Catalyst 4500 Series Switch
Cisco IOS Command Reference

Release IOS-XE 3.2.0 SG
Catalyst 4500 Series IOS Commands

New Commands
- hw-module system max-queue-limit
- ip admission proxy http refresh-all
- port-channel standalone-disable
- power inline four-pair forced
- qos account layer-all encapsulation
- source-interface
- source-ip-address

Revised Commands
- authentication event
- private-vlan
- show interfaces switchport
- show vlan private-vlan

A Commands
- aaa accounting dot1x default start-stop group radius
- aaa accounting system default start-stop group radius
- access-group mode
- access-list hardware capture mode
- access-list hardware entries
- access-list hardware region
- action
- apply
- arp access-list
attach module
authentication control-direction
authentication critical recovery delay
authentication event
authentication fallback
authentication host-mode
authentication open
authentication order
authentication periodic
authentication port-control
authentication priority
authentication timer
auto qos voip
auto-sync

C Commands

call-home (global configuration)
call-home request
call-home send
call-home send alert-group
call-home test
channel-group
channel-protocol
class-map
clear counters
clear errdisable
clear hw-module slot password
clear interface gigabitethernet
clear interface vlan
clear ip access-template
clear ip arp inspection log
clear ip arp inspection statistics
clear ip dhcp snooping binding
clear ip dhcp snooping database
clear ip dhcp snooping database statistics
clear ip igmp group
clear ip mfib counters
clear ip mfib fastdrop
clear lacp counters
clear mac-address-table dynamic
clear pagp
clear port-security
clear qos
clear vlan counters
clear vmps statistics
counter
control-plane

D Commands
debug adjacency
debug backup
debug condition interface
debug condition standby
debug condition vlan
debug dot1x
debug etherchnl
debug interface
debug ip dhcp snooping event
debug ip dhcp snooping packet
debug ip verify source packet
debug ipc
debug lacp
debug monitor
debug nvram
debug pagp
debug platform packet protocol lacp
debug platform packet protocol pagp
debug pm
debug port-security
debug redundancy
debug spanning-tree
debug spanning-tree backbonefast
debug spanning-tree switch
debug spanning-tree uplinkfast
debug sw-vlan
debug sw-vlan ifs
debug sw-vlan notification
debug sw-vlan vtp
debug udld
debug vqpc
define interface-range
deny
diagnostic start
diagnostic monitor action
dot1x auth-fail max-attempts
dot1x auth-fail vlan
dot1x critical
dot1x critical eapol
dot1x critical recovery delay
dot1x critical vlan
dot1x control-direction
dot1x guest-vlan
dot1x guest-vlan supplicant
dot1x host-mode
dot1x initialize
dot1x mac-auth-bypass
dot1x max-reauth-req
dot1x max-req
dot1x port-control
dot1x re-authenticate
dot1x re-authentication
dot1x system-auth-control
dot1x timeout
duplex

**E Commands**
erase
errdisable detect
errdisable recovery
F Commands
flowcontrol

H Commands
hardware statistics
hw-module port-group
hw-module power
hw-module system max-queue-limit
hw-module uplink mode shared-backplane
hw-module uplink select

I Commands
instance
interface
interface port-channel
interface range
interface vlan
ip admission proxy http refresh-all
ip arp inspection filter vlan
ip arp inspection limit (interface)
ip arp inspection log-buffer
ip arp inspection trust
ip arp inspection validate
ip arp inspection vlan
ip arp inspection vlan logging
ip cef load-sharing algorithm
ip dhcp snooping
ip dhcp snooping binding
ip dhcp snooping database
ip dhcp snooping information option
ip dhcp snooping information option allow-untrusted
ip dhcp snooping limit rate
ip dhcp snooping trust
ip dhcp snooping vlan
ip igmp filter
ip igmp max-groups
ip igmp profile
ip igmp query-interval
ip igmp snooping
ip igmp snooping report-suppression
ip igmp snooping vlan
ip igmp snooping vlan explicit-tracking
ip igmp snooping vlan immediate-leave
ip igmp snooping vlan mrouter
ip igmp snooping vlan static
ip local-proxy-arp
ip mfib fastdrop
ip route-cache flow
ip source binding
ip sticky-arp
ip verify header vlan all
ip verify source
ip verify unicast source reachable-via
ipv6 mld snooping
ipv6 mld snooping last-listener-query-count
ipv6 mld snooping last-listener-query-interval
ipv6 mld snooping listener-message-suppression
ipv6 mld snooping robustness-variable
ipv6 mld snooping tcn
ipv6 mld snooping vlan
issu abortversion
issu acceptversion
issu changeversion
issu commitversion
redundancy config-sync mismatched-commands
issu loadversion
issu runversion
issu set rollback-timer

L Commands
l2protocol-tunnel
l2protocol-tunnel cos
l2protocol-tunnel drop-threshold
l2protocol-tunnel shutdown-threshold
lacp port-priority
lacp system-priority
logging event trunk-status (global configuration)
logging event link-status (global configuration)
logging event link-status (interface configuration)
logging event trunk-status (interface configuration)

**M Commands**
match
mac access-list extended
mac-address-table aging-time
mac-address-table dynamic group protocols
mac address-table learning vlan
mac-address-table notification
mac-address-table static
macro apply cisco-desktop
macro apply cisco-phone
macro apply cisco-router
macro apply cisco-switch
macro global apply cisco-global
macro global apply system-cpp
macro global description
macro apply system-cpp
macro global description
main-cpu
match
match flow ip
mdix auto
media-type
mode
monitor session
mtu

**N Commands**
name

**P Commands**
pagp learn-method
pagp port-priority
passive-interface
permit
police
police (percent)
police rate
police (two rates)
policy-map
port-channel load-balance
port-channel standalone-disable
port-security mac-address
port-security mac-address sticky
port-security maximum
power dc input
power efficient-ethernet auto
power inline
power inline consumption
power inline four-pair forced
power inline logging global
power inline police
power redundancy-mode
priority
private-vlan
private-vlan mapping
private-vlan synchronize
profile

Q Commands
qos trust
queue-limit

R Commands
redundancy
redundancy force-switchover
redundancy reload
remote login module
remote-span
renew ip dhcp snooping database
reset
revision

**S Commands**

- service-policy (interface configuration)
- service-policy (policy-map class)
- service-policy input (control-plane)
- session module
- set
- set cos
- set dscp
- set precedence
- set qos-group
- shape (interface configuration)
- snmp ifindex clear
- snmp ifindex persist
- snmp-server enable traps
- snmp-server ifindex persist
- snmp-server ifindex persist compress
- snmp trap mac-notification change
- spanning-tree backbonefast
- spanning-tree bpdufilter
- spanning-tree bpduguard
- spanning-tree cost
- spanning-tree etherchannel guard misconfig
- spanning-tree extend system-id
- spanning-tree guard
- spanning-tree link-type
- spanning-tree loopguard default
- spanning-tree mode
- spanning-tree mst
- spanning-tree mst configuration
- spanning-tree mst forward-time
- spanning-tree mst hello-time
- spanning-tree mst max-age
- spanning-tree mst max-hops
- spanning-tree mst root
spanning-tree pathcost method
spanning-tree portfast (interface configuration mode)
spanning-tree portfast bpdufilter default
spanning-tree portfast bpduguard default
spanning-tree portfast default
spanning-tree port-priority
spanning-tree uplinkfast
spanning-tree vlan
speed
storm-control
storm-control broadcast include multicast
switchport
switchport access vlan
switchport autostate exclude
switchport block
switchport mode
switchport port-security
switchport private-vlan association trunk
switchport private-vlan host-association
switchport private-vlan mapping
switchport private-vlan trunk allowed vlan
switchport private-vlan trunk native vlan tag
switchport trunk
system mtu

**Show Commands**

show access-group mode interface
show adjacency
show arp access-list
show authentication
show auto install status
show auto qos
show bootflash:
show bootvar
show cable-diagnostics tdr
show call-home
show cdp neighbors
show class-map

show vlan
show vlan access-map
show vlan counters
show vlan dot1q tag native
show vlan internal usage
show vlan mtu
show vlan private-vlan
show vlan remote-span
show vmps
show vtp

**T Commands**

test cable-diagnostics tdr
traceroute mac
traceroute mac ip
trust
tx-queue

U Commands
udld (global configuration mode)
udld (interface configuration mode)
udld reset
username
username

V Commands
verify
vlan (VLAN Database mode)
vlan access-map
vlan configuration
vlan database
vlan dot1q tag native
vlan filter
vlan internal allocation policy
vmps reconfirm (global configuration)
vmps reconfirm (privileged EXEC)
vmps retry
vmps server
vtp (global configuration mode)
vtp client
vtp domain
vtp password
vtp pruning
vtp server
vtp transparent
vtp v2-mode

APPENDIX A

Abbreviations A-1

INDEX
Preface

This preface describes the audience, organization, and conventions of this publication, and provides information on how to obtain related documentation.

Audience

This publication is for experienced network administrators who are responsible for configuring and maintaining Catalyst 4500 series switches.

Organization

This publication is organized as follows:

<table>
<thead>
<tr>
<th>Chapter</th>
<th>Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chapter 1</td>
<td>Command-Line Interface</td>
<td>Describes the Catalyst 4500 series switch CLI.</td>
</tr>
<tr>
<td>Chapter 2</td>
<td>Cisco IOS Commands for the Catalyst 4500 Series Switches</td>
<td>Lists all Catalyst 4500 series Cisco IOS commands alphabetically and provides detailed information on each command.</td>
</tr>
<tr>
<td>Appendix A</td>
<td>Abbreviations</td>
<td>Defines the acronyms used in this publication.</td>
</tr>
</tbody>
</table>

Relateded Documentation

The Catalyst 4500 series Cisco IOS documentation set includes these publications:

- Catalyst 4500 Series Switch Installation Guide
- Catalyst 4500 Series Switch Supervisor Engine Installation Note
- Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide
- Catalyst 4500 Series Switch Cisco IOS System Message Guide
- Release Notes for Catalyst 4500 Series Switch Software
Access the Catalyst 4500 Series Switch documentation library at the URL http://www.cisco.com/go/cat4500/docs

Other documents in the Cisco IOS documentation set include:

- Cisco IOS Release 12.2 Configuration Guides
- Cisco IOS Release 12.2 Command References

For information about MIBs, refer to this URL:

**Conventions**

This document uses these conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>boldface font</strong></td>
<td>Boldface text indicates commands and keywords that you enter literally as shown.</td>
</tr>
<tr>
<td><em>italic font</em></td>
<td><em>Italic</em> text indicates arguments for which you supply values.</td>
</tr>
<tr>
<td>[x]</td>
<td>Square brackets enclose an optional element (keyword or argument).</td>
</tr>
<tr>
<td>l</td>
<td>A vertical line indicates a choice within an optional or required set of keywords or arguments.</td>
</tr>
<tr>
<td>[x</td>
<td>y]</td>
</tr>
<tr>
<td>{x</td>
<td>y}</td>
</tr>
<tr>
<td>[x {y</td>
<td>z}]</td>
</tr>
<tr>
<td>string</td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
<tr>
<td><strong>screen font</strong></td>
<td>Terminal sessions and information the system displays are in <strong>screen font</strong>.</td>
</tr>
<tr>
<td><strong>boldface screen font</strong></td>
<td>Information you must enter is in <strong>boldface screen font</strong>.</td>
</tr>
<tr>
<td><em>italic screen font</em></td>
<td>Arguments for which you supply values are in <em>italic screen font</em>.</td>
</tr>
<tr>
<td>^</td>
<td>The symbol ^ represents the key labeled Control—for example, the key combination ^D in a screen display means hold down the Control key while you press the D key.</td>
</tr>
<tr>
<td>&lt; &gt;</td>
<td>Nonprinting characters, such as passwords, are in angle brackets.</td>
</tr>
<tr>
<td>Convention</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>[ ]</td>
<td>Default responses to system prompts are in square brackets.</td>
</tr>
<tr>
<td>!, #</td>
<td>An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.</td>
</tr>
</tbody>
</table>

Notes use this convention:

Note

Means reader take note. Notes contain helpful suggestions or references to material not covered in the publication.

Cautions use this convention:

Caution

Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

Notices

The following notices pertain to this software license.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly What’s New in Cisco Product Documentation, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the What’s New in Cisco Product Documentation as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.
This chapter provides information for understanding and using the Cisco IOS command-line interface (CLI) on the Catalyst 4500 series switch. This chapter includes the following sections:

- Getting Help, page 1-1
- How to Find Command Options, page 1-2
- Understanding Command Modes, page 1-5
- Using the No and Default Forms of Commands, page 1-6
- Using the CLI String Search, page 1-6
- Saving Configuration Changes, page 1-11

For an overview of the Catalyst 4500 series switch Cisco IOS configuration, refer to the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide.

### Getting Help

To display a list of commands that you can use within a command mode, enter a question mark (?) at the system prompt. You also can display keywords and arguments for each command with this context-sensitive help feature.

Table 1-1 lists commands you can enter to get help that is specific to a command mode, a command, a keyword, or an argument.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>abbreviated-command-entry?</td>
<td>Displays a list of commands that begin with a particular character string. (Do not leave a space between the command and question mark.)</td>
</tr>
<tr>
<td>abbreviated-command-entry&lt;Tab&gt;</td>
<td>Completes a partial command name.</td>
</tr>
<tr>
<td>?</td>
<td>Lists all commands for the command mode.</td>
</tr>
<tr>
<td>command ?</td>
<td>Lists all keywords for the command. Leave a space between the command and the question mark.</td>
</tr>
<tr>
<td>command keyword ?</td>
<td>Lists all arguments for the keyword. Leave a space between the keyword and the question mark.</td>
</tr>
</tbody>
</table>
How to Find Command Options

This section provides an example of how to display syntax for a command. The syntax can consist of optional or required keywords. To display keywords for a command, enter a question mark (\?) at the command prompt or after entering part of a command followed by a space. The Catalyst 4500 series switch software displays a list of available keywords along with a brief description of the keywords. For example, if you are in global configuration mode and want to see all the keywords for the arap command, you enter arap ?.

Table 1-2 shows examples of how you can use the question mark (\?) to assist you in entering commands and also guides you through entering the following commands:

- interface gigabitethernet 1/1
- channel-group 1 mode auto

Table 1-2  How to Find Command Options

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch> enable Password: <password> Switch# | Enter the enable command and password to access privileged EXEC commands. You are in privileged EXEC mode when the prompt changes to Switch#.
| Switch# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Switch(config)# | Enter global configuration mode. You are in global configuration mode when the prompt changes to Switch(config)#.
| Switch(config)# interface gigabitethernet ? <1-9> GigabitEthernet interface number | Enter interface configuration mode by specifying the Gigabit Ethernet interface that you want to configure using the interface gigabitethernet global configuration command. Enter a ? to display what you must enter next on the command line. In this example, you must enter an interface number from 1 to 9 in the format module-number/port-number. You are in interface configuration mode when the prompt changes to Switch(config-if)#. |
| Switch(config)# interface gigabitethernet 1/1 Switch(config-if)# | 

### How to Find Command Options

**Switch(config-if)##**

**Interface configuration commands:**  
- access-expression  
- apollo  
- appletalk  
- arp  
- backup  
- bandwidth  
- bgp-policy  
- bridge-group  
- carrier-delay  
- cdp  
- channel-group  
- clns  
- cmns  
- custom-queue-list  
- decnet  
- default  
- delay  
- description  
- dlsw  
- dspu  
- exit  
- fair-queue  
- flowcontrol  
- fras  
- help  
- hold-queue  
- ip  
- iso-igrp  

**Switch(config-if)#**

Enter a ? to display a list of all the interface configuration commands available for the Gigabit Ethernet interface.

**Switch(config-if)# channel-group ?**

- group  

Enter the command that you want to configure for the controller. In this example, the channel-group command is used.

Enter a ? to display what you must enter next on the command line. In this example, you must enter the group keyword.

Because a <cr> is not displayed, it indicates that you must enter more information to complete the command.

---

**Table 1-2  How to Find Command Options (continued)**

<table>
<thead>

<td>- hold-queue: Set hold queue depth</td>
</tr>
<tr>
<td></td>
<td>- ip: Interface Internet Protocol config commands</td>
</tr>
<tr>
<td></td>
<td>- iso-igrp: ISO-IGRP interface subcommands</td>
</tr>
</tbody>
</table>

**Switch(config-if)#**

Enter a ? to display a list of all the interface configuration commands available for the Gigabit Ethernet interface.
### How to Find Command Options (continued)

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-if)# `channel-group` ?  
  <1-256> Channel group number | After you enter the `group` keyword, enter a `?` to display what you must enter next on the command line. In this example, you must enter a channel group number from 1 to 256. Because a `<cr>` is not displayed, it indicates that you must enter more information to complete the command. |

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# <code>channel-group</code></td>
<td></td>
</tr>
<tr>
<td>mode Etherchannel Mode of the interface</td>
<td>After you enter the channel group number, enter a <code>?</code> to display what you must enter next on the command line. In this example, you must enter the <code>mode</code> keyword. Because a <code>&lt;cr&gt;</code> is not displayed, it indicates that you must enter more information to complete the command.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-if)# `channel-group` mode ?  
  auto Enable PAgP only if a PAgP device is detected  
  desirable Enable PAgP unconditionally  
  on Enable Etherchannel only | After you enter the `mode` keyword, enter a `?` to display what you must enter next on the command line. In this example, you must enter the `auto`, `desirable`, or `on` keyword. Because a `<cr>` is not displayed, it indicates that you must enter more information to complete the command. |

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Switch(config-if)# `channel-group` mode auto ?  
  `<cr>` | In this example, the `auto` keyword is entered. After you enter the `auto` keyword, enter a `?` to display what you must enter next on the command line. Because a `<cr>` is displayed, it indicates that you can press Return to complete the command. If additional keywords are listed, you can enter more keywords or press Return to complete the command. |

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch(config-if)# <code>channel-group</code> mode auto</td>
<td>In this example, press Return to complete the command.</td>
</tr>
</tbody>
</table>
Understanding Command Modes

The Cisco IOS user interface on the Catalyst 4500 series switch has many different modes. The commands that are available to you depend on which mode you are currently in. You can obtain a list of commands available for each command mode by entering a question mark (?) at the system prompt.

When you start a session on the Catalyst 4500 series switch, you begin in user mode, often called EXEC mode. Only a limited subset of the commands are available in EXEC mode. In order to have access to all commands, you must enter privileged EXEC mode. Normally, you must enter a password to enter privileged EXEC mode. From privileged EXEC mode, you can enter any EXEC command or enter global configuration mode. Most EXEC commands are one-time commands, such as `show` commands, which show the current status of a given item, and `clear` commands, which clear counters or interfaces. The EXEC commands are not saved across reboots of the Catalyst 4500 series switch.

The configuration modes provide a way for you to make changes to the running configuration. When you save changes to the configuration, the changes remain intact when the Catalyst 4500 series switch reboots. From global configuration mode, you can enter interface configuration mode, subinterface configuration mode, and other protocol-specific modes.

ROM-monitor mode is a separate mode used when the Catalyst 4500 series switch cannot boot properly. If your Catalyst 4500 series switch or access server does not find a valid system image when it is booting, or if its configuration file is corrupted at startup, the system might enter ROM-monitor mode.

Table 1-3 provides a summary of the main command modes.

<table>
<thead>
<tr>
<th>Command Mode</th>
<th>Access Method</th>
<th>Prompt</th>
<th>Exit Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>User EXEC mode</td>
<td>Log in.</td>
<td>Switch&gt;</td>
<td>Use the <code>logout</code> command.</td>
</tr>
<tr>
<td>Privileged EXEC mode</td>
<td>From user EXEC mode, enter the <code>enable</code> EXEC command.</td>
<td>Switch#</td>
<td>To exit to user EXEC mode, enter the <code>disable</code> command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To enter global configuration mode, enter the <code>configure terminal</code> privileged EXEC command.</td>
</tr>
<tr>
<td>Global configuration mode</td>
<td>From privileged EXEC mode, enter the <code>configure terminal</code> privileged EXEC command.</td>
<td>Switch(config)#</td>
<td>To exit to privileged EXEC mode, enter the <code>exit</code> or <code>end</code> command or press Ctrl-Z.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To enter interface configuration mode, enter an <code>interface</code> configuration command.</td>
</tr>
<tr>
<td>Interface configuration mode</td>
<td>From global configuration mode, enter by specifying an interface with an <code>interface</code> command.</td>
<td>Switch(config-if)#</td>
<td>To exit to global configuration mode, enter the <code>exit</code> command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To exit to privileged EXEC mode, enter the <code>exit</code> command or press Ctrl-Z.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>To enter subinterface configuration mode, specify a subinterface with the <code>interface</code> command.</td>
</tr>
</tbody>
</table>
Using the No and Default Forms of Commands

Almost every configuration command has a no form. In general, enter the no form to disable a function. Use the command without the keyword no to reenable a disabled function or to enable a function that is disabled by default. For example, IP routing is enabled by default. To disable IP routing, specify the no ip routing command and specify ip routing to reenable it. This publication provides the complete syntax for the configuration commands and describes what the no form of a command does.

Some configuration commands have a default form. The default form of a command returns the command setting to its default settings. Most commands are disabled by default, so the default form is the same as the no form. However, some commands are enabled by default, with variables set to certain default values. In these cases, the default form of the command enables the command and returns its variables to their default values.

Using the CLI String Search

The pattern in the command output is referred to as a string. The CLI string search feature allows you to search or filter any show or more command output and allows you to search and filter at --More-- prompts. This feature is useful when you need to sort through large amounts of output, or if you want to exclude output that you do not need to see.

With the search function, you can begin unfiltered output at the first line that contains a regular expression you specify. You can then specify a maximum of one filter per command or start a new search from the --More-- prompt.

A regular expression is a pattern (a phrase, number, or more complex pattern) software uses to match against show or more command output. Regular expressions are case sensitive and allow for complex matching requirements. Examples of simple regular expressions are Serial, misses, and 138. Examples of complex regular expressions are 00210..., ( is ), and [Oo]utput.
You can perform three types of filtering:

- Use the **begin** keyword to begin output with the line that contains a specified regular expression.
- Use the **include** keyword to include output lines that contain a specified regular expression.
- Use the **exclude** keyword to exclude output lines that contain a specified regular expression.

You can then search this filtered output at the --More-- prompts.

**Note**

The CLI string search function does not allow you to search or filter backward through previous output; filtering cannot be specified using HTTP access to the CLI.

---

## Regular Expressions

A regular expression can be a single character that matches the same single character in the command output or multiple characters that match the same multiple characters in the command output. This section describes how to create both single-character patterns and multiple-character patterns and how to create more complex regular expressions using multipliers, alternation, anchoring, and parentheses.

---

### Single-Character Patterns

The simplest regular expression is a single character that matches the same single character in the command output. You can use any letter (A-Z, a-z) or digit (0-9) as a single-character pattern. You can also use other keyboard characters (such as ! or ~) as single-character patterns, but certain keyboard characters have special meaning when used in regular expressions. Table 1-4 lists the keyboard characters that have special meaning.

**Table 1-4 Characters with Special Meaning**

<table>
<thead>
<tr>
<th>Character</th>
<th>Special Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any single character, including white space.</td>
</tr>
<tr>
<td>*</td>
<td>Matches 0 or more sequences of the pattern.</td>
</tr>
<tr>
<td>+</td>
<td>Matches 1 or more sequences of the pattern.</td>
</tr>
<tr>
<td>?</td>
<td>Matches 0 or 1 occurrences of the pattern.</td>
</tr>
<tr>
<td>^</td>
<td>Matches the beginning of the string.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of the string.</td>
</tr>
<tr>
<td>_ (underscore)</td>
<td>Matches a comma (,), left brace ({), right brace (}), left parenthesis ( ( ), right parenthesis ( ) ), the beginning of the string, the end of the string, or a space.</td>
</tr>
</tbody>
</table>

To enter these special characters as single-character patterns, remove the special meaning by preceding each character with a backslash (\). These examples are single-character patterns matching a dollar sign, an underscore, and a plus sign, respectively.

\$ \_ \+
You can specify a range of single-character patterns to match against command output. For example, you can create a regular expression that matches a string containing one of the following letters: a, e, i, o, or u. One and only one of these characters must exist in the string for pattern matching to succeed. To specify a range of single-character patterns, enclose the single-character patterns in square brackets (\[ \]). For example,

\[aeiou\]

matches any one of the five vowels of the lowercase alphabet, while

\[abcdABCD\]

matches any one of the first four letters of the lower- or uppercase alphabet.

You can simplify ranges by entering only the end points of the range separated by a dash (-). Simplify the previous range as follows:

\[a-dA-D\]

To add a dash as a single-character pattern in your range, include another dash and precede it with a backslash:

\[a-dA-D\-\]

You can also include a right square bracket (\]) as a single-character pattern in your range. To do so, enter the following:

\[a-dA-D\]\]

The previous example matches any one of the first four letters of the lower- or uppercase alphabet, a dash, or a right square bracket.

You can reverse the matching of the range by including a caret (^) at the start of the range. This example matches any letter except the ones listed:

\[^a-dqsv\]

This example matches anything except a right square bracket (\]) or the letter d:

\[^\]d\]

**Multiple-Character Patterns**

When creating regular expressions, you can also specify a pattern containing multiple characters. You create multiple-character regular expressions by joining letters, digits, or keyboard characters that do not have special meaning. For example, a4% is a multiple-character regular expression. Put a backslash in front of the keyboard characters that have special meaning when you want to remove their special meaning.

With multiple-character patterns, order is important. The regular expression a4% matches the character a followed by a 4 followed by a % sign. If the string does not have a4%, in that order, pattern matching fails. This multiple-character regular expression:

\a.

uses the special meaning of the period character to match the letter a followed by any single character. With this example, the strings ab, a!, or a2 are all valid matches for the regular expression.

You can remove the special meaning of the period character by putting a backslash in front of it. In the following expression:

\a\.

only the string a. matches this regular expression.
You can create a multiple-character regular expression containing all letters, all digits, all keyboard characters, or a combination of letters, digits, and other keyboard characters. These examples are all valid regular expressions:

**telebit 3107 v32bis**

### Multipliers

You can create more complex regular expressions to match multiple occurrences of a specified regular expression by using some special characters with your single- and multiple-character patterns. Table 1-5 lists the special characters that specify “multiples” of a regular expression.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>Matches 0 or more single- or multiple-character patterns.</td>
</tr>
<tr>
<td>+</td>
<td>Matches 1 or more single- or multiple-character patterns.</td>
</tr>
<tr>
<td>?</td>
<td>Matches 0 or 1 occurrences of the single- or multiple-character patterns.</td>
</tr>
</tbody>
</table>

This example matches any number of occurrences of the letter a, including none:

**a***

This pattern requires that at least one letter a in the string is matched:

**a+**

This pattern matches the string bb or bab:

**ba?b**

This string matches any number of asterisks (*):

**\**

To use multipliers with multiple-character patterns, you enclose the pattern in parentheses. In the following example, the pattern matches any number of the multiple-character string ab:

**(ab)***

As a more complex example, this pattern matches one or more instances of alphanumeric pairs (but not none; that is, an empty string is not a match):

**\[(A-Za-z][0-9])\+**

The order for matches using multipliers (*, +, or ?) is to put the longest construct first. Nested constructs are matched from outside to inside. Concatenated constructs are matched beginning at the left side of the construct. Thus, the regular expression matches A9b3, but not 9Ab3 because the letters are specified before the numbers.
Alternation

Alternation allows you to specify alternative patterns to match against a string. You separate the alternative patterns with a vertical bar (|). Exactly one of the alternatives can match the string. For example, the regular expression

\texttt{codex | telebit}

matches the string codex or the string telebit, but not both codex and telebit.

Anchoring

You can match a regular expression pattern against the beginning or the end of the string. That is, you can specify that the beginning or end of a string contains a specific pattern. You “anchor” these regular expressions to a portion of the string using the special characters shown in Table 1-6.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>^</td>
<td>Matches the beginning of the string.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of the string.</td>
</tr>
</tbody>
</table>

This regular expression matches a string only if the string starts with abcd:

\texttt{^abcd}

In contrast, this expression is in a range that matches any single letter, as long as it is not the letters a, b, c, or d:

\texttt{[^abcd]}

With this example, the regular expression matches a string that ends with .12:

\texttt{$\.12}

Contrast these anchoring characters with the special character underscore (_). The underscore matches the beginning of a string (^), the end of a string ($), parentheses ( ), space ( ), braces { }, comma (,), or underscore (_). With the underscore character, you can specify that a pattern exist anywhere in the string. For example:

\texttt{_1300_}

matches any string that has 1300 somewhere in the string. The string’s 1300 can be preceded by or end with a space, brace, comma, or underscore. For example:

\texttt{\{1300_}

matches the regular expression, but 21300 and 13000 do not.

Using the underscore character, you can replace long regular expression lists, such as the following:

\texttt{^1300$ ^1300(space) (space)1300 \{1300, ,1300, \{1300},1300, (1300}

with

\texttt{_1300_}
Parentheses for Recall

As shown in the “Multipliers” section on page 1-9, you use parentheses with multiple-character regular expressions to multiply the occurrence of a pattern. You can also use parentheses around a single- or multiple-character pattern to remember a pattern for use elsewhere in the regular expression.

To create a regular expression that recalls a previous pattern, you use parentheses to indicate a remembered specific pattern and a backslash (\) followed by an integer to reuse the remembered pattern. The integer specifies the occurrence of the parentheses in the regular expression pattern. If you have more than one remembered pattern in your regular expression, then \1 indicates the first remembered pattern, \2 indicates the second remembered pattern, and so on.

This regular expression uses parentheses for recall:

\(a(.)bc(.)\1\2\)

This regular expression matches an \(a\) followed by any character (call it character 1), followed by bc followed by any character (character 2), followed by character 1 again, followed by character 2 again. So, the regular expression can match aZbcTZT. The software remembers that character 1 is Z and character 2 is T and then uses Z and T again later in the regular expression.

Saving Configuration Changes

To save your configuration changes to your startup configuration so that they will not be lost if there is a system reload or power outage, enter the following command:

Switch# copy system:running-config nvram:startup-config
Building configuration...

It might take a minute or two to save the configuration. After the configuration has been saved, the following output appears:

[OK]
Switch#

On most platforms, this step saves the configuration to NVRAM. On the Class A Flash file system platforms, this step saves the configuration to the location specified by the CONFIG_FILE environment variable. The CONFIG_FILE environment variable defaults to NVRAM.

show platform Commands

You should use these commands only when you are working directly with your technical support representative, while troubleshooting a problem. Do not use these commands unless your technical support representative asks you to do so.

Note

The show platform commands are not described in this document.
Cisco IOS Commands for the Catalyst 4500 Series Switches

This chapter contains an alphabetical listing of Cisco IOS commands for the Catalyst 4500 series switches. For information about Cisco IOS commands that are not included in this publication, refer to Cisco IOS Release 12.2 configuration guides and command references at this URL:

#macro keywords

To specify the help string for the macro keywords, use the `#macro keywords` command.

```
macro keywords [keyword1] [keyword2] [keyword3]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyword 1</td>
<td>(Optional) Specifies a keyword that is needed while applying a macro to an</td>
</tr>
<tr>
<td></td>
<td>interface.</td>
</tr>
<tr>
<td>keyword 2</td>
<td>(Optional) Specifies a keyword that is needed while applying a macro to an</td>
</tr>
<tr>
<td></td>
<td>interface.</td>
</tr>
<tr>
<td>keyword 3</td>
<td>(Optional) Specifies a keyword that is needed while applying a macro to an</td>
</tr>
<tr>
<td></td>
<td>interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify the mandatory keywords for a macro, the macro is to be considered invalid and fails when you attempt to apply it. By entering the `#macro keywords` command, you will receive a message indicating what you need to include to make the syntax valid.

**Examples**

This example shows how to specify the help string for keywords associated with a macro named test:

```
Switch(config)# macro name test
macro name test
Enter macro commands one per line. End with the character '@'.
#macro keywords $VLAN $MAX
switchport
@

Switch(config)# int gi1/1
Switch(config-if)# macro apply test ?
  WORD Keyword to replace with a value e.g $VLAN, $MAX  << It is shown as help
```

<cr>
<table>

</tr>
</tbody>
</table>
aaa accounting dot1x default start-stop group radius

To enable accounting for 802.1X authentication sessions, use the `aaa accounting dot1x default start-stop group radius` command. To disable accounting, use the `no` form of this command.

```
aaa accounting dot1x default start-stop group radius

no aaa accounting dot1x default start-stop group radius
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Accounting is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
802.1X accounting requires a RADIUS server.

This command enables the Authentication, Authorization, and Accounting (AAA) client’s accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

**Examples**
This example shows how to configure 802.1X accounting:

```
Switch(config)# aaa accounting dot1x default start-stop group radius
```

**Note**
The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tbody>
<tr>
<td>aaa accounting system default start-stop group radius</td>
<td>Receives the session termination messages after the switch reboots.</td>
</tr>
</tbody>
</table>
aaa accounting system default start-stop group radius

To receive the session termination messages after the switch reboots, use the `aaa accounting system default start-stop group radius` command. To disable accounting, use the `no` form of this command.

```
aaa accounting system default start-stop group radius
no aaa accounting system default start-stop group radius
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Accounting is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
802.1X accounting requires the RADIUS server.

This command enables the AAA client’s accounting feature to forward 802.1X update and watchdog packets from the 802.1X supplicant (workstation client) to the authentication (RADIUS) server. (Watchdog packets are defined as EAPOL-LOGON, EAPOL-LOGOFF, and EAPOL-INTERIM messages.) Successful authentication and authorization of the supplicant by the authentication server is required before these packets are considered valid and are forwarded. When the client is reauthenticated, an interim-update accounting notice is sent to the accounting server.

**Examples**
This example shows how to generate a logoff after a switch reboots:

```
Switch(config)# aaa accounting system default start-stop group radius
```

**Note**
The RADIUS authentication server must be properly configured to accept and log update or watchdog packets from the AAA client.

**Related Commands**

<table>

</table>
access-group mode

To specify the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode), use the access-group mode command. To return to preferred port mode, use the no form of this command.

```
access-group mode {prefer {port | vlan} | merge}
```

```
no access-group mode {prefer {port | vlan} | merge}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefer port</td>
<td>Specifies that the PACL mode take precedence if PACLs are configured. If no PACL features are configured on the port, other features applicable to the interface are merged and applied on the interface.</td>
</tr>
<tr>
<td>prefer vlan</td>
<td>Specifies that the VLAN-based ACL mode take precedence. If no VLAN-based ACL features are configured on the port’s VLAN, the PACL features on the port are applied.</td>
</tr>
<tr>
<td>merge</td>
<td>Merges applicable ACL features before they are programmed into the hardware.</td>
</tr>
</tbody>
</table>

### Defaults

PACL override mode

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

On the Layer 2 interface, prefer port, prefer VLAN, and merge modes are supported. A Layer 2 interface can have one IP ACL applied in either direction (one inbound and one outbound).

### Examples

This example shows how to make the PACL mode on the switch take effect:

```
(config-if)# access-group mode prefer port
```

This example shows how to merge applicable ACL features:

```
(config-if)# access-group mode merge
```
<table>
<thead>

</table>
access-list hardware capture mode

To select the mode of capturing control packets, use the **access-list hardware capture mode** command.

```
access-list hardware capture mode {global | vlan}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>global</td>
<td>Specifies the capture of control packets globally on all VLANs.</td>
</tr>
<tr>
<td>vlan</td>
<td>Specifies the capture of control packets on a specific VLAN.</td>
</tr>
</tbody>
</table>

### Defaults

The control packets are globally captured.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on Supervisor Engine 6-E and the Catalyst 4900M chassis.

Before configuring the capture mode, it is best to examine and modify your configuration to globally disable features such as DHCP snooping or IGMP snooping, and instead enable them on specific VLANs.

When changing to path managed mode, be aware that control traffic may be bridged in hardware or dropped initially until the per-vlan CAM entries are programmed in hardware.

You must ensure that any access control configuration on a member port or VLAN does not deny or drop the control packets from being forwarded to the CPU for the features which are enabled on the VLAN. If control packets are not permitted then the specific feature does not function.

### Examples

This example shows how to configure the switch to capture control packets on VLANs that are configured to enable capturing control packets:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode vlan
Switch(config)# end
Switch#
```

This example shows how to configure the switch to capture control packets globally across all VLANs (using a static ACL):

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode global
Switch(config)# end
Switch#
```
This example shows another way to configure the switch to capture control packets globally across all VLANs:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no access-list hardware capture mode vlan
Switch(config)# end
Switch#
access-list hardware entries

To designate how ACLs are programmed into the switch hardware, use the **access-list hardware entries** command.

```
access-list hardware entries {packed | scattered}
```

**Syntax Description**

- **packed**: Directs the software to use the first entry with a matching mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.
- **scattered**: Directs the software to use the first entry with a free mask when selecting an entry from the ACL TCAM for programming the ACEs in an ACL.

**Defaults**

The ACLs are programmed as packed.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Two types of hardware resources are used when ACLs are programmed: entries and masks. If one of these resources is consumed, no additional ACLs can be programmed into the hardware. If the masks are consumed, but the entries are available, change the programming algorithm from **packed** to **scattered** to make the masks available. This action allows additional ACLs to be programmed into the hardware.

The goal is to use TCAM resources more efficiently; that is, to minimize the number of masks per ACL entries. To compare TCAM utilization when using the **scattered** or **packed** algorithms, use the `show platform hardware acl statistics utilization brief` command. To change the algorithm from **packed** to **scattered**, use the **access-list hardware entries** command.

**Examples**

This example shows how to program ACLs into the hardware as packed. After they are programmed, you will need 89 percent of the masks to program only 49 percent of the ACL entries.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries packed
Switch(config)# end
Switch# 01:15:34: %SYS-5-CONFIG_I: Configured from console by console
Switch#
Switch# show platform hardware acl statistics utilization brief
Entries/Total(%)  Masks/Total(%)  
---------  -------------  -------------  
Input  Acl(PortAndVlan)  2016 / 4096 (49)  460 / 512 (89)  
Input  Acl(PortOrVlan)   6 / 4096 (0)  4 / 512 (0)  
Input  Qos(PortAndVlan)  0 / 4096 (0)  0 / 512 (0)  
Input  Qos(PortOrVlan)   0 / 4096 (0)  0 / 512 (0)  
```
This example shows how to reserve space (scatter) between ACL entries in the hardware. The number of masks required to program 49 percent of the entries has decreased to 49 percent.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries scattered
Switch(config)# end
Switch# 01:39:37: %SYS-5-CONFIG_I: Configured from console by console
Switch# Switch(config)# show platform hardware acl statistics utilization brief
Entries/Total(%)  Masks/Total(%)
-----------------  ---------------
Input  Acl(PortAndVlan)  2016 / 4096 ( 49)   252 /  512 ( 49)
Input  Acl(PortOrVlan)    6 / 4096 (  0)     5 /  512 (  0)
Input  Qos(PortAndVlan)   0 / 4096 (  0)     0 /  512 (  0)
Input  Qos(PortOrVlan)    0 / 4096 (  0)     0 /  512 (  0)
Output Acl(PortAndVlan)   0 / 4096 (  0)     0 /  512 (  0)
Output Acl(PortOrVlan)    0 / 4096 (  0)     0 /  512 (  0)
Output Qos(PortAndVlan)   0 / 4096 (  0)     0 /  512 (  0)
Output Qos(PortOrVlan)    0 / 4096 (  0)     0 /  512 (  0)
L4Ops: used 2 out of 64
Switch#
```
access-list hardware region

To modify the balance between TCAM regions in hardware, use the `access-list hardware region` command.

```
access-list hardware region {feature | qos} {input | output} balance {bal-num}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature</td>
<td>Specifies adjustment of region balance for ACLs.</td>
</tr>
<tr>
<td>qos</td>
<td>Specifies adjustment of region balance for QoS.</td>
</tr>
<tr>
<td>input</td>
<td>Specifies adjustment of region balance for input ACL and QoS.</td>
</tr>
<tr>
<td>output</td>
<td>Specifies adjustment of region balance for output ACL and QoS.</td>
</tr>
<tr>
<td>balance bal-num</td>
<td>Specifies relative sizes of the PandV and PorV regions in the TCAM; valid values are between 1 and 99.</td>
</tr>
</tbody>
</table>

**Defaults**

The default region balance for each TCAM is 50.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

PandV is a TCAM region containing entries which mask in both the port and VLAN tag portions of the flow label.

PorV is a TCAM region containing entries which mask in either the port or VLAN tag portion of the flow label, but not both.

A balance of 1 allocates the minimum number of PandV region entries and the maximum number of PorV region entries. A balance of 99 allocates the maximum number of PandV region entries and the minimum number of PorV region entries. A balance of 50 allocates equal numbers of PandV and PorV region entries in the specified TCAM.

Balances for the four TCAMs can be modified independently.

**Examples**

This example shows how to enable the MAC notification trap when a MAC address is added to a port:

```
Switch# configure terminal
Switch(config)# access-list hardware region feature input balance 75
Switch(config)#
```
action

To specify an action to be taken when a match occurs in a VACL, use the `action` command. To remove an action clause, use the `no` form of this command.

```
action {drop | forward}

no action {drop | forward}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>drop</td>
<td>Sets the action to drop packets.</td>
</tr>
<tr>
<td>forward</td>
<td>Sets the action to forward packets to their destination.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

VLAN access-map mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In a VLAN access map, if at least one ACL is configured for a packet type (IP or MAC), the default action for the packet type is `drop` (deny).

If an ACL is not configured for a packet type, the default action for the packet type is `forward` (permit).

If an ACL for a packet type is configured and the ACL is empty or undefined, the configured action will be applied to the packet type.

**Examples**

This example shows how to define a drop action:

```
Switch(config-access-map)# action drop
Switch(config-access-map)#
```

This example shows how to define a forward action:

```
Switch(config-access-map)# action forward
Switch(config-access-map)#
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match</td>
<td>Specifies a match clause by selecting one or more ACLs for a VLAN access-map sequence.</td>
</tr>
<tr>
<td>show vlan access-map</td>
<td>Displays the contents of a VLAN access map.</td>
</tr>
<tr>
<td>vlan access-map</td>
<td>Enters VLAN access-map command mode to create a VLAN access map.</td>
</tr>
</tbody>
</table>
active

To enable the destination profile, use the **active** command.

```
active
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default the profile is enabled upon creation.

**Examples**

This example shows how to enable the destination profile:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# active
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination address</td>
<td>Configures the destination e-mail address or URL to which Call Home messages will be sent.</td>
</tr>
<tr>
<td>destination message-size-limit bytes</td>
<td>Configures a maximum destination message size for the destination profile.</td>
</tr>
<tr>
<td>destination preferred-msg-format</td>
<td>Configures a preferred message format.</td>

<tr>
<td>destination transport-method</td>
<td>Enables the message transport method.</td>
</tr>
</tbody>
</table>
To implement a new VLAN database, increment the configuration number, save the configuration number in NVRAM, and propagate the configuration number throughout the administrative domain, use the `apply` command.

```plaintext
apply
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `apply` command implements the configuration changes that you made after you entered VLAN database mode and uses them for the running configuration. This command keeps you in VLAN database mode.

You cannot use this command when the switch is in the VTP client mode.

You can verify that the VLAN database changes occurred by entering the `show vlan` command from privileged EXEC mode.

**Examples**

This example shows how to implement the proposed new VLAN database and to recognize it as the current database:

```plaintext
Switch(config-vlan)# apply
Switch(config-vlan)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exit</code> (refer to Cisco IOS documentation)</td>
<td>Closes an active terminal session by logging off the switch.</td>
</tr>

<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Modifies the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
arp access-list

To define an ARP access list or add clauses at the end of a predefined list, use the `arp access-list` command.

```
arp access-list name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the access control list name.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to define an ARP access list named static-hosts:

```
Switch(config)# arp access-list static-hosts
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deny</td>
<td>Denies an ARP packet based on matches against the DHCP bindings.</td>
</tr>
<tr>
<td>ip arp inspection filter vlan</td>
<td>Permits ARPs from hosts that are configured for static IP when DAI is enabled and to define an ARP access list and applies it to a VLAN.</td>
</tr>
<tr>
<td>permit</td>
<td>Permits an ARP packet based on matches against the DHCP bindings.</td>
</tr>
</tbody>
</table>
# attach module

To remotely connect to a specific module, use the `attach module` configuration command.

```
attach module mod
```

## Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mod</td>
<td>Target module for the command.</td>
</tr>
</tbody>
</table>

## Defaults

This command has no default settings.

## Command Modes

Privileged EXEC mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

This command applies only to the Access Gateway Module on Catalyst 4500 series switches.

The valid values for `mod` depend on the chassis that are used. For example, if you have a Catalyst 4506 chassis, valid values for the module are from 2 to 6. If you have a 4507R chassis, valid values are from 3 to 7.

When you execute the `attach module mod` command, the prompt changes to Gateway#.

This command is identical in the resulting action to the `session module mod` and the `remote login module mod` commands.

## Examples

This example shows how to remotely log in to an Access Gateway Module:

```
Switch# attach module 5
Attaching console to module 5
Type 'exit' at the remote prompt to end the session

Gateway>
```

## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote login module</td>
<td>Remotely connects to a specific module.</td>
</tr>
<tr>
<td>session module</td>
<td>Logs in to the standby supervisor engine using a virtual console.</td>
</tr>
</tbody>
</table>
authentication control-direction

To change the port control to unidirectional or bidirectional, use the `authentication control-direction` command in interface configuration mode. To return to the default setting, use the `no` form of this command.

```
authentication control-direction { both | in }

no authentication control-direction
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>both</code></td>
<td>Enables bidirectional control on the port.</td>
</tr>
<tr>
<td><code>in</code></td>
<td>Enables unidirectional control on the port.</td>
</tr>
</tbody>
</table>

### Command Default

`both`

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `authentication control-direction` command replaces the following `dot1x` command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
dot1x control-direction { both | in }
```

The IEEE 802.1X standard defines a client-server-based access control and authentication protocol that restricts unauthorized devices from connecting to a LAN through publicly accessible ports.

IEEE 802.1X controls network access by creating two distinct virtual access points at each port. One access point is an uncontrolled port; the other is a controlled port. All traffic through the single port is available to both access points. IEEE 802.1X authenticates each user device that connects to a switch port and assigns the port to a VLAN before making available any services that are offered by the switch or the LAN. Until the device authenticates, 802.1X access control allows only Extensible Authentication Protocol (EAP) over LAN (EAPOL) traffic through the port to which the device connects. After authentication succeeds, normal traffic can pass through the port.

- **Unidirectional state**—When you configure a port as unidirectional with the `dot1x control-direction` interface configuration command, the port changes to the spanning-tree forwarding state.

  When the unidirectional controlled port is enabled, the connected host is in sleeping mode or power-down state. The host does not exchange traffic with other devices in the network. If the host connected to the unidirectional port that cannot send traffic to the network, the host can only receive traffic from other devices in the network.

- **Bidirectional state**—When you configure a port as bidirectional with the `dot1x control-direction` interface configuration command, the port is access-controlled in both directions. In this state, the switch port sends only EAPOL.
Using the **both** keyword or using the **no** form of this command changes the port to its bidirectional default setting.

Setting the port as bidirectional enables 802.1X authentication with Wake-on-LAN (WoL).

You can verify your settings by entering the `show authentication` privileged EXEC command.

**Examples**

The following example shows how to enable unidirectional control:

```
Switch(config-if)# authentication control-direction in
Switch(config-if)#
```

The following example shows how to enable bidirectional control:

```
Switch(config-if)# authentication control-direction both
Switch(config-if)#
```

The following example shows how to return to the default settings:

```
Switch(config-if)# no authentication control-direction
Switch(config-if)#
```

**Related Commands**

authentication critical recovery delay

To configure the 802.1X critical authentication parameters, use the `authentication critical recovery delay` command in global configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication critical recovery delay milliseconds

no authentication critical recovery delay
```

**Syntax Description**

- `milliseconds` Specifies the recovery delay period in milliseconds to wait to reinitialize a critical port when an unavailable RADIUS server becomes available. The range is 1 to 10000 milliseconds.

**Command Default**

10000 milliseconds

**Command Modes**

Global configuration mode

**Command History**

- **Release**
  - 12.2(50)SG Support for this command was introduced.

**Usage Guidelines**

The `authentication critical recovery delay` command replaces the following dot1x command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
dot1x critical recovery delay milliseconds
```

You can verify your settings by entering the `show authentication` privileged EXEC command.

**Examples**

This example shows how to set the recovery delay period that the switch waits to reinitialize a critical port when an unavailable RADIUS server becomes available:

```
Switch(config)# authentication critical recovery delay 1500
Switch(config)#
```

**Related Commands**

<table>
<thead>

</table>
authentication event

To configure the actions for authentication events, use the `authentication event` interface configuration command. To return to the default settings, use the `no` form of this command.

```
authentication event fail [retry count] action [authorize vlan vlan | next-method]
```

```
authentication event server {alive action reinitialize | dead action authorize [vlan vlan] | voice | dead action reinitialize [vlan vlan]}
```

```
authentication event no-response action authorize vlan vlan]
```

```
no authentication event {fail} | {server {alive | dead}} | {no-response}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fail</td>
<td>Specifies the behavior when an authentication fails due to bad user credentials.</td>
</tr>
<tr>
<td>retry count</td>
<td>(Optional) Specifies the number of times to retry failed authentications. Range is 0 to 5. Default is 2.</td>
</tr>
<tr>
<td>fail action authorize vlan vlan</td>
<td>When authentication fails due to wrong user credentials, authorizes the port to a particular VLAN.</td>
</tr>
<tr>
<td>fail action next-method</td>
<td>Specifies that the required action for an authentication event moves to the next authentication method.</td>
</tr>
<tr>
<td>server alive action reinitialize</td>
<td>Configures the authentication, authorization, and accounting (AAA) server alive actions as reinitialize all authorized clients for authentication events.</td>
</tr>
<tr>
<td>server dead action authorize [vlan vlan]</td>
<td>Configures the AAA server dead actions to authorize data or voice clients for the authentication events.</td>
</tr>
<tr>
<td>voice</td>
<td>Configures the AAA server dead actions to reinitialize all authorized data clients for authentication events.</td>
</tr>
<tr>
<td>no-response action authorize</td>
<td>When the client does not support 802.1x, authorizes the port to a particular VLAN.</td>
</tr>
</tbody>
</table>

### Command Default

The default settings are as follows:

- The `count` is 2 by default.
- The current authentication method is retried indefinitely (and fails each time) until the AAA server becomes reachable.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

The **authentication event fail** command replaces the following 802.1X commands, which are deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x auth-fail max-attempts count`
- `[no] dot1x auth-fail vlan vlan`

The **authentication event fail** command is supported only for 802.1X to signal authentication failures. By default, this failure type causes the authentication method to be retried. You can configure either to authorize the port in the configured VLAN or to failover to the next authentication method. Optionally, you can specify the number of authentication retries before performing this action.

The **authentication event server** command replaces the following 802.1X commands, which are deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x critical`
- `[no] dot1x critical vlan vlan`
- `[no] dot1x critical recover action initialize`

The **authentication event server** command specifies the behavior when the AAA server becomes unreachable, ports are authorized in the specified VLAN.

The **authentication server alive action** command specifies the action to be taken once the AAA server becomes reachable again.

You can verify your settings by entering the **show authentication** privileged EXEC command.

The **authentication event no-response** command replaces the following 802.1X command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

- `[no] dot1x guest-vlan vlan`

The **authentication event no-response** command specifies the action to be taken when the client does not support 802.1X.

**Examples**

The following example shows how to specify that when an authentication fails due to bad user credentials, the process advances to the next authentication method:

```
Switch(config-if)# authentication event fail action next-method
```

The following example shows how to specify the AAA server alive actions as reinitialize all authorized clients for authentication events:

```
Switch(config-if)# authentication event server alive action reinitialize
```

The following example shows how to specify the AAA server dead actions that authorize the port for authentication events:

```
Switch(config-if)# authentication event server dead action authorize
```

The following example shows how to specify the conditions when a client doesn't support 802.1X to authorize the port for authentication events:

```
Switch(config-if)# authentication event authentication event no-response action authorize vlan 10
```

```
Switch(config-if)#
```

<td>Interface configuration mode</td>
</tr>
<tr>
<td>Command History</td>
<td>Release Modification</td>
</tr>
<tr>
<td></td>
<td>12.2(50)SG Support for this command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

By default, if 802.1X times out and if MAB fails, WebAuth is enabled.

The authentication fallback command replaces the following dot1x command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x fallback profile
```

The Webauth fallback feature allows you to have those clients that do not have an 802.1X supplicant and are not managed devices to fall back to the WebAuth method.

You can verify your settings with the show authentication privileged EXEC command.

Examples

This example shows how to enable WebAuth fallback and specify the fallback profile to use when failing over to WebAuth:

```
Switch(config-if)# authentication fallback fallbacktest1
Switch(config-if)#
```

This example shows how to disable WebAuth fallback:

```
Switch(config-if)# no authentication fallback fallbacktest1
Switch(config-if)#
```

**authentication host-mode**

To define the classification of a session that will be used to apply the access-policies in host-mode configuration, use the `authentication host-mode` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication host-mode {single-host | multi-auth | multi-domain | multi-host} [open]
[no] authentication host-mode {single-host | multi-auth | multi-domain | multi-host} [open]
```

**Syntax Description**

- **single-host**: Specifies the session as an interface session, and allows one client on the port only. This is the default host mode when enabling 802.1X.

- **multi-auth**: Specifies the session as a MAC-based session. Any number of clients are allowed on a port in data domain and only one client in voice domain, but each one is required to authenticate separately.

- **multi-domain**: Specifies the session based on a combination of MAC address and domain, with the restriction that only one MAC is allowed per domain.

- **multi-host**: Specifies the session as an interface session, but allows more than one client on the port.

- **open**: (Optional) Configures the host-mode with open policy on the port.

**Command Default**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Single-host mode classifies the session as an interface session (for example, one MAC per interface). Only one client is allowed on the port, and any policies that are downloaded for the client are applied to the whole port. A security violation is triggered if more than one client is detected.

Multi-host mode classifies the session as an interface session, but the difference with this host-mode is that it allows more than one client to attach to the port. Only the first client that is detected on the port will be authenticated and the rest will inherit the same access as the first client. The policies that are downloaded for the first client will be applied to the whole port.

Multi-domain mode classifies the session based on a combination of MAC address and domain, with the restriction that only one MAC is allowed per domain. The domain in the switching environment refers to the VLAN, and the two supported domains are the DATA domain and the voice domain. Only one client is allowed on a particular domain. So, only two clients (MACs) per port are supported. Each one is required to authenticate separately. Any policies that are downloaded for the client will be applied for that client’s MAC/IP only and will not affect the other on the same port. The clients can be authenticated using different methods (such as 802.1X for PC, MAB for IP phone, or vice versa). No restriction exists on the authentication order.
The only caveat with the above statement is that web-based authentication is only available for data devices because a user is probably operating the device and HTTP capability exists. Also, if web-based authentication is configured in MDA mode, the only form of enforcement for all types of devices is downloadable ACLs (dACL). The restriction is in place because VLAN assignment is not supported for web-based authentication. Furthermore, if you use dACLs for data devices and not for voice devices, when the user’s data falls back to webauth, voice traffic is affected by the ACL that is applied based on the fallback policy. Therefore if webauth is configured as a fallback on an MDA enabled port, dACL is the only supported enforcement method.

Multi-auth mode classifies the session as a MAC-based. No limit exists for the number of clients allowed on a port data domain. Only one client is allowed in a voice domain and each one is required to authenticate separately. Any policies that are downloaded for the client are applied for that client’s MAC or IP only and do not affect others on the same port.

The optional pre-authentication open access mode allows you to gain network access before authentication is performed. This is primarily required for the PXE boot scenario, but not limited to just that use case, where a device needs to access the network before PXE times out and downloads a bootable image possibly containing a supplicant.

The configuration related to this feature is attached to the host-mode configuration whereby the host-mode itself is significant for the control plane, while the open access configuration is significant for the data plane. Open-access configuration has absolutely no bearing on the session classification. The host-mode configuration still controls this. If the open-access is defined for single-host mode, the port still allows only one MAC address. The port forwards traffic from the start and is only restricted by what is configured on the port. Such configurations are independent of 802.1X. So, if there is no form of access-restriction configured on the port, the client devices have full access on the configured VLAN.

You can verify your settings with the `show authentication` privileged EXEC command.

### Examples

This example shows how to define the classification of a session that are used to apply the access-policies using the host-mode configuration:

```
Switch(config-if)# authentication host-mode single-host
Switch(config-if)#
```

### Related Commands

<table>

**authentication open**

To enable open access on this port, use the `authentication open` command in interface configuration mode. To disable open access on this port, use the `no` form of this command.

```
authentication open
no authentication open
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Open Access allows clients or devices to gain network access before authentication is performed.
You can verify your settings with the `show authentication` privileged EXEC command.
This command overrides the `authentication host-mode session-type open` global configuration mode command for the port only.
This command operates per-port rather than globally.

**Examples**
The following example shows how to enable open access to a port:
```
Switch(config-if)# authentication open
```
```
Switch(config-if)#
```

The following example shows how to enable open access to a port:
```
Switch(config-if)# no authentication open
```
```
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td><code>show authentication</code></td>
<td>Displays Authentication Manager information.</td>
</tr>
</tbody>
</table>
To specify the order in which authentication methods should be attempted for a client on an interface, use the `authentication order` command in interface configuration mode. To return to the default settings, use the `no` form of this command.

```
authentication order method1 [method2] [method3]
```

```
no authentication order
```

### Syntax Description

- `method1` - Authentication method to be attempted. The valid values are as follows:
  - `dot1x` — Adds the dot1x authentication method.
  - `mab` — Adds the MAB authentication method.
  - `webauth` — Adds the WebAuth authentication method.

- `method2`, `method3` — (Optional) Authentication method to be attempted. The valid values are as follows:
  - `dot1x` — Adds the dot1x authentication method.
  - `mab` — Adds the MAB authentication method.
  - `webauth` — Adds the WebAuth authentication method.

### Command Default

The default order is dot1x, MAB, then WebAuth.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Once you enter the `authentication order` command, only those methods explicitly listed will run. Each method may be entered only once in the run list and no methods may be entered after you enter the `webauth` keyword.

Authentication methods are applied in the configured (or default) order until authentication succeeds. For authentication fails, failover to the next authentication method occurs (subject to the configuration of authentication event handling).

You can verify your settings with the `show authentication` privileged EXEC command.
Examples

The following example shows how to specify the order in which authentication methods should be attempted for a client on an interface:

```
Switch(config-if)# authentication order mab dot1x webauth
Switch(config-if)#
```

</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The **authentication periodic** command replaces the following dot1x command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x reauthentication
```

The reauthentication period can be set using the **authentication timer** command.

You can verify your settings by entering the **show authentication** privileged EXEC command.

**Examples**
The following example shows how to enable reauthentication for this port:

```
Switch(config-if)# authentication reauthentication
Switch(config-if)#
```

The following example shows how to disable reauthentication for this port:

```
Switch(config-if)# no authentication reauthentication
Switch(config-if)#
```

**Related Commands**

</table>
authentication port-control

To configure the port-control value, use the `authentication port-control` command in interface configuration mode. To return to the default setting, use the `no` form of this command.

```
authentication port-control [auto | force-authorized | force-unauthorized]

no authentication port-control
```

**Syntax Description**

- **auto** (Optional) Enables 802.1X port-based authentication and causes the port to begin in the unauthorized state.
- **force-authorized** (Optional) Disables 802.1X on the interface and causes the port to change to the authorized state without any authentication exchange required. The port transmits and receives normal traffic without 802.1X-based authentication of the client. The `force-authorized` keyword is the default.
- **force-unauthorized** (Optional) Denies all access through this interface by forcing the port to change to the unauthorized state, ignoring all attempts by the client to authenticate.

**Command Default**

force-authorized

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `authentication port-control` command replaces the following `dot1x` command, which is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x port-control [auto | force-authorized | force-unauthorized]
```

The following guidelines apply to Ethernet switch network modules:

- The 802.1X protocol is supported on Layer 2 static-access ports.
- You can use the `auto` keyword only if the port is not configured as one of the following types:
  - Trunk port—If you try to enable 802.1X on a trunk port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to trunk, the port mode is not changed.
  - EtherChannel port—Before enabling 802.1X on the port, you must first remove it from the EtherChannel. If you try to enable 802.1X on an EtherChannel or on an active port in an EtherChannel, an error message appears, and 802.1X is not enabled. If you enable 802.1X on a not-yet active port of an EtherChannel, the port does not join the EtherChannel.
Switch Port Analyzer (SPAN) destination port—You can enable 802.1X on a port that is a SPAN destination port; however, 802.1X is disabled until the port is removed as a SPAN destination.

You can enable 802.1X on a SPAN source port.

To globally disable 802.1X on the device, you must disable it on each port. There is no global configuration command for this task.

You can verify your settings with the `show authentication` privileged EXEC command.

The `auto` keyword allows you to send and receive only Extensible Authentication Protocol over LAN (EAPOL) frames through the port. The authentication process begins when the link state of the port transitions from down to up or when an EAPOL-start frame is received. The system requests the identity of the client and begins relaying authentication messages between the client and the authentication server. Each client attempting to access the network is uniquely identified by the system through the client's MAC address.

**Examples**

The following example shows that the authentication status of the client PC will be determined by the authentication process:

```
Switch(config-if)# authentication port-control auto
Switch(config-if)#
```

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Configuring priorities for authentication methods allows a higher priority method (not currently running) to interrupt an authentication in progress with a lower priority method. Alternatively, if the client is already authenticated, an interrupt from a higher priority method can cause a client, which was previously authenticated using a lower priority method, to reauthenticate.

The default priority of a method is equivalent to its position in the order of execution list. If you do not configure a priority, the relative priorities (highest first) are dot1x, MAB and then webauth. If you enter the **authentication order** command, the default priorities are the same as the configured order.

You can verify your settings with the **show authentication** privileged EXEC command.
**Examples**

The following example shows how to specify the priority in which authentication methods should be attempted for a client on an interface:

```
Switch(config-if)# authentication priority mab dot1x webauth
Switch(config-if)#
```

authentication timer

To configure the authentication timer, use the **authentication timer** command in interface configuration mode. To return to the default settings, use the **no** form of this command.

```
authentication timer {{inactivity value} | {reauthenticate {server | value}} | {restart value}}
no authentication timer {{inactivity value} | {reauthenticate value} | {restart value}}
```

**Syntax Description**

- **inactivity value**
  Specifies the amount of time in seconds that a host is allowed to be inactive before being authorized. Range is 1 to 65535. Default is Off.
  **Note** The inactivity value should be less than the reauthenticate timer value, but configuring the inactivity value higher than the reauthenticate timer value is not considered an error.

- **reauthenticate server**
  Specifies that the reauthentication period value for the client should be obtained from the authentication, authorization, and accounting (AAA) server as Session-Timeout (RADIUS Attribute 27).

- **reauthenticate value**
  Specifies the amount of time in seconds after which an automatic reauthentication is initiated. Range is 1 to 65535. Default is 3600.

- **restart value**
  Specifies the amount of time in seconds after which an attempt is made to authenticate an unauthorized port. Range is 1 to 65535. Default is Off.

**Command Default**

The default settings are as follows:

- **inactivity value**—Off.
- **reauthenticate value**—3600
- **restart value**—Off

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Reauthentication only occurs if it is enabled on the interface.

The **authentication timer reauthenticate value** command replaces the following dot1x command that is deprecated in Cisco IOS Release 12.2(50)SG and later releases:

```
[no] dot1x timeout { reauth-period seconds | quiet-period seconds | tx-period seconds | supp-timeout seconds | server-timeout seconds}
```
**Note**

You should change the default values of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients or authentication servers.

During the inactivity period, the Ethernet switch network module does not accept or initiate any authentication requests. If you want to provide a faster response time to the user, enter a number less than the default.

The `reauthenticate` keyword affects the behavior of the Ethernet switch network module only if you have enabled periodic reauthentication with the `authentication reauthentication` global configuration command.

**Examples**

The following example shows how to specify that the reauthentication period value for the client should be obtained from the authentication, authorization, and accounting (AAA) server as Session-Timeout (RADIUS Attribute 27):

```shell
Switch(config-if)# authentication timer reauthenticate server
Switch(config-if)#
```

auto qos voip

To automatically configure quality of service (auto-QoS) for voice over IP (VoIP) within a QoS domain, use the `auto qos voip` interface configuration command. To change the auto-QoS configuration settings to the standard QoS defaults, use the `no` form of this command.

```
auto qos voip {cisco-phone | trust}
no auto qos voip {cisco-phone | trust}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco-phone</td>
<td>Connects the interface to a Cisco IP phone and automatically configures QoS for VoIP. The CoS labels of incoming packets are trusted only when the telephone is detected.</td>
</tr>
<tr>
<td>trust</td>
<td>Connects the interface to a trusted switch or router and automatically configures QoS for VoIP. The CoS and DSCP labels of incoming packets are trusted.</td>
</tr>
</tbody>
</table>

**Defaults**

Auto-QoS is disabled on all interfaces.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to configure the QoS that is appropriate for VoIP traffic within the QoS domain. The QoS domain includes the switch, the interior of the network, and the edge devices that can classify incoming traffic for QoS.

Use the `cisco-phone` keyword on the ports at the edge of the network that are connected to Cisco IP phones. The switch detects the telephone through the Cisco Discovery Protocol (CDP) and trusts the CoS labels in packets that are received from the telephone.

Use the `trust` keyword on the ports that are connected to the interior of the network. Because it is assumed that the traffic has already been classified by the other edge devices, the CoS/DSCP labels in these packets are trusted.

When you enable the auto-QoS feature on the specified interface, these actions automatically occur:

- QoS is globally enabled (`qos global configuration command`).
- DBL is enabled globally (`qos dbi` global configuration command).
- When you enter the `auto qos voip cisco-phone` interface configuration command, the trusted boundary feature is enabled. It uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP phone. When a Cisco IP phone is detected, the ingress classification on the specific interface is set to trust the CoS label that is received in the packet because some old phones do not mark DSCP. When a Cisco IP phone is absent, the ingress classification is set to not trust the CoS label in the packet.
When you enter the `auto qos voip trust` interface configuration command, the ingress classification on the specified interface is set to trust the CoS label that is received in the packet if the specified interface is configured as Layer 2 (and is set to trust DSCP if the interface is configured as Layer 3). You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.

To display the QoS configuration that is automatically generated when auto-QoS is enabled, enable debugging before you enable auto-QoS. Use the `debug auto qos` privileged EXEC command to enable auto-QoS debugging.

To disable auto-QoS on an interface, use the `no auto qos voip` interface configuration command. When you enter this command, the switch enables standard QoS and changes the auto-QoS settings to the standard QoS default settings for that interface. This action will not change any global configuration performed by auto-QoS; the global configuration remains the same.

### Examples

This example shows how to enable auto-QoS and to trust the CoS and DSCP labels that are received in the incoming packets when the switch or router that is connected to Gigabit Ethernet interface 1/1 is a trusted device:

```plaintext
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip trust
```

This example shows how to enable auto-QoS and to trust the CoS labels that are received in incoming packets when the device connected to Fast Ethernet interface 2/1 is detected as a Cisco IP phone:

```plaintext
Switch(config)# interface fastethernet2/1
Switch(config-if)# auto qos voip cisco-phone
```

This example shows how to display the QoS configuration that is automatically generated when auto-QoS is enabled on a Supervisor Engine 6-E:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)#interface gigabitethernet3/10
Switch(config-if)#auto qos voip trust
Switch(config-if)#
1d03h:  service-policy input AutoQos-VoIP-Input-Cos-Policy
1d03h:  service-policy output AutoQos-VoIP-Output-Policy
Switch(config-if)#interface gigabitethernet3/11
Switch(config-if)#auto qos voip
cisco-phone
Switch(config-if)#
1d03h:  qos trust device cisco-phone
1d03h:  service-policy input AutoQos-VoIP-Input-Cos-Policy
1d03h:  service-policy output AutoQos-VoIP-Output-Policy
Switch(config-if)#end
Switch#
```

You can verify your settings by entering the `show auto qos interface` command.

<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the `no auto-sync standard` command, no automatic synchronizations occur.

**Examples**

This example shows how (from the default configuration) to enable automatic synchronization of the configuration register in the main CPU:

```
Switch# config terminal
Switch (config)# redundancy
Switch (config-r)# main-cpu
Switch (config-r-mc)# no auto-sync standard
Switch (config-r-mc)# auto-sync configure-register
Switch (config-r-mc)#
```

bandwidth

To specify or modify the minimum bandwidth provided to a class belonging to a policy map attached to a physical port, use the `bandwidth` policy-map class command. To return to the default setting, use the `no` form of this command.

```
bandwidth bandwidth-kbps | percent percent | remaining percent percent

no bandwidth
```

**Syntax Description**

- `bandwidth-kbps` Amount of bandwidth in kbps assigned to the class. The range is 32 to 16000000.
- `percent percent` Percentage of available bandwidth assigned to the parent class. The range is 1 to 100.
- `remaining percent percent` Percentage of remaining bandwidth assigned to parent class. The range is 1 to 100. This command is supported only when priority queuing class is configured, and the priority queuing class is not rate-limited.

**Defaults**

No bandwidth is specified.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `bandwidth` command only in a policy map attached to a physical port.

The `bandwidth` command specifies the minimum bandwidth for traffic in that class when there is traffic congestion in the switch. If the switch is not congested, the class receives more bandwidth than you specify with this command.

When queuing class is configured without any explicit bandwidth configuration, since the queue is not guaranteed any minimum bandwidth, this queue will get a share of any unallocated bandwidth on the port.

If there is no unallocated bandwidth for the new queue or if the unallocated bandwidth is not sufficient to meet the minimum configurable rate for all queues which do not have any explicit bandwidth configuration, then the policy association is rejected.
These restrictions apply to the `bandwidth` command:

- If the `percent` keyword is used, the sum of the class bandwidth percentages within a single policy map cannot exceed 100 percent. Percentage calculations are based on the bandwidth available on the port.
- The amount of bandwidth configured should be large enough to accommodate Layer 2 overhead.
- A policy map can have all the class bandwidths specified in either kbps or in percentages, but not a mix of both.

**Examples**

This example shows how to set the minimum bandwidth to 2000 kbps for a class called `silver-class`. The class already exists in the switch configuration.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map polmap6
Switch(config-pmap)# class silver-class
Switch(config-pmap-c)# bandwidth 2000
Switch(config-pmap-c)# end
```

This example shows how to guarantee 30 percent of the bandwidth for `class1` and 25 percent of the bandwidth for `class2` when CBWFQ is configured. A policy map with two classes is created and is then attached to a physical port.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# bandwidth percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# bandwidth percent 25
Switch(config-pmap-c)# exit
Switch(config-pmap)# end
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy input policy1
Switch(config-if)# end
```

This example shows how bandwidth is guaranteed if low-latency queueing (LLQ) and bandwidth are configured. In this example, LLQ is enabled in a class called `voice1`.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# bandwidth remaining percent 50
Switch(config-pmap-c)# exit
Switch(config-pmap)# class class2
Switch(config-pmap-c)# bandwidth remaining percent 25
Switch(config-pmap-c)# exit
Switch(config-pmap)# class voice1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# end
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

call-home (global configuration)

To enter call home configuration submode, use the call-home command in global configuration mode.

call-home

Syntax Description

This command has no arguments or keywords.

Command Default

This command has no default settings.

Command Modes

Global configuration mode

Command History

Release          Modification
12.2(52)SG       This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis.

Usage Guidelines

Once you enter the call-home command, the prompt changes to Switch (cfg-call-home)#, and you have access to the call home configuration commands as follows:

- alert-group—Enables or disables an alert group. See the alert-group command.
- contact-email-addr email-address—Assigns the system contact’s e-mail address. You can enter up to 128 alphanumeric characters in e-mail address format with no spaces.
- contract-id alphanumeric—Specifies the customer contract identification for Cisco AutoNotification. You can enter up to 64 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (“ ”).
- copy profile source-profile target-profile—Creates a new destination profile (target-profile) with the same configuration settings as the existing profile (source-profile).
- customer-id name—Provides customer identification for Cisco AutoNotify. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (“ ”).
- default—Sets a command to its defaults.
- exit—Exits call home configuration mode and returns to global configuration mode.
- mail-server {ipv4-address | name} priority priority—Assigns the customer’s e-mail server address and relative priority. You can enter an IP address or a fully qualified domain name (FQDN), and assign a priority from 1 (highest) to 100 (lowest).
  You can define backup e-mail servers by repeating the mail-server command and entering different priority numbers.
- no—Negates a command or set its defaults.
- phone-number +phone-number—Specifies the phone number of the contact person. The phone-number value must begin with a plus (+) prefix, and may contain only dashes (-) and numbers. You can enter up to 16 characters. If you include spaces, you must enclose your entry in quotes (“ ”).
• **profile name**—Enters call-home profile configuration mode. See the `profile` command.

• **rate-limit threshold**—Configures the call-home message rate-limit threshold; valid values are from 1 to 60 messages per minute.

• **sender** `{from | reply-to} email-address`—Specifies the call-home message sender’s e-mail addresses. You can enter up to 128 alphanumeric characters in e-mail address format with no spaces.

• **site-id alphanumeric**—Specifies the site identification for Cisco AutoNotify. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (" ").

• **street-address street-address**—Specifies the street address for the RMA part shipments. You can enter up to 256 alphanumeric characters. If you include spaces, you must enclose your entry in quotes (" ").

• **vrf**—Specifies the VPN routing or forwarding instance name; limited to 32 characters.

### Examples

This example shows how to configure the contact information:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# call-home
Switch(cfg-call-home)# contact-email-addr username@example.com
Switch(cfg-call-home)# phone-number +1-800-555-4567
Switch(cfg-call-home)# street-address "1234 Picaboo Street, Any city, Any state, 12345"
Switch(cfg-call-home)# customer-id Customer1234
Switch(cfg-call-home)# site-id Site1ManhattanNY
Switch(cfg-call-home)# contract-id Company1234
Switch(cfg-call-home)# exit
Switch(config)#
```

This example shows how to configure the call-home message rate-limit threshold:

```
Switch(config)# call-home
Switch(cfg-call-home)# rate-limit 50
```

This example shows how to set the call-home message rate-limit threshold to the default setting:

```
Switch(config)# call-home
Switch(cfg-call-home)# default rate-limit
```

This example shows how to create a new destination profile with the same configuration settings as an existing profile:

```
Switch(config)# call-home
Switch(cfg-call-home)# copy profile profile1 profile1a
```

This example shows how to configure the general e-mail parameters, including a primary and secondary e-mail server:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# call-home
Switch(cfg-call-home)# mail-server smtp.example.com priority 1
Switch(cfg-call-home)# mail-server 192.168.0.1 priority 2
Switch(cfg-call-home)# sender from username@example.com
Switch(cfg-call-home)# sender reply-to username@example.com
Switch(cfg-call-home)# exit
Switch(config)#
```
This example shows how to specify MgmtVrf as the vrf name where the call-home email message is forwarded:

\`Switch(cfg-call-home)# vrf MgmtVrf\`

<tr>
<td>ccoid user-id</td>
<td>(Optional) Specifies the identifier of a registered Smart Call Home user. If a user-id is specified, the resulting analysis report is sent to the e-mail address of the registered user. If no user-id is specified, the report is sent to the contact e-mail address of the device.</td>
</tr>
</tbody>
</table>

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The recipient profile does not need to be enabled for the call-home request. The profile should specify the e-mail address where the transport gateway is configured so that the request message can be forwarded to the Cisco TAC and the user can receive the reply from the Smart Call Home service.

Based on the keyword specifying the type of report requested, the following information is returned in response to the request:

- **config-sanity**—Information on best practices as related to the current running configuration.
- **bugs-list**—Known bugs in the running version and in the currently applied features.
- **command-reference**—Reference links to all commands in the running configuration.
- **product-advisory**—Product Security Incident Response Team (PSIRT) notices, End of Life (EOL) or End of Sales (EOS) notices, or field notices (FN) that may affect devices in your network.
This example shows a request for analysis of a user-specified show command:

```
Switch# call-home request output-analysis "show diagnostic result module all" profile TG
```
call-home send

To execute a CLI command and e-mail the command output, use the call-home send command in privileged EXEC mode.

```
   call-home send "cli-command" [email email-addr [service-number SR] | service-number SR]
```

**Syntax Description**

- **"cli-command"**
  Specifies a CLI command to be executed. The command output is sent by e-mail.
- **email email-addr**
  Specifies the e-mail address to which the CLI command output is sent. If no e-mail address is specified, the command output is sent to the Cisco TAC at attach@cisco.com.
- **service-number SR**
  Specifies an active TAC case number to which the command output pertains. This number is required only if no e-mail address (or a TAC e-mail address) is specified, and will appear in the e-mail subject line.

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command causes the specified CLI command to be executed on the system. The specified CLI command must be enclosed in quotes (""), and can be any run or show command, including commands for all modules.

The command output is then sent by e-mail to the specified e-mail address. If no e-mail address is specified, the command output is sent to the Cisco TAC at attach@cisco.com. The e-mail is sent in long text format with the service number, if specified, in the subject line.

**Examples**

This example shows how to send a CLI command and have the command output e-mailed:

```
Switch# call-home send "show diagnostic result module all" email support@example.com
```

**Related Commands**

- **call-home (global configuration)**
  Enters call home configuration mode.
- **call-home send alert-group**
  Sends a specific alert group message.
- **service call-home** (refer to Cisco IOS documentation)
  Enables or disables Call Home.
- **show call-home**
  Displays call-home configuration information.
call-home send alert-group

To send a specific alert group message, use the call-home send alert-group command in privileged EXEC mode.

```
call-home send alert-group {configuration | diagnostic module number | inventory} [profile profile-name]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>Sends the configuration alert-group message to the destination profile.</td>
</tr>
<tr>
<td>diagnostic module</td>

</tr>
<tr>
<td>module number</td>
<td>specific module number.</td>
</tr>
<tr>
<td>inventory</td>
<td>Sends the inventory call-home message.</td>
</tr>
<tr>
<td>profile profile-name</td>
<td>(Optional) Specifies the name of the destination profile.</td>
</tr>
</tbody>
</table>

**Command Default**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor</td>
</tr>
<tr>
<td></td>
<td>Engine 6-E, and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the module number, you can enter the number of the module.

If you do not specify the profile profile-name, the message is sent to all subscribed destination profiles.

Only the configuration, diagnostic, and inventory alert groups can be manually sent. The destination profile need not be subscribed to the alert group.

**Examples**

This example shows how to send the configuration alert-group message to the destination profile:

```
Switch# call-home send alert-group configuration
```

This example shows how to send the diagnostic alert-group message to the destination profile for a specific module number:

```
Switch# call-home send alert-group diagnostic module 3
```

This example shows how to send the diagnostic alert-group message to all destination profiles for a specific module number:

```
Switch# call-home send alert-group diagnostic module 3 profile Ciscotacl
```

This example shows how to send the inventory call-home message:

```
Switch# call-home send alert-group inventory
```

<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch, Supervisor Engine 6-E, and Catalyst 4900M chassis</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command sends a test message to the specified destination profile. If you enter test message text, you must enclose the text in quotes (""”) if it contains spaces. If you do not enter a message, a default message is sent.

### Examples

This example shows how to manually send a Call Home test message:

```
switch# call-home test "test of the day" profile Ciscotac1
```

### Related Commands

- `call-home (global configuration)` Enters call home configuration mode.
- `call-home send alert-group` Sends a specific alert group message.
- `service call-home` (refer to Cisco IOS documentation) Enables or disables Call Home.
- `show call-home` Displays call-home configuration information.
channel-group

To assign and configure an EtherChannel interface to an EtherChannel group, use the `channel-group` command. To remove a channel group configuration from an interface, use the `no` form of this command.

```
channel-group number mode {active | on | auto [non-silent]} | {passive | desirable [non-silent]}
```

```
no channel-group
```

**Syntax Description**

- `number`: Specifies the channel-group number; valid values are from 1 to 64.
- `mode`: Specifies the EtherChannel mode of the interface.
- `active`: Enables LACP unconditionally.
- `on`: Forces the port to channel without PAgP.
- `auto`: Places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not initiate PAgP packet negotiation.
- `non-silent`: (Optional) Used with the auto or desirable mode when traffic is expected from the other device.
- `passive`: Enables LACP only if an LACP device is detected.
- `desirable`: Places a port into an active negotiating state, in which the port initiates negotiations with other ports by sending PAgP packets.

**Defaults**

No channel groups are assigned.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Support for LACP was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You do not have to create a port-channel interface before assigning a physical interface to a channel group. If a port-channel interface has not been created, it is automatically created when the first physical interface for the channel group is created.

If a specific channel number is used for the PAgP-enabled interfaces of a channel group, that same channel number cannot be used for configuring a channel that has LACP-enabled interfaces or vice versa.

You can also create port channels by entering the `interface port-channel` command. This will create a Layer 3 port channel. To change the Layer 3 port channel into a Layer 2 port channel, use the `switchport` command before you assign physical interfaces to the channel group. A port channel cannot be changed from Layer 3 to Layer 2 or vice versa when it contains member ports.

You do not have to disable the IP address that is assigned to a physical interface that is part of a channel group, but we recommend that you do so.
Any configuration or attribute changes that you make to the port-channel interface are propagated to all interfaces within the same channel group as the port channel (for example, configuration changes are also propagated to the physical interfaces that are not part of the port channel, but are part of the channel group).

You can create in on mode a usable EtherChannel by connecting two port groups together.

**Caution**

Do not enable Layer 3 addresses on the physical EtherChannel interfaces. Do not assign bridge groups on the physical EtherChannel interfaces because it creates loops.

**Examples**

This example shows how to add Gigabit Ethernet interface 1/1 to the EtherChannel group that is specified by port-channel 45:

```bash
Switch(config-if)# channel-group 45 mode on
Creating a port-channel interface Port-channel45
Switch(config-if)#
```

**Related Commands**

</table>
channel-protocol

To enable LACP or PAgP on an interface, use the channel-protocol command. To disable the protocols, use the no form of this command.

    channel-protocol {lacp | pagp}

    no channel-protocol {lacp | pagp}

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>lACP</th>
<th>PAgP</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Enables LACP to manage channeling.</td>
<td>Enables PAgP to manage channeling.</td>
</tr>
</tbody>
</table>

**Defaults**

PAgP

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I. You can also select the protocol using the channel-group command.

If the interface belongs to a channel, the no form of this command is rejected.

All ports in an EtherChannel must use the same protocol; you cannot run two protocols on one module. PAgP and LACP are not compatible; both ends of a channel must use the same protocol.

You can manually configure a switch with PAgP on one side and LACP on the other side in the on mode.

You can change the protocol at any time, but this change causes all existing EtherChannels to reset to the default channel mode for the new protocol. You can use the channel-protocol command to restrict anyone from selecting a mode that is not applicable to the selected protocol.

Configure all ports in an EtherChannel to operate at the same speed and duplex mode (full duplex only for LACP mode).

For a complete list of guidelines, refer to the “Configuring EtherChannel” section of the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide.

**Examples**

This example shows how to select LACP to manage channeling on the interface:

```
Switch(config-if)# channel-protocol lacp
Switch(config-if)#
```

</table>
class

To specify the name of the class whose traffic policy you want to create or change, use the `class` policy-map configuration command. To delete an existing class from a policy map, use the `no` form of this command.

```
class class-name

no class class-name
```

**Syntax Description**

- `class-name` Name of the predefined traffic class for which you want to configure or modify a traffic policy. The class was previously created through the `class-map class-map-name` global configuration command.

**Defaults**

No classes are defined; except for the class-default.

**Command Modes**

Policy-map configuration mode

**Command History**

- **Release** 12.1(8a)EW
  - **Modification** Support for this command was introduced on the Catalyst 4500 series switches.

**Usage Guidelines**

Before using the `class` command, you must create a class map for matching packets to the class by using the `class-map` global configuration command. You also must use the `policy-map` global configuration command to identify the policy map and to enter policy-map configuration mode. After specifying a policy map, you can configure a traffic policy for new classes or modify a traffic policy for any existing classes in that policy map. The class name that you specify with the `class` command in the policy map ties the characteristics for that class (its policy) to the class map and its match criteria, as configured through the `class-map` global configuration command. You attach the policy map to a port by using the `service-policy (interface configuration)` configuration command.

After you enter the `class` command, the switch enters policy-map class configuration mode, and these configuration commands are available:

- **bandwidth** Specifies or modifies the minimum bandwidth provided to a class belonging to a policy map. For more information, see the `bandwidth` command. This command is available on the Supervisor Engine 6-E and the Catalyst 4900M chassis.
- **dbl** Enables dynamic buffer limiting for traffic hitting this class. For details on `dbl` parameters refer to the `show qos dbl` command.
- **exit** Exits policy-map class configuration mode and returns to policy-map configuration mode.
- **no** Returns a command to its default setting.
- **police** Configures a single-rate policer, an aggregate policer, or a two-rate traffic policer that uses the committed information rate (CIR) and the peak information rate (PIR) for a class of traffic. The policer specifies the bandwidth limitations and the action to take when the limits are exceeded. For

---

**Note:**

For detailed information, refer to the official Cisco documentation. The provided information is a concise summary of the key points from the document.
more information, see the `police` command. For more information about the two-rate policer, see the `police (two rates)` and the `police (percent)` command. The two-rate traffic policer is supported on a Supervisor Engine 6-E and the Catalyst 4900M chassis.

- **priority** Enables the strict priority queue for a class of traffic. For more information, see the `priority` command. This command is supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

- **service-policy (policy-map class)** Creates a service policy as a quality of service (QoS) policy within a policy map (called a hierarchical service policy). For more information, see the `service-policy (policy-map class)` command. This command is effective only in a hierarchical policy map attached to an interface.

- **set** Classifies IP traffic by setting a class of service (CoS), a Differentiated Services Code Point (DSCP) or IP-precedence in the packet. For more information, see the `set` command.

- **shape (class-based queueing)** Sets the token bucket committed information rate (CIR) in a policy map. For more information, see the `shape (class-based queueing)` command. This command is supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

- **trust** Defines a trust state for a traffic class. For more information, see the `trust` command. This command is not supported on the Supervisor Engine 6-E and the Catalyst 4900M chassis.

The switch supports up to 256 classes, including the default class, in a policy map. Packets that fail to meet any of the matching criteria are classified as members of the default traffic class. You configure the default traffic class by specifying `class-default` as the class name in the `class` policy-map class configuration command. You can manipulate the default traffic class (for example, set policies to police or to shape it) just like any other traffic class, but you cannot delete it.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.

### Examples

This example shows how to create a policy map called policy1. When attached to an ingress port, the policy matches all the inbound traffic defined in class1, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mbps and bursts of 20 KB. Traffic exceeding the profile is marked down to a DSCP value obtained from the policed-DSCP map and then sent.

