhcp snooping information option format remote-id hostname
Switch(config)#
```

The following example shows how to enable DHCP Snooping on VLAN 500 through 555 and option 82 remote ID:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
```
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config)# end

ip dhcp snooping limit rate

To configure the number of the DHCP messages that an interface can receive per second, use the `ip dhcp snooping limit rate` command. To disable the DHCP snooping rate limiting, use the `no` form of this command.

```
ip dhcp snooping limit rate rate
no ip dhcp snooping limit rate
```

**Syntax Description**

`rate` Number of DHCP messages a switch can receive per second.

**Defaults**

DHCP snooping rate limiting is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Typically, the rate limit applies to the untrusted interfaces. If you want to set up rate limiting for the trusted interfaces, note that the trusted interfaces aggregate all DHCP traffic in the switch, and you will need to adjust the rate limit of the interfaces to a higher value.

**Examples**

This example shows how to enable the DHCP message rate limiting:

```
Switch(config-if)# ip dhcp snooping limit rate 150
Switch(config)#
```

This example shows how to disable the DHCP message rate limiting:

```
Switch(config-if)# no ip dhcp snooping limit rate
Switch(config)#
```

ip dhcp snooping vlan

Use the **ip dhcp snooping vlan** command to enable DHCP snooping on a VLAN. To disable DHCP snooping on a VLAN, use the **no** form of this command.

```
ip dhcp snooping [vlan number]
no ip dhcp snooping [vlan number]
```

**Syntax Description**

- `vlan number` (Optional) Single VLAN number or a range of VLANs; valid values are from 1 to 4094.

**Defaults**

DHCP snooping is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

DHCP snooping is enabled on a VLAN only if both global snooping and the VLAN snooping are enabled.

**Examples**

This example shows how to enable DHCP snooping on a VLAN:

```
Switch(config)# ip dhcp snooping vlan 10
Switch(config)#
```

This example shows how to disable DHCP snooping on a VLAN:

```
Switch(config)# no ip dhcp snooping vlan 10
Switch(config)#
```

This example shows how to enable DHCP snooping on a group of VLANs:

```
Switch(config)# ip dhcp snooping vlan 10 55
Switch(config)#
```

This example shows how to disable DHCP snooping on a group of VLANs:

```
Switch(config)# no ip dhcp snooping vlan 10 55
Switch(config)#
```

ip dhcp snooping vlan information option format-type circuit-id string

To enable circuit-id (a suboption of DHCP snooping option 82) on a VLAN, use the `ip dhcp snooping vlan information option format-type circuit-id string` command. To disable circuit-id on a VLAN, use the `no` form of this command.

```
ip dhcp snooping vlan number information option format-type circuit-id [override] string

no ip dhcp snooping vlan number information option format-type circuit-id [override] string
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Specifies single or range of VLANs; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><code>override</code></td>
<td>(Optional) Specifies an override string.</td>
</tr>
<tr>
<td><code>string</code></td>
<td>Specifies a user-defined string for the circuit ID; range of 3 to 63 ASCII characters with no spaces.</td>
</tr>
</tbody>
</table>

### Defaults

VLAN-mod-port, if DHCP snooping option-82 is disabled.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Added the <code>override</code> option</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The circuit-id suboption of DHCP option 82 is supported only when DHCP snooping is globally enabled and on VLANs using DHCP option 82.

This command allows you to configure a string of ASCII characters to be the circuit ID. When you want to override the vlan-mod-port format type and instead use the circuit-ID to define subscriber information, use the `override` keyword.

### Examples

The following example shows how to enable DHCP snooping on VLAN 500 through 555 and option 82 circuit-id:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
```
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config)# end

This example shows how to configure the option-82 circuit-ID override suboption:

Switch(config-if)# ip dhcp snooping vlan 250 information option format-type circuit-id override string testcustomer

You can verify your settings by entering the show ip dhcp snooping user EXEC command.

\[\text{Note}\]

The show ip dhcp snooping user EXEC command only displays the global command output, including a remote-ID configuration. It does not display any per-interface, per-VLAN string that you have configured for the circuit ID.

---

<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can apply IGMP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.

An IGMP profile can be applied to one or more switch port interfaces, but one port can have only one profile applied to it.

**Examples**

This example shows how to apply IGMP profile 22 to an interface:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip igmp filter 22
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp profile</td>
<td>Creates an IGMP profile.</td>
</tr>
<tr>
<td>show ip igmp profile</td>
<td>Displays all configured IGMP profiles or a specified IGMP profile.</td>
</tr>
</tbody>
</table>
ip igmp max-groups

To set the maximum number of IGMP groups that a Layer 2 interface can join, use the **ip igmp max-groups** command. To set the maximum back to the default, use the **no** form of this command.

```
ip igmp max-groups number
```

```
no ip igmp max-groups
```

### Syntax Description

<table>
<thead>
<tr>
<th><strong>number</strong></th>
<th>Maximum number of IGMP groups that an interface can join; valid values are from 0 to 4294967294.</th>
</tr>
</thead>
</table>

### Defaults

No maximum limit.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can use the **ip igmp max-groups** command only on Layer 2 physical interfaces; you cannot set the IGMP maximum groups for the routed ports, the switch virtual interfaces (SVIs), or the ports that belong to an EtherChannel group.

### Examples

This example shows how to limit the number of IGMP groups that an interface can join to 25:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)
```
# ip igmp profile

To create an IGMP profile, use the **ip igmp profile** command. To delete the IGMP profile, use the **no** form of this command.

```
ip igmp profile profile number
no ip igmp profile profile number
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>profile number</strong></td>
<td>IGMP profile number being configured; valid values are from 1 to 4294967295.</td>
</tr>
</tbody>
</table>

## Defaults

No profile created.

## Command Modes

- Global configuration mode
- IGMP profile configuration

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

When entering a range, enter the low IP multicast address, a space, and the high IP multicast address. You can apply an IGMP profile to one or more Layer 2 interfaces, but each interface can have only one profile applied to it.

## Examples

This example shows how to configure IGMP profile 40 that permits the specified range of IP multicast addresses:

```
Switch # config terminal
Switch(config)# ip igmp profile 40
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 233.1.1.1 233.255.255.255
Switch(config-igmp-profile)#
```

## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp filter</td>
<td>Controls whether all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an IGMP profile to the interface.</td>

<td>show ip igmp profile</td>
<td>Displays all configured IGMP profiles or a specified IGMP profile.</td>
</tr>
</tbody>
</table>
ip igmp query-interval

To configure the frequency that the switch sends the IGMP host-query messages, use the `ip igmp query-interval` command. To return to the default frequency, use the `no` form of this command.

```
ip igmp query-interval seconds
no ip igmp query-interval
```

**Syntax Description**

- **seconds**
  - Frequency, in seconds, at which the IGMP host-query messages are transmitted; valid values depend on the IGMP snooping mode. See the "Usage Guidelines" section for more information.

**Defaults**

The query interval is set to 60 seconds.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you use the default IGMP snooping configuration, the valid query interval values are from 1 to 65535 seconds. If you have changed the default configuration to support CGMP as the IGMP snooping learning method, the valid query interval values are from 1 to 300 seconds.

The designated switch for a LAN is the only switch that sends the IGMP host-query messages. For IGMP version 1, the designated switch is elected according to the multicast routing protocol that runs on the LAN. For IGMP version 2, the designated querier is the lowest IP-addressed multicast switch on the subnet.

If no queries are heard for the timeout period (controlled by the `ip igmp query-timeout` command), the switch becomes the querier.

**Note**

Changing the timeout period may severely impact multicast forwarding.

**Examples**

This example shows how to change the frequency at which the designated switch sends the IGMP host-query messages:

```
Switch(config-if)# ip igmp query-interval 120
Switch(config-if)#
```

**Related Commands**
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip igmp querier-timeout</code></td>
<td>(refer to Cisco IOS documentation) Configures the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.</td>
</tr>
<tr>
<td><code>ip pim query-interval</code></td>
<td>(refer to Cisco IOS documentation) Configures the frequency of Protocol Independent Multicast (PIM) router query messages.</td>
</tr>
<tr>
<td><code>show ip igmp groups</code></td>
<td>(refer to Cisco IOS documentation) Displays the multicast groups with receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP), use the <code>show ip igmp groups</code> command in EXEC mode.</td>
</tr>
</tbody>
</table>
ip igmp snooping

To enable IGMP snooping, use the `ip igmp snooping` command. To disable IGMP snooping, use the `no` form of this command.

```
ip igmp snooping [tcn {flood query count count | query solicit}]  
no ip igmp snooping [tcn {flood query count count | query solicit}]
```

**Syntax Description**
- `tcn` (Optional) Specifies the topology change configurations.
- `flood` (Optional) Specifies to flood the spanning tree table to the network when a topology change occurs.
- `query` (Optional) Specifies the TCN query configurations.
- `count count` (Optional) Specifies how often the spanning tree table is flooded; valid values are from 1 to 10.
- `solicit` (Optional) Specifies an IGMP general query.

**Defaults**
IGMP snooping is enabled.

**Command Modes**
- Global configuration mode
- Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for flooding the spanning tree table was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `tcn flood` option applies only to Layer 2 switch ports and EtherChannels; it does not apply to routed ports, VLAN interfaces, or Layer 3 channels.

The `ip igmp snooping` command is disabled by default on multicast routers.

**Note**
You can use the `tcn flood` option in interface configuration mode.

**Examples**

This example shows how to enable IGMP snooping:

```
Switch(config)# ip igmp snooping
Switch(config)#
```

This example shows how to disable IGMP snooping:

```
Switch(config)# no ip igmp snooping
Switch(config)#
```
This example shows how to enable the flooding of the spanning tree table to the network after nine topology changes have occurred:

```
Switch(config)# ip igmp snooping tcn flood query count 9
Switch(config)#
```

This example shows how to disable the flooding of the spanning tree table to the network:

```
Switch(config)# no ip igmp snooping tcn flood
Switch(config)#
```

This example shows how to enable an IGMP general query:

```
Switch(config)# ip igmp snooping tcn query solicit
Switch(config)#
```

This example shows how to disable an IGMP general query:

```
Switch(config)# no ip igmp snooping tcn query solicit
Switch(config)#
```

### Related Commands

</table>
ip igmp snooping report-suppression

To enable report suppression, use the `ip igmp snooping report-suppression` command. To disable report suppression and forward the reports to the multicast devices, use the `no` form of this command.

```
ip igmp snooping report-suppression
no igmp snooping report-suppression
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

IGMP snooping report-suppression is enabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the `ip igmp snooping report-suppression` command is disabled, all the IGMP reports are forwarded to the multicast devices.

If the command is enabled, report suppression is done by IGMP snooping.

**Examples**

This example shows how to enable report suppression:

```
Switch(config)# ip igmp snooping report-suppression
Switch(config)#
```

This example shows how to disable report suppression:

```
Switch(config)# no ip igmp snooping report-suppression
Switch(config)#
```

This example shows how to display the system status for report suppression:

```
Switch# show ip igmp snoop
vlan 1
---------
IGMP snooping is globally enabled
IGMP snooping TCN solicit query is globally disabled
IGMP snooping global TCN flood query count is 2
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP_ONLY mode on this Vlan
IGMP snooping report suppression is enabled on this Vlan
Switch#
```

**ip igmp snooping vlan**

To enable IGMP snooping for a VLAN, use the `ip igmp snooping vlan` command. To disable IGMP snooping, use the `no` form of this command.

```
ip igmp snooping vlan vlan-id
no ip igmp snooping vlan vlan-id
```

**Syntax Description**

- `vlan-id` : Number of the VLAN; valid values are from 1 to 1001 and from 1006 to 4094.

**Defaults**

IGMP snooping is disabled.

**Command Modes**

Global configuration mode

**Command History**

- **Release** | **Modification**
  - 12.1(8a)EW | Support for this command was introduced on the Catalyst 4500 series switch.
  - 12.1(12c)EW | Support for extended addressing was added.

**Usage Guidelines**

This command is entered in VLAN interface configuration mode only.

The `ip igmp snooping vlan` command is disabled by default on multicast routers.

**Examples**

This example shows how to enable IGMP snooping on a VLAN:

```
Switch(config)# ip igmp snooping vlan 200
Switch(config)#
```

This example shows how to disable IGMP snooping on a VLAN:

```
Switch(config)# no ip igmp snooping vlan 200
Switch(config)#
```

**Related Commands**

ip igmp snooping vlan explicit-tracking

To enable per-VLAN explicit host tracking, use the `ip igmp snooping vlan explicit-tracking` command. To disable explicit host tracking, use the `no` form of this command.

```
ip igmp snooping vlan vlan-id explicit-tracking
no ip igmp snooping vlan vlan-id explicit-tracking
```

**Syntax Description**

`vlan_id`  (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.

**Defaults**

Explicit host tracking is enabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to disable IGMP explicit host tracking on interface VLAN 200 and how to verify the configuration:

```
Switch(config)# no ip igmp snooping vlan 200 explicit-tracking
Switch(config)# end
Switch# show ip igmp snooping vlan 200 | include explicit tracking
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping             : Enabled
IGMPv3 snooping           : Enabled
Report suppression        : Enabled
TCN solicit query         : Disabled
TCN flood query count     : 2
Vlan 2:
--------
IGMP snooping               : Enabled
IGMPv2 immediate leave     : Disabled
Explicit host tracking     : Disabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode : IGMP_ONLY
Explicit host tracking     : Disabled
Switch#                      
```

</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You enter this command in global configuration mode only.

Use the immediate-leave feature only when there is a single receiver for the MAC group for a specific VLAN.

The immediate-leave feature is supported only with IGMP version 2 hosts.

**Examples**

This example shows how to enable IGMP immediate-leave processing on VLAN 4:

```
Switch(config)# ip igmp snooping vlan 4 immediate-leave
Switch(config)#
```

This example shows how to disable IGMP immediate-leave processing on VLAN 4:

```
Switch(config)# no ip igmp snooping vlan 4 immediate-leave
Switch(config)#
```

<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

You enter this command in VLAN interface configuration mode only.

The interface to the switch must be in the VLAN where you are entering the command. It must be both administratively up and line protocol up.

The CGMP learning method can decrease control traffic.

The learning method that you configure is saved in NVRAM.

The static connections to multicast interfaces are supported only on switch interfaces.

**Examples**

This example shows how to specify the next-hop interface to a multicast switch:

```
Switch(config-if)# ip igmp snooping 400 mrouter interface fastethernet 5/6
Switch(config-if)#
```

This example shows how to specify the multicast switch learning method:

```
Switch(config-if)# ip igmp snooping 400 mrouter learn cgmp
Switch(config-if)#
```

ip igmp snooping vlan static

To configure a Layer 2 interface as a member of a group, use the **ip igmp snooping vlan static** command. To remove the configuration, use the **no** form of this command.

```
ip igmp snooping vlan vlan_num static mac-address {interface {fastethernet slot/port} | gigabitethernet slot/port} | {tengigabitethernet slot/port} | {port-channel number}}
```

```
oip igmp snooping vlan vlan_num static mac-address {interface {fastethernet slot/port} | gigabitethernet slot/port} | {tengigabitethernet mod/interface-number} | {port-channel number}}
```

**Syntax Description**

- **vlan_num**
  - Number of the VLAN.

- **mac-address**
  - Group MAC address.

- **interface**
  - Specifies the next-hop interface to multicast switch.

- **fastethernet slot/port**
  - Specifies the Fast Ethernet interface; number of the slot and port.

- **gigabitethernet slot/port**
  - Specifies the Gigabit Ethernet interface; number of the slot and port.

- **tengigabitethernet slot/port**
  - Specifies the 10-Gigabit Ethernet interface; number of the slot and port.

- **port-channel number**
  - Port-channel number; valid values are from 1 through 64.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

</tbody>
</table>
ip local-proxy-arp

To enable the local proxy ARP feature, use the ip local-proxy-arp command. To disable the local proxy ARP feature, use the no form of this command.

```
ip local-proxy-arp
no ip local-proxy-arp
```

**Syntax Description**  
This command has no arguments or keywords.

**Defaults**  
Local proxy ARP is disabled.

**Command Modes**  
Interface configuration mode

**Command History**  

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**  
Use this feature only on subnets where hosts are intentionally prevented from communicating directly to the switch on which they are connected.

ICMP redirect is disabled on interfaces where the local proxy ARP feature is enabled.

**Examples**  
This example shows how to enable the local proxy ARP feature:

```
Switch(config-if)# ip local-proxy-arp
Switch(config-if)#
```
ip mfib fastdrop

To enable MFIB fast drop, use the `ip mfib fastdrop` command. To disable MFIB fast drop, use the `no` form of this command.

```
ip mfib fastdrop
no ip mfib fastdrop
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

MFIB fast drop is enabled.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>

</table>
ip multicast multipath

To enable load splitting of IP multicast traffic over Equal Cost Multipath (ECMP), use the `ip multicast multipath` command in global configuration mode. To disable this functionality, use the `no` form of this command.

```
ip multicast [vrf vrf-name] multipath [s-g-hash {basic | next-hop-based}]
no ip multicast [vrf vrf-name] multipath [s-g-hash {basic | next-hop-based}]
```

### Syntax Description

- **vrf vrf-name**
  - (Optional) Enables ECMP multicast load splitting for IP multicast traffic associated with the Multicast Virtual Private Network (MVPN) routing and forwarding (MVRF) instance specified for the `vrf-name` argument.

- **s-g-hash basic | next-hop-based**
  - (Optional) Enables ECMP multicast load splitting based on source and group address or on source, group, and next-hop address.
    - The `basic` keyword enables a simple hash based on source and group address. This algorithm is referred to as the basic S-G-hash algorithm.
    - The `next-hop-based` keyword enables a more complex hash based on source, group, and next-hop address. This algorithm is referred to as the next-hop-based S-G-hash algorithm.

### Command Default

If multiple equal-cost paths exist, multicast traffic will not be load-split across those paths.

### Command Modes

Global configuration (config)

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(53)SG</td>
<td>The <code>s-g-hash</code> keyword was introduced on the Catalyst 4500 switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `ip multicast multipath` command does not work with bidirectional Protocol Independent Multicast (PIM).

Use the `ip multicast multipath` command to enable load splitting of IP multicast traffic across multiple equal-cost paths.

If two or more equal-cost paths from a source are available, unicast traffic will be load-split across those paths. However, by default, multicast traffic is not load-split across multiple equal-cost paths. In general, multicast traffic flows down from the reverse path forwarding (RPF) neighbor. According to the PIM specifications, this neighbor must have the highest IP address if more than one neighbor has the same metric.

When you configure load splitting with the `ip multicast multipath` command, the system splits multicast traffic across multiple equal-cost paths based on source address using the S-hash algorithm. When the `ip multicast multipath` command is configured and multiple equal-cost paths exist, the path in which...
multicast traffic will travel is selected based on the source IP address. Multicast traffic from different sources will be load-split across the different equal-cost paths. Load splitting will not occur across equal-cost paths for multicast traffic from the same source sent to different multicast groups.

**Note**
The `ip multicast multipath` command load splits the traffic but does not load balance the traffic. Traffic from a source will use only one path, even if the traffic greatly exceeds traffic from other sources.

If the `ip multicast multipath` command is configured with the `s-g-hash` keyword and multiple equal-cost paths exist, load splitting will occur across equal-cost paths based on source and group address or on source, group, and next-hop address. If you specify the optional `s-g-hash` keyword for load splitting IP multicast traffic, you must select the algorithm used to calculate the equal-cost paths by specifying one of the following keywords:

- **basic**—The basic S-G-hash algorithm is predictable because no randomization is used in calculating the hash value. The basic S-G-hash algorithm, however, is subject to polarization because for a given source and group the same hash is always chosen irrespective of the router that the hash is being calculated on.

- **next-hop-based**—The next-hop-based S-G-hash algorithm is predictable because no randomization is used to determine the hash value. Unlike the S-hash and basic S-G-hash algorithms, the next-hop-based hash mechanism is not subject to polarization.

**Examples**
The following example shows how to enable ECMP multicast load splitting on a router based on source address using the S-hash algorithm:

```
Switch(config)# ip multicast multipath
```

The following example shows how to enable ECMP multicast load splitting on a router based on source and group address using the basic S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash basic
```

The following example shows how to enable ECMP multicast load splitting on a router based on source, group, and next-hop address using the next-hop-based S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash next-hop-based
```
ip route-cache flow

To enable NetFlow statistics for IP routing, use the `ip route-cache flow` command. To disable NetFlow statistics, use the `no` form of this command.

```
ip route-cache flow [infer-fields]
no ip route-cache flow [infer-fields]
```

**Syntax Description**

- `infer-fields` (Optional) Includes the NetFlow fields as inferred by the software: Input identifier, Output identifier, and Routing information.

**Defaults**

NetFlow statistics is disabled.

Inferred information is excluded.

**Command Modes**

Global configuration mode

**Command History**

- **Release** 12.1(13)EW: Support for this command was introduced on the Catalyst 4500 series switches.
- **Modification** 12.1(19)EW: Command enhanced to support infer fields.

**Usage Guidelines**

To use these commands, you need to install the Supervisor Engine IV and the NetFlow Service Card.

The NetFlow statistics feature captures a set of traffic statistics. These traffic statistics include the source IP address, destination IP address, Layer 4 port information, protocol, input and output identifiers, and other routing information that can be used for network analysis, planning, accounting, billing and identifying DoS attacks.

NetFlow switching is supported on IP and IP-encapsulated traffic over all interface types.

If you enter the `ip route-cache flow infer-fields` command after the `ip route-cache flow` command, you will purge the existing cache, and vice versa. This action is done to avoid having flows with and without inferred fields in the cache simultaneously.

For additional information on NetFlow switching, refer to the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide*.

**Note**

NetFlow consumes additional memory and CPU resources compared to other switching modes. You need to know the resources required on your switch before enabling NetFlow.
**Examples**

This example shows how to enable NetFlow switching on the switch:

```
Switch# config terminal
Switch(config)# ip route-cache flow
Switch(config)# exit
Switch#
```

**Note**

This command does not work on individual interfaces.
ip source binding

To add or delete a static IP source binding entry, use the **ip source binding** command. To delete the corresponding IP source binding entry, use the **no** form of this command.

```
ip source binding ip-address mac-address vlan vlan-id interface interface-name
```

```
no ip source binding ip-address mac-address vlan vlan-id interface interface-name
```

### Syntax Description

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>Binding IP address.</td>
</tr>
<tr>
<td>mac-address</td>
<td>Binding MAC address.</td>
</tr>
<tr>
<td>vlan</td>
<td>VLAN number.</td>
</tr>
<tr>
<td>interface</td>
<td>Binding interface.</td>
</tr>
<tr>
<td>interface-name</td>
<td></td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The **ip source binding** command is used to add a static IP source binding entry only.

The **no** form of this command deletes the corresponding IP source binding entry. For the deletion to succeed, all required parameters must match.

Each static IP binding entry is keyed by a MAC address and VLAN number. If the CLI contains an existing MAC and VLAN, the existing binding entry will be updated with the new parameters; a separate binding entry will not be created.

### Examples

This example shows how to configure the static IP source binding:

```
Switch# config terminal
Switch(config)# ip source binding 11.0.0.1 0000.000A.000B vlan 10 interface fastethernet6/10
Switch(config)#
```

ip sticky-arp

To enable sticky ARP, use the ip sticky-arp command. Use the no form of this command to disable sticky ARP.

    ip sticky-arp
    no ip sticky-arp

Syntax Description
This command has no arguments or keywords.

Defaults
Enabled

Command Modes
Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines
This command is supported on PVLANs only.

ARP entries that are learned on Layer 3 PVLAN interfaces are sticky ARP entries. (You should display and verify ARP entries on the PVLAN interface using the show arp command).

For security reasons, sticky ARP entries on the PVLAN interface do not age out. Connecting new equipment with the same IP address generates a message and the ARP entry is not created.

Because the ARP entries on the PVLAN interface do not age out, you must manually remove ARP entries on the PVLAN interface if a MAC address changes.

Unlike static entries, sticky-ARP entries are not stored and restored when you enter the reboot and restart commands.

Examples
This example shows how to enable sticky ARP:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) ip sticky-arp
Switch(config)# end
Switch#
```

This example shows how to disable sticky ARP:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) no ip sticky-arp
Switch(config)# end
Switch#
```

ip verify header vlan all

To enable IP header validation for Layer 2-switched IPv4 packets, use the `ip verify header vlan all` command. To disable the IP header validation, use the `no` form of this command.

```
ip verify header vlan all
no ip verify header vlan all
```

**Syntax Description**
This command has no default settings.

**Defaults**
The IP header is validated for bridged and routed IPv4 packets.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command does not apply to Layer 3-switched (routed) packets.

The Catalyst 4500 series switch checks the validity of the following fields in the IPv4 header for all switched IPv4 packets:

- The version must be 4.
- The header length must be greater than or equal to 20 bytes.
- The total length must be greater than or equal to four times the header length and greater than the Layer 2 packet size minus the Layer 2 encapsulation size.

If an IPv4 packet fails the IP header validation, the packet is dropped. If you disable the header validation, the packets with the invalid IP headers are bridged but are not routed even if routing was intended. The IPv4 access lists also are not applied to the IP headers.

**Examples**
This example shows how to disable the IP header validation for the Layer 2-switched IPv4 packets:

```
Switch# config terminal
Switch(config)# no ip verify header vlan all
Switch(config)# end
Switch#
```
ip verify source

To enable IP source guard on untrusted Layer 2 interfaces, use the `ip verify source` command. To disable IP source guard on untrusted Layer 2 interfaces, use the `no` form of this command.

```
ip verify source {vlan dhcp-snooping | tracking} [port-security]
no ip verify source {vlan dhcp-snooping | tracking} [port-security]
```

### Syntax Description

<table>

<tr>
<td>12.2(37)SG</td>
<td>Added support for IP port security and tracking.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to enable IP source guard on VLANs 10 through 20 on a per-port basis:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10 20
Switch(config)# interface fastethernet6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk native vlan 10
Switch(config-if)# switchport trunk allowed vlan 11-20
Switch(config-if)# no ip dhcp snooping trust
Switch(config-if)# ip verify source vlan dhcp-snooping
Switch(config-if)# end
Switch# show ip verify source interface f6/1
Interface     Filter-type Filter-mode IP-address          Mac-address  Vlan
-------------- ----------- -------------- ------- --------------- --------
Fa6/1         ip-mac     active 10.0.0.1          deny-all            10
Fa6/1         ip-mac     active deny-all          10.0.0.1            11-20
Switch#
```
This example shows how to enable IP port security with IP-MAC filters on a Layer 2 access port:

Switch# configure terminal
Enter configuration commands, one per line. End with Ctrl/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastEthernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 1
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# ip verify source tracking port-security
Switch(config-if)# end

You can verify your settings by entering the `show ip verify source` privileged EXEC command.

<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 with a Supervisor Engine 6-E and the Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In basic RX mode, unicast RPF ensures a source address must be reachable on the arrived interface. For example, the source must be reachable without load balancing.

**Note**

Unicast RPF is an input function and is applied only on the input interface of a router at the upstream end of a connection.

Do not use unicast RPF on internal network interfaces. Internal interfaces might have routing asymmetry, which means that there are multiple routes to the source of a packet. Apply unicast RPF only where there is natural or configured symmetry.

**Examples**

This example shows how to enable unicast RPF exist-only checking mode:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip verify unicast source reachable-via rx allow-default
Switch(config-if)# end
Switch#
```

Usage Guidelines

This command instructs a router to enable or disable the support for the specified service number or the web-cache service name. A service number can be from 0 to 254. Once the service number or name is enabled, the router can participate in the establishment of a service group.

When the `no ip wccp` command is entered, the router terminates participation in the service group, deallocates space if none of the interfaces still has the service configured, and terminates the WCCP task if no other services are configured.

The keywords following the `web-cache` keyword and the `service-number` argument are optional and may be specified in any order, but only may be specified once. The following sections outline the specific usage of each of the optional forms of this command.

### ip wccp {web-cache | service-number} group-address multicast-address

A WCCP group address can be configured to set up a multicast address that cooperating routers and web caches can use to exchange WCCP protocol messages. If such an address is used, IP multicast routing must be enabled so that the messages that use the configured group (multicast) addresses are received correctly.

This option instructs the router to use the specified multicast IP address to coalesce the “I See You” responses for the “Here I Am” messages that it has received on this group address. The response is sent to the group address as well. The default is for no group address to be configured, in which case all “Here I Am” messages are responded to with a unicast reply.

### ip wccp {web-cache | service-number} redirect-list access-list

This option instructs the router to use an access list to control the traffic that is redirected to the web caches of the service group specified by the service name given. The `access-list` argument specifies either the number or the name of a standard or extended access list. The access list itself specifies which traffic is permitted to be redirected. The default is for no redirect list to be configured (all traffic is redirected).

WCCP requires that the following protocol and ports not be filtered by any access lists:

- User Datagram Protocol (UDP) (protocol type 17) port 2048. This port is used for control signaling. Blocking this type of traffic will prevent WCCP from establishing a connection between the router and cache engines.

### ip wccp {web-cache | service-number} group-list access-list

This option instructs the router to use an access list to control the cache engines that are allowed to participate in the specified service group. The `access-list` argument specifies either the number of a standard or extended access list or the name of any type of named access list. The access list itself specifies which cache engines are permitted to participate in the service group. The default is for no group list to be configured, in which case all cache engines may participate in the service group.
The `ip wccp {web-cache | service-number} group-list` command syntax resembles the `ip wccp {web-cache | service-number} group-listen` command, but these are entirely different commands. The `ip wccp group-listen` command is an interface configuration command used to configure an interface to listen for multicast notifications from a cache cluster. Refer to the description of the `ip wccp group-listen` command in the *Cisco IOS IP Application Services Command Reference*.

```
ip wccp {web-cache | service-number} password password
```

This option instructs the router to use MD5 authentication on the messages received from the service group specified by the service name given. Use this form of the command to set the password on the router. You must also configure the same password separately on each web cache. The password can be up to a maximum of eight characters. Messages that do not authenticate when authentication is enabled on the router are discarded. The default is for no authentication password to be configured and for authentication to be disabled.

**Examples**

The following example shows how to configure a router to run WCCP reverse-proxy service, using the multicast address of 239.0.0.0:

```
Router(config)# ip multicast-routing
Router(config)# ip wccp 99 group-address 239.0.0.0
Router(config)# interface gigabitethernet 3/1
Router(config-if)# ip wccp 99 group-listen
```

The following example shows how to configure a router to redirect web-related packets without a destination of 10.168.196.51 to the web cache:

```
Router(config)# access-list 100 deny ip any host 10.168.196.51
Router(config)# access-list 100 permit ip any any
Router(config)# ip wccp web-cache redirect-list 100
Router(config)# interface gigabitethernet 3/2
Router(config-if)# ip wccp web-cache redirect out
```

</tr>
</tbody>
</table>

**Usage Guidelines**

With the `ip wccp check services all` command, WCCP can be configured to check all configured services for a match and perform redirection for those services if appropriate. The caches to which packets are redirected can be controlled by a redirect ACL access control list (ACL) as well as by the priority value of the service.

It is possible to configure an interface with more than one WCCP service. When more than one WCCP service is configured on an interface, the precedence of a service depends on the relative priority of the service compared to the priority of the other configured services. Each WCCP service has a priority value as part of its definition.

If no WCCP services are configured with a redirect ACL, the services are considered in priority order until a service is found which matches the IP packet. If no services match the packet, the packet is not redirected. If a service matches the packet and the service has a redirect ACL configured, then the IP packet will be checked against the ACL. If the packet is rejected by the ACL, the packet will not be passed down to lower priority services unless the `ip wccp check services all` command is configured. When the `ip wccp check services all` command is configured, WCCP will continue to attempt to match the packet against any remaining lower priority services configured on the interface.

**Note**
The priority of a WCCP service group is determined by the web cache appliance. The priority of a WCCP service group cannot be configured via Cisco IOS software.

**Note**
The `ip wccp check services all` command is a global WCCP command that applies to all services and is not associated with a single service.
The following example shows how to configure all WCCP services:

```bash
Router(config)# ip wccp check services all
```

</tr>
</tbody>
</table>
**ip wccp group-listen**

To configure an interface on a router to enable or disable the reception of IP multicast packets for Web Cache Communication Protocol (WCCP), use the `ip wccp group-listen` command in interface configuration mode. To disable the reception of IP multicast packets for WCCP, use the `no` form of this command.

```
ip wccp {web-cache | service-number} group-listen
no ip wccp {web-cache | service-number} group-listen
```

**Syntax Description**

<tr>
<td><code>service-number</code></td>
<td>WCCP service number; valid values are from 0 to 254.</td>
</tr>
</tbody>
</table>

**Defaults**

This command is disabled by default.

**Command Modes**

Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>IOS XE 3.2(0)SG</td>
<td>Support extended to Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On routers that are to be members of a Service Group when IP multicast is used, the following configuration is required:

- Configure the IP multicast address for use by the WCCP Service Group.
- Configure the interfaces on which the router wishes to receive the IP multicast address with the `ip wccp {web-cache | service-number} group-listen` interface configuration command.

**Examples**

The following example shows how to enable the multicast packets for a web cache with a multicast address of 224.1.1.100:

```
Switch# configure terminal
Switch(config)# ip wccp web-cache group-address 224.1.1.100
Switch(config)# ip wccp interface gigabitethernet 3/1
Switch(config-if)# ip wccp web-cache group-listen
```

</tr>
</tbody>
</table>
ip wccp redirect

To enable packet redirection on an inbound or outbound interface using Web Cache Communication Protocol (WCCP), use the `ip wccp redirect` command in interface configuration mode. To disable WCCP redirection, use the `no` form of this command.

```plaintext
ip wccp {web-cache | service-number} redirect {in | out}
no ip wccp {web-cache | service-number} redirect {in | out}
```

### Syntax Description

<td><code>web-cache</code> and <code>service-number</code> keywords supports on Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `ip wccp {web-cache | service-number} redirect in` command allows you to configure WCCP redirection on an interface receiving inbound network traffic. When the command is applied to an interface, all packets arriving at that interface will be compared against the criteria defined by the specified WCCP service. If the packets match the criteria, they will be redirected.

Likewise, the `ip wccp {web-cache | service-number} redirect out` command allows you to configure the WCCP redirection check at an outbound interface.

### Tips

Be careful not to confuse the `ip wccp {web-cache | service-number} redirect {out | in}` interface configuration command with the `ip wccp redirect exclude in` interface configuration command.
**Examples**

The following example shows how to configure a session in which reverse proxy packets on Ethernet interface 3/1 are being checked for redirection and redirected to a Cisco Cache Engine:

```bash
Switch(config)# ip wccp 99
Switch(config)# interface gigabitethernet 3/1
Switch(config-if)# ip wccp 99 redirect out
```

The following example shows how to configure a session in which HTTP traffic arriving on GigabitEthernet interface 3/1 is redirected to a Cache Engine:

```bash
Switch(config)# ip wccp web-cache
Switch(config)# interface gigabitethernet 3/1
Switch(config-if)# ip wccp web-cache redirect in
```

p wccp redirect exclude in

To configure an interface to exclude packets received on an interface from being checked for redirection, use the **ip wccp redirect exclude in** command in interface configuration mode. To disable the ability of a router to exclude packets from redirection checks, use the **no** form of this command.

**ip wccp redirect exclude in**

**no ip wccp redirect exclude in**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Redirection exclusion is disabled.

**Command Modes**
Interface configuration (config-if)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support introduced on the Catalyst 4500 series switch.</td>

<tr>
<td>IOS XE 3.2(0)SG</td>
<td>Support extended to Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This configuration command instructs the interface to exclude inbound packets from any redirection check. Note that the command is global to all the services and should be applied to any inbound interface that will be excluded from redirection.

This command is intended to be used to accelerate the flow of packets from a cache engine to the Internet as well as allow for the use of the Web Cache Communication Protocol (WCCP) v2 packet return feature.

**Examples**
In the following example, packets arriving on GigabitEthernet interface 3/1 are excluded from WCCP output redirection checks:

```
Router (config)# interface gigabitethernet 3/1
Router (config-if)# ip wccp redirect exclude in
```

**ipv6 mld snooping**

To enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN, use the `ipv6 mld snooping` command without keywords. To disable MLD snooping on a switch or the VLAN, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id]
no ipv6 mld snooping [vlan vlan-id]
```

**Syntax Description**

```
vlan vlan-id (Optional) Enables or disables IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
```

**Defaults**

MLD snooping is globally disabled on the switch.

MLD snooping is enabled on all VLANs. However, MLD snooping must be globally enabled before VLAN snooping can take place.

**Command Modes**

Global configuration mode

**Command History**

```
Release     Modification
12.2(40)SG  This command was introduced on the Catalyst 4500.
```

**Usage Guidelines**

When MLD snooping is globally disabled, it is disabled on all the existing VLAN interfaces. When you globally enable MLD snooping, it is enabled on all VLAN interfaces that are in the default state (enabled). VLAN configuration overrides global configuration on interfaces on which MLD snooping has been disabled.

If MLD snooping is globally disabled, you cannot enable it on a VLAN. If MLD snooping is globally enabled, you can disable it on individual VLANs.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This example shows how to globally enable MLD snooping:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping
Switch(config)# end
Switch#
```
This example shows how to disable MLD snooping on a VLAN:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no ipv6 mld snooping vlan 11
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping` user EXEC command.

ipv6 mld snooping last-listener-query-count

To configure IP version 6 (IPv6) Multicast Listener Discovery Multicast Address Specific Queries (MASQs) that will be sent before aging out a client, use the `ipv6 mld snooping last-listener-query-count` command. To reset the query count to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] last-listener-query-count integer_value
no ipv6 mld snooping [vlan vlan-id] last-listener-query-count
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) Configures last-listener query count on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>integer_value</code></td>
<td>The integer range is 1 to 7.</td>
</tr>
</tbody>
</table>

**Command Default**

- The default global count is 2.
- The default VLAN count is 0 (the global count is used).

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In MLD snooping, the IPv6 multicast switch periodically sends out queries to hosts belonging to the multicast group. If a host wants to leave a multicast group, it can silently leave or it can respond to the query with a Multicast Listener Done message (equivalent to an IGMP Leave message). When Immediate Leave is not configured (it should not be configured if multiple clients for a group exist on the same port), the configured last-listener query count determines the number of MASQs that are sent before an MLD client is aged out.

When the last-listener query count is set for a VLAN, this count overrides the value configured globally. When the VLAN count is not configured (set to the default of 0), the global count is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
ipv6 mld snooping last-listener-query-count

Examples

This example shows how to globally set the last-listener query count:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping last-listener-query-count 1
Switch(config)# end
Switch#

This example shows how to set the last-listener query count for VLAN 10:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 10 last-listener-query-count 3
Switch(config)# end
Switch#

You can verify your settings by entering the `show ipv6 mld snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping last-listener-query-interval

To configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping last-listener query interval on the switch or on a VLAN, use the `ipv6 mld snooping last-listener-query-interval` command. To reset the query time to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] last-listener-query-interval integer_value

no ipv6 mld snooping [vlan vlan-id] last-listener-query-interval
```

**Syntax Description**
- `vlan vlan-id` (Optional) Configures last-listener query interval on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
- `integer_value` Sets the time period (in thousandths of a second) that a multicast switch must wait after issuing a MASQ before deleting a port from the multicast group. The range is 100 to 32,768. The default is 1000 (1 second).

**Command Default**
The default global query interval (maximum response time) is 1000 (1 second).
The default VLAN query interval (maximum response time) is 0 (the global count is used).

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The last-listener-query-interval time is the maximum time that a multicast switch waits after issuing a Multicast Address Specific Query (MASQ) before deleting a port from the multicast group.

In MLD snooping, when the IPv6 multicast switch receives an MLD leave message, it sends out queries to hosts belonging to the multicast group. If there are no responses from a port to a MASQ for a length of time, the switch deletes the port from the membership database of the multicast address. The last listener query interval is the maximum time that the switch waits before deleting a nonresponsive port from the multicast group.

When a VLAN query interval is set, the global query interval is overridden. When the VLAN interval is set at 0, the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
ipv6 mld snooping last-listener-query-interval

Examples

This example shows how to globally set the last-listener query interval to 2 seconds:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
Switch(config)# end
Switch#

This example shows how to set the last-listener query interval for VLAN 1 to 5.5 seconds:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 5500
Switch(config)# end
Switch#

You can verify your settings by entering the show ipv6 MLD snooping [vlan vlan-id] user EXEC command.

Related Commands

ipv6 mld snooping listener-message-suppression

To enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping listener message suppression, use the `ipv6 mld snooping listener-message-suppression` command. To disable MLD snooping listener message suppression, use the `no` form of this command.

```
ipv6 mld snooping listener-message-suppression

no ipv6 mld snooping listener-message-suppression
```

**Command Default**

The default is for MLD snooping listener message suppression to be disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

MLD snooping listener message suppression is equivalent to IGMP snooping report suppression. When it is enabled, received MLDv1 reports to a group are forwarded to IPv6 multicast switches only once in every report-forward time. This prevents the forwarding of duplicate reports.

**Examples**

This example shows how to enable MLD snooping listener message suppression:

```
Switch# configure terminal
Enter configuration commands, one per line.   End with CNTL/Z.
Switch(config)# ipv6 mld snooping listener-message-suppression
Switch(config)# end
Switch#
```

This example shows how to disable MLD snooping listener message suppression:

```
Switch# configure terminal
Enter configuration commands, one per line.   End with CNTL/Z.
Switch(config)# no ipv6 mld snooping listener-message-suppression
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping [vlan vlan-id]` user EXEC command.

</tbody>
</table>
ipv6 mld snooping robustness-variable

To configure the number of IP version 6 (IPv6) Multicast Listener Discovery (MLD) queries that the switch sends before deleting a listener that does not respond, or to enter a VLAN ID to configure the number of queries per VLAN, use the `ipv6 mld snooping robustness-variable` command. To reset the variable to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] robustness-variable integer_value
no ipv6 mld snooping [vlan vlan-id] robustness-variable
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) Configures the robustness variable on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td><code>integer_value</code></td>
<td>The robustness value ranges from 1 to 3.</td>
</tr>
</tbody>
</table>

**Command Default**

The default global robustness variable (number of queries before deleting a listener) is 2.

The default VLAN robustness variable (number of queries before aging out a multicast address) is 0, which means that the system uses the global robustness variable for aging out the listener.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Robustness is measured by the number of MLDv1 queries sent with no response before a port is removed from a multicast group. A port is deleted when there are no MLDv1 reports received for the configured number of MLDv1 queries. The global value determines the number of queries that the switch waits before deleting a listener that does not respond, and it applies to all VLANs that do not have a VLAN value set.

The robustness value configured for a VLAN overrides the global value. If the VLAN robustness value is 0 (the default), the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
## Examples

This example shows how to configure the global robustness variable so that the switch sends out three queries before it deletes a listener port that does not respond:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping robustness-variable 3
Switch(config)# end
Switch#
```

This example shows how to configure the robustness variable for VLAN 1. This value overrides the global configuration for the VLAN:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 robustness-variable 1
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 MLD snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping tcn

To configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) Topology Change Notifications (TCNs), use the `ipv6 mld snooping tcn` commands. To reset the default settings, use the `no` form of the commands.

```
ipv6 mld snooping tcn [flood query count integer_value | query solicit]

no ipv6 mld snooping tcn [flood query count integer_value | query solicit]
```

**Syntax Description**

- **flood query count**
  - `integer_value` Sets the flood query count, which is the number of queries that are sent before forwarding multicast data to only those ports requesting it. The range is 1 to 10.

- **query solicit** Enables soliciting of TCN queries.

**Command Default**

TCN query soliciting is disabled.

When enabled, the default flood query count is 2.

**Command Modes**

Global configuration mode

**Command History**

Release | Modification
--- | ---
12.2(25)SG | This command was introduced on the Catalyst 4500.

**Examples**

This example shows how to enable TCN query soliciting:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping tcn query solicit.
Switch(config)# end
Switch#
```

This example shows how to set the flood query count to 5:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping tcn flood query count 5.
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 MLD snooping [vlan vlan-id]` user EXEC command.

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should only configure the Immediate-Leave feature when there is only one receiver on every port in the VLAN. The configuration is saved in NVRAM.

The `static` keyword is used for configuring the MLD member ports statically.

The configuration and the static ports and groups are saved in NVRAM.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
This example shows how to enable MLD Immediate-Leave processing on VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 immediate-leave
Switch(config)# end
Switch#
```

This example shows how to disable MLD Immediate-Leave processing on VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no ipv6 mld snooping vlan 1 immediate-leave
Switch(config)# end
Switch#
```

This example shows how to configure a port as a multicast switch port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 mrouter interface GigabitEthernet1/1
Switch(config)# end
Switch#
```

This example shows how to configure a static multicast group:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 2 static FF12::34 interface GigabitEthernet1/1
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping vlan vlan-id` user EXEC command.

 issu abortversion

To cancel the ISSU upgrade or the downgrade process in progress and to restore the Catalyst 4500 series switch to its state before the start of the process, use the **issue abortversion** command.

```
issu abortversion active-slot [active-image-new]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>active-slot</code></td>
<td>Specifies the slot number for the current standby supervisor engine.</td>
</tr>
<tr>
<td><code>active-image-new</code></td>
<td>(Optional) Name of the new image present in the current standby supervisor engine.</td>
</tr>
</tbody>
</table>

**Defaults**

There are no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the **issue abortversion** command at any time to stop the ISSU process. To complete the process enter the **issue commitversion** command. Before any action is taken, a check ensures that both supervisor engines are either in the run version (RV) or load version (LV) state.

When the **issue abortversion** command is entered before the **issue runversion** command, the standby supervisor engine is reset and reloaded with the old image. When the **issue abortversion** command is entered after the **issue runversion** command, a change takes place and the new standby supervisor engine is reset and reloaded with the old image.

**Examples**

This example shows how you can reset and reload the standby supervisor engine:

```
Switch# issu abortversion 2
Switch#
```

<td><strong>show issu state</strong></td>
<td>Displays the ISSU state and current booted image name during the ISSU process.</td>
</tr>
</tbody>
</table>
issu acceptversion

To halt the rollback timer and to ensure that the new Cisco IOS software image is not automatically stopped during the ISSU process, use the **issu acceptversion** command.

```
issu acceptversion active-slot [active-image-new]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active-slot</td>
<td>Specifies the slot number for the currently active supervisor engine.</td>
</tr>
<tr>
<td>active-image-new</td>
<td>(Optional) Name of the new image on the currently active supervisor engine.</td>
</tr>
</tbody>
</table>

**Defaults**

Rollback timer resets automatically 45 minutes after you enter the **issu runversion** command.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After you are satisfied with the new image and have confirmed the new supervisor engine is reachable by both the console and the network, enter the **issu acceptversion** command to halt the rollback timer. If the **issu acceptversion** command is not entered within 45 minutes from the time the **issu runversion** command is entered, the entire ISSU process is automatically rolled back to the previous version of the software. The rollback timer starts immediately after you enter the **issu runversion** command.

If the rollback timer expires before the standby supervisor engine goes to a hot standby state, the timer is automatically extended by up to 15 minutes. If the standby state goes to a hot-standby state within this extension time or the 15 minute extension expires, the switch aborts the ISSU process. A warning message that requires your intervention is displayed every 1 minute of the timer extension.

If the rollback timer is set to a long period of time, such as the default of 45 minutes, and the standby supervisor engine goes into the hot standby state in 7 minutes, you have 38 minutes (45 minus 7) to roll back if necessary.

Use the **issu set rollback-timer** to configure the rollback timer.

**Examples**

This example shows how to halt the rollback timer and allow the ISSU process to continue:

```
Switch# issu acceptversion 2
Switch#
```

</tbody>
</table>

Defaults

Enabled by default.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The issu commitversion command verifies that the standby supervisor engine has the new Cisco IOS software image in its file system and that both supervisor engines are in the run version (RV) state. If these conditions are met, the following actions take place:

- The standby supervisor engine is reset and booted with the new version of Cisco IOS software.
- The standby supervisor engine moves into the Stateful Switchover (SSO) mode and is fully stateful for all clients and applications with which the standby supervisor engine is compatible.
- The supervisor engines are moved into final state, which is the same as initial state.

Entering the issu commitversion command completes the In Service Software Upgrade (ISSU) process. This process cannot be stopped or reverted to its original state without starting a new ISSU process.

Entering the issu commitversion command without entering the issu acceptversion command is equivalent to entering both the issu acceptversion and the issu commitversion commands. Use the issu commitversion command if you do not intend to run in the current state for an extended period of time and are satisfied with the new software version.

Examples

This example shows how you can configure the standby supervisor engine to be reset and reloaded with the new Cisco IOS software version:

Switch# issu commitversion 1
Switch#

Related Commands

standby-slot
Specifies the slot number for the currently active supervisor engine.

standby-image-new
(Optional) Name of the new image on the currently active supervisor engine.
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>issu acceptversion</code></td>
<td>Halts the rollback timer and ensures that the new Cisco IOS software image is not automatically stopped during the ISSU process.</td>

<tr>
<td><code>issu runversion</code></td>
<td>Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.</td>
</tr>
<tr>
<td><code>show issu state</code></td>
<td>Displays the ISSU state and current booted image name during the ISSU process.</td>
</tr>
</tbody>
</table>
issu loadversion

To start the ISSU process, use the **issu loadversion** command.

```
issu loadversion active-slot active-image-new standby-slot standby-image-new [force]
```

### Syntax Description

- **active-slot** Specifies the slot number for the currently active supervisor engine.
- **active-image-new** Specifies the name of the new image on the currently active supervisor engine.
- **standby-slot** Specifies the standby slot on the networking device.
- **standby-image-new** Specifies the name of the new image on the standby supervisor engine.
- **force** (Optional) Overrides the automatic rollback when the new Cisco IOS software version is detected to be incompatible.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The **issu loadversion** command causes the standby supervisor engine to be reset and booted with the new Cisco IOS software image specified by the command. If both the old image and the new image are ISSU capable, ISSU compatible, and have no configuration mismatches, the standby supervisor engine moves into Stateful Switchover (SSO) mode, and both supervisor engines move into the load version (LV) state.

It will take several seconds after the **issu loadversion** command is entered for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode.

### Examples

This example shows how to initiate the ISSU process:

```
Switch# issu loadversion 1 bootflash:new-image 2 slavebootflash:new-image
Switch#
```

### Related Commands

<tbody>
<tr>
<td><strong>issu abortversion</strong></td>
<td>Cancels the ISSU upgrade or the downgrade process in progress and restores the switch to its state before the start of the process.</td>
</tr>
<tr>
<td><strong>issu acceptversion</strong></td>
<td>Halts the rollback timer and ensures that the new Cisco IOS software image is not automatically stopped during the ISSU process.</td>
</tr>
</tbody>
</table>
### Command Description

- **issue commitversion**: Loads the new Cisco IOS software image into the new standby supervisor engine.

- **issue runversion**: Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.

- **show issu state**: Displays the ISSU state and current booted image name during the ISSU process.
**issu runversion**

To force a change from the active supervisor engine to the standby supervisor engine and to cause the newly active supervisor engine to run the new image specified in the `issu loadversion` command, use the `issu runversion` command.

```
issu runversion standby-slot [standby-image-new]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>standby-slot</td>
<td>Specifies the standby slot on the networking device.</td>
</tr>
<tr>
<td>standby-image-new</td>
<td>(Optional) Specifies the name of the new image on the standby supervisor engine.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `issu runversion` command changes the currently active-supervisor engine to standby-supervisor engine and the real standby-supervisor engine is booted with the old image version following and resets the switch. As soon as the standby-supervisor engine moves into the standby state, the rollback timer is started.

**Examples**

This example shows how to force a change of the active-supervisor engine to standby-supervisor engine:

```
Switch# issu runversion 2
Switch#
```

**Related Commands**

<table>
<thead>

</table>
**issu set rollback-timer**

To configure the In Service Software Upgrade (ISSU) rollback timer value, use the `issu set rollback-timer` command.

```
issu set rollback-timer seconds
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seconds</code></td>
<td>Specifies the rollback timer value, in seconds. The valid timer value range is from 0 to 7200 seconds (2 hours). A value of 0 seconds disables the rollback timer.</td>
</tr>
</tbody>
</table>

**Defaults**

Rollback timer value is 2700 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `issu set rollback-timer` command to configure the rollback timer value. You can only enable this command when the supervisor engines are in the init state.

**Examples**

This example shows how you can set the rollback timer value to 3600 seconds, or 1 hour:

```
Switch# configure terminal
Switch(config)# issu set rollback-timer 3600
Switch(config)# end
Switch#
```

**Related Commands**

<table>

</table>
To enable protocol tunneling on an interface, use the `l2protocol-tunnel` command. You can enable tunneling for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable tunneling on the interface, use the `no` form of this command.

```
l2protocol-tunnel \[cdp | stp | vtp\]
no l2protocol-tunnel \[cdp | stp | vtp\]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdp</td>
<td>(Optional) Enables tunneling of CDP.</td>
</tr>
<tr>
<td>stp</td>
<td>(Optional) Enables tunneling of STP.</td>
</tr>
<tr>
<td>vtp</td>
<td>(Optional) Enables tunneling of VTP.</td>
</tr>
</tbody>
</table>

### Defaults

The default is that no Layer 2 protocol packets are tunneled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must enter this command, with or without protocol types, to tunnel Layer 2 packets. Layer 2 protocol tunneling across a service-provider network ensures that Layer 2 information is propagated across the network to all customer locations. When protocol tunneling is enabled, protocol packets are encapsulated with a well-known Cisco multicast address for transmission across the network. When the packets reach their destination, the well-known MAC address is replaced by the Layer 2 protocol MAC address.

You can enable Layer 2 protocol tunneling for CDP, STP, and VTP individually or for all three protocols.

### Examples

This example shows how to enable protocol tunneling for the CDP packets:

```
Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)#
```

### Related Commands

<table>
<thead>

</tr>
</tbody>
</table>
l2protocol-tunnel cos

To configure the class of service (CoS) value for all tunneled Layer 2 protocol packets, use the `l2protocol-tunnel cos` command. To return to the default value of zero, use the `no` form of this command.

```
l2protocol-tunnel cos value

no l2protocol-tunnel cos
```

**Syntax Description**

- `value` Specifies the CoS priority value for tunneled Layer 2 protocol packets. The range is 0 to 7, with 7 being the highest priority.

**Defaults**

The default is to use the CoS value that is configured for data on the interface. If no CoS value is configured, the default is 5 for all tunneled Layer 2 protocol packets.

**Command Modes**

Global configuration mode

**Command History**

- **Release** 12.2(18)EW
- **Modification** This command was first introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

When enabled, the tunneled Layer 2 protocol packets use this CoS value.

The value is saved in NVRAM.

**Examples**

This example shows how to configure a Layer 2 protocol tunnel CoS value of 7:

```
Switch(config)# l2protocol-tunnel cos 7
Switch(config)#
```

**Related Commands**

<table>
<thead>

<tr>
<td>l2protocol-tunnel shutdown-threshold</td>
<td>Configures the protocol tunneling encapsulation rate.</td>
</tr>
</tbody>
</table>
l2protocol-tunnel drop-threshold

To set a drop threshold for the maximum rate of Layer 2 protocol packets per second to be received before an interface drops packets, use the `l2protocol-tunnel drop-threshold` command. You can set the drop threshold for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable the drop threshold on the interface, use the `no` form of this command.

```
l2protocol-tunnel drop-threshold [cdp | stp | vtp] value
no l2protocol-tunnel drop-threshold [cdp | stp | vtp] value
```

**Syntax Description**

- `cdp` (Optional) Specifies a drop threshold for CDP.
- `stp` (Optional) Specifies a drop threshold for STP.
- `vtp` (Optional) Specifies a drop threshold for VTP.
- `value` Specifies a threshold in packets per second to be received for encapsulation before the interface shuts down, or specifies the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.

**Defaults**

The default is no drop threshold for the number of the Layer 2 protocol packets.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `l2protocol-tunnel drop-threshold` command controls the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops the Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

**Examples**

This example shows how to configure the drop threshold rate:

```
Switch(config-if)# l2protocol-tunnel drop-threshold cdp 50
Switch(config-if)#
```

**Related Commands**

- `cdp`
- `stp`
- `vtp`
### l2protocol-tunnel drop-threshold

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>l2protocol-tunnel</code></td>
<td>Enables protocol tunneling on an interface.</td>
</tr>
<tr>
<td><code>l2protocol-tunnel cos</code></td>
<td>Configures the class of service (CoS) value for all tunneled Layer 2 protocol packets.</td>
</tr>
<tr>
<td><code>l2protocol-tunnel shutdown-threshold</code></td>
<td>Configures the protocol tunneling encapsulation rate.</td>
</tr>
</tbody>
</table>
To configure the protocol tunneling encapsulation rate, use the `l2protocol-tunnel shutdown-threshold` command. You can set the encapsulation rate for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable the encapsulation rate on the interface, use the `no` form of this command.

```
l2protocol-tunnel shutdown-threshold [cdp | stp | vtp] value
no l2protocol-tunnel shutdown-threshold [cdp | stp | vtp] value
```

**Syntax Description**

- `cdp` (Optional) Specifies a shutdown threshold for CDP.
- `stp` (Optional) Specifies a shutdown threshold for STP.
- `vtp` (Optional) Specifies a shutdown threshold for VTP.
- `value` Specifies a threshold in packets per second to be received for encapsulation before the interface shuts down. The range is 1 to 4096. The default is no threshold.

**Defaults**

The default is no shutdown threshold for the number of Layer 2 protocol packets.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `l2-protocol-tunnel shutdown-threshold` command controls the number of protocol packets per second that are received on an interface before it shuts down. When no protocol option is specified with the keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a drop threshold on the interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.

When the shutdown threshold is reached, the interface is error disabled. If you enable error recovery by entering the `errdisable recovery cause l2ptguard` command, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out. If the error recovery feature generation is not enabled for `l2ptguard`, the interface stays in the error-disabled state until you enter the `shutdown` and `no shutdown` commands.

**Examples**

This example shows how to configure the maximum rate:

```
Switch(config-if)# l2protocol-tunnel shutdown-threshold cdp 50
Switch(config-if)#
```

**Related Commands**

- `cdp`
- `stp`
- `vtp`
<table>

lacp port-priority

To set the LACP priority for the physical interfaces, use the `lacp port-priority` command.

```plaintext
lacp port-priority priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Priority for the physical interfaces; valid values are from 1 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

Priority is set to 32768.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>This command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the systems that are configured with a Supervisor Engine I.

You must assign each port in the switch a port priority that can be specified automatically or by entering the `lacp port-priority` command. The port priority is used with the port number to form the port identifier. The port priority is used to decide which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Although this command is a global configuration command, the `priority` value is supported only on port channels with LACP-enabled physical interfaces. This command is supported on LACP-enabled interfaces.

When setting the priority, the higher numbers indicate lower priorities.

**Examples**

This example shows how to set the priority for the interface:

```
Switch(config-if)# lACP port-priority 23748
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>

</tr>
<tr>
<td>show lacp</td>
<td>Displays LACP information.</td>
</tr>
</tbody>
</table>
**lacp system-priority**

To set the priority of the system for LACP, use the `lacp system-priority` command.

```
lacp system-priority priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>priority</code></td>
<td>Priority of the system; valid values are from 1 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

Priority is set to 32768.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>This command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I.

You must assign each switch that is running LACP a system priority that can be specified automatically or by entering the `lacp system-priority` command. The system priority is used with the switch MAC address to form the system ID and is also used during negotiation with other systems.

Although this command is a global configuration command, the `priority` value is supported on port channels with LACP-enabled physical interfaces.

When setting the priority, the higher numbers indicate lower priorities.

You can also enter the `lacp system-priority` command in interface configuration mode. After you enter the command, the system defaults to global configuration mode.

**Examples**

This example shows how to set the system priority:

```
Switch(config)# lacp system-priority 23748
Switch(config)#
```

**Related Commands**

lldp tlv-select power-management

To enable power negotiation through LLDP, use the `lldp tlv-select power-management` interface command.

```lldp tlv-select power-management```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled on POEP ports

**Command Modes**
Interface level

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>Support was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You need to disable this feature if you do not want to perform power negotiation through LLDP. This feature is not supported on non-POEP ports; the CLI is suppressed on such ports and TLV is not exchanged.

**Examples**
This example shows how to enable LLDP power negotiation on interface Gigabit Ethernet 3/1:

```
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int gi 3/1
Switch(config-if)# lldp tlv-select power-management
```

logging event link-status global (global configuration)

To change the default switch-wide global link-status event messaging settings, use the `logging event link-status global` command. Use the `no` form of this command to disable the link-status event messaging.

```
logging event link-status global

no logging event link-status global
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The global link-status messaging is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If link-status logging event is not configured at the interface level, this global link-status setting takes effect for each interface.

**Examples**

This example shows how to globally enable link status message on each interface:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# logging event link-status global
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>

logging event link-status (interface configuration)

To enable the link-status event messaging on an interface, use the `logging event link-status` command. Use the `no` form of this command to disable link-status event messaging. Use the `logging event link-status use-global` command to apply the global link-status setting.

```
logging event link-status

no logging event link-status

logging event link-status use-global
```

**Defaults**
Global link-status messaging is enabled.

**Command Modes**
Interface configuration mode

**Command History**
```
Release  Modification
12.2(25)SG  Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**
To enable system logging of interface state-change events on a specific interface, enter the `logging event link-status` command in interface configuration mode.

To enable system logging of interface state-change events on all interfaces in the system, enter the `logging event link-status global` command in global configuration mode. All interfaces without the state change event configuration use the global setting.

**Examples**
This example shows how to enable logging event state-change events on interface gi11/1:
```
Switch# config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event link-status
Switch(config-if)# end
Switch#
```

This example shows how to turn off logging event link status regardless of the global setting:
```
Switch# config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# no logging event link-status
Switch(config-if)# end
Switch#
```
This example shows how to enable the global event link-status setting on interface gi11/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event link-status use-global
Switch(config-if)# end
Switch#
```

</tbody>
</table>

**Usage Guidelines**

To enable system logging of interface state-change events on a specific interface, enter the `logging event trunk-status` command in interface configuration mode.

To enable system logging of interface state-change events on all interfaces in the system, enter the `logging event trunk-status use-global` command in global configuration mode. All interfaces without the state change event configuration use the global setting.

**Examples**

This example shows how to enable logging event state-change events on interface gi11/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event trunk-status
Switch(config-if)# end
Switch#
```

This example shows how to turn off logging event trunk status regardless of the global setting:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# no logging event trunk-status
Switch(config-if)# end
Switch#
```
This example shows how to enable the global event trunk-status setting on interface gi11/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event trunk-status use-global
Switch(config-if)# end
Switch#
```

mab

To enable and configure MAC authorization bypass (MAB) on a port, use the **mab** command in interface configuration mode. To disable MAB, use the **no** form of this command.

```
mab [eap]
no mab [eap]
```

**Note**
The **mab** command is totally independent of the effect of the **dot1x system-auth control** command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>eap</strong></td>
<td>(Optional) Specifies that a full EAP conversation should be used, as opposed to standard RADIUS Access-Request, Access-Accept conversation.</td>
</tr>
</tbody>
</table>

**Command Default**

Disabled

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a port is configured for MAB as a fallback method, it operates in a typical dot1X method until a configurable number of failed attempts to request the identity of the host. The authenticator learns the MAC address of the host and uses that information to query an authentication server to see whether this MAC address will be granted access.

**Examples**

The following example shows how to enable MAB on a port:

```
Switch(config-if)# mab
Switch(config-if)#
```

The following example shows how to enable and configure MAB on a port:

```
Switch(config-if)# mab eap
Switch(config-if)#
```

The following example shows how to disable MAB on a port:

```
Switch(config-if)# no mab
Switch(config-if)#
```

mac access-list extended

To define the extended MAC access lists, use the **mac access-list extended** command. To remove the MAC access lists, use the **no** form of this command.

```
mac access-list extended name

no mac access-list extended name
```

### Syntax Description

- **name**: ACL to which the entry belongs.

### Defaults

MAC access lists are not defined.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you enter the ACL name, follow these naming conventions:

- Maximum of 31 characters long and can include a-z, A-Z, 0-9, the dash character (-), the underscore character (_), and the period character (.)
- Must start with an alpha character and must be unique across all ACLs of all types
- Case sensitive
- Cannot be a number
- Must not be a keyword; keywords to avoid are all, default-action, map, help, and editbuffer

When you enter the **mac access-list extended name** command, you use the following subset to create or delete entries in a MAC layer access list:

```
[no] { permit | deny } {{ src-mac mask | any } [ dest-mac mask ]} { protocol-family { appletalk | arp-non-ipv4 | decnet | ipx | ipv6 | rarp-ipv4 | rarp-non-ipv4 | vines | xns } | < arbitrary ethertype> | name-coded ethertype }.
```

Table 2-7 describes the syntax of the **mac access-list extended** subcommands.

<table>
<thead>
<tr>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Specifies any source-host or destination-host.</td>
</tr>
<tr>
<td>arbitrary ethertype</td>
<td>(Optional) Specifies an arbitrary ethertype in the range 1536 to 65535 (Decimal or Hexadecimal)</td>
</tr>
<tr>
<td>deny</td>
<td>Prevents access if the conditions are matched.</td>
</tr>
</tbody>
</table>
Table 2-7  mac access-list extended Subcommands (continued)

<table>
<thead>
<tr>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest-mac mask</td>
<td>(Optional) Specifies a destination MAC address of the form: dest-mac-address dest-mac-address-mask.</td>
</tr>
<tr>
<td>no</td>
<td>(Optional) Deletes a statement from an access list.</td>
</tr>
<tr>
<td>permit</td>
<td>Allows access if the conditions are matched.</td>
</tr>
<tr>
<td>protocol-family</td>
<td>(Optional) Name of the protocol family. Table 2-8 lists which packets are mapped to a particular protocol family.</td>
</tr>
<tr>
<td>src-mac mask</td>
<td>Source MAC address in the form: source-mac-address source-mac-address-mask.</td>
</tr>
</tbody>
</table>

Table 2-8 describes mapping an Ethernet packet to a protocol family.

Table 2-8  Mapping an Ethernet Packet to a Protocol Family

<table>
<thead>
<tr>
<th>Protocol Family</th>
<th>Ethertype in Packet Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>Appletalk</td>
<td>0x809B, 0x80F3</td>
</tr>
<tr>
<td>Arp-Non-Ipv4</td>
<td>0x0806 and protocol header of Arp is a non-Ipv protocol family</td>
</tr>
<tr>
<td>Decnet</td>
<td>0x6000-0x6009, 0x8038-0x8042</td>
</tr>
</tbody>
</table>
When you enter the `src-mac mask` or `dest-mac mask` value, follow these guidelines:

- Enter the MAC addresses as three 4-byte values in dotted hexadecimal format such as 0030.9629.9f84.
- Enter the MAC address masks as three 4-byte values in dotted hexadecimal format. Use 1 bit as a wildcard. For example, to match an address exactly, use 0000.0000.0000 (can be entered as 0.0.0).
- For the optional `protocol` parameter, you can enter either the EtherType or the keyword.
- Entries without a `protocol` parameter match any protocol.
- The access list entries are scanned in the order that you enter them. The first matching entry is used. To improve performance, place the most commonly used entries near the beginning of the access list.
- An implicit `deny any any` entry exists at the end of an access list unless you include an explicit `permit any any` entry at the end of the list.
- All new entries to an existing list are placed at the end of the list. You cannot add entries to the middle of a list.

### Examples

This example shows how to create a MAC layer access list named `mac_layer` that denies traffic from 0000.4700.0001, which is going to 0000.4700.0009, and permits all other traffic:

```
Switch(config)# mac access-list extended mac_layer
Switch(config-ext-macl)# deny 0000.4700.0001 0.0.0 0000.4700.0009 0.0.0 protocol-family appletalk
Switch(config-ext-macl)# permit any any
Switch(config-ext-macl)# end
Switch#
```

mac-address-table aging-time

To configure the aging time for the entries in the Layer 2 table, use the **mac-address-table aging-time** command. To reset the **seconds** value to the default setting, use the **no** form of this command.

```
mac-address-table aging-time seconds [vlan vlan_id]
no mac-address-table aging-time seconds [vlan vlan_id]
```

**Syntax Description**

- **seconds**
  - Aging time in seconds; valid values are 0 and from 10 to 1000000 seconds.
- **vlan vlan_id**
  - (Optional) Single VLAN number or a range of VLANs; valid values are from 1 to 4094.

**Defaults**

Aging time is set to 300 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>T2.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not enter a VLAN, the change is applied to all routed-port VLANs.

Enter 0 seconds to disable aging.

**Examples**

This example shows how to configure the aging time to 400 seconds:

```
Switch(config)# mac-address-table aging-time 400
```

This example shows how to disable aging:

```
Switch(config)# mac-address-table aging-time 0
```

**Related Commands**

mac-address-table dynamic group protocols

To enable the learning of MAC addresses in both the “ip” and “other” protocol buckets, even though the incoming packet may belong to only one of the protocol buckets, use the `mac-address-table dynamic group protocols` command. To disable grouped learning, use the `no` form of this command.

```
mac-address-table dynamic group protocols {ip | other} {ip | other}
no mac-address-table dynamic group protocols {ip | other} {ip | other}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>Specifies the “ip” protocol bucket.</td>
</tr>
<tr>
<td>other</td>
<td>Specifies the “other” protocol bucket.</td>
</tr>
</tbody>
</table>

### Defaults

The group learning feature is disabled.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The entries within the “ip” and “other” protocol buckets are created according to the protocol of the incoming traffic.

When you use the `mac-address-table dynamic group protocols` command, an incoming MAC address that might belong to either the “ip” or the “other” protocol bucket, is learned on both protocol buckets. Therefore, any traffic destined to this MAC address and belonging to any of the protocol buckets is uncasted to that MAC address, rather than flooded. This reduces the unicast Layer 2 flooding that might be caused if the incoming traffic from a host belongs to a different protocol bucket than the traffic that is destined to the sending host.

### Examples

This example shows that the MAC addresses are initially assigned to either the “ip” or the “other” protocol bucket:

```
Switch# show mac-address-table dynamic
Unicast Entries
  vlan  mac address     type        protocols               port
-------------------+---------------------------------------------+-------------------|
  1    0000.0000.5000 dynamic other                GigabitEthernet1/1
  1    0001.0234.6616 dynamic ip                    GigabitEthernet3/1
  1    0003.3178.ec0a dynamic assigned              GigabitEthernet3/1
  1    0003.4700.24c3 dynamic ip                    GigabitEthernet3/1
  1    0003.4716.f475 dynamic ip                    GigabitEthernet3/1
  1    0003.4748.75c5 dynamic ip                    GigabitEthernet3/1
  1    0003.47f0.d6a3 dynamic ip                    GigabitEthernet3/1
  1    0003.47f6.a91a dynamic ip                    GigabitEthernet3/1
```
This example shows how to assign MAC addresses that belong to either the “ip” or the “other” bucket to both buckets:

```
Switch(config)# mac-address-table dynamic group protocols ip other
Switch(config)# exit
Switch# show mac address-table dynamic
```

</table>
mac address-table learning vlan

To enable MAC address learning on a VLAN, use the `mac address-table learning` global configuration command. Use the `no` form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

```
mac address-table learning vlan vlan-id

no mac address-table learning vlan vlan-id
```

**Syntax Description**

| `vlan-id` | Specifies a single VLAN ID or a range of VLAN IDs separated by a hyphen or comma. Valid VLAN IDs are 1 to 4094. |

**Defaults**

Enabled on all VLANs

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was modified to support the disable learning feature on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you control MAC address learning on a VLAN, you can manage the available table space by controlling which VLANs, and which ports can learn MAC addresses.

You can disable MAC address learning on a single VLAN ID (for example, by entering `no mac address-table learning vlan 223`) or on a range of VLAN IDs (for example, by entering `no mac address-table learning vlan 1-20, 15`).

Before you disable MAC address learning, familiarize yourself with the network topology and the switch system configuration. If you disable MAC address learning on a VLAN, flooding may occur in the network. For example, if you disable MAC address learning on a VLAN with a configured switch virtual interface (SVI), the switch floods all IP packets in the Layer 2 domain. If you disable MAC address learning on a VLAN that includes more than two ports, every packet entering the switch is flooded in that VLAN domain. Disable MAC address learning only in VLANs that contain two ports. Use caution before disabling MAC address learning on a VLAN with an SVI.

You cannot disable MAC address learning on a VLAN that the switch uses internally. This action causes the switch to generate an error message and rejects the `no mac address-table learning vlan` command. To view used internal VLANs, enter the `show vlan internal usage` privileged EXEC command.

If you disable MAC address learning on a VLAN configured as a PVLAN primary or a secondary VLAN, the MAC addresses are still learned on the VLAN (primary or secondary) associated with the PVLAN. You cannot disable MAC address learning on an RSPAN VLAN. The configuration is not allowed.

If you disable MAC address learning on a VLAN that includes a secure port, MAC address learning is not disabled on the secure port. If you later disable port security on the interface, the disabled MAC address learning state is enabled.
To display the MAC address learning status of a specific VLAN or for all VLANs, enter the `show mac-address-table learning vlan` command.

**Examples**

This example shows how to disable MAC address learning on VLAN 2003:

```
Switch(config)# no mac address-table learning vlan 2003
```

</tbody>
</table>
mac-address-table notification

To enable MAC address notification on a switch, use the `mac-address-table notification` command. To return to the default setting, use the `no` form of this command.

