CHAPTER 1

Product Overview 1-1

Layer 2 Software Features 1-1

802.1Q and Layer 2 Protocol Tunneling 1-2

CDP 1-2

EtherChannel Bundles 1-2

Ethernet CFM 1-3

Ethernet OAM Protocol 1-3

Flex Links and MAC Address-Table Move Update 1-3

Jumbo Frames 1-3

Link Layer Discovery Protocol 1-3

Location Service 1-4

Multiple Spanning Tree 1-4

Per-VLAN Rapid Spanning Tree 1-4

QoS 1-4

Resilient Ethernet Protocol 1-5

Spanning Tree Protocol 1-5

Stateful Switchover 1-6

SVI Autostate 1-6

UBRL 1-6

UDLD 1-7

Unidirectional Ethernet	1-7
VLANs	1-7
Virtual Switch System	1-8
Y.1731 (AIS and RDI)	1-8
Layer 3 Software Features	1-8
CEF	1-9
EIGRP Stub Routing	1-9
HSRP	1-9
SSO Aware HSRP	1-9
IP Routing Protocols	1-10
BGP	1-10
EIGRP	1-10
GLBP	1-11
IGRP	1-11
IS-IS	1-12
OSPF	1-12
RIP	1-12
VRRP	1-13
ISSU	1-13
Multicast Services	1-13
NSF with SSO	1-14
OSPF for Routed Access	1-14
Policy-Based Routing	1-15
Unidirectional Link Routing	1-15
VRF-lite	1-15
Management Features	1-16
Cisco Call Home	1-16
Cisco Network Assistant and Embedded CiscoView	1-16
Dynamic Host Control Protocol	1-17
Embedded Event Manager	1-17
Ethernet Management Port	1-17
FAT File Management System (Supervisor Engine 6-E only)	1-17
Forced 10/100 Autonegotiation	1-18
Intelligent Power Management	1-18
IP SLA	1-18
MAC Address Notification	1-18
MAC Notify MIB	1-18
NetFlow Statistics	1-19
Secure Shell	1-19
Simple Network Management Protocol	1-19

SPAN and RSPAN	1-19
Virtual Router Redundancy Protocol	1-20
Web Content Coordination Protocol	1-20
Security Features	1-20
802.1X Identity-Based Network Security	1-21
Cisco TrustSec SGT Exchange Protocol (SXP) IPv4	1-22
Dynamic ARP Inspection	1-22
Dynamic Host Configuration Protocol Snooping	1-23
Flood Blocking	1-23
Hardware-Based Control Plane Policing	1-23
IP Source Guard for Static Hosts	1-23
IP Source Guard	1-24
Local Authentication, RADIUS, and TACACS+ Authentication	1-24
Network Admission Control	1-24
Network Security with ACLs	1-24
Port Security	1-25
PPPoE Intermediate Agent	1-25
Storm Control	1-25
uRPF Strict Mode	1-26
Utilities	1-26
Layer 2 Traceroute	1-26
Time Domain Reflectometry	1-26
Debugging Features	1-26
Web-based Authentication	1-27

CHAPTER 2

Command-Line Interfaces	2-1
Accessing the Switch CLI	2-2
Accessing the CLI Using the EIA/TIA-232 Console Interface	2-2
Accessing the CLI Through Telnet	2-2
Performing Command-Line Processing	2-3
Performing History Substitution	2-4
Understanding Cisco IOS Command Modes	2-4
Getting a List of Commands and Syntax	2-5
Virtual Console for Standby Supervisor Engine	2-6
ROMMON Command-Line Interface	2-7
Archiving Crashfiles Information	2-8

CHAPTER 3

Configuring the Switch for the First Time	3-1
Default Switch Configuration	3-1
Configuring DHCP-Based Autoconfiguration	3-2
Understanding DHCP-Based Autoconfiguration	3-2
DHCP Client Request Process	3-3
Configuring the DHCP Server	3-4
Configuring the TFTP Server	3-4
Configuring the DNS Server	3-5
Configuring the Relay Device	3-5
Obtaining Configuration Files	3-6
Example Configuration	3-7
Configuring the Switch	3-8
Using Configuration Mode to Configure Your Switch	3-9
Verifying the Running Configuration Settings	3-9
Saving the Running Configuration Settings to Your Start-Up File	3-10
Reviewing the Configuration in NVRAM	3-10
Configuring a Default Gateway	3-11
Configuring a Static Route	3-11
Controlling Access to Privileged EXEC Commands	3-13
Setting or Changing a Static enable Password	3-13
Using the enable password and enable secret Commands	3-14
Setting or Changing a Privileged Password	3-15
Controlling Switch Access with TACACS+	3-15
Understanding TACACS+	3-15
TACACS+ Operation	3-17
Configuring TACACS+	3-17
Displaying the TACACS+ Configuration	3-22
Encrypting Passwords	3-22
Configuring Multiple Privilege Levels	3-23
Setting the Privilege Level for a Command	3-23
Changing the Default Privilege Level for Lines	3-23
Logging In to a Privilege Level	3-24
Exiting a Privilege Level	3-24
Displaying the Password, Access Level, and Privilege Level Configuration	3-24
Recovering a Lost Enable Password	3-25
Modifying the Supervisor Engine Startup Configuration	3-25
Understanding the Supervisor Engine Boot Configuration	3-25
Understanding the ROM Monitor	3-26
Configuring the Software Configuration Register	3-26

Modifying the Boot Field and Using the boot Command	3-27
Modifying the Boot Field	3-28
Verifying the Configuration Register Setting	3-29
Specifying the Startup System Image	3-30
Flash Memory Features	3-30
Security Precautions	3-30
Configuring Flash Memory	3-30
Controlling Environment Variables	3-31
Resetting a Switch to Factory Default Settings	3-31

CHAPTER 4

Administering the Switch 4-1

Managing the System Time and Date	4-1
System Clock	4-2
Understanding Network Time Protocol	4-2
Configuring NTP	4-3
Default NTP Configuration	4-4
Configuring NTP Authentication	4-4
Configuring NTP Associations	4-6
Configuring NTP Broadcast Service	4-7
Configuring NTP Access Restrictions	4-8
Configuring the Source IP Address for NTP Packets	4-10
Displaying the NTP Configuration	4-11
Configuring Time and Date Manually	4-11
Setting the System Clock	4-11
Displaying the Time and Date Configuration	4-12
Configuring the Time Zone	4-12
Configuring Summer Time (Daylight Saving Time)	4-13
Configuring a System Name and Prompt	4-14
Configuring a System Name	4-15
Understanding DNS	4-15
Default DNS Configuration	4-16
Setting Up DNS	4-16
Displaying the DNS Configuration	4-17
Creating a Banner	4-17
Default Banner Configuration	4-18
Configuring a Message-of-the-Day Login Banner	4-18
Configuring a Login Banner	4-19
Managing the MAC Address Table	4-19
Building the Address Table	4-20

MAC Addresses and VLANs	4-20
Default MAC Address Table Configuration	4-21
Changing the Address Aging Time	4-21
Removing Dynamic Address Entries	4-22
Configuring MAC Change Notification Traps	4-22
Configuring MAC Move Notification Traps	4-24
Configuring MAC Threshold Notification Traps	4-26
Adding and Removing Static Address Entries	4-27
Configuring Unicast MAC Address Filtering	4-28
Displaying Address Table Entries	4-30
Managing the ARP Table	4-30
Configuring Embedded CiscoView Support	4-30
Understanding Embedded CiscoView	4-31
Installing and Configuring Embedded CiscoView	4-31
Displaying Embedded CiscoView Information	4-33

CHAPTER 5

Configuring the Cisco IOS In Service Software Upgrade Process 5-1

Related Documents	5-2
Prerequisites to Performing ISSU	5-2
About Performing ISSU	5-3
Stateful Switchover Overview	5-3
NSF Overview	5-5
ISSU Process Overview	5-6
Guidelines for Performing ISSU	5-11
Versioning Capability in Cisco IOS Software to Support ISSU	5-11
Compatibility Matrix	5-12
SNMP Support for ISSU	5-13
Compatibility Verification Using Cisco Feature Navigator	5-13
How to Perform the ISSU Process	5-13
Verifying the ISSU Software Installation	5-14
Verifying Redundancy Mode Before Beginning the ISSU Process	5-14
Verifying the ISSU State Before Beginning the ISSU Process	5-16
Loading New Cisco IOS Software on the Standby Supervisor Engine	5-16
Switching to the Standby Supervisor Engine	5-19
Stopping the ISSU Rollback Timer (Optional)	5-21
Loading New Cisco IOS Software on the New Standby Supervisor Engine	5-22
Aborting a Software Upgrade During ISSU	5-24
Configuring the Rollback Timer to Safeguard Against Upgrade Issues	5-25
Displaying ISSU Compatibility Matrix Information	5-26

CHAPTER 6

Configuring Interfaces 6-1

- Overview of Interface Configuration 6-2
- Using the interface Command 6-2
- Configuring a Range of Interfaces 6-4
- Using the Ethernet Management Port 6-6
 - Understanding the Ethernet Management Port 6-7
 - Fa1 Interface and mgmtVrf 6-8
 - SSO Model 6-10
 - ISSU Model 6-10
 - Supported Features on the Ethernet Management Port 6-10
 - Configuring the Ethernet Management Port 6-11
- Defining and Using Interface-Range Macros 6-11
- Deploying SFP+ in X2 Ports 6-12
- Deploying 10-Gigabit Ethernet and Gigabit Ethernet SFP Ports on Supervisor Engine V-10GE 6-12
- Deploying 10-Gigabit Ethernet or Gigabit Ethernet Ports on WS-X4606-X2-E and Supervisor Engine 6-E 6-13
 - Port Numbering TwinGig Convertors 6-14
 - Limitations on Using a TwinGig Convertor 6-14
 - Selecting X2/TwinGig Convertor Mode 6-15
- Invoking Shared-backplane Uplink Mode on Supervisor Engine 6-E 6-16
- Digital Optical Monitoring Transceiver Support 6-17
- Configuring Optional Interface Features 6-17
 - Configuring Ethernet Interface Speed and Duplex Mode 6-18
 - Speed and Duplex Mode Configuration Guidelines 6-18
 - Setting the Interface Speed 6-18
 - Setting the Interface Duplex Mode 6-19
 - Displaying the Interface Speed and Duplex Mode Configuration 6-20
 - Adding a Description for an Interface 6-20
 - Configuring Flow Control 6-21
 - Configuring Jumbo Frame Support 6-23
 - Ports and Modules that Support Jumbo Frames 6-23
 - Jumbo Frame Support 6-24
 - Configuring MTU Sizes 6-25
 - Interacting with Baby Giants 6-26
 - Configuring the Port Debounce Timer 6-27
 - Configuring auto-MDIX on a Port 6-28
 - Displaying the Interface auto-MDIX Configuration 6-29

Understanding Online Insertion and Removal	6-30
Monitoring and Maintaining the Interface	6-30
Monitoring Interface and Controller Status	6-31
Clearing and Resetting the Interface	6-31
Shutting Down and Restarting an Interface	6-32
Configuring Interface Link Status and Trunk Status Events	6-32
Configuring Link Status Event Notification for an Interface	6-33
Global Settings	6-33
Configuring a Switch Global Link Status Logging Event	6-33
Result	6-34
Resetting the Interface to the Default Configuration	6-35

CHAPTER 7
Checking Port Status and Connectivity 7-1

Checking Module Status	7-2
Checking Interfaces Status	7-2
Displaying MAC Addresses	7-3
Checking Cable Status Using Time Domain Reflectometer	7-3
Overview	7-4
Running the TDR Test	7-4
TDR Guidelines	7-5
Using Telnet	7-5
Changing the Logout Timer	7-6
Monitoring User Sessions	7-6
Using Ping	7-7
Understanding How Ping Works	7-7
Running Ping	7-7
Using IP Traceroute	7-8
Understanding How IP Traceroute Works	7-8
Running IP Traceroute	7-9
Using Layer 2 Traceroute	7-9
Layer 2 Traceroute Usage Guidelines	7-10
Running Layer 2 Traceroute	7-11
Configuring ICMP	7-11
Enabling ICMP Protocol Unreachable Messages	7-12
Enabling ICMP Redirect Messages	7-12
Enabling ICMP Mask Reply Messages	7-13

CHAPTER 8

Configuring Supervisor Engine Redundancy Using RPR and SSO 8-1

- About Supervisor Engine Redundancy 8-2
 - Overview 8-2
 - RPR Operation 8-3
 - SSO Operation 8-3
- About Supervisor Engine Redundancy Synchronization 8-5
 - RPR Supervisor Engine Configuration Synchronization 8-5
 - SSO Supervisor Engine Configuration Synchronization 8-6
- Supervisor Engine Redundancy Guidelines and Restrictions 8-6
- Configuring Supervisor Engine Redundancy 8-8
 - Configuring Redundancy 8-9
 - Virtual Console for Standby Supervisor Engine 8-11
 - Synchronizing the Supervisor Engine Configurations 8-12
- Performing a Manual Switchover 8-13
- Performing a Software Upgrade 8-14
- Manipulating Bootflash on the Redundant Supervisor Engine 8-15

CHAPTER 9

Configuring Cisco NSF with SSO Supervisor Engine Redundancy 9-1

- About NSF with SSO Supervisor Engine Redundancy 9-1
 - About Cisco IOS NSF-Aware and NSF-Capable Support 9-2
 - NSF with SSO Supervisor Engine Redundancy Overview 9-4
 - SSO Operation 9-4
 - NSF Operation 9-5
 - Cisco Express Forwarding 9-5
 - Routing Protocols 9-5
 - BGP Operation 9-6
 - OSPF Operation 9-7
 - IS-IS Operation 9-7
 - EIGRP Operation 9-8
 - NSF Guidelines and Restrictions 9-9
- Configuring NSF with SSO Supervisor Engine Redundancy 9-10
 - Configuring SSO 9-10
 - Configuring CEF NSF 9-11
 - Verifying CEF NSF 9-11
 - Configuring BGP NSF 9-12
 - Verifying BGP NSF 9-12
 - Configuring OSPF NSF 9-13
 - Verifying OSPF NSF 9-13

Configuring IS-IS NSF	9-14
Verifying IS-IS NSF	9-15
Configuring EIGRP NSF	9-17
Verifying EIGRP NSF	9-17

CHAPTER 10

Environmental Monitoring and Power Management 10-1

About Environmental Monitoring	10-1
Using CLI Commands to Monitor your Environment	10-2
Displaying Environment Conditions	10-2
Conditions on Supervisor Engines II-Plus to V-10GE	10-2
Conditions on Supervisor Engine 6-E	10-3
Emergency Actions	10-3
System Alarms	10-4
Power Management	10-6
Power Management for the Catalyst 4500 Series Switches	10-6
Supported Power Supplies	10-7
Power Management Modes for the Catalyst 4500 Switch	10-8
Selecting a Power Management Mode	10-8
Power Management Limitations in Catalyst 4500 Series Switches	10-9
Available Power for Catalyst 4500 Series Switches Power Supplies	10-13
Special Considerations for the 4200 W AC and 6000 W AC Power Supplies	10-14
Combined Mode Power Resiliency	10-16
Special Considerations for the 1400 W DC Power Supply	10-17
Special Considerations for the 1400 W DC SP Triple Input Power Supply	10-18
Insufficient Inline Power Handling for Supervisor Engine II-TS	10-19
Powering Down a Module	10-20
Power Management for the Catalyst 4948 Switches	10-21
Power Management Modes for the Catalyst 4948 Switch	10-21

CHAPTER 11

Configuring Power over Ethernet 11-1

Overview	11-1
Hardware Requirements	11-2
Power Management Modes	11-2
Intelligent Power Management	11-4
Configuring Power Consumption for Powered Devices on an Interface	11-5
Displaying the Operational Status for an Interface	11-6
Displaying the PoE Consumed by a Module	11-7
PoE Policing and Monitoring	11-11

PoE Policing Modes	11-12
Configuring Power Policing on an Interface	11-12
Displaying Power Policing on an Interface	11-13
Configuring Errdisable Recovery	11-14
Enhanced Power PoE Support on the E-Series Chassis	11-15

CHAPTER 12

Configuring Cisco EnergyWise 12-1

About EnergyWise	12-1
EnergyWise Entity	12-2
EnergyWise Domain	12-2
EnergyWise Network	12-2
EnergyWise Power Level	12-3
EnergyWise Names, Roles, and Keywords	12-4
EnergyWise Query	12-4
EnergyWise Importance	12-5
Configuration Guidelines	12-5
Managing Single Entities	12-6
Single PoE Switch Scenario	12-6
Manually Managing Power	12-7
Powering the EnergyWise Entity	12-8
Configuring Entity Attributes	12-9
Powering the PoE Port	12-10
Configuring PoE Port Attributes	12-11
Automatically Managing Power (Recurrence)	12-12
Examples	12-14
Establishing the Domain	12-14
Manually Managing Power	12-14
Automatically Managing Power	12-15
Managing Multiple Entities	12-15
Multiple PoE Switch Scenario	12-15
Managing Power in a Domain with Queries	12-17
Examples of Managing Multiple Entities	12-18
Querying with the Name Attribute	12-18
Querying with Keywords	12-19
Querying to Set Power Levels	12-19
Managing Power in a LAN	12-20
Managing Power with IP Routing	12-20
Command Usage to Verify CLI Functioning	12-22
Using CLI Commands	12-22

Verifying the Power Usage 12-23

CHAPTER 13

Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant 13-1

- Configuring and Using the Network Assistant 13-1
 - Network Assistant-Related Features and Their Defaults 13-2
 - Overview of the CLI Commands 13-2
 - Configuring Your Switch for Network Assistant 13-3
 - (Minimum) Configuration Required to Access Catalyst 4500 Accessible from CNA 13-3
 - (Additional) Configuration Required to use Community 13-4
 - (Additional) Configuration Required to use Cluster 13-5
 - Managing a Network using Community 13-5
 - Candidate and Member Characteristics 13-6
 - Automatic Discovery of Candidates and Members 13-7
 - Community Names 13-7
 - Hostnames 13-7
 - Passwords 13-8
 - Communication Protocols 13-8
 - Access Modes in Network Assistant 13-8
 - Community Information 13-8
 - Adding Devices 13-8
 - Converting a Cluster into a Community 13-9
 - Managing a Network using Cluster 13-10
 - Understanding Switch Clusters 13-10
 - Using the CLI to Manage Switch Clusters 13-12
 - Configuring Network Assistant in Community or Cluster Mode 13-13
 - Configuring Network Assistant in on a Networked Switch in Community Mode 13-13
 - Configuring Network Assistant in a Networked Switch in Cluster Mode 13-17

CHAPTER 14

Configuring VLANs, VTP, and VMPS 14-1

- VLANs 14-1
 - Overview of VLANs 14-1
 - VLAN Configuration Guidelines and Restrictions 14-3
 - VLAN Ranges 14-3
 - Configurable Normal-Range VLAN Parameters 14-4
 - VLAN Default Configuration 14-4
 - Configuring VLANs 14-5
 - Configuring VLANs in Global Configuration Mode 14-6
 - Assigning a Layer 2 LAN Interface to a VLAN 14-8

VLAN Trunking Protocol	14-8
Overview of VTP	14-8
Understanding the VTP Domain	14-9
Understanding VTP Modes	14-9
Understanding VTP Advertisements	14-10
Understanding VTP Versions	14-10
Understanding VTP Pruning	14-11
VTP Configuration Guidelines and Restrictions	14-13
VTP Default Configuration	14-14
Configuring VTP	14-14
Configuring VTP Global Parameters	14-15
Configuring the VTP Mode	14-17
Starting a Takeover	14-20
Displaying VTP Statistics	14-20
Displaying VTP Devices in a Domain	14-21
VLAN Membership Policy Server	14-21
Overview of VMPS	14-22
Understanding the VMPS Server	14-22
Security Modes for VMPS Server	14-23
Fallback VLAN	14-24
Illegal VMPS Client Requests	14-24
Overview of VMPS Clients	14-24
Understanding Dynamic VLAN Membership	14-24
Default VMPS Client Configuration	14-25
Configuring a Switch as a VMPS Client	14-25
Administering and Monitoring the VMPS	14-29
Troubleshooting Dynamic Port VLAN Membership	14-30
Dynamic Port VLAN Membership Configuration Example	14-30
VMPS Database Configuration File Example	14-33

CHAPTER 15

Configuring IP Unnumbered Interface	15-1
Related Documents	15-2
Overview of IP Unnumbered Support	15-2
IP Unnumbered Interface Support with DHCP Server and Relay Agent	15-2
DHCP Option 82	15-3
IP Unnumbered with Connected Host Polling	15-4
Limitations and Restrictions	15-4
Configuring IP Unnumbered Interface Support with DHCP Server	15-5
Configuring IP Unnumbered Interface Support on LAN and VLAN Interfaces	15-5

Configuring IP Unnumbered Interface Support on a Range of Ethernet VLANs	15-6
Configuring IP Unnumbered Interface Support with Connected Host Polling	15-7
Displaying IP Unnumbered Interface Settings	15-8
Troubleshooting IP Unnumbered	15-9

CHAPTER 16

Configuring Layer 2 Ethernet Interfaces	16-1
Overview of Layer 2 Ethernet Switching	16-1
Understanding Layer 2 Ethernet Switching	16-2
Switching Frames Between Segments	16-2
Building the MAC Address Table	16-2
Understanding VLAN Trunks	16-3
Encapsulation Types	16-3
Layer 2 Interface Modes	16-4
Default Layer 2 Ethernet Interface Configuration	16-4
Layer 2 Interface Configuration Guidelines and Restrictions	16-5
Configuring Ethernet Interfaces for Layer 2 Switching	16-5
Configuring an Ethernet Interface as a Layer 2 Trunk	16-6
Configuring an Interface as a Layer 2 Access Port	16-8
Clearing Layer 2 Configuration	16-9

CHAPTER 17

Configuring SmartPort Macros	17-1
Understanding SmartPort Macros	17-1
Configuring SmartPort Macros	17-2
Passing Parameters Through the Macro	17-2
Macro Parameter Help	17-3
Default SmartPort Macro Configuration	17-3
cisco-global	17-4
cisco-desktop	17-4
cisco-phone	17-4
cisco-router	17-5
cisco-switch	17-5
SmartPort Macro Configuration Guidelines	17-6
Creating SmartPorts Macros	17-7
Applying SmartPorts Macros	17-8
cisco-global	17-9
cisco-desktop	17-10
cisco-phone	17-10
cisco-switch	17-11

cisco-router	17-12
Displaying SmartPort Macros	17-13

CHAPTER 18

Configuring STP and MST 18-1

Overview of STP	18-1
Understanding the Bridge ID	18-2
Bridge Priority Value	18-2
Extended System ID	18-2
STP MAC Address Allocation	18-3
Bridge Protocol Data Units	18-3
Election of the Root Bridge	18-4
STP Timers	18-4
Creating the STP Topology	18-4
STP Port States	18-5
MAC Address Allocation	18-5
STP and IEEE 802.1Q Trunks	18-6
Per-VLAN Rapid Spanning Tree	18-6
Default STP Configuration	18-6
Configuring STP	18-7
Enabling STP	18-7
Enabling the Extended System ID	18-8
Configuring the Root Bridge	18-9
Configuring a Secondary Root Switch	18-12
Configuring STP Port Priority	18-13
Configuring STP Port Cost	18-15
Configuring the Bridge Priority of a VLAN	18-16
Configuring the Hello Time	18-17
Configuring the Maximum Aging Time for a VLAN	18-18
Configuring the Forward-Delay Time for a VLAN	18-18
Disabling Spanning Tree Protocol	18-19
Enabling Per-VLAN Rapid Spanning Tree	18-20
Specifying the Link Type	18-21
Restarting Protocol Migration	18-21
Overview of MST	18-21
IEEE 802.1s MST	18-22
IEEE 802.1w RSTP	18-23
RSTP Port Roles	18-23
RSTP Port States	18-24
MST-to-SST Interoperability	18-24

Common Spanning Tree	18-25
MST Instances	18-26
MST Configuration Parameters	18-26
MST Regions	18-26
MST Region Overview	18-26
Boundary Ports	18-27
IST Master	18-27
Edge Ports	18-27
Link Type	18-28
Message Age and Hop Count	18-28
MST-to-PVST+ Interoperability	18-28
MST Configuration Restrictions and Guidelines	18-29
Configuring MST	18-29
Enabling MST	18-29
Configuring MST Instance Parameters	18-31
Configuring MST Instance Port Parameters	18-32
Restarting Protocol Migration	18-33
Displaying MST Configurations	18-33

CHAPTER 19

Configuring Flex Links and the MAC Address-Table Move Update Feature 19-1

Flex Links and the MAC Address-Table Move Update	19-1
Flex Links	19-2
VLAN Flex Link Load Balancing and Support	19-2
MAC Address-Table Move Update	19-3
Flex Link Failover Actions	19-4
Configuring Flex Links and the MAC Address-Table Move Update	19-5
Default Configuration	19-5
Configuration Guidelines	19-5
Configuring Flex Links	19-6
Configuring VLAN Load Balancing on Flex Links	19-8
Configuring the MAC Address-Table Move Update Feature	19-9
Monitoring Flex Links and the MAC Address-Table Move Update	19-11
19-12	

CHAPTER 20

Configuring Resilient Ethernet Protocol 20-1

Understanding REP	20-1
Link Integrity	20-3

Fast Convergence	20-3
VLAN Load Balancing	20-4
Spanning Tree Interaction	20-5
REP Ports	20-5
Configuring REP	20-6
Default REP Configuration	20-6
REP Configuration Guidelines	20-7
Configuring the REP Administrative VLAN	20-8
Configuring REP Interfaces	20-9
Setting Manual Preemption for VLAN Load Balancing	20-12
Configuring SNMP Traps for REP	20-13
Monitoring REP	20-13

CHAPTER 21

Configuring Optional STP Features	21-1
Overview of Root Guard	21-2
Enabling Root Guard	21-2
Overview of Loop Guard	21-3
Enabling Loop Guard	21-5
Overview of EtherChannel Guard	21-6
Enabling EtherChannel Guard (Optional)	21-6
Overview of PortFast	21-7
Enabling PortFast	21-7
Overview of BPDU Guard	21-8
Enabling BPDU Guard	21-8
Overview of PortFast BPDU Filtering	21-9
Enabling PortFast BPDU Filtering	21-10
Overview of UplinkFast	21-11
Enabling UplinkFast	21-12
Overview of BackboneFast	21-13
Enabling BackboneFast	21-16

CHAPTER 22

Configuring EtherChannel	22-1
EtherChannel Overview	22-1
Port-Channel Interfaces	22-2
How EtherChannels Are Configured	22-2
EtherChannel Configuration Overview	22-3
Manual EtherChannel Configuration	22-3

PAgP EtherChannel Configuration	22-3
IEEE 802.3ad LACP EtherChannel Configuration	22-4
Load Balancing	22-5
EtherChannel Configuration Guidelines and Restrictions	22-5
Configuring EtherChannel	22-6
Configuring Layer 3 EtherChannels	22-6
Creating Port-Channel Logical Interfaces	22-7
Configuring Physical Interfaces as Layer 3 EtherChannels	22-8
Configuring Layer 2 EtherChannels	22-10
Configuring the LACP System Priority and System ID	22-12
Configuring EtherChannel Load Balancing	22-13
Removing an Interface from an EtherChannel	22-14
Removing an EtherChannel	22-15
Displaying EtherChannel to a Virtual Switch System	22-15
Understanding VSS Client	22-16
Virtual Switch System	22-16
Dual-Active Scenarios	22-16
Dual-Active Detection Using Enhance PAgP	22-16
Displaying EtherChannel Links to VSS	22-18

 CHAPTER 23

Configuring IGMP Snooping and Filtering 23-1

Overview of IGMP Snooping	23-1
Immediate-Leave Processing	23-3
IGMP Configurable-Leave Timer	23-4
IGMP Snooping Querier	23-4
Explicit Host Tracking	23-4
Configuring IGMP Snooping	23-5
Default IGMP Snooping Configuration	23-5
Enabling IGMP Snooping Globally	23-6
Enabling IGMP Snooping on a VLAN	23-6
Configuring Learning Methods	23-7
Configuring PIM/DVMRP Learning	23-7
Configuring CGMP Learning	23-8
Configuring a Static Connection to a Multicast Router	23-8
Enabling IGMP Immediate-Leave Processing	23-8
Configuring the IGMP Leave Timer	23-9
Configuring IGMP Snooping Querier	23-10
Configuring Explicit Host Tracking	23-11
Configuring a Host Statically	23-12

Suppressing Multicast Flooding	23-12
IGMP Snooping Interface Configuration	23-13
IGMP Snooping Switch Configuration	23-14
Displaying IGMP Snooping Information	23-15
Displaying Querier Information	23-15
Displaying IGMP Host Membership Information	23-15
Displaying Group Information	23-16
Displaying Multicast Router Interfaces	23-18
Displaying MAC Address Multicast Entries	23-18
Displaying IGMP Snooping Information on a VLAN Interface	23-19
Displaying IGMP Snooping Querier Information	23-19
Configuring IGMP Filtering	23-20
Default IGMP Filtering Configuration	23-21
Configuring IGMP Profiles	23-21
Applying IGMP Profiles	23-22
Setting the Maximum Number of IGMP Groups	23-23
Displaying IGMP Filtering Configuration	23-24

CHAPTER 24

Configuring IPv6 MLD Snooping	24-1
Understanding MLD Snooping	24-1
MLD Messages	24-2
MLD Queries	24-3
Multicast Client Aging Robustness	24-3
Multicast Router Discovery	24-3
MLD Reports	24-4
MLD Done Messages and Immediate-Leave	24-4
Topology Change Notification Processing	24-4
Configuring IPv6 MLD Snooping	24-5
Default MLD Snooping Configuration	24-5
MLD Snooping Configuration Guidelines	24-6
Enabling or Disabling MLD Snooping	24-6
Configuring a Static Multicast Group	24-7
Configuring a Multicast Router Port	24-7
Enabling MLD Immediate Leave	24-8
Configuring MLD Snooping Queries	24-9
Disabling MLD Listener Message Suppression	24-10
Displaying MLD Snooping Information	24-11

CHAPTER 25

Configuring 802.1Q and Layer 2 Protocol Tunneling 25-1

- Understanding 802.1Q Tunneling 25-2
- Configuring 802.1Q Tunneling 25-3
 - 802.1Q Tunneling Configuration Guidelines 25-3
 - Native VLANs 25-4
 - System MTU 25-5
 - 802.1Q Tunneling and Other Features 25-5
 - Configuring an 802.1Q Tunneling Port 25-6
- Understanding Layer 2 Protocol Tunneling 25-7
- Configuring Layer 2 Protocol Tunneling 25-9
 - Default Layer 2 Protocol Tunneling Configuration 25-9
 - Layer 2 Protocol Tunneling Configuration Guidelines 25-10
 - Configuring Layer 2 Tunneling 25-11
- Monitoring and Maintaining Tunneling Status 25-12

CHAPTER 26

Configuring CDP 26-1

- Overview of CDP 26-1
- Configuring CDP 26-2
 - Enabling CDP Globally 26-2
 - Displaying the CDP Global Configuration 26-2
 - Enabling CDP on an Interface 26-3
 - Displaying the CDP Interface Configuration 26-3
 - Monitoring and Maintaining CDP 26-3

CHAPTER 27

Configuring LLDP, LLDP-MED, and Location Service 27-1

- Understanding LLDP, LLDP-MED, and Location Service 27-1
 - Understanding LLDP 27-1
 - Understanding LLDP-MED 27-2
 - Understanding Location Service 27-3
- Configuring LLDP and LLDP-MED, and Location Service 27-4
 - Default LLDP Configuration 27-4
 - Configuring LLDP Characteristics 27-5
 - Disabling and Enabling LLDP Globally 27-6
 - Disabling and Enabling LLDP on an Interface 27-7
 - Configuring LLDP-MED TLVs 27-8
 - Configuring Location TLV and Location Service 27-9
 - Monitoring and Maintaining LLDP, LLDP-MED, and Location Service 27-11

CHAPTER 28**Configuring UDLD 28-1**

- Overview of UDLD 28-1
 - Modes of Operation 28-1
- Default UDLD Configuration 28-2
- Configuring UDLD on the Switch 28-3
 - Enabling UDLD Globally 28-4
 - Enabling UDLD on Individual Interfaces 28-4
 - Disabling UDLD on Non-Fiber-Optic Interfaces 28-4
 - Configuring the UDLD Probe Message Interval 28-5
 - Resetting Disabled LAN Interfaces 28-5

CHAPTER 29**Configuring Unidirectional Ethernet 29-1**

- Overview of Unidirectional Ethernet 29-1
- Configuring Unidirectional Ethernet 29-2

CHAPTER 30**Configuring Layer 3 Interfaces 30-1**

- Overview of Layer 3 Interfaces 30-1
 - Logical Layer 3 VLAN Interfaces 30-2
 - Physical Layer 3 Interfaces 30-2
 - Understanding SVI Autostate Exclude 30-3
 - Understanding Layer 3 Interface Counters 30-3
- Configuration Guidelines 30-4
- Configuring Logical Layer 3 VLAN Interfaces 30-5
- Configuring VLANs as Layer 3 Interfaces 30-6
 - Configuring SVI Autostate Exclude 30-6
 - Configuring IP MTU Sizes 30-8
 - Configuring Layer 3 Interface Counters 30-9
- Configuring Physical Layer 3 Interfaces 30-10
- Configuring EIGRP Stub Routing 30-11
 - Overview 30-12
 - How to Configure EIGRP Stub Routing 30-12
 - Dual-Homed Remote Topology 30-14
 - EIGRP Stub Routing Configuration Task List 30-16
 - Monitoring and Maintaining EIGRP 30-17
 - EIGRP Configuration Examples 30-18
 - Route Summarization Example 30-18
 - Route Authentication Example 30-18
 - Stub Routing Example 30-19

CHAPTER 31

Configuring Cisco Express Forwarding 31-1

- Overview of CEF 31-1
 - Benefits of CEF 31-2
 - Forwarding Information Base 31-2
 - Adjacency Tables 31-2
 - Adjacency Discovery 31-2
 - Adjacency Resolution 31-3
 - Adjacency Types That Require Special Handling 31-3
 - Unresolved Adjacency 31-3
- Catalyst 4500 Series Switch Implementation of CEF 31-3
 - Hardware and Software Switching 31-4
 - Hardware Switching 31-5
 - Software Switching 31-5
 - Load Balancing 31-6
 - Software Interfaces 31-6
- CEF Configuration Restrictions 31-6
- Configuring CEF 31-6
 - Enabling CEF 31-6
 - Configuring Load Balancing for CEF 31-7
 - Configuring Per-Destination Load Balancing 31-7
 - Configuring Load Sharing Hash Function 31-7
 - Viewing CEF Information 31-8
- Monitoring and Maintaining CEF 31-8
 - Displaying IP Statistics 31-8

CHAPTER 32

Configuring Unicast Reverse Path Forwarding 32-1

- In This Chapter 32-1
- About Unicast Reverse Path Forwarding 32-2
 - How Unicast RPF Works 32-2
 - Implementing Unicast RPF 32-4
 - Security Policy and Unicast RPF 32-5
 - Where to Use Unicast RPF 32-5
 - Routing Table Requirements 32-7
 - Where Not to Use Unicast RPF 32-7
 - Unicast RPF with BOOTP and DHCP 32-8
- Restrictions 32-8
- Limitations 32-8
- Related Features and Technologies 32-8
- Prerequisites to Configuring Unicast RPF 32-9

Unicast RPF Configuration Task List	32-9
Configuring Unicast RPF	32-9
Verifying Unicast RPF	32-10
Monitoring and Maintaining Unicast RPF	32-10
Unicast RPF Configuration Example: Inbound and Outbound Filters	32-12

CHAPTER 33

Configuring IP Multicast	33-1
Overview of IP Multicast	33-1
IP Multicast Protocols	33-2
Internet Group Management Protocol	33-3
Protocol-Independent Multicast	33-3
Rendezvous Point (RP)	33-4
IGMP Snooping	33-4
IP Multicast on the Catalyst 4500 Series Switch	33-5
CEF, MFIB, and Layer 2 Forwarding	33-6
IP Multicast Tables	33-8
Hardware and Software Forwarding	33-9
Non-Reverse Path Forwarding Traffic	33-10
Multicast Fast Drop	33-11
Multicast Forwarding Information Base	33-12
S/M, 224/4	33-13
Restrictions on using Bidirectional PIM	33-13
Unsupported Feature	33-13
Configuring IP Multicast Routing	33-13
Default Configuration in IP Multicast Routing	33-13
Enabling IP Multicast Routing	33-14
Enabling PIM on an Interface	33-14
Enabling Dense Mode	33-15
Enabling Sparse Mode	33-15
Enabling Sparse-Dense Mode	33-15
Enabling Bidirectional Mode	33-16
Enabling PIM-SSM Mapping	33-17
Configuring a Rendezvous Point	33-17
Configuring Auto-RP	33-17
Configuring a Single Static RP	33-20
Load Splitting of IP Multicast Traffic	33-22
Monitoring and Maintaining IP Multicast Routing	33-23
Displaying System and Network Statistics	33-23

Displaying the Multicast Routing Table	33-23
Displaying IP MFIB	33-26
Displaying Bidirectional PIM Information	33-27
Displaying PIM Statistics	33-27
Clearing Tables and Databases	33-28
Configuration Examples	33-28
PIM Dense Mode: Example	33-28
PIM Sparse Mode: Example	33-29
Bidirectional PIM Mode: Example	33-29
Sparse Mode with a Single Static RP: Example	33-29
Sparse Mode with Auto-RP: Example	33-30

CHAPTER 34

Configuring ANCP Client	34-1
Overview	34-1
Enabling and Configuring ANCP Client	34-2
Identifying a Port with the ANCP Protocol	34-2
Example 1	34-3
Example 2	34-4
Identifying a Port with DHCP Option 82	34-4
Guidelines and Restrictions	34-5

CHAPTER 35

Configuring Policy-Based Routing	35-1
Overview of Policy-Based Routing	35-1
Understanding PBR	35-2
Understanding PBR on Supervisor Engine 6-E	35-2
Understanding PBR Flow Switching	35-3
Using Policy-Based Routing	35-3
Policy-Based Routing Configuration Task List	35-3
Enabling PBR	35-3
Enabling Local PBR	35-5
Unsupported Commands	35-5
Policy-Based Routing Configuration Examples	35-5
Equal Access	35-6
Differing Next Hops	35-6
Deny ACE	35-6

CHAPTER 36

Configuring VRF-lite	36-1
VRF-lite Overview	36-2

Default VRF-lite Configuration	36-4
VRF-lite Configuration Guidelines	36-5
Configuring VRFs	36-6
Configuring VRF-Aware Services	36-6
User Interface for ARP	36-7
User Interface for PING	36-7
User Interface for SNMP	36-7
User Interface for uRPF	36-8
User Interface for Syslog	36-8
User Interface for Traceroute	36-9
User Interface for FTP and TFTP	36-9
User Interface for Telnet and SSH	36-10
User Interface for NTP	36-10
Configuring Multicast VRFs	36-10
Configuring a VPN Routing Session	36-11
Configuring BGP PE to CE Routing Sessions	36-12
VRF-lite Configuration Example	36-13
Configuring Switch S8	36-14
Configuring Switch S20	36-15
Configuring Switch S11	36-16
Configuring the PE Switch S3	36-16
Displaying VRF-lite Status	36-17

CHAPTER 37

Configuring Quality of Service	37-1
Overview of QoS on the Catalyst 4500 Series Switch	37-2
Prioritization	37-2
QoS Terminology	37-3
Basic QoS Model	37-5
Classification	37-6
Classification Based on QoS ACLs	37-9
Classification Based on Class Maps and Policy Maps	37-9
Policing and Marking	37-10
Internal DSCP Values	37-14
Mapping Tables	37-15
Queueing and Scheduling	37-15
Active Queue Management	37-15
Sharing Link Bandwidth Among Transmit Queues	37-16
Strict Priority / Low Latency Queueing	37-16
Traffic Shaping	37-17

Packet Modification	37-17
Per Port Per VLAN QoS	37-17
QoS and Software Processed Packets	37-17
Configuring QoS on Supervisor Engines II-Plus, II+10GE, IV, V, V-10GE, 4924, 4948, and 4948-10GE	37-18
Default QoS Configuration	37-19
Configuration Guidelines	37-20
Enabling QoS Globally	37-21
Enabling IP DSCP Rewrite	37-21
Configuring a Trusted Boundary to Ensure Port Security	37-22
Enabling Dynamic Buffer Limiting	37-23
Enabling DBL Globally	37-24
Selectively Enable DBL	37-24
Creating Named Aggregate Policers	37-27
Configuring a QoS Policy	37-29
Overview of QoS Policy Configuration	37-29
Configuring a Class Map (Optional)	37-29
Configuring a Policy Map	37-31
Attaching a Policy Map to an Interface	37-36
Configuring CoS Mutation	37-37
Configuring User Based Rate Limiting	37-38
Examples	37-39
Configuring Hierarchical Policers	37-42
Enabling Per-Port Per-VLAN QoS	37-44
Enabling or Disabling QoS on an Interface	37-46
Configuring VLAN-Based QoS on Layer 2 Interfaces	37-47
Configuring the Trust State of Interfaces	37-48
Configuring the CoS Value for an Interface	37-49
Configuring DSCP Values for an Interface	37-50
Configuring Transmit Queues	37-50
Mapping DSCP Values to Specific Transmit Queues	37-51
Allocating Bandwidth Among Transmit Queues	37-52
Configuring Traffic Shaping of Transmit Queues	37-52
Configuring a High Priority Transmit Queue	37-53
Configuring DSCP Maps	37-53
Configuring the CoS-to-DSCP Map	37-54
Configuring the Policed-DSCP Map	37-54
Configuring the DSCP-to-CoS Map	37-55
Enabling Layer 2 Control Packet QoS	37-56
Usage Guidelines	37-60
Feature Interaction	37-60

Configuring Auto-QoS on Supervisor Engines II-Plus, II+10GE, IV, V, V-10GE, 4924, 4948, and 4948-10GE	37-61
Generated Auto-QoS Configuration	37-62
Effects of Auto-QoS on the Configuration	37-63
Configuration Guidelines	37-63
Enabling Auto-QoS for VoIP	37-64
Displaying Auto-QoS Information	37-65
Auto-QoS Configuration Example	37-65
Configuring QoS on Supervisor Engine 6-E and Catalyst 4900M	37-68
MQC-based QoS Configuration	37-68
Overview	37-69
Platform-supported Classification Criteria and QoS Features	37-70
Platform Hardware Capabilities	37-71
Prerequisites for Applying a QoS Service Policy	37-71
Restrictions for Applying a QoS Service Policy	37-71
Classification	37-71
Classification Statistics	37-72
Policing	37-72
How to Implement Policing	37-73
Platform Restrictions	37-73
Marking Network Traffic	37-73
Contents	37-73
Information About Marking Network Traffic	37-74
Marking Action Drivers	37-76
Traffic Marking Procedure Flowchart	37-76
Restrictions for Marking Network Traffic	37-77
Multi-attribute Marking Support	37-77
Hardware Capabilities for Marking	37-78
Configuring the Policy Map Marking Action	37-78
Marking Statistics	37-80
Shaping, Sharing (Bandwidth), Priority Queuing, Queue-limiting and DBL	37-80
Shaping	37-80
Sharing(bandwidth)	37-82
Priority queuing	37-85
Queue-limiting	37-86
Active Queue Management (AQM) via Dynamic Buffer Limiting (DBL)	37-89
Transmit Queue Statistics	37-90
Policy Associations	37-90
Software QoS	37-92
Configuring CoS Mutation	37-93

Configuring Auto-QoS on Supervisor Engine 6-E
and Catalyst 4900M 37-93

CHAPTER 38

Configuring Voice Interfaces 38-1

- Overview of Voice Interfaces 38-1
 - Cisco IP Phone Voice Traffic 38-2
 - Cisco IP Phone Data Traffic 38-2
- Configuring a Port to Connect to a Cisco 7960 IP Phone 38-3
- Configuring Voice Ports for Voice and Data Traffic 38-3
- Overriding the CoS Priority of Incoming Frames 38-5
- Configuring Power 38-5

CHAPTER 39

Configuring Private VLANs 39-1

- Command List 39-1
- Private VLANs 39-2
 - Definition Table 39-4
 - Private VLANs across Multiple Switches 39-5
 - Standard Trunk Ports 39-5
 - Isolated Private VLAN Trunk Ports 39-6
 - Promiscuous Private VLAN Trunk Ports 39-8
 - Private-VLAN Interaction with Other Features 39-8
 - PVLANS and VLAN ACL/QoS 39-9
 - Private VLANs and Unicast, Broadcast, and Multicast Traffic 39-9
 - Private VLANs and SVIs 39-10
 - Per-Virtual-Port Error Disable on Private VLANs 39-10
- Configuring PVLANS 39-10
 - Tasks for Configuring Private VLANs 39-11
 - Default Private-VLAN Configuration 39-11
 - PVLAN Configuration Guidelines and Restrictions 39-11
 - Configuring a VLAN as a PVLAN 39-13
 - Associating a Secondary VLAN with a Primary VLAN 39-14
 - Configuring a Layer 2 Interface as a PVLAN Promiscuous Port 39-16
 - Configuring a Layer 2 Interface as a PVLAN Host Port 39-17
 - Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port 39-18
 - Configuring a Layer 2 Interface as a Promiscuous PVLAN Trunk Port 39-19
 - Permitting Routing of Secondary VLAN Ingress Traffic 39-21