```
Switch# configure terminal
Switch(config)# class-map class1
Switch(config-cmap)# exit
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# set ip dscp 10
Switch(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet1/0/4
Switch(config-if)# service-policy input policy1
Switch#
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

class-map

To create a class map to be used for matching packets to the class whose name you specify and to enter class-map configuration mode, use the `class-map` global configuration command. To delete an existing class map and to return to global configuration mode, use the `no` form of this command.

```
class-map [match-all | match-any] class-map-name

no class-map [match-all | match-any] class-map-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>match-all</td>
<td>(Optional) Perform a logical-AND of all matching under this class map. All criteria in the class map must be matched.</td>
</tr>
<tr>
<td>match-any</td>
<td>(Optional) Perform a logical-OR of the matching statements under this class map. One or more criteria in the class map must be matched.</td>
</tr>
<tr>
<td>class-map-name</td>
<td>Name of the class map.</td>
</tr>
</tbody>
</table>

**Defaults**

No class maps are defined.

If neither the `match-all` nor the `match-any` keyword is specified, the default is `match-all`.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to specify the name of the class for which you want to create or modify class-map match criteria and to enter class-map configuration mode. Packets are checked against the match criteria configured for a class map to decide if the packet belongs to that class. If a packet matches the specified criteria, the packet is considered a member of the class and is forwarded according to the quality of service (QoS) specifications set in the traffic policy.

After you enter the `class-map` command, the switch enters class-map configuration mode, and these configuration commands are available:

- **description** Describes the class map (up to 200 characters). The `show class-map` privileged EXEC command displays the description and the name of the class map.
- **exit** Exits from QoS class-map configuration mode.
- **match** Configures classification criteria. For more information, see the `match (class-map configuration)` command.
- **no** Removes a match statement from a class map.
**Examples**

This example shows how to configure the class map called class1 with one match criterion, which is an access list called 103:

```
Switch# configure terminal
Switch(config)# access-list 103 permit any any dscp 10
Switch(config)# class-map class1
Switch(config-cmap)# match access-group 103
Switch(config-cmap)# exit
Switch#
```

This example shows how to delete the class1 class map:

```
Switch# configure terminal
Switch(config)# no class-map class1
Switch#
```

You can verify your settings by entering the `show class-map` privileged EXEC command.

**Related Commands**

</table>
clear counters

To clear the interface counters, use the `clear counters` command.

```
clear counters [{FastEthernet interface_number} | {GigabitEthernet interface_number} | {null interface_number} | {port-channel number} | {vlan vlan_id}]
```

### Syntax Description

- **FastEthernet interface_number**
  - (Optional) Specifies the Fast Ethernet interface; valid values are from 1 to 9.
- **GigabitEthernet interface_number**
  - (Optional) Specifies the Gigabit Ethernet interface; valid values are from 1 to 9.
- **null interface_number**
  - (Optional) Specifies the null interface; the valid value is 0.
- **port-channel number**
  - (Optional) Specifies the channel interface; valid values are from 1 to 64.
- **vlan vlan_id**
  - (Optional) Specifies the VLAN; valid values are from 1 to 4096.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command clears all the current interface counters from all the interfaces unless you specify an interface.

**Note**

This command does not clear the counters that are retrieved using SNMP, but only those seen when you enter the `show interface counters` command.

### Examples

This example shows how to clear all the interface counters:

```
Switch# clear counters
Clear "show interface" counters on all interfaces [confirm] y
Switch#
```

This example shows how to clear the counters on a specific interface:

```
Switch# clear counters vlan 200
Clear "show interface" counters on this interface [confirm] y
Switch#
```
### clear counters

clear energywise neighbors

Use the clear energywise neighbors privileged EXEC command to delete the EnergyWise neighbor tables.

clear energywise neighbors

Syntax Description
This command has no arguments or keywords.

Defaults
No default is defined.

Command Modes
Privileged EXEC

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Examples
This example shows how to delete the neighbor tables:

```
Switch# clear energywise neighbors
Cleared all non static energywise neighbors
```

You can verify that the tables were deleted by entering the show energywise neighbors privileged EXEC command.

Note
The clear energywise neighbors command clears all discovered neighbors.

Related Commands

clear errdisable

To re-enable error-disabled VLANs on an interface, use the `clear errdisable` command.

```
  clear errdisable interface {name} vlan [range]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface name</code></td>
<td>Specifies the interface of the VLAN(s) to recover.</td>
</tr>
<tr>
<td><code>vlan</code></td>
<td>Specifies all VLANs on the interface be recovered.</td>
</tr>
<tr>
<td><code>range</code></td>
<td>(Optional) Specifies the VLAN range to be recovered.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a VLAN range is not specified, all VLANs on the specified interface are re-enabled. The `clear errdisable` command recovers the disabled VLANs on an interface.

Clearing the error-disabled state from a virtual port does not change the link state of the physical port, and it does not affect other VLAN ports on the physical port. It does post an event to STP, and spanning tree goes through its normal process of bringing that VLAN port to the appropriate blocking or forwarding state.

**Examples**

This example shows how to re-enable a range of disabled VLANs on an interface:

```
Switch# clear errdisable interface ethernet2 vlan 10-15
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errdisable detect</td>
<td>Enables error-disable detection.</td>
</tr>
<tr>
<td>show errdisable detect</td>
<td>Displays the error-disable detection status.</td>
</tr>
<tr>
<td>show interfaces status</td>
<td>Displays the interface status or a list of interfaces in error-disabled state.</td>
</tr>
<tr>
<td>switchport port-security</td>
<td>Enables port security on an interface.</td>
</tr>
</tbody>
</table>
clear hw-module slot password

To clear the password on an intelligent line module, use the clear hw-module slot password command.

```
clear hw-module slot slot_num password
```

**Syntax Description**

- `slot_num` Slot on a line module.

**Defaults**

The password is not cleared.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You only need to change the password once unless the password is reset.

**Examples**

This example shows how to clear the password from slot 5 on a line module:

```
Switch# clear hw-module slot 5 password
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hw-module power</td>
<td>Turns the power off on a slot or line module.</td>
</tr>
</tbody>
</table>
clear interface gigabitethernet

To clear the hardware logic from a Gigabit Ethernet IEEE 802.3z interface, use the `clear interface gigabitethernet` command.

**Note**

On a Catalyst 4500 series switch, this command does not increment `interface resets` as displayed with the `show interface gigabitethernet mod/port` command.

**Syntax Description**

```
mod/port    Number of the module and port.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the hardware logic from a Gigabit Ethernet IEEE 802.3z interface:

```
Switch# clear interface gigabitethernet 1/1
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show interfaces status</code></td>
<td>Displays the interface status.</td>
</tr>
</tbody>
</table>
clear interface vlan

To clear the hardware logic from a VLAN, use the clear interface vlan command.

```
clear interface vlan number
```

**Syntax Description**

- `number`: Number of the VLAN interface; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(8a)EW: Support for this command was introduced on the Catalyst 4500 series switch.
- **Release** 12.1(12c)EW: Support for extended VLAN addresses added.

**Examples**

This example shows how to clear the hardware logic from a specific VLAN:

```
Switch# clear interface vlan 5
 Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces status</td>
<td>Displays the interface status.</td>
</tr>
</tbody>
</table>
clear ip access-template

To clear the statistical information in access lists, use the **clear ip access-template** command.

```
clear ip access-template access-list
```

### Syntax Description

<table>
<thead>
<tr>
<th>Access</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>access-list</strong></td>
<td>Number of the access list; valid values are from 100 to 199 for an IP extended access list, and from 2000 to 2699 for an expanded range IP extended access list.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to clear the statistical information for an access list:

```
Switch# clear ip access-template 201
Switch#
```
clear ip arp inspection log

To clear the status of the log buffer, use the `clear ip arp inspection log` command.

`clear ip arp inspection log`

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 12.1(19)EW | Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to clear the contents of the log buffer:

```
Switch# clear ip arp inspection log
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>arp access-list</strong></td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>
</tr>
<tr>
<td><strong>show ip arp inspection log</strong></td>
<td>Displays the status of the log buffer.</td>
</tr>
</tbody>
</table>
clear ip arp inspection statistics

To clear the dynamic ARP inspection statistics, use the `clear ip arp inspection statistics` command.

```
clear ip arp inspection statistics [vlan vlan-range]
```

**Syntax Description**

- `vlan vlan-range` (Optional) Specifies the VLAN range.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(19)EW
  - **Modification** Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to clear the DAI statistics from VLAN 1 and how to verify the removal:

```
Switch# clear ip arp inspection statistics vlan 1
Switch# show ip arp inspection statistics vlan 1

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Forwarded</th>
<th>Dropped</th>
<th>DHCP Drops</th>
<th>ACL Drops</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vlan</th>

<th>ACL Permits</th>
<th>Source MAC Failures</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vlan</th>
<th>Dest MAC Failures</th>
<th>IP Validation Failures</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp access-list</td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>
</tr>
<tr>
<td>clear ip arp inspection log</td>
<td>Clears the status of the log buffer.</td>
</tr>
<tr>
<td>show ip arp inspection log</td>
<td>Displays the status of the log buffer.</td>
</tr>
</tbody>
</table>
clear ip dhcp snooping binding

To clear the DHCP snooping binding, use the `clear ip dhcp snooping binding` command.

```
clear ip dhcp snooping binding [*] [ip-address] [vlan vlan_num] [interface interface_num]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>(Optional) Clears all DHCP snooping binding entries.</td>
</tr>
<tr>
<td>ip-address</td>
<td>(Optional) IP address for the DHCP snooping binding entries.</td>
</tr>
<tr>
<td>vlan vlan_num</td>
<td>(Optional) Specifies a VLAN.</td>
</tr>
<tr>
<td>interface interface_num</td>
<td>(Optional) Specifies an interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

These commands are mainly used to clear DHCP snooping binding entries.

DHCP snooping is enabled on a VLAN only if both the global snooping and the VLAN snooping are enabled.

**Examples**

This example shows how to clear all the DHCP snoop binding entries:

```
Switch#clear ip dhcp snooping binding *
Switch#
```

This example shows how to clear a specific DHCP snoop binding entry:

```
Switch#clear ip dhcp snooping binding 1.2.3.4
Switch#
```

This example shows how to clear all the DHCP snoop binding entries on the GigabitEthernet interface 1/1:

```
Switch#clear ip dhcp snooping binding interface gigabitEthernet 1/1
Switch#
```

This example shows how to clear all the DHCP snoop binding entries on VLAN 40:

```
Switch#clear ip dhcp snooping binding vlan 40
Switch#
```
### clear ip dhcp snooping binding

</tbody>
</table>
clear ip dhcp snooping database

To clear the DHCP binding database, use the `clear ip dhcp snooping database` command.

```
clear ip dhcp snooping database
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the DHCP binding database:

```
Switch# clear ip dhcp snooping database
Switch#
```

**Related Commands**

<td>Enables DHCP snooping on a VLAN or a group of VLANs.</td>
</tr>
<tr>
<td><code>show ip dhcp snooping</code></td>
<td>Displays the DHCP snooping configuration.</td>
</tr>
<tr>
<td><code>show ip dhcp snooping binding</code></td>
<td>Displays the DHCP snooping binding entries.</td>
</tr>
</tbody>
</table>
clear ip igmp group

To delete the IGMP group cache entries, use the **clear ip igmp group** command.

```plaintext
clear ip igmp group [{[fastethernet mod/port] | [GigabitEthernet mod/port] | [host_name | group_address] | [Loopback interface_number] | [null interface_number] | [port-channel number] | [vlan vlan_id]}]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastethernet</td>
<td>(Optional) Specifies the Fast Ethernet interface.</td>
</tr>
<tr>
<td>mod/port</td>
<td>(Optional) Number of the module and port.</td>
</tr>
<tr>
<td>GigabitEthernet</td>
<td>(Optional) Specifies the Gigabit Ethernet interface.</td>
</tr>
<tr>
<td>host_name</td>
<td>(Optional) Hostname, as defined in the DNS hosts table or with the <strong>ip host</strong> command.</td>
</tr>
<tr>
<td>group_address</td>
<td>(Optional) Address of the multicast group in four-part, dotted notation.</td>
</tr>
<tr>
<td>Loopback</td>
<td>(Optional) Specifies the loopback interface; valid values are from 0 to 2,147,483,647.</td>
</tr>
<tr>
<td>interface_number</td>
<td>(Optional) Specifies the loopback interface; the valid value is 0.</td>
</tr>
<tr>
<td>port-channel</td>
<td>(Optional) Specifies the channel interface; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>number</td>
<td>(Optional) Specifies the VLAN; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The IGMP cache contains a list of the multicast groups of which hosts on the directly connected LAN are members.

To delete all the entries from the IGMP cache, enter the **clear ip igmp group** command with no arguments.

**Examples**

This example shows how to clear the entries for a specific group from the IGMP cache:

```plaintext
Switch# clear ip igmp group 224.0.255.1
Switch#
```
This example shows how to clear the IGMP group cache entries from a specific interface:

Switch# `clear ip igmp group gigabitethernet 2/2`
Switch#

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip host</strong> (refer to Cisco IOS documentation)</td>
<td>Defines a static host name-to-address mapping in the host cache.</td>
</tr>
<tr>
<td><strong>show ip igmp groups</strong> (refer to Cisco IOS documentation)</td>
<td>Displays the multicast groups with receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP), use the <code>show ip igmp groups</code> command in EXEC mode.</td>
</tr>
<tr>
<td><strong>show ip igmp interface</strong></td>
<td>Displays the information about the IGMP-interface status and configuration.</td>

</tbody>
</table>
clear ip igmp snooping membership

To clear the explicit host-tracking database, use the **clear ip igmp snooping membership** command.

```
clear ip igmp snooping membership [vlan vlan_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan_id</code></td>
<td>(Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.</td>
</tr>
</tbody>
</table>

** Defaults **

This command has no default settings.

** Command Modes **

Privileged EXEC mode

** Command History **

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, the explicit host tracking database maintains a maximum of 1-KB entries. After you reach this limit, no additional entries can be created in the database. To create more entries, you will need to delete the database with the **clear ip igmp snooping statistics vlan** command.

**Examples**

This example shows how to display the IGMP snooping statistics for VLAN 25:

```
Switch# clear ip igmp snooping membership vlan 25
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip igmp snooping vlan explicit-tracking</strong></td>
<td>Enables per-VLAN explicit host tracking.</td>
</tr>
<tr>
<td><strong>show ip igmp snooping membership</strong></td>
<td>Displays host membership information.</td>
</tr>
</tbody>
</table>
clear ip mfib counters

To clear the global MFIB counters and the counters for all active MFIB routes, use the `clear ip mfib counters` command.

```
switch# clear ip mfib counters
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to clear all the active MFIB routes and global counters:

```
switch# clear ip mfib counters
switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip mfib</code></td>
<td>Displays all active Multicast Forwarding Information Base (MFIB) routes.</td>
</tr>
</tbody>
</table>
clear ip mfib fastdrop

To clear all the MFIB fast-drop entries, use the `clear ip mfib fastdrop` command.

```
clear ip mfib fastdrop
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If new fast-dropped packets arrive, the new fast-drop entries are created.

**Examples**
This example shows how to clear all the fast-drop entries:

```
Switch# clear ip mfib fastdrop
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip mfib fastdrop</td>
<td>Enables MFIB fast drop.</td>
</tr>
<tr>
<td>show ip mfib fastdrop</td>
<td>Displays all currently active fast-drop entries and shows whether fast drop is enabled.</td>
</tr>
</tbody>
</table>
clear lacp counters

To clear the statistics for all the interfaces belonging to a specific channel group, use the **clear lacp counters** command.

```
clear lacp [channel-group] counters
```

**Syntax Description**

- `channel-group` (Optional) Channel-group number; valid values are from 1 to 64.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- 12.1(13)EW Support for this command was introduced on the Catalyst 4500 series switches.

**Usage Guidelines**

- This command is not supported on systems that are configured with a Supervisor Engine I.
- If you do not specify a channel group, all channel groups are cleared.
- If you enter this command for a channel group that contains members in PAgP mode, the command is ignored.

**Examples**

This example shows how to clear the statistics for a specific group:

```
Switch# clear lacp 1 counters
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show lacp</td>
<td>Displays LACP information.</td>
</tr>
</tbody>
</table>
clear mac-address-table

To clear the global counter entries from the Layer 2 MAC address table, use the clear mac-address-table command.

```
clear mac-address-table {dynamic [{address mac_addr} | {interface interface}] [vlan vlan_id] | notification}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic</td>
<td>Specifies dynamic entry types.</td>
</tr>
<tr>
<td>address mac_addr</td>
<td>(Optional) Specifies the MAC address.</td>
</tr>
<tr>
<td>interface interface</td>
<td>(Optional) Specifies the interface and clears the entries associated with it; valid values are FastEthernet and GigabitEthernet.</td>
</tr>
<tr>
<td>vlan vlan_id</td>
<td>(Optional) Specifies the VLANs; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>notification</td>
<td>Specifies MAC change notification global counters.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Support for MAC address notification global counters added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Enter the clear mac-address-table dynamic command with no arguments to remove all dynamic entries from the table.

The clear mac-address-table notification command only clears the global counters which are displayed with show mac-address-table notification command. It does not clear the global counters and the history table of the CISCO-MAC-NATIFICATION-MIB.

### Examples

This example shows how to clear all the dynamic Layer 2 entries for a specific interface (gi1/1):

```
Switch# clear mac-address-table dynamic interface gi1/1
Switch#
```

This example shows how to clear the MAC address notification counters:

```
Switch# clear mac-address-table notification
Switch#
```
### Related Commands

<table>

</table>
clear mac-address-table dynamic

To clear the dynamic address entries from the Layer 2 MAC address table, use the `clear mac-address-table dynamic` command.

```
clear mac-address-table dynamic [{address mac_addr} | {interface interface}] [vlan vlan_id]
```

**Syntax Description**
- `address mac_addr` (Optional) Specifies the MAC address.
- `interface interface` (Optional) Specifies the interface and clears the entries associated with it; valid values are `FastEthernet` and `GigabitEthernet`.
- `vlan vlan_id` (Optional) Specifies the VLANs; valid values are from 1 to 4094.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</tr>
<tr>
<td><code>show mac-address-table address</code></td>
<td>Displays the information about the MAC-address table.</td>
</tr>
</tbody>
</table>
clear pagp

To clear the port-channel information, use the `clear pagp` command.

```
clear pagp {group-number | counters}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-number</code></td>
<td>Channel-group number; valid values are from 1 to 64.</td>
</tr>
<tr>
<td><code>counters</code></td>
<td>Clears traffic filters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to clear the port-channel information for a specific group:

```
Switch# clear pagp 32
Switch#
```

This example shows how to clear all the port-channel traffic filters:

```
Switch# clear pagp counters
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show pagp</code></td>
<td>Displays information about the port channel.</td>
</tr>
</tbody>
</table>
clear port-security

To delete all configured secure addresses or a specific dynamic or sticky secure address on an interface from the MAC address table, use the **clear port-security** command.

```
clear port-security dynamic [address mac-addr [vlan vlan-id]] | [interface interface-id] [vlan access | voice]
```

**Syntax Description**

- **dynamic**: Deletes all the dynamic secure MAC addresses.
- **address mac-addr**: (Optional) Deletes the specified secure MAC address.
- **vlan vlan-id**: (Optional) Deletes the specified secure MAC address from the specified VLAN.
- **interface interface-id**: (Optional) Deletes the secure MAC addresses on the specified physical port or port channel.
- **vlan access**: (Optional) Deletes the secure MAC addresses from access VLANs.
- **vlan voice**: (Optional) Deletes the secure MAC addresses from voice VLANs.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Usage Guidelines**

If you enter the **clear port-security all** command, the switch removes all the dynamic secure MAC addresses from the MAC address table.

- **Note**: You can clear sticky and static secure MAC addresses one at a time with the **no switchport port-security mac-address** command.

If you enter the **clear port-security dynamic interface interface-id** command, the switch removes all the dynamic secure MAC addresses on an interface from the MAC address table.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(31)SG</td>
<td>Add support for sticky port security.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to remove all the dynamic secure addresses from the MAC address table:

```
Switch# clear port-security dynamic
```

This example shows how to remove a dynamic secure address from the MAC address table:

```
Switch# clear port-security dynamic address 0008.0070.0007
```
This example shows how to remove all the dynamic secure addresses learned on a specific interface:

```
Switch# clear port-security dynamic interface gigabitethernet0/1
```

You can verify that the information was deleted by entering the `show port-security` command.

### Related Commands

<table>
<thead>

<tbody>
<tr>
<td><code>show port-security</code></td>
<td>Displays information about the port-security setting.</td>
</tr>
<tr>
<td><code>switchport port-security</code></td>
<td>Enables port security on an interface.</td>
</tr>
</tbody>
</table>
clear qos

To clear the global and per-interface aggregate QoS counters, use the `clear qos` command.

```
clear qos [aggregate-policer [name] | interface {fastethernet | GigabitEthernet} {mod/interface} | vlan [vlan_num] | port-channel {number}]
```

**Syntax Description**

- **aggregate-policer name** (Optional) Specifies an aggregate policer.
- **interface** (Optional) Specifies an interface.
- **fastethernet** (Optional) Specifies the Fast Ethernet 802.3 interface.
- **GigabitEthernet** (Optional) Specifies the Gigabit Ethernet 802.3z interface.
- **mod/interface** (Optional) Number of the module and interface.
- **vlan vlan_num** (Optional) Specifies a VLAN.
- **port-channel number** (Optional) Specifies the channel interface; valid values are from 1 to 64.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on Supervisor Engine 6-E and the Catalyst 4900M chassis.

**Note**

When you enter the `clear qos` command, the way that the counters work is affected and the traffic that is normally restricted could be forwarded for a short period of time.

The `clear qos` command resets the interface QoS policy counters. If no interface is specified, the `clear qos` command resets the QoS policy counters for all interfaces.

**Examples**

This example shows how to clear the global and per-interface aggregate QoS counters for all the protocols:

```
Switch# clear qos
Switch#
```

This example shows how to clear the specific protocol aggregate QoS counters for all the interfaces:

```
Switch# clear qos aggregate-policer
Switch#
```

clear vlan counters

To clear the software-cached counter values to start from zero again for a specified VLAN or all existing VLANs, use the `clear vlan counters` command.

```
clear vlan [vlan-id] counters
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan-id</strong></td>
<td>(Optional) VLAN number; see the “Usage Guidelines” section for valid values.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a `vlan-id` value; the software-cached counter values for all the existing VLANs are cleared.

**Examples**

This example shows how to clear the software-cached counter values for a specific VLAN:

```
Switch# clear vlan 10 counters
Clear "show vlan" counters on this vlan [confirm] y
Switch#
```

**Related Commands**

</tbody>
</table>
control-plane

To enter control-plane configuration mode, which allows users to associate or modify attributes or parameters (such as a service policy) that are associated with the control plane of the device, use the control-plane command.

Syntax Description
This command has no arguments or keywords.

Defaults
Default service police named “system-cpp-policy” is attached.

Command Modes
Global configuration mode

Command History
Release Modification
12.2(31)SG Support for this command was introduced.

Usage Guidelines
This command is not supported on Supervisor Engine 6-E and the Catalyst 4900M chassis.

After you enter the control-plane command, you can define control plane services for your route processor. For example, you can associate a service policy with the control plane to police all traffic that is destined to the control plane.

Examples
These examples show how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specified rate:

Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet
! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet
! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet
! Define class-map "telnet-class."
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map control-plane
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 32000 1000 conform transmit exceed drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
! Define aggregate control plane service for the active Route Processor.
Switch(config)# macro global apply system-cpp
Switch(config)# control-plane
Switch(config-cp)# service-police input system-cpp-policy
Switch(config-cp)# exit
### Related Commands

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
**counter**

To assign a counter set to a switch port, use the `counter` command. To remove a counter assignment, use the `no` form of this command.

```
  counter
  no counter
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default setting.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported on Supervisor Engine 6-E and the Catalyst 4900M chassis.

The total number of switch ports that can have transmit and receive counters is 4096.

When a Layer 3 port with counter assigned is changed to a Layer 2 port or removed, the hardware counters are freed. This action is similar to entering the `no counter` command.

**Examples**

This example shows how to assign a counter set to a switch port:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# interface vlan 20
Switch(config-if)# counter
Switch(config-if)# end
Switch#
```
To enable active queue management on a transmit queue used by a class of traffic, use the `dbl` command. Use the `no` form of this command to return to the default setting.

```
dbl
no dbl
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
Active queue management is disabled.

**Command Modes**
Policy-map class configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support added on Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The semantics of the DBL configuration is similar to the (W)RED algorithm. The `dbl` command can operate alone on class-default; otherwise, it requires you to configure the `bandwidth` or `shape` commands on the class.

**Examples**
This example shows how to enable `dbl` action in a class:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# dbl
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</tbody>
</table>
debug adjacency

To display information about the adjacency debugging, use the `debug adjacency` command. To disable debugging output, use the `no` form of this command.

```
debug adjacency [ipc]
```

```
no debug adjacency
```

**Syntax Description**
- `ipc` (Optional) Displays the IPC entries in the adjacency database.

**Defaults**
This command has no default settings.

**Command Modes**
- Privileged EXEC mode

**Command History**
- **Release** 12.1(8a)EW
- **Modification** Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**
This example shows how to display the information in the adjacency database:

```
Switch# debug adjacency
4d02h: ADJ: add 172.20.52.36 (GigabitEthernet1/1) via ARP will expire: 04:00:00
4d02h: ADJ: add 172.20.52.36 (GigabitEthernet1/1) via ARP will expire: 04:00:00

</table>
debug condition interface

To limit the debugging output of interface-related activities, use the `debug condition interface` command. To disable the debugging output, use the `no` form of this command.

```
debug condition interface {fastethernet mod/port | GigabitEthernet mod/port | null interface_num | port-channel interface-num | vlan vlan_id}

no debug condition interface {fastethernet mod/port | GigabitEthernet mod/port | null interface_num | port-channel interface-num | vlan vlan_id}
```

**Syntax Description**
- **fastethernet** Limits the debugging to Fast Ethernet interfaces.
- **mod/port** Number of the module and port.
- **GigabitEthernet** Limits the debugging to Gigabit Ethernet interfaces.
- **null interface-num** Limits the debugging to null interfaces; the valid value is 0.
- **port-channel interface-num** Limits the debugging to port-channel interfaces; valid values are from 1 to 64.
- **vlan vlan_id** Specifies the VLAN interface number; valid values are from 1 to 4094.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tr>
<td>debug interface</td>
<td>Abbreviates the entry of the <code>debug condition interface</code> command.</td>
</tr>
<tr>
<td>undebug condition interface</td>
<td>Enables interface-related activities.</td>
</tr>
<tr>
<td>(same as no debug condition interface)</td>
<td></td>
</tr>
</tbody>
</table>
**debug condition standby**

To limit the debugging output for the standby state changes, use the `debug condition standby` command. To disable the debugging output, use the `no` form of this command.

```
depug condition standby {fastethernet mod/port | GigabitEthernet mod/port | port-channel interface-num | vlan vlan_id group-number}
```

```
no debug condition standby {fastethernet mod/port | GigabitEthernet mod/port | port-channel interface-num | vlan vlan_id group-number}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Fastethernet</th>
<th>Limit the debugging to Fast Ethernet interfaces.</th>
</tr>
</thead>
<tbody>
<tr>
<td>mod/port</td>
<td>Number of the module and port.</td>
</tr>
<tr>
<td>GigabitEthernet</td>
<td>Limits the debugging to Gigabit Ethernet interfaces.</td>
</tr>
<tr>
<td>port-channel</td>
<td>Limits the debugging output to port-channel interfaces; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>interface-num</td>
<td></td>

<tr>
<td>vlan</td>
<td>Limits the debugging of a condition on a VLAN interface; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>vlan_id</td>
<td></td>
</tr>
<tr>
<td>group-number</td>
<td>VLAN group number; valid values are from 0 to 255.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you attempt to remove the only condition set, you will be prompted with a message asking if you want to abort the removal operation. You can enter `n` to abort the removal or `y` to proceed with the removal. If you remove the only condition set, an excessive number of debugging messages might occur.

### Examples

This example shows how to limit the debugging output to group 0 in VLAN 1:

```
Switch# debug condition standby vlan 1 0
Condition 3 set
Switch#
```
This example shows the display if you try to turn off the last standby debug condition:

```
Switch# no debug condition standby vlan 1 0
This condition is the last standby condition set.
Removing all conditions may cause a flood of debugging messages to result, unless specific debugging flags are first removed.

Proceed with removal? [yes/no]: n
% Operation aborted
Switch#
```

### Related Commands

<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify a keyword, all debug messages are displayed.

**Examples**

This example shows how to display all the EtherChannel debug messages:

```
Switch# debug etherchnl
PAgP Shim/FEC debugging is on
22:46:30:FEC:returning apport Po15 for port (Fa2/1)
22:46:31:FEC:returning apport Po15 for port (Fa4/14)
22:46:33:FEC:comparing GC values of Fa2/25 Fa2/15 flag = 1 1
22:46:33:FEC:EC - attrinb incompatable for Fa2/25; duplex of Fa2/25 is half, Fa2/15 is full
22:46:33:FEC:pagp_switch_choose_unique:Fa2/25, port Fa2/15 in apport Po3 is incompatable
Switch#
```

This example shows how to display the EtherChannel IDB debug messages:

```
Switch# debug etherchnl idb
Agport idb related debugging is on
Switch#
```
This example shows how to disable the debugging:

```
Switch# no debug etherchnl
Switch#
```

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>

debug interface

To abbreviate the entry of the `debug condition interface` command, use the `debug interface` command. To disable debugging output, use the `no` form of this command.

```
depth interface { FastEthernet mod/port | GigabitEthernet mod/port | null | port-channel interface-num | vlan vlan_id }
```

```
no debug interface { FastEthernet mod/port | GigabitEthernet mod/port | null | port-channel interface-num | vlan vlan_id }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FastEthernet</code></td>
<td>Limits the debugging to Fast Ethernet interfaces.</td>
</tr>
<tr>
<td><code>mod/port</code></td>
<td>Number of the module and port.</td>
</tr>
<tr>
<td><code>GigabitEthernet</code></td>
<td>Limits the debugging to Gigabit Ethernet interfaces.</td>
</tr>
<tr>
<td><code>null</code></td>
<td>Limits the debugging to null interfaces; the only valid value is 0.</td>
</tr>
<tr>
<td><code>port-channel interface-num</code></td>
<td>Limits the debugging to port-channel interfaces; valid values are from 1 to 64.</td>
</tr>
<tr>
<td><code>vlan vlan_id</code></td>
<td>Specifies the VLAN interface number; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to limit the debugging to interface VLAN 1:

```
Switch# debug interface vlan 1
Condition 1 set
Switch#
```

### Related Commands

</table>
debug ipc

To debug the IPC activity, use the debug ipc command. To disable the debugging output, use the no form of this command.

```
debug ipc { all | errors | events | headers | packets | ports | seats }

no debug ipc { all | errors | events | headers | packets | ports | seats }
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Enables all IPC debugging.</td>
</tr>
<tr>
<td>errors</td>
<td>Enables the IPC error debugging.</td>
</tr>
<tr>
<td>events</td>
<td>Enables the IPC event debugging.</td>
</tr>
<tr>
<td>headers</td>
<td>Enables the IPC header debugging.</td>
</tr>
<tr>
<td>packets</td>
<td>Enables the IPC packet debugging.</td>
</tr>
<tr>
<td>ports</td>
<td>Enables the debugging of the creation and deletion of ports.</td>
</tr>
<tr>
<td>seats</td>
<td>Enables the debugging of the creation and deletion of nodes.</td>
</tr>
</tbody>
</table>

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>

To debug the LACP activity, use the `debug lacp` command. To disable the debugging output, use the `no` form of this command.

```
d debug lacp [all | event | fsm | misc | packet]
```

### Syntax Description

- **all** (Optional) Enables all LACP debugging.
- **event** (Optional) Enables the debugging of the LACP events.
- **fsm** (Optional) Enables the debugging of the LACP finite state machine.
- **misc** (Optional) Enables the miscellaneous LACP debugging.
- **packet** (Optional) Enables the LACP packet debugging.

### Defaults

Debugging of LACP activity is disabled.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is supported only on the supervisor engine and enterable only from the Catalyst 4500 series switch console.

### Examples

This example shows how to enable the LACP miscellaneous debugging:

```
Switch# debug lacp
Port Aggregation Protocol Miscellaneous debugging is on
Switch# 
```

### Related Commands

<table>
<thead>
<tr>

<td><code>undebug pagp</code> (same as no debug pagp)</td>
<td>Disables debugging output.</td>
</tr>
</tbody>
</table>
debug monitor

To display the monitoring activity, use the `debug monitor` command. To disable the debugging output, use the `no` form of this command.

```
debug monitor { all | errors | idb-update | list | notifications | platform | requests }
no debug monitor { all | errors | idb-update | list | notifications | platform | requests }
```

**Syntax Description**

- `all` Displays all the SPAN debugging messages.
- `errors` Displays the SPAN error details.
- `idb-update` Displays the SPAN IDB update traces.
- `list` Displays the SPAN list tracing and the VLAN list tracing.
- `notifications` Displays the SPAN notifications.
- `platform` Displays the SPAN platform tracing.
- `requests` Displays the SPAN requests.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>

</table>
debug pm

To debug the port manager (PM) activity, use the `debug pm` command. To disable the debugging output, use the `no` form of this command.

```
debug pm {all | card | cookies | etherchnl | messages | port | registry | scp | sm | span | split | vlan | vp}

no debug pm {all | card | cookies | etherchnl | messages | port | registry | scp | sm | span | split | vlan | vp}
```

**Syntax Description**

- `all` Displays all PM debugging messages.
- `card` Debugs the module-related events.
- `cookies` Enables the internal PM cookie validation.
- `etherchnl` Debugs the EtherChannel-related events.
- `messages` Debugs the PM messages.
- `port` Debugs the port-related events.
- `registry` Debugs the PM registry invocations.
- `scp` Debugs the SCP module messaging.
- `sm` Debugs the state machine-related events.
- `span` Debugs the spanning-tree-related events.
- `split` Debugs the split-processor.
- `vlan` Debugs the VLAN-related events.
- `vp` Debugs the virtual port-related events.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable all PM debugging:

```
Switch# debug pm all
Switch#
```

**Related Commands**

- `undebug pm` (same as `no debug pm`) Disables debugging output.
**debug port-security**

To debug port security, use the `debug port-security` command. To disable the debugging output, use the `no` form of this command.

```plaintext
debug port-security

no debug port-security
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>

debug redundancy

To debug supervisor engine redundancy, use the `debug redundancy` command. To disable the debugging output, use the `no` form of this command.

```
debug redundancy {errors | fsm | kpa | msg | progression | status | timer}
no debug redundancy
```

**Syntax Description**

- **errors**: Enables the redundancy facility for error debugging.
- **fsm**: Enables the redundancy facility for FSM event debugging.
- **kpa**: Enables the redundancy facility for keepalive debugging.
- **msg**: Enables the redundancy facility for messaging event debugging.
- **progression**: Enables the redundancy facility for progression event debugging.
- **status**: Enables the redundancy facility for status event debugging.
- **timer**: Enables the redundancy facility for timer event debugging.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to debug the redundancy facility timer event debugging:

```
Switch# debug redundancy timer
Redundancy timer debugging is on
Switch#
```
debug spanning-tree

To debug the spanning tree activities, use the debug spanning-tree command. To disable the debugging output, use the no form of this command.

```
debug spanning-tree { all | backbonefast | bpdu | bpdu-opt | etherchannel | config | events | exceptions | general | ha | mstp | pvst+ | root | snmp | switch | synchronization | uplinkfast }
no debug spanning-tree { all | bpdu | bpdu-opt | etherchannel | config | events | exceptions | general | mst | pvst+ | root | snmp }
```

### Syntax Description
- `all`: Displays all the spanning tree debugging messages.
- `backbonefast`: Debugs the BackboneFast events.
- `bpdu`: Debugs the spanning tree BPDU.
- `bpdu-opt`: Debugs the optimized BPDU handling.
- `etherchannel`: Debugs the spanning tree EtherChannel support.
- `config`: Debugs the spanning tree configuration changes.
- `events`: Debugs the TCAM events.
- `exceptions`: Debugs the spanning tree exceptions.
- `general`: Debugs the general spanning tree activity.
- `ha`: Debugs the HA events.
- `mstp`: Debugs the multiple spanning tree events.
- `pvst+`: Debugs the PVST+ events.
- `root`: Debugs the spanning tree root events.
- `snmp`: Debugs the spanning tree SNMP events.
- `switch`: Debugs the switch debug events.
- `synchronization`: Debugs the STP state synchronization events.
- `uplinkfast`: Debugs the UplinkFast events.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>

<td><code>undebug spanning-tree switch</code> (same as no debug spanning-tree switch)</td>
<td>Disables debugging output.</td>
</tr>
</tbody>
</table>
**debug spanning-tree uplinkfast**

To enable the debugging of the spanning-tree UplinkFast events, use the `debug spanning-tree uplinkfast` command. To disable the debugging output, use the `no` form of this command.

```
debug spanning-tree uplinkfast [exceptions]
no debug spanning-tree uplinkfast
```

**Syntax Description**

- `exceptions` (Optional) Enables the debugging of the spanning tree UplinkFast exceptions.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

debug sw-vlan

To debug the VLAN manager activities, use the **debug sw-vlan** command. To disable the debugging output, use the **no** form of this command.

```
ddebug sw-vlan {badpmcookies | events | management | packets | registries}

nodiag debug sw-vlan {badpmcookies | events | management | packets | registries}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>

<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>undiag debug sw-vlan</td>
<td>(same as no debug sw-vlan)</td>
</tr>
</tbody>
</table>
**debug sw-vlan ifs**

To enable the VLAN manager Cisco IOS file system (IFS) error tests, use the `debug sw-vlan ifs` command. To disable the debugging output, use the `no` form of this command.

```
debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
no debug sw-vlan ifs {open {read | write} | read {1 | 2 | 3 | 4} | write}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>open</code></td>
<td>Enables the VLAN manager IFS debugging of errors in an IFS file-open operation.</td>
</tr>
<tr>
<td><code>read</code></td>
<td>Debugs the errors that occurred when the IFS VLAN configuration file was open for reading.</td>
</tr>
<tr>
<td><code>write</code></td>
<td>Debugs the errors that occurred when the IFS VLAN configuration file was open for writing.</td>
</tr>
<tr>
<td>`{1</td>
<td>2</td>
</tr>
<tr>
<td><code>write</code></td>
<td>Debugs the errors that occurred during an IFS file-write operation.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The following are four types of file read operations:

- **Operation 1**—Reads the file header, which contains the header verification word and the file version number.

- **Operation 2**—Reads the main body of the file, which contains most of the domain and VLAN information.

- **Operation 3**—Reads TLV descriptor structures.

- **Operation 4**—Reads TLV data.

### Examples

This example shows how to debug the TLV data errors during a file-read operation:

```
Switch# debug sw-vlan ifs read 4
vlan manager ifs read # 4 errors debugging is on
Switch#
```
### Related Commands

</table>
define interface-range

To create a macro of interfaces, use the `define interface-range` command.

```
define interface-range macro-name interface-range
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>macro-name</td>
<td>Name of the interface range macro; up to 32 characters.</td>
</tr>
<tr>
<td>interface-range</td>
<td>List of valid ranges when specifying interfaces; see the “Usage Guidelines” section.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The macro name is a character string of up to 32 characters.

A macro can contain up to five ranges. An interface range cannot span modules.

When entering the `interface-range`, use these formats:

- `interface-type {mod}/[/first-interface} - {last-interface}
- `interface-type {mod}/[/first-interface} - {last-interface}

The valid values for `interface-type` are as follows:

- FastEthernet
- GigabitEthernet
- Vlan `vlan_id`

**Examples**

This example shows how to create a multiple-interface macro:

```
Switch(config)# define interface-range macrol gigabitethernet 4/1-6, fastethernet 2/1-5
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface range</code></td>
<td>Runs a command on multiple ports at the same time.</td>
</tr>
</tbody>
</table>
To deny an ARP packet based on matches against the DHCP bindings, use the `deny` command. To remove the specified ACEs from the access list, use the `no` form of this command.

```
```

```
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request</td>
<td>(Optional) Requests a match for the ARP request. When request is not specified, matching is performed against all ARP packets.</td>
</tr>
<tr>
<td>ip</td>
<td>Specifies the sender IP address.</td>
</tr>
<tr>
<td>any</td>
<td>Specifies that any IP or MAC address will be accepted.</td>
</tr>
<tr>
<td>host sender-ip</td>
<td>Specifies that only a specific sender IP address will be accepted.</td>
</tr>
<tr>
<td>sender-ip</td>
<td>Specifies that a specific range of sender IP addresses will be accepted.</td>
</tr>
<tr>
<td>mac</td>
<td>Specifies the sender MAC address.</td>
</tr>
<tr>
<td>host sender-mac</td>
<td>Specifies that only a specific sender MAC address will be accepted.</td>
</tr>
<tr>
<td>sender-mac</td>
<td>Specifies that a specific range of sender MAC addresses will be accepted.</td>
</tr>
<tr>
<td>response</td>
<td>Specifies a match for the ARP responses.</td>
</tr>
<tr>
<td>ip</td>
<td>Specifies the IP address values for the ARP responses.</td>
</tr>
<tr>
<td>host target-ip</td>
<td>(Optional) Specifies that only a specific target IP address will be accepted.</td>
</tr>
<tr>
<td>target-ip</td>
<td>(Optional) Specifies that a specific range of target IP addresses will be accepted.</td>
</tr>
<tr>
<td>mac</td>
<td>Specifies the MAC address values for the ARP responses.</td>
</tr>
<tr>
<td>host target-mac</td>
<td>(Optional) Specifies that only a specific target MAC address will be accepted.</td>
</tr>
<tr>
<td>target-mac</td>
<td>(Optional) Specifies that a specific range of target MAC addresses will be accepted.</td>
</tr>
<tr>
<td>log</td>
<td>(Optional) Logs a packet when it matches the access control entry (ACE).</td>
</tr>
</tbody>
</table>

**Defaults**

At the end of the ARP access list, there is an implicit `deny ip any mac any` command.

**Command Modes**

arp-nacl configuration mode
deny

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Deny clauses can be added to forward or drop ARP packets based on some matching criteria.

Examples

This example shows a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This example shows how to deny both requests and responses from this host:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# deny ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
Switch# show arp access-list
        ARP access list static-hosts
        deny ip host 1.1.1.1 mac host 0000.0000.abcd
Switch#
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>arp access-list</strong></td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>

</tbody>
</table>
destination address

To configure the destination e-mail address or URL to which Call Home messages will be sent, use the destination address command.

```
destination address {email email-address | http url}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>email email-address</td>
<td>Specifies the destination e-mail address in 1 to 200 characters.</td>
</tr>
<tr>
<td>http url</td>
<td>Specifies the destination HTTP URL in 2 to 200 characters.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the **profile** command in call-home configuration mode.

When entering the https://destination URL for the secure server, you must also configure a trustpoint CA.

**Examples**

This example shows how to set the destination to the e-mail address `callhome@cisco.com`:

```
Switch(config)# call-home
Switch(config-call-home)# profile cisco
Switch(config-call-home-profile)# destination address email callhome@cisco.com
```

**Related Commands**

<tr>
<td>destination transport-method</td>
<td>Enables the message transport method.</td>
</tr>
</tbody>
</table>
destination message-size-limit bytes

To configure a maximum destination message size for the destination profile, use the `destination message-size-limit bytes` command.

```
destination message-size-limit bytes
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

3145728 bytes

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

**Examples**

This example shows how to configure the maximum message size for the destination profile as 3000000:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# destination message-size-limit 3000000
Switch(cfg-call-home-profile)#
```

**Related Commands**

</tr>
<tr>
<td><code>destination transport-method</code></td>
<td>Enables the message transport method.</td>
</tr>
</tbody>
</table>
destination preferred-msg-format

To configure a preferred message format, use the `destination preferred-msg-format` command.

```
destination preferred-msg-format { long-text | short-text | xml }
```

**Syntax Description**

- `long-text`: Sends the message in long-text format.
- `short-text`: Sends the message in short-text format.
- `xml`: Sends the message in XML format.

**Defaults**

xml

**Command Modes**

cfg-call-home-profile

**Command History**

<table>

</table>
diagnostic monitor action

To direct the action of the switch when it detects a packet memory failure, use the **diagnostic monitor action** command.

```
diagnostic monitor action [conservative | normal | aggressive]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conservative</td>
<td>(Optional) Specifies that the bootup SRAM diagnostics log all failures and remove all affected buffers from the hardware operation. The ongoing SRAM diagnostics will log events, but will take no other action.</td>
</tr>
<tr>
<td>normal</td>
<td>(Optional) Specifies that the SRAM diagnostics operate as in conservative mode, except that an ongoing failure resets the supervisor engine; allows for the bootup tests to map out the affected memory.</td>
</tr>
<tr>
<td>aggressive</td>
<td>(Optional) Specifies that the SRAM diagnostics operate as in normal mode, except that a bootup failure only logs failures and does not allow the supervisor engine to come online; allows for either a redundant supervisor engine or network-level redundancy to take over.</td>
</tr>
</tbody>
</table>

**Defaults**

normal mode

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `conservative` keyword when you do not want the switch to reboot so that the problem can be fixed.

Use the `aggressive` keyword when you have redundant supervisor engines, or when network-level redundancy has been provided.

**Examples**

This example shows how to configure the switch to initiate an RPR switchover when an ongoing failure occurs:

```
Switch# configure terminal
Switch (config)# diagnostic monitor action normal
```

**Related Commands**

</table>
diagnostic start

To run the specified diagnostic test, use the diagnostic start command.

    diagnostic start {module num} {test test-id} [port num]

Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module</td>
<td>Module number.</td>
</tr>
<tr>
<td>test</td>
<td>Specifies a test to run.</td>
</tr>
<tr>
<td>test-id</td>
<td>Specifies an identification number for the test to be run; can be the cable diagnostic test-id, or the cable-tdr keyword.</td>
</tr>
<tr>
<td>port</td>
<td>(Optional) Specifies the interface port number.</td>
</tr>
</tbody>
</table>

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

Release  Modification
12.2(25)SG  Support for this command was introduced on the Catalyst 4500 series switch.

Examples

This example shows how to run the specified diagnostic test at the specified module:

    This exec command starts the TDR test on specified interface
    Switch# diagnostic start module 1 test cable-tdr port 3
    diagnostic start module 1 test cable-tdr port 3
    module 1: Running test(s) 5 Run interface level cable diags
    module 1: Running test(s) 5 may disrupt normal system operation
    Do you want to continue? [no]: yes
    yes
    Switch#
    2d16h: %DIAG-6-TEST_RUNNING: module 1: Running online-diag-tdr(ID=5) ...
    2d16h: %DIAG-6-TEST_OK: module 1: online-diag-tdr(ID=5) has completed successfully
    Switch#

Note

The show cable-diagnostic tdr command displays the results of a TDR test. The test results will not be available until approximately 1 minute after the test starts. If you enter the show cable-diagnostic tdr command within 1 minute of the test starting, you may see a “TDR test is in progress on interface...” message.

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can manage remote systems using unidirectional control. Unidirectional control enables you to turn on systems remotely using a specific Ethernet packet, known as a magic packet.

Using unidirectional control enables you to remotely manage systems using 802.1X ports. In the past, the port became unauthorized after the systems was turned off. In this state, the port only allowed the receipt and transmission of EAPoL packets. Therefore, there was no way for the unidirectional control magic packet to reach the host and without being turned on there was no way for the system to authenticate and open the port.

**Examples**

This example shows how to enable unidirectional control on incoming packets:

```
Switch(config-if)# dot1x control-direction in
Switch(config-if)#
```

</tbody>
</table>
dot1x critical recovery delay

To set the time interval between port reinitializations, use the `dot1x critical recovery delay` command. To return to the default setting, use the `no` form of this command.

```
dot1x critical recovery delay delay-time

no dot1x critical recovery delay
```

**Syntax Description**

- `delay-time`: Specifies the interval between port reinitializations when AAA transition occurs; valid values are from 1 to 10,000 milliseconds.

**Defaults**

Delay time is set to 100 milliseconds.

**Command Modes**

Global configuration mode

**Command History**

<table>

dot1x critical vlan

To assign a critically authenticated port to a specific VLAN, use the `dot1x critical vlan` command. To return to the default setting, use the `no` form of this command.

```
dot1x critical vlan vlan-id
no dot1x critical vlan-id
```

**Syntax Description**
- `vlan-id` (Optional) Specifies the VLANs; valid values are from 1 to 4094.

**Defaults**
Critical authentication is disabled on a ports VLAN.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The type of VLAN specified must match the type of the port. If the port is an access port, the VLAN must be a regular VLAN. If the port is a private-VLAN host port, the VLAN must be the secondary VLAN of a valid private-VLAN domain. If the port is a routed port, no VLAN may be specified.

This command is not supported on platforms such as Layer 3 switches that do not include the Critical Auth VLAN subsystem.

**Examples**
This example shows how to enable 802.1x critical authentication on a ports VLAN:

```
Switch(config-if)# dot1x critical vlan 350
```

**Related Commands**

<table>
<thead>
<tr>

dot1x guest-vlan

To enable a guest VLAN on a per-port basis, use the `dot1x guest-vlan` command. To return to the default setting, use the `no` form of this command.

```
dot1x guest-vlan vlan-id

no dot1x guest-vlan vlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Specifies a VLAN in the range of 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.; the guest VLAN feature is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for secondary VLAN as the configured guest VLAN ID was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Guest VLANs can be configured only on ports that are statically configured as access ports or private VLAN host ports. Statically configured access ports can be configured with regular VLANs as guest VLANs; statically configured private VLAN host ports can be configured with secondary private VLANs as guest VLANs.

**Examples**

This example shows how to enable a guest VLAN on Fast Ethernet interface 4/3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x guest-vlan 26
Switch(config-if)# end
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x max-reauth-req</td>
<td>Sets the maximum number of times that the switch will retransmit an EAP-Request/Identity frame to the client before restarting the authentication process.</td>

</table>
**dot1x guest-vlan supplicant**

To place an 802.1X-capable supplicant (host) into a guest VLAN, use the `dot1x guest-vlan supplicant` global configuration command. To return to the default setting, use the `no` form of this command.

```
  dot1x guest-vlan supplicant

  no dot1x guest-vlan supplicant
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
802.1X-capable hosts are not put into a guest VLAN.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
With Cisco Release 12.2(25) EWA, you can use the `dot1x guest-vlan supplicant` command to place an 802.1X-capable host into a guest VLAN. Prior to Cisco Release 12.2(25)EWA, you could only place non-802.1X capable hosts into a guest VLAN.

When guest VLAN supplicant behavior is enabled, the Catalyst 4500 series switch does not maintain EAPOL packet history. The switch allows clients that fail 802.1X authentication to access a guest VLAN, whether or not EAPOL packets have been detected on the interface.

**Examples**
This example shows how to place an 802.1X-capable supplicant (host) into a guest VLAN:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dot1x system-auth-control</code></td>
<td>Enables 802.1X authentication on the switch.</td>

<tr>
<td><code>show dot1x</code></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x host-mode**

Use the `dot1x host-mode` interface configuration command on the switch stack or on a standalone switch to allow a single host (client) or multiple hosts on an IEEE 802.1x-authorized port. Use the `multi-domain` keyword to enable multidomain authentication (MDA) on an IEEE 802.1x-authorized port. Use the `no` form of this command to return to the default setting.

```
dot1x host-mode {multi-host | single-host | multi-domain}

no dot1x host-mode [multi-host | single-host | multi-domain]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multi-host</td>
<td>Enables multiple-hosts mode on the switch.</td>
</tr>
<tr>
<td>single-host</td>
<td>Enables single-host mode on the switch.</td>
</tr>
<tr>
<td>multi-domain</td>
<td>Enables MDA on a switch port.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is single-host mode.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(37)SG</td>
<td>Added support for multiple domains.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to limit an IEEE 802.1x-enabled port to a single client or to attach multiple clients to an IEEE 802.1x-enabled port. In multiple-hosts mode, only one of the attached hosts needs to be successfully authorized for all hosts to be granted network access. If the port becomes unauthorized (re-authentication fails or an Extensible Authentication Protocol over LAN [EAPOL]-logoff message is received), all attached clients are denied access to the network.

Use the `multi-domain` keyword to enable MDA on a port. MDA divides the port into both a data domain and a voice domain. MDA allows both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), on the same IEEE 802.1x-enabled port.

Before entering this command, make sure that the `dot1x port-control` interface configuration command is set to `auto` for the specified port.

You can assign both voice and data VLAN dynamically from the ACS server. No additional configuration is required to enable dynamic VLAN assignment on the switch. To enable VLAN assignment, you must configure the Cisco ACS server. For details on configuring the ACS server for voice VLAN assignment, refer to the “Cisco ACS Configuration for VLAN Assignment” section in the Catalyst 4500 Series Switch Software Configuration Guide—Release, 12.2(52)SG.
Examples

This example shows how to enable IEEE 802.1x authentication and to enable multiple-hosts mode:

```
Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet6/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
Switch(config-if)# end
Switch#
```

This example shows how to enable MDA and to allow both a host and a voice device on the port:

```
Switch# configure t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet6/1
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#
```

You can verify your settings by entering the `show dot1x [interface interface-id]` privileged EXEC command.

dot1x mac-auth-bypass

To enable the 802.1X MAC address bypassing on a switch, use the **dot1x mac-auth-bypass** command. Use the **no** form of this command to disable MAC address bypassing.

```
dot1x mac-auth-bypass [eap]

no dot1x mac-auth-bypass [eap]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>eap</th>
<th>(Optional) Specifies using EAP MAC address authentication.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defaults</td>
<td></td>
<td>There is no default setting.</td>
</tr>
<tr>
<td>Command Modes</td>
<td>Interface configuration mode</td>
<td></td>
</tr>
</tbody>
</table>

**Command History**

```
Release    Modification
12.2(31)SG Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

The removal of the **dot1x mac-auth-bypass** configuration from a port does not affect the authorization or authentication state of a port. If the port is in unauthenticated state, it remains unauthenticated, and if MAB is active, the authentication will revert back to the 802.1X Authenticator. If the port is authorized with a MAC address, and the MAB configuration is removed the port remains authorized until re-authentication takes place. When re-authentication occurs the MAC address is removed in favor of an 802.1X supplicant, which is detected on the wire.

**Examples**

This example shows how to enable EAP MAC address authentication:

```
Switch(config-if)# dot1x mac-auth-bypass
Switch(config-if)#
```
**dot1x max-reauth-req**

To set the maximum number of times that the switch will retransmit an EAP-Request/Identity frame to the client before restarting the authentication process, use the `dot1x max-reauth-req` command. To return to the default setting, use the `no` form of this command.

```
dot1x max-reauth-req count
no dot1x max-reauth-req
```

**Syntax Description**

- `count`: Number of times that the switch retransmits EAP-Request/Identity frames before restarting the authentication process; valid values are from 1 to 10.

**Defaults**
The switch sends a maximum of two retransmissions.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You should change the default value of this command only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers. This setting impacts the wait before a non-dot1x-capable client is admitted to the guest VLAN, if one is configured.

You can verify your settings by entering the `show dot1x` privileged EXEC command.

**Examples**

This example shows how to set 5 as the number of times that the switch retransmits an EAP-Request/Identity frame before restarting the authentication process:

```
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)#
```

<td>Sets the maximum number of times that the switch will retransmit an EAP-Request/Identity frame to the client before restarting the authentication process.</td>
</tr>
<tr>
<td><strong>show dot1x</strong></td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
dot1x port-control

To enable manual control of the authorization state on a port, use the `dot1x port-control` command. To return to the default setting, use the `no` form of this command.

```
  dot1x port-control {auto | force-authorized | force-unauthorized}
  no dot1x port-control {auto | force-authorized | force-unauthorized}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>auto</code></td>
<td>Enables 802.1X authentication on the interface and causes the port to transition to the authorized or unauthorized state based on the 802.1X authentication exchange between the switch and the client.</td>
</tr>
<tr>
<td><code>force-authorized</code></td>
<td>Disables 802.1X authentication on the interface and causes the port to transition to the authorized state without any authentication exchange required. The port transmits and receives normal traffic without 802.1X-based authentication of the client.</td>
</tr>
<tr>
<td><code>force-unauthorized</code></td>
<td>Denies all access through the specified interface by forcing the port to transition to the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the interface.</td>
</tr>
</tbody>
</table>

### Defaults

The port 802.1X authorization is disabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The 802.1X protocol is supported on both the Layer 2 static-access ports and the Layer 3-routed ports. You can use the `auto` keyword only if the port is not configured as follows:

- **Trunk port**—If you try to enable 802.1X on a trunk port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to trunk, the port mode is not changed.

- **Dynamic ports**—A port in dynamic mode can negotiate with its neighbor to become a trunk port. If you try to enable 802.1X on a dynamic port, an error message appears, and 802.1X is not enabled. If you try to change the mode of an 802.1X-enabled port to dynamic, the port mode is not changed.

- **EtherChannel port**—Before enabling 802.1X on the port, you must first remove it from the EtherChannel. If you try to enable 802.1X on an EtherChannel or on an active port in an EtherChannel, an error message appears, and 802.1X is not enabled. If you enable 802.1X on an inactive port of an EtherChannel, the port does not join the EtherChannel.
dot1x port-control

- Switch Port Analyzer (SPAN) destination port—You can enable 802.1X on a port that is a SPAN destination port; however, 802.1X is disabled until the port is removed as a SPAN destination. You can enable 802.1X on a SPAN source port.

To globally disable 802.1X on the switch, you must disable it on each port. There is no global configuration command for this task.

Examples

This example shows how to enable 802.1X on Gigabit Ethernet 1/1:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# dot1x port-control auto
Switch#
```

You can verify your settings by using the `show dot1x all` or `show dot1x interface int` commands to show the port-control status. An enabled status indicates that the port-control value is set either to `auto` or to `force-unauthorized`.

Related Commands

<table>
<thead>

</tbody>
</table>
**dot1x re-authenticate**

To manually initiate a reauthentication of all 802.1X-enabled ports or the specified 802.1X-enabled port, use the **dot1x re-authenticate** command.

```
dot1x re-authenticate [interface interface-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>interface</strong> interface-id</td>
<td>(Optional) Module and port number of the interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command to reauthenticate a client without waiting for the configured number of seconds between reauthentication attempts (re-authperiod) and automatic reauthentication.

**Examples**

This example shows how to manually reauthenticate the device connected to Gigabit Ethernet interface 1/1:

```
Switch# dot1x re-authenticate interface gigabitethernet1/1
Starting reauthentication on gigabitethernet1/1
Switch#
```
dot1x re-authentication

To enable the periodic reauthentication of the client, use the **dot1x re-authentication** command. To return to the default setting, use the **no** form of this command.

```
dot1x re-authentication

no dot1x re-authentication
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The periodic reauthentication is disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You configure the amount of time between the periodic reauthentication attempts by using the **dot1x timeout re-authperiod** global configuration command.

**Examples**
This example shows how to disable the periodic reauthentication of the client:

```
Switch(config-if)# no dot1x re-authentication
Switch(config-if)#
```

This example shows how to enable the periodic reauthentication and set the number of seconds between the reauthentication attempts to 4000 seconds:

```
Switch(config-if)# dot1x re-authentication
Switch(config-if)# dot1x timeout re-authperiod 4000
Switch#
```

You can verify your settings by entering the **show dot1x** privileged EXEC command.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x timeout</td>
<td>Sets the reauthentication timer.</td>
</tr>
<tr>
<td>show dot1x</td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
dot1x system-auth-control

To enable 802.1X authentication on the switch, use the **dot1x system-auth-control** command. To disable 802.1X authentication on the system, use the **no** form of this command.

```
  dot1x system-auth-control
  no dot1x system-auth-control
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The 802.1X authentication is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(2c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enable **dot1x system-auth-control** if you want to use the 802.1X access controls on any port on the switch. You can then use the **dot1x port-control auto** command on each specific port on which you want the 802.1X access controls to be used.

**Examples**

This example shows how to enable 802.1X authentication:

```
Switch(config)# dot1x system-auth-control
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dot1x initialize</td>
<td>Unauthorized an interface before reinitializing 802.1X.</td>
</tr>
<tr>
<td>show dot1x</td>
<td>Displays dot1x information.</td>
</tr>
</tbody>
</table>
**dot1x timeout**

To set the reauthentication timer, use the `dot1x timeout` command. To return to the default setting, use the `no` form of this command.

```
dot1x timeout {reauth-period [seconds | server] | quiet-period seconds | tx-period seconds | supp-timeout seconds | server-timeout seconds}
```

```
no dot1x timeout {reauth-period | quiet-period | tx-period | supp-timeout | server-timeout}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>reauth-period seconds</code></td>
<td>Number of seconds between reauthentication attempts; valid values are from 1 to 65535. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td><code>reauth-period server</code></td>
<td>Number of seconds between reauthentication attempts; valid values are from 1 to 65535 as derived from the Session-Timeout RADIUS attribute. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td><code>quiet-period seconds</code></td>
<td>Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client; valid values are from 0 to 65535 seconds.</td>
</tr>
<tr>
<td><code>tx-period seconds</code></td>
<td>Number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request; valid values are from 1 to 65535 seconds.</td>
</tr>
<tr>
<td><code>supp-timeout seconds</code></td>
<td>Number of seconds that the switch waits for the retransmission of EAP-Request packets; valid values are from 30 to 65535 seconds.</td>
</tr>
<tr>
<td><code>server-timeout seconds</code></td>
<td>Number of seconds that the switch waits for the retransmission of packets by the back-end authenticator to the authentication server; valid values are from 30 to 65535 seconds.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:

- Reauthentication period is 3600 seconds.
- Quiet period is 60 seconds.
- Transmission period is 30 seconds.
- Supplicant timeout is 30 seconds.
- Server timeout is 30 seconds.

### Command Modes

<tr>
<td>12.1(12)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for selecting the reauthentication timer from the “server” was added.</td>
</tr>
</tbody>
</table>
### Usage Guidelines

The periodic reauthentication must be enabled before entering the `dot1x timeout re-authperiod` command. Enter the `dot1x re-authentication` command to enable periodic reauthentication.

### Examples

This example shows how to set 60 as the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x timeout tx-period 60
Switch(config-if)# end
Switch#
```

You can verify your settings by entering the `show dot1x` privileged EXEC command.

This example shows how to set up the switch to use a reauthentication timeout derived from a Session-Timeout attribute taken from the RADIUS Access-Accept message received when a host successfully authenticates via 802.1X:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet4/3
Switch(config-if)# dot1x timeout reauth-period server
Switch(config-if)# end
Switch#
```

**duplex**

To configure the duplex operation on an interface, use the `duplex` command. To return to the default setting, use the `no` form of this command.

```
duplex { auto | full | half }
```

```
no duplex
```

**Syntax Description**
- `auto` Specifies the autonegotiation operation.
- `full` Specifies the full-duplex operation.
- `half` Specifies the half-duplex operation.

**Defaults**
Half-duplex operation

**Command Modes**
Interface configuration mode

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>10/100/1000</td>
<td>`duplex [half</td>
<td>half]`</td>
<td></td>
</tr>
</tbody>
</table>
If the transmission speed on a 16-port RJ-45 Gigabit Ethernet port is set to 1000, the duplex mode is set to full. If the transmission speed is changed to 10 or 100, the duplex mode stays at full. You must configure the correct duplex mode on the switch when the transmission speed changes to 10 or 100 from 1000 Mbps.

**Caution**

Changing the interface speed and duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table 2-2 describes the system performance for different combinations of the duplex and speed modes. The specified duplex command that is configured with the specified speed command produces the resulting action shown in the table.

<table>
<thead>
<tr>
<th>duplex Command</th>

energywise (global configuration)

Use the `energywise` global configuration command to enable and configure EnergyWise on an entity. Use the `no` form of this command to disable EnergyWise on the entity and remove the EnergyWise configuration.

```
energywise { importance importance | keywords word,word,... | level level | management tcp-port-number | name name | neighbor hostname | ip-address udp-port-number | role role }
no energywise { importance | keywords | level | management | name | neighbor | role }
```

**Syntax Description**

- **importance importance** Sets the importance of the entity. The range is from 1 to 100.

- **keywords word,word,...** Assigns at least one keyword for the entity. When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords. For the `word` value:
  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **level level** Sets the power level of the entity. The only valid value is 10.

- **management tcp-port-number** Specifies the TCP port that connects to the management station. The range is from 1 to 65000.

- **name name** Specifies the EnergyWise-specific entity name. For the `name` value:
  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **neighbor hostname | ip-address udp-port-number** Assigns a static neighbor. Hostname (hostname) or IP address (ip-address). UDP port (udp-port-number) that sends and receives queries. The range is from 1 to 65000.

- **role role** Specifies the role of the entity in the EnergyWise domain. For example, lobby.b20. For the `role` value:
  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.
energywise (global configuration)

Defaults

The importance is 1.
No keywords are defined.
The power level is 10.
The tcp-port-number is 43440.
The name is the hostname.
No neighbors are assigned.
The role is the model number.

Command Modes

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

When you add an entity to a domain, EnergyWise is enabled on the entity and its PoE ports.

Examples

This example shows how to enable EnergyWise, assign the entity to a domain, and set the password:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# energywise importance 50
Switch(config)# energywise keywords lab1,devlab
Switch(config)# energywise management 60500
Switch(config)# energywise name Entity01
Switch(config)# energywise neighbor 4500-21 43440
Switch(config)# energywise role role.lobbyaccess
Switch(config)# end
```

Related Commands

</tbody>
</table>
energywise (interface configuration)

Use the `energywise` interface configuration command to configure EnergyWise on the power over Ethernet (PoE) port. Use the `no` form of this command to disable EnergyWise on the port and remove the EnergyWise configuration.

```
energywise [importance importance | keywords word,word,... | level level [recurrence at minute hour day_of_month month day_of_week] | name name | role role]

no energywise
```

### Syntax Description

- **importance importance** *(Optional)* Sets the importance of the port.
  
  The range is from 1 to 100.

- **keywords word,word,...** *(Optional)* Assigns at least one keyword for the port.
  
  When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.

  For the `word` value:
  
  - You can enter alphanumeric characters and symbols such as #, (%, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **level level** *(Optional)* Sets the power level of the port.
  
  The only valid values are 0 and 10.

- **recurrence** *(Optional)* Schedules the power-on or power-off recurrence.

  - **importance importance**—Sets the importance of the port in the domain. The range is from 1 to 100.
  
  - **minute**—The range is from 0 to 59. Use * for the wildcard.
  
  - **hour**—The range is from 0 to 23. Use * for the wildcard.
  
  - **day_of_month**—The range is from 1 to 31. Use * for the wildcard.
  
  - **month**—The range is from 1 to 12. You can also enter `jan, feb, mar, apr,` and so on. Use * for the wildcard.
  
  - **day_of_week**—The range is from 0 to 7 (0 and 7 both represent Sunday). Use * for the wildcard.

  **Note** The specified times are local times based on the PoE-entity time zone.

  **Note** If the day of the month and day of the week are both specified, (that is, are not wildcards), the recurrence is executed when either field matches the current time.

  **Note** Recurrence takes effect within the minute specified, rather than exactly on the minute; it could occur as much as 60 seconds late.
energywise (interface configuration)

name name

(Optional) Specifies the EnergyWise-specific port name.

For the name value:

- You can enter alphanumeric characters and symbols such as #, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

role role

(Optional) Specifies the role of the port in the domain. For example, lobbyport.

For the role value:

- You can enter alphanumeric characters and symbols such as #, %, ! or &.
- Do not use an asterisk (*) or a blank space between the characters and symbols.

Defaults

The importance is 1.

No keywords are defined.

The power level is 10.

The name is the short version of the interface name; for example, Gi1.2 for Gigabit Ethernet 1/2.

Command Modes

Interface Configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To return the importance and level values to the default settings, use the default energywise importance and the default energywise level commands.

Examples

This example shows how to enable and configure EnergyWise on the PoE port:

```bash
Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# interface Gi1.2
Switch(config-if)# energywise level 10 recurrence importance 90 at 0 8 * * *
Switch(config-if)# energywise level 0 recurrence importance 90 at 0 20 * * *
Switch(config-if)# energywise importance 50
Switch(config-if)# energywise name lobbyInterface.3
Switch(config-if)# energywise role role.lobbyaccess
Switch(config-if)# end
```

Note

Recurrence takes effect within the minute specified, rather than exactly on the minute; it could occur as much as 60-seconds late.

</tr>
<tr>
<td></td>
<td>The interface and ip options are mutually exclusive.</td>
</tr>
</tbody>
</table>

**Defaults**

The entity is not assigned to a domain.

The password is not set.

The udp-port-number is 43440.
energywise domain

Command Modes
Configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
If you enter the `energywise domain domain-name secret [0 | 7] password` command, the entity selects the first available interface to communicate with the network and with management applications.

Examples
This example shows how to enable EnergyWise and how to set the `domain-name` and `password` values:

```
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
```

This example shows how to enable EnergyWise and to specify the route to the management applications:

```
Switch(config)# energywise domain cisco secret 0 cisco protocol udp port 43440 ip 192.168.1.2
```

**energywise query**

Use the `energywise query` privileged EXEC command to run a query to display power information or to power the entities or PoE ports.

```plaintext
energywise query importance importance {keywords word,word,... | name name} collect {delta | usage}
```

```plaintext
energywise query importance importance {keywords word,word,... | name name} set level level
```

```plaintext
energywise query importance importance {keywords word,word,... | name name} sum {delta | usage}
```

### Syntax Description

- **importance importance**
  
  Sets the importance of the entity or ports.
  
  The range is from 1 to 100.

- **keywords word,word,...**
  
  Specifies one of more keywords to use in the query.
  
  When specifying multiple keywords, separate the keywords with commas, and do not use spaces between keywords.

  For the `word` value:
  
  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **name name**

  Name to use in the query.

  For the wildcard, use * or `name*` with the asterisk at the end of the name.

  For the `name` value:

  - You can enter alphanumeric characters and symbols such as #, (, %, ! or &.
  - Do not use an asterisk (*) or a blank space between the characters and symbols.

- **collect {delta | usage}**

  Displays the delta or usage values for the entity or PoE ports.

  - **delta**—Displays only the differences between the current and available power levels.
  - **usage**—Displays only the current power usage.

- **set level level**

  Sets the power level of the entity or the PoE ports.

  For the entity, the only valid value is 10.

  For the ports, the valid values are 0 and 10.

- **sum {delta | usage}**

  Displays the sum of the delta or usage values for the entity or PoE ports.

  - **delta**—Displays only the sum of the differences between the current and available power levels.
  - **usage**—Displays only the sum of the current power usage.
energywise query

<tbody>
<tr>
<td>12.2(52)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
To power on or power off ports, enter the `energywise query {keywords word,word,... | name name} set level level` command.

⚠️ Caution
Use this query with care because it affects the entity on which you enter the command and other devices in the domain that match the query criteria.

Examples
These examples show how to filter with the entity name:

Switch# `energywise query importance 100 name phone* collect usage`
EnergyWise query, timeout is 3 seconds:

<table>
<thead>
<tr>
<th>Host</th>
<th>Name</th>
<th>Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>----</td>
<td>----</td>

Queried:  1    Responded:  1      Time:  0.11 seconds
erase

To erase a file system, use the `erase` command.

```
    erase [/all [non-default | nvram:] | cat4000_flash | nvram: | startup-config]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>/all nvram:</code></td>
<td>Erases everything in nvram:.</td>
</tr>
<tr>
<td><code>/all non-default</code></td>
<td>Erases files and configuration in nonvolatile storage including nvram:, bootflash:, cat4000_flash:, and crashinfo: of the local supervisor engine. Resets the Catalyst 4500 series switch to the factory default settings.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> This command option is intended to work only on a standalone supervisor engine.</td>
</tr>
<tr>
<td><code>cat4000_flash:</code></td>
<td>Erases the VLAN database configuration file.</td>
</tr>
<tr>
<td><code>nvram:</code></td>
<td>Erases the startup-config and private-config file in NVRAM.</td>
</tr>
<tr>
<td><code>startup-config:</code></td>
<td>Erases the startup-config and private-config file in NVRAM.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

When you use the `erase` command to erase a file system, you cannot recover the files in the file system.

In addition to the command options shown above, options with the prefix slave that are used to identify nvram: and flash (such as slavenvram: and slavecat4000_flash:) appear in the command help messages on the dual supervisor engine redundancy switch.

The `erase nvram:` command replaces the `write erase` and the `erase startup-config` commands. This command erases both the startup-config and the private-config file.

The `erase /all nvram:` command erases all files in nvram: in addition to startup-config file and private-config file.

The `erase cat4000-flash:` command erases the VLAN database configuration file.

The `erase /all non-default` command facilitates the work of a manufacturing facility and repair center. It erases the configuration and states stored in the nonvolatile storage and resets the Catalyst 4500 series switch to the factory default settings. The default settings include those mentioned in the Cisco IOS library as well as those set by the `erase /all non-default` command (vtp mode=transparent, and the ROMMON variables: ConfigReg=0x2101, PS1= “rommon ! >>” and EnableAutoConfig=1).
For the default settings, refer to these guides:

⚠️ **Caution**

The `erase /all non-default` command can erase Cisco IOS images in bootflash:. Ensure that a Cisco IOS image can be copied back to the bootflash: (such as, from a accessible TFTP server or a flash card inserted in slot0:) (available on most chassis models), or that the switch can boot from a image stored in an accessible network server.

---

### Examples

This example shows how to erase the files and configuration in a nonvolatile storage and reset the switch to factory default settings:

```
Switch# erase /all non-default
Switch# Erase and format operation will destroy all data in non-volatile storage. Continue? [confirm]
Formatting bootflash: ...

Format of bootflash complete
Erasing nvram:
Erasing cat4000_flash:
Clearing crashinfo: data
Clearing the last power failure timestamp
Clearing all ROMMON variables
Setting default ROMMON variables:
  ConfigReg=0x2101
  PS1=rommon ! >
  EnableAutoConfig=1
Setting vtp mode to transparent
%WARNING! Please reboot the system for the changes to take effect
```

```
Switch# 00:01:48: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
```

This example shows how to erase the contents in nvram.

```
Switch# erase /all nvram:
Erasing the nvram filesystem will remove all files! Continue? [confirm] [OK]
Erase of nvram: complete
Switch# 00:38:10: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
```

This example shows how to erase filesystem cat4000_flash.

```
Switch# erase cat4000_flash:
Erasing the cat4000_flash filesystem will remove all files! Continue? [confirm] [OK]
Erase of cat4000_flash: complete
Switch# 00:11:53: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
```

Switch# 00:01:48: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram

errdisable detect

To enable error-disable detection, use the **errdisable detect** command. To disable the error-disable detection feature, use the **no** form of this command.

```
errdisable detect cause {all | arp-inspection [action shutdown vlan] | bpduguard shutdown vlan | dhcp-rate-limit [action shutdown vlan] | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap}
```

```
no errdisable detect cause {all | arp-inspection [action shutdown vlan] | bpduguard shutdown vlan | dhcp-rate-limit [action shutdown vlan] | dtp-flap | gbic-invalid | l2ptguard | link-flap | pagp-flap}
```

**Syntax Description**

</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A cause (dtp-flap, link-flap, pagp-flap) is defined as the reason why the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in error-disabled state (an operational state that is similar to link-down state).

You must enter the **shutdown** command and then the **no shutdown** command to recover an interface manually from the error-disable state.
To prevent the port from shutting down, you can use the `shutdown vlan` option to shut down just the offending VLAN on the port where the violation occurred. This option is available for the following three causes: bpdu-guard, arp-inspection, and dhcp-rate-limit. You can use the `clear errdisable` command to recover disabled VLANs on a port.

**Examples**

This example shows how to enable error-disable detection for the link-flap error-disable cause:

```bash
Switch(config)# errdisable detect cause link-flap
Switch(config)#
```

This example shows how to enable per-VLAN error-disable detection for BPDU guard:

```bash
Switch(config)# errdisable detect cause bpdu-guard shutdown vlan
Switch(config)#
```

This example shows how to disable error-disable detection for DAI:

```bash
Switch(config)# no errdisable detect cause arp-inspection
Switch(config)# end
Switch# show errdisable detect
```

</tr>
</tbody>
</table>

**Usage Guidelines**

A cause (bpduguard, dtp-flap, link-flap, pagp-flap, udl) is defined as the reason why the error-disabled state occurred. When a cause is detected on an interface, the interface is placed in error-disabled state (an operational state that is similar to the link-down state). If you do not enable error-disable recovery for the cause, the interface stays in the error-disabled state until a shutdown and no shutdown occurs. If you enable recovery for a cause, the interface is brought out of the error-disabled state and allowed to retry operation again once all the causes have timed out.

You must enter the **shutdown** command and then the **no shutdown** command to recover an interface manually from error disable.

**Examples**

This example shows how to enable the recovery timer for the BPDU guard error disable cause:

```plaintext
Switch(config)# errdisable recovery cause bpduguard
```

This example shows how to set the timer to 300 seconds:

```plaintext
Switch(config)# errdisable recovery interval 300
```

This example shows how to enable the errdisable recovery for arp-inspection:

```plaintext
Switch(config)# errdisable recovery cause arp-inspection
Switch(config)# end
Switch(config)# show errdisable recovery
```

<table>

To configure a Gigabit Ethernet interface to send or receive pause frames, use the `flowcontrol` command. To disable the flow control setting, use the `no` form of this command.

```
flowcontrol {receive | send} {off | on | desired}

no flowcontrol {receive | send} {off | on | desired}
```

### Syntax Description

- **receive**
  - Specifies that the interface processes pause frames.
- **send**
  - Specifies that the interface sends pause frames.
- **off**
  - Prevents a local port from receiving and processing pause frames from remote ports or from sending pause frames to remote ports.
- **on**
  - Enables a local port to receive and process pause frames from remote ports or send pause frames to remote ports.
- **desired**
  - Obtains predictable results whether a remote port is set to on, off, or desired.

### Defaults

The default settings for Gigabit Ethernet interfaces are as follows:

- Sending pause frames is off—Non-oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Non-oversubscribed Gigabit Ethernet interfaces.
- Sending pause frames is on—Oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Oversubscribed Gigabit Ethernet interfaces.

Table 2-3 shows the default settings for the modules.

### Command History

- **Release** 12.1(8a)EW
  - Support for this command was introduced on the Catalyst 4500 series switch.
flowcontrol

Usage Guidelines

The pause frames are special packets that signal a source to stop sending frames for a specific period of time because the buffers are full.

Table 2-4 describes the guidelines for using the different configurations of the send and receive keywords with the flowcontrol command.

Table 2-4  Keyword Configurations for send and receive

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>send on</td>
<td>Enables a local port to send pause frames to remote ports. To obtain predictable results, use send on only when remote ports are set to receive on or receive desired.</td>
</tr>
<tr>
<td>send off</td>

</tbody>
</table>

Table 2-5 identifies how the flow control will be forced or negotiated on the Gigabit Ethernet interfaces based on their speed settings.

Table 2-5  Send Capability by Switch Type, Module, and Port

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Configured Speed</th>
<th>Advertised Flow Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100/1000BASE-TX</td>
<td>Speed 1000</td>
<td>Configured flow control always</td>
</tr>
<tr>
<td>1000BASE-T</td>
<td>Negotiation always enabled</td>
<td>Configured flow control always negotiated</td>
</tr>
<tr>
<td>1000BASE-X</td>
<td>No speed nonegotiation</td>
<td>Configured flow control negotiated</td>
</tr>
<tr>
<td>1000BASE-X</td>
<td>Speed nonegotiation</td>
<td>Configured flow control forced</td>
</tr>
</tbody>
</table>

Examples

This example shows how to enable send flow control:

```
Switch(config-if)# flowcontrol receive on
Switch(config-if)#
```

This example shows how to disable send flow control:

```
Switch(config-if)# flowcontrol send off
Switch(config-if)#
```
This example shows how to set receive flow control to desired:

```
Switch(config-if)# flowcontrol receive desired
Switch(config-if)#
```

hardware statistics

To enable TCAM hardware statistics in your ACLs use the `hardware statistics` command. To disable TCAM hardware statistics, use the `no` form of this command.

```
hardware statistics
no hardware statistics
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Hardware statistics is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Introduced support on Supervisor Engine 6-E and the Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Supervisor Engine 6-E and Catalyst 4900 M chassis TCAM hardware do not have sufficient hardware statistics entries for every classification/QoS cam entry. Therefore, the statistics for each cam entry needs to be enabled as needed.

**Examples**

This example shows how to enable TCAM hardware statistics in your ACLs ace:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#ip access-list extended myv4
Switch(config-ext-nacl)#permit ip any any
Switch(config-ext-nacl)#hardware statistics
Switch(config-ext-nacl)#end
```

**hw-module port-group**

To select either Gigabit Ethernet or 10-Gigabit Ethernet interfaces on your module, use the `hw-module port-group` command.

```
hw-module module number port-group number select [gigabitethernet | tengigabitethernet]
```

**Syntax Description**

- **module**
  - Specifies a line module.
- **number**
  - Specifies a module which supports TwinGig converter.
- **port-group number**
  - Port group number on a switch.
- **select**
  - Specifies an interface type; valid values are Gigabit Ethernet and 10-Gigabit Ethernet.
- **gigabitethernet**
  - (Optional) Specifies Gigabit Ethernet.
- **tengigabitethernet**
  - (Optional) Specifies 10-Gigabit Ethernet.

**Defaults**

10 Gigabit.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for TwinGig converter module introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Support for this command is available on Cisco Catalyst 4500 modules that support TwinGig converter modules, such as the Supervisor Engine 6-E and WS-X4606-10GE-E.

**Examples**

This example shows how to select Gigabit Ethernet interfaces on a WS-X4606-10GE-E using the TwinGig Converter:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# hw-module module 1 port-group 1 select gigabitethernet
Switch(config)# exit
```

Use the `show interfaces status` command to display your configuration.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show hw-module port-group</code></td>
<td>Displays how the X2 holes on a module are grouped.</td>

<td>Displays the interface status or a list of interfaces in error-disabled state.</td>
</tr>
</tbody>
</table>
**hw-module power**

To turn the power off on a slot or line module, use the `no hw-module power` command. To turn the power back on, use the `hw-module power` command.

```
hw-module [slot | module] number power
no hw-module [slot | module] number power
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>slot</td>

</tr>
<tr>
<td>module</td>
<td>(Optional) Specifies a line module.</td>
</tr>
<tr>
<td>number</td>
<td>Slot or module number.</td>
</tr>
</tbody>
</table>

**Defaults**

After a boot up, the power is on.

**Command Modes**

Global configuration mode

**Command History**

```
Release       Modification
-------------  ---------------------------------------------
12.1(8a)EW     Support for this command was introduced on the Catalyst 4500 series switch. 
12.2(18)EW     Add slot and module keywords. 
```

**Examples**

This example shows how to shut off power to a module in slot 5:

```
Switch(config)# no hw-module slot 5 power
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear hw-module slot password</td>
<td>Clears the password on an intelligent line module.</td>
</tr>
</tbody>
</table>
hw-module system max-queue-limit

To enable user to change the queue limit for all interfaces globally use the `hw-module system max-queue-limit` command. To cancel the global setting, use the `no form` of the command.