```
mac-address-table notification [ [change [history-size hs_value | interval intv_value]] | [mac-move] | [threshold [limit percentage | interval time]] | [learn-fail [interval time | limit num_fail]]]
```

```
no mac-address-table notification [ [change [history-size hs_value | interval intv_value]] | [mac-move] | [threshold [limit percentage | interval time]] | [learn-fail [interval time | limit num_fail]]]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>change</code></td>
<td>(Optional) Specifies enabling MAC change notification.</td>
</tr>
<tr>
<td><code>history-size hs_value</code></td>
<td>(Optional) Sets a maximum number of entries in the MAC change notification history table. The range is 0 to 500 entries.</td>
</tr>
<tr>
<td><code>interval intv_value</code></td>
<td>(Optional) Sets a notification trap interval: the set interval time between two consecutive traps. The range is 0 to 2,147,483,647 seconds.</td>
</tr>
<tr>
<td><code>mac-move</code></td>
<td>(Optional) Specifies enabling MAC move notification.</td>
</tr>
<tr>
<td><code>threshold</code></td>
<td>(Optional) Specifies enabling MAC threshold notification.</td>
</tr>
<tr>
<td><code>limit percentage</code></td>
<td>(Optional) Specifies the percentage of MAT utilization threshold; valid values are from 1 to 100 percent.</td>
</tr>
<tr>
<td><code>interval time</code></td>
<td>(Optional) Specifies the time between MAC threshold notifications; valid values are greater than or equal to 120 seconds.</td>
</tr>
<tr>
<td><code>learn-fail</code></td>
<td>(Optional) Specifies syslog (level 6) notifications of failures to install MAC addresses learned in software into hardware. Disabled by default.</td>
</tr>
<tr>
<td><code>interval time</code></td>
<td>(Optional) Specifies the syslog interval between hardware MAC learning failure notifications. The default value is 150 seconds. The range is between 1 to 100000 seconds.</td>
</tr>
<tr>
<td><code>limit num_fail</code></td>
<td>(Optional) Specifies the number of hardware MAC learning failures to be allowed in a notification interval.</td>
</tr>
</tbody>
</table>

### Defaults

MAC address notification feature is disabled.

The default MAC change trap interval value is 1 second.

The default number of entries in the history table is 1.

MAC move notification is disabled.

MAC threshold monitoring feature is disabled.

The default limit is 50 percent.

The default time is 120 seconds.

Hardware MAC learning failure syslog notification is disabled.

The default limit is 1000.

The default interval is 150 seconds.
mac-address-table notification

Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support for the learn-fail keyword, Supervisor Engine 6-E, and Catalyst 4900M chassis added.</td>
</tr>
</tbody>
</table>

Usage Guidelines
You can enable the MAC change notification feature using the `mac-address-table notification change` command. If you do this, you must also enable MAC notification traps on an interface using the `snmp trap mac-notification change interface` configuration command and configure the switch to send MAC change traps to the NMS using the `snmp-server enable traps mac-notification` global configuration command.

When the `history-size` option is configured, the existing MAC change history table is deleted, and a new table is created.

Examples

This example shows how to set the MAC address notification history table size to 300 entries:

```
Switch(config)# mac-address-table notification change history-size 300
Switch(config)#
```

This example shows how to set the MAC address notification interval time to 1250 seconds:

```
Switch(config)# mac-address-table notification change interval 1250
Switch(config)#
```

This example shows how to enable hardware MAC address learning failure syslog notification:

```
Switch(config)# mac address-table notification learn-fail
```

This example shows how to set the interval of hardware MAC address learning failure syslog notification to 30 seconds:

```
Switch(config)# mac address-table notification learn-fail interval 30
```

**mac-address-table static**

To configure the static MAC addresses for a VLAN interface or drop unicast traffic for a MAC address for a VLAN interface, use the `mac-address-table static` command. To remove the static MAC address configurations, use the `no form` of this command.

```
mac-address-table static mac-addr {vlan vlan-id} {interface type | drop}

no mac-address-table static mac-addr {vlan vlan-id} {interface type} {drop}
```

**Syntax Description**

- **mac-addr**: MAC address; optional when using the `no` form of this command.
- **vlan vlan-id**: VLAN and valid VLAN number; valid values are from 1 to 4094.
- **interface type**: Interface type and number; valid options are `FastEthernet` and `GigabitEthernet`.
- **drop**: Drops all traffic received from and going to the configured MAC address in the specified VLAN.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a static MAC address is installed, it is associated with a port.

The output interface specified must be a Layer 2 interface and not an SVI.

If you do not enter a protocol type, an entry is automatically created for each of the four protocol types.

Entering the `no` form of this command does not remove the system MAC addresses.

When removing a MAC address, entering `interface int` is optional. For unicast entries, the entry is removed automatically. For multicast entries, if you do not specify an interface, the entire entry is removed. You can specify the selected ports to be removed by specifying the interface.

**Examples**

This example shows how to add the static entries to the MAC address table:

```
Switch(config)# mac-address-table static 0050.3e8d.6400 vlan 100 interface fastethernet5/7
Switch(config)#
```

**Usage Guidelines**

This command can only be viewed and applied; it cannot be modified.

Ensure that the existing configuration on the interface does not conflict with the intended macro configuration. Before you apply the macro, clear the configuration on the interface with the `default interface` command.

**Examples**

This example shows how to enable the Cisco-recommended features and settings on port fa2/1:

```
Switch(config)# interface FastEthernet2/1
Switch(config-if)# macro apply cisco-desktop $AVID 50
Switch(config-if)#
```

The contents of this macro are as follows:

```
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID [access_vlanid]
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
# Ensure port-security age is greater than one minute
# and use inactivity timer
# *Port-security maximum 1* is the default and will not
# Show up in the config
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
```

macro auto device

Use the `macro auto device` command to simplify changing the parameters for a built-in functions for a device type. Use the `no` form of this command to revert to the initial parameter values.

```
macro auto device device_type [params values]
no macro auto device device_type [params values]
```

**Syntax Description**

- `device_type` - Specifies the device type.
  - `phone`—Apply interface configs on detecting a phone
  - `switch`—Apply interface configs on detecting a switch
  - `router`—Apply interface configs on detecting a router
  - `ap`—Apply interface configs on detecting an ap
  - `lwap`—Apply interface configs on detecting a light weight ap
  - `dmp`—Apply interface configs on detecting a DMP
  - `ipvsc`—Apply interface configs on detecting a IPVSC

- `param name=value` - (Optional) `parameter=value`—Replace default values that begin with $. Enter new values in the form of name value pair separated by a space: `[<name1>=<value1> <name2>=<value2>...]`. Default values are shown in parenthesis.

**Command Modes**

- Global configuration

**Command History**

- **Release** 12.2(54)SG
  - **Modification** This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

Although you can use the `macro auto execute` command to produce the same effect as the `macro auto device` command, the later is simpler.

**Examples**

This example shows how to change the access VLAN and voice VLAN from their default value to user defined values for phone devices.

```
(config)# macro auto device phone ACCESS_VLAN=10 VOICE_VLAN=20
```

macro auto execute (built-in function)

Use the macro auto execute configuration command to change built-in function default values or to map user-defined triggers to built-in functions and to pass the parameter values. Use the no form of this command to unmap the trigger.

`macro auto execute event_trigger builtin shell_function [param name=values]`

`no macro auto execute event_trigger builtin shell_function [param name=values]`

**Syntax Description**

- **event_trigger**
  - Defines mapping from an event trigger to a built-in macro.
  - Specify an event trigger:
    - CISCO_PHONE_EVENT
    - CISCO_SWITCH_EVENT
    - CISCO_ROUTER_EVENT
    - CISCO_WIRELESS_AP_EVENT
    - CISCO_WIRELESS_LIGHTWEIGHT_AP_EVENT
    - CISCO_DMP_EVENT
    - CISCO_IPVSC_EVENT
    - WORD—Apply a user-defined event trigger.

- **shell_function**
  - Specifies a built-in macro name:
    - CISCO_PHONE_AUTO_SMARTPORT
      - (Optional) Specify the parameter values: $ACCESS_VLAN=(1) and $VOICE_VLAN=(2).
    - CISCO_SWITCH_AUTO_SMARTPORT
      - (Optional) Specify the parameter values: $NATIVE_VLAN=(1).
    - CISCO_ROUTER_AUTO_SMARTPORT
      - (Optional) Specify the parameter values: $NATIVE_VLAN=(1).
    - CISCO_AP_AUTO_SMARTPORT
      - (Optional) Specify the parameter values: $NATIVE_VLAN=(1).
    - CISCO_LWAP_AUTO_SMARTPORT
      - (Optional) Specify the parameter values: $ACCESS_VLAN=(1).
    - CISCO_DMP_AUTO_SMARTPORT
    - CISCO_IP_CAMERA_AUTO_SMARTPORT

- **param name=value**
  - (Optional) Specifies values for the parameters that are to be used in the function body.

**Defaults**

Auto Smartports is disabled.

**Command Modes**

Global configuration
Usage Guidelines

The switch automatically maps from builtin event triggers to builtin functions. The builtin functions are system-defined functions in the software image.

Use the **macro auto execute** global configuration command to replace the builtin function default values with values specific to your switch.

You can also create user-defined triggers and use this command to map the triggers to builtin functions.

You can create user-defined event triggers by entering the **shell trigger** global configuration command. Use the **show shell** privileged EXEC command to display the contents of the builtin and user-defined triggers and functions.

Examples

This example shows how to use two built-in Auto Smartports macros for connecting Cisco switches and Cisco IP phones to the switch. It modifies the default voice VLAN, access VLAN, and native VLAN for the trunk interface:

```
Switch# configure terminal
Switch(config)#!!! the next command modifies the access and voice vlans
Switch(config)#!!! for the built in Cisco IP phone auto smartport macro
Switch(config)# macro auto execute CISCO_PHONE_EVENT builtin CISCO_PHONE_AUTO_SMARTPORT
ACCESS_VLAN=10 VOICE_VLAN=20
Switch(config)#
Switch(config)#!!! the next command modifies the native vlan
Switch(config)#!!! for the built in switch auto smartport macro
Switch(config)# macro auto execute CISCO_SWITCH_EVENT builtin CISCO_SWITCH_AUTO_SMARTPORT
NATIVE_VLAN=10
Switch(config)#!!! the next example creates a user-defined trigger and maps it to a builtin functions
Switch(config)# shell trigger myTrigger “user-defined trigger”
Switch(config)# macro auto execute myTrigger builtin CISCO_PHONE_AUTO_SMARTPORT_ACCESSVLAN
voice_vlan
Switch(config)#!!! the next command enables auto smart ports globally
Switch(config)# macro auto global processing fallback CDP
```

```
Switch# !!! here’s the running configuration of the interface connected
Switch# !!! to another Cisco Switch after the Macro is applied
Switch#
Switch# show running-config interface Gi1/0/1
Building configuration...

Current configuration : 284 bytes
!
interface GigabitEthernet1/0/1
   switchport trunk encapsulation dot1q
   switchport trunk native vlan 10
   switchport mode trunk
   srr-queue bandwidth share 10 10 60 20
   queue-set 2
   priority-queue out
   mls qos trust cos
   auto qos voip trust
   macro description CISCO_SWITCH_EVENT
end
```

</tr>
</thead>
</table>
| 12.2(54)SG | This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

This command enables you to store shell functions in a central location and utilized by ASP on many switches. This alleviates the problem of updating functions on every switch for each modification.

Triggering of the remotely defined function requires network connectivity to the URL, which is accessed for each execution of the function.

**Examples**

This example shows how to map a trigger to the remotely defined function **myfunction** - the filename that contains the function body:

```
Switch(config)# macro auto execute mytrigger remote tftp://dirt/tftpboot/myfunction
```

macro auto execute (user-defined function)

Use the `macro auto execute` configuration command to map a trigger to a user-defined function. Use the `no` form of this command to unmapped the trigger.

```
macro auto execute trigger_name [param_name=value] {function body}
no macro auto execute trigger_name [param_name=value]
```

**Syntax Description**

- `trigger_name` Specifies the trigger name.
- `param_name=value` (Optional) Specifies values for the parameters that are to be used in the function body.
- `function_body` Shell functions with CLIs.

**Defaults**

None.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Because the function defined in this command does not have a name, you cannot use it to map to another trigger. This is the only way that you can map a trigger to a user defined function. Shell functions defined in the non-configure mode can not be used to map triggers.

**Examples**

This example shows how to map the user-defined event trigger `Cisco Digital Media Player` (DMP) to a user-defined macro.

a. Connect the DMP to an 802.1x- or MAB-enabled switch port.
b. On the RADIUS server, set the attribute-value pair to `auto-smart-port=CISCO_DMP_EVENT`.
c. On the switch, create the event trigger `CISCO_DMP_EVENT`, and enter the user-defined macro commands shown below.
d. The switch recognizes the attribute-value pair=`CISCO_DMP_EVENT` response from the RADIUS server and applies the macro associated with this event trigger.

```
Switch(config)# shell trigger CISCO_DMP_EVENT Cisco DMP player
Switch(config)# macro auto execute CISCO_DMP_EVENT {
  if [[ $LINKUP -eq YES ]]; then
    conf t
    interface $INTERFACE
    macro description $TRIGGER
    switchport access vlan 1
    switchport mode access
    switchport port-security
```
```bash
macro auto execute (user-defined function)

switchport port-security maximum 1
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
spanning-tree portfast
spanning-tree bpduuard enable
exit
fi
if [[ $LINKUP -eq NO ]]; then
  conf t
  interface $INTERFACE
    no macro description $TRIGGER
    no switchport access vlan 1
    if [[ $AUTH_ENABLED -eq NO ]]; then
      no switchport mode access
    fi
    no switchport port-security
    no switchport port-security maximum 1
    no switchport port-security violation restrict
    no switchport port-security aging time 2
    no switchport port-security aging type inactivity
    no spanning-tree portfast
    no spanning-tree bpduuard enable
  exit
fi
}
Switch(config)# end

macro auto global processing

Use the `macro auto global processing` global configuration command to enable Auto SmartPorts macros on the switch. Use the `no` form of this command to disable Auto SmartPorts (ASP) macros globally.

```
macro auto global processing [cdp | lldp]
no macro auto global processing [cdp | lldp]
```

**Note** Starting with Release 15.0(2)SG, the `fallback` option has been deprecated.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cdp</td>
<td>Selects CDP as fallback mode.</td>
</tr>
<tr>
<td>lldp</td>
<td>Selects LLDP as fallback mode.</td>
</tr>
</tbody>
</table>

**Defaults**

Auto Smartports is disabled.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `macro auto global processing` global configuration command to globally enable Auto Smartports macros on the `switch`. To disable ASP macros on a specific `port`, use the `no macro auto processing` command in the interface mode before ASP is enabled globally.

Auto Smartports macros dynamically configure ports based on the device type detected on the port. When the switch detects a new device on a port it applies the appropriate ASP macro. When a link-down event occurs on a port, the switch removes the macro. For example, when you connect a Cisco IP phone to a port, ASP automatically applies the IP phone macro. The IP phone macro enables quality of service (QoS), security features, and a dedicated voice VLAN to ensure proper treatment of delay-sensitive voice traffic.

ASP uses event triggers to map devices to macros. The most common event triggers are based on Cisco Discovery Protocol (CDP) messages received from connected devices. The detection of a device invokes a CDP event trigger: Cisco IP phone, Cisco wireless access point, Cisco switch, or Cisco router. Other event triggers use MAC authentication bypass (MAB) and 802.1X authentication messages.

Use CDP if port authentication is enabled and the RADIUS server does not send an event trigger.

Select LLDP to apply auto configuration if authentication fails.

If authentication is enabled on a port, a switch ignores CDP and LLDP messages unless the `cdp` keyword is enabled.
When using 802.1X or MAB authentication, configure the RADIUS server to support the Cisco attribute-value (AV) pair `auto-smart-port=event trigger`.

When CDP-identified devices advertise multiple capabilities, a switch chooses a capability in this priority order: switch, router, access point, lightweight access point, phone, host.

To verify that an ASP macro is applied to an interface, use the `show running config` command.

The `macro auto global processing cdp` and `macro auto global processing lldp` commands enables ASP globally if it is not already enabled, and set the fallback to CDP or LLDP, respectively. However, the `no macro auto global processing [cdp | lldp]` command only removes the fallback mechanism. It does not disable ASP globally; only the `no macro auto global processing` command disables ASP globally.

The keywords `cdp` and `lldp` are also controlled at the interface level; by default, CDP is the fallback mechanism on an interface. If you prefer LLDP, first enter the `no macro auto processing cdp` command, then enter the `macro auto processing lldp` command.

If you want to activate both CDP and LLDP, you must enable them in sequence. For example, you would first enter the `macro auto processing cdp` command, then the `macro auto processing lldp` command.

**Examples**

This example shows how enable ASP on a switch and to disable the feature on Gi1/0/1:

```
Switch(config)# interface interface Gi1/0/1
Switch(config-if)# no macro auto processing
Switch(config)# macro auto global processing
```

macro auto macro-addr-group

Use the `macro auto macro-addr-group` command to configure a group of MAC-address or OUIs as a trigger. Use the `no` form of this command to unconfigure the group.

```
macro auto macro-addr-group grp_name
no macro auto macro-addr-group grp_name
```

**Syntax Description**
- `grp_name` Specifies the group name.

**Command Modes**
- Global configuration

**Command History**
- **Release** 12.2(54)SG
- **Modification** This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**
This command changes the mode to config-mac-addr-grp, in which you can add or remove a MAC address or OUI from the group.

You can specify a list of MACs or OUIs, or a range of OUIs (maximum of 5 in the range).

**Examples**
This example shows how to configure `testGroup` as a trigger:

```
Switch(config)# macro auto macro-addr-group testGroup
Switch(config-addr-grp-mac)# mac-address list 1111.1111.1111 2222.2222.2222
Switch(config-addr-grp-mac)# exit
Switch(config)# exit
```

**Related Commands**
- `macro auto execute (built-in function)` Changes built-in function default values or to map user-defined triggers to built-in functions, and to pass the parameter values.
- `macro auto execute (remotely-defined trigger)` Maps a trigger to a remotely defined functions.
- `macro auto execute (user-defined function)` Maps a trigger to a user-defined function.
- `macro auto global processing` Enables Auto Smartports on a switch.
- `macro auto processing` Enables Auto SmartPorts macros on a specific interface.
- `macro auto sticky` Specifies not to remove configurations applied by ASP across link flaps and device removal.
- `shell trigger` Creates a user defined trigger.
macro auto processing

**Note**
Only use this command when Auto SmartPorts (ASP) is enabled globally; when ASP is disabled globally, interface-level control has no effect.

Use the **macro auto processing** interface configuration command to enable ASP macros on a specific interface. Use the **no** form of this command to disable ASP on a specific interface before ASP is enabled globally.

```
macro auto processing [fallback cdp] [fallback lldp]
no macro auto processing [fallback cdp] [fallback lldp]
```

**Syntax Description**
- **fallback cdp**: Specifies as CDP as the fallback mechanism.
- **fallback lldp**: Specifies as LLDP as the fallback mechanism.

**Defaults**
Fallback mechanism is CDP.

**Command Modes**
Interface level configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The **no macro auto processing** command should be configured on all interfaces where ASP is not desirable (such as Layer 3 and EtherChannel interfaces) before ASP is enabled globally.

At the interface level, the default fallback mechanism is CDP. To change the mechanism to LLDP, enter the **no macro auto processing fallback cdp** command, followed by the **macro auto processing fallback lldp** command.

**Examples**
This example shows how to enable the feature on an interface:
```
Switch(config)# interface Gi3/1
Switch(config-if)# macro auto processing
```

</table>
**macro auto sticky**

Use the `macro auto sticky` configuration to specify not to remove configurations applied by ASP across link flaps and device removal.

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Not sticky (macros are removed)

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command enables you to avoid unnecessary removal of ASP configurations when a feature intentionally shuts down a link (like EnergyWise, which shuts down inactive links to save energy). When such a feature is enabled, you don’t want ASP macros to be applied and removed unnecessarily. So you configure the sticky feature.

**Examples**

This example shows how to specify not to remove configurations:

```
Switch(config)# macro auto sticky
```

<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td></td>
<td>(Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The main CPU submode is used to manually synchronize the configurations on the two supervisor engines. From the main CPU submode, use the **auto-sync** command to enable automatic synchronization of the configuration files in NVRAM.

**Note**

After you enter the main CPU submode, you can use the **auto-sync** command to automatically synchronize the configuration between the primary and secondary route processors based on the primary configuration. In addition, you can use all of the redundancy commands that are applicable to the main CPU.

**Examples**

This example shows how to reenable the default automatic synchronization feature using the auto-sync standard command to synchronize the startup-config and config-register configuration of the active supervisor engine with the standby supervisor engine. The updates for the boot variables are automatic and cannot be disabled.

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
Switch(config-r-mc)# end
Switch# copy running-config startup-config
Switch#
```

**Related Commands**

<tr>
<td>auto-sync</td>
<td>Enables automatic synchronization of the configuration files in NVRAM.</td>
</tr>
</tbody>
</table>
**match**

To specify a match clause by selecting one or more ACLs for a VLAN access-map sequence, use the `match` subcommand. To remove the match clause, use the `no` form of this command.

```
match {ip address {acl-number | acl-name}} | {mac address acl-name}
```

```
no match {ip address {acl-number | acl-name}} | {mac address acl-name}
```

**Note**

If a match clause is not specified, the action for the VLAN access-map sequence is applied to all packets. All packets are matched against that sequence in the access map.

**Syntax Description**

- `ip address acl-number` Selects one or more IP ACLs for a VLAN access-map sequence; valid values are from 1 to 199 and from 1300 to 2699.
- `ip address acl-name` Selects an IP ACL by name.
- `mac address acl-name` Selects one or more MAC ACLs for a VLAN access-map sequence.

**Defaults**

This command has no default settings.

**Command Modes**

VLAN access-map mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The match clause specifies the IP or MAC ACL for traffic filtering.

The MAC sequence is not effective for IP packets. IP packets should be access controlled by IP match clauses.

Refer to the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional configuration guidelines and restrictions.

Refer to the *Cisco IOS Command Reference* publication for additional match command information.

**Examples**

This example shows how to define a match clause for a VLAN access map:

```
Switch(config)# vlan access-map ganymede 10
Switch(config-access-map)# match ip address 13
Switch(config-access-map)#
```

**Related Commands**

</table>
match (class-map configuration)

To define the match criteria for a class map, use the **match** class-map configuration command. To remove the match criteria, use the **no** form of this command.

### Non-Supervisor Engine 6-E

```text
match { access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list }
```

```text
no match { access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list }
```

### Supervisor Engine 6-E and Catalyst 4900M chassis

```text
match { access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list | qos-group value | protocol [ip | ipv6 | arp] }
```

```text
no match { access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list | qos-group value | protocol [ip | ipv6 | arp] }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-group</td>
<td>Number or name of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699.</td>
</tr>
<tr>
<td>acl-index-or-name</td>
<td>Lists up to four Layer 2 class of service (CoS) values to match against a packet. Separate each value with a space. The range is 0 to 7.</td>
</tr>
<tr>
<td>cos cos-list</td>
<td>(Optional) IP keyword. It specifies that the match is for IPv4 packets only. If not used, the match is for both IPv4 and IPv6 packets. Lists up to eight IP Differentiated Services Code Point (DSCP) values to match against a packet. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value.</td>
</tr>
<tr>
<td>[lp] dscp dscp-list</td>
<td>(Optional) IP keyword. It specifies that the match is for IPv4 packets only. If not used, the match is for both IPv4 and IPv6 packets. Lists up to eight IP-precedence values to match against a packet. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.</td>
</tr>
<tr>
<td>[lp] precedence</td>
<td>Specifies the internally generated qos-group value assigned to a packet on the input qos classification.</td>
</tr>
<tr>
<td>ip-precedence-list</td>
<td>Specifies IP in the Ethernet header. The match criteria are supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Though visible in the command-line help strings, the only protocol types supported are IP, IPv6, and ARP.</td>
</tr>
</tbody>
</table>
### match (class-map configuration)

- **protocol ipv6**
  Specifies IPv6 in the Ethernet header. The match criteria are supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Though visible in the command-line help strings the only protocol types supported are IP, IPv6, and ARP.

- **protocol arp**
  Specifies ARP in the Ethernet header. The match criteria are supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Though visible in the command-line help strings the only protocol types supported are IP, IPv6, and ARP.

### Defaults

No match criteria are defined.

### Command Modes

Class-map configuration mode

### Command History

</tr>
<tr>
<td>12.2(46)SG</td>
<td>Added support for the <code>match protocol arp</code> command on the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before entering the `match` command, you must first enter the `class-map` global configuration command to specify the name of the class whose match criteria you want to establish. The `match` command is used to specify which fields in the packets are examined to classify the packets. If a packet matches the specified criteria, the packet is considered a member of the class and is forwarded according to the quality of service (QoS) specifications set in the traffic policy.

For the `match ip dscp dscp-list` or the `match ip precedence ip-precedence-list` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `match ip dscp af11` command, which is the same as entering the `match ip dscp 10` command. You can enter the `match ip precedence critical` command, which is the same as entering the `match ip precedence 5` command. For a list of supported mnemonics, enter the `match ip dscp ?` or the `match ip precedence ?` command to see the command-line help strings.

To match only IPv6 packets, you must use the `match protocol ipv6` command. To match only IPv4 packets you can use either the `ip` prefix or the protocol `ip` keyword.

To match only ARP packets, you must use the `match protocol arp` command.

You can configure the `match cos cos-list`, `match ip dscp dscp-list`, `match ip precedence ip-precedence-list` command in a class map within a policy map.

The `match cos cos-list` command applies only to Ethernet frames that carry a VLAN tag.

The `match qos-group` command is used by the class-map to identify a specific QoS group value assigned to a packet. The QoS group value is local to the switch and is associated with a packet on the input Qos classification.
Examples

This example shows how to create a class map called class2, which matches all the inbound traffic with DSCP values of 10, 11, and 12:

```
Switch# configure terminal
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
```

Switch#

This example shows how to create a class map called class3, which matches all the inbound traffic with IP-precedence values of 5, 6, and 7 for both IPv4 and IPv6 traffic:

```
Switch# configure terminal
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
```

Switch#

This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1:

```
Switch# configure terminal
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
```

Switch#

This example shows how to specify a class-map that applies only to IPv6 traffic on a Supervisor Engine 6-E:

```
Switch# configure terminal
Switch(config)# class-map match all ipv6 only
Switch(config-cmap)# match dscp af21
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
```

Switch#

You can verify your settings by entering the `show class-map` privileged EXEC command.

match flow ip

To specify match criteria to treat flows with a unique source or destination address as new flows, use the `match flow ip` command. To disable this function, use the `no` form of this command.

```
match flow ip {source-address [ip destination-address ip protocol L4 source-address L4
destination-address] | destination-address}
```

```
no match flow ip {source-address [ip destination-address ip protocol L4 source-address L4
destination-address] | destination-address}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>source-address</code></td>
<td>Establishes a new flow from a flow with a unique IP source address.</td>
</tr>
<tr>
<td><code>ip destination-address</code></td>
<td>(Optional) Comprises the full flow keyword; treats each flow with unique IP source, destination, protocol, and Layer 4 source and destination address as a new flow.</td>
</tr>

</tr>
<tr>
<td><code>destination-address</code></td>
<td></td>
</tr>
<tr>
<td><code>destination-address</code></td>
<td>Establishes a new flow from a flow with a unique IP destination address.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

class-map configuration submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Support for the full flow option was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you specify the source-address keyword, each flow with a unique source address is treated as a new flow.

When you specify the destination-address keyword, each flow with a unique destination address is treated as a new flow.

A policy map is called a flow-based policy map when you configure the flow keywords on the class map that it uses. To attach a flow-based policy map as a child to an aggregate policy map, use the `service-policy` command.

**Note**

The `match flow` command is available on the Catalyst 4500 series switch only when Supervisor Engine VI (WS-X4516-10GE) is present.
**Examples**

This example shows how to create a flow-based class map associated with a source address:

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# end
Switch# show class-map c1
Class Map match-all c1 (id 2)
   Match flow  ip source-address
Switch#
```

This example shows how to create a flow-based class map associated with a destination address:

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# end
Switch#
```

Switch# show class-map c1
Class Map match-all c1 (id 2)
   Match flow  ip destination-address
Switch#

Assume there are two active flows on the Fast Ethernet interface 6/1 with source addresses 192.168.10.20 and 192.168.10.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
```

Switch# show policy-map interface
FastEthernet6/1

Service-policy input: p1

Class-map: c1 (match-all)
15432182 packets
Match: flow  ip source-address
police: Per-interface
   Conform: 64995654 bytes Exceed: 2376965424 bytes

Class-map: class-default (match-any)
0 packets
Match: any
0 packets
Switch#
This example shows two active flows on the Fast Ethernet interface 6/1 with destination addresses of 192.168.20.20 and 192.168.20.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
Switch# show policy-map interface
FastEthernet6/1

Service-policy input: p1

Class-map: c1 (match-all)
2965072 packets
Match: flow ip destination-address
police: Per-interface
  Conform: 6105636 bytes Exceed: 476652528 bytes

Class-map: class-default (match-any)
0 packets
Match: any
  0 packets
Switch#
```

Assume there are two active flows as shown below on the Fast Ethernet interface 6/1:

<table>
<thead>
<tr>
<th>SrcIp</th>
<th>DstIp</th>
<th>IpProt</th>
<th>SrcL4Port</th>
<th>DstL4Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>81</td>
</tr>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>21</td>
</tr>
</tbody>
</table>

With the following configuration, each flow is policed to a 1000000 bps with an allowed 9000-byte burst value.

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol 14
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet 6/1
```

---

**Note**

If you use the `match flow ip source-address|destination-address` command, these two flows are consolidated into one flow because they have the same source and destination address.
Switch(config-if)# **service-policy** input p1
Switch(config-if)# **end**
Switch# **write memory**
Switch# **show policy-map interface**

To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the `mdix auto` command. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the `no` form of this command to disable auto-MDIX.

```
mdix auto
no mdix auto
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Auto-MDIX is enabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>

</tr>
<tr>
<td>12.2(46)SG</td>
<td>Added supported and unsupported linecard information to the usage guidelines.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The following linecards support Auto-MDIX through the CLI on their copper media ports:
- WS-X4124-RJ45, WS-X4148-RJ45 (hardware revision 3.0 or higher), and WS-X4232-GB-RJ45 (hardware revision 3.0, or higher), WS-X4920-GE-RJ45, and WS-4648-RJ45V+E (Auto-MDIX support when inline power is disabled on the port).

Linecards that support auto-MDIX by default when port auto-negotiation enabled and cannot be turned off using an `mdix` CLI command include: WS-X4448-GB-RJ45, WS-X4548-GB-RJ45, WS-X4424-GB-RJ45, and WS-X4412-2GB-T.

Linecards that cannot support auto-MDIX functionality, either by default or CLI commands, include:

When you enable auto-MDIX on an interface, you must also set the interface speed to be autonegotiated so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed) is enabled on one or both of connected interfaces, link up occurs even if the cable type (straight-through or crossover) is incorrect.

**Examples**
This example shows how to enable auto MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface FastEthernet6/3
Switch(config-if)# speed auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced for the WS-X4306-GB-T module and the WS-X4948 chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported on all ports on the WS-X4306-GB-T module and ports 1/45-48 on the WS-X4948 chassis.

Entering the `show interface capabilities` command provides the Multiple Media Types field, which displays the value `no` if a port is not dual-mode capable and lists the media types (`sfp` and `rj45`) for dual-mode capable ports.

**Examples**

This example shows how to configure port 5/45 on a WS-X4948 chassis to use the RJ-45 connector:

```
Switch(config)# interface gigabitethernet 5/45
Switch(config-if)# media-type rj45
```
mode

To set the redundancy mode, use the `mode` command.

```
mode {rpr | sso}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rpr</td>
<td>Specifies RPR mode.</td>
</tr>
<tr>
<td>sso</td>
<td>Specifies SSO mode.</td>
</tr>
</tbody>
</table>

**Defaults**

For Catalyst 4500 series switches that are configured with Supervisor Engine II+, Supervisor Engine IV, and Supervisor Engine V, the defaults are as follows:

- SSO if the supervisor engine is using Cisco IOS Release 12.2(20)EWA.
- RPR if the supervisor engine is using Cisco IOS Release 12.1(12c)EW through 12.2(18)EW, as well as 12.1(xx)E.

**Note**

If you are upgrading the current supervisor engine from Cisco IOS Release 12.2(18)EW or an earlier release to 12.2(20)EWA, and the RPR mode has been saved to the startup configuration, both supervisor engines will continue to operate in RPR mode after the software upgrade. To use SSO mode, you must manually change the redundancy mode to SSO.

**Command Modes**

Redundancy configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RPR and SSO mode are not supported on Catalyst 4500 series switches that are configured with Supervisor Engine 2.

The `mode` command can be entered only from within redundancy configuration mode.

Follow these guidelines when configuring your system to RPR or SSO mode:

- You must use identical Cisco IOS images and supervisor engines to support RPR and SSO mode. Redundancy may not work due to differences between the Cisco IOS release and supervisor engine capabilities.
- Any modules that are not online at the time of a switchover are reset and reloaded on a switchover.
- If you perform an OIR of the module within 60 seconds before a stateful switchover, the module resets during the stateful switchover and the port states are restarted.
- The FIB tables are cleared on a switchover. Routed traffic is interrupted until route tables reconverge.

The redundant supervisor engine reloads on any mode change and begins to work in the current mode.
This example shows how to set the redundancy mode to SSO:

```
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)#
```
To enable the SPAN sessions on interfaces or VLANs, use the `monitor session` command. To remove one or more source or destination interfaces from a SPAN session, or a source VLAN from a SPAN session, use the `no` form of this command.

```plaintext
monitor session session [destination interface {FastEthernet interface-number | GigabitEthernet interface-number} [encapsulation [isl | dot1q]] [ingress [vlan vlan_id] [learning]]] | [remote vlan vlan_id] | [source [interface {FastEthernet interface-number | GigabitEthernet interface-number} [Port-channel interface-number]]] | [vlan vlan_id]]

no monitor session session [destination interface {FastEthernet interface-number | GigabitEthernet interface-number} [encapsulation [isl | dot1q]] [ingress [vlan vlan_id] [learning]]] | [remote vlan vlan_id] | [source [interface {FastEther...
### Syntax Description

| **session** | Number of a SPAN session; valid values are from 1 to 6. |
| **destination** | Specifies a SPAN destination. |
| **interface** | Specifies an interface. |
| **FastEthernet interface-number** | Specifies a Fast Ethernet module and port number; valid values are from 1 to 6. |
| **GigabitEthernet interface-number** | Specifies a Gigabit Ethernet module and port number; valid values are from 1 to 6. |
| **encapsulation** | (Optional) Specifies the encapsulation type of the destination port. |
| **isl** | (Optional) Specifies ISL encapsulation. |
| **dot1q** | (Optional) Specifies dot1q encapsulation. |
| **ingress** | (Optional) Indicates whether the ingress option is enabled. |
| **vlan vlan_id** | (Optional) Specifies the VLAN; valid values are from 1 to 4094. |
| **learning** | (Optional) Enables host learning on ingress-enabled destination ports. |
| **remote vlan vlan_id** | Specifies an RSPAN source or destination session on a switch. |
| **source** | Specifies a SPAN source. |
| **Port-channel interface-number** | Specifies a port-channel interface; valid values are from 1 to 64. |
| **cpu** | Causes traffic received or sent from the CPU to be copied to the destination of the session. |
| **queue queue_id** | (Optional) Specifies that only traffic received on the specific CPU subqueue should be copied to the destination of the session. Valid values are from 1 to 64, or by the following names: all, control-packet, esmp, mtu-exceeded, unknown-port-vlan-mapping, unknown-sa, acl input, acl input copy, acl input error, acl input forward, acl input punt, acl output, acl output copy, acl output error, acl output forward, acl output punt, l2-forward, adjsame-if, bridge-cpu, ip-option, ipv6-scope-check-fail, l2-src-index-check-fail, mcast-rpf-fail, non-arpa, router-cpu, ttl-expired, ucast-rpf-fail, l3-forward, forward, glean, receive. |
| **acl** | (Optional) Specifies input and output ACLs; valid values are from 14 to 20. |
| **input** | Specifies input ACLs; valid values are from 14 to 16. |
| **error** | Specifies the ACL software errors. |
| **log/copy** | Specifies packets for ACL logging. |
| **punt** | Specifies packets punted due to overflows. |
| **rx** | Specifies monitoring received traffic only. |
output                  Specifies output ACLs; valid values are from 17 to 20.
l2-forward             (Optional) Layer 2 or Layer 3 exception packets.
bridge-cpu             Specifies packets bridged to CPU.
ip-option              Specifies packets with an IP option.
ipv6-scope-check-fail  Specifies IPv6 packets with scope-check failures.
l2-src-index-check-fail Specifies IP packets with mismatched SRC MAC and SRC IP addresses.
non-arpa               Specifies packets with non-ARPA encapsulation.
router-cpu             Specifies software routed packets.
ttl-expired            Specifies IPv4 routed packets exceed TTL.
adj-same-if            Specifies packets routed to the incoming interface.
bridged                Specifies Layer 2 bridged packets.
1                      Specifies packets with the highest priority.
2                      Specifies packets with the a high priority.
3                      Specifies packets with the a medium priority.
4                      Specifies packets with the a low priority.
all                    (Optional) all queues.
l3-forward             (Optional) Layer 3 packets.
forward                Specifies special Layer 3 forwards tunnel encapsulation.
glean                  Specifies special Layer 3 forwards glean.
receive                Specifies packets addressed to a port.
control-packet         (Optional) Layer 2 control packets.
esmp                   (Optional) ESMP packets.
mtu-exceeded           (Optional) Output Layer 3 interface MTU exceeded.
routed                Specifies Layer 3 routed packets.
received               Specifies packets addressed to a port.
rpf-failure            Specifies Multicast RPF failed packets.
unknown-port-vlan-mapping  (Optional) Packets with missing port-VLAN mapping.
unknown-sa             (Optional) Packets with missing source-IP-addresses.
,                      (Optional) Symbol to specify another range of SPAN VLANs; valid values are from 1 to 4094.
-                      (Optional) Symbol to specify a range of SPAN VLANs.
both                   (Optional) Monitors and filters received and transmitted traffic.
rx                      (Optional) Monitors and filters received traffic only.
tx                      (Optional) Monitors and filters transmitted traffic only.
filter                  Limits SPAN source traffic to specific VLANs.
ip access-group        (Optional) Specifies an IP access group filter, either a name or a number.
name                   (Optional) Specifies an IP access list name.
### monitor session

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>id</strong></td>
<td>(Optional) Specifies an IP access list number. Valid values are 1 to 199 for an IP access list and 1300 to 2699 for an IP expanded access list.</td>
</tr>
<tr>
<td><strong>vlan vlan_id</strong></td>
<td>(Optional) Specifies the VLAN to be filtered. The number is entered as a single value or a range; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><strong>packet-type</strong></td>
<td>Limits SPAN source traffic to packets of a specified type.</td>
</tr>
<tr>

<td>Specifies a good packet type</td>
</tr>
<tr>
<td><strong>bad</strong></td>
<td>Specifies a bad packet type.</td>
</tr>
<tr>
<td>**address-type unicast</td>
<td>multicast</td>
</tr>
</tbody>
</table>

**Defaults**

Received and transmitted traffic, as well as all VLANs, packet types, and address types are monitored on a trunking interface.

Packets are transmitted untagged out the destination port; ingress and learning are disabled.

All packets are permitted and forwarded “as is” on the destination port.

</tr>
</tbody>
</table>

**Usage Guidelines**

Only one SPAN destination for a SPAN session is supported. If you attempt to add another destination interface to a session that already has a destination interface that is configured, you will get an error. You must first remove a SPAN destination interface before changing the SPAN destination to a different interface.

Beginning in Cisco IOS Release 12.1(12c)EW, you can configure sources from different directions within a single user session.

**Note**

Beginning in Cisco IOS Release 12.1(12c)EW, SPAN is limited to two sessions containing ingress sources and four sessions containing egress sources. Bidirectional sources support both ingress and egress sources.
A particular SPAN session can either monitor VLANs or monitor individual interfaces: you cannot have a SPAN session that monitors both specific interfaces and specific VLANs. If you first configure a SPAN session with a source interface, and then try to add a source VLAN to the same SPAN session, you will receive an error. You will also receive an error message if you configure a SPAN session with a source VLAN, and then try to add a source interface to that session. You must first clear any sources for a SPAN session before switching to another type of source. CPU sources may be combined with source interfaces and source VLANs.

When configuring the **ingress** option on a destination port, you must specify an ingress VLAN if the configured encapsulation type is untagged (the default) or is 802.1Q. If the encapsulation type is ISL, then no ingress VLAN specification is necessary.

By default, when you enable ingress, no host learning is performed on destination ports. When you enter the **learning** keyword, host learning is performed on the destination port, and traffic to learned hosts is forwarded out the destination port.

If you enter the **filter** keyword on a monitored trunking interface, only traffic on the set of specified VLANs is monitored. Port-channel interfaces are displayed in the list of **interface** options if you have them configured. VLAN interfaces are not supported. However, you can span a particular VLAN by entering the **monitor session session source vlan vlan-id** command.

The packet-type filters are supported only in the Rx direction. You can specify both Rx- and Tx-type filters and multiple-type filters at the same time (for example, you can use **good** and **unicast** to only sniff nonerror unicast frames). As with VLAN filters, if you do not specify the type, the session will sniff all packet types.

The **queue** identifier allows sniffing for only traffic that is sent or received on the specified CPU queues. The queues may be identified either by number or by name. The queue names may contain multiple numbered queues for convenience.

**Examples**

This example shows how to configure IP access group 100 on a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 1 filter ip access-group 100
Switch(config)# end
Switch(config)#
```

This example shows how to add a source interface to a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 1 source interface fa2/3
Switch(config)# end
Switch(config)#
```

This example shows how to configure the sources with different directions within a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# monitor session 1 source interface fa2/3 rx
Switch(config)# monitor session 1 source interface fa2/2 tx
Switch(config)# end
```

This example shows how to remove a source interface from a SPAN session:

```plaintext
Switch# configure terminal
Switch(config)# no monitor session 1 source interface fa2/3
Switch(config)# end
```
This example shows how to limit SPAN traffic to VLANs 100 through 304:

```
Switch# configure terminal
Switch(config)# monitor session 1 filter vlan 100 - 304
Switch(config)# end
```

This example shows how to configure RSPAN VLAN 20 as the destination:

```
Switch# configure terminal
Switch(config)# monitor session 2 destination remote vlan 20
Switch(config)# end
```

This example shows how to use queue names and queue number ranges for the CPU as a SPAN source on Supervisor Engine 6-E:

```
Switch# configure terminal
Switch(config)# monitor session 2 source cpu queue control-packet rx
Switch(config)# monitor session 3 source cpu queue 10 rx
Switch(config)# end
```

**Note**
For Supervisor Engine 6-E, control-packet is mapped to queue 10.

mtu

To enable jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU), use the `mtu` command. To return to the default setting, use the `no` form of this command.

```
mtu  bytes

no mtu
```

**Syntax Description**
- `bytes` Byte size; valid values are from 1500 to 9198.

**Defaults**
The default settings are as follows:
- Jumbo frames are disabled
- 1500 bytes for all ports

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Jumbo frames are supported on nonblocking Gigabit Ethernet ports, switch virtual interfaces (SVI), and EtherChannels. Jumbo frames are not available for stub-based ports.

The baby giants feature uses the global `system mtu size` command to set the global baby giant MTU. It allows all stub-based port interfaces to support an Ethernet payload size of up to 1552 bytes.

Both the `system mtu` command and the per-interface `mtu` command work on interfaces that can support jumbo frames, but the per-interface `mtu` command takes precedence.

**Examples**
This example shows how to specify an MTU of 1800 bytes:

```
Switch(config)# interface GigabitEthernet 1/1
Switch(config-if)# mtu 1800
```

**Related Commands**

netflow-lite exporter

To define an exporter and to enter NetFlow-lite exporter submode, use the `netflow-lite exporter` command. To delete an exporter, use the `no` form of this command.

```
netflow-lite exporter exporter

no netflow-lite exporter exporter
```

**Syntax Description**

- `exporter` Specifies an exporter.

**Defaults**

None

**Command Modes**

- global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The exporter's name identifies the exporter. Mandatory parameters for a minimal complete exporter configuration are the destination IP address of the collector, source IP address (on the switch) to use and UDP destination port of the collector. Any unspecified non-mandatory parameters take on default values. The exporter name can be specified when activating sampling at a data source via the `monitor` command.

The exporter submode also allows you to specify the refresh frequency for the NetFlow templates. Metadata about the NetFlow packet sampling process like sampler configuration parameters and snmp interface table mapping can also be exported periodically to the collector.

Deleting or removing the value of a non-mandatory parameter restores the default.

**Examples**

This example shows how to configure an NetFlow exporter:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:

  Network Protocol Configuration:
    Destination IP address:   5.5.5.6
    Source IP Address:        5.5.5.5
    VRF label:                
    DSCP:                     0x20

netflow-lite monitor

To define a monitor instance on an interface and to enter netflow-lite monitor submode, use the netflow-lite monitor command. To delete the monitor, use the no form of this command.

```
netflow-lite monitor sampler-name
no netflow-lite sampler sampler-name
```

Syntax Description

| sampler-name | Specifies a sample. |

Defaults

None

Command Modes

global configuration mode

Command History

Release     Modification
15.0(2)SG   Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

Only a single packet sampling instance is supported on a data source. These commands are entered under the physical port interface mode, port channel interface, or config VLAN mode. Monitor is not supported on other interfaces. If the physical port is a member of a port channel, applying the monitor to the port has no effect. You must apply the monitor to the port channel instead.

Note

VLAN sampling is not supported in Cisco IOS Release 15.0(2)SG. It will be supported in a later release.

Mandatory parameters are sampler and exporter. If no exporter is associated with a monitor, no samples are exported. If so, no input packet sampling occurs for that target interface. A warning message displays indicating that the sampler or exporter is invalid if any mandatory parameters are missing.

The packet sampling mechanism tries to achieve random 1-in-N sampling. Internally 2 levels of sampling are done. The accuracy of the first level of sampling depends on the size of the packets arriving at a given interface. To tune the relative accuracy of the algorithm the average-packet-size parameter can be used.

The system automatically determines the average packet size at an interface based on observation of input traffic and uses that value in its first level of sampling.

Valid range of packet sizes that can be used by the algorithm is 64 - 9216 bytes. Any number below 64 bytes is taken to mean that automatic determination of average packet size is desired.
The following example shows how to configure a monitor on a port interface Gigabit 1/3:

Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)# exit
Switch#

Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
  Netflow-lite Monitor-1:
  Active:               TRUE
  Sampler:              sampler1
  Exporter:             exporter1
  Average Packet Size:  0
  Statistics:
    Packets exported:   0
    Packets observed:   0
    Packets dropped:    0
    Average Packet Size observed: 64
    Average Packet Size used: 64

Similarly, you can configure a monitor on a VLAN in VLAN config mode:

Switch# config terminal
Switch(config)# vlan config 2
Switch(config-vlan-config)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# exit
Switch(config-vlan-config)# exit
Switch#

Switch# show netflow-lite monitor 1 vlan 2
VlanID-2:
  Netflow-lite Monitor-1:
  Active:               TRUE
  Sampler:              sampler1
  Exporter:             exporter1
  Average Packet Size:  0
  Statistics:
    Packets exported:   0
    Packets observed:   0
    Packets dropped:    0
    Average Packet Size observed: 64
    Average Packet Size used: 64

You can verify your settings with the show netflow-lite sampler privileged EXEC command.

netflow-lite sampler

To configure packet sampling parameters as a reusable named entity and to enter netflow-lite sampler submode, use the netflow-lite sampler command. To delete the sampler, use the no form of this command.

```
netflow-lite sampler name

no netflow-lite sampler name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>name Specifies a sampler.</th>
</tr>
</thead>
</table>

**Defaults**

None

**Command Modes**

global configuration mode

**Command History**

<table>
<thead>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The sampler CLI construct allows the user to configure the rate at which input packets are to be sampled. Packet sampling rate can range from 32 to 2^15 in powers of 2. A sampling rate of 1 is allowed for troubleshooting for up to two 1 Gigabit ports only and is essentially equivalent to rx span. It cannot be configured on 10GE ports because the bandwidth demand on the fpga for export is too high.

Mandatory parameters are packet rate.

You can update a sampler in use at a target interface, but you cannot remove or unconfigure mandatory parameters.

All mandatory parameters must be present to validate a sampler. Any unspecified non-mandatory parameters take on default values.

**Examples**

This example shows how to configure packet sampling parameters as a reusable named entity and to display the sampler:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch#
```
Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
  Id :                   1
  Packet Sampling rate:  1 out of 32
  Packet Section Size:   64     bytes
  Packet offset:         16     bytes

You can verify your settings with the show netflow-lite exporter privileged EXEC command.

</tr>
<tr>
<td><code>interval-seconds</code></td>
<td>Duration in seconds before a switch sends the location or attachment updates to the MSE. The range is 1 to 30; the default is 30.</td>
</tr>
</tbody>
</table>

**Defaults**

NMSP is disabled, NMSP notification interval attachment and NMSP notification interval location defaults are 30 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `nmsp` global configuration command to enable the switch to send encrypted NMSP location and attachment notifications to a Cisco Mobility Services Engine (MSE).

**Examples**

This example shows how to enable NMSP on a switch and set the location notification time to 10 seconds:

```
Switch(config)# nmsp enable
Switch(config)# nmsp notification interval location 10
```

<td>Suppress reporting attachment information from a specified interface.</td>
</tr>
<tr>
<td><code>show nmsp</code></td>
<td>Displays the NMSP information.</td>
</tr>
</tbody>
</table>
nmsp attachment suppress

To suppress reporting attachment information from a specified interface, use the `nmsp attachment suppress interface` command. This command is available only when your switch is running the cryptographic (encrypted) software image. Use the `no` form of this command to report attachment information.

```
nmsp attachment suppress
no nmsp attachment suppress
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Attachment information is reported.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the `nmsp attachment suppress` interface configuration command to configure an interface to not send attachment notifications to a Cisco Mobility Services Engine (MSE).

**Examples**
This example shows how to configure an interface to not send attachment information to the MSE:

```
Switch(config)# switch interface gigabitethernet1/2
Switch(config-if)# nmsp attachment suppress
Switch(config-if)#
```

**Related Commands**

options timeout (netflow-lite exporter submode)

To specify an options timeout for the NetFlow-lite collector, use the `options timeout` command. To delete the value, use the `no` form of this command.

```
options {sampler-table | interface-table} timeout seconds
no options {sampler-table | interface-table} timeout second
```

**Syntax Description**

- `sampler-table` Specifies timeout value for export of sampler configuration.
- `interface-table` Specifies timeout value for export of snmp ifIndex mapping.
- `seconds` Specifies a n options timeout for the NetFlow-lite collector.

**Defaults**

1800 seconds

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Default timeout value is 1800 seconds or 30 minutes. The timeout value configured really depends on the collector and how often it needs the templates to be refreshed.

**Examples**

This example shows how to specify an options timeout for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter:

```
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
  Network Protocol Configuration:
    Destination IP address: 5.5.5.6
    Source IP Address: 5.5.5.5
    VRF label:
    DSCP: 0x20
    TTL: 128
    COS: 7
  Transport Protocol Configuration:
    Transport Protocol: UDP
    Destination Port: 8188
    Source Port: 61670
  Export Protocol Configuration:
    Export Protocol: netflow-v9
    Template data timeout: 60
    Options sampler-table timeout: 1800
    Options interface-table timeout: 1800
  Exporter Statistics:
    Packets Exported: 0
```

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

**packet-offset (netflow-lite sampler submode)**

To specify a starting packet offset in netflow-lite submode, use the `packet-offset` command. To reset to the default, use the `no` form of this command.

```
packet-offset offset
no packet-offset offset
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>offset</code></td>
<td>Specifies the starting packet offset in bytes (maximum of 48).</td>
</tr>
</tbody>
</table>

**Defaults**

starts at byte 0 of L2 header

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Default packet section offset value is 0. The packet section extracted from the sampled packet start at offset 0 of the packet.

**Examples**

This example shows how to specify a starting packet offset:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
  Id : 1
  Packet Sampling rate: 1 out of 32
  Packet Section Size: 64 bytes
  Packet offset: 16 bytes
```

You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.

**Related Commands**

<table>
<thead>

<td>Specifies a packet sampling rate in netflow-lite sampler submode</td>
</tr>
</tbody>
</table>
packet-rate (netflow-lite sampler submode)

To specify a packet sampling rate in netflow-lite sampler submode, use the `packet rate` command. To delete a packet sampling rate, use the `no` form of this command.

```
packet rate n

no packet rate n
```

**Syntax Description**

- `n` Specifies the packet sampling rate.

**Defaults**

None

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Packet sampling rate can range from 32 to $2^{15}$ in powers of 2. A rate of 1 is allowed for trouble shooting (equivalent to rx span) only for two 1Gigabit Ethernet ports. You cannot configure a rate of 1 on 10 Gigabit Ethernet ports because the bandwidth demand for export is too high.

This is a mandatory parameter. Up to 2 x 1 Gigabit Ethernet ports can be configured with 1-in-1 sampling. The best packet sampling rate that can be configured on any 1 Gigabit or 10 Gigabit Ethernet port is 1-in-32. Packet sampling rates can be configured in powers of 2 (1-in-64, 1-in-128, etc).

**Examples**

This example shows how to specify a packet sampling rate in netflow-lite sampler submode:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch#

Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
  Id :                   1
  Packet Sampling rate: 1 out of 32
  Packet Section Size:  64    bytes
  Packet offset:         16    bytes

You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.
```
<table>
<thead>
<tr>
<th><strong>Command</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>packet-section size (netflow-lite sampler submode)</td>
<td>Specifies a sampled header size in netflow-lite submode.</td>
</tr>
<tr>
<td>packet-offset (netflow-lite sampler submode)</td>
<td>Specifies a starting packet offset in netflow-lite submode.</td>
</tr>
</tbody>
</table>
packet-section size (netflow-lite sampler submode)

To specify a sampled header size in netflow-lite submode, use the `packet-section size` command. To store the default, use the `no` form of this command.

```
packet-section size bytes

no packet-section size bytes
```

**Syntax Description**

`bytes` Specifies the sampled header size. Size ranges from 16 to 252 bytes in increments of 4 bytes.

**Defaults**

64 bytes

**Command Modes**

netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Default packet section size is 64 bytes which normally would cover Layer 2, Layer 3, and Layer 4 headers for an input IPv4 packet.

**Examples**

This example shows how to specify a sampled header size:

```
Switch# config terminal
Switch(config)# netflow-lite sampler sampler1
Switch(config-netflow-lite-sampler)# packet-rate 32
Switch(config-netflow-lite-sampler)# packet-section size 128
Switch(config-netflow-lite-sampler)# packet-offset 16
Switch(config-netflow-lite-sampler)# exit
Switch(config)# exit
Switch#
```

```
Switch# show netflow-lite sampler sampler1
Netflow-lite Sampler sampler1:
   Id :                   1
   Packet Sampling rate: 1 out of 32
   Packet Section Size: 64  bytes
   Packet offset:         16  bytes
```

You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.
<table>

</tr>
</tbody>
</table>
pagp learn-method

To learn the input interface of the incoming packets, use the `pagp learn-method` command. To return to the default value, use the `no` form of this command.

```
pagp learn-method {aggregation-port | physical-port}
```

```
no pagp learn-method
```

**Syntax Description**
- **aggregation-port** Specifies learning the address on the port channel.
- **physical-port** Specifies learning the address on the physical port within the bundle.

**Defaults**
Aggregation port is enabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to enable physical port address learning within the bundle:
```
Switch(config-if)# pagp learn-method physical-port
Switch(config-if)#
```

This example shows how to enable aggregation port address learning within the bundle:
```
Switch(config-if)# pagp learn-method aggregation-port
Switch(config-if)#
```

<tr>
<td>interface-number</td>
<td>Specifies the interface number.</td>
</tr>
<tr>
<td>range</td>
<td>Specifies the range of subinterfaces being configured; see the “Usage Guidelines” section.</td>
</tr>
</tbody>
</table>

**Defaults**

Routing updates are sent on the interface.

**Command Modes**

Router configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `passive-interface range` command on the following interfaces: FastEthernet, GigabitEthernet, VLAN, Loopback, Port-channel, 10-GigabitEthernet, and Tunnel. When you use the `passive-interface range` command on a VLAN interface, the interface should be the existing VLAN SVIs. To display the VLAN SVIs, enter the `show running config` command. The VLANs that are not displayed cannot be used in the `passive-interface range` command.

The values that are entered with the `passive-interface range` command are applied to all the existing VLAN SVIs.

Before you can use a macro, you must define a range using the `define interface-range` command.

All configuration changes that are made to a port range through the `passive-interface range` command are retained in the running-configuration as individual passive-interface commands.

You can enter the `range` in two ways:

- Specifying up to five interface ranges
- Specifying a previously defined macro

You can either specify the interfaces or the name of an interface-range macro. An interface range must consist of the same interface type, and the interfaces within a range cannot span across the modules.
You can define up to five interface ranges on a single command; separate each range with a comma:

```
interface range gigabitethernet 5/1-20, gigabitethernet4/5-20.
```

Use this format when entering the `port-range`:

- `interface-type {mod}/[{first-port} - {last-port}]`

You cannot specify both a macro and an interface range in the same command. After creating a macro, you can enter additional ranges. If you have already entered an interface range, the CLI does not allow you to enter a macro.

You can specify a single interface in the `range range` value. This makes the command similar to the `passive-interface interface-number` command.

**Note**

The `range` keyword is only supported in OSPF, EIGRP, RIP, and ISIS router mode.

If you disable the sending of routing updates on an interface, the particular subnet will continue to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.

The `default` keyword sets all interfaces as passive by default. You can then configure individual interfaces where adjacencies are desired using the `no passive-interface` command. The `default` keyword is useful in Internet service provider (ISP) and large enterprise networks where many of the distribution routers have more than 200 interfaces.

For the Open Shortest Path First (OSPF) protocol, OSPF routing information is neither sent nor received through the specified router interface. The specified interface address appears as a stub network in the OSPF domain.

For the Intermediate System-to-Intermediate System (IS-IS) protocol, this command instructs IS-IS to advertise the IP addresses for the specified interface without actually running IS-IS on that interface. The `no` form of this command for IS-IS disables advertising IP addresses for the specified address.

**Note**

For IS-IS you must keep at least one active interface and configure the interface with the `ip router isis` command.

Enhanced Interior Gateway Routing Protocol (EIGRP) is disabled on an interface that is configured as passive although it advertises the route.

**Examples**

The following example sends EIGRP updates to all interfaces on network 10.108.0.0 except GigabitEthernet interface 1/1:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# router eigrp 109
Switch(config-router)# network 10.108.0.0
Switch(config-router)# passive-interface gigabitethernet 1/1
Switch(config-router)#
```
The following configuration enables IS-IS on Ethernet interface 1 and serial interface 0 and advertises the IP addresses of Ethernet interface 0 in its link-state protocol data units (PDUs):

```
Switch(config-if)# router isis Finance
Switch(config-router)# passive-interface Ethernet 0
Switch(config-router)# interface Ethernet 1
Switch(config-router)# ip router isis Finance
Switch(config-router)# interface serial 0
Switch(config-router)# ip router isis Finance
Switch(config-router)#
```

The following example sets all interfaces as passive, then activates Ethernet interface 0:

```
Switch(config-if)# router ospf 100
Switch(config-router)# passive-interface default
Switch(config-router)# no passive-interface ethernet0
Switch(config-router)# network 10.108.0.1 0.0.0.255 area 0
Switch(config-router)#
```

The following configuration sets the Ethernet ports 3 through 4 on module 0 and GigabitEthernet ports 4 through 7 on module 1 as passive:

```
Switch(config-if)# router ospf 100
Switch(config-router)# passive-interface range ethernet0/3-4,gigabitethernet1/4-7
Switch(config-router)#
```
### permit

To permit an ARP packet based on matches against the DHCP bindings, use the `permit` command. To remove a specified ACE from an access list, use the `no` form of this command.

```
```

```
```

#### Syntax Description

- **request**  
  (Optional) Requests a match for the ARP request. When `request` is not specified, matching is performed against all ARP packets.

- **ip**  
  Specifies the sender IP address.

- **any**  
  Specifies that any IP or MAC address will be accepted.

- **host sender-ip**  
  Specifies that only a specific sender IP address will be accepted.

- **sender-ip**  
  Specifies that a specific range of sender IP addresses will be accepted.

- **sender-ip-mask**  
  Specifies that a specific range of sender IP addresses will be accepted.

- **mac**  
  Specifies the sender MAC address.

- **host sender-mac**  
  Specifies that only a specific sender MAC address will be accepted.

- **sender-mac**  
  Specifies that a specific range of sender MAC addresses will be accepted.

- **sender-mac-mask**  
  Specifies that a specific range of sender MAC addresses will be accepted.

- **response**  
  Specifies a match for the ARP responses.

- **ip**  
  Specifies the IP address values for the ARP responses.

- **host target-ip**  
  (Optional) Specifies that only a specific target IP address will be accepted.

- **target-ip target-ip-mask**  
  (Optional) Specifies that a specific range of target IP addresses will be accepted.

- **mac**  
  Specifies the MAC address values for the ARP responses.

- **host target-mac**  
  (Optional) Specifies that only a specific target MAC address will be accepted.

- **target-mac**  
  (Optional) Specifies that a specific range of target MAC addresses will be accepted.

- **target-mac-mask**  
  (Optional) Specifies that a specific range of target MAC addresses will be accepted.

- **log**  
  (Optional) Logs a packet when it matches the access control entry (ACE).

#### Defaults

This command has no default settings.

#### Command Modes

- `arp-nacl configuration mode`
**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Permit clauses can be added to forward or drop ARP packets based on some matching criteria.

**Examples**

This example shows a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This example shows how to permit both requests and responses from this host:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
Switch# show arp access-list
  ARP access list static-hosts
  permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch#
```

</tbody>
</table>
To configure the Traffic Policing feature, use the `police` QoS policy-map class configuration command. To remove the Traffic Policing feature from the configuration, use the `no` form of this command.

```
police { bps | kbps | mbps | gbps } [burst-normal] [burst-max] conform-action action exceed-action action [violate-action action]
```

```
no police { bps | kbps | mbps | gbps } [burst-normal] [burst-max] conform-action action exceed-action action [violate-action action]
```

### Syntax Description

- **bps**: Average rate, in bits per second. Valid values are 32,000 to 32,000,000,000.
- **kbps**: Average rate, in kilobytes per second. Valid values are 32 to 32,000,000.
- **mbps**: Average rate, in megabits per second. Valid values are 1 to 32,000.
- **gbps**: Average rate, in gigabits per second. Valid values are 1 to 32.
- **burst-normal**: (Optional) Normal burst size, in bytes. Valid values are 64 to 2,596,929,536. Burst value of up to four times the configured rate can be supported.
- **burst-max**: (Optional) Excess burst size, in bytes. Valid values are 64 to 2,596,929,536. Burst value of up to four times the configured rate can be supported.
- **conform-action**: Action to take on packets that conform to the rate limit.
- **exceed-action**: Action to take on packets that exceed the rate limit.
- **violate-action**: (Optional) Action to take on packets that violate the normal and maximum burst sizes.
- **action**: Action to take on packets. Specify one of the following keywords:
  - `drop`: Drops the packet.
  - `set-cos-transmit new-ios`: Sets the class of services (CoS) value to a new value and send the packet. The range is 0 to 7.
  - `set-dscp-transmit value`: Sets the IP differentiated services code point (DSCP) value and transmits the packet with the new IP DSCP value setting.
  - `set-prec-transmit value`: Sets the IP precedence and transmits the packet with the new IP precedence value setting.
  - `transmit`: Transmits the packet. The packet is not altered.

### Defaults

This command is disabled by default.

### Command Modes

- Policy-map class configuration mode (when specifying a single action to be applied to a marked packet)
- Policy-map class police configuration mode (when specifying multiple actions to be applied to a marked packet)
Use the `police` command to mark a packet with different quality of service (QoS) values based on conformance to the service-level agreement.

Traffic policing will not be executed for traffic that passes through an interface.

**Specifying Multiple Actions**

The `police` command allows you to specify multiple policing actions. When specifying multiple policing actions when configuring the `police` command, note the following points:

- You can specify a maximum of four actions at one time.
- You cannot specify contradictory actions such as `conform-action transmit` and `conform-action drop`.

**Using the Police Command with the Traffic Policing Feature**

The `police` command can be used with Traffic Policing feature. The Traffic Policing feature works with a token bucket algorithm. Two types of token bucket algorithms are a single-token bucket algorithm and a two-token bucket algorithm. A single-token bucket system is used when the `violate-action` option is not specified, and a two-token bucket system is used when the `violate-action` option is specified.

**Token Bucket Algorithm with One Token Bucket**

The one token bucket algorithm is used when the `violate-action` option is not specified in the `police` command of the command-line interface (CLI).

The conform bucket is initially set to the full size (the full size is the number of bytes specified as the normal burst size).

When a packet of a given size (for example, “B” bytes) arrives at specific time (time “T”) the following actions occur:

- Tokens are updated in the conform bucket. If the previous arrival of the packet was at T1 and the current time is T, the bucket is updated with (T - T1) worth of bits based on the token arrival rate. The token arrival rate is calculated as follows:
  
  \[(\text{time between packets} < \text{which is equal to T - T1}> * \text{policer rate})/8 \text{ bytes}\]

- If the number of bytes in the conform bucket B is greater than or equal to 0, the packet conforms and the conform action is taken on the packet. If the packet conforms, B bytes are removed from the conform bucket and the conform action is completed for the packet.

- If the number of bytes in the conform bucket B (minus the packet size to be limited) is fewer than 0, the exceed action is taken.
Token Bucket Algorithm with Two Token Buckets (Refer to RFC 2697)

The two-token bucket algorithm is used when the violate-action is specified in the `police` command CLI. The conform bucket is initially full (the full size is the number of bytes specified as the normal burst size).

The exceed bucket is initially full (the full exceed bucket size is the number of bytes specified in the maximum burst size).

The tokens for both the conform and exceed token buckets are updated based on the token arrival rate, or committed information rate (CIR).

When a packet of given size (for example, “B” bytes) arrives at specific time (time “T”) the following actions occur:

- Tokens are updated in the conform bucket. If the previous arrival of the packet was at T1 and the current arrival of the packet is at t, the bucket is updated with T - T1 worth of bits based on the token arrival rate. The refill tokens are placed in the conform bucket. If the tokens overflow the conform bucket, the overflow tokens are placed in the exceed bucket.

  The token arrival rate is calculated as follows:

  (time between packets <which is equal to T-T1> * policer rate)/8 bytes

- If the number of bytes in the conform bucket - B is greater than or equal to 0, the packet conforms and the conform action is taken on the packet. If the packet conforms, B bytes are removed from the conform bucket and the conform action is taken. The exceed bucket is unaffected in this scenario.

- If the number of bytes in the conform bucket B is less than 0, the excess token bucket is checked for bytes by the packet. If the number of bytes in the exceed bucket B is greater than or equal to 0, the exceed action is taken and B bytes are removed from the exceed token bucket. No bytes are removed from the conform bucket.

- If the number bytes in the exceed bucket B is fewer than 0, the packet violates the rate and the violate action is taken. The action is complete for the packet.

Examples

Token Bucket Algorithm with One Token Bucket

This example shows how to define a traffic class (using the `class-map` command) and associate the match criteria from the traffic class with the Traffic Policing configuration, which is configured in the service policy (using the `policy-map` command). The `service-policy` command is then used to attach this service policy to the interface.

In this particular example, Traffic Policing is configured with the average rate at 8000 bits per second and the normal burst size at 1000 bytes for all packets leaving Gigabit Ethernet interface 6/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map access-match
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map police-setting
Switch(config-pmap)# class access-match
Switch(config-pmap-c)# police 8000 1000 conform-action transmit exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output police-setting
Switch(config-if)# end
```
In this example, the initial token buckets start full at 1000 bytes. If a 450-byte packet arrives, the packet conforms because enough bytes are available in the conform token bucket. The conform action (send) is taken by the packet and 450 bytes are removed from the conform token bucket (leaving 550 bytes).

If the next packet arrives 0.25 seconds later, 250 bytes are added to the token bucket ((0.25 * 8000)/8), leaving 800 bytes in the token bucket. If the next packet is 900 bytes, the packet exceeds and the exceed action (drop) is taken. No bytes are taken from the token bucket.

**Token Bucket Algorithm with Two Token Buckets Example (Refer to RFC 2697)**

In this particular example, Traffic Policing is configured with the average rate at 8000 bits per second, the normal burst size at 1000 bytes, and the excess burst size at 1000 bytes for all packets leaving Gigabit Ethernet interface 6/1.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map access-match
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map police-setting
Switch(config-pmap)# class access-match
Switch(config-pmap-c)# police 8000 1000 1000 conform-action transmit exceed-action
Switch(config-pmap-c)# set-qos-transmit 1 violate-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output police-setting
Switch(config-if)# end
```

In this example, the initial token buckets start full at 1000 bytes. If a 450-byte packet arrives, the packet conforms because enough bytes are available in the conform token bucket. The conform action (send) is taken by the packet and 450 bytes are removed from the conform token bucket (leaving 550 bytes).

If the next packet arrives 0.25 seconds later, 250 bytes are added to the conform token bucket ((0.25 * 8000)/8), leaving 800 bytes in the conform token bucket. If the next packet is 900 bytes, the packet does not conform because only 800 bytes are available in the conform token bucket.

The exceed token bucket, which starts full at 1000 bytes (as specified by the excess burst size) is then checked for available bytes. Because enough bytes are available in the exceed token bucket, the exceed action (set the QoS transmit value of 1) is taken and 900 bytes are taken from the exceed bucket (leaving 100 bytes in the exceed token bucket).

If the next packet arrives 0.40 seconds later, 400 bytes are added to the token buckets ((.40 * 8000)/8). Therefore, the conform token bucket now has 1000 bytes (the maximum number of tokens available in the conform bucket) and 200 bytes overflow the conform token bucket (because it only 200 bytes were needed to fill the conform token bucket to capacity). These overflow bytes are placed in the exceed token bucket, giving the exceed token bucket 300 bytes.

If the arriving packet is 1000 bytes, the packet conforms because enough bytes are available in the conform token bucket. The conform action (transmit) is taken by the packet and 1000 bytes are removed from the conform token bucket (leaving 0 bytes).

If the next packet arrives 0.20 seconds later, 200 bytes are added to the token bucket ((.20 * 8000)/8). Therefore, the conform bucket now has 200 bytes. If the arriving packet is 400 bytes, the packet does not conform because only 200 bytes are available in the conform bucket. Similarly, the packet does not exceed because only 300 bytes are available in the exceed bucket. Therefore, the packet violates and the violate action (drop) is taken.

Usage Guidelines

This command calculates the CIR and PIR on the basis of a percentage of the maximum amount of bandwidth available on the interface. When a policy map is attached to the interface, the equivalent CIR and PIR values in bits per second (bps) are calculated on the basis of the interface bandwidth and the percent value entered with this command. The show policy-map interface command can then be used to verify the bps rate calculated.

The calculated CIR and PIR bps rates must be in the range of 32,000 and 32,000,000,000 bps. If the rates are outside this range, the associated policy map cannot be attached to the interface. If the interface bandwidth changes (for example, more is added), the bps values of the CIR and the PIR are recalculated on the basis of the revised amount of bandwidth. If the CIR and PIR percentages are changed after the policy map is attached to the interface, the bps values of the CIR and PIR are recalculated.

This command also allows you to specify the values for the conform burst size and the peak burst size in milliseconds. If you want bandwidth to be calculated as a percentage, the conform burst size and the peak burst size must be specified in milliseconds (ms).

Examples

This example shows how to configure traffic policing using a CIR and a PIR based on a percentage of bandwidth on Gigabit interface 6/2. In this example, a CIR of 20 percent and a PIR of 40 percent have been specified. Additionally, an optional bc value and be value (300 ms and 400 ms, respectively) have been specified.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class-map class1
Switch(config-pmap-c)# police cir percent 20 bc 3 ms pir percent 40 be 4 ms
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# interface gigabitethernet 6/2
Switch(config-if)# service-policy output policy
Switch(config-if)# end
```
police rate

To configure single or dual rate policer, use the `police rate` command in policy-map configuration mode. To remove traffic policing from the configuration, use the `no` form of this command.