CHAPTER 40

Configuring 802.1X Port-Based Authentication 40-1

- Understanding 802.1X Port-Based Authentication 40-1

Device Roles	40-2
802.1X and Network Access Control	40-3
Authentication Initiation and Message Exchange	40-4
Ports in Authorized and Unauthorized States	40-5
802.1X Host Mode	40-6
Single-Host Mode	40-7
Multiple-Hosts Mode	40-7
Multidomain Authentication Mode	40-7
Multiauthentication Mode	40-8
Pre-Authentication Open Access	40-8
802.1X Violation Mode	40-9
Using 802.1X with VLAN Assignment	40-9
Using 802.1X for Guest VLANs	40-10
Usage Guidelines for Using 802.1X Authentication with Guest VLANs	40-10
Usage Guidelines for Using 802.1X Authentication with Guest VLANs on Windows-XP Hosts	40-11
Using 802.1X with MAC Authentication Bypass	40-11
Feature Interaction	40-12
Using 802.1X with Web-Based Authentication	40-13
Using 802.1X with Inaccessible Authentication Bypass	40-13
Using 802.1X with Unidirectional Controlled Port	40-14
Unidirectional State	40-14
Bidirectional State	40-14
Using 802.1X with Authentication Failed VLAN Assignment	40-14
Usage Guidelines for Using Authentication Failed VLAN Assignment	40-15
Using 802.1X with Port Security	40-16
Using 802.1X Authentication with ACL Assignments and Redirect URLs	40-17
Cisco Secure ACS and AV Pairs for URL-Redirect	40-17
ACLs	40-18
Using 802.1X with RADIUS-Provided Session Timeouts	40-18
Using 802.1X with Voice VLAN Ports	40-19
Using Multiple Domain Authentication and Multiple Authentication	40-20
How 802.1X Fails on a Port	40-21
Supported Topologies	40-21
Configuring 802.1X Port-Based Authentication	40-22
Default 802.1X Configuration	40-23
802.1X Configuration Guidelines	40-24
Enabling 802.1X Authentication	40-24
Configuring Switch-to-RADIUS-Server Communication	40-28
Configuring Multiple Domain Authentication and Multiple Authorization	40-30

Configuring 802.1X Authentication with ACL Assignments and Redirect URLs	40-34
Downloadable ACL	40-34
URL-Redirect	40-36
Configuring a Downloadable Policy	40-39
Configuring 802.1X Authentication with Per-User ACL and Filter-ID ACL	40-40
Per-User ACL and Filter-ID ACL	40-40
Configuring a Per-User ACL and Filter-ID ACL	40-46
Configuring RADIUS-Provided Session Timeouts	40-47
Configuring Violation Action	40-49
Configuring 802.1X with Guest VLANs	40-49
Configuring 802.1X with MAC Authentication Bypass	40-53
Configuring 802.1X with Inaccessible Authentication Bypass	40-55
Configuring 802.1X with Unidirectional Controlled Port	40-58
Configuring 802.1X with Authentication Failed	40-60
Configuring 802.1X with Voice VLAN	40-62
Configuring 802.1X with VLAN Assignment	40-63
Cisco ACS Configuration for VLAN Assignment	40-64
Enabling Fallback Authentication	40-65
Enabling Periodic Reauthentication	40-69
Enabling Multiple Hosts	40-70
Changing the Quiet Period	40-72
Changing the Switch-to-Client Retransmission Time	40-73
Setting the Switch-to-Client Frame-Retransmission Number	40-74
Manually Reauthenticating a Client Connected to a Port	40-76
Initializing the 802.1X Authentication State	40-76
Removing 802.1X Client Information	40-76
Resetting the 802.1X Configuration to the Default Values	40-76
Displaying 802.1X Statistics and Status	40-77
Displaying Authentication Details	40-77
Determining the Authentication Methods Registered with the Auth Manager	40-77
Displaying the Auth Manager Summary for an Interface	40-77
Displaying the Summary of All Auth Manager Sessions on the Switch	40-78
Displaying a Summary of All Auth Manager Sessions on the Switch Authorized for a Specified Authentication Method	40-78
Verifying the Auth Manager Session for an Interface	40-78
Displaying MAB Details	40-80
EPM Logging	40-80

Enabling PPPoE IA on a Switch	41-2
Configuring the Access Node Identifier for PPPoE IA on a Switch	41-2
Configuring the Identifier String, Option, and Delimiter for PPPoE IA on an Switch	41-2
Configuring the Generic Error Message for PPPoE IA on an Switch	41-2
Enabling PPPoE IA on an Interface	41-3
Configuring the PPPoE IA Trust Setting on an Interface	41-3
Configuring PPPoE IA Rate Limiting Setting on an Interface	41-4
Configuring PPPoE IA Vendor-tag Stripping on an Interface	41-4
Configuring PPPoE IA Circuit-ID and Remote-ID on an Interface	41-4
Enabling PPPoE IA for a Specific VLAN on an Interface	41-5
Configuring PPPoE IA Circuit-ID and Remote-ID for a VLAN on an Interface	41-5
Displaying Configuration Parameters	41-6
Clearing Packet Counters	41-7
Debugging PPPoE Intermediate Agent	41-8
Troubleshooting Tips	41-9
Related Documents	41-9
RFCs	41-9

CHAPTER 42

Configuring Web-Based Authentication 42-1

Understanding Web-Based Authentication	42-1
Device Roles	42-2
Host Detection	42-2
Session Creation	42-3
Authentication Process	42-3
Customization of the Authentication Proxy Web Pages	42-4
Web-based Authentication Interactions with Other Features	42-4
Port Security	42-4
LAN Port IP	42-4
Gateway IP	42-5
ACLs	42-5
Context-Based Access Control	42-5
802.1X Authentication	42-5
EtherChannel	42-5
Switchover	42-5
Configuring Web-Based Authentication	42-5
Default Web-Based Authentication Configuration	42-6
Web-Based Authentication Configuration Guidelines and Restrictions	42-6
Web-Based Authentication Configuration Task List	42-7
Configuring the Authentication Rule and Interfaces	42-7

Configuring AAA Authentication	42-8
Configuring Switch-to-RADIUS-Server Communication	42-9
Configuring the HTTP Server	42-11
Customizing the Authentication Proxy Web Pages	42-11
Specifying a Redirection URL for Successful Login	42-12
Configuring the Web-Based Authentication Parameters	42-13
Removing Web-Based Authentication Cache Entries	42-14
Displaying Web-Based Authentication Status	42-14

CHAPTER 43

Configuring Port Security 43-1

Command List	43-1
Port Security	43-3
Secure MAC Addresses	43-3
Maximum Number of Secure MAC Addresses	43-4
Aging Secure MAC Addresses	43-5
Sticky Addresses on a Port	43-5
Violation Actions	43-6
Invalid Packet Handling	43-6
Configuring Port Security on Access Ports	43-7
Configuring Port Security on Access Ports	43-7
Examples	43-10
Example 1: Setting Maximum Number of Secure Addresses	43-11
Example 2: Setting a Violation Mode	43-11
Example 3: Setting the Aging Timer	43-11
Example 4: Setting the Aging Timer Type	43-12
Example 5: Configuring a Secure MAC Address	43-12
Example 6: Configuring Sticky Port Security	43-13
Example 7: Setting a Rate Limit for Bad Packets	43-13
Example 8: Clearing Dynamic Secure MAC Addresses	43-14
Configuring Port Security on PVLAN Ports	43-14
Configuring Port Security on an Isolated Private VLAN Host Port	43-14
Example of Port Security on an Isolated Private VLAN Host Port	43-16
Configuring Port Security on a Private VLAN Promiscuous Port	43-16
Example of Port Security on a Private VLAN Promiscuous Port	43-17
Configuring Port Security on Trunk Ports	43-17
Configuring Trunk Port Security	43-17
Examples of Trunk Port Security	43-19
Example 1: Configuring a Maximum Limit of Secure MAC Addresses for all VLANs	43-19
Example 2: Configuring a Maximum Limit of Secure MAC Addresses for Specific VLANs	43-20

Example 3: Configuring Secure MAC Addresses in a VLAN Range	43-20
Trunk Port Security Guidelines and Restrictions	43-21
Port Mode Changes	43-22
Configuring Port Security on Voice Ports	43-22
Configuring Port Security on Voice Ports	43-23
Examples of Voice Port Security	43-25
Example 1: Configuring Maximum MAC Addresses for Voice and Data VLANs	43-25
Example 2: Configuring Sticky MAC Addresses for Voice and Data VLANs	43-26
Voice Port Security Guidelines and Restrictions	43-27
Displaying Port Security Settings	43-27
Examples	43-28
Example 1: Displaying Security Settings for the Entire Switch	43-28
Example 2: Displaying Security Settings for an Interface	43-29
Example 3: Displaying all Secure Addresses for the Entire Switch	43-29
Example 4: Displaying a Maximum Number of MAC Addresses on an Interface	43-30
Example 5: Displaying Security Settings on an Interface for a VLAN Range	43-30
Example 6: Displaying Secured MAC Addresses and Aging Information on an Interface	43-30
Example 7: Displaying Secured MAC Addresses for a VLAN Range on an Interface	43-31
Configuring Port Security with Other Features/Environments	43-31
DHCP and IP Source Guard	43-31
802.1X Authentication	43-32
Configuring Port Security in a Wireless Environment	43-32
Configuring Port Security over Layer 2 EtherChannel	43-33
Guidelines and Restrictions	43-33

CHAPTER 44

Configuring Control Plane Policing	44-1
Understanding How Control Plane Policing Works	44-2
Caveats for Control Plane Policing	44-3
CoPP Default Configuration	44-4
Configuring CoPP	44-4
Configure CoPP for Control Plane Traffic	44-4
Configure CoPP for Data Plane and Management Plane Traffic	44-6
CoPP Configuration Guidelines and Restrictions	44-8
Monitoring CoPP	44-8

CHAPTER 45

Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts	45-1
Overview of DHCP Snooping	45-1
Trusted and Untrusted Sources	45-2

Overview of the DHCP Snooping Database Agent	45-2
Option-82 Data Insertion	45-4
Configuring DHCP Snooping	45-6
Default Configuration for DHCP Snooping	45-7
Enabling DHCP Snooping	45-7
Enabling DHCP Snooping on the Aggregation Switch	45-9
Enabling DHCP Snooping and Option 82	45-10
Enabling DHCP Snooping on Private VLAN	45-11
Configuring DHCP Snooping on Private VLAN	45-12
Configuring DHCP Snooping with an Ethernet Channel Group	45-12
Enabling the DHCP Snooping Database Agent	45-12
Limiting the Rate of Incoming DHCP Packets	45-13
Configuration Examples for the Database Agent	45-15
Example 1: Enabling the Database Agent	45-15
Example 2: Reading Binding Entries from a TFTP File	45-16
Example 3: Adding Information to the DHCP Snooping Database	45-18
Displaying DHCP Snooping Information	45-18
Displaying a Binding Table	45-18
Displaying the DHCP Snooping Configuration	45-19
Overview of IP Source Guard	45-19
Configuring IP Source Guard	45-20
Configuring IP Source Guard on Private VLANs	45-22
Displaying IP Source Guard Information	45-22
Displaying IP Source Binding Information	45-23
Configuring IP Source Guard for Static Hosts	45-24
IPSG for Static Hosts on a Layer 2 Access Port	45-24
IPSG for Static Hosts on a PVLAN Host Port	45-28

CHAPTER 46

Configuring Dynamic ARP Inspection	46-1
Overview of Dynamic ARP Inspection	46-1
ARP Cache Poisoning	46-2
Purpose of Dynamic ARP Inspection	46-2
Interface Trust State, Security Coverage and Network Configuration	46-3
Relative Priority of Static Bindings and DHCP Snooping Entries	46-4
Logging of Dropped Packets	46-4
Rate Limiting of ARP Packets	46-4
Port Channels and Their Behavior	46-5
Configuring Dynamic ARP Inspection	46-5
Configuring Dynamic ARP Inspection in DHCP Environments	46-5

On Switch A	46-7
On Switch B	46-9
Configuring ARP ACLs for Non-DHCP Environments	46-11
Configuring the Log Buffer	46-14
Limiting the Rate of Incoming ARP Packets	46-16
Performing Validation Checks	46-19

CHAPTER 47

Configuring Network Security with ACLs 47-1

Understanding ACLs	47-2
ACL Overview	47-2
Supported Features That Use ACLs	47-3
Router ACLs	47-3
Port ACLs	47-4
VLAN Maps	47-5
Hardware and Software ACL Support	47-5
TCAM Programming and ACLs for Supervisor Engine II-Plus, Supervisor Engine IV, Supervisor Engine V, and Supervisor Engine V-10GE	47-6
TCAM Programming Algorithms	47-7
Change the Programming Algorithm	47-9
Resize the TCAM Regions	47-10
Troubleshooting High CPU Due to ACLs	47-12
Selecting Mode of Capturing Control Packets	47-12
Caveats and Restriction	47-13
Configuration	47-14
TCAM Programming and ACLs for Supervisor Engine 6-E	47-15
Layer 4 Operators in ACLs	47-15
Restrictions for Layer 4 Operations	47-15
Configuration Guidelines for Layer 4 Operations	47-16
How ACL Processing Impacts CPU	47-17
Configuring Unicast MAC Address Filtering	47-19
Configuring Named MAC Extended ACLs	47-19
Configuring EtherType Matching	47-21
Configuring Named IPv6 ACLs	47-22
Applying IPv6 ACLs to a Layer 3 Interface	47-23
Configuring VLAN Maps	47-23
VLAN Map Configuration Guidelines	47-24
Creating and Deleting VLAN Maps	47-25
Examples of ACLs and VLAN Maps	47-25

Applying a VLAN Map to a VLAN	47-27
Using VLAN Maps in Your Network	47-28
Denying Access to a Server on Another VLAN	47-29
Displaying VLAN Access Map Information	47-30
Using VLAN Maps with Router ACLs	47-31
Guidelines for Using Router ACLs and VLAN Maps on the Same VLAN	47-31
Examples of Router ACLs and VLAN Maps Applied to VLANs	47-31
ACLs and Switched Packets	47-31
ACLs and Routed Packets	47-32
Configuring PACLS	47-33
Creating a PACL	47-33
PACL Configuration Guidelines	47-34
Configuring IP and MAC ACLs on a Layer 2 Interface	47-34
Using PACL with Access-Group Mode	47-35
Configuring Access-group Mode on Layer 2 Interface	47-35
Applying ACLs to a Layer 2 Interface	47-36
Displaying an ACL Configuration on a Layer 2 Interface	47-36
Using PACL with VLAN Maps and Router ACLs	47-37

CHAPTER 48

Port Unicast and Multicast Flood Blocking 48-1

Overview of Flood Blocking	48-1
Configuring Port Blocking	48-1
Blocking Flooded Traffic on an Interface	48-2
Resuming Normal Forwarding on a Port	48-3

CHAPTER 49

Configuring Storm Control 49-1

Overview of Storm Control	49-1
Hardware-based Storm Control Implementation	49-2
Software-based Storm Control Implementation	49-3
Enabling Broadcast Storm Control	49-3
Enabling Multicast Storm Control	49-4
Multicast Suppression on the Supervisor Engine 6-E	49-4
Multicast Suppression on the WS-X4515, WS-X4014, and WS-X4013+ Supervisor Engines	49-5
Multicast Suppression on all the other Supervisor Engines	49-5
Disabling Broadcast Storm Control	49-6
Disabling Multicast Storm Control	49-7
Displaying Storm Control	49-8

CHAPTER 50

Configuring SPAN and RSPAN	50-1
Overview of SPAN and RSPAN	50-1
SPAN and RSPAN Concepts and Terminology	50-3
SPAN Session	50-3
Traffic Types	50-3
Source Port	50-4
Destination Port	50-5
VLAN-Based SPAN	50-5
SPAN Traffic	50-6
SPAN and RSPAN Session Limits	50-6
Default SPAN and RSPAN Configuration	50-6
Configuring SPAN	50-7
SPAN Configuration Guidelines and Restrictions	50-7
Configuring SPAN Sources	50-8
Configuring SPAN Destinations	50-9
Monitoring Source VLANs on a Trunk Interface	50-9
Configuration Scenario	50-10
Verifying a SPAN Configuration	50-10
CPU Port Sniffing	50-10
Encapsulation Configuration	50-12
Ingress Packets	50-12
Access List Filtering	50-13
ACL Configuration Guidelines	50-13
Configuring Access List Filtering	50-14
Packet Type Filtering	50-15
Configuration Example	50-16
Configuring RSPAN	50-16
RSPAN Configuration Guidelines	50-16
Creating an RSPAN Session	50-17
Creating an RSPAN Destination Session	50-19
Creating an RSPAN Destination Session and Enabling Ingress Traffic	50-20
Removing Ports from an RSPAN Session	50-21
Specifying VLANs to Monitor	50-22
Specifying VLANs to Filter	50-23
Displaying SPAN and RSPAN Status	50-25

CHAPTER 51

Configuring System Message Logging	51-1
Understanding System Message Logging	51-1

Configuring System Message Logging	51-2
System Log Message Format	51-2
Default System Message Logging Configuration	51-3
Disabling Message Logging	51-4
Setting the Message Display Destination Device	51-5
Synchronizing Log Messages	51-6
Enabling and Disabling Timestamps on Log Messages	51-7
Enabling and Disabling Sequence Numbers in Log Messages (Optional)	51-7
Defining the Message Severity Level (Optional)	51-8
Limiting Syslog Messages Sent to the History Table and to SNMP (Optional)	51-9
Configuring UNIX Syslog Servers	51-10
Logging Messages to a UNIX Syslog Daemon	51-10
Configuring the UNIX System Logging Facility	51-11
Displaying the Logging Configuration	51-12

CHAPTER 52

Onboard Failure Logging (OBFL)	52-1
Prerequisites for OBFL	52-1
Restrictions for OBFL	52-2
Information About OBFL	52-2
Overview of OBFL	52-2
Information about Data Collected by OBFL	52-2
OBFL Data Overview	52-2
Temperature	52-3
Operational Uptime	52-4
Interrupts	52-7
Message Logging	52-8
Default Settings for OBFL	52-9
Enabling OBFL	52-9
Configuration Examples for OBFL	52-10
Enabling OBFL Message Logging: Example	52-10
OBFL Message Log: Example	52-10
OBFL Component Uptime Report: Example	52-11
OBFL Report for a Specific Time: Example	52-11

CHAPTER 53

Configuring SNMP	53-1
Understanding SNMP	53-1
SNMP Versions	53-2
SNMP Manager Functions	53-3
SNMP Agent Functions	53-4

SNMP Community Strings	53-4
Using SNMP to Access MIB Variables	53-4
SNMP Notifications	53-5
Configuring SNMP	53-5
Default SNMP Configuration	53-5
SNMP Configuration Guidelines	53-6
Disabling the SNMP Agent	53-7
Configuring Community Strings	53-7
Configuring SNMP Groups and Users	53-9
Configuring SNMP Notifications	53-11
Setting the Agent Contact and Location Information	53-15
Limiting TFTP Servers Used Through SNMP	53-15
SNMP Examples	53-16
Displaying SNMP Status	53-17

CHAPTER 54

Configuring NetFlow	54-1
Overview of NetFlow Statistics Collection	54-2
NDE Versions	54-2
Information Derived from Hardware	54-3
Information Derived from Software	54-4
Assigning the Input and Output Interface and AS Numbers	54-4
Assigning the Inferred Fields	54-4
Assigning the Output Interface and Output Related Inferred Fields	54-4
Assigning the Input Interface and Input Related Inferred Fields	54-5
Feature Interaction of Netflow Statistics with UBRL and Microflow Policing	54-5
VLAN Statistics	54-5
Configuring NetFlow Statistics Collection	54-6
Checking for Required Hardware	54-6
Enabling NetFlow Statistics Collection	54-7
Configuring Switched/Bridged IP Flows	54-8
Exporting NetFlow Statistics	54-9
Managing NetFlow Statistics Collection	54-9
Configuring an Aggregation Cache	54-10
Verifying Aggregation Cache Configuration and Data Export	54-10
Configuring a NetFlow Minimum Prefix Mask for Router-Based Aggregation	54-11
Configuring the Minimum Mask of a Prefix Aggregation Scheme	54-11
Configuring the Minimum Mask of a Destination-Prefix Aggregation Scheme	54-11
Configuring the Minimum Mask of a Source-Prefix Aggregation Scheme	54-12
Monitoring and Maintaining Minimum Masks for Aggregation Schemes	54-12

Configuring NetFlow Aging Parameters	54-12
NetFlow Statistics Collection Configuration Example	54-13
NetFlow Configuration Examples	54-14
Sample NetFlow Enabling Schemes	54-14
Sample NetFlow Aggregation Configurations	54-14
Autonomous System Configuration	54-15
Destination Prefix Configuration	54-15
Prefix Configuration	54-15
Protocol Port Configuration	54-15
Source Prefix Configuration	54-16
Sample NetFlow Minimum Prefix Mask Router-Based Aggregation Schemes	54-16
Prefix Aggregation Scheme	54-16
Destination-Prefix Aggregation Scheme	54-16
Source-Prefix Aggregation Scheme	54-16

CHAPTER 55

Configuring Ethernet CFM and OAM 55-1

Command List	55-1
Ethernet CFM Overview	55-2
Definition List	55-3
CFM Domain	55-3
CFM Maintenance Points	55-4
General Packet Forwarding Rules	55-5
Inward-Facing MEPs	55-5
Outward-Facing MEPs	55-6
Transparent Ports	55-6
CFM Messages	55-7
Crosscheck Function	55-7
SNMP Traps	55-7
IP SLAs Support for CFM	55-8
Configuring Ethernet CFM	55-8
Default Ethernet CFM Configuration	55-8
Ethernet CFM Configuration Guidelines	55-9
Disabling CFM on a Port	55-9
Configuring the Ethernet CFM Service over VLANs	55-10
Configuring Ethernet CFM Crosscheck for VLANs	55-12
Configuring IP SLAs CFM Operation	55-13
Manually Configuring an IP SLAs CFM Probe or Jitter Operation	55-13
Configuring an IP SLAs Operation with Endpoint Discovery	55-15
Example: Switchport/VLAN CFM with an Inward-Facing MEP	55-17

Displaying Ethernet CFM Information	55-19
Ethernet OAM Protocol Overview	55-20
OAM Features	55-20
OAM Messages	55-21
Setting Up and Configuring Ethernet OAM	55-21
Default Ethernet OAM Configuration	55-21
Ethernet OAM Configuration Guidelines	55-22
Enabling Ethernet OAM on an Interface	55-22
Enabling Ethernet OAM Remote Loopback	55-24
Configuring Ethernet OAM Link Monitoring	55-25
Configuring Ethernet OAM Remote Failure Indications	55-27
Configuring Ethernet OAM Templates	55-30
Displaying Ethernet OAM Protocol Information	55-34
Ethernet CFM and Ethernet OAM Interaction	55-36
Ethernet OAM and CFM Configuration Example	55-36

CHAPTER 56

Configuring Y.1731 (AIS and RDI)	56-1
Definition List	56-1
Y.1731 Overview	56-2
Background	56-2
Server MEP	56-2
Alarm Indication Signal	56-2
Ethernet Remote Defect Indication	56-3
Configuring Y.1731	56-4
Y.1731 Configuration Guidelines	56-4
Configuring AIS Parameters	56-5
Clearing MEP from the AIS Defect Condition	56-6
Clearing SMEP from the AIS Defect Condition	56-6
Displaying Y.1731 Information	56-6
56-8	

CHAPTER 57

Configuring Call Home	57-1
Understanding Call Home	57-2
Obtaining Smart Call Home	57-2
Configuring Call Home	57-3
Configuring Contact Information	57-4
Configuring Destination Profiles	57-5
Copying a Destination Profile	57-6

Subscribing to Alert Groups	57-6
Configuring Periodic Notification	57-8
Configuring Message Severity Threshold	57-8
Configuring Syslog Pattern Matching	57-9
Configuring General E-Mail Options	57-9
Enabling Call Home	57-10
Testing Call Home Communications	57-10
Sending a Call Home Test Message Manually	57-10
Sending a Call Home Alert Group Message Manually	57-11
Sending a Request for an Analysis and Report	57-12
Sending the Output of a Command	57-13
Configuring and Enabling Smart Call Home	57-13
Displaying Call Home Configuration Information	57-13
Default Settings	57-18
Alert Group Trigger Events and Commands	57-18
Message Contents	57-21
Sample Syslog Alert Notification in Long-Text Format	57-25
Sample Syslog Alert Notification in XML Format	57-28

CHAPTER 58

Configuring Cisco IOS IP SLAs Operations 58-1

Command Table	58-1
Understanding Cisco IOS IP SLAs	58-2
Using Cisco IOS IP SLAs to Measure Network Performance	58-3
IP SLAs Responder and IP SLAs Control Protocol	58-4
Response Time Computation for IP SLAs	58-5
IP SLAs Operation Scheduling	58-6
IP SLAs Operation Threshold Monitoring	58-6
Configuring IP SLAs Operations	58-7
Default Configuration	58-7
Configuration Guidelines	58-7
Configuring the IP SLAs Responder	58-8
Analyzing IP Service Levels by Using the UDP Jitter Operation	58-9
Analyzing IP Service Levels by Using the ICMP Echo Operation	58-11
Monitoring IP SLAs Operations	58-13

CHAPTER 59

Configuring RMON 59-1

Understanding RMON	59-1
Configuring RMON	59-3

Default RMON Configuration	59-3
Configuring RMON Alarms and Events	59-3
Configuring RMON Collection on an Interface	59-5
Displaying RMON Status	59-6

CHAPTER 60

Performing Diagnostics 60-1

Configuring Online Diagnostics	60-1
Configuring On-Demand Online Diagnostics	60-2
Scheduling Online Diagnostics	60-2
Performing Diagnostics	60-3
Starting and Stopping Online Diagnostic Tests	60-3
Displaying Online Diagnostic Tests and Test Results	60-4
Line card Online Diagnostics	60-6
Troubleshooting with Online Diagnostics	60-7
Power-On Self-Test Diagnostics	60-8
Overview	60-8
Sample POST Results	60-9
Power-On Self-Test Results for Supervisor Engine V-10GE	60-13
POST on the Active Supervisor Engine	60-14
Sample POST Results on an Active Supervisor Engine	60-14
POST on a Standby Supervisor Engine	60-16
Sample Display of the POST on a Standby Supervisor Engine	60-17
Troubleshooting the Test Failures	60-19

CHAPTER 61

Configuring WCCP Version 2 Services 61-1

Understanding WCCP	61-2
WCCP Overview	61-2
Hardware Acceleration	61-2
Understanding WCCP Configuration	61-3
WCCP Features	61-4
Support for HTTP and Non-HTTP Services	61-4
Support for Multiple Routers	61-4
MD5 Security	61-5
Web Content Packet Return	61-5
Restrictions for WCCP	61-5
Configuring WCCP	61-6
Configuring a Service Group Using WCCP	61-6
Specifying a Web Cache Service	61-7
Using Access Lists for a WCCP Service Group	61-7

Setting a Password for a Router and Cache Engines	61-8
Verifying and Monitoring WCCP Configuration Settings	61-8
WCCP Configuration Examples	61-9
Performing a General WCCP Configuration Example	61-9
Running a Web Cache Service Example	61-9
Running a Reverse Proxy Service Example	61-9
Using Access Lists Example	61-10
Setting a Password for a Switch and Content Engines Example	61-10
Verifying WCCP Settings Example	61-10

CHAPTER 62

ROM Monitor 62-1

Entering the ROM Monitor	62-1
ROM Monitor Commands	62-2
Command Descriptions	62-2
Configuration Register	62-3
Changing the Configuration Register Manually	62-3
Changing the Configuration Register Using Prompts	62-3
Console Download	62-4
Error Reporting	62-5
Debug Commands	62-5
Exiting the ROM Monitor	62-5

CHAPTER 63

Configuring MIB Support 63-1

Determining MIB Support for Cisco IOS Releases	63-1
Using Cisco IOS MIB Tools	63-2
Downloading and Compiling MIBs	63-2
Considerations for Working with MIBs	63-2
Downloading MIBs	63-3
Compiling MIBs	63-4
Enabling SNMP Support	63-4

Acronyms and Abbreviations A-1

INDEX

Preface

This preface describes who should read this document, how it is organized, and its conventions. The preface also tells you how to obtain Cisco documents, as well as how to obtain technical assistance.

Audience

This guide is for experienced network administrators who are responsible for configuring and maintaining Catalyst 4500 series switches.

Organization

This guide is organized into the following chapters:

Chapter	Title	Description
Chapter 1	Product Overview	Presents an overview of the Cisco IOS software for the Catalyst 4500 series switches.
Chapter 2	Command-Line Interfaces	Describes how to use the CLI.
Chapter 3	Configuring the Switch for the First Time	Describes how to perform a baseline configuration of the switch.
Chapter 4	Administering the Switch	Describes how to administer the switch.
Chapter 5	Configuring the Cisco IOS In Service Software Upgrade Process	Describes how to configure ISSU on the switch.
Chapter 6	Configuring Interfaces	Describes how to configure non-layer-specific features on Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces.
Chapter 7	Checking Port Status and Connectivity	Describes how to check module and interface status.
Chapter 8	Configuring Supervisor Engine Redundancy Using RPR and SSO	Describes how to configure RPR and SSO on the Catalyst 4507R and 4510R switches.
Chapter 9	Configuring Cisco NSF with SSO Supervisor Engine Redundancy	Describes how to configure supervisor engine redundancy using Cisco nonstop forwarding (NSF) with stateful switchover (SSO).

Chapter	Title	Description
Chapter 10	Environmental Monitoring and Power Management	Describes how to configure power management and environmental monitoring features.
Chapter 11	Configuring Power over Ethernet	Describes how to configure Power over Ethernet (PoE).
Chapter 12	Configuring Cisco EnergyWise	Describes how to configure EnergyWise.
Chapter 13	Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant	Describes how to install and configure Network Assistant and Embedded CiscoView.
Chapter 14	Configuring VLANs, VTP, and VMPS	Describes how to configure VLANs, VTP, and VMPS.
Chapter 15	Configuring IP Unnumbered Interface	Describes how to configure IP Unnumbered support.
Chapter 16	Configuring Layer 2 Ethernet Interfaces	Describes how to configure interfaces to support Layer 2 features, including VLAN trunks.
Chapter 17	Configuring SmartPort Macros	Describes how to configure SmartPort macros.
Chapter 18	Configuring STP and MST	Describes how to configure the Spanning Tree Protocol (STP) and the Multiple Spanning Tree (MST) protocol and explains how they work.
Chapter 19	Configuring Flex Links and the MAC Address-Table Move Update Feature	Describes how to how to configure Flex Links on a switch.
Chapter 20	Configuring Resilient Ethernet Protocol	Describes how to configure Resilient Ethernet Protocol (REP).
Chapter 21	Configuring Optional STP Features	Describes how to configure the spanning-tree PortFast, UplinkFast, BackboneFast, and other STP features
Chapter 22	Configuring EtherChannel	Describes how to configure Layer 2 and Layer 3 EtherChannel port bundles.
Chapter 23	Configuring IGMP Snooping and Filtering	Describes how to configure Internet Group Management Protocol (IGMP) snooping.
Chapter 24	Configuring IPv6 MLD Snooping	Describes how to configure IPv6 MLD Snooping.
Chapter 25	Configuring 802.1Q and Layer 2 Protocol Tunneling	Describes how to configure 802.1Q and Layer 2 protocol Tunneling.
Chapter 26	Configuring CDP	Describes how to configure the Cisco Discovery Protocol (CDP).
Chapter 27	Configuring LLDP, LLDP-MED, and Location Service	Describes how to configure Link Layer Discovery Protocol (LLDP).
Chapter 28	Configuring UDLD	Describes how to configure the UniDirectional Link Detection (UDLD) protocol.
Chapter 29	Configuring Unidirectional Ethernet	Describes how to configure unidirectional Ethernet.
Chapter 30	Configuring Layer 3 Interfaces	Describes how to configure interfaces to support Layer 3 features.

Chapter	Title	Description
Chapter 31	Configuring Cisco Express Forwarding	Describes how to configure Cisco Express Forwarding (CEF) for IP unicast traffic.
Chapter 32	Configuring Unicast Reverse Path Forwarding	Describes how to configure Unicast Reverse Path Forwarding.
Chapter 33	Configuring IP Multicast	Describes how to configure IP Multicast Multilayer Switching (MMLS).
Chapter 34	Configuring ANCP Client	Describes how to configure ANCP.
Chapter 35	Configuring Policy-Based Routing	Describes how to configure policy-based routing.
Chapter 36	Configuring VRF-lite	Describes how to configure multiple VPN routing/forwarding (multi-VRF) instances in customer edge (CE) devices.
Chapter 37	Configuring Quality of Service	Describes how to configure quality of service (QoS).
Chapter 38	Configuring Voice Interfaces	Describes how to configure voice interfaces.
Chapter 39	Configuring Private VLANs	Describes how to set up and modify private VLANs.
Chapter 40	Configuring 802.1X Port-Based Authentication	Describes how to configure 802.1X port-based authentication.
Chapter 41	Configuring the PPPoE Intermediate Agent	Describes how to configure PPPoE Intermediate Agent.
Chapter 42	Configuring Web-Based Authentication	Describes how to configure web-based authentication.
Chapter 43	Configuring Port Security	Describes how to configure port security and trunk port security.
Chapter 44	Configuring Control Plane Policing	Describes how to protect your Catalyst 4500 series switch using control plane policing (CoPP).
Chapter 45	Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts	Describes how to configure DHCP snooping and IP Source Guard.
Chapter 46	Configuring Dynamic ARP Inspection	Describes how to configure Dynamic ARP Inspection.
Chapter 47	Configuring Network Security with ACLs	Describes how to configure ACLs, VACLs, and MACs.
Chapter 48	Port Unicast and Multicast Flood Blocking	Describes how to configure unicast flood blocking.
Chapter 49	Configuring Storm Control	Describes how to configure storm control suppression.
Chapter 50	Configuring SPAN and RSPAN	Describes how to configure the Switched Port Analyzer (SPAN).
Chapter 51	Configuring System Message Logging	Describes how to configure system message logging.
Chapter 52	Onboard Failure Logging (OBFL)	Describes how to configure OBFL.

Chapter	Title	Description
Chapter 53	Configuring SNMP	Describes how to configure the Simple Network Management Protocol (SNMP).
Chapter 54	Configuring NetFlow	Describes how to configure NetFlow statistics gathering.
Chapter 55	Configuring Ethernet CFM and OAM	Describes how to configure Ethernet OAM and CFM.
Chapter 56	Configuring Y.1731 (AIS and RDI)	Describes how to configure Y.1731.
Chapter 58	Configuring Cisco IOS IP SLAs Operations	Describes how to configure Cisco IOS IP SLA operations.
Chapter 59	Configuring RMON	Describes how to configure Remote Network Monitoring (RMON).
Chapter 57	Configuring Call Home	Describes how to configure Call Home.
Chapter 60	Performing Diagnostics	Describes various types of diagnostics on the Catalyst 4500 series switch.
Chapter 61	Configuring WCCP Version 2 Services	Describes how to configure the Catalyst 4500 series switches to redirect traffic to cache engines (web caches) using the Web Cache Communication Protocol (WCCP), and describes how to manage cache engine clusters (cache farms).
Chapter 62	ROM Monitor	Describes the ROM Monitor.
Chapter 63	Configuring MIB Support	Describes how to configure SNMP and MIB support.
Appendix A	Acronyms and Abbreviations	Defines acronyms and abbreviations used in this book.

Conventions

This document uses the following typographical conventions:

Convention	Description
boldface font	Commands, command options, and keywords are in boldface .
<i>italic font</i>	Command arguments for which you supply values are in <i>italics</i> .
[]	Command elements in square brackets are optional.
{ x y z }	Alternative keywords in command lines are grouped in braces and separated by vertical bars.
[x y z]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
string	A nonquoted set of characters. Do not use quotation marks around the string because the string will include the quotation marks.
screen font	System displays are in <code>screen font</code> .
boldface screen font	Information you must enter verbatim is in boldface screen font .
<i>italic screen font</i>	Arguments for which you supply values are in <i>italic screen font</i> .
→	This pointer highlights an important line of text in an example.
^	Represents the key labeled Control—for example, the key combination ^D in a screen display means hold down the Control key while you press the D key.
< >	Nonprinting characters such as passwords are in angle brackets.

Notes use the following conventions:

**Note**

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the publication.

**Caution**

Cautions use the following conventions:

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Commands in Task Tables

Commands listed in task tables show only the relevant information for completing the task and not all available options for the command. For a complete description of a command, refer to the command in the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

The license and distribution terms for any publicly available version or derivative of this code cannot be changed. i.e. this code cannot simply be copied and put under another distribution license [including the GNU Public License].

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

<http://www.cisco.com/en/US/docs/general/whatsnew/whatsnew.html>

Subscribe to the *What's New in Cisco Product Documentation* as a Really Simple Syndication (RSS) feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service and Cisco currently supports RSS Version 2.0.

CHAPTER 1

Product Overview

This chapter provides an overview of Catalyst 4500 series switches and includes the following major sections:

- [Layer 2 Software Features, page 1-1](#)
- [Layer 3 Software Features, page 1-8](#)
- [Management Features, page 1-16](#)
- [Security Features, page 1-20](#)

Note

For more information about the chassis, modules, and software features supported by the Catalyst 4500 series switch, refer to the *Release Notes for the Catalyst 4500 Series Switch* at this location:

http://www.cisco.com/en/US/products/hw/switches/ps4324/prod_release_notes_list.html

Layer 2 Software Features

The following subsections describe the key Layer 2 switching software features on the Catalyst 4500 series switch:

- [802.1Q and Layer 2 Protocol Tunneling, page 1-2](#)
- [CDP, page 1-2](#)
- [EtherChannel Bundles, page 1-2](#)
- [Ethernet CFM, page 1-3](#)
- [Ethernet OAM Protocol, page 1-3](#)
- [Flex Links and MAC Address-Table Move Update, page 1-3](#)
- [Jumbo Frames, page 1-3](#)
- [Link Layer Discovery Protocol, page 1-3](#)
- [Location Service, page 1-4](#)
- [Multiple Spanning Tree, page 1-4](#)
- [Per-VLAN Rapid Spanning Tree, page 1-4](#)
- [QoS, page 1-4](#)

- [Resilient Ethernet Protocol, page 1-5](#)
- [Spanning Tree Protocol, page 1-5](#)
- [Stateful Switchover, page 1-6](#)
- [SVI Autostate, page 1-6](#)
- [UBRL, page 1-6](#)
- [UDLD, page 1-7](#)
- [Unidirectional Ethernet, page 1-7](#)
- [VLANs, page 1-7](#)
- [Virtual Switch System, page 1-8](#)
- [Y.1731 \(AIS and RDI\), page 1-8](#)

802.1Q and Layer 2 Protocol Tunneling

802.1Q tunneling is a Q-in-Q technique that expands the VLAN space by retagging the tagged packets that enter the service provider infrastructure. 802.1Q tunneling allows service providers to assign a VLAN to each customer without losing the original customer VLAN IDs inside the tunnel. All data traffic that enters the tunnel is encapsulated with the tunnel VLAN ID. Layer 2 Protocol Tunneling is a similar technique for all Layer 2 control traffic. 802.1Q tunneling and Layer 2 Protocol Tunneling are supported on Supervisor Engines V , V-10GE, and 6-E.

For information on configuring 802.1Q tunneling, see [Chapter 25, “Configuring 802.1Q and Layer 2 Protocol Tunneling.”](#)

CDP

The Cisco Discovery Protocol (CDP) is a device-discovery protocol that is both media- and protocol-independent. CDP is available on all Cisco products, including routers, switches, bridges, and access servers. Using CDP, a device can advertise its existence to other devices and receive information about other devices on the same LAN. CDP enables Cisco switches and routers to exchange information, such as their MAC addresses, IP addresses, and outgoing interfaces. CDP runs over the data-link layer only, allowing two systems that support different network-layer protocols to learn about each other. Each device configured for CDP sends periodic messages to a multicast address. Each device advertises at least one address at which it can receive Simple Network Management Protocol (SNMP) messages.

For information on configuring CDP, see [Chapter 26, “Configuring CDP.”](#)

EtherChannel Bundles

EtherChannel port bundles allow you to create high-bandwidth connections between two switches by grouping multiple ports into a single logical transmission path.

For information on configuring EtherChannel, see [Chapter 22, “Configuring EtherChannel.”](#)

Ethernet CFM

Ethernet CFM is an end-to-end per-service-instance (per VLAN) Ethernet layer OAM protocol that includes proactive connectivity monitoring, fault verification, and fault isolation. End-to-end can be provider-edge-to-provider-edge (PE-to-PE) device or customer-edge-to-customer-edge (CE-to-CE) device. Ethernet CFM, as specified by IEEE 802.1ag, is the standard for Layer 2 ping, Layer 2 traceroute, and end-to-end connectivity check of the Ethernet network.

For information about CFM, see [Chapter 55, “Configuring Ethernet CFM and OAM.”](#)

Ethernet OAM Protocol

Ethernet Operations, Administration, and Maintenance (OAM) is a protocol for installing, monitoring, and troubleshooting Ethernet networks to increase management capability within the context of the overall Ethernet infrastructure. You can implement Ethernet OAM on any full-duplex point-to-point or emulated point-to-point Ethernet link for a network or part of a network (specified interfaces).

For information about OAM, see [Chapter 55, “Configuring Ethernet CFM and OAM.”](#)

Flex Links and MAC Address-Table Move Update

Flex Links are a pair of a Layer 2 interfaces (switch ports or port channels) where one interface is configured to act as a backup to the other. The feature provides an alternative solution to the Spanning Tree Protocol (STP). Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on the switch.

MAC Address-Table Move Update allows a switch to provide rapid bidirectional convergence when a primary (forwarding) link goes down and the standby link begins forwarding traffic.

For information about Flex Links and MAC Address-Table Move Update, see [Chapter 19, “Configuring Flex Links and the MAC Address-Table Move Update Feature”](#).

Jumbo Frames

The jumbo frames feature allows the switch to forward packets as large as 9216 bytes (larger than the IEEE Ethernet MTU), rather than declare those frames “oversize” and discard them. This feature is typically used for large data transfers. The jumbo feature can be configured on a per-port basis on Layer 2 and Layer 3 interfaces and is supported only on WS-X4306-GB: all ports, WS-X4232-GB-RJ: ports 1-2, WS-X4418-GB: ports 1-2, WS-X4412-2GB-TX: ports 13-14, WS-4648-RJ45V-E, WS-X4648+RJ45V+E, WS-X4706-10GE linecards, and on supervisor engine uplink ports.

For information on Jumbo Frames, see [Chapter 6, “Configuring Interfaces.”](#)

Link Layer Discovery Protocol

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB LLDP. Link Layer Discovery Protocol (LLDP) is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as *TLVs*. LLDP supported devices can use TLVs to receive and send information to their neighbors. Details such as configuration information, device capabilities, and device identity can be advertised using this protocol.

For information on configuring LLDP, see [Chapter 27, “Configuring LLDP, LLDP-MED, and Location Service.”](#)

Location Service

The location service feature enables the switch to provide location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired switch or controller. The switch informs device link up and link down events through encrypted Network Mobility Services Protocol (NMSP) location and attachment notifications to the MSE.

For information on configuring LLDP, see [Chapter 27, “Configuring LLDP, LLDP-MED, and Location Service.”](#)

Multiple Spanning Tree

IEEE 802.1s Multiple Spanning Tree (MST) allows for multiple spanning tree instances within a single 802.1Q or Inter-Switch Link (ISL) VLAN trunk. MST extends the IEEE 802.1w Rapid Spanning Tree (RST) algorithm to multiple spanning trees. This extension provides both rapid convergence and load balancing within a VLAN environment.

MST allows you to build multiple spanning trees over trunks. You can group and associate VLANs to spanning tree instances. Each instance can have a topology independent of other spanning tree instances. This new architecture provides multiple forwarding paths for data traffic and enables load balancing. Network fault tolerance is improved because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

For information on configuring MST, see [Chapter 18, “Configuring STP and MST.”](#)

Per-VLAN Rapid Spanning Tree

Per-VLAN Rapid Spanning Tree (PVRST+) is the implementation of 802.1w on a per-VLAN basis. It is the same as PVST+ with respect to STP mode and runs RSTP protocol based on 802.1w.

For information on configuring PVRST+, see [Chapter 18, “Configuring STP and MST.”](#)

QoS

Note

QoS functionality on the Catalyst 4900M and the Supervisor Engine 6-E are equivalent.

The quality of service (QoS) feature prevents congestion by selecting network traffic and prioritizing it according to its relative importance. Implementing QoS in your network makes network performance more predictable and bandwidth use more effective.

The Catalyst 4500 series switch supports the following QoS features:

- Classification and marking
- Ingress and egress policing, including per-port per-VLAN policing
- Sharing and shaping

Catalyst 4500 series switch supports trusted boundary, which uses the Cisco Discovery Protocol (CDP) to detect the presence of a Cisco IP phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a switch port. If the telephone is not detected, the trusted boundary feature disables the trusted setting on the switch port and prevents misuse of a high-priority queue.