```
 hw-module system max-queue-limit max-queue-limit
 no hw-module system max-queue-limit max-queue-limit
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>max-queue-limit</code></td>
<td>Specifies the queue limit for all interfaces. Valid values are from 1024 to 8184. This parameter must be a multiple of 8.</td>
</tr>
</tbody>
</table>

**Defaults**

Not enabled by default

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.2.1SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command allows you to change the queue limit for all interfaces globally rather than apply a policy with a queue limit to all the interfaces.

This is a global configuration command. It can be overridden by the per port, per class, `queue-limit` command.

For a standalone supervisor engine, you must reboot the engine after applying this command. For a redundant supervisor engine, you must enter the `redundancy reload shelf` command to enforce a reboot on both supervisor engines.

**Examples**

This example shows how to set the queue limit globally to 1024:

```
Switch> enable
Switch# configure terminal
Switch(config)# hw-module system max-queue-limit 1024
Switch(config)# exit
Switch# reload (for standalone supervisors)
Switch# redundancy reload shelf (for redundant supervisors in SSO mode)
or
Switch# redundancy force-switchover (followed by another redundancy force-switchover, for redundant supervisors in RPR mode)
```
hw-module uplink mode shared-backplane

To change the uplink mode so that you can use all four 10-Gigabit Ethernet ports as blocking ports on the Supervisor Engine 6-E and Catalyst 4900 M chassis when operating in redundant mode, use the `hw-module uplink mode shared-backplane` command. To disable shared-backplane uplink mode, use the `no` form of the command.

```
hw-module uplink mode shared-backplane

no hw-module uplink mode shared-backplane
```

**Syntax Description**

This command has no keywords or arguments.

**Defaults**

Only two 10-Gigabit Ethernet ports or four 1-Gigabit Ethernet ports can be used on a supervisor engine.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When changing the uplink mode using the `hw-module uplink mode shared-backplane` command, you must reload the system. A message is printed on the console to reflect this.

**Examples**

This example shows how to enable shared-backplane uplink mode:

```
Switch(config)# hw-module uplink mode shared-backplane
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

This example shows how to disable shared-backplane uplink mode:

```
Switch(config)# no hw-module uplink mode shared-backplane
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#
```

This example shows how to display the current state of uplink-mode:

```
Switch# show hw-module uplink
Active uplink mode configuration is Default
(will be Shared-backplane after next reload)
A reload of active supervisor is required to apply the new configuration.
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show hw-module uplink</code></td>
<td>Displays hardware-module uplink information.</td>
</tr>
</tbody>
</table>
**hw-module uplink select**

To select the 10-Gigabit Ethernet, or Gigabit Ethernet uplinks on a Supervisor Engine V-10GE in a WS-C4510R chassis, or Supervisor 7L-E in a WS-C4507R chassis, use the `hw-module uplink select` command.

```
hw-module uplink select { tengigabitethernet | gigabitethernet | all }
```

```
hw-module uplink select { tengigabitethernet | gigabitethernet } (Sup-7L-E only)
```

**Note**

Supervisor Engine 7L-E is not supported on a ten-slot chassis (WS-C4510R).

**Syntax Description**

- **tengigabitethernet** (Optional) Specifies the 10-Gigabit Ethernet uplinks.
- **gigabitethernet** (Optional) Specifies the Gigabit Ethernet uplinks.

**Defaults**

tengigabitethernet

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Support for the <strong>all</strong> keyword was added.</td>
</tr>
<tr>
<td>15.0(2)XO</td>
<td>The number of uplink ports for Supervisor Engine 7L-E in a WS-C4507R chassis depends on the supervisor engine mode (single or redundant) and the uplink mode configuration (1-Gigabit or 10-Gigabit).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On a Supervisor Engine V-10GE (WS-X4516-10GE) in a 10-slot chassis (Catalyst 4510R and 4510R-E), if a startup configuration with a new uplink mode is copied into flash memory and the system is power cycled, the system will not come up with the new uplink mode. After copying the startup configuration with the new uplink mode into flash memory, the uplink mode must be changed to the new uplink mode through the command interface before the system is power cycled. This ensures that the system comes up in the new uplink mode.

Supervisor Engine V-10GE and Supervisor Engine II+10GE support 10-Gigabit Ethernet and Gigabit Ethernet uplink ports. On the Supervisor Engine II+10GE, all uplink ports are always available. Similarly, when a Supervisor Engine V-10GE is plugged into a W-C4503, W-4506, or W-4507R chassis, all uplink ports are always available. When a Supervisor Engine V-10GE is plugged into a W-4510R chassis, you can choose to use the 10-Gigabit Ethernet uplink ports, the Gigabit Ethernet uplink ports,
or all uplink ports. If you choose to use all uplink ports, then the tenth slot will support only the WS-X4302-GB switching linecard. Be aware that this command takes effect only after a reload (after you have executed the `redundancy reload shelf` command).

Because the uplink selection is programmed into hardware during initialization, changing the active uplinks requires saving the configuration and reloading the switch. When you are configuring a change to the uplinks, the system responds with a message informing you that the switch must be reloaded and suggesting the appropriate command (depending on redundancy mode) to reload the switch.

If you select the **all** keyword, ensure that the tenth slot is either empty or has a WS-X4302-GB switching module.

A no form of this command does not exist. To undo the configuration, you must configure the uplinks.

For Supervisor Engine 7L-E in a WS-C4507R chassis, the number of uplink options depends on the supervisor engine mode (single or redundant) and the uplink mode configuration (1-Gigabit or 10-Gigabit)

**Single Supervisor Mode**

In single supervisor mode, Supervisor Engine 7L-E supports the uplink configuration of at most either two 10-Gigabit or four 1-Gigabit ports (Table 2-6).

**Table 2-6 Uplink Options for Single Supervisor Mode**

<table>
<thead>
<tr>
<th>Slot 1</th>
<th>Slot 2</th>

</tr>
</tbody>
</table>

**Redundant Supervisor Mode**

In redundant supervisor mode, Supervisor Engine 7L-E supports 1+1 (in 10-Gigabit mode) and 2+2 (in 1-Gigabit mode) (Table 2-7).

**Note**

No redundancy support exists for slots 3 and 4.

**Table 2-7 Uplink Options for Redundant Supervisor Mode**

<table>
<thead>
<tr>

Choose 1-Gigabit operation through the command line interface.

SFP SFP — — SFP SFP — — 4 Gbps

Examples

This example shows how to select the Gigabit Ethernet uplinks:

Switch(config)# hw-module uplink select gigabitethernet
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#

The Gigabit Ethernet uplinks will be active after the next reload.

Note

This example shows how to select the Gigabit Ethernet uplinks in a redundant system in SSO mode:

Switch(config)# hw-module uplink select gigabitethernet
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration.
Switch(config)# exit
Switch#

The Gigabit Ethernet uplinks will be active after the next reload of the chassis/shelf. Use the redundancy reload shelf command to reload the chassis/shelf.

Note

This example shows how to select the Gigabit Ethernet uplinks in a redundant system in RPR mode:

Switch(config)# hw-module uplink select gigabitethernet
A reload of the active supervisor is required to apply the new configuration.
Switch(config)# exit
Switch#

The Gigabit Ethernet uplinks will be active on a switchover or reload of the active supervisor engine.

Note

This example shows how to select all the uplinks in a redundant system in SSO mode:

Switch(config)# hw-module uplink select all
Warning: This configuration mode may disable slot10.
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration.
Switch(config)# exit
Switch#

If you select the all keyword, only the Drome board will be supported in the tenth slot of the supervisor engine.

Note
<table>
<thead>
<tr>

</tbody>
</table>
instance

To map a VLAN or a set of VLANs to an MST instance, use the instance command. To return the VLANs to the common instance default, use the no form of this command.

```
instance instance-id {vlans vlan-range}
no instance instance-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-id</td>
<td>MST instance to which the specified VLANs are mapped; valid values are from 0 to 15.</td>
</tr>
<tr>
<td>vlans vlan-range</td>
<td>Specifies the number of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

Mapping is disabled.

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The mapping is incremental, not absolute. When you enter a range of VLANs, this range is added or removed to the existing ones.

Any unmapped VLAN is mapped to the CIST instance.

**Examples**

This example shows how to map a range of VLANs to instance 2:

```
Switch(config-mst)# instance 2 vlans 1-100
Switch(config-mst)#
```

This example shows how to map a VLAN to instance 5:

```
Switch(config-mst)# instance 5 vlans 1100
Switch(config-mst)#
```

This example shows how to move a range of VLANs from instance 2 to the CIST instance:

```
Switch(config-mst)# no instance 2 vlans 40-60
Switch(config-mst)#
```

This example shows how to move all the VLANs mapped to instance 2 back to the CIST instance:

```
Switch(config-mst)# no instance 2
Switch(config-mst)#
```

<td>Displays interface information.</td>
</tr>
</tbody>
</table>
# interface port-channel

To access or create a port-channel interface, use the `interface port-channel` command.

```
interface port-channel channel-group
```

## Syntax Description

- `channel-group` Port-channel group number; valid values are from 1 to 64.

## Defaults

This command has no default settings.

## Command Modes

Global configuration mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

You do not have to create a port-channel interface before assigning a physical interface to a channel group. A port-channel interface is created automatically when the channel group gets its first physical interface, if it is not already created.

You can also create the port channels by entering the `interface port-channel` command. This will create a Layer 3 port channel. To change the Layer 3 port channel into a Layer 2 port channel, use the `switchport` command before you assign the physical interfaces to the channel group. A port channel cannot be changed from Layer 3 to Layer 2 or vice versa when it contains member ports.

Only one port channel in a channel group is allowed.

⚠️ **Caution**

The Layer 3 port-channel interface is the routed interface. Do not enable Layer 3 addresses on the physical Fast Ethernet interfaces.

If you want to use CDP, you must configure it only on the physical Fast Ethernet interface and not on the port-channel interface.

## Examples

This example creates a port-channel interface with a channel-group number of 64:

```
Switch(config)# interface port-channel 64
Switch(config)#
```

## Related Commands

interface range

To run a command on multiple ports at the same time, use the interface range command.

interface range {vlan vlan_id - vlan_id} {port-range | macro name}

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan_id - vlan_id</td>
<td>Specifies a VLAN range; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>port-range</td>
<td>Port range; for a list of valid values for port-range, see the “Usage Guidelines” section.</td>
</tr>
<tr>
<td>macro name</td>
<td>Specifies the name of a macro.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

- Global configuration mode
- Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended VLAN addresses added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the interface range command on the existing VLAN SVIs only. To display the VLAN SVIs, enter the show running config command. The VLANs that are not displayed cannot be used in the interface range command.

The values that are entered with the interface range command are applied to all the existing VLAN SVIs.

Before you can use a macro, you must define a range using the define interface-range command.

All configuration changes that are made to a port range are saved to NVRAM, but the port ranges that are created with the interface range command do not get saved to NVRAM.

You can enter the port range in two ways:
- Specifying up to five port ranges
- Specifying a previously defined macro

You can either specify the ports or the name of a port-range macro. A port range must consist of the same port type, and the ports within a range cannot span the modules.

You can define up to five port ranges on a single command; separate each range with a comma.

When you define a range, you must enter a space between the first port and the hyphen (-):

```
interface range gigabitethernet 5/1 -20, gigabitethernet4/5 -20.
```
Use these formats when entering the *port-range*:

- `interface-type {mod}/(first-port) - (last-port)`
- `interface-type {mod}/(first-port) - (last-port)`

Valid values for `interface-type` are as follows:

- **FastEthernet**
- **GigabitEthernet**
- **Vlan vlan_id**

You cannot specify both a macro and an interface range in the same command. After creating a macro, you can enter additional ranges. If you have already entered an interface range, the CLI does not allow you to enter a macro.

You can specify a single interface in the *port-range* value. This makes the command similar to the `interface interface-number` command.

**Examples**

This example shows how to use the `interface range` command to interface to FE 5/18 - 20:

Switch(config)# interface range fastethernet 5/18 - 20
Switch(config-if)#

This command shows how to run a port-range macro:

Switch(config)# interface range macro macro1
Switch(config-if)#

interface vlan

To create or access a Layer 3 switch virtual interface (SVI), use the `interface vlan` command. To delete an SVI, use the `no` form of this command.

```
interface vlan vlan_id

no interface vlan vlan_id
```

**Syntax Description**

- `vlan_id`: Number of the VLAN; valid values are from 1 to 4094.

**Defaults**

Fast EtherChannel is not specified.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The SVIs are created the first time that you enter the `interface vlan vlan_id` command for a particular VLAN. The `vlan_id` value corresponds to the VLAN tag that is associated with the data frames on an ISL or 802.1Q-encapsulated trunk or the VLAN ID that is configured for an access port. A message is displayed whenever a VLAN interface is newly created, so you can check that you entered the correct VLAN number.

If you delete an SVI by entering the `no interface vlan vlan_id` command, the associated interface is forced into an administrative down state and marked as deleted. The deleted interface will no longer be visible in a `show interface` command.

You can reinstate a deleted SVI by entering the `interface vlan vlan_id` command for the deleted interface. The interface comes back up, but much of the previous configuration will be gone.

**Examples**

This example shows the output when you enter the `interface vlan vlan_id` command for a new VLAN number:

```
Switch(config)# interface vlan 23
% Creating new VLAN interface.
Switch(config)#
```
ip admission proxy http refresh-all

To ensure that you see a customized WebAuth login page with the same name in the switch system directory as a same-named prior login page, use the `ip admission proxy http refresh-all` command.

```
ip admission proxy http [success | failure | refresh-all | login [expired | page]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>Successful authentication proxy.</td>
</tr>
<tr>
<td>failure</td>
<td>Failed authentication proxy.</td>
</tr>
<tr>
<td>refresh-all</td>
<td>Refresh all custom html pages.</td>
</tr>
<tr>
<td>login expired</td>
<td>Specify expired webpage</td>
</tr>
<tr>
<td>login page</td>
<td>Specify customized login webpage</td>
</tr>
</tbody>
</table>

**Defaults**

If you do not enter this command, if any of the customized web-based authentication page files with the file of same name have been changed, you see the old login page rather than the new file.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should enter this command whenever the customized web-based authentication page has been changed in the system directory.

**Examples**

This example shows how to enter this command:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip admission proxy http [success | failure | refresh-all | login]
Switch(config)# end
Switch#

<The new html page is observed.>
```
ip arp inspection filter vlan

To permit ARPs from hosts that are configured for static IP when DAI is enabled and to define an ARP access list and apply it to a VLAN, use the `ip arp inspection filter vlan` command. To disable this application, use the `no` form of this command.

```
ip arp inspection filter arp-acl-name vlan vlan-range [static]
no ip arp inspection filter arp-acl-name vlan vlan-range [static]
```

**Syntax Description**

- `arp-acl-name`: Access control list name.
- `vlan-range`: VLAN number or range; valid values are from 1 to 4094.
- `static`: (Optional) Specifies that the access control list should be applied statically.

**Defaults**

No defined ARP ACLs are applied to any VLAN.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When an ARP access control list is applied to a VLAN for dynamic ARP inspection, the ARP packets containing only the IP-to-Ethernet MAC bindings are compared against the ACLs. All other packet types are bridged in the incoming VLAN without validation.

This command specifies that the incoming ARP packets are compared against the ARP access control list, and the packets are permitted only if the access control list permits them.

If the access control lists deny the packets because of explicit denies, the packets are dropped. If the packets are denied because of an implicit deny, they are then matched against the list of DHCP bindings if the ACL is not applied statically.

**Examples**

This example shows how to apply the ARP ACL static hosts to VLAN 1 for DAI:

```
Switch# config terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip arp inspection filter static-hosts vlan 1
Switch(config)# end
Switch# show ip arp inspection vlan 1
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
```

### Related Commands

</tr>
</tbody>
</table>
ip arp inspection limit (interface)

To limit the rate of incoming ARP requests and responses on an interface and prevent DAI from consuming all of the system’s resources in the event of a DoS attack, use the `ip arp inspection limit` command. To release the limit, use the `no` form of this command.

```
ip arp inspection limit {rate pps | none} [burst interval seconds]
```

**Syntax Description**

- `rate pps`: Specifies an upper limit on the number of incoming packets processed per second. The rate can range from 1 to 10000.
- `none`: Specifies no upper limit on the rate of the incoming ARP packets that can be processed.
- `burst interval seconds`: (Optional) Specifies the consecutive interval in seconds over which the interface is monitored for the high rate of the ARP packets. The interval is configurable from 1 to 15 seconds.

**Defaults**

The rate is set to 15 packets per second on the untrusted interfaces, assuming that the network is a switched network with a host connecting to as many as 15 new hosts per second.

The rate is unlimited on all the trusted interfaces.

The burst interval is set to 1 second by default.

**Command Modes**

Interface configuration mode

**Command History**

- **Release** 12.1(19)EW: Support for this command was introduced on the Catalyst 4500 series switch.
- **Release** 12.1(20)EW: Added support for interface monitoring.

**Usage Guidelines**

The trunk ports should be configured with higher rates to reflect their aggregation. When the rate of the incoming packets exceeds the user-configured rate, the interface is placed into an error-disabled state. The error-disable timeout feature can be used to remove the port from the error-disabled state. The rate applies to both the trusted and nontrusted interfaces. Configure appropriate rates on trunks to handle the packets across multiple DAI-enabled VLANs or use the `none` keyword to make the rate unlimited.

The rate of the incoming ARP packets on the channel ports is equal to the sum of the incoming rate of packets from all the channel members. Configure the rate limit for the channel ports only after examining the rate of the incoming ARP packets on the channel members.

After a switch receives more than the configured rate of packets every second consecutively over a period of burst seconds, the interface is placed into an error-disabled state.
**Examples**

This example shows how to limit the rate of the incoming ARP requests to 25 packets per second:

```
Switch# config terminal
Switch(config)# interface fa6/3
Switch(config-if)# ip arp inspection limit rate 25
Switch(config-if)# end
Switch# show ip arp inspection interfaces fastEthernet 6/3
Interface        Trust State     Rate (pps)
---------------  -----------     ----------
Fa6/3            Trusted                 25
Switch#
```

This example shows how to limit the rate of the incoming ARP requests to 20 packets per second and to set the interface monitoring interval to 5 consecutive seconds:

```
Switch# config terminal
Switch(config)# interface fa6/1
Switch(config-if)# ip arp inspection limit rate 20 burst interval 5
Switch(config-if)# end
```

**Related Commands**

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>show ip arp inspection</td>
<td>Displays the status of dynamic ARP inspection for a specific range of VLANs.</td>
</tr>
</tbody>
</table>
ip arp inspection log-buffer

To configure the parameters that are associated with the logging buffer, use the `ip arp inspection log-buffer` command. To disable the parameters, use the `no` form of this command.

```
ip arp inspection log-buffer {entries number | logs number interval seconds}
no ip arp inspection log-buffer {entries | logs}
```

### Syntax Description

- **entries number**
  - Number of entries from the logging buffer; the range is from 0 to 1024.
- **logs number**
  - Number of entries to be logged in an interval; the range is from 0 to 1024. A 0 value indicates that entries should not be logged out of this buffer.
- **interval seconds**
  - Logging rate; the range is from 0 to 86400 (1 day). A 0 value indicates an immediate log.

### Defaults

- When dynamic ARP inspection is enabled, denied, or dropped, the ARP packets are logged.
- The number of entries is set to 32.
- The number of logging entries is limited to 5 per second.
- The interval is set to 1.

### Command Modes

- Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The first dropped packet of a given flow is logged immediately. The subsequent packets for the same flow are registered but are not logged immediately. Registering these packets is done in a log buffer that is shared by all the VLANs. Entries from this buffer are logged on a rate-controlled basis.

### Examples

This example shows how to configure the logging buffer to hold up to 45 entries:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection log-buffer entries 45
Switch(config)# end
Switch# show ip arp inspection log
Total Log Buffer Size : 45
Syslog rate : 5 entries per 1 seconds.
No entries in log buffer.
Switch#
```
This example shows how to configure the logging rate to 10 logs per 3 seconds:

```
Switch(config)# ip arp inspection log-buffer logs 10 interval 3
Switch(config)# end
Switch# show ip arp inspection log
Total Log Buffer Size : 45
Syslog rate : 10 entries per 3 seconds.
No entries in log buffer.
Switch#
```

</tbody>
</table>
ip arp inspection trust

To set a per-port configurable trust state that determines the set of interfaces where incoming ARP packets are inspected, use the **ip arp inspection trust** command. To make the interfaces untrusted, use the **no** form of this command.

```
ip arp inspection trust

no ip arp inspection trust
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to configure an interface to be trusted:

```
Switch# config terminal
Switch(config)# interface fastEthernet 6/3
Switch(config-if)# ip arp inspection trust
Switch(config-if)# end
```

To verify the configuration, use the show form of this command:

```
Switch# show ip arp inspection interfaces fastEthernet 6/3

Interface        Trust State     Rate (pps)  Burst Interval
---------------  -----------     ----------  ---------------
Fa6/3            Trusted               None           1
```

**Related Commands**

<table>
<thead>
<tr>

</tbody>
</table>
ip arp inspection validate

To perform specific checks for ARP inspection, use the `ip arp inspection validate` command. To disable checks, use the `no` form of this command.

```
ip arp inspection validate [src-mac] [dst-mac] [ip]
no ip arp inspection validate [src-mac] [dst-mac] [ip]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
<th>Command Modes</th>
</tr>
</thead>
<tbody>
<tr>
<td>src-mac</td>
<td>(Optional) Checks the source MAC address in the Ethernet header against the sender’s MAC address in the ARP body. This checking is done against both ARP requests and responses.</td>
<td>Checks are disabled.</td>
<td>Global configuration mode</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When <code>src-mac</code> is enabled, packets with different MAC addresses are classified as invalid and are dropped.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>dst-mac</td>
<td>(Optional) Checks the destination MAC address in the Ethernet header against the target MAC address in ARP body. This checking is done for ARP responses.</td>
<td>Checks are disabled.</td>
<td>Global configuration mode</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When <code>dst-mac</code> is enabled, the packets with different MAC addresses are classified as invalid and are dropped.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ip</td>
<td>(Optional) Checks the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. The sender IP addresses are checked in all ARP requests and responses and target IP addresses are checked only in ARP responses.</td>
<td>Checks are disabled.</td>
<td>Global configuration mode</td>
</tr>
</tbody>
</table>

**Defaults**

Checks are disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabling the checks, specify at least one of the keywords (`src-mac`, `dst-mac`, and `ip`) on the command line. Each command overrides the configuration of the previous command. If a command enables `src` and `dst mac` validations, and a second command enables IP validation only, the `src` and `dst mac` validations are disabled as a result of the second command.

The `no` form of this command disables only the specified checks. If none of the check options are enabled, all the checks are disabled.
This example shows how to enable the source MAC validation:

```
Switch(config)# ip arp inspection validate src-mac
Switch(config)# end
```

Switch# show ip arp inspection vlan 1
Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled

```
Vlan | Configuration | Operation | ACL Match | Static ACL
---- | ------------- | --------- | --------- | -----------
 1   | Enabled       | Active    |           |             
Vlan | ACL Logging   | DHCP Logging
---- | -------------- | --------------
 1   | Deny           | Deny           
```

Switch#

</tr>
</tbody>
</table>
**ip arp inspection vlan**

To enable dynamic ARP inspection (DAI) on a per-VLAN basis, use the `ip arp inspection vlan` command. To disable DAI, use the `no` form of this command.

```
ip arp inspection vlan vlan-range
no ip arp inspection vlan vlan-range
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th><code>vlan-range</code> VLAN number or range; valid values are from 1 to 4094.</th>
</tr>
</thead>
</table>

**Defaults**

ARP inspection is disabled on all VLANs.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must specify on which VLANs to enable DAI. DAI may not function on the configured VLANs if they have not been created or if they are private.

**Examples**

This example shows how to enable DAI on VLAN 1:

```
Switch# configure terminal
Switch(config)# ip arp inspection vlan 1
Switch(config)# end
Switch# show ip arp inspection vlan 1

Source Mac Validation : Disabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled
Vlan     Configuration    Operation   ACL Match          Static ACL
----     -------------    ---------   ---------          ----------
1     Enabled          Active
Vlan     ACL Logging      DHCP Logging
----     -----------      ------------
1     Deny             Deny
Switch#
```

This example shows how to disable DAI on VLAN 1:

```
Switch# configure terminal
Switch(config)# no ip arp inspection vlan 1
Switch(config)#
```
## ip arp inspection vlan

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td><strong>show ip arp inspection</strong></td>
<td>Displays the status of dynamic ARP inspection for a specific range of VLANs.</td>
</tr>
</tbody>
</table>
**ip arp inspection vlan logging**

To control the type of packets that are logged, use the `ip arp inspection vlan logging` command. To disable this logging control, use the `no` form of this command.

```
ip arp inspection vlan vlan-range logging { acl-match { matchlog | none } | dhcp-bindings { permit | all | none } }

no ip arp inspection vlan vlan-range logging { acl-match | dhcp-bindings }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>vlan-range</strong></td>
<td>Number of the VLANs to be mapped to the specified instance. The number is entered as a single value or a range; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><strong>acl-match</strong></td>
<td>Specifies the logging criteria for packets that are dropped or permitted based on ACL matches.</td>
</tr>
<tr>
<td><strong>matchlog</strong></td>
<td>Specifies that logging of packets matched against ACLs is controlled by the <code>matchlog</code> keyword in the permit and deny access control entries of the ACL.</td>
</tr>
<tr>
<td><strong>none</strong></td>
<td>Specifies that ACL-matched packets are not logged.</td>
</tr>
<tr>
<td><strong>dhcp-bindings</strong></td>
<td>Specifies the logging criteria for packets dropped or permitted based on matches against the DHCP bindings.</td>
</tr>
<tr>
<td><strong>permit</strong></td>
<td>Specifies logging when permitted by DHCP bindings.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Specifies logging when permitted or denied by DHCP bindings.</td>
</tr>
<tr>
<td><strong>none</strong></td>
<td>Prevents all logging of packets permitted or denied by DHCP bindings.</td>
</tr>
</tbody>
</table>

### Defaults

All denied or dropped packets are logged.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `acl-match` and `dhcp-bindings` keywords merge with each other. When you set an ACL match configuration, the DHCP bindings configuration is not disabled. You can use the `no` form of this command to reset some of the logging criteria to their defaults. If you do not specify either option, all the logging types are reset to log on when the ARP packets are denied. The two options that are available to you are as follows:

- **acl-match**—Logging on ACL matches is reset to log on deny
- **dhcp-bindings**—Logging on DHCP binding compared is reset to log on deny
**Examples**

This example shows how to configure an ARP inspection on VLAN 1 to add packets to a log on matching against the ACLs with the **logging** keyword:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip arp inspection vlan 1 logging acl-match matchlog
Switch(config)# end
Switch# show ip arp inspection vlan 1

Source Mac Validation : Enabled
Destination Mac Validation : Disabled
IP Address Validation : Disabled

ip cef load-sharing algorithm

To configure the load-sharing hash function so that the source TCP/UDP port, the destination TCP/UDP port, or both ports can be included in the hash in addition to the source and destination IP addresses, use the `ip cef load-sharing algorithm` command. To revert back to the default, which does not include the ports, use the `no` form of this command.

```
ip cef load-sharing algorithm {include-ports {source source | destination dest} | original | tunnel | universal}
nop ip cef load-sharing algorithm {include-ports {source source | destination dest} | original | tunnel | universal}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include-ports</td>
<td>Specifies the algorithm that includes the Layer 4 ports.</td>
</tr>
<tr>
<td>source source</td>
<td>Specifies the source port in the load-balancing hash functions.</td>
</tr>
<tr>
<td>destination dest</td>
<td>Specifies the destination port in the load-balancing hash. Uses the source and destination in hash functions.</td>
</tr>
<tr>
<td>original</td>
<td>Specifies the original algorithm; not recommended.</td>
</tr>
<tr>
<td>tunnel</td>
<td>Specifies the algorithm for use in tunnel-only environments.</td>
</tr>
<tr>
<td>universal</td>
<td>Specifies the default Cisco IOS load-sharing algorithm.</td>
</tr>
</tbody>
</table>

**Defaults**

Default load-sharing algorithm is disabled.

**Note**

This option does not include the source or destination port in the load-balancing hash.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The original algorithm, tunnel algorithm, and universal algorithm are routed through the hardware. For software-routed packets, the algorithms are handled by the software. The `include-ports` option does not apply to the software-switched traffic.

**Examples**

This example shows how to configure the IP CEF load-sharing algorithm that includes Layer 4 ports:

```
Switch(config)# ip cef load-sharing algorithm include-ports
Switch(config)#
```
This example shows how to configure the IP CEF load-sharing algorithm that includes Layer 4 tunneling ports:

```
Switch(config)# ip cef load-sharing algorithm include-ports tunnel
Switch(config)#
```

<table>
<thead>

ip dhcp snooping

To enable DHCP snooping globally, use the `ip dhcp snooping` command. To disable DHCP snooping, use the `no` form of this command.

```
ip dhcp snooping
no ip dhcp snooping
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

DHCP snooping is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enable DHCP snooping globally before you can use DHCP snooping on a VLAN.

**Examples**

This example shows how to enable DHCP snooping:

```
Switch(config)# ip dhcp snooping
Switch(config)#
```

This example shows how to disable DHCP snooping:

```
Switch(config)# no ip dhcp snooping
Switch(config)#
```

</table>
ip dhcp snooping binding

To set up and generate a DHCP binding configuration to restore bindings across reboots, use the `ip dhcp snooping binding` command. To disable the binding configuration, use the `no` form of this command.

```
ip dhcp snooping binding mac-address vlan vlan-# ip-address interface interface expiry seconds
no ip dhcp snooping binding mac-address vlan vlan-# ip-address interface interface
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-address</td>
<td>Specifies a MAC address.</td>
</tr>
<tr>
<td>vlan vlan-#</td>
<td>Specifies a valid VLAN number.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Specifies an IP address.</td>
</tr>
<tr>
<td>interface interface</td>
<td>Specifies an interface type and number.</td>
</tr>
<tr>
<td>expiry seconds</td>
<td>Specifies the interval (in seconds) after which binding is no longer valid.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Whenever a binding is added or removed using this command, the binding database is marked as changed and a write is initiated.

### Examples

This example shows how to generate a DHCP binding configuration on interface gigabitethernet1/1 in VLAN 1 with an expiration time of 1000 seconds:

```
Switch# ip dhcp snooping binding 0001.1234.1234 vlan 1 172.20.50.5 interface gi1/1 expiry 1000
```

</tr>
</tbody>
</table>
ip dhcp snooping database

To store the bindings that are generated by DHCP snooping, use the `ip dhcp snooping database` command. To either reset the timeout, reset the write-delay, or delete the agent specified by the URL, use the `no` form of this command.

```
ip dhcp snooping database { url | timeout seconds | write-delay seconds }

no ip dhcp snooping database { timeout | write-delay }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>url</code></td>
<td>Specifies the URL in one of the following forms:</td>
</tr>
<tr>
<td></td>
<td>• tftp://&lt;host&gt;/&lt;filename&gt;</td>
</tr>
<tr>
<td></td>
<td>• ftp://&lt;user&gt;:&lt;password&gt;@&lt;host&gt;/&lt;filename&gt;</td>
</tr>
<tr>
<td></td>
<td>• rcp://&lt;user&gt;@&lt;host&gt;/&lt;filename&gt;</td>
</tr>
<tr>
<td></td>
<td>• nvram://&lt;filename&gt;</td>
</tr>
<tr>
<td></td>
<td>• bootflash://&lt;filename&gt;</td>
</tr>
<tr>
<td><code>timeout seconds</code></td>
<td>Specifies when to abort the database transfer process after a change to the binding database. The minimum value of the delay is 15 seconds. 0 is defined as an infinite duration.</td>
</tr>
<tr>
<td><code>write-delay seconds</code></td>
<td>Specifies the duration for which the transfer should be delayed after a change to the binding database.</td>
</tr>
</tbody>
</table>

**Defaults**

The timeout value is set to 300 seconds (5 minutes).
The write-delay value is set to 300 seconds.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You need to create an empty file at the configured URL on network-based URLs (such as TFTP and FTP) before the switch can write the set of bindings for the first time at the URL.

**Note**

Because both NVRAM and bootflash have limited storage capacity, using TFTP or network-based files is recommended. If you use flash to store the database file, new updates (by the agent) result in the creation of new files (flash fills quickly). In addition, due to the nature of the file system used on the flash, a large number of files causes access to be considerably slowed. When a file is stored in a remote location accessible through TFTP, an RPR/SSO standby supervisor engine can take over the binding list when a switchover occurs.
Examples

This example shows how to store a database file with the IP address 10.1.1.1 within a directory called directory. A file named file must be present on the TFTP server.

Switch# config terminal
Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
Switch(config)# end
Switch# show ip dhcp snooping database
Agent URL : tftp://10.1.1.1/directory/file
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : Yes
Delay Timer Expiry : Not Running
Abort Timer Expiry : Not Running

Last Succeeded Time : None
Last Failed Time : None
Last Failed Reason : No failure recorded.

Total Attempts : 1 Startup Failures : 0
Successful Transfers : 0 Failed Transfers : 0
Successful Reads : 0 Failed Reads : 0
Successful Writes : 0 Failed Writes : 0
Media Failures : 0

ip dhcp snooping information option

To enable DHCP option 82 data insertion, use the `ip dhcp snooping information option` command. To disable DHCP option 82 data insertion, use the `no` form of this command.

```
ip dhcp snooping information option format remote-id {hostname | string \{word\}}
no ip dhcp snooping information option format remote-id {hostname | string \{word\}}
```

**Syntax Description**

- **format**: Specifies the option 82 information format.
- **remote-id**: Specifies the remote ID for option 82.
- **hostname**: Specifies the user-configured hostname for the remote ID.
- **string\ word**: Specifies the user-defined string for the remote ID. The word string can be from 1 to 63 characters long with no spaces.

**Defaults**

DHCP option 82 data insertion is enabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added <code>remote-id</code> keyword to support option 82 enhancement.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the hostname is longer than 63 characters it is truncated to 63 characters in the remote ID.

**Examples**

This example shows how to enable DHCP option 82 data insertion:

```
Switch(config)# ip dhcp snooping information option
Switch(config)#
```

This example shows how to disable DHCP option 82 data insertion:

```
Switch(config)# no ip dhcp snooping information option
Switch(config)#
```

This example shows how to configure the hostname as the remote ID:

```
Switch(config)# ip dhcp snooping information option format remote-id hostname
Switch(config)#
```

The following example shows how to enable DHCP Snooping on VLAN 500 through 555 and option 82 remote ID:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
```

Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config)# end

# ip dhcp snooping limit rate

To configure the number of the DHCP messages that an interface can receive per second, use the `ip dhcp snooping limit rate` command. To disable the DHCP snooping rate limiting, use the `no` form of this command.

```
ip dhcp snooping limit rate rate

no ip dhcp snooping limit rate
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rate</code></td>
<td>Number of DHCP messages a switch can receive per second.</td>
</tr>
</tbody>
</table>

## Defaults

DHCP snooping rate limiting is disabled.

## Command Modes

Interface configuration mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

Typically, the rate limit applies to the untrusted interfaces. If you want to set up rate limiting for the trusted interfaces, note that the trusted interfaces aggregate all DHCP traffic in the switch, and you will need to adjust the rate limit of the interfaces to a higher value.

## Examples

This example shows how to enable the DHCP message rate limiting:

```
Switch(config-if)# ip dhcp snooping limit rate 150
Switch(config)#
```

This example shows how to disable the DHCP message rate limiting:

```
Switch(config-if)# no ip dhcp snooping limit rate
Switch(config)#
```

ip dhcp snooping vlan

Use the **ip dhcp snooping vlan** command to enable DHCP snooping on a VLAN. To disable DHCP snooping on a VLAN, use the **no** form of this command.

```plaintext
ip dhcp snooping [vlan number]
no ip dhcp snooping [vlan number]
```

**Syntax Description**
- **vlan number**  
  (Optional) Single VLAN number or a range of VLANs; valid values are from 1 to 4094.

**Defaults**
DHCP snooping is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
DHCP snooping is enabled on a VLAN only if both global snooping and the VLAN snooping are enabled.

**Examples**
This example shows how to enable DHCP snooping on a VLAN:

```plaintext
Switch(config)# ip dhcp snooping vlan 10
Switch(config)#
```

This example shows how to disable DHCP snooping on a VLAN:

```plaintext
Switch(config)# no ip dhcp snooping vlan 10
Switch(config)#
```

This example shows how to enable DHCP snooping on a group of VLANs:

```plaintext
Switch(config)# ip dhcp snooping vlan 10 55
Switch(config)#
```

This example shows how to disable DHCP snooping on a group of VLANs:

```plaintext
Switch(config)# no ip dhcp snooping vlan 10 55
Switch(config)#
```

ip dhcp snooping vlan information option format-type

To enable circuit-id (a suboption of DHCP snooping option 82) on a VLAN, use the `ip dhcp snooping vlan information option format-type` command. To disable circuit-id on a VLAN, use the `no` form of this command.

```
ip dhcp snooping vlan number information option format-type circuit-id string string
no ip dhcp snooping vlan number information option format-type circuit-id string string
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Single VLAN number or a range of VLANs; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><code>circuit-id</code></td>
<td>Specifies using the string as the circuit ID.</td>
</tr>
<tr>
<td><code>string string</code></td>
<td>Specifies a user-defined string for the circuit ID.</td>
</tr>
</tbody>
</table>

### Defaults
VLAN-mod-port, if DHCP snooping option-82 is disabled.

### Command Modes
Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
The circuit-id suboption of DHCP option 82 is supported only when DHCP snooping is globally enabled and on VLANs using DHCP option 82.

### Examples
The following example shows how to enable DHCP snooping on VLAN 500 through 555 and option 82 circuit-id:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id string customer-500
Switch(config-if)# end
```

ip igmp filter

To control whether all hosts on a Layer 2 interface can join one or more IP multicast groups by applying an IGMP profile to the interface, use the **ip igmp filter** command. To remove a profile from the interface, use the **no** form of this command.

```
ip igmp filter profile number
no ip igmp filter
```

**Syntax Description**

```
profile number  IGMP profile number to be applied; valid values are from 1 to 429496795.
```

**Defaults**

Profiles are not applied.

**Command Modes**

Interface configuration mode

**Command History**

```
Release  Modification
12.1(11b)EW Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

You can apply IGMP filters only to Layer 2 physical interfaces; you cannot apply IGMP filters to routed ports, switch virtual interfaces (SVIs), or ports that belong to an EtherChannel group.

An IGMP profile can be applied to one or more switch port interfaces, but one port can have only one profile applied to it.

**Examples**

This example shows how to apply IGMP profile 22 to an interface:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip igmp filter 22
Switch(config-if)#
```

**Related Commands**

```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip igmp profile</td>
<td>Creates an IGMP profile.</td>
</tr>
<tr>
<td>show ip igmp profile</td>
<td>Displays all configured IGMP profiles or a specified IGMP profile.</td>
</tr>
</tbody>
</table>
```
ip igmp max-groups

To set the maximum number of IGMP groups that a Layer 2 interface can join, use the `ip igmp max-groups` command. To set the maximum back to the default, use the `no` form of this command.

```
ip igmp max-groups number

no ip igmp max-groups
```

**Syntax Description**

- `number` Maximum number of IGMP groups that an interface can join; valid values are from 0 to 4294967294.

**Defaults**

No maximum limit.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `ip igmp max-groups` command only on Layer 2 physical interfaces; you cannot set the IGMP maximum groups for the routed ports, the switch virtual interfaces (SVIs), or the ports that belong to an EtherChannel group.

**Examples**

This example shows how to limit the number of IGMP groups that an interface can join to 25:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)
```
ip igmp profile

To create an IGMP profile, use the `ip igmp profile` command. To delete the IGMP profile, use the `no` form of this command.

```
ip igmp profile profile number
no ip igmp profile profile number
```

**Syntax Description**

| `profile number` | IGMP profile number being configured; valid values are from 1 to 4294967295. |

**Defaults**

No profile created.

**Command Modes**

- Global configuration mode
- IGMP profile configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When entering a range, enter the low IP multicast address, a space, and the high IP multicast address.

You can apply an IGMP profile to one or more Layer 2 interfaces, but each interface can have only one profile applied to it.

**Examples**

This example shows how to configure IGMP profile 40 that permits the specified range of IP multicast addresses:

```
Switch # config terminal
Switch(config)# ip igmp profile 40
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 233.1.1.1 233.255.255.255
Switch(config-igmp-profile)#
```

**Related Commands**

</tr>
</tbody>
</table>
**ip igmp query-interval**

To configure the frequency that the switch sends the IGMP host-query messages, use the `ip igmp query-interval` command. To return to the default frequency, use the `no` form of this command.

```
ip igmp query-interval seconds

no ip igmp query-interval
```

**Syntax Description**

- `seconds`: Frequency, in seconds, at which the IGMP host-query messages are transmitted; valid values depend on the IGMP snooping mode. See the “Usage Guidelines” section for more information.

**Defaults**

The query interval is set to 60 seconds.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you use the default IGMP snooping configuration, the valid query interval values are from 1 to 65535 seconds. If you have changed the default configuration to support CGMP as the IGMP snooping learning method, the valid query interval values are from 1 to 300 seconds.

The designated switch for a LAN is the only switch that sends the IGMP host-query messages. For IGMP version 1, the designated switch is the Multicast Routing Protocol (MGRP) router that runs on the LAN. For IGMP version 2, the designated querier is the lowest IP-addressed multicast switch on the subnet.

If no queries are heard for the timeout period (controlled by the `ip igmp query-timeout` command), the switch becomes the querier.

**Note**

Changing the timeout period may severely impact multicast forwarding.

**Examples**

This example shows how to change the frequency at which the designated switch sends the IGMP host-query messages:

```
Switch(config-if)# ip igmp query-interval 120
Switch(config-if)#
```

**Related Commands**
### Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip igmp querier-timeout</strong> (refer to Cisco IOS documentation)</td>
<td>Configures the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying.</td>
</tr>
<tr>
<td><strong>ip pim query-interval</strong> (refer to Cisco IOS documentation)</td>
<td>Configures the frequency of Protocol Independent Multicast (PIM) router query messages.</td>
</tr>
<tr>
<td><strong>show ip igmp groups</strong> (refer to Cisco IOS documentation)</td>
<td>Displays the multicast groups with receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP), use the <strong>show ip igmp groups</strong> command in EXEC mode.</td>
</tr>
</tbody>
</table>
ip igmp snooping

To enable IGMP snooping, use the `ip igmp snooping` command. To disable IGMP snooping, use the `no` form of this command.

```plaintext
ip igmp snooping [tcn [flood query count count | query solicit]]
no ip igmp snooping [tcn [flood query count count | query solicit]]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tcn</td>
<td>(Optional) Specifies the topology change configurations.</td>
</tr>
<tr>
<td>flood</td>
<td>(Optional) Specifies to flood the spanning tree table to the network when a topology change occurs.</td>
</tr>
<tr>
<td>query</td>
<td>(Optional) Specifies the TCN query configurations.</td>
</tr>
<tr>
<td>count count</td>
<td>(Optional) Specifies how often the spanning tree table is flooded; valid values are from 1 to 10.</td>
</tr>
<tr>
<td>solicit</td>
<td>(Optional) Specifies an IGMP general query.</td>
</tr>
</tbody>
</table>

### Defaults

IGMP snooping is enabled.

### Command Modes

- Global configuration mode
- Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for flooding the spanning tree table was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `tcn flood` option applies only to Layer 2 switch ports and EtherChannels; it does not apply to routed ports, VLANS interfaces, or Layer 3 channels.

The `ip igmp snooping command` is disabled by default on multicast routers.

#### Note

You can use the `tcn flood` option in interface configuration mode.

### Examples

This example shows how to enable IGMP snooping:

```text
Switch(config)# ip igmp snooping
Switch(config)#
```

This example shows how to disable IGMP snooping:

```text
Switch(config)# no ip igmp snooping
Switch(config)#
```
This example shows how to enable the flooding of the spanning tree table to the network after nine topology changes have occurred:

Switch(config)# ip igmp snooping tcn flood query count 9
Switch(config)#

This example shows how to disable the flooding of the spanning tree table to the network:

Switch(config)# no ip igmp snooping tcn flood
Switch(config)#

This example shows how to enable an IGMP general query:

Switch(config)# ip igmp snooping tcn query solicit
Switch(config)#

This example shows how to disable an IGMP general query:

Switch(config)# no ip igmp snooping tcn query solicit
Switch(config)#

<table>

</tbody>
</table>
### ip igmp snooping report-suppression

To enable report suppression, use the `ip igmp snooping report-suppression` command. To disable report suppression and forward the reports to the multicast devices, use the `no` form of this command.

```
ip igmp snooping report-suppression
no igmp snooping report-suppression
```

#### Syntax Description

This command has no arguments or keywords.

#### Defaults

IGMP snooping report-suppression is enabled.

#### Command Modes

Global configuration mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

If the `ip igmp snooping report-suppression` command is disabled, all the IGMP reports are forwarded to the multicast devices.

If the command is enabled, report suppression is done by IGMP snooping.

#### Examples

This example shows how to enable report suppression:

```
Switch(config)# ip igmp snooping report-suppression
Switch(config)#
```

This example shows how to disable report suppression:

```
Switch(config)# no ip igmp snooping report-suppression
Switch(config)#
```

This example shows how to display the system status for report suppression:

```
Switch# show ip igmp snoop
vlan 1
--------
IGMP snooping is globally enabled
IGMP snooping TCN solicit query is globally disabled
IGMP snooping global TCN flood query count is 2
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP_ONLY mode on this Vlan
IGMP snooping report suppression is enabled on this Vlan
Switch#`
```

<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Number of the VLAN; valid values are from 1 to 1001 and from 1006 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

IGMP snooping is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is entered in VLAN interface configuration mode only.

The **ip igmp snooping vlan** command is disabled by default on multicast routers.

**Examples**

This example shows how to enable IGMP snooping on a VLAN:

```
Switch(config)# ip igmp snooping vlan 200
Switch(config)#
```

This example shows how to disable IGMP snooping on a VLAN:

```
Switch(config)# no ip igmp snooping vlan 200
Switch(config)#
```

</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You enter this command in global configuration mode only.

Use the immediate-leave feature only when there is a single receiver for the MAC group for a specific VLAN.

The immediate-leave feature is supported only with IGMP version 2 hosts.

### Examples

This example shows how to enable IGMP immediate-leave processing on VLAN 4:

```
Switch(config)# ip igmp snooping vlan 4 immediate-leave
```

This example shows how to disable IGMP immediate-leave processing on VLAN 4:

```
Switch(config)# no ip igmp snooping vlan 4 immediate-leave
```

ip igmp snooping vlan mrouter

To statically configure an Layer 2 interface as a multicast router interface for a VLAN, use the `ip igmp snooping vlan mrouter` command. To remove the configuration, use the `no` form of this command.

```
ip igmp snooping vlan vlan-id mrouter {interface {{fastethernet slot/port} | {gigabitethernet slot/port} | {tengigabitethernet slot/port} | {port-channel number}} | {learn {cgmp | pim-dvmrp}}}
```

Syntax Description

- **vlan vlan-id**: Specifies the VLAN ID number to use in the command; valid values are from 1 to 4094.
- **interface**: Specifies the next-hop interface to a multicast switch.
  - **fastethernet slot/port**: Specifies the Fast Ethernet interface; number of the slot and port.
  - **gigabitethernet slot/port**: Specifies the Gigabit Ethernet interface; number of the slot and port.
  - **tengigabitethernet slot/port**: Specifies the 10-Gigabit Ethernet interface; number of the slot and port.
  - **port-channel number**: Port-channel number; valid values are from 1 to 64.
- **learn**: Specifies the multicast switch learning method.
  - **cgmp**: Specifies the multicast switch snooping CGMP packets.
  - **pim-dvmrp**: Specifies the multicast switch snooping PIM-DVMRP packets.

Defaults

Multicast switch snooping PIM-DVMRP packets are specified.

Command Modes

Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

You enter this command in VLAN interface configuration mode only.

The interface to the switch must be in the VLAN where you are entering the command. It must be both administratively up and line protocol up.

The CGMP learning method can decrease control traffic.

The learning method that you configure is saved in NVRAM.

The static connections to multicast interfaces are supported only on switch interfaces.

**Examples**

This example shows how to specify the next-hop interface to a multicast switch:

```
Switch(config-if)# ip igmp snooping 400 mrouter interface fastethernet 5/6
Switch(config-if)#
```

This example shows how to specify the multicast switch learning method:

```
Switch(config-if)# ip igmp snooping 400 mrouter learn cgmp
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>

<tr>
<td>show ip igmp snooping mrouter</td>
<td>Displays information on the dynamically learned and manually configured multicast switch interfaces.</td>
</tr>
</tbody>
</table>

**ip igmp snooping vlan static**

To configure a Layer 2 interface as a member of a group, use the `ip igmp snooping vlan static` command. To remove the configuration, use the `no` form of this command.

```
ip igmp snooping vlan vlan_num static mac-address {interface {fastethernet slot/port} | {gigabitethernet slot/port} | {tengigabitethernet slot/port} | {port-channel number}}
```

```
no ip igmp snooping vlan vlan_num static mac-address {interface {fastethernet slot/port} | {gigabitethernet slot/port} | {tengigabitethernet slot/port} | {port-channel number}}
```

**Syntax Description**

- `vlan_num` Number of the VLAN.
- `mac-address` Group MAC address.
- `interface` Specifies the next-hop interface to multicast switch.
- `fastethernet slot/port` Specifies the Fast Ethernet interface; number of the slot and port.
- `gigabitethernet slot/port` Specifies the Gigabit Ethernet interface; number of the slot and port.
- `tengigabitethernet slot/port` Specifies the 10-Gigabit Ethernet interface; number of the slot and port.
- `port-channel number` Port-channel number; valid values are from 1 through 64.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>

</tbody>
</table>
**ip local-proxy-arp**

To enable the local proxy ARP feature, use the `ip local-proxy-arp` command. To disable the local proxy ARP feature, use the `no` form of this command.

```
ip local-proxy-arp
no ip local-proxy-arp
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Local proxy ARP is disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this feature only on subnets where hosts are intentionally prevented from communicating directly to the switch on which they are connected.

ICMP redirect is disabled on interfaces where the local proxy ARP feature is enabled.

**Examples**

This example shows how to enable the local proxy ARP feature:

```
Switch(config-if)# ip local-proxy-arp
Switch(config-if)#
```
ip mfib fastdrop

To enable MFIB fast drop, use the `ip mfib fastdrop` command. To disable MFIB fast drop, use the `no` form of this command.

```
ip mfib fastdrop
no ip mfib fastdrop
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
MFIB fast drop is enabled.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to enable MFIB fast drops:

```
Switch# ip mfib fastdrop
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip mfib fastdrop</td>
<td>Clears all the MFIB fast-drop entries.</td>
</tr>
<tr>
<td>show ip mfib fastdrop</td>
<td>Displays all currently active fast-drop entries and shows whether fast drop is enabled.</td>
</tr>
</tbody>
</table>
ip route-cache flow

To enable NetFlow statistics for IP routing, use the `ip route-cache flow` command. To disable NetFlow statistics, use the `no` form of this command.

```
  ip route-cache flow [infer-fields]
  no ip route-cache flow [infer-fields]
```

### Syntax Description

- **infer-fields** (Optional) Includes the NetFlow fields as inferred by the software: Input identifier, Output identifier, and Routing information.

### Defaults

NetFlow statistics is disabled.

Inferred information is excluded.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Command enhanced to support infer fields.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use these commands, you need to install the Supervisor Engine IV and the NetFlow Service Card.

The NetFlow statistics feature captures a set of traffic statistics. These traffic statistics include the source IP address, destination IP address, Layer 4 port information, protocol, input and output identifiers, and other routing information that can be used for network analysis, planning, accounting, billing and identifying DoS attacks.

NetFlow switching is supported on IP and IP-encapsulated traffic over all interface types.

If you enter the `ip route-cache flow infer-fields` command after the `ip route-cache flow` command, you will purge the existing cache, and vice versa. This action is done to avoid having flows with and without inferred fields in the cache simultaneously.

For additional information on NetFlow switching, refer to the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide*.

### Note

NetFlow consumes additional memory and CPU resources compared to other switching modes. You need to know the resources required on your switch before enabling NetFlow.
Examples

This example shows how to enable NetFlow switching on the switch:

Switch# config terminal
Switch(config)# ip route-cache flow
Switch(config)# exit
Switch#

Note

This command does not work on individual interfaces.
ip source binding

To add or delete a static IP source binding entry, use the `ip source binding` command. To delete the corresponding IP source binding entry, use the `no` form of this command.

```
ip source binding ip-address mac-address vlan vlan-id interface interface-name
no ip source binding ip-address mac-address vlan vlan-id interface interface-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip-address</code></td>
<td>Binding IP address.</td>
</tr>
<tr>
<td><code>mac-address</code></td>
<td>Binding MAC address.</td>
</tr>
<tr>
<td><code>vlan vlan-id</code></td>
<td>VLAN number.</td>
</tr>
<tr>
<td><code>interface interface-name</code></td>
<td>Binding interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `ip source binding` command is used to add a static IP source binding entry only.

The `no` form of this command deletes the corresponding IP source binding entry. For the deletion to succeed, all required parameters must match.

Each static IP binding entry is keyed by a MAC address and VLAN number. If the CLI contains an existing MAC and VLAN, the existing binding entry will be updated with the new parameters; a separate binding entry will not be created.

**Examples**

This example shows how to configure the static IP source binding:

```
Switch# config terminal
Switch(config)# ip source binding 11.0.0.1 0000.000A.000B vlan 10 interface fastethernet6/10
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show ip source binding</code></td>
<td>Displays IP source bindings that are configured on the system.</td>
</tr>
</tbody>
</table>
**ip sticky-arp**

To enable sticky ARP, use the `ip sticky-arp` command. Use the `no` form of this command to disable sticky ARP.

```
ip sticky-arp
no ip sticky-arp
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Enabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported on PVLANs only.

ARP entries that are learned on Layer 3 PVLAN interfaces are sticky ARP entries. (You should display and verify ARP entries on the PVLAN interface using the `show arp` command).

For security reasons, sticky ARP entries on the PVLAN interface do not age out. Connecting new equipment with the same IP address generates a message and the ARP entry is not created.

Because the ARP entries on the PVLAN interface do not age out, you must manually remove ARP entries on the PVLAN interface if a MAC address changes.

Unlike static entries, sticky-ARP entries are not stored and restored when you enter the `reboot` and `restart` commands.

**Examples**

This example shows how to enable sticky ARP:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) ip sticky-arp
Switch(config)# end
Switch#
```

This example shows how to disable sticky ARP:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config) no ip sticky-arp
Switch(config)# end
Switch#
```
<table>

ip verify header vlan all

To enable IP header validation for Layer 2-switched IPv4 packets, use the `ip verify header vlan all` command. To disable the IP header validation, use the `no` form of this command.

```
ip verify header vlan all
no ip verify header vlan all
```

**Syntax Description**
This command has no default settings.

**Defaults**
The IP header is validated for bridged and routed IPv4 packets.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command does not apply to Layer 3-switched (routed) packets.

The Catalyst 4500 series switch checks the validity of the following fields in the IPv4 header for all switched IPv4 packets:
- The version must be 4.
- The header length must be greater than or equal to 20 bytes.
- The total length must be greater than or equal to four times the header length and greater than the Layer 2 packet size minus the Layer 2 encapsulation size.

If an IPv4 packet fails the IP header validation, the packet is dropped. If you disable the header validation, the packets with the invalid IP headers are bridged but are not routed even if routing was intended. The IPv4 access lists also are not applied to the IP headers.

**Examples**
This example shows how to disable the IP header validation for the Layer 2-switched IPv4 packets:

```
Switch# config terminal
Switch(config)# no ip verify header vlan all
Switch(config)# end
Switch#
```
ip verify source

To enable IP source guard on untrusted Layer 2 interfaces, use the `ip verify source` command. To disable IP source guard on untrusted Layer 2 interfaces, use the `no` form of this command.

```
ip verify source  { vlan dhcp-snooping } [port-security]
no ip verify source { vlan dhcp-snooping } [port-security]
```

**Syntax Description**

- `vlan dhcp-snooping` Enables IP source guard on untrusted Layer 2 DHCP snooping interfaces.
- `port-security` (Optional) Filters both source IP and MAC addresses using the port security feature.

**Defaults**

IP source guard is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>

</tbody>
</table>

**Examples**

This example shows how to enable IP source guard on VLANs 10 through 20 on a per-port basis:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10 20
Switch(config)# interface fastethernet6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk native vlan 10
Switch(config-if)# switchport trunk allowed vlan 11-20
Switch(config-if)# no ip dhcp snooping trust
Switch(config-if)# ip verify source vlan dhcp-snooping
Switch(config)# end
Switch# show ip verify source interface f6/1
Interface   Filter-type  Filter-mode  IP-address       Mac-address        Vlan
------------  -----------  -----------  ---------------  -----------------  ----------
Fa6/1        ip-mac      active       10.0.0.1                            10
Fa6/1        ip-mac      active       deny-all                            11-20
Switch#
```

You can verify your settings by entering the `show ip verify source` privileged EXEC command.

<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 with a Supervisor Engine 6-E and the Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In basic RX mode, unicast RPF ensures a source address must be reachable on the arrived interface. For example, the source must be reachable without load balancing.

**Note**

Unicast RPF is an input function and is applied only on the input interface of a router at the upstream end of a connection.

Do not use unicast RPF on internal network interfaces. Internal interfaces might have routing asymmetry, which means that there are multiple routes to the source of a packet. Apply unicast RPF only where there is natural or configured symmetry.

**Examples**

This example shows how to enable unicast RPF exist-only checking mode:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# ip verify unicast source reachable-via rx allow-default
Switch(config-if)# end
Switch#
```

ipv6 mld snooping

To enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping globally or on the specified VLAN, use the `ipv6 mld snooping` command without keywords. To disable MLD snooping on a switch or the VLAN, use the `no` form of this command.

```
 ipv6 mld snooping [vlan vlan-id]

 no ipv6 mld snooping [vlan vlan-id]
```

### Syntax Description

- **vlan vlan-id** *(Optional)* Enables or disables IPv6 MLD snooping on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.

### Defaults

MLD snooping is globally disabled on the switch.

MLD snooping is enabled on all VLANs. However, MLD snooping must be globally enabled before VLAN snooping can take place.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- When MLD snooping is globally disabled, it is disabled on all the existing VLAN interfaces. When you globally enable MLD snooping, it is enabled on all VLAN interfaces that are in the default state (enabled). VLAN configuration overrides global configuration on interfaces on which MLD snooping has been disabled.

- If MLD snooping is globally disabled, you cannot enable it on a VLAN. If MLD snooping is globally enabled, you can disable it on individual VLANs.

- VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

### Examples

This example shows how to globally enable MLD snooping:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping
Switch(config)# end
Switch#
```
This example shows how to disable MLD snooping on a VLAN:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no ipv6 mld snooping vlan 11
Switch(config)# end
Switch#

You can verify your settings by entering the show ipv6 mld snooping user EXEC command.

ipv6 mld snooping last-listener-query-count

To configure IP version 6 (IPv6) Multicast Listener Discovery Multicast Address Specific Queries (MASQs) that will be sent before aging out a client, use the `ipv6 mld snooping last-listener-query-count` command. To reset the query count to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] last-listener-query-count integer_value
no ipv6 mld snooping [vlan vlan-id] last-listener-query-count
```

### Syntax Description

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Configures last-listener query count on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td>integer_value</td>
<td>The integer range is 1 to 7.</td>
</tr>
</tbody>
</table>

### Command Default

The default global count is 2.

The default VLAN count is 0 (the global count is used).

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

In MLD snooping, the IPv6 multicast switch periodically sends out queries to hosts belonging to the multicast group. If a host wants to leave a multicast group, it can silently leave or it can respond to the query with a Multicast Listener Done message (equivalent to an IGMP Leave message). When Immediate Leave is not configured (it should not be configured if multiple clients for a group exist on the same port), the configured last-listener query count determines the number of MASQs that are sent before an MLD client is aged out.

When the last-listener query count is set for a VLAN, this count overrides the value configured globally. When the VLAN count is not configured (set to the default of 0), the global count is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
This example shows how to globally set the last-listener query count:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping last-listener-query-count 1
Switch(config)# end
Switch#

This example shows how to set the last-listener query count for VLAN 10:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 10 last-listener-query-count 3
Switch(config)# end
Switch#

You can verify your settings by entering the show ipv6 mld snooping [vlan vlan-id] user EXEC command.

ipv6 mld snooping last-listener-query-interval

To configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping last-listener query interval on the switch or on a VLAN, use the `ipv6 mld snooping last-listener-query-interval` command. To reset the query time to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] last-listener-query-interval integer_value
```

```
no ipv6 mld snooping [vlan vlan-id] last-listener-query-interval
```

**Syntax Description**

- `vlan vlan-id` (Optional) Configures last-listener query interval on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
- `integer_value` Sets the time period (in thousandths of a second) that a multicast switch must wait after issuing a MASQ before deleting a port from the multicast group. The range is 100 to 32,768. The default is 1000 (1 second).

**Command Default**

The default global query interval (maximum response time) is 1000 (1 second).
The default VLAN query interval (maximum response time) is 0 (the global count is used).

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The last-listener-query-interval time is the maximum time that a multicast switch waits after issuing a Multicast Address Specific Query (MASQ) before deleting a port from the multicast group.

In MLD snooping, when the IPv6 multicast switch receives an MLD leave message, it sends out queries to hosts belonging to the multicast group. If there are no responses from a port to a MASQ for a length of time, the switch deletes the port from the membership database of the multicast address. The last listener query interval is the maximum time that the switch waits before deleting a nonresponsive port from the multicast group.

When a VLAN query interval is set, the global query interval is overridden. When the VLAN interval is set at 0, the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
This example shows how to globally set the last-listener query interval to 2 seconds:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
Switch(config)# end
Switch#
```

This example shows how to set the last-listener query interval for VLAN 1 to 5.5 seconds:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 last-listener-query-interval 5500
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 MLD snooping [vlan vlan-id]` user EXEC command.

### Related Commands

**ipv6 mld snooping listener-message-suppression**

To enable IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping listener message suppression, use the `ipv6 mld snooping listener-message-suppression` command. To disable MLD snooping listener message suppression, use the `no` form of this command.

```
ipv6 mld snooping listener-message-suppression
```

```
no ipv6 mld snooping listener-message-suppression
```

**Command Default**
The default is for MLD snooping listener message suppression to be disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

MLD snooping listener message suppression is equivalent to IGMP snooping report suppression. When it is enabled, received MLDv1 reports to a group are forwarded to IPv6 multicast switches only once in every report-forward time. This prevents the forwarding of duplicate reports.

**Examples**

This example shows how to enable MLD snooping listener message suppression:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ipv6 mld snooping listener-message-suppression
Switch(config)# end
Switch#
```

This example shows how to disable MLD snooping listener message suppression:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# no ipv6 mld snooping listener-message-suppression
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping [vlan vlan-id]` user EXEC command.

ipv6 mld snooping robustness-variable

To configure the number of IP version 6 (IPv6) Multicast Listener Discovery (MLD) queries that the switch sends before deleting a listener that does not respond, or to enter a VLAN ID to configure the number of queries per VLAN, use the `ipv6 mld snooping robustness-variable` command. To reset the variable to the default settings, use the `no` form of this command.

```
ipv6 mld snooping [vlan vlan-id] robustness-variable integer_value

no ipv6 mld snooping [vlan vlan-id] robustness-variable
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan</td>
<td>(Optional) Configure the robustness variable on the specified VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.</td>
</tr>
<tr>
<td>integer_value</td>
<td>The range is 1 to 3.</td>
</tr>
</tbody>
</table>

### Command Default

The default global robustness variable (number of queries before deleting a listener) is 2.

The default VLAN robustness variable (number of queries before aging out a multicast address) is 0, which means that the system uses the global robustness variable for aging out the listener.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Robustness is measured by the number of MLDv1 queries sent with no response before a port is removed from a multicast group. A port is deleted when there are no MLDv1 reports received for the configured number of MLDv1 queries. The global value determines the number of queries that the switch waits before deleting a listener that does not respond, and it applies to all VLANs that do not have a VLAN value set.

The robustness value configured for a VLAN overrides the global value. If the VLAN robustness value is 0 (the default), the global value is used.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
Examples

This example shows how to configure the global robustness variable so that the switch sends out three queries before it deletes a listener port that does not respond:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# ipv6 mld snooping robustness-variable 3
Switch(config)# end
Switch#

This example shows how to configure the robustness variable for VLAN 1. This value overrides the global configuration for the VLAN:

Switch# configure terminal
Enter configuration commands, one per line. End with CNTRL/Z.
Switch(config)# ipv6 mld snooping vlan 1 robustness-variable 1
Switch(config)# end
Switch#

You can verify your settings by entering the show ipv6 MLD snooping [vlan vlan-id] user EXEC command.

**ipv6 mld snooping tcn**

To configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) Topology Change Notifications (TCNs), use the `ipv6 mld snooping tcn` commands. To reset the default settings, use the `no` form of the commands.

```
ipv6 mld snooping tcn [flood query count integer_value | query solicit]

no ipv6 mld snooping tcn [flood query count integer_value | query solicit]
```

**Syntax Description**

- `flood query count integer_value`: Sets the flood query count, which is the number of queries that are sent before forwarding multicast data to only those ports requesting it. The range is 1 to 10.
- `query solicit`: Enables soliciting of TCN queries.

**Command Default**

TCN query soliciting is disabled.

When enabled, the default flood query count is 2.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable TCN query soliciting:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping tcn query solicit.
Switch(config)# end
Switch#
```

This example shows how to set the flood query count to 5:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping tcn flood query count 5.
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 MLD snooping [vlan vlan-id]` user EXEC command.

**Related Commands**

- `show ipv6 mld snooping`: Displays IP version 6 (IPv6) MLD snooping configuration of the switch or the VLAN.
**ipv6 mld snooping vlan**

To configure IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping parameters on the VLAN interface, use the `ipv6 mld snooping vlan` command. To reset the parameters to the default settings, use the `no` form of this command.

```
ipv6 mld snooping vlan vlan-id [immediate-leave | mrouter interface interface-id | static ipv6-multicast-address interface interface-id]

no ipv6 mld snooping vlan vlan-id [immediate-leave | mrouter interface interface-id | static ip-address interface interface-id]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan vlan-id</code></td>
</tr>
<tr>
<td><code>immediate-leave</code></td>
</tr>
<tr>
<td><code>mrouter interface</code></td>
</tr>
<tr>
<td><code>static ipv6-multicast-address</code></td>
</tr>
<tr>
<td><code>interface interface-id</code></td>
</tr>
</tbody>
</table>

**Command Default**

MLD snooping Immediate-Leave processing is disabled.

By default, there are no static IPv6 multicast groups.

By default, there are no multicast switch ports.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should only configure the Immediate-Leave feature when there is only one receiver on every port in the VLAN. The configuration is saved in NVRAM.

The `static` keyword is used for configuring the MLD member ports statically.

The configuration and the static ports and groups are saved in NVRAM.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.
Examples

This example shows how to enable MLD Immediate-Leave processing on VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 immediate-leave
Switch(config)# end
Switch#
```

This example shows how to disable MLD Immediate-Leave processing on VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no ipv6 mld snooping vlan 1 immediate-leave
Switch(config)# end
Switch#
```

This example shows how to configure a port as a multicast switch port:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 1 mrouter interface gigabitethernet1/0/2
Switch(config)# end
Switch#
```

This example shows how to configure a static multicast group:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ipv6 mld snooping vlan 2 static FF12::34 interface gigabitethernet1/0/2
Switch(config)# end
Switch#
```

You can verify your settings by entering the `show ipv6 mld snooping vlan vlan-id` user EXEC command.

issu abortversion

To cancel the ISSU upgrade or the downgrade process in progress and to restore the Catalyst 4500 series switch to its state before the start of the process, use the `issu abortversion` command.

```
issu abortversion active-slot [active-image-new]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>active-slot</code></td>
<td>Specifies the slot number for the current standby supervisor engine.</td>
</tr>
<tr>
<td><code>active-image-new</code></td>
<td>(Optional) Name of the new image present in the current standby supervisor engine.</td>
</tr>
</tbody>
</table>

### Defaults

There are no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can use the `issu abortversion` command at any time to stop the ISSU process. To complete the process enter the `issu commitversion` command. Before any action is taken, a check ensures that both supervisor engines are either in the run version (RV) or load version (LV) state.

When the `issu abortversion` command is entered before the `issu runversion` command, the standby supervisor engine is reset and reloaded with the old image. When the `issu abortversion` command is entered after the `issu runversion` command, a change takes place and the new standby supervisor engine is reset and reloaded with the old image.

### Examples

This example shows how you can reset and reload the standby supervisor engine:

```
Switch# issu abortversion 2
Switch#
```

### Related Commands

<td><strong>show issu state</strong></td>
<td>Displays the ISSU state and current booted image name during the ISSU process.</td>
</tr>
</tbody>
</table>
**issu acceptversion**

To halt the rollback timer and to ensure that the new Cisco IOS software image is not automatically stopped during the ISSU process, use the **issu acceptversion** command.

```plaintext
issu acceptversion active-slot [active-image-new]
```

**Syntax Description**

- **active-slot**: Specifies the slot number for the currently active supervisor engine.
- **active-image-new**: (Optional) Name of the new image on the currently active supervisor engine.

**Defaults**

Rollback timer resets automatically 45 minutes after you enter the **issu runversion** command.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After you are satisfied with the new image and have confirmed the new supervisor engine is reachable by both the console and the network, enter the **issu acceptversion** command to halt the rollback timer.

If the **issu acceptversion** command is not entered within 45 minutes from the time the **issu runversion** command is entered, the entire ISSU process is automatically rolled back to the previous version of the software. The rollback timer starts immediately after you enter the **issu runversion** command.

If the rollback timer expires before the standby supervisor engine goes to a hot standby state, the timer is automatically extended by up to 15 minutes. If the standby state goes to a hot-standby state within this extension time or the 15 minute extension expires, the switch aborts the ISSU process. A warning message that requires your intervention is displayed every 1 minute of the timer extension.

If the rollback timer is set to a long period of time, such as the default of 45 minutes, and the standby supervisor engine goes into the hot standby state in 7 minutes, you have 38 minutes (45 minus 7) to roll back if necessary.

Use the **issu set rollback-timer** to configure the rollback timer.

**Examples**

This example shows how to halt the rollback timer and allow the ISSU process to continue:

```plaintext
Switch# issu acceptversion 2
Switch#
```
## issu acceptversion

</tr>
</tbody>
</table>

### Defaults

None

### Command Modes

Privileged EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.1.0SG</td>
<td>This command was first supported on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `issu changeversion` command can be used to initiate a single-step, complete ISSU upgrade cycle. It performs the logic for all four of the standard commands (`issu loadversion`, `issu runversion`, `issu acceptversion`, and `issu commitversion`) without user intervention.

Additionally, the `issu changeversion` command allows the upgrade process to be scheduled in the future. This enables you to stage a number of systems to perform upgrades sequentially when a potential disruption would be least harmful.

Similar to the normal ISSU upgrade procedure, the in-progress upgrade procedure initiated by the `issu changeversion` command can be aborted with the `issu abortversion` command. If the system detects any problems or detects an unhealthy system during an upgrade, the upgrade might be automatically aborted.
Examples

This example shows how to use the `issu changeversion` command to initiate an automatic ISSU upgrade.

```
Switch# issu changeversion 5 bootflash:cat4500e-universalk9.SSA.03.01.00.SG.150-1.XO.bin 6
slavebootflash:cat4500e-universalk9.SSA.03.01.00.SG.150-1.XO.bin
Switch#
```

This example shows how to use the `issu changeversion` command with the quick option to initiate an automatic ISSU upgrade. In this example, the optional standby-slot and standby-image parameters are not specified.

```
Switch# issu changeversion 5 bootflash:cat4500e-universalk9.SSA.03.01.00.SG.150-1.XO.bin quick
Switch#
```

This example shows how to use the `issu changeversion` command with the in option to schedule an automatic ISSU upgrade to occur in 2 hours and 45 minutes. In this example, the optional standby-slot and standby-image parameters are not specified.

```
Switch# issu changeversion 5 bootflash:cat4500e-universalk9.SSA.03.01.00.SG.150-1.XO.bin in 02:45
Switch#
```

Related Commands

</tr>
<tr>
<td><code>issu runversion</code></td>
<td>Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.</td>
</tr>
</tbody>
</table>
**issu commitversion**

To load the new Cisco IOS software image into the new standby supervisor engine, use the `issu commitversion` command.

```
issu commitversion standby-slot [standby-image-new]
```

**Syntax Description**

- `standby-slot` (required) Specifies the slot number for the currently active supervisor engine.
- `standby-image-new` (optional) Name of the new image on the currently active supervisor engine.

**Defaults**

Enabled by default.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `issu commitversion` command verifies that the standby supervisor engine has the new Cisco IOS software image in its file system and that both supervisor engines are in the run version (RV) state. If these conditions are met, the following actions take place:

- The standby supervisor engine is reset and booted with the new version of Cisco IOS software.
- The standby supervisor engine moves into the Stateful Switchover (SSO) mode and is fully stateful for all clients and applications with which the standby supervisor engine is compatible.
- The supervisor engines are moved into final state, which is the same as initial state.

Entering the `issu commitversion` command completes the In Service Software Upgrade (ISSU) process. This process cannot be stopped or reverted to its original state without starting a new ISSU process.

Entering the `issu commitversion` command without entering the `issu acceptversion` command is equivalent to entering both the `issu acceptversion` and the `issu commitversion` commands. Use the `issu commitversion` command if you do not intend to run in the current state for an extended period of time and are satisfied with the new software version.

**Examples**

This example shows how you can configure the standby supervisor engine to be reset and reloaded with the new Cisco IOS software version:

```
Switch# issu commitversion 1
Switch#
```

**Related Commands**
### Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>issu acceptversion</code></td>
<td>Halts the rollback timer and ensures that the new Cisco IOS software image is not automatically stopped during the ISSU process.</td>

<tr>
<td><code>issu loadversion</code></td>
<td>Starts the ISSU process.</td>
</tr>
<tr>
<td><code>issu runversion</code></td>
<td>Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.</td>
</tr>
<tr>
<td><code>show issu state</code></td>
<td>Displays the ISSU state and current booted image name during the ISSU process.</td>
</tr>
</tbody>
</table>
issu loadversion

To start the ISSU process, use the **issu loadversion** command.

```
issu loadversion active-slot active-image-new standby-slot standby-image-new [force]
```

**Syntax Description**

- `active-slot` Specifies the slot number for the currently active supervisor engine.
- `active-image-new` Specifies the name of the new image on the currently active supervisor engine.
- `standby-slot` Specifies the standby slot on the networking device.
- `standby-image-new` Specifies the name of the new image on the standby supervisor engine.
- `force` (Optional) Overrides the automatic rollback when the new Cisco IOS software version is detected to be incompatible.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release**: 12.2(31)SGA
  - **Modification**: This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

The **issu loadversion** command causes the standby supervisor engine to be reset and booted with the new Cisco IOS software image specified by the command. If both the old image and the new image are ISSU capable, ISSU compatible, and have no configuration mismatches, the standby supervisor engine moves into Stateful Switchover (SSO) mode, and both supervisor engines move into the load version (LV) state.

It will take several seconds after the **issu loadversion** command is entered for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode.

**Examples**

This example shows how to initiate the ISSU process:

```
Switch# issu loadversion 1 bootflash:new-image 2 slavebootflash:new-image
Switch#
```

</table>
**issu runversion**

To force a change from the active supervisor engine to the standby supervisor engine and to cause the newly active supervisor engine to run the new image specified in the `issu loadversion` command, use the `issu runversion` command.

```
issu runversion standby-slot [standby-image-new]
```

**Syntax Description**

- **standby-slot**: Specifies the standby slot on the networking device.
- **standby-image-new**: (Optional) Specifies the name of the new image on the standby supervisor engine.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `issu runversion` command changes the currently active-supervisor engine to standby-supervisor engine and the real standby-supervisor engine is booted with the old image version following and resets the switch. As soon as the standby-supervisor engine moves into the standby state, the rollback timer is started.

**Examples**

This example shows how to force a change of the active-supervisor engine to standby-supervisor engine:

```
Switch# issu runversion 2
Switch#
```

**issu set rollback-timer**

To configure the In Service Software Upgrade (ISSU) rollback timer value, use the **issu set rollback-timer** command.

```
issu set rollback-timer seconds
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>seconds</strong></th>
<th>Specifies the rollback timer value, in seconds. The valid timer value range is from 0 to 7200 seconds (2 hours). A value of 0 seconds disables the rollback timer.</th>
</tr>
</thead>
</table>

** Defaults**

Rollback timer value is 2700 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **issu set rollback-timer** command to configure the rollback timer value. You can only enable this command when the supervisor engines are in the init state.

**Examples**

This example shows how you can set the rollback timer value to 3600 seconds, or 1 hour:

```
Switch# configure terminal
Switch(config)# issu set rollback-timer 3600
Switch(config)# end
Switch#
```

</tbody>
</table>
l2protocol-tunnel

To enable protocol tunneling on an interface, use the l2protocol-tunnel command. You can enable tunneling for the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunking Protocol (VTP) packets. To disable tunneling on the interface, use the no form of this command.

```
l2protocol-tunnel [cdp | stp | vtp]
no l2protocol-tunnel [cdp | stp | vtp]
```

Syntax Description

- **cdp** (Optional) Enables tunneling of CDP.
- **stp** (Optional) Enables tunneling of STP.
- **vtp** (Optional) Enables tunneling of VTP.

Defaults

The default is that no Layer 2 protocol packets are tunneled.

Command Modes

Interface configuration mode

Command History

**Release** | **Modification**
--- | ---
12.2(18)EW | Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

You must enter this command, with or without protocol types, to tunnel Layer 2 packets.

Layer 2 protocol tunneling across a service-provider network ensures that Layer 2 information is propagated across the network to all customer locations. When protocol tunneling is enabled, protocol packets are encapsulated with a well-known Cisco multicast address for transmission across the network. When the packets reach their destination, the well-known MAC address is replaced by the Layer 2 protocol MAC address.

You can enable Layer 2 protocol tunneling for CDP, STP, and VTP individually or for all three protocols.

Examples

This example shows how to enable protocol tunneling for the CDP packets:

```
Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)#
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tbody>
</table>
To configure the class of service (CoS) value for all tunneled Layer 2 protocol packets, use the `l2protocol-tunnel cos` command. To return to the default value of zero, use the `no` form of this command.

```
l2protocol-tunnel cos value
no l2protocol-tunnel cos
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Specifies the CoS priority value for tunneled Layer 2 protocol packets. The range is 0 to 7, with 7 being the highest priority.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is to use the CoS value that is configured for data on the interface. If no CoS value is configured, the default is 5 for all tunneled Layer 2 protocol packets.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabled, the tunneled Layer 2 protocol packets use this CoS value.

The value is saved in NVRAM.

**Examples**

This example shows how to configure a Layer 2 protocol tunnel CoS value of 7:

```
Switch(config)# l2protocol-tunnel cos 7
Switch(config)#
```

**Related Commands**

<table>
<thead>

<td>vtp</td>
<td>(Optional) Specifies a drop threshold for VTP.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies a threshold in packets per second to be received for encapsulation before the interface shuts down, or specifies the threshold before the interface drops packets. The range is 1 to 4096. The default is no threshold.</td>
</tr>
</tbody>
</table>

**Defaults**

The default is no drop threshold for the number of the Layer 2 protocol packets.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `l2protocol-tunnel drop-threshold` command controls the number of protocol packets per second that are received on an interface before it drops packets. When no protocol option is specified with a keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a shutdown threshold on the interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.

When the drop threshold is reached, the interface drops the Layer 2 protocol packets until the rate at which they are received is below the drop threshold.

**Examples**

This example shows how to configure the drop threshold rate:

```
Switch(config-if)# l2protocol-tunnel drop-threshold cdp 50
Switch(config-if)#
```

**Related Commands**

- `cdp` (Optional) Specifies a drop threshold for CDP.
- `stp` (Optional) Specifies a drop threshold for STP.
- `vtp` (Optional) Specifies a drop threshold for VTP.
## l2protocol-tunnel drop-threshold

<td>(Optional) Specifies a shutdown threshold for VTP.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Specifies a threshold in packets per second to be received for encapsulation before the interface shuts down. The range is 1 to 4096. The default is no threshold.</td>
</tr>
</tbody>
</table>

### Defaults

The default is no shutdown threshold for the number of Layer 2 protocol packets.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `l2-protocol-tunnel shutdown-threshold` command controls the number of protocol packets per second that are received on an interface before it shuts down. When no protocol option is specified with the keyword, the threshold is applied to each of the tunneled Layer 2 protocol types. If you also set a drop threshold on the interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.

When the shutdown threshold is reached, the interface is error disabled. If you enable error recovery by entering the `errdisable recovery cause l2ptguard` command, the interface is brought out of the error-disabled state and allowed to retry the operation again when all the causes have timed out. If the error recovery feature generation is not enabled for `l2ptguard`, the interface stays in the error-disabled state until you enter the `shutdown` and `no shutdown` commands.

### Examples

This example shows how to configure the maximum rate:

```bash
Switch(config-if)# l2protocol-tunnel shutdown-threshold cdp 50
Switch(config-if)#
```
## l2protocol-tunnel shutdown-threshold

</tbody>
</table>
**lacp port-priority**

To set the LACP priority for the physical interfaces, use the `lacp port-priority` command.

```
lacp port-priority priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>priority</code></td>
<td>Priority for the physical interfaces; valid values are from 1 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

Priority is set to 32768.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>This command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must assign each port in the switch a port priority that can be specified automatically or by entering the `lacp port-priority` command. The port priority is used with the port number to form the port identifier. The port priority is used to decide which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

Although this command is a global configuration command, the `priority` value is supported only on port channels with LACP-enabled physical interfaces. This command is supported on LACP-enabled interfaces.

When setting the priority, the higher numbers indicate lower priorities.

**Examples**

This example shows how to set the priority for the interface:

```
Switch(config-if)# lacp port-priority 23748
Switch(config-if)#
```

**Related Commands**

<table>

lACP system-priority

To set the priority of the system for LACP, use the **lACP system-priority** command.

```
lACP system-priority priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Priority of the system; valid values are from 1 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

Priority is set to 32768.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>This command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I.

You must assign each switch that is running LACP a system priority that can be specified automatically or by entering the **lACP system-priority** command. The system priority is used with the switch MAC address to form the system ID and is also used during negotiation with other systems.

Although this command is a global configuration command, the **priority** value is supported on port channels with LACP-enabled physical interfaces.

When setting the priority, the higher numbers indicate lower priorities.

You can also enter the **lACP system-priority** command in interface configuration mode. After you enter the command, the system defaults to global configuration mode.

**Examples**

This example shows how to set the system priority:

```
Switch(config)# lACP system-priority 23748
Switch(config)#
```

**Related Commands**

<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

To enable system logging of interface state-change events on a specific interface, enter the logging event link-status command in interface configuration mode.

To enable system logging of interface state-change events on all interfaces in the system, enter the logging event link-status global command in global configuration mode. All interfaces without the state change event configuration use the global setting.

Examples

This example shows how to enable logging event state-change events on interface gi11/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# logging event link-status
Switch(config-if)# end
Switch#
```

This example shows how to turn off logging event link status regardless of the global setting:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi11/1
Switch(config-if)# no logging event link-status
Switch(config-if)# end
Switch#
```
This example shows how to enable the global event link-status setting on interface gi1/1:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gi1/1
Switch(config-if)# logging event link-status use-global
Switch(config-if)# end
Switch#
```

at the interface configuration level.
**mab**

To enable and configure MAC authorization bypass (MAB) on a port, use the `mab` command in interface configuration mode. To disable MAB, use the `no` form of this command.

```
mab [eap]
no mab [eap]
```

**Note**
The `mab` command is totally independent of the effect of the `dot1x system-auth control` command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eap</td>
<td>(Optional) Specifies that a full EAP conversation should be used, as opposed to standard RADIUS Access-Request, Access-Accept conversation.</td>
</tr>
</tbody>
</table>

**Command Default**

Disabled

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a port is configured for MAB as a fallback method, it operates in a typical dot1X method until a configurable number of failed attempts to request the identity of the host. The authenticator learns the MAC address of the host and uses that information to query an authentication server to see whether this MAC address will be granted access.