**Syntax for Bytes Per Second**

```
police rate [burst burst-in-bytes bytes] [peak-rate peak-rate-in-bps bps] [pack-burst peak-burst-in-bytes bytes]
no police rate [burst burst-in-bytes bytes] [peak-rate peak-rate-in-bps bps] [pack-burst peak-burst-in-bytes bytes]
```

**Syntax for Percent**

```
police rate percent [burst ms ms] [peak-rate percent percentage] [pack-burst ms ms]
no police rate percent [burst ms ms] [peak-rate percent percentage] [pack-burst ms ms]
```

**Syntax Description**

- **units** Specifies the traffic police rate in bits per second. Valid range is 32,000 to 32,000,000,000.
- **bps** (Optional) Bits per second (bps) will be used to determine the rate at which traffic is policed.
- **burst burst-in-bytes bytes** (Optional) Specifies the burst rate, in bytes, will be used for policing traffic. Valid range is from 64 to 2,596,929,536.
- **peak-rate peak-rate-in-bps bps** (Optional) Specifies the peak burst value, in bytes, for the peak rate. Valid range is from 32,000 to 32,000,000,000.
- **peak-burst peak-burst-in-bytes bytes** (Optional) Specifies the peak burst value, in bytes, will be used for policing traffic. If the police rate is specified in bps, the valid range of values is 64 to 2,596,929,536.
- **percent** (Optional) A percentage of interface bandwidth will be used to determine the rate at which traffic is policed.
- **percentage** (Optional) Bandwidth percentage. Valid range is a number from 1 to 100.
- **burst ms ms** (Optional) Burst rate, in milliseconds, will be used for policing traffic. Valid range is a number from 1 to 2,000.
- **peak-rate percent percentage** (Optional) A percentage of interface bandwidth will be used to determine the PIR. Valid range is a number from 1 to 100.
- **peak-burst ms ms** (Optional) Peak burst rate, in milliseconds, will be used for policing traffic. Valid range is a number from 1 to 2,000.

**Command Default**

This command is disabled by default.
Command Modes
Policy-map configuration mode

Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Use the **police rate** command to limit traffic on the basis of pps, bps, or a percentage of interface bandwidth.

If the **police rate** command is issued, but the a rate is not specified, traffic that is destined will be policed on the basis of bps.

Examples
This example shows how to configure policing on a class to limit traffic to an average rate of 1,500,000 bps:

```
Switch(config)# class-map cl
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class cl
Switch(config-pmap-c)# police rate 1500000 burst 500000
Switch(config-pmap-c)# exit
```

Related Commands

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

Refer to RFC 2698-Two Rate Three Color Marker.

Two-rate traffic policing uses two token buckets—Tc and Tp—for policing traffic at two independent rates. Note the following points about the two token buckets:

- The Tc token bucket is updated at the CIR value each time a packet arrives at the two-rate policer. The Tc token bucket can contain up to the confirm burst (Bc) value.
- The Tp token bucket is updated at the PIR value each time a packet arrives at the two-rate policer. The Tp token bucket can contain up to the peak burst (Be) value.

### Updating Token Buckets

The following scenario illustrates how the token buckets are updated:

A packet of B bytes arrives at time t. The last packet arrived at time t1. The CIR and the PIR token buckets at time t are represented by Tc(t) and Tp(t), respectively. Using these values and in this scenario, the token buckets are updated as follows:

\[
Tc(t) = \min(CIR \times (t-t1) + Tc(t1), Bc)
\]

\[
Tp(t) = \min(PIR \times (t-t1) + Tp(t1), Be)
\]

### Marking Traffic

The two-rate policer marks packets as either conforming, exceeding, or violating a specified rate. The following points (using a packet of B bytes) illustrate how a packet is marked:

- If B > Tp(t), the packet is marked as violating the specified rate.
- If B > Tc(t), the packet is marked as exceeding the specified rate, and the Tp(t) token bucket is updated as Tp(t) = Tp(t) – B.

Otherwise, the packet is marked as conforming to the specified rate, and both token buckets—Tc(t) and Tp(t)—are updated as follows:

\[
Tp(t) = Tp(t) – B
\]

\[
Tc(t) = Tc(t) – B
\]

For example, if the CIR is 100 kbps, the PIR is 200 kbps, and a data stream with a rate of 250 kbps arrives at the two-rate policer, the packet would be marked as follows:

- 100 kbps would be marked as conforming to the rate.
- 100 kbps would be marked as exceeding the rate.
- 50 kbps would be marked as violating the rate.

### Marking Packets and Assigning Actions Flowchart

The flowchart in Figure 2-1 illustrates how the two-rate policer marks packets and assigns a corresponding action (that is, violate, exceed, or conform) to the packet.
This example shows how to configure two-rate traffic policing on a class to limit traffic to an average committed rate of 500 kbps and a peak rate of 1 Mbps:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map police
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# policy-map policy1
Switch(config-pmap)# class police
Switch(config-pmap-c)# police cir 500000 bc 10000 pir 1000000 be 10000 conform-action transmit exceed-action set-prec-transmit 2 violate-action drop
Switch(config-pmap-c)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch# show policy-map policy1
```

Traffic marked as conforming to the average committed rate (500 kbps) will be sent as is. Traffic marked as exceeding 500 kbps, but not exceeding 1 Mbps, will be marked with IP Precedence 2 and then sent. All traffic marked as exceeding 1 Mbps will be dropped. The burst parameters are set to 10000 bytes.
In the following example, 1.25 Mbps of traffic is sent (“offered”) to a policer class:

Switch# `show policy-map interface gigabitethernet 6/1`

GigabitEthernet6/1

Service-policy output: policy1

Class-map: police (match all)
148803 packets, 36605538 bytes
30 second offered rate 1249000 bps, drop rate 249000 bps
Match: access-group 101
police:
cir 500000 bps, conform-burst 100000, pir 1000000, peak-burst 1000000
conformed 59538 packets, 14646348 bytes; action: transmit
exceeded 59538 packets, 14646348 bytes; action: set-prec-transmit 2
violated 29731 packets, 7313826 bytes; action: drop
conformed 499000 bps, exceed 500000 bps violate 249000 bps

Class-map: class-default (match-any)
19 packets, 1990 bytes
30 seconds offered rate 0 bps, drop rate 0 bps
Match: any
Switch#

The two-rate policer marks 500 kbps of traffic as conforming, 500 kbps of traffic as exceeding, and 250 kbps of traffic as violating the specified rate. Packets marked as conforming to the rate will be sent as is, and packets marked as exceeding the rate will be marked with IP Precedence 2 and then sent. Packets marked as violating the rate are dropped.
policy-map

To create or modify a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode, use the `policy-map` global configuration command. To delete an existing policy map and to return to global configuration mode, use the `no` form of this command.

```
policy-map policy-map-name
no policy-map policy-map-name
```

Syntax Description

- **policy-map-name**: Name of the policy map.

Defaults

No policy maps are defined.

Command Modes

- Global configuration mode

Command History

- **Release**: 12.1(8a)EW
  - **Modification**: Support for this command was introduced on the Catalyst 4500 series switch.
- **Release**: 12.2(40)SG
  - **Modification**: Added support for the Supervisor Engine 6-E and Catalyst 4900M chassis.

Usage Guidelines

Before configuring policies for classes whose match criteria are defined in a class map, use the `policy-map` command to specify the name of the policy map to be created or modified. After you enter the `policy-map` command, the switch enters policy-map configuration mode. You can configure or modify the class policies for that policy map and decide how to treat the classified traffic.

These configuration commands are available in policy-map configuration mode:

- **class**: Defines the classification match criteria for the specified class map. For more information, see the “class” section on page 2-67.
- **description**: Describes the policy map (up to 200 characters).
- **exit**: Exits policy-map configuration mode and returns you to global configuration mode.
- **no**: Removes a previously defined policy map.

To return to global configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.

You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the `class-map` global configuration and `match` class-map configuration commands.
Examples

This example shows how to create a policy map called policy1. When attached to the ingress direction, it matches all the inbound traffic defined in class1, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mbps and bursts at 20 KB. Traffic exceeding the profile is marked down to a DSCP value obtained from the policed-DSCP map and then sent. This policer action is applicable on all Catalyst 4500 supervisor engines except the Supervisor Engine 6-E and Catalyst 4900M chassis.

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set ip dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch#
```

This example shows how to configure multiple classes in a policy map called policymap2 on a Supervisor Engine 6-E:

```
Switch# configure terminal
Switch(config)# policy-map policymap2
Switch(config-pmap)# class class1
Switch(config-pmap-c)# police 100000 20000 exceed-action
Switch(config-pmap-c)# set-dscp-transmit cs3
Switch(config-pmap-c)# set-cos-transmit 3
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# police cir 32000 pir 64000 conform-action transmit exceed-action
Switch(config-pmap-c)# set-dscp-transmit cs3 violate-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class3
Switch(config-pmap-c)# set dscp cs3
Switch(config-pmap-c)# exit
Switch#
```

This example shows how to delete the policy map called policymap2:

```
Switch# configure terminal
Switch(config)# no policy-map policymap2
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

</tbody>
</table>
**port-channel load-balance**

To set the load-distribution method among the ports in the bundle, use the `port-channel load-balance` command. To reset the load distribution to the default, use the `no` form of this command.

```
port-channel load-balance method
no port-channel load-balance
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>method</code></td>
<td>Specifies the load distribution method. See the “Usage Guidelines” section for more information.</td>
</tr>
</tbody>
</table>

**Defaults**

Load distribution on the source XOR destination IP address is enabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following values are valid for the load-distribution method:

- `dst-ip`—Load distribution on the destination IP address
- `dst-mac`—Load distribution on the destination MAC address
- `dst-port`—Load distribution on the destination TCP/UDP port
- `src-dst-ip`—Load distribution on the source XOR destination IP address
- `src-dst-mac`—Load distribution on the source XOR destination MAC address
- `src-dst-port`—Load distribution on the source XOR destination TCP/UDP port
- `src-ip`—Load distribution on the source IP address
- `src-mac`—Load distribution on the source MAC address
- `src-port`—Load distribution on the source port

**Examples**

This example shows how to set the load-distribution method to the destination IP address:

```
Switch(config)# port-channel load-balance dst-ip
Switch(config)#
```

This example shows how to set the load-distribution method to the source XOR destination IP address:

```
Switch(config)# port-channel load-balance src-dst-port
Switch(config)#
```
### Related Commands

port-channel standalone-disable

To disable the EtherChannel standalone option in a port channel, use the `port-channel standalone-disable` command in interface configuration mode. To enable this option, use the `no` form of this command.

```
port-channel standalone-disable

no port-channel standalone-disable
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The standalone option is disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG1</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command can only be used when the port channel protocol type is Link Aggregation Control Protocol (LACP). It allows you to change the current behavior when a physical port cannot bundle with an LACP EtherChannel.

**Examples**
The following example shows how to enable the EtherChannel standalone option in a port channel:

```
Switch(config-if)# no port-channel standalone-disable
```

**Related Commands**

port-security mac-address

To configure a secure address on an interface for a specific VLAN or VLAN range, use the **port-security mac-address** command.

```
port-security mac-address mac_address
```

**Syntax Description**

- `mac_address`: The MAC-address that needs to be secured.

**Command Modes**

- VLAN-range interface submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the **vlan** command, you can use the **port-security mac-address** command to specify different addresses on different VLANs.

**Examples**

This example shows how to configure the secure address 1.1.1 on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# end
```

**Related Commands**

<td><strong>port-security maximum</strong></td>
<td>Configures the maximum number of addresses on an interface for a specific VLAN or VLAN range.</td>
</tr>
</tbody>
</table>
**port-security mac-address sticky**

To configure a sticky address on an interface for a specific VLAN or VLAN range, use the `port-security mac-address sticky` command.

```
port-security mac-address sticky mac_address
```

**Syntax Description**

```
mac_address                  The MAC-address that needs to be secured.
```

**Command Modes**

VLAN-range interface submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Sticky feature must be enabled on an interface before you can configure the `port-security mac-address sticky` command.

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan` command, you can use the `port-security mac-address sticky` command to specify different sticky addresses on different VLANs.

The Sticky feature must be enabled on an interface before you can configure the `port-security mac-address sticky` command.

Sticky MAC addresses are addresses that persist across switch reboots and link flaps.

**Examples**

This example shows how to configure the sticky address 1.1.1 on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.1
Switch(config-if-vlan-range)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>

<tr>
<td><code>port-security maximum</code></td>
<td>Configures the maximum number of addresses on an interface for a specific VLAN or VLAN range.</td>
</tr>
</tbody>
</table>
To configure the maximum number of addresses on an interface for a specific VLAN or VLAN range, use the `port-security maximum` command.

```
port-security maximum max_value
```

**Syntax Description**
- `max_value`: The maximum number of MAC-addresses.

**Command Modes**
- VLAN-range interface submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan` command, you can use the `port-security maximum` command to specify the maximum number of secure addresses on different VLANs.

If a specific VLAN on a port is not configured with a maximum value, the maximum configured for the port is used for that VLAN. In this situation, the maximum number of addresses that can be secured on this VLAN is limited to the maximum value configured on the port.

Each VLAN can be configured with a maximum count that is greater than the value configured on the port. Also, the sum total of the maximum configured values for all the VLANs can exceed the maximum configured for the port. In either of these situations, the number of MAC addresses secured on each VLAN is limited to the lesser of the VLAN configuration maximum and the port configuration maximum.

**Examples**

This example shows how to configure a maximum number of addresses (5) on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security maximum 5
Switch(config-if-vlan-range)# exit
Switch#
```

</thead>
<tbody>
<tr>
<td>Release IOS XE 3.4.0SG and IOS 15.1(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

EEE is supported on WS-X4748-UPOE+E and WS-X4748-RJ45-E.

EEE defines support for physical layer devices (PHYs) to operate in Low Power Idle (LPI) mode. When enabled, EEE supports QUIET times during low link utilization allowing both sides of a link to disable portions of each PHY’s operating circuitry and save power. This functionality is provided per port and is not enabled by default. To avoid issues with EEE functionality on any port during run-time, Cisco provides the **power efficient-ethernet auto** command to enable or disable EEE.

Because EEE relies on Auto Negotiation pulse to determine whether to activate EEE, the port must initially enable auto negotiation. Furthermore, EEE is the correct action provided the speed is auto 100M, auto 1000M, or auto 100M and 1000M. 10M (either auto or forced mode) does not require EEE for power saving.

**Examples**

This example shows how to enable EEE:

```
Switch# config t
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# power efficient-ethernet auto
Switch(config-if)# exit
```
power inline

To set the inline-power state for the inline-power-capable interfaces, use the `power inline` command. To return to the default values, use the `no` form of this command.

```
power inline { auto [max milliwatt] | never | static [max milliwatt] | consumption milliwatt }
```

```
o power inline
```

### Syntax Description

<table>
<thead>

</tr>
<tr>
<td>12.2(44)SG</td>
<td>Maximum supported wattage increased beyond 15400 for the WS-X4648-RJ45V-E and the WS-X4648-RJ45V+E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If your interface is not capable of supporting Power over Ethernet, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```
Examples

This example shows how to set the inline-power detection and power for the inline-power-capable interfaces:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline auto
Switch(config-if)# end
Switch#

This example shows how to disable the inline-power detection and power for the inline-power-capable interfaces:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline never
Switch(config-if)# end
Switch#

This example shows how to set the permanent Power over Ethernet allocation to 8000 mW for Fast Ethernet interface 4/1 regardless what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline consumption 8000
Switch(config-if)# end
Switch#

This example shows how to pre-allocate Power over Ethernet to 16500 mW for Gigabit Ethernet interface 2/1 regardless of what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline static max 16500
Switch(config-if)# end
Switch#

power inline consumption

To set the default power that is allocated to an interface for all the inline-power-capable interfaces on the switch, use the `power inline consumption` command. To return to the default values, use the `no` form of this command.

```
power inline consumption default milliwatts

no power inline consumption default
```

**Syntax Description**

```
<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td>Specifies the switch to use the default allocation.</td>
</tr>
<tr>
<td><code>milliwatts</code></td>
<td>Sets the default power allocation in milliwatts; the valid range is from</td>
</tr>
<tr>
<td></td>
<td>4000 to 15400. Any non-default value disables automatic adjustment of power</td>
</tr>
<tr>
<td></td>
<td>allocation.</td>
</tr>
</tbody>
</table>
```

**Defaults**

Milliwatt mode is set to 15400.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(20)EW</td>
<td>Support added for Power over Ethernet.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `inline power consumption` command overrides the power allocated to the port through IEEE/Cisco phone discovery and CDP/LLDP power negotiation. To guarantee safe operation of the system, ensure that the value configured here is no less than the actual power requirement of the attached device. If the power drawn by the inline powered devices exceeds the capability of the power supply, it could trip the power supply.

If your interface is not capable of supporting Power over Ethernet, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```

**Examples**

This example shows how to set the Power over Ethernet allocation to use 8000 mW, regardless of any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power inline consumption default 8000
Switch(config)# end
Switch#
```
### Related Commands

<td>Sets the inline-power state for the inline-power-capable interfaces.</td>
</tr>
<tr>
<td>show power</td>
<td>Displays information about the power status.</td>
</tr>
</tbody>
</table>
To enable console messages that show when a PoE device has been detected and to show when a PoE device has been removed, use the **power inline logging global** command.

```
power inline logging global
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG2</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Be aware of the potential for console flooding if this command is used on a switch connected to several PoE devices.

**Examples**
This example shows how to globally enable PoE status messaging on each interface:

To enable PoE event logging, you use the **logging event poe-status global** command:

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power inline logging global
Switch(config)# int gigabitEthernet 5/5
Switch(config-if)# shut
Switch(config-if)#
Switch(config-if)# no shut
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging event link-status global (global configuration)</td>
<td>Changes the default switch-wide global link-status event messaging settings.</td>
</tr>
</tbody>
</table>
power inline police

To configure Power over Ethernet policing on a particular interface, use the power inline police command. The no form of the command disables PoE policing on an interface.

```
power inline police [action] [errdisable | log]

no power inline police [action] [errdisable | log]
```

**Syntax Description**

- **action** (Optional) Specifies the action to take on the port when a PoE policing fault occurs (the device consumes more power than it’s allocated).
- **errdisable** (Optional) Enables PoE policing on the interface and places the port in an errdisable state when a PoE policing fault occurs.
- **log** (Optional) Enables PoE policing on the interface and, if a PoE policing fault occurs, shuts, restarts the port, and logs an error message.

**Defaults**

PoE policing is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a port is in the errdisable state because of a PoE policing fault, enter the shut command followed by a no shut on the interface to make the port operational again.

You can also configure inline-power errdisable autorecovery so that an errdisabled interface is automatically revived when the errdisable autorecovery timer expires.

**Examples**

This example shows how to enable PoE policing and configure a policing action:

```
Switch(config)# int gigabitEthernet 2/1
Switch(config-if)# power inline police
Switch(config-if)# do show power inline police gigabitEthernet 2/1
Available:421(w)  Used:39(w)  Remaining:382(w)

Interface Admin Oper Admin Oper Cutoff Oper
  State State Police Police Power Power
------- ------- ------- ------- ------ ------
Gi2/1    auto on      errdisable ok 17.4   7.6

Switch(config-if)# power inline police action log
```

Available:421(w)  Used:39(w)  Remaining:382(w)

power redundancy-mode

To configure the power settings for the chassis, use the `power redundancy-mode` command. To return to the default setting, use the `default` form of this command.

```
power redundancy-mode { redundant | combined }

default power redundancy-mode
```

**Syntax Description**

- `redundant`: Configures the switch to redundant power management mode.
- `combined`: Configures the switch to combined power management mode.

**Defaults**

Redundant power management mode

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch. (Catalyst 4500 series switches only: 4503, 4506, and 4507).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The two power supplies must be the same type and wattage.

**Caution**

If you have power supplies with different types or wattages installed in your switch, the switch will not recognize one of the power supplies. A switch set to redundant mode will not have power redundancy. A switch set to combined mode will use only one power supply.

In redundant mode, the power from a single power supply must provide enough power to support the switch configuration.

**Table 2-9 Available Power**

<table>
<thead>
<tr>
<th>Power Supply</th>
<th>Redundant Mode (W)</th>
<th>Combined Mode (W)</th>
</tr>
</thead>
<tbody>
<tr>

Usage Guidelines
PPPoE Intermediate Agent is enabled on an interface provided the PPPoE Intermediate Agent is enabled both on the switch and the interface.

Examples
This example shows how to enable the PPPoE Intermediate Agent on an interface:
```
Switch(config-if)# pppoe intermediate-agent
```

This example shows how to disable the PPPoE Intermediate Agent on an interface:
```
Switch(config-if)# no pppoe intermediate-agent
```

</tbody>
</table>
**pppoe intermediate-agent (interface vlan-range)**

**Note**
This command takes effect only if you enable the **pppoe intermediate-agent** global command.

To enable PPPoE Intermediate Agent on an interface VLAN range, use the **pppoe intermediate-agent** global command. To disable the feature, use the **no** form of this command.

```
pppoe intermediate-agent

no pppoe intermediate-agent
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled on all VLANs on all interfaces

**Command Modes**
Interface vlan-range configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Although this command takes effect irrespective of the **pppoe intermediate-agent (interface configuration mode)** command, you must enable the **pppoe intermediate-agent (global configuration mode)** command.

**Examples**
This example shows how to enable PPPoE Intermediate Agent on a range of VLANs:

```
Switch(config-if)# vlan-range 167-368
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

This example shows how to disable PPPoE Intermediate Agent on a single VLAN:

```
Switch(config-if)# vlan-range 268
Switch(config-if-vlan-range)# no pppoe intermediate-agent
```

**Related Commands**

</tr>
</thead>
<tbody>
<tr>
<td><strong>pppoe intermediate-agent (interface)</strong></td>
<td>Enables the PPPoE Intermediate Agent feature on an interface.</td>
</tr>
</tbody>
</table>
pppoe intermediate-agent format-type (global)

To set the access node identifier, generic error message, and identifier string for the switch, use the `pppoe intermediate-agent format-type (global)` command. To disable the feature, use the `no` form of this command:

```plaintext
pppoe intermediate-agent format-type access-node-identifier string string
pppoe intermediate-agent format-type generic-error-message string string
pppoe intermediate-agent format-type identifier-string string string option {sp|sv|pv|spv} delimiter {,|.|;|/|#}
no pppoe intermediate-agent format-type {access-node-identifier | generic-error-message | identifier-string}
```

**Syntax Description**

- **access-node-identifier** string string: ASCII string literal value for the access-node-identifier.
- **generic-error-message** string string: ASCII string literal value for the generic-error-message.
- **identifier-string** string string: ASCII string literal value for the identifier-string.
- **option** {sp|sv|pv|spv}: Options:
  - **sp** = slot + port
  - **sv** = slot + VLAN
  - **pv** = port + VLAN
  - **spv** = slot + port + VLAN
- **delimiter** {,|.|;|/|#}: Delimiter between slot/port/VLAN portions of **option**.

**Defaults**

- **access-node-identifier** has a default value of 0.0.0.0.
- **generic-error-message**, **identifier-string**, **option**, and **delimiter** have no default values.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **access-node-identifier** and **identifier-string** commands to enable the switch to generate the circuit-id parameters automatically.

The **no** form of **identifier-string** command unsets the option and delimiter.
Use the `generic-error-message` command to set an error message notifying the sender that the PPPoE Discovery packet was too large.

**Examples**

This example shows how to set an access-node-identifier:

```
Switch(config)# pppoe intermediate-agent format-type access-node-identifier string
switch-abc-123
```

This example shows how to unset a generic-error-message:

```
Switch(config)# no pppoe intermediate-agent format-type generic-error-message
```

**Related Commands**

<table>

</table>
pppoe intermediate-agent format-type (interface)

This command takes effect only if you enable the **pppoe intermediate-agent** interface configuration command.

To set circuit-id or remote-id for an interface, use the `pppoe intermediate-agent format-type` command. To unset the parameters, use the **no** form of this command.

```
pppoe intermediate-agent format-type \{circuit-id | remote-id\} string string
no pppoe intermediate-agent format-type \{circuit-id | remote-id\} string string
```

### Syntax Description

- **circuit-id string string**: ASCII string literal value for circuit-id.
- **remote-id string string**: ASCII string literal value for remote-id.

### Defaults

No default values for circuit-id and remote-id.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `pppoe intermediate-agent format-type` command to set interface-specific circuit-id and remote-id values. If an interface-specific circuit-id is not set, the system's automatic generated circuit-id value is used.

### Examples

This example shows how to set remote-id for an interface:

```
Switch(config-if)# pppoe intermediate-agent format-type remote-id string user5551983
```

This example shows how to unset circuit-id for an interface:

```
Switch(config)# no pppoe intermediate-agent format-type circuit-id
```

pppoe intermediate-agent format-type (interface vlan-range)

Note
This command takes effect only if you enable the **pppoe intermediate-agent** interface vlan-range configuration mode command.

To set circuit-id or remote-id for an interface vlan-range, use the
*pppoe intermediate-agent format-type* interface vlan-range mode command. To unset the parameters, use the `no` form of this command.

```
pppoe intermediate-agent format-type {circuit-id | remote-id} string string

no pppoe intermediate-agent format-type {circuit-id | remote-id} string string
```

**Syntax Description**
- **circuit-id string string**
  - ASCII string literal value to be set for circuit-id.
- **remote-id string string**
  - ASCII string literal value to be set for remote-id.

**Defaults**
No default values for circuit-id and remote-id.

**Command Modes**
Interface vlan-range configuration mode

**Command History**
- **Release**
- **Modification**
  - 12.2(50)SG
  - Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**
Use these commands to set circuit-id or remote-id on an interface vlan-range. If the circuit-id is not set, the system’s automatically generated circuit-id is used.

**Examples**
This example shows how to set remote-id on an interface VLAN:
```
Switch(config-if)# vlan-range 268
Switch(config-if-vlan-range)# pppoe intermediate-agent format-type remote-id string user5551983-cabletv
```

This example shows how to unset circuit-id on an interface vlan-range:
```
Switch(config-if)# vlan-range 167-368
Switch(config-if-vlan-range)# no pppoe intermediate-agent format-type circuit-id
```

**pppoe intermediate-agent trust**

To set the trust configuration of an interface, use the `pppoe intermediate-agent trust` global command. To unset the trust parameter, use the `no` form of this command.

```
pppoe intermediate-agent trust
no pppoe intermediate-agent trust
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
All interfaces are untrusted.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
At least one trusted interface must be present on the switch for PPPoE Intermediate Agent feature to work.

Set the interface connecting the switch to the PPPoE Server (or BRAS) as trusted.

**Examples**
This example shows how to set an interface as trusted:

```
Switch(config-if)# pppoe intermediate-agent trust
```

This example shows how to disable the trust configuration for an interface:

```
Switch(config-if)# no pppoe intermediate-agent trust
```

**Related Commands**

</tr>
</tbody>
</table>
**pppoe intermediate-agent vendor-tag strip**

This command takes effect only if you enable the `pppoe intermediate-agent` interface configuration command and the `pppoe intermediate-agent trust` command.

To enable vendor-tag stripping on PPPoE Discovery packets from PPPoE Server (or BRAS), use the `pppoe intermediate-agent vendor-tag strip` command. To disable this setting, use the `no` form of this command.

```
pppoe intermediate-agent vendor-tag strip

no pppoe intermediate-agent vendor-tag strip
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Vendor-tag stripping is turned off.

**Command Modes**

Interface configuration mode

**Command History**

Release | Modification
---|---
12.2(50)SG | Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

This command has no effect on untrusted interfaces.

Use this command on a PPPoE Intermediate Agent trusted interface to strip off the vendor-specific tags in PPPoE Discovery packets that arrive downstream from the PPPoE Server (or BRAS), if any.

**Examples**

This example shows how to set vendor-tag stripping on an interface:

```
Switch(config-if)# pppoe intermediate-agent vendor-tag strip
```

This example shows how to disable vendor-tag stripping on an interface:

```
Switch(config-if)# no pppoe intermediate-agent vendor-tag strip
```

</tbody>
</table>
priority

To enable the strict priority queue (low-latency queueing [LLQ]) and to give priority to a class of traffic belonging to a policy map attached to a physical port, use the `priority` policy-map class configuration command. To return to the default setting, use the `no` form of this command.

```plaintext
priority
no priority
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The strict priority queue is disabled.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `priority` command only in a policy map attached to a physical port. You can use this command only in class-level classes, you cannot use this command in class class-default.

This command configures LLQ and provides strict-priority queueing. Strict-priority queueing enables delay-sensitive data, such as voice, to be sent before packets in other queues are sent. The priority queue is serviced first until it is empty.

You cannot use the `bandwidth`, `dbl`, and the `shape` policy-map class configuration commands with the `priority` policy-map class configuration command in the same class within the same policy map. However, you can use these commands in the same policy map.

You can use `police` or `set` class configuration commands with the priority `police-map` class configuration command.

If the priority queuing class is not rate limited, you cannot use the `bandwidth` command, you can use the `bandwidth remaining percent` command instead.

**Examples**

This example shows how to enable the LLQ for the policy map called policy1:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class voice
Switch(config-pmap-c)# priority
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

private-vlan

To configure private VLANs and the association between a private VLAN and a secondary VLAN, use the `private-vlan` command. To return to the default value, use the `no` form of this command.

```
private-vlan {isolated | community | twoway-community | primary}
private-vlan association secondary-vlan-list [ {add secondary-vlan-list} | {remove secondary-vlan-list} ]
no private-vlan {isolated | community | twoway-community | primary}
no private-vlan association
```

**Syntax Description**

- **isolated**: Designates the VLAN as an isolated private VLAN.
- **community**: Designates the VLAN as the community private VLAN.
- **twoway-community**: Designates the VLAN as a host port that belongs to a twoway-community secondary VLAN.
- **primary**: Designates the VLAN as the primary private VLAN.
- **association**: Creates an association between a secondary VLAN and a primary VLAN.
- **secondary-vlan-list**: Specifies the number of the secondary VLAN.
  The list can contain only one isolated VLAN ID; it can also contain multiple community or twoway-community VLAN IDs.
- **add** *(Optional)*: Associates a secondary VLAN to a primary VLAN.
- **remove** *(Optional)*: Clears the association between a secondary VLAN and a primary VLAN.

**Defaults**

Private VLANs are not configured.

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>

<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>15.0(2)SG</td>
<td>Support for twoway-community was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot configure VLAN 1 or VLANs 1001 to 1005 as private VLANs.

VTP does not support private VLANs. You must configure private VLANs on each device where you want private VLAN ports.
The `secondary_vlan_list` parameter cannot contain spaces; it can contain multiple comma-separated items. Each item can be a single private VLAN ID or a range of private VLAN IDs separated by hyphens.

The `secondary_vlan_list` parameter can contain multiple community VLAN IDs.

The `secondary_vlan_list` parameter can contain only one isolated VLAN ID. A private VLAN is defined as a set of private ports characterized by a common set of VLAN number pairs: each pair is made up of at least two special unidirectional VLANs and is used by isolated ports or by a community of ports to communicate with the switches.

An isolated VLAN is a VLAN that is used by the isolated ports to communicate with the promiscuous ports. The isolated VLAN traffic is blocked on all other private ports in the same VLAN and can be received only by the standard trunking ports and the promiscuous ports that are assigned to the corresponding primary VLAN.

A community VLAN is the VLAN that carries the traffic among the community ports and from the community ports to the promiscuous ports on the corresponding primary VLAN. A community VLAN is not allowed on a private VLAN trunk.

A promiscuous port is a private port that is assigned to a primary VLAN.

A primary VLAN is a VLAN that is used to convey the traffic from the switches to the customer end stations on the private ports.

You can specify only one isolated `vlan-id` value, while multiple community VLANs are allowed. You can only associate isolated and community VLANs to one VLAN. The associated VLAN list may not contain primary VLANs. Similarly, a VLAN that is already associated to a primary VLAN cannot be configured as a primary VLAN.

The `private-vlan` commands do not take effect until you exit the config-VLAN submode.

If you delete either the primary or secondary VLAN, the ports that are associated with the VLAN become inactive.

Refer to the `Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide` for additional configuration guidelines.

### Examples

This example shows how to configure VLAN 202 as a primary VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type                      Interfaces
------- --------- ----------------- ------------------------------------------
202               primary
```

This example shows how to configure VLAN 303 as a community VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 303
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type                      Interfaces
------- --------- ----------------- ------------------------------------------
202               primary
303       community
```

This example shows how to configure VLAN 440 as an isolated VLAN and verify the configuration:
Switch# configure terminal
Switch(config)# vlan 440
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# end
Switch# show vlan private-vlan

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Type</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>202</td>
<td></td>
<td>primary</td>
<td></td>
</tr>
<tr>
<td></td>
<td>303</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td></td>
<td>440</td>
<td>isolated</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to create a private VLAN relationship among the primary VLAN 14, the isolated VLAN 19, and community VLANs 20 and 21:

Switch(config)# vlan 19
Switch(config-vlan)# private-vlan isolated
Switch(config)# vlan 14
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# private-vlan association 19

This example shows how to remove a private VLAN relationship and delete the primary VLAN. The associated secondary VLANs are not deleted.

Switch(config-vlan)# no private-vlan 14
Switch(config-vlan)#

This example shows how to configure VLAN 550 as a twoway-community VLAN and verify the configuration:

Switch# configure terminal
Switch(config)# vlan 550
Switch(config-vlan)# private-vlan twoway-community
Switch(config-vlan)# end
Switch# show vlan private-vlan

<table>
<thead>
<tr>
<th>Primary</th>

<tr>
<td></td>
<td>303</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td></td>
<td>440</td>
<td>isolated</td>
<td></td>
</tr>
<tr>
<td></td>
<td>550</td>
<td>twoway-community</td>
<td></td>
</tr>
</tbody>
</table>

This example shows how to associate community VLANs 303 through 307 and 309 and isolated VLAN 440 with primary VLAN 202 and verify the configuration:

Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan association 303-307,309,440
Switch(config-vlan)# end
Switch# show vlan private-vlan

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Type</th>
<th>Interfaces</th>
</tr>
</thead>
<tbody>
<tr>
<td>202</td>
<td>303</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>304</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>305</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>306</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>307</td>
<td>community</td>
<td></td>
</tr>
<tr>
<td>202</td>
<td>309</td>
<td>community</td>

<tr>
<td>202</td>
<td>440</td>
<td>isolated</td>
<td></td>
</tr>
<tr>
<td>308</td>
<td></td>
<td>community</td>
<td></td>
</tr>
</tbody>
</table>
The secondary VLAN 308 has no associated primary VLAN.

This example shows how to remove an isolated VLAN from the private VLAN association:

Switch(config)# vlan 14
Switch(config-vlan)# private-vlan association remove 18
Switch(config-vlan)#

This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end

### private-vlan mapping

To create a mapping between the primary and the secondary VLANs so that both share the same primary VLAN SVI, use the `private-vlan mapping` command. To remove all PVLAN mappings from an SVI, use the `no` form of this command.

```
private-vlan mapping primary-vlan-id {{secondary-vlan-list | {add secondary-vlan-list} | {remove secondary-vlan-list}}}
no private-vlan mapping
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary-vlan-id</td>
<td>VLAN ID of the primary VLAN of the PVLAN relationship.</td>
</tr>
<tr>
<td>secondary-vlan-list</td>
<td>(Optional) VLAN ID of the secondary VLANs to map to the primary VLAN.</td>
</tr>
<tr>
<td>add</td>
<td>(Optional) Maps the secondary VLAN to the primary VLAN.</td>
</tr>
<tr>
<td>remove</td>
<td>(Optional) Removes the mapping between the secondary VLAN and the primary VLAN.</td>
</tr>
</tbody>
</table>

#### Defaults

All PVLAN mappings are removed.

#### Command Modes

Interface configuration mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple, comma-separated items. Each item can be a single PVLAN ID or a range of PVLAN IDs separated by hyphens.

This command is valid in the interface configuration mode of the primary VLAN.

The SVI of the primary VLAN is created at Layer 3.

The traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.

The SVIs of the existing secondary VLANs do not function and are considered down after this command is entered.

A secondary SVI can be mapped to only one primary SVI. If the configured PVLANs association is different from what is specified in this command (if the specified `primary-vlan-id` is configured as a secondary VLAN), all the SVIs that are specified in this command are brought down.

If you configure a mapping between two VLANs that do not have a valid Layer 2 association, the mapping configuration does not take effect.
This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

   Switch(config)# interface vlan 18
   Switch(config-if)# private-vlan mapping 18 20
   Switch(config-if)#

This example shows how to permit the routing of the secondary VLAN ingress traffic from PVLANs 303 through 307, 309, and 440 and how to verify the configuration:

   Switch(config)# config terminal
   Switch(config)# interface vlan 202
   Switch(config-if)# private-vlan mapping add 303-307,309,440
   Switch(config-if)# end
   Switch# show interfaces private-vlan mapping
   Interface Secondary VLAN Type
       --------- -------------- -----------------
       vlan202   303            isolated
       vlan202   304            isolated
       vlan202   305            isolated
       vlan202   306            isolated
       vlan202   307            isolated
       vlan202   309            isolated
       vlan202   440            isolated
   Switch#

This example shows the displayed message that you will see if the VLAN that you are adding is already mapped to the SVI of VLAN 18. You must delete the mapping from the SVI of VLAN 18 first.

   Switch(config)# interface vlan 19
   Switch(config-if)# private-vlan mapping 19 add 21
   Command rejected: The interface for VLAN 21 is already mapped as a secondary.
   Switch(config-if)#

This example shows how to remove all PVLAN mappings from the SVI of VLAN 19:

   Switch(config)# interface vlan 19
   Switch(config-if)# no private-vlan mapping
   Switch(config-if)#

   Switch# configure terminal
   Switch(config)# interface vlan 202
   Switch(config-if)# private-vlan mapping add 303-307,309,440
   Switch(config-if)# end
   Switch# show interfaces private-vlan mapping
   Interface Secondary VLAN Type
       --------- -------------- -----------------
       vlan202   303            community
       vlan202   304            community
       vlan202   305            community
       vlan202   306            community
       vlan202   307            community
       vlan202   309            community
       vlan202   440            isolated
   Switch#
### Related Commands

private-vlan synchronize

To map the secondary VLANs to the same instance as the primary VLAN, use the `private-vlan synchronize` command.

```
private-vlan synchronize
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not map the VLANs to the same instance as the associated primary VLAN when you exit the MST configuration submode, a warning message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The `private-vlan synchronize` command automatically maps all secondary VLANs to the same instance as the associated primary VLANs.

**Examples**

This example shows how to initialize PVLAN synchronization:

```
Switch(config-mst)# private-vlan synchronize
Switch(config-mst)#
```

This example assumes that a primary VLAN 2 and a secondary VLAN 3 are associated to VLAN 2, and that all VLANs are mapped to the CIST instance 1. This example also shows the output if you try to change the mapping for the primary VLAN 2 only:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 2
Switch(config-mst)# exit
These secondary vlans are not mapped to the same instance as their primary: ->3
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show spanning-tree mst</code></td>
<td>Displays MST protocol information.</td>
</tr>
</tbody>
</table>
**profile**

To enter profile call-home configuration submode, use the **profile** command in call-home configuration mode, use the **profile** command.

```
profile profile_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>profile_name</code></td>
<td>Specifies the profile name.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the **profile profile_name** command in call-home mode, the prompt changes to `Switch(cfg-call-home-profile)#`, and you have access to the following profile configuration commands:

- active
- destination address
- destination message-size-limit bytes
- destination preferred-msg-format
- destination transport-method
- end
- exit
- subscribe-to-alert-group all
- subscribe-to-alert-group configuration
- subscribe-to-alert-group diagnostic
- subscribe-to-alert-group environment
- subscribe-to-alert-group inventory
- subscribe-to-alert-group syslog
Examples

This example shows how to create and configure a user-defined call-home profile:

```bash
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# destination transport-method http
Switch(cfg-call-home-profile)# destination address http
https://172.17.46.17/its/service/oddce/services/DDCEService
Switch(cfg-call-home-profile)# subscribe-to-alert-group configuration
Switch(cfg-call-home-profile)# subscribe-to-alert-group diagnostic severity normal
Switch(cfg-call-home-profile)# subscribe-to-alert-group environment severity notification
Switch(cfg-call-home-profile)# subscribe-to-alert-group syslog severity notification
Switch(cfg-call-home-profile)# pattern "UPDOWN"
Switch(cfg-call-home-profile)# subscribe-to-alert-group inventory periodic daily 21:12
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis. On the Supervisor Engine 6-E and Catalyst 4900M chassis QoS is always enabled without being configured.

If QoS functionality is globally enabled, it is enabled on all interfaces, except on the interfaces where QoS has been disabled. If QoS functionality is globally disabled, all traffic is passed in QoS pass-through mode.

**Examples**
This example shows how to enable QoS functionality globally on the switch:

```
Switch(config)# qos
Switch(config)#
```

**Related Commands**

qos (interface configuration mode)

To enable QoS functionality on an interface, use the `qos` command. To disable QoS functionality on an interface, use the `no` form of this command.

```
qos
no qos
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

QoS is enabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis. On the Supervisor Engine 6-E and Catalyst 4900M chassis, attaching a service policy implicitly enables QoS on the supervisor engine and detaching a service policy implicitly disables QoS on the supervisor engine.

If QoS functionality is globally disabled, it is also disabled on all interfaces.

**Examples**

This example shows how to enable QoS functionality on an interface:

```
Switch(config-if)# qos
Switch(config-if)#
```

**Related Commands**

</tbody>
</table>
qos account layer-all encapsulation

| Note | This command is not supported on Supervisor Engine V-10GE and earlier supervisor engines. |

To account for Layer 1 header length of 20 bytes in QoS policing features, use the **qos account layer-all encapsulation** command. To disable the use of additional bytes, use the **no** form of this command.

```
qos account layer-all encapsulation
no qos account layer-all encapsulation
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

On Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E, policers account only for the Layer 2 header length in policing features. In contrast, shapers account for header length as well as IPG in rate calculations.

On Supervisor Engine V-10GE and earlier supervisor engines, policer or shaping computations involve only IP payload information. To include Layer 2 lengths and any overhead, use the **qos account layer2 encapsulation** command. For non-IP packets, the Layer 2 length specified in the Layer 2 Header is used for policing computation. To specify additional Layer 2 encapsulation length while policing IP packets, use the **qos account layer2 encapsulation** command.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Supervisor Engine 6-E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948E use the **qos account layer-all encapsulation** command to account for Layer 1 header of 20 bytes (preamble + IPG) and Layer 2 header in policing features. When this command is configured, policer statistics (in bytes) observed in the output of the **show policy-map interface** command reflect the Layer 1 header length as well (20 bytes per packet).

**Examples**

This example shows how to include IPG in policing:

```
Switch(config)# config t
Switch(config)# qos account layer-all encapsulation
Switch(config)# end
Switch#
```
<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show policy-map interface</td>
<td>Displays policer statistics on a specific interface.</td>
</tr>
</tbody>
</table>
qos account layer2 encapsulation

To include additional bytes to be accounted by the QoS features, use the `qos account layer2 encapsulation` command. To disable the use of additional bytes, use the `no` form of this command.

```
qos account layer2 encapsulation { arpa | dot1q | isl | length len }
no qos account layer2 encapsulation { arpa | dot1q | isl | length len }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arpa</td>
<td>Specifies the account length of the Ethernet ARPA-encapsulated packet (18 bytes).</td>
</tr>
<tr>
<td>dot1q</td>
<td>Specifies the account length of the 802.1Q-encapsulated packet (22 bytes).</td>
</tr>
<tr>
<td>isl</td>
<td>Specifies the account length of the ISL-encapsulated packet (48 bytes).</td>
</tr>
<tr>
<td>length len</td>
<td>Specifies the additional packet length to account for; the valid range is from 0 to 64 bytes.</td>
</tr>
</tbody>
</table>

**Defaults**

On Supervisor Engine V-10GE and earlier supervisor engines, only the length that is specified in the IP header for the IP packets and the length that is specified in the Ethernet header for non-IP packets are included.

On Supervisor Engine 6E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948-E, the length that is specified in the Ethernet header is considered for both IP and non-IP packets. The Layer 2 length includes the VLAN tag overhead.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the Catalyst 4500 series switch, for Supervisor Engine V-10GE and earlier supervisor engines, the `qos account layer2 encapsulation` command indicates that the policing feature should consider the configured length in addition to the IP length of the packet when policing the IP packets.

Sharing and shaping always use the Ethernet ARPA length.

On Supervisor Engine 6E, Supervisor Engine 6L-E, Catalyst 4900M, and Catalyst 4948-E, shaping and sharing always use Ethernet ARPA length to which 20 bytes of IPv6 overhead is always added for policing. However, only Layer 2 length including VLAN tag overhead is considered.

**Note**

The given length is included when policing all IP packets irrespective of the encapsulation with which it was received. When `qos account layer2 encapsulation isl` is configured, a fixed length of 48 bytes is included when policing all IP packets, not only those IP packets that are received with ISL encapsulation.

Sharing and shaping use the length that is specified in the Layer 2 headers.
This example shows how to include an additional 18 bytes when policing IP packets:

Switch# config terminal
Switch(config)# qos account layer2 encapsulation length 18
Switch (config)# end
Switch#

This example shows how to disable the consistent accounting of the Layer 2 encapsulation by the QoS features:

Switch# config terminal
Switch(config)# no qos account layer2 encapsulation
Switch (config)# end
Switch #

</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:

- Conform-action transmits
- Exceed-action drops

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

This policer can be shared by different policy map classes and on different interfaces.

The Catalyst 4506 switch supports up to 1000 aggregate input policers and 1000 output policers.

The `qos aggregate-policer` command allows you to configure an aggregate flow and a policing rule for that aggregate. When you enter your rate and burst parameters, the range for the average rate is 32 Kbps to 32 Gbps, and the range for the burst size is 1 KB to 512 MB.

A rate can be entered in bits-per-second without a suffix. In addition, the suffixes described in Table 2-10 are allowed.
qos aggregate-policer

Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

Bursts can be entered in bytes without a suffix. In addition, the suffixes shown in Table 2-11 are allowed.

<table>
<thead>
<tr>
<th>Table 2-10</th>
<th>Rate Suffix</th>
</tr>
</thead>
<tbody>
<tr>
<td>Suffix</td>
<td>Description</td>
</tr>
<tr>
<td>k</td>
<td>1000 bps</td>
</tr>
<tr>
<td>m</td>
<td>1,000,000 bps</td>
</tr>
<tr>
<td>g</td>
<td>1,000,000,000 bps</td>
</tr>
</tbody>
</table>

Note: Due to hardware granularity, the rate value is limited, so the burst that you configure might not be the value that is used.

Modifying an existing aggregate rate limit modifies that entry in NVRAM and in the switch if it is currently being used.

When you enter the aggregate policer name, follow these naming conventions:

- Maximum of 31 characters long and may include a-z, A-Z, 0-9, the dash (-), the underscore (_), and the period (.).
- Must start with an alphabetic character and must be unique across all ACLs of all types.
- Aggregate policer names are case sensitive.
- Cannot be a number.
- Must not be a keyword; keywords to avoid are all, default-action, map, help, and editbuffer.

An aggregate policer can be applied to one or more interfaces. However, if you apply the same policer to the input direction on one interface and to the output direction on a different interface, then you have created the equivalent of two different aggregate policers in the switching engine. Each policer has the same policing parameters, with one policing the ingress traffic on one interface and the other policing the egress traffic on another interface. If you apply an aggregate policer to multiple interfaces in the same direction, only one instance of the policer is created in the switching engine.

You can apply an aggregate policer to a physical interface or to a VLAN. If you apply the same aggregate policer to a physical interface and to a VLAN, then you have created the equivalent of two different aggregate policers in the switching engine. Each policer has the same policing parameters, with one policing the traffic on the configured physical interface and the other policing the traffic on the configured VLAN. If you apply an aggregate policer to only ports or only VLANs, then only one instance of the policer is created in the switching engine.

If you apply a single aggregate policer to the ports and the VLANs in different directions, then you have created the equivalent of four aggregate policers; one for all ports sharing the policer in the input direction, one for all ports sharing the policer in the output direction, one for all VLANs sharing the policer in the input direction, and one for all VLANs sharing the policer in the output direction.
### Examples

This example shows how to configure a QoS aggregate policer to allow a maximum of 100,000 bits per second with a normal burst size of 10,000 bytes, to transmit when these rates are not exceeded, and to drop packets when these rates are exceeded:

```
Switch(config)# qos aggregate-policer micro-one 100000 10000 conform-action transmit exceed-action drop
Switch(config)#
```

### Related Commands

qos control-packets

To enable Layer 2 control packet QoS mode on control packets use the **qos control-packets** global configuration command. Use the **no** form of this command to disable Layer 2 control packet QoS mode on control packets.

```
qos control-packets {bpdu-range | cdp-vtp | eapol | sstp | protocol-tunnel | lldp}
no qos control-packets {bpdu-range | cdp-vtp | eapol | sstp | protocol-tunnel | lldp}
```

**Syntax Description**

- **bpdu-range** Specifies enabling QoS on BPDU-range packets.
- **cdp-vtp** Specifies enabling QoS on CDP and VTP packets.
- **eapol** Specifies enabling QoS on EAPOL packets.
- **sstp** Specifies enabling QoS on SSTP packets.
- **protocol-tunnel** Specifies enabling QoS on protocol tunneling packets.
- **lldp** Specifies enabling QoS on LLDP packets.

**Defaults**

None

**Command Modes**

Global configuration

<table>
<thead>
<tr>
<th>Release</th>

</tr>
<tr>
<td></td>
<td>0180.C200.0003 EAPOL</td>
</tr>
<tr>
<td>CDP-VTP</td>
<td>0100.0CCC.CCCC</td>
</tr>
<tr>
<td>EAPOL</td>
<td>Ethertype 0x888E</td>
</tr>
</tbody>
</table>
If you enter the `qos control-packet` command without specifying any control packet types, the feature is enabled for all types.

When Layer 2 control packet QoS is enabled, you need to configure policies to match the required Layer 2 packets and police them as needed. When the feature is enabled on a particular packet type, MACLs that match the desired control packets are automatically generated, if not already present. The corresponding class maps matching these MACLs are auto-generated as well. You can then use these class maps in the policy maps to police the control packets, applying them as per-port, per-VLAN, or per-port per-VLAN. In addition, you can define MACLs or class maps to match the control packets. The only limitation is that the user-defined class maps must begin with the prefix system-control-packet.

### Examples

This example shows how to enable QoS on BDPU packets:

```
Switch# enable
Switch# configuration terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos control-packets bpdu-range
Switch(config)#
```

This example shows how to enable QoS on CDP and VTP packets:

```
Switch# enable
Switch# configuration terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos control-packets cdp-vtp
Switch(config)#
```

This example shows how to enable QoS on SSTP packets:

```
Switch# enable
Switch# configuration terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos control-packets sstp
Switch(config)#
```

This example shows how to enable QoS on LLDP packets:

```
Switch# enable
Switch# configuration terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos control-packets lldp
Switch(config)#
```
### qos control-packets

qos cos

To define the default CoS value for an interface, use the `qos cos` command. To remove a prior entry, use the `no` form of this command.

```
qos cos cos_value
no qos cos cos_value
```

**Syntax Description**

| `cos_value` | Default CoS value for the interface; valid values are from 0 to 7. |

**Defaults**

On non-Supervisor Engines 6-E, the default CoS value is 0.

On Supervisor Engine 6-E and Catalyst 4900M chassis, the default CoS is implicitly set to 1.

**Note**

CoS override is not configured.

**Command Modes**

Interface configuration mode

**Command History**

<table>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

CoS values are configurable on physical LAN ports only.

**Examples**

This example shows how to configure the default QoS CoS value as 6:

```
Switch(config-if)# qos cos 6
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>

<tr>
<td><code>show qos</code></td>
<td>Displays QoS information.</td>
</tr>
</tbody>
</table>
To enable Dynamic Buffer Limiting (DBL) globally on the switch, use the `qos dbl` command. To disable DBL, use the `no` form of this command.

```plaintext
qos dbl [buffers {aggressive-flow buffers} | credits {aggressive-flow credits | maximum max} | dscp-based {value | value range} | exceed-action {ecn | probability percent} | flow {include [layer4-ports] [vlan]}]

no qos dbl [buffers {aggressive-flow buffers} | credits {aggressive-flow credits | maximum max} | dscp-based {value | value range} | exceed-action {ecn | probability percent} | flow {include [layer4-ports] [vlan]}]
```

### Syntax Description

- **buffers** (Optional) Specifies the buffer limit for aggressive flows.
- **aggressive-flow** (Optional) Specifies the aggressive flow.
- **buffers** (Optional) Number of buffers for aggressive flows; valid values are from 0 to 255.
- **credits** (Optional) Specifies the credit limit for aggressive flows and all flows.
- **credits** (Optional) Number of credits for aggressive flows; valid values are from 0 to 15.
- **maximum** (Optional) Specifies the maximum credit for all flows.
- **max** (Optional) Number of credits for all flows; valid values are from 0 to 15.
- **dscp-based** (Optional) Specifies the packets that belong to the list of internal DSCPs.
- **value** (Optional) A single DSCP value; valid values are from 0 to 63.
- **value range** (Optional) A range of DSCP values; valid values are from 0 to 63. Up to 8 command separated DSCP values can be specified.
- **exceed-action** (Optional) Specifies the packet marking when the limits are exceeded.
- **ecn** (Optional) Specifies the explicit congestion notification.
- **probability** (Optional) Specifies the probability of packet marking.
- **percent** (Optional) Probability number; valid values are from 0 to 100.
- **flow** (Optional) Specifies the flows for limiting.
- **include** (Optional) Allows the Layer 4 ports and VLANs to be included in the flows.
- **layer4-ports** (Optional) Includes the Layer 4 ports in flows.
- **vlan** (Optional) Includes the VLANs in flows.

### Defaults

On non-Supervisor Engines 6-E, the default settings are as follows:

- QoS DBL is disabled.
- Aggressive-flow buffers is set to 2.
- Aggressive-flow credits is set to 2, with a limit of 10.
- Layer 4 ports are included.
- VLANs are included.
- 15 maximum credits are allowed.
- 15% drop probability is set.
- DSCP values are included.
On Supervisor Engines 6-E and Catalyst 4900M chassis, the default DBL values are implicitly set and cannot be changed. The settings are as follows:

- Seven maximum credits allowed.
- Aggressive-flow credits is set to 4.
- Aggressive-flow buffers is set to 4.
- Six percent drop probability is set.
- Hash function for Layer 2 packets uses source and destination MAC addresses as well as transmit VLAN identifiers.
- Hash function for IPv4 and IPv6 packets uses source and destination IP addresses source and destination Layer 4 ports as well as transmit VLAN identifiers.

**Command Modes**

- Global configuration mode
- QoS policy-map class configuration

**Command History**

<table>
<thead>
<tr>

<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(37)SG</td>
<td>Added support for DSCP-based flow management.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

**Examples**

This example shows how to enable DBL globally on the switch:

```plaintext
Switch(config)# qos db
Global DBL enabled
Switch(config)#
```

This example shows how to enable DBL in the QoS policy-map class configuration mode:

```plaintext
Switch(config)# class-map c1
Switch(config-cmap)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# db
Switch(config-pmap-c)#
```

This example shows how to selectively enable DBL on DSCP values 1 through 10:

```plaintext
Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos db 1-10
t Switch(config)# end
t Switch# show qos db
t DBL flow includes vlan
DBL flow includes layer4-ports
DBL does not use ecn to indicate congestion
DBL exceed-action probability: 15%
DBL max credits: 15
```
This example shows how to selectively disable DBL on DSCP values 1 through 10:

Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no qos dbl dscp-based 1-5, 7
Switch(config)# end
Switch# show qos dbl
DBL flow includes vlan
DBL flow includes layer4-ports
DBL does not use ecn to indicate congestion
DBL exceed-action probability: 15% DBL max credits: 15 DBL aggressive credit limit: 10 DBL aggressive buffer limit: 2 packets DBL DSCPs with default drop probability: 0,6,8-63

You can verify your settings by entering the show qos dbl privileged EXEC command.

**qos dscp**

To define the default CoS value for an interface, use the `qos dscp` command. To remove a prior entry, use the `no` form of this command.

```
qos dscp dscp_value
no qos dscp dscp_value
```

**Syntax Description**

| dscp_value | Default DSCP value for the interface; valid values are from 0 to 63. |

**Defaults**

On a non-Supervisor Engine 6-E, the default DSCP value is 0.
On a Supervisor Engine 6-E and Catalyst 4900M chassis, the port DSCP value is always set to 0.

**Command Modes**

Interface configuration mode

**Command History**

<table>

</table>
qos map cos

To define the ingress CoS-to-DSCP mapping for the trusted interfaces, use the `qos map cos to dscp` command. To remove a prior entry, use the `no` form of this command.

Note

You cannot remove a single entry from the table.

```
qos map cos cos_values to dscp dscp1
no qos map cos to dscp
```

**Syntax Description**

- `cos_values` CoS values; list up to eight CoS values separated by spaces.
- `to dscp` Defines mapping and specifies DSCP value.
- `dscp1` DSCP value to map to the CoS values; valid values are from 0 to 63.

**Defaults**

The default CoS-to-DSCP configuration settings are shown in the following table:

<table>
<thead>
<tr>
<th>CoS</th>
<th>0</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>5</th>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. In place of this limited map capability, the Supervisor Engine 6-E and Catalyst 4900M chassis supports the setting of various marking fields in a packet within a policy map. Refer to the `set` command for more details.

The CoS-to-DSCP map is used to map the packet CoS (on the interfaces that are configured to trust CoS) to the internal DSCP value. This map is a table of eight CoS values (0 through 7) and their corresponding DSCP values. The switch has one map.

**Examples**

This example shows how to configure the ingress CoS-to-DSCP mapping for CoS 0:

```
Switch(config)# qos map cos 0 to dscp 20
Switch(config)#
```

This example shows how to clear the entire CoS-to-DSCP mapping table:

```
Switch(config)# no qos map cos 0 to dscp 20
Switch(config)#
```

</table>

**Command Modes**

Global configuration mode

**Command History**

Release | Modification
---------|-----------------|
12.1(8a)EW | Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. In place of this command the Supervisor Engine 6-E and Catalyst 4900M chassis uses the tablemap command for QoS marking. Please refer to the tablemap command for details.

You use the DSCP-to-CoS map to map the final DSCP classification to a final CoS. The CoS map is written into the ISL header or 802.1Q tag of the transmitted packet on trunk interfaces and contains a table of 64 DSCP values and the corresponding CoS values. The switch has one map. You can enter up to eight DSCP values, separated by spaces, for a CoS value.

The DSCP-to-transmit-queue map is used to map the final DSCP classification to a transmit queue. You can enter up to eight DSCP values, separated by spaces, for a transmit queue.

**Examples**

This example shows how to configure the egress DSCP-to-CoS mapping:

```
Switch(config)# qos map dscp 20 25 to cos 3
Switch(config)#
```
This example shows how to configure the egress DSCP-to-transmit queue:

```
Switch(config)# qos map dscp 20 25 to tx-queue 1
Switch(config)#
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Various policer types are supported on the Supervisor Engine 6-E and Catalyst 4900M chassis that supports explicit QoS marking of DSCP, precedence, and CoS fields. Refer to the `police` command for details.

The DSCP-to-policed-DSCP map determines the marked-down DSCP value that is applied to the out-of-profile flows. The switch has one map.

You can enter up to eight DSCP values, separated by spaces.

You can enter only one policed DSCP value.

**Note**

To avoid out-of-sequence packets, configure the DSCP-to-policed-DSCP map so that marked-down packets remain in the same queue as in-profile traffic.

**Examples**

This example shows how to map multiple DSCPs to a single policed-DSCP value:

```
Switch(config)# qos map dscp policed 20 25 43 to dscp 4
Switch(config)#
```

**Related Commands**

- `dscp_list`
- `to dscp`
- `policed_dscp`

qos rewrite ip dscp

To enable DSCP rewrite for IP packets, use the qos rewrite ip dscp command. To disable IP DSCP rewrite, use the no form of this command.

```
qos rewrite ip dscp
no qos rewrite ip dscp
```

Syntax Description
This command has no arguments or keywords.

Defaults
IP DSCP rewrite is enabled.

Command Modes
Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines
This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

If you disable IP DSCP rewrite and enable QoS globally, the following events occur:

- The ToS byte on the IP packet is not modified.
- Marked and marked-down DSCP values are used for queueing.
- The internally derived DSCP (as per the trust configuration on the interface or VLAN policy) is used for transmit queue and Layer 2 CoS determination. The DSCP is not rewritten on the IP packet header.

If you disable QoS, the CoS and DSCP of the incoming packet are preserved and are not rewritten.

Examples
This example shows how to disable IP DSCP rewrite:

```
Switch(config)# no qos rewrite ip dscp
Switch(config)#
```

Related Commands

**qos trust**

To set the trusted state of an interface (for example, whether the packets arriving at an interface are trusted to carry the correct CoS, ToS, and DSCP classifications), use the `qos trust` command. To set an interface to the untrusted state, use the `no` form of this command.

```
qos trust {cos | device cisco-phone | dscp | extend [cos priority]}
```

```
no qos trust {cos | device cisco-phone | dscp | extend [cos priority]}
```

### Syntax Description

<td>Support for extending trust for voice was added.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for trust device Cisco IP phone was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

You can only configure the trusted state on physical LAN interfaces.

By default, the trust state of an interface when QoS is enabled is untrusted; when QoS is disabled on the interface, the trust state is reset to trust DSCP.

When the interface trust state is `qos trust cos`, the transmit CoS is always the incoming packet CoS (or the default CoS for the interface, if the packet is not tagged).

When the interface trust state is not `qos trust dscp`, the security and QoS ACL classification will always use the interface DSCP and not the incoming packet DSCP.
Trusted boundary should not be configured on the ports that are part of an EtherChannel (that is, a port channel).

**Examples**

This example shows how to set the trusted state of an interface to CoS:

```
Switch(config-if)# qos trust cos
Switch(config-if)#
```

This example shows how to set the trusted state of an interface to DSCP:

```
Switch(config-if)# qos trust dscp
Switch(config-if)#
```

This example shows how to set the PVID CoS level to 6:

```
Switch(config-if)# qos trust extend cos 6
Switch(config-if)#
```

This example shows how to set the Cisco phone as the trust device:

```
Switch(config-if)# qos trust device cisco-phone
Switch(config-if)#
```

qos vlan-based

To enable per-VLAN QoS for a Layer 2 interface, use the `qos vlan-based` command. To disable per-VLAN QoS for a Layer 2 interface, use the `no` form of this command.

```
qos vlan-based
no qos vlan-based
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
Per-VLAN QoS is disabled.

### Command Modes
Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. On the Supervisor Engine 6-E and Catalyst 4900M chassis various QoS marking and policing actions at the interface and VLAN level are appropriately merged. For details, refer to the *Catalyst 4500 Series Switch Configuration Guide*.

In VLAN-based mode, the policy map that is attached to the Layer 2 interface is ignored, and QoS is driven by the policy map that is attached to the corresponding VLAN interface.

Per-VLAN QoS can be configured only on the Layer 2 interfaces.

If no input QoS policy is attached to a Layer 2 interface, then the input QoS policy that is attached to the VLAN (on which the packet is received), if any, is used even if the port is not configured as VLAN based.

If you do not want this default, attach a placeholder input QoS policy to the Layer 2 interface.

Similarly, if no output QoS policy is attached to a Layer 2 interface, then the output QoS policy that is attached to the VLAN (on which the packet is transmitted), if any, is used even if the port is not configured as VLAN based.

If you do not want this default, attach a placeholder output QoS policy to the Layer 2 interface.

Layer 3 interfaces are always in interface-based mode. Layer 3 VLAN interfaces are always in VLAN-based mode.

### Examples
This example shows how to enable per-VLAN QoS for a Layer 2 interface:

```
Switch(config-if)# qos vlan-based
Switch(config-if)#
```

queue-limit

To specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map, use the queue-limit command. To remove the queue packet limit from a class, use the no form of this command.

```
queue-limit number-of-packets

no queue-limit number-of-packets
```

**Syntax Description**

- **number-of-packets**
  - Number of packets that the queue for this class can accumulate; valid range is 16 to 8184. This number must be a multiple of 8.

**Defaults**

By default, each physical interface on a Catalyst 4500 switch has a default queue based on the number of slots in a chassis and the number of ports on the linecards.

**Command Modes**

QoS policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This class-based queuing (CBQ) command applies only to the Supervisor Engine 6-E as part of the MQC support on the Catalyst 4500 Supervisor Engine.

By default, each physical interface on a Catalyst 4500 switch comes up with a default queue. The size of this queue is based on the number of slots in a chassis as well as the number of ports on the line card in each slot. The switch supports 512K queue entries of which 100 K are set aside as a common sharable pool. The remaining 412 K entries are equally distributed among the slots. Each slot further divides its allocated queue entries equally among its ports.

CBQ creates a queue for every class for which a class map is defined. Packets satisfying the match criterion for a class accumulate in the queue reserved for the class until they are sent, which occurs when the queue is serviced by the fair queuing process. When the maximum packet threshold you defined for the class is reached, queuing of any further packets to the class queue causes tail drop or, if DBL is configured for the class policy, packet drop to take effect.

**Note**

The queue-limit command is supported only after you first configure a scheduling action, such as bandwidth, shape, or priority, except when you configure queue-limit in the class-default class of an output QoS policy-map.
Examples

This example shows how to configure a policy-map called policy11 to contain policy for a class called acl203. Policy for this class is set so that the queue reserved for it has a maximum packet limit of 40:

```
Switch# configure terminal
Switch (config)# policy-map policy11
Switch (config-pmap)# class acl203
Switch (config-pmap-c)# bandwidth 2000
Switch (config-pmap-c)# queue-limit 40
Switch (config-pmap-c)# end
Switch#
```

To enter the redundancy configuration mode, use the `redundancy` command in the global configuration mode.

```
redundancy
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
This command has no default settings.

### Command Modes
Global configuration mode

### Usage Guidelines
The redundancy configuration mode is used to enter the main CPU submode.

To enter the main CPU submode, use the `main-cpu` command in the redundancy configuration mode.

The main CPU submode is used to manually synchronize the configurations on the two supervisor engines.

From the main CPU submode, use the `auto-sync` command to enable automatic synchronization of the configuration files in NVRAM.

Use the `no` command to disable redundancy. If you disable redundancy, then reenable redundancy, the switch returns to default redundancy settings.

Use the `exit` command to exit the redundancy configuration mode.

### Examples
This example shows how to enter redundancy mode:

```
Switch(config)# redundancy
Switch(config-red)#
```

This example shows how to enter the main CPU submode:

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)#
```

### Related Commands

**Release Modification**

- **12.1(12c)EW** Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R and 4510R only).

redemption config-sync mismatched-commands

To move the active supervisor engine into the Mismatched Command List (MCL) and resets the standby supervisor engine, use the **redemption config-sync mismatched-commands** command.

If your active and standby supervisors engines are running different versions of Cisco IOS, some of their CLIs will not be compatible. If such commands are already present in the running configuration of the active supervisor engine and the syntax-check for the command fails at the standby supervisor engine while it is booting, you must move the active supervisor engine into the Mismatched Command List (MCL).

```plaintext
redemption config-sync {ignore | validate} mismatched-commands
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>ignore</th>
<th>validate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Ignore the mismatched command list.</td>
<td>Revalidate the mismatched command list with the modified running-configuration.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(44)SG</td>
<td>Updated command name from <strong>issu config-sync</strong> to <strong>redemption config-sync</strong>.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following is a log entry example for mismatched commands:

```
00:06:31: Config Sync: Bulk-sync failure due to Servicing Incompatibility. Please check full list of mismatched commands via:
  show redemption config-sync failures mcl
00:06:31: Config Sync: Starting lines from MCL file:
  interface GigabitEthernet7/7
    ! <submode> "interface"
    - ip address 11.0.0.1 255.0.0.0
    ! </submode> "interface"
```

To display all mismatched commands, use the **show redemption config-sync failures mcl** command.

To clean the MCL, remove all mismatched commands from the active supervisor engine’s running configuration, revalidate the MCL with a modified running configuration using the **redemption config-sync validate mismatched-commands** command, then reload the standby supervisor engine.

You could also ignore the MCL by entering the **redemption config-sync ignore mismatched-commands** command and reloading the standby supervisor engine; the system changes to SSO mode.
Note: If you ignore the mismatched commands, the out-of-sync configuration at the active supervisor engine and the standby supervisor engine still exists.

You can verify the ignored MCL with the `show redundancy config-sync ignored mcl` command.

If SSO mode cannot be established between the active and standby supervisor engines because of an incompatibility in the configuration file, a mismatched command list (MCL) is generated at the active supervisor engine and a reload into RPR mode is forced for the standby supervisor engine. Subsequent attempts to establish SSO, after removing the offending configuration and rebooting the standby supervisor engine with the exact same image, might cause the C4K_RENDUNDANCY-2-IOS_VERSION_CHECK_FAIL and ISSU-3-PEER_IMAGE_INCOMPATIBLE messages to appear because the peer image is listed as incompatible. If the configuration problem can be corrected, you can clear the peer image from the incompatible list with the `redundancy config-sync ignore mismatched-commands` EXEC command while the peer is in a standby cold (RPR) state. This action allows the standby supervisor engine to boot in standby hot (SSO) state when it reloads.

### Examples

This example shows how to validate removal of entries from the MCL:

```
Switch# redundancy config-sync validate mismatched-commands
Switch# `redundancy config-sync ignore mismatched-commands

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>

redundancy force-switchover

To force a switchover from the active to the standby supervisor engine, use the **redundancy force-switchover** command.

```
redundancy force-switchover
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

### Usage Guidelines
Before using this command, refer to the “Performing a Software Upgrade” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional information.

The **redundancy force-switchover** command conducts a manual switchover to the redundant supervisor engine. The redundant supervisor engine becomes the new active supervisor engine running the Cisco IOS image. The modules are reset.

The old active supervisor engine reboots with the new image and becomes the standby supervisor engine.

### Examples
This example shows how to switch over manually from the active to the standby supervisor engine:

```
Switch# redundancy force-switchover
Switch#
```

### Related Commands

<td>Enters the redundancy configuration mode.</td>
</tr>
<tr>
<td>show redundancy</td>
<td>Displays redundancy facility information.</td>
</tr>
</tbody>
</table>
To force a reload of one or both supervisor engines, use the `redundancy reload` command.

```
redundancy reload {peer | shelf}
```

**Syntax Description**
- `peer` Reloads the peer unit.
- `shelf` Reboots both supervisor engines.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

Before using this command, refer to the “Performing a Software Upgrade” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional information.

The `redundancy reload shelf` command conducts a reboot of both supervisor engines. The modules are reset.

**Examples**
This example shows how to manually reload one or both supervisor engines:

```
Switch# redundancy reload shelf
Switch#
```

**Related Commands**
- `redundancy` Enters the redundancy configuration mode.
- `show redundancy` Displays redundancy facility information.
remote login module

To remotely connect to a specific module, use the `remote login module` configuration command.

```
remote login module mod
```

**Syntax Description**

<table>
<thead>
<tr>
<th>mod</th>
<th>Target module for the command.</th>
</tr>
</thead>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies only to the Access Gateway Module on Catalyst 4500 series switches.

The valid values for `mod` depends on the chassis used. For example, if you have a Catalyst 4506 chassis, valid values for the module are from 2 to 6. If you have a 4507R chassis, valid values are from 3 to 7.

When you execute the `remote login module mod` command, the prompt changes to Gateway#.

The `remote login module` command is identical to the `session module mod` and the `attach module mod` commands.

**Examples**

This example shows how to remotely log in to the Access Gateway Module:

```
Switch# remote login module 5
Attaching console to module 5
Type 'exit' at the remote prompt to end the session

Gateway>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attach module</td>
<td>Remotely connects to a specific module.</td>
</tr>
<tr>
<td>session module</td>
<td>Logs in to the standby supervisor engine using a virtual console.</td>

</tbody>
</table>
remote-span

To convert a VLAN into an RSPAN VLAN, use the `remote-span` command. To convert an RSPAN VLAN to a VLAN, use the `no` form of this command.

```
remote-span

no remote-span
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
RSPAN is disabled.

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to convert a VLAN into an RSPAN VLAN:

```
Switch# config terminal
Switch(config)# vlan 20
Switch(config-vlan)# remote-span
Switch(config-vlan)# end
Switch#
```

**Related Commands**

</table>
renew ip dhcp snooping database

To renew the DHCP binding database, use the `renew ip dhcp snooping database` command.