The Catalyst 4500 series switch also supports QoS Automation (Auto QoS), which simplifies the deployment of existing QoS features through automatic configuration.

Cisco Modular QoS Command-Line-Interface (Supervisor Engine 6-E)

Cisco Modular QoS CLI (MQC) is the framework used to implement Cisco IOS Software QoS. MQC allows the user to define a traffic class, create a traffic policy (containing the QoS feature to be applied to the traffic class), and attach the traffic policy to an interface. MQC is a cross-Cisco baseline that provides a consistent syntax and behavior of QoS features across multiple product families. Cisco IOS Software Release 12.2(40)SG complies to MQC for configuration of QoS features on the Supervisor Engine 6-E. MQC enables rapid deployment of new features and technology innovations and facilitates the management of network performance with respect to bandwidth, delay, jitter, and packet loss, enhancing the performance of mission-critical business applications. The rich and advanced QoS features that are supported as part of the Supervisor Engine 6-E are enabled using Cisco MQC.

Two-Rate Three-Color Policing (Supervisor Engine 6-E)

The Two-Rate Three-Color Policing feature (also termed *Hierarchical QoS*) limits the input or output transmission rate of a class of traffic based on user-defined criteria and marks or colors packets by setting the applicable differentiated services code point (DSCP) values. This feature is often configured on the interfaces at the edge of a network to limit the rate of traffic entering or leaving the network. Using this feature, traffic that conforms to user-defined criteria can be sent through the interfaces, while traffic that exceeds or violates these criteria is sent out with a decreased priority setting or even dropped.

For information on QoS and Auto QoS, see [Chapter 37, “Configuring Quality of Service.”](#)

Resilient Ethernet Protocol

Resilient Ethernet Protocol (REP) is a Cisco proprietary protocol that provides an alternative to Spanning Tree Protocol (STP) to control network loops, handle link failures, and improve convergence time. REP controls a group of ports connected in a segment, ensures that the segment does not create any bridging loops, and responds to link failures within the segment. REP provides a basis for constructing more complex networks and supports VLAN load balancing.

For information on QoS and Auto QoS, see [Chapter 20, “Configuring Resilient Ethernet Protocol.”](#)

Spanning Tree Protocol

The Spanning Tree Protocol (STP) allows you to create fault-tolerant internetworks that ensure an active, loop-free data path between all nodes in the network. STP uses an algorithm to calculate the best loop-free path throughout a switched network.

For information on configuring STP, see [Chapter 18, “Configuring STP and MST.”](#)

The Catalyst 4500 series switch supports the following STP enhancements:

- Spanning tree PortFast—PortFast allows a port with a directly attached host to transition to the forwarding state directly, bypassing the listening and learning states.
- Spanning tree UplinkFast—UplinkFast provides fast convergence after a spanning-tree topology change and achieves load balancing between redundant links using uplink groups. Uplink groups provide an alternate path in case the currently forwarding link fails. UplinkFast is designed to decrease spanning-tree convergence time for switches that experience a direct link failure.
- Spanning tree BackboneFast—BackboneFast reduces the time needed for the spanning tree to converge after a topology change caused by an indirect link failure. BackboneFast decreases spanning-tree convergence time for any switch that experiences an indirect link failure.
- Spanning tree root guard—Root guard forces a port to become a designated port so that no switch on the other end of the link can become a root switch.

For information on the STP enhancements, see [Chapter 21, “Configuring Optional STP Features.”](#)

Stateful Switchover

Stateful switchover (SSO) enables you to propagate configuration and state information from the active to the redundant supervisor engine so that sub-second interruptions in Layer 2 traffic occur when the active supervisor engine switches over to the redundant supervisor engine.

- Stateful IGMP Snooping

This feature propagates the IGMP data learned by the active supervisor engine to the redundant supervisor engine so that when a switchover occurs, the newly active supervisor engine is aware of the multicast group membership, which alleviates a disruption to multicast traffic during a switchover.

- Stateful DHCP Snooping

This feature propagates the DHCP-snooped data from the active supervisor engine to the redundant supervisor engine so that when a switchover occurs, the newly active supervisor engine is aware of the DHCP data that was already snooped, and the security benefits continue uninterrupted.

For information about SSO, see [Chapter 9, “Configuring Cisco NSF with SSO Supervisor Engine Redundancy.”](#)

SVI Autostate

When an SVI has multiple ports on a VLAN, normally the SVI will go down when all the ports in the VLAN go down. You might design your network so that some ports should not be counted in the calculation of SVI “going up or down.” SVI Autostate provides a knob to mark a port so that it is not counted in the SVI “going up and down” calculation and applies to all VLANs that are enabled on that port.

UBRL

User Based Rate Limiting (UBRL) enables you to adopt microflow policing to dynamically learn traffic flows and rate limit each unique flow to an individual rate. UBRL is available only on the Supervisor Engine V-10GE with the built-in NetFlow support.

For information about UBRL, see the [“Configuring User Based Rate Limiting” section on page 37-38.](#)

**Note**

Microflow is only supported on Supervisor Engine V-10GE.

UDLD

The UniDirectional Link Detection (UDLD) protocol allows devices connected through fiber-optic or copper Ethernet cables to monitor the physical configuration of the cables and detect a unidirectional link.

For information about UDLD, see [Chapter 28, “Configuring UDLD.”](#)

Unidirectional Ethernet

**Note**

Unidirectional Ethernet is *not* supported on either Supervisor Engine 6-E or a Catalyst 4900M chassis.

Unidirectional Ethernet uses only one strand of fiber for either transmitting or receiving one-way traffic for the Gigaport, instead of two strands of fiber for a full-duplex Gigaport Ethernet.

For information about Unidirectional Ethernet, see [Chapter 29, “Configuring Unidirectional Ethernet.”](#)

VLANs

A VLAN configures switches and routers according to logical, rather than physical, topologies. Using VLANs, a network administrator can combine any collection of LAN segments within an internetwork into an autonomous user group, such that the segments appear as a single LAN in the network. VLANs logically segment the network into different broadcast domains so that packets are switched only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily.

For more information about VLANs, VTP, and Dynamic VLAN Membership, see [Chapter 14, “Configuring VLANs, VTP, and VMPS.”](#)

The following VLAN-related features are also supported.

- **VLAN Trunking Protocol (VTP)**—VTP maintains VLAN naming consistency and connectivity between all devices in the VTP management domain. You can have redundancy in a domain by using multiple VTP servers, through which you can maintain and modify the global VLAN information. Only a few VTP servers are required in a large network.
- **Private VLANs**—Private VLANs are sets of ports that have the features of normal VLANs and also provide some Layer 2 isolation from other ports on the switch.

For information about private VLANs, see [Chapter 39, “Configuring Private VLANs.”](#)

- **Private VLAN Trunk Ports**—Private VLAN trunk ports allow a secondary port on a private VLAN to carry multiple secondary VLANs.
- **Private VLAN Promiscuous Trunk Ports**—Private VLAN promiscuous trunk extends the promiscuous port to a 802.1Q trunk port, carrying multiple primary VLANs (hence multiple subnets). Private VLAN promiscuous trunk is typically used to offer different services or content on different primary VLANs to isolated subscribers. Secondary VLANs can not be carried over the private VLAN promiscuous trunk.

- **Dynamic VLAN Membership**—Dynamic VLAN Membership allows you to assign switch ports to VLANs dynamically, based on the source Media Access Control (MAC) address of the device connected to the port. When you move a host from a port on one switch in the network to a port on another switch in the network, that switch dynamically assigns the new port to the proper VLAN for that host. With the VMPS Client feature, you can convert a dynamic access port to a VMPS client. VMPS clients can use VQP queries to communicate with the VMPS server to obtain a VLAN assignment for the port based on the MAC address of the host attached to that port.

Virtual Switch System

Catalyst 4500 series switches support enhanced PAgP. If a Catalyst 4500 series switch is connected to a Catalyst 6500 series Virtual Switch System (VSS) via a PAgP EtherChannel, the Catalyst 4500 series switch will automatically serve as a VSS client, using enhanced PAgP on this EtherChannel for dual-active detection. This VSS client feature has no impact on the performance of Catalyst 4500 series switches and does not require any user configuration.

For information on VSS, see [Chapter 22, “Configuring EtherChannel.”](#)

Y.1731 (AIS and RDI)

Y.1731 ETH-AIS (Ethernet Alarm Indication Signal function) and ETH-RDI (Ethernet Remote Defect Indication function) provides fault and performance management for service providers in large networks.

ETH-AIS is used to suppress alarms following detection of defect conditions at the server (sub) layer. Due to independent restoration capabilities provided within the Spanning Tree Protocol (STP) environments, ETH-AIS is not expected to be applied in the STP environments. In this case, AIS is configurable, and the administrator decides to enable and disable AIS in STP environment or not.

ETH-RDI can be used by a MEP to communicate to its peer MEPs that a defect condition has been encountered. ETH-RDI is used only when ETH-CC transmission is enabled.

For information about Y.1731, see [Chapter 56, “Configuring Y.1731 \(AIS and RDI\).”](#)

Layer 3 Software Features

A Layer 3 switch is a high-performance switch that has been optimized for a campus LAN or an intranet, and it provides both wirespeed Ethernet routing and switching services. Layer 3 switching improves network performance with two software functions: route processing and intelligent network services.

Compared to conventional software-based switches, Layer 3 switches process more packets faster; they do so by using application-specific integrated circuit (ASIC) hardware instead of microprocessor-based engines.

The following subsections describe the key Layer 3 switching software features on the Catalyst 4500 series switch:

- [CEF, page 1-9](#)
- [EIGRP Stub Routing, page 1-9](#)
- [HSRP, page 1-9](#)
- [IP Routing Protocols, page 1-10](#)

- [ISSU, page 1-13](#)
- [Multicast Services, page 1-13](#)
- [NSF with SSO, page 1-14](#)
- [OSPF for Routed Access, page 1-14](#)
- [Policy-Based Routing, page 1-15](#)
- [Unidirectional Link Routing, page 1-15](#)
- [VRF-lite, page 1-15](#)

CEF

Cisco Express Forwarding (CEF) is an advanced Layer 3 IP-switching technology. CEF optimizes network performance and scalability in networks with large and dynamic traffic patterns, such as the Internet, and on networks that use intensive web-based applications or interactive sessions. Although you can use CEF in any part of a network, it is designed for high-performance, highly resilient Layer 3 IP-backbone switching.

For information on configuring CEF, see [Chapter 31, “Configuring Cisco Express Forwarding.”](#)

EIGRP Stub Routing

The EIGRP stub routing feature, available in all images, reduces resource utilization by moving routed traffic closer to the end user.

The IP base image contains only EIGRP stub routing. The IP services image contains complete EIGRP routing.

In a network using EIGRP stub routing, the only route for IP traffic to follow to the user is through a switch that is configured with EIGRP stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

For information on configuring EIGRP Stub Routing, see [Chapter 30, “Configuring Layer 3 Interfaces.”](#)

HSRP

The Hot Standby Router Protocol (HSRP) provides high network availability by routing IP traffic from hosts on Ethernet networks without relying on the availability of any single Layer 3 switch. This feature is particularly useful for hosts that do not support a router discovery protocol and do not have the functionality to switch to a new router when their selected router reloads or loses power.

For information on configuring HSRP, refer to the following URL

http://www.cisco.com/en/US/docs/ios/ipapp/configuration/guide/ipapp_hsrp_ps6350_TSD_Products_Configuration_Guide_Chapter.html

SSO Aware HSRP

SSO Aware HSRP offers continuous data packet forwarding during a supervisor engine switchover without a path change to the standby HSRP router. During supervisor engine switchover, NSF with SSO continues forwarding data packets along known routes using the HSRP virtual IP address. When both

supervisor engines fail on the active HSRP router, the standby HSRP router takes over as the active HSRP router. It further extends reliability and availability offered by the Catalyst 4500's NSF with SSO to the Layer 3 aggregation with redundant chassis. SSO aware HSRP is available for Supervisor Engine IV, V and V-10GE on Catalyst 4507R and 4510R chassis with supervisor redundancy.

IP Routing Protocols

The following routing protocols are supported on the Catalyst 4500 series switch:

- [BGP, page 1-10](#)
- [EIGRP, page 1-10](#)
- [GLBP, page 1-11](#)
- [IGRP, page 1-11](#)
- [IS-IS, page 1-12](#)
- [OSPF, page 1-12](#)
- [RIP, page 1-12](#)
- [VRRP, page 1-13](#)

BGP

The Border Gateway Protocol (BGP) is an exterior gateway protocol that allows you to set up an interdomain routing system to automatically guarantee the loop-free exchange of routing information between autonomous systems. In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (called the autonomous system path), and a list of other path attributes.

The Catalyst 4500 series switch supports BGP version 4, including classless interdomain routing (CIDR). CIDR lets you reduce the size of your routing tables by creating aggregate routes, resulting in supernets. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes. CIDR routes can be carried by OSPF, EIGRP, and RIP.

BGP Route-Map Continue

The BGP Route-Map Continue feature introduces the continue clause to the BGP route-map configuration. The continue clause provides more programmable policy configuration and route filtering. It introduces the capability to execute additional entries in a route map after an entry is executed with successful match and set clauses. Continue clauses allow configuring and organizing more modular policy definitions to reduce the number of policy configurations that are repeated within the same route map.

For details on BGP, refer to this URL:

http://www.cisco.com/en/US/docs/ios/12_4t/ip_route/configuration/guide/t_brbbas.html

EIGRP

The Enhanced Interior Gateway Routing Protocol (EIGRP) is a version of IGRP that combines the advantages of link-state protocols with distance-vector protocols. EIGRP incorporates the Diffusing Update Algorithm (DUAL). EIGRP includes fast convergence, variable-length subnet masks, partially bounded updates, and multiple network-layer support. When a network topology change occurs, EIGRP

checks its topology table for a suitable new route to the destination. If such a route exists in the table, EIGRP updates the routing table instantly. You can use the fast convergence and partial updates that EIGRP provides to route Internetwork Packet Exchange (IPX) packets.

EIGRP saves bandwidth by sending routing updates only when routing information changes. The updates contain information only about the link that changed, not the entire routing table. EIGRP also takes into consideration the available bandwidth when determining the rate at which it transmits updates.

**Note**

Layer 3 switching does not support the Next Hop Resolution Protocol (NHRP).

**Note**

Customers can configure Enhanced Interior Gateway Routing Protocol (EIGRP) to route IPv6 prefixes. EIGRP configuration and protocol behavior for both IPv4 and IPv6 prefixes are similar, providing operational familiarity and continuity. EIGRP support for IPv6 will enable customers to use their existing EIGRP knowledge and processes, allowing them to deploy an IPv6 network at a low cost.

For details on EIGRP, refer to this URL

http://www.cisco.com/en/US/products/ps6630/products_ios_protocol_option_home.html

GLBP

The Gateway Load Balancing Protocol (GLBP) feature provides automatic router backup for IP hosts configured with a single default gateway on a LAN. Multiple first hop routers on the LAN combine to offer a single virtual first hop IP router while sharing the IP packet forwarding load. GLBP devices share packet-forwarding responsibilities, optimizing resource usage, thereby reducing costs. Other routers on the LAN may act as redundant GLBP routers that will become active if any of the existing forwarding routers fail. This improves the resiliency of the network and reduces administrative burden. GLBP is a feature that is applicable for the Supervisor Engine 6-E and the classic supervisor engines.

For details on GLBP, refer to this URL:

http://www.cisco.com/en/US/docs/ios/ipapp/configuration/guide/ipapp_glb_p6350_TSD_Products_Configuration_Guide_Chapter.html

IGRP

The Interior Gateway Routing Protocol (IGRP) is a robust distance-vector Interior Gateway Protocol (IGP) developed by Cisco to provide for routing within an autonomous system (AS). Distance vector routing protocols request that a switch send all or a portion of its routing table data in a routing update message at regular intervals to each of its neighboring routers. As routing information proliferates through the network, routers can calculate distances to all nodes within the internetwork. IGRP uses a combination of metrics: internetwork delay, bandwidth, reliability, and load are all factored into the routing decision.

For details on IGRP, refer to this URL:

http://www.cisco.com/en/US/docs/ios/12_2/ip/configuration/guide/1cfigrp.html

IS-IS

The Intermediate System-to-Intermediate System Protocol (IS-IS Protocol) uses a link-state routing algorithm. It closely follows the Open Shortest Path First (OSPF) routing protocol used within the TCP/IP environment. The operation of ISO IS-IS Protocol requires each router to maintain a full topology map of the network (that is, which intermediate systems and end systems are connected to which other intermediate systems and end systems). Periodically, the router runs an algorithm over its map to calculate the shortest path to all possible destinations.

The IS-IS Protocol uses a two-level hierarchy. Intermediate Systems (or routers) are classified as Level 1 and Level 2. Level 1 intermediate systems deal with a single routing area. Traffic is relayed only within that area. Any other internetwork traffic is sent to the nearest Level 2 intermediate systems, which also acts as a Level 1 intermediate systems. Level 2 intermediate systems move traffic between different routing areas within the same domain.

An IS-IS with multi-area support allows multiple Level 1 areas within in a single intermediate system, thus allowing an intermediate system to be in multiple areas. A single Level 2 area is used as backbone for inter-area traffic.

Only Ethernet frames are supported. The IS-IS Protocol does not support IPX.

For details on IS-IS, refer to this URL:

http://www.cisco.com/en/US/products/ps6632/products_ios_protocol_option_home.html

OSPF

The Open Shortest Path First (OSPF) protocol is a standards-based IP routing protocol designed to overcome the limitations of RIP. Because OSPF is a link-state routing protocol, it sends link-state advertisements (LSAs) to all other routers within the same hierarchical area. Information on the attached interfaces and their metrics is used in OSPF LSAs. As routers accumulate link-state information, they use the shortest path first (SPF) algorithm to calculate the shortest path to each node. Additional OSPF features include equal-cost multipath routing and routing based on the upper-layer type of service (ToS) requests.

OSPF employs the concept of an *area*, which is a group of contiguous OSPF networks and hosts. OSPF areas are logical subdivisions of OSPF autonomous systems in which the internal topology is hidden from routers outside the area. Areas allow an additional level of hierarchy different from that provided by IP network classes, and they can be used to aggregate routing information and mask the details of a network. These features make OSPF particularly scalable for large networks.

For details on OSPF, refer to this URL:

http://www.cisco.com/en/US/tech/tk365/tk480/tsd_technology_support_sub-protocol_home.html

RIP

The Routing Information Protocol (RIP) is a distance-vector, intradomain routing protocol. RIP works well in small, homogeneous networks. In large, complex internetworks, it has many limitations, such as a maximum hop count of 15, lack of support for variable-length subnet masks (VLSMs), inefficient use of bandwidth, and slow convergence. RIP II does support VLSMs.

For details on RIP, refer to this URL:

http://www.cisco.com/en/US/tech/tk365/tk554/tsd_technology_support_sub-protocol_home.html

VRRP

Virtual Router Redundancy Protocol (VRRP) is a standard based first-hop redundancy protocol. With VRRP, a group of routers function as one virtual router by sharing one virtual IP address and one virtual MAC address. The master router performs packet forwarding, while the backup routers stay idle. VRRP is typically used in the multivendor first-hop gateway redundancy deployment.

For details on nnnnnRIP, refer to this URL:

http://www.cisco.com/en/US/docs/ios/ipapp/configuration/guide/ipapp_vrrp_ps6441_TSD_Products_Configuration_Guide_Chapter.html

ISSU

SSO requires the same version of IOS on both the active and standby supervisor engines. Because of version mismatch during an upgrade or downgrade of the Cisco IOS software, a Catalyst 4500 series switch is forced into operating in RPR mode. In this mode, after the switchover, you can observe link-flaps and a disruption in service. This issue is solved by the In Service Software Upgrade (ISSU) feature that enables you to operate in SSO/NSF mode while performing software upgrade or downgrade.

ISSU allows an upgrade or downgrade of the Catalyst IOS images at different release levels on the both the active and standby supervisor engines by utilizing the Version Transformation Framework between the stateful components running on each supervisor engine.

Multicast Services

Multicast services save bandwidth by forcing the network to replicate packets only when necessary and by allowing hosts to join and leave groups dynamically. The following multicast services are supported:

- ANCP Client —ANCP Multicast enables you to control multicast traffic on a Catalyst 4500 switch using either ANCP (rather than IGMP) or direct static configuration on the CLI.
- Cisco Group Management Protocol (CGMP) server—CGMP server manages multicast traffic. Multicast traffic is forwarded only to ports with attached hosts that request the multicast traffic.
- Internet Group Management Protocol (IGMP) snooping—IGMP snooping manages multicast traffic. The switch software examines IP multicast packets and forwards packets based on their content. Multicast traffic is forwarded only to ports with attached hosts that request multicast traffic.

Support for IGMPv3 provides constrained flooding of multicast traffic in the presence of IGMPv3 hosts or routers. IGMPv3 snooping listens to IGMPv3 query and membership report messages to maintain host-to-multicast group associations. It enables a switch to propagate multicast data only to ports that need it. IGMPv3 snooping is fully interoperable with IGMPv1 and IGMPv2.

Explicit Host Tracking (EHT) is an extension to IGMPv3 snooping. EHT enables immediate leave operations on a per-port basis. EHT can be used to track per host membership information or to gather statistics about all IGMPv3 group members.

The IGMP Snooping Querier is a Layer 2 feature required to support IGMP snooping in a VLAN where PIM and IGMP are not configured because the multicast traffic does not require routing.

For information on configuring IGMP snooping, see [Chapter 23, “Configuring IGMP Snooping and Filtering.”](#)

- IPv6 Multicast Listen Discovery (MLD) and Multicast Listen Discovery snooping—MLD is a protocol used by IPv6 multicast devices to discover the presence of multicast listeners (nodes that want to receive IPv6 multicast packets) on its directly attached links and to discover which multicast

packets are of interest to neighboring nodes. MLD snooping is supported in two different versions: MLD v1 and MLD v2. Network switches use MLD snooping to limit the flood of multicast traffic, causing IPv6 multicast data to be selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This lessens the load on devices in the network, minimizing unnecessary bandwidth on links, enabling efficient distribution of IPv6 multicast data.

For information on configuring multicast services, see [Chapter 24, “Configuring IPv6 MLD Snooping.”](#)

Note IPv6 MLD Snooping is *only* supported on Supervisor Engine 6-E and the Catalyst 4900 chassis.

- Protocol Independent Multicast (PIM)—PIM is protocol-independent because it can leverage whichever unicast routing protocol is used to populate the unicast routing table, including EIGRP, OSPF, BGP, or static route. PIM also uses a unicast routing table to perform the Reverse Path Forwarding (RPF) check function instead of building a completely independent multicast routing table.

For information on PIM-SSM mapping, see the URL:

http://www.cisco.com/en/US/docs/ios-xml/ios/ipmulti_igmp/configuration/15-s/imc_ssm_map.html

- IP Multicast Load Splitting (Equal Cost Multipath (ECMP) Using S, G and Next Hop)—IP Multicast Load Splitting introduces more flexible support for ECMP multicast load splitting by adding support for load splitting based on source and group address and on source, group, and next-hop address. This feature enables multicast traffic from devices that send many streams to groups or that broadcast many channels, such as IPTV servers or MPEG video servers, to be more effectively load shared across equal-cost paths.

For information on configuring multicast services, see [Chapter 33, “Configuring IP Multicast.”](#)

NSF with SSO

Non-Stop Forwarding with Stateful Switchover (NSF/SSO) offers continuous data packet forwarding in a Layer 3 routing environment during supervisor engine switchover. It further extends reliability and availability offered by the Catalyst 4500's SSO and NSF-aware to the Layer 3 networks. During supervisor engine switchover, NSF/SSO continues forwarding data packets along known routes while the routing protocol information is recovered and validated, avoiding unnecessary route flaps and network instability. With NSF/SSO, IP phone calls do not drop. NSF/SSO is supported for OSPF, BGP, EIGRP, IS-IS, and Cisco Express Forwarding (CEF). NSF/SSO is typically deployed in the most critical parts of an enterprise or service provider network, such as Layer 3 aggregation/core or a resilient Layer 3 wiring closet design. It is an essential component of single chassis deployment for critical applications. NSF/SSO is available for all shipping supervisor engines on Catalyst 4507R and 4510R chassis with supervisor redundancy.

For information on NSF with SSO, see [Chapter 9, “Configuring Cisco NSF with SSO Supervisor Engine Redundancy.”](#)

OSPF for Routed Access

OSPF for Routed Access is designed specifically to enable customers to extend Layer 3 routing capabilities to the access or Wiring Closet.

**Note**

OSPF for Routed Access supports only one OSPFv2 and one OSPFv3 instance with a maximum number of 200 dynamically learned routes.

With the typical topology (hub and spoke) in a campus environment, where the wiring closets (spokes) are connected to the distribution switch (hub) forwarding all nonlocal traffic to the distribution layer, the wiring closet switch need not hold a complete routing table. A best practice design, where the distribution switch sends a default route to the wiring closet switch to reach inter-area and external routes (OSPF stub or totally stub area configuration) should be used when OSPF for Routed Access is used in the wiring closet.

Refer to the following link for more details:

<http://www.cisco.com/en/US/docs/solutions/Enterprise/Campus/routed-ex.html>

With Cisco IOS Release 12.2(53)SG, the IP Base image supports OSPF for routed access. The Enterprise Services image is required if you need multiple OSPFv2 and OSPFv3 instances without route restrictions. Additionally, Enterprise Services is required to enable the VRF-lite feature.

Policy-Based Routing

Traditional IP forwarding decisions are based purely on the destination IP address of the packet being forwarded. Policy Based Routing (PBR) enables forwarding based upon other information associated with a packet, such as the source interface, IP source address, Layer 4 ports, and so on. This feature allows network managers more flexibility in how they configure and design their networks.

For more information on policy-based routing, see [Chapter 35, “Configuring Policy-Based Routing.”](#)

Unidirectional Link Routing

Unidirectional link routing (UDLR) provides a way to forward multicast packets over a physical unidirectional interface (such as a satellite link of high bandwidth) to stub networks that have a back channel.

For information on configuring unidirectional link routing, refer to the chapter “Configuring Unidirectional Link Routing” in the *Cisco IP and IP Routing Configuration Guide*.

VRF-lite

VPN routing and forwarding (VRF-lite) is an extension of IP routing that provides multiple routing instances. Along with BGP, it enables the creation of a Layer 3 VPN service by keeping separate IP routing and forwarding tables for each VPN customer. VRF-lite uses input interfaces to distinguish routes for different VPNs. It forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF, allowing the creation of multiple Layer 3 VPNs on a single switch. Interfaces in a VRF could be either physical, such as an Ethernet port, or logical, such as a VLAN switch virtual interface (SVI). However, interfaces cannot belong to more than one VRF at any time.

For information on VRF-lite, see [Chapter 36, “Configuring VRF-lite.”](#)

Management Features

The Catalyst 4500 series switch offers network management and control through the CLI or through alternative access methods, such as SNMP. The switch software supports these network management features:

- [Cisco Call Home, page 1-16](#)
- [Cisco Network Assistant and Embedded CiscoView, page 1-16](#)
- [Dynamic Host Control Protocol, page 1-17](#)
- [Embedded Event Manager, page 1-17](#)
- [Ethernet Management Port, page 1-17](#)
- [FAT File Management System \(Supervisor Engine 6-E only\), page 1-17](#)
- [Forced 10/100 Autonegotiation, page 1-18](#)
- [Intelligent Power Management, page 1-18](#)
- [IP SLA, page 1-18](#)
- [MAC Address Notification, page 1-18](#)
- [MAC Notify MIB, page 1-18](#)
- [NetFlow Statistics, page 1-19](#)
- [Secure Shell, page 1-19](#)
- [Simple Network Management Protocol, page 1-19](#)
- [SPAN and RSPAN, page 1-19](#)
- [Virtual Router Redundancy Protocol, page 1-20](#)
- [Web Content Coordination Protocol, page 1-20](#)

Cisco Call Home

Call Home provides e-mail-based and web-based notification of critical system events. A versatile range of message formats are available for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications. Common uses of this feature may include direct paging of a network support engineer, e-mail notification to a Network Operations Center, XML delivery to a support website, and utilization of Cisco Smart Call Home services for direct case generation with the Cisco Systems Technical Assistance Center (TAC).

The Call Home feature can deliver alert messages containing information on configuration, diagnostics, environmental conditions, inventory, and syslog events.

For more information on Call Home, see [Chapter 57, “Configuring Call Home.”](#)

Cisco Network Assistant and Embedded CiscoView

Web-based tools to configure the Catalyst 4500 series switch. Cisco Network Assistant manages standalone devices, clusters of devices, or federations of devices from anywhere in your intranet. Using its graphical user interface, you can perform multiple configuration tasks without having to remember

command-line interface commands. Embedded CiscoView is a device management application that can be embedded on the switch flash and provides dynamic status, monitoring, and configuration information for your switch.

For more information on Cisco Network Assistant and Embedded CiscoView, see [Chapter 13, “Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant.”](#)

Dynamic Host Control Protocol

The Catalyst 4500 series switch uses DHCP in the following ways:

- **Dynamic Host Control Protocol server**—The Cisco IOS DHCP server feature is a full DHCP server implementation that assigns and manages IP addresses from specified address pools within the router to DHCP clients. If the Cisco IOS DHCP server cannot satisfy a DHCP request from its own database, it can forward the request to one or more secondary DHCP servers defined by the network administrator.
- **Dynamic Host Control Protocol autoconfiguration**—With this feature your switch (the DHCP client) is automatically configured at startup with IP address information and a configuration file.

For DHCP server configuration information, refer to the chapter, “Configuring DHCP,” in the *Cisco IOS IP and IP Routing Configuration Guide* at the following URL:

http://www.cisco.com/en/US/docs/ios/ipaddr/configuration/guide/iad_dhcp_rdmp_ps6350_TSD_Products_Configuration_Guide_Chapter.html

Embedded Event Manager

Embedded Event Manager (EEM) is a distributed and customized approach to event detection and recovery offered directly in a Cisco IOS device. EEM offers the ability to monitor events and take informational, corrective, or any desired EEM action when the monitored events occur or when a threshold is reached. An EEM policy is an entity that defines an event and the actions to be taken when that event occurs.

For information on EEM, see the URL:

<http://www.cisco.com/en/US/docs/ios-xml/ios/eem/configuration/12-4t/eem-overview.html>

Ethernet Management Port

The Ethernet management port, also referred to as the *Fa1* or *fastethernet1* port, is a Layer 3 host port to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management. When managing a switch stack, connect the PC to the Ethernet management port on a Catalyst 4500 series switch.

For more information on Ethernet management port, see the “Using the Ethernet Management Port” section in [Chapter 6, “Configuring Interfaces.”](#)

FAT File Management System (Supervisor Engine 6-E only)

The FAT file system is widely used to manage files on device disks and flash. The support of the FAT file system allows one to easily remove, add, and/or transfer images to and from the flash.

Forced 10/100 Autonegotiation

This feature allows you to configure a port to limit the speed at which it will autonegotiate to a speed lower than the physically maximum speed. This method of reducing the throughput incurs much less overhead than using an ACL.

Intelligent Power Management

Working with powered devices (PDs) from Cisco, this feature uses power negotiation to refine the power consumption of an 802.3af-compliant PD beyond the granularity of power consumption provided by the 802.3af class. Power negotiation also enables the backward compatibility of newer PDs with older modules that do not support either 802.3af or high-power levels as required by IEEE standard.

For more information on Intelligent Power Management, see the “Intelligent Power Management” section in [Chapter 11, “Configuring Power over Ethernet.”](#)

IP SLA

Cisco IOS IP Service Level Agreements (SLAs) allows Cisco customers to analyze IP service levels for IP applications and services by using active traffic monitoring—the generation of traffic in a continuous, reliable, and predictable manner—for measuring network performance. With Cisco IOS IP SLAs, service provider customers can measure and provide service level agreements, and enterprise customers can verify service levels, verify outsourced service level agreements, and understand network performance. Cisco IOS IP SLAs can perform network assessments, verify quality of service (QoS), ease the deployment of new services, and assist with network troubleshooting.

For more information on IP SLA, see [Chapter 58, “Configuring Cisco IOS IP SLAs Operations.”](#)

MAC Address Notification

MAC address notification monitors the MAC addresses that are learned by, aged out or removed from the Catalyst 4500 series switch. Notifications are sent out or retrieved via the CISCO-MAC-NOTIFICATION MIB. It is typically used by a central network management application to collect such MAC address notification events for host moves. User configurable MAC table utilization thresholds can be defined to notify any potential DoS or man-in-the-middle attack.

For information on MAC Address Notification, see [Chapter 4, “Administering the Switch.”](#)

MAC Notify MIB

The MAC Notify MIB feature monitors network performance, utilization, and security conditions enabling a network administrator to track the MAC addresses that are learned or removed on the switch forwarding the Ethernet frames.

NetFlow Statistics

**Note**

Supervisor Engine 6-E and Catalyst 4900M chassis do not support NetFlow.

NetFlow Statistics is a global traffic monitoring feature that allows flow-level monitoring of all IPv4-routed traffic through the switch. Both routed and switched IP flows are supported.

For more information on NetFlow statistics, see [Chapter 54, “Configuring NetFlow.”](#)

Secure Shell

Secure Shell (SSH) is a program that enables you to log into another computer over a network, to execute commands remotely, and to move files from one machine to another. The switch may not initiate SSH connections: SSH will be limited to providing a remote login session to the switch and will only function as a server.

Simple Network Management Protocol

Simple Network Management Protocol (SNMP) facilitates the exchange of management information between network devices. The Catalyst 4500 series switch supports these SNMP types and enhancements:

- SNMP—A full Internet standard
- SNMP v2—Community-based administrative framework for version 2 of SNMP
- SNMP v3—Security framework with three levels: noAuthNoPriv, authNoPriv, and authPriv (available only on a crypto image, like cat4000-i5k91s-mz)
- SNMP trap message enhancements—Additional information with certain SNMP trap messages, including spanning-tree topology change notifications and configuration change notifications

For more information on SNMP, see [Chapter 53, “Configuring SNMP.”](#)

SPAN and RSPAN

Switched Port Analyzer (SPAN) allows you to monitor traffic on any port for analysis by a network analyzer or Remote Monitoring (RMON) probe. You also can do the following:

- Configure ACLs on SPAN sessions.
- Allow incoming traffic on SPAN destination ports to be switched normally.
- Explicitly configure the encapsulation type of packets that are spanned out of a destination port.
- Restrict ingress sniffing depending on whether the packet is unicast, multicast, or broadcast, and depending on whether the packet is valid.
- Mirror packets sent to or from the CPU out of a SPAN destination port for troubleshooting purposes.

For information on SPAN, see [Chapter 50, “Configuring SPAN and RSPAN.”](#)

Remote SPAN (RSPAN) is an extension of SPAN, where source ports and destination ports are distributed across multiple switches, allowing remote monitoring of multiple switches across the network. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session on all participating switches.

For information on RSPAN, see [Chapter 50, “Configuring SPAN and RSPAN.”](#)

Virtual Router Redundancy Protocol

The Virtual Router Redundancy Protocol (VRRP) operates between routers attached to a common LAN and enables them to provide first-hop resiliency to LAN clients.

For information on VRRP, see the URL:

http://www.cisco.com/en/US/docs/ios/ipapp/configuration/guide/ipapp_vrrp_ps6441_TSD_Products_Configuration_Guide_Chapter.html

Web Content Coordination Protocol

Note

WCCP version 1 is *not* supported.

Note

Supervisor Engine 6-E and Catalyst 4900M chassis do not support WCCP Version 2.

Web Content Communication Protocol (WCCP) Version 2 Layer 2 redirection enables Catalyst 4500 series switches to transparently redirect content requests to the directly connected content engines via a Layer 2 and MAC address rewrite. The WCCPv2 Layer 2 redirection is accelerated in the switching hardware, and is more efficient than Layer 3 redirection using Generic Routing Encapsulation (GRE). The content engines in a cache cluster transparently store frequently accessed content, and then fulfill successive requests for the same content, eliminating repetitive transmissions of identical content from the original content servers. It supports the transparent redirection of HTTP and non-HTTP traffic with ports or dynamic services, such as Web caching, HTTPS caching, File Transfer Protocol (FTP) caching, proxy caching, media caching, and streaming services. WCCPv2 Layer 2 redirection is typically deployed for transparent caching at network edge, such as regional or branch sites. WCCPv2 Layer 2 redirection can not be enabled on the same input interface with PBR or VRF-lite. ACL-based classification for Layer 2 redirection is not supported.

For information on WCCP, see [Chapter 61, “Configuring WCCP Version 2 Services.”](#)

Security Features

The Catalyst 4500 series switch offers network management and control through the CLI or through alternative access methods, such as SNMP. The switch software supports these security features:

- [802.1X Identity-Based Network Security, page 1-21](#)
- [Cisco TrustSec SGT Exchange Protocol \(SXP\) IPv4, page 1-22](#)
- [Dynamic ARP Inspection, page 1-22](#)

802.1X Identity-Based Network Security

This security feature consists of the following:

- **802.1X protocol**—This feature provides a means for a host that is connected to a switch port to be authenticated before it is given access to the switch services.
- **802.1X with VLAN assignment**—This feature enables you to enable non-802.1X-capable hosts to access networks that use 802.1X authentication.
- **802.1X RADIUS accounting**—This feature enables you to track the usage of network devices.
- **802.1X authentication for Guest VLANs**—This feature enables you to use VLAN assignment to limit network access for certain users.
- **802.1X with MAC Authentication Bypass**—This feature provides network access to agentless devices without 802.1X supplicant capabilities, such as printers. Upon detecting a new MAC address on a switch port, the Catalyst 4500 series switch will proxy an 802.1X authentication request based on the device's MAC address.
- **802.1X with Inaccessible Authentication Bypass**—This feature applies when the AAA servers are unreachable or nonresponsive. In this situation, 802.1X user authentication typically fails with the port closed, and the user is denied access. Inaccessible Authentication Bypass provides a configurable alternative on the Catalyst 4500 series switch to grant a critical port network access in a locally specified VLAN.
- **802.1X with Unidirectional Controlled Port**—This feature allows the Wake-on-LAN (WoL) magic packets to reach a workstation attached to an unauthorized 802.1X switch port. Unidirectional Controlled Port is typically used to send operating systems or software updates from a central server to workstations at night.
- **802.1X Authentication Failed Open Assignment**—This feature enables you to configure a switch to handle the case when a device fails to authenticate itself correctly through 802.1X (for example, not providing the correct password).

- 802.1X with Port Security—This feature enables port security on an 802.1X port in either single- or multiple-host mode. When you enable port security and 802.1X on a port, 802.1X authenticates the port, and port security manages the number of MAC addresses allowed on that port, including that of the client.
- 802.1X Authentication with ACL Assignment—This feature downloads per-host policies such as ACLs and redirect URLs to the switch from the RADIUS server during 802.1X or MAB authentication of the host.
- 802.1X Authentication with Per-User ACL and Filter-ID ACL—This feature allow ACL policy enforcement using a third-party AAA server.
- 802.1X with RADIUS-Provided Session Timeouts—This feature enables you to specify whether a switch uses a locally configured or a RADIUS-provided reauthentication timeout.
- 802.1X with Voice VLAN—This feature enables you to use 802.1X security on a port while enabling it to be used by both Cisco IP phones and devices with 802.1X supplicant support.
- 802.1X Convergence—This feature provides consistency between the switching business units in 802.1X configuration and implementation.
- Multi-Domain Authentication—This feature allows both a data device and a voice device, such as an IP phone (Cisco or non-Cisco), to authenticate on the same switch port, which is divided into a data domain and a voice domain.

For more information on 802.1X identity-based network security, see [Chapter 40, “Configuring 802.1X Port-Based Authentication.”](#)

Cisco TrustSec SGT Exchange Protocol (SXP) IPv4

TrustSec Security Group Tag Exchange Protocol (SXP) IPv4 is a solution migration protocol developed to provide a mechanism for legacy switches (not tag capable) to participate in a TrustSec network. The IPv4 to SGT binding is communicated out of band to the SXP peer. The SXP peer will populate a local binding table. If the peer is an egress switch it will use these bindings to do SGACL enforcement. If the peer is configured as a distribution SXP switch to improve scaling, then the binding table updates will be provided to the egress switch by the distribution switch.

For more information, refer to the following URLs:

<http://www.cisco.com/en/US/docs/switches/lan/trustsec/configuration/guide/trustsec.html>

Dynamic ARP Inspection

Dynamic ARP Inspection (DAI) intercepts all ARP requests, replies on untrusted ports, and verifies each intercepted packet for valid IP to MAC bindings. Dynamic ARP Inspection helps to prevent attacks on a network by not relaying invalid ARP replies out to other ports in the same VLAN. Denied ARP packets are logged by the switch for auditing.

For more information on dynamic ARP inspection, see [Chapter 46, “Configuring Dynamic ARP Inspection.”](#)

Dynamic Host Configuration Protocol Snooping

Dynamic Host Configuration Protocol (DHCP) Snooping is a security feature that is a component of a DHCP server. DHCP snooping provides security by intercepting untrusted DHCP messages and by building and maintaining a DHCP snooping binding table. An untrusted message is a message that is received from outside the network or firewall that can cause traffic attacks within your network.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. It also provides a way to differentiate between untrusted interfaces connected to the end-user and trusted interfaces connected to the DHCP server or another switch.

For DHCP server configuration information, refer to the chapter, “Configuring DHCP,” in the *Cisco IOS IP and IP Routing Configuration Guide* at the following URL:

http://www.cisco.com/en/US/docs/ios/ipaddr/configuration/guide/iad_dhcp_rdmf_ps6350_TSD_Products_Configuration_Guide_Chapter.html

For information on configuring DHCP snooping, see [Chapter 45, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”](#)

Flood Blocking

Flood blocking enables users to disable the flooding of unicast and multicast packets on a per-port basis. Occasionally, unknown unicast or multicast traffic from an unprotected port is flooded to a protected port because a MAC address has timed out or has not been learned by the switch.

For information on flood blocking, see [Chapter 48, “Port Unicast and Multicast Flood Blocking.”](#)

Hardware-Based Control Plane Policing

Control Plane Policing provides a unified solution to limit the rate of CPU bound control plane traffic in hardware. It enables users to install system wide control plane ACLs to protect the CPU by limiting rates or filtering out malicious DoS attacks. Control plane policing ensures the network stability, availability and packet forwarding, and prevents network outages such as loss of protocol updates despite an attack or heavy load on the switch. Hardware-based control plane policing is available for all Catalyst 4500 supervisor engines. It supports various Layer 2 and Layer 3 control protocols, such as CDP, EAPOL, STP, DTP, VTP, ICMP, CGMP, IGMP, DHCP, RIPv2, OSPF, PIM, TELNET, SNMP, HTTP, and packets destined to 224.0.0.* multicast link local addresses. Predefined system policies or user-configurable policies can be applied to those control protocols.

For information on control plane policing, see [Chapter 44, “Configuring Control Plane Policing.”](#)

IP Source Guard for Static Hosts

This feature allows you to secure the IP address learned from static hosts via ARP packets and then bind that IP address to a given MAC address using the device tracking database, allowing entries to survive through link down events.

IP Source Guard (IPSG) for static hosts allows multiple bindings per port per MAC address for both DHCP and static hosts, in both device tracking database and DHCP snooping binding database. The feature enables you to take action when a limit is exceeded.

For information on configuring IPSG for static hosts, see [Chapter 45, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”](#)

IP Source Guard

Similar to DHCP snooping, this feature is enabled on an untrusted 12 port that is configured for DHCP snooping. Initially all IP traffic on the port is blocked except for the DHCP packets, which are captured by the DHCP snooping process. When a client receives a valid IP address from the DHCP server, a PVACL is installed on the port, which restricts the client IP traffic only to clients with assigned IP addresses, so any IP traffic with source IP addresses other than those assigned by the DHCP server will be filtered out. This filtering prevents a malicious host from attacking a network by hijacking neighbor host's IP address.

For information on configuring IP Source Guard, see [Chapter 45, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”](#)

Local Authentication, RADIUS, and TACACS+ Authentication

Local Authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+) authentication—These authentication methods control access to the switch. For additional information, refer to the following URL:

http://www.cisco.com/en/US/tech/tk59/technologies_configuration_example09186a0080178a51.shtml

Network Admission Control

Network Admission Control consists of two features:

- NAC Layer 2 IP validation

NAC Layer 2 IP is an integral part of Cisco Network Admission Control. It offers the first line of defense for infected hosts (PCs and other devices attached to a LAN port) attempting to connect to the corporate network. NAC Layer 2 IP on the Cisco Catalyst 4500 series switch performs posture validation at the Layer 2 edge of the network for non-802.1x-enabled host devices. Host device posture validation includes anti-virus state and OS patch levels. Depending on the corporate access policy and host device posture, a host may be unconditionally admitted, admitted with restricted access, or quarantined to prevent the spread of viruses across the network.

For more information on Layer 2 IP validation, see the URL:

http://www.cisco.com/en/US/docs/net_mgmt/cisco_secure_access_control_server_for_windows/4.2/configuration/guide/nac_conf.html

- NAC Layer 2 802.1X authentication

The Cisco Catalyst 4500 series switch extends NAC support to 802.1x-enabled devices. Like NAC Layer 2 IP, the NAC Layer 2 802.1x feature determines the level of network access based on endpoint information.