**Examples**

The following example shows how to enable MAB on a port:

```
Switch(config-if)# mab
Switch(config-if)#
```

The following example shows how to enable and configure MAB on a port:

```
Switch(config-if)# mab eap
Switch(config-if)#
```

The following example shows how to disable MAB on a port:

```
Switch(config-if)# no mab
Switch(config-if)#
```

mac access-list extended

To define the extended MAC access lists, use the `mac access-list extended` command. To remove the MAC access lists, use the `no` form of this command.

```
mac access-list extended name

no mac access-list extended name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>ACL to which the entry belongs.</td>
</tr>
</tbody>
</table>

**Defaults**

MAC access lists are not defined.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter the ACL name, follow these naming conventions:

- Maximum of 31 characters long and can include a-z, A-Z, 0-9, the dash character (-), the underscore character (_), and the period character (.)
- Must start with an alpha character and must be unique across all ACLs of all types
- Case sensitive
- Cannot be a number
- Must not be a keyword; keywords to avoid are all, default-action, map, help, and editbuffer

When you enter the `mac access-list extended name` command, you use the following subset to create or delete entries in a MAC layer access list:

```
[no] { permit | deny } {{ src-mac mask | any } [ dest-mac mask ]} [ protocol-family { appletalk | arp-non-ipv4 | decnet | ipx | ipv6 | rarp-ipv4 | rarp-non-ipv4 | vines | xns } | <arbitrary ethertype> | name-coded ethertype].
```

Table 2-9 describes the syntax of the `mac access-list extended` subcommands.

<table>
<thead>
<tr>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>any</td>
<td>Specifies any source-host or destination-host.</td>
</tr>
<tr>
<td>arbitrary ethertype</td>
<td>(Optional) Specifies an arbitrary ethertype in the range 1536 to 65535 (Decimal or Hexadecimal)</td>
</tr>
<tr>
<td>deny</td>
<td>Prevents access if the conditions are matched.</td>
</tr>
</tbody>
</table>
Table 2-9  mac access-list extended Subcommands (continued)

<table>
<thead>
<tr>
<th>Subcommand</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest-mac</td>
<td>(Optional) Specifies a destination MAC address of the form: dest-mac-address dest-mac-address-mask.</td>
</tr>
<tr>
<td>no</td>
<td>(Optional) Deletes a statement from an access list.</td>
</tr>
<tr>
<td>permit</td>
<td>Allows access if the conditions are matched.</td>
</tr>
<tr>
<td>protocol-family</td>
<td>(Optional) Name of the protocol family. Table 2-10 lists which packets are mapped to a particular protocol family.</td>
</tr>
<tr>
<td>src-mac</td>
<td>Source MAC address in the form: source-mac-address source-mac-address-mask.</td>
</tr>
</tbody>
</table>

Table 2-10 describes mapping an Ethernet packet to a protocol family.

Table 2-10  Mapping an Ethernet Packet to a Protocol Family

<table>
<thead>
<tr>
<th>Protocol Family</th>
<th>Ethertype in Packet Header</th>
</tr>
</thead>
<tbody>
<tr>
<td>Appletalk</td>
<td>0x809B, 0x80F3</td>
</tr>
<tr>
<td>Arp-Non-Ipv4</td>
<td>0x0806 and protocol header of Arp is a non-Ip protocol family</td>
</tr>
<tr>
<td>Decnet</td>
<td>0x6000-0x6009, 0x8038-0x8042</td>
</tr>
</tbody>
</table>
When you enter the `src-mac mask` or `dest-mac mask` value, follow these guidelines:

- Enter the MAC addresses as three 4-byte values in dotted hexadecimal format such as `0030.9629.9f84`.
- Enter the MAC address masks as three 4-byte values in dotted hexadecimal format. Use 1 bit as a wildcard. For example, to match an address exactly, use `0000.0000.0000` (can be entered as `0.0.0`).
- For the optional `protocol` parameter, you can enter either the EtherType or the keyword.
- Entries without a `protocol` parameter match any protocol.
- The access list entries are scanned in the order that you enter them. The first matching entry is used.
- To improve performance, place the most commonly used entries near the beginning of the access list.
- An implicit `deny any any` entry exists at the end of an access list unless you include an explicit `permit any any` entry at the end of the list.
- All new entries to an existing list are placed at the end of the list. You cannot add entries to the middle of a list.

### Examples

This example shows how to create a MAC layer access list named `mac_layer` that denies traffic from `0000.4700.0001`, which is going to `0000.4700.0009`, and permits all other traffic:

```
Switch(config)# mac access-list extended mac_layer
Switch(config-ext-macl)# deny 0000.4700.0001 0.0.0 0000.4700.0009 0.0.0 protocol-family appletalk
Switch(config-ext-macl)# permit any any
Switch(config-ext-macl)# end
Switch#
```

mac-address-table aging-time

To configure the aging time for the entries in the Layer 2 table, use the `mac-address-table aging-time` command. To reset the `seconds` value to the default setting, use the `no` form of this command.

```
mac-address-table aging-time seconds [vlan vlan_id]
no mac-address-table aging-time seconds [vlan vlan_id]
```

**Syntax Description**

- `seconds`  
  Aging time in seconds; valid values are 0 and from 10 to 1000000 seconds.

- `vlan vlan_id`  
  (Optional) Single VLAN number or a range of VLANs; valid values are from 1 to 4094.

**Defaults**

Aging time is set to 300 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not enter a VLAN, the change is applied to all routed-port VLANs.

Enter 0 seconds to disable aging.

**Examples**

This example shows how to configure the aging time to 400 seconds:

```
Switch(config)# mac-address-table aging-time 400
Switch(config)#
```

This example shows how to disable aging:

```
Switch(config)# mac-address-table aging-time 0
Switch(config)
```

mac-address-table dynamic group protocols

To enable the learning of MAC addresses in both the “ip” and “other” protocol buckets, even though the incoming packet may belong to only one of the protocol buckets, use the mac-address-table dynamic group protocols command. To disable grouped learning, use the no form of this command.

```
mac-address-table dynamic group protocols {ip | other} {ip | other}  
no mac-address-table dynamic group protocols {ip | other} {ip | other}
```

### Syntax Description
- **ip** Specifies the “ip” protocol bucket.
- **other** Specifies the “other” protocol bucket.

### Defaults
The group learning feature is disabled.

### Command Modes
Global configuration mode

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
The entries within the “ip” and “other” protocol buckets are created according to the protocol of the incoming traffic.

When you use the mac-address-table dynamic group protocols command, an incoming MAC address that might belong to either the “ip” or the “other” protocol bucket, is learned on both protocol buckets. Therefore, any traffic destined to this MAC address and belonging to any of the protocol buckets is unicast to that MAC address, rather than flooded. This reduces the unicast Layer 2 flooding that might be caused if the incoming traffic from a host belongs to a different protocol bucket than the traffic that is destined to the sending host.

### Examples
This example shows that the MAC addresses are initially assigned to either the “ip” or the “other” protocol bucket:

```
Switch# show mac-address-table dynamic
Unicast Entries
vlan mac address type protocols port
-------------------------------
1 0000.0000.5000 dynamic other GigabitEthernet1/1
1 0001.0234.6616 dynamic ip GigabitEthernet3/1
1 0003.3178.ec0a dynamic assigned GigabitEthernet3/1
1 0003.4700.24c3 dynamic ip GigabitEthernet3/1
1 0003.4716.f475 dynamic ip GigabitEthernet3/1
1 0003.4748.75c5 dynamic ip GigabitEthernet3/1
```
This example shows how to assign MAC addresses that belong to either the “ip” or the “other” bucket to both buckets:

```
Switch(config)# mac-address-table dynamic group protocols ip other
Switch(config)# exit
```

```
Switch# show mac address-table dynamic
Unicast Entries
  vlan  mac address     type        protocols               port
  -------+---------------+--------+---------------------+-------------------
  1  0000.0000.5000   dynamic ip,other     GigabitEthernet1/1
  1  0001.0234.4616   dynamic ip,other     GigabitEthernet1/1
  1  0001.4700.24c3   dynamic ip,other     GigabitEthernet1/1
  1  0003.4711.F275   dynamic ip,other     GigabitEthernet1/1
  1  0003.4748.75c5   dynamic ip,other     GigabitEthernet1/1
  1  0003.47c4.06c1   dynamic ip,other     GigabitEthernet1/1
  1  0003.47f0.66a3   dynamic ip,other     GigabitEthernet1/1
  1  0003.47f6.a91a   dynamic ip,other     GigabitEthernet1/1
  1  0003.5a0e.24a1   dynamic ip,other     GigabitEthernet1/1
  1  0003.5a5d.de53   dynamic ip,other     GigabitEthernet1/1

</table>
mac address-table learning vlan

To enable MAC address learning on a VLAN, use the **mac address-table learning** global configuration command. Use the **no** form of this command to disable MAC address learning on a VLAN to control which VLANs can learn MAC addresses.

```
mac address-table learning vlan vlan-id
no mac address-table learning vlan vlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Description</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>vlan-id</em></td>
<td>Specifies a single VLAN ID or a range of VLAN IDs separated by a hyphen or comma. Valid VLAN IDs are 1 to 4094.</td>
<td></td>
</tr>
</tbody>
</table>

**Defaults**

Enabled on all VLANs

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(54)SG</td>
<td>This command was modified to support the disable learning feature on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you control MAC address learning on a VLAN, you can manage the available table space by controlling which VLANs, and which ports can learn MAC addresses.

You can disable MAC address learning on a single VLAN ID (for example, by entering **no mac address-table learning vlan 223**) or on a range of VLAN IDs (for example, by entering **no mac address-table learning vlan 1-20, 15**.)

Before you disable MAC address learning, familiarize yourself with the network topology and the switch system configuration. If you disable MAC address learning on a VLAN, flooding may occur in the network. For example, if you disable MAC address learning on a VLAN with a configured switch virtual interface (SVI), the switch floods all IP packets in the Layer 2 domain. If you disable MAC address learning on a VLAN that includes more than two ports, every packet entering the switch is flooded in that VLAN domain. Disable MAC address learning only in VLANs that contain two ports. Use caution before disabling MAC address learning on a VLAN with an SVI.

You cannot disable MAC address learning on a VLAN that the switch uses internally. This action causes the switch to generate an error message and rejects the **no mac address-table learning vlan** command. To view used internal VLANs, enter the **show vlan internal usage** privileged EXEC command.

If you disable MAC address learning on a VLAN configured as a PVLAN primary or a secondary VLAN, the MAC addresses are still learned on the VLAN (primary or secondary) associated with the PVLAN.

You cannot disable MAC address learning on an RSPAN VLAN. The configuration is not allowed.

If you disable MAC address learning on a VLAN that includes a secure port, MAC address learning is not disabled on the secure port. If you later disable port security on the interface, the disabled MAC address learning state is enabled.
To display the MAC address learning status of a specific VLAN or for all VLANs, enter the `show mac-address-table learning vlan` command.

**Examples**

This example shows how to disable MAC address learning on VLAN 2003:

```
Switch(config)# no mac address-table learning vlan 2003
```
mac-address-table notification

To enable MAC address notification on a switch, use the **mac-address-table notification** command. To return to the default setting, use the **no** form of this command

```
mac-address-table notification [[change | history-size \(hs_value\) | interval \(intv_value\)] | [mac-move] | [threshold [limit \(percentage\) | interval \(time\)] | [learn-fail [interval \(time\) | limit \(num_fail\)]]]

no mac-address-table notification [[change | history-size \(hs_value\) | interval \(intv_value\)] | [mac-move] | [threshold [limit \(percentage\) | interval \(time\)] | [learn-fail [interval \(time\) | limit \(num_fail\)]]]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>change</td>
<td>(Optional) Specifies enabling MAC change notification.</td>
</tr>
<tr>
<td>history-size (hs_value)</td>
<td>(Optional) Sets a maximum number of entries in the MAC change notification history table. The range is 0 to 500 entries.</td>
</tr>
<tr>
<td>interval (intv_value)</td>
<td>(Optional) Sets a notification trap interval: the set interval time between two consecutive traps. The range is 0 to 2,147,483,647 seconds.</td>
</tr>
<tr>
<td>mac-move</td>
<td>(Optional) Specifies enabling MAC move notification.</td>
</tr>
<tr>
<td>threshold</td>
<td>(Optional) Specifies enabling MAC threshold notification.</td>
</tr>
<tr>
<td>limit (percentage)</td>
<td>(Optional) Specifies the percentage of MAT utilization threshold; valid values are from 1 to 100 percent.</td>
</tr>
<tr>
<td>interval (time)</td>
<td>(Optional) Specifies the time between MAC threshold notifications; valid values are greater than or equal to 120 seconds.</td>
</tr>
<tr>
<td>learn-fail</td>
<td>(Optional) Specifies syslog (level 6) notifications of failures to install MAC addresses learned in software into hardware. Disabled by default.</td>
</tr>
<tr>
<td>interval (time)</td>
<td>(Optional) Specifies the syslog interval between hardware MAC learning failure notifications. The default value is 150 seconds. The range is between 1 to 100000 seconds.</td>
</tr>
<tr>
<td>limit (num_fail)</td>
<td>(Optional) Specifies the number of hardware MAC learning failures to be allowed in a notification interval.</td>
</tr>
</tbody>
</table>

### Defaults

MAC address notification feature is disabled.

The default MAC change trap interval value is 1 second.

The default number of entries in the history table is 1.

MAC move notification is disabled.

MAC threshold monitoring feature is disabled.

The default limit is 50 percent.

The default time is 120 seconds.

Hardware MAC learning failure syslog notification is disabled.

The default limit is 1000.

The default interval is 150 seconds.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support for the learn-fail keyword, Supervisor Engine 6-E, and Catalyst 4900M</td>
</tr>
<tr>
<td></td>
<td>chassis added.</td>
</tr>
</tbody>
</table>

Usage Guidelines
You can enable the MAC change notification feature using the `mac-address-table notification change` command. If you do this, you must also enable MAC notification traps on an interface using the `snmp trap mac-notification change interface` configuration command and configure the switch to send MAC change traps to the NMS using the `snmp-server enable traps mac-notification` global configuration command.

When the `history-size` option is configured, the existing MAC change history table is deleted, and a new table is created.

Examples
This example shows how to set the MAC address notification history table size to 300 entries:

```
Switch(config)# mac-address-table notification change history-size 300
```

This example shows how to set the MAC address notification interval time to 1250 seconds:

```
Switch(config)# mac-address-table notification change interval 1250
```

This example shows how to enable hardware MAC address learning failure syslog notification:

```
Switch(config)# mac address-table notification learn-fail
```

This example shows how to set the interval of hardware MAC address learning failure syslog notification to 30 seconds:

```
Switch(config)# mac address-table notification learn-fail interval 30
```

</tbody>
</table>
mac-address-table static

To configure the static MAC addresses for a VLAN interface or drop unicast traffic for a MAC address for a VLAN interface, use the `mac-address-table static` command. To remove the static MAC address configurations, use the `no` form of this command.

```
mac-address-table static mac-addr {vlan vlan-id} {interface type | drop}
no mac-address-table static mac-addr {vlan vlan-id} {interface type} {drop}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac-addr</code></td>
<td>MAC address; optional when using the <code>no</code> form of this command.</td>
</tr>
<tr>
<td><code>vlan vlan-id</code></td>
<td>VLAN and valid VLAN number; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td><code>interface type</code></td>
<td>Interface type and number; valid options are <code>FastEthernet</code> and <code>GigabitEthernet</code>.</td>
</tr>
<tr>
<td><code>drop</code></td>
<td>Drops all traffic received from and going to the configured MAC address in the specified VLAN.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When a static MAC address is installed, it is associated with a port.

The output interface specified must be a Layer 2 interface and not an SVI.

If you do not enter a protocol type, an entry is automatically created for each of the four protocol types.

Entering the `no` form of this command does not remove the system MAC addresses.

When removing a MAC address, entering `interface int` is optional. For unicast entries, the entry is removed automatically. For multicast entries, if you do not specify an interface, the entire entry is removed. You can specify the selected ports to be removed by specifying the interface.

### Examples

This example shows how to add the static entries to the MAC address table:

```
Switch(config)# mac-address-table static 0050.3e8d.6400 vlan 100 interface fastethernet5/7
Switch(config)#
```

### Related Commands

</tr>
</tbody>
</table>

**Usage Guidelines**

This command can only be viewed and applied; it cannot be modified.

Ensure that the existing configuration on the interface does not conflict with the intended macro configuration. Before you apply the macro, clear the configuration on the interface with the `default interface` command.

**Examples**

This example shows how to enable the Cisco-recommended features and settings on port fa2/1:

```
Switch(config)# interface FastEthernet2/1
Switch(config-if)# macro apply cisco-desktop $AVID 50
Switch(config-if)#
```

The contents of this macro are as follows:

```
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID [access_vlanid]
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
# Ensure port-security age is greater than one minute
# and use inactivity timer
# "Port-security maximum 1" is the default and will not
# Show up in the config
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
```

Usage Guidelines

The main CPU submode is used to manually synchronize the configurations on the two supervisor engines. From the main CPU submode, use the auto-sync command to enable automatic synchronization of the configuration files in NVRAM.

Note

After you enter the main CPU submode, you can use the auto-sync command to automatically synchronize the configuration between the primary and secondary route processors based on the primary configuration. In addition, you can use all of the redundancy commands that are applicable to the main CPU.

Examples

This example shows how to reenable the default automatic synchronization feature using the auto-sync standard command to synchronize the startup-config and config-register configuration of the active supervisor engine with the standby supervisor engine. The updates for the boot variables are automatic and cannot be disabled.

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
Switch(config-r-mc)# end
Switch# copy running-config startup-config
Switch#
```

match

To specify a match clause by selecting one or more ACLs for a VLAN access-map sequence, use the `match` subcommand. To remove the match clause, use the `no` form of this command.

```
match {ip address {acl-number | acl-name}} | {mac address acl-name}

no match {ip address {acl-number | acl-name}} | {mac address acl-name}
```

**Syntax Description**

- `ip address acl-number`  Selects one or more IP ACLs for a VLAN access-map sequence; valid values are from 1 to 199 and from 1300 to 2699.
- `ip address acl-name`  Selects an IP ACL by name.
- `mac address acl-name`  Selects one or more MAC ACLs for a VLAN access-map sequence.

**Defaults**

This command has no default settings.

**Command Modes**

VLAN access-map mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The match clause specifies the IP or MAC ACL for traffic filtering.

The MAC sequence is not effective for IP packets. IP packets should be access controlled by IP match clauses.

Refer to the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional configuration guidelines and restrictions.

Refer to the *Cisco IOS Command Reference* publication for additional `match` command information.

**Examples**

This example shows how to define a match clause for a VLAN access map:

```
Switch(config)# vlan access-map ganymede 10
Switch(config-access-map)# match ip address 13
Switch(config-access-map)#
```

**Related Commands**

</table>
match (class-map configuration)

To define the match criteria for a class map, use the `match` class-map configuration command. To remove the match criteria, use the `no` form of this command.

```
match { access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list | qos-group value | protocol [ip | ipv6 | arp] }
no match { access-group acl-index-or-name | cos cos-list | [lp] dscp dscp-list | [lp] precedence ip-precedence-list | qos-group value | protocol [ip | ipv6 | arp] }
```

Syntax Description

| access-group acl-index-or-name | Number or name of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699. |
| cos cos-list | Lists up to four Layer 2 class of service (CoS) values to match against a packet. Separate each value with a space. The range is 0 to 7. |
| [lp] dscp dscp-list | (Optional) IP keyword. It specifies that the match is for IPv4 packets only. If not used, the match is for both IPv4 and IPv6 packets. Lists up to eight IP Differentiated Services Code Point (DSCP) values to match against a packet. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value. |
| [lp] precedence ip-precedence-list | (Optional) IP keyword. It specifies that the match is for IPv4 packets only. If not used, the match is for both IPv4 and IPv6 packets. Lists up to eight IP-precedence values to match against a packet. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value. |
| qos-group value | Specifies the internally generated qos-group value assigned to a packet on the input qos classification. |
| protocol ip | Specifies IP in the Ethernet header. The match criteria are supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Though visible in the command-line help strings, the only protocol types supported are IP, IPv6, and ARP. |
| protocol ipv6 | Specifies IPv6 in the Ethernet header. The match criteria are supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Though visible in the command-line help strings the only protocol types supported are IP, IPv6, and ARP. |
| protocol arp | Specifies ARP in the Ethernet header. The match criteria are supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Though visible in the command-line help strings the only protocol types supported are IP, IPv6, and ARP. |

Defaults

No match criteria are defined.

Command Modes

Class-map configuration mode
**match (class-map configuration)**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>

</tr>
<tr>
<td>12.2(46)SG</td>
<td>Added support for the <code>match protocol arp</code> command on the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before entering the `match` command, you must first enter the `class-map` global configuration command to specify the name of the class whose match criteria you want to establish. The `match` command is used to specify which fields in the packets are examined to classify the packets. If a packet matches the specified criteria, the packet is considered a member of the class and is forwarded according to the quality of service (QoS) specifications set in the traffic policy.

For the `match ip dscp dscp-list` or the `match ip precedence ip-precedence-list` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `match ip dscp af11` command, which is the same as entering the `match ip dscp 10` command. You can enter the `match ip precedence critical` command, which is the same as entering the `match ip precedence 5` command. For a list of supported mnemonics, enter the `match ip dscp ?` or the `match ip precedence ?` command to see the command-line help strings.

To match only IPv6 packets, you must use the `match protocol ipv6` command. To match only IPv4 packets you can use either the `ip` prefix or the protocol `ip` keyword.

To match only ARP packets, you must use the `match protocol arp` command.

You can configure the `match cos cos-list`, `match ip dscp dscp-list`, `match ip precedence ip-precedence-list` command in a class map within a policy map.

The `match cos cos-list` command applies only to Ethernet frames that carry a VLAN tag.

The `match qos-group` command is used by the class-map to identify a specific QoS group value assigned to a packet. The QoS group value is local to the switch and is associated with a packet on the input Qos classification.

Packets that do not meet any of the matching criteria are classified as members of the default traffic class. You configure it by specifying `class-default` as the class name in the `class` policy-map configuration command. For more information, see the “class” section on page 2-58.

**Examples**

This example shows how to create a class map called `class2`, which matches all the inbound traffic with DSCP values of 10, 11, and 12:

```
Switch# configure terminal
Switch(config)# class-map class2
Switch(config-cmap)# match ip dscp 10 11 12
Switch(config-cmap)# exit
Switch#
```

This example shows how to create a class map called `class3`, which matches all the inbound traffic with IP-precedence values of 5, 6, and 7 for both IPv4 and IPv6 traffic:

```
Switch# configure terminal
Switch(config)# class-map class3
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# exit
Switch#
```
This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1:

Switch# configure terminal
Switch(config)# class-map class2
Switch(config-cmap)# match ip precedence 5 6 7
Switch(config-cmap)# no match ip precedence
Switch(config-cmap)# match access-group acl1
Switch(config-cmap)# exit
Switch#

This example shows how to specify a class-map that applies only to IPv6 traffic on a Supervisor Engine 6-E:

Switch# configure terminal
Switch(config)# class-map match all ipv6 only
Switch(config-cmap)# match dscp af21
Switch(config-cmap)# match protocol ipv6
Switch(config-cmap)# exit
Switch#

You can verify your settings by entering the show class-map privileged EXEC command.

<table>
<thead>

</tbody>
</table>
match flow ip

To specify match criteria to treat flows with a unique source or destination address as new flows, use the `match flow ip` command. To disable this function, use the `no` form of this command.

```
match flow ip {source-address [ip destination-address ip protocol L4 source-address L4 destination-address] | destination-address}
no match flow ip {source-address [ip destination-address ip protocol L4 source-address L4 destination-address] | destination-address}
```

**Syntax Description**

- `source-address` Establishes a new flow from a flow with a unique IP source address.
- `ip destination-address` (Optional) Comprises the full flow keyword; treats each flow with unique IP source, destination, protocol, and Layer 4 source and destination address as a new flow.
- `ip protocol L4` Source-address L4 destination-address
- `destination-address` Establishes a new flow from a flow with a unique IP destination address.

**Defaults**

This command has no default settings.

**Command Modes**

class-map configuration submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Support for the full flow option was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you specify the source-address keyword, each flow with a unique source address is treated as a new flow.

When you specify the destination-address keyword, each flow with a unique destination address is treated as a new flow.

A policy map is called a flow-based policy map when you configure the flow keywords on the class map that it uses. To attach a flow-based policy map as a child to an aggregate policy map, use the `service-policy` command.

**Note**

The `match flow` command is available on the Catalyst 4500 series switch only when Supervisor Engine VI (WS-X4516-10GE) is present.
### Examples

This example shows how to create a flow-based class map associated with a source address:

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# end
Switch#
```

```
Switch# show class-map c1
Class Map match-all c1 (id 2)
  Match flow  ip source-address
Switch#
```

This example shows how to create a flow-based class map associated with a destination address:

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# end
Switch#
```

```
Switch# show class-map c1
Class Map match-all c1 (id 2)
  Match flow  ip destination-address
Switch#
```

Assume there are two active flows on the Fast Ethernet interface 6/1 with source addresses 192.168.10.20 and 192.168.10.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 100000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastethernet6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
```

```
Switch# show policy-map interface
FastEthernet6/1

  Service-policy input: p1

  Class-map: c1 (match-all)
    15432182 packets
    Match: flow  ip source-address
    police: Per-interface
      Conform: 64995654 bytes Exceed: 2376965424 bytes

  Class-map: class-default (match-any)
    0 packets
    Match: any
    0 packets
Switch#
```
This example shows two active flows on the Fast Ethernet interface 6/1 with destination addresses of 192.168.20.20 and 192.168.20.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class cl
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config)# interface fastethernet6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
Switch# show policy-map interface
FastEthernet6/1
  Service-policy input: p1
    Class-map: c1 (match-all)
      2965072 packets
      Match: flow ip destination-address
      police: Per-interface
        Conform: 6105636 bytes Exceed: 476652528 bytes
    Class-map: class-default (match-any)
      0 packets
      Match: any
        0 packets
Switch#
```

Assume there are two active flows as shown below on the Fast Ethernet interface 6/1:

<table>
<thead>
<tr>
<th>SrcIp</th>
<th>DstIp</th>
<th>IpProt</th>
<th>SrcL4Port</th>
<th>DstL4Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>81</td>
</tr>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>21</td>
</tr>
</tbody>
</table>

With the following configuration, each flow is policed to a 1000000 bps with an allowed 9000-byte burst value.

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol l4 source-port l4 destination-port
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class cl
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastEthernet 6/1
```

**Note:** If you use the `match flow ip source-address|destination-address` command, these two flows are consolidated into one flow because they have the same source and destination address.
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
Switch# show policy-map interface
FastEthernet6/1
class-map c1
  match flow ip source-address ip destination-address ip protocol l4 source-port l4
destination-port
! policy-map p1
class c1
  police 1000000 bps 9000 byte conform-action transmit exceed-action drop
! interface FastEthernet 6/1
  service-policy input p1

Switch# show class-map c1
Class Map match-all c1 (id 2)
  Match flow ip source-address ip destination-address ip protocol l4 source-port l4
destination-port

Switch# show policy-map p1

**mdix auto**

To enable the automatic medium-dependent interface crossover (auto-MDIX) feature on the interface, use the `mdix auto` command. When auto-MDIX is enabled, the interface automatically detects the required cable connection type (straight-through or crossover) and configures the connection appropriately. Use the `no` form of this command to disable auto-MDIX.

```
  mdix auto
  no mdix auto
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Auto-MDIX is enabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(46)SG</td>
<td>Added supported and unsupported linecard information to the usage guidelines.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following linecards support Auto-MDIX through the CLI on their copper media ports: WS-X4124-RJ45, WS-X4148-RJ45 (hardware revision 3.0 or higher), and WS-X4232-GB-RJ45 (hardware revision 3.0, or higher), WS-X4920-GE-RJ45, and WS-4648-RJ45V+E (Auto-MDIX support when inline power is disabled on the port).

Linecards that support auto-MDIX by default when port auto-negotiation enabled and cannot be turned off using an `mdix` CLI command include: WS-X4448-GB-RJ45, WS-X4548-GB-RJ45, WS-X4424-GB-RJ45, and WS-X4412-2GB-T.

When you enable auto-MDIX on an interface, you must also set the interface speed to be autonegotiated so that the feature operates correctly.

When auto-MDIX (and autonegotiation of speed) is enabled on one or both of connected interfaces, link up occurs even if the cable type (straight-through or crossover) is incorrect.

**Examples**

This example shows how to enable auto MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface FastEthernet6/3
Switch(config-if)# speed auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```
<table>

</tbody>
</table>
media-type

To select the connector for a dual-mode capable port, use the `media-type` command.

```
media-type { rj45 | sfp }
```

**Syntax Description**

- **rj45**: Uses the RJ-45 connector.
- **sfp**: Uses the SFP connector.

**Defaults**

- **sfp**

**Command Modes**

- Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced for the WS-X4306-GB-T module and the WS-X4948 chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported on all ports on the WS-X4306-GB-T module and ports 1/45-48 on the WS-X4948 chassis.

Entering the `show interface capabilities` command provides the Multiple Media Types field, which displays the value `no` if a port is not dual-mode capable and lists the media types (`sfp` and `rj45`) for dual-mode capable ports.

**Examples**

This example shows how to configure port 5/45 on a WS-X4948 chassis to use the RJ-45 connector:

```
Switch(config)# interface gigabitethernet 5/45
Switch(config-if)# media-type rj45
```
mode

To set the redundancy mode, use the `mode` command.

```mode {rpr | sso}```

**Syntax Description**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>rpr</td>
<td>Specifies RPR mode.</td>
</tr>
<tr>
<td>sso</td>
<td>Specifies SSO mode.</td>
</tr>
</tbody>
</table>

**Defaults**

If you are upgrading the current supervisor engine from Cisco IOS Release 12.2(18)EW or an earlier release to 12.2(20)EWA, and the RPR mode has been saved to the startup configuration, both supervisor engines will continue to operate in RPR mode after the software upgrade. To use SSO mode, you must manually change the redundancy mode to SSO.

**Command Modes**

Redundancy configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RPR and SSO mode are not supported on Catalyst 4500 series switches that are configured with Supervisor Engine 2.

The `mode` command can be entered only from within redundancy configuration mode.

Follow these guidelines when configuring your system to RPR or SSO mode:

- You must use identical Cisco IOS images and supervisor engines to support RPR and SSO mode. Redundancy may not work due to differences between the Cisco IOS release and supervisor engine capabilities.
- Any modules that are not online at the time of a switchover are reset and reloaded on a switchover.
- If you perform an OIR of the module within 60 seconds before a stateful switchover, the module resets during the stateful switchover and the port states are restarted.
- The FIB tables are cleared on a switchover. Routed traffic is interrupted until route tables reconverge.

The redundant supervisor engine reloads on any mode change and begins to work in the current mode.

**Examples**

This example shows how to set the redundancy mode to SSO:

```
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)#
```

<td>good</td>
<td>Specifies a good packet type.</td>
</tr>
<tr>
<td>bad</td>
<td>Specifies a bad packet type.</td>
</tr>
<tr>
<td>address-type unicast</td>
<td>multicast</td>
</tr>
</tbody>
</table>

**Defaults**

Received and transmitted traffic, as well as all VLANs, packet types, and address types are monitored on a trunking interface.

Packets are transmitted untagged out the destination port; ingress and learning are disabled.

All packets are permitted and forwarded “as is” on the destination port.

**Command Modes**

Global configuration mode
**Command History**

<table>

</tr>
</tbody>
</table>

**Usage Guidelines**

Only one SPAN destination for a SPAN session is supported. If you attempt to add another destination interface to a session that already has a destination interface that is configured, you will get an error. You must first remove a SPAN destination interface before changing the SPAN destination to a different interface.

Beginning in Cisco IOS Release 12.1(12c)EW, you can configure sources from different directions within a single user session.

> **Note**
>
> Beginning in Cisco IOS Release 12.1(12c)EW, SPAN is limited to two sessions containing ingress sources and four sessions containing egress sources. Bidirectional sources support both ingress and egress sources.

A particular SPAN session can either monitor VLANs or monitor individual interfaces: you cannot have a SPAN session that monitors both specific interfaces and specific VLANs. If you first configure a SPAN session with a source interface, and then try to add a source VLAN to the same SPAN session, you will receive an error. You will also receive an error message if you configure a SPAN session with a source VLAN, and then try to add a source interface to that session. You must first clear any sources for a SPAN session before switching to another type of source. CPU sources may be combined with source interfaces and source VLANs.

When configuring the **ingress** option on a destination port, you must specify an ingress VLAN if the configured encapsulation type is untagged (the default) or is 802.1Q. If the encapsulation type is ISL, then no ingress VLAN specification is necessary.

By default, when you enable ingress, no host learning is performed on destination ports. When you enter the **learning** keyword, host learning is performed on the destination port, and traffic to learned hosts is forwarded out the destination port.

If you enter the **filter** keyword on a monitored trunking interface, only traffic on the set of specified VLANs is monitored. Port-channel interfaces are displayed in the list of **interface** options if you have them configured. VLAN interfaces are not supported. However, you can span a particular VLAN by entering the **monitor session session source vlan vlan-id** command.

The packet-type filters are supported only in the Rx direction. You can specify both Rx- and Tx-type filters and multiple-type filters at the same time (for example, you can use **good** and **unicast** to only sniff nonerror unicast frames). As with VLAN filters, if you do not specify the type, the session will sniff all packet types.
The **queue** identifier allows sniffing for only traffic that is sent or received on the specified CPU queues. The queues may be identified either by number or by name. The queue names may contain multiple numbered queues for convenience.

### Examples

This example shows how to configure IP access group 100 on a SPAN session:

```
Switch# configure terminal
Switch(config)# monitor session 1 filter ip access-group 100
Switch(config)# end
```

This example shows how to add a source interface to a SPAN session:

```
Switch# configure terminal
Switch(config)# monitor session 1 source interface fa2/3
Switch(config)# end
```

This example shows how to configure the sources with different directions within a SPAN session:

```
Switch# configure terminal
Switch(config)# monitor session 1 source interface fa2/3 rx
Switch(config)# monitor session 1 source interface fa2/2 tx
Switch(config)# end
```

This example shows how to remove a source interface from a SPAN session:

```
Switch# configure terminal
Switch(config)# no monitor session 1 source interface fa2/3
Switch(config)# end
```

This example shows how to limit SPAN traffic to VLANs 100 through 304:

```
Switch# configure terminal
Switch(config)# monitor session 1 filter vlan 100 - 304
Switch(config)# end
```

This example shows how to configure RSPAN VLAN 20 as the destination:

```
Switch# configure terminal
Switch(config)# monitor session 2 destination remote vlan 20
Switch(config)# end
```

This example shows how to use queue names and queue number ranges for the CPU as a SPAN source on Supervisor Engine 6-E:

```
Switch# configure terminal
Switch(config)# monitor session 2 source cpu queue control-packet rx
Switch(config)# monitor session 3 source cpu queue 10 rx
Switch(config)# end
```

---

**Note**

`control-packet` is mapped to queue 10.

### Related Commands

<table>

</table>
mtu

To enable jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU), use the `mtu` command. To return to the default setting, use the `no` form of this command.

```
mtu bytes

no mtu
```

**Syntax Description**

`bytes` Byte size; valid values are from 1500 to 9198.

**Defaults**

The default settings are as follows:
- Jumbo frames are disabled
- 1500 bytes for all ports

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Jumbo frames are supported on nonblocking Gigabit Ethernet ports, switch virtual interfaces (SVI), and EtherChannels. Jumbo frames are not available for stub-based ports.

The baby giants feature uses the global `system mtu size` command to set the global baby giant MTU. It allows all stub-based port interfaces to support an Ethernet payload size of up to 1552 bytes.

Both the `system mtu` command and the per-interface `mtu` command work on interfaces that can support jumbo frames, but the per-interface `mtu` command takes precedence.

**Examples**

This example shows how to specify an MTU of 1800 bytes:

```
Switch(config)# interface GigabitEthernet 1/1
Switch(config-if)# mtu 1800
```

**Related Commands**

<tr>
<td><code>system mtu</code></td>
<td>Sets the maximum Layer 2 or Layer 3 payload size.</td>
</tr>
</tbody>
</table>
name

To set the MST region name, use the `name` command. To return to the default name, use the `no` form of this command.

```
name name
no name name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name name</code></td>
<td>Specifies the name of the MST region. The name can be any string with a maximum length of 32 characters.</td>
</tr>
</tbody>
</table>

**Defaults**

The MST region name is not set.

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Two or more Catalyst 4500 series switches with the same VLAN mapping and configuration version number are considered to be in different MST regions if the region names are different.

**Examples**

This example shows how to name a region:

```
Switch(config-mst)# name Cisco
Switch(config-mst)#
```

**Related Commands**

pagp learn-method

To learn the input interface of the incoming packets, use the `pagp learn-method` command. To return to the default value, use the `no` form of this command.

```
pagp learn-method {aggregation-port | physical-port}
no pagp learn-method
```

**Syntax Description**
- **aggregation-port**: Specifies learning the address on the port channel.
- **physical-port**: Specifies learning the address on the physical port within the bundle.

**Defaults**
Aggregation port is enabled.

**Command Modes**
Interface configuration mode

**Command History**
- **Release**: 12.1(8a)EW
  - Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**
- This example shows how to enable physical port address learning within the bundle:
  ```
  Switch(config-if)# pagp learn-method physical-port
  Switch(config-if)#
  ```
- This example shows how to enable aggregation port address learning within the bundle:
  ```
  Switch(config-if)# pagp learn-method aggregation-port
  Switch(config-if)#
  ```

**Related Commands**
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tbody>
</table>
pagp port-priority

To select a port in hot standby mode, use the `pagp port-priority` command. To return to the default value, use the `no` form of this command.

```
pagp port-priority priority

no pagp port-priority
```

**Syntax Description**

| `priority` | Port priority number; valid values are from 1 to 255. |

**Defaults**

Port priority is set to 128.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The higher the priority, the better the chances are that the port will be selected in the hot standby mode.

**Examples**

This example shows how to set the port priority:

```
Switch(config-if)# pagp port-priority 45
Switch(config-if)#
```

**Related Commands**

<table>

</tr>
<tr>
<td>range range</td>
<td>Specifies the range of subinterfaces being configured; see the “Usage Guidelines” section.</td>
</tr>
</tbody>
</table>

### Defaults

Routing updates are sent on the interface.

### Command Modes

Router configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can use the `passive-interface range` command on the following interfaces: FastEthernet, GigabitEthernet, VLAN, Loopback, Port-channel, 10-GigabitEthernet, and Tunnel. When you use the `passive-interface range` command on a VLAN interface, the interface should be the existing VLAN SVIs. To display the VLAN SVIs, enter the `show running config` command. The VLANs that are not displayed cannot be used in the `passive-interface range` command.

The values that are entered with the `passive-interface range` command are applied to all the existing VLAN SVIs.

Before you can use a macro, you must define a range using the `define interface-range` command.

All configuration changes that are made to a port range through the `passive-interface range` command are retained in the running-configuration as individual passive-interface commands.

You can enter the `range` in two ways:

- Specifying up to five interface ranges
- Specifying a previously defined macro

You can either specify the interfaces or the name of an interface-range macro. An interface range must consist of the same interface type, and the interfaces within a range cannot span across the modules.
You can define up to five interface ranges on a single command; separate each range with a comma:

```plaintext
interface range gigabitethernet 5/1-20, gigabitethernet 4/5-20.
```

Use this format when entering the `port-range`:

- `interface-type {mod}[/{first-port} - {last-port}]`

You cannot specify both a macro and an interface range in the same command. After creating a macro, you can enter additional ranges. If you have already entered an interface range, the CLI does not allow you to enter a macro.

You can specify a single interface in the `range range` value. This makes the command similar to the `passive-interface interface-number` command.

**Note**

The `range` keyword is only supported in OSPF, EIGRP, RIP, and ISIS router mode.

If you disable the sending of routing updates on an interface, the particular subnet will continue to be advertised to other interfaces, and updates from other routers on that interface continue to be received and processed.

The `default` keyword sets all interfaces as passive by default. You can then configure individual interfaces where adjacencies are desired using the `no passive-interface` command. The `default` keyword is useful in Internet service provider (ISP) and large enterprise networks where many of the distribution routers have more than 200 interfaces.

For the Open Shortest Path First (OSPF) protocol, OSPF routing information is neither sent nor received through the specified router interface. The specified interface address appears as a stub network in the OSPF domain.

For the Intermediate System-to-Intermediate System (IS-IS) protocol, this command instructs IS-IS to advertise the IP addresses for the specified interface without actually running IS-IS on that interface. The `no` form of this command for IS-IS disables advertising IP addresses for the specified address.

**Note**

For IS-IS you must keep at least one active interface and configure the interface with the `ip router isis` command.

Enhanced Interior Gateway Routing Protocol (EIGRP) is disabled on an interface that is configured as passive although it advertises the route.

**Examples**

The following example sends EIGRP updates to all interfaces on network 10.108.0.0 except GigabitEthernet interface 1/1:

```plaintext
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# router eigrp 109
Switch(config-router)# network 10.108.0.0
Switch(config-router)# network 10.108.0.0
Switch(config-router)# passive-interface gigabitethernet 1/1
```
The following configuration enables IS-IS on Ethernet interface 1 and serial interface 0 and advertises the IP addresses of Ethernet interface 0 in its link-state protocol data units (PDUs):

```
Switch(config-if)# router isis Finance
Switch(config-router)# passive-interface Ethernet 0
Switch(config-router)# interface Ethernet 1
Switch(config-router)# ip router isis Finance
Switch(config-router)# interface serial 0
Switch(config-router)# ip router isis Finance
```

The following example sets all interfaces as passive, then activates Ethernet interface 0:

```
Switch(config-if)# router ospf 100
Switch(config-router)# passive-interface default
Switch(config-router)# no passive-interface ethernet0
Switch(config-router)# network 10.108.0.1 0.0.0.255 area 0
Switch(config-router)#
```

The following configuration sets the Ethernet ports 3 through 4 on module 0 and GigabitEthernet ports 4 through 7 on module 1 as passive:

```
Switch(config-if)# router ospf 100
Switch(config-router)# passive-interface range ethernet0/3-4,gigabitethernet1/4-7
Switch(config-router)#
```
**permit**

To permit an ARP packet based on matches against the DHCP bindings, use the `permit` command. To remove a specified ACE from an access list, use the `no` form of this command.

```
```

```
```

defaults

This command has no default settings.

**Command Modes**

`arp-nacl configuration mode`

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Permit clauses can be added to forward or drop ARP packets based on some matching criteria.

Examples

This example shows a host with a MAC address of 0000.0000.abcd and an IP address of 1.1.1.1. This example shows how to permit both requests and responses from this host:

```
Switch(config)# arp access-list static-hosts
Switch(config-arp-nacl)# permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch(config-arp-nacl)# end
Switch# show arp access-list

ARP access list static-hosts
    permit ip host 1.1.1.1 mac host 0000.0000.abcd
Switch#
```

police

To configure the Traffic Policing feature, use the `police` QoS policy-map class configuration command. To remove the Traffic Policing feature from the configuration, use the `no` form of this command.

```
police { bps | kbps | mbps | gbps } [burst-normal] [burst-max] conform-action action exceed-action action [violate-action action]
```

```
no police { bps | kbps | mbps | gbps } [burst-normal] [burst-max] conform-action action exceed-action action [violate-action action]
```

**Syntax Description**

- **bps**
  - Average rate, in bits per second. Valid values are 32,000 to 32,000,000,000.

- **kbps**
  - Average rate, in kilobytes per second. Valid values are 32 to 32,000,000.

- **mbps**
  - Average rate, in megabits per second. Valid values are 1 to 32,000.

- **gbps**
  - Average rate, in gigabits per second. Valid values are 1 to 32.

- **burst-normal**
  - (Optional) Normal burst size, in bytes. Valid values are 64 to 2,596,929,536. Burst value of up to four times the configured rate can be supported.

- **burst-max**
  - (Optional) Excess burst size, in bytes. Valid values are 64 to 2,596,929,536. Burst value of up to four times the configured rate can be supported.

- **conform-action**
  - Action to take on packets that conform to the rate limit.

- **exceed-action**
  - Action to take on packets that exceed the rate limit.

- **violate-action**
  - (Optional) Action to take on packets that violate the normal and maximum burst sizes.

- **action**
  - Action to take on packets. Specify one of the following keywords:
    - `drop`—Drops the packet.
    - `set-cos-transmit` new-ios—Set the class of services (CoS) value to a new value and send the packet. The range is 0 to 7.
    - `set-dscp-transmit` value—Sets the IP differentiated services code point (DSCP) value and transmits the packet with the new IP DSCP value setting.
    - `set-prec-transmit` value—Sets the IP precedence and transmits the packet with the new IP precedence value setting.
    - `transmit`—Transmits the packet. The packet is not altered.

**Defaults**

This command is disabled by default.

**Command Modes**

- Policy-map class configuration mode (when specifying a single action to be applied to a marked packet)
- Policy-map class police configuration mode (when specifying multiple actions to be applied to a marked packet)
Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Use the **police** command to mark a packet with different quality of service (QoS) values based on conformance to the service-level agreement.

Traffic policing will not be executed for traffic that passes through an interface.

**Specifying Multiple Actions**

The **police** command allows you to specify multiple policing actions. When specifying multiple policing actions when configuring the **police** command, note the following points:

- You can specify a maximum of four actions at one time.
- You cannot specify contradictory actions such as **conform-action transmit** and **conform-action drop**.

**Using the Police Command with the Traffic Policing Feature**

The **police** command can be used with Traffic Policing feature. The Traffic Policing feature works with a token bucket algorithm. Two types of token bucket algorithms are a single-token bucket algorithm and a two-token bucket algorithm. A single-token bucket system is used when the **violate-action** option is not specified, and a two-token bucket system is used when the **violate-action** option is specified.

**Token Bucket Algorithm with One Token Bucket**

The one token bucket algorithm is used when the **violate-action** option is not specified in the **police** command of the command-line interface (CLI).

The conform bucket is initially set to the full size (the full size is the number of bytes specified as the normal burst size).

When a packet of a given size (for example, “B” bytes) arrives at specific time (time “T”) the following actions occur:

- Tokens are updated in the conform bucket. If the previous arrival of the packet was at T1 and the current time is T, the bucket is updated with (T - T1) worth of bits based on the token arrival rate. The token arrival rate is calculated as follows:
  \[(time \text{ between packets} < \text{which is equal to } T - T1 > \times \text{policer rate})/8 \text{ bytes}\]
- If the number of bytes in the conform bucket B is greater than or equal to 0, the packet conforms and the conform action is taken on the packet. If the packet conforms, B bytes are removed from the conform bucket and the conform action is completed for the packet.
- If the number of bytes in the conform bucket B (minus the packet size to be limited) is fewer than 0, the exceed action is taken.
Token Bucket Algorithm with Two Token Buckets (Refer to RFC 2697)

The two-token bucket algorithm is used when the \texttt{violate-action} is specified in the \texttt{police} command CLI. The conform bucket is initially full (the full size is the number of bytes specified as the normal burst size).

The exceed bucket is initially full (the full exceed bucket size is the number of bytes specified in the maximum burst size).

The tokens for both the conform and exceed token buckets are updated based on the token arrival rate, or committed information rate (CIR).

When a packet of given size (for example, “B” bytes) arrives at specific time (time “T”) the following actions occur:

- Tokens are updated in the conform bucket. If the previous arrival of the packet was at $T_1$ and the current arrival of the packet is at $t$, the bucket is updated with $(T - T_1)$ worth of bits based on the token arrival rate. The refill tokens are placed in the conform bucket. If the tokens overflow the conform bucket, the overflow tokens are placed in the exceed bucket. The token arrival rate is calculated as follows:

$$(\text{time between packets <which is equal to T-T1>} \times \text{policer rate}) / 8 \text{ bytes}$$

- If the number of bytes in the conform bucket - B is greater than or equal to 0, the packet conforms and the conform action is taken on the packet. If the packet conforms, B bytes are removed from the conform bucket and the conform action is taken. The exceed bucket is unaffected in this scenario.

- If the number of bytes in the conform bucket B is less than 0, the excess token bucket is checked for bytes by the packet. If the number of bytes in the exceed bucket B is greater than or equal to 0, the exceed action is taken and B bytes are removed from the exceed token bucket. No bytes are removed from the conform bucket.

- If the number bytes in the exceed bucket B is fewer than 0, the packet violates the rate and the violate action is taken. The action is complete for the packet.

Examples

Token Bucket Algorithm with One Token Bucket

This example shows how to define a traffic class (using the \texttt{class-map} command) and associate the match criteria from the traffic class with the Traffic Policing configuration, which is configured in the service policy (using the \texttt{policy-map} command). The \texttt{service-policy} command is then used to attach this service policy to the interface.

In this particular example, Traffic Policing is configured with the average rate at 8000 bits per second and the normal burst size at 1000 bytes for all packets leaving Gigabit Ethernet interface 6/1:

```
Switch(config)# configure terminal
Switch(config)# class-map access-match
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map police-setting
Switch(config-pmap)# class access-match
Switch(config-pmap-c)# police 8000 1000 conform-action transmit exceed-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output police-setting
Switch(config-if)# end
```
In this example, the initial token buckets start full at 1000 bytes. If a 450-byte packet arrives, the packet conforms because enough bytes are available in the conform token bucket. The conform action (send) is taken by the packet and 450 bytes are removed from the conform token bucket (leaving 550 bytes).

If the next packet arrives 0.25 seconds later, 250 bytes are added to the token bucket ((0.25 * 8000)/8), leaving 800 bytes in the token bucket. If the next packet is 900 bytes, the packet exceeds and the exceed action (drop) is taken. No bytes are taken from the token bucket.

Token Bucket Algorithm with Two Token Buckets Example (Refer to RFC 2697)

In this particular example, Traffic Policing is configured with the average rate at 8000 bits per second, the normal burst size at 1000 bytes, and the excess burst size at 1000 bytes for all packets leaving Gigabit Ethernet interface 6/1.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map access-match
Switch(config-cmap)# match access-group 1
Switch(config-cmap)# exit
Switch(config)# policy-map police-setting
Switch(config-pmap)# class access-match
Switch(config-pmap-c)# police 8000 1000 1000 conform-action transmit exceed-action set-qos-transmit 1
violate-action drop
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# exit
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output police-setting
Switch(config-if)# end
```

In this example, the initial token buckets start full at 1000 bytes. If a 450-byte packet arrives, the packet conforms because enough bytes are available in the conform token bucket. The conform action (send) is taken by the packet and 450 bytes are removed from the conform token bucket (leaving 550 bytes).

If the next packet arrives 0.25 seconds later, 250 bytes are added to the token bucket ((0.25 * 8000)/8), leaving 800 bytes in the token bucket. If the next packet is 900 bytes, the packet does not conform because only 800 bytes are available in the conform token bucket.

The exceed token bucket, which starts full at 1000 bytes (as specified by the excess burst size) is then checked for available bytes. Because enough bytes are available in the exceed token bucket, the exceed action (set the QoS transmit value of 1) is taken and 900 bytes are taken from the exceed bucket (leaving 100 bytes in the exceed token bucket).

If the next packet arrives 0.40 seconds later, 400 bytes are added to the token buckets ((.40 * 8000)/8). Therefore, the conform token bucket now has 1000 bytes (the maximum number of tokens available in the conform bucket) and 200 bytes overflow the conform token bucket (because it only 200 bytes were needed to fill the conform token bucket to capacity). These overflow bytes are placed in the exceed token bucket, giving the exceed token bucket 300 bytes.

If the arriving packet is 1000 bytes, the packet conforms because enough bytes are available in the conform token bucket. The conform action (transmit) is taken by the packet and 1000 bytes are removed from the conform token bucket (leaving 0 bytes).

If the next packet arrives 0.20 seconds later, 200 bytes are added to the token bucket ((.20 * 8000)/8). Therefore, the conform bucket now has 200 bytes. If the arriving packet is 400 bytes, the packet does not conform because only 200 bytes are available in the conform bucket. Similarly, the packet does not exceed because only 300 bytes are available in the exceed bucket. Therefore, the packet violates and the violate action (drop) is taken.

</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

Usage Guidelines
This command calculates the cir and pir on the basis of a percentage of the maximum amount of bandwidth available on the interface. When a policy map is attached to the interface, the equivalent cir and pir values in bits per second (bps) are calculated on the basis of the interface bandwidth and the percent value entered with this command. The `show policy-map interface` command can then be used to verify the bps rate calculated.

The calculated cir and pir bps rates must be in the range of 32,000 and 32,000,000,000 bps. If the rates are outside this range, the associated policy map cannot be attached to the interface. If the interface bandwidth changes (for example, more is added), the bps values of the cir and the pir are recalculated on the basis of the revised amount of bandwidth. If the cir and pir percentages are changed after the policy map is attached to the interface, the bps values of the cir and pir are recalculated.

This command also allows you to specify the values for the conform burst size and the peak burst size in milliseconds. If you want bandwidth to be calculated as a percentage, the conform burst size and the peak burst size must be specified in milliseconds (ms).

Examples
This example shows how to configure traffic policing using a CIR and a PIR based on a percentage of bandwidth on Gigabit interface 6/2. In this example, a CIR of 20 percent and a PIR of 40 percent have been specified. Additionally, an optional bc value and be value (300 ms and 400 ms, respectively) have been specified.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class-map class1
Switch(config-pmap-c)# police cir percent 20 bc 3 ms pir percent 40 be 4 ms
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# interface gigabitethernet 6/2
Switch(config-if)# service-policy output policy
Switch(config-if)# end
```
police rate

To configure single or dual rate policer, use the police rate command in policy-map configuration mode. To remove traffic policing from the configuration, use the no form of this command.

Syntax for Bytes Per Second

```
police rate units bps [burst burst-in-bytes bytes] [peak-rate peak-rate-in-bps bps] [pack-burst peak-burst-in-bytes bytes]
```

```
no police rate units bps [burst burst-in-bytes bytes] [peak-rate peak-rate-in-bps bps]
[pack-burst peak-burst-in-bytes bytes]
```

Syntax for Percent

```
police rate percent percentage [burst ms ms] [peak-rate percent percentage] [pack-burst ms ms]
```

```
no police rate percent percentage [burst ms ms] [peak-rate percent percentage] [pack-burst ms ms]
```

</tbody>
</table>

Usage Guidelines
Use the **police rate** command to limit traffic on the basis of pps, bps, or a percentage of interface bandwidth.

If the **police rate** command is issued, but the rate is not specified, traffic that is destined will be policed on the basis of bps.

Examples
This example shows how to configure policing on a class to limit traffic to an average rate of 1,500,000 bps:
```
Switch(config)# class-map cl
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class cl
Switch(config-pmap-c)# police rate 1500000  burst 500000
Switch(config-pmap-c)# exit
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>policy-map</strong></td>
<td>Creates or modifies a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>show policy-map</strong></td>
<td>Displays information about the policy map.</td>
</tr>
</tbody>
</table>
To configure traffic policing using two rates, the committed information rate (CIR) and the peak information rate (PIR), use the `police` command in policy-map configuration mode. To remove two-rate traffic policing from the configuration, use the `no` form of this command.

```
police cir cir [bc conform-burst] pir pir [be peak-burst] [conform-action action [exceed-action action [violate-action action]]]

no police cir cir [bc conform-burst] pir pir [be peak-burst] [conform-action action [exceed-action action [violate-action action]]]
```

### Syntax Description

- **cir**
  - Committed information rate (CIR) at which the first token bucket is updated.
  - Specifies the CIR value in bits per second. The value is a number from 32,000 to 32,000,000,000.

- **bc**
  - (Optional) Conform burst (bc) size used by the first token bucket for policing.
  - Specifies the bc value in bytes. The value is a number from 64 to 2,596,929,536.

- **pir**
  - Peak information rate (PIR) at which the second token bucket is updated.
  - Specifies the PIR value in bits per second. The value is a number from 32,000 to 32,000,000,000.

- **be**
  - (Optional) Peak burst (be) size used by the second token bucket for policing.
  - Specifies the peak burst (be) size in bytes. The value is a number from 64 to 2,596,929,536.

- **conform-action**
  - (Optional) Action to take on packets that conform to the CIR and PIR.

- **exceed-action**
  - (Optional) Action to take on packets that conform to the PIR but not the CIR.

- **violate-action**
  - (Optional) Action to take on packets exceed the PIR.

- **action**
  - (Optional) Action to take on packets. Specify one of the following keywords:
    - **drop**—Drops the packet.
    - **set-cos-transmit** new-ios—Set the class of services (CoS) value to a new value and send the packet. The range is 0 to 7.
    - **set-dscp-transmit** new-dscp—Sets the IP differentiated services code point (DSCP) value and sends the packet with the new IP DSCP value setting.
    - **set-prec-transmit** new-prec—Sets the IP precedence and sends the packet with the new IP precedence value setting.
    - **transmit**—Sends the packet with no alteration.

Chapter 2 Cisco IOS Commands for the Catalyst 4500 Series Switches

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Refer to RFC 2698-Two Rate Three Color Marker.

Two-rate traffic policing uses two token buckets—Tc and Tp—for policing traffic at two independent rates. Note the following points about the two token buckets:

- The Tc token bucket is updated at the CIR value each time a packet arrives at the two-rate policer. The Tc token bucket can contain up to the confirm burst (Bc) value.
- The Tp token bucket is updated at the PIR value each time a packet arrives at the two-rate policer. The Tp token bucket can contain up to the peak burst (Be) value.

Updating Token Buckets

The following scenario illustrates how the token buckets are updated:

A packet of B bytes arrives at time t. The last packet arrived at time t1. The CIR and the PIR token buckets at time t are represented by Tc(t) and Tp(t), respectively. Using these values and in this scenario, the token buckets are updated as follows:

\[
Tc(t) = \min(CIR \ast (t-t1) + Tc(t1), Bc)
\]

\[
Tp(t) = \min(PIR \ast (t-t1) + Tp(t1), Be)
\]

Marking Traffic

The two-rate policer marks packets as either conforming, exceeding, or violating a specified rate. The following points (using a packet of B bytes) illustrate how a packet is marked:

- If B > Tp(t), the packet is marked as violating the specified rate.
- If B > Tc(t), the packet is marked as exceeding the specified rate, and the Tp(t) token bucket is updated as Tp(t) = Tp(t) – B.

Otherwise, the packet is marked as conforming to the specified rate, and both token buckets—Tc(t) and Tp(t)—are updated as follows:

\[
Tp(t) = Tp(t) – B
\]

\[
Tc(t) = Tc(t) – B
\]

For example, if the CIR is 100 kbps, the PIR is 200 kbps, and a data stream with a rate of 250 kbps arrives at the two-rate policer, the packet would be marked as follows:

- 100 kbps would be marked as conforming to the rate.
- 100 kbps would be marked as exceeding the rate.
- 50 kbps would be marked as violating the rate.

Marking Packets and Assigning Actions Flowchart

The flowchart in Figure 2-1 illustrates how the two-rate policer marks packets and assigns a corresponding action (that is, violate, exceed, or conform) to the packet.
Examples

This example shows how to configure two-rate traffic policing on a class to limit traffic to an average committed rate of 500 kbps and a peak rate of 1 Mbps:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.  
Switch(config)# class-map police
Switch(config-cmap)# match access-group 101
Switch(config-cmap)# policy-map policy1
Switch(config-pmap)# class police
Switch(config-pmap-c)# police cir 500000 bc 10000 pir 1000000 be 10000 conform-action
transmit exceed-action set-prec-transmit 2 violate-action drop
Switch(config-pmap-c)# interface gigabitethernet 6/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch# show policy-map policy1

Policy Map policy1
Class police
  police cir 500000 conform-burst 10000 pir 1000000 peak-burst 1000000 conform-action
  transmit exceed-action set-prec-transmit 2 violate-action drop
Switch#
```

Traffic marked as conforming to the average committed rate (500 kbps) will be sent as is. Traffic marked as exceeding 500 kbps, but not exceeding 1 Mbps, will be marked with IP Precedence 2 and then sent. All traffic marked as exceeding 1 Mbps will be dropped. The burst parameters are set to 10000 bytes.
In the following example, 1.25 Mbps of traffic is sent (“offered”) to a policer class:

Switch# show policy-map interface gigabitethernet 6/1

GigabitEthernet6/1

Service-policy output: policy1

Class-map: police (match all)
148803 packets, 36605538 bytes
30 second offered rate 1249000 bps, drop rate 249000 bps
Match: access-group 101
police:
cir 500000 bps, conform-burst 10000, pir 1000000, peak-burst 1000000
conformed 59538 packets, 14646348 bytes; action: transmit
exceeded 59538 packets, 14646348 bytes; action: set-prec-transmit 2
violated 29731 packets, 7313826 bytes; action: drop
conformed 499000 bps, exceed 500000 bps violate 249000 bps

Class-map: class-default (match-any)
19 packets, 1990 bytes
30 seconds offered rate 0 bps, drop rate 0 bps
Match: any
Switch#

The two-rate policer marks 500 kbps of traffic as conforming, 500 kbps of traffic as exceeding, and 250 kbps of traffic as violating the specified rate. Packets marked as conforming to the rate will be sent as is, and packets marked as exceeding the rate will be marked with IP Precedence 2 and then sent. Packets marked as violating the rate are dropped.
policy-map

To create or modify a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode, use the **policy-map** global configuration command. To delete an existing policy map and to return to global configuration mode, use the **no** form of this command.

```
policy-map policy-map-name
no policy-map policy-map-name
```

**Syntax Description**

- **policy-map-name** Name of the policy map.

**Defaults**

No policy maps are defined.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before configuring policies for classes whose match criteria are defined in a class map, use the **policy-map** command to specify the name of the policy map to be created or modified. After you enter the **policy-map** command, the switch enters policy-map configuration mode. You can configure or modify the class policies for that policy map and decide how to treat the classified traffic.

These configuration commands are available in policy-map configuration mode:

- **class**: defines the classification match criteria for the specified class map. For more information, see the “class” section on page 2-58.
- **description**: describes the policy map (up to 200 characters).
- **exit**: exits policy-map configuration mode and returns you to global configuration mode.
- **no**: removes a previously defined policy map.

To return to global configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the **class-map** global configuration and **match** class-map configuration commands.

**Examples**

This example shows how to configure multiple classes in a policy map called “policymap2”:

```
Switch# configure terminal
Switch(config)# policy-map policymap2
Switch(config-pmap)# class class1
```
Switch(config-pmap-c)# **police 100000 20000 exceed-action**
Switch(config-pmap-c)# **set-dscp-transmit cs3**
Switch(config-pmap-c)# **set-cos-transmit 3**
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# **class class2**
Switch(config-pmap-c)# **police cir 32000 pir 64000 conform-action transmit exceed-action**
Switch(config-pmap-c)# **set-dscp-transmit cs3 violate-action drop**
Switch(config-pmap-c)# exit
Switch(config-pmap-c)# **class class3**
Switch(config-pmap-c)# **set dscp cs3**
Switch(config-pmap-c)# exit
Switch#

This example shows how to delete the policy map called “policymap2”:

Switch# **configure terminal**
Switch(config)# **no policy-map policymap2**
Switch#

You can verify your settings by entering the **show policy-map** privileged EXEC command.

port-channel load-balance

To set the load-distribution method among the ports in the bundle, use the `port-channel load-balance` command. To reset the load distribution to the default, use the `no` form of this command.

```
port-channel load-balance method

no port-channel load-balance
```

**Syntax Description**

`method` Specifies the load distribution method. See the “Usage Guidelines” section for more information.

**Defaults**

Load distribution on the source XOR destination IP address is enabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following values are valid for the load-distribution method:

- `dst-ip`—Load distribution on the destination IP address
- `dst-mac`—Load distribution on the destination MAC address
- `dst-port`—Load distribution on the destination TCP/UDP port
- `src-dst-ip`—Load distribution on the source XOR destination IP address
- `src-dst-mac`—Load distribution on the source XOR destination MAC address
- `src-dst-port`—Load distribution on the source XOR destination TCP/UDP port
- `src-ip`—Load distribution on the source IP address
- `src-mac`—Load distribution on the source MAC address
- `src-port`—Load distribution on the source port

**Examples**

This example shows how to set the load-distribution method to the destination IP address:

```
Switch(config)# port-channel load-balance dst-ip
Switch(config)#
```

This example shows how to set the load-distribution method to the source XOR destination IP address:

```
Switch(config)# port-channel load-balance src-dst-port
Switch(config)#
```
port-channel load-balance

port-security mac-address

To configure a secure address on an interface for a specific VLAN or VLAN range, use the **port-security mac-address** command.

```
port-security mac-address mac_address
```

**Syntax Description**

- **mac_address**: The MAC-address that needs to be secured.

**Command Modes**

VLAN-range interface submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the **vlan** command, you can use the **port-security mac-address** command to specify different addresses on different VLANs.

**Examples**

This example shows how to configure the secure address 1.1.1 on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# end
Switch#
```

**Related Commands**

<td>Configures the maximum number of addresses on an interface for a specific VLAN or VLAN range.</td>
</tr>
</tbody>
</table>
**port-security mac-address sticky**

To configure a sticky address on an interface for a specific VLAN or VLAN range, use the `port-security mac-address sticky` command.

```
port-security mac-address sticky mac_address
```

### Syntax Description

**mac_address**

The MAC-address that needs to be secured.

### Command Modes

VLAN-range interface submode

### Command History

**Release** | **Modification**
--- | ---
T2.2(25)EWA | Support for this command was introduced on the Catalyst 4500 series switch.

### Usage Guidelines

The Sticky feature must be enabled on an interface before you can configure the `port-security mac-address sticky` command.

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan` command, you can use the `port-security mac-address sticky` command to specify different sticky addresses on different VLANs.

The Sticky feature must be enabled on an interface before you can configure the `port-security mac-address sticky` command.

Sticky MAC addresses are addresses that persist across switch reboots and link flaps.

### Examples

This example shows how to configure the sticky address 1.1.1 on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.1
Switch(config-if-vlan-range)# end
Switch#
```

</tr>
</tbody>
</table>
port-security maximum

To configure the maximum number of addresses on an interface for a specific VLAN or VLAN range, use the `port-security maximum` command.

```
port-security maximum max_value
```

**Syntax Description**

- **max_value**: The maximum number of MAC-addresses.

**Command Modes**

VLAN-range interface submode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EWA</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the `vlan` command, you can use the `port-security maximum` command to specify the maximum number of secure addresses on different VLANs.

If a specific VLAN on a port is not configured with a maximum value, the maximum configured for the port is used for that VLAN. In this situation, the maximum number of addresses that can be secured on this VLAN is limited to the maximum value configured on the port.

Each VLAN can be configured with a maximum count that is greater than the value configured on the port. Also, the sum total of the maximum configured values for all the VLANs can exceed the maximum configured for the port. In either of these situations, the number of MAC addresses secured on each VLAN is limited to the lesser of the VLAN configuration maximum and the port configuration maximum.

**Examples**

This example shows how to configure a maximum number of addresses (5) on interface Gigabit Ethernet 1/1 for VLANs 2-3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan 2-3
Switch(config-if-vlan-range)# port-security maximum 5
Switch(config-if-vlan-range)# exit
Switch#
```

</tr>
<tr>
<td>3.4.0SG and IOS</td>
<td>series switch.</td>
</tr>
<tr>
<td>15.1(2)SG</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**
EEE is supported on WS-X4748-UPOE+E and WS-X4748-RJ45-E.

EEE defines support for physical layer devices (PHYs) to operate in Low Power Idle (LPI) mode. When enabled, EEE supports QUIET times during low link utilization allowing both sides of a link to disable portions of each PHY’s operating circuitry and save power. This functionality is provided per port and is not enabled by default. To avoid issues with EEE functionality on any port during run-time, Cisco provides the `power efficient-ethernet auto` command to enable or disable EEE.

Because EEE relies on Auto Negotiation pulse to determine whether to activate EEE, the port must initially enable auto negotiation. Furthermore, EEE is the correct action provided the speed is auto 100M, auto 1000M, or auto 100M and 1000M. 10M (either auto or forced mode) does not require EEE for power saving.

**Examples**
This example shows how to enable EEE:

```
Switch# config t
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# power efficient-ethernet auto
Switch(config-if)# exit
```
# power inline

To set the inline-power state for the inline-power-capable interfaces, use the `power inline` command. To return to the default values, use the `no` form of this command.

```plaintext
power inline [auto [max milliwatt] | never | static [max milliwatt] | consumption milliwatt]

no power inline
```

## Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>Sets the Power over Ethernet state to auto mode for inline-power-capable interfaces.</td>
</tr>
<tr>
<td>max milliwatt</td>
<td>(Optional) Sets the maximum power that the equipment can consume; valid range is from 2000 to 15400 mW for classic modules. For the WS-X4648-RJ45V-E, the maximum is 20000. For the WS-X4648-RJ45V+E, the maximum is 30000.</td>
</tr>
<tr>
<td>never</td>
<td>Disables both the detection and power for the inline-power capable interfaces.</td>
</tr>
<tr>
<td>static</td>
<td>Allocates power statically.</td>
</tr>
<tr>
<td>consumption</td>
<td>Sets power allocation per interface; valid range is from 4000 to 15400 for classic modules. Any non-default value disables automatic adjustment of power allocation.</td>
</tr>
</tbody>
</table>

## Defaults

The default settings are as follows:

- Auto mode for Power over Ethernet is set.
- Maximum mW mode is set to 15400. For the WS-X4648-RJ45V-E, the maximum mW is set to 20000. For the WS-X4648-RJ45V+E, the maximum mW is set to 30000.
- Default allocation is set to 15400.

## Command Modes

</tbody>
</table>

## Usage Guidelines

If your interface is not capable of supporting Power over Ethernet, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```
Examples

This example shows how to set the inline-power detection and power for the inline-power-capable interfaces:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline auto
Switch(config-if)# end
Switch#
```

This example shows how to disable the inline-power detection and power for the inline-power-capable interfaces:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline never
Switch(config-if)# end
Switch#
```

This example shows how to set the permanent Power over Ethernet allocation to 8000 mW for Fast Ethernet interface 4/1 regardless what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline consumption 8000
Switch(config-if)# end
Switch#
```

This example shows how to pre-allocate Power over Ethernet to 16500 mW for Gigabit Ethernet interface 2/1 regardless of what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline static max 16500
Switch(config-if)# end
Switch#
```

<tr>
<td>12.1(20)EW</td>
<td>Support added for Power over Ethernet.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If your interface is not capable of supporting Power over Ethernet, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```

**Examples**

This example shows how to set the Power over Ethernet allocation to use 8000 mW, regardless of any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power inline consumption default 8000
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>

power inline four-pair forced

**Note**
This command is available only on Supervisor Engine 7-E and Supervisor Engine 7L-E.

To automatically enable power on both signal and spare pairs from a switch port, provided the end-device is PoE capable on both signal and spare pairs but does not support the CDP or LLDP extensions required for UPOE, use the **power inline four-pair forced** command.

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
None

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 7-E and 7L-E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Although IEEE 802.at only provides for power up to 30W per port, the WS-X4748-UPOE+E module can provide up to 60W using the spare pair of an RJ45 cable (wires 4,5,7,8) with the signal pair (wires 1,2,3,6). Power on the spare pair is enabled when the switch port and end-device mutually identify themselves as UPOE capable using CDP or LLDP and the end-device requests for power on the spare pair to be enabled. When the spare pair is powered, the end-device can negotiate up to 60W power from the switch using CDP or LLDP.

If the end-device is PoE capable on both signal and spare pairs but does not support the CDP or LLDP extensions required for UPOE, then the following configuration automatically enables power on both signal and spare pairs from the switch port.

**Examples**
The following example shows how to automatically enable power on both signal and spare pairs from switch port gigabit ethernet 2/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline four-pair forced
Switch(config-if)# shutdown
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#
```
power inline four-pair forced

Do not enter this command if the end-device is incapable of sourcing inline power on the spare pair or if the end-device supports the CDP or LLDP extensions for UPOE.
power inline logging global

To enable console messages that show when a PoE device has been detected and to show when a PoE device has been removed, use the `power inline logging global` command.

```
power inline logging global
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>15.0(2)SG2/XE 3.2.2SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Be aware of the potential for console flooding if this command is used on a switch connected to several PoE devices.

**Examples**

This example shows how to globally enable PoE status messaging on each interface:

To enable PoE event logging, you use the `logging event poe-status global` command:

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power inline logging global
Switch(config)# int gigabitEthernet 5/5
Switch(config-if)# shut
Switch(config-if)#
Switch(config-if)# no shut
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>logging event link-status global (global configuration)</code></td>
<td>Changes the default switch-wide global link-status event messaging settings.</td>
</tr>
</tbody>
</table>
power inline police

To configure PoE policing on a particular interface, use the `power inline police` command. The `no` form of the command disables PoE policing on an interface.

```
power inline police [action] [errdisable | log]
no power inline police [action] [errdisable | log]
```

**Syntax Description**

- `action` (optional) Specifies the action to take on the port when a PoE policing fault occurs (the device consumes more power than it’s allocated).
- `errdisable` (optional) Enables PoE policing on the interface and places the port in an errdisable state when a PoE policing fault occurs.
- `log` (optional) Enables PoE policing on the interface and, if a PoE policing fault occurs, shuts, restarts the port, and logs an error message.

**Defaults**

PoE policing is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If a port is in the `errdisable` state because of a PoE policing fault, enter the `shut` command followed by a `no shut` on the interface to make the port operational again.

You can also configure inline-power errdisable autorecovery so that an errdisabled interface is automatically revived when the errdisable autorecovery timer expires.

**Examples**

This example shows how to enable PoE policing and configure a policing action:

```
Switch(config)# int gigabitEthernet 2/1
Switch(config-if)# power inline police
Switch(config-if)# do show power inline police gigabitEthernet 2/1
Available:421(w) Used:39(w) Remaining:382(w)

<table>
<thead>
<tr>
<th>Interface</th>
<th>Admin State</th>
<th>Oper State</th>
<th>Admin Police</th>
<th>Oper Police</th>
<th>Cutoff Power</th>
<th>Oper Power</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi2/1</td>
<td>auto</td>
<td>on</td>
<td>errdisable</td>
<td>ok</td>
<td>17.4</td>
<td>7.6</td>
</tr>
</tbody>
</table>

Switch(config-if)# power inline police action log
Available:421(w) Used:39(w) Remaining:382(w)
```
### Related Commands

</thead>
<tbody>
<tr>
<td></td>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch. (Catalyst 4500 series switches only: 4503, 4506, and 4507).</td>
</tr>
</tbody>
</table>

| Usage Guidelines | The two power supplies must be the same type and wattage. |

**Caution**

If you have power supplies with different types or wattages installed in your switch, the switch will not recognize one of the power supplies. A switch set to redundant mode will not have power redundancy. A switch set to combined mode will use only one power supply.

In redundant mode, the power from a single power supply must provide enough power to support the switch configuration.

Table 2-11 lists the maximum available power for chassis and Power over Ethernet for each power supply.

**Table 2-11   Available Power**

<table>
<thead>
<tr>
<th>Power Supply</th>
<th>Redundant Mode (W)</th>
<th>Combined Mode (W)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000 W AC</td>

</tr>
</tbody>
</table>
priority

To enable the strict priority queue (low-latency queueing [LLQ]) and to give priority to a class of traffic belonging to a policy map attached to a physical port, use the `priority` policy-map class configuration command. To return to the default setting, use the `no` form of this command.

```
priority

no priority
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

The strict priority queue is disabled.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `priority` command only in a policy map attached to a physical port. You can use this command only in class-level classes, you cannot use this command in class class-default.

This command configures LLQ and provides strict-priority queueing. Strict-priority queueing enables delay-sensitive data, such as voice, to be sent before packets in other queues are sent. The priority queue is serviced first until it is empty.

You cannot use the `bandwidth`, `dbl`, and the `shape` policy-map class configuration commands with the `priority` policy-map class configuration command in the same class within the same policy map. However, you can use these commands in the same policy map.

You can use police or set class configuration commands with the `priority` police-map class configuration command.

If the priority queuing class is not rate limited, you cannot use the bandwidth command, you can use the bandwidth remaining percent command instead.

**Examples**

This example shows how to enable the LLQ for the policy map called `policy1`:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class voice
Switch(config-pmap-c)# priority
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>3.1.1SG</td>
<td>Support for twoway-community was introduced on Supervisor 7-E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot configure VLAN 1 or VLANs 1001 to 1005 as private VLANs.

VTP does not support private VLANs. You must configure private VLANs on each device where you want private VLAN ports.
The secondary_vlan_list parameter cannot contain spaces; it can contain multiple comma-separated items. Each item can be a single private VLAN ID or a range of private VLAN IDs separated by hyphens.

The secondary_vlan_list parameter can contain multiple community VLAN IDs.

The secondary_vlan_list parameter can contain only one isolated VLAN ID. A private VLAN is defined as a set of private ports characterized by a common set of VLAN number pairs: each pair is made up of at least two special unidirectional VLANs and is used by isolated ports or by a community of ports to communicate with the switches.

An isolated VLAN is a VLAN that is used by the isolated ports to communicate with the promiscuous ports. The isolated VLAN traffic is blocked on all other private ports in the same VLAN and can be received only by the standard trunking ports and the promiscuous ports that are assigned to the corresponding primary VLAN.

A community VLAN is the VLAN that carries the traffic among the community ports and from the community ports to the promiscuous ports on the corresponding primary VLAN. A community VLAN is not allowed on a private VLAN trunk.

A promiscuous port is a private port that is assigned to a primary VLAN.

A primary VLAN is a VLAN that is used to convey the traffic from the switches to the customer end stations on the private ports.

You can specify only one isolated vlan-id value, while multiple community VLANs are allowed. You can only associate isolated and community VLANs to one VLAN. The associated VLAN list may not contain primary VLANs. Similarly, a VLAN that is already associated to a primary VLAN cannot be configured as a primary VLAN.

The private-vlan commands do not take effect until you exit the config-VLAN submode.

If you delete either the primary or secondary VLAN, the ports that are associated with the VLAN become inactive.

Refer to the Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide for additional configuration guidelines.

### Examples

This example shows how to configure VLAN 202 as a primary VLAN and verify the configuration:

```bash
Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202       primary
```

This example shows how to configure VLAN 303 as a community VLAN and verify the configuration:

```bash
Switch# configure terminal
Switch(config)# vlan 303
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202       primary
303       community
```

This example shows how to configure VLAN 440 as an isolated VLAN and verify the configuration:
Switch# configure terminal
Switch(config)# vlan 440
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# end
Switch# show vlan private-vlan

Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202 primary
303 community
440 isolated

This example shows how to create a private VLAN relationship among the primary VLAN 14, the isolated VLAN 19, and community VLANs 20 and 21:

Switch(config)# vlan 19
Switch(config-vlan) # private-vlan isolated
Switch(config)# vlan 14
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# private-vlan association 19

This example shows how to remove a private VLAN relationship and delete the primary VLAN. The associated secondary VLANs are not deleted.

Switch(config-vlan)# no private-vlan 14
Switch(config-vlan)#

This example shows how to configure VLAN 550 as a twoway-community VLAN and verify the configuration:

Switch# configure terminal
Switch(config)# vlan 550
Switch(config-vlan)# private-vlan twoway-community
Switch(config-vlan)# end
Switch# show vlan private-vlan

Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202 primary
303 community
440 isolated
550 twoway-community

This example shows how to associate community VLANs 303 through 307 and 309 and isolated VLAN 440 with primary VLAN 202 and verify the configuration:

Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan association 303-307,309,440
Switch(config-vlan)# end
Switch# show vlan private-vlan

Primary Secondary Type Interfaces
------- --------- ----------------- ------------------------------------------
202 303 community
202 304 community
202 305 community
202 306 community
202 307 community
202 309 community
202 440 isolated
202 308 community

Note
The secondary VLAN 308 has no associated primary VLAN.
This example shows how to remove an isolated VLAN from the private VLAN association:

Switch(config)# vlan 14
Switch(config-vlan)# private-vlan association remove 18
Switch(config-vlan)#

This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end
Switch# show interfaces fastethernet 5/1 switchport

private-vlan mapping

To create a mapping between the primary and the secondary VLANs so that both share the same primary VLAN SVI, use the `private-vlan mapping` command. To remove all PVLAN mappings from an SVI, use the `no` form of this command.

```
private-vlan mapping primary-vlan-id [secondary-vlan-list | {add secondary-vlan-list} | {remove secondary-vlan-list}]

no private-vlan mapping
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>primary-vlan-id</code></td>
<td>VLAN ID of the primary VLAN of the PVLAN relationship.</td>
</tr>
<tr>
<td><code>secondary-vlan-list</code></td>
<td>(Optional) VLAN ID of the secondary VLANs to map to the primary VLAN.</td>
</tr>
<tr>
<td><code>add</code></td>
<td>(Optional) Maps the secondary VLAN to the primary VLAN.</td>
</tr>
<tr>
<td><code>remove</code></td>
<td>(Optional) Removes the mapping between the secondary VLAN and the primary VLAN.</td>
</tr>
</tbody>
</table>

### Defaults

All PVLAN mappings are removed.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `secondary_vlan_list` parameter cannot contain spaces. It can contain multiple, comma-separated items. Each item can be a single PVLAN ID or a range of PVLAN IDs separated by hyphens.

This command is valid in the interface configuration mode of the primary VLAN.

The SVI of the primary VLAN is created at Layer 3.

The traffic that is received on the secondary VLAN is routed by the SVI of the primary VLAN.

The SVIs of the existing secondary VLANs do not function and are considered down after this command is entered.

A secondary SVI can be mapped to only one primary SVI. If the configured PVLANs association is different from what is specified in this command (if the specified `primary-vlan-id` is configured as a secondary VLAN), all the SVIs that are specified in this command are brought down.

If you configure a mapping between two VLANs that do not have a valid Layer 2 association, the mapping configuration does not take effect.
Examples

This example shows how to map the interface of VLAN 20 to the SVI of VLAN 18:

Switch(config)# interface vlan 18
Switch(config-if)# private-vlan mapping 18 20

This example shows how to permit the routing of the secondary VLAN ingress traffic from PVLANs 303 through 307, 309, and 440 and how to verify the configuration:

Switch# config terminal
Switch(config)# interface vlan 202
Switch(config-if)# private-vlan mapping add 303-307,309,440
Switch(config-if)# end
Switch# show interfaces private-vlan mapping

<table>

Switch#

This example shows the displayed message that you will see if the VLAN that you are adding is already mapped to the SVI of VLAN 18. You must delete the mapping from the SVI of VLAN 18 first.

Switch(config)# interface vlan 19
Switch(config-if)# private-vlan mapping 19 add 21
Command rejected: The interface for VLAN 21 is already mapped as secondary.
Switch(config-if)#

This example shows how to remove all PVLAN mappings from the SVI of VLAN 19:

Switch(config)# interface vlan 19
Switch(config-if)# no private-vlan mapping
Switch(config-if)#

Switch# config terminal
Switch(config)# interface vlan 202
Switch(config-if)# private-vlan mapping add 303-307,309,440
Switch(config-if)# end
Switch# show interfaces private-vlan mapping

<table>

</tbody>
</table>
private-vlan synchronize

To map the secondary VLANs to the same instance as the primary VLAN, use the `private-vlan synchronize` command.

```
private-vlan synchronize
```

### Syntax Description

This command has no arguments or keywords.

### Defaults

This command has no default settings.

### Command Modes

MST configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not map the VLANs to the same instance as the associated primary VLAN when you exit the MST configuration submode, a warning message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The `private-vlan synchronize` command automatically maps all secondary VLANs to the same instance as the associated primary VLANs.

### Examples

This example shows how to initialize PVLAN synchronization:

```
Switch(config-mst)# private-vlan synchronize
Switch(config-mst)#
```

This example assumes that a primary VLAN 2 and a secondary VLAN 3 are associated to VLAN 2, and that all VLANs are mapped to the CIST instance 1. This example also shows the output if you try to change the mapping for the primary VLAN 2 only:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 2
Switch(config-mst)# exit
These secondary vlans are not mapped to the same instance as their primary: ->3
Switch(config)#
```

### Related Commands

</tbody>
</table>
profile

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode, use the `profile` command.

```
profile profile_name
```

**Syntax Description**

```
profile_name
```

Specifies the profile name.

**Defaults**

This command has no default settings.

**Command Modes**

`cfg-call-home`

**Command History**

```
Release Modification
12.2(52)SG Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

When you enter the `profile profile_name` command in call-home mode, the prompt changes to `Switch(cfg-call-home-profile)#`, and you have access to the following profile configuration commands:

- `active`
- `destination address`
- `destination message-size-limit bytes`
- `destination preferred-msg-format`
- `destination transport-method`
- `end`
- `exit`
- `subscribe-to-alert-group all`
- `subscribe-to-alert-group configuration`
- `subscribe-to-alert-group diagnostic`
- `subscribe-to-alert-group environment`
- `subscribe-to-alert-group inventory`
- `subscribe-to-alert-group syslog`
Examples

This example shows how to create and configure a user-defined call-home profile:

Switch(config)# call-home
Switch(config)# profile cisco
Switch(config-call-home)# destination transport-method http
Switch(config-call-home)# destination address https://172.17.46.17/its/service/oddce/services/DDCEService
Switch(config-call-home)# subscribe-to-alert-group configuration
Switch(config-call-home)# subscribe-to-alert-group diagnostic severity normal
Switch(config-call-home)# subscribe-to-alert-group environment severity notification
Switch(config-call-home)# subscribe-to-alert-group syslog severity notification pattern "UPDOWN"
Switch(config-call-home)# subscribe-to-alert-group inventory periodic daily 21:12

qos account layer-all encapsulation

To account for Layer 1 header length of 20 bytes in QoS policing features, use the `qos account layer-all encapsulation` command. To disable the use of additional bytes, use the `no` form of this command.

```
qos account layer-all encapsulation
no qos account layer-all encapsulation
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

On Supervisor Engine 7-E, policers account only for the Layer 2 header length in policing features. In contrast, shapers account for header length as well as IPG in rate calculations.