```
renew ip dhcp snooping database [validation none] [url]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validation none</td>
<td>(Optional) Specifies that the checksum associated with the contents of the file specified by the URL is not verified.</td>
</tr>
<tr>
<td>url</td>
<td>(Optional) Specifies the file from which the read is performed.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(9)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the URL is not provided, the switch tries to read the file from the configured URL.

**Examples**

This example shows how to renew the DHCP binding database while bypassing the CRC checks:

```
Switch# renew ip dhcp snooping database validation none
Switch#
```

**Related Commands**

</tbody>
</table>
rep admin vlan

Use the `rep admin vlan` global configuration command to configure a Resilient Ethernet Protocol (REP) administrative VLAN for REP to transmit hardware flood layer (HFL) messages. Use the `no` form of this command to return to the default configuration with VLAN 1 as the administrative VLAN.

```
rep admin vlan vlan-id

no rep admin vlan
```

**Syntax Description**

| `vlan-id` | The VLAN ID range is from 1 to 4094. The default is VLAN 1; the range to configure is 2 to 4094. |

**Defaults**

The administrative VLAN is VLAN 1.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the VLAN does not already exist, this command does not create the VLAN.

To avoid the delay introduced by relaying messages in software for link-failure or VLAN-blocking notification during load balancing, REP floods packets at the hardware flood layer (HFL) to a regular multicast address. These messages are flooded to the whole network, not just the REP segment. Switches that do not belong to the segment treat them as data traffic. Configuring an administrative VLAN for the whole domain can control flooding of these messages.

If no REP administrative VLAN is configured, the default is VLAN 1.

There can be only one administrative VLAN on a switch and on a segment.

The administrative VLAN cannot be the RSPAN VLAN.

**Examples**

This example shows how to configure VLAN 100 as the REP administrative VLAN:

```
Switch(config)# rep admin vlan 100
```

You can verify your settings by entering the `show interface rep detail` privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces rep detail</code></td>
<td>Displays detailed REP configuration and status for all interfaces or the specified interface, including the administrative VLAN.</td>
</tr>
</tbody>
</table>
rep block port

Use the `rep block port` interface configuration command on the REP primary edge port to configure Resilient Ethernet Protocol (REP) VLAN load balancing. Use the `no` form of this command to return to the default configuration.

```
rep block port {id port-id | neighbor_offset | preferred} vlan {vlan-list | all}
no rep block port {id port-id | neighbor_offset | preferred}
```

**Syntax Description**

- **id port-id**: Identify the VLAN blocking alternate port by entering the unique port ID that is automatically generated when REP is enabled. The REP port ID is a 16-character hexadecimal value. You can view the port ID for an interface by entering the `show interface interface-id rep detail` command.

- **neighbor_offset**: Identify the VLAN blocking alternate port by entering the offset number of a neighbor. The range is –256 to +256; a value of 0 is invalid. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers identify the secondary edge port (offset number -1) and its downstream neighbors.

- **preferred**: Identify the VLAN blocking alternate port as the segment port on which you entered the `rep segment segment-id preferred` interface configuration command.

  **Note**: Entering the `preferred` keyword does not ensure that the preferred port is the alternate port; it gives it preference over other similar ports.

- **vlan**: Identify the VLANs to be blocked.

  - **vlan-list**: Enter a VLAN ID from 1 to 4094 or a range or sequence of VLANs (such as 1-3, 22, 41-44) of VLANs to be blocked.

  - **all**: Enter to block all VLANs.

**Defaults**

The default behavior after you enter the `rep preempt segment` privileged EXEC command (for manual preemption) is to block all VLANs at the primary edge port. This behavior remains until you configure the `rep block port` command.

If the primary edge port cannot determine which port is to be the alternate port, the default action is no preemption and no VLAN load balancing.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter this command on the REP primary edge port.
When you select an alternate port by entering an offset number, this number identifies the downstream neighbor port of an edge port. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers identify the secondary edge port (offset number -1) and its downstream neighbors. See Neighbor Offset Numbers in a REP Segment.

Figure 2-2 Neighbor Offset Numbers in a REP Segment

Note
You would never enter an offset value of 1 because that is the offset number of the primary edge port itself.

If you have configured a preempt delay time by entering the rep preempt delay seconds interface configuration command and a link failure and recovery occurs, VLAN load balancing begins after the configured preemption time period elapses without another link failure. The alternate port specified in the load-balancing configuration blocks the configured VLANs and unblocks all other segment ports. If the primary edge port cannot determine the alternate port for VLAN balancing, the default action is no preemption.

Each port in a segment has a unique port ID. The port ID format is similar to the one used by the spanning tree algorithm: a port number (unique on the bridge) associated to a MAC address (unique in the network). To determine the port ID of a port, enter the show interface interface-id rep detail privileged EXEC command.

There is no limit to the number of times that you can enter the rep block port id port-id vlan vlan-list interface configuration command. You can block an unlimited number, range, or sequence of VLANs.

When you use the rep block port id port-id vlan vlan-list interface configuration command on a REP primary edge port to block a VLAN list and then use the same command to block another VLAN list on the same port, the second VLAN list does not replace the first VLAN list but is appended to the first VLAN list.

When you use the rep block port id port-id vlan vlan-list interface configuration command on a REP primary edge port to block a VLAN list on one port and then use the same command to block another VLAN list on another port, the original port number and VLAN list are overwritten.
Examples

This example shows how to configure REP VLAN load balancing on the Switch B primary edge port (Gigabit Ethernet port 1/0/1) and to configure Gigabit Ethernet port 1/1 of Switch A as the alternate port to block VLANs 1 to 100. The alternate port is identified by its port ID, shown in bold in the output of the `show interface rep detail` command for the Switch A port.

Switch A# show interface gigabitethernet1/1 rep detail
GigabitEthernet1/1 REP enabled
Segment-id: 2 (Segment)
PortID: 0080001647FB1780

rep preempt delay

Use the `rep preempt delay` interface configuration command on the REP primary edge port to configure a waiting period after a segment port failure and recovery before Resilient Ethernet Protocol (REP) VLAN load balancing is triggered. Use the `no` form of this command to remove the configured delay.

```
rep preempt delay seconds
no rep preempt delay
```

### Syntax Description

- **seconds**: Set the number of seconds to delay REP preemption. The range is 15 to 300.

### Defaults

No preemption delay is set. If you do not enter the `rep preempt delay` command, the default is manual preemption with no delay.

### Command Modes

Interface configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must enter this command on the REP primary edge port.

You must enter this command and configure a preemption time delay if you want VLAN load balancing to automatically trigger after a link failure and recovery.

If VLAN load balancing is configured, after a segment port failure and recovery, the REP primary edge port starts a delay timer before VLAN load balancing occurs. Note that the timer restarts after each link failure. When the timer expires, the REP primary edge alerts the alternate port to perform VLAN load balancing (configured by using the `rep block port` interface configuration command) and prepares the segment for the new topology. The configured VLAN list is blocked at the alternate port, and all other VLANs are blocked at the primary edge port.

Do not configure VLAN load balancing on an interface that carries Ethernet over multiprotocol label switching (EoMPLS) traffic. VLAN load balancing across the REP ring might cause some of the EoMPLS traffic to not be forwarded.

### Examples

This example shows how to configure REP preemption time delay of 100 seconds on the primary edge port:

```
Switch(config)# interface gigabitethernet1/0/1
Switch(config-if)# rep preempt delay 100
Switch(config-if)# exit
```

You can verify your settings by entering the `show interfaces rep` privileged EXEC command.
<table>

</tr>
</tbody>
</table>
rep preempt segment

Use the `rep preempt segment` privileged EXEC command to manually start Resilient Ethernet Protocol (REP) VLAN load balancing on a segment.

```
rep preempt segment segment_id
```

**Syntax Description**

- `segment_id`: ID of the REP segment. The range is from 1 to 1024.

**Defaults**

Manual preemption is the default behavior.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the `rep preempt segment segment-id` command, a confirmation message appears before the command is executed because preemption can cause network disruption.

Enter this command on the switch on the segment that has the primary edge port.

If you do not configure VLAN load balancing, entering this command results in the default behavior—the primary edge port blocks all VLANs.

You configure VLAN load balancing by entering the `rep block port {id port-id | neighbor_offset | preferred} vlan {vlan-list | all}` interface configuration command on the REP primary edge port before you manually start preemption.

There is not a `no` version of this command.

**Examples**

This example shows how to manually trigger REP preemption on segment 100 with the confirmation message:

```
Switch) rep preempt segment 100
The command will cause a momentary traffic disruption.
Do you still want to continue? [confirm]

rep segment

Use the `rep segment` interface configuration command to enable Resilient Ethernet Protocol (REP) on the interface and to assign a segment ID to it. Use the `no` form of this command to disable REP on the interface.

```
rep segment segment-id [edge [no-neighbor] [primary]] [preferred]

no rep segment
```

**Syntax Description**

- **segment-id**: Assign a segment ID to the interface. The range is from 1 to 1024.
- **edge**: (Optional) Identify the interface as one of the two REP edge ports. Entering the `edge` keyword without the `primary` keyword configures the port as the secondary edge port.
- **no-neighbor**: (Optional) Configure a segment edge with no external REP neighbor.
- **primary**: (Optional) On an edge port, specify that the port is the primary edge port. A segment has only one primary edge port. If you configure two ports in a segment as the primary edge port, for example ports on different switches, the REP selects one of them to serve as the segment primary edge port.
- **preferred**: (Optional) Specify that the port is the preferred alternate port or the preferred port for VLAN load balancing.

**Note** Configuring a port as preferred does not guarantee that it becomes the alternate port; it merely gives it a slight edge among equal contenders. The alternate port is usually a previously failed port.

**Defaults**

REP is disabled on the interface.

When REP is enabled on an interface, the default is for the port to be a regular segment port.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>

<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>15(02)SG</td>
<td>The <code>no-neighbor</code> keyword was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

REP ports must be Layer 2 trunk ports. A non-ES REP port can be either an IEEE 802.1Q trunk port or an ISL trunk port.

REP ports should not be configured as one of these port types:

- SPAN destination port
- Private VLAN port
Chapter 2 Cisco IOS Commands for the Catalyst 4500 Series Switches

rep segment

- Tunnel port
- Access port

You must configure two edge ports on each REP segment, a primary edge port and a port to act as a secondary edge port. If you configure two ports in a segment as the primary edge port, for example ports on different switches, the configuration is allowed, but the REP selects one of them to serve as the segment primary edge port.

REP is supported on EtherChannels, but not on an individual port that belongs to an EtherChannel.

- REP ports follow these rules:
  - There is no limit to the number of REP ports on a switch; however, only two ports on a switch can belong to the same REP segment.
  - If only one port on a switch is configured in a segment, the port should be an edge port.
  - If two ports on a switch belong to the same segment, they must be both edge ports, both regular segment ports, or one regular port and one edge no-neighbor port. An edge port and regular segment port on a switch cannot belong to the same segment.
  - If two ports on a switch belong to the same segment and one is configured as an edge port and one as a regular segment port (a misconfiguration), the edge port is treated as a regular segment port.

If you configure two ports in a segment as the primary edge port, for example ports on different switches, the REP selects one of them to serve as the segment primary edge port. Enter the show rep topology privileged EXEC command on a port in the segment to verify which port is the segment primary edge port.

REP interfaces come up in a blocked state and remain in a blocked state until notified that it is safe to unblock. You need to be aware of this to avoid sudden connection losses.

You should configure REP only in networks with redundancy. Configuring REP in a network without redundancy causes loss of connectivity.

In networks where ports on a neighboring switch do not support REP, you can configure the non-REP facing ports as edge no-neighbor ports. These ports inherit all properties of edge ports and you can configure them as any other edge port, including to send STP or REP topology change notices to the aggregation switch. In this case, the STP topology change notice (TCN) that is sent is a multiple spanning-tree (MST) STP message.

Examples

This example shows how to enable REP on a regular (nonedge) segment port:

```
Switch (config)# interface gigabitethernet1/0/1
Switch (config-if)# rep segment 100
```

This example shows how to enable REP on a port and identify the port as the REP primary edge port:

```
Switch (config)# interface gigabitethernet1/1
Switch (config-if)# rep segment 100 edge primary
```

This example shows how to configure the same configuration when the interface has no external REP neighbor:

```
Switch# configure terminal
Switch (config)# interface gigabitethernet1/1
Switch (config-if)# rep segment 100 edge no-neighbor primary
```
This example shows how to enable REP on a port and identify the port as the REP secondary edge port:

```
Switch (config)# interface GigabitEthernet1/1
Switch (config-if)# rep segment 100 edge
```

You can verify your settings by entering the `show interfaces rep` privileged EXEC command. To verify which port in the segment is the primary edge port, enter the `show rep topology` privileged EXEC command.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
rep stcn

Use the rep stcn interface configuration command on a Resilient Ethernet Protocol (REP) edge port to configure the port to send REP segment topology change notifications (STCNs) to another interface, to other segments, or to Spanning Tree Protocol (STP) networks. Use the no form of this command to disable the sending of STCNs to the interface, segment, or STP network.

```
rep stcn {interface interface-id | segment id-list | stp}
no rep stcn {interface | segment | stp}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface-id</td>
<td>Identify a physical interface or port channel to receive STCNs.</td>
</tr>
<tr>
<td>segment id-list</td>
<td>Identify one REP segment or list of segments to receive STCNs. The range is 1 to 1024. You can also configure a sequence of segments (for example 3-5, 77, 100).</td>
</tr>
<tr>
<td>stp</td>
<td>Send STCNs to an STP network.</td>
</tr>
</tbody>
</table>

**Defaults**

Transmission of STCNs to other interfaces, segments, or STP networks is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter this command on a segment edge port.

You use this command to notify other portions of the Layer 2 network of topology changes that occur in the local REP segment. This removes obsolete entries in the Layer 2 forwarding table in other parts of the network, which allows faster network convergence.

**Examples**

This example shows how to configure a REP edge port to send STCNs to segments 25 to 50:

```
Switch (config)# interface GigabitEthernet1/1
Switch (config-if)# rep stcn segment 25-50
Switch (config-if)# exit
```

You can verify your settings by entering the `show interfaces rep detail` privileged EXEC command.

reset

To leave the proposed new VLAN database but remain in VLAN configuration mode and reset the proposed new database to be identical to the VLAN database currently implemented, use the reset command.

reset

Syntax Description
This command has no arguments or keywords.

Defaults
This command has no default settings.

Command Modes
VLAN configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Examples
This example shows how to reset the proposed new VLAN database to the current VLAN database:

Switch(vlan-config)# reset
RESET completed.
Switch(vlan-config)#
revision

To set the MST configuration revision number, use the `revision` command. To return to the default settings, use the no form of this command.

```
revision version

no revision
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>Configuration revision number; valid values are from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

Revision version is set to 0.

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If two Catalyst 4500 series switches have the same configuration but have different configuration revision numbers, they are considered to be part of two different regions.

⚠️ **Caution**

Be careful when using the `revision` command to set the MST configuration revision number because a mistake can put the switch in a different region.

**Examples**

This example shows how to set the configuration revision number:

```
Switch(config-mst)# revision 5
Switch(config-mst)#
```

**Related Commands**

sampler (netflow-lite monitor submode)

To activate sampling on an interface in netflow-lite monitor submode, use the `sampler` command. To delete a sampler, use the `no` form of this command.

```
  sampler sampler-name
  no sampler sampler-name
```

### Syntax Description

- **sampler-name**: Specifies a sampler.

### Defaults

None

### Command Modes

- netflow-lite exporter submode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can enter this command under the physical port interface mode, port channel interface, or config VLAN mode.

### Examples

The following example shows how to configure a monitor on a port interface Gigabit 1/3:

```
Switch# config terminal
Switch(config)# int GigabitEthernet1/3
Switch(config-if)# netflow-lite monitor 1
Switch(config-netflow-lite-monitor)# sampler sampler1
Switch(config-netflow-lite-monitor)# average-packet-size 128
Switch(config-netflow-lite-monitor)# exporter exporter1
Switch(config-netflow-lite-monitor)# exit
Switch(config-if)# exit
Switch(config)# exit
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
  Netflow-lite Monitor-1:
    Sampler: sampler1
    Exporter: exporter1
    Average Packet Size: 128
  Statistics:
    Packets exported: 0
    Packets observed: 0
    Packets dropped: 0
```

You can verify your settings with the `show netflow-lite sampler` privileged EXEC command.
### Related Commands

service-policy (interface configuration)

To attach a policy map to an interface or to apply different QoS policies on VLANs that an interface belongs to, use the **service-policy** command. To remove a policy map from an interface, use the **no** form of this command.

```
service-policy {input | output} policy-map name

no service-policy {input | output} policy-map name
```

### Syntax Description

- **input**: Specifies the input policy maps.
- **output**: Specifies the output policy maps.
- **policy-map name**: Name of a previously configured policy map.

### Defaults

A policy map is not attached to an interface or a VLAN.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for applying different QoS policies on VLANs was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the **vlan-range** command, you can use the **service-policy** command to specify different QoS policies on different VLANs.

**Note**

This capability is restricted to Layer 2 interfaces.

**Non-Supervisor Engine 6-E**

You cannot apply a policy map under an interface and a VLAN range at the same time.

To attach a service policy to a VLAN an SVI must be created for the VLAN and the policy must be applied to the SVI.

**Supervisor Engine 6-E and Catalyst 4900M chassis**

You can apply a service policy under an interface as well as a VLAN range at the same time. However, this is allowed only when the interface policy has only queuing actions whereas a VLAN has only non-queueing actions (QoS marking and/or policing) actions.

To attach a service policy to a VLAN, the VLAN configuration mode has to be used.
This example shows how to attach a policy map to Fast Ethernet interface 5/20:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/20
Switch(config-if)# service-policy input pmap1
Switch(config-if)# end

This example shows how to apply policy map p1 for traffic in VLANs 20 and 400, and policy map p2 for traffic in VLANs 300 through 301:

Switch# configure terminal
Switch(config)# interface gigabitEthernet 6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan-range 20,400
Switch(config-if-vlan-range)# service-policy input p1
Switch(config-if-vlan-range)# exit
Switch(config-if)# vlan-range 300-301
Switch(config-if-vlan-range)# service-policy output p2
Switch(config-if-vlan-range)# end
Switch# show policy-map interface gigabitEthernet 6/1 vlan 20
GigabitEthernet6/1 vlan 20
Service-policy input: p1
  Class-map: class-default (match-any)
   0 packets
   Match: any
   0 packets
   police: Per-interface
   Conform: 0 bytes Exceed: 0 bytes

Switch# show policy-map interface gigabitEthernet 6/1 vlan 300
GigabitEthernet6/1 vlan 300
Service-policy output: p2
  Class-map: class-default (match-any)
   0 packets
   Match: any
   0 packets
   police: Per-interface
   Conform: 0 bytes Exceed: 0 bytes

Switch# show policy-map interface gigabitEthernet 6/1 vlan 301
GigabitEthernet6/1 vlan 301
Service-policy output: p2
  Class-map: class-default (match-any)
   0 packets
   Match: any
   0 packets
police: Per-interface
   Conform: 0 bytes Exceed: 0 bytes

GigabitEthernet6/1 vlan 400
Service-policy input: p1

   Class-map: class-default (match-any)
   0 packets
   Match: any
   0 packets
   police: Per-interface
   Conform: 0 bytes Exceed: 0 bytes

This example shows how to attach a policy map to a VLAN using an SVI on a non-Supervisor Engine 6-E:

Switch# configure terminal
Switch(config)#interface vlan 10
Switch(config-if)#service-policy out policy-vlan
Switch(config-if)#end
Switch#

This example shows how to attach a policy map to a VLAN using a Supervisor Engine 6-E:

Switch# configure terminal
Switch(config)#vlan configuration 20
Switch(config-vlan-config)#service-policy out policy-vlan
Switch(config-vlan-config)#end
Switch#

service-policy (policy-map class)

To create a service policy that is a quality of service (QoS) policy within a policy map (called a hierarchical service policy), use the `service-policy` policy-map class configuration command. To disable the service policy within a policy map, use the `no` form of this command.

```
service-policy policy-map-name

no service-policy policy-map-name
```

### Syntax Description

- **policy-map-name**
  
  Name of the policy map.

### Defaults

No service policies maps are defined.

### Command Modes

Policy-map class configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `service-policy` command only in a hierarchical policy map attached to a physical port. This command is valid in policy maps at level two of the hierarchy.

You can create a hierarchy by having the parent policy map specify marking and/or policing actions and having the child policy map specify the queueing actions.

If you enter this command in policy-map class configuration mode, you return to policy-map configuration mode by using the `exit` command. To return to privileged EXEC mode, use the `end` command.

### Examples

This example shows how to create a hierarchical service policy in the service policy called “parent”:

```
Switch# configure terminal
Switch(config)# policy-map child
Switch(config-pmap)# class voice
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map parent
Switch(config-pmap)# class class1
Switch(config-pmap-c)# police 32k
Switch(config-pmap-c)# service-policy child
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.
## service-policy (policy-map class)

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bandwidth</td>
<td>Creates a signaling class structure that can be referred to by its name.</td>
</tr>
<tr>
<td>class</td>
<td>Specifies the name of the class whose traffic policy you want to create or change.</td>
</tr>
<tr>
<td>dbl</td>
<td>Enables active queue management on a transmit queue used by a class of traffic.</td>
</tr>
<tr>
<td>policy-map</td>
<td>Creates a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode.</td>
</tr>
<tr>
<td>priority</td>
<td>Enables the strict priority queue (low-latency queueing [LLQ]) and to give priority to a class of traffic belonging to a policy map attached to a physical port.</td>
</tr>
<tr>
<td>random-detect (refer to Cisco IOS documentation)</td>
<td>Enables Weighted Random Early Detection (WRED) or distributed WRED (DWRED).</td>
</tr>
<tr>
<td>shape (class-based queueing)</td>
<td>Enables traffic shaping a class of traffic in a policy map attached to a physical port.</td>
</tr>
<tr>
<td>show policy-map</td>
<td>Displays information about the policy map.</td>
</tr>
</tbody>
</table>
service-policy input (control-plane)

To attach a policy map to a control plane for aggregate control plane services, use the `service-policy input` command. Use the `no` form of this command to remove a service policy from a control plane.

```
service-policy input policy-map-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>input</code></td>
<td>Applies the specified service policy to the packets that are entering the control plane.</td>
</tr>
<tr>
<td><code>policy-map-name</code></td>
<td>Name of a service policy map (created using the <code>policy-map</code> command) to be attached.</td>
</tr>
</tbody>
</table>

**Defaults**

No service policy is specified.

**Command Modes**

Control-plane configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In this release, the only policy-map accepted on the control-plane is system-cpp-policy. It is already attached to the control-plane at start-up. If not (due to some error conditions), it is recommended to use the `global macro system-cpp` command to attach it to the control-plane. The system-cpp-policy created by the system contains system predefined classes. For these predefined classes, you can change the policing parameters but you should not make any other change to the classes.

You can define your own class-maps and append them to the end of the system-cpp-policy policy-map.

**Examples**

This example shows how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specified rate:

```
Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet
! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet
! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet
! Define class-map "telnet-class.*
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map control-plane-policy
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 80000 conform transmit exceed drop
Switch(config-pmap-pmap-c)# exit
Switch(config)# exit
! Define aggregate control plane service for the active Route Processor.
```
Switch(config)# control-plane
Switch(config-cp)# service-policy input control-plane-policy
Switch(config-cp)# exit

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Catalyst 4500 series switches can be configured with two supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. Therefore, you must connect to the standby console to access, monitor or debug the standby supervisor.

The virtual console for the standby supervisor engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine and emulates the standby console on the active supervisor engine. Only one active standby console session is active at any time.

The virtual console for the standby supervisor engine allows users who are logged onto the active supervisor engine to remotely execute show commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the `attach module`, `session module`, or `remote login` commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

Note

The `session module` command is identical to the `attach module mod` and the `remote login module mod` commands.
Once you enter the standby virtual console, the terminal prompt automatically changes to <hostname>-standby-console#, where hostname is the configured name of the switch. The prompt is restored back to the original prompt when you exit the virtual console.

You exit the virtual console with the exit or quit commands. When the inactivity period of the terminal on the active supervisor engine where you logged in exceeds the configured idle time, you are automatically logged out of the terminal on the active supervisor engine. In such a case, the virtual console session is also terminated. Virtual console session is also automatically terminated when the standby is rebooted. After the standby boots up, you need to create another virtual console session.

The following limitations apply to the standby virtual console:

- All commands on the virtual console run to completion. It does not provide the auto-more feature; it behaves as if the terminal length 0 command has been executed. It is also non-interactive. Therefore, a running command cannot be interrupted or aborted by any key sequence on the active supervisor engine. If a command produces considerable output, the virtual console displays it on the supervisor screen.

- The virtual console is non-interactive. Because the virtual console does not detect the interactive nature of a command, any command that requires user interaction causes the virtual console to wait until the RPC timer aborts the command.

- The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60 seconds. During this time, you cannot abort the command from the keyboard. You must wait for the timer to expire before you continue.

- You cannot use virtual console to view debug and syslog messages that are being displayed on the standby supervisor engine. The virtual console only displays the output of commands that are executed from the virtual console. Other information that is displayed on the real standby console does not appear on the virtual console.

Examples

To log in to the standby supervisor engine using a virtual console, do the following:

Switch# session module 2
Connecting to standby virtual console
Type 'exit' or 'quit' to end this session

Switch-standby-console# exit
Switch#

If the standby console is not enabled, the following message appears:

Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can use the set command only in class-level classes.

The `set dscp new-dscp` and the `set precedence new-precedence` commands are the same as the `set ip dscp new-dscp` and the `set ip precedence new-precedence` commands.

For the `set dscp new-dscp` or the `set precedence new-precedence` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `set dscp af11` command, which is the same as entering the `set dscp 10` command. You can enter the `set precedence critical` command, which is the same as entering the `set precedence 5` command. For a list of supported mnemonics, enter the `set dscp ?` or the `set precedence ?` command to see the command-line help strings.

You can configure the `set cos new-cos`, `set dscp new-dscp`, or `set precedence new-precedence` command in an ingress and an egress policy map attached to an interface or VLAN.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.
Examples

This example shows how to create a policy map called p1 with CoS values assigned to different traffic types. Class maps for voice and video-data have already been created.

```
Switch# configure terminal
Switch(config)# policy-map p1
Switch(config-pmap)# class voice
Switch(config-pmap-c)# set cos 1
Switch(config-pmap)# exit
Switch(config-pmap)# class video-data
Switch(config-pmap-c)# set cos 2
Switch(config-pmap)# exit
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

set cos

To set the Layer 2 class of service (CoS) value of a packet, use the `set cos` command in policy-map class configuration mode. To remove a specific CoS value setting, use the `no` form of this command.

```
set cos {cos-value | from-field [table table-map-name]}
no set cos {cos-value | from-field [table table-map-name]}
```

### Syntax Description

| cos-value | Specific IEEE 802.1Q CoS value from 0 to 7. |
| from-field | Specific packet-marking category to be used to set the CoS value of the packet. If you are using a table map for mapping and converting packet-marking values, this establishes the “map from” packet-marking category. Packet-marking category keywords are as follows: |
|            | • precedence |
|            | • dscp |
|            | • cos |
|            | • qos group |
| table | (Optional) Indicates that the values set in a specified table map will be used to set the CoS value. |
| table-map-name | (Optional) Name of the table map used to specify the CoS value. The table map name can be a maximum of 64 alphanumeric characters. |

### Command Default

No CoS value is set for the outgoing packet.

### Command Modes

Policy-map class configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `set cos` command can be used in an ingress as well as an egress policy map attached to an interface or VLAN.

You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the CoS value. The “from-field” packet-marking categories are as follows:

- Precedence
- Differentiated services code point (DSCP)
- Cost of Service (CoS)
- Quality of Service (QoS) group
If you specify a “from-field” category but do not specify the table keyword and the applicable table-map-name argument, the default action will be to copy the value associated with the “from-field” category as the CoS value. For instance, if you configure the `set cos precedence` command, the precedence value will be copied and used as the CoS value.

You can do the same for the DSCP marking category. That is, you can configure the `set cos dscp` command, and the DSCP value will be copied and used as the CoS value.

**Note**
If you configure the `set cos dscp` command, only the first three bits (the class selector bits) of the DSCP field are used.

**Note**
If you configure the `set cos qos group` command, only the three least significant bits of the qos group field are used.

### Examples

This example shows how to configure a policy map called cos-set and assign different CoS values for different types of traffic. This example assumes that the class maps called voice and video-data have already been created.

```
Switch# configure terminal
Switch(config)# policy-map cos-set
Switch(config-pmap)# class voice
Switch(config-pmap-c)# set cos 1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class video-data
Switch(config-pmap-c)# set cos 2
Switch(config-pmap-c)# end
Switch#
```

This example shows how to configure a policy map called policy-cos and to use the values defined in a table map called table-map1. The table map called table-map1 was created earlier with the `table-map (value mapping)` command. For more information about the `table-map (value mapping)` command, see the `table-map (value mapping)` command page.

This example shows how the setting of the CoS value is based on the precedence value defined in table-map1:

```
Switch# configure terminal
Switch(config)# policy-map policy-cos
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set cos precedence table table-map1
Switch(config-pmap-c)# end
Switch#
```

</tr>
</tbody>
</table>
set dscp

To mark a packet by setting the differentiated services code point (DSCP) value in the type of service (ToS) byte, use the set dscp command in policy-map class configuration mode. To remove a previously set DSCP value, use the no form of this command.

```
set [ip] dscp {dscp-value | from-field [table table-map-name]}

no set [ip] dscp {dscp-value | from-field [table table-map-name]}
```

**Syntax Description**

- **ip** (Optional) Specifies that the match is for IPv4 packets only. If not used, the match is on both IPv4 and IPv6 packets.
- **dscp-value** A number from 0 to 63 that sets the DSCP value. A mnemonic name for commonly used values can also be used.
- **from-field** Specific packet-marking category to be used to set the DSCP value of the packet. If you are using a table map for mapping and converting packet-marking values, this establishes the “map from” packet-marking category. Packet-marking category keywords are as follows:
  - cos
  - qos-group
  - dscp
  - precedence
- **table** (Optional) Used in conjunction with the from-field argument. Indicates that the values set in a specified table map will be used to set the DSCP value.
- **table-map-name** (Optional) Used in conjunction with the table keyword. Name of the table map used to specify the DSCP value. The name can be a maximum of 64 alphanumeric characters.

**Command Default**  Disabled

**Command Modes**  Policy-map class configuration mode

**Command History**

</tr>
</tbody>
</table>
set dscp

Usage Guidelines

Once the DSCP bit is set, other quality of service (QoS) features can then operate on the bit settings.

DSCP and Precedence Values Are Mutually Exclusive

The `set dscp` command cannot be used with the `set precedence` command to mark the same packet. The two values, DSCP and precedence, are mutually exclusive. A packet can have one value or the other, but not both.

You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the DSCP value. The “from-field” packet-marking categories are as follows:

- Class of service (CoS)
- QoS group
- Precedence
- Differentiated services code point (DSCP)

If you specify a “from-field” category but do not specify the `table` keyword and the applicable `table-map-name` argument, the default action will be to copy the value associated with the “from-field” category as the DSCP value. For instance, if you configure the `set dscp cos` command, the CoS value will be copied and used as the DSCP value.

Note

The CoS field is a three-bit field, and the DSCP field is a six-bit field. If you configure the `set dscp cos` command, only the three bits of the CoS field will be used.

If you configure the `set dscp qos-group` command, the QoS group value will be copied and used as the DSCP value.

The valid value range for the DSCP is a number from 0 to 63. The valid value range for the QoS group is a number from 0 to 63.

Set DSCP Values in IPv6 Environments

When this command is used in IPv6 environments, the default match occurs on both IP and IPv6 packets. However, the actual packets set by this function are only those which meet the match criteria of the class-map containing this function.

Set DSCP Values for IPv6 Packets Only

To set DSCP values for IPv6 values only, the `match protocol ipv6` command must also be used. Without that command, the DSCP match defaults to match both IPv4 and IPv6 packets.

Set DSCP Values for IPv4 Packets Only

To set DSCP values for IPv4 packets only, use the `ip` keyword in the `match` command for classification. Without the `ip` keyword, the match occurs on both IPv4 and IPv6 packets.
**Examples**

**Packet-marking Values and Table Map**

In the following example, the policy map called policy1 is created to use the packet-marking values defined in a table map called table-map1. The table map was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the table-map (value mapping) command page.

This example shows how the DSCP value is set according to the CoS value defined in the table map called table-map1.

```plaintext
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set dscp cos table table-map1
Switch(config-pmap-c)# end
Switch#
```

</tr>
</tbody>
</table>

### Command Default

Disabled

### Command Modes

Policy-map class configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for ‘from-field’ for policy-map configured on a Supervisor Engine 6-E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

**Command Compatibility**

The **set precedence** command cannot be used with the **set dscp** command to mark the *same* packet. The two values, DSCP and precedence, are mutually exclusive. A packet can be one value or the other, but not both.
You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the precedence value. The “from-field” packet-marking categories are as follows:

- CoS
- QoS group
- DSCP
- Precedence

If you specify a “from-field” category but do not specify the table keyword and the applicable table-map-name argument, the default action will be to copy the value associated with the “from-field” category as the precedence value. For instance, if you configure the `set precedence cos` command, the CoS value will be copied and used as the precedence value.

You can do the same for the QoS group-marking category. That is, you can configure the `set precedence qos-group` command, and the QoS group value will be copied and used as the precedence value.

The valid value range for the precedence value is a number from 0 to 7. The valid value range for the QoS group is a number from 0 to 63. Therefore, when configuring the `set precedence qos-group` command the three least significant bits of qos-group are copied to precedence.

**Precedence Values in IPv6 Environments**

When this command is used in IPv6 environments it can set the value in both IPv4 and IPv6 packets. However, the actual packets set by this function are only those that meet the match criteria of the class-map containing this function.

**Setting Precedence Values for IPv6 Packets Only**

To set the precedence values for IPv6 packets only, the `match protocol ipv6` command must also be used in the class-map that classified packets for this action. Without the `match protocol ipv6` command, the class-map may classify both IPv6 and IPv4 packets, (depending on other match criteria) and the `set precedence` command will act upon both types of packets.

**Setting Precedence Values for IPv4 Packets Only**

To set the precedence values for IPv4 packets only, use a command involving the `ip` keyword like the `match ip precedence` or `match ip dscp` command or include the `match protocol ip` command along with the others in the class map. Without the additional `ip` keyword, the class-map may match both IPv6 and IPv4 packets (depending on the other match criteria) and the `set precedence` or `set dscp` command may act upon both types of packets.

**Examples**

In the following example, the policy map named policy-cos is created to use the values defined in a table map named table-map1. The table map named table-map1 was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the `table-map` (value mapping) command page.

This example shows how the precedence value is set according to the CoS value defined in table-map1.

```
Switch# configure terminal
Switch(config)# policy-map policy-cos
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set precedence cos table table-map1
Switch(config-pmap-c)# end
Switch#
```
### Related Commands

set qos-group

To set a quality of service (QoS) group identifier (ID) that can be used later to classify packets, use the set qos-group command in policy-map class configuration mode. To remove the group ID, use the no form of this command.

```
set qos-group group-id

no set qos-group group-id
```

Syntax Description

| group-id | Group ID number in the range from 0 to 63. |

Command Default

The group ID is set to 0.

Command Modes

Policy-map class configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The set qos-group command allows you to associate a group ID with a packet. This association is made through a service-policy attached to an interface or VLAN in the input direction. The group ID can be later used in the output direction to apply QoS service policies to the packet.

Examples

This example shows how to set the qos-group to 5:

```
Switch# configure terminal
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# set qos
Switch(config-pmap-c)# set qos-group 5
Switch(config-pmap-c)# end
Switch#
```

</tr>
</tbody>
</table>
shape (class-based queueing)

To enable traffic shaping a class of traffic in a policy map attached to a physical port, use the `shape average` policy-map class command. Traffic shaping limits the data transmission rate. To return to the default setting, use the `no` form of this command.

```
shape average \{rate\} [bps | kbps | mbps | gbps]
shape average percent \{percent_value\}
no shape average
```

### Syntax Description

- **rate**
  - Specifies an average rate for traffic shaping; the range is 16000 to 10000000000.
  - Post-fix notation (k, m, and g) is optional and a decimal point is allowed.
- **bps**
  - (Optional) Specifies a rate in bits per seconds.
- **kbps**
  - (Optional) Specifies a rate in kilobytes per seconds.
- **mbps**
  - (Optional) Specifies a rate in megabits per seconds.
- **gbps**
  - (Optional) Specifies a rate in gigabits per seconds.
- **percent**
  - Specifies a percentage of bandwidth for traffic shaping.
- **percent_value**
  - (Optional) Specifies a percentage of the bandwidth used for traffic shaping; valid values are from 1 to 100 percent.

### Defaults

Average-rate traffic shaping is disabled.

### Command Modes

Policy-map class configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `shape` command only in a policy map attached to a physical port. This command is valid in policy maps at any level of the hierarchy.

Shaping is the process of delaying out-of-profile packets in queues so that they conform to a specified profile. Shaping is distinct from policing. Policing drops packets that exceed a configured threshold, but shaping buffers packets so that traffic remains within the threshold. Shaping offers greater smoothness in handling traffic than policing.

You cannot use the `bandwidth`, `db1`, and the `shape` policy-map class configuration commands with the `priority` policy-map class configuration command in the same class within the same policy map. However, you can use these commands in the same policy map.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.
shape (class-based queueing)

Examples

This example shows how to limit the specified traffic class to a data transmission rate of 256 kbps:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

Traffic shaping is available on all the ports, and it sets an upper limit on the bandwidth.

When the high shape rates are configured on the Catalyst 4500 Supervisor Engine II-Plus-10GE (WS-X4013+10GE), the Catalyst 4500 Supervisor Engine V (WS-X4516), and the Catalyst 4500 Supervisor Engine V-10GE (WS-X4516-10GE), the shaped traffic rate may not be achieved in situations that involve contention and unusual packet size distributions. On the ports that are multiplexed through a Stub ASIC and connected to the backplane gigaports, the shape rates above 7 Mbps may not be achieved under worst-case conditions. On ports that are connected directly to the backplane gigaports, or the supervisor engine gigaports, the shape rates above 50 Mbps may not be achieved under worst-case conditions.

Some examples of ports that are connected directly to the backplane are as follows:

- Uplink ports on Supervisor Engine II+, II+10GE, III, IV, V, and V-10GE
- Ports on the WS-X4306-GB module
- The two 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first two ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module
All ports on the 24-port modules and the 48-port modules are multiplexed through a Stub ASIC. Some examples of ports multiplexed through a Stub ASIC are as follows:

- 10/100 ports on the WS-X4148-RJ45 module
- 10/100/1000 ports on the WS-X4124-GB-RJ45 module
- 10/100/1000 ports on the WS-X4448-GB-RJ45 module

**Examples**

This example shows how to configure a maximum bandwidth (70 percent) for the interface fa3/1:

```bash
Switch(config)# interface fastethernet3/1
Switch(config-if)# tx-queue 3
Switch(config-if-tx-queue)# shape 70m
Switch(config-if-tx-queue)#
```
shell trigger

Use the shell trigger global configuration command to create a user defined trigger. Use the no form of this command to delete the trigger.

```
shell trigger identifier description
no shell trigger identifier description
```

### Syntax Description

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>identifier</td>
<td>Specifies the event trigger identifier. The identifier should have no spaces or hyphens between words.</td>
</tr>
<tr>
<td>description</td>
<td>Specifies the event trigger description text.</td>
</tr>
</tbody>
</table>

### Defaults

There are system-defined event triggers:

- CISCO_PHONE_EVENT
- CISCO_SWITCH_EVENT
- CISCO_ROUTER_EVENT
- CISCO_WIRELESS_AP_EVENT
- CISCO_WIRELESS_LIGHTWEIGHT_AP_EVENT
- DMP
- IPVSC

### Command Modes

Global configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SE</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use this command to create user-defined event triggers in conjunction with the macro auto execute global configuration command.

To support dynamic device discovery when using 802.1X authentication, configure the RADIUS authentication server to support the Cisco attribute-value (AV) pair: `auto-smart-port=event trigger`.

This command is mainly used for 802.1X authentication based triggers provided 802.1X or MAB is supported, enabling you to map new platform strings or device IDs to their respective macros or functions.

### Examples

This example shows how to create a user-defined event trigger called RADIUS_MAB_EVENT:

```
Switch# configure terminal
Switch(config)# shell trigger RADIUS_MAB_EVENT MAC_AuthBypass Event
Switch(config)# end
```
<table>

</tbody>
</table>
**show access-group mode interface**

To display the ACL configuration on a Layer 2 interface, use the **show access-group mode interface** command.

```
show access-group mode interface [interface interface-number]
```

**Syntax Description**

- **interface** (Optional) Interface type; valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, and `port-channel`.
- **interface-number** (Optional) Interface number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The valid values for the port number depend on the chassis used.

**Examples**

This example shows how to display the ACL configuration on the Fast Ethernet interface 6/1:

```
Switch# show access-group mode interface fa6/1
Interface FastEthernet6/1:
  Access group mode is: merge
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>access-group mode</strong></td>
<td>Specifies the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode).</td>
</tr>
</tbody>
</table>
show adjacency

To display information about the Layer 3 switching adjacency table, use the `show adjacency` command.

```
show adjacency [interface interface-number] | [null interface-number] | [port-channel number]
    | {vlan vlan-id} | detail | internal | summary]
```

**Syntax Description**

- `interface` (Optional) Interface type; possible valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `pos`, `ge-wan`, and `atm`.
- `interface-number` (Optional) Module and port number; see the “Usage Guidelines” section for valid values.
- `null interface-number` (Optional) Specifies the null interface; the valid value is 0.
- `port-channel number` (Optional) Specifies the channel interface; valid values are a maximum of 64 values ranging from 1 to 256.
- `vlan vlan-id` (Optional) Specifies the VLAN; valid values are from 1 to 4094.
- `detail` (Optional) Displays the information about the protocol detail and timer.
- `internal` (Optional) Displays the information about the internal data structure.
- `summary` (Optional) Displays a summary of CEF-adjacency information.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

- **Release** 12.2(25)EW Extended to include the 10-Gigabit Ethernet interface.

**Usage Guidelines**

The `interface-number` argument designates the module and port number. Valid values for `interface-number` depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 1 to 13, and valid values for the port number are from 1 to 48.

Hardware Layer 3 switching adjacency statistics are updated every 60 seconds.

The following information is contained in the `show adjacency` command:

- Protocol interface.
- Type of routing protocol that is configured on the interface.
- Interface address.
- Method of adjacency that was learned.
MAC address of the adjacent router.
Time left before the adjacency rolls out of the adjacency table. After it rolls out, a packet must use the same next hop to the destination.

**Examples**

This example shows how to display adjacency information:

```
Switch# show adjacency
Protocol Interface                 Address
IP       FastEthernet2/3           172.20.52.1(3045)
IP       FastEthernet2/3           172.20.52.22(11)
Switch#
```

This example shows how to display a summary of adjacency information:

```
Switch# show adjacency summary
Adjacency Table has 2 adjacencies
  Interface                 Adjacency Count
  FastEthernet2/3           2
Switch#
```

This example shows how to display protocol detail and timer information:

```
Switch# show adjacency detail
Protocol Interface                 Address
  IP       FastEthernet2/3           172.20.52.1(3045)
     0 packets, 0 bytes
     000000000FF9200003800000000000000
     00000000000000000000000000000000
     00605C865B2800D0BB0F980B0800
     ARP       03:58:12
  IP       FastEthernet2/3           172.20.52.22(11)
     0 packets, 0 bytes
     000000000FF9200003800000000000000
     00000000000000000000000000000000
     00801C93804000D0BB0F980B0800
     ARP       03:58:06
Switch#
```

This example shows how to display adjacency information for a specific interface:

```
Switch# show adjacency fastethernet2/3
Protocol Interface                 Address
  IP       FastEthernet2/3           172.20.52.1(3045)
  IP       FastEthernet2/3           172.20.52.22(11)
Switch#
```

show ancp multicast

To display multicast streams activated by Access Node Control Protocol (ANCP), use the **show ancp multicast** command.

```
show ancp multicast [group groupaddr] [source sourceaddr] [interface interfacename]
```

**Syntax Description**
- **group groupaddr** (Optional) Specifies a multicast group address.
- **source sourceaddr** (Optional) Specifies a multicast source address.
- **interface interfacename** (Optional) Specifies a multicast flowing on a specific interface.

**Defaults**
Displays all the multicast streams activated with ANCP.

**Command Modes**
Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

ANCP-Client#
```
show arp access-list

To display detailed information on an ARP access list, use the show arp command.

show arp access-list

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to display the ARP ACL information for a switch:

Switch# show arp access-list
ARP access list rose
    permit ip 10.101.1.1 0.0.0.255 mac any
    permit ip 20.3.1.0 0.0.0.255 mac any

</table>
show authentication

To display the Auth Manager information, use the `show authentication` command in EXEC or Privileged EXEC mode.

```
show authentication {interface interface | registrations | sessions [session-id session-id] [handle handle] [interface interface] [mac mac] [method method]}
```

**Syntax Description**

- **interface interface**: Displays all of the Auth Manager details associated with the specified interface.
- **registrations**: Displays details of all methods registered with the Auth Manager.
- **sessions**: Displays details of the current Auth Manager sessions (for example, client devices). If you do not enter any optional specifiers, all current active sessions are displayed. You can enter the specifiers singly or in combination to display a specific session (or group of sessions).
- **session-id session-id**: (Optional) Specifies an Auth Manager session.
- **handle handle**: (Optional) Specifies the particular handle for which Auth Manager information is displayed. Range is 1 to 4294967295.
- **mac mac**: (Optional) Displays Auth Manager session information for a specified MAC address.
- **method method**: (Optional) Displays all clients authorized by a specified authentication method. Valid values are as follows:
  - `dot1x`
  - `mab`
  - `webauth`

**Command Default**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Table 2-13 describes the significant fields shown in the show authentication display.

**Note**

The possible values for the status of sessions are given below. For a session in terminal state, “Authz Success” or “Authz Failed” are displayed. “No methods” is displayed if no method has provided a result.
Table 2-13  show authentication Command Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle</td>
<td>The session has been initialized and no methods have run yet.</td>
</tr>
<tr>
<td>Running</td>
<td>A method is running for this session.</td>
</tr>
<tr>
<td>No methods</td>
<td>No method has provided a result for this session.</td>
</tr>
<tr>
<td>Authc Success</td>
<td>A method has resulted in authentication success for this session.</td>
</tr>
<tr>
<td>Authc Failed</td>
<td>A method has resulted in authentication fail for this session.</td>
</tr>
<tr>
<td>Authz Success</td>
<td>All features have been successfully applied for this session.</td>
</tr>
<tr>
<td>Authz Failed</td>
<td>A feature has failed to be applied for this session.</td>
</tr>
</tbody>
</table>

Table 2-14 lists the possible values for the state of methods. For a session in terminal state, “Authc Success,” “Authc Failed,” or “Failed over” are displayed (the latter indicates a method ran and failed over to the next method which did not provide a result. “Not run” is displayed in the case of sessions that are synchronized on standby.

Table 2-14  State Method Values

<table>
<thead>
<tr>
<th>Method State</th>
<th>State Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not run</td>
<td>Terminal</td>
<td>The method has not run for this session.</td>
</tr>
<tr>
<td>Running</td>
<td>Intermediate</td>
<td>The method is running for this session.</td>
</tr>
<tr>
<td>Failed over</td>

</table>
show auto install status

To display the status of an automatic installation, use the `show auto install status` command.

```
show auto install status
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the IP address of the TFTP server and to display whether or not the switch is currently acquiring the configuration file on the TFTP server:

```
Switch# show auto install status
Status            : Downloading config file
DHCP Server       : 20.0.0.1
TFTP Server       : 30.0.0.3
Config File Fetched: Undetermined
```

The first IP address in the display indicates the server that is used for the automatic installation. The second IP address indicates the TFTP server that provided the configuration file.
show auto qos

To display the automatic quality of service (auto-QoS) configuration that is applied, use the show auto qos user EXEC command.

    show auto qos [interface [interface-id]] [{begin | exclude | include} expression]

**Syntax Description**

- **interface interface-id**: (Optional) Displays auto-QoS information for the specified interface or for all interfaces. Valid interfaces include physical ports.
- **begin**: (Optional) Begins with the line that matches the expression.
- **exclude**: (Optional) Excludes lines that match the expression.
- **include**: (Optional) Includes lines that match the specified expression.
- **expression**: (Optional) Expression in the output to use as a reference point.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **show auto qos interface interface-id** command displays the auto-QoS configuration; it does not display any user changes to the configuration that might be in effect.

To display information about the QoS configuration that might be affected by auto-QoS on a non-Supervisor Engine 6-E, use one of these commands:

- show qos
- show qos map
- show qos interface interface-id
- show running-config

Expressions are case sensitive. For example, if you enter **exclude output**, the lines that contain *output* do not appear, but the lines that contain *Output* appear.

**Examples**

This example shows output from the **show auto qos** command when auto-QoS is enabled:

``` mexico
Switch# show auto qos
GigabitEthernet1/2
auto qos voip cisco-phone
Switch#
```

**Related Commands**

- **auto qos voip**: Automatically configures quality of service (auto-QoS) for Voice over IP (VoIP) within a QoS domain.
show bootflash:

To display information about the bootflash: file system, use the `show bootflash:` command.

```
show bootflash: [all | chips | filesys]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Displays all possible Flash information.</td>
</tr>
<tr>
<td>chips</td>
<td>(Optional) Displays Flash chip information.</td>
</tr>
<tr>
<td>filesys</td>
<td>(Optional) Displays file system information.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display file system status information:

```
Switch> show bootflash: filesys

-------- FILE SYSTEM STATUS --------
Device Number = 0
DEVICE INFO BLOCK: bootflash

show bootvar

To display BOOT environment variable information, use the `show bootvar` command.

```
show bootvar
```

**Syntax Description**  
This command has no arguments or keywords.

**Defaults**  
This command has no default settings.

**Command Modes**  
Privileged EXEC mode

**Command History**  
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
```

**Examples**  
This example shows how to display BOOT environment variable information:

```
Switch# show bootvar
BOOT variable = sup:1;
CONFIG_FILE variable does not exist
BOOTLDR variable does not exist
Configuration register is 0x0
Switch#
```
show cable-diagnostics tdr

To display the test results for the TDR cable diagnostics, use the **show cable-diagnostics tdr** command.

```
show cable-diagnostics tdr [interface {interface interface-number}]}
```

**Note**

This command will be deprecated in future Cisco IOS releases; use the **diagnostic start** command instead.

**Syntax Description**

- **interface interface** Interface type; valid values are `fastethernet` and `gigabitethernet`.
- **interface-number** Module and port number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The TDR test is supported on Catalyst 4500 series switches running Cisco IOS Release 12.2(25)SG for the following line cards only:

- WS-X4548-GB-RJ45
- WS-X4548-GB-RJ45V
- WS-X4524-GB-RJ45V
- WS-X4013+TS
- WS-C4948
- WS-C4948-10GE

The distance to the fault is displayed in meters (m).

**Examples**

This example shows how to display information about the TDR test:

```
Switch# show cable-diagnostics tdr interface gi4/13
Interface Speed Local pair Cable length Remote channel Status
Gi4/13 0Mbps 1-2 102 +2m Unknown Fault
3-6 100 +2m Unknown Fault
4-5 102 +2m Unknown Fault
7-8 102 +2m Unknown Fault
Switch#
```
Table 2-15 describes the fields in the `show cable-diagnostics tdr` command output.

<table>
<thead>
<tr>

show cdp neighbors

To display detailed information about the neighboring devices that are discovered through CDP, use the show cdp neighbors command.

```
show cdp neighbors [type number] [detail]
```

**Syntax Description**

- `type` (Optional) Interface type that is connected to the neighbors about which you want information; possible valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `port-channel`, and `vlan`.
- `number` (Optional) Interface number that is connected to the neighbors about which you want information.
- `detail` (Optional) Displays detailed information about a neighbor (or neighbors) including network address, enabled protocols, hold time, and software version.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release  Modification
12.2(25)EW  Extended to include the 10-Gigabit Ethernet interface.
```

**Usage Guidelines**

The `vlan` keyword is supported in Catalyst 4500 series switches that are configured with a Supervisor Engine 2.

The `port-channel` values are from 0 to 282; values from 257 to 282 are supported on the CSM and the FWSM only.

**Examples**

This example shows how to display the information about the CDP neighbors:

```
Switch# show cdp neighbors
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, r - Repeater, P - Phone
Device ID         Local Intrfce    Holdtme    Capability  Platform  Port ID           
lab-7206          Eth 0            157        R           7206VXR   Fas 0/0/0
lab-as5300-1      Eth 0            163        R           AS5300    Fas 0
lab-as5300-2      Eth 0            159        R           AS5300    Eth 0
lab-as5300-3      Eth 0            122        R           AS5300    Eth 0
lab-as5300-4      Eth 0            132        R           AS5300    Fas 0/0
lab-3621          Eth 0            140        R S         3631-telcoFas 0/0
008024 2758E0      Eth 0            132        T           CAT3000   1/2
Switch#
```
Table 2-16 describes the fields that are shown in the example.

<table>

</tbody>
</table>
show class-map

To display class map information, use the **show class-map** command.

```
show class-map class_name
```

**Syntax Description**

| **class_name** | Name of the class map. |

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Displays results from the full-flow option.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display class map information for all class maps:

```
Switch# show class-map
Class Map match-any class-default (id 0)
  Match any
Class Map match-any class-simple (id 2)
  Match any
Class Map match-all ipp5 (id 1)
  Match ip precedence 5
Class Map match-all agg-2 (id 3)
Switch#
```

This example shows how to display class map information for a specific class map:

```
Switch# show class-map ipp5
Class Map match-all ipp5 (id 1)
  Match ip precedence 5
Switch#
```

Assume there are two active flows as shown below on Fast Ethernet interface 6/1:

```
+-----------------+-----------------+-----------------+-----------------+-----------------|
|  SrcIp          |  DstIp          | IpProt | SrcL4Port | DstL4Port       |
+-----------------+-----------------+-----------------+-----------------+-----------------|
| 192.168.10.10   | 192.168.20.20   | 20     | 6789       | 81              |
| 192.168.10.10   | 192.168.20.20   | 20     | 6789       | 21              |
```

With following configuration, each flow will be policed to a 1000000 bps with an allowed 9000-byte burst value.

**Note**

If you use the **match flow ip source-address|destination-address** command, these two flows are consolidated into one flow and they have the same source and destination address.
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.

</thead>
<tbody>
<tr>
<td>class-map</td>
<td>Creates a class map to be used for matching packets to the class whose name you specify and to be used enter class-map configuration mode.</td>
</tr>
<tr>
<td>show policy-map</td>
<td>Displays information about the policy map.</td>
</tr>
<tr>
<td>show policy-map interface</td>
<td>Displays the statistics and configurations of the input and output policies that are attached to an interface.</td>
</tr>
</tbody>
</table>
show diagnostic content

To display test information about the test ID, test attributes, and supported coverage test levels for each test and for all modules, use the `show diagnostic content` command.

```
show diagnostic content module {all | num}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Displays all the modules on the chassis.</td>
</tr>
<tr>
<td>num</td>
<td>Module number.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the test suite, monitoring interval, and test attributes for all the modules of the chassis:

```
Switch# show diagnostic content module all

module 1:

Diagnostics test suite attributes:
  B/* - Basic ondemand test / NA
  P/V/* - Per port test / Per device test / NA
  D/N/* - Disruptive test / Non-disruptive test / NA
  S/* - Only applicable to standby unit / NA
  X/* - Not a health monitoring test / NA
  F/* - Fixed monitoring interval test / NA
  E/* - Always enabled monitoring test / NA
  A/I - Monitoring is active / Monitoring is inactive
  m/* - Mandatory bootup test, can't be bypassed / NA
  o/* - Ongoing test, always active / NA

ID Test Name Test Attributes Testing Interval (day hh:mm:ss.ms)
==== ============== ========== =========
1) supervisor-bootup **DD*****I** not configured
2) packet-memory-bootup **DD*****I** not configured
3) packet-memory-ongoing **NN*****O** not configured
```
module 6:

Diagnostics test suite attributes:

B/* - Basic ondemand test / NA
P/V/* - Per port test / Per device test / NA
D/N/* - Disruptive test / Non-disruptive test / NA
S/* - Only applicable to standby unit / NA
X/* - Not a health monitoring test / NA
F/* - Fixed monitoring interval test / NA
E/* - Always enabled monitoring test / NA
A/I - Monitoring is active / Monitoring is inactive
m/* - Mandatory bootup test, can't be bypassed / NA
o/* - Ongoing test, always active / NA

<table>
<thead>
<tr>
<th>ID</th>
<th>Test Name</th>
<th>Attributes</th>
<th>Testing Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>linecard-online-diag</td>
<td><strong>D</strong>*I**</td>
<td>not configured</td>
</tr>
</tbody>
</table>

Switch#
show diagnostic result module

To display the module-based diagnostic test results, use the show diagnostic result module command.

```
show diagnostic result module [slot-num | all] [test [test-id | test-id-range | all]] [detail]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slot-num</td>
<td>(Optional) Specifies the slot on which diagnostics are displayed.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Displays the diagnostics for all slots.</td>
</tr>
<tr>
<td>test</td>
<td>(Optional) Displays selected tests on the specified module.</td>
</tr>
<tr>
<td>test-id</td>
<td>(Optional) Specifies a single test ID.</td>
</tr>
<tr>
<td>test-id-range</td>
<td>(Optional) Specifies a range of test IDs.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Displays the diagnostics for all tests.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays the complete test results.</td>
</tr>
</tbody>
</table>

### Defaults

A summary of the test results for all modules in the chassis is displayed.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to display the summary results for all modules in the chassis:

```
Switch# show diagnostic result module

Current bootup diagnostic level: minimal

module 1:
Overall diagnostic result: PASS
Diagnostic level at card bootup: bypass
Test results: (. = Pass, F = Fail, U = Untested)
   1) supervisor-bootup -----------------------> U
   2) packet-memory-bootup -----------------------> U
   3) packet-memory-ongoing -----------------------> U

module 4:
Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal
Test results: (. = Pass, F = Fail, U = Untested)
   1) linecard-online-diag -----------------------> .
```
module 5:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag ----------------------> .

module 6:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag ----------------------> .

This example shows how to display the online diagnostics for module 1:

Switch# show diagnostic result module 1 detail

Current bootup diagnostic level: minimal

module 1:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) supervisor-bootup ----------------------> .

  Error code --------------------------> 0 (DIAG_SUCCESS)
  Total run count ----------------------> 0
  Last test execution time --------------> n/a
  First test failure time -------------> n/a
  Last test failure time --------------> n/a
  Last test pass time ------------------> n/a
  Total failure count ------------------> 0
  Consecutive failure count ------------> 0

Switch#
show diagnostic result module test

To display the results of the bootup packet memory test, use the `show diagnostic result module test` command. The output indicates whether the test passed, failed, or was not run.

```
show diagnostic result module [N | all] [test test-id] [detail]
```

**Syntax Description**

- **N** (Optional) Specifies the module number.
- **all** (Optional) Specifies all modules.
- **test test-id** (Optional) Specifies the number for the tdr test on the platform.
- **detail** (Optional) Specifies the display of detailed information for analysis.

This option is recommended.

**Defaults**

Non-detailed results.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `detail` keyword is intended for use by Cisco support personnel when analyzing failures.

**Examples**

This example shows how to display the results of the bootup packet memory tests:

```
Switch# show diagnostic result module 6 detail
module 6:

Overall diagnostic result:PASS
Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag------------------> .
   Error code --------------------------> 0 (DIAG_SUCCESS)
   Total run count ---------------------> 1
   Last test execution time --------------> Jan 21 2001 19:48:30
   First test failure time ---------------> n/a
   Last test failure time ---------------> n/a
   Last test pass time ------------------> Jan 21 2001 19:48:30
   Total failure count ------------------> 0
   Consecutive failure count ------------> 0
```
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

show diagnostic result module test 2

To display the results of the bootup packet memory test, use the `show diagnostic result module test 2` command. The output indicates whether the test passed, failed, or was not run.

```
show diagnostic result module N test 2 [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Specifies the module number.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Specifies the display of detailed information for analysis.</td>
</tr>
</tbody>
</table>

**Defaults**

Non-detailed results.

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `detail` keyword is intended for use by Cisco support personnel when analyzing failures.

**Examples**

This example shows how to display the results of the bootup packet memory tests:

```
Switch# show diagnostic result module 1 test 2
Test results: (. = Pass, F = Fail, U = Untested)
  2) packet-memory-bootup ------------> .
```

This example shows how to display detailed results from the bootup packet memory tests:

```
Switch# show diagnostic result module 2 test 2 detail
Test results: (. = Pass, F = Fail, U = Untested)
  2) packet-memory-bootup ------------> .
  
  Error code ------------------> 0 (DIAG_SUCCESS)
  Total run count ---------------> 0
  Last test execution time -------> n/a
  First test failure time -------> n/a
  Last test failure time -------> n/a
  Last test pass time ----------> n/a
  Total failure count ----------> 0
  Consecutive failure count -----> 0
  packet buffers on free list: 64557 bad: 0 used for ongoing tests: 979
```
show diagnostic result module test 2

Number of errors found: 0
Cells with hard errors (failed two or more tests): 0
Cells with soft errors (failed one test, includes hard): 0
Suspect bad cells (uses a block that tested bad): 0
total buffers: 65536
bad buffers: 0 (0.0%)
good buffers: 65536 (100.0%)
Bootup test results:
No errors.

<table>

</table>
show dot1x

To display the 802.1X statistics and operational status for the entire switch or for a specified interface, use the `show dot1x` command.

```
show dot1x [interface interface-id] | [statistics [interface interface-id]] | [all]
```

**Syntax Description**

- `interface interface-id` (Optional) Displays the 802.1X status for the specified port.
- `statistics` (Optional) Displays 802.1X statistics for the switch or the specified interface.
- `all` (Optional) Displays per-interface 802.1X configuration information for all interfaces with a nondefault 802.1X configuration.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>T2.1(19)EW</td>
<td>Display enhanced to show the guest-VLAN value.</td>
</tr>
<tr>
<td>T2.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>T2.2(25)EWA</td>
<td>Support for currently assigned reauthentication timer (if the timer is configured to honor the Session-Timeout value) was added.</td>
</tr>
<tr>
<td>T2.2(31)SG</td>
<td>Support for port direction control and critical recovery was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify an interface, the global parameters and a summary are displayed. If you specify an interface, the details for that interface are displayed.

If you enter the `statistics` keyword without the `interface` option, the statistics are displayed for all interfaces. If you enter the `statistics` keyword with the `interface` option, the statistics are displayed for the specified interface.

Expressions are case sensitive. For example, if you enter `exclude output`, the lines that contain `output` are not displayed, but the lines that contain `Output` are displayed.

The `show dot1x` command displays the currently assigned reauthentication timer and time remaining before reauthentication, if reauthentication is enabled.
**Examples**

This example shows how to display the output from the `show dot1x` command:

```
Switch# show dot1x
Sysauthcontrol = Disabled
Dot1x Protocol Version = 2
Dot1x Oper Controlled Directions = Both
Dot1x Admin Controlled Directions = Both
Critical Recovery Delay = 500
Critical EAP = Enabled
Switch#
```

This example shows how to display the 802.1X statistics for a specific port:

```
Switch# show dot1x interface fastethernet6/1
Dot1x Info for FastEthernet6/1

show energywise

Use the show energywise privileged EXEC command to display the EnergyWise settings and status of the entity and the power over Ethernet (PoE) ports.

```
```

**Syntax Description**

- **categories** (Optional) Displays the power levels.
- **children** (Optional) Displays the status of the entity and the PoE ports.
- **domain** (Optional) Displays the domain to which the entity belongs.
- **events** (Optional) Displays the last ten events (messages) sent to other entities in the domain.
- **level children** (Optional) Displays the available power level for the entity.
  - **children**—Available power levels for the entity and the PoE ports.
  - **current**—Current power level for the entity.
    - (Optional) **children**—Current power levels for the entity and the PoE ports.
  - **delta**—Difference between the current and available power levels for the entity.
    - (Optional) **children**—Difference between the current and available power levels for the entity and the PoE ports.
- **neighbors** (Optional) Displays the neighbor tables for the domains to which the entity belongs.
- **recurrences** (Optional) Displays the EnergyWise settings and status for recurrence.
- **statistics** (Optional) Displays the counters for events and errors.
- **usage children** (Optional) Displays the power for the entity.
  - **children**—Displays the power for the PoE ports.
- **version** (Optional) Displays the EnergyWise version.

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Expressions are case sensitive. For example, if you enter |exclude output, the lines that contain output do not appear, but the lines that contain Output appear.
show energywise

Examples

show environment

To display the environment alarm, operational status, and current reading for the chassis, use the `show environment` command.

```
show environment [alarm] [status [chassis | fantray | powersupply | supervisor]] [temperature]
```

### Syntax Description

- **alarm**: (Optional) Specifies the alarm status of the chassis.
- **status**: (Optional) Specifies the operational status information.
- **chassis**: (Optional) Specifies the operational status of the chassis.
- **fantray**: (Optional) Specifies the status of the fan tray, and shows fan tray power consumption.
- **powersupply**: (Optional) Specifies the status of the power supply.
- **supervisor**: (Optional) Specifies the status of the supervisor engine.
- **temperature**: (Optional) Specifies the current chassis temperature readings.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

#### Release Modification

<table>
<thead>
<tr>

Supervisor Led Color : Green
Fantray : good
Power consumed by Fantray : 50 Watts

Switch#

This example shows how to display information about the chassis:

Switch# show environment status chassis
Chassis Type : WS-C4507R
Switch#

This example shows how to display information about the fan tray:

Switch# show environment status fantray
Fantray : good
Power consumed by Fantray : 50 Watts
Switch#
This example shows how to display information about the power supply:

```
Switch# show environment status powersupply
Power Supply  Model No    Type       Status   Sensor
-------  ---------------  ---------  -------  ------
PS1      WS-X4008       AC  400W    good     good
PS2      WS-X4008       AC  400W    good     good
PS3      none            --         --       --
```

Switch#

This example shows how to display information about the supervisor engine:

```
Switch# show environment status supervisor
Supervisor Led Color :Green
Switch#
```

This example shows how to display information about the temperature of the chassis:

```
Switch# show environment temperature
Chassis Temperature = 32 degrees Celsius
Chassis Over Temperature Threshold = 75 degrees Celsius
Chassis Critical Temperature Threshold = 95 degrees Celsius
Switch#
```
show errdisable detect

To display the error disable detection status, use the `show errdisable detect` command.

```
show errdisable detect
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>

<tr>
<td>12.1(19)EW</td>
<td>Display includes the status of storm control.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display recovery timer information for error disable:

```
Switch# show errdisable recovery
ErrDisable Reason   Timer Status
-----------------    --------------
udld               Disabled
bpduguard          Disabled
security-violatio  Disabled
channel-misconfig  Disabled
vmps               Disabled
pagp-flap          Disabled
dtp-flap           Disabled
link-flap           Disabled
l2ptguard          Disabled
psecure-violation  Disabled
gbic-invalid       Disabled
dhcp-rate-limit    Disabled
unicast-flood      Disabled
storm-control      Disabled
arp-inspection     Disabled

Timer interval: 30 seconds

Interfaces that will be enabled at the next timeout:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Errdisable reason</th>
<th>Time left(sec)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa7/32</td>
<td>arp-inspect</td>
<td>13</td>
</tr>
</tbody>
</table>
```
## show errdisable recovery

The `show errdisable recovery` command displays the interface status or a list of interfaces in error-disabled state.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>errdisable detect</code></td>
<td>Enables error-disable detection.</td>
</tr>
<tr>
<td><code>errdisable recovery</code></td>
<td>Configures the recovery mechanism variables.</td>
</tr>
<tr>
<td><code>show interfaces status</code></td>
<td>Displays the interface status or a list of interfaces in error-disabled state.</td>
</tr>
</tbody>
</table>
show etherchannel

To display EtherChannel information for a channel, use the show etherchannel command.

```
show etherchannel [channel-group] [port-channel | brief | detail | summary | port | load-balance | protocol]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>channel-group</td>
<td>(Optional) Number of the channel group; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>port-channel</td>
<td>Displays port-channel information.</td>
</tr>
<tr>
<td>brief</td>
<td>Displays a summary of EtherChannel information.</td>
</tr>
<tr>
<td>detail</td>
<td>Displays detailed EtherChannel information.</td>
</tr>
<tr>
<td>summary</td>
<td>Displays a one-line summary per channel group.</td>
</tr>
<tr>
<td>port</td>
<td>Displays EtherChannel port information.</td>
</tr>
<tr>
<td>load-balance</td>
<td>Displays load-balance information.</td>
</tr>
<tr>
<td>protocol</td>
<td>Displays the enabled protocol.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Release**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>T2.1(13)EW</td>
<td>Support for LACP was added to this command.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a channel group, all channel groups are displayed.

In the output below, the Passive port list field is displayed for Layer 3 port channels only. This field means that the physical interface, which is still not up, is configured to be in the channel group (and indirectly in the only port channel in the channel group).

**Examples**

This example shows how to display port-channel information for a specific group:

```
Switch# show etherchannel 1 port-channel
Port-channels in the group:

<tr>
<td>TxPause</td>
<td>Number of pause frames transmitted.</td>
</tr>
</tbody>
</table>
This example shows how to display the flow control status on all the Gigabit Ethernet interfaces:

```
Switch# show flowcontrol
Port       Send FlowControl  Receive FlowControl  RxPause TxPause
---------  -------- -------- -------- --------    ------- -------
Tel1/1      off      off      on       off         0       0
Tel1/2      off      off      on       off         0       0
Gi1/3      off      off      desired  on          0       0
Gi1/4      off      off      desired  on          0       0
Gi1/5      off      off      desired  on          0       0
Gi1/6      off      off      desired  on          0       0
Gi3/1      off      off      desired  off         0       0
Gi3/2      off      off      desired  off         0       0
Gi3/3      off      off      desired  off         0       0
Gi3/4      off      off      desired  off         0       0
Gi3/5      off      off      desired  off         0       0
Gi3/6      off      off      desired  off         0       0
Switch#
```

This example shows how to display the flow control status on module 1:

```
Switch# show flowcontrol module 1
Port    Send FlowControl  Receive FlowControl  RxPause TxPause
admin    oper     admin    oper
-----   -------- -------- -------- --------    ------- -------
Gi1/1   desired  off      off      off         0       0
Gi1/2   on       disagree on       on          0       0
Switch#
```

This example shows how to display the flow control status on Gigabit Ethernet interface 3/4:

```
Switch# show flowcontrol interface gigabitethernet3/4
Port    Send FlowControl  Receive FlowControl  RxPause TxPause
admin    oper     admin    oper
-----   -------- -------- -------- --------    ------- -------
Gi3/4   off      off      on       on          0       0
Switch#
```

This example shows how to display the flow control status on 10-Gigabit Ethernet interface 1/1:

```
Switch# show flowcontrol interface tengigabitethernet1/1
Port       Send FlowControl  Receive FlowControl  RxPause TxPause
---------  -------- -------- -------- --------    ------- -------
Te1/1      off      off      on       off         0       0
Switch#
```

**Defaults**

X2 mode.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for WS-X4606-10GE-E Twin Gigabit converter introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a TwinGig converter is enabled or disabled, the number and type of ports on the line card change dynamically. The terminology must reflect this behavior. In Cisco IOS, 10-Gigabit ports are named TenGigabit and 1-Gigabit ports are named Gigabit. Starting with Cisco IOS Release 12.2(40)SG, to avoid having ports named TenGigabit1/1 and Gigabit1/1, the 10-Gigabit and 1-Gigabit port numbers are independent. The WS-X4606-10GE-E module with six X2 ports are named TenGigabit<slot-num>/<1-6>, and the SFP ports are named Gigabit<slot-num>/<7-18>.