For more information on 802.1X identity-based network security, see [Chapter 40, “Configuring 802.1X Port-Based Authentication.”](#)

Network Security with ACLs

An access control list (ACL) filters network traffic by controlling whether routed packets are forwarded or blocked at the router interfaces. The Catalyst 4500 series switch examines each packet to determine whether to forward or drop the packet based on the criteria you specified within the access lists.

MAC access control lists (MACLs) and VLAN access control lists (VACLs) are supported. VACLs are also known as VLAN maps in Cisco IOS.

The following security features are supported:

- MAC address filtering, which enables you to block unicast traffic for a MAC address on a VLAN interface.
- Port ACLs, which enable you to apply ACLs to Layer 2 interfaces on a switch for inbound traffic.

For information on ACLs, MACLs, VLAN maps, MAC address filtering, and Port ACLs, see [Chapter 47, “Configuring Network Security with ACLs.”](#)

Port Security

Port security restricts traffic on a port based upon the MAC address of the workstation that accesses the port. Trunk port security extends this feature to trunks, including private VLAN isolated trunks, on a per-VLAN basis.

Sticky port security extends port security by saving the dynamically learned MAC addresses in the running configuration to survive port link down and switch reset. It enables a network administrator to restrict the MAC addresses allowed or the maximum number of MAC addresses on each port.

Voice VLAN sticky port security further extends the sticky port security to the Voice-over-IP deployment. Voice VLAN sticky port security locks a port and blocks access from a station with a MAC address different from the IP phone and the workstation behind the IP phone.

For information on port security, see [Chapter 43, “Configuring Port Security.”](#)

PPPoE Intermediate Agent

PPPoE Intermediate Agent (PPPoE IA) is placed between a subscriber and BRAS to help the service provider BRAS distinguish between end hosts connected over Ethernet to an access switch. On the access switch, PPPoE IA enables Subscriber Line Identification by appropriately tagging Ethernet frames of different users. (The tag contains specific information like which subscriber is connected to the switch and VLAN.) PPPoE IA acts as mini security firewall between host and BRAS by intercepting all PPPoE Active Discovery (PAD) messages on a per-port per-vlan basis. It provides specific security feature such as verifying the intercepted PAD message from untrusted port, performing per port PAD message rate limiting, inserting and removing VSA Tags into and from PAD messages, respectively.

For information on PPPoE Agent, see [Chapter 41, “Configuring the PPPoE Intermediate Agent.”](#)

Storm Control

Broadcast suppression is used to prevent LANs from being disrupted by a broadcast storm on one or more switch ports. A LAN broadcast storm occurs when broadcast packets flood the LAN, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation or in the network configuration can cause a broadcast storm. Multicast and broadcast suppression measures how much broadcast traffic is passing through a port and compares the broadcast traffic with some configurable threshold value within a specific time interval. If the amount of broadcast traffic reaches the threshold during this interval, broadcast frames are dropped, and optionally the port is shut down.

Cisco IOS Software Release 12.2(40)SG allows suppression of broadcast and multicast traffic on a per-port basis. (Supervisor Engine 6-E only)

For information on configuring broadcast suppression, see [Chapter 49, “Configuring Storm Control.”](#)

uRPF Strict Mode

Note

The feature is only supported on Supervisor Engine 6-E and on the Catalyst 4900M switch.

The uRPF feature mitigates problems caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. uRPF deflects denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This helps to protect the network of the customer, the ISP, and the rest of the Internet. When using uRPF in strict mode, the packet must be received on the interface that the router would use to forward the return packet. uRPF strict mode is supported for both IPv4 and IPv6 prefixes.

For information on configuring broadcast suppression, see [Chapter 32, “Configuring Unicast Reverse Path Forwarding”](#)

Utilities

Layer 2 Traceroute

Layer 2 Traceroute allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses.

For information about Layer 2 Traceroute, see [Chapter 7, “Checking Port Status and Connectivity.”](#)

Time Domain Reflectometry

Time Domain Reflectometry (TDR) is a technology used for diagnosing the state and reliability of cables. TDR can detect open, shorted, or terminated cable states. The calculation of the distance to the failure point is also supported.

For information about TDR, see [Chapter 7, “Checking Port Status and Connectivity.”](#)

Debugging Features

The Catalyst 4500 series switch has several commands to help you debug your initial setup. These commands are included in the following command groups:

- **platform**
- **debug platform**

For more information, refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

Web-based Authentication

The web-based authentication feature, known as Web Authentication Proxy, enables you to authenticate end users on host systems that do not run the IEEE 802.1X supplicant. When you initiate an HTTP session, this feature intercepts ingress HTTP packets from the host and sends an HTML login page to your. You key in the credentials, which the web-based authentication feature sends to the AAA server for authentication. If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

For information on configuring web-based authentication, see [Chapter 42, “Configuring Web-Based Authentication.”](#)

CHAPTER 2

Command-Line Interfaces

This chapter describes the CLIs you use to configure the Catalyst 4500 series switch. This chapter includes the following major sections:

- [Accessing the Switch CLI, page 2-2](#)
- [Performing Command-Line Processing, page 2-3](#)
- [Performing History Substitution, page 2-4](#)
- [Understanding Cisco IOS Command Modes, page 2-4](#)
- [Getting a List of Commands and Syntax, page 2-5](#)
- [ROMMON Command-Line Interface, page 2-7](#)
- [Archiving Crashfiles Information, page 2-8](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Command Reference, it is located in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

The following command changes apply to Supervisor Engine 6-E alone:

- The **verify** and **squeeze** commands are not supported in the FAT file system.
- The **rename** command is supported in the FAT file system.

For Supervisor Engine 6-E, the **rename** command has been added for bootflash and slot0. For all other supervisor engines, the **rename** command is supported for NVRAM devices only.

- The **fsck** command is supported for the slot0 device. It is not supported in the file systems on supervisor engines other than 6-E.

Accessing the Switch CLI

The following sections describe how to access the switch CLI:

- [Accessing the CLI Using the EIA/TIA-232 Console Interface, page 2-2](#)
- [Accessing the CLI Through Telnet, page 2-2](#)

Accessing the CLI Using the EIA/TIA-232 Console Interface

**Note**

EIA/TIA-232 was known as recommended standard 232 (RS-232) before its acceptance as a standard by the Electronic Industries Alliance (EIA) and Telecommunications Industry Association (TIA).

Perform the initial switch configuration over a connection to the EIA/TIA-232 console interface. Refer to the *Catalyst 4500 Series Switch Module Installation Guide* for console interface cable connection procedures.

To access the switch through the console interface, perform this task:

	Command	Purpose
Step 1	Switch> enable	From the user EXEC prompt (>), enter enable to change to enable mode (also known as privileged mode or privileged EXEC mode).
Step 2	Password: <i>password</i> Switch#	At the password prompt, enter the system password. The prompt (#) appears, indicating that you have accessed the CLI in enabled mode.
Step 3	Switch# quit	When you are finished executing the task command, exit the session.

After accessing the switch through the EIA/TIA-232 interface, you see this display:

Press Return for Console prompt

```
Switch> enable
Password:< >
Switch#
```

Accessing the CLI Through Telnet

**Note**

Before you make a Telnet connection to the switch, you must set the IP address for the switch. See the [“Configuring Physical Layer 3 Interfaces” section on page 30-10](#).

The switch supports up to eight simultaneous Telnet sessions. Telnet sessions disconnect automatically after remaining idle for the period specified by the **exec-timeout** command.

To make a Telnet connection to the switch, perform this task:

	Command	Purpose
Step 1	telnet {hostname ip_addr}	From the remote host, enter the telnet command and the name or IP address of the switch you want to access.
Step 2	Password: <i>password</i> Switch#	At the prompt, enter the password for the CLI. If no password has been configured, press Return .
Step 3		Enter the necessary commands to complete your desired tasks.
Step 4	Switch# quit	When finished, exit the Telnet session.

This example shows how to open a Telnet session to the switch:

```
unix_host% telnet Switch_1
Trying 172.20.52.40...
Connected to 172.20.52.40.
Escape character is '^]'.
User Access Verification
Password:< >
Switch_1> enable
Password:
Switch_1#
```

Performing Command-Line Processing

Switch commands are not case sensitive. You can abbreviate commands and parameters if the abbreviations contain enough letters to be different from any other currently available commands or parameters.

You can scroll through the last 20 commands stored in the history buffer and enter or edit a command at the prompt. [Table 2-1](#) lists the keyboard shortcuts for entering and editing switch commands.

Table 2-1 Keyboard Shortcuts

Keystrokes	Result
Press Ctrl-B or press the Left Arrow key ¹	Moves the cursor back one character.
Press Ctrl-F or press the Right Arrow key ¹	Moves the cursor forward one character.
Press Ctrl-A	Moves the cursor to the beginning of the command line.
Press Ctrl-E	Moves the cursor to the end of the command line.
Press Esc-B	Moves the cursor back one word.
Press Esc-F	Moves the cursor forward one word.

1. The Arrow keys function only on ANSI-compatible terminals, such as VT100s.

Performing History Substitution

The history buffer stores the last 20 command lines you entered. History substitution enables you to access these command lines without retyping them. [Table 2-2](#) lists the history substitution commands.

Table 2-2 History Substitution Commands

Command	Purpose
Ctrl-P or the Up Arrow key ¹	Recalls commands in the history buffer, beginning with the most recent command. Repeat the key sequence to recall older commands successively.
Ctrl-N or the Down Arrow key ¹	Returns to more recent commands in the history buffer after commands have been recalled with Ctrl-P or the Up Arrow key. Repeat the key sequence to recall more recent commands.
Switch# show history	Lists the last several commands you have entered in EXEC mode.

1. The Arrow keys function only on ANSI-compatible terminals such as VT100s.

Understanding Cisco IOS Command Modes

Note

For complete information about Cisco IOS command modes, refer to the *Cisco IOS Configuration Fundamentals Configuration Guide* and the *Cisco IOS Configuration Fundamentals Command Reference* at the following URLs:

http://www.cisco.com/en/US/docs/ios/12_2/configfun/configuration/guide/ffun_c.html

http://www.cisco.com/en/US/docs/ios/fundamentals/command/reference/cf_book.html

The Cisco IOS user interface has many different modes: user EXEC, privileged EXEC (enable), global configuration, interface, subinterface, and protocol-specific. The commands available to you depend on which mode you are in. To get a list of the commands in a given mode, enter a question mark (?) at the system prompt. See the [“Getting a List of Commands and Syntax”](#) section on [page 2-5](#) for more information.

When you start a session on the switch, you begin in user mode, also called user EXEC mode. Only a small subset of commands are available in EXEC mode. To have access to all commands, you must enter privileged EXEC mode, also called enable mode. To access the privileged EXEC mode, you must enter a password. When you are in the privileged EXEC mode, you can enter any EXEC command or access global configuration mode. Most EXEC commands are one-time commands, such as **show** commands, which display the current configuration status, and **clear** commands, which reset counters or interfaces. The EXEC commands are not saved when the switch is rebooted.

The configuration modes allow you to make changes to the running configuration. If you save the configuration, these commands are stored when you reboot the switch. You must start in global configuration mode. From global configuration mode, you can enter interface configuration mode, subinterface configuration mode, and a variety of protocol-specific modes.

You would use a separate mode called ROMMON when the switch cannot boot up properly. For example, the switch might enter ROMMON mode if it does not find a valid system image when it is booting, or if its configuration file is corrupted. For more information, see the [“ROMMON Command-Line Interface” section on page 2-7](#).

Table 2-3 lists and describes frequently used Cisco IOS modes.

Table 2-3 *Frequently Used Cisco IOS Command Modes*

Mode	What You Use It For	How to Access	Prompt
User EXEC	To connect to remote devices, change terminal settings on a temporary basis, perform basic tests, and display system information.	Log in.	Switch>
Privileged EXEC (enable)	To set operating parameters. The privileged command set includes the commands in user EXEC mode, as well as the configure command. Use the configure command to access the other command modes.	From user EXEC mode, enter the enable command and the enable password (if a password has been configured).	Switch#
Global configuration	To configure features that affect the system as a whole, such as the system time or switch name.	From privileged EXEC mode, enter the configure terminal command.	Switch(config)#
Interface configuration	To enable or modify the operation of a 10-Gigabit Ethernet, Gigabit Ethernet, or Fast Ethernet interface with interface commands .	From global configuration mode, enter the interface <i>type location</i> command.	Switch(config-if)#
Console configuration	To configure the console interface; from the directly connected console or the virtual terminal; used with Telnet.	From global configuration mode, enter the line console 0 command.	Switch(config-line)#

The Cisco IOS command interpreter, called the EXEC, interprets and runs the commands you enter. You can abbreviate commands and keywords by entering just enough characters to make the command unique from other commands. For example, you can abbreviate the **show** command to **sh** and the **configure terminal** command to **conf t**.

When you type **exit**, the switch backs out one level. To exit configuration mode completely and return to privileged EXEC mode, press **Ctrl-Z**.

Getting a List of Commands and Syntax

In any command mode, you can get a list of available commands by entering a question mark (?).

```
Switch> ?
```

To obtain a list of commands that begin with a particular character sequence, enter those characters followed by the question mark (?). Do not include a space before the question mark. This form of help is called word help, because it completes a word for you.

To list keywords or arguments, enter a question mark in place of a keyword or argument. Include a space before the question mark. This form of help is called command syntax help, because it reminds you which keywords or arguments are applicable based on the command, keywords, and arguments you have already entered.

```
Switch# configure ?
memory          Configure from NV memory
network          Configure from a TFTP network host
overwrite-network Overwrite NV memory from TFTP network host
terminal         Configure from the terminal
<cr>
```

To redisplay a command you previously entered, press the **Up Arrow** key or **Ctrl-P**. You can continue to press the **Up Arrow** key to see the last 20 commands you entered.

Tip

If you are having trouble entering a command, check the system prompt and enter the question mark (?) for a list of available commands. You might be in the wrong command mode or using incorrect syntax.

Type **exit** to return to the previous mode. Press **Ctrl-Z** or enter the **end** command in any mode to immediately return to privileged EXEC mode.

Virtual Console for Standby Supervisor Engine

Catalyst 4500 series switches can be configured with 2 supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. Therefore, you must connect to the standby console to access, monitor or debug the standby supervisor.

Virtual Console for Standby Supervisor Engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine and thus emulate the standby console on the active supervisor engine. Only one active standby console session is active at any time.

The Virtual Console for Standby Supervisor Engine enables users who are logged onto the active supervisor engine to remotely execute show commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual Console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the **attach module**, **session module**, or **remote login** commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

Once you enter the standby virtual console, the terminal prompt automatically changes to "<hostname>-standby-console#" where hostname is the configured name of the switch. The prompt is restored back to the original prompt when you exit the virtual console.

You exit the virtual console with the **exit** or **quit** commands. When the inactivity period of the terminal on the active supervisor engine where you logged in exceeds the configured idle time, you are automatically logged out of the terminal on the active supervisor engine. In such a case, the virtual console session is also terminated. Virtual console session is also automatically terminated when the standby is rebooted. After the standby boots up, you need to create another virtual console session.

To login to the standby supervisor engine using a virtual console, do the following:

```
Switch# session module 2
Connecting to standby virtual console
Type "exit" or "quit" to end this session
Switch-standby-console# exit
```

If the standby console is not enabled, the following message appears:

```
Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout
```

Virtual session into the standby console is N/A with RPR:

```
Switch# session module 2
IPC server port name IFConsoleServer:2 not registered on standby.
Secondary cannot be accessed by virtual console
```

**Note**

The standby virtual console provides the standard features that are available from the supervisor console such as command history, command completion, command help and partial command keywords.

The following limitations apply to the standby virtual console:

- All commands on the virtual console run to completion. It does not provide the auto-more feature; it behaves as if the **terminal length 0** command has been executed. It is also noninteractive. Therefore, a running command cannot be interrupted or aborted by any key sequence on the active supervisor engine. If a command produces considerable output, the virtual console displays it on the supervisor screen.
- The virtual console is noninteractive. Because the virtual console does not detect the interactive nature of a command, any command that requires user interaction causes the virtual console to wait until the RPC timer aborts the command.

The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60 seconds. During this time, you cannot abort the command from the keyboard. You must wait for the timer to expire before you continue.

- You cannot use virtual console to view debug and syslog messages that are being displayed on the standby supervisor engine. The virtual console only displays the output of commands that are executed from the virtual console. Other information that is displayed on the real standby console does not appear on the virtual console.

ROMMON Command-Line Interface

ROMMON is a ROM-based program that is involved at power-up or reset, or when a fatal exception error occurs. The switch enters ROMMON mode if the switch does not find a valid software image, if the NVRAM configuration is corrupted, or if the configuration register is set to enter ROMMON mode. From the ROMMON mode, you can load a software image manually from flash memory, from a network server file, or from bootflash.

You can also enter ROMMON mode by restarting the switch and pressing **Ctrl-C** during the first five seconds of startup.

**Note**

Ctrl-C is always enabled for 60 seconds after you reboot the switch, even if **Ctrl-C** is configured to be off in the configuration register settings.

When you enter ROMMON mode, the prompt changes to **rommon 1>**. Use the **?** command to see the available ROMMON commands.

For more information about the ROMMON commands, refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

Archiving Crashfiles Information

This feature allows you to archive crashinfo files (that would otherwise be overwritten if another system reset were to happen) first to the bootflash. Having access to archived crashinfo data greatly assists in troubleshooting.

To archive crashinfo files, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# exception crashinfo file bootflash: name	Enables archiving crashinfo files to bootflash. The files are stored in bootflash with the <i>name</i> specified concatenated with the date.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show running-config	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

CHAPTER 3

Configuring the Switch for the First Time

This chapter describes how to initially configure a Catalyst 4500 series switch.

The information presented here supplements the administration information and procedures in this publication: *Cisco IOS Configuration Fundamentals Command Reference*, Release 12.2SR, at this URL:

http://www.cisco.com/en/US/docs/ios/fundamentals/configuration/guide/12_4/cf_12_4_book.html

This chapter includes the following major sections:

- [Default Switch Configuration, page 3-1](#)
- [Configuring DHCP-Based Autoconfiguration, page 3-2](#)
- [Configuring the Switch, page 3-8](#)
- [Controlling Access to Privileged EXEC Commands, page 3-13](#)
- [Recovering a Lost Enable Password, page 3-25](#)
- [Modifying the Supervisor Engine Startup Configuration, page 3-25](#)
- [Resetting a Switch to Factory Default Settings, page 3-31](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Default Switch Configuration

This section describes the default configurations for the Catalyst 4500 series switch. [Table 3-1](#) shows the default configuration settings for each feature.

Table 3-1 **Default Switch Configuration**

Feature	Default Settings
Administrative connection	Normal mode
Global switch information	No default value for system name, system contact, and location
System clock	No value for system clock time
Passwords	No passwords are configured for normal mode or enable mode (press the Return key)
Switch prompt	Switch>
Interfaces	Enabled, with speed and flow control autonegotiated, and without IP addresses

Configuring DHCP-Based Autoconfiguration

These sections describe how to configure DHCP-based autoconfiguration:

- [Understanding DHCP-Based Autoconfiguration, page 3-2](#)
- [DHCP Client Request Process, page 3-3](#)
- [Configuring the DHCP Server, page 3-4](#)
- [Configuring the TFTP Server, page 3-4](#)
- [Configuring the DNS Server, page 3-5](#)
- [Configuring the Relay Device, page 3-5](#)
- [Obtaining Configuration Files, page 3-6](#)
- [Example Configuration, page 3-7](#)

If your DHCP server is a Cisco device, or if you are configuring the switch as a DHCP server, refer to the “IP Addressing and Services” section in the *Cisco IOS IP and IP Routing Configuration Guide for Cisco IOS Release 12.1* for additional information about configuring DHCP.

Understanding DHCP-Based Autoconfiguration

**Note**

Starting with Release 12.2(20)EW, you can enable DHCP AutoConfiguration by entering the **write erase** command. This command clears the startup-config in NVRAM. In images prior to Release 12.2(20)EW, this command will not enable autoconfiguration.

DHCP provides configuration information to Internet hosts and internetworking devices. This protocol consists of two components: one component for delivering configuration parameters from a DHCP server to a device and another component that is a mechanism for allocating network addresses to devices. DHCP is built on a client-server model, in which designated DHCP servers allocate network addresses and deliver configuration parameters to dynamically configured devices. The switch can act as both a DHCP client and a DHCP server.

With DHCP-based autoconfiguration, no DHCP client-side configuration is needed on your switch because your switch (the DHCP client) is automatically configured at startup with IP address information and a configuration file. However, you need to configure the DHCP server or the DHCP server feature on your switch for various lease options associated with IP addresses. If you are using DHCP to relay the configuration file location on the network, you might also need to configure a Trivial File Transfer Protocol (TFTP) server and a Domain Name System (DNS) server.

DHCP-based autoconfiguration replaces the BOOTP client functionality on your switch.

DHCP Client Request Process

At startup the switch automatically requests configuration information from a DHCP server if a configuration file is not present on the switch.

Figure 3-1 shows the sequence of messages that are exchanged between the DHCP client and the DHCP server.

Figure 3-1 DHCP Client and Server Message Exchange

The client, Switch A, broadcasts a DHCPDISCOVER message to locate a DHCP server. The DHCP server offers configuration parameters (such as an IP address, subnet mask, gateway IP address, DNS IP address, lease for the IP address, and so forth) to the client in a DHCPOFFER unicast message.

In a DHCPREQUEST broadcast message, the client returns a formal request for the offered configuration information to the DHCP server. The formal request is broadcast so that all other DHCP servers that received the DHCPDISCOVER broadcast message from the client can reclaim the IP addresses that they offered to the client.

The DHCP server confirms that the IP address has been allocated to the client by returning a DHCPACK unicast message to the client. With this message, the client and server are bound, and the client uses the configuration information that it received from the server. The amount of information the switch receives depends on how you configure the DHCP server. For more information, see the [“Configuring the DHCP Server”](#) section on page 3-4.

If the configuration parameters sent to the client in the DHCPOFFER unicast message are invalid (if configuration error exists), the client returns a DHCPDECLINE broadcast message to the DHCP server.

The DHCP server sends the client a DHCPNAK denial broadcast message, which means that the offered configuration parameters have not been assigned, that an error has occurred during the negotiation of the parameters, or that the client has been slow in responding to the DHCPOFFER message. (The DHCP server might have assigned the parameters to another client.)

A DHCP client might receive offers from multiple DHCP servers and can accept any of them; however, the client usually accepts the first offer it receives. The offer from the DHCP server is not a guarantee that the IP address will be allocated to the client; however, the server usually reserves the address until the client has had a chance to formally request the address.

Configuring the DHCP Server

A switch can act as both the DHCP client and the DHCP server. By default, the Cisco IOS DHCP server and relay agent features are enabled on your switch.

You should configure the DHCP server, or the DHCP server feature running on your switch, with reserved leases that are bound to each switch by the switch hardware address.

If you want the switch to receive IP address information, you must configure the DHCP server with these lease options:

- IP address of the client (required)
- Subnet mask of the client (required)
- DNS server IP address (optional)
- Router IP address (required)

**Note**

The router IP address is the default gateway address for the switch.

If you want the switch to receive the configuration file from a TFTP server, you must configure the DHCP server with these lease options:

- TFTP server name or IP address (required)
- Boot filename (the name of the configuration file that the client needs) (recommended)
- Host name (optional)

Depending on the settings of the DHCP server or the DHCP server feature running on your switch, the switch can receive IP address information, the configuration file, or both.

If you do not configure the DHCP server, or the DHCP server feature running on your switch, with the lease options described earlier, the switch replies to client requests with only those parameters that are configured. If the IP address and subnet mask are not in the reply, the switch is not configured. If the router IP address or TFTP server name (or IP address) are not found, the switch might send broadcast, instead of unicast, TFTP requests. Unavailability of other lease options does not impact autoconfiguration.

The DHCP server, or the DHCP server feature running on your switch, can be on the same LAN or on a different LAN than the switch. If the DHCP server is running on a different LAN, you should configure a DHCP relay, which forwards broadcast traffic between two directly connected LANs. A router does not forward broadcast packets, but it forwards packets based on the destination IP address in the received packet. For more information on relay devices, see the [“Configuring the Relay Device” section on page 3-5](#).

Configuring the TFTP Server

Based on the DHCP server configuration, the switch attempts to download one or more configuration files from the TFTP server. If you configured the DHCP server to respond to the switch with all the options required for IP connectivity to the TFTP server, and if you configured the DHCP server with a TFTP server name, address, and configuration filename, the switch attempts to download the specified configuration file from the specified TFTP server.

If you did not specify the configuration filename or the TFTP server name, or if the configuration file could not be downloaded, the switch attempts to download a configuration file using various combinations of filenames and TFTP server addresses. The files include the specified configuration

filename (if any) and the following files: `network-config`, `cisconet.cfg`, `hostname.config`, or `hostname.cfg`, where *hostname* is the current hostname of the switch and `router-config` and `ciscotr.cfg`. The TFTP server addresses used include the specified TFTP server address (if any) and the broadcast address (255.255.255.255).

For the switch to successfully download a configuration file, the TFTP server must contain one or more configuration files in its base directory. The files can include the following:

- The configuration file named in the DHCP reply (the actual switch configuration file).
- The `network-config` or the `cisconet.cfg` file (known as the default configuration files).
- The `router-config` or the `ciscotr.cfg` file. (These files contain commands common to all switches. Normally, if the DHCP and TFTP servers are properly configured, these files are not accessed.)

If you specify the TFTP server name in the DHCP server-lease database, you must also configure the TFTP server name-to-IP-address mapping in the DNS-server database.

If the TFTP server you plan to use is on a different LAN from the switch, or if you plan to access it with the switch through the broadcast address (which occurs if the DHCP server response does not contain all the required information described earlier), you must configure a relay to forward the TFTP packets to the TFTP server. For more information, see the [“Configuring the Relay Device” section on page 3-5](#). The preferred solution is to configure either the DHCP server or the DHCP server feature running on your switch with all the required information.

Configuring the DNS Server

The DHCP server, or the DHCP server feature running on your switch, uses the DNS server to resolve the TFTP server name to an IP address. You must configure the TFTP server name-to-IP address map on the DNS server. The TFTP server contains the configuration files for the switch.

You can configure the IP addresses of the DNS servers in the lease database of the DHCP server where the DHCP replies will retrieve them. You can enter up to two DNS server IP addresses in the lease database.

The DNS server can be on the same or on a different LAN as the switch. If it is on a different LAN, the switch must be able to access it through a router.

Configuring the Relay Device

You must configure a relay device to forward received broadcast packets to the destination host whenever a switch sends broadcast packets to which a host on a different LAN must respond. Examples of such broadcast packets are DHCP, DNS, and in some cases, TFTP packets.

If the relay device is a Cisco router, enable IP routing (**ip routing** global configuration command), and configure helper addresses (**ip helper-address** interface configuration command). For example, in [Figure 3-2](#), configure the router interfaces as follows:

On interface 10.0.0.2:

```
router(config-if)# ip helper-address 20.0.0.2
router(config-if)# ip helper-address 20.0.0.3
router(config-if)# ip helper-address 20.0.0.4
```

On interface 20.0.0.1

```
router(config-if)# ip helper-address 10.0.0.1
```

Figure 3-2 Relay Device Used in Autoconfiguration

49068

Obtaining Configuration Files

Depending on the availability of the IP address and the configuration filename in the DHCP reserved lease, the switch obtains its configuration information in these ways:

- The IP address and the configuration filename are reserved for the switch and provided in the DHCP reply (one-file read method).

The switch receives its IP address, subnet mask, TFTP server address, and the configuration filename from either the DHCP server or the DHCP server feature running on your switch. The switch sends a unicast message to the TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, completes its boot-up process.

- The IP address and the configuration filename is reserved for the switch, but the TFTP server address is not provided in the DHCP reply (one-file read method).

The switch receives its IP address, subnet mask, and the configuration filename from either the DHCP server or the DHCP server feature running on your switch. The switch sends a broadcast message to a TFTP server to retrieve the named configuration file from the base directory of the server, and upon receipt, completes its boot-up process.

- Only the IP address is reserved for the switch and provided in the DHCP reply. The configuration filename is not provided (two-file read method).

The switch receives its IP address, subnet mask, and the TFTP server address from either the DHCP server or the DHCP server feature running on your switch. The switch sends a unicast message to the TFTP server to retrieve the `network-config` or `cisconet.cfg` default configuration file. (If the `network-config` file cannot be read, the switch reads the `cisconet.cfg` file.)

The default configuration file contains the host names-to-IP-address mapping for the switch. The switch fills its host table with the information in the file and obtains its host name. If the host name is not found in the file, the switch uses the host name in the DHCP reply. If the host name is not specified in the DHCP reply, the switch uses the default *Switch* as its host name.

After obtaining its host name from the default configuration file or the DHCP reply, the switch reads the configuration file that has the same name as its host name (`hostname-config` or `hostname.cfg`, depending on whether or not the `network-config` file or the `cisconet.cfg` file was read earlier) from the TFTP server. If the `cisconet.cfg` file is read, the filename of the host is truncated to eight characters.

If the switch cannot read the network-config, cisco.net.cfg, or the hostname file, it reads the router-config file. If the switch cannot read the router-config file, it reads the ciscotr.cfg file.

Note

The switch broadcasts TFTP server requests provided that one of these conditions is met: the TFTP server is not obtained from the DHCP replies; all attempts to read the configuration file through unicast transmissions fail; or the TFTP server name cannot be resolved to an IP address.

Example Configuration

Figure 3-3 shows a network example for retrieving IP information using DHCP-based autoconfiguration.

Figure 3-3 DHCP-Based Autoconfiguration Network Example

Table 3-2 shows the configuration of the reserved leases on either the DHCP server or the DHCP server feature running on your switch.

Table 3-2 DHCP Server Configuration

	Switch 1	Switch 2	Switch 3	Switch 4
Binding key (hardware address)	00e0.9f1e.2001	00e0.9f1e.2002	00e0.9f1e.2003	00e0.9f1e.2004
IP address	10.0.0.21	10.0.0.22	10.0.0.23	10.0.0.24
Subnet mask	255.255.255.0	255.255.255.0	255.255.255.0	255.255.255.0
Router address	10.0.0.10	10.0.0.10	10.0.0.10	10.0.0.10
DNS server address	10.0.0.2	10.0.0.2	10.0.0.2	10.0.0.2
TFTP server name	maritsu or 10.0.0.3	maritsu or 10.0.0.3	maritsu or 10.0.0.3	maritsu or 10.0.0.3
Boot filename (configuration file) (optional)	switch1-config	switch2-config	switch3-config	switch4-config
Host name (optional)	switch1	switch2	switch3	switch4

DNS Server Configuration

The DNS server maps the TFTP server name *maritsu* to IP address 10.0.0.3.

TFTP Server Configuration (on UNIX)

The TFTP server base directory is set to `/tftpserver/work/`. This directory contains the `network-config` file used in the two-file read method. This file contains the host name that you plan to assign to the switch based on its IP address. The base directory also contains a configuration file for each switch (*switch1-config*, *switch2-config*, and so forth) as shown in the following display:

```
prompt> cd /tftpserver/work/
prompt> ls
network-config
switch1-config
switch2-config
switch3-config
switch4-config
prompt> cat network-config
ip host switch1 10.0.0.21
ip host switch2 10.0.0.22
ip host switch3 10.0.0.23
ip host switch4 10.0.0.24
```

DHCP Client Configuration

No configuration file is present on Switch 1 through Switch 4.

Configuration Explanation

In [Figure 3-3](#), Switch 1 reads its configuration file as follows:

- Switch 1 obtains its IP address 10.0.0.21 from the DHCP server.
- If no configuration filename is given in the DHCP server reply, Switch 1 reads the `network-config` file from the base directory of the TFTP server.
- Switch 1 adds the contents of the `network-config` file to its host table.
- Switch 1 reads its host table by indexing its IP address 10.0.0.21 to its host name (switch1).
- Switch 1 reads the configuration file that corresponds to its host name; for example, it reads *switch1-config* from the TFTP server.

Switches 2 through 4 retrieve their configuration files and IP addresses in the same way.

Configuring the Switch

The following sections describe how to configure your switch:

- [Using Configuration Mode to Configure Your Switch, page 3-9](#)
- [Verifying the Running Configuration Settings, page 3-9](#)
- [Saving the Running Configuration Settings to Your Start-Up File, page 3-10](#)
- [Reviewing the Configuration in NVRAM, page 3-10](#)
- [Configuring a Default Gateway, page 3-11](#)
- [Configuring a Static Route, page 3-11](#)

Using Configuration Mode to Configure Your Switch

To configure your switch from configuration mode, perform this procedure:

-
- Step 1** Connect a console terminal to the console interface of your supervisor engine.
- Step 2** After a few seconds, you will see the user EXEC prompt (**Switch>**). Now, you may want to enter privileged EXEC mode, also known as enable mode. Type **enable** to enter enable mode:
- ```
Switch> enable
```
-  **Note** You must be in enable mode to make configuration changes.
- 
- The prompt will change to the enable prompt (#):
- ```
Switch#
```
- Step 3** At the enable prompt (#), enter the **configure terminal** command to enter global configuration mode:
- ```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#
```
- Step 4** At the global configuration mode prompt, enter the **interface type slot/interface** command to enter interface configuration mode:
- ```
Switch(config)# interface fastethernet 5/1
Switch(config-if)#
```
- Step 5** In either of these configuration modes, enter changes to the switch configuration.
- Step 6** Enter the **end** command to exit configuration mode.
- Step 7** Save your settings. (See the [“Saving the Running Configuration Settings to Your Start-Up File”](#) section on page 3-10.)
-

Your switch is now minimally configured and can boot with the configuration you entered. To see a list of the configuration commands, enter **?** at the prompt or press the **help** key in configuration mode.

Verifying the Running Configuration Settings

To verify the configuration settings you entered or the changes you made, enter the **show running-config** command at the enable prompt (#), as shown in this example:

```
Switch# show running-config
Building configuration...

Current configuration:
!
version 12.0
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname Switch
```

```
<...output truncated...>

!
line con 0
  transport input none
line vty 0 4
  exec-timeout 0 0
  password lab
  login
  transport input lat pad dsipcon mop telnet rlogin udptn nasi
!
end
Switch#
```

Saving the Running Configuration Settings to Your Start-Up File

Caution

This command saves the configuration settings that you created in configuration mode. If you fail to do this step, your configuration will be lost the next time you reload the system.

To store the configuration, changes to the configuration, or changes to the startup configuration in NVRAM, enter the **copy running-config startup-config** command at the enable prompt (#), as follows:

```
Switch# copy running-config startup-config
```

Reviewing the Configuration in NVRAM

To display information stored in NVRAM, enter the **show startup-config EXEC** command.

The following example shows a typical system configuration:

```
Switch# show startup-config
Using 1579 out of 491500 bytes, uncompressed size = 7372 bytes
Uncompressed configuration from 1579 bytes to 7372 bytes
!
version 12.1
no service pad
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
service compress-config
!
hostname Switch
!
!
ip subnet-zero
!
!
!
interface GigabitEthernet1/1
  no snmp trap link-status
!
interface GigabitEthernet1/2
  no snmp trap link-status
!--More--

<...output truncated...>
```

```

!
line con 0
  exec-timeout 0 0
  transport input none
line vty 0 4
  exec-timeout 0 0
  password lab
  login
  transport input lat pad dsipcon mop telnet rlogin udptn nasi
!
end

Switch#

```

Configuring a Default Gateway

Note

The switch uses the default gateway only when it is not configured with a routing protocol.

Configure a default gateway to send data to subnets other than its own when the switch is not configured with a routing protocol. The default gateway must be the IP address of an interface on a router that is directly connected to the switch.

To configure a default gateway, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip default-gateway <i>IP-address</i>	Configures a default gateway.
Step 2	Switch# show ip route	Verifies that the default gateway is correctly displayed in the IP routing table.

This example shows how to configure a default gateway and how to verify the configuration:

```

Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# ip default-gateway 172.20.52.35
Switch(config)# end
3d17h: %SYS-5-CONFIG_I: Configured from console by console
Switch# show ip route
Default gateway is 172.20.52.35

Host                Gateway                Last Use    Total Uses  Interface
ICMP redirect cache is empty
Switch#

```

Configuring a Static Route

If your Telnet station or SNMP network management workstation is on a different network from your switch and a routing protocol has not been configured, you might need to add a static routing table entry for the network where your end station is located.

To configure a static route, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip route <i>dest_IP_address mask</i> { <i>forwarding_IP</i> vlan <i>vlan_ID</i> }	Configures a static route to the remote network.
Step 2	Switch# show running-config	Verifies that the static route is displayed correctly.

This example shows how to use the **ip route** command to configure a static route to a workstation at IP address 171.10.5.10 on the switch with a subnet mask and IP address 172.20.3.35 of the forwarding router:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip route 171.10.5.10 255.255.255.255 172.20.3.35
Switch(config)# end
Switch#
```

This example shows how to use the **show running-config** command to confirm the configuration of the static route:

```
Switch# show running-config
Building configuration...

.
<...output truncated...>
.
ip default-gateway 172.20.52.35
ip classless
ip route 171.10.5.10 255.255.255.255 172.20.3.35
no ip http server
!
line con 0
  transport input none
line vty 0 4
  exec-timeout 0 0
  password lab
  login
  transport input lat pad dsipcon mop telnet rlogin udptn nasi
!
end

Switch#
```

This example shows how to use the **ip route** command to configure the static route IP address 171.20.5.3 with subnet mask and connected over VLAN 1 to a workstation on the switch:

```
Switch# configure terminal
Switch(config)# ip route 171.20.5.3 255.255.255.255 vlan 1
Switch(config)# end
Switch#
```

This example shows how to use the **show running-config** command to confirm the configuration of the static route:

```
Switch# show running-config
Building configuration...

.
<...output truncated...>
.
ip default-gateway 172.20.52.35
ip classless
ip route 171.20.5.3 255.255.255.255 Vlan1
no ip http server
!
!
x25 host z
!
line con 0
  transport input none
line vty 0 4
  exec-timeout 0 0
  password lab
  login
  transport input lat pad dsipcon mop telnet rlogin udptn nasi
!
end

Switch#
```

Controlling Access to Privileged EXEC Commands

The procedures in these sections let you control access to the system configuration file and privileged EXEC commands:

- [Setting or Changing a Static enable Password, page 3-13](#)
- [Using the enable password and enable secret Commands, page 3-14](#)
- [Setting or Changing a Privileged Password, page 3-15](#)
- [Encrypting Passwords, page 3-22](#)
- [Encrypting Passwords, page 3-22](#)
- [Configuring Multiple Privilege Levels, page 3-23](#)

Setting or Changing a Static enable Password

To set or change a static password that controls access to the enable mode, perform this task:

Command	Purpose
Switch(config)# enable password <i>password</i>	Sets a new password or changes an existing password for the privileged EXEC mode.

This example shows how to configure an enable password as “lab” at the privileged EXEC mode:

```
Switch# configure terminal
Switch(config)# enable password lab
Switch(config)#
```

For instructions on how to display the password or access level configuration, see the [“Displaying the Password, Access Level, and Privilege Level Configuration”](#) section on page 3-24.

Using the enable password and enable secret Commands

To provide an additional layer of security, particularly for passwords that cross the network or that are stored on a TFTP server, you can use either the **enable password** or **enable secret** command. Both commands configure an encrypted password that you must enter to access the enable mode (the default) or any other privilege level that you specify.

We recommend that you use the **enable secret** command.

If you configure the **enable secret** command, it takes precedence over the **enable password** command; the two commands cannot be in effect simultaneously.

To configure the switch to require an enable password, perform either one of these tasks:

Command	Purpose
Switch(config)# enable password [level level] {password encryption-type encrypted-password}	Establishes a password for the privileged EXEC mode.
Switch(config)# enable secret [level level] {password encryption-type encrypted-password}	Specifies a secret password that will be saved using a nonreversible encryption method. (If enable password and enable secret commands are both set, users must enter the enable secret password.)

When you enter either of these password commands with the **level** option, you define a password for a specific privilege level. After you specify the level and set a password, give the password only to users who need to have access at this level. Use the **privilege level** configuration command to specify commands accessible at various levels.

If you enable the **service password-encryption** command, the password you enter is encrypted. When you display the password with the **more system:running-config** command, the password displays the password in encrypted form.

If you specify an encryption type, you must provide an encrypted password—an encrypted password you copy from another Catalyst 4500 series switch configuration.

Note

You cannot recover a lost encrypted password. You must clear NVRAM and set a new password. See the [“Recovering a Lost Enable Password”](#) section on page 3-25 for more information.

For information on how to display the password or access level configuration, see the [“Displaying the Password, Access Level, and Privilege Level Configuration”](#) section on page 3-24.

Setting or Changing a Privileged Password

To set or change a privileged password, perform this task:

Command	Purpose
Switch(config-line)# password <i>password</i>	Sets a new password or changes an existing password for the privileged level.

For information on how to display the password or access level configuration, see the [“Displaying the Password, Access Level, and Privilege Level Configuration”](#) section on page 3-24.

Controlling Switch Access with TACACS+

This section describes how to enable and configure TACACS+, which provides detailed accounting information and flexible administrative control over authentication and authorization processes. TACACS+ is facilitated through authentication, authorization, accounting (AAA) and can be enabled only through AAA commands.

**Note**

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Security Command Reference, Release 12.2*.

This section contains this configuration information:

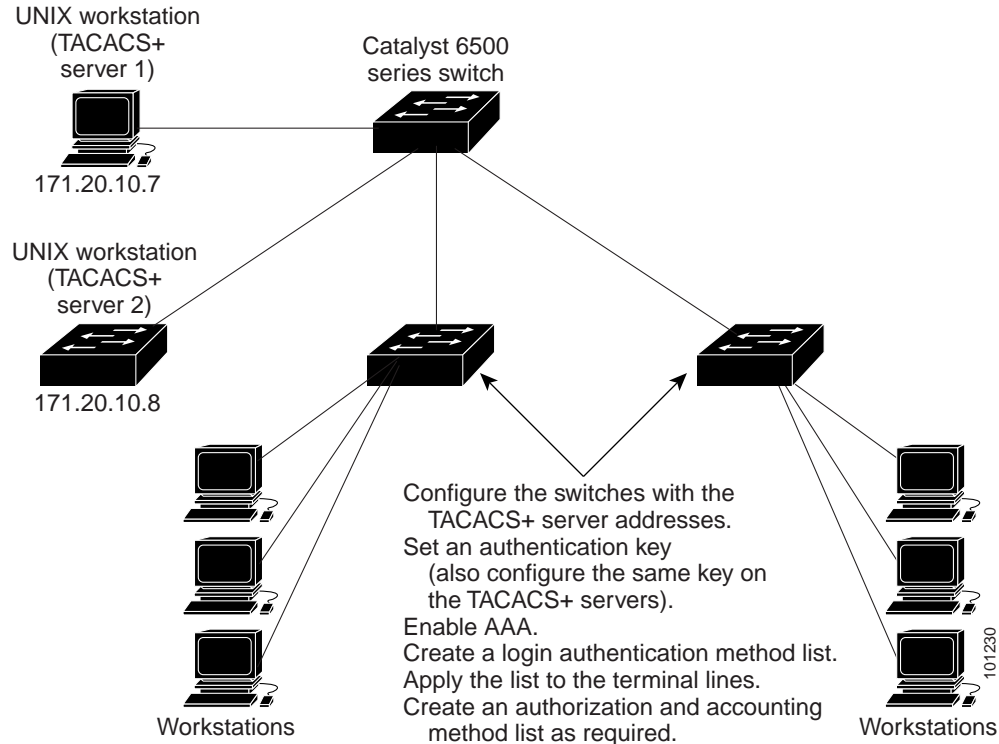

- [Understanding TACACS+, page 3-15](#)
- [TACACS+ Operation, page 3-17](#)
- [Configuring TACACS+, page 3-17](#)
- [Displaying the TACACS+ Configuration, page 3-22](#)

Understanding TACACS+

TACACS+ is a security application that provides centralized validation of users attempting to gain access to your switch. TACACS+ services are maintained in a database on a TACACS+ daemon typically running on a UNIX or Windows NT workstation. You should have access to and should configure a TACACS+ server before configuring TACACS+ features on your switch.

TACACS+ provides for separate and modular AAA facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service—authentication, authorization, and accounting—independently. Each service can be locked into its own database to take advantage of other services available on that server or on the network, depending on the capabilities of the daemon.

The goal of TACACS+ is to provide a method for managing multiple network access points from a single management service. Your switch can be a network access server along with other Cisco routers and access servers. A network access server provides connections to a single user, to a network or subnetwork, and to interconnected networks as shown in [Figure 3-4](#).

Figure 3-4 Typical TACACS+ Network Configuration

TACACS+ administered through the AAA security services can provide these services:

- **Authentication**—Provides complete control of authentication through login and password dialog, challenge and response, and messaging support.
The authentication facility can conduct a dialog with the user (such as, after a username and password are provided, to challenge a user with several questions such as home address, mother's maiden name, service type, and social security number). The TACACS+ authentication service can also send messages to user screens. For example, a message could notify users that their passwords must be changed because of the company's password aging policy.
- **Authorization**—Provides strict control over user capabilities for the duration of the user's session, including but not limited to setting autocommands, access control, session duration, or protocol support. You can also enforce restrictions on the commands a user can execute with the TACACS+ authorization feature.
- **Accounting**—Collects and sends information used for billing, auditing, and reporting to the TACACS+ daemon. Network managers can use the accounting facility to track user activity for a security audit or to provide information for user billing. Accounting records include user identities, start and stop times, executed commands (such as PPP), number of packets, and number of bytes.

The TACACS+ protocol provides authentication between the switch and the TACACS+ daemon, and it ensures confidentiality because all protocol exchanges between the switch and the TACACS+ daemon are encrypted.

You need a system running the TACACS+ daemon software to use TACACS+ on your switch.

TACACS+ Operation

When a user attempts a simple ASCII login by authenticating to a switch using TACACS+, this process occurs:

1. When the connection is established, the switch contacts the TACACS+ daemon to obtain a username prompt, which is then displayed to the user. The user enters a username, and the switch then contacts the TACACS+ daemon to obtain a password prompt. The switch displays the password prompt to the user, the user enters a password, and the password is then sent to the TACACS+ daemon.

TACACS+ allows a conversation between the daemon and the user until the daemon receives enough information to authenticate the user. The daemon prompts for a username and password combination, but can include other items such as the user's mother's maiden name.

2. The switch eventually receives one of these responses from the TACACS+ daemon:
 - **ACCEPT**—The user is authenticated and service can begin. If the switch is configured to require authorization, authorization begins at this time.
 - **REJECT**—The user is not authenticated. The user can be denied access or is prompted to retry the login sequence, depending on the TACACS+ daemon.
 - **ERROR**—An error occurred at some time during authentication with the daemon or in the network connection between the daemon and the switch. If an ERROR response is received, the switch typically tries to use an alternative method for authenticating the user.
 - **CONTINUE**—The user is prompted for additional authentication information.

After authentication, the user undergoes an additional authorization phase if authorization has been enabled on the switch. Users must first successfully complete TACACS+ authentication before proceeding to TACACS+ authorization.

3. If TACACS+ authorization is required, the TACACS+ daemon is again contacted, and it returns an ACCEPT or REJECT authorization response. If an ACCEPT response is returned, the response contains data in the form of attributes that direct the EXEC or NETWORK session for that user and the services that the user can access:
 - Telnet, Secure Shell (SSH), rlogin, or privileged EXEC services
 - Connection parameters, including the host or client IP address, access list, and user timeouts

Configuring TACACS+

This section describes how to configure your switch to support TACACS+. At a minimum, you must identify the host or hosts maintaining the TACACS+ daemon and define the method lists for TACACS+ authentication. You can optionally define method lists for TACACS+ authorization and accounting. A method list defines the sequence and methods used to authenticate, to authorize, or to keep accounts on a user. You can use method lists to designate one or more security protocols, ensuring a backup system if the initial method fails. The software uses the first method listed to authenticate, to authorize, or to keep accounts on users; if that method does not respond, the software selects the next method in the list. This process continues until there is successful communication with a listed method or the method list is exhausted.

This section contains this configuration information:

- [Default TACACS+ Configuration, page 3-18](#)
- [Identifying the TACACS+ Server Host and Setting the Authentication Key, page 3-18](#)
- [Configuring TACACS+ Login Authentication, page 3-19](#)

- [Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services, page 3-21](#)
- [Starting TACACS+ Accounting, page 3-21](#)

Default TACACS+ Configuration

TACACS+ and AAA are disabled by default.

To prevent a lapse in security, you cannot configure TACACS+ through a network management application. When enabled, TACACS+ can authenticate users accessing the switch through the CLI.

Note

Although TACACS+ configuration is performed through the CLI, the TACACS+ server authenticates HTTP connections that have been configured with a privilege level of 15.

Identifying the TACACS+ Server Host and Setting the Authentication Key

You can configure the switch to use a single server or AAA server groups in order to group existing server hosts for authentication. You can group servers to select a subset of the configured server hosts and use them for a particular service. The server group is used with a global server-host list and contains the list of IP addresses of the selected server hosts.

Beginning in privileged EXEC mode, follow these steps to identify the IP host or host maintaining TACACS+ server and optionally set the encryption key:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	tacacs-server host <i>hostname</i> [port <i>integer</i>] [timeout <i>integer</i>] [key <i>string</i>]	Identifies the IP host or hosts maintaining a TACACS+ server. Enter this command multiple times to create a list of preferred hosts. The software searches for hosts in the order in which you specify them. <ul style="list-style-type: none"> • For <i>hostname</i>, specify the name or IP address of the host. • (Optional) For port <i>integer</i>, specify a server port number. The default is port 49. The range is 1 to 65535. • (Optional) For timeout <i>integer</i>, specify a time in seconds the switch waits for a response from the daemon before it times out and declares an error. The default is 5 seconds. The range is 1 to 1000 seconds. • (Optional) For key <i>string</i>, specify the encryption key for encrypting and decrypting all traffic between the switch and the TACACS+ daemon. You must configure the same key on the TACACS+ daemon for encryption to succeed.
Step 3	aaa new-model	Enables AAA.
Step 4	aaa group server tacacs+ <i>group-name</i>	(Optional) Defines the AAA server-group with a group name. This command puts the switch in a server group subconfiguration mode.
Step 5	server <i>ip-address</i>	(Optional) Associates a particular TACACS+ server with the defined server group. Repeat this step for each TACACS+ server in the AAA server group. Each server in the group must be previously defined in Step 2.
Step 6	end	Returns to privileged EXEC mode.

	Command	Purpose
Step 7	<code>show tacacs</code>	Verifies your entries.
Step 8	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

To remove the specified TACACS+ server name or address, use the **no tacacs-server host** *hostname* global configuration command. To remove a server group from the configuration list, use the **no aaa group server tacacs+** *group-name* global configuration command. To remove the IP address of a TACACS+ server, use the **no server ip-address** server group subconfiguration command.

Configuring TACACS+ Login Authentication

To configure AAA authentication, define a named list of authentication methods and then apply that list to various ports. The method list defines the types of authentication you intend to perform and the sequence in which you intend to perform them; you must apply the list to a specific port before you can perform any of the defined authentication methods. The only exception is the default method list (which, by coincidence, is named *default*). The default method list is automatically applied to all ports except those that have a named method list explicitly defined. A defined method list overrides the default method list.

A method list describes the sequence and authentication methods that must be queried to authenticate a user. You can designate one or more security protocols for authentication, ensuring a backup system for authentication in case the initial method fails. The software uses the first method listed to authenticate users; if that method fails to respond, the software selects the next authentication method in the method list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle—meaning that the security server or local username database responds by denying the user access—the authentication process stops, and no other authentication methods are attempted.

Beginning in privileged EXEC mode, follow these steps to configure login authentication:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>aaa new-model</code>	Enables AAA.

	Command	Purpose
Step 3	<code>aaa authentication login {default list-name} method1 [method2...]</code>	<p>Creates a login authentication method list.</p> <ul style="list-style-type: none"> To create a default list that is used when a named list is <i>not</i> specified in the login authentication command, use the default keyword followed by the methods that you plan to use in default situations. The default method list is automatically applied to all ports. For <i>list-name</i>, specify a character string to name the list you are creating. For <i>method1...</i>, specify the actual method the authentication algorithm tries. The additional methods of authentication are used only if the previous method returns an error, not if it fails. <p>Select one of these methods:</p> <ul style="list-style-type: none"> enable—Use the enable password for authentication. Before you can use this authentication method, you must define an enable password by using the enable password global configuration command. group tacacs+—Uses TACACS+ authentication. Before you can use this authentication method, you must configure the TACACS+ server. For more information, see the “Identifying the TACACS+ Server Host and Setting the Authentication Key” section on page 3-18. line—Use the line password for authentication. Before you can use this authentication method, you must define a line password. Use the password password line configuration command. local—Use the local username database for authentication. You must enter username information in the database. Use the username password global configuration command. local-case—Use a case-sensitive local username database for authentication. You must enter username information in the database by using the username name password global configuration command. none—Do not use any authentication for login.
Step 4	<code>line [console tty vty] line-number [ending-line-number]</code>	Enters line configuration mode, and configure the lines to which you want to apply the authentication list.
Step 5	<code>login authentication {default list-name}</code>	<p>Applies the authentication list to a line or set of lines.</p> <ul style="list-style-type: none"> If you specify default, use the default list created with the aaa authentication login command. For <i>list-name</i>, specify the list created with the aaa authentication login command.
Step 6	<code>end</code>	Returns to privileged EXEC mode.
Step 7	<code>show running-config</code>	Verifies your entries.
Step 8	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

To disable AAA, use the **no aaa new-model** global configuration command. To disable AAA authentication, use the **no aaa authentication login {default | list-name} method1 [method2...]** global configuration command. To either disable TACACS+ authentication for logins or to return to the default value, use the **no login authentication {default | list-name}** line configuration command.

Configuring TACACS+ Authorization for Privileged EXEC Access and Network Services

AAA authorization limits the services available to a user. When AAA authorization is enabled, the switch uses information retrieved from the user's profile, which is located either in the local user database or on the security server, to configure the user's session. The user is granted access to a requested service only if the information in the user profile allows it.

You can use the **aaa authorization** global configuration command with the **tacacs+** keyword to set parameters that restrict a user's network access to privileged EXEC mode.

The **aaa authorization exec tacacs+ local** command sets these authorization parameters:

- Use TACACS+ for privileged EXEC access authorization if authentication was performed by using TACACS+.
- Use the local database if authentication was not performed by using TACACS+.

Note

Authorization is bypassed for authenticated users who log in through the CLI even if authorization has been configured.

Beginning in privileged EXEC mode, follow these steps to specify TACACS+ authorization for privileged EXEC access and network services:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	aaa authorization network tacacs+	Configures the switch for user TACACS+ authorization for all network-related service requests.
Step 3	aaa authorization exec tacacs+	Configures the switch for user TACACS+ authorization if the user has privileged EXEC access. The exec keyword might return user profile information (such as autocommand information).
Step 4	end	Returns to privileged EXEC mode.
Step 5	show running-config	Verifies your entries.
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable authorization, use the **no aaa authorization {network | exec} method1** global configuration command.

Starting TACACS+ Accounting

The AAA accounting feature tracks the services that users are accessing and the amount of network resources that they are consuming. When AAA accounting is enabled, the switch reports user activity to the TACACS+ security server in the form of accounting records. Each accounting record contains accounting attribute-value (AV) pairs and is stored on the security server. This data can then be analyzed for network management, client billing, or auditing.

Beginning in privileged EXEC mode, follow these steps to enable TACACS+ accounting for each Cisco IOS privilege level and for network services:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>aaa accounting network start-stop tacacs+</code>	Enables TACACS+ accounting for all network-related service requests.
Step 3	<code>aaa accounting exec start-stop tacacs+</code>	Enables TACACS+ accounting to send a start-record accounting notice at the beginning of a privileged EXEC process and a stop-record at the end.
Step 4	<code>end</code>	Returns to privileged EXEC mode.
Step 5	<code>show running-config</code>	Verifies your entries.
Step 6	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

To disable accounting, use the **no aaa accounting {network | exec} {start-stop} method1...** global configuration command.

Displaying the TACACS+ Configuration

To display TACACS+ server statistics, use the **show tacacs** privileged EXEC command.

Encrypting Passwords

Because protocol analyzers can examine packets (and read passwords), you can increase access security by configuring the Cisco IOS software to encrypt passwords. Encryption prevents the password from being readable in the configuration file.

To configure the Cisco IOS software to encrypt passwords, perform this task:

Command	Purpose
Switch(config)# service password-encryption	Encrypts a password.

Encryption occurs when the current configuration is written or when a password is configured. Password encryption is applied to all passwords, including authentication key passwords, the privileged command password, console and virtual terminal line access passwords, and Border Gateway Protocol (BGP) neighbor passwords. The **service password-encryption** command keeps unauthorized individuals from viewing your password in your configuration file.

Caution

The **service password-encryption** command does not provide a high level of network security. If you use this command, you should also take additional network security measures.

Although you cannot recover a lost encrypted password (that is, you cannot get the original password back), you can regain control of the switch after having lost or forgotten the encrypted password. See the [“Recovering a Lost Enable Password”](#) section on page 3-25 for more information.

For information on how to display the password or access level configuration, see the [“Displaying the Password, Access Level, and Privilege Level Configuration”](#) section on page 3-24.

Configuring Multiple Privilege Levels

By default, Cisco IOS software has two modes of password security: user EXEC mode and privileged EXEC mode. You can configure up to 16 hierarchical levels of commands for each mode. By configuring multiple passwords, you can allow different sets of users to have access to specified commands.

For example, if you want many users to have access to the **clear line** command, you can assign it level 2 security and distribute the level 2 password fairly widely. If you want more restricted access to the **configure** command, you can assign it level 3 security and distribute that password to fewer users.

The procedures in the following sections describe how to configure additional levels of security:

- [Setting the Privilege Level for a Command, page 3-23](#)
- [Changing the Default Privilege Level for Lines, page 3-23](#)
- [Logging In to a Privilege Level, page 3-24](#)
- [Exiting a Privilege Level, page 3-24](#)
- [Displaying the Password, Access Level, and Privilege Level Configuration, page 3-24](#)

Setting the Privilege Level for a Command

To set the privilege level for a command, perform this task:

	Command	Purpose
Step 1	Switch(config)# privilege mode level level <i>command</i>	Sets the privilege level for a command.
Step 2	Switch(config)# enable password level level <i>[encryption-type] password</i>	Specifies the enable password for a privilege level.

For information on how to display the password or access level configuration, see the [“Displaying the Password, Access Level, and Privilege Level Configuration”](#) section on page 3-24.

Changing the Default Privilege Level for Lines

To change the default privilege level for a given line or a group of lines, perform this task:

Command	Purpose
Switch(config-line)# privilege level level	Changes the default privilege level for the line.

For information on how to display the password or access level configuration, see the [“Displaying the Password, Access Level, and Privilege Level Configuration”](#) section on page 3-24.

Logging In to a Privilege Level

To log in at a specified privilege level, perform this task:

Command	Purpose
Switch# enable <i>level</i>	Logs in to a specified privilege level.

Exiting a Privilege Level

To exit to a specified privilege level, perform this task:

Command	Purpose
Switch# disable <i>level</i>	Exits to a specified privilege level.

Displaying the Password, Access Level, and Privilege Level Configuration

To display detailed password information, perform this task:

	Command	Purpose
Step 1	Switch# show running-config	Displays the password and access level configuration.
Step 2	Switch# show privilege	Shows the privilege level configuration.

This example shows how to display the password and access level configuration:

```
Switch# show running-config
Building configuration...

Current configuration:
!
version 12.0
service timestamps debug datetime localtime
service timestamps log datetime localtime
no service password-encryption
!
hostname Switch
!
boot system flash sup-bootflash
enable password lab
!
<...output truncated...>
```

This example shows how to display the privilege level configuration:

```
Switch# show privilege
Current privilege level is 15
Switch#
```

Recovering a Lost Enable Password

**Note**

For more information on the configuration register which is preconfigured in NVRAM, see [“Configuring the Software Configuration Register”](#) section on page 3-26.

To recover a lost enable password, follow these steps:

-
- | | |
|---------------|--------------------------------------------------------------------------------------------------------------|
| Step 1 | Connect to the console interface. |
| Step 2 | Stop the boot sequence and enter ROM monitor by pressing Ctrl-C during the first 5 seconds of bootup. |
| Step 3 | Configure the switch to boot-up without reading the configuration memory (NVRAM). |
| Step 4 | Reboot the system. |
| Step 5 | Access enable mode (this can be done without a password if a password has not been configured). |
| Step 6 | View or change the password, or erase the configuration. |
| Step 7 | Reconfigure the switch to boot-up and read the NVRAM as it normally does. |
| Step 8 | Reboot the system. |
-

Modifying the Supervisor Engine Startup Configuration

These sections describe how the startup configuration on the supervisor engine works and how to modify the BOOT variable and the configuration register:

- [Understanding the Supervisor Engine Boot Configuration, page 3-25](#)
- [Configuring the Software Configuration Register, page 3-26](#)
- [Specifying the Startup System Image, page 3-30](#)
- [Controlling Environment Variables, page 3-31](#)

Understanding the Supervisor Engine Boot Configuration

The supervisor engine boot process involves two software images: ROM monitor and supervisor engine software. When the switch is booted or reset, the ROMMON code is executed. Depending on the NVRAM configuration, the supervisor engine either stays in ROMMON mode or loads the supervisor engine software.

Two user-configurable parameters determine how the switch boots: the configuration register and the BOOT environment variable. The configuration register is described in the [“Modifying the Boot Field and Using the boot Command”](#) section on page 3-27. The BOOT environment variable is described in the [“Specifying the Startup System Image”](#) section on page 3-30.

Understanding the ROM Monitor

The ROM monitor (ROMMON) is invoked at switch bootup, reset, or when a fatal exception occurs. The switch enters ROMMON mode if the switch does not find a valid software image, if the NVRAM configuration is corrupted, or if the configuration register is set to enter ROMMON mode. From ROMMON mode, you can manually load a software image from bootflash or a flash disk, or you can boot up from the management interface. ROMMON mode loads a primary image from which you can configure a secondary image to boot up from a specified source either locally or through the network using the BOOTLDR environment variable. This variable is described in the “[Switch#](#)” section on [page 3-31](#).

You can also enter ROMMON mode by restarting the switch and then pressing **Ctrl-C** during the first five seconds of startup. If you are connected through a terminal server, you can escape to the Telnet prompt and enter the **send break** command to enter ROMMON mode.

Note

Ctrl-C is always enabled for five seconds after you reboot the switch, regardless of whether the configuration-register setting has **Ctrl-C** disabled.

The ROM monitor has these features:

- Power-on confidence test
- Hardware initialization
- Boot capability (manual bootup and autoboot)
- File system (read-only while in ROMMON)

Configuring the Software Configuration Register

The switch uses a 16-bit software configuration register, which allows you to set specific system parameters. Settings for the software configuration register are preconfigured in NVRAM.

Here are some reasons why you might want to change the software configuration register settings:

- To select a boot source and default boot filename
- To control broadcast addresses
- To set the console terminal baud rate
- To load operating software from flash memory
- To recover a lost password
- To manually boot the system using the **boot** command at the bootstrap program prompt
- To force an automatic bootup from the system bootstrap software (boot image) or from a default system image in onboard flash memory, and read any **boot system** commands that are stored in the configuration file in NVRAM

Caution

To avoid possibly halting the Catalyst 4500 series switch, remember that valid configuration register settings might be combinations of settings and not just the individual settings listed in [Table 3-3](#). For example, the factory default value of 0x2101 is a combination of settings.

[Table 3-3](#) lists the meaning of each of the software configuration memory bits. [Table 3-4](#) defines the *boot* field.

Table 3-3 Software Configuration Register Bits

Bit Number ¹	Hexadecimal	Meaning
00 to 03	0x0000 to 0x000F	Boot field (see Table 3-4)
04	0x0010	Unused
05	0x0020	Bit two of console line speed
06	0x0040	Causes system software to ignore NVRAM contents
07	0x0080	OEM ² bit enabled
08	0x0100	Unused
09	0x0200	Unused
10	0x0400	IP broadcast with all zeros
11 to 12	0x0800 to 0x1000	Bits one and zero of Console line speed (default is 9600 baud)
13	0x2000	Loads ROM monitor after netboot fails
14	0x4000	IP broadcasts do not have network numbers

1. The factory default value for the configuration register is 0x2101. This value is a combination of the following: binary bit 13, bit 8 = 0x0100 and binary bits 00 through 03 = 0x0001. (See [Table 3-4](#).)

2. OEM = original equipment manufacturer.

Table 3-4 Explanation of Boot Field (Configuration Register Bits 00 to 03)

Boot Field	Meaning
00	Stays at the system bootstrap prompt (does not autoboot).
01	Boots the first file in onboard flash memory.
02 to 0F	Autoboots using image(s) specified by the BOOT environment variable. If more than one image is specified, the switch attempts to boot the first image specified in the BOOT variable. As long as the switch can successfully boot from this image, the same image will be used on a reboot. If the switch fails to boot from the image specified in the BOOT variable, the switch will try to boot from the next image listed in the BOOT variable. If the end of the BOOT variable is reached without the switch booting successfully, the switch attempts the boot from the beginning of the BOOT variable. The autoboot continues until the switch successfully boots from one of the images specified in the BOOT variable.

Modifying the Boot Field and Using the boot Command

The configuration register boot field determines whether the switch loads an operating system image and, if so, where it obtains this system image. The following sections describe how to use and set the configuration register boot field and the procedures you must perform to modify the configuration register boot field. In ROMMON, you can use the **confreg** command to modify the configuration register and change boot settings.

Bits 0 through 3 of the software configuration register contain the boot field.

Note

The factory default configuration register setting for systems and spares is 0x2101. However, the recommended value is 0x0102.

When the boot field is set to either 00 or 01 (0-0-0-0 or 0-0-0-1), the system ignores any boot instructions in the system configuration file and the following occurs:

- When the boot field is set to 00, you must boot up the operating system manually by issuing the **boot** command at the system bootstrap or ROMMON prompt.
- When the boot field is set to 01, the system boots the first image in the bootflash single in-line memory module (SIMM).
- When the entire boot field equals a value between 0-0-1-0 and 1-1-1-1, the switch loads the system image specified by **boot system** commands in the startup configuration file.

Caution

If you set bootfield to a value between 0-0-1-0 and 1-1-1-1, you must specify a value in the **boot system** command, else the switch cannot boot up and will remain in ROMMON.

You can enter the **boot** command only or enter the command and include additional boot instructions, such as the name of a file stored in flash memory, or a file that you specify for booting from a network server. If you use the **boot** command without specifying a file or any other boot instructions, the system boots from the default flash image (the first image in onboard flash memory). Otherwise, you can instruct the system to boot up from a specific flash image (using the **boot system flash filename** command).

You can also use the **boot** command to boot up images stored in the compact flash cards located in slot 0 on the supervisor engine.

Modifying the Boot Field

Modify the boot field from the software configuration register. To modify the software configuration register boot field, perform this task:

	Command	Purpose
Step 1	Switch# show version	Determines the current configuration register setting.
Step 2	Switch# configure terminal	Enters configuration mode, and specify the terminal option.
Step 3	Switch(config)# config-register <i>value</i>	Modifies the existing configuration register setting to reflect the way you want the switch to load a system image.
Step 4	Switch(config)# end	Exits configuration mode.
Step 5	Switch# reload	Reboots the switch to make your changes take effect.

To modify the configuration register while the switch is running Cisco IOS software, follow these steps:

- Step 1** Enter the **enable** command and your password to enter privileged level, as follows:

```
Switch> enable
Password:
Switch#
```

- Step 2** Enter the **configure terminal** command at the EXEC mode prompt (#), as follows:

```
Switch# configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
Switch(config)#
```

- Step 3** Configure the configuration register to 0x102 as follows:

```
Switch(config)# config-register 0x102
```

Set the contents of the configuration register by specifying the *value* command variable, where *value* is a hexadecimal number preceded by 0x (see [Table 3-3 on page 3-27](#)).

- Step 4** Enter the **end** command to exit configuration mode. The new value settings are saved to memory; however, the new settings do not take effect until the system is rebooted.

- Step 5** Enter the **show version EXEC** command to display the configuration register value currently in effect; it will be used at the next reload. The value is displayed on the last line of the screen display, as shown in this sample output:

```
Configuration register is 0x141 (will be 0x102 at next reload)
```

- Step 6** Save your settings.

See the “[Saving the Running Configuration Settings to Your Start-Up File](#)” section on page 3-10. Note that configuration register changes take effect only after the system reloads, such as when you enter a **reload** command from the console.

- Step 7** Reboot the system. The new configuration register value takes effect with the next system boot up.

Verifying the Configuration Register Setting

Enter the **show version EXEC** command to verify the current configuration register setting. In ROMMON mode, enter the **show version** command to verify the configuration register setting.

To verify the configuration register setting for the switch, perform this task:

Command	Purpose
Switch# show version	Displays the configuration register setting.

In this example, the **show version** command indicates that the current configuration register is set so that the switch does not automatically load an operating system image. Instead, it enters ROMMON mode and waits for you to enter ROM monitor commands.

```
Switch# show version

"tftp://172.25.60.31/auto/gsg-sw/interim/zave/newest_image/ios/dev/cat4500-entservic"

cisco WS-C4948-10GE (MPC8540) processor (revision 5) with 262144K bytes of memory.
```

Specifying the Startup System Image

You can enter multiple boot commands in the startup configuration file or in the BOOT environment variable to provide backup methods for loading a system image.

The BOOT environment variable is also described in the “Specify the Startup System Image in the Configuration File” section in the “Loading and Maintaining System Images and Microcode” chapter of the *Cisco IOS Configuration Fundamentals Configuration Guide*.

Use the following sections to configure your switch to boot from flash memory. flash memory can be either single in-line memory modules (SIMMs) or flash disks. Check the appropriate hardware installation and maintenance guide for information about types of flash memory.

Flash Memory Features

Flash memory allows you to do the following:

- Remotely load multiple system software images through TFTP or RCP transfers (one transfer for each file loaded)
- Boot a switch manually or automatically from a system software image stored in flash memory (you can also boot directly from ROM)
- Copy the system image to flash memory using TFTP
- Boot the system from flash memory either automatically or manually
- Copy the flash memory image to a network server using TFTP or RCP

For more information on Flash Memory, see this URL:

http://www.cisco.com/en/US/docs/switches/lan/catalyst4500/hardware/configuration/notes/OL_2788.html

Security Precautions

Note the following security precaution when loading from flash memory:

You can only change the system image stored in flash memory from privileged EXEC level on the console terminal.

Configuring Flash Memory

To configure your switch to boot from flash memory, perform the following procedure. (Refer to the appropriate hardware installation and maintenance publication for complete instructions on installing the hardware.)

-
- Step 1** Copy a system image to flash memory using TFTP or other protocols. Refer to the “Cisco IOS File Management” and “Loading and Maintaining System Images” chapters in the *Cisco IOS Configuration Fundamentals Configuration Guide*, Release 12.2, at the following URL:
- http://www.cisco.com/en/US/docs/ios/fundamentals/configuration/guide/12_2sr/cf_12_2sr_book.html
- Step 2** Configure the system to boot automatically from the desired file in flash memory.
- You might need to change the configuration register value. See the “[Modifying the Boot Field and Using the boot Command](#)” section on page 3-27, for more information on modifying the configuration register.
- Step 3** Save your configurations.
- Step 4** Power cycle and reboot your system to verify that all is working as expected.
-

Controlling Environment Variables

Although the ROM monitor controls environment variables, you can create, modify, or view them with certain commands. To create or modify the BOOT and BOOTLDR variables, use the **boot system** and **boot bootldr** global configuration commands, respectively. Refer to the “Specify the Startup System Image in the Configuration File” section in the “Loading and Maintaining System Images and Microcode” chapter of the *Configuration Fundamentals Configuration Guide* for details on setting the BOOT environment variable.

Note

When you use the **boot system** and **boot bootldr** global configuration commands, you affect only the running configuration. To save the configuration for future use, you must save the environment variable settings to your startup configuration, which places the information under ROM monitor control. Enter the **copy system:running-config nvram:startup-config** command to save the environment variables from your running configuration to your startup configuration.

You can view the contents of the BOOT and BOOTLDR variables using the **show bootvar** command. This command displays the settings for these variables as they exist in the startup configuration and in the running configuration if a running configuration setting differs from a startup configuration setting. This example shows how to check the BOOT and BOOTLDR variables on the switch:

```
Switch# show bootvar
BOOTLDR variable = bootflash:cat4000-is-mz,1;
Configuration register is 0x0
Switch#
```

Resetting a Switch to Factory Default Settings

Manufacturing and repair centers can use the **erase /all non-default** command to do the following:

- Clear the non-volatile configurations and states of the local supervisor engine (NVRAM and flashes).
- Set the factory default parameters on the Catalyst 4500 series switch before it is ready to ship to a customer.

For example, entering this command can generate the following output:

```
Switch# erase /all non-default
```

```
Erase and format operation will destroy all data in non-volatile storage. Continue?
[confirm]
Formatting bootflash: ...
```

```
Format of bootflash complete
Erasing nvram:
Erasing cat4000_flash:
Clearing crashinfo:data
Clearing the last power failure timestamp
Clearing all ROMMON variables
Setting default ROMMON variables:
    ConfigReg=0x2101
    PS1=rommon ! >
    EnableAutoConfig=1
Setting vtp mode to transparent
%WARNING! Please reboot the system for the changes to take effect
Switch#
00:01:48: %SYS-7-NV_BLOCK_INIT: Initialized the geometry of nvram
Switch#
```

If the Catalyst 4500 series switch is accessible to a TFTP server, you can copy an image to the bootflash memory with the TFTP command:

```
Switch# copy tftp://192.20.3.123/tftpboot/abc/cat4500-entservices-mz.bin bootflash:
```

When the copying is completed, you can reboot the just-copied Catalyst 4500 series switch image to the image stored in the bootflash memory with the **reload** command:

```
Switch# reload
```

```
System configuration has been modified. Save? [yes/no]: no
Proceed with reload? [confirm]
```

```
00:06:17: %SYS-5-RELOAD: Reload requested by console. Reload Reason: Reload Command.
```

To see details about the default parameters set by the **erase /all non-default** command, see the usage guidelines for the **erase** command in the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

CHAPTER 4

Administering the Switch

This chapter describes how to perform one-time operations to administer the Catalyst 4500 Series switch.

This chapter also describes how to install and configure the Embedded CiscoView network management system to provide a graphical representation of a Catalyst 4500 series switch and to provide a GUI-based management and configuration interface.

This chapter includes the following major sections:

- [Managing the System Time and Date, page 4-1](#)
- [Configuring a System Name and Prompt, page 4-14](#)
- [Creating a Banner, page 4-17](#)
- [Managing the MAC Address Table, page 4-19](#)
- [Managing the ARP Table, page 4-30](#)
- [Configuring Embedded CiscoView Support, page 4-30](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Managing the System Time and Date

You can configure the system time and date on your switch manually or automatically by using Network Time Protocol (NTP).

These sections contain this configuration information:

- [System Clock, page 4-2](#)
- [Understanding Network Time Protocol, page 4-2](#)

- [Configuring NTP, page 4-3](#)
- [Configuring Time and Date Manually, page 4-11](#)

System Clock

The core of the time service is the system clock, which monitors the date and time. This clock starts when the system starts.

The system clock can provide time to these services:

- User **show** commands
- Logging and debugging messages

The system clock keeps track of time internally based on Universal Time Coordinated (UTC), also known as Greenwich Mean Time (GMT). You can configure information about the local time zone and summer time (daylight saving time) so that the time is correct for the local time zone.

The system clock keeps track of whether the time is *authoritative* or not (whether it has been set by a time source considered to be authoritative). If it is not authoritative, the time is available only for display purposes and is not redistributed. For configuration information, see the [“Configuring Time and Date Manually” section on page 4-11](#).

Understanding Network Time Protocol

The NTP is designed to synchronize a network of devices. NTP runs over User Datagram Protocol (UDP), which runs over IP. NTP is documented in RFC 1305.

An NTP network usually gets its time from an authoritative time source, such as a radio clock or an atomic clock attached to a time server. NTP then distributes this time across the network. NTP is extremely efficient; no more than one packet per minute is necessary to synchronize two devices to within a millisecond of one another.

NTP uses the concept of a *stratum* to describe how many NTP hops away a device is from an authoritative time source. A stratum 1 time server has a radio or atomic clock directly attached, a stratum 2 time server receives its time through NTP from a stratum 1 time server, and so on. A device running NTP automatically chooses as its time source the device with the lowest stratum number with which it communicates through NTP. This strategy effectively builds a self-organizing tree of NTP speakers.

NTP avoids synchronizing to a device whose time might not have been synchronized. NTP also compares the time reported by several devices and does not synchronize to a device whose time is significantly different than the others, even if its stratum is lower.

The communications between devices running NTP (known as *associations*) are usually statically configured; each device is given the IP address of all devices with which it should associate. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages; however, information flow is one-way only.

The time kept on a device is a critical resource; you should use the security features of NTP to avoid the accidental or malicious setting of an incorrect time. Two mechanisms are available: an access list-based restriction scheme and an encrypted authentication mechanism.

Cisco's implementation of NTP does not support stratum 1 service; it is not possible to connect to a radio or atomic clock. We recommend that the time service for your network be derived from the public NTP servers available on the IP Internet.

Figure 4-1 shows a typical network example using NTP. Switch A is the NTP master, with Switches B, C, and D configured in NTP server mode, in server association with Switch A. Switch E is configured as an NTP peer to the upstream and downstream switches, Switch B and Switch F, respectively.

Figure 4-1 Typical NTP Network Configuration

If the network is isolated from the Internet, Cisco's implementation of NTP allows a device to act as if it is synchronized through NTP, when it is not. Other devices then synchronize to that device through NTP.

NTP time overrides the time set by any other method.

Several manufacturers include NTP software for their host systems, and a public version for systems running UNIX and its various derivatives is also available. This software allows host systems to be synchronized as well.

Configuring NTP

These sections contain this configuration information:

- [Default NTP Configuration, page 4-4](#)
- [Configuring NTP Authentication, page 4-4](#)

- [Configuring NTP Associations, page 4-6](#)
- [Configuring NTP Broadcast Service, page 4-7](#)
- [Configuring NTP Access Restrictions, page 4-8](#)
- [Configuring the Source IP Address for NTP Packets, page 4-10](#)
- [Displaying the NTP Configuration, page 4-11](#)

Default NTP Configuration

Table 4-1 shows the default NTP configuration.

Table 4-1 *Default NTP Configuration*

Feature	Default Setting
NTP authentication	Disabled. No authentication key is specified.
NTP peer or server associations	None configured.
NTP broadcast service	Disabled; no interface sends or receives NTP broadcast packets.
NTP access restrictions	No access control is specified.
NTP packet source IP address	The source address is set by the outgoing interface.

NTP is enabled on all interfaces by default. All interfaces receive NTP packets.

Configuring NTP Authentication

This procedure must be coordinated with the administrator of the NTP server; the information you configure in this procedure must be matched by the servers used by the switch to synchronize its time to the NTP server.

To authenticate the associations (communications between devices running NTP that provide for accurate timekeeping) with other devices for security purposes, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	ntp authenticate	Enables the NTP authentication feature, which is disabled by default.
Step 3	ntp authentication-key <i>number</i> md5 <i>value</i>	<p>Defines the authentication keys. By default, none are defined.</p> <ul style="list-style-type: none"> • For <i>number</i>, specify a key number. The range is 1 to 4294967295. • md5 specifies that message authentication support is provided by using the message digest algorithm 5 (MD5). • For <i>value</i>, enter an arbitrary string of up to eight characters for the key. <p>The switch does not synchronize to a device unless both have one of these authentication keys, and the key number is specified by the ntp trusted-key <i>key-number</i> command.</p>

	Command	Purpose
Step 4	ntp trusted-key <i>key-number</i>	Specifies one or more key numbers (defined in Step 3) that a peer NTP device must provide in its NTP packets for this switch to synchronize to it. By default, no trusted keys are defined. For <i>key-number</i> , specify the key defined in Step 3. This command provides protection against accidentally synchronizing the switch to a device that is not trusted.
Step 5	end	Returns to privileged EXEC mode.
Step 6	show running-config	Verifies your entries.
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable NTP authentication, use the **no ntp authenticate** global configuration command. To remove an authentication key, use the **no ntp authentication-key** *number* global configuration command. To disable authentication of the identity of a device, use the **no ntp trusted-key** *key-number* global configuration command.

This example shows how to configure the switch to synchronize only to devices providing authentication key 42 in the device's NTP packets:

```
Switch# configure terminal
Switch(config)# ntp authenticate
Switch(config)# ntp authentication-key 42 md5 aNiceKey
Switch(config)# ntp trusted-key 42
Switch(config)# end
Switch#
```

Configuring NTP Associations

An NTP association can be a peer association (this switch can either synchronize to the other device or allow the other device to synchronize to it), or it can be a server association (meaning that only this switch synchronizes to the other device, and not the other way around).

To form an NTP association with another device, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	ntp peer <i>ip-address</i> [version <i>number</i>] [key <i>keyid</i>] [source <i>interface</i>] [prefer] or ntp server <i>ip-address</i> [version <i>number</i>] [key <i>keyid</i>] [source <i>interface</i>] [prefer]	Configures the switch system clock to synchronize a peer or to be synchronized by a peer (peer association). or Configures the switch system clock to be synchronized by a time server (server association). No peer or server associations are defined by default. <ul style="list-style-type: none"> For <i>ip-address</i> in a peer association, specify either the IP address of the peer providing, or being provided, the clock synchronization. For a server association, specify the IP address of the time server providing the clock synchronization. (Optional) For <i>number</i>, specify the NTP version number. The range is 1 to 3. By default, Version 3 is selected. (Optional) For <i>keyid</i>, enter the authentication key defined with the ntp authentication-key global configuration command. (Optional) For <i>interface</i>, specify the interface from which to pick the IP source address. By default, the source IP address is taken from the outgoing interface. (Optional) Enter the prefer keyword to make this peer or server the preferred one that provides synchronization. This keyword reduces switching back and forth between peers and servers.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show running-config	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

You need to configure only one end of an association; the other device can automatically establish the association. If you are using the default NTP version (Version 3) and NTP synchronization does not occur, try using NTP Version 2. Many NTP servers on the Internet run Version 2.

To remove a peer or server association, use the **no ntp peer** *ip-address* or the **no ntp server** *ip-address* global configuration command.

This example shows how to configure the switch to synchronize its system clock with the clock of the peer at IP address 172.16.22.44 using NTP Version 2:

```
Switch# configure terminal
Switch(config)# ntp server 172.16.22.44 version 2
Switch(config)# end
Switch#
```

Configuring NTP Broadcast Service

The communications between devices running NTP (known as *associations*) are usually statically configured; each device is given the IP addresses of all devices with which it should form associations. Accurate timekeeping is possible by exchanging NTP messages between each pair of devices with an association. However, in a LAN environment, NTP can be configured to use IP broadcast messages instead. This alternative reduces configuration complexity because each device can simply be configured to send or receive broadcast messages. However, the information flow is one-way only.

The switch can send or receive NTP broadcast packets on an interface-by-interface basis if there is an NTP broadcast server, such as a router, broadcasting time information on the network. The switch can send NTP broadcast packets to a peer so that the peer can synchronize to it. The switch can also receive NTP broadcast packets to synchronize its own clock. This section provides procedures for both sending and receiving NTP broadcast packets.

To configure the switch to send NTP broadcast packets to peers so that they can synchronize their clock to the switch, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Specifies the interface to send NTP broadcast packets, and enter interface configuration mode.
Step 3	ntp broadcast [<i>version number</i>] [<i>key keyid</i>] [<i>destination-address</i>]	Enables the interface to send NTP broadcast packets to a peer. By default, this feature is disabled on all interfaces. <ul style="list-style-type: none"> (Optional) For <i>number</i>, specify the NTP version number. The range is 1 to 3. If you do not specify a version, Version 3 is used. (Optional) For <i>keyid</i>, specify the authentication key to use when sending packets to the peer. (Optional) For <i>destination-address</i>, specify the IP address of the peer that is synchronizing its clock to this switch.
Step 4	end	Returns to privileged EXEC mode.
Step 5	show running-config	Verifies your entries.
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable the interface from sending NTP broadcast packets, use the **no ntp broadcast** interface configuration command.

This example shows how to configure a port to send NTP Version 2 packets:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast version 2
Switch(config-if)# end
Switch#
```

To configure the switch to receive NTP broadcast packets from connected peers, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Specifies the interface to receive NTP broadcast packets, and enter interface configuration mode.
Step 3	ntp broadcast client	Enables the interface to receive NTP broadcast packets. By default, no interfaces receive NTP broadcast packets.
Step 4	exit	Returns to global configuration mode.
Step 5	ntp broadcastdelay <i>microseconds</i>	(Optional) Changes the estimated round-trip delay between the switch and the NTP broadcast server. The default is 3000 microseconds; the range is 1 to 999999.
Step 6	end	Returns to privileged EXEC mode.
Step 7	show running-config	Verifies your entries.
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable an interface from receiving NTP broadcast packets, use the **no ntp broadcast client** interface configuration command. To change the estimated round-trip delay to the default, use the **no ntp broadcastdelay** global configuration command.

This example shows how to configure a port to receive NTP broadcast packets:

```
Switch# configure terminal
Switch(config)# interface gigabitethernet0/1
Switch(config-if)# ntp broadcast client
Switch(config-if)# end
Switch#
```

Configuring NTP Access Restrictions

You can control NTP access on two levels as described in these sections:

- [Creating an Access Group and Assigning a Basic IP Access List, page 4-9](#)
- [Disabling NTP Services on a Specific Interface, page 4-10](#)

Creating an Access Group and Assigning a Basic IP Access List

To control access to NTP services by using access lists, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>ntp access-group { query-only serve-only serve peer } access-list-number</code>	Creates an access group, and apply a basic IP access list. The keywords have these meanings: <ul style="list-style-type: none"> • query-only—Allows only NTP control queries. • serve-only—Allows only time requests. • serve—Allows time requests and NTP control queries, but does not allow the switch to synchronize to the remote device. • peer—Allows time requests and NTP control queries and allows the switch to synchronize to the remote device. For <i>access-list-number</i> , enter a standard IP access list number from 1 to 99.
Step 3	<code>access-list access-list-number permit source [source-wildcard]</code>	Creates the access list. <ul style="list-style-type: none"> • For <i>access-list-number</i>, enter the number specified in Step 2. • Enter the permit keyword to permit access if the conditions are matched. • For <i>source</i>, enter the IP address of the device that is permitted access to the switch. • (Optional) For <i>source-wildcard</i>, enter the wildcard bits to be applied to the source. <p>Note When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.</p>
Step 4	<code>end</code>	Returns to privileged EXEC mode.
Step 5	<code>show running-config</code>	Verifies your entries.
Step 6	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

The access group keywords are scanned in this order, from least restrictive to most restrictive:

1. **peer**—Allows time requests and NTP control queries and allows the switch to synchronize itself to a device whose address passes the access list criteria.
2. **serve**—Allows time requests and NTP control queries, but does not allow the switch to synchronize itself to a device whose address passes the access list criteria.
3. **serve-only**—Allows only time requests from a device whose address passes the access list criteria.
4. **query-only**—Allows only NTP control queries from a device whose address passes the access list criteria.

If the source IP address matches the access lists for more than one access type, the first type is granted. If no access groups are specified, all access types are granted to all devices. If any access groups are specified, only the specified access types are granted.

To remove access control to the switch NTP services, use the **no ntp access-group {query-only | serve-only | serve | peer}** global configuration command.

This example shows how to configure the switch to allow itself to synchronize to a peer from access list 99. However, the switch restricts access to allow only time requests from access list 42:

```
Switch# configure terminal
Switch(config)# ntp access-group peer 99
Switch(config)# ntp access-group serve-only 42
Switch(config)# access-list 99 permit 172.20.130.5
Switch(config)# access list 42 permit 172.20.130.6
Switch(config)# end
Switch#
```

Disabling NTP Services on a Specific Interface

NTP services are enabled on all interfaces by default.

To disable NTP packets from being received on an interface, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Enters interface configuration mode, and specify the interface to disable.
Step 3	ntp disable	Disables NTP packets from being received on the interface. By default, all interfaces receive NTP packets. To reenabling receipt of NTP packets on an interface, use the no ntp disable interface configuration command
Step 4	end	Returns to privileged EXEC mode.
Step 5	show running-config	Verifies your entries.
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring the Source IP Address for NTP Packets

When the switch sends an NTP packet, the source IP address is normally set to the address of the interface through which the NTP packet is sent. Use the **ntp source** global configuration command when you want to use a particular source IP address for all NTP packets. The address is taken from the specified interface. This command is useful if the address on an interface cannot be used as the destination for reply packets.

To configure a specific interface from which the IP source address is to be taken, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	ntp source <i>type number</i>	Specifies the interface type and number from which the IP source address is taken. By default, the source address is set by the outgoing interface.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show running-config	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The specified interface is used for the source address for all packets sent to all destinations. If a source address is to be used for a specific association, use the **source** keyword in the **ntp peer** or **ntp server** global configuration command as described in the [“Configuring NTP Associations”](#) section on page 4-6.

Displaying the NTP Configuration

You can use two privileged EXEC commands to display NTP information:

- **show ntp associations [detail]**
- **show ntp status**

For detailed information about the fields in these displays, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.3*.

Configuring Time and Date Manually

If no other source of time is available, you can manually configure the time and date after the system is restarted. The time remains accurate until the next system restart. We recommend that you use manual configuration only as a last resort. If you have an outside source to which the switch can synchronize, you do not need to manually set the system clock.

These sections contain this configuration information:

- [Setting the System Clock, page 4-11](#)
- [Displaying the Time and Date Configuration, page 4-12](#)
- [Configuring the Time Zone, page 4-12](#)
- [Configuring Summer Time \(Daylight Saving Time\), page 4-13](#)

Setting the System Clock

If you have an outside source on the network that provides time services, such as an NTP server, you do not need to manually set the system clock.

To set the system clock, perform this task:

	Command	Purpose
Step 1	<code>clock set hh:mm:ss day month year</code> or <code>clock set hh:mm:ss month day year</code>	Manually sets the system clock using one of these formats. <ul style="list-style-type: none"> • For <i>hh:mm:ss</i>, specify the time in hours (24-hour format), minutes, and seconds. The time specified is relative to the configured time zone. • For <i>day</i>, specify the day by date in the month. • For <i>month</i>, specify the month by name. • For <i>year</i>, specify the year (no abbreviation).