**Command Modes**

Global configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOS-XE 3.2.0SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

On Supervisor Engine 7-E, use the `qos account layer-all encapsulation` command to account for Layer 1 header of 20 bytes (preamble + IPG) and Layer 2 header in policing features. When this command is configured, policer statistics (in bytes) observed in the output of the `show policy-map interface` command reflect the Layer 1 header length as well (20 bytes per packet).

**Examples**

This example shows how to include IPG in policing:

```
Switch) config t
Switch(config)# qos account layer-all encapsulation
Switch(config)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show policy-map interface</code></td>
<td>Displays policer statistics on a specific interface.</td>
</tr>
</tbody>
</table>
qos trust

To set the trusted state of an interface (for example, whether the packets arriving at an interface are trusted to carry the correct CoS, ToS, and DSCP classifications), use the `qos trust` command. To set an interface to the untrusted state, use the `no` form of this command.

```
qos trust {cos | device cisco-phone | dscp | extend [cos priority]}
```

```
no qos trust {cos | device cisco-phone | dscp | extend [cos priority]}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cos</code></td>
<td>Specifies that the CoS bits in incoming frames are trusted and derives the internal DSCP value from the CoS bits.</td>
</tr>
<tr>
<td><code>device cisco-phone</code></td>
<td>Specifies the Cisco IP phone as the trust device for a port.</td>
</tr>
<tr>
<td><code>dscp</code></td>
<td>Specifies that the ToS bits in the incoming packets contain a DSCP value.</td>
</tr>
<tr>
<td><code>extend</code></td>
<td>Specifies to extend the trust to Port VLAN ID (PVID) packets coming from the PC.</td>
</tr>
<tr>
<td><code>cos priority</code></td>
<td>(Optional) Specifies that the CoS priority value is set to PVID packets; valid values are from 0 to 7.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:

- If global QoS is enabled, trust is disabled on the port.
- If global QoS is disabled, trust DSCP is enabled on the port.
- The CoS priority level is 0.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for extending trust for voice was added.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for trust device Cisco IP phone was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

You can only configure the trusted state on physical LAN interfaces.

By default, the trust state of an interface when QoS is enabled is untrusted; when QoS is disabled on the interface, the trust state is reset to trust DSCP.

When the interface trust state is `qos trust cos`, the transmit CoS is always the incoming packet CoS (or the default CoS for the interface, if the packet is not tagged).

When the interface trust state is not `qos trust dscp`, the security and QoS ACL classification will always use the interface DSCP and not the incoming packet DSCP.
Trusted boundary should not be configured on the ports that are part of an EtherChannel (that is, a port channel).

**Examples**

This example shows how to set the trusted state of an interface to CoS:

```
Switch(config-if)# qos trust cos
```

This example shows how to set the trusted state of an interface to DSCP:

```
Switch(config-if)# qos trust dscp
```

This example shows how to set the PVID CoS level to 6:

```
Switch(config-if)# qos trust extend cos 6
```

This example shows how to set the Cisco phone as the trust device:

```
Switch(config-if)# qos trust device cisco-phone
```

**Related Commands**

<table>

</thead>
<tbody>
<tr>
<td><code>show qos interface</code></td>
<td>Displays QoS information for an interface.</td>
</tr>
</tbody>
</table>
queue-limit

To specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map, use the `queue-limit` command. To remove the queue packet limit from a class, use the `no` form of this command.

```
queue-limit number-of-packets

no queue-limit number-of-packets
```

### Syntax Description

| `number-of-packets` | Number of packets that the queue for this class can accumulate; valid range is 16 to 8184. This number must be a multiple of 8. |

### Defaults

By default, each physical interface on a Catalyst 4500 switch has a default queue based on the number of slots in a chassis and the number of ports on the linecards.

### Command Modes

QoS policy-map class configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(44)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This class-based queuing (CBQ) command applies only to the Supervisor 6E as part of the MQC support on the Catalyst 4500 supervisor.

By default, each physical interface on a Catalyst 4500 switch comes up with a default queue. The size of this queue is based on the number of slots in a chassis as well as the number of ports on the line card in each slot. The switch supports 512K queue entries of which 100K are set aside as a common sharable pool. The remaining 412K entries are equally distributed among the slots. Each slot further divides its allocated queue entries equally among its ports.

CBQ creates a queue for every class for which a class map is defined. Packets satisfying the match criterion for a class accumulate in the queue reserved for the class until they are sent, which occurs when the queue is serviced by the fair queuing process. When the maximum packet threshold you defined for the class is reached, queuing of any further packets to the class queue causes tail drop or, if DBL is configured for the class policy, packet drop to take effect.

**Note**

The queue-limit command is supported only after you first configure a scheduling action, such as bandwidth, shape, or priority, except when you configure queue-limit in the class-default class of an output QoS policy-map.
This example shows how to configure a policy-map called *policy11* to contain policy for a class called *acl203*. Policy for this class is set so that the queue reserved for it has a maximum packet limit of 40:

Switch# configure terminal
Switch (config)# policy-map policy11
Switch (config-pmap)# class acl203
Switch (config-pmap-c)# bandwidth 2000
Switch (config-pmap-c)# queue-limit 40
Switch (config-pmap-c)# end
Switch#

redundancy

To enter the redundancy configuration mode, use the `redundancy` command in the global configuration mode.

```
redundancy
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R and 4510R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The redundancy configuration mode is used to enter the main CPU submode.

To enter the main CPU submode, use the `main-cpu` command in the redundancy configuration mode.

The main CPU submode is used to manually synchronize the configurations on the two supervisor engines.

From the main CPU submode, use the `auto-sync` command to enable automatic synchronization of the configuration files in NVRAM.

Use the `no` command to disable redundancy. If you disable redundancy, then reenable redundancy, the switch returns to default redundancy settings.

Use the `exit` command to exit the redundancy configuration mode.

**Examples**

This example shows how to enter redundancy mode:

```
Switch(config)# redundancy
Switch(config-red)#
```

This example shows how to enter the main CPU submode:

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)#
```

**Related Commands**

Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R and 4510R only).
<table>
<thead>
<tr>

</table>
**redundancy config-sync mismatched-commands**

If your active and standby supervisors are running different versions of IOS, some of their CLIs will not be compatible. If such commands are already present in the running configuration of the active supervisor engine and the syntax-check for the command fails at the standby supervisor engine while it is booting, the `redundancy config-sync mismatched-commands` command moves the active supervisor engine into the Mismatched Command List (MCL) and resets the standby supervisor engine.

```
redundancy config-sync {ignore | validate} mismatched-commands
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignore</td>
<td>Ignore the mismatched command list.</td>
</tr>
<tr>
<td>validate</td>
<td>Revalidate the mismatched command list with the modified running-configuration.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(44)SG</td>
<td>Updated command syntax from issu config-sync to redundancy config-sync.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The following is a log entry example for mismatched commands:

```
00:06:31: Config Sync: Bulk-sync failure due to Servicing Incompatibility. Please check full list of mismatched commands via:
  show redundancy config-sync failures mcl
00:06:31: Config Sync: Starting lines from MCL file:
  interface GigabitEthernet7/7
  ! <submode> "interface"
  - ip address 11.0.0.1 255.0.0.0
  ! </submode> "interface"
```

To display all mismatched commands, use the `show redundancy config-sync failures mcl` command.

To clean the MCL, follow these steps:

1. **Step 1** Remove all mismatched commands from the active supervisor engine’s running configuration.
2. **Step 2** Revalidate the MCL with a modified running configuration using the `redundancy config-sync validate mismatched-commands` command.
3. **Step 3** Reload the standby supervisor engine.
redundancy config-sync mismatched-commands

You could also ignore the MCL by doing the following:

**Step 1** Enter the `redundancy config-sync ignore mismatched-commands` command.

**Step 2** Reload the standby supervisor engine; the system changes to SSO mode.

**Note** If you ignore the mismatched commands, the *out-of-sync* configuration at the active supervisor engine and the standby supervisor engine still exists.

**Step 3** You can verify the ignored MCL with the `show redundancy config-sync ignored mcl` command.

If SSO mode cannot be established between the active and standby supervisor engines because of an incompatibility in the configuration file, a mismatched command list (MCL) is generated at the active supervisor engine and a reload into RPR mode is forced for the standby supervisor engine. Subsequent attempts to establish SSO, after removing the offending configuration and rebooting the standby supervisor engine with the exact same image, might cause the C4K_REDUNDANCY-2-IOS_VERSION_CHECK_FAIL and ISSU-3-PEER_IMAGE_INCOMPATIBLE messages to appear because the peer image is listed as incompatible. If the configuration problem can be corrected, you can clear the peer image from the incompatible list with the `redundancy config-sync ignore mismatched-commands` EXEC command while the peer is in a standby cold (RPR) state. This action allows the standby supervisor engine to boot in standby hot (SSO) state when it reloads.

**Examples**

This example shows how you can validate removal of entries from the MCL:

```
Switch# redundancy config-sync validate mismatched-commands
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show redundancy config-sync</code></td>
<td>Displays an ISSU config-sync failure or the ignored mismatched command list (MCL).</td>
</tr>
</tbody>
</table>
redundancy force-switchover

To force a switchover from the active to the standby supervisor engine, use the `redundancy force-switchover` command.

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before using this command, refer to the “Performing a Software Upgrade” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional information.

The `redundancy force-switchover` command conducts a manual switchover to the redundant supervisor engine. The redundant supervisor engine becomes the new active supervisor engine running the Cisco IOS image. The modules are reset.

The old active supervisor engine reboots with the new image and becomes the standby supervisor engine.

**Examples**

This example shows how to switch over manually from the active to the standby supervisor engine:

```
Switch# redundancy force-switchover
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

<td><code>redundancy</code></td>
<td>Enters the redundancy configuration mode.</td>
</tr>
<tr>
<td><code>show redundancy</code></td>
<td>Displays redundancy facility information.</td>
</tr>
</tbody>
</table>
redundancy reload

To force a reload of one or both supervisor engines, use the redundancy reload command.

```
redundancy reload {peer | shelf}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peer</td>
<td>Reloads the peer unit.</td>
</tr>
<tr>
<td>shelf</td>
<td>Reboots both supervisor engines.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before using this command, refer to the “Performing a Software Upgrade” section of the *Catalyst 4500 Series Switch Cisco IOS Software Configuration Guide* for additional information.

The redundancy reload shelf command conducts a reboot of both supervisor engines. The modules are reset.

**Examples**

This example shows how to manually reload one or both supervisor engines:

```
Switch# redundancy reload shelf
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>redundancy</td>
<td>Enters the redundancy configuration mode.</td>
</tr>
<tr>
<td>show redundancy</td>
<td>Displays redundancy facility information.</td>
</tr>

</table>
remote login module

To remotely connect to a specific module, use the `remote login module` configuration command.

```
remote login module mod
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mod</td>
<td>Target module for the command.</td>
</tr>
</tbody>
</table>

| Defaults | This command has no default settings. |

| Command Modes | Privileged EXEC mode |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies only to the Access Gateway Module on Catalyst 4500 series switches.

The valid values for `mod` depend on the chassis used. For example, if you have a Catalyst 4506 chassis, valid values for the module are from 2 to 6. If you have a 4507R chassis, valid values are from 3 to 7.

When you execute the `remote login module mod` command, the prompt changes to Gateway#

The `remote login module` command is identical to the `session module mod` and the `attach module mod` commands.

**Examples**

This example shows how to remotely log in to the Access Gateway Module:

```
Switch# remote login module 5
Attaching console to module 5
Type 'exit' at the remote prompt to end the session

Gateway>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>attach module</code></td>
<td>Remotely connects to a specific module.</td>
</tr>
<tr>
<td><code>session module</code></td>
<td>Logs in to the standby supervisor engine using a virtual console.</td>
</tr>
</tbody>
</table>
remote-span

To convert a VLAN into an RSPAN VLAN, use the **remote-span** command. To convert an RSPAN VLAN to a VLAN, use the **no** form of this command.

```
remote-span
no remote-span
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

RSPAN is disabled.

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to convert a VLAN into an RSPAN VLAN:

```
Switch# config terminal
Switch(config)# vlan 20
Switch(config-vlan)# remote-span
Switch(config-vlan)# end
Switch#
```

**Related Commands**

<table>
<thead>
<tr>

</table>
renew ip dhcp snooping database

To renew the DHCP binding database, use the **renew ip dhcp snooping database** command.

```
renew ip dhcp snooping database [validation none] [url]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>validation none</td>
<td>(Optional) Specifies that the checksum associated with the contents of the file specified by the URL is not verified.</td>
</tr>
<tr>
<td>url</td>
<td>(Optional) Specifies the file from which the read is performed.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the URL is not provided, the switch tries to read the file from the configured URL.

**Examples**

This example shows how to renew the DHCP binding database while bypassing the CRC checks:

```
Switch# renew ip dhcp snooping database validation none
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip dhcp snooping</td>
<td>Globally enables DHCP snooping.</td>
</tr>
<tr>
<td>ip dhcp snooping binding</td>
<td>Sets up and generates a DHCP binding configuration to restore bindings across reboots.</td>

reset

To leave the proposed new VLAN database but remain in VLAN configuration mode and reset the proposed new database to be identical to the VLAN database currently implemented, use the `reset` command.

```
reset
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to reset the proposed new VLAN database to the current VLAN database:

```
Switch(vlan-config)# reset
RESET completed.
Switch(vlan-config)#
```
revision

To set the MST configuration revision number, use the `revision` command. To return to the default settings, use the `no` form of this command.

```
revision version
no revision
```

**Syntax Description**

```
revision version  Configuration revision number; valid values are from 0 to 65535.
```

**Defaults**

Revision version is set to 0.

**Command Modes**

MST configuration mode

**Command History**

```
Release Modification
12.1(12c)EW Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

If two Catalyst 4500 series switches have the same configuration but have different configuration revision numbers, they are considered to be part of two different regions.

⚠️ **Caution**

Be careful when using the `revision` command to set the MST configuration revision number because a mistake can put the switch in a different region.

**Examples**

This example shows how to set the configuration revision number:

```
Switch(config-mst)# revision 5
Switch(config-mst)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tbody>
</table>
service-policy (interface configuration)

To attach a policy map to an interface or to apply different QoS policies on VLANs that an interface belongs to, use the service-policy command. To remove a policy map from an interface, use the no form of this command.

```
service-policy {input | output} policy-map name

no service-policy {input | output} policy-map name
```

**Syntax Description**

- **input** Specifies the input policy maps.
- **output** Specifies the output policy maps.
- **policy-map name** Name of a previously configured policy map.

**Defaults**

A policy map is not attached to an interface or a VLAN.

**Command Modes**

Interface configuration mode

**Command History**

- **Release** 12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.
- **Release** 12.2(25)EWA Support for applying different QoS policies on VLANs was introduced.

**Usage Guidelines**

Layer 2 interfaces can be part of multiple VLANs (for example, a typical trunk port). In conjunction with the vlan-range command, you can use the service-policy command to specify different QoS policies on different VLANs.

**Note**

This capability is restricted to Layer 2 interfaces.

You can apply a service policy under an interface as well as a VLAN range at the same time. However, this is allowed only when the interface policy has only queuing actions whereas a VLAN has only non-queueing actions (QoS marking and/or policing) actions.

To attach a service policy to a VLAN, the VLAN configuration mode has to be used.

**Examples**

This example shows how to attach a policy map to Fast Ethernet interface 5/20:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/20
Switch(config-if)# service-policy input pmap1
Switch(config-if)# end
```
This example shows how to apply policy map p1 for traffic in VLANs 20 and 400, and policy map p2 for traffic in VLANs 300 through 301:

```
Switch# configure terminal
Switch(config)# interface gigabitEthernet 6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# vlan-range 20,400
Switch(config-if-vlan-range)# service-policy input p1
Switch(config-if-vlan-range)# exit
Switch(config-if)# vlan-range 300-301
Switch(config-if-vlan-range)# service-policy output p2
Switch(config-if-vlan-range)# end
Switch# show policy-map interface gigabitEthernet 6/1 vlan 20

  0 packets
  police: Per-interface
  Conform: 0 bytes Exceed: 0 bytes

This example shows how to attach a policy map to a VLAN:

Switch# configure terminal
Switch(config)#vlan configuration 20
Switch(config-vlan-config)#service-policy out policy-vlan
Switch(config-vlan-config)#end
Switch#

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>
service-policy (policy-map class)

To create a service policy that is a quality of service (QoS) policy within a policy map (called a hierarchical service policy), use the service-policy policy-map class configuration command. To disable the service policy within a policy map, use the no form of this command.

```
  service-policy policy-map-name
  no service-policy policy-map-name
```

**Syntax Description**

- `policy-map-name` Name of the policy map.

**Defaults**

No service policies maps are defined.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the service-policy command only in a hierarchical policy map attached to a physical port. This command is valid in policy maps at level two of the hierarchy.

You can create a hierarchy by having the parent policy map specify marking and/or policing actions and having the child policy map specify the queueing actions.

If you enter this command in policy-map class configuration mode, you return to policy-map configuration mode by using the exit command. To return to privileged EXEC mode, use the end command.

**Examples**

This example shows how to create a hierarchical service policy in the service policy called “parent”:

```
Switch# configure terminal
Switch(config)# policy-map child
Switch(config-pmap)# class voice
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# policy-map parent
Switch(config-pmap)# class class1
Switch(config-pmap-c)# police 32k
Switch(config-pmap-c)# service-policy child
Switch#
```

You can verify your settings by entering the show policy-map privileged EXEC command.

**service-policy input (control-plane)**

To attach a policy map to a control plane for aggregate control plane services, use the `service-policy input` command. Use the `no` form of this command to remove a service policy from a control plane.

```
service-policy input policy-map-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>input</strong></td>
<td>Applies the specified service policy to the packets that are entering the control plane.</td>
</tr>
<tr>
<td><strong>policy-map-name</strong></td>
<td>Name of a service policy map (created using the <code>policy-map</code> command) to be attached.</td>
</tr>
</tbody>
</table>

**Defaults**

No service policy is specified.

**Command Modes**

Control-plane configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In this release, the only policy-map accepted on the control-plane is system-cpp-policy. It is already attached to the control-plane at start up. If not (due to some error conditions), it is recommended to use the `global macro system-cpp` command to attach it to the control-plane. The system-cpp-policy created by the system contains system pre-defined classes. For these pre-defined classes, you can change the policing parameters but you should not make any other change to the classes.

You can define your own class-maps and append them to the end of the system-cpp-policy policy-map.

**Examples**

This example shows how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specified rate:

```
Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet
! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet
! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet
! Define class-map "telnet-class."
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit
Switch(config)# policy-map control-plane-policy
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 80000 conform transmit exceed drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
! Define aggregate control plane service for the active Route Processor.
```
### Service-Policy Input (Control-Plane)

```plaintext
Switch(config)# control-plane
Switch(config-cp)# service-policy input control-plane-policy
Switch(config-cp)# exit
```

session module

**Note**
This command is only supported in SSO mode and does not work in RPR mode.

To login to the standby supervisor engine using a virtual console, use the `session module` configuration command.

```
session module mod
```

**Syntax Description**

```
mod Target module for the command.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Catalyst 4500 series switches can be configured with 2 supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. Therefore, you must connect to the standby console to access, monitor or debug the standby supervisor.

Virtual Console for Standby Supervisor Engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine and thus emulate the standby console on the active supervisor engine. Only one active standby console session is active at any time.

The Virtual Console for Standby Supervisor Engine allows users who are logged onto the active supervisor engine to remotely execute show commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual Console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the `attach module`, `session module`, or `remote login` commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

**Note**

The `session module` command is identical to the `attach module mod` and the `remote login module mod` commands.
Once you enter the standby virtual console, the terminal prompt automatically changes to "<hostname>-standby-console#" where hostname is the configured name of the switch. The prompt is restored back to the original prompt when you exit the virtual console.

You exit the virtual console with the `exit` or `quit` commands. When the inactivity period of the terminal on the active supervisor engine where you logged in exceeds the configured idle time, you are automatically logged out of the terminal on the active supervisor engine. In such a case, the virtual console session is also terminated. Virtual console session is also automatically terminated when the standby is rebooted. After the standby boots up, you need to create another virtual console session.

The following limitations apply to the standby virtual console:

All commands on the virtual console run to completion. It does not provide the auto-more feature; it behaves as if the `terminal length 0` command has been executed. It is also non-interactive. Therefore, a running command cannot be interrupted or aborted by any key sequence on the active supervisor engine. Therefore if a command produces considerable output, the virtual console displays it on the supervisor screen.

The virtual console is non-interactive. Because the virtual console does not detect the interactive nature of a command, any command that requires user interaction causes the virtual console to wait until the RPC timer aborts the command.

The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60 seconds. During this time, you cannot abort the command from the keyboard. You must wait for the timer to expire before you continue.

You cannot use virtual console to view debug and syslog messages that are being displayed on the standby supervisor engine. The virtual console only displays the output of commands that are executed from the virtual console. Other information that is displayed on the real standby console does not appear on the virtual console.

### Examples

To login to the standby supervisor engine using a virtual console, do the following:

```
Switch# session module 2
Connecting to standby virtual console
Type "exit" or "quit" to end this session

Switch-standby-console# exit
Switch#
```

If the standby console is not enabled, the following message appears.

```
Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout
```

set

To mark IP traffic by setting a class of service (CoS), a Differentiated Services Code Point (DSCP), or IP-precedence in the packet, use the `set` policy-map class configuration command. To remove the traffic classification, use the `no` form of this command.

```
set {cos new-cos | [ip] {dscp new-dscp | precedence new-precedence} | qos group value}
no set cos new-cos | [ip] {dscp new-dscp | precedence new-precedence} | qos group value}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cos new-cos</code></td>
<td>New CoS value assigned to the classified traffic. The range is 0 to 7.</td>
</tr>
<tr>
<td><code>ip dscp new-dscp</code></td>
<td>New DSCP value assigned to the classified traffic. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value. The specified value sets the type of service (ToS) traffic class byte in the IPv4/IPv6 packet header.</td>
</tr>
<tr>
<td><code>ip precedence new-precedence</code></td>
<td>New IP-precedence value assigned to the classified traffic. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value. The specified value sets the precedence bit in the IP header.</td>
</tr>
<tr>
<td><code>qos group value</code></td>
<td>Internal QoS group assigned to a classified packet on ingress to an interface.</td>
</tr>
</tbody>
</table>

### Defaults

No marking is enabled on packets.

### Command Modes

Policy-map class configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can use the `set` command only in class-level classes.

The `set dscp new-dscp` and the `set precedence new-precedence` commands are the same as the `set ip dscp new-dscp` and the `set ip precedence new-precedence` commands. For the `set dscp new-dscp` or the `set precedence new-precedence` command, you can enter a mnemonic name for a commonly used value. For example, you can enter the `set dscp af11` command, which is the same as entering the `set dscp 10` command. You can enter the `set precedence critical` command, which is the same as entering the `set precedence 5` command. For a list of supported mnemonics, enter the `set dscp ?` or the `set precedence ?` command to see the command-line help strings.

You can configure the `set cos new-cos`, `set dscp new-dscp`, or `set precedence new-precedence` command in an ingress and an egress policy map attached to an interface or VLAN.

To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.
Examples

This example shows how to create a policy map called \textit{p1} with CoS values assigned to different traffic types. Class maps for “voice” and “video-data” have already been created.

\begin{verbatim}
Switch# configure terminal
Switch(config)# policy-map p1
Switch(config-pmap)# class voice
Switch(config-pmap-c)# set cos 1
Switch(config-pmap)# exit
Switch(config-pmap)# class video-data
Switch(config-pmap-c)# set cos 2
Switch(config-pmap)# exit
Switch#
\end{verbatim}

You can verify your settings by entering the \texttt{show policy-map} privileged EXEC command.

set cos

To set the Layer 2 class of service (CoS) value of a packet, use the `set cos` command in policy-map class configuration mode. To remove a specific CoS value setting, use the `no` form of this command.

```
set cos {cos-value | from-field [table table-map-name]}
no set cos {cos-value | from-field [table table-map-name]}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cos-value</td>
<td>Specific IEEE 802.1Q CoS value from 0 to 7.</td>
</tr>
</tbody>
</table>
| from-field       | Specific packet-marking category to be used to set the CoS value of the packet. If you are using a table map for mapping and converting packet-marking values, this establishes the “map from” packet-marking category. Packet-marking category keywords are as follows:  
  - precedence  
  - dscp  
  - cos  
  - qos group  
| table            | (Optional) Indicates that the values set in a specified table map will be used to set the CoS value. |
| table-map-name   | (Optional) Name of the table map used to specify the CoS value. The table map name can be a maximum of 64 alphanumeric characters. |

**Command Default**

No CoS value is set for the outgoing packet.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `set cos` command can be used in an ingress as well as an egress policy map attached to an interface or VLAN.

You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the CoS value. The “from-field” packet-marking categories are as follows:

- Precedence  
- Differentiated services code point (DSCP)  
- Cost of Service (CoS)  
- Quality of Service (QoS) group
If you specify a “from-field” category but do not specify the `table` keyword and the applicable `table-map-name` argument, the default action will be to copy the value associated with the “from-field” category as the CoS value. For instance, if you configure the `set cos precedence` command, the precedence value will be copied and used as the CoS value.

You can do the same for the DSCP marking category. That is, you can configure the `set cos dscp` command, and the DSCP value will be copied and used as the CoS value.

**Note**

If you configure the `set cos dscp` command, only the first three bits (the class selector bits) of the DSCP field are used.

**Note**

If you configure the `set cos qos group` command, only the three least significant bits of the qos group field are used.

**Examples**

This example shows how to configure a policy map called “cos-set” and assign different CoS values for different types of traffic. This example assumes that the class maps called “voice” and “video-data” have already been created.

```
Switch# configure terminal
Switch(config)# policy-map cos-set
Switch(config-pmap)# class voice
Switch(config-pmap-c)# set cos 1
Switch(config-pmap-c)# exit
Switch(config-pmap)# class video-data
Switch(config-pmap-c)# set cos 2
Switch(config-pmap-c)# end
Switch#
```

This example shows how to configure a policy map called “policy-cos” and to use the values defined in a table map called “table-map1”. The table map called “table-map1” was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the `table-map` (value mapping) command page.

This example shows how the setting of the CoS value is based on the precedence value defined in “table-map1”:

```
Switch# configure terminal
Switch(config)# policy-map policy-cos
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set cos precedence table table-map1
Switch(config-pmap-c)# end
Switch#
```

<td>(Optional) Used in conjunction with the table keyword. Name of the table map used to specify the DSCP value. The name can be a maximum of 64 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

Disabled

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for ‘from-field’ for policy-map configured on a Supervisor Engine 6-E.</td>
</tr>
</tbody>
</table>
Once the DSCP bit is set, other quality of service (QoS) features can then operate on the bit settings.

**Usage Guidelines**

**DSCP and Precedence Values Are Mutually Exclusive**

The `set dscp` command cannot be used with the `set precedence` command to mark the same packet. The two values, DSCP and precedence, are mutually exclusive. A packet can have one value or the other, but not both.

You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the DSCP value. The “from-field” packet-marking categories are as follows:

- Class of service (CoS)
- QoS group
- Precedence
- Differentiated services code point (DSCP)

If you specify a “from-field” category but do not specify the `table` keyword and the applicable `table-map-name` argument, the default action will be to copy the value associated with the “from-field” category as the DSCP value. For instance, if you configure the `set dscp cos` command, the CoS value will be copied and used as the DSCP value.

---

**Note**

The CoS field is a three-bit field, and the DSCP field is a six-bit field. If you configure the `set dscp cos` command, only the three bits of the CoS field will be used.

If you configure the `set dscp qos-group` command, the QoS group value will be copied and used as the DSCP value.

The valid value range for the DSCP is a number from 0 to 63. The valid value range for the QoS group is a number from 0 to 63.

**Set DSCP Values in IPv6 Environments**

When this command is used in IPv6 environments, the default match occurs on both IP and IPv6 packets. However, the actual packets set by this function are only those which meet the match criteria of the class-map containing this function.

**Set DSCP Values for IPv6 Packets Only**

To set DSCP values for IPv6 values only, the `match protocol ipv6` command must also be used. Without that command, the DSCP match defaults to match both IPv4 and IPv6 packets.

**Set DSCP Values for IPv4 Packets Only**

To set DSCP values for IPv4 packets only, use the `ip` keyword in the `match` command for classification. Without the `ip` keyword, the match occurs on both IPv4 and IPv6 packets.
Examples

Packet-marking Values and Table Map

In the following example, the policy map called “policy1” is created to use the packet-marking values defined in a table map called “table-map1”. The table map was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the `table-map` (value mapping) command page.

This example shows how the DSCP value is set according to the CoS value defined in the table map called “table-map1”.

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set dscp cos table table-map1
Switch(config-pmap-c)# end
Switch#
```

<tbody>
<tr>
<td>12.2(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for ‘from-field’ for policy-map configured on a Supervisor Engine 6-E.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `set precedence` command cannot be used with the `set dscp` command to mark the same packet. The two values, DSCP and precedence, are mutually exclusive. A packet can be one value or the other, but not both.
You can use this command to specify the “from-field” packet-marking category to be used for mapping and setting the precedence value. The “from-field” packet-marking categories are as follows:

- CoS
- QoS group
- DSCP
- Precedence

If you specify a “from-field” category but do not specify the table keyword and the applicable table-map-name argument, the default action will be to copy the value associated with the “from-field” category as the precedence value. For instance, if you configure the `set precedence cos` command, the CoS value will be copied and used as the precedence value.

You can do the same for the QoS group-marking category. That is, you can configure the `set precedence qos-group` command, and the QoS group value will be copied and used as the precedence value.

The valid value range for the precedence value is a number from 0 to 7. The valid value range for the QoS group is a number from 0 to 63. Therefore, when configuring the `set precedence qos-group` command the three least significant bits of qos-group are copied to precedence.

### Precedence Values in IPv6 Environments

When this command is used in IPv6 environments it can set the value in both IPv4 and IPv6 packets. However, the actual packets set by this function are only those that meet the match criteria of the class-map containing this function.

### Setting Precedence Values for IPv6 Packets Only

To set the precedence values for IPv6 packets only, the `match protocol ipv6` command must also be used in the class-map that classified packets for this action. Without the `match protocol ipv6` command, the class-map may classify both IPv6 and IPv4 packets, (depending on other match criteria) and the `set precedence` command will act upon both types of packets.

### Setting Precedence Values for IPv4 Packets Only

To set the precedence values for IPv4 packets only, use a command involving the `ip` keyword like the `match ip precedence` or `match ip dscp` command or include the `match protocol ip` command along with the others in the class map. Without the additional `ip` keyword, the class-map may match both IPv6 and IPv4 packets (depending on the other match criteria) and the `set precedence` or `set dscp` command may act upon both types of packets.

### Examples

In the following example, the policy map named policy-cos is created to use the values defined in a table map named table-map1. The table map named table-map1 was created earlier with the `table-map` (value mapping) command. For more information about the `table-map` (value mapping) command, see the `table-map` (value mapping) command page.

This example shows how the precedence value is set according to the CoS value defined in table-map1.

```
Switch# configure terminal
Switch(config)# policy-map policy-cos
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# set precedence cos table table-map1
Switch(config-pmap-c)# end
Switch#
```
### Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

**set precedence**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>match (class-map configuration)</strong></td>
<td>Defines the match criteria for a class map.</td>
</tr>
<tr>
<td><strong>policy-map</strong></td>
<td>Creates or modifies a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>service-policy (policy-map class)</strong></td>
<td>Creates a service policy that is a quality of service (QoS) policy within a policy map.</td>
</tr>
<tr>
<td><strong>set cos</strong></td>
<td>Sets IP traffic by setting a class of service (CoS).</td>
</tr>
<tr>
<td><strong>set dscp</strong></td>
<td>Marks a packet by setting the differentiated services code point (DSCP) value in the type of service (ToS) byte.</td>
</tr>
<tr>
<td><strong>set qos-group</strong></td>
<td>Sets a quality of service (QoS) group identifier (ID) that can be used later to classify packets.</td>
</tr>
<tr>
<td><strong>set precedence</strong></td>
<td>Sets the precedence value in the packet header.</td>
</tr>
<tr>
<td><strong>show policy-map</strong></td>
<td>Displays information about the policy map.</td>
</tr>
<tr>
<td><strong>show policy-map interface</strong></td>
<td>Displays the statistics and configurations of the input and output policies that are attached to an interface.</td>
</tr>
<tr>
<td><strong>table-map (value mapping)</strong> (refer to Cisco IOS documentation)</td>
<td>Modifies metric and tag values when the IP routing table is updated with BGP learned routes.</td>
</tr>
</tbody>
</table>
set qos-group

To set a quality of service (QoS) group identifier (ID) that can be used later to classify packets, use the `set qos-group` command in policy-map class configuration mode. To remove the group ID, use the `no` form of this command.

```
set qos-group group-id

no set qos-group group-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group-id</code></td>
<td>Group ID number in the range from 0 to 63.</td>
</tr>
</tbody>
</table>

**Command Default**

The group ID is set to 0.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `set qos-group` command allows you to associate a group ID with a packet. This association is made through a service-policy attached to an interface or VLAN in the input direction. The group ID can be later used in the output direction to apply QoS service policies to the packet.

**Examples**

This example shows how to set the qos-group to 5:

```
Switch#configure terminal
Switch(config)#policy-map p1
Switch(config-pmap)#class cl
Switch(config-pmap-c)#set qos
Switch(config-pmap-c)#set qos-group 5
Switch(config-pmap-c)#end
Switch#
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>set qos-group</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Related Commands</strong></td>
<td><strong>Command</strong></td>
</tr>
<tr>
<td></td>
<td><strong>match (class-map configuration)</strong></td>
</tr>
<tr>
<td></td>
<td><strong>policy-map</strong></td>
</tr>
<tr>
<td></td>
<td><strong>service-policy (policy-map class)</strong></td>
</tr>
<tr>
<td></td>
<td><strong>show policy-map</strong></td>
</tr>
<tr>
<td></td>
<td><strong>show policy-map interface</strong></td>
</tr>
</tbody>
</table>
shape (class-based queueing)

To enable traffic shaping a class of traffic in a policy map attached to a physical port, use the `shape average` policy-map class command. Traffic shaping limits the data transmission rate. To return to the default setting, use the `no` form of this command.

```
shape average {rate} [bps | kbps | mbps | gbps]
shape average percent {percent_value}
no shape average
```

**Syntax Description**

- `rate`: Specifies an average rate for traffic shaping; the range is 16000 to 10000000000. Post-fix notation (k, m, and g) is optional and a decimal point is allowed.
- `bps`: (Optional) Specifies a rate in bits per seconds.
- `kbps`: (Optional) Specifies a rate in kilobytes per seconds.
- `mbps`: (Optional) Specifies a rate in megabytes per seconds.
- `gbps`: (Optional) Specifies a rate in gigabytes per seconds.
- `percent`: Specifies a percentage of bandwidth for traffic shaping.
- `percent_value`: (Optional) Specifies a percentage of the bandwidth used for traffic shaping; valid values are from 1 to 100 percent.

**Defaults**

Average-rate traffic shaping is disabled.

**Command Modes**

Policy-map class configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch using a Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Use the `shape` command only in a policy map attached to a physical port. This command is valid in policy maps at any level of the hierarchy.

- Shaping is the process of delaying out-of-profile packets in queues so that they conform to a specified profile. Shaping is distinct from policing. Policing drops packets that exceed a configured threshold, but shaping buffers packets so that traffic remains within the threshold. Shaping offers greater smoothness in handling traffic than policing.

- You cannot use the `bandwidth`, `dbl`, and the `shape` policy-map class configuration commands with the `priority` policy-map class configuration command in the same class within the same policy map. However, you can use these commands in the same policy map.

- To return to policy-map configuration mode, use the `exit` command. To return to privileged EXEC mode, use the `end` command.
This example shows how to limit the specified traffic class to a data transmission rate of 256 kbps:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
```

You can verify your settings by entering the `show policy-map` privileged EXEC command.

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bandwidth</strong></td>
<td>Creates a signaling class structure that can be referred to by its name.</td>
</tr>
<tr>
<td><strong>class</strong></td>
<td>Specifies the name of the class whose traffic policy you want to create or change.</td>
</tr>
<tr>
<td><strong>dbl</strong></td>
<td>Enables active queue management on a transmit queue used by a class of traffic.</td>
</tr>
<tr>
<td><strong>policy-map</strong></td>
<td>Creates a policy map that can be attached to multiple ports to specify a service policy and to enter policy-map configuration mode.</td>
</tr>
<tr>
<td><strong>service-policy (policy-map class)</strong></td>
<td>Creates a service policy that is a quality of service (QoS) policy within a policy map.</td>
</tr>
<tr>
<td><strong>show policy-map</strong></td>
<td>Displays information about the policy map.</td>
</tr>
</tbody>
</table>
shape (interface configuration)

To specify traffic shaping on an interface, use the `shape` command. To remove traffic shaping, use the `no` form of this command

```
shape [rate] [percent]
no shape [rate] [percent]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rate</code></td>
<td>(Optional) Specifies an average rate for traffic shaping; the range is 16000 to 1000000000. Post-fix notation (k, m, and g) is optional and a decimal point is allowed.</td>
</tr>
<tr>
<td><code>percent</code></td>
<td>(Optional) Specifies a percent of bandwidth for traffic shaping.</td>
</tr>
</tbody>
</table>

**Defaults**

Default is no traffic shaping.

**Command Modes**

Interface transmit queue configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. Traffic shaping is available on all the ports, and it sets an upper limit on the bandwidth. Some examples of ports that are connected directly to the backplane are as follows:

- Uplink ports on Supervisor Engine II+, II+10GE, III, IV, V, and V-10GE
- Ports on the WS-X4306-GB module
- The two 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first two ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module

All ports on the 24-port modules and the 48-port modules are multiplexed through a Stub ASIC. Some examples of ports multiplexed through a Stub ASIC are as follows:

- 10/100 ports on the WS-X4148-RJ45 module
- 10/100/1000 ports on the WS-X4124-GB-RJ45 module
- 10/100/1000 ports on the WS-X4448-GB-RJ45 module

**Examples**

This example shows how to configure a maximum bandwidth (70 percent) for the interface fa3/1:

```
Switch(config)# interface fastethernet3/1
Switch(config-if)# tx-queue 3
```
Switch(config-if-tx-queue)# shape 70m
Switch(config-if-tx-queue)#
shape (interface configuration)
**show access-group mode interface**

To display the ACL configuration on a Layer 2 interface, use the `show access-group mode interface` command.

```
show access-group mode interface [interface interface-number]
```

**Syntax Description**
- `interface` (Optional) Interface type; valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, and `port-channel`.
- `interface-number` (Optional) Interface number.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The valid values for the port number depend on the chassis used.

**Examples**
This example shows how to display the ACL configuration on the Fast Ethernet interface 6/1:

```
Switch# show access-group mode interface fa6/1
Interface FastEthernet6/1:
  Access group mode is: merge
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access-group mode</code></td>
<td>Specifies the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode).</td>
</tr>
</tbody>
</table>
show adjacency

To display information about the Layer 3 switching adjacency table, use the **show adjacency** command.

```
show adjacency [interface interface-number] | [null interface-number] | [port-channel number]
 | {vlan vlan-id} | detail | internal | summary]
```

**Syntax Description**

- **interface** *(Optional)* Interface type; possible valid values are *ethernet*, *fastethernet*, *gigabitethernet*, *tengigabitethernet*, *pos*, *ge-wan*, and *atm*.
- **interface-number** *(Optional)* Module and port number; see the “Usage Guidelines” section for valid values.
- **null interface-number** *(Optional)* Specifies the null interface; the valid value is 0.
- **port-channel number** *(Optional)* Specifies the channel interface; valid values are a maximum of 64 values ranging from 1 to 256.
- **vlan vlan-id** *(Optional)* Specifies the VLAN; valid values are from 1 to 4094.
- **detail** *(Optional)* Displays the information about the protocol detail and timer.
- **internal** *(Optional)* Displays the information about the internal data structure.
- **summary** *(Optional)* Displays a summary of CEF-adjacency information.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Extended to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The **interface-number** argument designates the module and port number. Valid values for **interface-number** depend on the specified interface type and the chassis and module that are used. For example, if you specify a Gigabit Ethernet interface and have a 48-port 10/100BASE-T Ethernet module that is installed in a 13-slot chassis, valid values for the module number are from 1 to 13, and valid values for the port number are from 1 to 48.

Hardware Layer 3 switching adjacency statistics are updated every 60 seconds.

The following information is contained in the **show adjacency** command:

- Protocol interface.
- Type of routing protocol that is configured on the interface.
- Interface address.
- Method of adjacency that was learned.
• MAC address of the adjacent router.
• Time left before the adjacency rolls out of the adjacency table. After it rolls out, a packet must use the same next hop to the destination.

**Examples**

This example shows how to display adjacency information:

```
Switch# show adjacency
Protocol Interface     Address
IP      FastEthernet2/3   172.20.52.1(3045)
IP      FastEthernet2/3   172.20.52.22(11)
Switch#
```

This example shows how to display a summary of adjacency information:

```
Switch# show adjacency summary
Adjacency Table has 2 adjacencies
  Interface          Adjacency Count
  FastEthernet2/3      2
Switch#
```

This example shows how to display protocol detail and timer information:

```
Switch# show adjacency detail
Protocol Interface     Address
IP      FastEthernet2/3   172.20.52.1(3045)
  0 packets, 0 bytes
  0000000000FF9200003800000000000000
  00000000000000000000000000000000
  0065C865B2800DBB0F980B0800
  ARP       03:58:12
IP      FastEthernet2/3   172.20.52.22(11)
  0 packets, 0 bytes
  0000000000FF9200003800000000000000
  00000000000000000000000000000000
  00801C93804000DBB0F980B0800
  ARP       03:58:06
Switch#
```

This example shows how to display adjacency information for a specific interface:

```
Switch# show adjacency fastethernet2/3
Protocol Interface     Address
IP      FastEthernet2/3   172.20.52.1(3045)
IP      FastEthernet2/3   172.20.52.22(11)
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>debug adjacency</td>
<td>Displays information about the adjacency debugging.</td>
</tr>
</tbody>
</table>
show arp access-list

To display detailed information on an ARP access list, use the `show arp` command.

```
show arp access-list
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the ARP ACL information for a switch:

```
Switch# show arp access-list
ARP access list rose
    permit ip 10.101.1.1 0.0.0.255 mac any
    permit ip 20.3.1.0 0.0.0.255 mac any
```

<tr>
<td><code>arp access-list</code></td>
<td>Defines an ARP access list or adds clauses at the end of a predefined list.</td>
</tr>
<tr>
<td><code>ip arp inspection filter vlan</code></td>
<td>Permits ARPs from hosts that are configured for static IP when DAI is enabled, defines an ARP access list, and applies the access list to a VLAN.</td>
</tr>
</tbody>
</table>
show authentication

To display the Auth Manager information, use the `show authentication` command in EXEC or Privileged EXEC mode.

```
show authentication {interface interface | registrations | sessions [session-id session-id] [handle handle] [interface interface] [mac mac] [method method]}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface interface</code></td>
<td>Displays all of the Auth Manager details associated with the specified interface.</td>
</tr>
<tr>
<td><code>registrations</code></td>
<td>Displays details of all methods registered with the Auth Manager.</td>
</tr>
<tr>
<td><code>sessions</code></td>
<td>Displays detail of the current Auth Manager sessions (for example, client devices). If you do not enter any optional specifiers, all current active sessions are displayed. You can enter the specifiers singly or in combination to display a specific session (or group of sessions).</td>
</tr>
<tr>
<td><code>session-id session-id</code></td>
<td>(Optional) Specifies an Auth Manager session.</td>
</tr>
<tr>
<td><code>handle handle</code></td>
<td>(Optional) Range: 1 to 4294967295.</td>
</tr>
<tr>

</tr>
<tr>
<td><code>method method</code></td>
<td>(Optional) Displays all clients authorized by a specified authentication method. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• dot1x</td>
</tr>
<tr>
<td></td>
<td>• mab</td>
</tr>
<tr>
<td></td>
<td>• webauth</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Table 2-12 describes the significant fields shown in the show authentication display.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The possible values for the status of sessions are given below. For a session in terminal state, “Authz Success” or “Authz Failed” are displayed, with “No methods” if no method has provided a result.</td>
</tr>
</tbody>
</table>
Table 2-12  show authentication Command Output

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle</td>
<td>The session has been initialized and no methods have run yet</td>
</tr>
<tr>
<td>Running</td>
<td>A method is running for this session</td>
</tr>
<tr>
<td>No methods</td>
<td>No method has provided a result for this session</td>
</tr>
<tr>
<td>Authc Success</td>
<td>A method has resulted in authentication success for this session</td>
</tr>
<tr>
<td>Authc Failed</td>
<td>A method has resulted in authentication fail for this session</td>
</tr>
<tr>
<td>Authz Success</td>
<td>All features have been successfully applied for this session</td>
</tr>
<tr>
<td>Authz Failed</td>
<td>A feature has failed to be applied for this session</td>
</tr>
</tbody>
</table>

Table 2-13 lists the possible values for the state of methods. For a session in terminal state, “Authc Success,” “Authc Failed,” or “Failed over” are displayed (the latter indicates a method ran and failed over to the next method which did not provide a result), with “Not run” in the case of sessions that are synchronized on standby.

Table 2-13  State Method Values

<table>
<thead>
<tr>
<th>Method State</th>
<th>State Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not run</td>
<td>Terminal</td>
<td>The method has not run for this session.</td>
</tr>
<tr>
<td>Running</td>
<td>Intermediate</td>
<td>The method is running for this session.</td>
</tr>
<tr>
<td>Failed over</td>
<td>Terminal</td>
<td>The method has failed and the next method is expected to provide a result.</td>
</tr>
<tr>
<td>Authc Success</td>
<td>Terminal</td>
<td>The method has provided a successful authentication result for the session.</td>
</tr>
<tr>
<td>Authc Failed</td>
<td>Terminal</td>
<td>The method has provided a failed authentication result for the session.</td>
</tr>
</tbody>
</table>

Examples

The following example shows how to display authentication methods registered with Auth Manager:

Switch# show authentication registrations
Auth Methods registered with the Auth Manager:
Handle Priority Name
3 0 dot1x
2 1 mab
1 2 webauth
Switch#

The following example shows how to display Auth Manager details for a specific interface:

Switch# show authentication interface gigabitethernet1/23
Client list:
MAC Address Domain Status Handle Interface
000e.84af.59bd DATA Authz Success 0xE0000000 GigabitEthernet1/0/23
Available methods list:
Handle Priority Name
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

```
3 0 dot1x
Runnable methods list:
Handle Priority Name
3 0 dot1x
Switch#
```

The following example shows how to display all Auth Manager sessions on the switch:

```
Switch# show authentication sessions
Interface  MAC Address     Method   Domain   Status         Session ID
Gi3/45     (unknown)       N/A      DATA     Authz Failed   090814040000007003651EC
Gi3/46     (unknown)       N/A      DATA     Authz Success  09081404000000800057C274
```

The following example shows how to display all Auth Manager sessions on an interface:

```
Switch# show authentication sessions int gi 3/46
Interface:  GigabitEthernet3/46
MAC Address:  Unknown
IP Address:  Unknown
Status:  Authz Success
Domain:  DATA
Oper host mode:  multi-host
Oper control dir:  both
Authorized By:  Guest Vlan
Vlan Policy:  4094
Session timeout:  N/A
Idle timeout:  N/A
Common Session ID:  09081404000000080057C274
Acct Session ID:  0x0000000A
Handle:  0xCC000008
Runnable methods list:
Method   State
dot1x    Failed over
```

The following example shows how to display Auth Manager session for a specified MAC address:

```
Switch# show authentication sessions mac 000e.84af.59bd
Interface: GigabitEthernet1/23
MAC Address: 000e.84af.59bd
Status: Authz Success
Domain: DATA
Oper host mode: single-host
Authorized By: Authentication Server
Vlan Policy: 10
Handle: 0xEE000000
Runnable methods list:
Method State
dot1x Authc Success
```

The following example shows how to display all clients authorized via a specified auth method:

```
Switch# show authentication sessions method mab
No Auth Manager contexts match supplied criteria
Switch# show authentication sessions method dot1x
MAC Address Domain Status Handle Interface
000e.84af.59bd DATA Authz Success 0xEE000000 GigabitEthernet1/23
```

</tbody>
</table>
show auto install status

To display the status of an automatic installation, use the `show auto install status` command.

```
show auto install status
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to display the IP address of the TFTP server and to display whether or not the switch is currently acquiring the configuration file on the TFTP server:

```
Switch# show auto install status
```

```
Status              : Downloading config file
DHCP Server         : 20.0.0.1
TFTP Server         : 30.0.0.3
Config File Fetched : Undetermined
```

The first IP address in the display indicates the server that is used for the automatic installation. The second IP address indicates the TFTP server that provided the configuration file.
show auto qos

To display the automatic quality of service (auto-QoS) configuration that is applied, use the show auto qos user EXEC command.

```
show auto qos [interface [interface-id]] [{begin | exclude | include} expression]
```

**Syntax Description**

- **interface interface-id** (Optional) Displays auto-QoS information for the specified interface or for all interfaces. Valid interfaces include physical ports.
- **begin** (Optional) Begins with the line that matches the expression.
- **exclude** (Optional) Excludes lines that match the expression.
- **include** (Optional) Includes lines that match the specified expression.
- **expression** (Optional) Expression in the output to use as a reference point.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show auto qos interface interface-id` command displays the auto-QoS configuration; it does not display any user changes to the configuration that might be in effect.

To display information about the QoS configuration that might be affected by auto-QoS on a non-Supervisor Engine 6-E, use one of these commands:

- `show qos`
- `show qos map`
- `show qos interface interface-id`
- `show running-config`

Expressions are case sensitive. For example, if you enter `exclude output`, the lines that contain `output` do not appear, but the lines that contain `Output` appear.

**Examples**

This example shows output from the `show auto qos` command when auto-QoS is enabled:

```
Switch# show auto qos
GigabitEthernet1/2
auto qos voip cisco-phone
Switch#
```

**Related Commands**

<table>
<thead>
<tr>

show bootvar

To display BOOT environment variable information, use the show bootvar command.

show bootvar

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to display BOOT environment variable information:

Switch# show bootvar
BOOT variable = sup:1;
CONFIG_FILE variable does not exist
BOOTLDR variable does not exist
Configuration register is 0x0
Switch#
show cable-diagnostics tdr

To display the test results for the TDR cable diagnostics, use the `show cable-diagnostics tdr` command.

```
show cable-diagnostics tdr {interface {interface interface-number}}
```

**Note**
This command will be deprecated in future Cisco IOS releases. Please use the `diagnostic start` command.

**Syntax Description**
- `interface interface` Interface type: valid values are `fastethernet` and `gigabitethernet`.
- `interface-number` Module and port number.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**
- **Release Modification**
  - 12.2(25)SG Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**
The TDR test is supported on Catalyst 4500 series switches running Cisco IOS Release 12.2(25)SG for the following line cards only:
- WS-X4548-GB-RJ45
- WS-X4548-GB-RJ45V
- WS-X4524-GB-RJ45V
- WS-X4013+TS
- WS-C4948
- WS-C4948-10GE

The distance to the fault is displayed in meters (m).

**Examples**
This example shows how to display information about the TDR test:

```
Switch# show cable-diagnostics tdr interface gi4/13
Interface Speed  Local pair  Cable length  Remote channel  Status
Gi4/13  0Mbps  1-2       102 +5m     Unknown       Fault
        3-6       100 +5m     Unknown       Fault
        4-5       102 +5m     Unknown       Fault
        7-8       102 +5m     Unknown       Fault
Switch#
```
Table 2-14 describes the fields in the `show cable-diagnostics tdr` command output.

# show cdp neighbors

To display detailed information about the neighboring devices that are discovered through CDP, use the `show cdp neighbors` command.

```
show cdp neighbors [type number] [detail]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>(Optional) Interface type that is connected to the neighbors about which you want information; possible valid values are <code>ethernet</code>, <code>fastethernet</code>, <code>gigabitethernet</code>, <code>tengigabitethernet</code>, <code>port-channel</code>, and <code>vlan</code>.</td>
</tr>
<tr>
<td><code>number</code></td>
<td>(Optional) Interface number that is connected to the neighbors about which you want information.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>(Optional) Displays detailed information about a neighbor (or neighbors) including network address, enabled protocols, hold time, and software version.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Extended to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `vlan` keyword is supported in Catalyst 4500 series switches that are configured with a Supervisor Engine 2.

The `port-channel` values are from 0 to 282; values from 257 to 282 are supported on the CSM and the FWSM only.

**Examples**

This example shows how to display the information about the CDP neighbors:

```
Switch# show cdp neighbors
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                 S - Switch, H - Host, I - IGMP, r - Repeater, P - Phone
Device ID        Local Intrfce   Holdtme    Capability   Platform  Port ID
lab-7206         Eth 0         157         R           7206VXR   Fas 0/0/0
lab-as5300-1     Eth 0         163         R           AS5300    Fas 0

</tbody>
</table>

This example shows how to display detailed information about your CDP neighbors:

Switch# show cdp neighbors detail
-----------------------------
Device ID: lab-7206
Entry address(es):
  IP address: 172.19.169.83
Platform: cisco 7206VXR, Capabilities: Router
Interface: Ethernet0, Port ID (outgoing port): FastEthernet0/0/0
Holdtime : 123 sec

Version :
Cisco Internetwork Operating System Software
IOS (tm) 5800 Software (C5800-P4-M), Version 12.1(2)
Copyright (c) 1986-2002 by Cisco Systems, Inc.
advertisement version: 2
Duplex: half

-----------------------------
Device ID: lab-as5300-1
Entry address(es):
  IP address: 172.19.169.87
.
.
Switch#
Table 2-16 describes the fields that are shown in the example.

**Table 2-16  ** `show cdp neighbors detail` Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device ID</td>
<td>Name of the neighbor device and either the MAC address or the serial number of this device.</td>
</tr>
<tr>
<td>Entry address(es)</td>
<td>List of network addresses of neighbor devices.</td>
</tr>
<tr>
<td>[network protocol] address</td>
<td>Network address of the neighbor device. The address can be in IP, IPX, AppleTalk, DECnet, or CLNS protocol conventions.</td>
</tr>
<tr>
<td>Platform</td>
<td>Product name and number of the neighbor device.</td>
</tr>
<tr>
<td>Capabilities</td>
<td>Device type of the neighbor. This device can be a router, a bridge, a transparent bridge, a source-routing bridge, a switch, a host, an IGMP device, or a repeater.</td>
</tr>
<tr>
<td>Interface</td>
<td>Protocol and port number of the port on the current device.</td>
</tr>
<tr>
<td>Holdtime</td>
<td>Remaining amount of time, in seconds, that the current device holds the CDP advertisement from a transmitting router before discarding it.</td>
</tr>
<tr>
<td>Version: advertisement version:</td>
<td>Software version running on the neighbor device. Version of CDP that is being used for CDP advertisements.</td>
</tr>
<tr>
<td>Duplex:</td>
<td>Duplex state of connection between the current device and the neighbor device.</td>
</tr>
</tbody>
</table>

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show cdp</code> (refer to Cisco IOS documentation)</td>
<td>Displays global CDP information, including timer and hold-time information.</td>
</tr>
<tr>
<td><code>show cdp entry</code> (refer to Cisco IOS documentation)</td>
<td>Displays information about a specific neighboring device discovered using Cisco Discovery Protocol (CDP).</td>
</tr>
<tr>
<td><code>show cdp interface</code> (refer to Cisco IOS documentation)</td>
<td>Displays information about the interfaces on which Cisco Discovery Protocol (CDP) is enabled.</td>
</tr>
<tr>
<td><code>show cdp traffic</code> (refer to Cisco IOS documentation)</td>
<td>Displays traffic information from the CDP table.</td>
</tr>
</tbody>
</table>
show class-map

To display class map information, use the show class-map command.

```
show class-map class_name
```

### Syntax Description

- **class_name**: Name of the class map.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)SG</td>
<td>Displays results from the full flow option.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to display class map information for all class maps:

```
Switch# show class-map
Class Map match-any class-default (id 0)
  Match any
Class Map match-any class-simple (id 2)
  Match any
Class Map match-all ipp5 (id 1)
  Match ip precedence 5
Class Map match-all agg-2 (id 3)
Switch#
```

This example shows how to display class map information for a specific class map:

```
Switch# show class-map ipp5
Class Map match-all ipp5 (id 1)
  Match ip precedence 5
Switch#
```

Assume there are two active flows as shown below on Fast Ethernet interface 6/1:

<table>
<thead>
<tr>
<th>SrcIp</th>
<th>DstIp</th>
<th>IpProt</th>
<th>SrcL4Port</th>
<th>DstL4Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>81</td>
</tr>
<tr>
<td>192.168.10.10</td>
<td>192.168.20.20</td>
<td>20</td>
<td>6789</td>
<td>21</td>
</tr>
</tbody>
</table>

With following configuration, each flow will be policed to a 1000000 bps with an allowed 9000-byte burst value.

### Note

If you use the `match flow ip source-address|destination-address` command, these two flows are consolidated into one flow and they have the same source and destination address.
Switch# **config terminal**
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# **class-map c1**
Switch(config-cmap)# **match flow ip source-address ip destination-address ip protocol l4 source-port l4 destination-port**
Switch(config-cmap)# **exit**
Switch(config)# **policy-map p1**
Switch(config-pmap)# **class c1**
Switch(config-pmap-c)# **police 1000000 9000**
Switch(config-pmap-c)# **exit**
Switch(config-pmap)# **exit**
Switch(config)# **interface fastEthernet 6/1**
Switch(config-if)# **service-policy input p1**
Switch(config-if)# **end**
Switch# **write memory**
Switch# **show policy-map interface**
FastEthernet6/1

**class-map c1**
   **match flow ip source-address ip destination-address ip protocol l4 source-port l4 destination-port**

**policy-map p1**
   **class c1**
      **police 1000000 bps 9000 byte conform-action transmit exceed-action drop**

**interface FastEthernet 6/1**
   **service-policy input p1**

Switch# **show class-map c1**
Class Map match-all c1 (id 2)
   **Match flow ip source-address ip destination-address ip protocol l4 source-port l4 destination-port**
Switch#

**Examples**

This example shows how to display the summary results for all modules in the chassis:

```
Switch# show diagnostic result module

Current bootup diagnostic level: minimal

module 1:

Overall diagnostic result: PASS
Diagnostic level at card bootup: bypass

Test results: (. = Pass, F = Fail, U = Untested)
1) supervisor-bootup -----------------------> U
2) packet-memory-bootup ------------------> U
3) packet-memory-ongoing ------------------> U

module 4:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)
1) linecard-online-diag ------------------> .
```
module 5:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag ------------------ > .

module 6:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag ------------------ > .

This example shows how to display the online diagnostics for module 1:

Switch# show diagnostic result module 1 detail

Current bootup diagnostic level: minimal

module 1:

Overall diagnostic result: PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) supervisor-bootup ------------------ > .

    Error code -------------------------- > 0 (DIAG_SUCCESS)
    Total run count --------------------- > 0
    Last test execution time ------------- > n/a
    First test failure time -------------- > n/a

Switch#
show diagnostic result module test

To display the results of the bootup packet memory test, use the `show diagnostic result module test` command. The output indicates whether the test passed, failed, or was not run.

```
show diagnostic result module [N | all] [test test-id] [detail]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Specifies the module number.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies all modules.</td>
</tr>
<tr>
<td>test test-id</td>
<td>Specifies the number for the tdr test on the platform.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Specifies the display of detailed information for analysis. This option is recommended.</td>
</tr>
</tbody>
</table>

**Defaults**

Non-detailed results

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `detail` keyword is intended for use by Cisco support personnel when analyzing failures.

**Examples**

This example shows how to display the results of the bootup packet memory tests:

```
Switch# show diagnostic result module 6 detail
module 6:
Overall diagnostic result:PASS
Test results:(. = Pass, F = Fail, U = Untested)

1) linecard-online-diag --------------------------> .
   Error code --------------------------> 0 (DIAG_SUCCESS)
   Total run count --------------------------> 1
   Last test execution time ----------------> Jan 21 2001 19:48:30
   First test failure time ------------------> n/a
   Last test failure time ------------------> n/a
   Last test pass time ----------------------> Jan 21 2001 19:48:30
   Total failure count ----------------------> 0
   Consecutive failure count --------------> 0
```

</table>

### Usage Guidelines

The `detail` keyword is intended for use by Cisco support personnel when analyzing failures.

### Examples

This example shows how to display the results of the bootup packet memory tests:

```
Switch# show diagnostic result module 1 test 2
Test results: (. = Pass, F = Fail, U = Untested)
  2) packet-memory-bootup ------------> .
```

This example shows how to display detailed results from the bootup packet memory tests:

```
Switch# show diagnostic result module 2 test 2 detail
Test results: (. = Pass, F = Fail, U = Untested)
  2) packet-memory-bootup ------------> .
```

```
Error code ---------------> 0 (DIAG_SUCCESS)
Total run count ------------> 0
Last test execution time ------> n/a
First test failure time ------> n/a
Last test failure time ------> n/a
Last test pass time ----------> n/a
Total failure count ----------> 0
Consecutive failure count ---> 0
packet buffers on free list: 64557 bad: 0 used for ongoing tests: 979
```
Number of errors found: 0
Cells with hard errors (failed two or more tests): 0
Cells with soft errors (failed one test, includes hard): 0
Suspect bad cells (uses a block that tested bad): 0
total buffers: 65536
bad buffers: 0 (0.0%)  
good buffers: 65536 (100.0%)
Bootup test results:
No errors.

<table>
<thead>
<tr>
<th>Command</th>

<td>12.2(31)SG</td>
<td>Support for port direction control and critical recovery was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify an interface, the global parameters and a summary are displayed. If you specify an interface, the details for that interface are displayed.

If you enter the **statistics** keyword without the **interface** option, the statistics are displayed for all interfaces. If you enter the **statistics** keyword with the **interface** option, the statistics are displayed for the specified interface.

Expressions are case sensitive. For example, if you enter **exclude output**, the lines that contain **output** are not displayed, but the lines that contain **Output** are displayed.

The **show dot1x** command displays the currently assigned reauthentication timer and time remaining before reauthentication, if reauthentication is enabled.
### Examples

This example shows how to display the output from the `show dot1x` command:

```
Switch# show dot1x
Sysauthcontrol = Disabled
Dot1x Protocol Version = 2
Dot1x Oper Controlled Directions = Both
Dot1x Admin Controlled Directions = Both
Critical Recovery Delay = 500
Critical EAP = Enabled
Switch#
```

This example shows how to display the 802.1X statistics for a specific port:

```
Switch# show dot1x interface fastethernet6/1
Dot1x Info for FastEthernet6/1
-----------------------------------
PAE                       = AUTHENTICATOR
PortControl               = AUTO
ControlDirection          = Both
HostMode                  = MULTI_DOMAIN
ReAuthentication          = Disabled
QuietPeriod               = 60
ServerTimeout             = 30
SuppTimeout               = 30
ReAuthPeriod              = 3600 (Locally configured)
ReAuthMax                 = 2
MaxReq                    = 2
TxPeriod                  = 30
RateLimitPeriod           = 0

Dot1x Authenticator Client List
-----------------------------------
Domain                    = DATA

Authorized By             = Authentication Server
```

```
Switch#
```

---

**Note**

Table 2-17 provides a partial list of the displayed fields. The remaining fields in the display show internal state information. For a detailed description of these state machines and their settings, refer to the 802.1X specification.
This is an example of output from the `show dot1x statistics interface gigabitethernet1/1` command. Table 2-18 describes the fields in the display.

```
Switch# show dot1x statistics interface gigabitethernet1/1
PortStatistics Parameters for Dot1x
--------------------------------------------
TxReqId = 0    TxReq = 0     TxTotal = 0
RxStart = 0    RxLogoff = 0  RxRespId = 0  RxResp = 0
RxInvalid = 0  RxLenErr = 0  RxTotal= 0
RxVersion = 0  LastRxSrcMac 0000.0000.0000
Switch#
```

Related Commands
show energywise

Use the `show energywise` privileged EXEC command to display the EnergyWise settings and status of the entity and the power over Ethernet (PoE) ports.

```plaintext
show energywise [categories | children | domain | events | level [children | current [children] | delta children] | neighbors | recurrences | statistics | usage [children] | version] [ | {begin | exclude | include} expression]
```

### Syntax Description

- **categories** (Optional) Display the power levels.
- **children** (Optional) Display the status of the entity and the PoE ports.
- **domain** (Optional) Display the domain to which the entity belongs.
- **events** (Optional) Displays the last ten events (messages) sent to other entities in the domain.
- **level [children | current [children] | delta | delta children]** (Optional) Display the available power level for the entity.  
  - **children**—Available power levels for the entity and the PoE ports.
  - **current**—Current power level for the entity.
    
    (Optional) **children**—Current power levels for the entity and the PoE ports.
  - **delta**—Difference between the current and available power levels for the entity.
    
    (Optional) **children**—Difference between the current and available power levels for the entity and the PoE ports.
- **neighbors** (Optional) Display the neighbor tables for the domains to which the entity belongs.
- **recurrence** (Optional) Display the EnergyWise settings and status for recurrence.
- **statistics** (Optional) Display the counters for events and errors.
- **usage [children]** (Optional) Display the power for the entity.
  - **children**—Display the power for the PoE ports.
- **version** (Optional) Display the EnergyWise version.

show environment

To display the environment alarm, operational status, and current reading for the chassis, use the `show environment` command.

```
show environment [alarm] | [status [chassis | fantray | powersupply | supervisor]] | [temperature]
```

**Syntax Description**

- `alarm` (Optional) Specifies the alarm status of the chassis.
- `status` (Optional) Specifies the operational status information.
- `chassis` (Optional) Specifies the operational status of the chassis.
- `fantray` (Optional) Specifies the status of the fan tray, and shows fan tray power consumption.
- `powersupply` (Optional) Specifies the status of the power supply.
- `supervisor` (Optional) Specifies the status of the supervisor engine.
- `temperature` (Optional) Specifies the current chassis temperature readings.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.1(8a)EW
  - Support for this command was introduced on the Catalyst 4500 series switch.
- **Release** 12.1(12c)EW
  - Support for the ability to display generic environment information with the `show environment` command was added.

**Examples**

This example shows how to display information about the environment alarms, operational status, and current temperature readings for the chassis:

```
Switch# show environment
no alarm

Chassis Temperature        = 32 degrees Celsius
Chassis Over Temperature Threshold = 75 degrees Celsius
Chassis Critical Temperature Threshold = 95 degrees Celsius

Power
Supply   Model No        Type    Status    Sensor
--------  ---------------  ---------  ----------  -----
PS1      PWR-C45-1400AC   AC 1400W   good      good
PS2      none             --        --         --

Fan
Supply  Max        Min       Max       Min       Absolute
--------  ------  ------  ------  ------  -----------------
PS1      1360    1360    1400     --       --
PS2      1360    1360    1400     --       --
```
This example shows how to display information about the environment alarms:

Switch# `show environment alarm`
no alarm
Switch#

This example shows how to display information about the power supplies, chassis type, and fan trays:

Switch# `show environment status`

<table>
<thead>
<tr>
<th>Power Supply (Nos in Watts)</th>
<th>Max Inline</th>

<td>--</td>
<td>--</td>
<td>--</td>
</tr>
</tbody>
</table>

Power supplies needed by system : 1
Chassis Type : WS-C4507R
Supervisor Led Color : Green
Fantray : good
Power consumed by Fantray : 50 Watts

Switch#

This example shows how to display information about the chassis:

Switch# `show environment status chassis`
Chassis Type : WS-C4507R
Switch#

This example shows how to display information about the fan tray:

Switch# `show environment status fantray`
Fantray : good
Power consumed by Fantray : 50 Watts
Switch#
This example shows how to display information about the power supply:

```
Switch# show environment status powersupply
Power
Supply  Model No         Type       Status  Sensor
------  ---------------  ---------  ------  ------
PS1     WS-X4008         AC 400W    good    good
PS2     WS-X4008         AC 400W    good    good
PS3     none             --         --      --
Switch#
```

This example shows how to display information about the supervisor engine:

```
Switch# show environment status supervisor
Supervisor Led Color : Green
Switch#
```

This example shows how to display information about the temperature of the chassis:

```
Switch# show environment temperature
Chassis Temperature        = 32 degrees Celsius
Chassis Over Temperature Threshold = 75 degrees Celsius
Chassis Critical Temperature Threshold = 95 degrees Celsius
Switch#
```
show errdisable detect

To display the error disable detection status, use the `show errdisable detect` command.

```
show errdisable detect
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

</tbody>
</table>
show errdisable recovery

To display error disable recovery timer information, use the `show errdisable recovery` command.

```
show errdisable recovery
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Display includes the status of storm control.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display recovery timer information for error disable:

```
Switch# show errdisable recovery
ErrDisable Reason    Timer Status
-----------------    --------------
udld                 Disabled
bpduguard           Disabled
security-violation  Disabled
channel-misconfig   Disabled
vmps                 Disabled
pagp-flap            Disabled
dtp-flap             Disabled
link-flap            Disabled
12ptguard            Disabled
psecure-violation   Disabled
gbic-invalid        Disabled
dhcp-rate-limit      Disabled
unicast-flood        Disabled
storm-control        Disabled
arp-inspection       Disabled

Timer interval:30 seconds

Interfaces that will be enabled at the next timeout:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Errdisable reason</th>
<th>Time left(sec)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa7/32</td>
<td>arp-inspect</td>

</table>
show etherchannel

To display EtherChannel information for a channel, use the `show etherchannel` command.

```
show etherchannel [channel-group] [port-channel | brief | detail | summary | port | load-balance | protocol]
```

### Syntax Description

- `channel-group` *(Optional)* Number of the channel group; valid values are from 1 to 64.
- `port-channel` Displays port-channel information.
- `brief` Displays a summary of EtherChannel information.
- `detail` Displays detailed EtherChannel information.
- `summary` Displays a one-line summary per channel group.
- `port` Displays EtherChannel port information.
- `load-balance` Displays load-balance information.
- `protocol` Displays the enabled protocol.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>
<td>Support for LACP was added to this command.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not specify a channel group, all channel groups are displayed.

In the output below, the Passive port list field is displayed for Layer 3 port channels only. This field means that the physical interface, which is still not up, is configured to be in the channel group (and indirectly is in the only port channel in the channel group).

### Examples

This example shows how to display port-channel information for a specific group:

```
Switch# show etherchannel 1 port-channel
Port-channels in the group:
---------
Port-channel: Po1
-------------
Age of the Port-channel   = 02h:35m:26s
Logical slot/port   = 10/1       Number of ports in agport = 0
GC                   = 0x00000000       HotStandBy port = null
Passive port list   = Fa5/4 Fa5/5
Port state           = Port-channel L3-Ag Ag-Not-Inuse
```
Port in the Port-channel:
Index  Load  Port
-------------------
Switch#

This example shows how to display load-balancing information:

Switch# show etherchannel load-balance

</tbody>
</table>

**Defaults**

X2 mode.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>Support for WS-X4606-10GE-E Twin Gigabit convertor introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When a TwinGig Convertor is enabled or disabled, the number and type of ports on the linecard change dynamically. The terminology must reflect this behavior. In Cisco IOS, 10-Gigabit ports are named TenGigabit and 1-Gigabit ports are named Gigabit. Starting with Cisco IOS Release 12.2(40)SG, to avoid having ports named TenGigabit1/1 and Gigabit1/1, the 10-Gigabit and 1-Gigabit port numbers are independent. The WS-X4606-10GE-E module with six X2 ports are named TenGigabit<slot-num>/<1-6>, and the SFP ports are named Gigabit<slot-num>/<7-18>.

In the Supervisor Engine 6-E and Catalyst 4900M chassis, the ports are connected to the switching engine through a stub ASIC. This stub ASIC imposes some limitations on the ports: Gigabit and 10-Gigabit ports cannot be mixed on a single stub ASIC; they must either be all 10-Gigabit (X2), or all Gigabit (TwinGig Converter and SFP). The faceplates of X2 modules show this stub-port grouping, either with an actual physical grouping, or a box drawn around a grouping.

**Examples**

This example shows to determine how the X2 holes on a module are grouped on a WS-X4606-10GE-E:

```
Switch# show hw-module module 1 port-group
Module Port-group Active Inactive
----------- ---------- ----------- -----------
1 1 Tel1/1-3  Gi1/7-12
1 2 Tel1/4-6  Gi1/13-18
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hw-module port-group</td>
<td>Selects either Gigabit Ethernet or Ten Gigabit Ethernet interfaces on your module.</td>
</tr>
</tbody>
</table>
show hw-module uplink

To display the current uplink mode, use the `show hw-module uplink` command.

```plaintext
show hw-module uplink
```

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If the active uplink mode is different than configured mode, the output displays the change.
By default, the current (operational) uplink selection is displayed.

**Examples**
This example shows the output displaying the current (active) uplinks:

```plaintext
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
```

This example shows the output for redundant systems in SSO mode if the 10-Gigabit Ethernet uplinks are active, and the Gigabit Ethernet uplinks are selected:

```plaintext
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
(will be GigabitEthernet after next reload)
A 'redundancy reload shelf' or power-cycle of chassis is required to apply the new configuration
```

This example shows the output for redundant systems in RPR mode if the 10-Gigabit Ethernet uplinks are active, and the Gigabit Ethernet uplinks are selected:

```plaintext
Switch# show hw-module uplink
Active uplink configuration is TenGigabitEthernet
(will be GigabitEthernet after next reload)
A reload of active supervisor is required to apply the new configuration.
```

  Power Consumption = -1
  RMA Failure Code = 255 255 255 255
Switch#
```
show interfaces

To display traffic on a specific interface, use the `show interfaces` command.

```
show interfaces [{fastethernet mod/interface-number} | {gigabitethernet mod/interface-number} | {tengigabitethernet mod/interface-number} | {null interface-number} | vlan vlan_id | status]
```

**Syntax Description**

- **fastethernet mod/interface-number** (Optional) Specifies the Fast Ethernet module and interface.
- **gigabitethernet mod/interface-number** (Optional) Specifies the Gigabit Ethernet module and interface.
- **tengigabitethernet mod/interface-number** (Optional) Specifies the 10-Gigabit Ethernet module and interface.
- **null interface-number** (Optional) Specifies the null interface; the valid value is 0.
- **vlan vlan_id** (Optional) Specifies the VLAN; valid values are from 1 to 4094.
- **status** (Optional) Displays status information.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>

<td>Support for auto-MDIX reflected in command output.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Added support for per-VLAN error-disable detection.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The statistics are collected per VLAN for Layer 2 switched packets and Layer 3 switched packets. The statistics are available for both unicast and multicast. The Layer 3 switched packet counts are available for both the ingress and egress directions. The per-VLAN statistics are updated every 5 seconds.

In some cases, the duplex mode that is displayed by the `show interfaces` command is different than that displayed by the `show running-config` command. The duplex mode that is displayed in the `show interfaces` command is the actual duplex mode that the interface is running. The `show interfaces` command shows the operating mode for an interface, but the `show running-config` command shows the configured mode for an interface.
If you do not enter any keywords, all counters for all modules are displayed.

Linecards that support auto-MDIX configuration on their copper media ports include: WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or later, and WS-X4232-GB-RJ with hardware revision 3.0 or later.

### Examples

This example shows how to display traffic for Gigabit Ethernet interface 2/5:

```
Switch# show interfaces gigabitethernet2/5
GigabitEthernet9/5 is up, line protocol is up (connected) (vlan-err-dis)
Hardware is C4k 1000Mb 802.3, address is 0001.64f8.3fa5 (bia 0001.64f8.3fa5)
Internet address is 172.20.20.20/24
MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec, reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Full-duplex, 1000Mb/s
ARP type: ARPA, ARP Timeout 04:00:00
Last input 00:00:00, output never, output hang never
Last clearing of "show interface" counters never
Queueing strategy: fifo
Output queue 0/40, 0 drops; input queue 0/75, 0 drops
5 minute input rate 1000 bits/sec, 2 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
L2 Switched: ucast: 8199 pkt, 1362060 bytes - mcast: 6980 pkt, 371952 bytes
L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes mcast
L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes
300114 packets input, 27301436 bytes, 0 no buffer
Received 43458 broadcasts, 0 runts, 0 giants, 0 throttles
0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
0 input packets with dribble condition detected
15181 packets output, 1955836 bytes, 0 underruns
0 output errors, 0 collisions, 3 interface resets
0 babbles, 0 late collision, 0 deferred
0 lost carrier, 0 no carrier
0 output buffer failures, 0 output buffers swapped out
Switch#
```

This example shows how to display traffic for 10-Gigabit Ethernet interface 1/1:

```
Switch# show interfaces tengigabitethernet1/1
Name: Tengigabitethernet1/1
Switchport: Enabled
Administrative Mode: private-vlan promiscuous trunk
Operational Mode: private-vlan promiscuous (suspended member of bundle Po1)
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: none
Trunking Native Mode VLAN: none
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304)
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk
Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: 802.1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Administrative private-vlan mapping trunk: New 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304) 204 (VLAN0204) 305 (VLAN0305) 306 (VLAN0306)
```
show interfaces

Operational private-vlan: 202 (VLAN0202) 303 (VLAN0303) 304 (VLAN0304)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Switch#

This example shows how to verify the status of auto-MDIX on an RJ-45 port:

Note

You can verify the configuration setting and the operational state of auto-MDIX on the interface by entering the `show interfaces` EXEC command. This field is applicable and appears only on the `show interfaces` command output for 10/100/1000BaseT RJ-45 copper ports on supported linecards including WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or later, and WS-X4232-GB-RJ with hardware revision 3.0 or later.

FastEthernet6/3 is up, line protocol is up (connected)
Hardware is Fast Ethernet Port, address is 0003.6ba8.6e68 (bia 0003.6ba8.6e68)
MTU 1500 bytes, BW 100000 Kbit, DLY 100 usec,
   reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
Full-duplex, 100Mb/s, link type is auto, media type is 10/100BaseTX
input flow-control is unsupported output flow-control is unsupported
Auto-MDIX on (operational: on)
ARP type: ARPA, ARP Timeout 04:00:00
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Queueing strategy: fifo
Output queue: 0/40 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
   0 packets input, 0 bytes, 0 no buffer
   Received 0 broadcasts (0 multicasts)
   0 runs, 0 giants, 0 throttles
   0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
   0 input packets with dribble condition detected
157082 packets output, 13418032 bytes, 0 underruns
   0 output errors, 0 collisions, 0 interface resets
   1 babbles, 0 late collision, 0 deferred
   0 lost carrier, 0 no carrier
   0 output buffer failures, 0 output buffers swapped out
Switch#

This example shows how to display status information for Gigabit Ethernet interface 1/2:

Switch# show interfaces gigabitethernet1/2 status
Port Name Status Vlan Duplex Speed Type
Gi1/2 notconnect 1 auto 1000 1000-XWDM-RXONLY
Switch#

This example shows how to display status information for the interfaces on the supervisor engine:

Switch# show interfaces status

Port Name Status Vlan Duplex Speed Type
Te1/1 connected 1 full 10G 10GBase-LR
Te1/2 connected 1 full 10G 10GBase-LR
Switch#
show interfaces capabilities

To display the interface capabilities for an interface or for all the interfaces on a switch, use the show interfaces capabilities command.

```
show interfaces capabilities [{module mod}]
show interfaces [interface interface-number] capabilities
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module mod</td>
<td>(Optional) Display information for the specified module only.</td>
</tr>
<tr>
<td>interface</td>
<td>(Optional) Interface type; valid values are fastethernet, gigabitethernet, tengigabitethernet, and port-channel.</td>
</tr>
<tr>
<td>interface-number</td>
<td>(Optional) Port number.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Support for the 10-Gigabit Ethernet interface was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support for auto-MDIX reflected in command output.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `interface-number` argument designates the module and port number. Valid values for `interface-number` depend on the chassis and module used. For example, if you have a 48-port 10/100-Mbps Fast Ethernet RJ-21 (telco connector) switching module installed in a Catalyst 4507 chassis, valid values for the slot number are from 2 to 13 and valid values for the port number are 1 to 48.

Linecards that support auto-MDIX configuration on their copper media ports include: WS-X4124-RJ45, WS-X4148-RJ with hardware revision 3.0 or higher, and WS-X4232-GB-RJ with hardware revision 3.0 or higher.
This example shows how to display the interface capabilities for a module:

```
Switch# show interfaces capabilities module 1
GigabitEthernet1/1
  Model:                WS-X4516-Gbic
  Type:                 Unsupported GBIC

- Speed: 1000
- Duplex: full
- Trunk encap. type: 802.1Q, ISL
- Trunk mode: on,off,desirable,negotiate
- Channel: yes
- Broadcast suppression: percentage(0-100), hw
- Flowcontrol: rx-(off, on, desired), tx-(off, on, desired)
- VLAN Membership: static, dynamic
- Fast Start: yes
- Queuing: rx-(N/A), tx-(4q1t, Sharing/Shaping)
- CoS rewrite: yes
- ToS rewrite: yes
- Inline power: no
- SPAN: source/destination
- UDLD: yes
- Link Debounce: no
- Link Debounce Time: no
- Port Security: yes
- Dot1x: yes
- MTU Supported: jumbo frames, baby giants

Switch#

This example shows how to display the interface capabilities for Fast Ethernet interface 3/1:

Switch#  `show interfaces fastethernet3/1 capabilities`

FastEthernet3/1

- Model: WS-X4148-RJ-RJ-45
- Type: 10/100BaseTX
- Speed: 10,100,auto
- Duplex: half,full,auto
- Trunk encap. type: 802.1Q, ISL
- Trunk mode: on,off,desirable,negotiate
- Channel: yes
- Broadcast suppression: percentage(0-100), sw
- Flowcontrol: rx-(none), tx-(none)
- VLAN Membership: static, dynamic
- Fast Start: yes
- Queuing: rx-(N/A), tx-(4q1t, Shaping)
- CoS rewrite: yes
- ToS rewrite: yes
- Inline power: no
- SPAN: source/destination
- UDLD: yes
This example shows how to verify that the auto-MDIX configuration is supported on a port:

```
Switch# show interfaces fastethernet6/3 capabilities
FastEthernet6/3
  Model:                 WS-X4232-GB-RJ-RJ-45
  Type:                  10/100BaseTX
  Speed:                 10,100,auto
  Duplex:                half,full,auto
  Auto-MDIX              yes
  Trunk encap. type:     802.1Q,ISL
  Trunk mode:            on,off,desirable,negotiate
  Channel:               yes
  Broadcast suppression: percentage(0-100), hw
  Flowcontrol:           rx-(none),tx-(none)
  VLAN Membership:       static, dynamic
  Fast Start:            yes
  Queuing:               rx-(N/A), tx-(1p3q1t, Sharing/Shaping)
  CoS rewrite:           yes
  ToS rewrite:           yes
  Inline power:          no
  SPAN:                  source/destination
  UDLD:                  yes
  Link Debounce:         no
  Link Debounce Time:    no
  Port Security:         yes
  Dot1x:                 yes
  Maximum MTU:           1552 bytes (Baby Giants)
  Multiple Media Types:  no
  Diagnostic Monitoring: N/A
Switch#
```
show interfaces counters

To display the traffic on the physical interface, use the `show interfaces counters` command.

```
show interfaces counters [all | detail | errors | storm-control | trunk] [module mod]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Displays all the interface counters including errors, trunk, and detail.</td>
</tr>
<tr>
<td>detail</td>
<td>(Optional) Displays the detailed interface counters.</td>
</tr>
<tr>
<td>errors</td>
<td>(Optional) Displays the interface error counters.</td>
</tr>
<tr>
<td>storm-control</td>
<td>(Optional) Displays the number of packets discarded due to suppression on the interface.</td>
</tr>
<tr>
<td>trunk</td>
<td>(Optional) Displays the interface trunk counters.</td>
</tr>
<tr>
<td>module mod</td>
<td>(Optional) Limits the display to interfaces on a specific module.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for storm control.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support for the display of total suppression discards.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not enter any keywords, all the counters for all modules are displayed.

The display for the `storm-control` keyword includes the suppressed multicast bytes.