In the Supervisor Engine 6-E and Catalyst 4900M chassis, the ports are connected to the switching engine through a stub ASIC. This stub ASIC imposes some limitations on the ports: Gigabit and 10-Gigabit ports cannot be mixed on a single stub ASIC; they must either be all 10-Gigabit (X2), or all Gigabit (TwinGig converter and SFP). The faceplates of X2 modules show this stub-port grouping, either with an actual physical grouping, or a box drawn around a grouping.

**Examples**

This example shows to determine how the X2 holes on a module are grouped on a WS-X4606-10GE-E:

```
Switch# show hw-module module 1 port-group
Module | Port-group | Active | Inactive |
-------|------------|--------|----------|
1      | 1          | Te1/1-3| Gi1/7-12 |
1      | 2          | Te1/4-6| Gi1/13-18|
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>hw-module port-group</code></td>
<td>Selects either Gigabit Ethernet or Ten Gigabit Ethernet interfaces on your module.</td>
</tr>
</tbody>
</table>
**show hw-module uplink**

To display the current uplink mode, use the `show hw-module uplink` command.

```bash
show hw-module uplink
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the active uplink mode is different than configured mode, the output displays the change.

By default, the current (operational) uplink selection is displayed.

**Examples**

This example shows the output displaying the current (active) uplinks:

```bash
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
```

This example shows the output for redundant systems in SSO mode if the 10-Gigabit Ethernet uplinks are active, and the Gigabit Ethernet uplinks are selected:

```bash
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
(Will be GigabitEthernet after next reload)
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration
```

This example shows the output for redundant systems in RPR mode if the 10-Gigabit Ethernet uplinks are active, and the Gigabit Ethernet uplinks are selected:

```bash
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
(Will be GigabitEthernet after next reload)
A reload of active supervisor is required to apply the new configuration.
```

**Related Commands**

<table>
<thead>

</tbody>
</table>
show idprom

To display the IDPROMs for the chassis, supervisor engine, module, power supplies, fan trays, clock
module, and multiplexer (mux) buffer, use the show idprom command.

```
show idprom { all | chassis | module [mod] | interface int_name | supervisor | power-supply
number | fan-tray }
```

### Syntax Description

   Power Consumption = -1
   RMA Failure Code = 255 255 255 255
Switch#
```
show interfaces

To display traffic on a specific interface, use the show interfaces command.

```
show interfaces [{fastethernet mod/interface-number} | {gigabitethernet mod/interface-number} | {tengigabitethernet mod/interface-number} | {null interface-number} | vlan vlan_id | status]
```

**Syntax Description**
- **fastethernet mod/interface-number** (Optional) Specifies the Fast Ethernet module and interface.
- **gigabitethernet mod/interface-number** (Optional) Specifies the Gigabit Ethernet module and interface.
- **tengigabitethernet mod/interface-number** (Optional) Specifies the 10-Gigabit Ethernet module and interface.
- **null interface-number** (Optional) Specifies the null interface; the valid value is 0.
- **vlan vlan_id** (Optional) Specifies the VLAN; valid values are from 1 to 4094.
- **status** (Optional) Displays status information.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

</tr>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The statistics are collected per VLAN for Layer 2 switched packets and Layer 3 switched packets. The statistics are available for both unicast and multicast. The Layer 3 switched packet counts are available for both the ingress and egress directions. The per-VLAN statistics are updated every 5 seconds.

In some cases, the duplex mode that is displayed by the show interfaces command is different than that displayed by the show running-config command. The duplex mode that is displayed in the show interfaces command is the actual duplex mode that the interface is running. The show interfaces command shows the operating mode for an interface, but the show running-config command shows the configured mode for an interface.
If you do not enter any keywords, all counters for all modules are displayed.

Line cards that support auto-MDIIX configuration on their copper media ports include: WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or later, and WS-X4232-GB-RJ with hardware revision 3.0 or later.

Examples

This example shows how to display traffic for Gigabit Ethernet interface 2/5:

Switch# show interfaces gigabitethernet2/5
GigabitEthernet9/5 is up, line protocol is up (connected) (vlan-err-dis)
Hardware is C4k 1000Mb 802.3, address is 0001.64f8.3fa5 (bia 0001.64f8.3fa5)
Internet address is 172.20.20.20/24
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec, reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Full-duplex, 1000Mb/s
ARP type: ARPA, ARP Timeout 04:00:00
Last input 00:00:00, output never, output hang never
Last clearing of *show interface* counters never
Queuing strategy: fifo
Output queue 0/40, 0 drops; input queue 0/75, 0 drops
5 minute input rate 1000 bits/sec, 2 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
L2 Switched: ucast: 8199 pkt, 136260 bytes - mcast: 6980 pkt, 371952 bytes
L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes mcast
L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes
300114 packets input, 27301436 bytes, 0 no buffer
Received 43458 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
0 input packets with dribble condition detected
15181 packets output, 1955836 bytes, 0 underruns
0 output errors, 0 collisions, 3 interface resets
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier
0 output buffer failures, 0 output buffers swapped out
Switch#

This example shows how to display traffic for 10-Gigabit Ethernet interface 1/1:

Switch# show interfaces tengigabitethernet1/1
Name: Tengigabitethernet1/1
Switchport: Enabled
Administrative Mode: private-vlan promiscuous trunk
Operational Mode: private-vlan promiscuous (suspended member of bundle Po1)
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: off
Access Mode VLAN: none
Trunking Native Mode VLAN: none
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304)
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk
Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: 802.1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Administrative private-vlan trunk mapping trunk: New 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304) 204 (VLAN0204) 305 (VLAN0305) 306 (VLAN0306)
Operational private-vlan: 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Switch#

This example shows how to verify the status of auto-MDIX on an RJ-45 port:

Note
You can verify the configuration setting and the operational state of auto-MDIX on the interface by entering the `show interfaces` EXEC command. This field is applicable and appears only on the `show interfaces` command output for 10/100/1000BaseT RJ-45 copper ports on supported linecards including WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or later, and WS-X4232-GB-RJ with hardware revision 3.0 or later.

FastEthernet6/3 is up, line protocol is up (connected)
  Hardware is Fast Ethernet Port, address is 0003.6ba8.ee68 (bia 0003.6ba8.ee68)
  MTU 1500 bytes, BW 100000 Kbit, DLY 100 usec,
      reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive set (10 sec)
  Full-duplex, 100Mb/s, link type is auto, media type is 10/100BaseTX
  input flow-control is unsupported output flow-control is unsupported
  Auto-MDIX on (operational: on)
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Queueing strategy: fifo
  Output queue: 0/40 (size/max)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
  0 packets input, 0 bytes, 0 no buffer
  Received 0 broadcasts (0 multiscasts)
  0 runts, 0 giants, 0 throttles
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
  0 input packets with dribble condition detected
  157082 packets output, 13418032 bytes, 0 underruns
  0 output errors, 0 collisions, 0 interface resets
  0 babbles, 0 late collision, 0 deferred
  0 lost carrier, 0 no carrier
  0 output buffer failures, 0 output buffers swapped out
Switch#

This example shows how to display status information for Gigabit Ethernet interface 1/2:

Switch# `show interfaces gigabitethernet1/2 status`
Port       Name         Status       Vlan       Duplex  Speed Type
Gi1/2      notconnect   1            auto   1000 10G-10GBase-LR
Switch#

This example shows how to display status information for the interfaces on the supervisor engine:

Switch# `show interfaces status`
Port       Name         Status       Vlan       Duplex  Speed Type
Te1/1      connected   1            full    10G 10GBase-LR
Te1/2      connected   1            full    10G 10GBase-LR
Switch#
**show interfaces capabilities**

To display the interface capabilities for an interface or for all the interfaces on a switch, use the `show interfaces capabilities` command.

```
show interfaces capabilities [(module mod)]
show interfaces [interface interface-number] capabilities
```

**Syntax Description**

- **module mod** (Optional) Displays information for the specified module only.
- **interface** (Optional) Interface type; valid values are `fastethernet`, `gigabitethernet`, `tengigabitethernet`, and `port-channel`.
- **interface-number** (Optional) Port number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support for auto-MDIX reflected in command output.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `interface-number` argument designates the module and port number. Valid values for `interface-number` depend on the chassis and module used. For example, if you have a 48-port 10/100-Mbps Fast Ethernet RJ-21 (telco connector) switching module installed in a Catalyst 4507 chassis, valid values for the slot number are from 2 to 13 and valid values for the port number are 1 to 48.

Line cards that support auto-MDIX configuration on their copper media ports include: WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or higher, and WS-X4232-GB-RJ with hardware revision 3.0 or higher.
Examples

This example shows how to display the interface capabilities for a module:

Switch# **show interfaces capabilities module 1**

GigabitEthernet1/1

- **Model:** WS-X4516-Gbic
- **Type:** Unsupported GBIC
- **Speed:** 1000
- **Duplex:** full
- **Trunk encaps. type:** 802.1Q, ISL
- **Trunk mode:** on, off, desirable, nonegotiate
- **Channel:** yes
- **Broadcast suppression:** percentage(0-100), hw
- **Flowcontrol:** rx-(off, on, desired), tx-(off, on, desired)
- **VLAN Membership:** static, dynamic
- **Fast Start:** yes
- **Queueing:** rx-(N/A), tx-(4q1t, Sharing/Shaping)
- **CoS rewrite:** yes
- **ToS rewrite:** yes
- **Inline power:** no
- **SPAN:** source/destination
- **UDLD:** yes
- **Link Debounce:** no
- **Link Debounce Time:** no
- **Port Security:** yes
- **Dot1x:** yes

GigabitEthernet1/2

- **Model:** WS-X4516-Gbic
- **Type:** Unsupported GBIC
- **Speed:** 1000
- **Duplex:** full
- **Trunk encaps. type:** 802.1Q, ISL
- **Trunk mode:** on, off, desirable, nonegotiate
- **Channel:** yes
- **Broadcast suppression:** percentage(0-100), hw
- **Flowcontrol:** rx-(off, on, desired), tx-(off, on, desired)
- **VLAN Membership:** static, dynamic
- **Fast Start:** yes
- **Queueing:** rx-(N/A), tx-(4q1t, Sharing/Shaping)
- **CoS rewrite:** yes
- **ToS rewrite:** yes
- **Inline power:** no

</table>
show interfaces counters

To display the traffic on the physical interface, use the `show interfaces counters` command.

```
show interfaces counters [all | detail | errors | storm-control | trunk] [module mod]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Displays all the interface counters including errors, trunk, and detail.</td>
</tr>
<tr>

<td>Support for the display of total suppression discards.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not enter any keywords, all the counters for all modules are displayed.

The display for the `storm-control` keyword includes the suppressed multicast bytes.

### Examples

This example shows how to display the error counters for a specific module:

```
Switch# show interfaces counters errors module 1
```

```
Port     Align-Err  FCS-Err  Xmit-Err  Rcv-Err  UnderSize
Gi1/1    0          0        0        0        0        0        0
Gi1/2    0          0        0        0        0        0        0

Port     Single-Col Multi-Col Late-Col Excess-Col Carri-Sen Runts Giants
Gi1/1    0          0        0        0        0        0        0
Gi1/2    0          0        0        0        0        0        0
Switch#
```
This example shows how to display the traffic that is seen by a specific module:

```
Switch# show interfaces counters module 1

+---------------+--------+--------+--------+--------+
<table>
<thead>
<tr>
<th>Port</th>
<th>InOctets</th>
<th>InUcastPkts</th>
<th>InMcastPkts</th>

</table>
```

Switch#

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces capabilities</td>
<td>Displays the interface capabilities for an interface or for all the interfaces on a switch.</td>
</tr>
</tbody>
</table>
show interfaces description

To display a description and status of an interface, use the `show interfaces description` command.

```
show interfaces [interface] description
```

**Syntax Description**

```
interface (Optional) Type of interface.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information for all interfaces:

```
Switch# show interfaces description
Interface Status Protocol Description
PO0/0   admin down  down  First interface
PO0/1   admin down  down
Gi1/1   up           up  GigE to server farm
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description (refer to Cisco IOS documentation)</td>
<td>Includes a specific description about the digital signal processor (DSP) interface.</td>
</tr>
</tbody>
</table>
show interfaces link

To display how long a cable has been disconnected from an interface, use the `show interfaces link` command:

```
show interfaces link [module mod_num]
```

**Syntax Description**

```
module mod_num (Optional) Limits the display to interfaces on a module.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the interface state is up, the command displays 0:00. If the interface state is down, the time (in hours, minutes, and seconds) is displayed.

**Examples**

This example shows how to display active link-level information:

```
Switch# show interfaces link

<table>
<thead>
<tr>
<th>Port</th>
<th>Name</th>
<th>Down Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/1</td>
<td></td>
<td>00:00:00</td>
</tr>
<tr>
<td>Gi1/2</td>
<td></td>
<td>00:00:00</td>
</tr>
<tr>
<td>Gi3/1</td>
<td></td>
<td>00:00:00</td>
</tr>
<tr>
<td>Gi3/2</td>
<td></td>
<td>00:00:00</td>
</tr>
<tr>
<td>Fa4/1</td>
<td></td>
<td>00:00:00</td>
</tr>
<tr>
<td>Fa4/2</td>
<td></td>
<td>00:00:00</td>
</tr>
<tr>
<td>Fa4/3</td>
<td></td>
<td>00:00:00</td>
</tr>
<tr>
<td>Fa4/4</td>
<td></td>
<td>00:00:00</td>
</tr>
</tbody>
</table>
```

This example shows how to display inactive link-level information:

```
Switch# show interfaces link

<table>
<thead>
<tr>
<th>Port</th>
<th>Name</th>
<th>Down Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi3/4</td>
<td></td>
<td>1 minute 28 secs</td>
</tr>
<tr>
<td>Gi3/5</td>
<td></td>
<td>1 minute 28 secs</td>
</tr>
<tr>
<td>Gi3/6</td>
<td></td>
<td>1 minute 28 secs</td>
</tr>
<tr>
<td>Gi4/1</td>
<td></td>
<td>1 minute 28 secs</td>
</tr>
</tbody>
</table>
```

In this example, the cable has been disconnected from the port for 1 minute and 28 seconds.
**show interfaces mtu**

To display the maximum transmission unit (MTU) size of all the physical interfaces and SVIs on the switch, use the `show interfaces mtu` command.

```
show interfaces mtu [module mod]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module mod</td>
<td>(Optional) Limits the display to interfaces on a specific module.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the MTU size for all interfaces on module 1:

```
Switch> show interfaces mtu module 1

Port  Name  MTU
Gi1/1  1500
Gi1/2  1500
Switch>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>Enables jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU).</td>
</tr>
</tbody>
</table>
**show interfaces private-vlan mapping**

To display PVLAN mapping information for VLAN SVIs, use the `show interfaces private-vlan mapping` command.

```
show interfaces private-vlan mapping [active]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active</td>
<td>(Optional) Displays active interfaces only.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays SVI information only.

**Examples**

This example shows how to display PVLAN mapping information:

```
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
--------- -------------- -----------------
vlan2     301            isolated
vlan2     302            isolated
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>private-vlan</td>
<td>Configures private VLANs and the association between a private VLAN and a secondary VLAN.</td>
</tr>
<tr>
<td>private-vlan mapping</td>
<td>Creates a mapping between the primary and the secondary VLANs so that both share the same primary VLAN SVI.</td>
</tr>
</tbody>
</table>
show interfaces status

To display the interface status or a list of interfaces in error-disabled state, use the `show interfaces status` command.

```
show interfaces status [err-disabled | inactive] [module {module}]
```

### Syntax Description

- **err-disabled** (Optional) Displays interfaces in error-disabled state.
- **inactive** (Optional) Displays interfaces in inactive state.
- **module module** (Optional) Displays interfaces on a specific module.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support for WS-X4606-10GE-E Twin Gigabit converter introduced.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support for per-VLAN error-disable was introduced by adding Err-Disabled VLAN column to output.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When at least one VLAN on a port is error-disabled the output for the `show interfaces status` command will display `vl-err-dis` in the VLAN column.

### Examples

This example shows how to display the status of all interfaces:

```
Switch# show interfaces status

Port    Name      Status     Vlan     Duplex Speed Type
Tel/1    1         connected  1         full   10G 10GBase-LR
Tel/2    vl-err-dis connected full   10G 10GBase-LR
Switch#
```

This example shows how to display the status of interfaces in an error-disabled state:

```
Switch# show interfaces status err-disabled

Port    Name      Status     Reason           Err-Disabled VLANS
Fa9/4    4         notconnect link-flap          ---------------
Fa9/5    5         err-disabled psecure_violation 3-5
Fa9/6    6         connected  psecure_violation 10,15
Switch#```
This example shows how to display the Gigabit Ethernet interfaces on a WS-X4606-10GE-E switch using the TwinGig Convertor:

Switch# `show interfaces status module 1`
Port Name Status Vlan Duplex Speed Type
Te1/1 inactive 1 full 10G No X2
Te1/2 inactive 1 full 10G No X2
Te1/3 inactive 1 full 10G No X2
Te1/4 notconnect 1 full 10G No X2
Te1/5 notconnect 1 full 10G No X2
Te1/6 notconnect 1 full 10G No X2
Gi1/7 notconnect 1 full 1000 No Gbic
Gi1/8 notconnect 1 full 1000 No Gbic
Gi1/9 notconnect 1 full 1000 No Gbic
Gi1/10 notconnect 1 full 1000 No Gbic
Gi1/11 notconnect 1 full 1000 No Gbic
Gi1/12 notconnect 1 full 1000 No Gbic
Gi1/13 inactive 1 full 1000 No Gbic
Gi1/14 inactive 1 full 1000 No Gbic
Gi1/15 inactive 1 full 1000 No Gbic
Gi1/16 inactive 1 full 1000 No Gbic
Gi1/17 inactive 1 full 1000 No Gbic
Gi1/18 inactive 1 full 1000 No Gbic
Switch#

</tbody>
</table>
show interfaces switchport

To display the administrative and operational status of a switching (nonrouting) port, use the `show interfaces switchport` command.

```
show interfaces [interface-id] switchport [module mod]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface-id</code></td>
<td>(Optional) Interface ID for the physical port.</td>
</tr>
<tr>
<td><code>module mod</code></td>
<td>(Optional) Limits the display to interfaces on the specified module; valid values are from 1 to 6.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tr>
<td>15.1.0 SG</td>
<td>Support for PVLAN modes over EtherChannel. Modes include: private-vlan host, private-vlan promiscuous, private-vlan trunk secondary, and private-vlan trunk promiscuous.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display switch-port information using the `begin` output modifier:

```
Switch# show interfaces switchport | include VLAN
Name: Fa5/6
Access Mode VLAN: 200 (VLAN0200)
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: ALL
Switch#
```

This example shows how to display switch-port information for module 1:

```
Switch# show interfaces switchport module 1
Name:G1/1
Switchport:Enabled
Administrative Mode:dynamic auto
Operational Mode:down
Administrative Trunking Encapsulation:negotiate
Negotiation of Trunking:On
Access Mode VLAN:1 (default)
Trunking Native Mode VLAN:1 (default)
Administrative private-vlan host-association:none
Administrative private-vlan mapping:none
Operational private-vlan:none
Trunking VLANs Enabled:ALL
```
Pruning VLANs Enabled: 2-1001

Name: Gi1/2
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: down
Administrative Trunking Encapsulation: negotiate

</tbody>
</table>
show interfaces transceiver

To display diagnostic-monitoring data for all interfaces that have transceivers installed, use the `show interfaces transceiver` command.

```
show interfaces {{[int_name] transceiver {[detail]} | {transceiver [module mod] | detail [module mod]}}}
```

**Syntax Description**

- `int_name` (Optional) Interface name.
- `detail` (Optional) Displays the calibrated values and the A2D readouts if the readout values differ from the calibrated values. Also displays the high-alarm, high-warning, low-warning, and low-alarm thresholds.
- `module mod` (Optional) Limits the display to interfaces on a specific module.

**Defaults**

The noninterface-specific versions of the `show interfaces transceiver` command are enabled by default. The interface-specific versions of these commands are enabled by default if the specified interface has a transceiver (GBIC or SFP) that is configured for diagnostic monitoring, and the transceiver is in a module that supports diagnostic monitoring.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support for the <code>calibration</code> keyword was withdrawn.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show interfaces transceiver` command provides useful information under the following conditions:

- At least one transceiver is installed on a chassis that is configured for diagnostic monitoring.
- The transceiver is in a module that supports diagnostic monitoring.

If you notice that the alarm and warning flags have been set on a transceiver, reenter the command to confirm.
Examples

This example shows how to display diagnostic monitoring data for all interfaces with transceivers installed on the switch:

Switch# **show interfaces transceiver**

If device is externally calibrated, only calibrated values are printed.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).

<table>
<thead>
<tr>
<th>Port</th>
<th>Temperature (Celsius)</th>
<th>Voltage (Volts)</th>
<th>Current (mA)</th>
<th>Optical Tx Power (dBm)</th>
<th>Optical Rx Power (dBm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/1</td>
<td>48.1</td>
<td>3.30</td>
<td>0.0</td>
<td>8.1 ++</td>
<td>N/A</td>
</tr>
<tr>
<td>Gi1/2</td>
<td>33.0</td>
<td>3.30</td>
<td>1.8</td>
<td>-10.0</td>
<td>-36.9</td>
</tr>
<tr>
<td>Gi2/1</td>
<td>43.7</td>
<td>5.03</td>
<td>50.6 +</td>

<tr>
<td>Gi2/2</td>
<td>39.2</td>
<td>5.02</td>
<td>25.7</td>
<td>0.8</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Switch#

Note

The value for the Optical Tx Power (in dBm) equals ten times log (Tx Power in mW). If the Tx Power value is 3 mW, then the Optical Tx Power value equals 10 * log (3), which equals 10 * .477 or 4.77 dBm. The Optical Rx Power value behaves similarly. If the Tx Power or the Rx Power is zero, then its dBm value is undefined and is shown as N/A (not applicable).

This example shows how to display detailed diagnostic monitoring data, including calibrated values, alarm and warning thresholds, A2D readouts, and alarm and warning flags. The A2D readouts are reported separately in parentheses only if they differ from the calibrated values:

Switch# **show interfaces transceiver detail**

mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are calibrated.

This example shows how to display the monitoring data for the transceivers on interface Gi1/2:

```
Switch# show interfaces g1/2 transceiver
ITU Channel 23 (1558.98 nm),
Transceiver is externally calibrated.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).
```

```
+-----------------+-----------------+-----------------+-----------------+-----------------+
| Port            | Current  | High Alarm  | High Warn  | Low Warn  | Low Alarm  |
|                 | (mA)     | Threshold   | Threshold  | Threshold | Threshold  |
|-----------------+----------+-------------+------------+-----------+-----------|
| Gi2/1           | 50.6     | 60.0        | 40.0       | 10.0      | 5.0       |
| Gi2/2           | 25.8     | 60.0        | 40.0       | 10.0      | 5.0       |
```

Switch#

This example shows how to display detailed monitoring data for the transceivers on interface Gi1/2:

```
Switch# show interfaces g1/2 transceiver detail
ITU Channel 23 (1558.98 nm),
Transceiver is externally calibrated.
mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are calibrated.
```

```
+-----------------+-----------------+-----------------+-----------------+-----------------+
| Port            | Temperature  | Voltage  | Current  | Optical Tx Power  | Optical Rx Power |
|                 | (Celsius)    | (Volts)  | (mA)     | (dBm)              | (dBm)           |

</tbody>
</table>
show interfaces trunk

To display port and module interface-trunk information, use the `show interfaces trunk` command.

```
  show interfaces trunk [module mod]
```

**Syntax Description**

- `module mod` (Optional) Limits the display to interfaces on the specified module; valid values are from 1 to 6.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a keyword, only information for trunking ports is displayed.

**Examples**

This example shows how to display interface-trunk information for module 5:

```
Switch# show interfaces trunk module 5

Port      Mode         Encapsulation  Status        Native vlan
Fa5/1     routed       negotiate      routed        1
Fa5/2     routed       negotiate      routed        1
Fa5/3     routed       negotiate      routed        1
Fa5/4     routed       negotiate      routed        1
Fa5/5     routed       negotiate      routed        1
Fa5/6     off          negotiate      not-trunking  10
Fa5/7     off          negotiate      not-trunking  10
Fa5/8     off          negotiate      not-trunking  1
Fa5/9     desirable    n-isl          trunking      1
Fa5/10    desirable    negotiate      not-trunking  1
Fa5/11    routed       negotiate      routed        1
Fa5/12    routed       negotiate      routed        1
...       Fa5/48 routed   negotiate      routed        1

Port      Vlans allowed on trunk
Fa5/1     none
Fa5/2     none
Fa5/3     none
Fa5/4     none
Fa5/5     none
Fa5/6     none
Fa5/7     none
Fa5/8     200
Fa5/9     1-1005
```
This example shows how to display trunking information for active trunking ports:

```
Switch# show interfaces trunk

Port        Mode         Encapsulation  Status        Native vlan
Fa5/9       desirable    n-isl          trunking      1

Port        Vlans allowed on trunk
Fa5/9       1-1005

Port        Vlans allowed and active in management domain
Fa5/9       1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-8
            02,850,917,999,1002-1005

Port        Vlans in spanning tree forwarding state and not pruned
Fa5/9       1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-8
            02,850,917,999,1002-1005
```

Switch#
show ip arp inspection

To show the status of dynamic ARP inspection for a specific range of VLANs, use the `show ip arp inspection` command.

```
show ip arp inspection { [statistics] vlan vlan-range | interfaces [interface-name] }
```

**Syntax Description**

- `statistics` (Optional) Displays statistics for the following types of packets that have been processed by this feature: forwarded, dropped, MAC validation failure, and IP validation failure.
- `vlan vlan-range` (Optional) When used with the `statistics` keyword, displays the statistics for the selected range of VLANs. Without the `statistics` keyword, displays the configuration and operating state of DAI for the selected range of VLANs.
- `interfaces interface-name` (Optional) Displays the trust state and the rate limit of ARP packets for the provided interface. When the interface name is not specified, the command displays the trust state and rate limit for all applicable interfaces in the system.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the statistics of packets that have been processed by DAI for VLAN 3:

```
Switch# show ip arp inspection statistics vlan 3

Vlan      Forwarded        Dropped     DHCP Drops     ACL Drops
----      ---------        -------     ----------     ----------
 3          31753         102407         102407              0

Vlan   DHCP Permits    ACL Permits   Source MAC Failures
----   ------------    -----------   -------------------
 3          31753              0                    0

Vlan   Dest MAC Failures   IP Validation Failures
----   -----------------   ----------------------
 3                  0                        0

Switch#
```
This example shows how to display the statistics of packets that have been processed by DAI for all active VLANs:

Switch# `show ip arp inspection statistics`

show ip arp inspection log

To show the status of the log buffer, use the show ip arp inspection log command.

show ip arp inspection log

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

Release        Modification
--------------  ----------------------------------------
12.1(19)EW      Support for this command was introduced on the Catalyst 4500 series switch.

Examples

This example shows how to display the current contents of the log buffer before and after the buffers are cleared:

Switch# show ip arp inspection log
Total Log Buffer Size : 10
Syslog rate : 0 entries per 10 seconds.

<tr>
<td>12.2(25)EWA</td>
<td>Support for option 82 on untrusted ports was added.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the DHCP snooping configuration:

```
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled
DHCP snooping is configured on following VLANs:
500,555
DHCP snooping is operational on following VLANs:
500,555
DHCP snooping is configured on the following L3 Interfaces:
Insertion of option 82 is enabled
circuit-id default format: vlan-mod-port
remote-id: switch123 (string)
Option 82 on untrusted port is not allowed Verification of hwaddr field is enabled DHCP
snooping trust/rate is configured on the following Interfaces:
Interface Trusted Rate limit (pps)
------------------------ ------- ----------------
FastEthernet5/1 yes 100
Custom circuit-ids:
VLAN 555: customer-555
FastEthernet2/1 no unlimited
Custom circuit-ids:
VLAN 500: customer-500
Switch#
```

**Related Commands**

<table>

</tr>
</thead>
<tbody>
<tr>
<td><code>ip dhcp snooping</code></td>
<td>Globally enables DHCP snooping.</td>
</tr>
<tr>
<td><code>ip dhcp snooping information option</code></td>
<td>Enables DHCP option 82 data insertion.</td>
</tr>
<tr>
<td><code>ip dhcp snooping limit rate</code></td>
<td>Configures the number of the DHCP messages that an interface can receive per second.</td>
</tr>
</tbody>
</table>
show ip dhcp snooping

**Command** | **Description**
--- | ---
`ip dhcp snooping trust` | Enables DHCP snooping on a trusted VLAN.
`ip dhcp snooping vlan` | Enables DHCP snooping on a VLAN or a group of VLANs.
show ip dhcp snooping binding

To display the DHCP snooping binding entries, use the show ip dhcp snooping binding command.

```
show ip dhcp snooping binding [ip-address] [mac-address] [vlan vlan_num]
 [interface interface_num]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>(Optional) IP address for the binding entries.</td>
</tr>
<tr>
<td>mac-address</td>
<td>(Optional) MAC address for the binding entries.</td>
</tr>
<tr>
<td>vlan vlan_num</td>
<td>(Optional) Specifies a VLAN.</td>
</tr>
<tr>
<td>interface interface_num</td>
<td>(Optional) Specifies an interface.</td>
</tr>
</tbody>
</table>

**Defaults**

If no argument is specified, the switch will display the entire DHCP snooping binding table.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

DHCP snooping is enabled on a VLAN only if both the global snooping and the VLAN snooping are enabled.

To configure a range of VLANs, use the optional last_vlan argument to specify the end of the VLAN range.

**Examples**

This example shows how to display the DHCP snooping binding entries for a switch:

```
Switch# show ip dhcp snooping binding
MacAddress IP Address Lease (seconds) Type VLAN Interface
---------------- -------- -------------- -------- ---- ----------
0000.0100.0201 10.0.0.1 1600 dhcp-snooping 100  FastEthernet3/1
Switch#
```

This example shows how to display an IP address for DHCP snooping binding entries:

```
Switch# show ip dhcp snooping binding 172.100.101.102
MacAddress IP Address Lease (seconds) Type VLAN Interface
---------------- -------- -------------- -------- ---- ----------
0000.0100.0201 172.100.101.102 1600 dhcp-snooping 100  FastEthernet3/1
Switch#
```
This example shows how to display the MAC address for the DHCP snooping binding entries:

```
Switch# show ip dhcp snooping binding 55.5.5.2 0002.b33f.3d5f
```

<table>
<thead>
<tr>
<th>MacAddress</th>
<th>IpAddress</th>

</table>
show ip igmp interface

To view IP IGMP interface status and configuration information, use the `show ip igmp interface` command.

```
show ip igmp interface [fastethernet slot/port | gigabitethernet slot/port | tengigabitethernet slot/port | null interface-number | vlan vlan_id]
```

**Syntax Description**

- `fastethernet slot/port` (Optional) Specifies the Fast Ethernet interface and the number of the slot and port.
- `gigabitethernet slot/port` (Optional) Specifies the Gigabit Ethernet interface and the number of the slot and port; valid values are from 1 to 9.
- `tengigabitethernet slot/port` (Optional) Specifies the 10-Gigabit Ethernet interface and the number of the slot and port; valid values are from 1 to 2.
- `null interface-number` (Optional) Specifies the null interface and the number of the interface; the only valid value is 0.
- `vlan vlan_id` (Optional) Specifies the VLAN and the number of the VLAN; valid values are from 1 to 4094.

**Defaults**

If you do not specify a VLAN, information for VLAN 1 is shown.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you omit the optional arguments, the `show ip igmp interface` command displays information about all interfaces.

**Examples**

This example shows how to view IGMP information for VLAN 200:

```
Switch# show ip igmp interface vlan 200
IGMP snooping is globally enabled
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP-ONLY mode on this VLAN
Switch#
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>clear ip igmp group</code></td>
<td>Deletes the IGMP group cache entries.</td>
</tr>
<tr>
<td><code>show ip igmp snooping mrouter</code></td>
<td>Displays information on the dynamically learned and manually configured multicast switch interfaces.</td>
</tr>
</tbody>
</table>
show ip igmp profile

To view all configured IGMP profiles or a specified IGMP profile, use the `show ip igmp profile` privileged EXEC command.

```
show ip igmp profile [profile number]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>profile number</code></td>
<td>(Optional) IGMP profile number to be displayed; valid ranges are from 1 to 4294967295.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If no profile number is entered, all IGMP profiles are displayed.

**Examples**

This example shows how to display IGMP profile 40:

```
Switch# show ip igmp profile 40
IGMP Profile 40
  permit
    range 233.1.1.1 233.255.255.255
Switch#
```

This example shows how to display all IGMP profiles:

```
Switch# show ip igmp profile
IGMP Profile 3
  range 230.9.9.0 230.9.9.0
IGMP Profile 4
  permit
    range 229.9.9.0 229.255.255.255
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip igmp profile</code></td>
<td>Creates an IGMP profile.</td>

</tbody>
</table>
show ip igmp snooping

To display information on dynamically learned and manually configured VLAN switch interfaces, use the `show ip igmp snooping` command.

```
show ip igmp snooping [querier | groups | mrouter] [vlan vlan_id] a.b.c.d [summary | sources | hosts] [count]
```

**Syntax Description**

- **querier** (Optional) Specifies that the display will contain IP address and version information.
- **groups** (Optional) Specifies that the display will list VLAN members sorted by group IP addresses.
- **mrouter** (Optional) Specifies that the display will contain information on dynamically learned and manually configured multicast switch interfaces.
- **vlan vlan_id** (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.
- **a.b.c.d** Group or multicast IP address.
- **summary** (Optional) Specifies a display of detailed information for a v2 or v3 group.
- **sources** (Optional) Specifies a list of the source IPs for the specified group.
- **hosts** (Optional) Specifies a list of the host IPs for the specified group.
- **count** (Optional) Specifies a display of the total number of group addresses learned by the system on a global or per-VLAN basis.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

```
Release          Modification
12.1(8a)EW       Support for this command was introduced on the Catalyst 4500 series switch.
12.1(19)EW       Support for extended addressing was added.
12.1(20)EW       Added support to display configuration state for IGMPv3 explicit host tracking.
```

**Usage Guidelines**

You can also use the `show mac-address-table multicast` command to display the entries in the MAC address table for a VLAN that has IGMP snooping enabled.

You can display IGMP snooping information for VLAN interfaces by entering the `show ip igmp snooping` command.
**Examples**

This example shows how to display the global snooping information on the switch:

```
Switch# show ip igmp snooping
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping     : Enabled
IGMPv3 snooping   : Enabled
Report suppression : Enabled
TCN solicit query : Disabled
TCN flood query count : 2

Vlan 1:
-------
IGMP snooping     : Enabled
IGMPv2 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode : IGMP_ONLY

Vlan 2:
-------
IGMP snooping     : Enabled
IGMPv2 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode : IGMP_ONLY
```

Switch>

This example shows how to display the snooping information on VLAN 2:

```
Switch# show ip igmp snooping vlan 2
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping     : Enabled
IGMPv3 snooping   : Enabled
Report suppression : Enabled
TCN solicit query : Disabled
TCN flood query count : 2

Vlan 2:
-------
IGMP snooping     : Enabled
IGMPv2 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode : IGMP_ONLY
```

Switch>

This example shows how to display IGMP querier information for all VLANs on a switch:

```
Switch# show ip igmp snooping querier
Vlan   IP Address     IGMP Version Port
----------------------------------------
 2      10.10.10.1     v2       Router
 3      172.20.50.22   v3       Fa3/15
```

Switch>
This example shows how to display IGMP querier information for VLAN 5 when running IGMPv2:

Switch# show ip igmp snooping querier vlan 5
IP address : 5.5.5.10
IGMP version : v2
Port : Fa3/1
Max response time : 10s
Switch>

This example shows how to display IGMP querier information for VLAN 5 when running IGMPv3:

Switch# show ip igmp snooping querier vlan 5
IP address : 5.5.5.10
IGMP version : v3
Port : Fa3/1
Max response time : 10s
Query interval : 60s
Robustness variable : 2
Switch>

This example shows how to display snooping information for a specific group:

Switch# show ip igmp snooping group
Vlan Group Version Ports
----------------------------------------
2 224.0.1.40 v3 Router
2 224.2.2.2 v3 Fa6/2
Switch>

This example shows how to display the group’s host types and ports in VLAN 1:

Switch# show ip igmp snooping group vlan 1
Vlan Group Host Type Ports
----------------------------------------
1 229.2.3.4 v3 fa2/1 fa2/3
1 224.2.2.2 v3 Fa6/2
Switch>

This example shows how to display the group’s host types and ports in VLAN 1:

Switch# show ip igmp snooping group vlan 10 226.6.6.7
Vlan Group Version Ports
----------------------------------------
10 226.6.6.7 v3 Fa7/13, Fa7/14
Switch>

This example shows how to display the current state of a group with respect to a source IP address:

Switch# show ip igmp snooping group vlan 10 226.6.6.7 sources
Source information for group 226.6.6.7:
Timers: Expired sources are deleted on next IGMP General Query
SourceIP Expires Uptime Inc Hosts Exc Hosts
----------------------------------------

</table>
show ip igmp snooping membership

To display host membership information, use the `show ip igmp snooping membership` command.

```
show ip igmp snooping membership [interface interface_num] [vlan vlan_id]
  [reporter a.b.c.d] [source a.b.c.d group a.b.c.d]
```

### Syntax Description
- **interface interface_num** (Optional) Displays IP address and version information of an interface.
- **vlan vlan_id** (Optional) Displays VLAN members sorted by group IP address of a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.
- **reporter a.b.c.d** (Optional) Displays membership information for a specified reporter.
- **source a.b.c.d** (Optional) Specifies a reporter, source, or group IP address.
- **group a.b.c.d** (Optional) Displays all members of a channel (source, group), sorted by interface or VLAN.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
This command is valid only if explicit host tracking is enabled on the switch.

### Examples
This example shows how to display host membership for the Gigabit Ethernet interface 4/1:

```
Switch# show ip igmp snooping membership interface gigabitethernet4/1
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave
40.40.40.2/224.10.10.10 Gi4/1 20.20.20.20 00:23:37 00:06:50 00:20:30
40.40.40.4/224.10.10.10Gi4/1 20.20.20.20 00:39:42 00:09:17 -
Switch#
```

This example shows how to display host membership for VLAN 20 and group 224.10.10.10:

```
Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave
40.40.40.2/224.10.10.10 Gi4/1 20.20.20.20 00:23:37 00:06:50 00:20:30
Switch#
```
show ip igmp snooping membership

This example shows how to display host membership information for VLAN 20 and to delete the explicit host tracking:

Switch# show ip igmp snooping membership vlan 20
Snooping Membership Summary for Vlan 20
------------------------------------------
Total number of channels:5
Total number of hosts :4

<table>

</table>
show ip igmp snooping mrouter

To display information on the dynamically learned and manually configured multicast switch interfaces, use the `show ip igmp snooping mrouter` command.

```
show ip igmp snooping mrouter [vlan vlan-id]
```

**Syntax Description**

- `vlan vlan-id` (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

<tr>
<td>T2.1(19)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use the `show mac-address-table multicast` command to display entries in the MAC address table for a VLAN that has IGMP snooping enabled.

You can display IGMP snooping information for the VLAN interfaces by entering the `show ip igmp interface vlan vlan-num` command.

**Examples**

This example shows how to display snooping information for a specific VLAN:

```
Switch# show ip igmp snooping mrouter vlan 1
vlan 1 ports
-----------------------------
 1  Gi1/1,Gi2/1,Fa3/48,Switch
Switch#
```

</tbody>
</table>
**show ip igmp snooping vlan**

To display information on the dynamically learned and manually configured VLAN switch interfaces, use the `show ip igmp snooping vlan` command.

```
show ip igmp snooping vlan vlan_num
```

**Syntax Description**
- `vlan_num`: Number of the VLAN; valid values are from 1 to 1001 and from 1006 to 4094.

**Defaults**
This command has no default settings.

**Command Modes**
- Privileged EXEC mode

**Command History**

**Usage Guidelines**
You can also use the `show mac-address-table multicast` command to display the entries in the MAC address table for a VLAN that has IGMP snooping enabled.

**Examples**
This example shows how to display snooping information for a specific VLAN:

```
Switch# show ip igmp snooping vlan 2
vlan 2
---------
IGMP snooping is globally enabled
IGMP snooping TCN solicit query is globally enabled
IGMP snooping global TCN flood query count is 2
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP_ONLY mode on this Vlan
Switch#
```

<td>(Optional) Interface number.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Extended to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable. A usable interface is one through which the software can send and receive packets. If the software determines that an interface is not usable, it removes the directly connected routing entry from the routing table. Removing the entry allows the software to use dynamic routing protocols to determine backup routes to the network, if any.

If the interface can provide two-way communication, the line protocol is marked “up.” If the interface hardware is usable, the interface is marked “up.”

If you specify an optional interface type, you see information only on that specific interface.

If you specify no optional arguments, you see information on all the interfaces.

When an asynchronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP fast switching is enabled. The `show ip interface` command on an asynchronous interface that is encapsulated with PPP or SLIP displays a message indicating that IP fast switching is enabled.

**Examples**

This example shows how to display the usability status for a specific VLAN:

```
Switch# show ip interface vlan 1
Vlan1 is up, line protocol is up
    Internet address is 10.6.58.4/24
    Broadcast address is 255.255.255.255
    Address determined by non-volatile memory
    MTU is 1500 bytes
    Helper address is not set
    Directed broadcast forwarding is disabled
    Outgoing access list is not set
    Inbound access list is not set
    Proxy ARP is enabled
```
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachable are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Fast switching turbo vector
IP Normal CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Probe proxy name replies are disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
Sampled Netflow is disabled
IP multicast multilayer switching is disabled
Netflow Data Export (hardware) is enabled
Switch#

<td>12.2(40)SG</td>
<td>Support for command introduced on the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

In the Supervisor Engine 6-E and Catalyst 4900M chassis, the output of the `show ip mfib` command does not display any hardware counters.

The MFIB table contains a set of IP multicast routes; each route in the MFIB table contains several flags that associate to the route.

The route flags indicate how a packet that matches a route is forwarded. For example, the IC flag on an MFIB route indicates that some process on the switch needs to receive a copy of the packet. These flags are associated with MFIB routes:

- Internal Copy (IC) flag—Set on a route when a process on the switch needs to receive a copy of all packets matching the specified route.
- Signaling (S) flag—Set on a route when a switch process needs notification that a packet matching the route is received. In the expected behavior, the protocol code updates the MFIB state in response to having received a packet on a signaling interface.
- Connected (C) flag—When set on a route, the C flag has the same meaning as the S flag, except that the C flag indicates that only packets sent by directly connected hosts to the route should be signaled to a protocol process.
A route can also have a set of flags associated with one or more interfaces. For an (S,G) route, the flags on interface 1 indicate how the ingress packets should be treated and whether packets matching the route should be forwarded onto interface 1. These per-interface flags are associated with the MFIB routes:

- Accepting (A)—Set on the RPF interface when a packet that arrives on the interface and that is marked as Accepting (A) is forwarded to all Forwarding (F) interfaces.
- Forwarding (F)—Used with the A flag as described above. The set of forwarding interfaces together form a multicast output interface list.
- Signaling (S)—Set on an interface when a multicast routing protocol process in Cisco IOS needs to be notified of ingress packets on that interface.
- Not Platform (NP) fast-switched—Used with the F flag. A forwarding interface is also marked as Not Platform fast-switched whenever that output interface cannot be fast-switched by the platform hardware and requires software forwarding.

For example, the Catalyst 4506 switch with Supervisor Engine III cannot switch tunnel interfaces in hardware so these interfaces are marked with the NP flag. When an NP interface is associated with a route, a copy of every ingress packet arriving on an Accepting interface is sent to the switch software forwarding path for software replication and then forwarded to the NP interface.

**Examples**

This example shows how to display all active MFIB routes:

```
Switch# show ip mfib
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal, IC - Internal Copy
Interface Flags: A - Accept, F - Forward, NS - Signal, NP - Not platform switched
Packets: Fast/Partial/Slow Bytes: Fast/Partial/Slow:
(171.69.10.13, 224.0.1.40), flags (IC)
  Packets: 2292/2292/0, Bytes: 518803/0/518803
  Vlan7 (A)
  Vlan105 (F NS)

<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you omit all the optional arguments and keywords, the `show ip mroute` command displays all the entries in the IP multicast routing table.

The `show ip mroute active kbps` command displays all the sources sending at a rate greater than or equal to `kbps`.

The multicast routing table is populated by creating source, group (S,G) entries from star, group (*,G) entries. The star refers to all source addresses, the “S” refers to a single source address, and the “G” refers to the destination multicast group address. In creating (S,G) entries, the software uses the best path to that destination group found in the unicast routing table (through Reverse Path Forwarding (RPF)).
Examples

This example shows how to display all the entries in the IP multicast routing table:

Switch# show ip mroute

IP Multicast Routing Table
Flags:D = Dense, S = Sparse, s = SSM Group, C = Connected, L = Local,
P = Pruned, R = RP-bit set, F = Register flag, T = SPT-bit set,
J = Join SPT, M = MSDP created entry, X = Proxy Join Timer Running
A = Advertised via MSDP, U = URD, I = Received Source Specific Host
Report
Outgoing interface flags:H = Hardware switched
Timers:Uptime/Expires
Interface state:Interface, Next-Hop or VCD, State/Mode

(*, 230.13.13.1), 00:16:41/00:00:00, RP 10.15.1.20, flags:SJC
Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20
Outgoing interface list:
  GigabitEthernet4/9, Forward/Sparse-Dense, 00:16:41/00:00:00, H

(*, 230.13.13.2), 00:16:41/00:00:00, RP 10.15.1.20, flags:SJC
Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD
Outgoing interface list:

Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD
Outgoing interface list:Null
Switch#

This example shows how to display the rate that the active sources are sending to the multicast groups
and to display only the active sources that are sending at greater than the default rate:

Switch# show ip mroute active

Active IP Multicast Sources - sending >= 4 kbps

Group: 224.2.127.254, (sdr.cisco.com)
  Source: 146.137.28.69 (mbone.ipd.anl.gov)
  Rate: 1 pps/4 kbps(1sec), 4 kbps(last 1 secs), 4 kbps(life avg)

Group: 224.2.201.241, ACM 97
  Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
  Rate: 9 pps/93 kbps(1sec), 145 kbps(last 20 secs), 85 kbps(life avg)

Group: 224.2.207.215, ACM 97
  Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
  Rate: 3 pps/31 kbps(1sec), 63 kbps(last 19 secs), 65 kbps(life avg)
Switch#
This example shows how to display route and packet count information:

Switch# `show ip mroute count`

IP Multicast Statistics
56 routes using 28552 bytes of memory
13 groups, 3.30 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second

Other counts: Total/RPF failed/Other drops (OIF-null, rate-limit etc)

Group: 224.2.136.89, Source count: 1, Group pkt count: 29051
Source: 132.206.72.28/32, Forwarding: 29051/-278/1186/0, Other: 85724/8/56665

Switch#

This example shows how to display summary information:

Switch# `show ip mroute summary`

IP Multicast Routing Table

<table>
<thead>
<tr>
<th>Flags:</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>D - Dense</td>
<td>Entry is operating in dense mode.</td>
</tr>
<tr>
<td>S - Sparse</td>
<td>Entry is operating in sparse mode.</td>
</tr>
<tr>
<td>s - SSM Group</td>

Table 2-23 describes the fields shown in the output.
Table 2-23  show ip mroute Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>J - Join SPT</td>
<td>For (<em>, G) entries, indicates that the rate of traffic flowing down the shared tree is exceeding the SPT-Threshold set for the group. (The default SPT-Threshold setting is 0 kbps.) When the J - Join SPT flag is set, the next (S,G) packet received down the shared tree triggers an (S,G) join in the direction of the source causing the switch to join the source tree. For (S, G) entries, indicates that the entry was created because the SPT-Threshold for the group was exceeded. When the J - Join SPT flag is set for (S,G) entries, the switch monitors the traffic rate on the source tree and attempts to switch back to the shared tree for this source if the traffic rate on the source tree falls below the group’s SPT-Threshold for more than one minute. The switch measures the traffic rate on the shared tree and compares the measured rate to the group’s SPT-Threshold once every second. If the traffic rate exceeds the SPT-Threshold, the J- Join SPT flag is set on the (</em>, G) entry until the next measurement of the traffic rate. The flag is cleared when the next packet arrives on the shared tree and a new measurement interval is started. If the default SPT-Threshold value of 0 Kbps is used for the group, the J- Join SPT flag is always set on (*, G) entries and is never cleared. When the default SPT-Threshold value is used, the switch immediately switches to the shortest-path tree when traffic from a new source is received.</td>

# show ip source binding

To display IP source bindings that are configured on the system, use the `show ip source binding` EXEC command.

```
show ip source binding [ip-address] [mac-address] [dhcp-snooping | static] [vlan vlan-id] [interface interface-name]
```

## Syntax Description

- **ip-address** (Optional) Binding IP address.
- **mac-address** (Optional) Binding MAC address.
- **dhcp-snooping** (Optional) DHCP-snooping type binding.
- **static** (Optional) Statically configured binding.
- **vlan vlan-id** (Optional) VLAN number.
- **interface interface-name** (Optional) Binding interface.

## Defaults

Displays both static and DHCP snooping bindings.

## Command Modes

Privileged EXEC mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

The optional parameters filter the display output result.

## Examples

This example shows how to display the IP source bindings:

```
Switch# show ip source binding
MacAddress          IpAddress        Lease(sec)  Type           VLAN  Interface
------------------  ---------------  ----------  -------------  ----  --------------------
00:00:00:0A:00:0B   11.0.0.1         infinite    static         10    FastEthernet6/10
Switch#
```

This example shows how to display the static IP binding entry of IP address 11.0.01:

```
Switch# show ip source binding 11.0.0.1 0000.000A.000B static vlan 10 interface Fa6/10
```

## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip source binding</strong></td>
<td>Adds or deletes a static IP source binding entry.</td>
</tr>
</tbody>
</table>
show ip verify source

To display the IP source guard configuration and filters on a particular interface, use the `show ip verify source` command.

```
show ip verify source [interface interface_num]
```

**Syntax Description**

- `interface interface_num` (Optional) Specifies an interface.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(19)EW Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

These examples show how to display the IP source guard configuration and filters on a particular interface with the `show ip verify source interface` command:

- This output appears when DHCP snooping is enabled on VLANs 10–20, interface fa6/1 has IP source filter mode that is configured as IP, and an existing IP address binding 10.0.0.1 is on VLAN 10:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>10.0.0.1</td>
<td></td>
<td>10</td>
</tr>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>deny-all</td>
<td></td>
<td>11-20</td>
</tr>
</tbody>
</table>

  **Note** The second entry shows that a default PVACL (deny all IP traffic) is installed on the port for those snooping-enabled VLANs that do not have a valid IP source binding.

- This output appears when you enter the `show ip verify source interface fa6/2` command and DHCP snooping is enabled on VLANs 10–20, interface fa6/1 has IP source filter mode that is configured as IP, and there is an existing IP address binding 10.0.0.1 on VLAN 10:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/2</td>
<td>ip</td>
<td>inactive-trust-port</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This output appears when you enter the `show ip verify source interface fa6/3` command and the interface fa6/3 does not have a VLAN enabled for DHCP snooping:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/3</td>
<td>ip</td>
<td>inactive-no-snooping-vlan</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
This output appears when you enter the **show ip verify source interface fa6/4** command and the interface fa6/4 has an IP source filter mode that is configured as IP MAC and the existing IP MAC that binds 10.0.0.2/aaaa.bbbb.cccc on VLAN 10 and 11.0.0.1/aaaa.bbbb.cccd on VLAN 11:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.2</td>
<td>aaaa.bbbb.cccc</td>
<td>10</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>11.0.0.1</td>
<td>aaaa.bbbb.cccd</td>
<td>11</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>deny-all</td>
<td>12-20</td>
</tr>
</tbody>
</table>

This output appears when you enter the **show ip verify source interface fa6/5** command and the interface fa6/5 has IP source filter mode that is configured as IP MAC and existing IP MAC binding 10.0.0.3/aaaa.bbbb.ccce on VLAN 10, but port security is not enabled on fa6/5:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.3</td>
<td>permit-all</td>
<td>10</td>
</tr>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>permit-all</td>
<td>11-20</td>
</tr>
</tbody>
</table>

**Note** Enable port security first because the DHCP security MAC filter cannot apply to the port or VLAN.

This output appears when you enter the **show ip verify source interface fa6/6** command and the interface fa6/6 does not have IP source filter mode that is configured:

DHCP security is not configured on the interface fa6/6.

This example shows how to display all the interfaces on the switch that have DHCP snooping security and IP Port Security tracking enabled with the **show ip verify source** command.

The output is an accumulation of per-interface show CLIs:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/1</td>

# show ip wccp

To display the Web Cache Communication Protocol (WCCP) global configuration and statistics, use the `show ip wccp` command in user EXEC or privileged EXEC mode.

```
show ip wccp [service-number [view | detail] | interfaces [cef | counts | detail] | web-cache]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service-number</td>
<td>(Optional) Identification number of the web cache service group being controlled by the cache. The number can be from 0 to 254. For web caches using Cisco cache engines, the reverse proxy service is indicated by a value of 99.</td>
</tr>
<tr>
<td>interfaces</td>
<td>(Optional) WCCP redirect interfaces.</td>
</tr>
<tr>
<td>cef</td>
<td>(Optional) CEF interface statistics, including the number of input, output, dynamic, static, and multicast services.</td>
</tr>
<tr>
<td>counts</td>
<td>(Optional) WCCP interface count statistics, including the number of CEF and process-switched output and input packets redirected.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) WCCP interface configuration statistics, including the number of input, output, dynamic, static, and multicast services.</td>
</tr>
<tr>
<td>web-cache</td>
<td>(Optional) Statistics for the web cache service.</td>
</tr>
<tr>
<td>view</td>
<td>(Optional) Other members of a particular service group, have or have not been detected.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Information about the router and all web caches.</td>
</tr>
</tbody>
</table>

## Command Modes

User EXEC (>)
Privileged EXEC (#)

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>This command was introduced on Catalyst 4900M, Catalyst 4948E, Supervisor Engine 6-E, and Supervisor Engine 6L-E.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

Use the `clear ip wccp` command to reset the counter for the “Packets Redirected” information.

Use the `show ip wccp service-number` command to get the “Total Packets S/W Redirected” count. The “Total Packets S/W Redirected” count is the number of packets redirected in software.

Use the `show ip wccp service-number detail` command to get the “Packets Redirected” count. The “Packets Redirected” count is the number of packets redirected in software.

Use the `show ip wccp web-cache detail` command to get an indication of which traffic is redirected to which cache engine.

Use the `show ip wccp` command to show the configured WCCP services and a summary of their current state.

For cache-engine clusters using Cisco cache engines, the reverse proxy `service-number` is indicated by a value of 99.

All the packet statistics correspond to packets switched in software.
Examples

This section contains examples and field descriptions for the following forms of this command:

- `show ip wccp` service-number
- `show ip wccp` service-number view
- `show ip wccp` service-number detail
- `show ip wccp` interfaces
- `show ip wccp` web-cache
- `show ip wccp` web-cache detail
- `show ip wccp`

`show ip wccp` service-number

The following is sample output from the `show ip wccp service-number` command:

```
Switch# show ip wccp 90

Global WCCP information:
  Router information:
    Router Identifier:                   100.1.1.16
    Protocol Version:                    2.0

Service Identifier: 90
  Number of Service Group Clients:     1
  Number of Service Group Routers:     1
  Total Packets s/w Redirected:        0
    Process:                           0
    CEF:                               0
  Redirect Access-list:                -none-
  Total Packets Denied Redirect:       0
  Total Packets Unassigned:            0
  Group Access-list:                   -none-
  Total Messages Denied to Group:      0
  Total Authentication failures:       0
  Total Bypassed Packets Received:     0
```

Table 24 describes the significant fields shown in the display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Router information</td>
<td>A list of routers detected by the current router.</td>
</tr>
<tr>
<td>Protocol Version</td>
<td>The version of WCCP being used by the router in the service group.</td>
</tr>
<tr>
<td>Service Identifier</td>
<td>Indicates which service is detailed.</td>
</tr>
<tr>
<td>Number of Service Group Clients</td>
<td>The number of clients that are visible to the router and other clients in the service group.</td>
</tr>
<tr>
<td>Number of Service Group Routers</td>
<td>The number of routers in the service group.</td>
</tr>
<tr>
<td>Total Packets s/w Redirected</td>
<td>Total number of packets s/w redirected by the router.</td>
</tr>
<tr>
<td>Redirect Access-list</td>
<td>The name or number of the access list that determines which packets will be redirected.</td>
</tr>
<tr>
<td>Total Packets Denied Redirect</td>
<td>Total number of packets that were not redirected because they did not match the access list.</td>
</tr>
</tbody>
</table>
The following is sample output from the `show ip wccp service-number view` command for service group 1:

```
Switch# show ip wccp 1 view

WCCP Router Informed of:
  10.168.88.10
  10.168.88.20

WCCP Cache Engines Visible
  10.168.88.11
  10.168.88.12

WCCP Cache Engines Not Visible:
  -none-
```

**Note**

The number of maximum service groups that can be configured is 256.

If any web cache is displayed under the WCCP Cache Engines Not Visible field, the router needs to be reconfigured to map the web cache that is not visible to it.

**Table 25** describes the significant fields shown in the display.

### Table 25: show ip wccp service-number view Field Descriptions

<table>
<thead>
<tr>

<td>Displays the status of the local IPC server.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

**Release Modification**

12.1(12c)EW Support for this command was introduced on the Catalyst 4500 series switch.

### Examples

This example shows how to display the participating nodes:

```
Switch# show ipc nodes
There are 3 nodes in this IPC realm.
   ID  Type       Name                      Last Sent Last Heard
       10000 Local IPC Master               0       0
       2010000 Local GALIOS IPC:Card 1      0       0
       2020000 Ethernet GALIOS IPC:Card 2   12      26
Switch#
```

This example shows how to display the local IPC ports:

```
Switch# show ipc ports
There are 11 ports defined.

<table>

Switch#

This example shows how to display the contents of the IPC retransmission queue:

Switch# show ipc queue
There are 0 IPC messages waiting for acknowledgement in the transmit queue.
There are 0 IPC messages waiting for a response.
There are 0 IPC messages waiting for additional fragments.
There are 0 IPC messages currently on the IPC inboundQ.
There are 0 messages currently in use by the system.
Switch#

This example shows how to display the status of the local IPC server:

Switch# show ipc status
IPC System Status:

This processor is the IPC master server.

6000 IPC message headers in cache
3363 messages in, 1680 out, 1660 delivered to local port,
1686 acknowledgements received, 1675 sent,
0 NACKs received, 0 sent,
0 messages dropped on input, 0 messages dropped on output
0 no local port, 0 destination unknown, 0 no transport
0 missing callback or queue, 0 duplicate ACKs, 0 retries,
0 message timeouts.
0 ipc_output failures, 0 mtu failures,
0 msg alloc failed, 0 emer msg alloc failed, 0 no origs for RPC replies
0 pak alloc failed, 0 memd alloc failed
0 no hwq, 1 failed opens, 0 hardware errors
No regular dropping of IPC output packets for test purposes
Switch#
**show ipv6 mld snooping**

To display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping configuration of the switch or the VLAN, use the `show ipv6 mld snooping` command.

```
show ipv6 mld snooping [vlan vlan-id]
```

**Syntax Description**

- **vlan vlan-id** (Optional) Specifies a VLAN; the range is 1 to 1001 and 1006 to 4094.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display MLD snooping configuration for the switch or for a specific VLAN. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping vlan` command. It shows snooping characteristics for a specific VLAN.

```
Switch> show ipv6 mld snooping vlan 100
Global MLD Snooping configuration:
-------------------------------------------
MLD snooping          : Enabled
MLDv2 snooping (minimal) : Enabled
Listener message suppression : Enabled
TCN solicit query     : Disabled
TCN flood query count : 2
Robustness variable   : 3
Last listener query count : 2
Last listener query interval : 1000

Vlan 100:
--------
MLD snooping          : Disabled
MLDv1 immediate leave : Disabled
Explicit host tracking: Enabled
Multicast router learning mode : pim-dvmrp
Robustness variable   : 3
Last listener query count : 2
Last listener query interval : 1000
```

This is an example of output from the `show ipv6 mld snooping` command. It displays snooping characteristics for all VLANs on the switch.

```
Switch> show ipv6 mld snooping
Global MLD Snooping configuration:
-------------------------------------------
```

This is an example of output from the `show ipv6 mld snooping` command. It displays snooping characteristics for all VLANs on the switch.
show ipv6 mld snooping

MLD snooping : Enabled
MLDv2 snooping (minimal) : Enabled
Listener message suppression : Enabled

show ipv6 mld snooping querier

To display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping querier-related information most recently received by the switch or the VLAN, use the show ipv6 mld snooping querier command.

```
show ipv6 mld snooping querier [vlan vlan-id]
```

**Syntax Description**

- **vlan vlan-id**  
  (Optional) Specifies a VLAN; the range is 1 to 1001 and 1006 to 4094.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ipv6 mld snooping querier` command to display the MLD version and IPv6 address of a detected device that sends MLD query messages, which is also called a querier. A subnet can have multiple multicast switches but has only one MLD querier. The querier can be a Layer 3 switch.

The `show ipv6 mld snooping querier` command output also shows the VLAN and interface on which the querier was detected. If the querier is the switch, the output shows the Port field as `Router`. If the querier is a router, the output shows the port number on which the querier is learned in the Port field.

The output of the `show ipv6 mld snooping querier vlan` command displays the information received in response to a query message from an external or internal querier. It does not display user-configured VLAN values, such as the snooping robustness variable on the particular VLAN. This querier information is used only on the MASQ message that is sent by the switch. It does not override the user-configured robustness variable that is used for aging out a member that does not respond to query messages.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping querier` command:

```
Switch> show ipv6 mld snooping querier
Vlan   IP Address       MLD Version Port
---------------------------------------------
2      FE80::201:C9FF:FE40:6000 v1          Gi3/0/1
```

This is an example of output from the `show ipv6 mld snooping querier vlan` command:

```
Switch> show ipv6 mld snooping querier vlan 2
IP address : FE80::201:C9FF:FE40:6000
MLD version : v1
Port : Gi3/0/1
Max response time : 1000s
```
### show ipv6 mld snooping querier

The `show ipv6 mld snooping querier` command is used to display information about MLD (Multicast Listener Discovery) queriers on the Catalyst 4500 Series switches.

show issu capability

To display the ISSU capability for a client, use the `show issu capability` command.

```plaintext
show issu capability {entries | groups | types} [client_id]
```

**Syntax Description**

- **entries**: Displays a list of Capability Types and Dependent Capability Types that are included in a single Capability Entry. Types within an entry can also be independent.
- **groups**: Displays a list of Capability Entries in priority order (the order that they will be negotiated on a session).
- **types**: Displays an ID that identifies a particular capability.
- **client_id** *(Optional)*: Identifies the client registered to the ISSU infrastructure.
  
  To obtain a list of client IDs, use the `show issu clients` command.

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

Release Modification

12.2(31)SGA This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

Capability is a functionality that an ISSU client can support and is required to interoperate with peers.

When an ISSU-aware client establishes its session with the peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

**Examples**

The following example shows how to display the ISSU capability types for the IP host ISSU client (clientid=2082):

```
Switch# show issu capability types 2082
Client_ID = 2082, Entity_ID = 1 :
    Cap_Type = 0
Switch#
```

The following example shows how to display the ISSU capabilities entries for the IP host ISSU client (clientid=2082):

```
Switch# show issu capability entries 2082
Client_ID = 2082, Entity_ID = 1 :
    Cap_Entry = 1 :
        Cap_Type = 0
Switch#
```
The following example shows how to display the ISSU capabilities groups for the IP host ISSU client (clientid=2082):

```
Switch# show issu capability groups 2082
Client_ID = 2082, Entity_ID = 1 :
    Cap_Group = 1 :
        Cap_Entry = 1
            Cap_Type = 0
```

Switch#

<td><strong>show issu clients</strong></td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
show issu clients

To display the ISSU clients, use the `show issu clients` command.

```
show issu clients [peer_uid]
```

**Syntax Description**

peer_uid (Optional) Displays a list of clients registered to ISSU infrastructure at the peer supervisor engine.

**Defaults**

Displays a list of clients registered to the ISSU infrastructure at the supervisor engine where the command is entered.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To implement ISSU versioning functionality, a client must first register itself, client capability, and client message information with the ISSU infrastructure during the system initialization.

**Examples**

The following example shows how to display the ISSU clients:

```
Switch# show issu clients
Client_ID = 2, Client_Name = ISSU Proto client, Entity_Count = 1
Client_ID = 3, Client_Name = ISSU RF, Entity_Count = 1
Client_ID = 4, Client_Name = ISSU CF client, Entity_Count = 1

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before attempting an ISSU, you should know the compatibility level between the old and the new Cisco IOS software versions on the active and the standby supervisor engines. ISSU will not work if the two versions are incompatible.

The compatibility matrix is available on Cisco.com so that you can also view in advance whether an upgrade can be performed with the ISSU process. The compatibility matrix during the ISSU process and later by entering the show issu comp-matrix command. To display information on the negotiation of the compatibility matrix data between two software versions on a given system, use the show issu comp-matrix negotiated command.

Compatibility matrix data is stored with each Cisco IOS software image that supports ISSU capability. To display stored compatibility matrix information, use the show issu comp-matrix stored command.

The compatibility matrix information are built-in any Cisco IOS ISSU image. The ISSU infrastructure performs a matrix lookup as soon as the communication with the standby supervisor engine is established. There are three possible results from the lookup operation:

- **Compatible**—The Base-level system infrastructure and all optional HA-aware subsystems are compatible. In-service upgrade or downgrade between these versions will succeed with minimal service impact.

- **Base-Level Compatible**—One or more of the optional HA-aware subsystems are not compatible. Although an in-service upgrade or downgrade between these versions will succeed, some subsystems will not be able to maintain their state during the switchover. Prior to attempting an in-service upgrade or downgrade, the impact of this on operation and service of the switch must be considered carefully.
• Incompatible—A set of core system infrastructure must be able to execute in a stateful manner for SSO to function correctly. If any of these “required” features or subsystems is not compatible in two different Cisco IOS images, the two versions of the Cisco IOS images are declared “Incompatible”. This means that an in-service upgrade or downgrade between these versions is not possible. The systems operates in RPR mode during the period when the versions of Cisco IOS at the active and standby supervisor engines differ.

### Examples

This example displays negotiated compatibility matrix information:

```
Switch# show issu comp-matrix negotiated
CardType: WS-C4507R(112), Uid: 2, Image Ver: 12.2(31)SGA

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show issu clients</td>
<td>Displays the ISSU clients.</td>
</tr>
<tr>
<td>show issu sessions</td>
<td>Displays ISSU session information for a specified client.</td>
</tr>
</tbody>
</table>
**show issu endpoints**

To display the ISSU endpoint information, use the `show issu endpoints` command.

```
show issu endpoints
```

**Syntax Description**
This command has no arguments or keywords

**Defaults**
This command has no default settings.

**Command Modes**
User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Endpoint is an execution unit within a redundancy domain. There are only 2 endpoints on the Catalyst 4500 series switch redundant chassis: 1 and 2. The endpoints correspond to the slot numbers for the supervisor engine. The ISSU infrastructure communicates between these two endpoints to establish session and to perform session negotiation for ISSU clients.

**Examples**
The following example shows how to display the ISSU endpoints:

```
Switch# show issu endpoints
My_Unique_ID = 1/0x1, Client_Count = 46

This endpoint communicates with 1 peer endpoints:
Peer_Unique_ID CAP VER XFORM ERP Compatibility
2/0x2 1 1 1 1 Same

Shared Negotiation Session Info:
Nego_Session_ID = 15
Nego_Session_Name = shared nego session
Transport_Mtu = 4096
Ses_In_Use = 2
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show issu clients</code></td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
show issu entities

To display the ISSU entity information, use the `show issu entities` command.

```
show issu entities [client_id]
```

**Syntax Description**

| client_id | (Optional) ISSU client ID. |

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Entity is a logical group of sessions with some common attributes (like capability list and message type). Currently, most ISSU clients on the Catalyst 4500 series switch have only one entity.

**Examples**

The following example shows how to display the entity information for a specified ISSU client:

```
Switch#show issu entities 2072
Client_ID = 2072 :
    Entity_ID = 1, Entity_Name = ISSU dot1x entity :
    MsgType MsgGroup CapType CapEntry CapGroup
    Count   Count   Count   count    Count
    28       1       1       1        1
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show issu clients</code></td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
### show issu fsm

**Note**

This command is not intended for end-users.

To display the ISSU finite state machine (FSM) information corresponding to an ISSU session, use the `show issu fsm` command.

```
show issu fsm [session_id]
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>(Optional) Provides detailed information about the FSM for the specified session.</td>
</tr>
</tbody>
</table>

#### Defaults

This command has no default settings.

#### Command Modes

User EXEC mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

#### Examples

The following example displays and verifies the ISSU state after LOADVERSION:

```
Switch# show issu fsm 26
Session_ID = 26 :
<table>
<thead>
<tr>
<th>FSM_Name</th>
<th>Curr_State</th>
<th>Old_State</th>
<th>Error_Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>FSM_L1   TRANS</td>
<td>A_VER</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>FSM_L2_HELLO EXIT</td>
<td>RCVD</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>FSM_L2_A_CAP A_EXIT</td>
<td>A_RSP</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>FSM_L2_P_CAP P_INIT</td>
<td>unknown</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>FSM_L2_A_VER A_EXIT</td>
<td>A_RES_RSP</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>FSM_L2_P_VER P_INIT</td>
<td>unknown</td>
<td>none</td>
<td></td>
</tr>
<tr>
<td>FSM_L2_TRANS COMP</td>
<td>COMP</td>
<td>none</td>
<td></td>
</tr>
</tbody>
</table>
Current FSM is FSM_L2_TRANS
Session is compatible
Negotiation started at 00:01:07.688, duration is 0.148 seconds
Switch#
```

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show issu clients</td>
<td>Displays the ISSU clients.</td>
</tr>
<tr>
<td>show issu sessions</td>
<td>Displays ISSU session information for a specified client.</td>
</tr>
</tbody>
</table>
show issu message

To display checkpoint messages for a specified ISSU client, use the `show issu message` command.

```
show issu message {groups | types} [client_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>groups</code></td>
<td>Displays information on Message Group supported by the specified client.</td>
</tr>
<tr>
<td><code>types</code></td>
<td>Displays information on all Message Types supported by the specified client.</td>
</tr>
<tr>
<td><code>client_id</code></td>
<td>(Optional) Specifies a client ID.</td>
</tr>
</tbody>
</table>

**Defaults**

If client ID is not specified, displays message groups or message types information for all clients registered to the ISSU infrastructure.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Messages are sync-data (also known as checkpoint data) sent between two endpoints.

When an ISSU-aware client establishes its session with a peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

**Examples**

The following example shows how to display the message groups for Client_Id 2082:

```
Switch#show issu message groups 2082
Client_ID = 2082,  Entity_ID = 1 :
    Message_Group = 1 :
        Message_Type = 1,  Version_Range = 1 ~ 2
        Message_Type = 2,  Version_Range = 1 ~ 2
Switch#
```

The following example shows how to display the message types for Client_Id 2082:

```
Switch#show issu message types 2082
Client_ID = 2082,  Entity_ID = 1 :
    Message_Type = 1,  Version_Range = 1 ~ 2
        Message_Ver = 1,    Message_Mtu = 12
        Message_Ver = 2,    Message_Mtu = 8
    Message_Type = 2,  Version_Range = 1 ~ 2
        Message_Ver = 1,    Message_Mtu = 32
        Message_Ver = 2,    Message_Mtu = 28

show issu negotiated

To display the negotiated capability and message version information of the ISSU clients, use the `show issu negotiated` command.

```
show issu negotiated {capability | version} [session_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capability</td>
<td>Displays all negotiated capabilities.</td>
</tr>
<tr>
<td>version</td>
<td>Displays details of all negotiated messages.</td>
</tr>
<tr>
<td>session_id</td>
<td>(Optional) Specifies the ISSU session ID for which the capability or version information is displayed.</td>
</tr>
</tbody>
</table>

**Defaults**

Displays negotiated capability or version information for all ISSU sessions.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to display the message types for a specific group:

```
Switch# show issu negotiated capability 26
Session_ID = 26 :
  Cap_Type = 0,     Cap_Result = 1     No cap value assigned

Switch# show issu negotiated version 26
Session_ID = 26 :
  Message_Type = 1,  Negotiated_Version = 1,  Message_MTU = 44
  Message_Type = 2,  Negotiated_Version = 1,  Message_MTU = 4
```

</tr>
</tbody>
</table>
show issu sessions

To display ISSU session information for a specified client, use the show issu sessions command.

    show issu sessions [client_id]

Syntax Description

    client_id           (Optional) Specifies the ISSU client ID.

Defaults

Displays session information for all clients registered to the ISSU infrastructure.

Command Modes

User EXEC mode

Command History

Release                Modification
12.2(31)SGA            This command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

Session is bidirectional and a reliable connection is established between two endpoints. Sync-data and negotiation messages are sent to the peer endpoint through a session. On a Catalyst 4500 series switch, each ISSU-aware client has a maximum of one session at each endpoint.

When an ISSU-aware client establishes its session with the peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

Examples

The following example shows how to display the rollback-timer status:

    Switch#show issu sessions 2072
    Client_ID = 2072, Entity_ID = 1 :

      *** Session_ID = 26, Session_Name = dot1x :

          Peer  Peer  Negotiate  Negotiated  Cap  Msg  Session
          UniqueID  Sid    Role       Result   GroupID GroupID Signature
            2       26   PRIMARY   COMPATIBLE    1        1         0
            (no policy)

          Negotiation Session Info for This Message Session:
            Nego_Session_ID = 26
            Nego_Session_Name = dot1x
            Transport_Mtu = 17884

    Switch#

</thead>
<tbody>
<tr>
<td>show issu clients</td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
show issu state

To display the ISSU state and current booted image name during the ISSU process, use the `show issu state` command.