This example shows how to manually set the system clock to 1:32 p.m. on July 23, 2001:

```
Switch# clock set 13:32:00 23 July 2001
```

Displaying the Time and Date Configuration

To display the time and date configuration, use the **show clock [detail]** privileged EXEC command.

The system clock keeps an *authoritative* flag that shows whether the time is authoritative (believed to be accurate). If the system clock has been set by a timing source such as NTP, the flag is set. If the time is not authoritative, it is used only for display purposes. Until the clock is authoritative and the *authoritative* flag is set, the flag prevents peers from synchronizing to the clock when the peers' time is invalid.

The symbol that precedes the **show clock** display has this meaning:

- *—Time is not authoritative.
- (blank)—Time is authoritative.
- .—Time is authoritative, but NTP is not synchronized.

Configuring the Time Zone

To manually configure the time zone, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	clock timezone <i>zone</i> <i>hours-offset</i> [<i>minutes-offset</i>]	<p>Sets the time zone.</p> <p>To set the time to UTC, use the no clock timezone global configuration command.</p> <p>The switch keeps internal time in universal time coordinated (UTC), so this command is used only for display purposes and when the time is manually set.</p> <ul style="list-style-type: none"> • For <i>zone</i>, enter the name of the time zone to be displayed when standard time is in effect. The default is UTC. • For <i>hours-offset</i>, enter the hours offset from UTC. • (Optional) For <i>minutes-offset</i>, enter the minutes offset from UTC.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show running-config	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The *minutes-offset* variable in the **clock timezone** global configuration command is available for those cases where a local time zone is a percentage of an hour different from UTC. For example, the time zone for some sections of Atlantic Canada (AST) is UTC-3.5, where the 3 means 3 hours and .5 means 50 percent. In this case, the necessary command is **clock timezone AST -3 30**.

Configuring Summer Time (Daylight Saving Time)

To configure summer time (daylight saving time) in areas where it starts and ends on a particular day of the week each year, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	clock summer-time zone recurring [week day month hh:mm week day month hh:mm [offset]]	Configures summer time to start and end on the specified days every year. Summer time is disabled by default. If you specify clock summer-time zone recurring without parameters, the summer time rules default to the United States rules. <ul style="list-style-type: none"> For <i>zone</i>, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect. (Optional) For <i>week</i>, specify the week of the month (1 to 5 or last). (Optional) For <i>day</i>, specify the day of the week (Sunday, Monday...). (Optional) For <i>month</i>, specify the month (January, February...). (Optional) For <i>hh:mm</i>, specify the time (24-hour format) in hours and minutes. (Optional) For <i>offset</i>, specify the number of minutes to add during summer time. The default is 60.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show running-config	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The first part of the **clock summer-time** global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

This example shows how to specify that summer time starts on the first Sunday in April at 02:00 and ends on the last Sunday in October at 02:00:

```
Switch# configure terminal
Switch(config)# clock summer-time PDT recurring 1 Sunday April 2:00 last Sunday October 2:00
Switch(config)# end
Switch#
```

If summer time in your area does not follow a recurring pattern (configure the exact date and time of the next summer time events), perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	clock summer-time zone date [month date year hh:mm month date year hh:mm [offset]] or clock summer-time zone date [date month year hh:mm date month year hh:mm [offset]]	Configures summer time to start on the first date and end on the second date. To disable summer time, use the no clock summer-time global configuration command. Summer time is disabled by default. <ul style="list-style-type: none"> For <i>zone</i>, specify the name of the time zone (for example, PDT) to be displayed when summer time is in effect. (Optional) For <i>week</i>, specify the week of the month (1 to 5 or last). (Optional) For <i>day</i>, specify the day of the week (Sunday, Monday...). (Optional) For <i>month</i>, specify the month (January, February...). (Optional) For <i>hh:mm</i>, specify the time (24-hour format) in hours and minutes. (Optional) For <i>offset</i>, specify the number of minutes to add during summer time. The default is 60.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show running-config	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The first part of the **clock summer-time** global configuration command specifies when summer time begins, and the second part specifies when it ends. All times are relative to the local time zone. The start time is relative to standard time. The end time is relative to summer time. If the starting month is after the ending month, the system assumes that you are in the southern hemisphere.

To disable summer time, use the **no clock summer-time** global configuration command.

This example shows how to set summer time to start on October 12, 2000, at 02:00, and end on April 26, 2001, at 02:00:

```
Switch# configure terminal
Switch(config)# clock summer-time pdt date 12 October 2000 2:00 26 April 2001 2:00
Switch#
```

Configuring a System Name and Prompt

You configure the system name on the switch to identify it. By default, the system name and prompt are *Switch*.

If you have not configured a system prompt, the first 20 characters of the system name are used as the system prompt. A greater-than symbol [>] is appended. The prompt is updated whenever the system name changes.

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.3* and the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols, Release 12.3*.

These sections contain this configuration information:

- [Configuring a System Name, page 4-15](#)
- [Understanding DNS, page 4-15](#)

Configuring a System Name

To manually configure a system name, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	hostname <i>name</i>	Manually configures a system name. The default setting is <i>switch</i> . The name must follow the rules for ARPANET hostnames. They must start with a letter, end with a letter or digit, and have as interior characters only letters, digits, and hyphens. Names can be up to 63 characters. To return to the default hostname, use the no hostname global configuration command.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show running-config	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

When you set the system name, it is also used as the system prompt.

Understanding DNS

The DNS protocol controls the Domain Name System (DNS), a distributed database with which you can map hostnames to IP addresses. When you configure DNS on your switch, you can substitute the hostname for the IP address with all IP commands, such as **ping**, **telnet**, **connect**, and related Telnet support operations.

IP defines a hierarchical naming scheme that allows a device to be identified by its location or domain. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco Systems is a commercial organization that IP identifies by a *com* domain name, so its domain name is *cisco.com*. A specific device in this domain, for example, the File Transfer Protocol (FTP) system is identified as *ftp.cisco.com*.

To keep track of domain names, IP has defined the concept of a domain name server, which holds a cache (or database) of names mapped to IP addresses. To map domain names to IP addresses, you must first identify the hostnames, specify the name server that is present on your network, and enable the DNS.

These sections contain this configuration information:

- [Default DNS Configuration, page 4-16](#)
- [Setting Up DNS, page 4-16](#)
- [Displaying the DNS Configuration, page 4-17](#)

Default DNS Configuration

[Table 4-2](#) shows the default DNS configuration.

Table 4-2 *Default DNS Configuration*

Feature	Default Setting
DNS enable state	Enabled.
DNS default domain name	None configured.
DNS servers	No name server addresses are configured.

Setting Up DNS

To set up your switch to use the DNS, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	ip domain-name <i>name</i>	<p>Defines a default domain name that the software uses to complete unqualified hostnames (names without a dotted-decimal domain name).</p> <p>To remove a domain name, use the no ip domain-name <i>name</i> global configuration command.</p> <p>Do not include the initial period that separates an unqualified name from the domain name.</p> <p>At boot time, no domain name is configured; however, if the switch configuration comes from a BOOTP or Dynamic Host Configuration Protocol (DHCP) server, then the default domain name might be set by the BOOTP or DHCP server (if the servers were configured with this information).</p>
Step 3	ip name-server <i>server-address1</i> [<i>server-address2</i> ... <i>server-address6</i>]	<p>Specifies the address of one or more name servers to use for name and address resolution.</p> <p>To remove a name server address, use the no ip name-server <i>server-address</i> global configuration command.</p> <p>You can specify up to six name servers. Separate each server address with a space. The first server specified is the primary server. The switch sends DNS queries to the primary server first. If that query fails, the backup servers are queried.</p>

	Command	Purpose
Step 4	<code>ip domain-lookup</code>	(Optional) Enables DNS-based hostname-to-address translation on your switch. This feature is enabled by default. To disable DNS on the switch, use the no ip domain-lookup global configuration command. If your network devices require connectivity with devices in networks for which you do not control name assignment, you can dynamically assign device names that uniquely identify your devices by using the global Internet naming scheme (DNS).
Step 5	<code>end</code>	Returns to privileged EXEC mode.
Step 6	<code>show running-config</code>	Verifies your entries.
Step 7	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

If you use the switch IP address as its hostname, the IP address is used and no DNS query occurs. If you configure a hostname that contains no periods (.), a period followed by the default domain name is appended to the hostname before the DNS query is made to map the name to an IP address. The default domain name is the value set by the **ip domain-name** global configuration command. If there is a period (.) in the hostname, the Cisco IOS software looks up the IP address without appending any default domain name to the hostname.

Displaying the DNS Configuration

To display the DNS configuration information, use the **show running-config** privileged EXEC command.

Creating a Banner

You can configure a message-of-the-day (MOTD) and a login banner. The MOTD banner displays on all connected terminals at login and is useful for sending messages that affect all network users (such as impending system shutdowns).

The login banner also displays on all connected terminals. It appears after the MOTD banner and before the login prompts.

Note

For complete syntax and usage information for the commands used in this section, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.3*.

These sections contain this configuration information:

- [Default Banner Configuration, page 4-18](#)
- [Configuring a Message-of-the-Day Login Banner, page 4-18](#)
- [Configuring a Login Banner, page 4-19](#)

Default Banner Configuration

The MOTD and login banners are not configured.

Configuring a Message-of-the-Day Login Banner

You can create a single or multiline message banner that appears on the screen when someone logs in to the switch.

To configure a MOTD login banner, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	banner motd <i>c message c</i>	Specifies the message of the day. To delete the MOTD banner, use the no banner motd global configuration command. For <i>c</i> , enter the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. For <i>message</i> , enter a banner message up to 255 characters. You cannot use the delimiting character in the message.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show running-config	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure a MOTD banner for the switch by using the pound sign (#) symbol as the beginning and ending delimiter:

```
Switch(config)# banner motd #
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
#
Switch(config)#
```

This example shows the banner that appears from the previous configuration:

```
Unix> telnet 172.2.5.4
Trying 172.2.5.4...
Connected to 172.2.5.4.
Escape character is '^]'.
```

```
This is a secure site. Only authorized users are allowed.
For access, contact technical support.
```

```
User Access Verification
```

```
Password:
```

Configuring a Login Banner

You can configure a login banner to be displayed on all connected terminals. This banner appears after the MOTD banner and before the login prompt.

To configure a login banner, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>banner login c message c</code>	Specifies the login message. To delete the login banner, use the no banner login global configuration command. For <i>c</i> , enter the delimiting character of your choice, for example, a pound sign (#), and press the Return key. The delimiting character signifies the beginning and end of the banner text. Characters after the ending delimiter are discarded. For <i>message</i> , enter a login message up to 255 characters. You cannot use the delimiting character in the message.
Step 3	<code>end</code>	Returns to privileged EXEC mode.
Step 4	<code>show running-config</code>	Verifies your entries.
Step 5	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

This example shows how to configure a login banner for the switch by using the dollar sign (\$) symbol as the beginning and ending delimiter:

```
Switch# configuration terminal
Switch(config)# banner login $
Access for authorized users only. Please enter your username and password.
$
Switch(config)# end
Switch#
```

Managing the MAC Address Table

The MAC address table contains address information that the switch uses to forward traffic between ports. All MAC addresses in the address table are associated with one or more ports. The address table includes these types of addresses:

- Dynamic address—A source MAC address that the switch learns and then ages when it is not in use.
- Static address—A manually entered unicast address that does not age and that is not lost when the switch resets.

The address table lists the destination MAC address, the associated VLAN ID, and port number associated with the address and the type (static or dynamic).

Note

For complete syntax and usage information for the commands used in this section, see the command reference for this release.

These sections contain this configuration information:

- [Building the Address Table, page 4-20](#)
- [MAC Addresses and VLANs, page 4-20](#)
- [Default MAC Address Table Configuration, page 4-21](#)
- [Changing the Address Aging Time, page 4-21](#)
- [Removing Dynamic Address Entries, page 4-22](#)
- [Configuring MAC Change Notification Traps, page 4-22](#)
- [Configuring MAC Move Notification Traps, page 4-24](#)
- [Configuring MAC Threshold Notification Traps, page 4-26](#)
- [Adding and Removing Static Address Entries, page 4-27](#)
- [Configuring Unicast MAC Address Filtering, page 4-28](#)
- [Displaying Address Table Entries, page 4-30](#)

Building the Address Table

With multiple MAC addresses supported on all ports, you can connect any port on the switch to individual workstations, repeaters, switches, routers, or other network devices. The switch provides dynamic addressing by learning the source address of packets it receives on each port and adding the address and its associated port number to the address table. As stations are added or removed from the network, the switch updates the address table, adding new dynamic addresses and aging out those that are not in use.

The aging interval is globally configured. However, the switch maintains an address table for each VLAN, and STP can accelerate the aging interval on a per-VLAN basis.

The switch sends packets between any combination of ports, based on the destination address of the received packet. Using the MAC address table, the switch forwards the packet only to the port associated with the destination address. If the destination address is on the port that sent the packet, the packet is filtered and not forwarded. The switch always uses the store-and-forward method: complete packets are stored and checked for errors before transmission.

MAC Addresses and VLANs

All addresses are associated with a VLAN. An address can exist in more than one VLAN and have different destinations in each. Unicast addresses, for example, could be forwarded to port 1 in VLAN 1 and ports 9, 10, and 1 in VLAN 5.

Each VLAN maintains its own logical address table. A known address in one VLAN is unknown in another until it is learned or statically associated with a port in the other VLAN.

When private VLANs are configured, address learning depends on the type of MAC address:

- Dynamic MAC addresses learned in one VLAN of a private VLAN are replicated in the associated VLANs. For example, a MAC address learned in a private-VLAN secondary VLAN is replicated in the primary VLAN.
- Static MAC addresses configured in a primary or secondary VLAN are not replicated in the associated VLANs. When you configure a static MAC address in a private VLAN primary or secondary VLAN, you should also configure the same static MAC address in all associated VLANs.

For more information about private VLANs, see [Chapter 39, “Configuring Private VLANs.”](#)

Default MAC Address Table Configuration

[Table 4-3](#) shows the default MAC address table configuration.

Table 4-3 *Default MAC Address Table Configuration*

Feature	Default Setting
Aging time	300 seconds
Dynamic addresses	Automatically learned
Static addresses	None configured

Changing the Address Aging Time

Dynamic addresses are source MAC addresses that the switch learns and then ages when they are not in use. You can change the aging time setting for all VLANs or for a specified VLAN.

Setting too short an aging time can cause addresses to be prematurely removed from the table. Then when the switch receives a packet for an unknown destination, it floods the packet to all ports in the same VLAN as the receiving port. This unnecessary flooding can impact performance. Setting too long an aging time can cause the address table to be filled with unused addresses, which prevents new addresses from being learned. Flooding results, which can impact switch performance.

To configure the dynamic address table aging time, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>mac address-table aging-time [0 10-1000000] [vlan vlan-id]</code>	<p>Sets the length of time that a dynamic entry remains in the MAC address table after the entry is used or updated.</p> <p>To return to the default value, use the no mac address-table aging-time global configuration command.</p> <p>The range is 10 to 1000000 seconds. The default is 300. You can also enter 0, which disables aging. Static address entries are never aged or removed from the table.</p> <p>For <i>vlan-id</i>, valid IDs are 1 to 4094.</p>
Step 3	<code>end</code>	Returns to privileged EXEC mode.

	Command	Purpose
Step 4	<code>show mac address-table aging-time</code>	Verifies your entries.
Step 5	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Removing Dynamic Address Entries

To remove all dynamic entries, use the **clear mac address-table dynamic** command in EXEC mode. You can also remove a specific MAC address (**clear mac address-table dynamic address *mac-address***), remove all addresses on the specified physical port or port channel (**clear mac address-table dynamic interface *interface-id***), or remove all addresses on a specified VLAN (**clear mac address-table dynamic vlan *vlan-id***).

To verify that dynamic entries have been removed, use the **show mac address-table dynamic** privileged EXEC command.

Configuring MAC Change Notification Traps

MAC change notification enables you to track users on a network by storing the MAC change activity on the switch. Whenever the switch learns or removes a MAC address, an SNMP notification can be generated and sent to the network management system. If you have many users entering and exiting the network, you can set a trap interval time to bundle the notification traps and reduce network traffic. The MAC notification history table stores the MAC address activity for each hardware port for which the trap is enabled. MAC address notifications are generated for dynamic and static MAC addresses; events are not generated for self addresses or multicast addresses.

To send MAC change notification traps to an NMS host, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>snmp-server host <i>host-addr</i> [traps informs] {version {1/2c/3}} [auth noauth priv] <i>community-string</i> [udp-port <i>port</i>] [notification-type]</code>	Specifies the recipient of the trap message. <ul style="list-style-type: none"> For <i>host-addr</i>, specify the name or address of the NMS. Specify traps (the default) to send SNMP traps to the host. Specify informs to send SNMP informs to the host. Specify the SNMP version to support. Version 1, the default, is not available with informs. For <i>community-string</i>, specify the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. For <i>notification-type</i>, use the mac-notification keyword.

	Command	Purpose
Step 3	<code>snmp-server enable traps mac-notification change</code>	Enables the switch to send MAC change traps to the NMS. To disable the switch from sending MAC change notification traps, use the no snmp-server enable traps mac-notification change global configuration command.
Step 4	<code>mac address-table notification change</code>	Enables the MAC address change notification feature.
Step 5	<code>mac address-table notification change [interval value] [history-size value]</code>	Enters the trap interval time and the history table size. <ul style="list-style-type: none"> • (Optional) For interval value, specify the notification trap interval in seconds between each set of traps that are generated to the NMS. The range is 0 to 2147483647 seconds; the default is 1 second. • (Optional) For history-size value, specify the maximum number of entries in the MAC notification history table. The range is 0 to 500; the default is 1. To disable the MAC change notification feature, use the no mac address-table notification change global configuration command.
Step 6	<code>interface interface-id</code>	Enters interface configuration mode, and specify the interface on which to enable the SNMP MAC change notification trap.
Step 7	<code>snmp trap mac-notification change {added removed}</code>	Enables the MAC change notification trap. <ul style="list-style-type: none"> • Enable the MAC change notification trap whenever a MAC address is added on this interface. • Enable the MAC change notification trap whenever a MAC address is removed from this interface. To disable the MAC change notification traps on a specific interface, use the no snmp trap mac-notification change {added removed} interface configuration command.
Step 8	<code>end</code>	Returns to privileged EXEC mode.
Step 9	<code>show mac address-table notification change interface</code> <code>show running-config</code>	Verifies your entries.
Step 10	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

This example shows how to specify 172.69.59.93 as the network management system, enable the switch to send MAC change notification traps to the network management system, enable the MAC change notification feature, set the interval time to 60 seconds, set the history-size to 100 entries, and enable traps whenever a MAC address is added on the specified port:

```
Switch# configure terminal
Switch(config)# snmp-server host 172.69.59.93 private mac-notification
Switch(config)# snmp-server enable traps mac-notification change
Switch(config)# mac address-table notification change
Switch(config)# mac address-table notification change interval 60
Switch(config)# mac address-table notification change history-size 100
Switch(config)# interface fastethernet0/2
Switch(config-if)# snmp trap mac-notification change added
Switch(config-if)# end
Switch# show mac address-table notification change interface
MAC Notification Feature is Enabled on the switch
MAC Notification Flags For All Ethernet Interfaces :
-----
Interface          MAC Added Trap  MAC Removed Trap
-----
GigabitEthernet1/1  Enabled         Enabled
GigabitEthernet1/2  Enabled         Enabled
GigabitEthernet1/3  Enabled         Enabled
GigabitEthernet1/4  Enabled         Enabled
GigabitEthernet1/5  Enabled         Enabled
GigabitEthernet1/6  Enabled         Enabled
GigabitEthernet1/7  Enabled         Enabled
GigabitEthernet1/8  Enabled         Enabled
GigabitEthernet1/9  Enabled         Enabled
GigabitEthernet1/10 Enabled         Enabled
GigabitEthernet1/11 Enabled         Enabled
GigabitEthernet1/12 Enabled         Enabled

Switch#
```

Configuring MAC Move Notification Traps

When you configure MAC move notification, an SNMP notification is generated and sent to the network management system whenever a MAC address moves from one port to another within the same VLAN.

To configure MAC move notification, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>snmp-server host host-addr [traps informs] {version {1/2c/3}} [auth noauth priv] community-string [udp-port port] [notification-type]</code>	Specifies the recipient of the trap message. <ul style="list-style-type: none"> For <i>host-addr</i>, specify the name or address of the NMS. Specify traps (the default) to send SNMP traps to the host. Specify informs to send SNMP informs to the host. Specify the SNMP version to support. Version 1, the default, is not available with informs. For <i>community-string</i>, specify the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. For <i>notification-type</i>, use the mac-notification keyword.
Step 3	<code>snmp-server enable traps mac-notification move</code>	Enables the switch to send MAC move notification traps to the NMS. To disable the switch from sending MAC notification traps, use the no snmp-server enable traps mac-notification move global configuration command.
Step 4	<code>mac address-table notification mac-move</code>	Enables the MAC-move notification feature. To disable this feature, use the no mac-address-table notification mac-move global configuration command.
Step 5	<code>end</code>	Returns to privileged EXEC mode.
Step 6	<code>show mac address-table notification mac-move</code> <code>show running-config</code>	Displays the MAC-move notification status.
Step 7	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

This example shows how to specify 172.69.59.93 as the network management system, enable the switch to send MAC move notification traps to the NMS, enable the MAC move notification feature, and enable traps whenever a MAC address moves from one port to another:

```
Switch# configure terminal
Switch(config)# snmp-server host 171.69.59.93 private mac-notification
Switch(config)# snmp-server enable traps mac-notification move
Switch(config)# mac address-table notification mac-move
Switch(config)# end
Switch# show mac address-table notification mac-move
MAC Move Notification: Enabled
```

Configuring MAC Threshold Notification Traps

When you configure MAC threshold notification, an SNMP notification is generated and sent to the network management system when a MAC address table (MAT) threshold limit is reached or exceeded.

To configure MAC address threshold notification, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>snmp-server host host-addr [traps/informs] {version {1/2c/3}} [auth noauth priv] community-string [udp-port port] [notification-type]</code>	Specifies the recipient of the trap message. <ul style="list-style-type: none"> For <i>host-addr</i>, specify the name or address of the NMS. Specify traps (the default) to send SNMP traps to the host. Specify informs to send SNMP informs to the host. Specify the SNMP version to support. Version 1, the default, is not available with informs. For <i>community-string</i>, specify the string to send with the notification operation. Though you can set this string by using the snmp-server host command, we recommend that you define this string by using the snmp-server community command before using the snmp-server host command. For <i>notification-type</i>, use the mac-notification keyword.
Step 3	<code>snmp-server enable traps mac-notification threshold</code>	Enables the switch to send MAC threshold notification traps to the NMS. To disable the switch from sending MAC threshold notification traps, use the no snmp-server enable traps mac-notification threshold global configuration command.
Step 4	<code>mac address-table notification threshold</code>	Enables the MAC address threshold notification feature. To disable this feature, use the no address-table notification threshold global configuration command.
Step 5	<code>mac address-table notification threshold [limit percentage] [interval time]</code>	Enters the threshold value for the MAT usage monitoring. <ul style="list-style-type: none"> (Optional) For limit percentage, specify the percentage of the MAT utilization; valid values are from 1 to 100 percent. Default is 50 per cent. (Optional) For interval time, specify the time between notifications; valid values are greater than or equal to 120 seconds. Default is 120 seconds.

	Command	Purpose
Step 6	end	Returns to privileged EXEC mode.
Step 7	show mac address-table notification threshold show running-config	Displays the MAT utilization threshold notification status.
Step 8	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to specify 172.69.59.93 as the network management system, enable the MAC threshold notification feature, enable the switch to send MAC threshold notification traps to the NMS, set the interval to 123 seconds, and set the limit to 78 per cent:

```
Switch# configure terminal
Switch(config)# snmp-server host 171.69.59.93 private mac-notification
Switch(config)# snmp-server enable traps mac-notification threshold
Switch(config)# mac address-table notification threshold
Switch(config)# mac address-table notification threshold interval 123
Switch(config)# mac address-table notification threshold limit 78
Switch(config)# end
Switch# show mac-address-table notification threshold
      Status      limit      Interval
-----+-----+-----
      enabled      78          123
Switch#
```

Adding and Removing Static Address Entries

A static address has these characteristics:

- It is manually entered in the address table and must be manually removed.
- It can be a unicast or multicast address.
- It does not age and is retained when the switch restarts.

You can add and remove static addresses and define the forwarding behavior for them. The forwarding behavior defines how a port that receives a packet forwards it to another port for transmission. Because all ports are associated with at least one VLAN, the switch acquires the VLAN ID for the address from the ports that you specify. You can specify a different list of destination ports for each source port.

A packet with a static address that arrives on a VLAN where it has not been statically entered is flooded to all ports and not learned.

You add a static address to the address table by specifying the destination MAC unicast address and the VLAN from which it is received. Packets received with this destination address are forwarded to the interface specified with the *interface-id* option.

When you configure a static MAC address in a private-VLAN primary or secondary VLAN, you should also configure the same static MAC address in all associated VLANs. Static MAC addresses configured in a private-VLAN primary or secondary VLAN are not replicated in the associated VLAN. For more information about private VLANs, see [Chapter 39, “Configuring Private VLANs.”](#)

To add a static address, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>mac address-table static mac-addr vlan vlan-id interface interface-id</code>	<p>Adds a static address to the MAC address table.</p> <ul style="list-style-type: none"> For <i>mac-addr</i>, specify the destination MAC unicast address to add to the address table. Packets with this destination address received in the specified VLAN are forwarded to the specified interface. For <i>vlan-id</i>, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094. For <i>interface-id</i>, specify the interface to which the received packet is forwarded. Valid interfaces include physical ports or port channels. <p>You can specify static multicast addresses for multiple interface IDs. However, you cannot assign static unicast MAC address to multiple interfaces with the same MAC address and VLAN ID.</p> <p>To remove static entries from the address table, use the no <code>mac address-table static mac-addr vlan vlan-id [interface interface-id]</code> global configuration command.</p>
Step 3	<code>end</code>	Returns to privileged EXEC mode.
Step 4	<code>show mac address-table static</code>	Verifies your entries.
Step 5	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

This example shows how to add the static address c2f3.220a.12f4 to the MAC address table. When a packet is received in VLAN 4 with this MAC address as its destination address, the packet is forwarded to the specified port:

```
Switch# configure terminal
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 interface
gigabitethernet0/1
Switch(config)# end
Switch#
```

Configuring Unicast MAC Address Filtering

When unicast MAC address filtering is enabled, the switch drops packets with specific source or destination MAC addresses. This feature is disabled by default and only supports unicast static addresses.

Follow these guidelines when using this feature:

- Multicast MAC addresses, broadcast MAC addresses, and router MAC addresses are not supported. If you specify one of these addresses when entering the **mac address-table static mac-addr vlan vlan-id drop** global configuration command, one of these messages appears:
 - % Only unicast addresses can be configured to be dropped
 - % CPU destined address cannot be configured as drop address
- Packets that are forwarded to the CPU are also not supported.

- If you add a unicast MAC address as a static address and configure unicast MAC address filtering, the switch either adds the MAC address as a static address or drops packets with that MAC address, depending on which command was entered last. The second command that you entered overrides the first command.

For example, if you enter the **mac address-table static *mac-addr* vlan *vlan-id* interface** global configuration command followed by the **mac address-table static *mac-addr* vlan *vlan-id* drop** command, the switch drops packets with the specified MAC address as a source or destination.

If you enter the **mac address-table static *mac-addr* vlan *vlan-id* drop** global configuration command followed by the **mac address-table static *mac-addr* vlan *vlan-id* interface** command, the switch adds the MAC address as a static address.

You enable unicast MAC address filtering and configure the switch to drop packets with a specific address by specifying the source or destination unicast MAC address and the VLAN from which it is received.

To configure the switch to drop a source or destination unicast static address, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> drop	Enables unicast MAC address filtering and configure the switch to drop a packet with the specified source or destination unicast static address. <ul style="list-style-type: none"> • For <i>mac-addr</i>, specify a source or destination unicast MAC address. Packets with this MAC address are dropped. • For <i>vlan-id</i>, specify the VLAN for which the packet with the specified MAC address is received. Valid VLAN IDs are 1 to 4094. To disable unicast MAC address filtering, use the no mac address-table static <i>mac-addr</i> vlan <i>vlan-id</i> global configuration command.
Step 3	end	Returns to privileged EXEC mode.
Step 4	show mac address-table static	Verifies your entries.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable unicast MAC address filtering and to configure the switch to drop packets that have a source or destination address of c2f3.220a.12f4. When a packet is received in VLAN 4 with this MAC address as its source or destination, the packet is dropped:

```
Switch# configure terminal
Switch(config)# mac address-table static c2f3.220a.12f4 vlan 4 drop
Switch(config)# end
Switch#
```

Note

To filter MAC addresses on a secondary VLAN, specify the corresponding primary VLAN in the above configuration. If the specified VLAN is a primary VLAN, all matching packets received in this primary VLAN and associated secondary VLANs are dropped.

Displaying Address Table Entries

You can display the MAC address table by using one or more of the privileged EXEC commands described in [Table 4-4](#):

Table 4-4 *Commands for Displaying the MAC Address Table*

Command	Description
show ip igmp snooping groups	Displays the Layer 2 multicast entries for all VLANs or the specified VLAN.
show mac address-table address	Displays MAC address table information for the specified MAC address.
show mac address-table aging-time	Displays the aging time in all VLANs or the specified VLAN.
show mac address-table count	Displays the number of addresses present in all VLANs or the specified VLAN.
show mac address-table dynamic	Displays only dynamic MAC address table entries.
show mac address-table interface	Displays the MAC address table information for the specified interface.
show mac address-table notification	Displays the MAC notification parameters and history table.
show mac address-table static	Displays only static MAC address table entries.
show mac address-table vlan	Displays the MAC address table information for the specified VLAN.

Managing the ARP Table

To communicate with a device (over Ethernet, for example), the software first must learn the 48-bit MAC address or the local data link address of that device. The process of learning the local data link address from an IP address is called *address resolution*.

The Address Resolution Protocol (ARP) associates a host IP address with the corresponding media or MAC addresses and the VLAN ID. Using an IP address, ARP finds the associated MAC address. When a MAC address is found, the IP-MAC address association is stored in an ARP cache for rapid retrieval. Then the IP datagram is encapsulated in a link-layer frame and sent over the network. Encapsulation of IP datagrams and ARP requests and replies on IEEE 802 networks other than Ethernet is specified by the Subnetwork Access Protocol (SNAP). By default, standard Ethernet-style ARP encapsulation (represented by the **arpa** keyword) is enabled on the IP interface.

ARP entries added manually to the table do not age and must be manually removed.

For CLI procedures, see the Cisco IOS Release 12.3 documentation on Cisco.com.

Configuring Embedded CiscoView Support

The Catalyst 4500 series switch supports CiscoView web-based administration through the Catalyst Web Interface (CWI) tool. CiscoView is a device management application that can be embedded on the switch flash and provides dynamic status, monitoring, and configuration information for your switch. CiscoView displays a physical view of your switch chassis with color-coded modules and ports and monitoring capabilities that display the switch status, performance, and other statistics. Configuration capabilities allow comprehensive changes to devices, if the required security privileges have been granted. The configuration and monitoring capabilities for the Catalyst 4500 series of switches mirror those available in CiscoView in all server-based CiscoWorks solutions, including CiscoWorks LAN Management Solution (LMS) and CiscoWorks Routed WAN Management Solution (RWAN).

These sections describe the Embedded CiscoView support available with Cisco IOS Release 12.1(20)EW and later releases:

- [Understanding Embedded CiscoView, page 4-31](#)
- [Installing and Configuring Embedded CiscoView, page 4-31](#)
- [Displaying Embedded CiscoView Information, page 4-33](#)

Understanding Embedded CiscoView

The Embedded CiscoView network management system is a web-based interface that uses HTTP and SNMP to provide a graphical representation of the switch and to provide a GUI-based management and configuration interface.

Installing and Configuring Embedded CiscoView

To install and configure Embedded CiscoView, perform this task:

	Command	Purpose
Step 1	Switch# dir <i>device_name</i>	Displays the contents of the device. If you are installing Embedded CiscoView for the first time, or if the CiscoView directory is empty, skip to Step 5 .
Step 2	Switch# delete <i>device_name:cv/*</i>	Removes existing files from the CiscoView directory.
Step 3	Switch# squeeze <i>device_name:</i>	Recovers the space in the file system.
Step 4	Switch# copy tftp bootflash	Copies the tar file to bootflash.
Step 5	Switch# archive tar /xtract tftp:// ip address of tftp server/ciscoview.tar device_name:cv	Extracts the CiscoView files from the tar file on the TFTP server to the CiscoView directory.
Step 6	Switch# dir <i>device_name:</i>	Displays the contents of the device. In a redundant configuration, repeat Step 1 through Step 6 for the file system on the redundant supervisor engine.
Step 7	Switch# configure terminal	Enters global configuration mode.
Step 8	Switch(config)# ip http server	Enables the HTTP web server.
Step 9	Switch(config)# snmp-server community <i>string</i> ro	Configures the SNMP password for read-only operation.
Step 10	Switch(config)# snmp-server community <i>string</i> rw	Configures the SNMP password for read/write operation.

Note

The default password for accessing the switch web page is the enable-level password of the switch.