**Examples**

This example shows how to display the error counters for a specific module:

```
Switch# show interfaces counters errors module 1

Port  Align-Err  FCS-Err  Xmit-Err  Rcv-Err  UnderSize
Gi1/1  0      0      0      0      0
Gi1/2  0      0      0      0      0

Port  Single-Col Multi-Col Late-Col Excess-Col Carri-Sen Runts Giants
Gi1/1  0      0      0      0      0      0      0
Gi1/2  0      0      0      0      0      0      0
Switch#
```
show interfaces counters

This example shows how to display the traffic that is seen by a specific module:

```
Switch# show interfaces counters module 1
```

<table>
<thead>
<tr>
<th>Port</th>
<th>InOctets</th>
<th>InUcastPkts</th>
<th>InMcastPkts</th>
<th>InBcastPkts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Gi1/2</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Port</th>
<th>OutOctets</th>
<th>OutUcastPkts</th>
<th>OutMcastPkts</th>
<th>OutBcastPkts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/1</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Gi1/2</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Switch#

This example shows how to display the trunk counters for a specific module:

```
Switch# show interfaces counters trunk module 1
```

<table>
<thead>
<tr>
<th>Port</th>
<th>TrunkFramesTx</th>
<th>TrunkFramesRx</th>
<th>WrongEncap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/1</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Gi1/2</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

Switch#

This example shows how to display the number of packets that are discarded due to suppression:

```
Switch# show interfaces counters storm-control
```

Multicast Suppression : Enabled

<table>
<thead>
<tr>
<th>Port</th>
<th>BcastSuppLevel</th>
<th>TotalSuppressionDiscards</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fa5/35</td>
<td>10.00%</td>
<td>6278550</td>
</tr>
</tbody>
</table>

Switch#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interfaces capabilities</td>
<td>Displays the interface capabilities for an interface or for all the interfaces on a switch.</td>
</tr>
</tbody>
</table>
show interfaces description

To display a description and status of an interface, use the show interfaces description command.

```
show interfaces description [interface]
```

**Syntax Description**

```
interface (Optional) Type of interface.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information for all interfaces:

```
Switch# show interfaces description
Interface Status     Protocol Description
P00/0       admin down     down     First interface
P00/1       admin down     down
Gi1/1        up             up       GigE to server farm
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description (refer to Cisco IOS documentation)</td>
<td>Includes a specific description about the digital signal processor (DSP) interface.</td>
</tr>
</tbody>
</table>
show interfaces link

To display how long a cable has been disconnected from an interface, use the `show interfaces link` command:

```
  show interfaces link [module mod_num]
```

**Syntax Description**

| **module mod_num** | (Optional) Limits the display to interfaces on a module. |

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the interface state is up, the command displays 0:00. If the interface state is down, the time (in hours, minutes, and seconds) is displayed.

**Examples**

This example shows how to display active link-level information:

```
Switch# show interfaces link

Port    Name               Down Time
Gi1/1                       00:00:00
Gi1/2                       00:00:00
Gi3/1                       00:00:00
Gi3/2                       00:00:00
Fa4/1                       00:00:00
Fa4/2                       00:00:00
Fa4/3                       00:00:00
Fa4/4                       00:00:00
```

This example shows how to display inactive link-level information:

```
Switch# show interfaces link

Port    Name               Down Time
Gi3/4                      1 minute 28 secs
Gi3/5                      1 minute 28 secs
Gi3/6                      1 minute 28 secs
Gi4/1                      1 minute 28 secs
```

In this example, the cable has been disconnected from the port for 1 minute and 28 seconds.
show interfaces mtu

To display the maximum transmission unit (MTU) size of all the physical interfaces and SVIs on the switch, use the `show interfaces mtu` command.

```
show interfaces mtu [module mod]
```

**Syntax Description**

- `module mod` (Optional) Limits the display to interfaces on a specific module.

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

- **Release** 12.1(13)EW
- **Modification** Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to display the MTU size for all interfaces on module 1:

```
Switch> show interfaces mtu module 1

Port   Name     MTU
Gi1/1   1500
Gi1/2   1500
Switch>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtu</td>
<td>Enables jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU).</td>
</tr>
</tbody>
</table>
show interfaces private-vlan mapping

To display PVLAN mapping information for VLAN SVIs, use the `show interfaces private-vlan mapping` command.

```
show interfaces private-vlan mapping [active]
```

**Syntax Description**

```
active (Optional) Displays active interfaces only.
```

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

```
Release Modification
12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**

This command displays SVI information only.

**Examples**

This example shows how to display PVLAN mapping information:

```
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
--------- -------------- -----------------
vlan2     301            isolated
vlan2     302            isolated
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>private-vlan</code></td>
<td>Configures private VLANs and the association between a private VLAN and a secondary VLAN.</td>
</tr>
<tr>
<td><code>private-vlan mapping</code></td>
<td>Creates a mapping between the primary and the secondary VLANs so that both share the same primary VLAN SVI.</td>
</tr>
</tbody>
</table>
show interfaces status

To display the interface status or a list of interfaces in error-disabled state, use the `show interfaces status` command.

```text
show interfaces status [err-disabled | inactive] [module {module}]
```

**Syntax Description**
- **err-disabled** (Optional) Displays interfaces in error-disabled state.
- **inactive** (Optional) Displays interfaces in inactive state.
- **module module** (Optional) Displays interfaces on a specific module.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**
- **12.1(8a)EW** Support for this command was introduced on the Catalyst 4500 series switch.
- **12.2(40)SG** Support for WS-X4606-10GE-E Twin Gigabit convertor introduced.
- **12.2(52)SG** Support for per-VLAN error-disable was introduced by adding Err-Disabled VLAN column to output.

**Usage Guidelines**
When at least one VLAN on a port is error-disabled the output for the `show interfaces status` command will display `vl-err-dis` in the VLAN column.

**Examples**
This example shows how to display the status of all interfaces:
```
Switch# show interfaces status
Port    Name              Status     Vlan    Duplex Speed  Type
Te1/1                      connected 1  full   10G  10GBase-LR
Te1/2                      connected vl-err-dis full 10G  10GBase-LR
Switch#
```

This example shows how to display the status of interfaces in an error-disabled state:
```
Switch# show interfaces status err-disabled
Port    Name              Status    Reason          Err-Disabled VLANs
Fa9/4                      notconnect  link-flap
Fa9/5                      err-disabled psecure_violation 3-5
Fa9/6                      connected psecure_violation 10,15
Switch#
```
This example shows how to display the Gigabit Ethernet interfaces on a WS-X4606-10GE-E switch using the TwinGig Convertor:

Switch# show interfaces status module 1
Port Name Status Vlan Duplex Speed Type
Te1/1 inactive 1 full 10G No X2
Te1/2 inactive 1 full 10G No X2
Te1/3 inactive 1 full 10G No X2
Te1/4 notconnect 1 full 10G No X2
Te1/5 notconnect 1 full 10G No X2
Te1/6 notconnect 1 full 10G No X2
Gi1/7 notconnect 1 full 1000 No Gbic
Gi1/8 notconnect 1 full 1000 No Gbic
Gi1/9 notconnect 1 full 1000 No Gbic
Gi1/10 notconnect 1 full 1000 No Gbic
Gi1/11 notconnect 1 full 1000 No Gbic
Gi1/12 notconnect 1 full 1000 No Gbic
Gi1/13 inactive 1 full 1000 No Gbic
Gi1/14 inactive 1 full 1000 No Gbic
Gi1/15 inactive 1 full 1000 No Gbic
Gi1/16 inactive 1 full 1000 No Gbic
Gi1/17 inactive 1 full 1000 No Gbic
Gi1/18 inactive 1 full 1000 No Gbic
Switch#

</tbody>
</table>
**show interfaces transceiver**

To display diagnostic-monitoring data for all interfaces that have transceivers installed, use the `show interfaces transceiver` command.

```
show interfaces {{[int_name] transceiver {[detail]} | {transceiver [module mod] | detail [module mod]}}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>int_name</code></td>
<td>(Optional) Interface.</td>
</tr>
<tr>
<td><code>detail</code></td>
<td>(Optional) Displays the calibrated values and the A2D readouts if the readout values differ from the calibrated values. Also displays the high-alarm, high-warning, low-warning, and low-alarm thresholds.</td>
</tr>
<tr>
<td><code>module mod</code></td>
<td>(Optional) Limits the display to interfaces on a specific module.</td>
</tr>
</tbody>
</table>

**Defaults**

The noninterface-specific versions of the `show interfaces transceiver` command are enabled by default. The interface-specific versions of these commands are enabled by default if the specified interface has a transceiver (GBIC or SFP) that is configured for diagnostic monitoring, and the transceiver is in a module that supports diagnostic monitoring.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(20)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Support for the <code>calibration</code> keyword was withdrawn.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `show interfaces transceiver` command provides useful information under the following conditions:

- At least one transceiver is installed on a chassis that is configured for diagnostic monitoring.
- The transceiver is in a module that supports diagnostic monitoring.

If you notice that the alarm and warning flags have been set on a transceiver, reenter the command to confirm.
Examples

This example shows how to display diagnostic monitoring data for all interfaces with transceivers installed on the switch:

Switch\# show interfaces transceiver
If device is externally calibrated, only calibrated values are printed.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).

<table>
<thead>
<tr>
<th>Port</th>
<th>Temperature (Celsius)</th>
<th>Voltage (Volts)</th>
<th>Current (mA)</th>
<th>Optical Tx Power (dBm)</th>
<th>Optical Rx Power (dBm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gi1/1</td>
<td>48.1</td>
<td>3.30</td>
<td>0.0</td>
<td>8.1 ++</td>
<td>N/A</td>
</tr>
<tr>
<td>Gi1/2</td>
<td>34.9</td>
<td>3.30</td>
<td>1.8</td>
<td>-10.0 -36.9</td>
<td></td>
</tr>
<tr>
<td>Gi2/1</td>
<td>43.7</td>
<td>5.03</td>
<td>50.6 +</td>
<td>-16.7 -- N/A</td>
<td></td>
</tr>
<tr>
<td>Gi2/2</td>
<td>39.2</td>
<td>5.02</td>
<td>25.7</td>
<td>0.8</td>
<td>N/A</td>
</tr>
</tbody>
</table>

Switch#

Note: The value for the Optical Tx Power (in dBm) equals ten times log (Tx Power in mW). If the Tx Power value is 3 mW, then the Optical Tx Power value equals 10 * log (3), which equals 10 * .477 or 4.77 dBm. The Optical Rx Power value behaves similarly. If the Tx Power or the Rx Power is zero, then its dBm value is undefined and is shown as N/A (not applicable).

This example shows how to display detailed diagnostic monitoring data, including calibrated values, alarm and warning thresholds, A2D readouts, and alarm and warning flags. The A2D readouts are reported separately in parentheses only if they differ from the calibrated values:

Switch\# show interfaces transceiver detail
mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable.
A2D readouts (if they differ), are reported in parentheses.
The threshold values are calibrated.

Catalyst 4500 Series Switch Cisco IOS Command Reference—Release IOS-XE 3.2.0 SG
This example shows how to display the monitoring data for the interfaces that have transceivers installed on module 2:

Switch# `show interfaces transceiver module 2`

If device is externally calibrated, only calibrated values are printed. ++ : high alarm, + : high warning, - : low warning, -- : low alarm.
NA or N/A: not applicable, Tx: transmit, Rx: receive.
mA: milliamperes, dBm: decibels (milliwatts).

Switch#

This example shows how to display the detailed monitoring data for the interfaces that have transceivers installed on module 2:

Switch# `show interfaces transceiver detail module 2`

mA: milliamperes, dBm: decibels (milliwatts), NA or N/A: not applicable. ++ : high alarm, + : high warning, - : low warning, -- : low alarm.
A2D readouts (if they differ), are reported in parentheses. The threshold values are calibrated.

show interfaces trunk

To display port and module interface-trunk information, use the show interfaces trunk command.

    show interfaces trunk [module mod]

Syntax Description

module mod (Optional) Limits the display to interfaces on the specified module; valid values are from 1 to 6.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

Release Modification

12.1(8a)EW   Support for this command was introduced on the Catalyst 4500 series switch.

Usage Guidelines

If you do not specify a keyword, only information for trunking ports is displayed.

Examples

This example shows how to display interface-trunk information for module 5:

    Switch# show interfaces trunk module 5

    Port   Mode     Encapsulation  Status      Native vlan
    Fa5/1  routed  negotiate      routed       1
    Fa5/2  routed  negotiate      routed       1
    Fa5/3  routed  negotiate      routed       1
    Fa5/4  routed  negotiate      routed       1
    Fa5/5  routed  negotiate      routed       1
    Fa5/6  off     negotiate      not-trunking 10
    Fa5/7  off     negotiate      not-trunking 10
    Fa5/8  off     negotiate      not-trunking 1
    Fa5/9  desirable n-isl        trunking     1
    Fa5/10 desirable negotiate    not-trunking 1
    Fa5/11 routed  negotiate      routed       1
    Fa5/12 routed  negotiate      routed       1
    ...  routed  negotiate      routed       1

    Port   Vlans allowed on trunk
    Fa5/1  none
    Fa5/2  none
    Fa5/3  none
    Fa5/4  none
    Fa5/5  none
    Fa5/6  none
    Fa5/7  none
    Fa5/8  200
    Fa5/9  1-1005
This example shows how to display trunking information for active trunking ports:

```
Switch# show interfaces trunk

    Port  Mode          Encapsulation  Status       Native vlan
Fa5/9  desirable    n-isl          trunking      1

Port  Vlans allowed on trunk
Fa5/9  1-1005

Port  Vlans allowed and active in management domain
Fa5/9  1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-8
       02,850,917,999,1002-1005

Port  Vlans in spanning tree forwarding state and not pruned
Fa5/9  1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-8
       02,850,917,999,1002-1005
Switch#
```
show ip arp inspection

To show the status of dynamic ARP inspection for a specific range of VLANs, use the show ip arp inspection command.

```
show ip arp inspection { [statistics] vlan vlan-range | interfaces [interface-name] }
```

**Syntax Description**

- **statistics** (Optional) Displays statistics for the following types of packets that have been processed by this feature: forwarded, dropped, MAC validation failure, and IP validation failure.

- **vlan vlan-range** (Optional) When used with the statistics keyword, displays the statistics for the selected range of VLANs. Without the statistics keyword, displays the configuration and operating state of DAI for the selected range of VLANs.

- **interfaces interface-name** (Optional) Displays the trust state and the rate limit of ARP packets for the provided interface. When the interface name is not specified, the command displays the trust state and rate limit for all applicable interfaces in the system.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

show ip cef vlan

To view IP CEF VLAN interface status and configuration information and display the prefixes for a specific interface, use the `show ip cef vlan` command.

```
show ip cef vlan vlan_num [detail]
```

**Syntax Description**

- `vlan_num` Number of the VLAN.
- `detail` (Optional) Displays detailed information.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

**Release** Modification

12.1(8a)EW Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to display the prefixes for a specific VLAN:

```
Switch# show ip cef vlan 1003
Prefix       Next Hop             Interface
0.0.0.0/0    172.20.52.1          FastEthernet3/3
0.0.0.0/32   receive
10.7.0.0/16  172.20.52.1          FastEthernet3/3
10.16.18.0/23 172.20.52.1        FastEthernet3/3
Switch#
```

This example shows how to display detailed IP CEF information for a specific VLAN:

```
Switch# show ip cef vlan 1003 detail
IP Distributed CEF with switching (Table Version 2364), flags=0x0
1383 routes, 0 reresolve, 0 unresolved (0 old, 0 new)
1383 leaves, 201 nodes, 380532 bytes, 2372 inserts, 989 invalidations
0 load sharing elements, 0 bytes, 0 references
universal per-destination load sharing algorithm, id 9B6C9823
3 CEF resets, 0 revisions of existing leaves
refcounts: 54276 leaf, 51712 node

Adjacency Table has 5 adjacencies
Switch#
```
show ip dhcp snooping

To display the DHCP snooping configuration, use the **show ip dhcp snooping** command.

```
show ip dhcp snooping
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support for option 82 on untrusted ports was added.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the DHCP snooping configuration:

```
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled
DHCP snooping is configured on following VLANs: 500,555
DHCP snooping is operational on following VLANs: 500,555
DHCP snooping is configured on the following L3 Interfaces:
Insertion of option 82 is enabled
circuit-id default format: vlan-mod-port
remote-id: switch123 (string)
Option 82 on untrusted port is not allowed
Verification of hwaddr field is enabled
DHCP snooping trust/rate is configured on the following Interfaces:
Interface Trusted Rate limit (pps)
------------------------ ------- ----------------
FastEthernet5/1 yes 100
Custom circuit-ids:
VLAN 555: customer-555
FastEthernet2/1 no unlimited
Custom circuit-ids:
VLAN 500: customer-500
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>
show ip dhcp snooping binding

To display the DHCP snooping binding entries, use the `show ip dhcp snooping binding` command.

`show ip dhcp snooping binding [ip-address] [mac-address] [vlan vlan_num] [interface interface_num]`

**Syntax Description**
- `ip-address` (Optional) IP address for the binding entries.
- `mac-address` (Optional) MAC address for the binding entries.
- `vlan vlan_num` (Optional) Specifies a VLAN.
- `interface interface_num` (Optional) Specifies an interface.

**Defaults**
If no argument is specified, the switch will display the entire DHCP snooping binding table.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
DHCP snooping is enabled on a VLAN only if both the global snooping and the VLAN snooping are enabled.

To configure a range of VLANs, use the optional `last_vlan` argument to specify the end of the VLAN range.

**Examples**

This example shows how to display the DHCP snooping binding entries for a switch:

```
Switch# show ip dhcp snooping binding

MacAddress      IP Address     Lease (seconds)     Type       VLAN  Interface
---------------- -----------    --------------    ----------    ------  -----------
0000.0100.0201   10.0.0.1      1600             dhcp-snooping 100      FastEthernet3/1
```

This example shows how to display an IP address for DHCP snooping binding entries:

```
Switch# show ip dhcp snooping binding 172.100.101.102

MacAddress      IP Address     Lease (seconds)     Type       VLAN  Interface
---------------- -----------    --------------    ----------    ------  -----------
0000.0100.0201   172.100.101.102 1600             dhcp-snooping 100      FastEthernet3/1
```

This example shows how to display the MAC address for the DHCP snooping binding entries:

Switch# show ip dhcp snooping binding 55.5.5.2 0002.b33f.3d5f

<table>

show ip igmp interface

To view IP IGMP interface status and configuration information, use the `show ip igmp interface` command.

```
show ip igmp interface [fastethernet slot/port | gigabitethernet slot/port | tengigabitethernet slot/port | null interface-number | vlan vlan_id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastethernet</td>
<td>(Optional) Specifies the Fast Ethernet interface and the number of the slot and port.</td>
</tr>
<tr>
<td>gigabitethernet</td>
<td>(Optional) Specifies the Gigabit Ethernet interface and the number of the slot and port; valid values are from 1 to 9.</td>
</tr>
<tr>
<td>tengigabitethernet</td>
<td>(Optional) Specifies the 10-Gigabit Ethernet interface and the number of the slot and port; valid values are from 1 to 2.</td>
</tr>
<tr>
<td>null</td>
<td>(Optional) Specifies the null interface and the number of the interface; the only valid value is 0.</td>
</tr>
<tr>
<td>vlan vlan_id</td>
<td>(Optional) Specifies the VLAN and the number of the VLAN; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

### Defaults

If you do not specify a VLAN, information for VLAN 1 is shown.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you omit the optional arguments, the `show ip igmp interface` command displays information about all interfaces.

### Examples

This example shows how to view IGMP information for VLAN 200:

```
Switch# show ip igmp interface vlan 200
IGMP snooping is globally enabled
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mroutet learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP-ONLY mode on this VLAN
Switch#
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip igmp group</td>
<td>Deletes the IGMP group cache entries.</td>
</tr>
<tr>
<td>show ip igmp snooping mrouter</td>
<td>Displays information on the dynamically learned and manually configured multicast switch interfaces.</td>
</tr>
</tbody>
</table>
show ip igmp profile

To view all configured IGMP profiles or a specified IGMP profile, use the show ip igmp profile privileged EXEC command.

    show ip igmp profile [profile number]

Syntax Description

- **profile number** (Optional) IGMP profile number to be displayed; valid ranges are from 1 to 4294967295.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(11b)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If no profile number is entered, all IGMP profiles are displayed.

Examples

This example shows how to display IGMP profile 40:

```
Switch# show ip igmp profile 40
IGMP Profile 40
    permit
    range 233.1.1.1 233.255.255.255
Switch#
```

This example shows how to display all IGMP profiles:

```
Switch# show ip igmp profile
IGMP Profile 3
    range 230.9.9.0 230.9.9.0
IGMP Profile 4
    permit
    range 229.9.9.0 229.555.555
Switch#
```

Related Commands

<table>
<thead>
<tr>

</tbody>
</table>
show ip igmp snooping

To display information on dynamically learned and manually configured VLAN switch interfaces, use the `show ip igmp snooping` command.

```
show ip igmp snooping [querier | groups | mrouter] [vlan vlan_id] a.b.c.d [summary | sources | hosts] [count]
```

### Syntax Description

- **querier** (Optional) Specifies that the display will contain IP address and version information.
- **groups** (Optional) Specifies that the display will list VLAN members sorted by group IP addresses.
- **mrouter** (Optional) Specifies that the display will contain information on dynamically learned and manually configured multicast switch interfaces.
- **vlan vlan_id** (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.
- **a.b.c.d** Group or multicast IP address.
- **summary** (Optional) Specifies a display of detailed information for a v2 or v3 group.
- **sources** (Optional) Specifies a list of the source IPs for the specified group.
- **hosts** (Optional) Specifies a list of the host IPs for the specified group.
- **count** (Optional) Specifies a display of the total number of group addresses learned by the system on a global or per-VLAN basis.

### Defaults

This command has no default settings.

### Command Modes

EXEC

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
<tr>
<td>12.1(20)EW</td>
<td>Added support to display configuration state for IGMPv3 explicit host tracking.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can also use the `show mac-address-table multicast` command to display the entries in the MAC address table for a VLAN that has IGMP snooping enabled.

You can display IGMP snooping information for VLAN interfaces by entering the `show ip igmp snooping` command.
Examples

This example shows how to display the global snooping information on the switch:

```
Switch# show ip igmp snooping
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping             : Enabled
IGMPv3 snooping           : Enabled
Report suppression        : Enabled
TCN solicit query         : Disabled
TCN flood query count     : 2

Vlan 1:
--------
IGMP snooping                  : Enabled
IGMPv2 immediate leave         : Disabled
Explicit host tracking         : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode    : IGMP_ONLY
```

```
Switch>
```

This example shows how to display the snooping information on VLAN 2:

```
Switch# show ip igmp snooping vlan 2
Global IGMP Snooping configuration:
-----------------------------------
IGMP snooping             : Enabled
IGMPv3 snooping           : Enabled
Report suppression        : Enabled
TCN solicit query         : Disabled
TCN flood query count     : 2

Vlan 2:
--------
IGMP snooping                  : Enabled
IGMPv2 immediate leave         : Disabled
Explicit host tracking         : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode    : IGMP_ONLY
```

```
Switch>
```

This example shows how to display IGMP querier information for all VLANs on a switch:

```
Switch# show ip igmp snooping querier
Vlan  IP Address     IGMP Version        Port
-----------------------------------
2   10.10.10.1     v2                  Router
3   172.20.50.22   v3                  Fa3/15
```

```
Switch>
```
This example shows how to display IGMP querier information for VLAN 5 when running IGMPv2:

```
Switch# show ip igmp snooping querier vlan 5
IP address : 5.5.5.10
IGMP version : v2
Port : Fa3/1
Max response time : 10s
Switch>
```

This example shows how to display IGMP querier information for VLAN 5 when running IGMPv3:

```
Switch# show ip igmp snooping querier vlan 5
IP address : 5.5.5.10
IGMP version : v3
Port : Fa3/1
Max response time : 10s
Query interval : 60s
Robustness variable : 2
Switch>
```

This example shows how to display snooping information for a specific group:

```
Switch# show ip igmp snooping group
Vlan Group Version Ports
---------------------------------------------------------
2 224.0.1.40 v3 Router
2 224.2.2.2 v3 Fa6/2
Switch>
```

This example shows how to display the group’s host types and ports in VLAN 1:

```
Switch# show ip igmp snooping group vlan 1
Vlan Group Host Type Ports
---------------------------------------------------------
1 229.2.3.4 v3 fa2/1 fa2/3
1 224.2.2.2 v3 Fa6/2
Switch>
```

This example shows how to display the group’s host types and ports in VLAN 1:

```
Switch# show ip igmp snooping group vlan 10 226.6.6.7
Vlan Group Version Ports
---------------------------------------------------------
10 226.6.6.7 v3 Fa7/13, Fa7/14
Switch>
```

This example shows how to display the current state of a group with respect to a source IP address:

```
Switch# show ip igmp snooping group vlan 10 226.6.6.7 sources
Source information for group 226.6.6.7:
Timers: Expired sources are deleted on next IGMP General Query
SourceIP Expires Uptime Inc. Hosts Exc. Hosts
-------------------------------------------------------
2.0.0.1 00:03:04 00:03:48 2 0
2.0.0.2 00:03:04 00:02:07 2 0
Switch>
```
This example shows how to display the current state of a group with respect to a host MAC address:

```
Switch# show ip igmp snooping group vlan 10 226.6.6.7 hosts
IGMPv3 host information for group 226.6.6.7
Timers: Expired hosts are deleted on next IGMP General Query

<table>
<thead>
<tr>
<th>Host (MAC/IP)</th>

</tr>
</tbody>
</table>
```

Switch>

This example shows how to display summary information for a v3 group:

```
Switch# show ip igmp snooping group vlan 10 226.6.6.7 summary
Group Address (Vlan 10)   : 226.6.6.7
Host type                : v3
Member Ports             : Fa7/13, Fa7/14
Filter mode              : INCLUDE
Expires                  : stopped
Sources                   : 2
Reporters (Include/Exclude) : 2/0
Switch>
```

This example shows how to display multicast router information for VLAN 1:

```
Switch# show ip igmp snooping mrouter vlan 1
vlan        ports
----------+----------------------------------------
1          Gi1/1,Gi2/1,Fa3/48,Router
Switch#
```

This example shows how to display the total number of group addresses learned by the system globally:

```
Switch# show ip igmp snooping group count
Total number of groups: 54
Switch>
```

This example shows how to display the total number of group addresses learned on VLAN 5:

```
Switch# show ip igmp snooping group vlan 5 count
Total number of groups: 30
Switch>
```

</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command is valid only if explicit host tracking is enabled on the switch.

Examples

This example shows how to display host membership for the Gigabit Ethernet interface 4/1:

```
Switch# show ip igmp snooping membership interface gigabitethernet4/1
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave
40.40.40.2/224.10.10.10 G14/1 20.20.20.20 00:23:37 00:06:50 00:20:30
40.40.40.4/224.10.10.10G14/1 20.20.20.20 00:39:42 00:09:17 -
Switch#
```

This example shows how to display host membership for VLAN 20 and group 224.10.10.10:

```
Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave
40.40.40.2/224.10.10.10 G14/1 20.20.20.20 00:23:37 00:06:50 00:20:30
Switch#
```
This example shows how to display host membership information for VLAN 20 and to delete the explicit host tracking:

Switch# **show ip igmp snooping membership vlan 20**
Snooping Membership Summary for Vlan 20
------------------------------------------
Total number of channels:5
Total number of hosts :4

</table>
show ip igmp snooping mrouter

To display information on the dynamically learned and manually configured multicast switch interfaces, use the **show ip igmp snooping mrouter** command.

```
show ip igmp snooping mrouter [{vlan vlan-id}]
```

**Syntax Description**

- `vlan vlan-id` (Optional) Specifies a VLAN; valid values are from 1 to 1001 and from 1006 to 4094.

** Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use the **show mac-address-table multicast** command to display entries in the MAC address table for a VLAN that has IGMP snooping enabled.

You can display IGMP snooping information for the VLAN interfaces by entering the **show ip igmp interface vlan vlan-num** command.

**Examples**

This example shows how to display snooping information for a specific VLAN:

```
Switch# show ip igmp snooping mrouter vlan 1
vlan  ports
-----+----------------------------------------
1    Gi1/1,Gi2/1,Fa3/48,Switch
Switch#
```

**Related Commands**

</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use the `show mac-address-table multicast` command to display the entries in the MAC address table for a VLAN that has IGMP snooping enabled.

**Examples**

This example shows how to display snooping information for a specific VLAN:

```
Switch# show ip igmp snooping vlan 2
vlan 2
--------
IGMP snooping is globally enabled
IGMP snooping TCN solicit query is globally enabled
IGMP snooping global TCN flood query count is 2
IGMP snooping is enabled on this Vlan
IGMP snooping immediate-leave is disabled on this Vlan
IGMP snooping mrouter learn mode is pim-dvmrp on this Vlan
IGMP snooping is running in IGMP_ONLY mode on this Vlan
Switch#
```

show ip interface

To display the usability status of interfaces that are configured for IP, use the `show ip interface` command.

```
show ip interface [type number]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>(Optional) Interface type.</td>
</tr>
<tr>
<td>number</td>
<td>(Optional) Interface number.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

EXEC

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)EW</td>
<td>Extended to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco IOS software automatically enters a directly connected route in the routing table if the interface is usable. A usable interface is one through which the software can send and receive packets. If the software determines that an interface is not usable, it removes the directly connected routing entry from the routing table. Removing the entry allows the software to use dynamic routing protocols to determine backup routes to the network, if any.

If the interface can provide two-way communication, the line protocol is marked “up.” If the interface hardware is usable, the interface is marked “up.”

If you specify an optional interface type, you see information only on that specific interface.

If you specify no optional arguments, you see information on all the interfaces.

When an asynchronous interface is encapsulated with PPP or Serial Line Internet Protocol (SLIP), IP fast switching is enabled. The `show ip interface` command on an asynchronous interface that is encapsulated with PPP or SLIP displays a message indicating that IP fast switching is enabled.

**Examples**

This example shows how to display the usability status for a specific VLAN:

```
Switch# show ip interface vlan 1
Vlan1 is up, line protocol is up
    Internet address is 10.6.58.4/24
    Broadcast address is 255.255.255.255
    Address determined by non-volatile memory
    MTU is 1500 bytes
    Helper address is not set
    Directed broadcast forwarding is disabled
    Outgoing access list is not set
    Inbound access list is not set
    Proxy ARP is enabled
```
Local Proxy ARP is disabled
Security level is default
Split horizon is enabled
ICMP redirects are always sent
ICMP unreachables are always sent
ICMP mask replies are never sent
IP fast switching is enabled
IP fast switching on the same interface is disabled
IP Flow switching is disabled
IP CEF switching is enabled
IP Fast switching turbo vector
IP Normal CEF switching turbo vector
IP multicast fast switching is enabled
IP multicast distributed fast switching is disabled
IP route-cache flags are Fast, CEF
Router Discovery is disabled
IP output packet accounting is disabled
IP access violation accounting is disabled
TCP/IP header compression is disabled
RTP/IP header compression is disabled
Probe proxy name replies are disabled
Policy routing is disabled
Network address translation is disabled
WCCP Redirect outbound is disabled
WCCP Redirect inbound is disabled
WCCP Redirect exclude is disabled
BGP Policy Mapping is disabled
Sampled Netflow is disabled
IP multicast multilayer switching is disabled
Netflow Data Export (hardware) is enabled
Switch#

show ip mfib

To display all active Multicast Forwarding Information Base (MFIB) routes, use the `show ip mfib` command.

```
show ip mfib [all | counters | log [n]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Specifies all routes in the MFIB, including those routes that are used to accelerate fast switching but that are not necessarily in the upper-layer routing protocol table.</td>
</tr>
<tr>
<td>counters</td>
<td>(Optional) Specifies the counts of MFIB-related events. Only nonzero counters are shown.</td>
</tr>
<tr>
<td>log</td>
<td>(Optional) Specifies a log of the most recent number of MFIB-related events. The most recent event is first.</td>
</tr>
<tr>
<td>n</td>
<td>(Optional) Number of events.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support for command introduced on the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the Supervisor Engine 6-E and Catalyst 4900M chassis, the output of the `show ip mfib` command does not display any hardware counters.

The MFIB table contains a set of IP multicast routes; each route in the MFIB table contains several flags that associate to the route.

The route flags indicate how a packet that matches a route is forwarded. For example, the IC flag on an MFIB route indicates that some process on the switch needs to receive a copy of the packet. These flags are associated with MFIB routes:

- **Internal Copy (IC) flag**—Set on a route when a process on the switch needs to receive a copy of all packets matching the specified route.
- **Signaling (S) flag**—Set on a route when a switch process needs notification that a packet matching the route is received. In the expected behavior, the protocol code updates the MFIB state in response to having received a packet on a signaling interface.
- **Connected (C) flag**—When set on a route, the C flag has the same meaning as the S flag, except that the C flag indicates that only packets sent by directly connected hosts to the route should be signaled to a protocol process.
A route can also have a set of flags associated with one or more interfaces. For an (S,G) route, the flags on interface I indicate how the ingress packets should be treated and whether packets matching the route should be forwarded onto interface I. These per-interface flags are associated with the MFIB routes:

- **Accepting (A)**—Set on the RPF interface when a packet that arrives on the interface and that is marked as Accepting (A) is forwarded to all Forwarding (F) interfaces.
- **Forwarding (F)**—Used with the A flag as described above. The set of forwarding interfaces together form a multicast olist or output interface list.
- **Signaling (S)**—Set on an interface when a multicast routing protocol process in Cisco IOS needs to be notified of ingress packets on that interface.
- **Not Platform (NP) fast-switched**—Used with the F flag. A forwarding interface is also marked as Not Platform fast-switched whenever that output interface cannot be fast-switched by the platform hardware and requires software forwarding.

For example, the Catalyst 4506 switch with Supervisor Engine III cannot switch tunnel interfaces in hardware so these interfaces are marked with the NP flag. When an NP interface is associated with a route, a copy of every ingress packet arriving on an Accepting interface is sent to the switch software forwarding path for software replication and then forwarded to the NP interface.

### Examples

This example shows how to display all active MFIB routes:

```
Switch# show ip mfib
IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal,
IC - Internal Copy
Interface Flags: A - Accept, F - Forward, NS - Signal,
NP - Not platform switched
Packets: Fast/Partial/Slow Bytes: Fast/Partial/Slow:
(171.69.10.13, 224.0.1.40), flags (IC)
   Packets: 2292/2292/0, Bytes: 518803/0/518803
Vlan7 (A)
Vlan100 (F NS)
Vlan105 (F NS)
(*, 224.0.1.60), flags ()

show ip mroute

To display IP multicast routing table information, use the **show ip mroute** command.

```
show ip mroute [interface_type slot/port | host_name | host_address [source] | active [kbps | interface_type num] | count | pruned | static | summary]
```

### Syntax Description

- **interface_type**
  - slot/port: (Optional) Interface type and number of the slot and port; valid values for interface type are `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `null`, and `vlan`.

- **host_name**: (Optional) Name or IP address as defined in the DNS hosts table.

- **host_address**: (Optional) IP address or name of a multicast source.

- **source**: (Optional) IP address or name of a multicast source.

- **active**: (Optional) Displays the rate that active sources are sending to multicast groups.

- **kbps**: (Optional) Minimum rate at which active sources are sending to multicast groups; active sources sending at this rate or greater will be displayed. Valid values are from 1 to 4294967295 kbps.

- **interface_type num**: (Optional) Interface type and number of the slot and port; valid values for interface type are `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `null`, and `vlan`.

- **count**: (Optional) Displays the route and packet count information.

- **pruned**: (Optional) Displays the pruned routes.

- **static**: (Optional) Displays the static multicast routes.

- **summary**: (Optional) Displays a one-line, abbreviated summary of each entry in the IP multicast routing table.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you omit all the optional arguments and keywords, the **show ip mroute** command displays all the entries in the IP multicast routing table.

The **show ip mroute active kbps** command displays all the sources sending at a rate greater than or equal to **kbps**.

The multicast routing table is populated by creating source, group (S,G) entries from star, group (*,G) entries. The star refers to all source addresses, the “S” refers to a single source address, and the “G” refers to the destination multicast group address. In creating (S,G) entries, the software uses the best path to that destination group found in the unicast routing table (through Reverse Path Forwarding (RPF)).
Examples

This example shows how to display all the entries in the IP multicast routing table:

Switch# show ip mroute

IP Multicast Routing Table
Flags:D - Dense, S - Sparse, s - SSM Group, C - Connected, L - Local,
P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running
A - Advertised via MSDP, U - URD, I - Received Source Specific Host Report
Outgoing interface flags:H - Hardware switched
Timers:Uptime/Expires
Interface state:Interface, Next-Hop or VCD, State/Mode

(*, 230.13.13.1), 00:16:41/00:00:00, RP 10.15.1.20, flags:SJC
   Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20
   Outgoing interface list:
      GigabitEthernet4/9, Forward/Sparse-Dense, 00:16:41/00:00:00, H

(*, 230.13.13.2), 00:16:41/00:00:00, RP 10.15.1.20, flags:SJC
   Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD
   Outgoing interface list:
      GigabitEthernet4/9, Forward/Sparse-Dense, 00:16:41/00:00:00, H

(10.20.1.15, 230.13.13.1), 00:14:31/00:01:40, flags:CJT
   Incoming interface:GigabitEthernet4/8, RPF nbr 10.15.1.20, RPF-MFD
   Outgoing interface list:
      GigabitEthernet4/9, Forward/Sparse-Dense, 00:14:31/00:00:00, H

This example shows how to display the rate that the active sources are sending to the multicast groups and to display only the active sources that are sending at greater than the default rate:

Switch# show ip mroute active

Active IP Multicast Sources - sending >= 4 kbps

Group: 224.2.127.254, (edr.cisco.com)
   Source: 146.137.28.69 (mbone.ipd.anl.gov)
   Rate: 1 pps/4 kbps(1sec), 4 kbps(last 1 secs), 4 kbps(life avg)

Group: 224.2.201.241, ACM 97
   Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
   Rate: 9 pps/93 kbps(1sec), 145 kbps(last 20 secs), 85 kbps(life avg)

Group: 224.2.207.215, ACM 97
   Source: 130.129.52.160 (webcast3-e1.acm97.interop.net)
   Rate: 3pps/31 kbps(1sec), 63 kbps(last 19 secs), 65 kbps(life avg)
Switch#
This example shows how to display route and packet count information:

```
Switch# show ip mroute count
IP Multicast Statistics
56 routes using 28552 bytes of memory
13 groups, 3.30 average sources per group
Forwarding Counts: Pkt Count/Pkts per second/Avg Pkt Size/Kilobits per second
Other counts: Total/RPF failed/Other drops (OIF-null, rate-limit etc)
Group: 224.2.136.89, Source count: 1, Group pkt count: 29051
  Source: 132.206.72.28/32, Forwarding: 29051/-278/1186/0, Other: 85724/8/56665
Switch#
```

This example shows how to display summary information:

```
Switch# show ip mroute summary
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, s - SSM Group, C - Connected, L - Local,
  P - Pruned, R - RP-bit set, F - Register flag, T - SPT-bit set,
  J - Join SPT, M - MSDP created entry, X - Proxy Join Timer Running
  A - Advertised via MSDP, U - URD, I - Received Source Specific Host
  Report
Outgoing interface flags: H - Hardware switched
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode
Switch#
```

Table 2-22 describes the fields shown in the output.

**Table 2-22 show ip mroute Field Descriptions**

<table>

show ip mroute

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>J - Join SPT</td>
<td>For (<em>, G) entries, indicates that the rate of traffic flowing down the shared tree is exceeding the SPT-Threshold set for the group. (The default SPT-Threshold setting is 0 kbps.) When the J - Join SPT flag is set, the next (S,G) packet received down the shared tree triggers an (S,G) join in the direction of the source causing the switch to join the source tree. For (S, G) entries, indicates that the entry was created because the SPT-Threshold for the group was exceeded. When the J - Join SPT flag is set for (S,G) entries, the switch monitors the traffic rate on the source tree and attempts to switch back to the shared tree for this source if the traffic rate on the source tree falls below the group’s SPT-Threshold for more than one minute. The switch measures the traffic rate on the shared tree and compares the measured rate to the group’s SPT-Threshold once every second. If the traffic rate exceeds the SPT-Threshold, the J- Join SPT flag is set on the (</em>, G) entry until the next measurement of the traffic rate. The flag is cleared when the next packet arrives on the shared tree and a new measurement interval is started. If the default SPT-Threshold value of 0 Kbps is used for the group, the J- Join SPT flag is always set on (*, G) entries and is never cleared. When the default SPT-Threshold value is used, the switch immediately switches to the shortest-path tree when traffic from a new source is received.</td>

Table 2-22  show ip mroute Field Descriptions (continued)
### Table 2-22: show ip mroute Field Descriptions (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RP</td>
<td>Address of the RP switch. For switches and access servers operating in sparse mode, this address is always 0.0.0.0.</td>
</tr>
<tr>
<td>flags:</td>
<td>Information about the entry.</td>
</tr>
<tr>
<td>Incoming interface</td>
<td>Expected interface for a multicast packet from the source. If the packet is not received on this interface, it is discarded.</td>
</tr>
<tr>
<td>RPF neighbor</td>
<td>IP address of the upstream switch to the source. “Tunneling” indicates that this switch is sending data to the RP encapsulated in Register packets. The hexadecimal number in parentheses indicates to which RP it is registering. Each bit indicates a different RP if multiple RPs per group are used.</td>
</tr>
<tr>
<td>DVMRP or Mroute</td>
<td>Status of whether the RPF information is obtained from the DVMRP routing table or the static mroute configuration.</td>
</tr>
<tr>
<td>Outgoing interface list</td>
<td>Interfaces through which packets are forwarded. When the ip pim nbma-mode command is enabled on the interface, the IP address of the PIM neighbor is also displayed.</td>
</tr>
<tr>
<td>Ethernet0</td>
<td>Name and number of the outgoing interface.</td>
</tr>
<tr>
<td>Next hop or VCD</td>
<td>Next hop specifies downstream neighbor’s IP address. VCD specifies the virtual circuit descriptor number. VCD0 indicates that the group is using the static-map virtual circuit.</td>
</tr>
<tr>
<td>Forward/Dense</td>
<td>Status of the packets; indicates if they are they forwarded on the interface if there are no restrictions due to access lists or the TTL threshold. Following the slash (/), mode in which the interface is operating (dense or sparse).</td>
</tr>
<tr>
<td>Forward/Sparse</td>
<td>Sparse mode interface is in forward mode.</td>
</tr>
<tr>
<td>time/time</td>
<td>Per interface, how long (in hours, minutes, and seconds) the entry has been in the IP multicast routing table. Following the slash (/), how long (in hours, minutes, and seconds) until the entry is removed from the IP multicast routing table.</td>
</tr>
</tbody>
</table>

show ip source binding

To display IP source bindings that are configured on the system, use the **show ip source binding** EXEC command.

```
show ip source binding [ip-address] [mac-address] [dhcp-snooping | static] [vlan vlan-id] [interface interface-name]
```

**Syntax Description**

- **ip-address** (Optional) Binding IP address.
- **mac-address** (Optional) Binding MAC address.
- **dhcp-snooping** (Optional) DHCP-snooping type binding.
- **static** (Optional) Statically configured binding.
- **vlan vlan-id** (Optional) VLAN number.
- **interface interface-name** (Optional) Binding interface.

**Defaults**

Displays both static and DHCP snooping bindings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The optional parameters filter the display output result.

**Examples**

This example shows how to display the IP source bindings:

```
Switch# show ip source binding
MacAddress       IpAddress       Lease(sec) Type          VLAN        Interface
----------------- ----------- ------- ------- -------------- ------------- -------------------
00:00:00:0A:00:0B 11.0.0.1     infinite static         10           FastEthernet6/10
Switch#
```

This example shows how to display the static IP binding entry of IP address 11.0.01:

```
Switch# show ip source binding 11.0.0.1 0000.000A.000B static vlan 10 interface Fa6/10
switch ip source binding 11.0.0.1 0000.000A.000B static vlan 10 interface Fa6/10
MacAddress       IpAddress       Lease(sec) Type          VLAN        Interface
----------------- ----------- ------- ------- -------------- ------------- -------------------
00:00:00:0A:00:0B 11.0.0.1     infinite static         10           FastEthernet6/10
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</thead>
<tbody>
<tr>
<td><strong>ip source binding</strong></td>
<td>Adds or deletes a static IP source binding entry.</td>
</tr>
</tbody>
</table>
show ip verify source

To display the IP source guard configuration and filters on a particular interface, use the show ip verify source command.

```
show ip verify source [interface interface_num]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface interface_num</td>
<td>(Optional) Specifies an interface.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

These examples show how to display the IP source guard configuration and filters on a particular interface with the show ip verify source interface command:

- This output appears when DHCP snooping is enabled on VLANs 10–20, interface fa6/1 has IP source filter mode that is configured as IP, and an existing IP address binding 10.0.0.1 is on VLAN 10:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>10.0.0.1</td>
<td></td>
<td>10</td>
</tr>
<tr>
<td>fa6/1</td>
<td>ip</td>
<td>active</td>
<td>deny-all</td>
<td></td>
<td>11-20</td>
</tr>
</tbody>
</table>

  **Note**

The second entry shows that a default PVACL (deny all IP traffic) is installed on the port for those snooping-enabled VLANs that do not have a valid IP source binding.

- This output appears when you enter the show ip verify source interface fa6/2 command and DHCP snooping is enabled on VLANs 10–20, interface fa6/1 has IP source filter mode that is configured as IP, and there is an existing IP address binding 10.0.0.1 on VLAN 10:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/2</td>
<td>ip</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- This output appears when you enter the show ip verify source interface fa6/3 command and the interface fa6/3 does not have a VLAN enabled for DHCP snooping:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/3</td>
<td>ip</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
• This output appears when you enter the `show ip verify source interface fa6/4` command and the interface fa6/4 has an IP source filter mode that is configured as IP MAC and the existing IP MAC that binds 10.0.0.2/aaaa.bbbb.cccc on VLAN 10 and 11.0.0.1/aaaa.bbbb.cccd on VLAN 11:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.2</td>
<td>aaaa.bbbb.cccc</td>
<td>10</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>11.0.0.1</td>
<td>aaaa.bbbb.cccd</td>
<td>11</td>
</tr>
<tr>
<td>fa6/4</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>deny-all</td>
<td>12-20</td>
</tr>
</tbody>
</table>

• This output appears when you enter the `show ip verify source interface fa6/5` command and the interface fa6/5 has IP source filter mode that is configured as IP MAC and existing IP MAC binding 10.0.0.3/aaaa.bbbb.ccce on VLAN 10, but port security is not enabled on fa6/5:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>10.0.0.3</td>
<td>permit-all</td>
<td>10</td>
</tr>
<tr>
<td>fa6/5</td>
<td>ip-mac</td>
<td>active</td>
<td>deny-all</td>
<td>permit-all</td>
<td>11-20</td>
</tr>
</tbody>
</table>

Note: Enable port security first because the DHCP security MAC filter cannot apply to the port or VLAN.

• This output appears when you enter the `show ip verify source interface fa6/6` command and the interface fa6/6 does not have IP source filter mode that is configured:

DHCP security is not configured on the interface fa6/6.

This example shows how to display all the interfaces on the switch that have DHCP snooping security and IP Port Security tracking enabled with the `show ip verify source` command.

The output is an accumulation of per-interface `show` CLIs:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Filter-type</th>
<th>Filter-mode</th>
<th>IP-address</th>
<th>Mac-address</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>

show ipc

To display IPC information, use the show ipc command.

```
show ipc {nodes | ports | queue | status}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nodes</td>
<td>Displays the participating nodes.</td>
</tr>
<tr>
<td>ports</td>
<td>Displays the local IPC ports.</td>
</tr>
<tr>
<td>queue</td>
<td>Displays the contents of the IPC retransmission queue.</td>
</tr>
<tr>
<td>status</td>
<td>Displays the status of the local IPC server.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the participating nodes:

```
Switch# show ipc nodes
There are 3 nodes in this IPC realm.
ID   Type       Name                       Last Sent Last Heard
10000 Local      IPC Master                               0      0
2010000 Local      GALIOS IPC:Card 1                        0      0
2020000 Ethernet   GALIOS IPC:Card 2                        12     26
Switch#
```

This example shows how to display the local IPC ports:

```
Switch# show ipc ports
There are 11 ports defined.
Port ID   Type       Name                      (current/peak/total)
10000.1 unicast   IPC Master:Zone
10000.2 unicast   IPC Master:Echo
10000.3 unicast   IPC Master:Control
10000.4 unicast   Remote TTY Server Port
10000.5 unicast   GALIOS RF :Active
    index = 0  seat_id = 0x2020000  last sent = 0      heard = 1635   0/1/1635
10000.6 unicast   GALIOS RED:Active
    index = 0  seat_id = 0x2020000  last sent = 0   heard = 2     0/1/2
2020000.3 unicast   GALIOS IPC:Card 2:Control
2020000.4 unicast   GALIOS RFS :Standby
2020000.5 unicast   Slave: Remote TTY Client Port
2020000.6 unicast   GALIOS RF :Standby
2020000.7 unicast   GALIOS RED:Standby
```
show ipc

RPC packets: current/peak/total

Switch#

This example shows how to display the contents of the IPC retransmission queue:

Switch# show ipc queue
There are 0 IPC messages waiting for acknowledgement in the transmit queue.
There are 0 IPC messages waiting for a response.
There are 0 IPC messages waiting for additional fragments.
There are 0 IPC messages currently on the IPC inboundQ.
There are 0 messages currently in use by the system.
Switch#

This example shows how to display the status of the local IPC server:

Switch# show ipc status
IPC System Status:

This processor is the IPC master server.

6000 IPC message headers in cache
3363 messages in, 1680 out, 1660 delivered to local port,
1686 acknowledgements received, 1675 sent,
0 NACKS received, 0 sent,
0 messages dropped on input, 0 messages dropped on output
0 no local port, 0 destination unknown, 0 no transport
0 missing callback or queue, 0 duplicate ACKs, 0 retries,
0 message timeouts.
0 ipc_output failures, 0 mtu failures,
0 msg alloc failed, 0 emer msg alloc failed, 0 no origs for RPC replies
0 pak alloc failed, 0 memd alloc failed
0 no hwq, 1 failed opens, 0 hardware errors
No regular dropping of IPC output packets for test purposes
Switch#
show ipv6 mld snooping

To display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping configuration of the switch or the VLAN, use the show ipv6 mld snooping command.

```
show ipv6 mld snooping [vlan vlan-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.</td>
</tr>
</tbody>
</table>

**Command Modes**

User EXEC mode

**Command History**

Release | Modification
---------|---------------
12.2(40)SG | This command was introduced on the Catalyst 4500.

**Usage Guidelines**

Use this command to display MLD snooping configuration for the switch or for a specific VLAN. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping vlan` command. It shows snooping characteristics for a specific VLAN.

```
Switch> show ipv6 mld snooping vlan 100
Global MLD Snooping configuration:
-------------------------------------------
MLD snooping                        : Enabled
MLDv2 snooping (minimal)            : Enabled
Listener message suppression        : Enabled
TCN solicit query                   : Disabled
TCN flood query count               : 2
Robustness variable                 : 3
Last listener query count           : 2
Last listener query interval         : 1000

Vlan 100:
---------
MLD snooping                        : Disabled
MLDv1 immediate leave               : Disabled
Explicit host tracking              : Enabled
Multicast router learning mode      : pim-dvmrp
Robustness variable                 : 3
Last listener query count           : 2
Last listener query interval         : 1000
```

This is an example of output from the `show ipv6 mld snooping` command. It displays snooping characteristics for all VLANs on the switch.

```
Switch> show ipv6 mld snooping
Global MLD Snooping configuration:
-------------------------------------------
MLD snooping                        : Enabled
MLDv2 snooping (minimal)            : Enabled
Listener message suppression        : Enabled
TCN solicit query                   : Disabled
TCN flood query count               : 2
Robustness variable                 : 3
Last listener query count           : 2
Last listener query interval         : 1000
```
show ipv6 mld snooping

MLD snooping : Enabled
MLDv2 snooping (minimal) : Enabled
Listener message suppression : Enabled
TCN solicit query : Disabled
TCN flood query count : 2
Robustness variable : 3
Last listener query count : 2
Last listener query interval : 1000

Vlan 1:
--------
MLD snooping : Disabled
MLDv1 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
Robustness variable : 1
Last listener query count : 2
Last listener query interval : 1000

Vlan 951:
--------
MLD snooping : Disabled
MLDv1 immediate leave : Disabled
Explicit host tracking : Enabled
Multicast router learning mode : pim-dvmrp
Robustness variable : 3
Last listener query count : 2
Last listener query interval : 1000

**Usage Guidelines**

Use this command to display MLD snooping switch ports for the switch or for a specific VLAN. VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping mrouter` command. It displays snooping characteristics for all VLANs on the switch that are participating in MLD snooping.

```
Switch> show ipv6 mld snooping mrouter
Vlan  ports
  ----  -----  
    2    Gi1/0/11(dynamic)
    72   Gi1/0/11(dynamic)
   200   Gi1/0/11(dynamic)
```

This is an example of output from the `show ipv6 mld snooping mrouter vlan` command. It shows multicast switch ports for a specific VLAN.

```
Switch> show ipv6 mld snooping mrouter vlan 100
Vlan  ports
  ----  -----  
    2    Gi1/0/11(dynamic)
```

show ipv6 mld snooping querier

To display IP version 6 (IPv6) Multicast Listener Discovery (MLD) snooping querier-related information most recently received by the switch or the VLAN, use the `show ipv6 mld snooping querier` command.

```
show ipv6 mld snooping querier [vlan vlan-id]
```

**Syntax Description**

- `vlan vlan-id`  (Optional) Specify a VLAN; the range is 1 to 1001 and 1006 to 4094.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on the Catalyst 4500.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show ipv6 mld snooping querier` command to display the MLD version and IPv6 address of a detected device that sends MLD query messages, which is also called a *querier*. A subnet can have multiple multicast switches but has only one MLD querier. The querier can be a Layer 3 switch.

The `show ipv6 mld snooping querier` command output also shows the VLAN and interface on which the querier was detected. If the querier is the switch, the output shows the `Port` field as *Router*. If the querier is a router, the output shows the port number on which the querier is learned in the `Port` field.

The output of the `show ipv6 mld snooping querier vlan` command displays the information received in response to a query message from an external or internal querier. It does not display user-configured VLAN values, such as the snooping robustness variable on the particular VLAN. This querier information is used only on the MASQ message that is sent by the switch. It does not override the user-configured robustness variable that is used for aging out a member that does not respond to query messages.

VLAN numbers 1002 through 1005 are reserved for Token Ring and FDDI VLANs and cannot be used in MLD snooping.

**Examples**

This is an example of output from the `show ipv6 mld snooping querier` command:

```
Switch> show ipv6 mld snooping querier
Vlan  IP Address      MLD Version Port
------------------------------------
 2     FE80::201:C9FF:FE40:6000 v1     Gi3/0/1
```

This is an example of output from the `show ipv6 mld snooping querier vlan` command:

```
Switch> show ipv6 mld snooping querier vlan 2
IP address : FE80::201:C9FF:FE40:6000
MLD version : v1
Port : Gi3/0/1
Max response time : 1000s
```

show issu capability

To display the ISSU capability for a client, use the show issu capability command.

```
show issu capability {entries | groups | types} [client_id]
```

**Syntax Description**

- **entries**: Displays a list of Capability Types and Dependent Capability Types that are included in a single Capability Entry. Types within an entry can also be independent.
- **groups**: Displays a list of Capability Entries in priority order (the order that they will be negotiated on a session).
- **types**: Displays an ID that identifies a particular capability.
- **client_id**: (Optional) Identifies the client registered to the ISSU infrastructure.

To obtain a list of client IDs, use the `show issu clients` command.

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Capability is a functionality that an ISSU client can support and is required to interoperate with peers. When an ISSU-aware client establishes its session with the peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

**Examples**

The following example shows how to display the ISSU capability types for the IP host ISSU client (clientid=2082):

```
Switch#show issu capability types 2082
Client_ID = 2082, Entity_ID = 1 :
  Cap_Type = 0
Switch#
```

The following example shows how to display the ISSU capabilities entries for the IP host ISSU client (clientid=2082):

```
Switch#show issu capability entries 2082
Client_ID = 2082, Entity_ID = 1 :
  Cap_Entry = 1 :
    Cap_Type = 0
Switch#
```
The following example shows how to display the ISSU capabilities groups for the IP host ISSU client (clientid=2082):

```
Switch#show issu capability groups 2082
Client_ID = 2082, Entity_ID = 1 :
    Cap_Group = 1 :
        Cap_Entry = 1
            Cap_Type = 0
Switch#
```

### Related Commands

</tbody>
</table>
### show issu clients

To display the ISSU clients, use the **show issu clients** command.

```
show issu clients [peer_uid]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>peer_uid</th>
<th>(Optional) Displays a list of clients registered to ISSU infrastructure at the peer supervisor engine.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defaults</td>
<td></td>
<td>Displays a list of clients registered to the ISSU infrastructure at the supervisor engine where the command is entered.</td>
</tr>
<tr>
<td>Command Modes</td>
<td>User EXEC mode</td>
<td></td>
</tr>
<tr>
<td>Command History</td>
<td>Release</td>
<td>Modification</td>
</tr>
<tr>
<td></td>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To implement ISSU versioning functionality, a client must first register itself, client capability, and client message information with the ISSU infrastructure during the system initialization.

### Examples

The following example shows how to display the ISSU clients:

```
Switch# show issu clients
Client_ID = 2,  Client_Name = ISSU Proto client,  Entity_Count = 1
Client_ID = 3,  Client_Name = ISSU RF,  Entity_Count = 1
Client_ID = 4,  Client_Name = ISSU CF client,  Entity_Count = 1
Client_ID = 5,  Client_Name = ISSU Network RF client,  Entity_Count = 1
Client_ID = 7,  Client_Name = ISSU CONFIG SYNC,  Entity_Count = 1
Client_ID = 8,  Client_Name = ISSU ifIndex sync,  Entity_Count = 1
Client_ID = 9,  Client_Name = ISSU IPC client,  Entity_Count = 1
Client_ID = 10,  Client_Name = ISSU IPC Server client,  Entity_Count = 1
Client_ID = 11,  Client_Name = ISSU Red Mode Client,  Entity_Count = 1
Client_ID = 100,  Client_Name = ISSU rfs client,  Entity_Count = 1
Client_ID = 110,  Client_Name = ISSU ifs client,  Entity_Count = 1
Client_ID = 200,  Client_Name = ISSU Event Manager client,  Entity_Count = 1
Client_ID = 2002,  Client_Name = CEF Push ISSU client,  Entity_Count = 1

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before attempting an ISSU, you should know the compatibility level between the old and the new Cisco IOS software versions on the active and the standby-supervisor engines. ISSU will not work if the two versions are incompatible.

The compatibility matrix is available on Cisco.com so that you can also view in advance whether an upgrade can be performed with the ISSU process. The compatibility matrix during the ISSU process and later by entering the show issu comp-matrix command. To display information on the negotiation of the compatibility matrix data between two software versions on a given system, use the show issu comp-matrix negotiated command.

Compatibility matrix data is stored with each Cisco IOS software image that supports ISSU capability. To display stored compatibility matrix information, use the show issu comp-matrix stored command.

The compatibility matrix information are built-in any IOS ISSU image. The ISSU infrastructure performs a matrix lookup as soon as the communication with the standby supervisor engine is established. There are three possible results from the lookup operation:

- **Compatible**—The Base-level system infrastructure and all optional HA-aware subsystems are compatible. In-service upgrade or downgrade between these versions will succeed with minimal service impact.
- **Base-Level Compatible**—One or more of the optional HA-aware subsystems are not compatible. Although an in-service upgrade or downgrade between these versions will succeed, some subsystems will not be able to maintain their state during the switchover. Prior to attempting an in-service upgrade or downgrade, the impact of this on operation and service of the switch must be considered carefully.
Incompatible—A set of core system infrastructure must be able to execute in a stateful manner for SSO to function correctly. If any of these “required” features or subsystems is not compatible in two different IOS images, the two versions of the Cisco IOS images are declared “Incompatible”. This means that an in-service upgrade or downgrade between these versions is not possible. The systems operates in RPR mode during the period when the versions of IOS at the active and standby supervisor engines differ.

Examples

This example displays negotiated compatibility matrix information:

Switch# show issu comp-matrix negotiated

show issu endpoints

To display the ISSU endpoint information, use the **show issu endpoints** command.

```
show issu endpoints
```

**Syntax Description**

This command has no arguments or keywords

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Endpoint is an execution unit within a redundancy domain. There are only 2 endpoints on the Catalyst 4500 series switch redundant chassis: 1 and 2; they correspond to the slot numbers for the supervisor engine. The ISSU infrastructure communicates between these two endpoints to establish session and to perform session negotiation for ISSU clients.

**Examples**

The following example shows how to display the ISSU endpoints:

```
Switch# show issu endpoints
My_Unique_ID = 1/0x1, Client_Count = 46

This endpoint communicates with 1 peer endpoints :
  Peer_Unique_ID    CAP  VER  XFORM  ERP  Compatibility
  2/0x2              1    1    1      1    Same

Shared Negotiation Session Info :
  Nego_Session_ID = 15
  Nego_Session_Name = shared nego session
  Transport_Mtu = 4096
  Ses_In_Use = 2

Switch#
```

show issu entities

To display the ISSU entity information, use the `show issu entities` command.

```
show issu entities [client_id]
```

**Syntax Description**

- `client_id` (Optional) ISSU client ID.

**Defaults**

This command has no default settings.

**Command Modes**

- User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Entity is a logical group of sessions with some common attributes (like capability list and message type). Currently, most ISSU clients on the Catalyst 4500 series switch have only one entity.

**Examples**

The following example shows how to display the entity information for a specified ISSU client:

```
Switch# show issu entities 2072
Client_ID = 2072 :
    Entity_ID = 1, Entity_Name = ISSU dot1x entity :
    MsgType MsgGroup CapType CapEntry CapGroup
    Count Count Count count Count
    28   1   1   1   1

Switch#
```

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show issu clients</code></td>
<td>Displays the ISSU clients.</td>
</tr>
</tbody>
</table>
show issu fsm

**Note**

This command is not intended for end-users.

To display the ISSU finite state machine (FSM) information corresponding to an ISSU session, use the `show issu fsm` command.

```
show issu fsm [session_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>(Optional) Provides detailed information about the FSM for the specified session.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

The following example displays and verifies the ISSU state after LOADVERSION:

```
Switch# show issu fsm 26
Session_ID = 26 :

FSM_Name    Curr_State Old_State Error_Reason
FSM_L1       TRANS     A_VER     none
FSM_L2_HELLO EXIT       RCVD     none
FSM_L2_A_CAP A_EXIT     A_RSP     none
FSM_L2_P_CAP P_INIT     unknown  none
FSM_L2_A_VER A_EXIT     A_RES_RSP none
FSM_L2_P_VER P_INIT     unknown  none
FSM_L2_TRANS  COMP      COMP     none

Current FSM is FSM_L2_TRANS
Session is compatible
Negotiation started at 00:01:07.688, duration is 0.148 seconds
Switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show issu clients</td>
<td>Displays the ISSU clients.</td>

</tbody>
</table>
show issu message

To display checkpoint messages for a specified ISSU client, use the `show issu message` command.

```
show issu message {groups | types} [client_id]
```

**Syntax Description**
- `groups` Displays information on Message Group supported by the specified client.
- `types` Displays information on all Message Types supported by the specified client.
- `client_id` (Optional) Specifies a client ID.

**Defaults**
If client ID is not specified, displays message groups or message types information for all clients registered to the ISSU infrastructure.

**Command Modes**
User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Messages are sync-data (also known as checkpoint data) sent between two endpoints.

When an ISSU-aware client establishes its session with a peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

**Examples**
The following example shows how to display the message groups for Client_id 2082:

```
Switch#show issu message groups 2082
Client_ID = 2082, Entity_ID = 1 :
    Message_Group = 1 :
        Message_Type = 1, Version_Range = 1 - 2
        Message_Type = 2, Version_Range = 1 - 2
Switch#
```

The following example shows how to display the message types for Client_id 2082:

```
Switch#show issu message types 2082
Client_ID = 2082, Entity_ID = 1 :
    Message_Type = 1, Version_Range = 1 - 2
        Message_Ver = 1, Message_Mtu = 12
        Message_Ver = 2, Message_Mtu = 8
    Message_Type = 2, Version_Range = 1 - 2
        Message_Ver = 1, Message_Mtu = 32
        Message_Ver = 2, Message_Mtu = 28
Switch#
```

</tr>
</tbody>
</table>
show issu negotiated

To display the negotiated capability and message version information of the ISSU clients, use the `show issu negotiated` command.

```
show issu negotiated {capability | version} [session_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capability</td>
<td>Displays all negotiated capabilities.</td>
</tr>
<tr>
<td>version</td>
<td>Displays details of all negotiated messages.</td>
</tr>
<tr>
<td>session_id</td>
<td>(Optional) Specifies the ISSU session ID for which the capability or version information is displayed.</td>
</tr>
</tbody>
</table>

**Defaults**
Displays negotiated capability or version information for all ISSU sessions.

**Command Modes**
User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to display the message types for a specific group:

```
Switch# show issu negotiated capability 26
Session_ID = 26 :
  Cap_Type = 0, Cap_Result = 1 No cap value assigned
```

```
Switch# show issu negotiated version 26
Session_ID = 26 :
  Message_Type = 1, Negotiated_Version = 1, Message_MTU = 44
  Message_Type = 2, Negotiated_Version = 1, Message_MTU = 4
```

</tbody>
</table>
show issu sessions

To display ISSU session information for a specified client, use the `show issu sessions` command.

`show issu sessions [client_id]`

Syntax Description

- `client_id` (Optional) Specifies the ISSU client ID.

Defaults

Displays session information for all clients registered to the ISSU infrastructure.

Command Modes

User EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Session is bidirectional and a reliable connection is established between two endpoints. Sync-data and negotiation messages are sent to the peer endpoint through a session. On a Catalyst 4500 series switch, each ISSU-aware client has a maximum of one session at each endpoint.

When an ISSU-aware client establishes its session with the peer, an ISSU negotiation takes place. The ISSU infrastructure uses the registered information to negotiate the capabilities and the message version to be used during the session.

Examples

The following example shows how to display the rollback-timer status:

```
Switch#show issu sessions 2072
Client_ID = 2072, Entity_ID = 1 :

*** Session_ID = 26, Session_Name = dot1x :

<table>
<thead>
<tr>

</tbody>
</table>
show issu state

To display the ISSU state and current booted image name during the ISSU process, use the `show issu state` command.

```
show issu state [slot_number] [detail]
```

**Syntax Description**

- `slot_number` (Optional) Specifies the slot number whose ISSU state needs to be displayed (1 or 2).
- `detail` (Optional) Provides detailed information about the state of the active and standby supervisor engines.

**Defaults**

The command displays the ISSU state and current booted image name of both the active and standby supervisor engines.

**Command Modes**

Privileged EXEC mode

**Command History**

- **Release** 12.2(31)SGA
- **Modification** This command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

It might take several seconds after the `issu loadversion` command is entered for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode. If you enter the `show issu state` command too soon, you might not see the information you need.

**Examples**

The following example displays and verifies the ISSU state after LOADVERSION:

```
Switch# show issu state detail
  Slot = 1
  RP State = Active
  ISSU State = Load Version
  Boot Variable = bootflash:old_image,12
  Operating Mode = Stateful Switchover
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:old_image

  Slot = 2
  RP State = Standby
  ISSU State = Load Version
  Boot Variable = bootflash:new_image,12;bootflash:old_image,12
  Operating Mode = Stateful Switchover
  Primary Version = bootflash:old_image
  Secondary Version = bootflash:new_image
  Current Version = bootflash:new_image

Switch#
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>issu abortversion</strong></td>
<td>Cancels the ISSU upgrade or the downgrade process in progress and restores the switch to its state before the start of the process.</td>
</tr>
<tr>
<td><strong>issu acceptversion</strong></td>
<td>Halts the rollback timer and ensures that the new Cisco IOS software image is not automatically stopped during the ISSU process.</td>
</tr>
<tr>
<td><strong>issu commitversion</strong></td>
<td>Loads the new Cisco IOS software image into the new standby supervisor engine.</td>
</tr>
<tr>
<td><strong>issu loadversion</strong></td>
<td>Starts the ISSU process.</td>
</tr>
<tr>
<td><strong>issu runversion</strong></td>
<td>Forces a change from the active supervisor engine to the standby supervisor engine and causes the newly active supervisor engine to run the new image specified.</td>
</tr>
</tbody>
</table>
show l2protocol-tunnel

To display information about the Layer 2 protocol tunnel ports, use the show l2protocol-tunnel command. This command displays information for the interfaces with protocol tunneling enabled.

```
show l2protocol-tunnel [interface interface-id] [[summary] | {begin | exclude | include} expression]
```

**Syntax Description**

- `interface interface-id` (Optional) Specifies the interface for which protocol tunneling information appears. Valid interfaces are physical ports and port channels; the port channel range is 1 to 64.
- `summary` (Optional) Displays only Layer 2 protocol summary information.
- `begin` (Optional) Displays information beginning with the line that matches the expression.
- `exclude` (Optional) Displays information that excludes lines that match the expression.
- `include` (Optional) Displays the lines that match the specified expression.
- `expression` (Optional) Expression in the output to use as a reference point.

**Command Modes**

User EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After enabling Layer 2 protocol tunneling on an access or 802.1Q tunnel port with the l2protocol-tunnel command, you can configure some or all of these parameters:

- Protocol type to be tunneled
- Shutdown threshold
- Drop threshold

If you enter the `show l2protocol-tunnel [interface interface-id]` command, only information about the active ports on which all the parameters are configured appears.

If you enter the `show l2protocol-tunnel summary` command, only information about the active ports on which some or all of the parameters are configured appears.

Expressions are case sensitive. For example, if you enter `exclude output`, the lines that contain `output` do not appear, but the lines that contain `Output` appear.
This is an example of output from the `show l2protocol-tunnel` command:

```
Switch> show l2protocol-tunnel
COS for Encapsulated Packets: 5

show lacp

To display LACP information, use the show lacp command.

    show lacp [channel-group] {counters | internal | neighbors | sys-id}

**Syntax Description**

- **channel-group** (Optional) Number of the channel group; valid values are from 1 to 64.
- **counters** Displays the LACP statistical information.
- **internal** Displays the internal information.
- **neighbors** Displays the neighbor information.
- **sys-id** Displays the LACP system identification.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I.

If you do not specify a channel-group value, all channel groups are displayed.

You can enter the optional channel-group value to specify a channel group for all keywords, except the sys-id keyword.

**Examples**

This example shows how to display LACP statistical information for a specific channel group:

```
Switch# show lacp 1 counters
          LACPDU      Marker     LACPDU
          Sent  Recv  Sent  Recv  Pkts  Err
---------------------------------------------------
Channel group: 1
    Fa4/1  8   15      0   0      3   0
    Fa4/2 14  18      0   0      3   0
    Fa4/3 14  18      0   0      0   0
    Fa4/4 13  18      0   0      0   0
```

The output displays the following information:

- The LACPDU Sent and Recv columns display the LACPDU sent and received on each specific interface.
- The LACPDU Pkts and Err columns display the marker protocol packets.
This example shows how to display internal information for the interfaces belonging to a specific channel:

```
Switch# show lacp 1 internal
Flags:  S - Device sends PDUs at slow rate. F - Device sends PDUs at fast rate.
       A - Device is in Active mode.       P - Device is in Passive mode.

Switch#

In the case where no PDUs have been received, the default administrative information is displayed in braces.

This example shows how to display the LACP system identification:

Switch> **show lacp sys-id**

8000,AC-12-34-56-78-90

Switch>

The system identification is made up of the system priority and the system MAC address. The first two bytes are the system priority, and the last six bytes are the globally administered individual MAC address associated to the system.

**show mab**

To display MAC authentication bypass (MAB) information, use the `show mab` command in EXEC mode.

```
show mab [interface interface interface-number | all] [detail]
```

**Syntax Description**

- `interface interface` (Optional) Interface type; possible valid value is `gigabitethernet`.
- `interface-number` Module and port number.
- `all` (Optional) Displays MAB information for all interfaces.
- `detail` (Optional) Displays detailed MAB information.

**Command Default**

None.

### Examples

The following example shows how to display MAB information:

```plaintext
Switch# show mab all
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
Switch#
```

The following example shows how to display detailed MAB information:

```plaintext
Switch# show mab all detail
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
---------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED
```

The following example shows how to display MAB information for a specific interface:

```plaintext
Switch# show mab interface GigaEthernet1/3
MAB details for GigaEthernet1/3
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
```

The following example shows how to display detailed MAB information for a specific interface:

```plaintext
Switch# show mab interface gigabitethernet1/1 detail
MAB details for GigaEthernet1/1
-------------------------------------
Mac-Auth-Bypass = Enabled
Inactivity Timeout = None
MAB Client List
---------------
Client MAC = 000f.23c4.a401
MAB SM state = TERMINATE
Auth Status = AUTHORIZED
Switch#
```
### related commands

<tbody>
<tr>
<td>mab</td>
<td>Enables and configures MAC authorization bypass (MAB) on a port.</td>
</tr>
</tbody>
</table>
show mac access-group interface

To display the ACL configuration on a Layer 2 interface, use the `show mac access-group interface` command.

```
show mac access-group interface [interface interface-number]
```

**Syntax Description**

- `interface` (Optional) Specifies the interface type; valid values are `ethernet`, `fastethernet`, `gigabitethernet`, `tengigabitethernet`, `pos`, `atm`, `port-channel`, and `ge-wan`.
- `interface-number` (Optional) Specifies the port number.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The valid values for the port number depend on the chassis used.

**Examples**

This example shows how to display the ACL configuration on interface fast 6/1:

```
Switch# show mac access-group interface fast 6/1
Interface FastEthernet6/1:
   Inbound access-list is simple-mac-acl
   Outbound access-list is not set
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access-group mode</td>
<td>Specifies the override modes (for example, VACL overrides PACL) and the non-override modes (for example, merge or strict mode).</td>
</tr>
</tbody>
</table>
show mac-address-table address

To display MAC address table information for a specific MAC address, use the show mac-address-table address command.

\[
\text{show mac-address-table address } \text{mac_addr [interface type slot/port | protocol protocol | vlan vlan_id]}
\]

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac_addr</td>
<td>48-bit MAC address; the valid format is H.H.H.</td>
</tr>
<tr>
<td>interface type slot/port</td>
<td>(Optional) Displays information for a specific interface; valid values for type are fastethernet, gigabitethernet, and tengigabitethernet.</td>
</tr>
<tr>
<td>protocol protocol</td>
<td>(Optional) Specifies a protocol. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td>vlan vlan_id</td>
<td>(Optional) Displays entries for the specific VLAN only; valid values are from 1 to 4094.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

The keyword definitions for the protocol variable are as follows:

- **ip** specifies the IP protocol.
- **ipx** specifies the IPX protocols.
- **assigned** specifies the assigned protocol entries.
- **other** specifies the other protocol entries.
Examples

This example shows how to display MAC address table information for a specific MAC address:

```
Switch# show mac-address-table address 0030.94fc.0dff
```

Unicast Entries

<table>
<thead>
<tr>

</tbody>
</table>
show mac-address-table aging-time

To display the MAC address aging time, use the `show mac-address-table aging-time` command.

```
show mac-address-table aging-time [vlan vlan_id]
```

**Syntax Description**

- `vlan vlan_id` (Optional) Specifies a VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the currently configured aging time for all VLANs:

```
Switch# show mac-address-table aging-time
Vlan    Aging Time
----    ----------
100     300
200     1000

Switch#
```

This example shows how to display the currently configured aging time for a specific VLAN:

```
Switch# show mac-address-table aging-time vlan 100
Vlan    Aging Time
----    ----------
100     300

Switch#
```

<td><code>show mac-address-table protocol</code></td>
<td>Displays the MAC address table information that is based on the protocol.</td>
</tr>
</tbody>
</table>
### Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show mac-address-table static</code></td>
<td>Displays the static MAC address table entries only.</td>
</tr>
<tr>
<td><code>show mac-address-table vlan</code></td>
<td>Displays information about the MAC address table for a specific VLAN.</td>
</tr>
</tbody>
</table>
show mac-address-table dynamic

To display the dynamic MAC address table entries only, use the `show mac-address-table dynamic` command.

```
show mac-address-table dynamic [address mac_addr | interface type slot/port | protocol protocol | vlan vlan_id]
```

**Syntax Description**

- `address mac_addr` (Optional) Specifies a 48-bit MAC address; the valid format is H.H.H.
- `interface type slot/port` (Optional) Specifies an interface to match; valid values for `type` are `fastethernet`, `gigabitethernet`, and `tengigabitethernet`.
- `protocol protocol` (Optional) Specifies a protocol. See the “Usage Guidelines” section for more information.
- `vlan vlan_id` (Optional) Displays entries for a specific VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The keyword definitions for the `protocol` argument are as follows:

- `assigned` specifies assigned protocol entries.
- `ip` specifies IP protocol.
- `ipx` specifies IPX protocols.
- `other` specifies other protocol entries.

The `show mac-address-table dynamic` command output for an EtherChannel interface changes the port number designation (such as, 5/7) to a port group number (such as, Po80).

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.
### Examples

This example shows how to display all the dynamic MAC address entries:

```
Switch# show mac-address-table dynamic
Unicast Entries
  vlan mac address     type        protocols               port
  -------+---------------+--------+---------------------+-------------------
  1    0000.0000.0201   dynamic ip                     FastEthernet6/15
  1    0000.0000.0202   dynamic ip                     FastEthernet6/15
  1    0000.0000.0203   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0204   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0205   dynamic ip,assigned            FastEthernet6/15
  2    0000.0000.0101   dynamic ip                     FastEthernet6/16
  2    0000.0000.0102   dynamic ip                     FastEthernet6/16
  2    0000.0000.0103   dynamic ip,assigned            FastEthernet6/16
  2    0000.0000.0104   dynamic ip,assigned            FastEthernet6/16
  2    0000.0000.0105   dynamic ip,assigned            FastEthernet6/16
Switch#
```

This example shows how to display the dynamic MAC address entries with a specific protocol type (in this case, assigned):

```
Switch# show mac-address-table dynamic protocol assigned
Unicast Entries
  vlan mac address     type        protocols               port
  -------+---------------+--------+---------------------+-------------------
  1    0000.0000.0203   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0204   dynamic ip,assigned            FastEthernet6/15
  1    0000.0000.0205   dynamic ip,assigned            FastEthernet6/15
  2    0000.0000.0103   dynamic ip,assigned            FastEthernet6/16
  2    0000.0000.0104   dynamic ip,assigned            FastEthernet6/16
  2    0000.0000.0105   dynamic ip,assigned            FastEthernet6/16
Switch#
```

show mac-address-table multicast

To display information about the multicast MAC address table, use the **show mac-address-table multicast** command.

```
show mac-address-table multicast [count] [igmp-snooping [count]] [user [count]] [vlan vlan_num]
```

**Syntax Description**

- `count` (Optional) Displays the number of multicast entries.
- `igmp-snooping` (Optional) Displays only the addresses learned by IGMP snooping.
- `user` (Optional) Displays only the user-entered static addresses.
- `vlan vlan_num` (Optional) Displays information for a specific VLAN only; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

**Examples**

This example shows how to display multicast MAC address table information for a specific VLAN:

```
Switch# show mac-address-table multicast vlan 1
Multicast Entries
  vlan  mac address  type     ports
  1     ffff.ffff.ffff  system  Switch,Fa6/15
Switch#
```

This example shows how to display the number of multicast MAC entries for all VLANs:

```
Switch# show mac-address-table multicast count
MAC Entries for all vlans:
  Multicast MAC Address Count: 141
  Total Multicast MAC Addresses Available: 16384
Switch#
```

show mac-address-table notification

To display the MAC address table notification status and history, use the show mac-address-table notification command.

```
show mac-address-table notification change [interface [interface-id]] | [mac-move] | [threshold] | [learn-fail]
```

**Syntax Description**

- `change` (Optional) Displays the MAC address change notification status.
- `interface` (Optional) Displays MAC change information for an interfaces.
- `interface-id` (Optional) Displays the information for a specific interface. Valid interfaces include physical ports and port channels.
- `mac-move` (Optional) Displays MAC move notification status.
- `threshold` (Optional) Displays the MAC threshold notification status.
- `learn-fail` (Optional) Displays general information of hardware MAC learning failure notifications.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support for <strong>learn-fail</strong> keyword, Supervisor Engine 6-E, and Catalyst 4900M chassis added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show mac-address-table notification change` command to display the MAC change notification interval, the maximum number of entries allowed in the history table, the history table contents, and whether the MAC change feature is enabled or disabled.

Use the `interface` keyword to display the flags for all interfaces. If the `interface-id` is included, only the flags for that interface are displayed.

**Examples**

This example shows how to display all the MAC address notification information:

```
Switch# show mac-address-table notification change
MAC Notification Feature is Enabled on the switch
Interval between Notification Traps : 1 secs
Number of MAC Addresses Added : 5
Number of MAC Addresses Removed : 1
Number of Notifications sent to NMS : 3
Maximum Number of entries configured in History Table : 500
Current History Table Length : 3
MAC Notification Traps are Enabled
```
History Table contents
----------------------
History Index 1, Entry Timestamp 478433, Despatch Timestamp 478433
MAC Changed Message:
Operation: Added  Vlan: 1  MAC Addr: 1234.5678.9ab0  Dot1dBasePort: 323
History Index 2, Entry Timestamp 481834, Despatch Timestamp 481834

<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

For the MAC address table entries that are used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

The keyword definitions for the `protocol` argument are as follows:

- **assigned** specifies the assigned protocol entries.
- **ip** specifies the IP protocol.
- **ipx** specifies the IPX protocols.
- **other** specifies the other protocol entries.
Examples

This example shows how to display all the static MAC address entries:

```
Switch# show mac-address-table static
Unicast Entries
  vlan   mac address     type        protocols               port
  -------+---------------+--------+---------------------+-------------------
  1      0030.94fc.0dff    static ip,ipx,assigned,other  Switch
Fa6/1   0030.94fc.0dff    static ip,ipx,assigned,other  Switch
Fa6/2   0030.94fc.0dff    static ip,ipx,assigned,other  Switch

Multicast Entries
  vlan    mac address     type    ports
  -------+---------------+-------+-------------------------------------------
  1      ffff.ffff.ffff   system Switch,Fa6/15
  2      ffff.ffff.ffff   system Fa6/16
  1002    ffff.ffff.ffff   system
  1003    ffff.ffff.ffff   system
  1004    ffff.ffff.ffff   system
  1005    ffff.ffff.ffff   system
Fa6/1   ffff.ffff.ffff   system Switch,Fa6/1
Fa6/2   ffff.ffff.ffff   system Switch,Fa6/2
```

This example shows how to display the static MAC address entries with a specific protocol type (in this case, assigned):

```
Switch# show mac-address-table static protocol assigned
Unicast Entries
  vlan   mac address     type        protocols               port
  -------+---------------+--------+---------------------+-------------------
  1      0030.94fc.0dff    static ip,ipx,assigned,other  Switch
Fa6/1   0030.94fc.0dff    static ip,ipx,assigned,other  Switch
Fa6/2   0030.94fc.0dff    static ip,ipx,assigned,other  Switch

Multicast Entries
  vlan    mac address     type    ports
  -------+---------------+-------+-------------------------------------------
  1      ffff.ffff.ffff   system Switch,Fa6/15
  2      ffff.ffff.ffff   system Fa6/16
  1002    ffff.ffff.ffff   system
  1003    ffff.ffff.ffff   system
  1004    ffff.ffff.ffff   system
  1005    ffff.ffff.ffff   system
Fa6/1   ffff.ffff.ffff   system Switch,Fa6/1
Fa6/2   ffff.ffff.ffff   system Switch,Fa6/2
```

**Usage Guidelines**

For the MAC address table entries used by the routed ports, the routed port name is displayed in the “vlan” column not the internal VLAN number.

The keyword definitions for the **protocol** variable are as follows:

- **assigned** specifies the assigned protocol entries.
- **ip** specifies the IP protocol.
- **ipx** specifies the IPX protocols.
- **other** specifies the other protocol entries.
Examples

This example shows how to display information about the MAC address table for a specific VLAN:

```
Switch# show mac-address-table vlan 1
```

Unicast Entries

```
  vlan  mac address     type        protocols               port
              -------+---------------+--------+---------------------+--------------------
  1    0000.0000.0201   dynamic ip                     FastEthernet6/15
  1    0000.0000.0202   dynamic ip                     FastEthernet6/15
  1    0000.0000.0203   dynamic other                  FastEthernet6/15
  1    0000.0000.0204   dynamic other                  FastEthernet6/15
  1    0030.94fc.0dff    static ip,ipx,assigned,other  Switch
```

Multicast Entries

```
  vlan    mac address     type    ports
              -------+---------------+-------+-------------------------------------------
  1    ffff.ffff.ffff   system Switch,Fa6/15
```

Switch#

This example shows how to display MAC address table information for a specific protocol type:

```
Switch# show mac-address-table vlan 100 protocol other
```

Unicast Entries

```
  vlan   mac address     type        protocols               port
              -------+---------------+--------+---------------------+--------------------
  1    0000.0000.0203   dynamic other                  FastEthernet6/15
  1    0000.0000.0204   dynamic other                  FastEthernet6/15
  1    0030.94fc.0dff    static ip,ipx,assigned,other  Switch
```

Multicast Entries

```
  vlan    mac address     type    ports
              -------+---------------+-------+-------------------------------------------
  1    ffff.ffff.ffff   system Switch,Fa6/15
```

Switch#

show module

To display information about the module, use the show module command.

```
show module [mod | all]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>mod</strong></td>
<td>(Optional) Number of the module; valid values vary from chassis to chassis.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>(Optional) Displays information for all modules.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Enhanced the output of the show idprom interface command to include the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In the Mod Sub-Module fields in the command output, the show module command displays the supervisor engine number but appends the uplink daughter card’s module type and information.