```
show issu state [slot_number] [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>slot_number</th>
<th>(Optional) Specifies the slot number whose ISSU state needs to be displayed (1 or 2).</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>(Optional) Provides detailed information about the state of the active and standby supervisor engines.</td>
</tr>
</tbody>
</table>

**Defaults**

The command displays the ISSU state and current booted image name of both the active and standby supervisor engines.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

It might take several seconds after the `issu loadversion` command is entered for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode. If you enter the `show issu state` command too soon, you might not see the information you need.

**Examples**

The following example displays and verifies the ISSU state after LOADVERSION:

```
Switch# show issu state detail
Slot = 1
  RP State = Active
  ISSU State = Load Version
  Boot Variable = bootflash:old_image,12
  Operating Mode = Stateful Switchover
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:old_image

  Slot = 2
  RP State = Standby
  ISSU State = Load Version
  Boot Variable = bootflash:new_image,12;bootflash:old_image,12
  Operating Mode = Stateful Switchover
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:new_image

Switch#
```

</tbody>
</table>
show l2protocol-tunnel

To display information about the Layer 2 protocol tunnel ports, use the `show l2protocol-tunnel` command. This command displays information for the interfaces with protocol tunneling enabled.

```
show l2protocol-tunnel [interface interface-id] [[summary] | {begin | exclude | include} expression]
```

**Syntax Description**

- `interface interface-id` (Optional) Specifies the interface for which protocol tunneling information appears. Valid interfaces are physical ports and port channels; the port channel range is 1 to 64.
- `summary` (Optional) Displays only Layer 2 protocol summary information.
- `begin` (Optional) Displays information beginning with the line that matches the `expression`.
- `exclude` (Optional) Displays information that excludes lines that match the `expression`.
- `include` (Optional) Displays the lines that match the specified `expression`.
- `expression` (Optional) Expression in the output to use as a reference point.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After enabling Layer 2 protocol tunneling on an access or 802.1Q tunnel port with the `l2protocol-tunnel` command, you can configure some or all of these parameters:

- Protocol type to be tunneled
- Shutdown threshold
- Drop threshold

If you enter the `show l2protocol-tunnel [interface interface-id]` command, only information about the active ports on which all the parameters are configured appears.

If you enter the `show l2protocol-tunnel summary` command, only information about the active ports on which some or all of the parameters are configured appears.

Expressions are case sensitive. For example, if you enter `| exclude output`, the lines that contain `output` do not appear, but the lines that contain `Output` appear.
Examples

This is an example of output from the `show l2protocol-tunnel` command:

```
Switch# show l2protocol-tunnel

</tbody>
</table>
show lacp

To display LACP information, use the `show lacp` command.

```
show lacp [channel-group] {counters | internal | neighbors | sys-id}
```

**Syntax Description**

- `channel-group` (Optional) Number of the channel group; valid values are from 1 to 64.
- `counters` Displays the LACP statistical information.
- `internal` Displays the internal information.
- `neighbors` Displays the neighbor information.
- `sys-id` Displays the LACP system identification.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I.

If you do not specify a `channel-group` value, all channel groups are displayed.

You can enter the optional `channel-group` value to specify a channel group for all keywords, except the `sys-id` keyword.

**Examples**

This example shows how to display LACP statistical information for a specific channel group:

```
Switch# show lacp 1 counters

+----------------+----------------+----------------+----------------+----------------+----------------+
| Port           | LACPUs Sent    | Marker Sent    | LACPUs Pkts    |
|                | Recv           | Recv           |                |                |
|----------------+----------------+----------------+----------------+----------------+----------------+
| Fa4/1          | 8              | 0              | 3              |
| Fa4/2          | 14             | 0              | 3              |
| Fa4/3          | 14             | 0              | 0              |
| Fa4/4          | 13             | 0              | 0              |
|                |                |                |                |
```

The output displays the following information:

- The LACPUs Sent and Recv columns display the LACPUs sent and received on each specific interface.
- The LACPUs Pkts and Err columns display the marker protocol packets.
This example shows how to display internal information for the interfaces belonging to a specific channel:

Switch# **show lacp 1 internal**

Flags:  
S - Device sends PDUs at slow rate.  
F - Device sends PDUs at fast rate.  
A - Device is in Active mode.  
P - Device is in Passive mode.

</table>

In the case where no PDUs have been received, the default administrative information is displayed in braces.

This example shows how to display the LACP system identification:

Switch> **show lacp sys-id**

8000,AC-12-34-56-78-90

Switch>

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address associated to the system.

<table>

### Examples

The following example shows how to display MAB information:

Switch# `show mab all`
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
Switch#

The following example shows how to display detailed MAB information:

Switch# `show mab all detail`
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
---------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED

The following example shows how to display MAB information for a specific interface:

Switch# `show mab interface GigaEthernet1/3`
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
The following example shows how to display detailed MAB information for a specific interface:

```
Switch# show mab interface gigabitethernet1/1 detail
MAB details for GigaEthernet1/1
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
---------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED
Switch#
```

show mac access-group interface

To display the ACL configuration on a Layer 2 interface, use the show mac access-group interface command.

```
show mac access-group interface [interface interface-number]
```

**Syntax Description**

- **interface** (Optional) Specifies the interface type; valid values are ethernet, fastethernet, gigabitethernet, tengigabitethernet, pos, atm, port-channel, and ge-wan.
- **interface-number** (Optional) Specifies the port number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

Release Modification
12.1(19)EW Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

The valid values for the port number depend on the chassis used.

**Examples**

This example shows how to display the ACL configuration on interface fast 6/1:

```
Switch# show mac access-group interface fast 6/1
Interface FastEthernet6/1:
    Inbound access-list is simple-mac-acl
    Outbound access-list is not set
```

<td>(Optional) Displays information for a specific interface; valid values for</td>
</tr>
<tr>
<td><code>slot/port</code></td>
<td><code>type</code> are <code>fastethernet</code>, <code>gigabitethernet</code>, and <code>tengigabitethernet</code>.</td>
</tr>
<tr>
<td><code>protocol protocol</code></td>
<td>(Optional) Specifies a protocol. See the “Usage Guidelines” section for</td>
</tr>
<tr>
<td></td>
<td>more information.</td>
</tr>
<tr>
<td><code>vlan vlan_id</code></td>
<td>(Optional) Displays entries for the specific VLAN only; valid values are</td>
</tr>
<tr>
<td></td>
<td>from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

The keyword definitions for the `protocol` variable are as follows:

- `ip` specifies the IP protocol.
- `ipx` specifies the IPX protocols.
- `assigned` specifies the assigned protocol entries.
- `other` specifies the other protocol entries.
show mac-address-table address

This example shows how to display MAC address table information for a specific MAC address:

```
Switch# show mac-address-table address 0030.94fc.0dff
```

### Examples

#### Unicast Entries

<table>

</tbody>
</table>
show mac-address-table aging-time

To display the MAC address aging time, use the `show mac-address-table aging-time` command.

```plaintext
show mac-address-table aging-time [vlan vlan_id]
```

Syntax Description
- `vlan vlan_id` (Optional) Specifies a VLAN; valid values are from 1 to 4094.

Defaults
- This command has no default settings.

Command Modes
- Privileged EXEC mode

Command History
- **Release** Modification
  - 12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.
  - 12.1(12c)EW Support for extended addressing was added.

Examples
- This example shows how to display the currently configured aging time for all VLANs:
  ```plaintext
  Switch# show mac-address-table aging-time
  Vlan    Aging Time
  ----    ----------
  100     300
  200     1000
  Switch#
  ```

- This example shows how to display the currently configured aging time for a specific VLAN:
  ```plaintext
  Switch# show mac-address-table aging-time vlan 100
  Vlan    Aging Time
  ----    ----------
  100     300
  Switch#
  ```

Related Commands
- `show mac-address-table address` Displays the information about the MAC-address table.
- `show mac-address-table count` Displays the number of entries currently in the MAC address table.
- `show mac-address-table dynamic` Displays the dynamic MAC address table entries only.
- `show mac-address-table interface` Displays the MAC address table information for a specific interface.
- `show mac-address-table multicast` Displays information about the multicast MAC address table.
### Command Description

<table>
<thead>
<tr>

<tr>
<td><code>show mac-address-table vlan</code></td>
<td>Displays information about the MAC address table for a specific VLAN.</td>
</tr>
</tbody>
</table>
show mac-address-table count

To display the number of entries currently in the MAC address table, use the **show mac-address-table count** command.

```
show mac-address-table count [vlan vlan_id]
```

**Syntax Description**
- **vlan vlan_id** (Optional) Specifies a VLAN; valid values are from 1 to 4094.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
show mac-address-table dynamic

To display the dynamic MAC address table entries only, use the show mac-address-table dynamic command.

```
show mac-address-table dynamic [address mac_addr | interface type slot/port | protocol protocol | vlan vlan_id]
```

**Syntax Description**

- **address mac_addr** (Optional) Specifies a 48-bit MAC address; the valid format is H.H.H.
- **interface type slot/port** (Optional) Specifies an interface to match; valid values for type are fastethernet, gigabitethernet, and tengigabitethernet.
- **protocol protocol** (Optional) Specifies a protocol. See the “Usage Guidelines” section for more information.
- **vlan vlan_id** (Optional) Displays entries for a specific VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The keyword definitions for the `protocol` argument are as follows:

- **assigned** specifies assigned protocol entries.
- **ip** specifies IP protocol.
- **ipx** specifies IPX protocols.
- **other** specifies other protocol entries.

The show mac-address-table dynamic command output for an EtherChannel interface changes the port number designation (such as, 5/7) to a port group number (such as, Po80).

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.
This example shows how to display all the dynamic MAC address entries:

```
Switch# show mac-address-table dynamic
Unicast Entries
  vlan  mac address     type        protocols               port
  -------+---------------+--------+---------------------+---------------------
  1    0000.0000.0201   dynamic ip                     FastEthernet6/15
  1    0000.0000.0202   dynamic ip                     FastEthernet6/15
  1    0000.0000.0203   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0204   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0205   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0206   dynamic ip,assigned            FastEthernet6/15

Switch#
```

This example shows how to display the dynamic MAC address entries with a specific protocol type (in this case, assigned):

```
Switch# show mac-address-table dynamic protocol assigned
Unicast Entries
  vlan  mac address     type        protocols               port
  -------+---------------+--------+---------------------+---------------------
  1    0000.0000.0203   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0204   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0205   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0206   dynamic ip,assigned            FastEthernet6/15

Switch#
```

</tbody>
</table>
show mac address-table learning

To display the status of MAC address learning for all VLANs or a specified VLAN, use the show mac address-table learning user EXEC command.

```
show mac address-table learning [vlan vlan-id] [ | begin | exclude | include] expression]
```

**Syntax Description**

- **vlan vlan-id** (Optional) Displays information for a specific VLAN. The range is 1 to 4094.
- **begin** (Optional) Displays the line that matches the `expression`.
- **exclude** (Optional) Displays excluded lines that match the `expression`.
- **include** (Optional) Displays included lines that match the specified `expression`.
- **expression** (Optional) Specifies the expression in the output as a reference point.

**Defaults**

MAC address learning is enabled on all VLANs.

**Command Modes**

User EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was modified to support the learning disable feature on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To display configured VLANs, and whether MAC address learning is enabled or disabled, use the show mac address-table learning command without keywords.

To display the learning status on an individual VLAN, use the command with a specific VLAN ID.

Expressions are case sensitive. For example, if you enter `| exclude output`, the lines that contain `output` do not appear, but the lines that contain `Output` appear.

**Examples**

This example shows that MAC address learning is disabled on VLAN 200:

```
Switch> show mac address-table learning
VLAN Learning Status
---- ------------------
1     yes
100   yes
200   no
```

**Related Commands**

<table>
<thead>

</tr>
</thead>
<tbody>
<tr>
<td>mac address-table learning vlan</td>
<td>Enables or disables MAC address learning on a VLAN.</td>
</tr>
</tbody>
</table>
show mac-address-table multicast

To display information about the multicast MAC address table, use the `show mac-address-table multicast` command.

```
show mac-address-table multicast [count | {igmp-snooping [count]} | {user [count]} | {vlan vlan_num}]
```

**Syntax Description**

- `count` (Optional) Displays the number of multicast entries.
- `igmp-snooping` (Optional) Displays only the addresses learned by IGMP snooping.
- `user` (Optional) Displays only the user-entered static addresses.
- `vlan vlan_num` (Optional) Displays information for a specific VLAN only; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **12.1(8a)EW** Support for this command was introduced on the Catalyst 4500 series switch.
- **12.1(12c)EW** Added support for extended VLAN addresses.

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

**Examples**

This example shows how to display multicast MAC address table information for a specific VLAN:

```
Switch# show mac-address-table multicast vlan 1
Multicast Entries
  vlan  mac address   type    ports
-----------------------------------------------
  1    ffff.ffff.ffff  system  Switch,Fa6/15
Switch#
```

This example shows how to display the number of multicast MAC entries for all VLANs:

```
Switch# show mac-address-table multicast count
MAC Entries for all vlans:
Multicast MAC Address Count:          141
Total Multicast MAC Addresses Available:  16384
Switch#
```

</tbody>
</table>
show mac-address-table notification

To display the MAC address table notification status and history, use the **show mac-address-table notification** command.

```
show mac-address-table notification [change] [interface [interface-id]] | [mac-move] | [threshold] | [learn-fail]
```

**Syntax Description**
- **change** (Optional) Displays the MAC address change notification status.
- **interface** (Optional) Displays MAC change information for an interface.
- **interface-id** (Optional) Displays the information for a specific interface. Valid interfaces include physical ports and port channels.
- **mac-move** (Optional) Displays MAC move notification status.
- **threshold** (Optional) Displays the MAC threshold notification status.
- **learn-fail** (Optional) Displays general information of hardware MAC learning failure notifications.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support for <code>learn-fail</code> keyword, Supervisor Engine 6-E, and Catalyst 4900M chassis added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the **show mac-address-table notification change** command to display the MAC change notification interval, the maximum number of entries allowed in the history table, the history table contents, and whether the MAC change feature is enabled or disabled.

Use the **interface** keyword to display the flags for all interfaces. If the **interface-id** is included, only the flags for that interface are displayed.

**Examples**

This example shows how to display all the MAC address notification information:

```
Switch# show mac-address-table notification change
MAC Notification Feature is Enabled on the switch
Interval between Notification Traps : 1 secs
Number of MAC Addresses Added : 5
Number of MAC Addresses Removed : 1
Number of Notifications sent to NMS : 3
Maximum Number of entries configured in History Table : 500
Current History Table Length : 3
MAC Notification Traps are Enabled
```
show mac-address-table notification

History Table contents
----------------------
History Index 1, Entry Timestamp 478433, Despatch Timestamp 478433
MAC Changed Message :  
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab0 Dot1dBasePort: 323

History Index 2, Entry Timestamp 481834, Despatch Timestamp 481834
MAC Changed Message :
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab1 Dot1dBasePort: 323
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab2 Dot1dBasePort: 323
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab3 Dot1dBasePort: 323
Operation: Added Vlan: 1 MAC Addr: 1234.5678.9ab4 Dot1dBasePort: 323

History Index 3, Entry Timestamp 484334, Despatch Timestamp 484334
MAC Changed Message :
Operation: Deleted Vlan: 1 MAC Addr: 1234.5678.9ab0 Dot1dBasePort: 323

This example shows how to display the MAC address change status on the FastEthernet interface 7/1:

Switch# show mac-address-table notification change interface FastEthernet 7/1

MAC Notification Feature is Enabled on the switch
Interface MAC Added Trap MAC Removed Trap
--------- -------------- ----------------
FastEthernet7/1 Enabled Disabled

Switch#

This example shows how to display the MAC address move status:

Switch# show mac-address-table notification mac-move
MAC Move Notification: Enabled
Switch#

This example shows how to display the MAC address table utilization status:

Switch# show mac-address-table notification threshold
Status limit Interval
---------- ----------- ------------
enabled 50 120

Switch#

This example shows how to display general information of MAC learning failure notifications:

Switch# show mac address-table notification learn-fail
Status limit Interval
---------- ----------- ------------
disabled 2000 120

### Usage Guidelines

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the the internal VLAN number.

### Examples

This example shows how to display the MAC address table entries that have a specific protocol type (in this case, assigned):

```
Switch# show mac-address-table protocol assigned

  vlan mac address type protocol qos   ports
  ----------- ------- ------ ------ -----  -------
  200 0050.3e8d.6400 static assigned   -- Switch
  100 0050.3e8d.6400 static assigned   -- Switch
   5  0050.3e8d.6400 static assigned   -- Switch
 4092 0000.0000.0000 dynamic assigned   -- Switch
  4  0050.3e8d.6400 static assigned   -- Switch
 4092 0050.f0ac.3059 static assigned   -- Switch
  4  0050.f0ac.3059 dynamic assigned   -- Switch
  1  0010.7b3b.0978 dynamic assigned   -- Fa5/9

Switch#
```
This example shows the other output for the previous example:

```
Switch# show mac-address-table protocol other
Unicast Entries
  vlan  mac address     type          protocols               port
-------+---------------+--------+---------------------+--------------------

<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

The keyword definitions for the protocol argument are as follows:

- **assigned** specifies the assigned protocol entries.
- **ip** specifies the IP protocol.
- **ipx** specifies the IPX protocols.
- **other** specifies the other protocol entries.
Examples

This example shows how to display all the static MAC address entries:

Switch# show mac-address-table static

Unicast Entries

</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries used by the routed ports, the routed port name is displayed in the “vlan” column not the the internal VLAN number.

The keyword definitions for the `protocol` variable are as follows:

- `assigned` specifies the assigned protocol entries.
- `ip` specifies the IP protocol.
- `ipx` specifies the IPX protocols.
- `other` specifies the other protocol entries.
**show mac-address-table vlan**

This example shows how to display information about the MAC address table for a specific VLAN:

Switch# **show mac-address-table vlan 1**

**Unicast Entries**

- vlan  mac address     type        protocols               port
- 1    0000.0000.0201   dynamic ip                     FastEthernet6/15
- 1    0000.0000.0202   dynamic ip                     FastEthernet6/15
- 1    0000.0000.0203   dynamic other                  FastEthernet6/15
- 1    0000.0000.0204   dynamic other                  FastEthernet6/15
- 1    0030.94fc.0dff    static ip,ipx,assigned,other  Switch

**Multicast Entries**

- vlan    mac address     type    ports
-  1    ffff.ffff.ffff   system Switch,Fa6/15

Switch#

This example shows how to display MAC address table information for a specific protocol type:

Switch# **show mac-address-table vlan 100 protocol other**

**Unicast Entries**

- vlan  mac address     type        protocols               port
- 1    0000.0000.0203   dynamic other                  FastEthernet6/15
- 1    0000.0000.0204   dynamic other                  FastEthernet6/15
- 1    0030.94fc.0dff    static ip,ipx,assigned,other  Switch

**Multicast Entries**

- vlan    mac address     type    ports
-  1    ffff.ffff.ffff   system Switch,Fa6/15

Switch#

**show macro auto mac-address-group**

Use the `show macro auto mac-address-group` command to display the configuration of MAC address group.

```
show macro auto mac-address-group
```

---

**Syntax Description**

No keywords

---

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

---

**Examples**

This example shows how to display the configuration of the MAC address group:

```
Switch# show macro auto address-group
MAC Address Group Configuration:

<table>
<thead>
<tr>
<th>Group Name</th>
<th>OUI</th>
<th>MAC ADDRESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>testGroup</td>
<td>2222.2222.2222</td>
<td>1111.1111.1111</td>
</tr>
</tbody>
</table>
```

show macro auto device

Use the `show macro auto device` global configuration command to display the default information for a device, including built-in function name and the parameters that can be provided for the commands when executing the built-in function.

```
show macro auto device device_id
```

**Syntax Description**

```
device_id
```

Specifies the device ID.

**Defaults**

None

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the default values as well as the currently used values if configured.

**Examples**

This example shows how to display the default information for the device access-point:

```
Switch# show macro auto device access-point
Device: access-point
Default Macro: CISCO_AP_AUTO_SMARTPORT
Current Macro: CISCO_AP_AUTO_SMARTPORT
Configurable Parameters: NATIVE_VLAN
Defaults Parameters: NATIVE_VLAN=1
Current Parameters: NATIVE_VLAN=1
```

**Related Commands**

<table>

</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display Auto SmartPorts status and the applied macros:

```
Switch# show macro auto int gi3/8
Global Auto Smart Port Status
Auto Smart Ports Enabled
Fallback : CDP Disabled, LLDP Disabled
Interface     Auto Smart Port   Fallback    Macro Description(s)
--------------------------------------------------------------
Gi3/8         TRUE              None        CISCO_PHONE_EVENT
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show macro auto device</code></td>
<td>Displays the default information for a device, including builtin function name and the parameters that can be provided for the commands when executing the builtin function.</td>
</tr>
</tbody>
</table>
show module

To display information about the module, use the **show module** command.

```
show module [mod | all]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mod</td>
<td>(Optional) Number of the module; valid values vary from chassis to chassis.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Displays information for all modules.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Enhanced the output of the <strong>show idprom interface</strong> command to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the Mod Sub-Module fields in the command output, the **show module** command displays the supervisor engine number but appends the uplink daughter card’s module type and information.

If the PoE consumed by the module is more than 50 W above the administratively allocated PoE, the “Status” displays as “PwrOver.” If the PoE consumed by the module is more than 50 W above the PoE module limit, the “Status” displays as “PwrFault.”

**Examples**

This example shows how to display information for all the modules.

This example shows the **show module** command output for a system with inadequate power for all installed modules. The system does not have enough power for Module 5; the “Status” displays it as “PwrDeny.”

```
Switch# show module all

<table>
<thead>
<tr>

**show monitor**

To display information about the SPAN session, use the `show monitor` command.

```
show monitor [session] [range session-range | local | remote | all | session-number] [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>session</code></td>
<td>(Optional) Displays the SPAN information for a session.</td>
</tr>
<tr>
<td><code>range</code></td>
<td>(Optional) Displays information for a range of sessions.</td>
</tr>
<tr>
<td><code>session-range</code></td>
<td>(Optional) Specifies a range of sessions.</td>
</tr>
<tr>
<td><code>local</code></td>
<td>(Optional) Displays all local SPAN sessions.</td>
</tr>
<tr>
<td><code>remote</code></td>
<td>(Optional) Displays the RSPAN source and destination sessions.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>(Optional) Displays the SPAN and RSPAN sessions.</td>
</tr>
<tr>
<td><code>session-number</code></td>
<td>(Optional) Session number; valid values are from 1 to 6.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>(Optional) Displays the detailed SPAN information for a session.</td>
</tr>
</tbody>
</table>

**Defaults**

The `detail` keyword only displays lines with a nondefault configuration.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Added support for differing directions within a single user session.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Output enhanced to display configuration status of SPAN enhancements.</td>
</tr>
<tr>
<td>12.1(20)EW</td>

</tr>
<tr>
<td>12.2(20)EW</td>
<td>Added support to display ACLs that are applied to SPAN sessions.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display whether ACLs are applied to a given SPAN session on a Catalyst 4500 series switch:

```
Switch# show monitor

Session 1
--------
Type      : Local Session
Source Ports :
  Both    : Fa6/1
Destination Ports : Fa6/2
  Encapsulation : Native
  Ingress      : Disabled
  Learning     : Disabled
Filter VLANs : 1
IP Access-group : 10
```

---

2-784

Catalyst 4500 Series Switch Cisco IOS Command Reference—Release 15.0(2)SG

OL-23829-01
This example shows how to display SPAN information for session 2:

```
Switch# show monitor session 2
Session 2
----------
Type: Remote Source Session
Source Ports:
   RX Only: Fa1/1-3
Dest RSPAN VLAN: 901
Ingress: Enabled, default VLAN=2
Learning: Disabled
Switch#
```

This example shows how to display the detailed SPAN information for session 1:

```
Switch# show monitor session 1 detail
Session 1
---------
Type: Local Session
Source Ports:
   RX Only: None
   TX Only: None
   Both: G1/1, CPU
Source VLANS:
   RX Only: None
   TX Only: None
   Both: None
Source RSPAN VLAN: Fa6/1
Destination Ports: Fa6/1
   Encapsulation: DOT1Q
      Ingress: Enabled, default VLAN = 2
Filter VLANS:
   None
Filter Types RX: Good
Filter Types TX: None
Dest Rspan Vlan: 901
Ingress: Enabled, default VLAN=2
Learning: Disabled
IP Access-group: None
Switch#
```

This example shows how to display SPAN information for session 1 beginning with the line that starts with Destination:

```
Switch# show monitor session 1 | begin Destination
Destination Ports: None
Filter VLANS: None
Switch#
Switch#
```

**show netflow-lite exporter**

To display information about the collector and global stats, use the `show netflow-lite exporter` command.

```
show netflow-lite exporter exporter-name
```

**Syntax Description**

- `exporter-name` Specifies an exporter name.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

</tbody>
</table>

**Usage Guidelines**

This command displays the total number of export packets sent.

**Examples**

This example shows how to display information about the collector and global stats:

```
Switch# show netflow-lite exporter e1
Netflow-lite Exporter e1:
  Description: Exporter
  Network Protocol Configuration:
    Destination IP address: 192.168.1.1
    VRF label: cisc
    Source IP Address: 10.1.1.5
    DSCP: 0x1
    TTL: 30
    COS: 1
  Transport Protocol Configuration:
    Transport Protocol: UDP
    Destination Port: 1234
    Source Port: 65535
  Export Protocol Configuration:
    Export Protocol: netflow-v9
  Exporter Statistics:
    Export packets sent: 36
```

show netflow-lite monitor

To display information about a particular packet or per data source stats, use the `show netflow-lite monitor` command.

```
show netflow-lite monitor monitor-number interface interface-name
show netflow-lite monitor monitor-number vlan vlan-id
```

### Syntax Description

- **monitor-number**: Specifies a monitor name.
- **interface-name**: Specifies an interface.
- **vlan-id**: Specifies a VLAN.

### Defaults

None

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Command introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command displays information about a particular packet or per data source stats. The interface can be either a physical port or a VLAN.

This command displays the following packet sampling statistics:

- Total # of packet (samples) exported
- Total # of packet (samples) dropped due to lack of local resources
- Total # of packets seen at the data source

The `packetsObserved` statistic accounts for packets that are dropped by input ACL or QoS policer.

The exported packets only represent samples from the non-dropped packet population.

### Examples

These examples show how to display information about a particular packet or per data source stats:

```
Switch# show netflow-lite monitor 1 interface gi1/3
Interface GigabitEthernet1/3:
    Netflow-lite Monitor-1:
        Active:      TRUE
        Sampler:    sampler1
        Exporter:   exporter1
        Average Packet Size: 0
        Statistics:
            Packets exported: 0
            Packets observed: 0
            Packets dropped: 0
            Average Packet Size observed: 64
```
Average Packet Size used: 64

Switch# show netflow-lite monitor 1 vlan 2
VlanID-2:
Netflow-lite Monitor-1:
  Active: TRUE
  Sampler: sampler1
  Exporter: exporter1
  Average Packet Size: 0
Statistics:
  Packets exported: 0
  Packets observed: 0
  Packets dropped: 0
  Average Packet Size observed: 64
  Average Packet Size used: 64

show netflow-lite sampler

To display information about a sampler, use the `show netflow-lite sampler` command.

```plaintext
show netflow-lite sampler sampler-name
```

### Syntax Description

- `sampler-name` Specifies a sampler name.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

### Examples

This is an example of output from the `show nmsp attachment suppress interface` command:

```
Switch# show nmsp attachment suppress interface
NMSP Attachment Suppression Interfaces
--------------------------------------
GigabitEthernet1/1
GigabitEthernet1/2
Switch#
```
This is an example of output from the `show nmsp capability` command:

```
Switch# show nmsp capability
NMSP Switch Capability
------------------------
Service       Subservice
----------       ----------
Attachment     Wired Station
Location       Subscription
Switch#
```

This is an example of output from the `show nmsp notification interval` command:

```
Switch# show nmsp notification interval
NMSP Notification Intervals
-------------------------------
Attachment notify interval: 30 sec (default)
Location notify interval: 30 sec (default)
Switch#
```

This is an example of output from the `show nmsp statistics connection` and `show nmsp statistics summary` commands:

```
Switch# show nmsp statistics connection
NMSP Connection Counters
-------------------------------
Connection 1:                          
  Connection status: UP
  Freed connection: 0

  Tx message count      Rx message count
  ----------------------  ----------------------
  Subscr Resp: 1         Subscr Req: 1

  Socket write would block: 0
  Partial socket write: 0
  Failed socket read: 0
  Socket read would block: 0
  Transmit Q full: 0
  Max Location Notify Msg: 0
  Max Attachment Notify Msg: 0
  Max TX Q Size: 0
Switch#
```
This is an example of output from the `show nmsp status` command:

```
Switch# show nmsp status
NMSP Status
-------------
NMSP: enabled

MSE IP Address         TxEchoResp RxEchoReq TxData RxData
--------------------- ----------- ----------- ------- -------
172.19.35.109          5           5         4       4
Switch#
```

This is an example of output from the `show nmsp show subscription detail` and `show nmsp show subscription summary` commands:

```
Switch# show nmsp subscription detail
Mobility Services Subscribed by 172.19.35.109:
Services  Subservices
----------  ---------------
Attachment: Wired Station
Location: Subscription

Switch# show nmsp subscription summary
Mobility Services Subscribed:
MSE IP Address  Services
---------------  -------
172.19.35.109    Attachment, Location
```

show pagp

To display information about the port channel, use the show pagp command.

```
show pagp [group-number] {counters | dual-active | internal | neighbor}
```

**Syntax Description**

- `group-number`: (Optional) Channel-group number; valid values are from 1 to 64.
- `counters`: Specifies the traffic counter information.
- `dual-active`: Specifies the dual-active information.
- `internal`: Specifies the PAgP internal information.
- `neighbor`: Specifies the PAgP neighbor information.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can enter any `show pagp` command to display the active PAgP port-channel information. To display the nonactive information, enter the `show pagp` command with a group.

**Examples**

This example shows how to display information about the PAgP counter:

```
Switch# show pagp counters
               Information         Flush
          Port   Sent  Recv   Sent  Recv
--------------------------------------
   Channel group: 1
   Fa5/4    2660  2452   0      0
   Fa5/5    2676  2453   0      0
   Channel group: 2
   Fa5/6    289   261   0      0
   Fa5/7    290   261   0      0
Switch#
```

This example shows how to display PAgP dual-active information:

```
Switch# show pagp dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1
```
This example shows how to display internal PAgP information:

```bash
Switch# show pagp 1 internal
Flags:  S - Device is sending Slow hello.  C - Device is in Consistent state.
       A - Device is in Auto mode.
Timers: H - Hello timer is running.       Q - Quit timer is running.
       S - Switching timer is running.    I - Interface timer is running.
```

<table>
<thead>
<tr>

<td>SC</td>
<td>U6/S7</td>
<td>30s</td>
<td>1</td>
<td>128</td>
<td>Any</td>
<td>129</td>
</tr>
</tbody>
</table>

This example shows how to display PAgP neighbor information for all neighbors:

```bash
Switch# show pagp neighbor
Flags:  S - Device is sending Slow hello.  C - Device is in Consistent state.
       A - Device is in Auto mode.        P - Device learns on physical port.
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

The `show policy-map control-plane` command displays information for aggregate control-plane services that control the number or rate of packets that are going to the process level.

**Examples**

This example shows that the policy map TEST is associated with the control plane. This policy map polices traffic that matches the class-map TEST, while allowing all other traffic (that matches the class-map class-default) to go through as is. Table 2-33 describes the fields shown in the display.

```
Switch# show policy-map control-plane

Control Plane

  Service-policy input: system-cpp-policy

  Class-map: system-cpp-eapol (match-all)
  0 packets
  Match: access-group name system-cpp-eapol

  Class-map: system-cpp-bpdu-range (match-all)
  0 packets
  Match: access-group name system-cpp-bpdu-range

  Class-map: system-cpp-cdp (match-all)
  28 packets
  Match: access-group name system-cpp-cdp
  police: Per-interface
    Conform: 530 bytes Exceed: 0 bytes
```
Class-map: system-cpp-garp (match-all)

show policy-map interface

To display the statistics and configurations of the input and output policies that are attached to an interface, use the `show policy-map interface` command.

```
show policy-map interface [{fastethernet interface-number} | {gigabitethernet interface-number} | {port-channel number} | {vlan vlan_id}] [input | output]
```

**Syntax Description**

- `fastethernet interface-number` (Optional) Specifies the Fast Ethernet 802.3 interface.
- `gigabitethernet interface-number` (Optional) Specifies the Gigabit Ethernet 802.3z interface.
- `port-channel number` (Optional) Specifies the port channel.
- `vlan vlan_id` (Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
- `input` (Optional) Specifies input policies only.
- `output` (Optional) Specifies output policies only.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.
- **Release** 12.1(12c)EW Added support for extended VLAN addresses.
- **Release** 12.2(25)SG Displays results for full flow policing.

**Examples**

This example shows how to display the statistics and configurations of all input and output policies attached to an interface:

```
Switch# show policy-map interface

FastEthernet6/1

  service-policy input:ipp5-policy

    class-map:ipp5 (match-all)
      0 packets
      match:ip precedence 5
      set:
        ip precedence 6

    class-map:class-default (match-any)
      0 packets
      match:any
      0 packets
```
service-policy output:ipp5-policy

class-map:ipp5 (match-all)
  0 packets
  match:ip precedence 5
  set:
    ip precedence 6

class-map:class-default (match-any)
  0 packets
  match:any
  0 packets
Switch#

This example shows how to display the input policy statistics and configurations for a specific interface:

Switch# show policy-map interface fastethernet 5/36 input

With the following configuration, each flow is policed to a 1000000 bps with an allowed 9000-byte burst value.

Note: If you use the match flow ip source-address|destination-address command, these two flows are consolidated into one flow and they have the same source and destination address.

Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol l4 source-port l4 destination-port
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet 6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
Switch# show policy-map interface
FastEthernet6/1

class-map c1

**Examples**

The following example show a configuration on a non-Supervisor Engine 6-E:

```plaintext
interface GigabitEthernet3/1
vlan-range 20-400
service-policy input p1
vlan-range 300-301
service-policy output p2
```

This example shows how to display policy-map statistics on VLAN 20 on the Gigabit Ethernet 6/1 interface:

```
Switch# show policy-map interface gigabitEthernet 3/1 vlan 20
GigabitEthernet3/1 vlan 20
Service-policy input: p1

Class-map: class-default (match-any)
0 packets
Match: any
0 packets
police: Per-interface
Conform: 0 bytes Exceed: 0 bytes
```

Switch#

The following example shows a configuration on a non-Supervisor Engine 6-E:

```plaintext
interface fastethernet6/1
vlan-range 100
service-policy in p1
```

This example shows how to display policy-map statistics on VLAN 100 on the FastEthernet interface:

```
Switch# show policy-map interface fastEthernet 6/1 vlan 100
FastEthernet6/1 vlan 100
Service-policy input: p1
```
show policy-map interface vlan

Class-map: c1 (match-all)
0 packets
Match: ip dscp af11 (10)
   police: Per-interface
      Conform: 0 bytes Exceed: 0 bytes

<tr>
<td>show policy-map interface</td>
<td>Displays the statistics and configurations of the input and output policies that are attached to an interface.</td>
</tr>
</tbody>
</table>
show port-security

To display the port security settings for an interface or for the switch, use the **show port-security** command.

```
show port-security [address] [interface interface-id]
   [interface port-channel port-channel-number] [vlan vlan-id]
```

**Syntax Description**

- **address** (Optional) Displays all secure MAC addresses for all ports or for a specific port.
- **interface interface-id** (Optional) Displays port security settings for a specific interface.
- **interface port-channel port-channel-number** (Optional) Displays port security for a specific port-channel interface.
- **vlan vlan-id** (Optional) Displays port security settings for a specific VLAN.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support was enhanced to display sticky MAC addresses.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support was enhanced to display settings on a per-VLAN basis.</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support was enhanced to display settings on EtherChannel interfaces.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the command without keywords, the output includes the administrative and operational status of all secure ports on the switch.

If you enter the `interface-id` value or `port-channel-interface` value, the **show port-security** command displays port security settings for the interface.

If you enter the `address` keyword, the **show port-security address** command displays the secure MAC addresses for all interfaces and the aging information for each secure address.

If you enter the `interface-id` value and the `address` keyword, the **show port-security address interface** command displays all the MAC addresses for the interface with aging information for each secure address. You can also use this command to display all the MAC addresses for an interface even if you have not enabled port security on it.

Sticky MAC addresses are addresses that persist across switch reboots and link flaps.
### Examples

This example shows how to display port security settings for the entire switch:

```
Switch# show port-security
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
            (Count)       (Count)          (Count)
--------------------------------------------------
Fa3/1        2            2                  0         Restrict
Fa3/2        2            2                  0         Restrict
Fa3/3        2            2                  0         Shutdown
Fa3/4        2            2                  0         Shutdown
Fa3/5        2            2                  0         Shutdown

</tr>
</tbody>
</table>

**Usage Guidelines**

If a powered device is connected to an interface with external power, the switch does not recognize the powered device. The Device column in the output of the `show power inline` command displays as unknown.

If your port is not capable of supporting PoE, you will receive this message:

`Power over Ethernet not supported on interface Admin`

The `show power inline interface | module` command displays the amount of power that is used to operate a Cisco IP Phone. To view the amount of power requested, use the `show cdp neighbors` command.

Because FPGAs and other hardware components on the WS-X4548-RJ45V+ and WS-X4648-RJ45V+E modules consume PoE, the operating PoE consumption for an 802.3af-compliant module can be nonzero when there are no powered devices attached to the module. The operating PoE can vary by as much as 20 W because of fluctuations in the PoE that is consumed by the hardware components.
### Examples

This example shows how to display information about the general power supply:

```plaintext
Switch# show power

<table>
<thead>
<tr>
<th>Power Supply</th>
<th>Model No</th>
<th>Type</th>
<th>Status</th>
<th>Fan Status</th>
<th>Inline Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PWR-C45-2800AC</td>
<td>AC 2800W</td>
<td>good</td>
<td>good</td>
<td>good</td>
</tr>
<tr>
<td></td>
<td>PWR-C45-1000AC</td>
<td>AC 1000W</td>
<td>err-disable</td>
<td>good</td>
<td>n.a.</td>
</tr>
</tbody>
</table>

*** Power Supplies of different type have been detected***

Power supplies needed by system : 1
Power supplies currently available : 1

<table>
<thead>
<tr>
<th>Power Summary</th>
<th>Used</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total</td>
<td></td>
<td></td>
</tr>
<tr>
<td>System Power (12V)</td>
<td>328</td>
<td>1360</td>
</tr>
<tr>
<td>Inline Power (-50V)</td>
<td>0</td>
<td>1400</td>
</tr>
<tr>
<td>Backplane Power (3.3V)</td>
<td>10</td>
<td>40</td>
</tr>
</tbody>
</table>

Total Used 338 (not to exceed Total Maximum Available = 750)

Switch#
```

This example shows how to display the amount of available system power:

```plaintext
Switch# show power available

<table>
<thead>
<tr>
<th>Power Summary</th>
<th>Available</th>
<th>Used</th>
<th>Remaining</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>System Power</td>
<td>1360</td>
<td>280</td>
<td>1080</td>
</tr>
<tr>
<td>Inline Power</td>
<td>1400</td>
<td>0</td>
<td>1400</td>
</tr>
<tr>
<td>Maximum Power</td>
<td>2800</td>
<td>280</td>
<td>2520</td>
</tr>
</tbody>
</table>

Switch#
```

**Note**

The “Inline Power Oper” column displays the PoE consumed by the powered devices attached to the module in addition to the PoE consumed by the FPGAs and other hardware components on the module. The “Inline Power Admin” column displays only the PoE allocated by the powered devices attached to the module.

This example shows how to display the power status information:

```plaintext
Switch# show power status

<table>
<thead>
<tr>
<th>Power Supply</th>
<th>Model No</th>
<th>Type</th>
<th>Status</th>
<th>Fan Status</th>
<th>Inline Status</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>PWR-C45-2800AC</td>
<td>AC 2800W</td>
<td>good</td>
<td>good</td>
<td>good</td>
</tr>
<tr>
<td></td>
<td>PWR-C45-1000AC</td>
<td>AC 1000W</td>
<td>err-disable</td>
<td>good</td>
<td>n.a.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Power Supply</th>
<th>Max Inline</th>
<th>Min Inline</th>
<th>Max System</th>
<th>Min System</th>
<th>Absolute Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>1400</td>
<td>1400</td>
<td>1360</td>
<td>1360</td>
<td>2800</td>
</tr>
<tr>
<td></td>
<td>1400</td>
<td>1400</td>
<td>1360</td>
<td>1360</td>
<td>2800</td>
</tr>
</tbody>
</table>

Switch#
```

This example shows how to verify the PoE consumption for the switch:

```plaintext
Switch# show power inline consumption default

Default PD consumption : 5000 mW

Switch#
```
show power

This example shows how to display the status of inline power:

```
Switch# show power inline
Available:677(w) Used:117(w) Remaining:560(w)
```

Note When the Supervisor Engine II+TS is used with the 1400 W DC power supply (PWR-C45-1400DC), and only one 12.5 A input of the DC power supply is used, the supervisor engine’s power consumption may vary depending on whether there is any linecard inserted at slot 2 and 3, as well as on the type of linecards inserted. This amount varies between 155 W and 330 W. This variability also affects the
maximum amount of available supervisor engine inline power, which can also vary from 0 W to 175 W. Therefore, it is possible for a supervisor engine to deny inline power to some connected inline power devices when one or more linecards are inserted into the chassis.

The output of the commands `show power detail` and `show power module` display the supervisor engine’s variable power consumption and its inline power summary:

```
Switch# show power detail
sh power detail

show power inline police

To display PoE policing and monitoring status, use the show power inline police command.

```
show power inline police [interfacename] [module n]
```

**Syntax Description**

- `interfacename` (optional) Displays PoE policing and monitoring status for a particular interface.
- `module n` (optional) Display PoE policing and monitoring status for all interfaces on this module.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Oper Power field displays the true power consumption of the connected device.

The `show power inline police` command with no keywords displays PoE policing status for all interfaces in the chassis.

If this command is executed at the global level, the last line of the output under Oper Power field displays the total true inline power consumption of all devices connected to the switch.

**Examples**

This example shows how to display PoE policing status for a interface GigabitEthernet 2/1:

```
Switch# show power inline police gigabitEthernet 2/1
Available:421(w) Used:44(w) Remaining:377(w)

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin State</th>
<th>Oper State</th>
<th>Admin Police</th>
<th>Oper Police</th>
<th>Cutoff</th>
<th>Oper Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi2/1</td>
<td>auto</td>
<td>on</td>
<td>errdisable</td>
<td>ok</td>
<td>22.6</td>
<td>9.6</td>
</tr>
</tbody>
</table>
```

**Related Commands**

- `power inline police` Configures PoE policing on a particular interface.
show pppoe intermediate-agent interface

To display PPPoE Intermediate Agent configuration and statistics (packet counters), use the show pppoe intermediate-agent interface command.

```
show pppoe intermediate-agent information interface
show pppoe intermediate-agent statistics interface interface
```

Syntax Description

```
interface interface         Interface for which information or statistics are displayed.
```

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to display PPPoE Intermediate Agent configuration:

```
Switch# show pppoe intermediate-agent information
Switch PPPoE Intermediate-Agent is enabled
PPPoE Intermediate-Agent trust/rate is configured on the following Interfaces:
Interface     IA  Trusted  Vsa Strip  Rate limit (pps)
------------------------ -------  --------  --------  ---------------
GigabitEthernet3/4     no      yes     yes        unlimited
PPPoE Intermediate-Agent is configured on following VLANS:
2-3
GigabitEthernet3/7     no      no      no         unlimited
PPPoE Intermediate-Agent is configured on following VLANS:
2-3
```

This example shows how to display PPPoE Intermediate Agent statistics on an interface:

```
Switch# show pppoe intermediate-agent statistics interface g3/7
Interface : GigabitEthernet3/7
Packets received:
All = 3
PADI = 0  PADO = 0
PADR = 0  PADS = 0
PADT = 3
Packets dropped:
Rate-limit exceeded = 0
Server responses from untrusted ports = 0
Client requests towards untrusted ports = 0
Malformed PPPoE Discovery packets = 0
Vlan 2: Packets received PADI = 6  PADO = 0  PADR = 6  PADS = 0  PADT = 6
Vlan 3: Packets received PADI = 4  PADO = 0  PADR = 4  PADS = 0  PADT = 4
```

show qos dbl

To display global Dynamic Buffer Limiting (DBL) information, use the `show qos dbl` command.

```
show qos dbl
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

**Examples**
This example shows how to display global DBL information:

```
Switch# show qos dbl
DBL is enabled globally
DBL flow includes vlan
DBL flow includes 14-ports
DBL does not use ecn to indicate congestion
DBL exceed-action mark probability:15%
DBL max credits:15
DBL aggressive credit limit:10
DBL aggressive buffer limit:2 packets
DBL DSCPs with default drop probability:
 1-10
Switch#
```

**Related Commands**

</table>
show qos interface

To display queueing information, use the `show qos interface` command.

```
show qos interface {fastethernet interface-number | gigabitethernet interface-number} |
  [vlan vlan_id | port-channel number]
```

**Syntax Description**

- `fastethernet interface-number`: Specifies the Fast Ethernet 802.3 interface.
- `gigabitethernet interface-number`: Specifies the Gigabit Ethernet 802.3z interface.
- `vlan vlan_id`: (Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
- `port-channel number`: (Optional) Specifies the port channel; valid ranges are from 1 to 64.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(8a)EW: Support for this command was introduced on the Catalyst 4500 series switch.
- **Release** 12.1(13)EW: Added support for extended VLAN addresses.
- **Release** 12.1(19)EW: Display changed to include the Port Trust Device.

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

**Examples**

This example shows how to display queueing information:

```
Switch# show qos interface fastethernet 6/1
QoS is enabled globally
Port QoS is enabled
  Administrative Port Trust State: 'dscp'
  Operational Port Trust State: 'untrusted'
  Port Trust Device: 'cisco-phone'
  Default DSCP:0 Default CoS:0

  Tx-Queue  Bandwidth  ShapeRate  Priority  QueueSize
          (bps)        (bps)        (packets)
  1        31250000  disabled    N/A      240
  2        31250000  disabled    N/A      240
  3        31250000  disabled    normal   240
  4        31250000  disabled    N/A      240

Switch#
```

show redundancy

To display redundancy facility information, use the `show redundancy` command.

```
show redundancy {clients | counters | history | states}
```

**Syntax Description**

- **clients** (Optional) Displays information about the redundancy facility client.
- **counters** (Optional) Displays information about the redundancy facility counter.
- **history** (Optional) Displays a log of past status and related information for the redundancy facility.
- **states** (Optional) Displays information about the redundancy facility state, such as disabled, initialization, standby, active.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1.(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support for ISSU was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information about the redundancy facility:

```
Switch# show redundancy
Switch# show redundancy
4507r-demo#show redundancy
Redundant System Information :
----------------------------------------
Available system uptime = 2 days, 2 hours, 39 minutes
Switchovers system experienced = 0
Standby failures = 0
Last switchover reason = none

   Hardware Mode = Duplex
   Configured Redundancy Mode = Stateful Switchover
   Operating Redundancy Mode = Stateful Switchover
   Maintenance Mode = Disabled
   Communications = Up

Current Processor Information :
----------------------------------------
   Active Location = slot 1
   Current Software state = ACTIVE
   Uptime in current state = 2 days, 2 hours, 39 minutes
   Image Version = Cisco Internetwork Operating System Software
   IOS (tm) Catalyst 4000 L3 Switch Software (cat4000-I5S-M), Version 12.2(20)EWA(3 .92), CISCO INTERNAL USE ONLY ENHANCED PRODUCTION VERSION
```
This example shows how to display redundancy facility client information:

Switch# show redundancy clients
clientID = 0  clientSeq = 0  RF_INTERNAL_MSG
clientID = 30  clientSeq = 135  Redundancy Mode RF
clientID = 28  clientSeq = 330  GALIOS_CONFIG_SYNC
clientID = 65000  clientSeq = 65000  RF_LAST_CLIENT Switch

The output displays the following information:

- `clientID` displays the client’s ID number.
- `clientSeq` displays the client’s notification sequence number.
- Current redundancy facility state.

This example shows how to display the redundancy facility counter information:

Switch# show redundancy counters
Redundancy Facility OMs
  comm link up = 1
  comm link down down = 0
  invalid client tx = 0
  null tx by client = 0
  tx failures = 0
  tx msg length invalid = 0
  client not rxing msgs = 0
  rx peer msg routing errors = 0
  null peer msg rx = 0
  errored peer msg rx = 0
  buffers tx = 1535
  tx buffers unavailable = 0
  buffers rx = 1530
  buffer release errors = 0
  duplicate client registers = 0
  failed to register client = 0
  Invalid client syncs = 0

Switch#
This example shows how to display redundancy facility history information:

Switch# show redundancy history
00:00:01 client added: RF_INTERNAL_MSG(0) seq=0
00:00:01 client added: RF_LAST_CLIENT(65000) seq=65000

**show redundancy config-sync**

To display an ISSU config-sync failure or the ignored mismatched command list (MCL), if any, use the `show redundancy config-sync` command.

```
show redundancy config-sync {failures | ignored} {bem | mcl | prc}
```

```
show redundancy config-sync ignored failures mcl
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failures</td>
<td>Displays MCL entries or BEM/PRC failures.</td>
</tr>
<tr>
<td>ignored</td>
<td>Displays the ignored MCL entries.</td>

</tr>
<tr>
<td>12.2(44)SG</td>
<td>Updated command syntax from issu config-sync to redundancy config-sync.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When two versions of Cisco IOS images are involved, the command sets supported by two images might differ. If any of those mismatched commands are executed on the active supervisor engine, the standby supervisor engine might not recognize those commands. This causes a config mismatch condition. If the syntax check for the command fails on standby supervisor engine during a bulk sync, the command is moved into the MCL and the standby supervisor engine is reset. To display all the mismatched commands, use the `show redundancy config-sync failures mcl` command.
To *clean* the MCL, follow these steps:

**Step 1** Remove all mismatched commands from the active supervisor engines’ running configuration.

**Step 2** Revalidate the MCL with a modified running configuration using the `redundancy config-sync validate mismatched-commands` command.

**Step 3** Reload the standby supervisor engine.

Alternatively, you could ignore the MCL by following these steps:

**Step 1** Enter the `redundancy config-sync ignore mismatched-commands` command.

**Step 2** Reload the standby supervisor engine; the system transitions to SSO mode.

**Note** If you ignore the mismatched commands, the *out-of-sync* configuration at the active supervisor engine and the standby supervisor engine still exists.

**Step 3** You can verify the ignored MCL with the `show redundancy config-sync ignored mcl` command.

Each command sets a return code in the action function that implements the command. This return code indicates whether or not the command successfully executes. The active supervisor engine maintains the PRC after executing a command. The standby supervisor engine executes the command and sends PRC back to the active supervisor engine. PRC failure occurs if these two PRCs do not match. If a PRC error occurs at the standby supervisor engine either during bulk sync or LBL sync, the standby supervisor engine is reset. To display all PRC failures, use the `show redundancy config-sync failures prc` command.

To display best effort method (BEM) errors, use the `show redundancy config-sync failures bem` command.

**Examples**

The following example shows how to display the ISSU BEM failures:

```
Switch# show redundancy config-sync failures bem
BEM Failed Command List
-------------------------
The list is Empty
Switch#
```

The following example shows how to display the ISSU MCL failures:

```
Switch# show redundancy config-sync failures mcl
Mismatched Command List
------------------------
The list is Empty
Switch#
```
The following example shows how to display the ISSU PRC failures:

```bash
Switch# show redundancy config-sync failures prc
PRC Failed Command List
-----------------------------
interface FastEthernet3/2
  ! <submode> "interface"
  - channel-protocol pagp
  ! </submode> "interface"
```

### Related Commands

</table>
**show running-config**

To display the module status and configuration, use the `show running-config` command.

```
show running-config [module slot]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th><code>module slot</code> (Optional) Specifies the module slot number; valid values are from 1 to 6.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defaults</td>
<td>This command has no default settings.</td>
</tr>
<tr>
<td>Command Modes</td>
<td>Privileged EXEC mode</td>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In some cases, you might see a difference in the duplex mode displayed when you enter the `show interfaces` command and the `show running-config` command. If you do see a difference, the duplex mode displayed in the `show interfaces` command is the actual duplex mode that the interface is running. The `show interfaces` command shows the operating mode for an interface, while the `show running-config` command shows the configured mode for an interface.

The `show running-config` command output for an interface may display a duplex mode configuration but no configuration for the speed. When no speed is displayed in the output, it indicates that the interface speed is configured to be auto and that the duplex mode shown becomes the operational setting once the speed is configured to something other than auto. With this configuration, it is possible that the operating duplex mode for that interface does not match the duplex mode shown with the `show running-config` command.

**Examples**

This example shows how to display the module and status configuration for all modules:

```
Switch# show running-config
03:23:36:%SYS-5-CONFIG_I:Configured from console by consolesh runn
Building configuration...

Current configuration: 3268 bytes
!
version 12.1
no service pad
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname Switch
!
power supplies required 1
ip subnet-zero
```
This example shows the output for the `show running-config` command when you have enabled the `switchport voice vlan` command:

```
Switch# show running-config int fastethernet 6/1
Building configuration...

Current configuration:133 bytes
!
interface FastEthernet6/1
 switchport voice vlan 2
 no snmp trap link-status
 spanning-tree portfast
 channel-group 1 mode on
end

Switch#
```
show shell functions

Use the `show shell functions` command to display configurations for all builtin shell functions.

```
show shell functions
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>No keywords</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defaults</td>
<td>None</td>
</tr>
<tr>
<td>Command Modes</td>
<td>Privileged EXEC</td>
</tr>
</tbody>
</table>

**Command History**

show spanning-tree

To display spanning-tree state information, use the `show spanning-tree` command.

```
show spanning-tree [bridge_group | active | backbonefast | bridge [id] | inconsistentports | interface type | root | summary [total] | uplinkfast | vlan vlan_id | pathcost method | detail]
```

### Syntax Description

- `bridge_group` (Optional) Specifies the bridge group number; valid values are from 1 to 255.
- `active` (Optional) Displays the spanning-tree information on active interfaces only.
- `backbonefast` (Optional) Displays the spanning-tree BackboneFast status.
- `bridge` (Optional) Displays the bridge status and configuration information.
- `id` (Optional) Name of the bridge.
- `inconsistentports` (Optional) Displays the root inconsistency state.
- `interface type` (Optional) Specifies the interface type and number; valid values are `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `port-channel` (1 to 64), and `vlan` (1 to 4094).
- `root` (Optional) Displays the root bridge status and configuration.
- `summary` (Optional) Specifies a summary of port states.
- `total` (Optional) Displays the total lines of the spanning-tree state section.
- `uplinkfast` (Optional) Displays the spanning-tree UplinkFast status.
- `vlan vlan_id` (Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
- `pathcost method` (Optional) Displays the default path cost calculation method used.
- `detail` (Optional) Displays a summary of interface information.

### Defaults

Interface information summary is displayed.

### Command Modes

Privileged EXEC mode

This example shows how to display spanning-tree information on the active interfaces only:

```plaintext
Switch# show spanning-tree active
UplinkFast is disabled
BackboneFast is disabled

VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0050.3e8d.6401
Configured hello time 2, max age 20, forward delay 15
Current root has priority 16384, address 0060.704c.7000
Root port is 265 (FastEthernet5/9), cost of root path is 38
Topology change flag not set, detected flag not set
Number of topology changes 0 last change occurred 18:13:54 ago
Times: hold 1, topology change 24, notification 2
       hello 2, max age 14, forward delay 10
Timers: hello 0, topology change 0, notification 0

Port 265 (FastEthernet5/9) of VLAN1 is forwarding
   Port path cost 19, Port priority 128, Port Identifier 129.9.
   Designated root has priority 16384, address 0060.704c.7000
   Designated bridge has priority 32768, address 00e0.4fac.b000
   Designated port id is 128.2, designated path cost 19
   Timers: message age 3, forward delay 0, hold 0
   Number of transitions to forwarding state: 1
   BPDU: sent 3, received 32852
Switch#
```

This example shows how to display the spanning-tree BackboneFast status:

```plaintext
Switch# show spanning-tree backbonefast
BackboneFast is enabled

BackboneFast statistics
-----------------------
Number of transition via backboneFast (all VLANs) : 0
Number of inferior BPDUs received (all VLANs)     : 0
Number of RLQ request PDUs received (all VLANs)   : 0
Number of RLQ response PDUs received (all VLANs)  : 0
Number of RLQ request PDUs sent (all VLANs)       : 0
Number of RLQ response PDUs sent (all VLANs)      : 0
Switch#
```

This example shows how to display spanning-tree information for the bridge:

```plaintext
Switch# show spanning-tree bridge
VLAN1
   Bridge ID  Priority    32768
   Address    0050.3e8d.6401
   Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec
VLAN2
   Bridge ID  Priority    32768
   Address    0050.3e8d.6402
   Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec
VLAN3
   Bridge ID  Priority    32768
   Address    0050.3e8d.6403
   Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec
Switch#
```

This example shows how to display a summary of interface information:

```plaintext
Switch# show spanning-tree

VLAN1
```
Spanning tree enabled protocol ieee
Root ID  Priority 32768
        Address 0030.94fc.0a00
    This bridge is the root
Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec

Bridge ID Priority 32768
        Address 0030.94fc.0a00
Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec
Aging Time 300

Interface                                      Designated
Name                   Port ID Prio Cost Sts   Cost Bridge ID            Port ID
-------------------    ------- --- ------ ---   ---- -------------------- -------
FastEthernet6/15       129.79  128     19 FWD      0 32768 0030.94fc.0a00 129.79

VLAN2
Spanning tree enabled protocol ieee
Root ID  Priority 32768
        Address 0030.94fc.0a01
    This bridge is the root
Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec

Bridge ID Priority 32768
        Address 0030.94fc.0a01
Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec

This example shows how to display spanning-tree information for Fast Ethernet interface 5/9:

Switch# show spanning-tree interface fastethernet5/9
Interface Fa0/10 (port 23) in Spanning tree 1 is ROOT-INCONSISTENT
Port path cost 100, Port priority 128
    Designated root has priority 8192, address 0090.0c71.a400
    Designated bridge has priority 32768, address 00e0.1e9f.8940
    Designated port is 23, path cost 115
    Timers: message age 0, forward delay 0, hold 0
    BPDU: sent 0, received 0
    The port is in the portfast mode
Switch#

This example shows how to display spanning-tree information for a specific VLAN:

Switch# show spanning-tree vlan 1
VLAN1 is executing the ieee compatible Spanning Tree protocol
    Bridge Identifier has priority 32768, address 0030.94fc.0a00
    Configured hello time 2, max age 20, forward delay 15
    We are the root of the spanning tree
    Topology change flag not set, detected flag not set
    Number of topology changes 5 last change occurred 01:50:47 ago
    from FastEthernet6/16
    Times: hold 1, topology change 35, notification 2
    hello 2, max age 20, forward delay 15
    Timers: hello 0, topology change 0, notification 0, aging 300
    Port 335 (FastEthernet6/15) of VLAN1 is forwarding
This example shows how to display spanning-tree information for a specific bridge group:

```
Switch# show spanning-tree vlan 1
UplinkFast is disabled
BackboneFast is disabled
Switch#
```

This example shows how to display a summary of port states:

```
Switch# show spanning-tree summary
Root bridge for: VLAN1, VLAN2.
PortFast BPDU Guard is disabled
EtherChannel misconfiguration guard is enabled
UplinkFast is disabled
BackboneFast is disabled
Default pathcost method used is short

<table>
<thead>
<tr>
<th>Name</th>
<th>Blocking</th>
<th>Listening</th>
<th>Learning</th>
<th>Forwarding</th>
<th>STP Active</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>

show spanning-tree mst

To display MST protocol information, use the `show spanning-tree mst` command.

```
show spanning-tree mst [configuration]
show spanning-tree mst [instance-id] [detail]
show spanning-tree mst [instance-id] interface interface [detail]
```

**Syntax Description**

- `configuration` (Optional) Displays region configuration information.
- `instance-id` (Optional) Instance identification number; valid values are from 0 to 15.
- `detail` (Optional) Displays detailed MST protocol information.
- `interface interface` (Optional) Interface type and number; valid values for type are `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `port-channel`, and `vlan`. See the “Usage Guidelines” section for more information.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I.

In the output display of the `show spanning-tree mst configuration` command, a warning message might display. This message appears if you do not map secondary VLANs to the same instance as the associated primary VLAN. The display includes a list of the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The warning message is as follows:

```
These secondary vlans are not mapped to the same instance as their primary:
-> 3
```

See the `show spanning-tree` command for output definitions.
Examples

This example shows how to display region configuration information:

Switch# `show spanning-tree mst configuration`
Name     [leo]
Revision 2702
Instance Vlans mapped
-------- ---------------------------------------------------------------------
  0      1-9,11-19,21-29,31-39,41-4094
  1      10,20,30,40
---------------------------------------------------------------------

Switch#

This example shows how to display additional MST protocol values:

Switch# `show spanning-tree mst 3 detail`
# # # # # # MST03 vlans mapped: 3,3000-3999
Bridge address 0002.172c.f400 priority 32771 (32768 sysid 3)
Root this switch for MST03
GigabitEthernet1/1 of MST03 is boundary forwarding
Port info port id 128.1 priority 128
cost 20000
Designated root address 0002.172c.f400 priority 32771
cost 0
Designated bridge address 0002.172c.f400 priority 32771 port
id 128.1
Timers: message expires in 0 sec, forward delay 0, forward transitions 1
Bpdus (MRecords) sent 4, received 0
FastEthernet4/2 of MST03 is backup blocking
Port info port id 128.194 priority 128 cost 200000
Designated root address 0002.172c.f400 priority 32771
cost 0
Designated bridge address 0002.172c.f400 priority 32771 port
id 128.193
Timers: message expires in 2 sec, forward delay 0, forward transitions 1
Bpdus (MRecords) sent 3, received 252
Switch#

This example shows how to display MST information for a specific interface:

Switch# `show spanning-tree mst 0 interface fastethernet4/1 detail`
Edge port: no (trunk) port guard : none
(default)
Link type: point-to-point (point-to-point) bpdu filter: disable
(default)
Boundary : internal bpdu guard : disable
(default)
FastEthernet4/1 of MST00 is designated forwarding
Vlans mapped to MST00 1-2,4-2999,4000-4094
Port info port id 128.193 priority 128 cost 200000
Designated root address 0050.3e66.d000 priority 8193
cost 20004
Designated ist master address 0002.172c.f400 priority 49152
cost 0
Designated bridge address 0002.172c.f400 priority 49152 port
id 128.193
Timers: message expires in 0 sec, forward delay 0, forward transitions 1
Bpdus sent 492, received 3
Switch#
## Related Commands

**show storm-control**

To display the broadcast storm control settings on the switch or on the specified interface, use the `show storm-control` command.

```
show storm-control [interface-id | broadcast]
```

**Supervisor Engine 6-E and Catalyst 4900M chassis**

```
show storm-control [interface-id | broadcast | multicast]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface-id</code></td>
<td>(Optional) Specifies the interface ID for the physical port.</td>
</tr>
<tr>
<td><code>broadcast</code></td>
<td>(Optional) Displays the broadcast storm threshold setting.</td>
</tr>
<tr>
<td><code>multicast</code></td>
<td>(Optional) Displays the multicast storm threshold setting.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter an interface ID, the storm control thresholds are displayed for the specified interface. If you do not enter an interface ID, the settings are displayed for the broadcast traffic type for all ports on the switch.

**Examples**

This is an example of output from the `show storm-control` command when no keywords are entered. Because no traffic type keyword was entered, the broadcast storm control settings are displayed.

```
Switch# show storm-control
Interface   Filter State   Upper    Lower    Current
-----------  --------------  --------  --------  -------
Gi2/1       Forwarding    30.00%   30.00%    N/A
Gi4/1       Forwarding    30.00%   30.00%    N/A
Gi4/3       Forwarding    30.00%   30.00%    N/A
Switch#
```
This is an example of output from the `show storm-control multicast` command on a Supervisor Engine 6-E:

```
Switch# show storm-control multicast //Supervisor Engine 6-E
Interface Filter State  Broadcast Multicast Level
--------- ------------- --------- --------- -----
Fa6/2  Blocking   Enabled  Enabled  61%
```

This is an example of output from the `show storm-control` command on a Supervisor Engine 6-E when no keywords are entered:

```
Switch# show storm-control
Interface Filter State  Broadcast Multicast Level
--------- ------------- --------- --------- -----
Fa6/1  Blocking   Enabled  Disabled  81%
Fa6/2  Blocking   Enabled  Enabled  61%
```

This is an example of output from the `show storm-control` command for a specified interface:

```
Switch# show storm-control fastethernet2/17
Interface  Filter State  Level    Current
---------  -------------  -------  -------
Fa2/17    Forwarding      50.00%    0.00%
```

This is an example of output from the `show storm-control` command for a specified interface on a Supervisor Engine 6-E:

```
Switch# show storm-control interface fastethernet6/1
Interface  Filter State  Broadcast Multicast  Level
---------  -------------  ------------------  -----
Fa6/1     Blocking   Enabled  Disabled     81%
```

Table 2-34 describes the fields in the `show storm-control` display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface</td>
<td>Displays the ID of the interface.</td>
</tr>
<tr>
<td>Filter State</td>
<td>Displays the status of the filter:</td>
</tr>
<tr>
<td></td>
<td>• Blocking—Storm control is enabled, and a storm has occurred.</td>
</tr>
<tr>
<td></td>
<td>• Forwarding—Storm control is enabled, and no storms have occurred.</td>
</tr>
<tr>
<td></td>
<td>• Inactive—Storm control is disabled.</td>
</tr>
<tr>
<td>Level</td>
<td>Displays the threshold level set on the interface for broadcast traffic.</td>
</tr>
<tr>
<td>Current</td>
<td>Displays the bandwidth utilization of broadcast traffic as a percentage of total available bandwidth. This field is valid only when storm control is enabled.</td>
</tr>
<tr>
<td>Note</td>
<td>N/A is displayed for interfaces that do storm control in the hardware.</td>
</tr>
</tbody>
</table>

Related Commands
### Command Description

<table>

</tbody>
</table>
**show system mtu**

To display the global MTU setting, use the `show system mtu` command.

```
show system mtu
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
```

**Examples**

This example shows how to display the global MTU setting:

```
Switch# show system mtu
Global Ethernet MTU is 1550 bytes.
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>system mtu</code></td>
<td>Sets the maximum Layer 2 or Layer 3 payload size.</td>
</tr>
</tbody>
</table>
show tech-support

To display troubleshooting information for TAC, use the show tech-support command.

```
show tech-support [bridging | cef | ipmulticast | isis | password [page] | page]
```

**Syntax Description**

- `bridging` (Optional) Specifies bridging-related information.
- `cef` (Optional) Specifies CEF-related information.
- `ipmulticast` (Optional) Specifies IP multicast-related information.
- `isis` (Optional) Specifies CLNS and ISIS-related information.
- `password` (Optional) Includes passwords and other security information in the output.
- `page` (Optional) Displays one page of information at a time in the output.

**Defaults**

The defaults are as follows:

- Outputs are displayed without page breaks.
- Passwords and other security information are removed from the output.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release       Modification
12.1(8a)EW    Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

Output from the show tech-support command may be terminated in midstream with the key combination Ctrl+Alt+6. The command output is buffered so that the command terminates when output of the current subcommand running under this command completes.

Press the Return key to display the next line of output, or press the Space bar to display the next page of information. If you do not enter the page keyword, the output scrolls. It does not stop for page breaks.

If you enter the password keyword, password encryption is enabled, but only the encrypted form appears in the output.

If you do not enter the password keyword, the passwords and other security-sensitive information in the output are replaced in the output with the word “removed.”

The show tech-support commands are a compilation of several show commands and the output can be quite lengthy. For a sample display of the output of the show tech-support command, see the individual show command listed.

If you enter the show tech-support command without arguments, the output displays the equivalent of these show commands:

- show version
- show running-config
- show stacks
show tech-support

- show interfaces
- show controllers
- show process memory
- show process cpu
- show buffers
- show logging
- show module
- show power
- show environment
- show interfaces switchport
- show interfaces trunk
- show vlan

If you enter the `ipmulticast` keyword, the output displays the equivalent of these show commands:

- show ip pim interface
- show ip pim interface count
- show ip pim neighbor
- show ip pim rp
- show ip igmp groups
- show ip igmp interface
- show ip mroute count
- show ip mroute
- show ip mcache
- show ip dvmrp route

**Examples**

For a sample display of the `show tech-support` command output, see the commands listed in the “Usage Guidelines” section for more information.

**Related Commands**

See the “Usage Guidelines” section.
show udld

To display the administrative and operational UDLD status, use the `show udld` privileged EXEC command.

```
show udld [interface-id] | neighbors | fast-hello [interface id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-id</td>
<td>Specifies the administrative and operational UDLD status for a specific interface.</td>
</tr>
<tr>
<td>neighbors</td>
<td>Specifies the UDLD neighbor summary.</td>
</tr>
<tr>
<td>fast-hello</td>
<td>Specifies Fast UDLD neighbor summary and interface specific status.</td>
</tr>
<tr>
<td>interface-id</td>
<td>Specifies the name of the interface.</td>
</tr>
</tbody>
</table>

### Defaults

None

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Added support for <code>show udld fast-hello</code> and <code>show udld fast-hello interface id</code>.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not enter an `interface_id` value, the administrative and operational UDLD status for all interfaces is displayed.

### Examples

To verify status for a particular link as reported by UDLD, enter the following command:

```
Switch# show udld g1/34
Interface Gi1/34
---
Port enable administrative configuration setting: Enabled / in aggressive mode
Port enable operational state: Enabled / in aggressive mode
Current bidirectional state: Bidirectional
Current operational state: Advertisement - Single neighbor detected
Message interval: 15000 ms
Time out interval: 5000 ms

Entry 1
---
Port fast-hello configuration setting: Disabled
Port fast-hello interval: 0 ms
Port fast-hello operational state: Disabled
Neighbor fast-hello configuration setting: Disabled
Neighbor fast-hello interval: Unknown
```
show udld

Expiration time: 43300 ms
Cache Device index: 1
Current neighbor state: Bidirectional
Device ID: FOX10430380
Port ID: Gi1/34
Neighbor echo 1 device: FOX104303NL
Neighbor echo 1 port: Gi1/34

TLV Message interval: 15 sec
No TLV fast-hello interval
TLV Time out interval: 5
TLV CDP Device name: Switch

To verify link status as reported by UDLD, enter the following command:

Switch# show udld neighbors

<table>
<thead>
<tr>
<th>Port</th>
<th>Device Name</th>
<th>Device ID</th>
<th>Port ID</th>
<th>Neighbor State</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/33</td>
<td>FOX10430380</td>
<td>1</td>
<td>Gi1/33</td>
<td>Bidirectional</td>
</tr>
<tr>
<td>Gi1/34</td>
<td>FOX10430380</td>
<td>1</td>
<td>Gi1/34</td>
<td>Bidirectional</td>
</tr>
</tbody>
</table>

To verify Fast UDLD configuration, enter the following command:

Switch# show udld fast-hello

Total ports on which fast hello can be configured: 16
Total ports with fast hello configured: 3
Total ports with fast hello operational: 3
Total ports with fast hello non-operational: 0

<table>
<thead>
<tr>
<th>Port-ID</th>
<th>Hello Neighbor</th>
<th>Neighbor Device</th>
<th>Neighbor-Port</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/45</td>
<td>200</td>
<td>FOX104303NL</td>
<td>Gi1/45</td>
<td>Operational</td>
</tr>
<tr>
<td>Gi1/46</td>
<td>200</td>
<td>FOX104303NL</td>
<td>Gi1/46</td>
<td>Operational</td>
</tr>
<tr>
<td>Gi1/47</td>
<td>200</td>

show vlan

To display VLAN information, use the show vlan command.