The following example shows how to install and configure Embedded CiscoView on your switch:

```

CHAPTER 5

Configuring the Cisco IOS In Service Software Upgrade Process

Note

ISSU is available in Cisco IOS 12.2(31)SGA and later releases. All linecards are supported.

Operating on redundant systems, the In Service Software Upgrade (ISSU) process allows Cisco IOS software to be updated or otherwise modified while packet forwarding continues. In most networks, planned software upgrades are a significant cause of downtime. ISSU allows Cisco IOS software to be modified while packet forwarding continues. This increases network availability and reduces downtime caused by planned software upgrades. This document provides information about ISSU concepts and describes the steps taken to perform ISSU in a system.

Topics include:

- [Prerequisites to Performing ISSU, page 5-2](#)
- [About Performing ISSU, page 5-3](#)
- [How to Perform the ISSU Process, page 5-13](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

ISSU and MPLS clients	ISSU MPLS Clients

Prerequisites to Performing ISSU

Before performing ISSU, you need to meet these prerequisites:

- Image type of the existing and target image must match. For example, you cannot upgrade from an IP Base image to an Enterprise Services image (and vice versa) without experiencing several minutes of traffic loss. Note that a similar limitation applies between crypto and non-crypto images.
- The active and the standby supervisor engines must have the same supervisor engine hardware (same model, same memory, NFL daughter card and so on).
- The new and old Cisco IOS software images must be loaded into the file systems (bootflash or compact flash) of both the active and the standby supervisor engines before you begin the ISSU process.

The old image should be available either in bootflash or compact flash and the system should have been booted from one of these locations because the boot variable should not be changed before the ISSU process unfolds.

Note **auto-boot** must be enabled for ISSU to succeed.

- Stateful Switchover (SSO) must be configured and the standby supervisor engine should be in standby hot state.

These commands indicate whether SSO is enabled: **show module**, **show running-config**, **show redundancy state**.

If you do not have SSO enabled, see the *Stateful Switchover* document for further information on how to enable and configure SSO.

- Nonstop Forwarding (NSF) must be configured and working properly. If you do not have NSF enabled, see the *Cisco Nonstop Forwarding* document for further information on how to enable and configure NSF.

- Before you perform ISSU, ensure that the system is configured for redundancy mode SSO and that the file system for both the active and the standby supervisor engines contains the new ISSU-compatible image. The current Cisco IOS version running in the system must also support ISSU.

You can enter various commands on the Catalyst 4500 series switch to determine supervisor engine versioning and Cisco IOS compatibility. Alternatively, you can use the ISSU application on Cisco Feature Navigator to determine this.

- If you enter the **no ip routing** command, ISSU will fall back from SSO to RPR mode, resulting in traffic loss.
- Autoboot is turned on and the current booted image matches the one specified in the BOOT environmental variable. For details on how to configure and verify these, please refer to "[Modifying the Boot Field and Using the boot Command](#), page 3-27.
- If you enter the **no ip routing** command, ISSU falls back from SSO to RPR mode, resulting in traffic loss.

About Performing ISSU

Note

Do not make any hardware changes while performing ISSU.

Before you perform ISSU, you should understand the following concepts:

- [Stateful Switchover Overview](#), page 5-3
- [NSF Overview](#), page 5-5
- [ISSU Process Overview](#), page 5-6
- [Guidelines for Performing ISSU](#), page 5-11
- [Versioning Capability in Cisco IOS Software to Support ISSU](#), page 5-11
- [SNMP Support for ISSU](#), page 5-13
- [Compatibility Verification Using Cisco Feature Navigator](#), page 5-13

Stateful Switchover Overview

Development of the SSO feature is an incremental step within an overall program to improve the availability of networks constructed with Cisco IOS switches.

In specific Cisco networking devices that support dual supervisor engines, SSO takes advantage of supervisor engine redundancy to increase network availability. SSO achieves this by establishing one of the supervisor engines as the active processor while the other supervisor engine is designated as the standby processor. Following an initial synchronization between the two supervisor engines, SSO dynamically synchronizes supervisor engine state information between them in real-time.

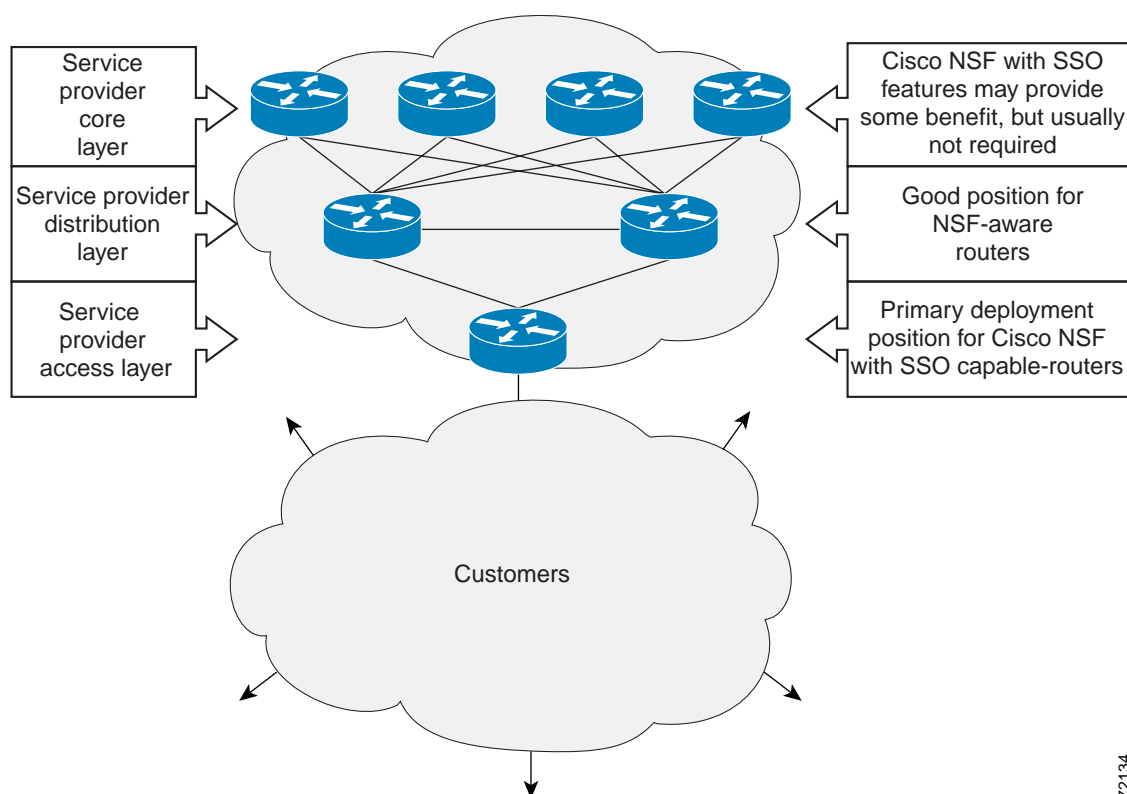

A switchover from the active to the standby processor occurs when the active supervisor engine fails or is removed from the networking device.

Cisco NSF is used with SSO. Cisco NSF allows the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. With Cisco NSF, peer networking devices do not experience routing flaps, which reduce loss of service outages for customers.

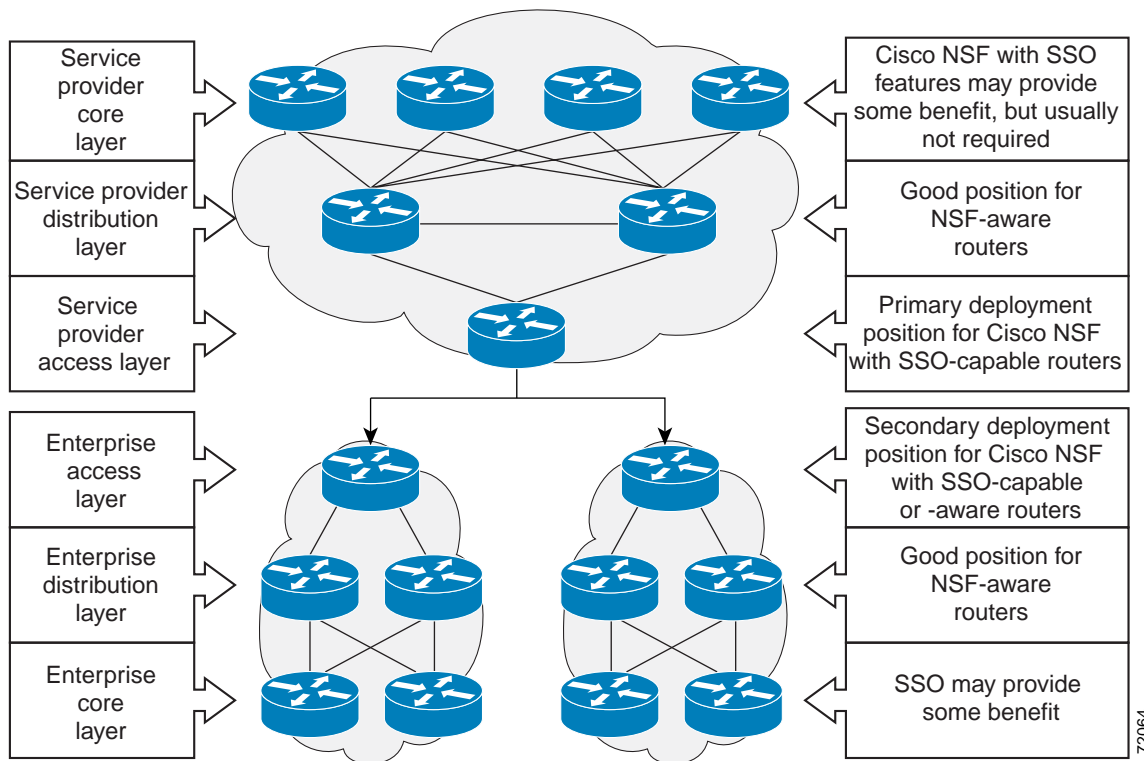

Figure 5-1 illustrates how SSO is typically deployed in service provider networks. In this example, Cisco NSF with SSO is enabled at the access layer (edge) of the service provider network. A fault at this point could result in loss of service for enterprise customers requiring access to the service provider network.

For Cisco NSF protocols that require neighboring devices to participate in Cisco NSF, Cisco NSF-aware software images must be installed on those neighboring distribution layer devices. Depending on your objectives, you may decide to deploy Cisco NSF and SSO features at the core layer of your network. Doing this can help reduce the time to restore network capacity and service for certain failures, which leads to additional availability.

Figure 5-1 Cisco NSF with SSO Network Deployment: Service Provider Networks

Additional levels of availability may be gained by deploying Cisco NSF with SSO at other points in the network where a single point of failure exists. Figure 5-2 illustrates an optional deployment strategy that applies Cisco NSF with SSO at the enterprise network access layer. In this example, each access point in the enterprise network represents another single point of failure in the network design. In the event of a switchover or a planned software upgrade, enterprise customer sessions would continue uninterrupted through the network in this example.

Figure 5-2 Cisco NSF with SSO Network Deployment: Enterprise Networks

For further information on SSO, see the *Stateful Switchover* document.

NSF Overview

Cisco NSF works with the SSO feature in Cisco IOS software. SSO is a prerequisite of Cisco NSF. NSF works with SSO to minimize the amount of time a network is unavailable to its users following a switchover. The main objective of Cisco NSF is to continue forwarding IP packets following a supervisor engine switchover.

Usually, when a networking device restarts, all routing peers of that device detect that the device went down and then came back up. This transition results in what is called a routing flap, which could spread across multiple routing domains. Routing flaps caused by routing restarts create routing instabilities, which are detrimental to the overall network performance. Cisco NSF helps to suppress routing flaps in SSO-enabled devices, thus reducing network instability.

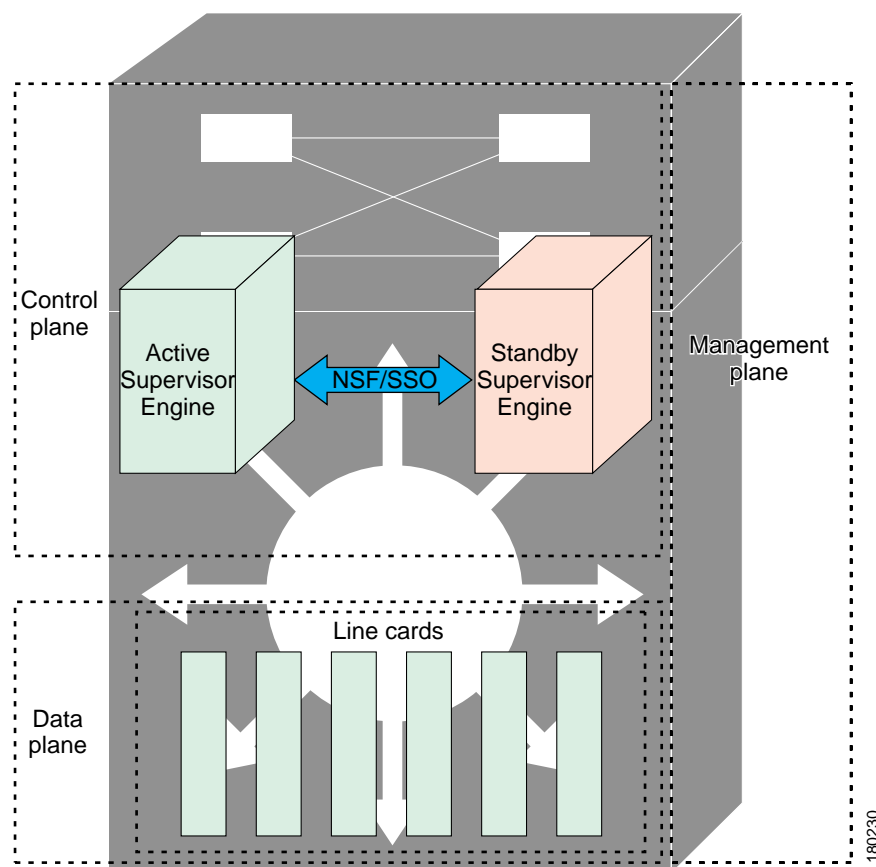

Cisco NSF allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. With Cisco NSF, peer networking devices do not experience routing flaps. Data traffic is forwarded while the standby supervisor engine assumes control from the failed active supervisor engine during a switchover. The ability of physical links to remain up through a switchover and to be kept current with the Forwarding Information Base (FIB) on the active supervisor engine is key to Cisco NSF operation.

ISSU Process Overview

The ISSU process allows you to perform a Cisco IOS software upgrade or downgrade while the system continues to forward packets. (For an illustration of the commands used during the ISSU process, refer to [Figure 5-8 on page 5-11](#).) Cisco IOS ISSU takes advantage of the Cisco IOS high availability infrastructure—Cisco NSF with SSO and hardware redundancy—and eliminates downtime associated with software upgrades or version changes by allowing changes while the system remains in service (see [Figure 5-3](#)).

SSO and NSF mode support configuration and runtime state synchronization from the active to the standby supervisor engine. For this process to happen, the images on both the active and the standby supervisor engines must be the same. When images on active and standby supervisor engines are different ISSU allows the two supervisor engines to be kept in synchronization even when these two versions of Cisco IOS support different sets of features and commands.

Figure 5-3 High Availability Features and Hardware Redundancy in the ISSU Process

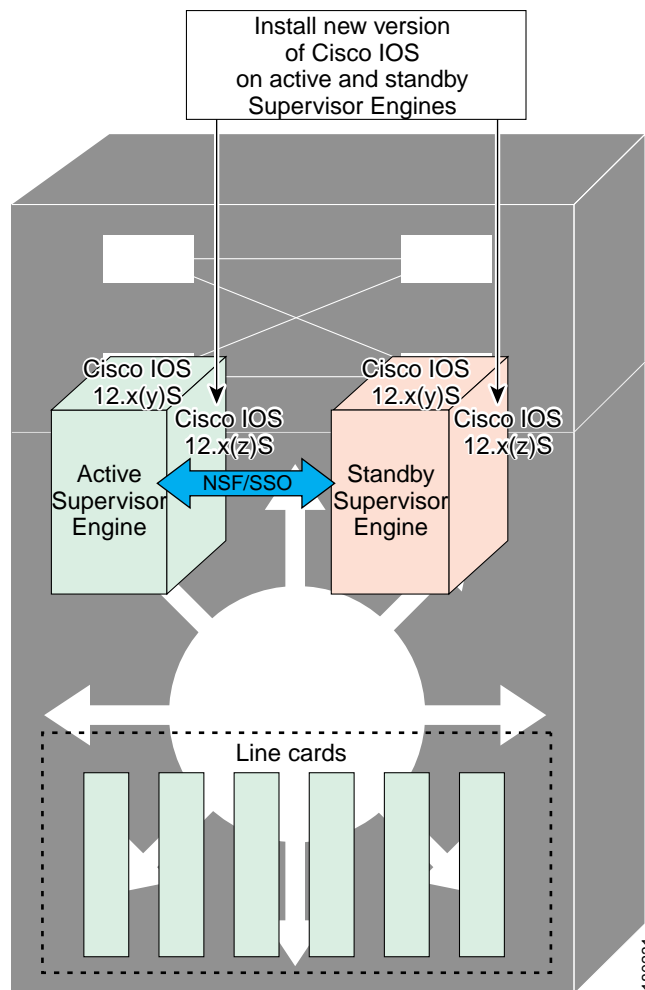

An ISSU-capable switch consists of two supervisor engines (active and standby) and one or more line cards. Before initiating the ISSU process, copy the Cisco IOS software into the file systems of both supervisor engines (see [Figure 5-4](#)).

Note

In the following figure, Cisco IOS 12.x(y)S represents the *current* version of Cisco IOS.

Figure 5-4 Install/Copy New Version of Cisco IOS Software on Both Supervisor Engines

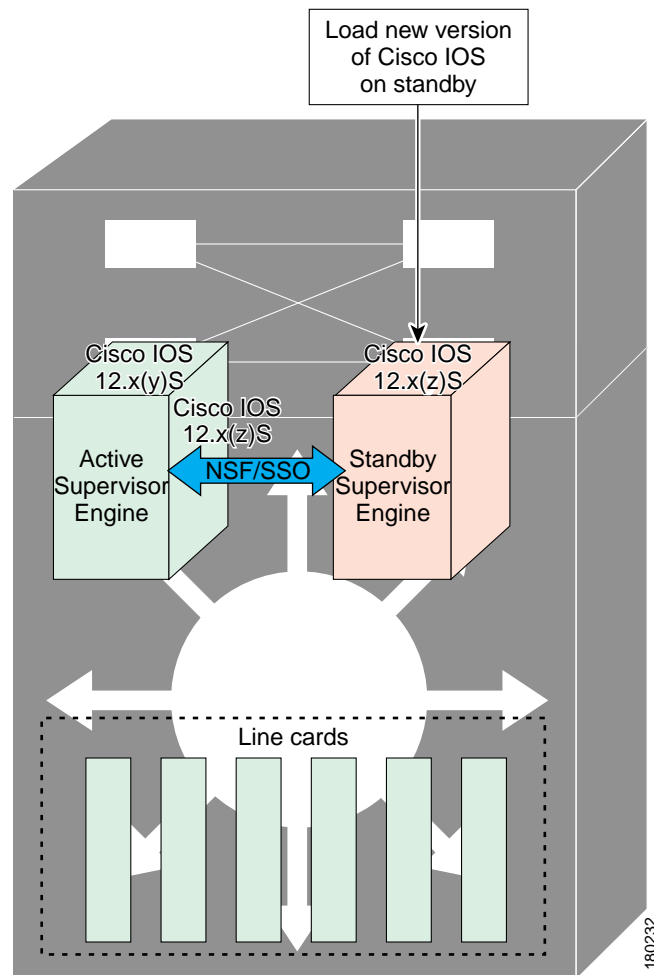

After you have copied the Cisco IOS software to both file systems, load the new version of Cisco IOS software onto the standby supervisor engine (see [Figure 5-5](#)).

**Note**

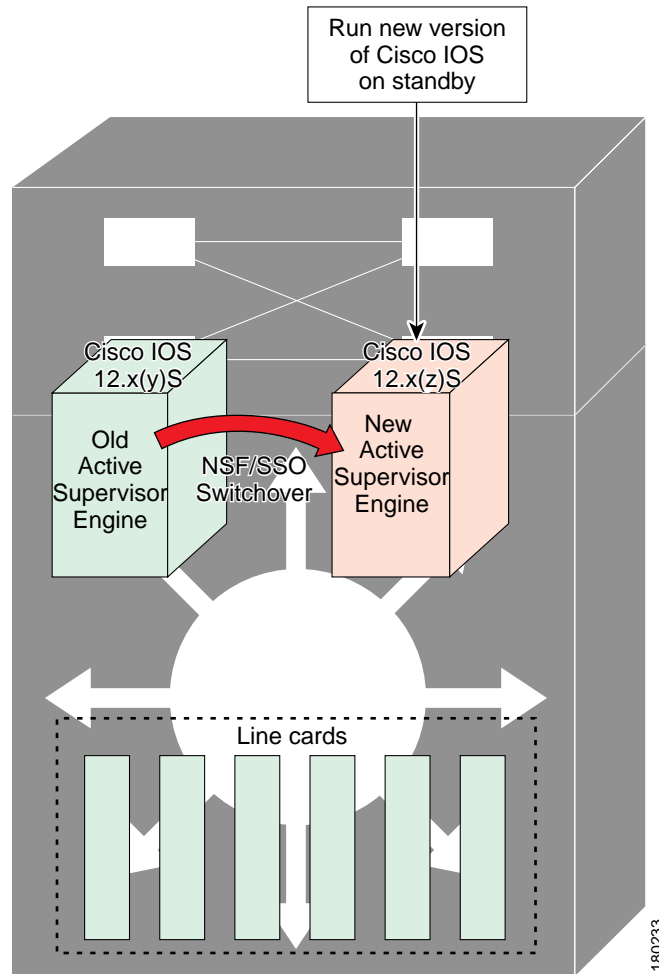

Without the ISSU feature, you cannot have SSO/NSF functioning between the active and standby supervisor engines when they are running two different versions of Cisco IOS image.

Figure 5-5 Load New Version of Cisco IOS Software on the Standby Supervisor Engine

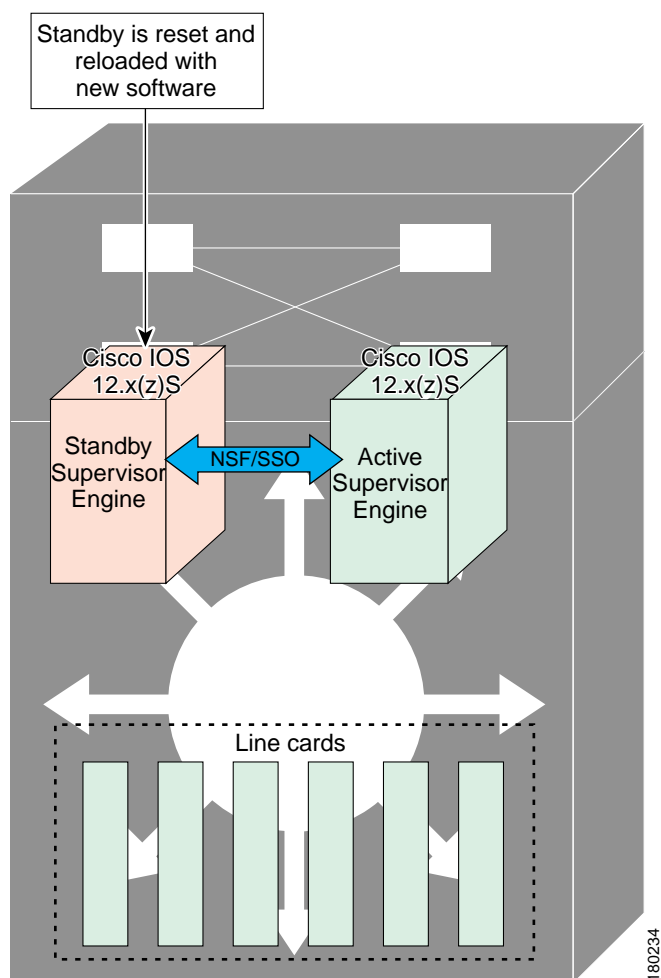

After a switchover (NSF/SSO, not RPR), the standby supervisor engine takes over as the new active supervisor engine (see [Figure 5-6](#)).

Figure 5-6 *Switch Over to Standby Supervisor Engine*

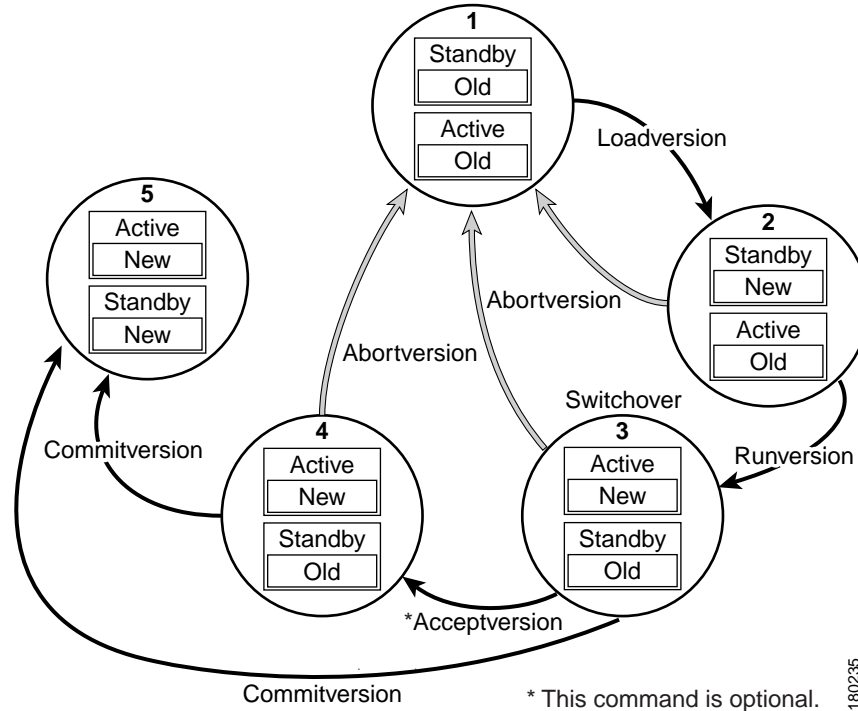

The former active supervisor engine is loaded with an old Cisco IOS image so that if the new active supervisor engine experiences problems, you can abort and conduct a switchover to the former active, which is already running the old image. Next, the former active supervisor engine is loaded with the new version of Cisco IOS software and becomes the new standby supervisor engine (see [Figure 5-7](#)).

Figure 5-7 Load New Standby Supervisor Engine with New Cisco IOS Software

[Figure 5-8](#) shows the steps during the ISSU process.

Figure 5-8 Steps During the ISSU Process

180235

Guidelines for Performing ISSU

Be aware of the following guidelines while performing the ISSU process:

- Even with ISSU, it is recommended that upgrades be performed during a maintenance window.
- The new features should not be enabled (if they require change of configuration) during the ISSU process.
- In a downgrade scenario, if any feature is not available in the downgrade revision of Cisco IOS software image, that feature should be disabled prior to initiating the ISSU process.

Versioning Capability in Cisco IOS Software to Support ISSU

Before the introduction of ISSU, the SSO mode of operation required each supervisor engine to be running the same versions of Cisco IOS software.

Note

The operating mode of the system in a redundant HA configuration is determined by exchanging version strings when the standby supervisor engine registers with the active supervisor engine.

The system entered SSO mode only if the versions running on the both supervisor engines were the same. If not, the redundancy mode will be changed to RPR. With ISSU capability, the implementation allows two different but compatible release levels of Cisco IOS images to interoperate in SSO mode and enables software upgrades while packet forwarding continues. Version checking done before ISSU capability was introduced is no longer sufficient to allow the system to determine the operating mode.

ISSU requires additional information to determine compatibility between software versions. Therefore, a compatibility matrix is defined that contains information about other images with respect to the one in question. This compatibility matrix represents the compatibility of two software versions, one running on the active and the other on the standby supervisor engine, and to allow the system to determine the highest operating mode it can achieve. Incompatible versions will not be able to progress to SSO operational mode.

The Cisco IOS infrastructure has been internally modified and redesigned to accommodate subsystem versioning with ISSU. Cisco IOS subsystems correspond to feature sets and software component groupings. Features or subsystems that maintain state information across supervisor engines are HA-aware or SSO clients. A mechanism called ISSU Framework, or ISSU protocol, allows subsystems within Cisco IOS software to communicate between the active and the standby supervisor engines and to negotiate the message version for communication between supervisor engines. Internally, all NSF- and SSO-compliant applications or subsystems that are HA-aware must follow this protocol to establish communication with their peer across different versions of software. (For further information on operating modes, see the *Stateful Switchover* document.)

Compatibility Matrix

You can perform the ISSU process when the Cisco IOS software on both the active and the standby supervisor engine is capable of ISSU and the old and new images are compatible. The compatibility matrix information stores the compatibility among releases as follows:

- **Compatible**—The base-level system infrastructure and all optional HA-aware subsystems are compatible. An in-service upgrade or downgrade between these versions will succeed with minimal service impact. The matrix entry designates the images to be compatible (C).
- **Base-level compatible**—One or more of the optional HA-aware subsystems is not compatible. An in-service upgrade or downgrade between these versions will succeed; however, some subsystems will not be able to maintain state always during the transition from the old to the new version of Cisco IOS. The matrix entry designates the images to be base-level compatible (B).

However, you should be able to perform an ISSU upgrade without any functionality loss even if the matrix entry is B. The downgrade may experience some functionality loss if the newer image had additional functionality.

- **Incompatible**—A core set of system infrastructure exists in Cisco IOS that must be able to interoperate in a stateful manner for SSO to function correctly. If any of these required features or subsystems is not interoperable, then the two versions of the Cisco IOS software images are declared to be incompatible. An in-service upgrade or downgrade between these versions is not possible. The matrix entry designates the images to be incompatible (I). The system operates in RPR mode during the period when the versions of Cisco IOS at the active and standby supervisor engines are incompatible.

If you attempt to perform ISSU with a peer that does not support ISSU, the system automatically uses RPR instead.

The compatibility matrix represents the compatibility relationship a Cisco IOS software image has with all of the other Cisco IOS software versions within the designated support window (for example, all of those software versions the image “knows” about) and is populated and released with every image. The matrix stores compatibility information between its own release and prior releases. It is always the newest release that contains the latest information about compatibility with existing releases in the field. The compatibility matrix is available within the Cisco IOS software image and on Cisco.com so that users can determine in advance whether an upgrade can be done using the ISSU process.

To display the compatibility matrix data between two software versions on a given system, enter the **show issu comp-matrix stored** command.

**Note**

This command is useful *only for verification purposes* because it is available *only after* the ISSU process has started. You might want to check the compatibility matrix prior to starting ISSU. Use the Feature Navigator to obtain the needed information

<http://tools.cisco.com/ITDIT/CFN/jsp/index.jsp>

SNMP Support for ISSU

SNMP for SSO provides a mechanism for synchronizing the SNMP configurations and the MIBs that support SSO from the active supervisor engine to the standby supervisor engine, assuming that both supervisor engines are running the same version of Cisco IOS software. This assumption is not valid for ISSU.

With ISSU, an SNMP client can handle transformations for the MIBs across two different versions of Cisco IOS, if needed. An SNMP client handles transformation for all MIBs and handles the transmit and receive functionality across the active and standby supervisor engines. During SNMP, a MIB is completely synchronized from the active supervisor engine to the standby supervisor engine only if the versions of the MIB on both Cisco IOS releases are the same.

Compatibility Verification Using Cisco Feature Navigator

The ISSU application on Cisco Feature Navigator allows you to:

- Select an ISSU-capable image
- Identify which images are compatible with that image
- Compare two images and understand the compatibility level of the images (that is, compatible, base-level compatible, and incompatible)
- Compare two images and see the client compatibility for each ISSU client
- Provide links to release notes for the image

How to Perform the ISSU Process

Unlike SSO, which is a mode of operation for the device and a prerequisite for performing ISSU, the ISSU process is a series of steps performed while the switch is in operation. The steps result in an upgrade to a new or modified Cisco IOS software, and have a minimal impact to traffic.

**Note**

For an illustration of the process flow for ISSU, refer to [Figure 5-8 on page 5-11](#).

This section includes the following topics:

- [Verifying the ISSU Software Installation, page 5-14](#)
- [Loading New Cisco IOS Software on the Standby Supervisor Engine, page 5-16](#) (required)
- [Switching to the Standby Supervisor Engine, page 5-19](#) (required)
- [Stopping the ISSU Rollback Timer \(Optional\), page 5-21](#) (optional)

- [Loading New Cisco IOS Software on the New Standby Supervisor Engine, page 5-22](#)
- [Aborting a Software Upgrade During ISSU, page 5-24](#)
- [Configuring the Rollback Timer to Safeguard Against Upgrade Issues, page 5-25](#)
- [Displaying ISSU Compatibility Matrix Information, page 5-26](#)

Verifying the ISSU Software Installation

During the ISSU process, there are five valid states: init, load version, run version, and system reset. Use the **show issu state** command to obtain the current ISSU state:

- Disabled state—The state for the standby supervisor engine while this engine is resetting.
- Init state—The initial state is two supervisor engines, one active and one standby, before the ISSU process is started. It is also the final state after the ISSU process completes.
- Load version (LV) state—The standby supervisor engine is loaded with the new version of Cisco IOS software.
- Run version (RV) state—The **issu runversion** command forces the switchover of the supervisor engines. The newly active supervisor engine now runs the new Cisco IOS software image.
- System reset (SR) state—This state occurs either when you issue the **issu abortversion** command before the Init state is reached, or if the rollback timer expires before you execute the **issu acceptversion** command.

You can verify the ISSU software installation by entering **show** commands to provide information on the state of the during the ISSU process.

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	Switch# show issu state [detail]	Displays the state of the during the ISSU process.
Step 3	Switch# show redundancy	Displays current or historical status, mode, and related redundancy information about the device.

This example shows how to display the state and the current status of the supervisor engine during the ISSU process:

```
Switch> enable
Switch# show issu state
Switch# show redundancy
```

Verifying Redundancy Mode Before Beginning the ISSU Process

Before you begin the ISSU process, verify the redundancy mode for the system and be sure to configure NSF and SSO.

The following example displays verification that the system is in SSO mode, that slot 1 is the active supervisor engine, and that slot 2 is the standby supervisor engine. Both supervisor engines are running the same Cisco IOS software image.

```

Switch# show redundancy states
    my state = 13 -ACTIVE
    peer state = 8  -STANDBY HOT
        Mode = Duplex
        Unit = Primary
    Unit ID = 1

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured)  = Stateful Switchover
Redundancy State              = Stateful Switchover
Maintenance Mode = Disabled
    Manual Swact = enabled
    Communications = Up

    client count = 39
    client_notification_TMR = 240000 milliseconds
        keep_alive TMR = 9000 milliseconds
        keep_alive count = 0
        keep_alive threshold = 18
        RF debug mask = 0x0

Switch# show redundancy
Redundant System Information :
-----
    Available system uptime = 1 minute
    Switchovers system experienced = 0
        Standby failures = 0
    Last switchover reason = none

        Hardware Mode = Duplex
    Configured Redundancy Mode = Stateful Switchover
    Operating Redundancy Mode = Stateful Switchover
    Maintenance Mode = Disabled
    Communications = Up

Current Processor Information :
-----
    Active Location = slot 1
    Current Software state = ACTIVE
    Uptime in current state = 0 minutes
        Image Version = Cisco IOS Software, Catalyst 4500 L3 Switch Software
        (cat4500-ENTSERVICES-M), Version 12.2(31)SGA, RELEASE SOFTWARE (fc1)
    Technical Support: http://www.cisco.com/techsupport
    Copyright (c) 1986-2006 by Cisco Systems, Inc.
    Compiled Tue 05-Sep-06 16:16 by sanjdas
        BOOT = bootflash:old_image,1;
    Configuration register = 0x822

Peer Processor Information :
-----
    Standby Location = slot 2
    Current Software state = STANDBY HOT
    Uptime in current state = 1 minute
        Image Version = Cisco IOS Software, Catalyst 4500 L3 Switch Software
        (cat4500-ENTSERVICES-M), Version 12.2(31)SGA, RELEASE SOFTWARE (fc1)
    Technical Support: http://www.cisco.com/techsupport
    Copyright (c) 1986-2006 by Cisco Systems, Inc.

        BOOT = bootflash:old_image,1;
    Configuration register = 0x822

```

Verifying the ISSU State Before Beginning the ISSU Process

Ensure that the active and standby supervisor engines are up and in ISSU Init state and that the boot variables are set and pointing to valid files.

The following example displays the ISSU state before the process begins:

```
Switch# show issu state detail
      Slot = 1
      RP State = Active
      ISSU State = Init
      Boot Variable = bootflash:old_image,1;
      Operating Mode = Stateful Switchover
      Primary Version = N/A
      Secondary Version = N/A
      Current Version = bootflash:old_image

      Slot = 2
      RP State = Standby
      ISSU State = Init
      Boot Variable = bootflash:old_image,1;
      Operating Mode = Stateful Switchover
      Primary Version = N/A
      Secondary Version = N/A
      Current Version = bootflash:old_image
```

The new version of the Cisco IOS software must be present on both of the supervisor engines. The directory information displayed for each of the supervisor engines (or supervisor engines) shows that the new version is present.

```
Switch# dir bootflash:
Directory of bootflash:/

   5  -rwx   13636500   Sep 6 2006 09:32:33 +00:00   old_image
   6  -rwx   13636500   Sep 6 2006 09:34:07 +00:00   new_image

61341696 bytes total (1111388 bytes free)

Switch# dir slavebootflash:
Directory of slavebootflash:/

   4  -rwx   13636500   Sep 6 2006 09:40:10 +00:00   old_image
   5  -rwx   13636500   Sep 6 2006 09:42:13 +00:00   new_image

61341696 bytes total (1116224 bytes free)
```

Loading New Cisco IOS Software on the Standby Supervisor Engine

This task describes how to use ISSU to load a new version of Cisco IOS software to the standby supervisor engine.

Prerequisites

- Ensure that the new version of Cisco IOS software image is already present in the file system of both the active and standby supervisor engines. Also ensure that appropriate boot parameters (BOOT string and config-register) are set for the standby supervisor engine.

Note The switch must boot with the BOOT string setting before the ISSU procedure is attempted.

Note **auto-boot** must be enabled for ISSU to succeed.

- Optionally, perform additional tests and commands to determine the current state of peers and interfaces for later comparison.
- Ensure the system (both active and standby supervisor engines) is in SSO redundancy mode. If the system is in RPR mode rather than SSO mode, you can still upgrade the system using the ISSU CLI commands, but the system will experience extended packet loss during the upgrade.'

Refer to the *Stateful Switchover* document for more details on how to configure SSO mode on supervisor engines.

- For ISSU to function, the image names on the active and standby supervisor engines must match.

Perform the following steps at the active supervisor engine:

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	Switch# issu loadversion <i>active-slot</i> <i>active-image-new standby-slot standby-image-new</i> [forced]	Starts the ISSU process and (optionally) overrides the automatic rollback when the new Cisco IOS software version is detected to be incompatible. It may take several seconds after the issu loadversion command is entered for Cisco IOS software to load onto the standby supervisor engine and for the standby supervisor engine to transition to SSO mode. This causes the standby supervisor engine to reload with the new image. If you use the forced option, the standby supervisor engine is booted with the new image. After the image is loaded on the standby supervisor engine, if the image is incompatible, the system is forced to the RPR mode. Otherwise the system will continue in the SSO mode.
Step 3	Switch# show issu state [detail]	Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that the standby supervisor engine is loaded and is in SSO mode. It may take several seconds after entering the issu loadversion command for Cisco IOS software to load onto the standby supervisor engine and the standby supervisor engine to transition to SSO mode. If you enter the show issu state command too quickly, you may not see the information you need.
Step 4	Switch# show redundancy [states]	Displays redundancy facility state information.

This example shows how to start the ISSU process, boot the standby supervisor engine in the Standby Hot state, and load the standby supervisor engine slot (2) with the new image:

```
Switch> enable
Switch# issu loadversion 1 bootflash:new_image 2 slavebootflash:new_image
Switch# show issu state detail
      Slot = 1
      RP State = Active
      ISSU State = Load Version
      Boot Variable = bootflash:old_image,12
      Operating Mode = Stateful Switchover
      Primary Version = bootflash:old_image
      Secondary Version = bootflash:new_image
      Current Version = bootflash:old_image

      Slot = 2
      RP State = Standby
      ISSU State = Load Version
      Boot Variable = bootflash:new_image,12;bootflash:old_image,12
      Operating Mode = Stateful Switchover
      Primary Version = bootflash:old_image
      Secondary Version = bootflash:new_image
      Current Version = bootflash:new_image

Switch# show redundancy states
  my state = 13 -ACTIVE
  peer state = 8  -STANDBY HOT
    Mode = Duplex
    Unit = Primary
    Unit ID = 1

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured)  = Stateful Switchover
Redundancy State               = Stateful Switchover
Maintenance Mode = Disabled
  Manual Swact = enabled
  Communications = Up

  client count = 39
  client_notification_TMR = 240000 milliseconds
    keep_alive TMR = 9000 milliseconds
    keep_alive count = 1
  keep_alive threshold = 18
    RF debug mask = 0x0
```

The following example shows how the forced option places the system in RPR mode:

```
Switch> enable
Switch# issu loadversion 1 bootflash:new_image 2 slavebootflash:new_image forced
Switch# show issu state detail
      Slot = 1
      RP State = Active
      ISSU State = Load Version
      Boot Variable = bootflash:old_image,12
      Operating Mode = RPR
      Primary Version = bootflash:old_image
      Secondary Version = bootflash:new_image
      Current Version = bootflash:old_image

      Slot = 2
      RP State = Standby
```

```

ISSU State = Load Version
Boot Variable = bootflash:new_image,12;bootflash:old_image,12
Operating Mode = RPR
Primary Version = bootflash:old_image
Secondary Version = bootflash:new_image
Current Version = bootflash:new_image

```

The following example shows the redundancy mode as RPR:

```

Switch# show redundancy states
  my state = 13 -ACTIVE
  peer state = 4  -STANDBY COLD
    Mode = Duplex
    Unit = Primary
    Unit ID = 1

Redundancy Mode (Operational) = RPR
Redundancy Mode (Configured)  = Stateful Switchover
Redundancy State              = RPR
Maintenance Mode = Disabled
  Manual Swact = enabled
  Communications = Up

  client count = 39
  client_notification_TMR = 240000 milliseconds
    keep_alive TMR = 9000 milliseconds
    keep_alive count = 1
  keep_alive threshold = 18
    RF debug mask = 0x0

```

Switching to the Standby Supervisor Engine

This task describes how to switchover to the standby supervisor engine, which is running the new Cisco IOS software image.

Perform the following steps at the active supervisor engine.

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	Switch# issu runversion <i>standby-slot</i> <i>[standby-image-new]</i>	Forces a switchover from the active to the standby supervisor engine and reloads the former active (current standby) supervisor engines with the old image. When you enter the issu runversion command, an SSO switchover will be performed, and NSF procedures will be invoked if so configured.
Step 3	Switch# show issu state <i>[detail]</i>	Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that a switchover occurs to slot 2.
Step 4	Switch# show redundancy <i>[states]</i>	Displays redundancy facility state information.

This example shows how to cause a switchover to the former standby supervisor engine (slot 2), reset the former active supervisor engine and reload it with the old image so it becomes the standby supervisor engine:

```
Switch> enable
Switch# issu runversion 2 slavebootflash:new_image
This command will reload the Active unit. Proceed ? [confirm]
```

A switchover happens at this point. At the new active supervisor engine, do the following after old active supervisor engine comes up as standby.

```
Switch# show issu state detail

      Slot = 2
      RP State = Active
      ISSU State = Run Version
      Boot Variable = bootflash:new_image,12;bootflash:old_image,12
      Operating Mode = Stateful Switchover
      Primary Version = bootflash:new_image
      Secondary Version = bootflash:old_image
      Current Version = bootflash:new_image

      Slot = 1
      RP State = Standby
      ISSU State = Run Version
      Boot Variable = bootflash:old_image,12
      Operating Mode = Stateful Switchover
      Primary Version = bootflash:new_image
      Secondary Version = bootflash:old_image
      Current Version = bootflash:old_image
```

Note

The new active supervisor engine is now running the new version of software, and the standby supervisor engine is running the old version of software and is in the standby hot state.

```
Switch# show redundancy states
my state = 13 -ACTIVE
peer state = 8 -STANDBY HOT
Mode = Duplex
Unit = Secondary
Unit ID = 2

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Maintenance Mode = Disabled
Manual Swact = enabled
Communications = Up

client count = 39
client_notification_TMR = 240000 milliseconds
keep_alive TMR = 9000 milliseconds
keep_alive count = 1
keep_alive threshold = 18
RF debug mask = 0x0
```

Once Runversion has completed, the new active supervisor engine will be running the new version of software and the previously active supervisor engine will now become the standby supervisor engine. The standby will be reset and reloaded, but it will remain on the previous version of software and come back online in standbyhot status. The following example shows how to verify these conditions:

```
Switch# show redundancy
Redundant System Information :
```

```

-----
    Available system uptime = 23 minutes
Switchovers system experienced = 1
    Standby failures = 0
    Last switchover reason = user forced

    Hardware Mode = Duplex
Configured Redundancy Mode = Stateful Switchover
Operating Redundancy Mode = Stateful Switchover
Maintenance Mode = Disabled
Communications = Up

Current Processor Information :
-----
    Active Location = slot 2
    Current Software state = ACTIVE
    Uptime in current state = 11 minutes
    Image Version = Cisco IOS Software, Catalyst 4500 L3 Switch Software
(cat4500-ENTSERVICES-M), Version 12.2(31)SGA, RELEASE SOFTWARE (fc1)
Technical Support: http://www.cisco.com/techsupport
Copyright (c) 1986-2006 by Cisco Systems, Inc.

    BOOT = bootflash:old_image,12
    Configuration register = 0x822

```

Stopping the ISSU Rollback Timer (Optional)

This optional task describes how to stop the rollback timer.

If you do not run the following procedure before the rollback timer “timeout,” the system automatically aborts the ISSU process and reverts to the original Cisco IOS software version. By default the rollback timer is 45 minutes.

Use the following information to decide what action you should take:

- If you want to retain your switch in this state for an extended period, you need to stop the rollback timer (then validate and run the **commitversion** command directly).
- If you want to proceed to the following step (running “acceptversion”) within the rollback timer window of 45 minutes, you do not need to stop the roll-back timer.

Note

The **issu acceptversion** command may be optionally executed after the **issu runversion** command.

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	Switch# issu acceptversion <i>active-slot</i> <i>[active-image-new]</i>	Halts the rollback timer and ensures the new Cisco IOS ISSU process is not automatically aborted during the ISSU process. Enter the issu acceptversion command within the time period specified by the rollback timer to acknowledge that the supervisor engine has achieved connectivity to the outside world; otherwise, the ISSU process is terminated, and the system reverts to the previous version of Cisco IOS software by switching to the standby supervisor engine.
Step 3	Switch# show issu rollback-timer	Displays the amount of time left before an automatic rollback will occur.

This example displays the Timer before you stop it. In the following example, the “Automatic Rollback Time” information indicates the amount of time remaining before an automatic rollback will occur.

```
Switch> enable
Switch# show issu rollback-timer
      Rollback Process State = In progress
      Configured Rollback Time = 45:00
      Automatic Rollback Time = 38:30

Switch# issu acceptversion 2 bootflash:new_image
% Rollback timer stopped. Please issue the commitversion command.
Switch# show issu rollback-timer
      Rollback Process State = Not in progress
      Configured Rollback Time = 45:00
```

Loading New Cisco IOS Software on the New Standby Supervisor Engine

This task explains how to load new version of Cisco IOS software to the new standby supervisor engine. Perform the following steps at the active supervisor engine.

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> Enter your password if prompted.
Step 2	Switch# issu commitversion <i>standby-slot-number</i> <i>[standby-image-new]</i>	Allows the new Cisco IOS software image to be loaded into the standby supervisor engine.
Step 3	Switch# show redundancy <i>[states]</i>	Displays redundancy facility state information.
Step 4	Switch# show issu state <i>[detail]</i>	Displays the state of the during the ISSU process. At this point in the ISSU process, use this command to check that a switchover occurs to slot 2.

This example shows how to reset and reload the current standby supervisor engine (slot 1) with the new Cisco IOS software version. After entering the **commitversion** command, the standby supervisor engine will boot in the Standby Hot state.

```
Switch> enable
Switch# issu commitversion 1 slavebootflash:new_image
```

Wait till standby supervisor is reloaded with the new image. Then apply the following:

```
Switch# show redundancy states
00:17:12: %RF-5-RF_TERMINAL_STATE: Terminal state reached for (SSO)
    my state = 13 -ACTIVE
    peer state = 8 -STANDBY HOT
        Mode = Duplex
        Unit = Secondary
    Unit ID = 2

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
Redundancy State = Stateful Switchover
Maintenance Mode = Disabled
    Manual Swact = enabled
    Communications = Up

    client count = 39
    client_notification_TMR = 240000 milliseconds
        keep_alive TMR = 9000 milliseconds
        keep_alive count = 0
    keep_alive threshold = 18
    RF debug mask = 0x0

Switch# show redundancy
Redundant System Information :
-----
    Available system uptime = 41 minutes
    Switchovers system experienced = 1
        Standby failures = 1
    Last switchover reason = user forced

    Hardware Mode = Duplex
    Configured Redundancy Mode = Stateful Switchover
    Operating Redundancy Mode = Stateful Switchover
    Maintenance Mode = Disabled
    Communications = Up

Current Processor Information :
-----
    Active Location = slot 2
    Current Software state = ACTIVE
    Uptime in current state = 29 minutes

```

The ISSU process has been completed. At this stage, any further Cisco IOS software version upgrade or downgrade will require that a new ISSU process be invoked.

Aborting a Software Upgrade During ISSU

You can abort the ISSU process at any stage manually (prior to entering the **issu commitversion** command) by entering the **issu abortversion** command. The ISSU process also aborts on its own if the software detects a failure.

Note

If you enter the **issu abortversion** command before the standby supervisor engine becomes hot, the traffic might be disrupted.

If you abort the process after you issue the **issu loadversion** command, the standby supervisor engine is reset and reloaded with the original software.

If the process is aborted after you enter either the **issu runversion** or **issu acceptversion** command, then a second switchover is performed to the new standby supervisor engine that is still running the original software version. The supervisor engine that had been running the new software is reset and reloaded with the original software version.

Note

Ensure that the standby supervisor is fully booted *before* issuing the **abortversion** command on an active sup command.

The following task describes how to abort the ISSU process before you complete the ISSU process with the **issu commitversion** command.

Perform the following task on the active supervisor engine.

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	Switch# issu abortversion <i>active slot</i> <i>[active-image-new]</i>	Cancels the ISSU upgrade or downgrade process in progress and restores the router to its state before the process had started.

This example shows how to abort the ISSU process on slot number 2, the slot for the current active supervisor engine:

```
Switch> enable
Switch# issu abortversion 2
```

Configuring the Rollback Timer to Safeguard Against Upgrade Issues

Cisco IOS software maintains an ISSU rollback timer, to safeguard against an upgrade that may leave the new active supervisor engine in a state in which communication with the standby supervisor engine is severed.

You may want to configure the rollback timer to fewer than 45 minutes (the default) so that the user need not wait in case the new software is not committed or the connection to the switch was lost while it was in runversion mode. A user may want to configure the rollback timer to more than 45 minutes in order to have enough time to verify the operation of the new Cisco IOS software before committing the new image.

Note

The valid timer value range is from 0 to 7200 seconds (two hours). A value of 0 seconds disables the rollback timer.

Once you are satisfied that the ISSU process has been successful and you want to remain in the current state, you must indicate acceptance by issuing the **issu acceptversion** command, which stops the rollback timer. Therefore, entering the **issu acceptversion** command is extremely important to moving the ISSU process forward.

Issuing the **issu commitversion** command at this stage is equal to entering both the **issu acceptversion** and the **issu commitversion** commands. Use the **issu commitversion** command if you do not intend to run in the current state for a period of time and are satisfied with the new software version.

Note

The rollback timer can be configured only in the ISSU Init state.

This task explains how to configure the rollback timer.

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# issu set rollback-timer <i>hh:mm:ss</i>	Configures the rollback timer value.

	Command or Action	Purpose
Step 4	Switch(config)# exit	Returns the user to privileged EXEC mode.
Step 5	Switch# show issu rollback-timer	Displays the current setting of the ISSU rollback timer.

This example shows how to set the rollback timer to 3600 seconds:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# issu set rollback-timer 3600
% Rollback timer value set to [ 3600 ] seconds
```

```
Switch(config)# exit
```

```
Switch# show issu rollback-timer
Rollback Process State = Not in progress
Configured Rollback Time = 60:00
```

The Rollback Timer cannot be set in LV state, as the following example illustrates:

```
Switch# show issu state detail
      Slot = 1
      RP State = Active
      ISSU State = Load Version
      Boot Variable = bootflash:old_image,12
      Operating Mode = RPR
      Primary Version = bootflash:old_image
      Secondary Version = bootflash:new_image
      Current Version = bootflash:old_image

      Slot = 2
      RP State = Standby
      ISSU State = Load Version
      Boot Variable = bootflash:new_image,12;bootflash:old_image,12
      Operating Mode = RPR
      Primary Version = bootflash:old_image
      Secondary Version = bootflash:new_image
      Current Version = bootflash:new_image

Switch# show issu rollback-timer
Rollback Process State = Not in progress
Configured Rollback Time = 60:00

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# issu set rollback-timer 20
% ISSU state should be [ init ] to set the rollback timer
```

Displaying ISSU Compatibility Matrix Information

The ISSU compatibility matrix contains information about other software images about the version in question. This compatibility matrix represents the compatibility of the two software versions, one running on the active and the other on the standby supervisor engine, and the matrix allows the system to determine the highest operating mode it can achieve. This information helps the user identify whether to use ISSU.

This task shows how to display information about the ISSU compatibility matrix.

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode. <ul style="list-style-type: none"> • Enter your password if prompted.
Step 2	Switch# show issu comp-matrix { negotiated stored xml }	Displays information regarding the ISSU compatibility matrix. <ul style="list-style-type: none"> • negotiated—Displays negotiated compatibility matrix information. • stored—Displays negotiated compatibility matrix information. • xml—Displays negotiated compatibility matrix information in XML format.

This example shows how to display negotiated information regarding the compatibility matrix:

```
Switch> enable
Switch# show issu comp-matrix negotiated
```

```
CardType: WS-C4507R(112), Uid: 2, Image Ver: 12.2(31)SGA
Image Name: cat4500-ENTSERVICES-M
```

12.2(31)SGA10  Base(2)
12.2(50)SG3    Dynamic(0)
12.2(53)SG     Comp(3)
```

Dynamic(0) was introduced in Cisco IOS Release 12.2(50)SG with the Dynamic Image Version Compatibility (DIVC) feature. With DIVC, we store Dynamic(0) rather than Incomp(1), Base(2), or Comp(3), and determine compatibility during run-time when two different DIVC-capable images are running in the active and standby supervisor engines during ISSU.

For Catalyst 4500 switches, a value of Dynamic(0) in the stored compatibility-matrix normally results in Base(2) or Comp(3) upon run-time negotiation between the two images; as of today, you never observe Incomp(1) as long as the other image name is present in the stored compatibility-matrix.

CHAPTER 6

Configuring Interfaces

This chapter describes how to configure interfaces for the Catalyst 4500 series switches. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- [Overview of Interface Configuration, page 6-2](#)
- [Using the interface Command, page 6-2](#)
- [Configuring a Range of Interfaces, page 6-4](#)
- [Using the Ethernet Management Port, page 6-6](#)
- [Defining and Using Interface-Range Macros, page 6-11](#)
- [Deploying SFP+ in X2 Ports, page 6-12](#)
- [Deploying 10-Gigabit Ethernet and Gigabit Ethernet SFP Ports on Supervisor Engine V-10GE, page 6-12](#)
- [Deploying 10-Gigabit Ethernet or Gigabit Ethernet Ports on WS-X4606-X2-E and Supervisor Engine 6-E, page 6-13](#)
- [Invoking Shared-backplane Uplink Mode on Supervisor Engine 6-E, page 6-16](#)
- [Digital Optical Monitoring Transceiver Support, page 6-17](#)
- [Configuring Optional Interface Features, page 6-17](#)
- [Understanding Online Insertion and Removal, page 6-30](#)
- [Monitoring and Maintaining the Interface, page 6-30](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Interface Configuration

By default, all interfaces are enabled. The 10/100-Mbps Ethernet interfaces autonegotiate connection speed and duplex. The 10/100/1000-Mbps Ethernet interfaces negotiate speed, duplex, and flow control. The 1000-Mbps Ethernet interfaces negotiate flow control only. Autonegotiation automatically selects the fastest speed possible on that port for the given pair. If a speed is explicitly stated for an interface, that interface will default to half duplex unless it is explicitly set for full duplex.

Many features are enabled on a per-interface basis. When you enter the **interface** command, you must specify the following:

- Interface type:
 - Fast Ethernet (use the **fastethernet** keyword)
 - Gigabit Ethernet (use the **gigabitethernet** keyword)
 - 10-Gigabit Ethernet (use the **tengigabitethernet** keyword)
- Slot number—The slot in which the interface module is installed. Slots are numbered starting with 1, from top to bottom.
- Interface number—The interface number on the module. The interface numbers always begin with 1. When you are facing the front of the switch, the interfaces are numbered from left to right.

You can identify interfaces by physically checking the slot/interface location on the switch. You can also use the Cisco IOS **show** commands to display information about a specific interface or all the interfaces.

Using the interface Command

These general instructions apply to all interface configuration processes:

-
- Step 1** At the privileged EXEC prompt, enter the **configure terminal** command to enter global configuration mode:
- ```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#
```
- Step 2** In global configuration mode, enter the **interface** command. Identify the interface type and the number of the connector on the interface card. The following example shows how to select Fast Ethernet, slot 5, interface 1:
- ```
Switch(config)# interface fastethernet 5/1
Switch(config-if)#
```
- Step 3** Interface numbers are assigned at the factory at the time of installation or when modules are added to a system. Enter the **show interfaces** EXEC command to see a list of all interfaces installed on your switch. A report is provided for each interface that your switch supports, as shown in this display:
- ```
Switch(config-if)#Ctrl-Z
Switch#show interfaces

 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 input packets with dribble condition detected
 0 packets output, 0 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 babbles, 0 late collision, 0 deferred
 0 lost carrier, 0 no carrier
 0 output buffer failures, 0 output buffers swapped out
--More--
<...output truncated...>
```

- Step 4** To begin configuring Fast Ethernet interface 5/5, as shown in the following example, enter the **interface** keyword, interface type, slot number, and interface number in global configuration mode:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/5
Switch(config-if)#
```

**Note** You do not need to add a space between the interface type and interface number. For example, in the preceding line you can specify either *fastethernet 5/5* or *fastethernet5/5*.