If the PoE consumed by the module is more than 50 W above the administratively allocated PoE, the “Status” displays as “PwrOver.” If the PoE consumed by the module is more than 50 W above the PoE module limit, the “Status” displays as “PwrFault.”
### Examples

This example shows how to display information for all the modules.

This example shows the `show module` command output for a system with inadequate power for all installed modules. The system does not have enough power for Module 5; the “Status” displays it as “PwrDeny.”

```
Switch# show module all
Mod  Ports  Card Type                              Model              Serial No.

Switch#
show monitor

To display information about the SPAN session, use the show monitor command.

```
show monitor [session] [range session-range | local | remote | all | session-number] [detail]
```

**Syntax Description**

- `session` (Optional) Displays the SPAN information for a session.
- `range` (Optional) Displays information for a range of sessions.
- `session-range` (Optional) Specifies a range of sessions.
- `local` (Optional) Displays all local SPAN sessions.
- `remote` (Optional) Displays the RSPAN source and destination sessions.
- `all` (Optional) Displays the SPAN and RSPAN sessions.
- `session-number` (Optional) Session number; valid values are from 1 to 6.
- `detail` (Optional) Displays the detailed SPAN information for a session.

**Defaults**

The `detail` keyword only displays lines with a nondefault configuration.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(13)EW</td>

</tr>
<tr>
<td>12.2(20)EW</td>
<td>Added support to display ACLs that are applied to SPAN sessions.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display whether ACLs are applied to a given SPAN session on a Catalyst 4500 series switch:

```
Switch# show monitor

Session 1
--------
Type      : Local Session
Source Ports:
  Both     : Fa6/1
Destination Ports: Fa6/2
  Encapsulation : Native
  Ingress     : Disabled
  Learning    : Disabled
Filter VLANs : 1
IP Access-group : 10
```
This example shows how to display SPAN information for session 2:

Switch# `show monitor session 2`
Session 2
-----------
Type : Remote Source Session
Source Ports:
    RX Only:       Fa1/1-3
Dest RSPAN VLAN:  901
Ingress : Enabled, default VLAN=2
Learning : Disabled
Switch#

This example shows how to display the detailed SPAN information for session 1:

Switch# `show monitor session 1 detail`
Session 1
---------
Type              : Local Session
Source Ports      :
    RX Only       : None
    TX Only       : None
    Both          : Gi1/1, CPU
Source VLANs      :
    RX Only       : None
    TX Only       : None
    Both          : None
Source RSPAN VLAN : Fa6/1
Destination Ports : Fa6/1
    Encapsulation : DOT1Q
        Ingress : Enabled, default VLAN = 2
    Filter VLANs : None
    Filter Types RX : Good
    Filter Types TX : None
Dest Rspan Vlan : 901
Ingress : Enabled, default VLAN=2
Learning : Disabled
IP Access-group : None
Switch#

This example shows how to display SPAN information for session 1 beginning with the line that starts with Destination:

Switch# `show monitor session 1 | begin Destination`
Destination Ports: None
Filter VLANs:      None
Switch#

show pagp

To display information about the port channel, use the `show pagp` command.

```
show pagp [group-number] [counters | dual-active | internal | neighbor]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group-number</td>
<td>(Optional) Channel-group number; valid values are from 1 to 64.</td>
</tr>
<tr>
<td>counters</td>
<td>Specifies the traffic counter information.</td>
</tr>
<tr>
<td>dual-active</td>
<td>Specifies the dual-active information.</td>
</tr>
<tr>
<td>internal</td>
<td>Specifies the PAgP internal information.</td>
</tr>
<tr>
<td>neighbor</td>
<td>Specifies the PAgP neighbor information.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can enter any `show pagp` command to display the active PAgP port-channel information. To display the nonactive information, enter the `show pagp` command with a group.

### Examples

This example shows how to display information about the PAgP counter:

```
Switch# show pagp counters
    Information          Flush
    Port     Sent  Recv     Sent  Recv
-----------------  -------  -------  -------  -------
Channel group: 1
    Fa5/4    2660   2452     0      0
    Fa5/5    2676   2453     0      0
Channel group: 2
    Fa5/6    289    261      0      0
    Fa5/7    290    261      0      0
Switch#
```

This example shows how to display PAgP dual-active information:

```
Switch# show pagp dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1
```
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

show policy-map

To display information about the policy map, use the show policy-map command.

```plaintext
show policy-map [policy_map_name]
```

**Syntax Description**

- `policy_map_name` (Optional) Name of the policy map.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

show policy-map control-plane

To display the configuration either of a class or of all classes for the policy map of a control plane, use the `show policy-map control-plane` command.

`show policy-map control-plane [input [class class-name] | [class class-name]]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>(Optional) Displays statistics for the attached input policy.</td>
</tr>
<tr>
<td>class class-name</td>
<td>(Optional) Displays the name of the class.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

The `show policy-map control-plane` command displays information for aggregate control-plane services that control the number or rate of packets that are going to the process level.

**Examples**

This example shows that the policy map TEST is associated with the control plane. This policy map polices traffic that matches the class-map TEST, while allowing all other traffic (that matches the class-map class-default) to go through as is. Table 2-27 describes the fields shown in the display.

```
Switch# show policy-map control-plane

Control Plane

Service-policy input: system-cpp-policy

Class-map: system-cpp-eapol (match-all)
0 packets
Match: access-group name system-cpp-eapol

**show policy-map interface**

To display the statistics and configurations of the input and output policies that are attached to an interface, use the `show policy-map interface` command.

```
show policy-map interface [{fastethernet interface-number} | {gigabitethernet interface-number} | {port-channel number} | {vlan vlan_id}] [input | output]
```

**Syntax Description**

- **fastethernet interface-number** (Optional) Specifies the Fast Ethernet 802.3 interface.
- **gigabitethernet interface-number** (Optional) Specifies the Gigabit Ethernet 802.3z interface.
- **port-channel number** (Optional) Specifies the port channel.
- **vlan vlan_id** (Optional) Specifies the VLAN ID; valid values are from 1 to 4094.
- **input** (Optional) Specifies input policies only.
- **output** (Optional) Specifies output policies only.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>

**Examples**

This example shows how to display the statistics and configurations of all input and output policies attached to an interface:

```
Switch# show policy-map interface

FastEthernet6/1

service-policy input:ipp5-policy

class-map:ipp5 (match-all)
  0 packets
  match:ip precedence 5
  set:
  ip precedence 6

class-map:class-default (match-any)
  0 packets
  match:any
  0 packets
```
This example shows how to display the input policy statistics and configurations for a specific interface:

```
Switch# show policy-map interface fastethernet 5/36 input

service-policy input:ipp5-policy

  class-map:ipp5 (match-all)
    0 packets
    match:ip precedence 5
    set:
      ip precedence 6

  class-map:class-default (match-any)
    0 packets
    match:any
    0 packets

Switch#
```

With the following configuration, each flow is policed to a 1000000 bps with an allowed 9000-byte burst value.

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.

Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol l4 source-port l4 destination-port

**Examples**

Take the following configuration on a non-Supervisor Engine 6-E as an example:

```
interface GigabitEthernet3/1
vlan-range 20,400
service-policy input p1
vlan-range 300-301
service-policy output p2
```

This example shows how to display policy-map statistics on VLAN 20 on the Gigabit Ethernet 6/1 interface:

```
Switch# show policy-map interface gigabitEthernet 3/1 vlan 20
GigabitEthernet3/1 vlan 20
Service-policy input: p1
Class-map: class-default (match-any)
  0 packets
Match: any
  0 packets
  police: Per-interface
    Conform: 0 bytes Exceed: 0 bytes
Switch#
```

Take the following configuration on a non-Supervisor Engine 6-E as an example:

```
interface fastethernet6/1
vlan-range 100
service-policy in p1
```

This example shows how to display policy-map statistics on VLAN 100 on the FastEthernet interface:

```
Switch# show policy-map interface fastEthernet 6/1 vlan 100
FastEthernet6/1 vlan 100
Service-policy input: p1
```
Class-map: c1 (match-all)
  0 packets
  Match: ip dscp af11 (10)
  police: Per-interface
    Conform: 0 bytes Exceed: 0 bytes

Class-map: class-default (match-any)
  0 packets
  Match: any
  0 packets

Switch#

Take the following configuration on a Supervisor Engine 6-E as an example:

```
interface gigabitethernet3/1
  vlan-range 100
  service-policy in p1
```

This example shows how to display policy-map statistics on VLAN 100 on the FastEthernet interface:

```
Switch#show policy-map interface gigabitethernet 3/1 vlan 100
GigabitEthernet3/1 vlan 100
  Service-policy input: p1

  Class-map: c1 (match-all)
    0 packets
    Match: ip dscp af11 (10)
    police:
      rate 128000 bps, burst 4000 bytes
      conformed 0 packets, 0 bytes; action: transmit
      exceeded 0 packets, 0 bytes; action: drop
      conformed 0 bps, exceeded 0 bps

  Class-map: class-default (match-any)
    0 packets
    Match: any
    0 packets
```

</tr>
</tbody>
</table>
show port-security

To display the port security settings for an interface or for the switch, use the `show port-security` command.

```
show port-security [address] [interface interface-id]
   [interface port-channel port-channel-number] [vlan vlan-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Support was enhanced to display sticky MAC addresses.</td>
</tr>
<tr>
<td>12.2(25)EWA</td>
<td>Support was enhanced to display settings on a per-VLAN basis.</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support was enhanced to display settings on EtherChannel interfaces.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you enter the command without keywords, the output includes the administrative and operational status of all secure ports on the switch.

If you enter the `interface-id` value or `port-channel-interface` value, the `show port-security` command displays port security settings for the interface.

If you enter the `address` keyword, the `show port-security address` command displays the secure MAC addresses for all interfaces and the aging information for each secure address.

If you enter the `interface-id` value and the `address` keyword, the `show port-security address interface` command displays all the MAC addresses for the interface with aging information for each secure address. You can also use this command to display all the MAC addresses for an interface even if you have not enabled port security on it.

Sticky MAC addresses are addresses that persist across switch reboots and link flaps.
Examples

This example shows how to display port security settings for the entire switch:

```
Switch# show port-security
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
             (Count)       (Count)          (Count)     
---------------------------------------------------------------------------
Fa3/1              2            2                  0         Restrict
Fa3/2              2            2                  0         Restrict

<td>Displays inline power handling for the Supervisor Engine II-Plus-TS.</td>
</tr>
<tr>
<td>12.2(52)SG</td>
<td>Support to display detailed PoE consumption information on an interface/module.</td>
</tr>
</tbody>
</table>

Usage Guidelines

If a powered device is connected to an interface with external power, the switch does not recognize the powered device. The Device column in the output of the show power inline command displays as unknown.

If your port is not capable of supporting PoE, you will receive this message:

```
Power over Ethernet not supported on interface Admin
```

The show power inline interface l module command displays the amount of power that is used to operate a Cisco IP Phone. To view the amount of power requested, use the show cdp neighbors command.

Because FPGAs and other hardware components on the WS-X4548-RJ45V+ and WS-X4648-RJ45V+E modules consume PoE, the operating PoE consumption for an 802.3af-compliant module can be nonzero when there are no powered devices attached to the module. The operating PoE can vary by as much as 20 W because of fluctuations in the PoE that is consumed by the hardware components.
Examples

This example shows how to display information about the general power supply:

```
Switch# show power
Power Supply Model No Type Status Fan Sensor Inline Status
-------- ----------------- --------- ----------- ------ ------ ------ -----
PS1     PWR-C45-2800AC  AC 2800W good good good
PS2     PWR-C45-1000AC  AC 1000W err-disable good n.a.

*** Power Supplies of different type have been detected***

Power supplies needed by system : 1
Power supplies currently available : 1

Power Summary (in Watts) Maximum
---------------------- -----
System Power (12V)     328   1360
Inline Power (-50V)    0     1400
Backplane Power (3.3V) 10     40

Total Used             338 (not to exceed Total Maximum Available = 750)
```

This example shows how to display the amount of available system power:

```
Switch# show power available
Power Summary (in Watts)
----------------------  ---------  ------
System Power            1360       280
Inline Power            1400         0
Maximum Power           2800       280
```

Note

The “Inline Power Oper” column displays the PoE consumed by the powered devices attached to the module in addition to the PoE consumed by the FPGAs and other hardware components on the module. The “Inline Power Admin” column displays only the PoE allocated by the powered devices attached to the module.

This example shows how to display the power status information:

```
Switch# show power status
Power Supply Model No Type Status Fan Sensor Inline Status
-------- ----------------- --------- ----------- ------ ------ ------ -----
PS1     PWR-C45-2800AC  AC 2800W good good good
PS2     PWR-C45-1000AC  AC 1000W err-disable good n.a.

Power Supply (Nos in Watts) Max Min Max Min Absolute
---------------------- ----- ----- ----- ----- --------
PS1                   1400 1400 1360 1360 2800
PS2                   1400 1400 1360 1360 2800
```

This example shows how to verify the PoE consumption for the switch:

```
Switch# show power inline consumption default
Default PD consumption : 5000 mW
Switch#
```
This example shows how to display the status of inline power:

```
Switch# show power inline
Available:677(w) Used:117(w) Remaining:560(w)

**Note**

When the Supervisor Engine II+TS is used with the 1400 W DC power supply (PWR-C45-1400DC), and only one 12.5 A input of the DC power supply is used, the supervisor engine’s power consumption may vary depending on whether there is any linecard inserted at slot 2 and 3, as well as on the type of linecards inserted. This amount varies between 155 W and 330 W. This variability also affects the
The maximum amount of available supervisor engine inline power, which can also vary from 0 W to 175 W. Therefore, it is possible for a supervisor engine to deny inline power to some connected inline power devices when one or more linecards are inserted into the chassis.

The output of the commands show power detail and show power module display the supervisor engine's variable power consumption and its inline power summary.

</tbody>
</table>
show power inline police

To display PoE policing and monitoring status, use the `show power inline police` command.

```
show power inline police [interfacename] [module n]
```

**Syntax Description**
- `interfacename` (optional) Displays PoE policing and monitoring status for a particular interface.
- `n` (optional) Display PoE policing and monitoring status for all interfaces on this module.

**Defaults**
None

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(50)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Oper Power field displays the true power consumption of the connected device.

The `show power inline police` command with no keywords displays PoE policing status for all interfaces in the chassis.

If this command is executed at the global level, the last line of the output under Oper Power field displays the total true inline power consumption of all devices connected to the switch.

**Examples**

This example shows how to display PoE policing status for a interface GigabitEthernet 2/1:

```
Switch# show power inline police gigabitEthernet 2/1
Available:421(w)  Used:44(w)  Remaining:377(w)

 Interface  Admin  Oper  Admin  Oper  Cutoff  Oper
           State  State  Police  Police  Power  Power
-------------  --------  --------  --------  --------  --------  --------
Gi2/1          auto     on      errdisable ok  22.6      9.6
```

**Related Commands**
- **power inline police**: Configures PoE policing on a particular interface.
show qos

To display QoS information, use the `show qos` command.

```
show qos
```

Syntax Description

This command has no arguments or keywords.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

Examples

This example shows the output that might be displayed if you do not enter any keywords:

```
Switch# show qos
QoS is enabled globally
Switch#
```
show qos aggregate policer

To display QoS aggregate policer information, use the `show qos aggregate policer` command.

```
show qos aggregate policer [aggregate_name]
```

Syntax Description

- `aggregate_name` (Optional) Named aggregate policer.

Defaults

This command has no default settings.

Command Modes

Privileged EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. The aggregate policer name is case sensitive.

Examples

This example shows the output if you do not enter any keywords:

```
Switch# show qos aggregate policer
Policer aggr-1
Rate(bps):10000000 Normal-Burst(bytes):1000000
conform-action:transmit exceed-action:policed-dscp-transmit
Policy maps using this policer:
  ipp5-policy
Switch#
```

Related Commands

<table>
<thead>
<tr>

<tr>
<td>qos trust</td>
<td>Defines a named aggregate policer.</td>
</tr>
</tbody>
</table>
show qos dbl

To display global Dynamic Buffer Limiting (DBL) information, use the `show qos dbl` command.

```plaintext
show qos dbl
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

**Examples**
This example shows how to display global DBL information:

```plaintext
Switch# show qos dbl
DBL is enabled globally
DBL flow includes vlan
DBL flow includes l4-ports
DBL does not use ecn to indicate congestion
DBL exceed-action mark probability:15%
DBL max credits:15
DBL aggressive credit limit:10
DBL aggressive buffer limit:2 packets
DBL DSCPw with default drop probability: 1-10
Switch#
```
show qos interface

To display queueing information, use the show qos interface command.

```
show qos interface {fastethernet interface-number | gigabitethernet interface-number} | 
[vlan vlan_id | port-channel number]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fastethernet interface-number</td>
<td>Specifies the Fast Ethernet 802.3 interface.</td>
</tr>
<tr>
<td>gigabitethernet interface-number</td>
<td>Specifies the Gigabit Ethernet 802.3z interface.</td>
</tr>
<tr>
<td>vlan vlan_id</td>
<td>(Optional) Specifies the VLAN ID; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>port-channel number</td>
<td>(Optional) Specifies the port channel; valid ranges are from 1 to 64.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>

Switch#
**show redundancy**

To display redundancy facility information, use the `show redundancy` command.

```
show redundancy {clients | counters | history | states}
```

### Syntax Description

- **clients** (Optional): Displays information about the redundancy facility client.
- **counters** (Optional): Displays information about the redundancy facility counter.
- **history** (Optional): Displays a log of past status and related information for the redundancy facility.
- **states** (Optional): Displays information about the redundancy facility state, such as disabled, initialization, standby, active.

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1.(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch (Catalyst 4507R only).</td>
</tr>
<tr>
<td>12.2(31)SGA</td>
<td>Support for ISSU was introduced.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to display information about the redundancy facility:

```
Switch# show redundancy
Switch# show redundancy
4507r-demo#show redundancy
Redundant System Information :
-----------------------------------
Available system uptime = 2 days, 2 hours, 39 minutes
Switchovers system experienced = 0
Standby failures = 0
Last switchover reason = none
Hardware Mode = Duplex
Configured Redundancy Mode = Stateful Switchover
Operating Redundancy Mode = Stateful Switchover
Maintenance Mode = Disabled
Communications = Up

Current Processor Information :
-----------------------------------
Active Location = slot 1
Current Software state = ACTIVE
Uptime in current state = 2 days, 2 hours, 39 minutes
Image Version = Cisco Internetwork Operating System Software IOS (tm) Catalyst 4000 L3 Switch Software (cat4000-I5S-M), Version 12.2(20)EWA(3 .92), CISCO INTERNAL USE ONLY ENHANCED PRODUCTION VERSION
```
This example shows how to display redundancy facility client information:

```plaintext
Switch# show redundancy clients
clientID = 0       clientSeq = 0        RF_INTERNAL_MSG
clientID = 30      clientSeq = 135      Redundancy Mode RF
clientID = 28      clientSeq = 330      GALIOS_CONFIG_SYNC
clientID = 65000   clientSeq = 65000    RF_LAST_CLIENT Switch
```

The output displays the following information:

- `clientID` displays the client’s ID number.
- `clientSeq` displays the client’s notification sequence number.
- Current redundancy facility state.

This example shows how to display the redundancy facility counter information:

```plaintext
Switch# show redundancy counters
Redundancy Facility OMs
      comm link up = 1
      comm link down = 0
      invalid client tx = 0
      null tx by client = 0
      tx failures = 0
      tx msg length invalid = 0
      client not rxing msgs = 0
      rx peer msg routing errors = 0
      null peer msg rx = 0
      errored peer msg rx = 0
      buffers tx = 1535
      tx buffers unavailable = 0
      buffers rx = 1530
      buffer release errors = 0

      duplicate client registers = 0
      failed to register client = 0
      Invalid client syncs = 0
```

Switch#
This example shows how to display redundancy facility history information:

```
Switch# show redundancy history

Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

show redundancy config-sync

To display an ISSU config-sync failure or the ignored mismatched command list (MCL), if any, use the show redundancy config-sync command.

```
show redundancy config-sync {failures | ignored} {bem | mcl | prc}
show redundancy config-sync ignored failures mcl
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failures</td>
<td>Displays MCL entries or BEM/PRC failures.</td>
</tr>
<tr>
<td>ignored</td>
<td>Displays the ignored MCL entries.</td>
</tr>
<tr>
<td>bem</td>
<td>(Deprecated)</td>
</tr>
<tr>
<td>mcl</td>
<td>Displays commands that exist in the active supervisor engine’s running configuration, but are not supported by the image on the standby supervisor engine.</td>
</tr>
<tr>
<td>prc</td>
<td>Displays a Parser Return Code (PRC) failure and forces the system to operate in RPR mode provided there is a mismatch in the return code for a command execution at the active and standby supervisor engine.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

User EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SGA</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(44)SG</td>
<td>Updated command syntax from issu config-sync to redundancy config-sync.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When two versions of Cisco IOS images are involved, the command sets supported by two images might differ. If any of those mismatched commands are executed on the active supervisor engine, the standby supervisor engine might not recognize those commands. This causes a config mismatch condition. If the syntax check for the command fails on standby supervisor engine during a bulk sync, the command is moved into the MCL and the standby supervisor engine is reset. To display all the mismatched commands, use the `show redundancy config-sync failures mcl` command.
To **clean** the MCL, follow these steps:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Remove all mismatched commands from the active supervisor engines’ running configuration.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Revalidate the MCL with a modified running configuration using the <code>redundancy config-sync validate mismatched-commands</code> command.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Reload the standby supervisor engine.</td>
</tr>
</tbody>
</table>

Alternatively, you could ignore the MCL by following these steps:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Enter the <code>redundancy config-sync ignore mismatched-commands</code> command.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Reload the standby supervisor engine; the system transitions to SSO mode.</td>
</tr>
</tbody>
</table>

**Note** If you ignore the mismatched commands, the `out-of-sync` configuration at the active supervisor engine and the standby supervisor engine still exists.

<table>
<thead>
<tr>
<th>Step 3</th>
<th>You can verify the ignored MCL with the <code>show redundancy config-sync ignored mcl</code> command.</th>
</tr>
</thead>
</table>

Each command sets a return code in the action function that implements the command. This return code indicates whether or not the command successfully executes. The active supervisor engine maintains the PRC after executing a command. The standby supervisor engine executes the command and sends PRC back to the active supervisor engine. PRC failure occurs if these two PRCs do not match. If a PRC error occurs at the standby supervisor engine either during bulk sync or LBL sync, the standby supervisor engine is reset. To display all PRC failures, use the `show redundancy config-sync failures prc` command.

To display best effort method (BEM) errors, use the `show redundancy config-sync failures bem` command.

**Examples**

The following example shows how to display the ISSU BEM failures:

```
Switch# show redundancy config-sync failures bem
BEM Failed Command List
-------------------------------------
The list is Empty
Switch#
```

The following example shows how to display the ISSU MCL failures:

```
Switch# show redundancy config-sync failures mcl
Mismatched Command List
-----------------------
The list is Empty
Switch#
```
The following example shows how to display the ISSU PRC failures:

```
Switch#show redundancy config-sync failures prc
PRC Failed Command List
-----------------------------
interface FastEthernet3/2
  ! <submode> "interface"
  - channel-protocol pagp
  ! </submode> "interface"
```

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>redundancy config-sync</td>
<td>Moves the active supervisor engine into the Mismatched Command List (MCL) and resets the standby supervisor engine.</td>
</tr>
<tr>
<td></td>
<td>mismatched-commands</td>
<td></td>
</tr>
</tbody>
</table>
**show running-config**

To display the module status and configuration, use the `show running-config` command.

```
show running-config [module slot]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>module slot</th>
<th>(Optional) Specifies the module slot number; valid values are from 1 to 6.</th>
</tr>
</thead>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In some cases, you might see a difference in the duplex mode displayed when you enter the `show interfaces` command and the `show running-config` command. If you do see a difference, the duplex mode displayed in the `show interfaces` command is the actual duplex mode that the interface is running. The `show interfaces` command shows the operating mode for an interface, while the `show running-config` command shows the configured mode for an interface.

The `show running-config` command output for an interface may display a duplex mode configuration but no configuration for the speed. When no speed is displayed in the output, it indicates that the interface speed is configured to be auto and that the duplex mode shown becomes the operational setting once the speed is configured to something other than auto. With this configuration, it is possible that the operating duplex mode for that interface does not match the duplex mode shown with the `show running-config` command.

**Examples**

This example shows how to display the module and status configuration for all modules:

```
Switch# show running-config
03:23:36:%SYS-5-CONFIG_I:Configured from console by console
Building configuration...

Current configuration:3268 bytes
!
version 12.1
no service pad
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname Switch
!
!
power supplies required 1
ip subnet-zero
```
This example shows the output for the `show running-config` command when you have enabled the `switchport voice vlan` command:

```
Switch# show running-config int fastethernet 6/1
Building configuration...

Current configuration:133 bytes
!
interface FastEthernet6/1
  switchport voice vlan 2
  no snmp trap link-status
  spanning-tree portfast
  channel-group 1 mode on
end

Switch#
```
show slavebootflash:

To display information about the standby bootflash file system, use the `show slavebootflash:` command.

```
show slavebootflash: [all | chips | filesys]
```

### Syntax Description

### Examples

This example shows how to display spanning-tree information on the active interfaces only:

```
Switch# show spanning-tree active
UplinkFast is disabled
BackboneFast is disabled

VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0050.3e8d.6401
Configured hello time 2, max age 20, forward delay 15
Current root has priority 16384, address 0060.704c.7000
Root port is 265 (FastEthernet5/9), cost of root path is 38
Topology change flag not set, detected flag not set
Number of topology changes 0 last change occurred 18:13:54 ago
Times: hold 1, topology change 24, notification 2
       hello 2, max age 14, forward delay 10
Times: hello 0, topology change 0, notification 0

Port 265 (FastEthernet5/9) of VLAN1 is forwarding
Port path cost 19, Port priority 128, Port Identifier 128.9.
Designated root has priority 16384, address 0060.704c.7000
Designated bridge has priority 32768, address 00e0.4fac.b000
Designated port id is 128.2, designated path cost 19
Timers: message age 3, forward delay 0, hold 0
Number of transitions to forwarding state: 1
BPDU: sent 3, received 32852
```

Switch#

This example shows how to display the spanning-tree BackboneFast status:

```
Switch# show spanning-tree backbonefast
BackboneFast is enabled

BackboneFast statistics
-----------------------
Number of transition via backboneFast (all VLANs) : 0
Number of inferior BPDUUs received (all VLANs)  : 0
Number of RLQ request PDUs received (all VLANs)  : 0
Number of RLQ response PDUs received (all VLANs) : 0
Number of RLQ request PDUs sent (all VLANs)      : 0
Number of RLQ response PDUs sent (all VLANs)     : 0
```

Switch#

This example shows how to display spanning-tree information for the bridge:

```
Switch# show spanning-tree bridge
VLAN1
  Bridge ID Priority 32768
  Address 0050.3e8d.6401
  Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
VLAN2
  Bridge ID Priority 32768
  Address 0050.3e8d.6402
  Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
VLAN3
  Bridge ID Priority 32768
  Address 0050.3e8d.6403
  Hello Time 2 sec Max Age 20 sec Forward Delay 15 sec
```

Switch#

This example shows how to display a summary of interface information:

```
Switch# show spanning-tree
VLAN1
```

```
Spanning tree enabled protocol ieee
Root ID  Priority  32768
  Address  0030.94fc.0a00
This bridge is the root
  Hello Time  2 sec  Max Age 20 sec  Forward Delay 15 sec

Bridge ID  Priority  32768
  Address  0030.94fc.0a00
  Hello Time  2 sec  Max Age 20 sec  Forward Delay 15 sec
  Aging Time 300

Interface Name                  Port ID Prio  Cost Sts  Cost Bridge ID                        Port ID
-------------------    ------- --- ------ ---   ---- -------------------- -------
FastEthernet6/15       129.79  128     19 FWD      0 32768 0030.94fc.0a00 129.79

VLAN2
Spanning tree enabled protocol ieee
Root ID  Priority  32768
  Address  0030.94fc.0a01
This bridge is the root
  Hello Time  2 sec  Max Age 20 sec  Forward Delay 15 sec

Bridge ID  Priority  32768
  Address  0030.94fc.0a01
  Hello Time  2 sec  Max Age 20 sec  Forward Delay 15 sec
  Aging Time 300

Interface Name                  Port ID Prio  Cost Sts  Cost Bridge ID                        Port ID
-------------------    ------- --- ------ ---   ---- -------------------- -------
FastEthernet6/16       129.80  128     19 FWD      0 32768 0030.94fc.0a01 129.80

This example shows how to display spanning-tree information for Fast Ethernet interface 5/9:

Switch# show spanning-tree interface fastethernet5/9
Interface Fa0/10 (port 23) in Spanning tree 1 is ROOT-INCONSISTENT
  Port path cost 100, Port priority 128
  Designated root has priority 8192, address 0090.0c71.a400
  Designated bridge has priority 32768, address 00e0.1e9f.8940
  Designated port is 23, path cost 115
  Timers: message age 0, forward delay 0, hold 0
  BPDU: sent 0, received 0
  The port is in the portfast mode
Switch#

This example shows how to display spanning-tree information for a specific VLAN:

Switch# show spanning-tree vlan 1
VLAN1 is executing the ieee compatible Spanning Tree protocol
  Bridge Identifier has priority 32768, address 0030.94fc.0a00
  Configured hello time 2, max age 20, forward delay 15
  We are the root of the spanning tree
  Topology change flag not set, detected flag not set
  Number of topology changes 5 last change occurred 01:50:47 ago
  from FastEthernet6/16
  Times: hold 1, topology change 35, notification 2
  hello 2, max age 20, forward delay 15
  Timers:hello 0, topology change 0, notification 0, aging 300
  Port 335 (FastEthernet6/15) of VLAN1 is forwarding
Port path cost 19, Port priority 128, Port Identifier 129.79.
Designated root has priority 32768, address 0030.94fc.0a00
Designated bridge has priority 32768, address 0030.94fc.0a00
Designated port id is 129.79, designated path cost 0
Timers:message age 0, forward delay 0, hold 0
Number of transitions to forwarding state:1
BPDU: sent 6127, received 0
Switch#

This example shows how to display spanning-tree information for a specific bridge group:
Switch# show spanning-tree vlan 1
UplinkFast is disabled
BackboneFast is disabled
Switch#

This example shows how to display a summary of port states:
Switch# show spanning-tree summary
Root bridge for: VLAN1, VLAN2.
PortFast BPDU Guard is disabled
EtherChannel misconfiguration guard is enabled
UplinkFast is disabled
BackboneFast is disabled
Default pathcost method used is short

<table>

show spanning-tree mst

To display MST protocol information, use the `show spanning-tree mst` command.

```
show spanning-tree mst [configuration]
show spanning-tree mst [instance-id] [detail]
show spanning-tree mst [instance-id] interface interface [detail]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>configuration</td>
<td>(Optional) Displays region configuration information.</td>
</tr>
<tr>
<td>instance-id</td>

<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on systems that are configured with a Supervisor Engine I.

In the output display of the `show spanning-tree mst configuration` command, a warning message might display. This message appears if you do not map secondary VLANs to the same instance as the associated primary VLAN. The display includes a list of the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The warning message is as follows:

```
These secondary vlans are not mapped to the same instance as their primary:
-> 3
```

See the `show spanning-tree` command for output definitions.
This example shows how to display region configuration information:

```
Switch# show spanning-tree mst configuration
Name [leo]
Revision 2702
Instance Vlans mapped
--------  ---------------------------------------------------------------------
0         1-9,11-19,21-29,31-39,41-4094
1         10,20,30,40
-------------------------------------------------------------------------------
Switch#
```

This example shows how to display additional MST protocol values:

```
Switch# show spanning-tree mst 3 detail
# # # # # # MST03 vlans mapped: 3,3000-3999
Bridge address 0002.172c.f400 priority 32771 (32768 sysid 3)
Root this switch for MST03

GigabitEthernet1/1 of MST03 is boundary forwarding
Port info port id 128.1 priority 128 cost 20000
Designated root address 0002.172c.f400 priority 32771 cost 0
Designated bridge address 0002.172c.f400 priority 32771 port id 128.1
Timers: message expires in 0 sec, forward delay 0, forward transitions 1
Bpdus (MRecords) sent 4, received 0

FastEthernet4/2 of MST03 is backup blocking
Port info port id 128.194 priority 128 cost 200000
Designated root address 0002.172c.f400 priority 32771 cost 0
Designated bridge address 0002.172c.f400 priority 32771 port id 128.193
Timers: message expires in 2 sec, forward delay 0, forward transitions 1
Bpdus (MRecords) sent 3, received 252
Switch#
```

This example shows how to display MST information for a specific interface:

```
Switch# show spanning-tree mst 0 interface fastethernet4/1 detail
Edge port: no (trunk) port guard : none (default)
Link type: point-to-point (point-to-point) bpdu filter: disable (default)
Boundary : internal bpdu guard : disable (default)
FastEthernet4/1 of MST00 is designated forwarding
Vlans mapped to MST00 1-2,4-2999,4000-4094
Port info port id 128.193 priority 128 cost 200000
Designated root address 0050.3e66.d000 priority 8193 cost 20004
Designated ist master address 0002.172c.f400 priority 49152 cost 0
Designated bridge address 0002.172c.f400 priority 49152 port id 128.193
Timers: message expires in 0 sec, forward delay 0, forward transitions 1
Bpdus sent 492, received 3
Switch#
```

show storm-control

To display the broadcast storm control settings on the switch or on the specified interface, use the **show storm-control** command.

```
show storm-control [interface-id | broadcast]
```

### Supervisor Engine 6-E and Catalyst 4900M chassis

```
show storm-control [interface-id | broadcast | multicast]
```

#### Syntax Description

- **interface-id** (Optional) Specifies the interface ID for the physical port.
- **broadcast** (Optional) Displays the broadcast storm threshold setting.
- **multicast** (Optional) Displays the multicast storm threshold setting.

#### Command Modes

Privileged EXEC mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Added support for the Supervisor Engine 6-E and Catalyst 4900M chassis.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

When you enter an interface ID, the storm control thresholds are displayed for the specified interface.

If you do not enter an interface ID, the settings are displayed for the broadcast traffic type for all ports on the switch.

#### Examples

This is an example of output from the **show storm-control** command when no keywords are entered. Because no traffic type keyword was entered, the broadcast storm control settings are displayed.

```
Switch# show storm-control
Interface Filter State Upper Lower Current
-------- -------------- ------- ------- -----
Gi2/1    Forwarding   30.00% 30.00% N/A
Gi4/1    Forwarding   30.00% 30.00% N/A
Gi4/3    Forwarding   30.00% 30.00% N/A
Switch#
```

This is an example of output from the **show storm-control multicast** command on a Supervisor Engine 6-E.

```
Switch# show storm-control multicast // Supervisor Engine 6-E
Interface Filter State Broadcast Multicast Level
-------- -------------- -------------- ------------- -----
Fa6/2    Blocking     Enabled Enabled 61%
Switch#
```
This is an example of output from the `show storm-control` command on a Supervisor Engine 6-E when no keywords are entered.

```
Switch# show storm-control
Interface Filter State   Broadcast Multicast Level
--------- ------------- --------- --------- -----
Fa6/1   Blocking     Enabled   Disabled   81%  
Fa6/2   Blocking     Enabled   Enabled    61%  
Switch#
```

This is an example of output from the `show storm-control` command for a specified interface.

```
Switch# show storm-control fastethernet2/17
Interface  Filter State   Level    Current
---------  -------------  -------  -------
Fa2/17     Forwarding      50.00%    0.00%
Switch#
```

This is an example of output from the `show storm-control` command for a specified interface on a Supervisor Engine 6-E.

```
Switch# show storm-control interface fastethernet6/1
Interface  Filter State   Broadcast Multicast Level
---------  -------------  -------  -------  -----  ----- -----
Fa6/1     Blocking     Enabled   Disabled   81%  
Switch#
```

Table 2-28 describes the fields in the `show storm-control` display.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

Catalyst 4500 Series Switch Cisco IOS Command Reference—Release IOS-XE 3.2.0 SG

OL-23829-01

2-703
**show system mtu**

To display the global MTU setting, use the `show system mtu` command.

```
show system mtu
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to display the global MTU setting:

```
Switch# show system mtu
Global Ethernet MTU is 1550 bytes.
Switch#
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>system mtu</code></td>
<td>Sets the maximum Layer 2 or Layer 3 payload size.</td>
</tr>
</tbody>
</table>
**show tech-support**

To display troubleshooting information for TAC, use the **show tech-support** command.

```
show tech-support [bridging | cef | ipmulticast | isis | password [page] | page]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>bridging</th>
<th>(Optional) Specifies bridging-related information.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>cef</td>
<td>(Optional) Specifies CEF-related information.</td>
</tr>
<tr>
<td></td>
<td>ipmulticast</td>
<td>(Optional) Specifies IP multicast-related information.</td>
</tr>
<tr>
<td></td>
<td>isis</td>
<td>(Optional) Specifies CLNS and ISIS-related information.</td>
</tr>
<tr>
<td></td>
<td>password</td>
<td>(Optional) Includes passwords and other security information in the output.</td>
</tr>
<tr>
<td></td>
<td>page</td>
<td>(Optional) Displays one page of information at a time in the output.</td>
</tr>
</tbody>
</table>

**Defaults**

The defaults are as follows:

- Outputs are displayed without page breaks.
- Passwords and other security information are removed from the output.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Output from the **show tech-support** command may be terminated in midstream with the key combination Ctrl+Alt+6. The command output is buffered so that the command terminates when output of the current sub-command running under this command completes.

Press the Return key to display the next line of output, or press the Space bar to display the next page of information. If you do not enter the **page** keyword, the output scrolls. It does not stop for page breaks.

If you enter the **password** keyword, password encryption is enabled, but only the encrypted form appears in the output.

If you do not enter the **password** keyword, the passwords and other security-sensitive information in the output are replaced in the output with the word “removed.”

The **show tech-support** commands are a compilation of several **show** commands and the output can be quite lengthy. For a sample display of the output of the **show tech-support** command, see the individual **show** command listed.

If you enter the **show tech-support** command without arguments, the output displays the equivalent of these **show** commands:

- **show version**
- **show running-config**
- **show stacks**
• show interfaces
• show controllers
• show process memory
• show process cpu
• show buffers
• show logging
• show module
• show power
• show environment
• show interfaces switchport
• show interfaces trunk
• show vlan

If you enter the `ipmulticast` keyword, the output displays the equivalent of these `show` commands:

• show ip pim interface
• show ip pim interface count
• show ip pim neighbor
• show ip pim rp
• show ip igmp groups
• show ip igmp interface
• show ip mroute count
• show ip mroute
• show ip mcache
• show ip dvmrp route

**Examples**

For a sample display of the `show tech-support` command output, see the commands listed in the “Usage Guidelines” section for more information.

**Related Commands**

See the “Usage Guidelines” section.
show udld

To display the administrative and operational UDLD status, use the `show udld` command.

```
show udld interface-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>interface-id</code></th>
<th>Name of the interface.</th>
</tr>
</thead>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(25)EW</td>
<td>Added support for the 10-Gigabit Ethernet interface.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not enter an interface ID value, the administrative and operational UDLD status for all interfaces is displayed.

**Examples**

This example shows how to display the UDLD state for Gigabit Ethernet interface 2/2:

```
Switch# show udld gigabitethernet2/2
Interface Gi2/2
---
Port enable administrative configuration setting: Follows device default
Port enable operational state: Enabled
Current bidirectional state: Bidirectional
Current operational state: Advertisement
Message interval: 60
Time out interval: 5
No multiple neighbors detected
  Entry 1
    ---
    Expiration time: 146
    Device ID: 1
    Current neighbor state: Bidirectional
    Device name: 0050e2826000
    Port ID: 2/1
    Neighbor echo 1 device: SAD03160954
    Neighbor echo 1 port: Gi1/1
    Message interval: 5
    CDP Device name: 066527791
Switch#
```
Related Commands

<table>

</tbody>
</table>
show vlan

To display VLAN information, use the `show vlan` command.

```
show vlan [brief | id vlan_id | name name]
```

```
show vlan private-vlan [type]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brief</td>
<td>(Optional) Displays only a single line for each VLAN, naming the VLAN, status, and ports.</td>
</tr>
<tr>
<td>id vlan_id</td>
<td>(Optional) Displays information about a single VLAN identified by VLAN ID number; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>name name</td>
<td>(Optional) Displays information about a single VLAN identified by VLAN name; valid values are an ASCII string from 1 to 32 characters.</td>
</tr>
<tr>
<td>private-vlan</td>
<td>Displays private VLAN information.</td>
</tr>
<tr>
<td>type</td>
<td>(Optional) Private VLAN type.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Added support for extended VLAN addresses.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the VLAN parameters for all VLANs within the administrative domain:

```
Switch# show vlan
VLAN Name                        Status  Ports
-----------------------------    -------  -------------------------------
1 default                       active   Fa5/9
2 VLAN0002                      active   Fa5/9
3 VLAN0003                      active   Fa5/9
4 VLAN0004                      active   Fa5/9
5 VLAN0005                      active   Fa5/9
6 VLAN0006                      active   Fa5/9
10 VLAN0010                     active   Fa5/9
20 VLAN0020                     active   Fa5/9
<...Output truncated...>
```
This example shows how to display the VLAN name, status, and associated ports only:

```
Switch# show vlan brief

VLAN Name             Status   Ports
---- ----------------- --------- -------------------------------
1    default          active    Fa5/9
2    VLAN0002         active    Fa5/9
3    VLAN0003         active    Fa5/9
4    VLAN0004         active    Fa5/9
5    VLAN0005         active    Fa5/9
10   VLAN0010         active    Fa5/9
.     .                  .          .
999   VLAN0999         active    Fa5/9
1002  fddi-default    active    Fa5/9
1003  trcrf-default   active    Fa5/9
1004  fddinet-default active    Fa5/9
1005  trbrf-default   active    Fa5/9
```

This example shows how to display the VLAN name, status, and associated ports only:

```
Switch# show vlan brief

VLAN Name             Status   Ports
---- ----------------- --------- -------------------------------
1    default          active    Fa5/9
2    VLAN0002         active    Fa5/9
3    VLAN0003         active    Fa5/9
4    VLAN0004         active    Fa5/9
5    VLAN0005         active    Fa5/9
10   VLAN0010         active    Fa5/9
.     .                  .          .
999   VLAN0999         active    Fa5/9
1002  fddi-default    active    Fa5/9

<tr>
<td>BrdgNo</td>
<td>Bridge number for the VLAN, if applicable.</td>
</tr>
<tr>
<td>Stp</td>
<td>Spanning Tree Protocol type used on the VLAN.</td>
</tr>
</tbody>
</table>

The following example shows how to verify that the primary vlan and secondary vlans are correctly associated with each other and the same association also exists on the PVLAN port:

Switch# `show vlan private-vlan`

```
Primary Secondary Type              Ports
------- --------- ----------------- ------------------------------------------
10            100   community       Fa3/1, Fa3/2
```

Now, let’s say that you remove the VLAN association, as follows:

Switch(config)# `vlan 10`
Switch(config-vlan)# `private-vlan association remove 100`
Switch(config-vlan)# `end`

Switch# `show vlan private`

```
Primary Secondary Type              Ports
------- ----------------- ------------------------------------------
10            primary
100           community
```

Table 2-29 show vlan Command Output Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VLAN</td>
<td>VLAN number.</td>
</tr>
<tr>
<td>Name</td>
<td>Name, if configured, of the VLAN.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the VLAN (active or suspend).</td>
</tr>
<tr>
<td>Ports</td>
<td>Ports that belong to the VLAN.</td>
</tr>
<tr>
<td>Type</td>
<td>Media type of the VLAN.</td>
</tr>
<tr>
<td>SAID</td>
<td>Security Association Identifier value for the VLAN.</td>
</tr>
<tr>
<td>MTU</td>
<td>Maximum transmission unit size for the VLAN.</td>
</tr>
<tr>
<td>Parent</td>
<td>Parent VLAN, if one exists.</td>
</tr>
<tr>
<td>RingNo</td>
<td>Ring number for the VLAN, if applicable.</td>
</tr>
<tr>
<td>BrdgNo</td>
<td>Bridge number for the VLAN, if applicable.</td>
</tr>
<tr>
<td>Stp</td>
<td>Spanning Tree Protocol type used on the VLAN.</td>
</tr>
</tbody>
</table>
You can use the following command to verify PVLAN configuration on the interface:

Switch# `show interface f3/2 status`
```
Port     Name      Status      Vlan   Duplex   Speed       Type
Fa3/2    connected pvlan  seco  a-full a-100 10/100BaseTX
```

Switch# `show interface f3/1 status`
```
Port     Name      Status      Vlan   Duplex   Speed       Type
Fa3/1    connected pvlan  prom a-full a-100 10/100BaseTX
```

show vlan access-map

To display the contents of a VLAN access map, use the show vlan access-map command.

    show vlan access-map [map-name]

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>map-name</td>
<td>(Optional) Name of the VLAN access map.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This command shows how to display the contents of a VLAN access map:

    Switch# show vlan access-map mordred
    Vlan access-map "mordred" 1
        match: ip address 13
        action: forward capture
    Switch#

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan access-map</td>
<td>Enters VLAN access-map command mode to create a VLAN access map.</td>
</tr>
</tbody>
</table>
show vlan counters

To display the software-cached counter values, use the `show vlan counters` command.

```
show vlan [id vlanid] counters
```

**Syntax Description**

<table>
<thead>
<tr>
<th>id vlanid</th>
<th>(Optional) Displays the software-cached counter values for a specific VLAN.</th>
</tr>
</thead>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the `show vlan counters` command without specifying the VLAN ID, the software-cached counter values for all VLANs are displayed.

**Examples**

This example shows how to display the software-cached counter values for a specific VLAN:

```
Switch# show vlan counters
* Multicast counters include broadcast packets

Vlan Id : 1
L2 Unicast Packets : 0
L2 Unicast Octets : 0
L3 Input Unicast Packets : 0
L3 Input Unicast Octets : 0
L3 Output Unicast Packets : 0
L3 Output Unicast Octets : 0
L3 Output Multicast Packets : 0
L3 Output Multicast Octets : 0
L3 Input Multicast Packets : 0
L3 Input Multicast Octets : 0
L2 Multicast Packets : 1
L2 Multicast Octets : 94
```

**Related Commands**

</thead>
<tbody>
<tr>
<td>clear vlan counters</td>
<td>Clears the software-cached counter values to start from zero again for a specified VLAN or all existing VLANs.</td>
</tr>
</tbody>
</table>
show vlan dot1q tag native

To display all the ports on the switch that are eligible for native VLAN tagging as well as their current native VLAN tagging status, use the `show vlan dot1q tag native` command.

```
show vlan dot1q tag native
```

### Syntax Description
This command has no arguments or keywords.

### Command Modes
User EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(18)EW</td>
<td>This command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples
This is an example of output from the `show vlan dot1q tag native` command:

```
Switch# show vlan dot1q tag native
dot1q native vlan tagging is disabled globally

Per Port Native Vlan Tagging State
------------------------------------
Port    Operational    Native VLAN Tagging State
------------------------------------
f3/2    trunk          enabled
f3/16   PVLAN trunk    disabled
f3/16   trunk          enabled
```

### Related Commands

</tbody>
</table>
show vlan internal usage

To display information about the internal VLAN allocation, use the `show vlan internal usage` command.

```
show vlan [id vlan-id] internal usage
```

**Syntax Description**

- `id vlan-id` (Optional) Displays internal VLAN allocation information for the specified VLAN; valid values are from 1 to 4094.

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information about the current internal VLAN allocation:

```
Switch# show vlan internal usage

VLAN Usage
---- -------------------
 1025 -
 1026 -
 1027 -
 1028 -
 1029 Port-channel6
 1030 GigabitEthernet1/2
 1032 FastEthernet3/20
 1033 FastEthernet3/21
 1129 -
```

This example shows how to display information about the internal VLAN allocation for a specific VLAN:

```
Switch# show vlan id 1030 internal usage

VLAN Usage
---- -------------------
 1030 GigabitEthernet1/2
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan internal allocation policy</code></td>
<td>Configures the internal VLAN allocation scheme.</td>
</tr>
</tbody>
</table>
show vlan mtu

To display the minimum and maximum transmission unit (MTU) sizes of each VLAN, use the `show vlan mtu` command.

```
show vlan mtu
```

**Syntax Description**

This command has no arguments or keywords

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `MTU_Mismatch` column in the command output indicates whether all the ports in the VLAN have the same MTU. When “yes” is displayed in the `MTU_Mismatch` column, it means that the VLAN has a port with different MTUs, and packets might be dropped that are switched from a port with a larger MTU to a port with a smaller MTU. If the VLAN does not have an SVI, the hyphen (-) symbol is displayed in the `SVI_MTU` column.

For a VLAN, if the `MTU-Mismatch` column displays `yes`, the names of the port with the `MinMTU` and the port with the `MaxMTU` are displayed. For a VLAN, if the `SVI_MTU` is bigger than the `MinMTU`, “TooBig” is displayed after the `SVI_MTU`.

**Examples**

This is an example of output from the `show vlan mtu` command:

```
Switch# show vlan mtu

VLAN  SVI_MTU  MinMTU(port)  MaxMTU(port)  MTU_Mismatch
----- ------------- -------------  ------------  ------------
 1    1500         1500           1500           No
Switch>
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mtu</code></td>
<td>Enables jumbo frames on an interface by adjusting the maximum size of a packet or maximum transmission unit (MTU).</td>
</tr>
</tbody>
</table>
show vlan private-vlan

To display private VLAN information, use the `show vlan private-vlan` command.

```
show vlan private-vlan [type]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>type</code></td>
<td>(Optional) Displays the private VLAN type; valid types are isolated, primary, community, twoway-community, nonoperational, and normal.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
<tr>
<td>3.1.1SG</td>
<td>Support for PVLAN modes over EtherChannel. Modes include: private-vlan host, private-vlan promiscuous, private-vlan trunk secondary, and private-vlan trunk promiscuous.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the `show vlan private-vlan type` command displays a VLAN type as normal, it indicates that a regular VLAN has been used in the private VLAN configuration. When normal is displayed, this indicates that two VLANs have been associated before the type was set, and the private VLAN is not operational. This information is useful for debugging purposes.

**Examples**

This example shows how to display information about all currently configured private VLANs:

```
Switch# show vlan private-vlan

Primary Secondary Type           Ports
------- --------- ----------------- ------------------------------------------
 2    301       community         Fa5/3, Fa5/25
 2    302       community        Fa5/3, Po63
 2    303       community        Fa5/3, Po63
 10    101      isolated          Fa5/3, Po63
 150    151     non-operational  Fa5/3, Po63
 202    303     twoway-community  Fa5/3, Po63
 401    402     non-operational  Fa5/3, Po63
Switch#
```

**Note**

A blank Primary value indicates that no association exists.
This example shows how to display information about all currently configured private VLAN types:

```
Switch# show vlan private-vlan

Vlan Type
---- -----------------
202  primary
303  community
304  community
305  community
306  community
307  community
308  normal
309  community
440  isolated

Switch#
```

Table 2-30 describes the fields in the `show vlan private-vlan` command output.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Number of the primary VLAN.</td>

show vmps

To display the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers, use the show vmps command.

    show vmps [statistics]

**Syntax Description**

| statistics  | (Optional) Displays the client-side statistics. |

**Defaults**

This command has no default settings.

**Command Modes**

Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Examples**

This is an example of output from the show vmps command:

    Switch# show vmps
    VQP Client Status:
    -------------------
    VMPS VQP Version: 1
    Reconfirm Interval: 60 min
    Server Retry Count: 3
    VMPS domain server: 172.20.50.120 (primary, current)

    Reconfirmation status
    ---------------------
    VMPS Action: No Dynamic Port
    Switch#

This is an example of output from the show vmps statistics command:

    Switch# show vmps statistics
    VMPS Client Statistics
    -----------------------
    VQP Queries: 0
    VQP Responses: 0
    VMPS Changes: 0
    VQP Shutdowns: 0
    VQP Denied: 0
    VQP Wrong Domain: 0
    VQP Wrong Version: 0
    VQP Insufficient Resource: 0
    Switch#

show vtp

To display VTP statistics and domain information, use the `show vtp` command.

```
show vtp {counters | status}
```

### Syntax Description

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>counters</td>
<td>Specifies the VTP statistics.</td>
</tr>
<tr>
<td>status</td>
<td>Specifies the VTP domain status.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to display the VTP statistics:

```
Switch# show vtp counters
VTP statistics:
Summary advertisements received : 1
Subset advertisements received    : 1
Request advertisements received   : 0
Summary advertisements transmitted: 31
Subset advertisements transmitted : 1
Request advertisements transmitted: 0
Number of config revision errors  : 0
Number of config digest errors    : 0
Number of V1 summary errors      : 0

VTP pruning statistics:
Trunk                        Join Transmitted Join Received Summary advts received from non-pruning-capable device
--------------------------------------------------------------------------------------------------------------------------------------------
Fa5/9                        1555                         1564                         0
Switch#
```

This example shows how to display the VTP domain status:

```
Switch# show vtp status
VTP Version                  : 2
Configuration Revision       : 250
Maximum VLANs supported locally : 1005
Number of existing VLANs     : 33
VTP Operating Mode           : Server
VTP Domain Name              : Lab_Network
VTP Pruning Mode             : Enabled
VTP V2 Mode                  : Enabled
VTP Traps Generation         : Disabled
```
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

show vtp

MD5 digest                      : 0xE6 0xF8 0x3E 0xDD 0xA4 0xF5 0xC2 0x0E
Configuration last modified by 172.20.52.18 at 9-22-99 11:18:20
Local updater ID is 172.20.52.18 on interface Vl1 (lowest numbered VLAN interface found)

Switch#

This example shows how to display only those lines in the show vtp output that contain the word Summary:

Switch# show vtp counters | include Summary
Summary advertisements received : 1
Summary advertisements transmitted : 32
Trunk            Join Transmitted Join Received    Summary advts received from
Switch#

Table 2-31 describes the fields in the show vtp command output.

show vtp
snmp ifindex clear

To clear any previously configured `snmp ifindex` commands that were entered for a specific interface, use the `snmp ifindex clear` command.

`snmp ifindex clear`

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
This command has no default settings.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Interface index persistence occurs when ifIndex values in the interface MIB (IF-MIB) persist across reboots and allow for consistent identification of specific interfaces using SNMP.

Use the `snmp ifindex clear` command on a specific interface when you want that interface to use the global configuration setting for ifIndex persistence. This command clears any ifIndex configuration commands previously entered for that specific interface.

**Examples**
This example shows how to enable ifIndex persistence for all interfaces:

```
Router(config)# snmp-server ifindex persist
```

This example shows how to disable IfIndex persistence for FastEthernet 1/1 only:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit
```

This example shows how to clear the ifIndex configuration from the FastEthernet 1/1 configuration:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex clear
Router(config-if)# exit
```

As a result of this sequence of commands, ifIndex persistence is enabled for all interfaces that are specified by the `snmp-server ifindex persist` global configuration command.
## snmp ifindex clear

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>snmp ifindex persist</strong></td>
<td>Enables ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface.</td>

</tr>
</tbody>
</table>
snmp ifindex persist

To enable ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface, use the `snmp ifindex persist` command. To disable ifIndex persistence only on a specific interface, use the `no` form of this command.

```
  snmp ifindex persist

  no snmp ifindex persist
```

### Syntax Description

This command has no arguments or keywords.

### Defaults

Disabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The `snmp ifindex persist` interface configuration command enables and disables ifIndex persistence for individual entries (that correspond to individual interfaces) in the ifIndex table of the IF-MIB.

The `snmp-server ifindex persist` global configuration command enables and disables ifIndex persistence for all interfaces on the routing device. This action applies only to interfaces that have ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

### Examples

This example shows how to enable ifIndex persistence for interface FastEthernet 1/1 only:

```
Router(config)# interface fastethernet 1/1
Router(config-if)# snmp ifindex persist
Router(config-if)# exit
```

This example shows how to enable ifIndex persistence for all interfaces, and then disable ifIndex persistence for interface FastEthernet 1/1 only:

```
Router(config)# snmp-server ifindex persist
Router(config)# interface fastethernet 1/1
Router(config-if)# no snmp ifindex persist
Router(config-if)# exit
```
### snmp ifindex persist

**Description**

Enables ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

snmp-server enable traps

To enable SNMP notifications (traps or informs), use the `snmp-server enable traps` command. To disable all SNMP notifications, use the `no` form of this command.

```
  snmp-server enable traps [snmp [authentication | linkdown | linkup | coldstart | warmstart] |
call-home [message-send-fail | server-fail] | memory | cpu_threshold | rf | fru-ctrl | entity |
erether-oam | flash [insertion | removal] | vtp | vlancreate | vlandelete | auth-framework |
[sec-violation] | dot1x [auth-fail-vlan | guest-vlan | no-auth-fail-vlan | no-guest-vlan] |
envmon [fan | shutdown | supply | temperature | status] | entity-diag | port-security |
[trap-rate] | ethernet [cfm alarm] | energywise | bgp | config | hsrp | bridge [newroot |
topologychange] | stpx [inconsistency | root-inconsistency | loop-inconsistency] | syslog |
vlan-membership | mac-notification [change | move | threshold] | license ]
```

```
  no snmp-server enable traps [snmp | call-home | memory | cpu_threshold | rf | fru-ctrl | entity |
erether-oam | flash [insertion | removal] | vtp | vlancreate | vlandelete | auth-framework |
dot1x | envmon | entity-diag | port-security | [trap-rate] | ethernet [cfm alarm] | energywise |
bgp | config | hsrp | bridge | stpx | syslog | vlan-membership | mac-notification | license ]
```

### Syntax Description

<tr>
<td>IOS XE 3.1.0 SG</td>
<td>Support for cpu_threshold notification was added.</td>
</tr>
</tbody>
</table>

Usage Guidelines
If you enter this command without an option, all notification types controlled by this command are enabled.

SNMP notifications can be sent as traps or inform requests. This command enables both traps and inform requests for the specified notification types. To specify whether the notifications should be sent as traps or informs, use the `snmp-server host [traps | informs]` command.

The `snmp-server enable traps` command is used in conjunction with the `snmp-server host` command. Use the `snmp-server host` command to specify which host or hosts receive SNMP notifications. To send notifications, you must configure at least one `snmp-server host` command.

This list of the MIBs is used for the traps:

- **flash**—Controls SNMP FLASH traps from the CISCO-FLASH-MIB.
  - **insertion**—Controls the SNMP Flash insertion trap notifications.
  - **removal**—Controls the SNMP Flash removal trap notifications.
- **fru-ctrl**—Controls the FRU control traps from the CISCO-ENTITY-FRU-CONTROL-MIB.
- **port-security**—Controls the port-security traps from the CISCO-PORT-SECURITY-MIB.
- **stpx**—Controls all the traps from the CISCO-STP-EXTENSIONS-MIB.
- **vlancreate**—Controls SNMP VLAN created trap notifications.
- **vlandelete**—Controls SNMP VLAN deleted trap notifications.
- **vtp**—Controls the VTP traps from the CISCO-VTP-MIB.
Examples

This example shows how to send all traps to the host is specified by the name myhost.cisco.com using the community string defined as public:

Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
Switch(config)#

This example shows how to enable the MAC address change MIB notification:

Switch(config)# snmp-server enable traps mac-notification change
Switch(config)#

SNMP traps can be enabled with a rate-limit to detect port-security violations due to restrict mode. The following example shows how to enable traps for port-security with a rate of 5 traps per second:

Switch(config)# snmp-server enable traps port-security trap-rate 5
Switch(config)#

snmp-server ifindex persist

To globally enable ifIndex values that will remain constant across reboots for use by SNMP, use the `snmp-server ifindex persist` command. To globally disable ifIndex persistence, use the `no` form of this command.

```
snmp-server ifindex persist
no snmp-server ifindex persist
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Interface index persistence occurs when ifIndex values in the IF-MIB persist across reboots and allow for consistent identification of specific interfaces using SNMP.

The `snmp-server ifindex persist` global configuration command does not override the interface-specific configuration. To override the interface-specific configuration of ifIndex persistence, enter the `no snmp ifindex persist` and `snmp ifindex clear` interface configuration commands.

Entering the `no snmp-server ifindex persist` global configuration command enables and disables ifIndex persistence for all interfaces on the routing device using ifDescr and ifIndex entries in the ifIndex table of the IF-MIB.

**Examples**
This example shows how to enable ifIndex persistence for all interfaces:
```
Router(config)# snmp-server ifindex persist
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>snmp ifindex clear</code></td>
<td>Clears any previously configured <code>snmp ifindex</code> commands that were entered for a specific interface.</td>
</tr>
<tr>
<td><code>snmp ifindex persist</code></td>
<td>Enables ifIndex values in the Interfaces MIB (IF-MIB) that persist across reboots (ifIndex persistence) on a specific interface.</td>
</tr>
</tbody>
</table>
To configure the format of the ifIndex table in a compressed format, use the `snmp-server ifindex persist compress` command. To place the table in a decompressed format, use the `no` form of this command.

```plaintext
snmp-server ifindex persist compress
no snmp-server ifindex persist compress
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
Disabled

### Command Modes
Global configuration mode.

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
This command is hidden on Supervisor Engine V and later supervisor engines because the ifIndex table is always in a compressed format on those supervisor engines.

At bootup, if the nvram:ifIndex-table.gz file (the ifIndex table in a compressed format) is present on a Supervisor Engine II+, Supervisor Engine III, or Supervisor Engine IV, the `snmp-server ifindex persist compress` command is automatically run even if the startup-config file does not have this configuration.

### Examples
This example shows how to enable compression of the ifIndex table:

```
Router(config)# snmp-server ifindex persist compress
```

This example shows how to disable compression of the ifIndex table:

```
Router(config)# no snmp-server ifindex persist compress
```

### Related Commands

snmp trap mac-notification change

To enable SNMP MAC address notifications, use the `snmp trap mac-notification` command. To return to the default setting, use the `no` form of this command.

```
  snmp trap mac-notification change {added | removed}
  no snmp trap mac-notification change {added | removed}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>added</code></td>
<td>Specifies enabling the MAC address notification trap whenever a MAC address is added to an interface.</td>
</tr>
<tr>
<td><code>removed</code></td>
<td>Specifies enabling the MAC address notification trap whenever a MAC address is removed from an interface.</td>
</tr>
</tbody>
</table>

### Defaults

MAC address addition and removal are disabled.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(31)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Even though you enable the change notification trap for a specific interface by using the `snmp trap mac-notification change` command, the trap is generated only when you enable the `snmp-server enable traps mac-notification change` and the `mac address-table notification change` global configuration commands.

### Examples

This example shows how to enable the MAC notification trap when a MAC address is added to a port:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# snmp trap mac-notification change added
```

You can verify your settings by entering the `show mac address-table notification change interface privileged EXEC command`.

### Related Commands

**source-interface**

To send out call home email messages with specific source interface, use the `source-interface` command.

```
source-interface interface name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface name</td>
<td>Source interface name for call home email messages</td>
</tr>
</tbody>
</table>

**Defaults**

None

**Command Modes**

cfg-call-home

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.1.1 SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should configure `no shut` on an interface and provide a valid IP address before specifying it as a source interface for Call Home. Doing this avoids a connection failure when sending Call Home email messages. You should only specify a source interface name under Call Home if source-ip-address is not specified. You can only specify either a source interface or source-ip-address in call-home mode, not simultaneously.

**Examples**

This example shows how to configure source interface for Call Home. Generally, the interface should already be configured with a valid IP address as usually configured for an interface.

```
Switch# config terminal
Switch(config)# call-home
Switch(config-call-home)# source-interface fastEthernet 1/1
Switch(config-call-home)# source-ip
Switch(config-call-home)# source-ip-address 10.2.4.1
Error:a source-interface has already been configured,please remove source-interface config first if you want to configure source-ip-address
Switch(config-call-home)# no source-interface
Switch(config-call-home)# source-ip-address 10.2.4.1
```

**Note**

If Call Home is configured to use http or https as the transport method, you must use `ip http client source-interface` to configure the source interface for all http clients. You cannot specify a source interface for Call Home http messages only.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source-ip-address</td>
<td></td>
</tr>
</tbody>
</table>
## source-ip-address

To send out Call Home email messages with specific source IP address, use the `source-ip-address` command.

```
source-ip-address ip address
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip address</code></td>
<td>Source IP address for Call Home messages.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Defaults</th>
<th>None</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command Modes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cfg-call-home</code></td>
<td></td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.1.1 SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

It is best to configure `no shut` an interface with this valid IP address before specifying it as source-ip-address for Call Home. Doing this avoids a connection failure when sending Call Home email messages. You should only specify source-ip-address under Call Home if source-interface is not specified. You can only specify either source interface or source-ip-address in Call Home mode, not both simultaneously.

### Examples

This example shows how to configure source-ip-address for Call Home:

```
Switch# config terminal
Switch(config)# call-home
Switch(cfg-call-home)# source-interface fastEthernet 1/1
Switch(cfg-call-home)# source-ip
Switch(cfg-call-home)# source-ip-address 10.2.4.1
Error:a source-interface has already been configured,please remove source-interface config first if you want to configure source-ip-address
Switch(cfg-call-home)# no source-interface
Switch(cfg-call-home)# source-ip-address 10.2.4.1
```

---
spanning-tree backbonefast

To enable BackboneFast on a spanning-tree VLAN, use the `spanning-tree backbonefast` command. To disable BackboneFast, use the `no` form of this command.

```
spanning-tree backbonefast
no spanning-tree backbonefast
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
BackboneFast is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
BackboneFast should be enabled on all Catalyst 4506 series switches to allow the detection of indirect link failures. Enabling BackboneFast starts the spanning-tree reconfiguration more quickly.

**Examples**
This example shows how to enable BackboneFast on all VLANs:

```
Switch(config)# spanning-tree backbonefast
Switch(config)#
```

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use care when entering the `spanning-tree bpdufilter enable` command. Enabling BPDU filtering on an interface is approximately equivalent to disabling the spanning tree for this interface. It is possible to create bridging loops if this command is not correctly used.

When configuring Layer 2 protocol tunneling on all the service provider edge switches, you must enable spanning-tree BPDU filtering on the 802.1Q tunnel ports by entering the `spanning-tree bpdufilter enable` command.

BPDU filtering allows you to prevent a port from sending and receiving BPDUs. The configuration is applicable to the whole interface, whether it is trunking or not. This command has three states:

- **spanning-tree bpdufilter enable**—This state unconditionally enables the BPDU filter feature on the interface.
- **spanning-tree bpdufilter disable**—This state unconditionally disables the BPDU filter feature on the interface.
- **no spanning-tree bpdufilter**—This state enables the BPDU filter feature on the interface if the interface is in operational PortFast state and if the `spanning-tree portfast bpdufilter default` command is configured.
This example shows how to enable the BPDU filter feature on this interface:

Switch(config-if)# spanning-tree bpdufilter enable
Switch(config-if)#

spanning-tree bpduguard

To enable BPDU guard on an interface, use the `spanning-tree bpduguard` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree bpduguard { enable | disable }
no spanning-tree bpduguard
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BPDU guard on this interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BPDU guard on this interface.</td>
</tr>
</tbody>
</table>

**Defaults**

BPDU guard is disabled.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

BPDU guard is a feature that prevents a port from receiving BPDUs. This feature is typically used in a service provider environment where the administrator wants to prevent an access port from participating in the spanning tree. If the port still receives a BPDU, it is put in the ErrDisable state as a protective measure. This command has three states:

- **spanning-tree bpduguard enable**—This state unconditionally enables BPDU guard on the interface.
- **spanning-tree bpduguard disable**—This state unconditionally disables BPDU guard on the interface.
- **no spanning-tree bpduguard**—This state enables BPDU guard on the interface if it is in the operational PortFast state and if the `spanning-tree portfast bpduguard default` command is configured.

**Examples**

This example shows how to enable BPDU guard on this interface:

```
Switch(config-if)# spanning-tree bpduguard enable
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show spanning-tree</code></td>
<td>Displays spanning-tree information.</td>
</tr>
<tr>
<td><code>spanning-tree portfast bpdufilter default</code></td>
<td>Enables the BPDU filtering by default on all PortFast ports.</td>
</tr>
</tbody>
</table>
spanning-tree cost

To calculate the path cost of STP on an interface, use the **spanning-tree cost** command. To revert to the default, use the **no** form of this command.

```
spanning-tree cost cost
no spanning-tree cost cost
```

**Syntax Description**

<table>
<thead>
<tr>
<th>cost</th>
<th>Path cost; valid values are from 1 to 200,000,000.</th>
</tr>
</thead>
</table>

**Defaults**

The default settings are as follows:

- FastEthernet—19
- GigabitEthernet—1

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you configure the cost, the higher values indicate higher costs. The range applies regardless of the protocol type that is specified. The path cost is calculated, based on the interface bandwidth.

**Examples**

This example shows how to access an interface and set a path cost value of 250 for the spanning-tree VLAN that is associated with that interface:

```
Switch(config)# interface fastethernet 2/1
Switch(config-if)# spanning-tree cost 250
Switch(config-if)#
```

spanning-tree etherchannel guard misconfig

To display an error message when a loop due to a channel misconfiguration is detected, use the `spanning-tree etherchannel guard misconfig` command. To disable the feature, use the `no` form of this command.

```
spanning-tree etherchannel guard misconfig
no spanning-tree etherchannel guard misconfig
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Spanning-tree EtherChannel guard is enabled.

**Command Modes**
Global configuration mode

**Command History**
```
Release     Modification
T2.1(8a)EW  Support for this command was introduced on the Catalyst 4500 series switch.
```

**Usage Guidelines**
When an EtherChannel guard misconfiguration is detected, this message is displayed:

```
%SPANTREE-2-CHNL_MISCFG:Detected loop due to etherchannel misconfig of interface Port-Channel1
```

To determine which local ports are involved in the misconfiguration, enter the `show interfaces status err-disabled` command. To verify the EtherChannel configuration on the remote device, enter the `show etherchannel summary` command on the remote device.

After you correct the configuration, enter the `shutdown` and the `no shutdown` commands on the associated port-channel interface.

**Examples**
This example shows how to enable the EtherChannel guard misconfiguration feature:

```
Switch(config)# spanning-tree etherchannel guard misconfig
```

**Related Commands**
<table>
<thead>
<tr>

</table>
spanning-tree extend system-id

To enable the extended system ID feature on a chassis that supports 1024 MAC addresses, use the `spanning-tree extend system-id` command. To disable the feature, use the `no` form of this command.

```
spanning-tree extend system-id
no spanning-tree extend system-id
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled on systems that do not provide 1024 MAC addresses.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Releases 12.1(13)E and later support chassis with 64 or 1024 MAC addresses. For chassis with 64 MAC addresses, STP uses the extended system ID plus a MAC address to make the bridge ID unique for each VLAN.

You cannot disable the extended system ID on chassis that support 64 MAC addresses.

Enabling or disabling the extended system ID updates the bridge IDs of all active STP instances, which might change the spanning-tree topology.

**Examples**
This example shows how to enable the extended system ID:

```
Switch(config)# spanning-tree extend system-id
Switch(config)#
```

**Related Commands**

</table>
spanning-tree link-type

To configure a link type for a port, use the `spanning-tree link-type` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree link-type {point-to-point | shared}
no spanning-tree link-type
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>point-to-point</th>
<th>Specifies that the interface is a point-to-point link.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>shared</td>
<td>Specifies that the interface is a shared medium.</td>
</tr>
</tbody>
</table>

**Defaults**
Link type is derived from the duplex mode.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
RSTP+ fast transition works only on point-to-point links between two bridges.
By default, the switch derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link.
If you designate a port as a shared link, RSTP+ fast transition is forbidden, regardless of the duplex setting.

**Examples**
This example shows how to configure the port as a shared link:
```
Switch(config-if)# spanning-tree link-type shared
Switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>show spanning-tree</td>
<td>Displays spanning-tree information.</td>
</tr>
</tbody>
</table>
spanning-tree loopguard default

To enable loop guard as the default on all ports of a specific bridge, use the `spanning-tree loopguard default` command. To disable loop guard, use the `no` form of this command.

```
spanning-tree loopguard default
no spanning-tree loopguard default
```

**Syntax Description**
This command has no keywords or arguments.

**Defaults**
Loop guard is disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Loop guard provides an additional security in the bridge network. Loop guard prevents alternate or root ports from becoming the designated port because of a failure leading to a unidirectional link.

Loop guard operates only on ports that are considered point-to-point by the spanning tree. Individual loop-guard port configuration overrides this global default.

**Examples**
This example shows how to enable loop guard:
```
Switch(config)# spanning-tree loopguard default
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>spanning-tree guard</td>
<td>Enables root guard.</td>
</tr>
<tr>
<td>show spanning-tree</td>
<td>Displays spanning-tree information.</td>
</tr>
</tbody>
</table>
spanning-tree mode

To switch between PVST+ and MST modes, use the `spanning-tree mode` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mode { pvst | mst | rapid-pvst }
no spanning-tree mode { pvst | mst | rapid-pvst }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pvst</code></td>
<td>Specifies PVST+ mode.</td>
</tr>
<tr>
<td><code>mst</code></td>
<td>Specifies MST mode.</td>
</tr>
<tr>
<td><code>rapid-pvst</code></td>
<td>Specifies Rapid PVST mode.</td>
</tr>
</tbody>
</table>

### Defaults

PVST+ mode

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(19)EW</td>
<td>Support for the <code>rapid-pvst</code> keyword.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

⚠️ **Caution**

Be careful when using the `spanning-tree mode` command to switch between PVST+ and MST modes. When you enter the command, all spanning-tree instances are stopped for the previous mode and restarted in the new mode. Using this command may cause disruption of user traffic.

### Examples

This example shows how to switch to MST mode:

```
Switch(config)# spanning-tree mode mst
Switch(config)#
```

This example shows how to return to the default mode (PVST):

```
Switch(config)# no spanning-tree mode
Switch(config)#
```

### Related Commands

<td><code>show spanning-tree mst</code></td>
<td>Displays MST protocol information.</td>
</tr>
</tbody>
</table>
spanning-tree mst

To set the path cost and port-priority parameters for any MST instance (including the CIST with instance ID 0), use the spanning-tree mst command. To return to the default settings, use the no form of this command.

```
spanning-tree mst instance-id [cost cost] | [port-priority prio]
```

```
no spanning-tree mst instance-id {cost | port-priority}
```

**Syntax Description**

- **instance-id**: Instance ID number; valid values are from 0 to 15.
- **cost**: (Optional) Specifies the path cost for an instance; valid values are from 1 to 200000000.
- **port-priority**: (Optional) Specifies the port priority for an instance; valid values are from 0 to 240 in increments of 16.

**Defaults**

Port priority is **128**.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 12.1(12c)EW | Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

The higher **cost** values indicate higher costs. When entering the **cost** value, do not include a comma in the entry; for example, enter **1000**, not **1,000**.

The higher **port-priority** values indicate smaller priorities.

By default, the cost depends on the port speed; faster interface speeds indicate smaller costs. MST always uses long path costs.

**Examples**

This example shows how to set the interface path cost:

```
Switch(config-if)# spanning-tree mst 0 cost 17031970
Switch(config-if)#
```

This example shows how to set the interface priority:

```
Switch(config-if)# spanning-tree mst 0 port-priority 64
Switch(config-if)#
```
### Related Commands

spanning-tree mst configuration

To enter the MST configuration submode, use the `spanning-tree mst configuration` command. To return to the default MST configuration, use the `no` form of this command.

```
spanning-tree mst configuration
no spanning-tree mst configuration
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The default settings are as follows:
- No VLANs are mapped to any MST instance.
- All VLANs are mapped to the CIST instance.
- The region name is an empty string.
- The revision number is 0.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The MST configuration consists of three main parameters:
- Instance VLAN mapping (see the `instance` command)
- Region name (see the `name` command)
- Configuration revision number (see the `revision` command)

By default, the value for the MST configuration is the default value for all its parameters.

The `abort` and `exit` commands allow you to exit the MST configuration submode. The difference between the two commands depends on whether you want to save your changes or not.

The `exit` command commits all the changes before leaving the MST configuration submode. If you do not map the secondary VLANs to the same instance as the associated primary VLAN, when you exit the MST configuration submode, a message displays and lists the secondary VLANs that are not mapped to the same instance as the associated primary VLAN. The message is as follows:

```
These secondary vlans are not mapped to the same instance as their primary:
   ->3
```

The `abort` command leaves the MST configuration submode without committing any changes.
Whenever you change an MST configuration submode parameter, it can cause a loss of connectivity. To reduce the number of service disruptions, when you enter the MST configuration submode, you are changing a copy of the current MST configuration. When you are done editing the configuration, you can apply all the changes at once by using the `exit` keyword, or you can exit the submode without committing any change to the configuration by using the `abort` keyword.

In the unlikely event that two users enter a new configuration at exactly the same time, this message is displayed:

```
Switch(config-mst)# exit
% MST CFG:Configuration change lost because of concurrent access
Switch(config-mst)#
```

**Examples**

This example shows how to enter the MST configuration submode:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)#
```

This example shows how to reset the MST configuration to the default settings:

```
Switch(config)# no spanning-tree mst configuration
Switch(config)#
```

</tr>
<tr>
<td>primary</td>
<td>Sets a high enough priority (low value) to make the bridge root of the spanning-tree instance.</td>
</tr>
<tr>
<td>secondary</td>
<td>Designates this switch as a secondary root if the primary root fails.</td>
</tr>
<tr>
<td>priority prio</td>
<td>Sets the bridge priority; see the “Usage Guidelines” section for valid values and additional information.</td>
</tr>
<tr>
<td>diameter dia</td>
<td>(Optional) Sets the timer values for the bridge based on the network diameter; valid values are from 2 to 7.</td>
</tr>
<tr>
<td>hello-time hello</td>
<td>(Optional) Specifies the duration between the generation of configuration messages by the root switch.</td>
</tr>
</tbody>
</table>

**Defaults**

Bridge priority is 32768.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The bridge priority can be set in increments of 4096 only. When you set the priority, valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

You can set the priority to 0 to make the switch root.

The spanning-tree root secondary bridge priority value is 16384.

The diameter dia and hello-time hello options are available for instance 0 only.

If you do not specify the hello_time value, the value is calculated from the network diameter.
spanning-tree mst root

Examples
This example shows how to set the priority and timer values for the bridge:

```plaintext
Switch(config)# spanning-tree mst 0 root primary diameter 7 hello-time 2
Switch(config)# spanning-tree mst 5 root primary
Switch(config)#
```

Related Commands

</table>
spanning-tree pathcost method

To set the path cost calculation method, use the `spanning-tree pathcost method` command. To revert to the default setting, use the `no` form of this command.

```
spanning-tree pathcost method {long | short}
no spanning-tree pathcost method
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>Specifies 32-bit-based values for port path costs.</td>
</tr>
<tr>
<td>short</td>
<td>Specifies 16-bit-based values for port path costs.</td>
</tr>
</tbody>
</table>

**Defaults**

Port path cost has 16-bit-based values.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command applies to all the spanning-tree instances on the switch.

The `long` path cost calculation method uses all the 32 bits for path cost calculation and yields values in the range of 1 through 200,000,000.

The `short` path cost calculation method (16 bits) yields values in the range of 1 through 65,535.

**Examples**

This example shows how to set the path cost calculation method to long:

```
Switch(config) spanning-tree pathcost method long
```

This example shows how to set the path cost calculation method to short:

```
Switch(config) spanning-tree pathcost method short
```

<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables PortFast on the interface.</td>
</tr>
<tr>
<td>trunk</td>
<td>Enables PortFast on the interface even while in the trunk mode.</td>
</tr>
</tbody>
</table>

Defaults

PortFast mode is disabled.

Command Modes

Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>The disable and trunk options were added.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You should use this feature only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

Be careful when using the no spanning-tree portfast command. This command does not disable PortFast if the spanning-tree portfast default command is enabled.

This command has four states:

- **spanning-tree portfast**—This command enables PortFast unconditionally on the given port.
- **spanning-tree portfast disable**—This command explicitly disables PortFast for the given port. The configuration line shows up in the running-configuration as it is not the default.
- **spanning-tree portfast trunk**—This command allows you to configure PortFast on trunk ports.

**Note**

If you enter the spanning-tree portfast trunk command, the port is configured for PortFast even when in the access mode.
• **no spanning-tree portfast**—This command implicitly enables PortFast if the `spanning-tree portfast default` command is defined in global configuration and if the port is not a trunk port. If you do not configure PortFast globally, the `no spanning-tree portfast` command is equivalent to the `spanning-tree portfast disable` command.

### Examples

This example shows how to enable PortFast mode:

```
Switch(config-if)# spanning-tree portfast
Switch(config-if)
```

spanning-tree portfast bpdufilter default

To enable the BPDU filtering by default on all PortFast ports, use the `spanning-tree portfast bpdufilter default` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree portfast bpdufilter default

no spanning-tree portfast bpdufilter default
```

**Syntax Description**

This command has no keywords or arguments.

**Defaults**

BPDU filtering is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `spanning-tree portfast bpdufilter default` command enables BPDU filtering globally on the Catalyst 4500 series switch. BPDU filtering prevents a port from sending or receiving any BPDUs.

You can override the effects of the `spanning-tree portfast bpdufilter default` command by configuring BPDU filtering at the interface level.

**Note**

Be careful when enabling BPDU filtering. Functionality is different when enabling on a per-port basis or globally. When enabled globally, BPDU filtering is applied only on ports that are in an operational PortFast state. Ports still send a few BPDUs at linkup before they effectively filter outbound BPDUs. If a BPDU is received on an edge port, it immediately loses its operational PortFast status and BPDU filtering is disabled.

When enabled locally on a port, BPDU filtering prevents the Catalyst 4500 series switch from receiving or sending BPDUs on this port.

**Caution**

Be careful when using this command. This command can cause bridging loops if not used correctly.

**Examples**

This example shows how to enable BPDU filtering by default:

```
Switch(config)# spanning-tree portfast bpdufilter default
Switch(config)#
```
<table>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**
Be careful when using this command. You should use this command only with the interfaces that connect to the end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

BPDU guard disables a port if it receives a BPDU. BPDU guard is applied only on ports that are PortFast enabled and are in an operational PortFast state.

**Examples**

This example shows how to enable BPDU guard by default:

```
Switch(config)# spanning-tree portfast bpduguard default
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>

spanning-tree portfast default

To globally enable PortFast by default on all access ports, use the `spanning-tree portfast default` command. To disable PortFast as default on all access ports, use the `no` form of this command.

```
spanning-tree portfast default
no spanning-tree portfast default
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

PortFast is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

⚠️ **Caution**

Be careful when using this command. You should use this command only with the interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data packet loop and disrupt the Catalyst 4500 series switch and network operation.

An interface with PortFast mode enabled is moved directly to the spanning-tree forwarding state when linkup occurs without waiting for the standard forward-time delay.

You can enable PortFast mode on individual interfaces using the `spanning-tree portfast (interface configuration mode)` command.

**Examples**

This example shows how to globally enable PortFast by default on all access ports:

```
Switch(config)# spanning-tree portfast default
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td><code>spanning-tree portfast (interface configuration mode)</code></td>
<td>Enables PortFast mode.</td>
</tr>
</tbody>
</table>
spanning-tree port-priority

To prioritize an interface when two bridges compete for position as the root bridge, use the `spanning-tree port-priority` command. The priority you set breaks the tie. To revert to the default setting, use the `no` form of this command.

```
spanning-tree port-priority port_priority

no spanning-tree port-priority
```

**Syntax Description**

| `port_priority` | Port priority; valid values are from 0 to 240 in increments of 16. |

**Defaults**

Port priority value is set to 128.

**Command Modes**

Interface configuration mode

**Command History**

spanning-tree uplinkfast

To enable the UplinkFast feature, use the `spanning-tree uplinkfast` command. To disable UplinkFast, use the `no` form of this command.

```
spanning-tree uplinkfast [max-update-rate packets-per-second]
no spanning-tree uplinkfast [max-update-rate]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-update-rate</td>
<td>Specifies the maximum rate (in packets per second) at which update packets are sent; valid values are from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- Disabled.
- Maximum update rate is 150.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command should be used only on access switches.

When UplinkFast is configured, the bridge priority is changed to 49,152 so that this switch will not be selected as root. All interface path costs of all spanning-tree interfaces belonging to the specified spanning-tree instances are also increased by 3000.

When spanning tree detects that the root interface has failed, the UplinkFast feature causes an immediate switchover to an alternate root interface, transitioning the new root interface directly to the forwarding state. During this time, a topology change notification is sent. To minimize the disruption caused by the topology change, a multicast packet is sent to 01-00-0C-CD-CD-CD for each station address in the forwarding bridge except for those associated with the old root interface.

Use the `spanning-tree uplinkfast max-update-rate` command to enable UplinkFast (if not already enabled) and change the rate at which the update packets are sent. Use the `no` form of this command to return the default rate of 150 packets per second.

**Examples**

This example shows how to enable UplinkFast and set the maximum rate to 200 packets per second:

```
Switch(config)# spanning-tree uplinkfast
Switch(config)# spanning-tree uplinkfast max-update-rate 200
```
### Related Commands

</tr>
</tbody>
</table>
**spanning-tree vlan**

To configure STP on a per-VLAN basis, use the `spanning-tree vlan` command. To return to the default value, use the `no` form of this command.