```
show vlan [brief | id vlan_id | name name]
show vlan private-vlan [type]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brief</td>
<td>(Optional) Displays only a single line for each VLAN, naming the VLAN, status, and ports.</td>
</tr>
<tr>
<td>id vlan_id</td>
<td>(Optional) Displays information about a single VLAN identified by VLAN ID number; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>name name</td>
<td>(Optional) Displays information about a single VLAN identified by VLAN name; valid values are an ASCII string from 1 to 32 characters.</td>
</tr>
<tr>
<td>private-vlan</td>
<td>Displays private VLAN information.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Private VLAN type.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<tr>
<td>BrdgNo</td>
<td>Bridge number for the VLAN, if applicable.</td>
</tr>
<tr>
<td>Stp</td>
<td>Spanning Tree Protocol type used on the VLAN.</td>
</tr>
</tbody>
</table>

The following example shows how to verify that the primary VLAN and secondary VLANs are correctly associated with each other and the same association also exists on the PVLAN port:

```
Switch# show vlan private-vlan
```

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Type</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>100</td>
<td>community</td>
<td>Fa3/1, Fa3/2</td>
</tr>
</tbody>
</table>

The following example shows how to remove the VLAN association:

```
Switch(config)# vlan 10
Switch(config-vlan)# private-vlan association remove 100
Switch(config-vlan)# end
Switch# show vlan private
```

<table>
<thead>
<tr>
<th>Primary</th>
<th>Secondary</th>
<th>Type</th>
<th>Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>100</td>
<td>primary</td>
<td>community</td>
</tr>
</tbody>
</table>
This example shows how to verify PVLAN configuration on the interface:

```
Switch# show interface f3/2 status
Port   Name               Status       Vlan      Duplex  Speed  Type
Fa3/2                         connected  pvlan seco a-full  a-100 10/100BaseTX

Switch# show interface f3/1 status
Port   Name               Status       Vlan      Duplex  Speed  Type
Fa3/1                         connected  pvlan prom a-full  a-100 10/100BaseTX
```

</table>
**show vlan access-map**

To display the contents of a VLAN access map, use the **show vlan access-map** command.

```
show vlan access-map [map-name]
```

**Syntax Description**
- `map-name` (Optional) Name of the VLAN access map.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This command shows how to display the contents of a VLAN access map:

```
Switch# show vlan access-map mordred
Vlan access-map "mordred"  1
    match: ip address 13
    action: forward capture
Switch#
```

**Related Commands**

<table>

<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan access-map</strong></td>
<td>Enters VLAN access-map command mode to create a VLAN access map.</td>
</tr>
</tbody>
</table>
show vlan counters

To display the software-cached counter values, use the `show vlan counters` command.

```
show vlan [id vlanid] counters
```

**Syntax Description**

- `id vlanid` (Optional) Displays the software-cached counter values for a specific VLAN.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(13)EW
- **Modification** Support for this command was introduced on the Catalyst 4500 series switches.

**Usage Guidelines**

If you enter the `show vlan counters` command without specifying the VLAN ID, the software-cached counter values for all VLANs are displayed.

**Examples**

This example shows how to display the software-cached counter values for a specific VLAN:

```
Switch# show vlan counters
* Multicast counters include broadcast packets

Vlan Id                                           : 1
L2 Unicast Packets                                : 0
L2 Unicast Octets                                 : 0
L3 Input Unicast Packets                          : 0
L3 Input Unicast Octets                           : 0
L3 Output Unicast Packets                         : 0
L3 Output Unicast Octets                          : 0
L3 Output Multicast Packets                       : 0
L3 Output Multicast Octets                        : 0
L3 Input Multicast Packets                        : 0
L3 Input Multicast Octets                         : 0
L2 Multicast Packets                              : 1
L2 Multicast Octets                               : 94
Switch>
```

</table>
show vlan dot1q tag native

To display all the ports on the switch that are eligible for native VLAN tagging as well as their current native VLAN tagging status, use the `show vlan dot1q tag native` command.

```
show vlan dot1q tag native
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(18)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the `show vlan dot1q tag native` command:

```
Switch# show vlan dot1q tag native
dot1q native vlan tagging is disabled globally

Per Port Native Vlan Tagging State
-------------------------------

<table>
<thead>
<tr>
<th>Port</th>
<th>Operational Mode</th>
<th>Native VLAN Tagging State</th>
</tr>
</thead>
<tbody>
<tr>
<td>f3/2</td>
<td>trunk</td>
<td>enabled</td>
</tr>
<tr>
<td>f3/16</td>
<td>PVLAN trunk</td>
<td>disabled</td>
</tr>
<tr>
<td>f3/16</td>
<td>trunk</td>
<td>enabled</td>
</tr>
</tbody>
</table>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switchport mode</code></td>
<td>Sets the interface type.</td>
</tr>
<tr>
<td><code>vlan (global configuration)</code></td>
<td>Enters global VLAN configuration mode.</td>

</tr>
</tbody>
</table>
show vlan group

To display the VLANs mapped to VLAN groups, use the `show vlan group` privileged EXEC command.

```
show vlan group [group-name group-name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-name</code></td>
<td>(Optional) Displays the VLANs mapped to the specified VLAN group.</td>
</tr>
</tbody>
</table>

**Defaults**

None

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was modified to support user distribution on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show vlan group` command displays the existing VLAN groups and lists the VLANs and VLAN ranges that are members of each VLAN group. If you use the `group-name` keyword, you display only the members of the VLAN group specified by the `group-name` argument.

**Examples**

This example shows how to display the members of a specified VLAN group:

```
Switch# show vlan group group-name ganymede
```

```
Group Name Vlans Mapped
---------- ------------
ganymede   7-9
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan group</code></td>
<td>Creates or modifies a VLAN group.</td>
</tr>
</tbody>
</table>
show vlan internal usage

To display information about the internal VLAN allocation, use the show vlan internal usage command.

```
show vlan [id vlan-id] internal usage
```

**Syntax Description**

- `id vlan-id` (Optional) Displays internal VLAN allocation information for the specified VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(19)EW
- **Modification** Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to display information about the current internal VLAN allocation:

```
Switch# show vlan internal usage

VLAN Usage
---- -------------------
1025 -
1026 -
1027 -
1028 -
1029 Port-channel6
1030 GigabitEthernet1/2
1032 FastEthernet3/20
1033 FastEthernet3/21
1129 -
```

This example shows how to display information about the internal VLAN allocation for a specific VLAN:

```
Switch# show vlan id 1030 internal usage

VLAN Usage
---- -------------------
1030 GigabitEthernet1/2
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan internal allocation policy</td>
<td>Configures the internal VLAN allocation scheme.</td>
</tr>
</tbody>
</table>
show vlan mapping

Use the *show vlan mapping* privileged EXEC command to display information about VLAN mapping on trunk ports.

```
show vlan mapping [interface interface-id] [ | begin | exclude | include] expression]
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>interface interface-id</strong></th>
<th>(Optional) Displays VLAN mapping information for the specified interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>begin</strong></td>
<td>(Optional) Displays begins with the line that matches the <em>expression</em>.</td>
</tr>
<tr>
<td><strong>exclude</strong></td>
<td>(Optional) Displays excludes lines that match the <em>expression</em>.</td>
</tr>
<tr>
<td><strong>include</strong></td>
<td>(Optional) Displays includes lines that match the specified <em>expression</em>.</td>
</tr>
<tr>
<td><strong>expression</strong></td>
<td>Specifies an expression in the output to use as a reference point.</td>
</tr>
</tbody>
</table>

**Defaults**

None

**Command Modes**

Privileged EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Expressions are case sensitive. For example, if you enter *exclude output*, the lines that contain *output* are not displayed, but the lines that contain *Output* are displayed.

**Examples**

This is a sample output from the *show vlan mapping* command:

```
Switch# show vlan mapping
Interface Fa0/5:
VLANs on wire     Translated VLAN     Operation
------------------     ---------------     --------------
default QinQ        1              selective QinQ
Interface Fa0/2:
VLANs on wire     Translated VLAN     Operation
------------------     ---------------     --------------
2                   104             1-to-1 mapping
```

This is a sample output from the *show vlan mapping interface fa0/6* command for an interface:

```
Switch# show vlan mapping interface fa0/6
Interface fa0/6:
VLAN on wire     Translated VLAN     Operation
---              ---------------     --------------
1                11              1-to-1 mapping
12,16-18         100             selective QinQ
*                 101             default QinQ
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>switchport vlan mapping</code></td>
<td>Configures VLAN mapping on an interface.</td>
</tr>
</tbody>
</table>
show vlan mtu

To display the minimum and maximum transmission unit (MTU) sizes of each VLAN, use the **show vlan mtu** command.

```
show vlan mtu
```

**Syntax Description**

This command has no arguments or keywords

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The MTU_Mismatch column in the command output indicates whether all the ports in the VLAN have the same MTU. When “yes” is displayed in the MTU_Mismatch column, it means that the VLAN has a port with different MTUs, and packets might be dropped that are switched from a port with a larger MTU to a port with a smaller MTU. If the VLAN does not have an SVI, the hyphen (-) symbol is displayed in the SVI_MTU column.

For a VLAN, if the MTU-Mismatch column displays “yes,” the names of the port with the MinMTU and the port with the MaxMTU are displayed. For a VLAN, if the SVI_MTU is bigger than the MinMTU, “TooBig” is displayed after the SVI_MTU.

**Examples**

This is an example of output from the **show vlan mtu** command:

```
Switch# show vlan mtu

<table>
<thead>
<tr>
<th>VLAN</th>
<th>SVI_MTU</th>
<th>MinMTU(port)</th>
<th>MaxMTU(port)</th>
<th>MTU_Mismatch</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1500</td>
<td>1500</td>
<td>1500</td>
<td>No</td>
</tr>
</tbody>
</table>

Switch>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>Enables jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU).</td>
</tr>
</tbody>
</table>
show vlan private-vlan

To display private VLAN information, use the `show vlan private-vlan` command.

```
show vlan private-vlan [type]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code> (Optional)</td>
<td>Displays the private VLAN type; valid types are isolated, primary, community, twoway-community, nonoperational, and normal.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>15.1.0 SG</td>
<td>Support for PVLAN modes over EtherChannel. Modes include: private-vlan host, private-vlan promiscuous, private-vlan trunk secondary, and private-vlan trunk promiscuous.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the `show vlan private-vlan type` command displays a VLAN type as normal, it indicates that a regular VLAN has been used in the private VLAN configuration. When normal is displayed, this indicates that two VLANs have been associated before the type was set, and the private VLAN is not operational. This information is useful for debugging purposes.

**Examples**

This example shows how to display information about all currently configured private VLANs:

```
Switch# show vlan private-vlan

Primary Secondary Type                Ports
------- --------- ----------------- ------------------------------------------
2        301     community         Fa5/3, Fa5/25
2        302     community
2        303     community         Fa5/3, Po63
10        community
100       101     isolated
150       151     non-operational
202       community
303       twoway-community
401       402     non-operational
Switch#
```

**Note**

A blank Primary value indicates that no association exists.
This example shows how to display information about all currently configured private VLAN types:

```
Switch# show vlan private-vlan type

Vlan Type
---- -----------------
202  primary
303  community
304  community
305  community
306  community
307  community
308  normal
309  community
440  isolated
Switch#
```

Table 2-36 describes the fields in the `show vlan private-vlan` command output.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Number of the primary VLAN.</td>
</tr>
<tr>
<td>Secondary</td>
<td>Number of the secondary VLAN.</td>
</tr>
<tr>
<td>Secondary-Type</td>
<td>Secondary VLAN type is <code>isolated</code> or <code>community</code>.</td>
</tr>
<tr>
<td>Ports</td>
<td>Indicates the ports within a VLAN.</td>
</tr>
<tr>
<td>Type</td>
<td>Type of VLAN; possible values are <code>primary</code>, <code>isolated</code>, <code>community</code>, <code>nonoperational</code>, or <code>normal</code>.</td>
</tr>
</tbody>
</table>

show vlan remote-span

To display a list of Remote SPAN (RSPAN) VLANs, use the `show vlan remote-span` command.

```
show vlan remote-span
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

**show vmps**

To display the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers, use the `show vmps` command.

```
show vmps [statistics]
```

### Syntax Description

- `statistics` (Optional) Displays the client-side statistics.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This is an example of output from the `show vmps` command:

```
Switch# show vmps
VQP Client Status:
-------------------
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.50.120 (primary, current)
Reconfirmation status
---------------------
VMPS Action: No Dynamic Port
Switch#
```

This is an example of output from the `show vmps statistics` command:

```
Switch# show vmps statistics
VMPS Client Statistics
----------------------
VQP Queries: 0
VQP Responses: 0
VMPS Changes: 0
VQP Shutdowns: 0
VQP Denied: 0
VQP Wrong Domain: 0
VQP Wrong Version: 0
VQP Insufficient Resource: 0
Switch#
```
**show vmps**

</tr>
</tbody>
</table>
show vtp

To display VTP statistics and domain information, use the show vtp command.

    show vtp {counters | status}

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>counters</td>
<td>Specifies the VTP statistics.</td>
</tr>
<tr>
<td>status</td>
<td>Specifies the VTP domain status.</td>
</tr>
</tbody>
</table>

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

Release   Modification
---------- -----------------------------
12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.

Examples

This example shows how to display the VTP statistics:

Switch# show vtp counters
VTP statistics:
Summary advertisements received : 1
Subset advertisements received   : 1
Request advertisements received  : 0
Summary advertisements transmitted : 31
Subset advertisements transmitted : 1
Request advertisements transmitted : 0
Number of config revision errors : 0
Number of config digest errors   : 0
Number of V1 summary errors     : 0

VTP pruning statistics:

<table>
<thead>
<tr>
<th>Trunk</th>
<th>Join Transmitted</th>
<th>Join Received</th>
<th>Summary advts received from non-pruning-capable device</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa5/9</td>
<td>1555</td>
<td>1564</td>
<td>0</td>
</tr>
</tbody>
</table>

Switch#

This example shows how to display the VTP domain status:

Switch# show vtp status
VTP Version                      : 2
Configuration Revision           : 250
Maximum VLANs supported locally  : 1005
Number of existing VLANs         : 33
VTP Operating Mode               : Server
VTP Domain Name                  : Lab_Network
VTP Pruning Mode                 : Enabled
VTP V2 Mode                      : Enabled
VTP Traps Generation             : Disabled
This example shows how to display only those lines in the `show vtp` output that contain the word `Summary`:

```
Switch# show vtp counters | include Summary
```

Table 2-37 describes the fields in the `show vtp` command output.

**Table 2-37  show vtp Command Output Fields**

show vtp
snmp ifindex clear

To clear any previously configured snmp ifindex commands that were entered for a specific interface, use the snmp ifindex clear command.

    snmp ifindex clear

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Interface index persistence occurs when ifIndex values in the interface MIB (IF-MIB) persist across reboots and allow for consistent identification of specific interfaces using SNMP.

Use the snmp ifindex clear command on a specific interface when you want that interface to use the global configuration setting for ifIndex persistence. This command clears any ifIndex configuration commands previously entered for that specific interface.

**Examples**

This example shows how to enable ifIndex persistence for all interfaces:

```
Router(config)# snmp-server ifindex persist
```

This example shows how to disable IfIndex persistence for FastEthernet 1/1 only:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit
```

This example shows how to clear the ifIndex configuration from the FastEthernet 1/1 configuration:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex clear
Router(config-if)# exit
```

As a result of this sequence of commands, ifIndex persistence is enabled for all interfaces that are specified by the snmp-server ifindex persist global configuration command.

**snmp ifindex persist**

To enable ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface, use the **snmp ifindex persist** command. To disable ifIndex persistence only on a specific interface, use the **no** form of this command.

```
snmp ifindex persist
no snmp ifindex persist
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The **snmp ifindex persist** interface configuration command enables and disables ifIndex persistence for individual entries (that correspond to individual interfaces) in the ifIndex table of the IF-MIB.

The **snmp-server ifindex persist** global configuration command enables and disables ifIndex persistence for all interfaces on the routing device. This action applies only to interfaces that have ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

**Examples**

This example shows how to enable ifIndex persistence for interface FastEthernet 1/1 only:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex persist
Router(config-if)# exit
```

This example shows how to enable ifIndex persistence for all interfaces, and then disable ifIndex persistence for interface FastEthernet 1/1 only:

```
Router(config)# snmp-server ifindex persist
Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit
```

</table>
snmp-server enable traps

To enable SNMP notifications (traps or informs), use the `snmp-server enable traps` command. To disable all SNMP notifications, use the `no` form of this command.

```
snmp-server enable traps [flash [insertion | removal] | fru-ctrl | port-security [trap-rate
trap-rate] | removal | stpx | vlancreate | vlandelete | vtp] [mac-notification [change | move | threshold]
```

```
no snmp-server enable traps [flash [insertion | removal] | fru-ctrl | port-security [trap-rate
trap-rate] | removal | stpx | vlancreate | vlandelete | vtp] [mac-notification]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flash</td>
<td>(Optional) Controls the SNMP FLASH trap notifications.</td>
</tr>
<tr>
<td>insertion</td>

</tr>
<tr>
<td>move</td>
<td>(Optional) Controls the SNMP MAC move trap notifications.</td>
</tr>
<tr>
<td>threshold</td>
<td>(Optional) Controls the SNMP MAC threshold trap notifications.</td>
</tr>
</tbody>
</table>

**Defaults**

SNMP notifications are disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for MAC notification was added.</td>
</tr>
</tbody>
</table>
If you enter this command without an option, all notification types controlled by this command are enabled.

SNMP notifications can be sent as traps or inform requests. This command enables both traps and inform requests for the specified notification types. To specify whether the notifications should be sent as traps or informs, use the `snmp-server host [traps | informs]` command.

The `snmp-server enable traps` command is used in conjunction with the `snmp-server host` command. Use the `snmp-server host` command to specify which host or hosts receive SNMP notifications. To send notifications, you must configure at least one `snmp-server host` command.

This list of the MIBs is used for the traps:

- **flash**—Controls SNMP FLASH traps from the CISCO-FLASH-MIB.
  - **insertion**—Controls the SNMP Flash insertion trap notifications.
  - **removal**—Controls the SNMP Flash removal trap notifications.
- **fru-ctrl**—Controls the FRU control traps from the CISCO-ENTITY-FRU-CONTROL-MIB.
- **port-security**—Controls the port-security traps from the CISCO-PORT-SECURITY-MIB.
- **stpx**—Controls all the traps from the CISCO-STP-EXTENSIONS-MIB.
- **vlancreate**—Controls SNMP VLAN created trap notifications.
- **vlandelete**—Controls SNMP VLAN deleted trap notifications.
- **vtp**—Controls the VTP traps from the CISCO-VTP-MIB.

**Examples**

This example shows how to send all traps to the host is specified by the name myhost.cisco.com using the community string defined as public:

```plaintext
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
Switch(config)#
```

This example shows how to enable the MAC address change MIB notification:

```plaintext
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)#
```

SNMP traps can be enabled with a rate-limit to detect port-security violations due to restrict mode. The following example shows how to enable traps for port-security with a rate of 5 traps per second:

```plaintext
Switch(config)# snmp-server enable traps port-security trap-rate 5
Switch(config)#
```

### snmp-server ifindex persist

To globally enable ifIndex values that will remain constant across reboots for use by SNMP, use the `snmp-server ifindex persist` command. To globally disable ifIndex persistence, use the `no` form of this command.

```
  snmp-server ifindex persist

  no snmp-server ifindex persist
```

#### Syntax Description

This command has no arguments or keywords.

#### Defaults

Disabled.

#### Command Modes

Global configuration mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The `snmp-server ifindex persist` global configuration command does not override the interface-specific configuration. To override the interface-specific configuration of ifIndex persistence, enter the `no snmp ifindex persist` and `snmp ifindex clear` interface configuration commands.

Entering the `no snmp-server ifindex persist` global configuration command enables and disables ifIndex persistence for all interfaces on the routing device using ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

#### Examples

This example shows how to enable ifIndex persistence for all interfaces:

```
Router(config)# snmp-server ifindex persist
```

#### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>Enables ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface.</td>
</tr>
</tbody>
</table>
snmp-server ifindex persist compress

To configure the format of the ifIndex table in a compressed format, use the `snmp-server ifindex persist compress` command. To place the table in a decompressed format, use the `no` form of this command.

```
snmp-server ifindex persist compress
no snmp-server ifindex persist compress
```

Syntax Description

This command has no arguments or keywords.

Defaults

Disabled

Command Modes

Global configuration mode.

Command History

Release Modification

12.2(52)SG Support for this command was introduced on the Catalyst 4500 series switches.

Usage Guidelines

This command is hidden on Supervisor Engine V and later supervisor engines because the ifIndex table is always in a compressed format on those supervisor engines.

At bootup, if the nvram:ifIndex-table.gz file (the ifIndex table in a compressed format) is present on a Supervisor Engine II+, Supervisor Engine III, or Supervisor Engine IV, the `snmp-server ifindex persist compress` command is automatically run even if the startup-config file does not have this configuration.

Examples

This example shows how to enable compression of the ifIndex table:

```
Router(config)# snmp-server ifindex persist compress
```

This example shows how to disable compression of the ifIndex table:

```
Router(config)# no snmp-server ifindex persist compress
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
snmp trap mac-notification change

To enable SNMP MAC address notifications, use the `snmp trap mac-notification` command. To return to the default setting, use the `no` form of this command.

```
no snmp trap mac-notification change {added | removed}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>added</td>
<td>Specifies enabling the MAC address notification trap whenever a MAC address is added to an interface.</td>
</tr>
<tr>
<td>removed</td>
<td>Specifies enabling the MAC address notification trap whenever a MAC address is removed from an interface.</td>
</tr>
</tbody>
</table>

### Defaults

MAC address addition and removal are disabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Even though you enable the change notification trap for a specific interface by using the `snmp trap mac-notification change` command, the trap is generated only when you enable the `snmp-server enable traps mac-notification change` and the `mac address-table notification change` global configuration commands.

### Examples

This example shows how to enable the MAC notification trap when a MAC address is added to a port:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# snmp trap mac-notification change added
```

You can verify your settings by entering the `show mac address-table notification change interface` privileged EXEC command.

source (netflow-lite exporter submode)

To specify a source Layer 3 interface of the NetFlow-lite collector, use the source command. To delete a source address, use the no form of this command.

source source-address

no source source-address

Syntax Description

| source-address | Specifies a source Layer 3 interface for a NetFlow-lite exporter. |

Defaults

None

Command Modes

netflow-lite exporter submode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

One of the mandatory parameters for a minimally configured exporter along with the destination address and the UDP destination port of the collector.

Examples

This example shows how to specify a source Layer 3 interface of the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter

```
Switch# show netflow-lite exporter exporter1
Netflow-lite  Exporter exporter1:
    Network Protocol Configuration:
        Destination IP address:  5.5.5.6
        Source IP Address:  5.5.5.5
        VRF label:  
        DSCP:  0x20
        TTL:  128
        COS:  7
```
Transport Protocol Configuration:
  Transport Protocol:          UDP
  Destination Port:            8188
  Source Port:                 61670
Export Protocol Configuration:
  Export Protocol:              netflow-v9
  Template data timeout:       60
  Options sampler-table timeout: 1800
  Options interface-table timeout: 1800
Exporter Statistics:
  Packets Exported:           0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

<table>

source-interface

To send out call home email messages with specific source interface, use the source-interface command.

```
source-interface interface name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface name</td>
<td>Source interface name for call home email messages</td>
</tr>
</tbody>
</table>

**Defaults**

None

**Command Modes**

cfg-call-home

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should configure no shut on an interface and provide a valid IP address before specifying it as a source interface for Call Home. Doing this avoids a connection failure when sending Call Home email messages. You should only specify a source interface name under Call Home if source-ip-address is not specified. You can only specify either a source interface or source-ip-address in call-home mode, not simultaneously.

**Examples**

This example shows how to configure source interface for Call Home. Generally, the interface should already be configured with a valid IP address as usually configured for an interface.

```
Switch# config terminal
Switch(config)# call-home
Switch(config-call-home)# source-interface fastEthernet 1/1
Switch(config-call-home)# source-ip
Switch(config-call-home)# source-ip-address 10.2.4.1
Error:a source-interface has already been configured,please remove source-interface config first if you want to configure source-ip-address
Switch(config-call-home)# no source-interface
Switch(config-call-home)# source-ip-address 10.2.4.1
```

**Note**

If Call Home is configured to use http or https as the transport method, you must use ip http client source-interface to configure the source interface for all http clients. You cannot specify a source interface for Call Home http messages only.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

source-ip-address

To send out Call Home email messages with specific source IP address, use the source-ip-address command.

    source-ip-address ip address

Syntax Description

<table>
<thead>
<tr>
<th>Description</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip address</td>
<td>Source IP address for Call Home messages.</td>
</tr>
</tbody>
</table>

Defaults

None

Command Modes

cfg-call-home

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

It is best to configure no shut an interface with this valid IP address before specifying it as source-ip-address for Call Home. Doing this avoids a connection failure when sending Call Home email messages. You should only specify source-ip-address under Call Home if source-interface is not specified. You can only specify either source interface or source-ip-address in Call Home mode, not both simultaneously.

Examples

This example shows how to configure source-ip-address for Call Home:

```plaintext
Switch# config terminal
Switch(config)# call-home
Switch(config-call-home)# source-interface fastEthernet 1/1
Switch(config-call-home)# source-ip
Switch(config-call-home)# source-ip-address 10.2.4.1
Error:a source-interface has already been configured,please remove source-interface config first if you want to configure source-ip-address
Switch(config-call-home)# no source-interface
Switch(config-call-home)# source-ip-address 10.2.4.1
```

spanning-tree backbonefast

To enable BackboneFast on a spanning-tree VLAN, use the `spanning-tree backbonefast` command. To disable BackboneFast, use the `no` form of this command.

```
spanning-tree backbonefast
no spanning-tree backbonefast
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
BackboneFast is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
BackboneFast should be enabled on all Catalyst 4506 series switches to allow the detection of indirect link failures. Enabling BackboneFast starts the spanning-tree reconfiguration more quickly.

**Examples**
This example shows how to enable BackboneFast on all VLANs:

```
Switch(config)# spanning-tree backbonefast
Switch(config)#
```

</tbody>
</table>

**Defaults**

Disabled

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

Use care when entering the `spanning-tree bpdufilter enable` command. Enabling BPDU filtering on an interface is approximately equivalent to disabling the spanning tree for this interface. It is possible to create bridging loops if this command is not correctly used.

When configuring Layer 2 protocol tunneling on all the service provider edge switches, you must enable spanning-tree BPDU filtering on the 802.1Q tunnel ports by entering the `spanning-tree bpdufilter enable` command.

BPDU filtering allows you to prevent a port from sending and receiving BPDUs. The configuration is applicable to the whole interface, whether it is trunking or not. This command has three states:

- **spanning-tree bpdufilter enable**—This state unconditionally enables the BPDU filter feature on the interface.
- **spanning-tree bpdufilter disable**—This state unconditionally disables the BPDU filter feature on the interface.
- **no spanning-tree bpdufilter**—This state enables the BPDU filter feature on the interface if the interface is in operational PortFast state and if the `spanning-tree portfast bpdufilter default` command is configured.
The `spanning-tree bpdufilter enable` command is used to enable the BPDU filter feature on an interface.

**Examples**

This example shows how to enable the BPDU filter feature on this interface:

```
Switch(config-if)# spanning-tree bpdufilter enable
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show spanning-tree</code></td>
<td>Displays spanning-tree information.</td>
</tr>
<tr>
<td><code>spanning-tree portfast bpdufilter default</code></td>
<td>Enables the BPDU filtering by default on all PortFast ports.</td>

</tbody>
</table>
spanning-tree bpdu guard

To enable BPDU guard on an interface, use the `spanning-tree bpdu guard` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree bpdu guard {enable | disable}
no spanning-tree bpdu guard
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BPDU guard on this interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BPDU guard on this interface.</td>
</tr>
</tbody>
</table>

**Defaults**

BPDU guard is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

BPDU guard is a feature that prevents a port from receiving BPDUs. This feature is typically used in a service provider environment where the administrator wants to prevent an access port from participating in the spanning tree. If the port still receives a BPDU, it is put in the ErrDisable state as a protective measure. This command has three states:

- `spanning-tree bpdu guard enable`—This state unconditionally enables BPDU guard on the interface.
- `spanning-tree bpdu guard disable`—This state unconditionally disables BPDU guard on the interface.
- `no spanning-tree bpdu guard`—This state enables BPDU guard on the interface if it is in the operational PortFast state and if the `spanning-tree portfast bpdu guard default` command is configured.

**Examples**

This example shows how to enable BPDU guard on this interface:

```
Switch(config-if)# spanning-tree bpdu guard enable
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show spanning-tree</code></td>
<td>Displays spanning-tree information.</td>
</tr>
<tr>
<td><code>spanning-tree portfast bpdufilter default</code></td>
<td>Enables the BPDU filtering by default on all PortFast ports.</td>
</tr>
</tbody>
</table>
spanning-tree cost

To calculate the path cost of STP on an interface, use the `spanning-tree cost` command. To revert to the default, use the `no` form of this command.

```
spanning-tree cost cost

no spanning-tree cost cost
```

### Syntax Description

- **Syntax:** `spanning-tree cost cost`
- **Description:** Path cost; valid values are from 1 to 200,000,000.

### Defaults

The default settings are as follows:
- FastEthernet—19
- GigabitEthernet—1

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you configure the cost, the higher values indicate higher costs. The range applies regardless of the protocol type that is specified. The path cost is calculated, based on the interface bandwidth.

### Examples

This example shows how to access an interface and set a path cost value of 250 for the spanning-tree VLAN that is associated with that interface:

```
Switch(config)# interface fastethernet 2/1
Switch(config-if)# spanning-tree cost 250
```

spanning-tree etherchannel guard misconfig

To display an error message when a loop due to a channel misconfiguration is detected, use the `spanning-tree etherchannel guard misconfig` command. To disable the feature, use the `no` form of this command.

```
spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Spanning-tree EtherChannel guard is enabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When an EtherChannel guard misconfiguration is detected, this message is displayed:

```
%SPANTREE-2-CHNL_MISCFG:Detected loop due to etherchannel misconfig of interface Port-Channel1
```

To determine which local ports are involved in the misconfiguration, enter the `show interfaces status err-disabled` command. To verify the EtherChannel configuration on the remote device, enter the `show etherchannel summary` command on the remote device.

After you correct the configuration, enter the `shutdown` and the `no shutdown` commands on the associated port-channel interface.

**Examples**
This example shows how to enable the EtherChannel guard misconfiguration feature:

```
Switch(config)# spanning-tree etherchannel guard misconfig
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>

</table>
spanning-tree extend system-id

To enable the extended system ID feature on a chassis that supports 1024 MAC addresses, use the `spanning-tree extend system-id` command. To disable the feature, use the `no` form of this command.

```
spanning-tree extend system-id
no spanning-tree extend system-id
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled on systems that do not provide 1024 MAC addresses.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Releases 12.1(13)E and later support chassis with 64 or 1024 MAC addresses. For chassis with 64 MAC addresses, STP uses the extended system ID plus a MAC address to make the bridge ID unique for each VLAN.

You cannot disable the extended system ID on chassis that support 64 MAC addresses.

Enabling or disabling the extended system ID updates the bridge IDs of all active STP instances, which might change the spanning-tree topology.

**Examples**

This example shows how to enable the extended system ID:

```
Switch(config)# spanning-tree extend system-id
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>

spanning-tree link-type

To configure a link type for a port, use the `spanning-tree link-type` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree link-type {point-to-point | shared}
```

```
o spanning-tree link-type
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>point-to-point</th>
<th>Specifies that the interface is a point-to-point link.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>shared</td>
<td>Specifies that the interface is a shared medium.</td>
</tr>
</tbody>
</table>

**Defaults**

Link type is derived from the duplex mode.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RSTP+ fast transition works only on point-to-point links between two bridges.

By default, the switch derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link.

If you designate a port as a shared link, RSTP+ fast transition is forbidden, regardless of the duplex setting.

**Examples**

This example shows how to configure the port as a shared link:

```
Switch(config-if)# spanning-tree link-type shared
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree</td>
<td>Displays spanning-tree information.</td>
</tr>
</tbody>
</table>
spanning-tree loopguard default

To enable loop guard as the default on all ports of a specific bridge, use the `spanning-tree loopguard default` command. To disable loop guard, use the `no` form of this command.

```
spanning-tree loopguard default
no spanning-tree loopguard default
```

**Syntax Description**

This command has no keywords or arguments.

**Defaults**

Loop guard is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Loop guard provides an additional security in the bridge network. Loop guard prevents alternate or root ports from becoming the designated port because of a failure leading to a unidirectional link.

Loop guard operates only on ports that are considered point-to-point by the spanning tree. Individual loop-guard port configuration overrides this global default.

**Examples**

This example shows how to enable loop guard:

```
Switch(config)# spanning-tree loopguard default
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>spanning-tree guard</code></td>
<td>Enables root guard.</td>
</tr>
<tr>
<td><code>show spanning-tree</code></td>
<td>Displays spanning-tree information.</td>
</tr>
</tbody>
</table>
spanning-tree mode

To switch between PVST+ and MST modes, use the `spanning-tree mode` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mode {pvst | mst | rapid-pvst}
no spanning-tree mode {pvst | mst | rapid-pvst}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>pvst</th>
<th>Specifies PVST+ mode.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>mst</td>
<td>Specifies MST mode.</td>
</tr>
<tr>
<td></td>
<td>rapid-pvst</td>
<td>Specifies Rapid PVST mode.</td>
</tr>
</tbody>
</table>

**Defaults**

PVST+ mode

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for the <code>rapid-pvst</code> keyword.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

Be careful when using the `spanning-tree mode` command to switch between PVST+ and MST modes. When you enter the command, all spanning-tree instances are stopped for the previous mode and restarted in the new mode. Using this command may cause disruption of user traffic.

**Examples**

This example shows how to switch to MST mode:

```
Switch(config)# spanning-tree mode mst
Switch(config)#
```

This example shows how to return to the default mode (PVST):

```
Switch(config)# no spanning-tree mode
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree mst</td>
<td>Displays MST protocol information.</td>
</tr>
</tbody>
</table>
**spanning-tree mst**

To set the path cost and port-priority parameters for any MST instance (including the CIST with instance ID 0), use the `spanning-tree mst` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst instance-id [cost cost] | [port-priority prio]
no spanning-tree mst instance-id {cost | port-priority}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-id</td>
<td>Instance ID number; valid values are from 0 to 15.</td>
</tr>
<tr>
<td>cost cost</td>
<td>(Optional) Specifies the path cost for an instance; valid values are from 1</td>
</tr>
<tr>
<td></td>
<td>to 200000000.</td>
</tr>
<tr>
<td>port-priority</td>
<td>(Optional) Specifies the port priority for an instance; valid values are from</td>
</tr>
<tr>
<td>prio</td>
<td>0 to 240 in increments of 16.</td>
</tr>
</tbody>
</table>

### Defaults

Port priority is 128.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The higher cost values indicate higher costs. When entering the cost value, do not include a comma in the entry; for example, enter 1000, not 1,000.

The higher port-priority values indicate smaller priorities.

By default, the cost depends on the port speed; faster interface speeds indicate smaller costs. MST always uses long path costs.

### Examples

This example shows how to set the interface path cost:

```
Switch(config-if)# spanning-tree mst 0 cost 17031970
Switch(config-if)#
```

This example shows how to set the interface priority:

```
Switch(config-if)# spanning-tree mst 0 port-priority 64
Switch(config-if)#
```

spanning-tree mst configuration

To enter the MST configuration submode, use the `spanning-tree mst configuration` command. To return to the default MST configuration, use the `no` form of this command.

```
spanning-tree mst configuration
no spanning-tree mst configuration
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The default settings are as follows:
- No VLANs are mapped to any MST instance.
- All VLANs are mapped to the CIST instance.
- The region name is an empty string.
- The revision number is 0.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The MST configuration consists of three main parameters:
- Instance VLAN mapping (see the `instance` command)
- Region name (see the `name` command)
- Configuration revision number (see the `revision` command)

By default, the value for the MST configuration is the default value for all its parameters.

The `abort` and `exit` commands allow you to exit the MST configuration submode. The difference between the two commands depends on whether you want to save your changes or not.

The `exit` command commits all the changes before leaving MST configuration submode. If you do not map the secondary VLANs to the same instance as the associated primary VLAN, when you exit the MST configuration submode, a message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The message is as follows:

```
These secondary vlans are not mapped to the same instance as their primary: ->3
```

The `abort` command leaves the MST configuration submode without committing any changes.
Whenever you change an MST configuration submode parameter, it can cause a loss of connectivity. To reduce the number of service disruptions, when you enter the MST configuration submode, you are changing a copy of the current MST configuration. When you are done editing the configuration, you can apply all the changes at once by using the `exit` keyword, or you can exit the submode without committing any change to the configuration by using the `abort` keyword.

In the unlikely event that two users enter a new configuration at exactly the same time, this message is displayed:

```
Switch(config-mst)# exit
% MST CFG:Configuration change lost because of concurrent access
Switch(config-mst)#
```

### Examples

This example shows how to enter the MST configuration submode:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)#
```

This example shows how to reset the MST configuration to the default settings:

```
Switch(config)# no spanning-tree mst configuration
Switch(config)#
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify the `hello-time` value, the value is calculated from the network diameter.

**Examples**

This example shows how to set the hello-time delay timer:

```
Switch(config)# spanning-tree mst hello-time 3
Switch(config)#
```

**Related Commands**

- `show spanning-tree mst`: Displays MST protocol information.
spanning-tree mst max-age

To set the max-age timer for all the instances, use the `spanning-tree mst max-age` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst max-age seconds

no spanning-tree mst max-age
```

**Syntax Description**

| seconds       | Number of seconds to set the max-age timer for all the instances on the Catalyst 4500 series switch; valid values are from 6 to 40 seconds. |

**Defaults**

The max-age timer is set for 20 seconds.

<td>Configures switch as the root switch.</td>
</tr>
<tr>
<td>primary</td>
<td>Sets a high enough priority (low value) to make the bridge root of the spanning-tree instance.</td>
</tr>
<tr>
<td>secondary</td>
<td>Designates this switch as a secondary root if the primary root fails.</td>
</tr>
<tr>
<td>priority prio</td>
<td>Sets the bridge priority; see the “Usage Guidelines” section for valid values and additional information.</td>
</tr>
<tr>
<td>diameter dia</td>
<td>(Optional) Sets the timer values for the bridge based on the network diameter; valid values are from 2 to 7.</td>
</tr>
<tr>
<td>hello-time hello</td>
<td>(Optional) Specifies the duration between the generation of configuration messages by the root switch.</td>
</tr>
</tbody>
</table>

### Defaults

Bridge priority is 32768.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The bridge priority can be set in increments of 4096 only. When you set the priority, valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

You can set the priority to 0 to make the switch root.

The `spanning-tree root secondary` bridge priority value is 16384.

The `diameter dia` and `hello-time hello` options are available for instance 0 only.

If you do not specify the `hello_time` value, the value is calculated from the network diameter.
spanning-tree mst root

Examples

This example shows how to set the priority and timer values for the bridge:

Switch(config)# spanning-tree mst 0 root primary diameter 7 hello-time 2
Switch(config)# spanning-tree mst 5 root primary

Related Commands

spanning-tree pathcost method

To set the path cost calculation method, use the `spanning-tree pathcost method` command. To revert to the default setting, use the `no` form of this command.

```
spanning-tree pathcost method {long | short}
no spanning-tree pathcost method
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>Specifies 32-bit-based values for port path costs.</td>
</tr>
<tr>
<td>short</td>
<td>Specifies 16-bit-based values for port path costs.</td>
</tr>
</tbody>
</table>

**Defaults**

Port path cost has 16-bit-based values.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies to all the spanning-tree instances on the switch.

The `long` path cost calculation method uses all the 32 bits for path cost calculation and yields values in the range of 1 through 200,000,000.

The `short` path cost calculation method (16 bits) yields values in the range of 1 through 65,535.

**Examples**

This example shows how to set the path cost calculation method to long:

```
Switch(config) spanning-tree pathcost method long
```

This example shows how to set the path cost calculation method to short:

```
Switch(config) spanning-tree pathcost method short
```

spanning-tree portfast (interface configuration mode)

To enable PortFast mode, where the interface is immediately put into the forwarding state upon linkup without waiting for the timer to expire, use the `spanning-tree portfast` command. To return to the default setting, use the `no` form of this command.

```
spanning-tree portfast {disable | trunk}
```

Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables PortFast on the interface.</td>
</tr>
<tr>
<td>trunk</td>
<td>Enables PortFast on the interface even while in the trunk mode.</td>
</tr>
</tbody>
</table>

Defaults

PortFast mode is disabled.

Command Modes

Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>The <code>disable</code> and <code>trunk</code> options were added.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You should use this feature only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

Be careful when using the `no spanning-tree portfast` command. This command does not disable PortFast if the `spanning-tree portfast default` command is enabled.

This command has four states:

- `spanning-tree portfast`—This command enables PortFast unconditionally on the given port.
- `spanning-tree portfast disable`—This command explicitly disables PortFast for the given port. The configuration line shows up in the running-configuration as it is not the default.
- `spanning-tree portfast trunk`—This command allows you to configure PortFast on trunk ports.

Note: If you enter the `spanning-tree portfast trunk` command, the port is configured for PortFast even when in the access mode.
• **no spanning-tree portfast**—This command implicitly enables PortFast if the `spanning-tree portfast default` command is defined in global configuration and if the port is not a trunk port. If you do not configure PortFast globally, the `no spanning-tree portfast` command is equivalent to the `spanning-tree portfast disable` command.

**Examples**

This example shows how to enable PortFast mode:

```
Switch(config-if)# spanning-tree portfast
Switch(config-if)
```

**Related Commands**

spanning-tree portfast bpdufilter default

To enable the BPDU filtering by default on all PortFast ports, use the `spanning-tree portfast bpdufilter default` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree portfast bpdufilter default
no spanning-tree portfast bpdufilter default
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
BPDU filtering is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `spanning-tree portfast bpdufilter default` command enables BPDU filtering globally on the Catalyst 4500 series switch. BPDU filtering prevents a port from sending or receiving any BPDU.

You can override the effects of the `spanning-tree portfast bpdufilter default` command by configuring BPDU filtering at the interface level.

**Note**
Be careful when enabling BPDU filtering. Functionality is different when enabling on a per-port basis or globally. When enabled globally, BPDU filtering is applied only on ports that are in an operational PortFast state. Ports still send a few BPDU's at linkup before they effectively filter outbound BPDU's. If a BPDU is received on an edge port, it immediately loses its operational PortFast status and BPDU filtering is disabled.

When enabled locally on a port, BPDU filtering prevents the Catalyst 4500 series switch from receiving or sending BPDU's on this port.

**Caution**
This command can cause bridging loops if not used correctly.

**Examples**
This example shows how to enable BPDU filtering by default:

```
Switch(config)# spanning-tree portfast bpdufilter default
Switch(config)#
```

spanning-tree portfast default

To globally enable PortFast by default on all access ports, use the `spanning-tree portfast default` command. To disable PortFast as default on all access ports, use the `no` form of this command.

```
spanning-tree portfast default
no spanning-tree portfast default
```

Syntax Description
This command has no arguments or keywords.

Defaults
PortFast is disabled.

Command Modes
Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

⚠️ Caution
Be careful when using this command. You should use this command only with the interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

You can enable PortFast mode on individual interfaces using the `spanning-tree portfast (interface configuration mode)` command.

Examples

This example shows how to globally enable PortFast by default on all access ports:

```
Switch(config)# spanning-tree portfast default
Switch(config)#
```

Related Commands

</table>
spanning-tree uplinkfast

To enable the UplinkFast feature, use the `spanning-tree uplinkfast` command. To disable UplinkFast, use the `no` form of this command.

```
spanning-tree uplinkfast [max-update-rate packets-per-second]
```

```
no spanning-tree uplinkfast [max-update-rate]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>max-update-rate packets_per_second</code></td>
<td>(Optional) Specifies the maximum rate (in packets per second) at which update packets are sent; valid values are from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- Disabled.
- Maximum update rate is 150.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command should be used only on access switches.

When UplinkFast is configured, the bridge priority is changed to 49,152 so that this switch will not be selected as root. All interface path costs of all spanning-tree interfaces belonging to the specified spanning-tree instances are also increased by 3000.

When spanning tree detects that the root interface has failed, the UplinkFast feature causes an immediate switchover to an alternate root interface, transitioning the new root interface directly to the forwarding state. During this time, a topology change notification is sent. To minimize the disruption caused by the topology change, a multicast packet is sent to 01-00-0C-CD-CD-CD for each station address in the forwarding bridge except for those associated with the old root interface.

Use the `spanning-tree uplinkfast max-update-rate` command to enable UplinkFast (if not already enabled) and change the rate at which the update packets are sent. Use the `no` form of this command to return the default rate of 150 packets per second.

**Examples**

This example shows how to enable UplinkFast and set the maximum rate to 200 packets per second:

```
Switch(config)# spanning-tree uplinkfast
Switch(config)# spanning-tree uplinkfast max-update-rate 200
```

</tr>
</tbody>
</table>
Usage Guidelines

When you are setting the **max-age seconds** value, if a bridge does not hear BPDUs from the root bridge within the specified interval, it assumes that the network has changed and recomputes the spanning-tree topology.

The `spanning-tree root primary` command alters the switch bridge priority to 8192. If you enter the `spanning-tree root primary` command and the switch does not become root, then the bridge priority is changed to 100 less than the bridge priority of the current bridge. If the switch does not become root, an error will result.

The `spanning-tree root secondary` command alters the switch bridge priority to 16384. If the root switch fails, this switch becomes the next root switch.

Use the `spanning-tree root` commands on backbone switches only.

Examples

This example shows how to enable spanning tree on VLAN 200:

```
Switch(config)# spanning-tree vlan 200
Switch(config)#
```

This example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:

```
Switch(config)# spanning-tree vlan 10 root primary diameter 4
Switch(config)#
```

This example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:

```
Switch(config)# spanning-tree vlan 10 root secondary diameter 4
Switch(config)#
```

speed

To configure the interface speed, use the `speed` command. To disable a speed setting, use the `no` form of this command.

```
speed { 10 | 100 | 1000 | auto [10 | 100 | 1000] | nonegotiate }
```

```
no speed
```

### Syntax Description

- **10**: Configures the interface to transmit at 10 Mbps.
- **100**: Configures the interface to transmit at 100 Mbps.
- **1000**: Configures the interface to transmit at 1000 Mbps.
- **auto 10 | 100 | 1000**: Enables the interface to autonegotiate the speed and specify the exact values to advertise when autonegotiating.
- **nonegotiate**: Enables the interface to not negotiate the speed.

### Defaults

The default values are shown in the following table:

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Supported Syntax</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100-Mbps module</td>
<td>`speed [10</td>
<td>100</td>

<td>speed [10</td>
<td>100</td>
<td>1000</td>
</tr>
<tr>
<td>1000</td>
<td>Not applicable.</td>
<td>Not applicable.</td>
<td>The speed is always 1000. The duplex is half.</td>
</tr>
</tbody>
</table>

If you configure the interface speed and duplex commands manually and enter a value other than speed auto (for example, 10 or 100 Mbps), make sure that you configure the connecting interface speed command to a matching speed but do not use the auto parameter.

When manually configuring the interface speed to either 10 or 100 Mbps, the switch prompts you to also configure duplex mode on the interface.

**Note**

Catalyst 4506 switches cannot automatically negotiate the interface speed and the duplex mode if either connecting interface is configured to a value other than auto.

**Caution**

Changing the interface speed and the duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table 2-39 describes the system’s performance for different combinations of the duplex and speed modes. The specified duplex command that is configured with the specified speed command produces the resulting system action.
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

speed

Example
This example shows how to set the interface speed to 100 Mbps on the Fast Ethernet interface 5/4:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed 100
```

This example shows how to allow Fast Ethernet interface 5/4 to autonegotiate the speed and duplex mode:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed auto
```

Note
The `speed auto 10 100` command is similar to the `speed auto` command on a Fast Ethernet interface.

Example
This example shows how to limit the interface speed to 10 and 100 Mbps on the Gigabit Ethernet interface 1/1 in auto-negotiation mode:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 10 100
```

This example shows how to limit the speed negotiation to 100 Mbps on the Gigabit Ethernet interface 1/1:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 100
```

</tbody>
</table>
To enable broadcast storm control on a port and to specify what to do when a storm occurs on a port, use the `storm-control` interface configuration command. To disable storm control for the broadcast traffic and to disable a specified storm-control action, use the `no` form of this command.

```
storm-control {broadcast level high level [lower level]} | action {shutdown | trap}
```

```
no storm-control {broadcast level level [lower level]} | action {shutdown | trap}
```

**Syntax Description**

- `broadcast` Enables the broadcast storm control on the port.
- `level high-level lower-level` Defines the rising and falling suppression levels:
  - `high-level`—Rising suppression level as a percent of total bandwidth, up to two decimal places; valid values are from 0 to 100 percent. Blocks the flooding of storm packets when the value specified for `level` is reached.
  - `lower-level`—(Optional) Falling suppression level as a percent of total bandwidth, up to two decimal places; valid values are from 0 to 100. This value must be less than the rising suppression value.
- `action` Directs the switch to take action when a storm occurs on a port.
  - `shutdown` Disables the port during a storm.
  - `trap` Sends an SNMP trap when a storm occurs. This keyword is available but not supported in 12.1(19)EW.

**Defaults**

Broadcast storm control is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support for the Supervisor Engine 6-E and Catalyst 4900M chassis is introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the `storm-control broadcast level` command to enable traffic storm control on the interface, configure the traffic storm control level, and apply the traffic storm control level to the broadcast traffic on the interface.

The Catalyst 4500 series switch supports broadcast traffic storm control on all LAN ports.

The period is required when you enter the fractional suppression level.

The suppression level is entered as a percentage of the total bandwidth. A threshold value of 100 percent indicates that no limit is placed on traffic. A value of 0.0 means that all specified traffic on that port is blocked.
Enter the `show interfaces counters storm-control` command to display the discard count.

Enter the `show running-config` command to display the enabled suppression mode and level setting.

To turn off suppression for the specified traffic type, you can do one of the following:

- Set the `high-level` value to 100 percent for the specified traffic type.
- Use the `no` form of this command.

The lower level is ignored for the interfaces that perform storm control in the hardware.

**Note**

The `lower level` keyword does not apply to the Supervisor Engine 6-E and Catalyst 4900M chassis implementations.

---

**Examples**

This example shows how to enable broadcast storm control on a port with a 75.67 percent rising suppression level:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control broadcast level 75.67
Switch(config-if)# end
```

This example shows how to disable the port during a storm:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control action shutdown
Switch(config-if)# end
```

This example shows how to disable storm control on a port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# no storm-control broadcast level
Switch(config-if)# end
```

This example shows how to disable storm control by setting the high level to 100 percent:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control broadcast level 100
Switch(config-if)# end
```

---

</table>
storm-control broadcast include multicast

To enable multicast storm control on a port, use the `storm-control broadcast include multicast` command. To disable multicast storm control, use the `no` form of this command.

```
storm-control broadcast include multicast
no storm-control broadcast include multicast
```

**Syntax Description**  
This command has no arguments or keywords.

**Defaults**  
Multicast storm control is disabled.

**Command Modes**  
Global configuration mode  
Interface configuration mode on a Supervisor Engine 6-E and Catalyst 4900M chassis

**Command History**  
Release Modification  
12.2(18)EW Support for this command was introduced on the Catalyst 4500 series switch.  
12.2(40)SG Support for the Supervisor Engine 6-E and Catalyst 4900M chassis is introduced.

**Usage Guidelines**  
This command prompts the hardware to filter multicast packets if it is already filtering broadcast packets. Supervisor Engine 6-E, Supervisor 6L-E, Catalyst 4900M, and Catalyst 4948E support per-interface multicast suppression. When you enable multicast suppression on an interface you subject incoming multicast and broadcast traffic on that interface to suppression.

**Examples**  
This example shows how to enable multicast storm control globally:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# storm-control broadcast include multicast
Switch(config)# end
```

This example shows how to enable per-port Multicast storm control on a Supervisor Engine 6-E:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet2/4
Switch(config-if)# storm-control broadcast include multicast
Switch(config-if)# end
```

subscribe-to-alert-group all

subscribe-to-alert-group inventory
Subscribes this destination profile to the Inventory alert group.

subscribe-to-alert-group syslog
Subscribes this destination profile to the Syslog alert group.
subscribe-to-alert-group configuration

To subscribe a destination profile to the Configuration alert group, use the `subscribe-to-alert-group configuration` command.

```
subscribe-to-alert-group configuration [periodic {daily hh:mm | monthly date hh:mm | weekly day hh:mm}]
```

**Syntax Description**

- **periodic** (Optional) Specifies a periodic call-home message.
- **daily hh:mm** Sets a daily alert in hours and minutes.
- **monthly date hh:mm** Sets a monthly alert in day, hour, and minute.
- **weekly day hh:mm** Sets a weekly alert in day, hour, and minutes.

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>

</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

The Configuration alert group can be configured for periodic notification.

**Examples**

This example shows how to configure periodic "configuration" alert-group:

```
Switch(config)# call-home
Switch(config)# profile cisco
Switch(config)# profile cisco
Switch(config)# subscribe-to-alert-group configuration periodic weekly
Tuesday 21:16
```

</table>
subscribe-to-alert-group diagnostic

To subscribe a destination profile to the Diagnostic alert group, use the subscribe-to-alert-group diagnostic command.

```
subscribe-to-alert-group diagnostic [severity catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal | debugging]
```

**Syntax Description**

- `severity catastrophic` (Optional) Specifies network wide catastrophic failure (highest severity).
- `disaster` (Optional) Specifies significant network impact.
- `fatal` (Optional) Specifies that the system is unusable (system log level 0).
- `critical` (Optional) Specifies that immediate attention is needed (system log level 1).
- `major` (Optional) Specifies a major condition (System log level 2).
- `minor` (Optional) Specifies a minor condition (System log level 3).
- `warning` (Optional) Specifies a warning condition (System log level 4).
- `notification` (Optional) Specifies an informational message (System log level 5).
- `normal` (Optional) Specifies returning to a normal state (System log level 6).
- `debugging` (Optional) Specifies a debugging message (Lowest severity).

**Defaults**

normal

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>

</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

**Examples**

This example shows how to configure the "diagnostic" alert-group with "normal" severity:

```
Switch(config)# call-home
Switch(config)# profile cisco
Switch(cfg-call-home)# profile diagnostic
Switch(cfg-call-home-profile)# subscribe-to-alert-group diagnostic severity normal
```

**Related Commands**
### Command Description

<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

The Environment alert group can be configured to filter messages based on severity.

**Examples**

This example shows how to configure the "environmental" alert-group with "severity notification":

```
Switch(config)# call-home
Switch(config-call-home)# profile cisco
Switch(config-call-home-profile)# subscribe-to-alert-group environment severity notification
```

**Related Commands**

subscribe-to-alert-group inventory

To subscribe a destination profile to the Inventory alert group, use the `subscribe-to-alert-group inventory` command.

```
subscribe-to-alert-group inventory [periodic {daily hh:mm | monthly date hh:mm | weekly day hh:mm}]
```

### Syntax Description

- **periodic** (Optional) Specifies a periodic call-home message.
- **daily hh:mm** Sets a daily alert in hours and minutes.
- **monthly date hh:mm** Sets a monthly alert in day, hour, and minute.
- **weekly day hh:mm** Sets a weekly alert in day, hour, and minutes.

### Defaults

This command has no default settings.

### Command Modes

cfg-call-home-profile

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

You can configure the Syslog alert group can be configured to filter messages based on severity by specifying a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (""").

**Examples**

This example shows how to configure the syslog alert group with severity notification:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group syslog severity notification pattern "UPDOWN"
```

**switchport**

To modify the switching characteristics of a Layer 2 switch interface, use the `switchport` command. To return the interface to the routed-interface status and cause all further Layer 2 configuration to be erased, use the `no` form of this command without parameters.

```
switchport [access vlan vlan_num] | [nonegotiate] | [voice vlan {vlan_id | dot1p | none | untagged}]
```

```
no switchport [access | nonegotiate | voice vlan]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access vlan vlan_num</code></td>
<td>Optional) Sets the VLAN when the interface is in access mode; valid values are from 1 to 1005.</td>
</tr>
<tr>
<td><code>nonegotiate</code></td>
<td>(Optional) Specifies that the DISL/DTP negotiation packets will not be sent on the interface.</td>
</tr>
<tr>
<td><code>voice vlan vlan_id</code></td>
<td>(Optional) Specifies the number of the VLAN; valid values are from 1 to 1005.</td>
</tr>
<tr>
<td><code>dot1p</code></td>
<td>(Optional) Specifies that the PVID packets are tagged as priority.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>(Optional) Specifies that the telephone and voice VLAN do not communicate.</td>
</tr>
<tr>
<td><code>untagged</code></td>
<td>(Optional) Specifies the untagged PVID packets.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:

- Switchport trunking mode is enabled.
- Dynamic negotiation parameter is set to auto.
- Access VLANs and trunk interface native VLANs are a default VLAN corresponding to the platform or interface hardware.
- All VLAN lists include all VLANs.
- No voice VLAN is enabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for voice VLAN was added.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

The **no switchport** command shuts the port down and then reenables it, which may generate messages on the device to which the port is connected.

The **no** form of the **switchport access** command resets the access mode VLAN to the appropriate default VLAN for the device. The **no** form of the **switchport nonegotiate** command removes the **nonegotiate** status.

When you are using the **nonegotiate** keyword, DISL/DTP negotiation packets will not be sent on the interface. The device will trunk or not trunk according to the **mode** parameter given: **access** or **trunk**. This command will return an error if you attempt to execute it in **dynamic (auto or desirable)** mode.

The voice VLAN is automatically set to VLAN 1 unless you use one of the optional keywords.

If you use the **switch port voice vlan** command for an interface, the interface cannot join a port channel.

When you use the **switchport voice vlan** command, the output for the **show running-config** command changes to show the voice VLAN set.

### Examples

This example shows how to cause the port interface to stop operating as a Cisco-routed port and convert to a Layer 2-switched interface:

```
Switch(config-if)# switchport
Switch(config-if)#
```

This example shows how to cause a port interface in access mode, which is configured as a switched interface, to operate in VLAN 2:

```
Switch(config-if)# switchport access vlan 2
Switch(config-if)#
```

This example shows how to cause a port interface, which is configured as a switched interface, to refrain from negotiating in trunking mode and act as a trunk or access port (depending on the **mode** set):

```
Switch(config-if)# switchport nonegotiate
Switch(config-if)#
```

This example shows how to set the voice VLAN for the interface to VLAN 2:

```
Switch(config-if)# switchport voice vlan 2
switchport voice vlan 2
Switch(config-if)#
```

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td><strong>show interfaces switchport</strong></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>
<td></td>
</tr>
</tbody>
</table>
### switchport access vlan

To set the VLAN when an interface is in access mode, use the `switchport access vlan` command. To reset the access mode VLAN to the appropriate default VLAN for the device, use the `no` form of this command.

```
switchport access [vlan {vlan-id | dynamic}]

no switchport access vlan
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>(Optional) Number of the VLAN on the interface in access mode; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><code>dynamic</code></td>
<td>(Optional) Enables VMPS control of the VLAN.</td>
</tr>
</tbody>
</table>

#### Defaults

The default settings are as follows:

- The access VLAN and trunk interface native VLAN are default VLANs that correspond to the platform or the interface hardware.
- All VLAN lists include all VLANs.

#### Command Modes

Interface configuration mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>T2.1(13)EW</td>
<td>Support for VPMS was added.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

You must enter the `switchport` command without any keywords to configure the LAN interface as a Layer 2 interface before you can enter the `switchport access vlan` command. This action is required only if you have not already entered the `switchport` command for the interface.

Entering the `no switchport` command shuts the port down and then reenables it, which could generate messages on the device to which the port is connected.

The `no` form of the `switchport access vlan` command resets the access mode VLAN to the appropriate default VLAN for the device.

If your system is configured with a Supervisor Engine I, valid values for `vlan-id` are from 1 to 1005. If your system is configured with a Supervisor Engine II, valid values for `vlan-id` are from 1 to 4094. Extended-range VLANs are not supported on systems configured with a Supervisor Engine I.

#### Examples

This example shows how to cause the port interface to stop operating as a Cisco-routed port and convert to a Layer 2-switched interface:

```
Switch(config-if)# switchport
Switch(config-if)#
```
switchport access vlan

Note

This command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

This example shows how to cause a port interface that has already been configured as a switched interface to operate in VLAN 2 instead of the platform's default VLAN when in access mode:

```
Switch(config-if)# switchport access vlan 2
Switch(config-if)#
```

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td></td>
<td><code>show interfaces switchport</code></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>
</tr>
</tbody>
</table>
switchport autostate exclude

To exclude a port from the VLAN interface link-up calculation, use the `switchport autostate exclude` command. To return to the default settings, use the `no` form of this command.

```
switchport autostate exclude
no switchport autostate exclude
```

**Syntax Description**

This command has no keywords or arguments.

**Defaults**

All ports are included in the VLAN interface link-up calculation.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(37)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter the `switchport` command without any keywords to configure the LAN interface as a Layer 2 interface before you can enter the `switchport autostate exclude` command. This action is required only if you have not entered the `switchport` command for the interface.

**Note**

The `switchport` command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

The `switchport autostate exclude` command marks the port to be excluded from the interface VLAN up calculation when there are multiple ports in the VLAN.

The `show interface interface switchport` command displays the autostate mode if the mode has been set. If the mode has not been set, the autostate mode is not displayed.

**Examples**

This example shows how to exclude a port from the VLAN interface link-up calculation:

```
Switch(config-if)# switchport autostate exclude
Switch(config-if)#
```

This example shows how to include a port in the VLAN interface link-up calculation:

```
Switch(config-if)# no switchport autostate exclude
Switch(config-if)#
```

You can verify your settings by entering the `show interfaces switchport` privileged EXEC command.
<table>

switchport block

To prevent the unknown multicast or unicast packets from being forwarded, use the switchport block interface configuration command. To allow the unknown multicast or unicast packets to be forwarded, use the no form of this command.

```
switchport block {multicast | unicast}
no switchport block {multicast | unicast}
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>Specifies that the unknown multicast traffic should be blocked.</td>
</tr>
<tr>
<td>unicast</td>
<td>Specifies that the unknown unicast traffic should be blocked.</td>
</tr>
</tbody>
</table>

Defaults

Unknown multicast and unicast traffic are not blocked.
All traffic with unknown MAC addresses is sent to all ports.

Command Modes

Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can block the unknown multicast or unicast traffic on the switch ports.
Blocking the unknown multicast or unicast traffic is not automatically enabled on the switch ports; you must explicitly configure it.

Note

For more information about blocking the packets, refer to the software configuration guide for this release.

Examples

This example shows how to block the unknown multicast traffic on an interface:

```
Switch(config-if)# switchport block multicast
```

You can verify your setting by entering the show interfaces interface-id switchport privileged EXEC command.

</tr>
<tr>
<td>private-vlan trunk secondary</td>
<td>Specifies that the ports with a valid PVLAN trunk association become active host private VLAN trunk ports.</td>
</tr>
</tbody>
</table>

### Defaults

- Link converts to a trunk link.
- `dot1q` tunnel ports are disabled.

### Command Modes

- Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support was added for configuring <code>dot1q</code> tunnel ports.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support was added for trunk promiscuous ports.</td>
</tr>
</tbody>
</table>
If you enter access mode, the interface goes into permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not approve the change.

If you enter trunk mode, the interface goes into permanent trunking mode and negotiates to convert the link into a trunk link even if the neighboring interface does not approve the change.

If you enter dynamic auto mode, the interface converts the link to a trunk link if the neighboring interface is set to trunk or desirable mode.

If you enter dynamic desirable mode, the interface becomes a trunk interface if the neighboring interface is set to trunk, desirable, or auto mode.

If you specify the dot1q-tunnel keyword, the port is set unconditionally as an 802.1Q tunnel port. The port becomes inactive if you configure it as a private VLAN trunk port and one of the following applies:

- The port does not have a valid PVLAN association.
- The port does not have valid allowed normal VLANs.

If a private port PVLAN association or mapping is deleted, or if a private port is configured as a SPAN destination, it becomes inactive.

This example shows how to set the interface to dynamic desirable mode:

```
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)#
```

This example shows how to set a port to PVLAN host mode:

```
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)#
```

This example shows how to set a port to private VLAN trunk:

```
Switch(config-if)# switchport mode private-vlan trunk
Switch(config-if)#
```

This example shows how to configure a port for an 802.1Q tunnel port:

```
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)#
```

This example shows how to configure a promiscuous trunk port:

```
Switch(config-if)# switchport mode private-vlan trunk promiscuous
Switch(config-if)#
```

This example shows how to configure an isolated trunk port:

```
Switch(config-if)# switchport mode private-vlan trunk
OR
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)#
```

You can verify your settings by entering the `show interfaces switchport` command and examining information in the Administrative Mode and Operational Mode rows.
This example shows how to configure interface FastEthernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end

To enable port security on an interface, use the `switchport port-security` command. To disable port security and set parameters to their default states, use the `no` form of this command.

```plaintext
switchport port-security [aging {static | time time | type {absolute | inactivity}}] | limit rate invalid-source-mac [N | none] | mac-address mac-address [vlan {access | voice}] | mac-address sticky [mac-address] [vlan access | voice] | maximum value [vlan {access | voice}] | violation {restrict | shutdown | shutdown vlan}]

no switchport port-security [aging {static | time time | type {absolute | inactivity}}] | limit rate invalid-source-mac [N | none] | mac-address mac-address [vlan {access | voice}] | mac-address sticky [mac-address] [vlan access | voice] | maximum value [vlan {access | voice}] | violation {restrict | shutdown | shutdown vlan}]
```

### Syntax Description

- **aging***(Optional) Specifies aging for port security.*
- **static***(Optional) Enables aging for statically configured secure addresses on this port.*
- **time time***(Optional) Specifies the aging time for this port. The valid values are from 0 to 1440 minutes. If the time is 0, aging is disabled for this port.*
- **type absolute***(Optional) Sets the aging type as absolute aging. All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list.*
- **type inactivity***(Optional) Sets the aging type as inactivity aging. The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period.*
- **limit rate invalid-source-mac***(Optional) Sets the rate limit for bad packets. This rate limit also applies to the port where DHCP snooping security mode is enabled as filtering the IP and MAC address.*
- **N none***(Optional) Supplies a rate limit (N) or indicates none (`none`).*
- **mac-address mac-address***(Optional) Specifies a secure MAC address for the interface; a 48-bit MAC address. You can add additional secure MAC addresses up to the maximum value that is configured.*
- **sticky***(Optional) Configures the dynamic addresses as sticky on the interface.*
- **vlan access***(Optional) Deletes the secure MAC addresses from access VLANs.*
- **vlan voice***(Optional) Deletes the secure MAC addresses from voice VLANs.*
- **maximum value***(Optional) Sets the maximum number of secure MAC addresses for the interface. Valid values are from 1 to 3072. The default setting is 1.*
- **violation***(Optional) Sets the security violation mode and action to be taken if port security is violated.*
- **restrict***(Optional) Sets the security violation restrict mode. In this mode, a port security violation restricts data and causes the security violation counter to increment.*
switchport port-security

shutdown
(Optional) Sets the security violation shutdown mode. In this mode, a port security violation causes the interface to immediately become error disabled.

shutdown vlan
(Optional) Set the security violation mode to per-VLAN shutdown. In this mode, only the VLAN on which the violation occurred is error-disabled.

Defaults
The default settings are as follows:

- Port security is disabled.
- When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1.
- Aging is disabled.
- Aging time is 0 minutes.
- All secure addresses on this port age out immediately after they are removed from the secure address list.

Command Modes
Interface configuration mode

</table>

Usage Guidelines
After you set the maximum number of secure MAC addresses that are allowed on a port, you can add secure addresses to the address table by manually configuring them, by allowing the port to dynamically configure them, or by configuring some MAC addresses and allowing the rest to be dynamically configured.

The packets are dropped into the hardware when the maximum number of secure MAC addresses are in the address table and a station that does not have a MAC address in the address table attempts to access the interface.

If you enable port security on a voice VLAN port and if there is a PC connected to the IP phone, you set the maximum allowed secure addresses on the port to more than 1.

You cannot configure static secure MAC addresses in the voice VLAN.

A secure port has the following limitations:

- A secure port cannot be a dynamic access port or a trunk port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

switchport port-security

- A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
- A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel port group.

When a secure port is in the error-disabled state, you can remove it from this state by entering the `errdisable recovery cause psecure-violation` global configuration command, or you can manually re-enable it by entering the `shutdown` and `no shutdown` interface configuration commands. If a port is disabled, you can also use the `clear errdisable` command to re-enable the offending VLAN on the port.

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that port.

To allow limited time access to particular secure addresses, set the aging type as `absolute`. When the aging time lapses, the secure addresses are deleted.

To allow continuous access to a limited number of secure addresses, set the aging type as `inactivity`. This action removes the secure address when it becomes inactive, and other addresses can become secure.

To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the statically configured secure address by using the `no switchport port-security aging static` interface configuration command.

If the sticky command is executed without a MAC address specified, all MAC addresses that are learned on that port will be made sticky. You can also specify a specific MAC address to be a sticky address by entering the `sticky` keyword next to it.

You can configure the sticky feature even when port security is not enabled on the interface. The feature becomes operational when you enable port security on the interface.

You can use the `no` form of the `sticky` command only if the sticky feature is already enabled on the interface.

### Examples

This example shows how to set the aging time to 2 hours (120 minutes) for the secure addresses on the Fast Ethernet port 12:

```bash
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security aging time 120
```

This example shows how to set the aging timer type to Inactivity for the secure addresses on the Fast Ethernet port 12:

```bash
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switch port-security aging type inactivity
```

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet port 12:

```bash
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security limit rate invalid-source-mac 100
```

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet port 12:

```bash
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security limit rate invalid-source-mac none
```
You can verify the settings for all secure ports or the specified port by using the `show port-security` privileged EXEC command.

This example shows how to remove all sticky and static addresses that are configured on the interface:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address
```

This example shows how to configure a secure MAC address on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 1000.2000.3000
```

This example shows how to make all MAC addresses learned on Fast Ethernet port 12 sticky:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# switchport port-security mac-address sticky
```

This example shows how to make MAC address 1000.2000.3000 sticky on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# switchport port-security mac-address sticky 1000.2000.3000
```

This example shows how to disable the sticky feature on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address sticky
```

Note

This command makes all sticky addresses on this interface normal learned entries. It does not delete the entries from the secure MAC address table.

Note

The following examples show how to configure sticky secure MAC addresses in access and voice VLANs on interfaces with voice VLAN configured. If you do not have voice VLAN configured the `vlan [access | voice]` keywords are not supported.

This example shows how to configure sticky MAC addresses for voice and data VLANs on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.000b vlan voice
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0005 vlan access
Switch(config-if)# end
```

This example shows how to designate a maximum of one MAC address for a voice VLAN (for a Cisco IP Phone, let’s say) and one MAC address for the data VLAN (for a PC, let’s say) on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
```
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security maximum 1 vlan voice
Switch(config-if)# switchport port-security maximum 1 vlan access
Switch(config-if)# end

This example shows how to configure a port to shut down only the VLAN if a violation occurs:

Switch(config)# interface gigabitethernet 5/1
Switch(config)# switchport port-security violation shutdown vlan

**Note**

Sending traffic to the ports causes the system to configure the port with sticky secure addresses.

You can verify your settings by using the `show port-security address` privileged EXEC command.