```
spanning-tree vlan vlan_id [forward-time seconds | hello-time seconds | max-age seconds | priority priority | protocol protocol | root {primary | secondary} [diameter net-diameter [hello-time seconds]]]
```

```
no spanning-tree vlan vlan_id [forward-time | hello-time | max-age | priority | root]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vlan_id</td>
<td>VLAN identification number; valid values are from 1 to 4094.</td>
</tr>
<tr>
<td>forward-time</td>
<td>(Optional) Sets the STP forward delay time; valid values are from 4 to 30 seconds.</td>
</tr>
<tr>
<td>hello-time</td>
<td>(Optional) Specifies, in seconds, the time between configuration messages generated by the root switch; valid values are from 1 to 10 seconds.</td>
</tr>
<tr>
<td>max-age</td>
<td>(Optional) Sets the maximum time, in seconds, that the information in a BPDU is valid; valid values are from 6 to 40 seconds.</td>
</tr>
<tr>
<td>priority</td>
<td>(Optional) Sets the STP bridge priority; valid values are from 0 to 65535.</td>
</tr>
<tr>
<td>protocol</td>
<td>(Optional) Specifies the protocol.</td>
</tr>
<tr>
<td>root</td>
<td>(Optional) Forces this switch to be the root bridge.</td>
</tr>
<tr>
<td>root secondary</td>
<td>(Optional) Specifies this switch act as the root switch should the primary root fail.</td>
</tr>
<tr>
<td>diameter</td>
<td>(Optional) Specifies the maximum number of bridges between two end stations; valid values are from 2 to 7.</td>
</tr>
</tbody>
</table>

### Defaults

The default settings are as follows:

- **Forward-time**—15 seconds
- **Hello-time**—2 seconds
- **Max-age**—20 seconds
- **Priority**—32768 with STP enabled; 128 with MST enabled
- **Root**—No STP root

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch..</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>
When you are setting the `max-age seconds` value, if a bridge does not hear BPDUs from the root bridge within the specified interval, it assumes that the network has changed and recomputes the spanning-tree topology.

The `spanning-tree root primary` command alters the switch bridge priority to 8192. If you enter the `spanning-tree root primary` command and the switch does not become root, then the bridge priority is changed to 100 less than the bridge priority of the current bridge. If the switch does not become root, an error will result.

The `spanning-tree root secondary` command alters the switch bridge priority to 16384. If the root switch fails, this switch becomes the next root switch.

Use the `spanning-tree root` commands on backbone switches only.

This example shows how to enable spanning tree on VLAN 200:

```
Switch(config)# spanning-tree vlan 200
Switch(config)#
```

This example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:

```
Switch(config)# spanning-tree vlan 10 root primary diameter 4
Switch(config)#
```

This example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:

```
Switch(config)# spanning-tree vlan 10 root secondary diameter 4
Switch(config)#
```

</tr>
<tr>
<td>12.2(20)EWA</td>
<td>Support for auto negotiating specific speeds added.</td>
</tr>
</tbody>
</table>
Table 2-32 lists the supported command options by interface.

<table>
<thead>
<tr>
<th>Interface Type</th>
<th>Supported Syntax</th>
<th>Default Setting</th>
<th>Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100-Mbps module</td>
<td>speed [10</td>
<td>100</td>
<td>auto]</td>
</tr>
<tr>
<td>100-Mbps fiber</td>
<td>Not applicable.</td>
<td>Not applicable.</td>
<td>Not applicable.</td>
</tr>
<tr>
<td>modules</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Gigabit Ethernet</td>
<td>speed nonnegotiate</td>
<td>nonnegotiate is enabled.</td>
<td>This is only applicable to Gigabit Ethernet ports.</td>
</tr>
<tr>
<td>Interface</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>10/100/1000</td>
<td>speed [10</td>
<td>100</td>
<td>1000</td>
</tr>
<tr>
<td>1000</td>
<td>Not applicable.</td>
<td>Not applicable.</td>
<td>The speed is always 1000. The duplex is half.</td>
</tr>
</tbody>
</table>

If you configure the interface speed and duplex commands manually and enter a value other than speed auto (for example, 10 or 100 Mbps), make sure that you configure the connecting interface speed command to a matching speed but do not use the auto parameter.

When manually configuring the interface speed to either 10 or 100 Mbps, the switch prompts you to also configure duplex mode on the interface.

**Note**

Catalyst 45006 switches cannot automatically negotiate the interface speed and the duplex mode if either connecting interface is configured to a value other than auto.

**Caution**

Changing the interface speed and the duplex mode configuration might shut down and reenable the interface during the reconfiguration.

Table 2-33 describes the system’s performance for different combinations of the duplex and speed modes. The specified duplex command that is configured with the specified speed command produces the resulting system action.
Chapter 2  Cisco IOS Commands for the Catalyst 4500 Series Switches

Table 2-33  System Action Using duplex and speed Commands

<table>
<thead>
<tr>
<th>duplex Command</th>
<th>speed Command</th>
<th>Resulting System Action</th>

<tr>
<td>duplex half</td>
<td>speed 10</td>
<td>Forces 10 Mbps and half duplex</td>
</tr>
<tr>
<td>duplex full</td>
<td>speed 10</td>
<td>Forces 10 Mbps and full duplex</td>
</tr>
<tr>
<td>duplex full</td>
<td>speed 100</td>
<td>Forces 100 Mbps and half duplex</td>
</tr>
<tr>
<td>duplex full</td>
<td>speed 1000</td>
<td>Forces 1000 Mbps and full duplex</td>
</tr>
</tbody>
</table>

Examples

This example shows how to set the interface speed to 100 Mbps on the Fast Ethernet interface 5/4:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed 100
```

This example shows how to allow Fast Ethernet interface 5/4 to autonegotiate the speed and duplex mode:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed auto
```

Note

The `speed auto 10 100` command is similar to the `speed auto` command on a Fast Ethernet interface.

This example shows how to limit the interface speed to 10 and 100 Mbps on the Gigabit Ethernet interface 1/1 in auto-negotiation mode:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 10 100
```

This example shows how to limit the speed negotiation to 100 Mbps on the Gigabit Ethernet interface 1/1:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 100
```

storm-control

To enable broadcast storm control on a port and to specify what to do when a storm occurs on a port, use the storm-control interface configuration command. To disable storm control for the broadcast traffic and to disable a specified storm-control action, use the no form of this command.

storm-control {broadcast level high level [lower level]} | action {shutdown | trap}}

no storm-control {broadcast level level [lower level]} | action {shutdown | trap}}

Syntax Description

| broadcast | Enables the broadcast storm control on the port. |
| level high-level lower-level | Defines the rising and falling suppression levels: |
| action | Directs the switch to take action when a storm occurs on a port. |
| shutdown | Disables the port during a storm. |
| trap | Sends an SNMP trap when a storm occurs. This keyword is available but not supported in 12.1(19)EW. |

Defaults

Broadcast storm control is disabled.

Command Modes

Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support for the Supervisor Engine 6-E and Catalyst 4900M chassis is introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Enter the storm-control broadcast level command to enable traffic storm control on the interface, configure the traffic storm control level, and apply the traffic storm control level to the broadcast traffic on the interface.

The Catalyst 4500 series switch supports broadcast traffic storm control on all LAN ports.

The period is required when you enter the fractional suppression level.

The suppression level is entered as a percentage of the total bandwidth. A threshold value of 100 percent indicates that no limit is placed on traffic. A value of 0.0 means that all specified traffic on that port is blocked.
Enter the `show interfaces counters storm-control` command to display the discard count.

Enter the `show running-config` command to display the enabled suppression mode and level setting.

To turn off suppression for the specified traffic type, you can do one of the following:

- Set the `high-level` value to 100 percent for the specified traffic type.
- Use the `no` form of this command.

The lower level is ignored for the interfaces that perform storm control in the hardware.

---

**Note**

The `lower level` keyword does not apply to the Supervisor Engine 6-E and Catalyst 4900M chassis implementations.

---

**Examples**

This example shows how to enable broadcast storm control on a port with a 75.67 percent rising suppression level:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control broadcast level 75.67
Switch(config-if)# end
```

This example shows how to disable the port during a storm:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control action shutdown
Switch(config-if)# end
```

This example shows how to disable storm control on a port:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# no storm-control broadcast level
Switch(config-if)# end
```

This example shows how to disable storm control by setting the high level to 100 percent:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/1
Switch(config-if)# storm-control broadcast level 100
Switch(config-if)# end
```

---

storm-control broadcast include multicast

To enable multicast storm control on a port, use the **storm-control broadcast include multicast** command. To disable multicast storm control, use the **no** form of this command.

```
storm-control broadcast include multicast

no storm-control broadcast include multicast
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Multicast storm control is disabled.

**Command Modes**
- Global configuration mode
- Interface configuration mode on a Supervisor Engine 6-E and Catalyst 4900M chassis

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(40)SG</td>
<td>Support introduced for Supervisor Engine 6-E and the Catalyst 4900M.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command prompts the hardware to filter multicast packets if it is already filtering broadcast packets.

The Catalyst 4500 series switch supports per-interface multicast suppression. When you enable multicast suppression on an interface you subject incoming multicast and broadcast traffic on that interface to suppression.

**Examples**
This example shows how to enable multicast storm control globally:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# storm-control broadcast include multicast
Switch(config)# end
```

This example shows how to enable per-port Multicast storm control on a Supervisor Engine 6-E:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet2/4
Switch(config-if)# storm-control broadcast include multicast
Switch(config-if)# end
```

**Related Commands**

subscribe-to-alert-group all

To subscribe to all available alert groups, use the `subscribe-to-alert-group all` command.

```
subscribe-to-alert-group all
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

This command has no default settings.

**Command Modes**

cfg-call-home-profile

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

**Examples**

This example shows how to subscribe to all available alert groups:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group all
```

subscribe-to-alert-group all

subscribe-to-alert-group inventory
Subscribes this destination profile to the Inventory alert group.

subscribe-to-alert-group syslog
Subscribes this destination profile to the Syslog alert group.
subscribe-to-alert-group configuration

To subscribe a destination profile to the Configuration alert group, use the subscribe-to-alert-group configuration command.

```
subscribe-to-alert-group configuration [periodic {daily hh:mm | monthly date hh:mm | weekly day hh:mm}]
```

**Syntax Description**

- **periodic** (Optional) Specifies a periodic call-home message.
- **daily hh:mm** Sets a daily alert in hours and minutes.
- **monthly date hh:mm** Sets a monthly alert in day, hour, and minute.
- **weekly day hh:mm** Sets a weekly alert in day, hour, and minutes.

**Defaults**

This command has no default settings.

**Command Modes**

`cfg-call-home-profile`

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>
<td>Support was introduced on the Catalyst 4500 series switches.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

The Configuration alert group can be configured for periodic notification.

**Examples**

This example shows how to configure periodic "configuration" alert-group:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group configuration periodic weekly Tuesday 21:16
```

subscribe-to-alert-group diagnostic

To subscribe a destination profile to the Diagnostic alert group, use the `subscribe-to-alert-group diagnostic` command.

```
subscribe-to-alert-group diagnostic [severity catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal | debugging]
```

**Syntax Description**

- **severity catastrophic** (Optional) Specifies network wide catastrophic failure (highest severity).
- **disaster** (Optional) Specifies significant network impact.
- **fatal** (Optional) Specifies that the system is unusable (system log level 0).
- **critical** (Optional) Specifies that immediate attention is needed (system log level 1).
- **major** (Optional) Specifies a major condition (System log level 2).
- **minor** (Optional) Specifies a minor condition (System log level 3).
- **warning** (Optional) Specifies a warning condition (System log level 4).
- **notification** (Optional) Specifies an informational message (System log level 5).
- **normal** (Optional) Specifies returning to a normal state (System log level 6).
- **debugging** (Optional) Specifies a debugging message (Lowest severity).

**Defaults**

normal

**Command Modes**

cfg-call-home-profile

**Command History**

<table>

</tbody>
</table>

**Usage Guidelines**

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

**Examples**

This example shows how to configure the "diagnostic" alert-group with "normal" severity:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group diagnostic severity normal
```

subscribe-to-alert-group environment

To subscribe a destination profile to the Environment alert group, use the `subscribe-to-alert-group environment` command.

```
subscribe-to-alert-group environment [severity catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal | debugging]
```

**Syntax Description**
- `severity catastrophic` (Optional) Specifies network wide catastrophic failure (highest severity).
- `disaster` (Optional) Specifies significant network impact.
- `fatal` (Optional) Specifies that the system is unusable (system log level 0).
- `critical` (Optional) Specifies that immediate attention is needed (system log level 1).
- `major` (Optional) Specifies a major condition (System log level 2).
- `minor` (Optional) Specifies a minor condition (System log level 3).
- `warning` (Optional) Specifies a warning condition (System log level 4).
- `notification` (Optional) Specifies an informational message (System log level 5).
- `normal` (Optional) Specifies returning to a normal state (System log level 6).
- `debugging` (Optional) Specifies a debugging message (Lowest severity).

**Defaults**
- `normal`

**Command Modes**
- `cfg-call-home-profile`

**Command History**

</tr>
<tr>
<td>weekly day hh:mm</td>
<td>Sets a weekly alert in day, hour, and minutes.</td>
</tr>
</tbody>
</table>

### Defaults

This command has no default settings.

### Command Modes

cfg-call-home-profile

### Command History

```
Release       Modification
------------- ----------------
12.2(52)SG    Support was introduced on the Catalyst 4500 series switches.
```

### Usage Guidelines

To enter profile call-home configuration submode, use the `profile` command in call-home configuration mode.

The Inventory alert group can be configured for periodic notification.

### Examples

This example shows how to configure the Inventory alert group with periodic daily alert at 21:12:

Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group inventory periodic daily 21:12

subscribe-to-alert-group syslog

To subscribe this destination profile to the Syslog alert group, use the subscribe-to-alert-group syslog command.

```
subscribe-to-alert-group syslog [severity catastrophic | disaster | fatal | critical | major | minor | warning | notification | normal | debugging | pattern string]
```

### Syntax Description

- **severity catastrophic**: (Optional) Specifies network wide catastrophic failure (highest severity).
- **disaster**: (Optional) Specifies significant network impact.
- **fatal**: (Optional) Specifies that the system is unusable (system log level 0).
- **critical**: (Optional) Specifies that immediate attention is needed (system log level 1).
- **major**: (Optional) Specifies a major condition (System log level 2).
- **minor**: (Optional) Specifies a minor condition (System log level 3).
- **warning**: (Optional) Specifies a warning condition (System log level 4).
- **notification**: (Optional) Specifies an informational message (System log level 5).
- **normal**: (Optional) Specifies returning to a normal state (System log level 6).
- **debugging**: (Optional) Specifies a debugging message (Lowest severity).

### Defaults

- normal

### Command Modes

- cfg-call-home-profile

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(52)SG</td>

</tbody>
</table>

### Usage Guidelines

To enter profile call-home configuration submode, use the **profile** command in call-home configuration mode.

You can configure the Syslog alert group can be configured to filter messages based on severity by specifying a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (""").

### Examples

This example shows how to configure the syslog alert group with severity notification:

```
Switch(config)# call-home
Switch(cfg-call-home)# profile cisco
Switch(cfg-call-home-profile)# subscribe-to-alert-group syslog severity notification pattern "UPDOWN"
```

# switchport

To modify the switching characteristics of a Layer 2 switch interface, use the `switchport` command. To return the interface to the routed-interface status and cause all further Layer 2 configuration to be erased, use the `no` form of this command without parameters.

```plaintext
switchport [access vlan vlan_num] | [nonegotiate] | [voice vlan [vlan_id | dot1p | none | untagged]]

no switchport [access | nonegotiate | voice vlan]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access vlan vlan_num</code></td>
<td>(Optional) Sets the VLAN when the interface is in access mode; valid values are from 1 to 1005.</td>
</tr>
<tr>
<td><code>nonegotiate</code></td>
<td>(Optional) Specifies that the DISL/DTP negotiation packets will not be sent on the interface.</td>
</tr>
<tr>
<td><code>voice vlan vlan_id</code></td>
<td>(Optional) Specifies the number of the VLAN; valid values are from 1 to 1005.</td>
</tr>
<tr>
<td><code>dot1p</code></td>
<td>(Optional) Specifies that the PVID packets are tagged as priority.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>(Optional) Specifies that the telephone and voice VLAN do not communicate.</td>
</tr>
<tr>
<td><code>untagged</code></td>
<td>(Optional) Specifies the untagged PVID packets.</td>
</tr>
</tbody>
</table>

## Defaults

The default settings are as follows:

- Switchport trunking mode is enabled.
- Dynamic negotiation parameter is set to auto.
- Access VLANs and trunk interface native VLANs are a default VLAN corresponding to the platform or interface hardware.
- All VLAN lists include all VLANs.
- No voice VLAN is enabled.

## Command Modes

Interface configuration mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(11)EW</td>
<td>Support for voice VLAN was added.</td>
</tr>
</tbody>
</table>
The **no switchport** command shuts the port down and then reenables it, which may generate messages on the device to which the port is connected.

The **no** form of the **switchport access** command resets the access mode VLAN to the appropriate default VLAN for the device. The **no** form of the **switchport nonegotiate** command removes the **nonegotiate** status.

When you are using the **nonegotiate** keyword, DISL/DTP negotiation packets will not be sent on the interface. The device will trunk or not trunk according to the **mode** parameter given: **access** or **trunk**. This command will return an error if you attempt to execute it in **dynamic** (**auto** or **desirable**) mode.

The voice VLAN is automatically set to VLAN 1 unless you use one of the optional keywords.

If you use the **switch port voice vlan** command for an interface, the interface cannot join a port channel.

When you use the **switchport voice vlan** command, the output for the **show running-config** command changes to show the voice VLAN set.

### Examples

This example shows how to cause the port interface to stop operating as a Cisco-routed port and convert to a Layer 2-switched interface:

```
Switch(config-if)# switchport
Switch(config-if)#
```

This example shows how to cause a port interface in access mode, which is configured as a switched interface, to operate in VLAN 2:

```
Switch(config-if)# switchport access vlan 2
Switch(config-if)#
```

This example shows how to cause a port interface, which is configured as a switched interface, to refrain from negotiating in trunking mode and act as a trunk or access port (depending on the **mode** set):

```
Switch(config-if)# switchport nonegotiate
Switch(config-if)#
```

This example shows how to set the voice VLAN for the interface to VLAN 2:

```
Switch(config-if)# switchport voice vlan 2
switchport voice vlan 2
Switch(config-if)#
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show interfaces switchport</strong></td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>
</tr>
</tbody>
</table>
switchport access vlan

To set the VLAN when an interface is in access mode, use the `switchport access vlan` command. To reset the access mode VLAN to the appropriate default VLAN for the device, use the `no` form of this command.

```
switchport access [vlan {vlan-id | dynamic}]
```

```
no switchport access vlan
```

**Syntax Description**

| `vlan-id` | (Optional) Number of the VLAN on the interface in access mode; valid values are from 1 to 4094. |
| `dynamic` | (Optional) Enables VMPS control of the VLAN. |

**Defaults**

The default settings are as follows:

- The access VLAN and trunk interface native VLAN are default VLANs that correspond to the platform or the interface hardware.
- All VLAN lists include all VLANs.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>T2.1(13)EW</td>
<td>Support for VPMS was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter the `switchport` command without any keywords to configure the LAN interface as a Layer 2 interface before you can enter the `switchport access vlan` command. This action is required only if you have not already entered the `switchport` command for the interface.

Entering the `no switchport` command shuts the port down and then reenables it, which could generate messages on the device to which the port is connected.

The `no` form of the `switchport access vlan` command resets the access mode VLAN to the appropriate default VLAN for the device.

Valid values for `vlan-id` are from 1 to 4094.

**Examples**

This example shows how to cause the port interface to stop operating as a Cisco-routed port and convert to a Layer 2-switched interface:

```
Switch(config-if)# switchport
Switch(config-if)#
```
This command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

This example shows how to cause a port interface that has already been configured as a switched interface to operate in VLAN 2 instead of the platform’s default VLAN when in access mode:

```plaintext
Switch(config-if)# switchport access vlan 2
Switch(config-if)#
```

<table>

</thead>
<tbody>
<tr>
<td></td>
<td>show interfaces switchport</td>
<td>Displays the administrative and operational status of a switching (nonrouting) port.</td>
</tr>
</tbody>
</table>
switchport autostate exclude

To exclude a port from the VLAN interface link-up calculation, use the `switchport autostate exclude` command. To return to the default settings, use the `no` form of this command.

```
switchport autostate exclude

no switchport autostate exclude
```

**Syntax Description**

This command has no keywords or arguments.

**Defaults**

All ports are included in the VLAN interface link-up calculation.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(37)SG</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter the `switchport` command without any keywords to configure the LAN interface as a Layer 2 interface before you can enter the `switchport autostate exclude` command. This action is required only if you have not entered the `switchport` command for the interface.

**Note**

The `switchport` command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.

The `switchport autostate exclude` command marks the port to be excluded from the interface VLAN up calculation when there are multiple ports in the VLAN.

The `show interface interface switchport` command displays the autostate mode if the mode has been set. If the mode has not been set, the autostate mode is not displayed.

**Examples**

This example shows how to exclude a port from the VLAN interface link-up calculation:

```
Switch(config-if)# switchport autostate exclude
Switch(config-if)#
```

This example shows how to include a port in the VLAN interface link-up calculation:

```
Switch(config-if)# no switchport autostate exclude
Switch(config-if)#
```

You can verify your settings by entering the `show interfaces switchport` privileged EXEC command.
### Related Commands

<table>
<thead>

**switchport block**

To prevent the unknown multicast or unicast packets from being forwarded, use the `switchport block` interface configuration command. To allow the unknown multicast or unicast packets to be forwarded, use the `no` form of this command.

```
switchport block {multicast | unicast}
no switchport block {multicast | unicast}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>Specifies that the unknown multicast traffic should be blocked.</td>
</tr>
<tr>
<td>unicast</td>
<td>Specifies that the unknown unicast traffic should be blocked.</td>
</tr>
</tbody>
</table>

**Defaults**

Unknown multicast and unicast traffic are not blocked.
All traffic with unknown MAC addresses is sent to all ports.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can block the unknown multicast or unicast traffic on the switch ports.

Blocking the unknown multicast or unicast traffic is not automatically enabled on the switch ports; you must explicitly configure it.

**Note**

For more information about blocking the packets, refer to the software configuration guide for this release.

**Examples**

This example shows how to block the unknown multicast traffic on an interface:

```
Switch(config-if)# switchport block multicast
```

You can verify your setting by entering the `show interfaces interface-id switchport` privileged EXEC command.

**Related Commands**

</tbody>
</table>
If you enter `access` mode, the interface goes into permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not approve the change.

If you enter `trunk` mode, the interface goes into permanent trunking mode and negotiates to convert the link into a trunk link even if the neighboring interface does not approve the change.

If you enter `dynamic auto` mode, the interface converts the link to a trunk link if the neighboring interface is set to `trunk` or `desirable` mode.

If you enter `dynamic desirable` mode, the interface becomes a trunk interface if the neighboring interface is set to `trunk`, `desirable`, or `auto` mode.

If you specify the `dot1q-tunnel` keyword, the port is set unconditionally as an 802.1Q tunnel port.

The port becomes inactive if you configure it as a private VLAN trunk port and one of the following applies:

- The port does not have a valid PVLAN association.
- The port does not have valid allowed normal VLANs.

If a private port PVLAN association or mapping is deleted, or if a private port is configured as a SPAN destination, it becomes inactive.

This example shows how to set the interface to dynamic desirable mode:

```bash
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)#
```

This example shows how to set a port to PVLAN host mode:

```bash
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)#
```

This example shows how to set a port to private VLAN trunk:

```bash
Switch(config-if)# switchport mode private-vlan trunk
Switch(config-if)#
```

This example shows how to configure a port for an 802.1Q tunnel port:

```bash
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)#
```

This example shows how to configure a promiscuous trunk port:

```bash
Switch(config-if)# switchport mode private-vlan trunk promiscuous
Switch(config-if)#
```

This example shows how to configure an isolated trunk port:

```bash
Switch(config-if)# switchport mode private-vlan trunk
OR
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)#
```

You can verify your settings by entering the `show interfaces switchport` command and examining information in the Administrative Mode and Operational Mode rows.
This example shows how to configure interface FastEthernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end

switchport port-security

To enable port security on an interface, use the `switchport port-security` command. To disable port security and set parameters to their default states, use the `no` form of this command.

```
switchport port-security [aging {static | time time | type {absolute | inactivity}}] | limit rate invalid-source-mac [N | none] | mac-address mac-address [vlan {access | voice}] | mac-address sticky [mac-address] [vlan access | voice] | maximum value [vlan {access | voice}] | violation {restrict | shutdown | shutdown vlan}]
```

```
no switchport port-security [aging {static | time time | type {absolute | inactivity}}] | limit rate invalid-source-mac [N | none] | mac-address mac-address [vlan {access | voice}] | mac-address sticky [mac-address] [vlan access | voice] | maximum value [vlan {access | voice}] | violation {restrict | shutdown | shutdown vlan}]
```

### Syntax Description

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shutdown</td>
<td>(Optional) Sets the security violation shutdown mode. In this mode, a port security violation causes the interface to immediately become error disabled.</td>
</tr>
<tr>
<td>shutdown vlan</td>
<td>(Optional) Set the security violation mode to per-VLAN shutdown. In this mode, only the VLAN on which the violation occurred is error-disabled.</td>
</tr>
</tbody>
</table>

#### Defaults

The default settings are as follows:

- Port security is disabled.
- When port security is enabled and no keywords are entered, the default maximum number of secure MAC addresses is 1.
- Aging is disabled.
- Aging time is 0 minutes.
- All secure addresses on this port age out immediately after they are removed from the secure address list.

</table>

#### Usage Guidelines

After you set the maximum number of secure MAC addresses that are allowed on a port, you can add secure addresses to the address table by manually configuring them, by allowing the port to dynamically configure them, or by configuring some MAC addresses and allowing the rest to be dynamically configured.

The packets are dropped into the hardware when the maximum number of secure MAC addresses are in the address table and a station that does not have a MAC address in the address table attempts to access the interface.

If you enable port security on a voice VLAN port and if there is a PC connected to the IP phone, you set the maximum allowed secure addresses on the port to more than 1.

You cannot configure static secure MAC addresses in the voice VLAN.

A secure port has the following limitations:

- A secure port cannot be a dynamic access port or a trunk port.
- A secure port cannot be a routed port.
- A secure port cannot be a protected port.
• A secure port cannot be a destination port for Switched Port Analyzer (SPAN).
• A secure port cannot belong to a Fast EtherChannel or Gigabit EtherChannel port group.
• A secure port cannot be an 802.1X port.
• If you try to enable 802.1X on a secure port, an error message appears, and 802.1X is not enabled.
  If you try to change an 802.1X-enabled port to a secure port, an error message appears, and the
  security settings are not changed.

When a secure port is in the error-disabled state, you can remove it from this state by entering the
errdisable recovery cause psecure-violation global configuration command, or you can manually
re-enable it by entering the shutdown and no shutdown interface configuration commands. If a port is
disabled, you can also use the clear errdisable command to re-enable the offending VLAN on the
port.

To enable secure address aging for a particular port, set the aging time to a value other than 0 for that
port.

To allow limited time access to particular secure addresses, set the aging type as absolute. When the
aging time lapses, the secure addresses are deleted.

To allow continuous access to a limited number of secure addresses, set the aging type as inactivity. This
action removes the secure address when it becomes inactive, and other addresses can become secure.

To allow unlimited access to a secure address, configure it as a secure address, and disable aging for the
statically configured secure address by using the no switchport port-security aging static interface
configuration command.

If the sticky command is executed without a MAC address specified, all MAC addresses that are learned
on that port will be made sticky. You can also specify a specific MAC address to be a sticky address by
entering the sticky keyword next to it.

You can configure the sticky feature even when port security is not enabled on the interface. The feature
becomes operational when you enable port security on the interface.

You can use the no form of the sticky command only if the sticky feature is already enabled on the
interface.

Examples

This example shows how to set the aging time to 2 hours (120 minutes) for the secure addresses on the
Fast Ethernet port 12:

```bash
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security aging time 120
Switch(config-if)#
```

This example shows how to set the aging timer type to Inactivity for the secure addresses on the Fast
Ethernet port 12:

```bash
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security aging type inactivity
Switch(config-if)#
```

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet
port 12:

```bash
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport port-security limit rate invalid-source-mac 100
Switch(config-if)#
```

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet
port 12:
You can verify the settings for all secure ports or the specified port by using the `show port-security` privileged EXEC command.

This example shows how to remove all sticky and static addresses that are configured on the interface:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address
```

This example shows how to configure a secure MAC address on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 0/12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address 1000.2000.3000
```

This example shows how to make all MAC addresses learned on Fast Ethernet port 12 sticky:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# switchport port-security mac-address sticky
```

This example shows how to make MAC address 1000.2000.3000 sticky on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# switchport port-security mac-address sticky 1000.2000.3000
```

This example shows how to disable the sticky feature on Fast Ethernet port 12:

```
Switch(config)# interface fastethernet 2/12
Switch(config-if)# no switchport port-security mac-address sticky
```

This command makes all sticky addresses on this interface normal learned entries. It does not delete the entries from the secure MAC address table.

The following examples show how to configure sticky secure MAC addresses in access and voice VLANs on interfaces with voice VLAN configured. If you do not have voice VLAN configured the `vlan [access | voice]` keywords are not supported.

This example shows how to configure sticky MAC addresses for voice and data VLANs on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.obob vlan voice
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0005 vlan access
Switch(config-if)# end
```
This example shows how to designate a maximum of one MAC address for a voice VLAN (for a Cisco IP Phone, let’s say) and one MAC address for the data VLAN (for a PC, let’s say) on Fast Ethernet interface 5/1 and to verify the configuration:

```plaintext
Switch# configure terminal
Enter configuration commands, one per line. End with CTRL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security maximum 1 vlan voice
Switch(config-if)# switchport port-security maximum 1 vlan access
Switch(config-if)# end
```

This example shows how to configure a port to shut down only the VLAN if a violation occurs:

```plaintext
Switch(config)# interface gigabitethernet 5/1
Switch(config)# switchport port-security violation shutdown vlan
```

### Note

Sending traffic to the ports causes the system to configure the port with sticky secure addresses.

You can verify your settings by using the `show port-security address` privileged EXEC command.

switchport private-vlan association trunk

To configure the association between a secondary VLAN and a VLAN on a private VLAN trunk port, use the `switchport private-vlan association trunk` command. To remove the private VLAN mapping from the port, use the `no` form of this command.

```
switchport private-vlan association trunk {primary-vlan-id} {secondary-vlan-id}
```

```
no switchport private-vlan association trunk {primary-vlan-id}
```

Syntax Description
- `primary-vlan-id`: Number of the primary VLAN of the private VLAN relationship.
- `secondary-vlan-id`: Number of the secondary VLAN of the private VLAN relationship.

Defaults
Private VLAN mapping is disabled.

Command Modes
Interface configuration mode

Command History

<table>
<thead>

<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(20)EW</td>
<td>Support for community VLAN was added.</td>
</tr>
</tbody>
</table>

Usage Guidelines
Multiple private VLAN pairs can be specified so that a private VLAN trunk port can carry multiple secondary VLANs. If an association is specified for the existing primary VLAN, the existing association is replaced.

Only isolated secondary VLANs can be carried over a private VLAN trunk.

Note
Community secondary VLANs on a private VLAN trunk are not supported in this release.

If there is no trunk association, any packets received on the secondary VLANs are dropped.

Examples
This example shows how to configure a port with a primary VLAN (VLAN 18) and secondary VLAN (VLAN 20):

```
Switch(config-if)# switchport private-vlan association trunk 18 20
Switch(config-if)#
```

This example shows how to remove the private VLAN association from the port:

```
Switch(config-if)# no switchport private-vlan association trunk 18
Switch(config-if)#
```
This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301

<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.1(12c)EW</td>
<td>Support for extended addressing was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

There is no runtime effect on the port unless it is in PVLAN host mode. If the port is in PVLAN host mode but all VLANs do not exist, the command is allowed, but the port is made inactive.

The secondary VLAN may be an isolated or community VLAN.

**Examples**

This example shows how to configure a port with a primary VLAN (VLAN 18) and secondary VLAN (VLAN 20):

```
Switch(config-if)# switchport private-vlan host-association 18 20
Switch(config-if)#
```

This example shows how to remove the PVLAN association from the port:

```
Switch(config-if)# no switchport private-vlan host-association
Switch(config-if)#
```
This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end
Switch# show interfaces fastethernet 5/1 switchport

</tr>
</tbody>
</table>

### Usage Guidelines

There is no run-time effect on the port unless it is in private VLAN promiscuous mode. If the port is in private VLAN promiscuous mode but the VLANs do not exist, the command is allowed, but the port is made inactive.

The secondary VLAN may be an isolated or community VLAN.

### Note

The maximum number of unique private VLAN pairs supported by the `switchport private-vlan mapping trunk` command above is 500. For example, one thousand secondary VLANs could map to one primary VLAN, or one thousand secondary VLANs could map one to one to one thousand primary VLANs.
Examples

This example shows how to configure the mapping of primary VLAN 18 to the secondary isolated VLAN 20 on a port:

```
Switch(config-if)# switchport private-vlan mapping 18 20
```

This example shows how to add a VLAN to the mapping:

```
Switch(config-if)# switchport private-vlan mapping 18 add 21
```

This example shows how to add a range of secondary VLANs to the mapping:

```
Switch(config-if)# switchport private-vlan mapping 18 add 22-24
```

This example shows how to add a range of secondary VLANs to the trunk mapping:

```
Switch(config-if)# switchport private-vlan mapping trunk 18 add 22-24
```

This example shows how to configure interface Fast Ethernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end
```

```
Switch# show interfaces fastethernet 5/2 switchport

**switchport private-vlan trunk allowed vlan**

To configure a list of the allowed normal VLANs on a private VLAN trunk port, use the `switchport private-vlan trunk allowed vlan` command. To remove all the allowed normal VLANs from a private VLAN trunk port, use the `no` form of this command.

```
switchport private-vlan trunk allowed vlan {vlan-list} all | none | [add | remove | except]
  vlan_atom [,vlan_atom...]
```

```
no switchport private-vlan trunk allowed vlan
```

**Syntax Description**

- `vlan_list`: Sets the list of allowed VLANs; see the “Usage Guidelines” section for formatting guidelines for `vlan_list`.
- `all`: Specifies all VLANs from 1 to 4094. This keyword is not supported on commands that do not permit all VLANs in the list to be set at the same time.
- `none`: Indicates an empty list. This keyword is not supported on commands that require certain VLANs to be set or at least one VLAN to be set.
- `add`: (Optional) Adds the defined list of VLANs to those currently set instead of replacing the list.
- `remove`: (Optional) Removes the defined list of VLANs from those currently set instead of replacing the list.
- `except`: (Optional) Lists the VLANs that should be calculated by inverting the defined list of VLANs.
- `vlan_atom`: Either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers, the lesser one first, separated by a hyphen.

**Defaults**

All allowed normal VLANs are removed from a private VLAN trunk port.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, no normal VLANs are allowed unless you explicitly configure the VLANs to be allowed. Use this command only for normal VLANs on a private VLAN trunk port.

Use the `switchport private-vlan association trunk` command to configure a port that can carry private VLANs on a private VLAN trunk port.
### Examples

This example shows how to configure the private VLAN trunk port that carries normal VLANs 1 to 10:

```plaintext
Switch(config-if)# switchport private-vlan trunk allowed vlan 1-10
Switch(config-if)#
```

This example shows how to remove all the allowed normal VLANs from a private VLAN trunk port:

```plaintext
Switch(config-if)# no switchport private-vlan trunk allowed vlan
Switch(config-if)#
```

This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```plaintext
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301
Switch(config-if)# end

switchport private-vlan trunk native vlan tag

To control the tagging of the native VLAN traffic on 802.1Q private VLAN trunks, use the `switchport private-vlan trunk native vlan tag` command. To remove the control of tagging (and default to the global setting), use the `no` form of this command.

```
switchport private-vlan trunk native vlan tag
no switchport private-vlan trunk native vlan tag
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
The default setting is global; the settings on the port are determined by the global setting.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
<tr>
<td>12.2(18)EW</td>
<td>Removed <code>vlan-id</code> keyword.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The configuration created with this command only applies to ports that are configured as private VLAN trunks.

**Examples**
This example shows how to enable 802.1Q native VLAN tagging on a PVLAN trunk:

```
Switch(config-if)# switchport private-vlan trunk native vlan tag
Switch(config-if)#
```

**Related Commands**

</tbody>
</table>
### switchport trunk

To set the trunk characteristics when an interface is in trunking mode, use the `switchport trunk` command. To reset all of the trunking characteristics back to the original defaults, use the `no` form of this command.

```
switchport trunk native vlan {tag | vlan_id}
no switchport trunk native vlan {tag | vlan_id}
switchport trunk allowed vlan vlan_list
no switchport trunk allowed vlan vlan_list
switchport trunk pruning vlan vlan_list
no switchport trunk pruning vlan vlan_list
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>native vlan tag</td>
<td>Specifies the tagging of native VLAN traffic on 802.1Q trunks.</td>
</tr>
<tr>
<td>native vlan vlan_id</td>
<td>Sets the native VLAN for the trunk in 802.1Q trunking mode.</td>
</tr>
<tr>
<td>allowed vlan vlan_list</td>
<td>Sets the list of allowed VLANs that transmit this interface in tagged format when in trunking mode. See the “Usage Guidelines” section for formatting guidelines for <code>vlan_list</code>.</td>

<tr>
<td>pruning vlan vlan_list</td>
<td>Sets the list of VLANs that are enabled for VTP pruning when the switch is in trunking mode. See the “Usage Guidelines” section for formatting guidelines for <code>vlan_list</code>.</td>
</tr>
</tbody>
</table>

#### Defaults

The default settings are as follows:

- IOS-XE only supports dot1Q.
- The access VLANs and trunk interface native VLANs are a default VLAN that corresponds to the platform or the interface hardware.
- All VLAN lists include all VLANs.
- Native VLAN tagging is enabled on the port if enabled globally.

#### Command Modes

Interface configuration mode

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>

</tr>
</tbody>
</table>
The `vlan_list` format is `{all | none | [add | remove | except] vlan_atom[,vlan_atom...]}`, where:

- **all** specifies all VLANs from 1 to 4094. This keyword is not supported on commands that do not permit all VLANs in the list to be set at the same time.
- **none** indicates an empty list. This keyword is not supported on commands that require certain VLANs to be set or at least one VLAN to be set.
- **add** adds the defined list of VLANs to those currently set, instead of replacing the list.
- **remove** removes the defined list of VLANs from those currently set, instead of replacing the list.
- **except** lists the VLANs that should be calculated by inverting the defined list of VLANs.
- **vlan_atom** is either a single VLAN number from 1 to 4094 or a continuous range of VLANs described by two VLAN numbers (the lesser one first, separated by a hyphen).

The **no** form of the `native vlan` command resets the native mode VLAN to the appropriate default VLAN for the device.

The **no** form of the `allowed vlan` command resets the list to the default list, which allows all VLANs.

The **no** form of the `pruning vlan` command resets the list to the default list, which enables all VLANs for VTP pruning.

These configuration guidelines and restrictions apply when using 802.1Q trunks and impose some limitations on the trunking strategy for a network:

- When connecting Cisco switches through an 802.1Q trunk, make sure that the native VLAN for an 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning-tree loops might result.
- Disabling spanning tree on the native VLAN of an 802.1Q trunk without disabling spanning tree on every VLAN in the network can cause spanning-tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an 802.1Q trunk. If this is not possible, disable spanning tree on every VLAN in the network. Make sure that your network is free of physical loops before disabling spanning tree.
- When you connect two Cisco switches through 802.1Q trunks, the switches exchange spanning-tree BPDUs on each VLAN that is allowed on the trunks. The BPDUs on the native VLAN of the trunk are sent untagged to the reserved 802.1d spanning-tree multicast MAC address (01-80-C2-00-00-00). The BPDUs on all other VLANs on the trunk are sent tagged to the reserved SSTP multicast MAC address (01-00-0c-cc-cc-cd).
- Non-Cisco 802.1Q switches maintain only a single instance of spanning tree (MST) that defines the spanning-tree topology for all VLANs. When you connect a Cisco switch to a non-Cisco switch through an 802.1Q trunk, the MST of the non-Cisco switch and the native VLAN spanning tree of the Cisco switch combine to form a single spanning-tree topology known as the CST.
- Because Cisco switches transmit BPDUs to the SSTP multicast MAC address on the VLANs other than the native VLAN of the trunk, non-Cisco switches do not recognize these frames as BPDUs and flood them on all ports in the corresponding VLAN. Cisco switches connected to the non-Cisco 802.1Q network receive these flooded BPDUs. Because Cisco switches receive the flooded BPDUs, the switches can maintain a per-VLAN spanning-tree topology across a network of non-Cisco 802.1Q switches. The non-Cisco 802.1Q network separating the Cisco switches is treated as a single broadcast segment between all switches that are connected to the non-Cisco 802.1Q network through the 802.1Q trunks.
- Ensure that the native VLAN is the same on all of the 802.1Q trunks connecting the Cisco switches to the non-Cisco 802.1Q network.
If you are connecting multiple Cisco switches to a non-Cisco 802.1Q network, all of the connections must be through the 802.1Q trunks. You cannot connect Cisco switches to a non-Cisco 802.1Q network through the ISL trunks or through the access ports. This action causes the switch to place the ISL trunk port or access port into the spanning-tree “port inconsistent” state and no traffic will pass through the port.

Follow these guidelines for native VLAN tagging:

- The **no switchport trunk native vlan tag** command disables the native VLAN tagging operation on a port. This overrides the global tagging configuration.
- The **switchport trunk native vlan tag** command can be used to reenable tagging on a disabled port.
- The **no** option is saved to NVRAM so that the user does not have to manually select the ports to disable the tagging operation each time that the switch reboots.
- When the **switchport trunk native vlan tag** command is enabled and active, all packets on the native VLAN are tagged, and incoming untagged data packets are dropped. Untagged control packets are accepted.

**Examples**

This example shows how to enable 802.1Q tagging on a port:
```
Switch(config-if)# switchport trunk native vlan tag
Switch(config-if)#
```

This example shows how to configure a secure MAC-address and a maximum limit of secure MAC addresses on Gigabit Ethernet port 1 for all VLANs:
```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 3
```

This example shows how to configure a secure MAC-address on Gigabit Ethernet port 1 in a specific VLAN or range of VLANs:
```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security maximum 3
```

This example shows how to configure a secure MAC-address in a VLAN on Gigabit Ethernet port 1:
```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security mac-address sticky
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.2
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.3
```

You can verify your settings by using the **show port-security interface vlan** privileged EXEC command.

<table>
<thead>
<tr>

system mtu

To set the maximum Layer 2 or Layer 3 payload size, use the `system mtu` command. To revert to the default MTU setting, use the `no` form of this command.

```
        system mtu datagram-size

        no system mtu
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datagram-size</td>
<td>Layer 2 payload size; valid values from 1500 to 1552 bytes.</td>
</tr>
</tbody>
</table>

**Defaults**

The default MTU setting is 1500 bytes.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `datagram-size` parameter specifies the Ethernet payload size, not the total Ethernet frame size, and the Layer 3 MTU is changed as a result of changing the `system mtu` command.

For ports from 3 to 18 on model WS-X4418-GB and ports from 1 to 12 on model WS-X4412-2GB-TX, only the standard IEEE Ethernet payload size of 1500 bytes is supported.

For other modules, an Ethernet payload size of up to 1552 bytes is supported with a total Ethernet frame size of up to 1600 bytes.

**Examples**

This example shows how to set the MTU size to 1550 bytes:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# system mtu 1550
Switch(config)# end
Switch#
```

This example shows how to revert to the default MTU setting:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no system mtu
Switch(config)# end
Switch#
```

test cable-diagnostics tdr

To test the condition of copper cables on 48-port 10/100/1000 BASE-T modules, use the test cable-diagnostics tdr command.

```
test cable-diagnostics tdr [interface {interface interface-number}]
```

**Note**
This command will be deprecated in future Cisco IOS releases. Please use the diagnostic start command.

**Syntax Description**
- `interface interface` Interface type; valid values are fastethernet and gigabitethernet.
- `interface-number` Module and port number.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(25)SG</td>
<td>Support for this command on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The TDR test is supported on Catalyst 4500 series switches running Cisco IOS Release 12.2(25)SG for the following line cards only:
- WS-X4548-GB-RJ45
- WS-X4548-GB-RJ45V
- WS-X4524-GB-RJ45V
- WS-X4013+TS
- WS-C4948
- WS-C4948-10GE

The valid values for `interface interface` are fastethernet and gigabitethernet.

Do not start the test at the same time on both ends of the cable. Starting the test at both ends of the cable at the same time can lead to false test results.

Do not change the port configuration during any cable diagnostics test. This action may result in incorrect test results.

The interface must be operating before starting the TDR test. If the port is down, the results of the test will be invalid. Issue the `no shutdown` command on the port.
This example shows how to start the TDR test on port 1 on module 2:

```
Switch# test cable-diagnostics tdr int gi2/1
Switch#
```

This example shows the message that displays when the TDR test is not supported on a module:

```
Switch# test cable-diagnostics tdr int gi2/1
00:03:15:%C4K_IOSDIAGMAN-4-TESTNOTSUPPORTEDONMODULE: Online cable
diag tdr test is not supported on this module
Switch#
```

**Note**

The `show cable-diagnostic tdr` command is used to display the results of a TDR test. The test results will not be available until approximately 1 minute after the test starts. If you enter the `show cable-diagnostic tdr` command within 1 minute of the test starting, you may see a “TDR test is in progress on interface...” message.

</table>

**Usage Guidelines**

Do not use leading zeros when entering a VLAN ID.

The Layer 2 traceroute feature is available on these switches:

- Catalyst 2950 switches running Release 12.1(12c)EA1 or later
- Catalyst 3550 switches running Release 12.1(12c)EA1 or later
- Catalyst 4500 series switches running Catalyst operating system Release 6.2 or later for the supervisor engine
- Catalyst 4500 series switches running Release 12.1(15)EW or later
- Catalyst 5000 family switches running Catalyst operating system Release 6.1 or later for the supervisor engine
- Catalyst 6500 series switches running Catalyst operating system Release 6.1 or later for the supervisor engine

For Layer 2 traceroute to functional properly, Cisco Discovery Protocol (CDP) must be enabled on all of the switches in the network. Do not disable CDP.

When the switch detects a device in the Layer 2 path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.
Layer 2 traceroute supports only unicast traffic. If you specify a multicast source or destination MAC address, the physical path is not identified, and a message appears.

The `traceroute mac` command output shows the Layer 2 path when the specified source and destination addresses belong to the same VLAN. If you specify source and destination addresses that belong to different VLANs, the Layer 2 path is not identified, and a message appears.

If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and a message appears.

This feature is not supported in Token Ring VLANs.

**Examples**

This example shows how to display the Layer 2 path by specifying the source and destination MAC addresses:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201
```

```
Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 (2.2.6.6) :Fa0/1 =>Fa0/3
con5 (2.2.5.5 ) : Fa0/3 =>G10/1

</table>
**traceroute mac ip**

To display the Layer 2 path that is taken by the packets from the specified source IP address or hostname to the specified destination IP address or hostname, use the `traceroute mac` command.

```
traceroute mac ip {source-ip-address | source-hostname} {destination-ip-address | destination-hostname} [detail]
```

### Syntax Description

<table>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(13)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The Layer 2 traceroute feature is available on these switches:

- Catalyst 2950 switches running Release 12.1(12c)EA1 or later
- Catalyst 3550 switches running Release 12.1(12c)EA1 or later
- Catalyst 4500 series switches running Catalyst operating system Release 6.2 or later for the supervisor engine
- Catalyst 4500 series switches running Release 12.1(15)EW or later
- Catalyst 5000 family switches running Catalyst operating system Release 6.1 or later for the supervisor engine
- Catalyst 6500 series switches running Catalyst operating system Release 6.1 or later for the supervisor engine

For Layer 2 traceroute to functional properly, Cisco Discovery Protocol (CDP) must be enabled on all the switches in the network. Do not disable CDP.

When the switch detects a device in the Layer 2 path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

The maximum number of hops identified in the path is ten.
The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses are in the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP addresses with the corresponding MAC addresses and the VLAN IDs.

- If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
- If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. The IP addresses must be in the same subnet. If the IP address is not resolved, the path is not identified, and a message appears.

Layer 2 traceroute is not supported when multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port). When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.

This feature is not supported in Token Ring VLANs.

**Examples**

This example shows how to display the Layer 2 path by specifying the source and destination IP addresses and by using the **detail** keyword:

```
Switch# traceroute mac ip 2.2.66.66 2.2.22.22 detail
Translating IP to mac.......
2.2.66.66 =>0000.0201.0601
2.2.22.22 =>0000.0201.0201

Source 0000.0201.0601 found on con6[WS-C2950G-24-EI] (2.2.6.6)
con6 / WS-C2950G-24-EI / 2.2.6.6 :
    Fa0/1 [auto, auto] =>Fa0/3 [auto, auto]
con5 / WS-C2950G-24-EI / 2.2.5.5 :
    Fa0/3 [auto, auto] =>G10/1 [auto, auto]
con1 / WS-C3550-12G / 2.2.1.1 :
    G10/1 [auto, auto] =>G10/2 [auto, auto]
con2 / WS-C3550-24 / 2.2.2.2 :
    G10/2 [auto, auto] =>Fa0/1 [auto, auto]
Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
Switch#
```

This example shows how to display the Layer 2 path by specifying the source and destination hostnames:

```
Switch# traceroute mac ip con6 con2
Translating IP to mac ..... 
2.2.66.66 =>0000.0201.0601
2.2.22.22 =>0000.0201.0201

Source 0000.0201.0601 found on con6
con6 (2.2.6.6) : Fa0/1 => Fa0/3
    (2.2.5.5 ) :
    Fa0/3 => G10/1
con1 (2.2.1.1) :
    G10/1 => G10/2
con2 (2.2.2.2) :
    G10/2 => Fa0/1
Destination 0000.0201.0201 found on con2
Layer 2 trace completed.
Switch#
```

This example shows the Layer 2 path when Address Resolution Protocol (ARP) cannot associate the source IP address with the corresponding MAC address:

```
Switch# traceroute mac ip 2.2.66.66 2.2.77.77
Arp failed for destination 2.2.77.77.
Layer2 trace aborted.
Switch#
```

tx-queue

To configure the transmit queue parameters for an interface, use the `tx-queue` command. To return to the default value, use the `no` form of this command.

```
   tx-queue [queue-id] {bandwidth bandwidth-rate | priority high | shape shape-rate}
   no tx-queue
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue-id</td>
<td>(Optional) Number of the queue; valid values are from 1 to 4.</td>
</tr>
<tr>
<td>bandwidth bandwidth-rate</td>
<td>Specifies traffic bandwidth; valid values are from 16000 to 1000000000 bits per second.</td>
</tr>
<tr>
<td>priority high</td>
<td>Specifies high priority.</td>
</tr>
<tr>
<td>shape shape-rate</td>
<td>Specifies the maximum rate that packets are passed through a transmit queue; valid values are from 16000 to 1000000000 bits per second.</td>
</tr>
</tbody>
</table>

**Defaults**

The default settings are as follows:

- Encapsulation type is dependent on the platform or interface hardware.
- QoS enabled bandwidth rate is 4:255.
- QoS disabled bandwidth rate is 255:1.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis. The bandwidth and shape rates cannot exceed the maximum speed of the interface.

The bandwidth can be configured only on the following:

- Uplink ports on Supervisor Engine III (WS-X4014)
- Ports on the WS-X4306-GB module
- The two 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first two ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module

Only transmit queue 3 can be configured to be a high-priority transmit queue.
Examples

This example shows how to allocate bandwidth on queue 1 to 100 Mbps:

```
Switch(config-if)# tx-queue 1
Switch(config-if-tx-queue)# bandwidth 1000000000
Switch(config-if-tx-queue)#
```

This example shows how to configure transmit queue 3 to the high priority:

```
Switch(config-if)# tx-queue 3
Switch(config-if-tx-queue)# priority high
Switch(config-if-tx-queue)#
```

This example shows how to configure the traffic shaping rate of 64 kbps to transmit queue 1:

```
Switch(config-if)# tx-queue 1
Switch(config-if-tx-queue)# shape 64000
Switch(config-if-tx-queue)#
```

Related Commands

<table>
<thead>

</table>
udld (global configuration mode)

To enable aggressive or normal mode in the UDLD protocol and to set the configurable message timer time, use the `udld` command. Use the `no` form of this command to do the following:

- Disable normal mode UDLD on all the fiber ports by default
- Disable aggressive mode UDLD on all the fiber ports by default
- Disable the message timer

```
udld enable | aggressive
no udld enable | aggressive
udld message time message-timer-time
no udld message time
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>aggressive</th>
<th>message time message-timer-time</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables UDLD in normal mode by default on all the fiber interfaces.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>aggressive</td>
<td>Enables UDLD in aggressive mode by default on all the fiber interfaces.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>message time</td>
<td>Sets the period of time between the UDLD probe messages on the ports that are in advertisement mode and are currently determined to be bidirectional; valid values are from 1 to 90 seconds.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Defaults**

All fiber interfaces are disabled and the message timer time equals 15 seconds.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enable aggressive mode, once all the neighbors of a port have aged out either in the advertisement or in the detection phase, UDLD restarts the linkup sequence to try to resynchronize with any potentially out-of-sync neighbor and shuts down the port if the message train from the link is still undetermined.

This command affects the fiber interfaces only. Use the `udld (interface configuration mode)` command to enable UDLD on the other interface types.

**Examples**

This example shows how to enable UDLD on all the fiber interfaces:

```
Switch (config)# udld enable
Switch (config)#
```
### Related Commands

<table>

</tr>
</tbody>
</table>
udld (interface configuration mode)

To enable UDLD on an individual interface or to prevent a fiber interface from being enabled by the udld (global configuration mode) command, use the udld command. To return to the udld (global configuration mode) command setting, or if the port is a nonfiber port to disable UDLD, use the no form of this command.

```
udld { enable | aggressive | disable }
no udld { enable | aggressive | disable }
```

**Syntax Description**
- **enable** Enables UDLD on this interface.
- **aggressive** Enables UDLD in aggressive mode on this interface.
- **disable** Disables UDLD on this interface.

**Defaults**
The fiber interfaces are enabled per the state of the global udld (enable or aggressive) command, and the nonfiber interfaces are enabled with UDLD disabled.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you enable aggressive mode, once all the neighbors of a port have aged out either in the advertisement or in the detection phase, UDLD restarts the link-up sequence to try to resynchronize with any potentially out-of-sync neighbor and shuts down the port if the message train from the link is still undetermined.

Use the no udld enable command on the fiber ports to return control of UDLD to the global udld enable command or to disable UDLD on the nonfiber ports.

Use the udld aggressive command on the fiber ports to override the setting of the global udld (enable or aggressive) command. Use the no form on the fiber ports to remove this setting, return control of UDLD enabling back to the global udld command or to disable UDLD on the nonfiber ports.

The disable keyword is supported on the fiber ports only. Use the no form of this command to remove this setting and return control of UDLD to the udld (global configuration mode) command.

If the port changes from fiber to nonfiber or vice versa, all configurations will be maintained because of a change of module or a GBIC change detected by the platform software.
**Examples**

This example shows how to cause any port interface to enable UDLD, despite the current global `udld (global configuration mode)` setting:

```
Switch (config-if)# udld enable
Switch (config-if)#
```

This example shows how to cause any port interface to enable UDLD in aggressive mode, despite the current global `udld (enable or aggressive)` setting:

```
Switch (config-if)# udld aggressive
Switch (config-if)#
```

This example shows how to cause a fiber port interface to disable UDLD, despite the current global `udld (global configuration mode)` setting:

```
Switch (config-if)# udld disable
Switch (config-if)#
```

**Related Commands**

</tr>
</tbody>
</table>
**udld reset**

To reset all the UDLD ports in the shutdown state (that is, errdisabled by UDLD), use the `udld reset` command.

**udld reset**

**Syntax Description**
This command has no keywords or variables.

**Defaults**
This command has no default settings.

**Command Modes**
Privileged EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If the interface configuration is still enabled for UDLD, these ports will begin to run UDLD again and may shut down if the reason for the shutdown has not been corrected.

The `udld reset` command permits the traffic to flow on the ports again; other features, such as spanning tree, PAgP, and DTP, operate normally if enabled.

**Examples**
This example shows how to reset all the ports that are shut down by UDLD:

```
Switch# udld reset
Switch#
```

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>T2.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to enable enhanced password security for the specified username. This command enables MD5 encryption on the password. MD5 encryption is a strong encryption method that is not retrievable. You cannot use MD5 encryption with protocols that require clear-text passwords, such as CHAP.

You can use this command for defining usernames that get special treatment. For example, you can define an “info” username that does not require a password but that connects the user to a general-purpose information service.

The **username** command provides both username and **secret** authentication for login purposes only. The `name` argument can be only one word. White spaces and quotation marks are not allowed.

You can use multiple `username` commands to specify options for a single user.

For information about additional `username` commands, refer to the *Cisco IOS Command Reference*.

**Examples**

This example shows how to specify an MD5 encryption on a password (warrior) for a username (xena):

```bash
Switch(config)# username xena secret 5 warrior
Switch(config)#
```

### verify

To verify the checksum of a file on a Flash memory file system, use the `verify` command.

```
verify [md5] [flash-filesystem:] [filename] [expected-md5-signature]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/md5</td>
<td>(Optional) Verifies the MD5 signatures.</td>
</tr>
<tr>
<td>flash-filesystem:</td>
<td>(Optional) Device where the Flash resides; valid values are <code>bootflash:</code>, <code>slot0:</code>, <code>flash:</code>, or <code>sup-bootflash:</code>.</td>
</tr>
<tr>
<td>filename</td>
<td>(Optional) Name of the Cisco IOS image.</td>
</tr>
<tr>
<td>expected-md5-signature</td>
<td>(Optional) MD5 signature.</td>
</tr>
</tbody>
</table>

### Defaults

The current working device is specified.

### Command Modes

Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Each software image that is distributed on the disk uses a single checksum for the entire image. This checksum is displayed only when the image is copied into the Flash memory.

The Readme file, which is included with the image on the disk, lists the name, file size, and checksum of the image. Review the contents of the Readme file before loading or duplicating the new image so that you can verify the checksum when you copy it into the Flash memory or on to a server.

Use the `verify /md5` command to verify the MD5 signature of a file before using it. This command validates the integrity of a copied file by comparing a precomputed MD5 signature with the signature that is computed by this command. If the two MD5 signatures match, the copied file is identical to the original file.

You can find the MD5 signature posted on the Cisco.com page with the image.

You can use the `verify /md5` command in one of the following ways:

- **Verify the MD5 signatures manually by entering the `verify /md5 filename` command.**
  
  Check the displayed signature against the MD5 signature posted on the Cisco.com page.

- **Allow the system to compare the MD5 signatures by entering the `verify /md5 {flash-filesystem:filename} {expected-md5-signature}` command.**
After completing the comparison, the system returns with a verified message. If an error is detected, the output is similar to the following:

```
Switch# verify /md5 slot0:c4-jsv-mz 0f
..................................
..................................
..................................
..................................
..................................
...............................Done!
%Error verifying slot0:c4-jsv-mz
Computed signature = 0f369ed9e98756f179d4f29d6e7755d3
Submitted signature = 0f
```

To display the contents of the Flash memory, enter the `show flash` command. The Flash contents listing does not include the checksum of the individual files. To recompute and verify the image checksum after the image has been copied into the Flash memory, enter the `verify` command.

A colon (:) is required after the specified device.

### Examples

This example shows how to use the `verify` command:

```
Switch# verify cat6k_r47_1.cbi
..........................................................
File cat6k_r47_1.cbi verified OK.
Switch#
```

This example shows how to manually verify the MD5 signature:

```
Switch# verify /md5 c4-jsv-mz
.................................................
.................................................
.................................................
.................................................
.................................................
............................................Done!
verify /md5 (slot0:c4-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3
Switch#
```

This example shows how to allow the system to compare the MD5 signatures:

```
Switch# verify /md5 slot0:c4-jsv-mz 0f369ed9e98756f179d4f29d6e7755d3
.................................................
.................................................
.................................................
.................................................
.................................................
............................................Done!
verified /md5 (slot0:c6sup12-jsv-mz) = 0f369ed9e98756f179d4f29d6e7755d3
Switch#
```

vlan (VLAN Database mode)

To configure a specific VLAN, use the `vlan` command. To delete a VLAN, use the `no` form of this command.

```
vlan vlan_id [are hops] [backupcrf mode] [bridge type | bridge-num] [media type] [mtu mtu-size] [name vlan-name] [parent parent-vlan-id] [ring ring-number] [said said-value] [state {suspend | active}] [stp type type] [tb-vlan1 tb-vlan1-id] [tb-vlan2 tb-vlan2-id]
```

**Syntax Description**

- **vlan_id**: Number of the VLAN; valid values are from 1 to 4094.
- **are hops**: (Optional) Specifies the maximum number of All Route Explorer hops for this VLAN; valid values are from 0 to 13. Zero is assumed if no value is specified.
- **backupcrf mode**: (Optional) Enables or disables the backup CRF mode of the VLAN; valid values are **enable** and **disable**.
- **bridge type**: (Optional) Specifies the bridging characteristics of the VLAN or identification number of the bridge; valid type values are **srb** and **srt**.
- **bridge_num**: (Optional) Valid bridge_num values are from 0 to 15.
- **media type**: (Optional) Specifies the media type of the VLAN; valid values are **fast ethernet**, **fd-net**, **fddi**, **trcrf**, and **trbrf**.
- **mtu mtu-size**: (Optional) Specifies the maximum transmission unit (packet size, in bytes) that the VLAN can use; valid values are from 576 to 18190.
- **name vlan-name**: (Optional) Defines a text string used as the name of the VLAN (1 to 32 characters).
- **parent parent-vlan-id**: (Optional) Specifies the ID number of the parent VLAN of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.
- **ring ring-number**: (Optional) Specifies the ring number of FDDI or Token Ring-type VLANs; valid values are from 2 to 1001.
- **said said-value**: (Optional) Specifies the security association identifier; valid values are from 1 to 4294967294.
- **state**: (Optional) Specifies the state of the VLAN.
- **suspend**: Specifies that the state of the VLAN is suspended. VLANs in the suspended state do not pass packets.
- **active**: Specifies that the state of the VLAN is active.
- **stp type type**: (Optional) Specifies the STP type; valid values are **ieee**, **ibm**, and **auto**.
- **tb-vlan1 tb-vlan1-id**: (Optional) Specifies the ID number of the first translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.
- **tb-vlan2 tb-vlan2-id**: (Optional) Specifies the ID number of the second translational VLAN for this VLAN; valid values are from 2 to 1001. Zero is assumed if no value is specified.
Defaults

The defaults are as follows:

- The vlan-name is “VLANxxxx” where “xxxx” represents four numeric digits (including leading zeroes) equal to the VLAN ID number.
- The media type is Fast Ethernet.
- The state is active.
- The said-value is 100,000 plus the VLAN ID number.
- The mtu-size default is dependent upon the VLAN type:
  - fddi—1500
  - trcrf—1500 if V2 is not enabled; 4472 if it is enabled
  - fd-net—1500
  - trbrf—1500 if V2 is not enabled; 4472 if it is enabled
- No ring number is specified.
- No bridge number is specified.
- No parent VLAN is specified.
- No STP type is specified.
- No translational bridge VLAN is specified.

Command Modes

VLAN configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

Usage Guidelines

VLAN 1 parameters are factory configured and cannot be changed.

When you define vlan-name, the name must be unique within the administrative domain.

The SAID is documented in 802.10. When the no form is used, the VLANs SAID is returned to the default.

When you define the said-value, the name must be unique within the administrative domain.

The bridge bridge-number argument is used only for Token Ring-net and FDDI-net VLANs and is ignored in other types of VLANs. When the no form is used, the VLANs source-route bridging number returns to the default.

The parent VLAN resets to the default if the parent VLAN is deleted or the media keyword changes the VLAN type or the VLAN type of the parent VLAN.

The tb-vlan1 and tb-vlan2 are used to configure translational bridge VLANs of a specified type of VLAN and are not allowed in other types of VLANs. The translational bridge VLANs must be a different VLAN type than the affected VLAN; if two VLANs are specified, the two must be different VLAN types.

A translational bridge VLAN will reset to the default if the translational bridge VLAN is deleted or the media keyword changes the VLAN type or the VLAN type of the corresponding translational bridge VLAN.
Examples

This example shows how to add a new VLAN with all the default parameters to the new VLAN database:

```
Switch(vlan)# vlan 2
```

**Note**

If the VLAN already exists, no action occurs.

This example shows how to cause the device to add a new VLAN, specify the media type and parent VLAN ID number 3, and set all the other parameters to the defaults:

```
Switch(vlan)# vlan 2 media fastethernet parent 3
VLAN 2 modified:
    Media type FASTETHERNET
    Parent VLAN 3
```

This example shows how to delete VLAN 2:

```
Switch(vlan)# no vlan 2
Switch(vlan)#
```

This example shows how to return the MTU to the default for its type and the translational bridging VLANs to the default:

```
Switch(vlan)# no vlan 2 mtu tb-vlan1 tb-vlan2
Switch(vlan)#
```

Related Commands

<table>

</tbody>
</table>
**vlan access-map**

To enter VLAN access-map command mode to create a VLAN access map, use the `vlan access-map` command. To remove a mapping sequence or the entire map, use the `no` form of this command.

```
vlan access-map name [seq# ]
no vlan access-map name [seq# ]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>VLAN access-map tag.</td>
</tr>
<tr>
<td>seq#</td>
<td>(Optional) Map sequence number; valid values are from 0 to 65535.</td>
</tr>
</tbody>
</table>

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the sequence number of an existing map sequence, you enter VLAN access-map mode. If you do not specify a sequence number, a number is automatically assigned. You can enter one match clause and one action clause per map sequence. If you enter the `no vlan access-map name [seq# ]` command without entering a sequence number, the whole map is removed. Once you enter VLAN access-map mode, the following commands are available:

- **action**—Sets the action to be taken (forward or drop).
- **default**—Returns a command to its default settings.
- **end**—Exits from configuration mode.
- **exit**—Exits from VLAN access-map configuration mode.
- **match**—Sets the values to match (IP address or MAC address).
- **no**—Negates a command or reset its defaults.

**Examples**

This example shows how to enter VLAN access-map mode:

```
Switch(config)# vlan access-map cisco
Switch(config-access-map)#
```
### Related Commands

**vlan configuration**

To configure a service-policy on a VLAN, use the `vlan configuration` command to enter the VLAN feature configuration mode.

```
 vlan configuration \{vlan\}
```

**Syntax Description**
- `vlan` Specifies a list of VLANs. “,” “-” operators can be used; such as, 1-10,20.

**Defaults**
This command has no default settings.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(40)SG</td>
<td>This command was introduced on Catalyst 4900M and Supervisor Engine 6E.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Even though an SVI is not needed in all cases, such as when you use your Catalyst 4500 series switch as a pure Layer 2 switch, you are required to create an SVI.

VLAN configuration mode has been introduced to remove the requirement of creating an SVI. With this command you can specify lists of VLANs and the input and output policies that are applied. To configure your system in this mode there is no requirement for you to create SVIs, or create VLAN or VTP mode interactions. Once the VLAN becomes active the configuration becomes active on that VLAN. You can use “-” or “,” extensions to specifying VLAN list.

**Examples**

This example shows how to configure a service policy while in VLAN configuration mode and display the new service policy:

```
Switch# configure terminal
Switch(config)# vlan configuration 30-40
Switch(config-vlan-config)# service-policy input p1
Switch(config-vlan-config)# end
Switch# show running configuration | begin vlan configuration
!
vlan configuration 30-40
    service-policy input p1
!
vlan internal allocation policy ascending !
vlan 2-1000
!
Switch#
```
This example shows how to display the new service policy:

```
Switch# show policy-map vlan 30
vlan 30

Service-policy input: p1

Class-map: class-default (match-any)
  0 packets
  Match: any
  0 packets
police:
  rate 128000 bps, burst 4000 bytes
  conformed 0 packets, 0 bytes; action: transmit
  exceeded 0 packets, 0 bytes; action: drop
  conformed 0 bps, exceeded 0 bps
```

Switch#

</tr>
</tbody>
</table>
vlan database

To enter VLAN configuration mode, use the vlan database command.

```
vlan database
```

### Syntax Description
This command has no arguments or keywords.

### Defaults
This command has no default settings.

### Command Modes
Privileged EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
From VLAN configuration mode, you can access the VLAN database editing buffer manipulation commands, including:

- **abort**—Exits mode without applying the changes.
- **apply**—Applies the current changes and bumps the revision number.
- **exit**—Applies the changes, bumps the revision number, and exits VLAN configuration mode.
- **no**—Negates a command or sets its defaults; valid values are vlan and vtp.
- **reset**—Abandons the current changes and rereads the current database.
- **show**—Displays the database information.
- **vlan**—Accesses the subcommands to add, delete, or modify values that are associated with a single VLAN. For information about the vlan subcommands, see the `vlan (VLAN Database mode)` command.
- **vtp**—Accesses the subcommands to perform VTP administrative functions. For information about the vtp subcommands, see the `vtp client` command.

### Examples
This example shows how to enter VLAN configuration mode:

```
Switch# vlan database
Switch(vlan)#
```

This example shows how to exit VLAN configuration mode without applying changes after you are in VLAN configuration mode:

```
Switch(vlan)# abort
Abortng....
Switch#
```
This example shows how to delete a VLAN after you are in VLAN configuration mode:

Switch(vlan)# no vlan 100
Deleting VLAN 100...
Switch(vlan)#

This example shows how to turn off pruning after you are in VLAN configuration mode:

Switch(vlan)# no vtp pruning
Pruning switched OFF
Switch(vlan)#

**vlan dot1q tag native**

To enable tagging of the native VLAN frames on all 802.1Q trunk ports, use the `vlan dot1q tag native` command. To disable tagging of native VLAN frames, use the `no` form of this command.

```
vlan dot1q tag native

no vlan dot1q tag native
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

802.1Q native VLAN tagging is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.2(18)EW</td>
<td>This command was first introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When enabled, the native VLAN packets exiting all 802.1Q trunk ports are tagged unless the port is explicitly configured to disable native VLAN tagging.

When disabled, the native VLAN packets exiting all 802.1Q trunk ports are not tagged.

You can use this command with 802.1Q tunneling. This feature operates on an edge switch of a service-provider network and expands VLAN space by using a VLAN-in-VLAN hierarchy and by tagging the tagged packets. You must use the 802.1Q trunk ports for sending out the packets to the service-provider network. However, the packets going through the core of the service-provider network might also be carried on the 802.1Q trunks. If the native VLANs of an 802.1Q trunk match the native VLAN of a tunneling port on the same switch, the traffic on the native VLAN is not tagged on the sending trunk port. This command ensures that the native VLAN packets on all 802.1Q trunk ports are tagged.

**Examples**

This example shows how to enable 802.1Q tagging on the native VLAN frames and verify the configuration:

```
Switch# config terminal
Switch (config)# vlan dot1q tag native
Switch (config)# end
Switch# show vlan dot1q tag native
dot1q native vlan tagging is enabled
```
### Related Commands

**vlan filter**

To apply a VLAN access map, use the `vlan filter` command. To clear the VLAN access maps from VLANs or interfaces, use the `no` form of this command.

```
vlan filter map-name {vlan-list vlan-list}
no vlan filter map-name {vlan-list [vlan-list]}
```

**Syntax Description**

- `map-name` VLAN access-map tag.
- `vlan-list` Specifies the VLAN list; see the “Usage Guidelines” section for valid values.

**Defaults**

This command has no default settings.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(12c)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When configuring an action clause in a VLAN access map, note the following:

- You can apply the VLAN access map to one or more VLANs.
- The `vlan-list` parameter can be a single VLAN ID, a list of VLAN IDs, or VLAN ID ranges (`vlan-id-vlan-id`). Multiple entries are separated by `-`, (hyphen), or `,` (comma).
- You can apply only one VLAN access map to each VLAN.

When entering the `no` form of this command, the `vlan-list` parameter is optional (but the keyword `vlan-list` is required). If you do not enter the `vlan-list` parameter, the VACL is removed from all the VLANs where the `map-name` is applied.

**Examples**

This example shows how to apply a VLAN access map on VLANs 7 through 9:

```
Switch(config)# vlan filter ganymede vlan-list 7-9
Switch(config)#
```
vlan internal allocation policy

To configure the internal VLAN allocation scheme, use the `vlan internal allocation policy` command. To return to the default setting, use the `no` form of this command.

```plaintext
vlan internal allocation policy {ascending | descending}

no vlan internal allocation policy
```

**Syntax Description**

- `ascending` Specifies to allocate internal VLANs from 1006 to 4094.
- `descending` Specifies to allocate internal VLANs from 4094 to 1006.

**Defaults**

The default is the ascending allocation scheme.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(19)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure internal VLAN allocation to be from 1006 and up or from 4094 and down. The internal VLANs and user-configured VLANs share the 1006 to 4094 VLAN spaces. A “first come, first served” policy is used in allocating these spaces.

The `vlan internal allocation policy` command allows you to configure the allocation direction of the internal VLAN.

During system bootup, the internal VLANs that are required for features in the startup-config file are allocated first. The user-configured VLANs in the startup-config file are configured next. If you configure a VLAN that conflicts with an existing internal VLAN, the VLAN that you configured is put into a nonoperational status until the internal VLAN is freed and becomes available.

After you enter the `write mem` command and the system reloads, the reconfigured allocation scheme is used by the port manager.

**Examples**

This example shows how to configure the VLANs in a descending order as the internal VLAN allocation policy:

```plaintext
Switch(config)# vlan internal allocation policy descending
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tr>
</tbody>
</table>
vmps reconfirm (global configuration)

To change the reconfirmation interval for the VLAN Query Protocol (VQP) client, use the `vmps reconfirm` command. To return to the default setting, use the `no` form of this command.

```
vmps reconfirm interval

no vmps reconfirm
```

**Syntax Description**

- `interval` Queries to the VLAN Membership Policy Server (VMPS) to reconfirm dynamic VLAN assignments; valid values are from 1 to 120 minutes.

**Defaults**

The reconfirmation interval is 60 minutes.

**Command Modes**

Global configuration mode

**Command History**

- **Release**: 12.1(13)EW
  - **Modification**: Support for this command was introduced on the Catalyst 4500 series switch.

**Examples**

This example shows how to set the VQP client to reconfirm dynamic VLAN entries every 20 minutes:

```
Switch(config)# vmps reconfirm 20
Switch(config)#
```

You can verify your setting by entering the `show vmps` command and examining information in the Reconfirm Interval row.

**Related Commands**

To configure the per-server retry count for the VLAN Query Protocol (VQP) client, use the `vmps retry` command. To return to the default setting, use the `no` form of this command.

```
vmps retry count

no vmps retry
```

**Syntax Description**
- `count`: Number of attempts to contact the VLAN Membership Policy Server (VMPS) by the client before querying the next server in the list; valid values are from 1 to 10.

**Defaults**
The retry count is 3.

**Command Modes**
Global configuration mode

**Command History**
- **Release**       **Modification**
  - 12.1(13)EW      Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**
You can verify your setting by entering the `show vmps` command and examining information in the Server Retry Count row.

**Examples**
This example shows how to set the retry count to 7:
```
Switch(config)# vmps retry 7
```

**Related Commands**
- **Command**   **Description**
  - `show vmps` Displays the VLAN Query Protocol (VQP) version, reconfirmation interval, retry count, VLAN Membership Policy Server (VMPS) IP addresses, current servers, and primary servers.
To configure the primary VLAN Membership Policy Server (VMPS) and up to three secondary servers, use the `vmps server` command. To remove a VMPS server, use the `no` form of this command.

```
vmps server ipaddress [primary]
no vmps server ipaddress
```

**Syntax Description**

- `ipaddress`: IP address or host name of the primary or secondary VMPS servers. If you specify a hostname, the Domain Name System (DNS) server must be configured.
- `primary`: (Optional) Determines whether primary or secondary VMPS servers are being configured.

**Defaults**

No primary or secondary VMPS servers are defined.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(4)EA1</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The first server that you entered is automatically selected as the primary server whether or not `primary` is entered. You can override the first server address by using `primary` in a subsequent command.

If a member switch in a cluster configuration does not have an IP address, the cluster does not use the VMPS server that is configured for that member switch. Instead, the cluster uses the VMPS server on the command switch, and the command switch proxies the VMPS requests. The VMPS server treats the cluster as a single switch and uses the IP address of the command switch to respond to requests.

When using the `no` form without specifying the `ipaddress`, all configured servers are deleted. If you delete all servers when dynamic-access ports are present, the switch cannot forward the packets from the new sources on these ports because it cannot query the VMPS.

You can verify your setting by entering the `show vmps` command and examining information in the VMPS Domain Server row.
Examples

This example shows how to configure the server with IP address 191.10.49.20 as the primary VMPS server. The servers with IP addresses 191.10.49.21 and 191.10.49.22 are configured as secondary servers:

Switch(config)# vmps server 191.10.49.20 primary
Switch(config)# vmps server 191.10.49.21
Switch(config)# vmps server 191.10.49.22
Switch(config)#

This example shows how to delete the server with IP address 191.10.49.21:

Switch(config)# no vmps server 191.10.49.21
Switch(config)#

</tr>
</tbody>
</table>
vtp (global configuration mode)

To modify the name of a VTP configuration storage file, use the `vtp` command. To clear a filename, use the `no` form of this command.

```
vtp {{file filename} | {if-id name}}
no vtp {{file filename} | {if-id name}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Specifies the IFS file where VTP configuration will be stored.</td>
</tr>
<tr>
<td>if-id</td>
<td>Specifies the name of the interface providing the VTP updater ID for this device, where the <code>if-id name</code> is an ASCII string limited to 255 characters.</td>
</tr>
</tbody>
</table>

**Defaults**

Disabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot use the `vtp file` command to load a new database. You can use it only to rename the file in which the existing database is stored.

You can use the `vtp if-id` command to specify the name of the interface providing the VTP updater ID for this device. The VTP updater is the device that adds, deletes, or modifies VLANs to a network, and triggers a VTP updater to inform the rest of the system of the changes.

**Examples**

This example shows how to specify the IFS file system file where VTP configuration is stored:

```
Switch(config)# vtp file vtpconfig
Setting device to store VLAN database at filename vtpconfig.
Switch(config)#
```

This example shows how to specify the name of the interface providing the VTP updater ID:

```
Switch(config)# vtp if-id fastethernet
Switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp</td>
<td>Displays VTP statistics and domain information.</td>
</tr>
</tbody>
</table>
vtp client

To place a device in VTP client mode, use the `vtp client` command. To return to VTP server mode, use the `no vtp client` form of this command.

```
vtp client
no vtp client
```

**Syntax Description**

This command has no arguments or keywords.

**Defaults**

Disabled

**Command Modes**

VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the receiving switch is in client mode, the client switch changes its configuration to duplicate the configuration of the server. If you have switches in client mode, make sure to make all VTP or VLAN configuration changes on a switch in server mode.

The `vtp server` command is the functional equivalent of `no vtp client` except that it does not return an error if the device is not in client mode.

**Examples**

This example shows how to place the device in VTP client mode:

```
Switch(vlan-config)# vtp client
Switch(vlan-config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td><code>show vtp</code></td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
vtp domain

To configure the administrative domain name for a device, use the `vtp domain` command.

```
vtp domain domain-name
```

**Syntax Description**

- `domain-name` Name of the domain.

**Defaults**

This command has no default settings.

**Command Modes**

VLAN configuration mode

**Command History**

- **Release** 12.1(8a)EW
- **Modification** Support for this command was introduced on the Catalyst 4500 series switch.

**Usage Guidelines**

When you define the `domain-name`, the domain name is case sensitive and can be from 1 to 32 characters.

You must set a domain name before you can transmit any VTP advertisements.

Even if you do not set a domain name, the device will leave the no-management-domain state upon receiving the first VTP summary packet on any port that is currently trunking.

If the device receives its domain from a summary packet, it resets its configuration revision number to zero. Once the device leaves the no-management-domain state, it can never be configured to reenter the number except by cleaning NVRAM and reloading.

**Examples**

This example shows how to set the devices administrative domain:

```
Switch(vlan-config)# vtp domain DomainChandon
Switch(vlan-config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vtp</code></td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
To create a VTP domain password, use the `vtp password` command. To delete the password, use the `no` form of this command.

```
vtp password password-value
no vtp password
```

**Syntax Description**

- `password-value`: An ASCII string, from 1 to 32 characters, identifying the administrative domain for the device.

**Defaults**

Disabled

**Command Modes**

VLAN configuration mode

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch..</td>
</tr>
</tbody>
</table>
```

**Examples**

This example shows how to create a VTP domain password:

```
Switch(vlan-config)# vtp password DomainChandon
Switch(vlan-config)#
```

This example shows how to delete the VTP domain password:

```
Switch(vlan-config)# no vtp password
Clearing device VLAN database password.
Switch(vlan-config)#
```

**Related Commands**

<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp</td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td>vtp (global configuration mode)</td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
vtp pruning

To enable pruning in the VLAN database, use the **vtp pruning** command. To disable pruning in the VLAN database, use the **no** form of this command.

```
vtp pruning
no vtp pruning
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
VTP pruning causes information about each pruning-eligible VLAN to be removed from VTP updates if there are no stations belonging to that VLAN.

**Examples**
This example shows how to enable pruning in the VLAN database:

```
Switch(vlan-config)# vtp pruning
Pruning switched ON
Switch(vlan-config)#
```

This example shows how to disable pruning in the VLAN database:

```
Switch(vlan-config)# no vtp pruning
Pruning switched OFF
Switch(vlan-config)#
```

**Related Commands**

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp</td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td>vtp (global configuration mode)</td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
vtp server

To place the device in VTP server mode, use the `vtp server` command.

```
vtp server
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Enabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you make a change to the VTP or VLAN configuration on a switch in server mode, that change is propagated to all the switches in the same VTP domain.

You can set VTP to either server or client mode only when you disable dynamic VLAN creation.

If the receiving switch is in server mode, the configuration is not changed.

The `vtp server` command is the functional equivalent of `no vtp client`, except that it does not return an error if the device is not in client mode.

**Examples**
This example shows how to place the device in VTP server mode:

```
Switch(vlan-config)# vtp server
Switch(vlan-config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show vtp</code></td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td><code>vtp (global configuration mode)</code></td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
vtp transparent

To place a device in VTP transparent mode, use the vtp transparent command. To return to VTP server mode, use the no form of this command.

```
vtp transparent
no vtp transparent
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The `vtp transparent` command disables VTP from the domain but does not remove the domain from the switch.

If the receiving switch is in transparent mode, the configuration is not changed. The switches in transparent mode do not participate in VTP. If you make VTP or VLAN configuration changes on a switch in transparent mode, the changes are not propagated to the other switches in the network.

The `vtp server` command is similar to the `no vtp transparent` command, except that it does not return an error if the device is not in transparent mode.

**Examples**
This example shows how to place the device in VTP transparent mode:
```
Switch(vlan-config)# vtp transparent
Switch(vlan-config)#
```

This example shows how to return the device to VTP server mode:
```
Switch(vlan-config)# no vtp transparent
Switch(vlan-config)#
```

**Related Commands**

<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vtp</td>
<td>Displays VTP statistics and domain information.</td>
</tr>
<tr>
<td>vtp (global configuration mode)</td>
<td>Configures the name of a VTP configuration storage file.</td>
</tr>
</tbody>
</table>
vtp v2-mode

To enable version 2 mode, use the `vtp v2-mode` command. To disable version 2 mode, use the `no` form of this command.

```
vtp v2-mode
no vtp v2-mode
```

**Syntax Description**
This command has no arguments or keywords.

**Defaults**
Disabled

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>12.1(8a)EW</td>
<td>Support for this command was introduced on the Catalyst 4500 series switch.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
All switches in a VTP domain must run the same version of VTP. VTP version 1 and VTP version 2 do not operate on switches in the same VTP domain.

If all switches in a domain are VTP version 2-capable, you only need to enable VTP version 2 on one switch; the version number is then propagated to the other version 2-capable switches in the VTP domain.

If you toggle the version 2 mode, the parameters of certain default VLANs will be modified.

**Examples**

This example shows how to enable version 2 mode in the VLAN database:

```
Switch(vlan-config)# vtp v2-mode
Switch(vlan-config)#
```

This example shows how to disable version 2 mode in the VLAN database:

```
Switch(vlan-config)# no vtp v2-mode
Switch(vlan-config)#
```

Symbols

$ matches the end of a string 1-7
( ) in commands 1-11
* matches 0 or more sequences of a pattern 1-7
+ matches 1 or more sequences of a pattern 1-7
. matches any single character 1-7
? command 1-1
? matches 0 or 1 occurrence of a pattern 1-7
^ matches the beginning of a string 1-7
_ matches a comma (,), left brace ({}), left parenthesis 1-7
" 1-10