**switchport private-vlan association trunk**

To configure the association between a secondary VLAN and a VLAN on a private VLAN trunk port, use the `switchport private-vlan association trunk` command. To remove the private VLAN mapping from the port, use the `no` form of this command.

```
switchport private-vlan association trunk {primary-vlan-id} {secondary-vlan-id}
```

```
no switchport private-vlan association trunk {primary-vlan-id}
```

**Syntax Description**

- **primary-vlan-id** Number of the primary VLAN of the private VLAN relationship.
- **secondary-vlan-id** Number of the secondary VLAN of the private VLAN relationship.

**Defaults**

Private VLAN mapping is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Multiple private VLAN pairs can be specified so that a private VLAN trunk port can carry multiple secondary VLANs. If an association is specified for the existing primary VLAN, the existing association is replaced.

Only isolated secondary VLANs can be carried over a private VLAN trunk.

**Note**

Community secondary VLANs on a private VLAN trunk are not supported in this release.

If there is no trunk association, any packets received on the secondary VLANs are dropped.

**Examples**

This example shows how to configure a port with a primary VLAN (VLAN 18) and secondary VLAN (VLAN 20):

```
Switch(config-if)# switchport private-vlan association trunk 18 20
Switch(config-if)#
```

This example shows how to remove the private VLAN association from the port:

```
Switch(config-if)# no switchport private-vlan association trunk 18
Switch(config-if)#
```
This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10. 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport

**switchport private-vlan host-association**

To define a PVLAN association for an isolated or community port, use the `switchport private-vlan host-association` command. To remove the PVLAN mapping from the port, use the `no` form of this command.

```
switchport private-vlan host-association {primary-vlan-id} {secondary-vlan-id}
no switchport private-vlan host-association
```

**Syntax Description**

- `primary-vlan-id` Number of the primary VLAN of the PVLAN relationship; valid values are from 1 to 4094.
- `secondary-vlan-list` Number of the secondary VLAN of the private VLAN relationship; valid values are from 1 to 4094.

**Defaults**

Private VLAN mapping is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

There is no runtime effect on the port unless it is in PVLAN host mode. If the port is in PVLAN host mode but all VLANs do not exist, the command is allowed, but the port is made inactive.

The secondary VLAN may be an isolated or community VLAN.

**Examples**

This example shows how to configure a port with a primary VLAN (VLAN 18) and secondary VLAN (VLAN 20):

```
Switch(config-if)# switchport private-vlan host-association 18 20
Switch(config-if)#
```

This example shows how to remove the PVLAN association from the port:

```
Switch(config-if)# no switchport private-vlan host-association
Switch(config-if)#
```
This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end
Switch# show interfaces fastethernet 5/1 switchport

</tbody>
</table>
**switchport private-vlan mapping**

To define private VLAN mapping for a promiscuous port, use the `switchport private-vlan mapping` command. To clear all mapping from the primary VLAN, use the **no** form of this command.

```
switchport private-vlan mapping (primary-vlan-id) (secondary-vlan-list) |
{add secondary-vlan-list} | {remove secondary-vlan-list} |

switchport private-vlan mapping trunk (primary-vlan-id) [add | remove] secondary-vlan-list

no switchport private-vlan mapping [trunk]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>

</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for trunk VLAN was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

There is no run-time effect on the port unless it is in private VLAN promiscuous mode. If the port is in private VLAN promiscuous mode but the VLANs do not exist, the command is allowed, but the port is made inactive.

The secondary VLAN may be an isolated or community VLAN.

### Note

The maximum number of unique private VLAN pairs supported by the `switchport private-vlan mapping trunk` command above is 500. For example, one thousand secondary VLANs could map to one primary VLAN, or one thousand secondary VLANs could map one to one to one thousand primary VLANs.
Examples

This example shows how to configure the mapping of primary VLAN 18 to the secondary isolated VLAN 20 on a port:

```
Switch(config-if)# switchport private-vlan mapping 18 20
```

This example shows how to add a VLAN to the mapping:

```
Switch(config-if)# switchport private-vlan mapping 18 add 21
```

This example shows how to add a range of secondary VLANs to the mapping:

```
Switch(config-if)# switchport private-vlan mapping 18 add 22-24
```

This example shows how to add a range of secondary VLANs to the trunk mapping:

```
Switch(config-if)# switchport private-vlan mapping trunk 18 add 22-24
```

This example shows how to configure interface FastEthernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end

switchport private-vlan trunk allowed vlan

To configure a list of the allowed normal VLANs on a private VLAN trunk port, use the `switchport private-vlan trunk allowed vlan` command. To remove all the allowed normal VLANs from a private VLAN trunk port, use the `no` form of this command.

```
switchport private-vlan trunk allowed vlan {vlan-list} all | none | [add | remove | except] 
  vlan_atom [,vlan_atom...]
```

```
no switchport private-vlan trunk allowed vlan
```

**Syntax Description**

- `vlan_list` Sets the list of allowed VLANs; see the “Usage Guidelines” section for formatting guidelines for `vlan_list`.
- `all` Specifies all VLANs from 1 to 4094. This keyword is not supported on commands that do not permit all VLANs in the list to be set at the same time.
- `none` Indicates an empty list. This keyword is not supported on commands that require certain VLANs to be set or at least one VLAN to be set.
- `add` (Optional) Adds the defined list of VLANs to those currently set instead of replacing the list.
- `remove` (Optional) Removes the defined list of VLANs from those currently set instead of replacing the list.
- `except` (Optional) Lists the VLANs that should be calculated by inverting the defined list of VLANs.
- `vlan_atom` Either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

**Defaults**

All allowed normal VLANs are removed from a private VLAN trunk port.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, no normal VLANs are allowed unless you explicitly configure the VLANs to be allowed. Use this command only for normal VLANs on a private VLAN trunk port.

Use the `switchport private-vlan association trunk` command to configure a port that can carry private VLANs on a private VLAN trunk port.
switchport private-vlan trunk allowed vlan

Examples

This example shows how to configure the private VLAN trunk port that carries normal VLANs 1 to 10:

Switch(config-if)# switchport private-vlan trunk allowed vlan 1-10

Switch(config-if)#

This example shows how to remove all the allowed normal VLANs from a private VLAN trunk port:

Switch(config-if)# no switchport private-vlan trunk allowed vlan
Switch(config-if)#

This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301

switchport private-vlan trunk native vlan tag

To control the tagging of the native VLAN traffic on 802.1Q private VLAN trunks, use the `switchport private-vlan trunk native vlan tag` command. To remove the control of tagging (and default to the global setting), use the `no` form of this command.

```
switchport private-vlan trunk native vlan tag
no switchport private-vlan trunk native vlan tag
```

Syntax Description
This command has no arguments or keywords.

Defaults
The default setting is global; the settings on the port are determined by the global setting.

Command Modes
Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Removed <code>vlan-id</code> keyword.</td>
</tr>
</tbody>
</table>

Usage Guidelines
The configuration created with this command only applies to ports that are configured as private VLAN trunks.

Examples
This example shows how to enable 802.1Q native VLAN tagging on a PVLAN trunk:

```
Switch(config-if)# switchport private-vlan trunk native vlan tag
Switch(config-if)#
```

</table>
**switchport trunk**

To set the trunk characteristics when an interface is in trunking mode, use the **switchport trunk** command. To reset all of the trunking characteristics back to the original defaults, use the **no** form of this command.

```
switchport trunk encapsulation {isl | dot1q | negotiate}
no switchport trunk encapsulation

switchport trunk native vlan {tag | vlan_id}
no switchport trunk native vlan {tag | vlan_id}

switchport trunk allowed vlan vlan_list
no switchport trunk allowed vlan vlan_list

switchport trunk pruning vlan vlan_list
no switchport trunk pruning vlan vlan_list
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>encapsulation isl</td>
<td>Sets the trunk encapsulation format to ISL.</td>
</tr>
<tr>
<td>encapsulation dot1q</td>
<td>Sets the trunk encapsulation format to 802.1Q.</td>
</tr>
<tr>
<td>encapsulation negotiate</td>
<td>Specifies that if DISL and DTP negotiation do not resolve the encapsulation format, ISL will be the selected format.</td>
</tr>
<tr>
<td>native vlan tag</td>
<td>Specifies the tagging of native VLAN traffic on 802.1Q trunks.</td>
</tr>
<tr>
<td>native vlan vlan_id</td>
<td>Sets the native VLAN for the trunk in 802.1Q trunking mode.</td>
</tr>
<tr>
<td>allowed vlan vlan_list</td>
<td>Sets the list of allowed VLANs that transmit this interface in tagged format when in trunking mode. See the “Usage Guidelines” section for formatting guidelines for vlan_list.</td>
</tr>
<tr>
<td>pruning vlan vlan_list</td>
<td>Sets the list of VLANs that are enabled for VTP pruning when the switch is in trunking mode. See the “Usage Guidelines” section for formatting guidelines for vlan_list.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- The encapsulation type is dependent on the platform or interface hardware.
- The access VLANs and trunk interface native VLANs are a default VLAN that corresponds to the platform or the interface hardware.
- All VLAN lists include all VLANs.
- Native VLAN tagging is enabled on the port if enabled globally.

Usage Guidelines

The *vlan_list* format is `all | none | [add | remove | except] vlan_atom[,vlan_atom...]`, where:

- `all` specifies all VLANs from 1 to 4094. This keyword is not supported on commands that do not permit all VLANs in the list to be set at the same time.
- `none` indicates an empty list. This keyword is not supported on commands that require certain VLANs to be set or at least one VLAN to be set.
- `add` adds the defined list of VLANs to those currently set, instead of replacing the list.
- `remove` removes the defined list of VLANs from those currently set, instead of replacing the list.
- `except` lists the VLANs that should be calculated by inverting the defined list of VLANs.
- `vlan_atom` is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers (the lesser one first, separated by a hyphen).

The **switchport trunk encapsulation** command is supported only for platforms and interface hardware that can support both ISL and 802.1Q formats.

If you enter the **negotiate** keywords, and DISL and DTP negotiation do not resolve the encapsulation format, ISL is the selected format. The **no** form of this command resets the trunk encapsulation format back to the default.

The **no** form of the **native vlan** command resets the native mode VLAN to the appropriate default VLAN for the device.

The **no** form of the **allowed vlan** command resets the list to the default list, which allows all VLANs.

The **no** form of the **pruning vlan** command resets the list to the default list, which enables all VLANs for VTP pruning.

These configuration guidelines and restrictions apply when using 802.1Q trunks and impose some limitations on the trunking strategy for a network:

- When connecting Cisco switches through an 802.1Q trunk, make sure that the native VLAN for an 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
- Disabling spanning tree on the native VLAN of an 802.1Q trunk without disabling spanning tree on every VLAN in the network can cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an 802.1Q trunk. If this is not possible, disable spanning tree on every VLAN in the network. Make sure that your network is free of physical loops before disabling spanning tree.
- When you connect two Cisco switches through 802.1Q trunks, the switches exchange spanning-tree BPDUs on each VLAN that is allowed on the trunks. The BPDUs on the native VLAN of the trunk are sent untagged to the reserved 802.1d spanning-tree multicast MAC address (01-80-C2-00-00-00). The BPDUs on all other VLANs on the trunk are sent tagged to the reserved SSTP multicast MAC address (01-00-0c-cc-cc-cd).
Non-Cisco 802.1Q switches maintain only a single instance of spanning tree (MST) that defines the spanning-tree topology for all VLANs. When you connect a Cisco switch to a non-Cisco switch through an 802.1Q trunk, the MST of the non-Cisco switch and the native VLAN spanning tree of the Cisco switch combine to form a single spanning-tree topology known as the CST.

Because Cisco switches transmit BPDUs to the SSTP multicast MAC address on the VLANs other than the native VLAN of the trunk, non-Cisco switches do not recognize these frames as BPDUs and flood them on all ports in the corresponding VLAN. Cisco switches connected to the non-Cisco 802.1Q network receive these flooded BPDUs. Because Cisco switches receive the flooded BPDUs, the switches can maintain a per-VLAN spanning-tree topology across a network of non-Cisco 802.1Q switches. The non-Cisco 802.1Q network separating the Cisco switches is treated as a single broadcast segment between all switches that are connected to the non-Cisco 802.1Q network through the 802.1Q trunks.

Ensure that the native VLAN is the same on all of the 802.1Q trunks connecting the Cisco switches to the non-Cisco 802.1Q network.

If you are connecting multiple Cisco switches to a non-Cisco 802.1Q network, all of the connections must be through the 802.1Q trunks. You cannot connect Cisco switches to a non-Cisco 802.1Q network through the ISL trunks or through the access ports. This action causes the switch to place the ISL trunk port or access port into the spanning-tree “port inconsistent” state and no traffic will pass through the port.

Follow these guidelines for native VLAN tagging:

- The no switchport trunk native vlan tag command disables the native VLAN tagging operation on a port. This overrides the global tagging configuration.
- The switchport trunk native vlan tag command can be used to reenable tagging on a disabled port.
- The no option is saved to NVRAM so that the user does not have to manually select the ports to disable the tagging operation each time that the switch reboots.
- When the switchport trunk native vlan tag command is enabled and active, all packets on the native VLAN are tagged, and incoming untagged data packets are dropped. Untagged control packets are accepted.

Examples

This example shows how to cause a port interface that is configured as a switched interface to encapsulate in 802.1Q trunking format regardless of its default trunking format in trunking mode:

```
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)#
```

This example shows how to enable 802.1Q tagging on a port:

```
Switch(config-if)# switchport trunk native vlan tag
Switch(config-if)#
```

This example shows how to configure a secure MAC-address and a maximum limit of secure MAC addresses on Gigabit Ethernet port 1 for all VLANs:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 3
```
This example shows how to configure a secure MAC-address on Gigabit Ethernet port 1 in a specific VLAN or range of VLANs:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security maximum 3
```

This example shows how to configure a secure MAC-address in a VLAN on Gigabit Ethernet port 1:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.2
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.3
```

You can verify your settings by using the `show port-security interface vlan` privileged EXEC command.

switchport vlan mapping

Use the `switchport vlan mapping` interface configuration command to configure VLAN mapping on a trunk port. You can configure one-to-one VLAN mapping, traditional IEEE 802.1Q tunneling (QinQ) mapping, or selective QinQ mapping. Use the `no` form of the command to disable the configuration.

```
switchport vlan mapping vlan-id {translated-id | dot1q tunnel translated-id}

no switchport vlan mapping vlan-id {translated-id | dot1q tunnel translated-id}

no switchport vlan mapping all
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Specify the original (customer) VLAN or VLANs (C-VLANs), also known as the VLAN on the wire, for one-to-one or selective QinQ mapping. You can enter multiple VLAN IDs separated by a comma or a series of VLAN IDs separated by a hyphen (for example 1,2,3-5). The range is from 1 to 4094.</td>
</tr>
<tr>
<td><code>translated-id</code></td>
<td>Specify the translated VLAN-ID: the S-VLAN to be used in the service provider network. The range is from 1 to 4094.</td>
</tr>
<tr>
<td><code>dot1q-tunnel</code></td>
<td>Add a translated VLAN-ID to specify a VLAN tunnel (add an outer S-VLAN tag). The range of the S-VLAN tag is 1 to 4094. Use these keywords for traditional QinQ mapping.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>In the <code>no switchport vlan mapping</code> command, specifies that all VLAN mapping configurations on the interface are deleted.</td>
</tr>
</tbody>
</table>

**Defaults**
No VLAN mapping is configured.

**Command Modes**
Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Before configuring VLAN mapping on an interface, enter the **switchport mode trunk** interface configuration command to configure the interface as a trunk port.

You can configure VLAN mapping on a physical interface or on a port channel of multiple interfaces with the same configuration.

To configure one-to-one VLAN mapping, use the **switchport vlan mapping** `vlan-id translated-id` command.

**Note**

To avoid mixing customer traffic, when you configure traditional QinQ on a trunk port, you should use the **switchport trunk allowed vlan** `vlan-id` interface configuration command to configure the outer VLAN ID (S-VLAN) as an allowed VLAN on the trunk port.

**Note**

You cannot configure one-to-one mapping and selective QinQ on the same interface.

The **no** form of the **switchport vlan mapping** commands clears the specified mapping configuration. The **no switchport vlan mapping all** command clears all mapping configurations on the interface.

You cannot configure encapsulation replicate on a SPAN destination port if the source port is configured as a tunnel port or has a 1-to-2 mapping configured. Encapsulation replicate is supported with 1-to-1 VLAN mapping.

Examples

This example shows how to use one-to-one mapping to map VLAN IDs 1 and 2 in the customer network to VLANs 1001 and 1002 in the service-provider network and to drop traffic from any other VLAN IDs.

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport vlan mapping 1 1001
Switch(config-if)# switchport vlan mapping 2 1002
Switch(config-if)# exit
```

This example shows how to configure selective QinQ mapping on the port so that traffic with a C-VLAN ID of 5, 7, or 8 would enter the switch with an S-VLAN ID of 100. The traffic of any other VLAN IDs is dropped.

```
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# switchport vlan mapping 5, 7-8 dot1q-tunnel 100
Switch(config-if)# exit
```

</table>
system mtu

To set the maximum Layer 2 or Layer 3 payload size, use the **system mtu** command. To revert to the default MTU setting, use the **no** form of this command.

```
    system mtu  datagram-size
    no  system mtu
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>datagram-size</strong></td>
<td>Layer 2 payload size; valid values from 1500 to 1552 bytes.</td>
</tr>
</tbody>
</table>

**Defaults**

The default MTU setting is 1500 bytes.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `datagram-size` parameter specifies the Ethernet payload size, not the total Ethernet frame size, and the Layer 3 MTU is changed as a result of changing the `system mtu` command.

For ports from 3 to 18 on model WS-X4418-GB and ports from 1 to 12 on model WS-X4412-2GB-TX, only the standard IEEE Ethernet payload size of 1500 bytes is supported.

For other modules, an Ethernet payload size of up to 1552 bytes is supported with a total Ethernet frame size of up to 1600 bytes.

**Examples**

This example shows how to set the MTU size to 1550 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# system mtu 1550
Switch(config)# end
Switch#
```

This example shows how to revert to the default MTU setting:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no system mtu
Switch(config)# end
Switch#
```

### template data timeout (netflow-lite exporter submode)

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a template data timeout for the NetFlow-lite collector, use the `template data timeout` command. To delete the value, use the `no` form of this command.

```
template data timeout seconds
no dscp dscp-value
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Specifies a template data timeout value for the NetFlow-lite collector.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Defaults</th>
<th>1800 seconds</th>
</tr>
</thead>
</table>

**Command Modes**
netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Default timeout value is 1800 seconds or 30 minutes. The timeout value configured really depends on the collector and how often it needs the templates to be refreshed.

**Examples**
This example shows how to specify a template data timeout for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter
```
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:
    Network Protocol Configuration:
        Destination IP address: 5.5.5.6
```
Source IP Address: 5.5.5.5
VRF label: 
DSCP: 0x20
TTL: 128
COS: 7
Transport Protocol Configuration:
Transport Protocol: UDP
Destination Port: 8188
Source Port: 61670
Export Protocol Configuration:
Export Protocol: netflow-v9
Template data timeout: 60
Options sampler-table timeout: 1800
Options interface-table timeout: 1800
Exporter Statistics:
Packets Exported: 0

You can verify your settings with the `show netflow-lite exporter` privileged EXEC command.

test cable-diagnostics tdr

To test the condition of copper cables on 48-port 10/100/1000 BASE-T modules, use the test cable-diagnostics tdr command.

```
test cable-diagnostics tdr {interface (interface interface-number)}
```

**Note**
This command will be deprecated in future Cisco IOS releases. Use the diagnostic start command instead.

### Syntax Description
- **interface interface**  Interface type; valid values are fastethernet and gigabitethernet.
- **interface-number**  Module and port number.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
The TDR test is supported on Catalyst 4500 series switches running Cisco IOS Release 12.2(25)SG for the following line cards only:
- WS-X4548-GB-RJ45
- WS-X4548-GB-RJ45V
- WS-X4524-GB-RJ45V
- WS-X4013+TS
- WS-C4948
- WS-C4948-10GE

The valid values for interface interface are fastethernet and gigabitethernet.

Do not start the test at the same time on both ends of the cable. Starting the test at both ends of the cable at the same time can lead to false test results.

Do not change the port configuration during any cable diagnostics test. This action may result in incorrect test results.

The interface must be operating before starting the TDR test. If the port is down, the results of the test will be invalid. Issue the no shutdown command on the port.
test cable-diagnostics tdr

Examples

This example shows how to start the TDR test on port 1 on module 2:

```
Switch# test cable-diagnostics tdr int gi2/1
Switch#
```

This example shows the message that displays when the TDR test is not supported on a module:

```
Switch# test cable-diagnostics tdr int gi2/1
00:03:15:%C4K_IOSDIAGMAN-4-TESTNOTSUPPORTEDONMODULE: Online cable
diag tdr test is not supported on this module
Switch#
```

Note

The `show cable-diagnostic tdr` command is used to display the results of a TDR test. The test results will not be available until approximately 1 minute after the test starts. If you enter the `show cable-diagnostic tdr` command within 1 minute of the test starting, you may see a “TDR test is in progress on interface...” message.

Related Commands

<table>

tracert route mac

To display the Layer 2 path taken by the packets from the specified source MAC address to the specified destination MAC address, use the **tracert route mac** command.

```
tracert route mac [interface interface-id] [source-mac-address] [interface interface-id]
   [destination-mac-address] [vlan vlan-id] [detail]
```

### Syntax Description

- **interface interface-id** (Optional) Specifies the source or destination switch interface.
- **source-mac-address** MAC address of the source switch in hexadecimal format.
- **destination-mac-address** MAC address of the destination switch in hexadecimal format.
- **vlan vlan-id** (Optional) Specifies the VLAN on which to trace the Layer 2 path that the packets take from the source switch to the destination switch; valid VLAN IDs are from 1 to 4094. Do not enter leading zeros.
- **detail** (Optional) Displays detail information.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(15)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Do not use leading zeros when entering a VLAN ID.

The Layer 2 traceroute feature is available on these switches:

- Catalyst 2950 switches running Release 12.1(12c)EA1 or later
- Catalyst 3550 switches running Release 12.1(12c)EA1 or later
- Catalyst 4500 series switches running Catalyst operating system Release 6.2 or later for the supervisor engine
- Catalyst 4500 series switches running Release 12.1(15)EW or later
- Catalyst 5000 family switches running Catalyst operating system Release 6.1 or later for the supervisor engine
- Catalyst 6500 series switches running Catalyst operating system Release 6.1 or later for the supervisor engine

For Layer 2 traceroute to functional properly, Cisco Discovery Protocol (CDP) must be enabled on all of the switches in the network. Do not disable CDP.

When the switch detects a device in the Layer 2 path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.
Layer 2 traceroute supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and a message appears.

The `traceroute mac` command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN. If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and a message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and a message appears.

This feature is not supported in Token Ring VLANs.

### Examples

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
  con6 (2.2.6.6) : Fa0/1 => Fa0/3
  con5 (2.2.5.5) : Fa0/3 => Gi0/1
  con1 (2.2.1.1) : Gi0/1 => Gi0/2
  con2 (2.2.2.2) : Gi0/2 => Fa0/1
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed
```

Switch#

This example shows how to display the detailed Layer 2 path:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201 detail
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
  con6 / WS-C2950G-24-EI / 2.2.6.6 :
    Fa0/1 [auto, auto] => Fa0/3 [auto, auto]
  con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/3 [auto, auto] => Gi0/1 [auto, auto]
  con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
  con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

Switch#

This example shows the Layer 2 path when the switch is not connected to the source switch:

```
Switch# traceroute mac 0000.0201.0501 0000.0201.0201 detail
Source not directly connected, tracing source ......
Source 0000.0201.0501 found on con5[WS-C2950G-24-EI] (2.2.5.5)
  con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/1 [auto, auto] => Gi0/1 [auto, auto]
  con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] => Gi0/2 [auto, auto]
  con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] => Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
```

Switch#
This example shows the Layer 2 path when the switch cannot find the destination port for the source MAC address:

Switch# traceroute mac 0000.0011.1111 0000.0201.0201
Error: Source Mac address not found.
Layer2 trace aborted.
Switch#

This example shows the Layer 2 path when the source and destination devices are in different VLANs:

Switch# traceroute mac 0000.0201.0601 0000.0301.0201
Error: Source and destination macs are on different vlans.
Layer2 trace aborted.
Switch#

This example shows the Layer 2 path when the destination MAC address is a multicast address:

Switch# traceroute mac 0000.0201.0601 0100.0201.0201
Invalid destination mac address
Switch#

This example shows the Layer 2 path when the source and destination switches belong to multiple VLANs:

Switch# traceroute mac 0000.0201.0601 0000.0201.0201
Error: Mac found on multiple vlans.
Layer2 trace aborted.
Switch#

This example shows how to display the Layer 2 path by specifying the interfaces on the source and destination switches:

Switch# traceroute mac interface fastethernet0/1 0000.0201.0601 interface fastethernet0/3 0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 (2.2.6.6) : Fa0/1 => Fa0/3
con5 (2.2.5.5) : Fa0/3 => Gi0/1
con1 (2.2.1.1) : Gi0/1 => Gi0/2

traceroute mac ip

To display the Layer 2 path that is taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname, use the traceroute mac command.

```
traceroute mac ip {source-ip-address | source-hostname} {destination-ip-address | destination-hostname} [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-ip-address</td>
<td>IP address of the source switch as a 32-bit quantity in dotted-decimal format.</td>
</tr>
<tr>
<td>destination-ip-address</td>
<td>IP address of the destination switch as a 32-bit quantity in dotted-decimal format.</td>
</tr>
<tr>
<td>source-hostname</td>
<td>IP hostname of the source switch.</td>
</tr>
<tr>
<td>destination-hostname</td>
<td>IP hostname of the destination switch.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays detailed traceroute MAC IP information.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Layer 2 traceroute feature is available on these switches:

- Catalyst 2950 switches running Release 12.1(12c)EA1 or later
- Catalyst 3550 switches running Release 12.1(12c)EA1 or later
- Catalyst 4500 series switches running Catalyst operating system Release 6.2 or later for the supervisor engine
- Catalyst 4500 series switches running Release 12.1(15)EW or later
- Catalyst 5000 family switches running Catalyst operating system Release 6.1 or later for the supervisor engine
- Catalyst 6500 series switches running Catalyst operating system Release 6.1 or later for the supervisor engine

For Layer 2 traceroute to functional properly, Cisco Discovery Protocol (CDP) must be enabled on all the switches in the network. Do not disable CDP.

When the switch detects a device in the Layer 2 path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.
The `traceroute mac ip` command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

### Examples

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the `detail` keyword:

```
Switch# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac......
2.2.66.66 =>0000.0201.0601
2.2.22.22 =>0000.0201.0201
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C2950G-24-EI / 2.2.6.6 :
    Fa0/1 [auto, auto] =>Fa0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/3 [auto, auto] =>Gi0/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    Gi0/1 [auto, auto] =>Gi0/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    Gi0/2 [auto, auto] =>Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
Switch#
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```
Switch# traceroute mac ip con6 con2
Translating IP to mac.....
2.2.66.66 =>0000.0201.0601
2.2.22.22 =>0000.0201.0201
Source 0000.0201.0601 found on con6
con6 (2.2.6.6) :Fa0/1 =>Fa0/3
    (2.2.5.5 ) : Fa0/3 =>Gi0/1
    (2.2.1.1 ) : Gi0/1 =>Gi0/2
    (2.2.2.2 ) : Gi0/2 =>Fa0/1
Destination 0000.0201.0201 found on con2
Layer 2 trace completed.
Switch#
```

This example shows the Layer 2 path when Address Resolution Protocol (ARP) cannot associate the source IP address with the corresponding MAC address:

```
Switch# traceroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace aborted.
Switch#
```

transport udp (netflow-lite exporter submode)

Note
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a UDP transport destination port for a NetFlow-lite collector, use the transport udp command. To delete a transport UDP, use the no form of this command.

transport udp destination-port

no transport udp destination-port

Syntax Description
| destination-port | Specifies a UDP transport destination port for a NetFlow-lite collector. |

Defaults
None

Command Modes
netflow-lite exporter submode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

Usage Guidelines
One of the mandatory parameters for a minimally configured exporter along with the destination address and UDP destination port of the NetFlow-lite collector.

Examples
This example shows how to specify a UDP transport destination port for a NetFlow-lite collector:

Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#

Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:

</tbody>
</table>
transport udp load-share (netflow-lite exporter submode)

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify the number of destination ports to load balance on for a NetFlow-lite collector, use the `transport udp load-share` command. To delete a transport UDP, use the `no` form of this command.

```
transport udp load-share destination-port

no transport udp load-share destination-port
```

**Syntax Description**
- `destination-port` Specifies number of destination ports to load balance on.

**Defaults**
1

**Command Modes**
netflow-lite exporter submode

**Command History**
- 15.0(2)SG Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

**Usage Guidelines**
The CLI for UDP destination port load sharing allows you leverage multiple receive packet queues in current server NICs, where the collector is running. This is an optional parameter. When `number >= 2` is configured, a switch exports datagrams with a UDP destination port number that “round robins” between a set of consecutive destination UDP port numbers starting with the base `udp port number` and ending with base `udp port number + num ports-1`. Typically, netflow templates are sent on the base UDP port number and the packet sample netflow records are sent on the remaining UDP ports. So, the collector provides optimized processing for templates or metadata and packet sample records on a socket.

**Examples**
This example shows how to specify a UDP transport destination port for a NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# transport udp load-share
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
```
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#

Display the exporter
Switch# show netflow-lite exporter exporter1
Netflow-lite Exporter exporter1:

trust

To define a trust state for traffic classified through the class policy-map configuration command, use the trust policy-map class configuration command. To return to the default setting, use the no form of this command.

```
trust [cos | dscp]
```

```
no trust [cos | dscp]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cos</td>
<td>(Optional) Classifies an ingress packet by using the packet class of service (CoS) value. For an untagged packet, the port default CoS value is used.</td>
</tr>
<tr>
<td>dscp</td>
<td>(Optional) Classifies an ingress packet by using the packet Differentiated Services Code Point (DSCP) values (most significant 6 bits of 8-bit service-type field). For a non-IP packet, the packet CoS value is used if the packet is tagged. If the packet is untagged, the default port CoS value is used to map CoS to DSCP.</td>
</tr>
</tbody>
</table>

### Defaults

The action is not trusted.

### Command Modes

Policy-map class configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

Use this command to distinguish the quality of service (QoS) trust behavior for certain traffic from other traffic. For example, inbound traffic with certain DSCP values can be trusted. You can configure a class map to match and trust the DSCP values in the inbound traffic.

Trust values set with this command supersede trust values set with the qos trust interface configuration command.

If you specify trust cos, QoS uses the received or default port CoS value and the CoS-to-DSCP map to generate a DSCP value for the packet.

If you specify trust dscp, QoS uses the DSCP value from the ingress packet. For non-IP packets that are tagged, QoS uses the received CoS value; for non-IP packets that are untagged, QoS uses the default port CoS value. In either case, the DSCP value for the packet is derived from the CoS-to-DSCP map.

To return to policy-map configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.

### Examples

This example shows how to define a port trust state to trust inbound DSCP values for traffic classified with “class1”:
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# trust dscp
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch#

You can verify your settings by entering the `show policy-map` privileged EXEC command.

---

**ttl (netflow-lite exporter submode)**

**Note**
NetFlow-lite is only supported on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.

To specify a ttl value for the NetFlow-lite collector, use the `ttl` command. To delete the value, use the `no` form of this command.

```
  ttl ttl-value
  no ttl ttl-value
```

**Syntax Description**
- `ttl-value` Specifies a ttl value for the NetFlow-lite collector.
  Valid values are from 1 to 254.

**Defaults**
254

**Command Modes**
netflow-lite exporter submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4948E and Catalyst 4948E-F Ethernet switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The ttl limit takes effect only when the export packets are based on IPv4. It has no effect on IPv6.

**Examples**
This example shows how to specify a ttl value for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```

Display the exporter
Switch# show netflow-lite exporter exporter1

tx-queue

To configure the transmit queue parameters for an interface, use the **tx-queue** command. To return to the default value, use the **no** form of this command.

```
tx-queue [queue-id] {bandwidth bandwidth-rate | priority high | shape shape-rate}
no tx-queue
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue-id</td>
<td>(Optional) Number of the queue; valid values are from 1 to 4.</td>
</tr>
<tr>
<td>bandwidth</td>
<td>Specifies traffic bandwidth; valid values are from 16000 to 1000000000 bits per second.</td>
</tr>
<tr>
<td>bandwidth-rate</td>
<td></td>
</tr>
<tr>
<td>priority high</td>
<td>Specifies high priority.</td>
</tr>
<tr>
<td>shape</td>
<td></td>
</tr>
<tr>
<td>shape-rate</td>
<td>Specifies the maximum rate that packets are passed through a transmit queue; valid values are from 16000 to 1000000000 bits per second.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:
- Encapsulation type is dependent on the platform or interface hardware.
- QoS enabled bandwidth rate is 4:255.
- QoS disabled bandwidth rate is 255:1.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

The bandwidth and shape rates cannot exceed the maximum speed of the interface.

The bandwidth can be configured only on the following:
- Uplink ports on Supervisor Engine III (WS-X4014)
- Ports on the WS-X4306-GB module
- The two 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first two ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module

Only transmit queue 3 can be configured to be a high-priority transmit queue.
Examples

This example shows how to allocate bandwidth on queue 1 to 100 Mbps:

```
Switch(config-if)# tx-queue 1
Switch(config-if-tx-queue)# bandwidth 1000000000
Switch(config-if-tx-queue)#
```

This example shows how to configure transmit queue 3 to the high priority:

```
Switch(config-if)# tx-queue 3
Switch(config-if-tx-queue)# priority high
Switch(config-if-tx-queue)#
```

This example shows how to configure the traffic shaping rate of 64 kbps to transmit queue 1:

```
Switch(config-if)# tx-queue 1
Switch(config-if-tx-queue)# shape 64000
Switch(config-if-tx-queue)#
```

Related Commands

<table>
<thead>

</tbody>
</table>
udld (global configuration mode)

To enable aggressive or normal mode in the UDLD protocol and to set the configurable message timer time, use the `udld` global configuration command. You can also use this command to set the error reporting mode for Fast UDLD.

Use the `no` form of this command to do the following:

- Disable normal mode UDLD on all the fiber ports by default
- Disable aggressive mode UDLD on all the fiber ports by default
- Disable the message timer
- Disable Fast UDLD error reporting mode

```
udld enable | aggressive
no udld enable | aggressive
udld message time message-timer-time
no udld message time
udld fast-hello error-reporting
no udld fast-hello error-reporting
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables UDLD in normal mode by default on all the fiber-optic interfaces.</td>
</tr>
<tr>
<td><code>aggressive</code></td>
<td>Enables UDLD in aggressive mode by default on all the fiber-optic interfaces.</td>
</tr>
<tr>
<td><code>message time message-timer-time</code></td>
<td>Sets the period of time between the UDLD probe messages on the ports that are in advertisement mode and are currently determined to be bidirectional; valid values are from 1 to 90 seconds.</td>
</tr>
<tr>
<td><code>fast-hello error-reporting</code></td>
<td>If Fast UDLD is enabled and a link failure is detected, reports the link failure through a log message instead of errdisabling the port.</td>
</tr>
</tbody>
</table>

**Defaults**

All fiber-optic interfaces are disabled and the message timer for UDLD is set to 15 seconds.

Fast UDLD is disabled on all interfaces.

**Command Modes**

Global configuration
udld (global configuration mode)

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Support for Fast UDLD was added.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If you enable aggressive mode, once all the switch port’s neighbors have aged out either in the advertisement or in the detection phase, UDLD and Fast UDLD restart the linkup sequence. They can resynchronize with any potentially out-of-sync neighbor and shut down the port if the UDLD messages from the neighbor indicate that the link state is still undetermined.

This command affects fiber interfaces only. Use the udld (interface configuration mode) command to enable UDLD on other interface types.

Examples

This example shows how to enable UDLD on all the fiber interfaces:

Switch (config)# udld enable
Switch (config)#

Related Commands

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>show udld</td>
<td>Displays the administrative and operational UDLD status.</td>
</tr>
<tr>
<td>udld (interface configuration mode)</td>
<td>Enables UDLD and Fast UDLD on an individual interface or prevents a fiber interface from being enabled by the udld (global configuration mode) command.</td>
</tr>
</tbody>
</table>
udld (interface configuration mode)

To enable UDLD and Fast UDLD on an individual interface or to prevent a fiber-optic interface from being enabled by the udld (global configuration mode) command, use the udld interface level command. Use the no form of this command to disable UDLD, or to return a nonfiber port to the setting specified with the udld (global configuration mode) command.

```
udld port {aggressive | disable}
no udld port {aggressive | disable}
udld fast-hello interval
no udld fast-hello
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggressive</td>
<td>Enables UDLD in aggressive mode.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables UDLD.</td>
</tr>
<tr>
<td>fast-hello</td>
<td>Enables Fast UDLD with the configured timer.</td>
</tr>
<tr>
<td>interval</td>
<td>Sets the timer interval.</td>
</tr>
</tbody>
</table>

**Defaults**

The fiber-optic interfaces are enabled with the state of the global udld (enable or aggressive) command. The nonfiber interfaces are enabled with UDLD disabled. Fast UDLD is disabled.

**Command Modes**

Interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(54)SG</td>
<td>Support was added for Fast UDLD.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enable aggressive mode, once all the switch port’s neighbors have aged out either in the advertisement or in the detection phase, UDLD and Fast UDLD restart the linkup sequence. They can resynchronize with any potentially out-of-sync neighbor and shut down the port if the UDLD messages from the neighbor indicate that the link state is still undetermined.

Use the udld port aggressive command on fiber-optic ports to override the setting of the global udld (enable or aggressive) command. Use the no form of the command on fiber-optic ports to restore the UDLD state as configured by the global udld command.

If udld enable is configured globally, UDLD is enabled on all fiber-optic interfaces in nonaggressive mode. You can configure udld port aggressive on a fiber-optic interface to override the udld enable command setting and to enter aggressive mode. If you enter the no udld port aggressive command, the settings of the previous global state are reestablished and the aggressive mode is removed.
The `disable` keyword is supported on fiber-optic ports only. Use the `no` form of the `udld` command to reset UDLD to the value specified by the `udld (global configuration mode)` command. If the port changes from fiber-optic to nonfiber-optic or vice versa, all configurations are maintained.

### Examples

This example shows how to enable UDLD on any port interface for any global `udld (global configuration mode)` setting:

```
Switch (config-if)# udld port
Switch (config-if)#
```

This example shows how to enable UDLD in aggressive mode on any port interface for any global `udld (enable or aggressive)` setting:

```
Switch (config-if)# udld port aggressive
Switch (config-if)#
```

This example shows how to disable UDLD on a fiber port interface for any global `udld (global configuration mode)` setting:

```
Switch (config-if)# udld disable
Switch (config-if)#
```

This example shows how to enable Fast UDLD on a port interface with a timer value of 200 ms. To enable Fast UDLD on a port, you must first enable UDLD in normal or aggressive mode:

```
Switch (config-if)# udld port
Switch (config-if)# udld fast-hello 200
Switch (config-if)#
```

### Related Commands

<table>

</thead>
<tbody>
<tr>
<td><code>show udld</code></td>
<td>Displays the administrative and operational UDLD and Fast UDLD status.</td>
</tr>
<tr>
<td><code>udld (global configuration mode)</code></td>
<td>Enables aggressive or normal mode in the UDLD protocol and sets the configurable message timer time.</td>
</tr>
</tbody>
</table>
udld reset

To reset all the UDLD ports in the shutdown state (that is, errdisabled by UDLD), use the udld reset privileged EXEC command.

udld reset

Syntax Description
This command has no arguments or keywords.

Defaults
This command has no default settings.

Command Modes
Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines
If the interface configuration is still enabled for UDLD, those ports will begin to run UDLD again and may shut down if the reason for the shutdown has not been resolved.

The udld reset command permits the traffic to flow on the ports again. Other features, operate normally if enabled, such as STP, PAgP, and DTP.

Examples
This example shows how to reset all the ports that are shut down by UDLD:

```
Switch# udld reset
Switch#
```

<tr>
<td>show udld</td>
<td>Displays the administrative and operational UDLD status.</td>
</tr>
</tbody>
</table>
unidirectional

To configure the nonblocking Gigabit Ethernet ports to unidirectionally send or receive traffic on an interface, use the `unidirectional` command. To disable unidirectional communication, use the `no` form of this command.

```
unidirectional {receive-only | send-only}
```

```
no unidirectional {receive-only | send-only}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>receive-only</td>
<td>Specifies the unidirectional reception.</td>
</tr>
<tr>
<td>send-only</td>
<td>Specifies the unidirectional transmission.</td>
</tr>
</tbody>
</table>

### Defaults

Disabled

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Enabling port unidirectional mode automatically disables port UDLD. You must manually ensure that the unidirectional link does not create a spanning-tree loop in the network.

### Examples

This example shows how to set Gigabit Ethernet interface 1/1 to receive traffic unidirectionally:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# unidirectional receive-only
Switch(config-if)# end
Switch#
```

### Related Commands

</thead>
<tbody>
<tr>
<td>show interfaces switchport</td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>
</tr>
</tbody>
</table>
username

To establish a username-based authentication system, use the **username** command.

```
username name secret {0 | 5} password
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>User ID of the user.</td>
</tr>
<tr>
<td>secret</td>
<td>Specifies the authentication system for the user; valid values are 0 (text immediately following is not encrypted) and 5 (text immediately following is encrypted using an MD5-type encryption method).</td>
</tr>
<tr>
<td>password</td>
<td>Password of the user.</td>
</tr>
</tbody>
</table>

**Defaults**

No username-based authentication system is established.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to enable enhanced password security for the specified username. This command enables MD5 encryption on the password. MD5 encryption is a strong encryption method that is not retrievable. You cannot use MD5 encryption with protocols that require clear-text passwords, such as CHAP.

You can use this command for defining usernames that get special treatment. For example, you can define an “info” username that does not require a password but that connects the user to a general-purpose information service.

The **username** command provides both username and secret authentication for login purposes only.

The **name** argument can be only one word. White spaces and quotation marks are not allowed.

You can use multiple **username** commands to specify options for a single user.

For information about additional **username** commands, refer to the *Cisco IOS Command Reference*.

**Examples**

This example shows how to specify an MD5 encryption on a password (warrior) for a username (xena):

```
Switch(config)# username xena secret 5 warrior
Switch(config)#
```
## Related Commands

</table>
verify

To verify the checksum of a file on a flash memory file system, use the `verify` command.

```
verify [/md5] [flash-filesystem:] [filename] [expected-md5-signature]
```

**Syntax Description**

- `/md5` (Optional) Verifies the MD5 signatures.
- `flash-filesystem:` (Optional) Device where the flash resides; valid values are `bootflash:`, `slot0: flash:`, or `sup-bootflash:`.
- `filename` (Optional) Name of the Cisco IOS image.
- `expected-md5-signature` (Optional) MD5 signature.

**Defaults**
The current working device is specified.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each software image that is distributed on the disk uses a single checksum for the entire image. This checksum is displayed only when the image is copied into the flash memory.

The Readme file, which is included with the image on the disk, lists the name, file size, and checksum of the image. Review the contents of the Readme file before loading or duplicating the new image so that you can verify the checksum when you copy it into the flash memory or on to a server.

Use the `verify /md5` command to verify the MD5 signature of a file before using it. This command validates the integrity of a copied file by comparing a precomputed MD5 signature with the signature that is computed by this command. If the two MD5 signatures match, the copied file is identical to the original file.

You can find the MD5 signature posted on the Cisco.com page with the image.

You can use the `verify /md5` command in one of the following ways:

- Verify the MD5 signatures manually by entering the `verify /md5 filename` command.
  
  Check the displayed signature against the MD5 signature posted on the Cisco.com page.

- Allow the system to compare the MD5 signatures by entering the `verify /md5 [flash-filesystem:filename] [expected-md5-signature]` command.
After completing the comparison, the system returns with a verified message. If an error is detected, the output is similar to the following:

```
Switch# verify /md5 slot0:c4-jsv-mz 0f
..................................
..................................
..................................
..................................
..................................
...............................Done!
%Error verifying slot0:c4-jsv-mz
Computed signature = 0f369ed9e98756f179d4f29d6e7755d3
Submitted signature = 0f
```

To display the contents of the flash memory, enter the `show flash` command. The flash contents listing does not include the checksum of the individual files. To recompute and verify the image checksum after the image has been copied into the flash memory, enter the `verify` command.

A colon (:) is required after the specified device.

### Examples

This example shows how to use the `verify` command:

```
Switch# verify cat6k_r47_1.cbi
..........................................................
File cat6k_r47_1.cbi verified OK.
Switch#
```

This example shows how to manually verify the MD5 signature:

```
Switch# verify /md5 c4-jsv-mz
............................................Done!
verify /md5 (slot0:c4-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3
Switch#
```

This example shows how to allow the system to compare the MD5 signatures:

```
Switch# verify /md5 slot0:c4-jsv-mz 0f369ed9e98756f179d4f29d6e7755d3
............................................Done!
verified /md5 (slot0:c6sup12-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3
Switch#
```

## vlan (VLAN Database mode)

To configure a specific VLAN, use the `vlan` command. To delete a VLAN, use the `no` form of this command.

```bash
vlan vlan_id [are hops] [backupcrf mode] [bridge type | bridge-num] [media type] [mtu mtu-size] [name vlan-name] [parent parent-vlan-id] [ring ring-number] [said said-value] [state {suspend | active}] [stp type type] [tb-vlan1 tb-vlan1-id] [tb-vlan2 tb-vlan2-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan_id</code></td>
<td>Number of the VLAN; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><code>are hops</code></td>
<td>(Optional) Specifies the maximum number of All Route Explorer hops for this VLAN; valid values are from 0 to 13. Zero is assumed if no value is specified.</td>
</tr>
<tr>
<td><code>backupcrf mode</code></td>
<td>(Optional) Enables or disables the backup CRF mode of the VLAN; valid values are <code>enable</code> and <code>disable</code>.</td>
</tr>
<tr>
<td><code>bridge type</code></td>
<td>(Optional) Specifies the bridging characteristics of the VLAN or identification number of the bridge; valid type values are <code>srb</code> and <code>srt</code>.</td>
</tr>
<tr>
<td><code>bridge_num</code></td>
<td>(Optional) Valid bridge_num values are from 0 to 15.</td>
</tr>
<tr>
<td><code>media type</code></td>
<td>(Optional) Specifies the media type of the VLAN; valid values are <code>fast ethernet</code>, <code>fd-net</code>, <code>fddi</code>, <code>trcrf</code>, and <code>trbfrf</code>.</td>
</tr>
<tr>
<td><code>mtu mtu-size</code></td>
<td>(Optional) Specifies the maximum transmission unit (packet size, in bytes) that the VLAN can use; valid values are from 576 to 18190.</td>
</tr>
<tr>
<td><code>name vlan-name</code></td>
<td>(Optional) Defines a text string used as the name of the VLAN (1 to 32 characters).</td>
</tr>
<tr>
<td><code>parent parent-vlan-id</code></td>
<td>(Optional) Specifies the ID number of the parent VLAN of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.</td>
</tr>
<tr>
<td><code>ring ring-number</code></td>
<td>(Optional) Specifies the ring number of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.</td>
</tr>
<tr>
<td><code>said said-value</code></td>
<td>(Optional) Specifies the security association identifier; valid values are from 1 to 4294967294.</td>
</tr>
<tr>
<td><code>state</code></td>
<td>(Optional) Specifies the state of the VLAN.</td>
</tr>
<tr>
<td><code>suspend</code></td>
<td>Specifies that the state of the VLAN is suspended. VLANs in the suspended state do not pass packets.</td>
</tr>
<tr>
<td><code>active</code></td>
<td>Specifies that the state of the VLAN is active.</td>
</tr>
<tr>
<td><code>stp type type</code></td>
<td>(Optional) Specifies the STP type; valid values are <code>ieee</code>, <code>ibm</code>, and <code>auto</code>.</td>
</tr>
<tr>
<td><code>tb-vlan1 tb-vlan1-id</code></td>
<td>(Optional) Specifies the ID number of the first translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.</td>
</tr>
<tr>
<td><code>tb-vlan2 tb-vlan2-id</code></td>
<td>(Optional) Specifies the ID number of the second translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.</td>
</tr>
</tbody>
</table>
The defaults are as follows:

- The vlan-name is “VLANxxxx” where “xxxx” represents four numeric digits (including leading zeroes) equal to the VLAN ID number.
- The media type is Fast Ethernet.
- The state is active.
- The said-value is 100,000 plus the VLAN ID number.
- The mtu-size default is dependent upon the VLAN type:
  - fddi—1500
  - trcrf—1500 if V2 is not enabled; 4472 if it is enabled
  - fd-net—1500
  - trbrf—1500 if V2 is not enabled; 4472 if it is enabled
- No ring number is specified.
- No bridge number is specified.
- No parent VLAN is specified.
- No STP type is specified.
- No translational bridge VLAN is specified.

### Command Modes

VLAN configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

VLAN 1 parameters are factory configured and cannot be changed.

When you define `vlan-name`, the name must be unique within the administrative domain.

The SAID is documented in 802.10. When the `no` form is used, the VLANs SAID is returned to the default.

When you define the `said-value`, the name must be unique within the administrative domain.

The `bridge bridge-number` argument is used only for Token Ring-net and FDDI-net VLANs and is ignored in other types of VLANs. When the `no` form is used, the VLANs source-route bridging number returns to the default.

The parent VLAN resets to the default if the parent VLAN is deleted or the `media` keyword changes the VLAN type or the VLAN type of the parent VLAN.

The `tb-vlan1` and `tb-vlan2` are used to configure translational bridge VLANs of a specified type of VLAN and are not allowed in other types of VLANs. The translational bridge VLANs must be a different VLAN type than the affected VLAN; if two VLANs are specified, the two must be different VLAN types.

A translational bridge VLAN will reset to the default if the translational bridge VLAN is deleted or the `media` keyword changes the VLAN type or the VLAN type of the corresponding translational bridge VLAN.
Examples

This example shows how to add a new VLAN with all the default parameters to the new VLAN database:

```
Switch(vlan)# vlan 2
```

Note

If the VLAN already exists, no action occurs.

This example shows how to cause the device to add a new VLAN, specify the media type and parent VLAN ID number 3, and set all the other parameters to the defaults:

```
Switch(vlan)# vlan 2 media fastethernet parent 3
VLAN 2 modified:
    Media type FASTETHERNET
    Parent VLAN 3
```

This example shows how to delete VLAN 2:

```
Switch(vlan)# no vlan 2
Switch(vlan)#
```

This example shows how to return the MTU to the default for its type and the translational bridging VLANs to the default:

```
Switch(vlan)# no vlan 2 mtu tb-vlan1 tb-vlan2
Switch(vlan)#
```

<tbody>
<tr>
<td>show vlan</td>
<td>Displays VLAN information.</td>
</tr>
</tbody>
</table>
**vlan access-map**

To enter VLAN access-map command mode to create a VLAN access map, use the `vlan access-map` command. To remove a mapping sequence or the entire map, use the `no` form of this command.

```
vlan access-map name [seq#]
no vlan access-map name [seq#]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>VLAN access-map tag.</td>
</tr>
<tr>
<td>seq#</td>
<td>(Optional) Map sequence number; valid values are from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the sequence number of an existing map sequence, you enter VLAN access-map mode. If you do not specify a sequence number, a number is automatically assigned. You can enter one match clause and one action clause per map sequence. If you enter the `no vlan access-map name [seq#]` command without entering a sequence number, the whole map is removed. Once you enter VLAN access-map mode, the following commands are available:

- **action**—Sets the action to be taken (forward or drop).
- **default**—Returns a command to its default settings.
- **end**—Exits from configuration mode.
- **exit**—Exits from VLAN access-map configuration mode.
- **match**—Sets the values to match (IP address or MAC address).
- **no**—Negates a command or reset its defaults.

**Examples**

This example shows how to enter VLAN access-map mode:

```
Switch(config)# vlan access-map cisco
Switch(config-access-map)#
```
Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match</td>
<td>Specifies a match clause by selecting one or more ACLs for a VLAN access-map sequence.</td>
</tr>
<tr>
<td>show vlan access-map</td>
<td>Displays the contents of a VLAN access map.</td>
</tr>
</tbody>
</table>
**vlan configuration**

To configure a service-policy on a VLAN, use the `vlan configuration` command to enter the VLAN feature configuration mode.

```
 vlan configuration {vlan}
```

**Syntax Description**

- `vlan` Specifies a list of VLANs. “,” “-” operators can be used; such as, 1-10,20.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on Catalyst 4900M and Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Even though an SVI is not needed in all cases, such as when you use your Catalyst 4500 series switch as a pure Layer 2 switch, you are required to create an SVI.

VLAN configuration mode has been introduced to remove the requirement of creating an SVI. With this command you can specify lists of VLANs and the input and output policies that are applied. To configure your system in this mode there is no requirement for you to create SVIs, or create VLAN or VTP mode interactions. Once the VLAN becomes active the configuration becomes active on that VLAN. You can use “-” or “,” extensions to specifying VLAN list.

**Examples**

This example shows how to configure a service policy while in VLAN configuration mode and display the new service policy:

```
Switch# configure terminal
Switch(config)# vlan configuration 30-40
Switch(config-vlan-config)# service-policy input p1
Switch(config-vlan-config)# end
Switch# show running configuration | begin vlan configuration
! vlan configuration 30-40
   service-policy input p1
! vlan internal allocation policy ascending!
! vlan 2-1000
!
Switch#
```
This example shows how to display the new service policy:

```
Switch# show policy-map vlan 30
vlan 30

Service-policy input: p1

Class-map: class-default (match-any)
  0 packets
  Match: any
  0 packets
police:
  rate 128000 bps, burst 4000 bytes
  conformed 0 packets, 0 bytes; action: transmit
  exceeded 0 packets, 0 bytes; action: drop
  conformed 0 bps, exceeded 0 bps
Switch#
```

### Related Commands

</tbody>
</table>
vlan database

To enter VLAN configuration mode, use the vlan database command.

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

From VLAN configuration mode, you can access the VLAN database editing buffer manipulation commands, including:

- **abort**—Exits mode without applying the changes.
- **apply**—Applies the current changes and bumps the revision number.
- **exit**—Applies the changes, bumps the revision number, and exits VLAN configuration mode.
- **no**—Negates a command or sets its defaults; valid values are vlan and vtp.
- **reset**—Abandons the current changes and rereads the current database.
- **show**—Displays the database information.
- **vlan**—Accesses the subcommands to add, delete, or modify values that are associated with a single VLAN. For information about the vlan subcommands, see the vlan (VLAN Database mode) command.
- **vtp**—Accesses the subcommands to perform VTP administrative functions. For information about the vtp subcommands, see the vtp client command.

Examples

This example shows how to enter VLAN configuration mode:

```
Switch# vlan database
Switch(vlan)#
```

This example shows how to exit VLAN configuration mode without applying changes after you are in VLAN configuration mode:

```
Switch(vlan)# abort
Aborting....
Switch#
```
This example shows how to delete a VLAN after you are in VLAN configuration mode:

```bash
Switch(vlan)# no vlan 100
Deleting VLAN 100...
Switch(vlan)#
```

This example shows how to turn off pruning after you are in VLAN configuration mode:

```bash
Switch(vlan)# no vtp pruning
Pruning switched OFF
Switch(vlan)#
```

</tbody>
</table>
**vlan dot1q tag native**

To enable tagging of the native VLAN frames on all 802.1Q trunk ports, use the `vlan dot1q tag native` command. To disable tagging of native VLAN frames, use the `no` form of this command.

```
vlan dot1q tag native
no vlan dot1q tag native
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

802.1Q native VLAN tagging is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabled, the native VLAN packets exiting all 802.1Q trunk ports are tagged unless the port is explicitly configured to disable native VLAN tagging.

When disabled, the native VLAN packets exiting all 802.1Q trunk ports are not tagged.

You can use this command with 802.1Q tunneling. This feature operates on an edge switch of a service-provider network and expands VLAN space by using a VLAN-in-VLAN hierarchy and by tagging the tagged packets. You must use the 802.1Q trunk ports for sending out the packets to the service-provider network. However, the packets going through the core of the service-provider network might also be carried on the 802.1Q trunks. If the native VLANs of an 802.1Q trunk match the native VLAN of a tunneling port on the same switch, the traffic on the native VLAN is not tagged on the sending trunk port. This command ensures that the native VLAN packets on all 802.1Q trunk ports are tagged.

**Examples**

This example shows how to enable 802.1Q tagging on the native VLAN frames and verify the configuration:

```
Switch# config terminal
Switch (config)# vlan dot1q tag native
Switch (config)# end
Switch# show vlan dot1q tag native
dot1q native vlan tagging is enabled
```
<table>

**vlan filter**

To apply a VLAN access map, use the `vlan filter` command. To clear the VLAN access maps from VLANs or interfaces, use the `no` form of this command.

```
vlan filter map-name {vlan-list vlan-list}

no vlan filter map-name {vlan-list [vlan-list]}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>map-name</code></td>
<td>VLAN access-map tag.</td>
</tr>
<tr>
<td><code>vlan-list</code></td>
<td>Specifies the VLAN list; see the “Usage Guidelines” section for valid values.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When configuring an action clause in a VLAN access map, note the following:

- You can apply the VLAN access map to one or more VLANs.
- The `vlan-list` parameter can be a single VLAN ID, a list of VLAN IDs, or VLAN ID ranges (`vlan-id-vlan-id`). Multiple entries are separated by (-), (hyphen), or (,) (comma).
- You can apply only one VLAN access map to each VLAN.

When entering the `no` form of this command, the `vlan-list` parameter is optional (but the keyword `vlan-list` is required). If you do not enter the `vlan-list` parameter, the VACL is removed from all the VLANs where the `map-name` is applied.

**Examples**

This example shows how to apply a VLAN access map on VLANs 7 through 9:

```
Switch(config)# vlan filter ganymede vlan-list 7-9
Switch(config)#
```
### vlan group

To create or modify a VLAN group, use the `vlan group` command in global configuration mode. Use the `no` form of this command to remove a VLAN list from the VLAN group.

```
vlan group group-name vlan-list vlan-list

no vlan group group-name vlan-list vlan-list
```

<table>

**vlan internal allocation policy**

To configure the internal VLAN allocation scheme, use the `vlan internal allocation policy` command. To return to the default setting, use the **no** form of this command.

```
vlan internal allocation policy {ascending | descending}
no vlan internal allocation policy
```

**Syntax Description**

- **ascending** Specifies to allocate internal VLANs from 1006 to 4094.
- **descending** Specifies to allocate internal VLANs from 4094 to 1006.

**Defaults**

The default is the ascending allocation scheme.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure internal VLAN allocation to be from 1006 and up or from 4094 and down.

The internal VLANs and user-configured VLANs share the 1006 to 4094 VLAN spaces. A “first come, first served” policy is used in allocating these spaces.

The `vlan internal allocation policy` command allows you to configure the allocation direction of the internal VLAN.

During system bootup, the internal VLANs that are required for features in the startup-config file are allocated first. The user-configured VLANs in the startup-config file are configured next. If you configure a VLAN that conflicts with an existing internal VLAN, the VLAN that you configured is put into a nonoperational status until the internal VLAN is freed and becomes available.

After you enter the **write mem** command and the system reloads, the reconfigured allocation scheme is used by the port manager.

**Examples**

This example shows how to configure the VLANs in a descending order as the internal VLAN allocation policy:

```
Switch(config)# vlan internal allocation policy descending
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

vmps reconfirm (global configuration)

To change the reconfirmation interval for the VLAN Query Protocol (VQP) client, use the `vmps reconfirm` command. To return to the default setting, use the `no` form of this command.

```
vmps reconfirm interval
no vmps reconfirm
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>Queries to the VLAN Membership Policy Server (VMPS) to reconfirm dynamic VLAN assignments; valid values are from 1 to 120 minutes.</td>
</tr>
</tbody>
</table>

**Defaults**

The reconfirmation interval is 60 minutes.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set the VQP client to reconfirm dynamic VLAN entries every 20 minutes:

```
Switch(config)# vmps reconfirm 20
Switch(config)#
```

You can verify your setting by entering the `show vmps` command and examining information in the Reconfirm Interval row.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vmps</code></td>
<td>Displays the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers.</td>

<td><code>vmps reconfirm (privileged EXEC)</code></td>
<td>Sends VLAN Query Protocol (VQP) queries to reconfirm all the dynamic VLAN assignments with the VLAN Membership Policy Server (VMPS).</td>
</tr>
</tbody>
</table>
**vmps reconfirm (privileged EXEC)**

To immediately send VLAN Query Protocol (VQP) queries to reconfirm all the dynamic VLAN assignments with the VLAN Membership Policy Server (VMPS), use the `vmps reconfirm` command.

```
vmps reconfirm
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can verify your setting by entering the `show vmps` command and examining the VMPS Action row of the Reconfirmation Status section. The `show vmps` command shows the result of the last time that the assignments were reconfirmed either because the reconfirmation timer expired or because the `vmps reconfirm` command was entered.

**Examples**
This example shows how to immediately send VQP queries to the VMPS:

```
Switch# vmps reconfirm
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>Changes the reconfirmation interval for the VLAN Query Protocol (VQP) client.</td>
</tr>
</tbody>
</table>
vmps retry

To configure the per-server retry count for the VLAN Query Protocol (VQP) client, use the `vmps retry` command. To return to the default setting, use the `no` form of this command.

```
vmps retry count
no vmps retry
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>count</code></td>
<td>Number of attempts to contact the VLAN Membership Policy Server (VMPS) by the client before querying the next server in the list; valid values are from 1 to 10.</td>
</tr>
</tbody>
</table>

**Defaults**

The retry count is 3.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can verify your setting by entering the `show vmps` command and examining information in the Server Retry Count row.

**Examples**

This example shows how to set the retry count to 7:

```
Switch(config)# vmps retry 7
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vmps</code></td>
<td>Displays the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers.</td>
</tr>
</tbody>
</table>
vmps server

To configure the primary VLAN Membership Policy Server (VMPS) and up to three secondary servers, use the `vmps server` command. To remove a VMPS server, use the `no` form of this command.

```
vmps server ipaddress [primary]
no vmps server ipaddress
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddress</td>
<td>IP address or host name of the primary or secondary VMPS servers. If you specify a hostname, the Domain Name System (DNS) server must be configured.</td>
</tr>
<tr>
<td>primary</td>
<td>(Optional) Determines whether primary or secondary VMPS servers are being configured.</td>
</tr>
</tbody>
</table>

**Defaults**
No primary or secondary VMPS servers are defined.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(4)EA1</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The first server that you entered is automatically selected as the primary server whether or not `primary` is entered. You can override the first server address by using `primary` in a subsequent command.

If a member switch in a cluster configuration does not have an IP address, the cluster does not use the VMPS server that is configured for that member switch. Instead, the cluster uses the VMPS server on the command switch, and the command switch proxies the VMPS requests. The VMPS server treats the cluster as a single switch and uses the IP address of the command switch to respond to requests.

When using the `no` form without specifying the `ipaddress`, all configured servers are deleted. If you delete all servers when dynamic-access ports are present, the switch cannot forward the packets from the new sources on these ports because it cannot query the VMPS.

You can verify your setting by entering the `show vmps` command and examining information in the VMPS Domain Server row.
This example shows how to configure the server with IP address 191.10.49.20 as the primary VMPS server. The servers with IP addresses 191.10.49.21 and 191.10.49.22 are configured as secondary servers:

```
Switch(config)# vmps server 191.10.49.20 primary
Switch(config)# vmps server 191.10.49.21
Switch(config)# vmps server 191.10.49.22
Switch(config)#
```

This example shows how to delete the server with IP address 191.10.49.21:

```
Switch(config)# no vmps server 191.10.49.21
Switch(config)#
```

### Related Commands

<table>
<thead>

</table>
**vrf (netflow-lite exporter submode)**

To specify a VRF label for the NetFlow-lite collector, use the `vrf` command. To delete a VRF label, use the `no` form of this command.

```
vrf source-address
no vrf source-address
```

**Syntax Description**
- `vrf-label`: Specifies a VRF label for the NetFlow-lite collector.

**Defaults**
- `global vrf`

**Command Modes**
- `netflow-lite exporter submode`

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default when no vrf label is specified the global vrf is used for routing. The vrf label is ignored if the collector’s address is IPv6. Default global routing table is used to route the IPv6 export packets to the collector.

**Note**
Support for VRF with IPv6 will be provided in a later release.

**Examples**

This example shows how to specify a VRF label for the NetFlow-lite collector:

```
Switch# config terminal
Switch(config)# netflow-lite exporter exporter1
Switch(config-netflow-lite-exporter)# destination 5.5.5.6
Switch(config-netflow-lite-exporter)# source 5.5.5.5
Switch(config-netflow-lite-exporter)# transport udp 8188
Switch(config-netflow-lite-exporter)# ttl 128
Switch(config-netflow-lite-exporter)# cos 7
Switch(config-netflow-lite-exporter)# dscp 32
Switch(config-netflow-lite-exporter)# template data timeout 1
Switch(config-netflow-lite-exporter)# options sampler-table timeout 1
Switch(config-netflow-lite-exporter)# options interface-table timeout 1
Switch(config-netflow-lite-exporter)# export-protocol netflow-v9
Switch(config-netflow-lite-exporter)# exit
Switch(config)#
```
Display the exporter
Switch# **show netflow-lite exporter exporter1**
Netflow-lite Exporter exporter1:
   Network Protocol Configuration:
      Destination IP address: 5.5.5.6
      Source IP Address: 5.5.5.5
      VRF label:
      DSCP: 0x20
      TTL: 128
      COS: 7
   Transport Protocol Configuration:
      Transport Protocol: UDP
      Destination Port: 8188
      Source Port: 61670
   Export Protocol Configuration:
      Export Protocol: netflow-v9
      Template data timeout: 60
      Options sampler-table timeout: 1800
      Options interface-table timeout: 1800
   Exporter Statistics:
      Packets Exported: 0

You can verify your settings with the **show netflow-lite exporter** privileged EXEC command.

vtp (global configuration mode)

To modify the name of a VTP configuration storage file, use the `vtp` command. To clear a filename, use the `no` form of this command.

```
vtp {{file filename} | {if-id name}}
no vtp {{file filename} | {if-id name}}
```

**Syntax Description**
- `file filename`: Specifies the IFS file where VTP configuration will be stored.
- `if-id name`: Specifies the name of the interface providing the VTP updater ID for this device, where the `if-id name` is an ASCII string limited to 255 characters.

**Defaults**
Disabled

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You cannot use the `vtp file` command to load a new database. You can use it only to rename the file in which the existing database is stored.

You can use the `vtp if-id` command to specify the name of the interface providing the VTP updater ID for this device. The VTP updater is the device that adds, deletes, or modifies VLANs to a network, and triggers a VTP updater to inform the rest of the system of the changes.

**Examples**

This example shows how to specify the IFS file system file where VTP configuration is stored:

```
Switch(config)# vtp file vtpconfig
Setting device to store VLAN database at filename vtpconfig.
Switch(config)#
```

This example shows how to specify the name of the interface providing the VTP updater ID:

```
Switch(config)# vtp if-id fastethernet
Switch(config)#
```

**Related Commands**

<td><code>show vtp</code></td>
<td>Displays VTP statistics and domain information.</td>
</tr>
</tbody>
</table>
vtp client

To place a device in VTP client mode, use the `vtp client` command. To return to VTP server mode, use the `no` form of this command.

```
vtp client
no vtp client
```

Syntax Description

This command has no arguments or keywords.

Defaults

Disabled

Command Modes

VLAN configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If the receiving switch is in client mode, the client switch changes its configuration to duplicate the configuration of the server. If you have switches in client mode, make sure to make all VTP or VLAN configuration changes on a switch in server mode.

The `vtp server` command is the functional equivalent of `no vtp client` except that it does not return an error if the device is not in client mode.

Examples

This example shows how to place the device in VTP client mode:

```
Switch(vlan-config)# vtp client
Switch(vlan-config)#
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>

<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td>vtp (global configuration mode)</td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
vtp domain

To configure the administrative domain name for a device, use the `vtp domain` command.

```
vtp domain domain-name
```

**Syntax Description**

- `domain-name` Name of the domain.

**Defaults**

This command has no default settings.

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you define the `domain-name`, the domain name is case sensitive and can be from 1 to 32 characters.

You must set a domain name before you can transmit any VTP advertisements.

Even if you do not set a domain name, the device will leave the no-management-domain state upon receiving the first VTP summary packet on any port that is currently trunking.

If the device receives its domain from a summary packet, it resets its configuration revision number to zero. Once the device leaves the no-management-domain state, it can never be configured to reenter the number except by cleaning NVRAM and reloading.

**Examples**

This example shows how to set the devices administrative domain:

```
Switch(vlan-config)# vtp domain DomainChandon
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vtp</code></td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
**vtp password**

To create a VTP domain password, use the `vtp password` command. To delete the password, use the `no vtp password` form of this command.

```
vtp password password-value
no vtp password
```

**Syntax Description**

- `password-value`: An ASCII string, from 1 to 32 characters, identifying the administrative domain for the device.

**Defaults**

Disabled

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to create a VTP domain password:

```
Switch(vlan-config)# vtp password DomainChandon
Switch(vlan-config)#
```

This example shows how to delete the VTP domain password:

```
Switch(vlan-config)# no vtp password
Clearing device VLAN database password.
Switch(vlan-config)#
```

**Related Commands**

<table>
<thead>

</tbody>
</table>
vtp pruning

To enable pruning in the VLAN database, use the `vtp pruning` command. To disable pruning in the VLAN database, use the `no` form of this command.

```
vtp pruning
no vtp pruning
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
VTP pruning causes information about each pruning-eligible VLAN to be removed from VTP updates if there are no stations belonging to that VLAN.

**Examples**
This example shows how to enable pruning in the VLAN database:

```
Switch(vlan-config)# vtp pruning
Pruning switched ON
Switch(vlan-config)#
```

This example shows how to disable pruning in the VLAN database:

```
Switch(vlan-config)# no vtp pruning
Pruning switched OFF
Switch(vlan-config)#
```

**Related Commands**

</tr>
</tbody>
</table>
vtp server

To place the device in VTP server mode, use the vtp server command.

    vtp server

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Enabled

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you make a change to the VTP or VLAN configuration on a switch in server mode, that change is propagated to all the switches in the same VTP domain.

You can set VTP to either server or client mode only when you disable dynamic VLAN creation.

If the receiving switch is in server mode, the configuration is not changed.

The vtp server command is the functional equivalent of no vtp client, except that it does not return an error if the device is not in client mode.

**Examples**

This example shows how to place the device in VTP server mode:

    Switch(vlan-config)# vtp server
    Switch(vlan-config)#

</table>
vtp transparent

To place a device in VTP transparent mode, use the `vtp transparent` command. To return to VTP server mode, use the `no vtp transparent` form of this command.

```
vtp transparent
no vtp transparent
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `vtp transparent` command disables VTP from the domain but does not remove the domain from the switch.

If the receiving switch is in transparent mode, the configuration is not changed. The switches in transparent mode do not participate in VTP. If you make VTP or VLAN configuration changes on a switch in transparent mode, the changes are not propagated to the other switches in the network.

The `vtp server` command is similar to the `no vtp transparent` command, except that it does not return an error if the device is not in transparent mode.

**Examples**
This example shows how to place the device in VTP transparent mode:

```
Switch(vlan-config)# vtp transparent
Switch(vlan-config)#
```

This example shows how to return the device to VTP server mode:

```
Switch(vlan-config)# no vtp transparent
Switch(vlan-config)#
```

</thead>
<tbody>
<tr>
<td><code>show vtp</code></td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
**vtp v2-mode**

To enable version 2 mode, use the `vtp v2-mode` command. To disable version 2 mode, use the `no` form of this command.

```
vtp v2-mode
no vtp v2-mode
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

All switches in a VTP domain must run the same version of VTP. VTP version 1 and VTP version 2 do not operate on switches in the same VTP domain.

If all switches in a domain are VTP version 2-capable, you only need to enable VTP version 2 on one switch; the version number is then propagated to the other version 2-capable switches in the VTP domain.

If you toggle the version 2 mode, the parameters of certain default VLANs will be modified.

**Examples**

This example shows how to enable version 2 mode in the VLAN database:

```
Switch(vlan-config)# vtp v2-mode
Switch(vlan-config)#
```

This example shows how to disable version 2 mode in the VLAN database:

```
Switch(vlan-config)# no vtp v2-mode
Switch(vlan-config)#
```