- Step 5** Follow each **interface** command with the interface configuration commands your particular interface requires. The commands you enter define the protocols and applications that will run on the interface. The commands are collected and applied to the **interface** command until you enter another **interface** command or press **Ctrl-Z** to exit interface configuration mode and return to privileged EXEC mode.
- Step 6** After you configure an interface, check its status by using the EXEC **show** commands listed in the [“Monitoring and Maintaining the Interface”](#) section on page 6-30.

## Configuring a Range of Interfaces

The interface-range configuration mode allows you to configure multiple interfaces with the same configuration parameters. When you enter the interface-range configuration mode, all command parameters you enter are attributed to all interfaces within that range until you exit interface-range configuration mode.

To configure a range of interfaces with the same configuration, perform this task:

| Command                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Purpose                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch(config)# <b>interface range</b> { <b>vlan</b> <i>vlan_ID</i> - <i>vlan_ID</i> }   {{ <b>fastethernet</b>   <b>gigabitethernet</b>   <b>tengigabitethernet</b>   <b>macro</b> <i>macro_name</i> } <i>slot/interface</i> - <i>interface</i> } [, { <b>vlan</b> <i>vlan_ID</i> - <i>vlan_ID</i> } {{ <b>fastethernet</b>   <b>gigabitethernet</b>   <b>tengigabitethernet</b>   <b>macro</b> <i>macro_name</i> } <i>slot/interface</i> - <i>interface</i> }] | <p>Selects the range of interfaces to be configured. Note the following:</p> <ul style="list-style-type: none"> <li>You are required to enter a space before the dash.</li> <li>You can enter up to five comma-separated ranges.</li> <li>You are not required to enter spaces before or after the comma.</li> </ul> |

**Note** When you use the **interface range** command, you must add a space between the **vlan**, **fastethernet**, **gigabitethernet**, **tengigabitethernet**, or **macro** keyword and the dash. For example, the command **interface range fastethernet 5/1 - 5** specifies a valid range; the command **interface range fastethernet 5/1-5** does not contain a valid range command.

**Note**

The **interface range** command works only with VLAN interfaces that have been configured with the **interface vlan** command (the **show running-configuration** command displays the configured VLAN interfaces). VLAN interfaces that are not displayed by the **show running-configuration** command cannot be used with the **interface range** command.

This example shows how to reenable all Fast Ethernet interfaces 5/1 to 5/5:

```
Switch(config)# interface range fastethernet 5/1 - 5
Switch(config-if-range)# no shutdown
Switch(config-if-range)#
*Oct 6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/1, changed state to up
*Oct 6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/2, changed state to up
*Oct 6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/3, changed state to up
*Oct 6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/4, changed state to up
*Oct 6 08:24:35: %LINK-3-UPDOWN: Interface FastEthernet5/5, changed state to up
*Oct 6 08:24:36: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/
5, changed state to up
*Oct 6 08:24:36: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/
3, changed state to up
*Oct 6 08:24:36: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/
4, changed state to up
Switch(config-if)#
```

This example shows how to use a comma to add different interface type strings to the range to re-enable all Fast Ethernet interfaces ranging from 5/1 to 5/5 and both Gigabit Ethernet interfaces 1/1 and 1/2:

```
Switch(config-if)# interface range fastethernet 5/1 - 5, gigabitethernet 1/1 - 2
Switch(config-if)# no shutdown
Switch(config-if)#
*Oct 6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/1, changed state to up
*Oct 6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/2, changed state to up
*Oct 6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/3, changed state to up
*Oct 6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/4, changed state to up
*Oct 6 08:29:28: %LINK-3-UPDOWN: Interface FastEthernet5/5, changed state to up
*Oct 6 08:29:28: %LINK-3-UPDOWN: Interface GigabitEthernet1/1, changed state to
up
*Oct 6 08:29:28: %LINK-3-UPDOWN: Interface GigabitEthernet1/2, changed state to
up
*Oct 6 08:29:29: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/
5, changed state to up
*Oct 6 08:29:29: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/
3, changed state to up
*Oct 6 08:29:29: %LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet5/
4, changed state to up
Switch(config-if)#
```

#### Note

If you enter multiple configuration commands while you are in interface-range configuration mode, each command is run as it is entered (they are not batched together and run after you exit interface-range configuration mode). If you exit interface-range configuration mode while the commands are being run, some commands might not be run on all interfaces in the range. Wait until the command prompt is displayed before exiting interface-range configuration mode.

## Using the Ethernet Management Port

This section has this information:

- [Understanding the Ethernet Management Port, page 6-7](#)
- [Supported Features on the Ethernet Management Port, page 6-10](#)
- [Configuring the Ethernet Management Port, page 6-11](#)

## Understanding the Ethernet Management Port

The Ethernet management port, also referred to as the *Fa1* or *fastethernet1* port, is a Layer 3 host port to which you can connect a PC. You can use the Ethernet management port instead of the switch console port for network management. When managing a switch, connect the PC to the Ethernet management port on a Catalyst 4500 series switch. (Figure 6-1).

**Note**

When connecting a PC to the Ethernet management port, you must assign an IP address.

**Figure 6-1** Connecting a Switch to a PC

By default, the Ethernet management port is enabled. The switch cannot route packets from the Ethernet management port to a network port, and from the network port to the Ethernet port. To obtain these, the Fa1 interface is automatically placed in a separate routing domain (or VRF domain), called *mgmtVrf*. (You observe the *ip Vrf forwarding mgmtVrf* line in the running configuration when you boot up.) For details, read the “[Fa1 Interface and mgmtVrf](#)” section on page 6-8.

Even though the Ethernet management port does not support routing, you might need to enable routing protocols on the port. As illustrated in Figure 6-2, you must enable routing protocols on the Ethernet management port when the PC is multiple hops away from the switch and the packets must pass through multiple Layer 3 devices to reach the PC.

**Figure 6-2** Network Example with Routing Protocols Enabled

The specific implementation of Ethernet management port depends on the redundancy model you are applying.

For details on configuring SSO and ISSU, refer to [Chapter 8, “Configuring Supervisor Engine Redundancy Using RPR and SSO”](#) and [Chapter 5, “Configuring the Cisco IOS In Service Software Upgrade Process”](#)

## Fa1 Interface and mgmtVrf

### Caution

The Ethernet management port is intended for out-of-band access only. Like the console port, the Ethernet management port has direct access to critical resources on the switch. Connecting this port to an in-band network might cause performance degradation and vulnerability to a denial of service attack.

All features that use fa1 now need to be VRF-aware.

### Note

You cannot configure any other interface in the same routing domain and you cannot configure a different routing domain for the Fa1 interface.

On bootup the fa1 port assumes the following default configuration:

```
ip unicast-routing

ip vrf mgmtVrf
!
interface FastEthernet1
 ip vrf forwarding mgmtVrf
 speed auto
 duplex auto
```

```
Switch# show ip vrf
 Name Default RD Interfaces

mgmtVrf
```

Because the management port is placed in mgmtVrf, you should be aware of the VRF aware commands required for the following tasks:

- [Ping, page 6-8](#)
- [TraceRoute, page 6-9](#)
- [Telnet, page 6-9](#)
- [TFTP, page 6-9](#)
- [FTP, page 6-9](#)
- [SSH, page 6-9](#)

### Note

Command usage specific to the mgmtVrf are mentioned below. The additional configuration needed to make the feature work needs to be configured.

## Ping

If you want to ping an IP address that is reachable through an fa1 port, enter the following command:

```
Switch# ping vrf mgmtVrf ip address
```

For example,

```
Switch# ping vrf mgmtVrf 20.20.20.1
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 20.20.20.1, timeout is 2 seconds:
!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/2/4 ms
```

## TraceRoute

```
Switch# traceroute vrf mgmtVrf ip address

Eg: Switch# traceroute vrf mgmtVrf 20.20.20.1
Type escape sequence to abort.
Tracing the route to 20.20.20.1
 1 20.20.20.1 0 msec 0 msec *
```

## Telnet

If you want to Telnet to a remote switch through the Fa1 port, enter the following command:

```
Switch# telnet <word> /vrf mgmtVrf
word IP address or hostname of a remote system
```

### An example

```
Switch# telnet 20.20.20.1 /vrf mgmtVrf
Trying 20.20.20.1 ... Open
User Access Verification
Password:
switch> en
Password:
switch#
```

## TFTP

If you want to use Fa1 port for TFTP operation, configure the Fa1 port as the source interface for TFTP as follows:

```
Switch(config)# ip tftp source-interface fastEthernet1
```

## FTP

If you want to use an Fa1 port for an FTP operation, configure the Fa1 port as the source interface for FTP as follows:

```
Switch(config)# ip ftp source-interface fastEthernet1
```

## SSH

If you want to initiate SSH from your switch through the Fa1 port, enter the following command:

```
Switch# ssh -l <login name> -vrf mgmtVrf <ip address>
```

For example,

```
Switch# ssh -l xyz -vrf mgmtVrf 20.20.20.1
```

## SSO Model

On a redundant chassis, management port behavior differs from that of a standard Ethernet port in that each supervisor engine possesses a management port, and only the port on the active supervisor engine is enabled. The management port on the standby supervisor engine is always disabled; it cannot switch any kind of traffic.

When a switchover occurs, the management port of the standby supervisor engine (now, active) is enabled and can be used to switch traffic, while the management port on the “old” active supervisor engine is disabled.

**Note**

The IOS configuration for the management port is synchronized between the two supervisor engines. So, under IOS, they will possess the same IP address. To avoid address overlapping during a switchover on a redundant chassis, you should assign a different IP address on the management port from the one you assigned to the same port in the ROMMON configuration.

## ISSU Model

In SSO mode, the running configurations on the active and standby supervisor engines must match. So, you cannot enable the management port on a redundant chassis if one of the two supervisor engines is running an IOS image older than 12.2(50)SG (where the Management port is not supported).

When you perform an ISSU upgrade or downgrade between an image prior to Cisco IOS Release 12.2(50)SF and Cisco IOS Release 12.2(50)SG, IOS automatically disables the management port. The port configuration is restored when both images running on the supervisor engines are at least 12.2(50)SG. A warning message is also displayed to flag the event.

## Supported Features on the Ethernet Management Port

The Ethernet management port supports these features:

- Express Setup
- Telnet with passwords
- TFTP
- Secure Shell (SSH)
- DHCP-based autoconfiguration
- SNMP (only the ENTITY-MIB and the IF-MIB)
- IP ping
- Interface features
  - Speed—10 Mb/s, 100 Mb/s, 1000Mb/s, and autonegotiation
  - Duplex mode—Full, half, and autonegotiation
  - Loopback detection
- Cisco Discovery Protocol (CDP) (only on WS-C4900M and WS-C4948)
- IPv4 access control lists (ACLs)
- Routing protocols (only on WS-C4900M and WS-C4948)
- AAA

**Caution**

Before enabling a feature on the Ethernet management port, ensure that the feature is supported. If you try to configure an unsupported feature on an Ethernet management port, the feature might not work properly, and the switch might fail.

## Configuring the Ethernet Management Port

To specify the Ethernet management port, enter **fastethernet1**.

To disable the port, use the **shutdown** interface configuration command. To enable the port, use the **no shutdown** interface configuration command.

To determine the link status to the PC, you can monitor the LED for the Ethernet management port:

The LED is green (on) when the link is active.

The LED is off when the link is down.

The LED is amber when there is a POST failure.

To display the link status, use the **show interfaces fastethernet 1** privileged EXEC command.

## Defining and Using Interface-Range Macros

You can define an interface-range macro to automatically select a range of interfaces for configuration. Before you can use the **macro** keyword in the **interface-range** macro command string, you must define the macro.

To define an interface-range macro, perform this task:

**Table 6-1**

| Command                                                                                                                                                                                                                                                                                                                                                                     | Purpose                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Switch(config)# <b>define interface-range</b> <i>macro_name</i><br>{ <b>vlan</b> <i>vlan_ID</i> - <i>vlan_ID</i> }   {{ <b>fastethernet</b>  <br><b>gigabitethernet</b> } <i>slot/interface</i> - <i>interface</i> }<br>[, { <b>vlan</b> <i>vlan_ID</i> - <i>vlan_ID</i> } {{ <b>fastethernet</b>  <br><b>gigabitethernet</b> } <i>slot/interface</i> - <i>interface</i> }] | Defines the interface-range macro and saves it in the running configuration file. |

This example shows how to define an interface-range macro named **enet\_list** to select Fast Ethernet interfaces 5/1 through 5/4:

```
Switch(config)# define interface-range enet_list fastethernet 5/1 - 4
```

To show the defined interface-range macro configuration, perform this task:

**Table 6-2**

| Command                            | Purpose                                                |
|------------------------------------|--------------------------------------------------------|
| Switch# <b>show running-config</b> | Shows the defined interface-range macro configuration. |

This example shows how to display the defined interface-range macro named **enet\_list**:

```
Switch# show running-config | include define
define interface-range enet_list FastEthernet5/1 - 4
Switch#
```

To use an interface-range macro in the **interface range** command, perform this task:

Table 6-3

| Command                                                  | Purpose                                                                                               |
|----------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Switch(config)# <b>interface range macro</b> <i>name</i> | Selects the interface range to be configured using the values saved in a named interface-range macro. |

This example shows how to change to the interface-range configuration mode using the interface-range macro **enet\_list**:

```
Switch(config)# interface range macro enet_list
Switch(config-if)#
```

## Deploying SFP+ in X2 Ports

### Note

This feature is supported on Supervisor Engine 6-E X2 ports as well as the WS-X4606-10GE (or WS-X4606-X2-E), WS-X4908-10GE, WS-X4904-10GE, and WS-C4900M chassis.

To use an SFP+ in an X2 port to obtain 10-Gigabit Ethernet bandwidth, the Catalyst 4500 series switch supports OneX Convertor modules. When you plug a OneX Converter module into an X2 port, it converts the X2 port into an SFP+ port into which you can plug in an SFP+. An SFP+ in a OneX Convertor module provides the same functionality as an X2 and maintains the same port numbering.

The output for the **show idprom tengigabitethernet slot/interface** command displays the contents of both the SFP+ and the OneX Convertor module seeproms when an SFP+ in a OneX Convertor module is plugged into an X2 port.

## Deploying 10-Gigabit Ethernet and Gigabit Ethernet SFP Ports on Supervisor Engine V-10GE

### Note

LAN Base image does not support 10-Gigabit Ethernet uplinks.

### Note

On a Catalyst 4510R series switch, if you enable both the 10-Gigabit Ethernet and Gigabit Ethernet SFP uplink ports, you must re-boot the switch. On the Catalyst 4503, 4506, and 4507R series switches, this capability is automatically enabled.

Prior to Cisco IOS Release 12.2(25)SG, the Cisco Catalyst 4500 Supervisor Engine V-10GE allowed you to enable either the dual wire-speed 10-Gigabit Ethernet ports, or four alternatively wired Gigabit Ethernet SFP uplink ports. With Cisco IOS Release 12.2(25)SG, you can simultaneously deploy the dual 10 Gigabit Ethernet ports and the four Gigabit Ethernet SFP ports on the Catalyst 4503, Catalyst 4506, and Catalyst 4507R chassis.

When you deploy a Catalyst 4510R chassis, one of the following configurations is supported:

- Dual 10-Gigabit Ethernet ports (X2 optics) only.
- Four Gigabit Ethernet ports (SFP optics) only.
- Both the dual 10-Gigabit Ethernet and the four Gigabit Ethernet ports, with the understanding that the tenth slot (Flex-Slot) will only support a 2-port gigabit interface converter (GBIC) line card (WS-X4302-GB) when in this mode.
- You cannot place a linecard with a backplane traffic capacity exceeding 6Gbps in slots 8, 9 and 10 of a Catalyst 4510R-E chassis when used with a Supervisor Engine 6-E.

To select the 10-Gigabit Ethernet or the Gigabit Ethernet SFP uplink port, perform this task:

|        | Command                                                                                     | Purpose                                |
|--------|---------------------------------------------------------------------------------------------|----------------------------------------|
| Step 1 | Switch# <b>configure terminal</b>                                                           | Establishes global configuration mode. |
| Step 2 | Switch(config)# <b>hw-module uplink select</b> [all   gigabitethernet   tengigabitethernet] | Selects the port type to enable.       |

#### Note

On a Supervisor Engine V-10GE (WS-X4516-10GE) in a 10 slot chassis (Catalyst 4510R and 4510RE), if a startup configuration with a new uplink mode is copied into flash memory and the system is power cycled, the system will not come up with the new uplink mode. After copying the startup configuration with the new uplink mode into flash memory, the uplink mode must be changed to the new uplink mode through the command interface before the system is power cycled. This ensures that the system comes up in the new uplink mode.

The following example shows how to enable both 10-Gigabit Ethernet and Gigabit Ethernet SFP uplink ports on a Catalyst 4510R series switch:

```
Switch# configure terminal
Switch(config)# hw-module uplink select all
Warning: This configuration mode will place slot 10 in flex slot mode
```

#### Note

When you modify the uplink mode, you must re-boot the switch.

## Deploying 10-Gigabit Ethernet or Gigabit Ethernet Ports on WS-X4606-X2-E and Supervisor Engine 6-E

To increase the flexibility of X2 ports on both Supervisor Engine 6-E and WS-X4606-X2-E, the Catalyst 4500 switch as well as the 4900M chassis supports TwinGig Convertor modules. When you plug a TwinGig Convertor module into an X2 hole, it converts a single X2 hole (capable of holding one pluggable X2 optic) into two SFP holes (capable of holding two pluggable SFP optics). This enables you to have 10 Gigabit ports and 1-Gigabit ports on the same linecard. It also allows you to use Gigabit ports, and then switch to a 10-Gigabit port, when needed.

Topics include:

- Port Numbering TwinGig Convertors, page 6-14
- Limitations on Using a TwinGig Convertor, page 6-14
- Selecting X2/TwinGig Convertor Mode, page 6-15

## Port Numbering TwinGig Convertors

When a TwinGig Convertor is enabled or disabled, the number and type of ports on the linecard change dynamically. The terminology must reflect this behavior. In Cisco IOS, 10-Gigabit ports are named *TenGigabit* and 1-Gigabit ports are named *Gigabit*. Starting with Cisco IOS Release 12.2(40)SG, to avoid having two ports named *TenGigabit1/1* and *Gigabit1/1*, the 10-Gigabit and 1-Gigabit port numbers are independent. For example, for a WS-X4606-X2-E module with six X2 holes, the X2 ports are named *TenGigabit slot-num/<1-6>*, and the SFP ports are named *Gigabit slot-num/<7-18>*.

**Figure 6-3 Faceplate for WS-X4606-10GE**

In Cisco IOS, ports 1 through 18 always exist. This means that you can apply configurations on them and they display in the CLI output. However, only the X2 or the SFP ports can be active at any particular time. For example, if an X2 is plugged into the second hole, the X2 port 2 is active and SFP ports 9 and 10 are inactive. If a TwinGig Convertor is plugged into the second hole, the X2 port 2 is inactive, and the SFP ports 9 and 10 are active. The inactive ports are treated analogously to the inactive ports on Supervisor Engines IV and V-10GE, where at no time are all of the uplinks connected to the switching ASICs.

### Note

When using both TwinGig and X2 transceivers on the WS-X4606-X2-E module, place ports 1-3 in one group and ports 4-6 in another. (The mode selected with the **show hw-module module port-group** command determines the behaviour. See [“Selecting X2/TwinGig Convertor Mode”](#).) Mixing within a port group will not work. For example, you cannot have an X2 in port 1 and a TwinGig in port 2 and expect both of them to function.

## Limitations on Using a TwinGig Convertor

In a Supervisor Engine 6-E system, the ports are connected to the switching engine through a stub ASIC. This stub ASIC imposes some limitations on the ports: Gig and 10 Gig ports cannot be mixed on a single stub ASIC; they must either be all 10 Gig (X2), or all Gig (TwinGig Convertor and SFP). The faceplates of X2 modules show this stub port grouping, either with actual physical grouping with a box drawn around a grouping.

## Selecting X2/TwinGig Convertor Mode

The default configuration mode is X2. So, if you plan to deploy 10-Gigabit interfaces, you don't need to configure anything. However, if you want to deploy Gigabit interfaces (that is, use TwinGig Convertors), you must configure the associated port-group:

- To determine how the X2 holes on a module are grouped, enter the **show hw-module module *m* port-group *p*** command.

**Note** For a 10-Gigabit port that accepts a HAMM, you must place it into 1-Gigabit mode instead of 10-Gigabit mode.

If you configure a 10-Gigabit port as 1-Gigabit port, an output similar to the following displays:

```
Switch# show hw-module module 5 port-group
Module Port-group Active Inactive

5 1 Gi5/3-6 Te5/1-2
```

Instead, if the port is set to the default, 10-Gigabit mode, an output similar to the following displays:

```
Switch# show hw-module module 6 port-group
Module Port-group Active Inactive

6 1 Te6/1-2 Gi6/3-6
```

```
Switch# show int status mod 1
```

| Port   | Name | Status     | Vlan | Duplex | Speed | Type       |
|--------|------|------------|------|--------|-------|------------|
| Te1/1  |      | notconnect | 1    | full   | 10G   | 10GBase-LR |
| Te1/2  |      | connected  | 1    | full   | 10G   | 10GBase-LR |
| Te1/3  |      | notconnect | 1    | full   | 10G   | No X2      |
| Te1/4  |      | notconnect | 1    | full   | 10G   | No X2      |
| Te1/5  |      | notconnect | 1    | full   | 10G   | No X2      |
| Te1/6  |      | notconnect | 1    | full   | 10G   | No X2      |
| Gi1/7  |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/8  |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/9  |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/10 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/11 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/12 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/13 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/14 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/15 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/16 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/17 |      | inactive   | 1    | full   | 1000  | No Gbic    |
| Gi1/18 |      | inactive   | 1    | full   | 1000  | No Gbic    |

Switch#

- To configure the modes of operation for each X2 port group in which you want to deploy Gigabit, enter the **hw-module module *m* port-group *p* select gigabitethernet** command. This configuration is preserved across power cycles and reloads.

To deploy Gigabit Ethernet interfaces using the TwinGig Convertor, perform this task:

|        | Command                                                                                                            | Purpose                                                                                       |
|--------|--------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| Step 1 | Switch# <b>configure terminal</b>                                                                                  | Establishes global configuration mode.                                                        |
| Step 2 | Switch(config)# <b>hw-module module <i>m</i> port-group <i>p</i> select [gigabitethernet   tengigabitethernet]</b> | Selects the mode of operation for each X2 port-group.<br>Default is TenGigabit Ethernet (x2). |
| Step 3 | Switch(config)# <b>exit</b>                                                                                        | Exits configuration mode.                                                                     |
| Step 4 | Switch# <b>show int status mod <i>n</i></b>                                                                        | Verifies the setting.                                                                         |

This example shows how to select Gigabit Ethernet interfaces on a WS-X4606-X2-E using the TwinGig Convertor:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# hw-module module 1 port-group 1 select gigabitethernet
Switch(config)# exit
Switch# show int status mod 1
```

| Port   | Name | Status     | Vlan | Duplex | Speed | Type     |
|--------|------|------------|------|--------|-------|----------|
| Te1/1  |      | inactive   | 1    | full   | 10G   | No X2    |
| Te1/2  |      | inactive   | 1    | full   | 10G   | No X2    |
| Te1/3  |      | inactive   | 1    | full   | 10G   | No X2    |
| Te1/4  |      | notconnect | 1    | full   | 10G   | No X2    |
| Te1/5  |      | notconnect | 1    | full   | 10G   | No X2    |
| Te1/6  |      | notconnect | 1    | full   | 10G   | No X2    |
| Gi1/7  |      | notconnect | 1    | full   | 1000  | No Gbic  |
| Gi1/8  |      | notconnect | 1    | full   | 1000  | No Gbic  |
| Gi1/9  |      | notconnect | 1    | full   | 1000  | No Gbic  |
| Gi1/10 |      | notconnect | 1    | full   | 1000  | No Gbic  |
| Gi1/11 |      | notconnect | 1    | full   | 1000  | No Gbic  |
| Gi1/12 |      | notconnect | 1    | full   | 1000  | No Gbic  |
| Gi1/13 |      | inactive   | 1    | full   | 1000  | No Gbic  |
| Gi1/14 |      | inactive   | 1    | full   | 1000  | No Gbic  |
| Gi1/15 |      | inactive   | 1    | full   | 1000  | No Gbic  |
| Gi1/16 |      | inactive   | 1    | full   | 1000  | No Gbic  |
| Gi1/17 |      | inactive   | 1    | full   | 1000  | No Gbic  |
| Gi1/18 |      | inactive   | 1    | full   | 1000  | No GbicI |

## Invoking Shared-backplane Uplink Mode on Supervisor Engine 6-E

This feature enables you to use all 4 10-Gigabit Ethernet ports on the supervisor engines as blocking ports when in redundant mode.

Prior to Cisco IOS Release 12.2(40)SG, the Catalyst 4500 Supervisor Engine V-10GE allowed you to enable either the dual wire-speed 10-Gigabit Ethernet ports, or four Twin-Gigabit converter based Gigabit Ethernet SFP uplink ports when operating in redundant mode. With Cisco IOS Release 12.2(40)SG, you can deploy (1) all 4 10-Gigabit Ethernet ports, (2) 2 blocking ports on an active supervisor engine and 2 blocking ports on the standby supervisor engine, or (3) all 8 Gigabit Ethernet SFP ports, 4 on the active supervisor and 4 on the standby supervisor engine. This capability is supported on all Catalyst 4500 and 4500E series chassis.

To enable shared-backplane mode, enter this command:

| Command                                                    | Purpose                                                                       |
|------------------------------------------------------------|-------------------------------------------------------------------------------|
| Switch(config)# <b>hw-mod uplink mode shared-backplane</b> | A reload of the active supervisor is required to apply the new configuration. |

To disable shared-backplane mode, enter this command:

| Command                                                       | Purpose                                                                       |
|---------------------------------------------------------------|-------------------------------------------------------------------------------|
| Switch(config)# <b>no hw-mod uplink mode shared-backplane</b> | A reload of the active supervisor is required to apply the new configuration. |

## Digital Optical Monitoring Transceiver Support

Command line interface (CLI) commands (show inventory, show idprom interface) are used on transceivers to obtain serial number, model name, inventory information.

The following commands are specific to the transceivers that support the DOM capability:

- Displays current values and thresholds for all sensor on a particular interface transceiver:  
**show interfaces <int-name> transceiver [detail] [threshold]**
- Enables or disables the *entSensorThresholdNotification* for all sensors in all the transceivers:  
**snmp-server enable trap transceiver**
- Enables or disables transceiver monitoring:  
**transceiver type all monitoring**

### Note

This feature is only available when a DOM capable transceiver is present and configured for monitoring. The frequency at which the sensor information is refreshed depends on default values configured in the transceiver SEEPROM (Serial Electrically Erasable Programmable Read Only Memory).

### Note

For details on transceiver module compatibility, refer to this URL:

[http://www.cisco.com/en/US/products/hw/modules/ps5455/products\\_device\\_support\\_tables\\_list.html](http://www.cisco.com/en/US/products/hw/modules/ps5455/products_device_support_tables_list.html)

## Configuring Optional Interface Features

The following subsections describe optional procedures:

- [Configuring Ethernet Interface Speed and Duplex Mode, page 6-18](#)
- [Configuring Flow Control, page 6-21](#)
- [Configuring Jumbo Frame Support, page 6-23](#)

- [Interacting with Baby Giants, page 6-26](#)
- [Configuring the Port Debounce Timer, page 6-27](#)
- [Configuring auto-MDIX on a Port, page 6-28](#)

## Configuring Ethernet Interface Speed and Duplex Mode

- [Speed and Duplex Mode Configuration Guidelines, page 6-18](#)
- [Setting the Interface Speed, page 6-18](#)
- [Setting the Interface Duplex Mode, page 6-19](#)
- [Displaying the Interface Speed and Duplex Mode Configuration, page 6-20](#)
- [Adding a Description for an Interface, page 6-20](#)

### Speed and Duplex Mode Configuration Guidelines

#### Note

You do not configure the client device for autonegotiation. Rather, you configure the switch with the speed, or range of speeds, that you want to autonegotiate.

You can configure the interface speed and duplex mode parameters to **auto** and allow the Catalyst 4500 series switch to negotiate the interface speed and duplex mode between interfaces. If you decide to configure the interface **speed** and **duplex** commands manually, consider the following:

- If you enter the **no speed** command, the switch automatically configures both interface **speed** and **duplex** to **auto**.
- When you set the interface speed to **1000** (Mbps) or **auto 1000**, the duplex mode is full duplex. You cannot change the duplex mode.
- If the interface speed is set to **10** or **100**, the duplex mode is set to half duplex by default unless you explicitly configure it.

#### Caution

Changing the interface speed and duplex mode configuration might shut down and restart the interface during the reconfiguration.

### Setting the Interface Speed

If you set the interface speed to **auto** on a 10/100-Mbps Ethernet interface, speed and duplex are autonegotiated. The forced 10/100 autonegotiation feature allows you to limit interface speed auto negotiation up to 100 Mbps on a 10/100/1000BASE-T port.

To set the port speed for a 10/100-Mbps Ethernet interface, perform this task:

|        | Command                                                                                            | Purpose                                    |
|--------|----------------------------------------------------------------------------------------------------|--------------------------------------------|
| Step 1 | Switch(config)# <b>interface fastethernet</b> <i>slot/interface</i>                                | Specifies the interface to be configured.  |
| Step 2 | Switch(config-if)# <b>speed</b> [ <b>10</b>   <b>100</b>   <b>auto</b> [ <b>10</b>   <b>100</b> ]] | Sets the interface speed of the interface. |

This example shows how to set the interface speed to 100 Mbps on the Fast Ethernet interface 5/4:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed 100
```

This example shows how to allow Fast Ethernet interface 5/4 to autonegotiate the speed and duplex mode:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# speed auto
```

**Note**

This is analogous to specifying **speed auto 10 100**.

This example shows how to limit the interface speed to 10 and 100 Mbps on the Gigabit Ethernet interface 1/1 in auto-negotiation mode:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 10 100
```

This example shows how to limit speed negotiation to 100 Mbps on the Gigabit Ethernet interface 1/1:

```
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# speed auto 100
```

**Note**

Turning off autonegotiation on a Gigabit Ethernet interface will result in the port being forced into 1000 Mbps and full-duplex mode.

To turn off the port speed autonegotiation for Gigabit Ethernet interface 1/1, perform this task:

|        | Command                                             | Purpose                                    |
|--------|-----------------------------------------------------|--------------------------------------------|
| Step 1 | Switch(config)# <b>interface gigabitethernet1/1</b> | Specifies the interface to be configured.  |
| Step 2 | Switch(config-if)# <b>speed nonegotiate</b>         | Disables autonegotiation on the interface. |

To restore autonegotiation, enter the **no speed nonegotiate** command in the interface configuration mode.

**Note**

For the blocking ports on the WS-X4416 module, do not set the speed to autonegotiate.

## Setting the Interface Duplex Mode

**Note**

When the interface is set to 1000 Mbps, you cannot change the duplex mode from full duplex to half duplex.

To set the duplex mode of a Fast Ethernet interface, perform this task:

|        | Command                                                      | Purpose                                   |
|--------|--------------------------------------------------------------|-------------------------------------------|
| Step 1 | Switch(config)# <b>interface fastethernet slot/interface</b> | Specifies the interface to be configured. |
| Step 2 | Switch(config-if)# <b>duplex [auto   full   half]</b>        | Sets the duplex mode of the interface.    |

This example shows how to set the interface duplex mode to full on Fast Ethernet interface 5/4:

```
Switch(config)# interface fastethernet 5/4
Switch(config-if)# duplex full
```

## Displaying the Interface Speed and Duplex Mode Configuration

To display the interface speed and duplex mode configuration for an interface, perform this task:

| Command                                                                                                                           | Purpose                                                     |
|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| Switch# <b>show interfaces</b> [ <b>fastethernet</b>   <b>gigabitethernet</b>   <b>tengigabitethernet</b> ] <i>slot/interface</i> | Displays the interface speed and duplex mode configuration. |

This example shows how to display the interface speed and duplex mode of Fast Ethernet interface 6/1:

```
Switch# show interface fastethernet 6/1
FastEthernet6/1 is up, line protocol is up
 Hardware is Fast Ethernet Port, address is 0050.547a.dee0 (bia 0050.547a.dee0)
 MTU 1500 bytes, BW 100000 Kbit, DLY 100 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation ARPA, loopback not set
 Keepalive set (10 sec)
 Full-duplex, 100Mb/s
 ARP type: ARPA, ARP Timeout 04:00:00
 Last input 00:00:54, output never, output hang never
 Last clearing of "show interface" counters never
 Input queue: 50/2000/0/0 (size/max/drops/flushes); Total output drops: 0
 Queueing strategy: fifo
 Output queue: 0/40 (size/max)
 5 minute input rate 0 bits/sec, 0 packets/sec
 5 minute output rate 0 bits/sec, 0 packets/sec
 50 packets input, 11300 bytes, 0 no buffer
 Received 50 broadcasts, 0 runts, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 input packets with dribble condition detected
 1456 packets output, 111609 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 babbles, 0 late collision, 0 deferred
 1 lost carrier, 0 no carrier
 0 output buffer failures, 0 output buffers swapped out
Switch#
```

## Adding a Description for an Interface

You can add a description about an interface to help you remember its function. The description appears in the output of the following commands: **show configuration**, **show running-config**, and **show interfaces**.

To add a description for an interface, enter the following command:

| Command                                             | Purpose                              |
|-----------------------------------------------------|--------------------------------------|
| Switch(config-if)# <b>description</b> <i>string</i> | Adds a description for an interface. |

This example shows how to add a description on Fast Ethernet interface 5/5:

```
Switch(config)# interface fastethernet 5/5
```

```
Switch(config-if)# description Channel-group to "Marketing"
```

## Configuring Flow Control

Gigabit Ethernet ports use Flow Control to slow-down the transmission of incoming packets. If a buffer on a Gigabit Ethernet port runs out of space, the port transmits a special packet that requests remote ports to delay sending packets for a period of time. The port can also receive this special packet from its link-partner for the same purpose. This special packet is called a *pause frame*.

The default settings for Gigabit Ethernet interfaces are as follows:

- Sending pause frames is off—non-oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—non-oversubscribed Gigabit Ethernet interfaces.
- Sending pause frames is on—Oversubscribed Gigabit Ethernet interfaces.
- Receiving pause frames is desired—Oversubscribed Gigabit Ethernet interfaces

The default settings for Tenggigabit Ethernet interfaces are as follows:

- Sending pause frames is off.
- Receiving pause frames is on.

**Note**

**desired** is not a flow control option on the Tenggigabit Ethernet interfaces.

To configure flow control, perform this task:

|        | Command                                                                                                                  | Purpose                                                                                        |
|--------|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| Step 1 | Switch# <b>configure terminal</b>                                                                                        | Enters global configuration mode.                                                              |
| Step 2 | Switch(config)# <b>interface</b><br><i>interface-id</i>                                                                  | Enters interface configuration mode and specifies the interface to be enabled for flowcontrol. |
| Step 3 | Switch(config-if)# <b>flowcontrol</b><br>{ <b>receive</b>   <b>send</b> } { <b>off</b>   <b>on</b>  <br><b>desired</b> } | Configures a Gigabit Ethernet port to send or receive pause frames.                            |
| Step 4 | Switch(config-if)# <b>end</b>                                                                                            | Returns to configuration mode.                                                                 |
| Step 5 | Switch(config)# <b>end</b>                                                                                               | Returns to privileged EXEC mode.                                                               |

This example shows how to configure flow control on an oversubscribed Gigabit Ethernet port 7/5:

```
Switch# configure terminal
Switch(config)# interface g7/5
Switch(config-if)# flowcontrol send on
Switch(config-if)# end
Switch)# show interfaces gigabitEthernet 7/5 capabilities
GigabitEthernet7/5
 Model: WS-X4548-GB-RJ45-RJ-45
 Type: 10/100/1000-TX
 Speed: 10,100,1000,auto
 Duplex: half,full,auto
 Trunk encap. type: 802.1Q,ISL
 Trunk mode: on,off,desirable,nonegotiate
 Channel: yes
 Broadcast suppression: percentage(0-100), hw
 Flowcontrol: rx- (off,on,desired),tx- (off,on,desired)
```

```

VLAN Membership: static, dynamic

## Configuring Jumbo Frame Support

These subsections describe jumbo frame support:

- [Ports and Modules that Support Jumbo Frames, page 6-23](#)
- [Jumbo Frame Support, page 6-24](#)
- [Configuring MTU Sizes, page 6-25](#)

### Ports and Modules that Support Jumbo Frames

The following ports and modules support jumbo frames:

- Supervisor uplink ports
- WS-X4306-GB: all ports
- WS-X4232-GB-RJ: ports 1-2
- WS-X4418-GB: ports 1-2
- WS-X4412-2GB-TX: ports 13-14
- WS-X4506-GB-T
- the 4648-GB-RJ45V
- WS-X4648-GB+RJ45V
- WS-X4648-RJ45V-E
- WS-X4648-RJ45V+E

- WS-X4706-10GE

## Jumbo Frame Support

These sections describe jumbo frame support:

- [Maximum Transmission Units, page 6-24](#)
- [Jumbo Frame Support Overview, page 6-24](#)
- [Ethernet Ports, page 6-25](#)
- [VLAN Interfaces, page 6-25](#)

### Maximum Transmission Units

The Catalyst 4500 series switch allows you to configure a maximum of 32 different maximum transmission unit (MTU) sizes systemwide. This means that the maximum number of different MTU sizes that you can configure with the **system mtu**, **mtu**, **ip mtu**, and **ipv6 mtu** command on all Layer 2 and Layer 3 interfaces combined is 32.

Also, the system stores the ipv4 and ipv6 MTU sizes configured on an interface separately. So, for every **system mtu** command or per interface **mtu** command, two separate MTU values are stored, one for ipv4 and one for ipv6. This further reduces the number of slots available (out of 32). However, only a single MTU value is stored for each **ip mtu** and **ipv6 mtu** commands.

If the new MTU value you are configuring is already present in the system (that is, configured on some other interface), then no new slot(s) will be allocated to store it again.

If the maximum limit of 32 is reached and an attempt is made to configure a new MTU size on a new interface, the system will only allow configuration to proceed if the new MTU size has previously been configured on some interface. Otherwise, an error message will be displayed and the default MTU size will be assigned to the interface being configured.

### Jumbo Frame Support Overview

A jumbo frame is a frame larger than the default Ethernet size. Enable jumbo frame support by configuring a larger-than-default MTU size on a port or interface.

Catalyst 4500 series switch Ethernet LAN ports configured with a nondefault MTU size accept frames containing packets with a size between 1500 and 9216 bytes (including Ethernet payload, header and trailer). (The maximum MTU size for a Catalyst 4948 series switch is 9198 bytes (not including header and trailer.)) With a nondefault MTU size configured, the packet size of ingress frames is checked. If the packet is larger than the configured MTU, it is dropped.

For traffic that needs to be routed, the MTU of the egress port is checked. If the MTU is smaller than the packet size, the packet is forwarded to the CPU. If the “do not fragment bit” is not set, it is fragmented. Otherwise, the packet is dropped.

#### Note

---

Jumbo frame support does not fragment Layer 2 switched packets.

---

The Catalyst 4500 series switch does not compare the packet size with the MTU at the egress port, but jumbo frames are dropped in ports that do not support them. The frames can be transmitted in ports that do support jumbo frames, even though the MTU is not configured to jumbo size.

**Note**

Jumbo frame support is only configured per interface; jumbo frame support cannot be configured globally.

## Ethernet Ports

These sections describe configuring nondefault MTU sizes on Ethernet ports:

- [Ethernet Port Overview, page 6-25](#)
- [Layer 3 and Layer 2 EtherChannels, page 6-25](#)

### Ethernet Port Overview

With Cisco IOS Release 12.2(25)EW, configuring a nondefault MTU size on certain Ethernet ports limits the size of ingress packets. The MTU does not impact the egress packets.

With releases earlier than Cisco IOS Release 12.1(13)EW, you can configure the MTU size only on Gigabit Ethernet.

### Layer 3 and Layer 2 EtherChannels

With Release Cisco IOS Release 12.2(25)EW and later releases, you can configure all the interfaces in an EtherChannel provided that they have the same MTU. Changing the MTU of an EtherChannel changes the MTU of all member ports. If the MTU of a member port cannot be changed to the new value, that port is suspended (administratively shut down). A port cannot join an EtherChannel if the port has a different MTU. If a member port of an EtherChannel changes MTU, the member port is suspended.

## VLAN Interfaces

If switch ports reside in the same VLAN, either configure all of the switch ports to handle jumbo frames and support the same MTU size, or configure none of them. However, such uniformity of MTU size in the same VLAN is not enforced.

When a VLAN has switch ports with different MTU size, packets received from a port with a larger MTU might be dropped when they are forwarded to a port with a smaller MTU.

If the switch ports in a VLAN have jumbo frames enabled, the corresponding SVI can have jumbo frames enabled. The MTU of an SVI should always be smaller than the smallest MTU among all the switch ports in the VLAN, but this condition is not enforced.

The MTU of a packet is not checked on the ingress side for an SVI; it is checked on the egress side of an SVI. If the MTU of a packet is larger than the MTU of the egress SVI, the packet will be sent to the CPU for fragmentation processing. If the “do not fragment” bit is not set, the packet is fragmented. Otherwise, the packet is dropped.

## Configuring MTU Sizes

To configure the MTU size, perform this task:

|        | Command                                                                                                                                                                                    | Purpose                             |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| Step 1 | Switch(config)# <b>interface</b> {{ <b>vlan</b> <i>vlan_ID</i> }   {{ <i>type</i> <sup>1</sup> <i>slot/port</i> }   { <b>port-channel</b> <i>port_channel_number</i> } <i>slot/port</i> }} | Selects the interface to configure. |

|        | Command                                                                                                              | Purpose                                       |
|--------|----------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|
| Step 2 | Switch(config-if)# <b>mtu</b> <i>mtu_size</i>                                                                        | Configures the MTU size.                      |
|        | Switch(config-if)# <b>no mtu</b>                                                                                     | Reverts to the default MTU size (1500 bytes). |
| Step 3 | Switch(config-if)# <b>end</b>                                                                                        | Exits configuration interface mode.           |
| Step 4 | Switch(config)# <b>end</b>                                                                                           | Exits configuration mode.                     |
| Step 5 | Switch# <b>show running-config interface</b><br>[{ <b>fastethernet</b>   <b>gigabitethernet</b> } <i>slot/port</i> ] | Verifies the running configuration.           |

1. *type* = **fastethernet**, **gigabitethernet**, or **tengigabitethernet**

**Note**

When you remove a linecard, and then reinsert the card, some or all of the MTU values configured on the ports of that linecard may be unconfigured. This will happen if the systemwide limit of 32 different MTUs is reached while the card is removed. Upon reinserting the linecard, the system attempts to reapply the MTU configuration on the ports. If this attempt fails, the MTU values are set to the default.

**Note**

When configuring the MTU size for VLAN interfaces and Layer 3 and Layer 2 Ethernet ports, note that the supported MTU values are from 1500 to 9198 bytes.

This example shows how to configure the MTU size on Gigabit Ethernet port 1/1:

```
switch# conf terminal
switch(config)# interface gi1/1
switch(config-if)# mtu 9198
switch(config-if)# end
switch(config)# end
switch# show interface gigabitethernet 1/2
GigabitEthernet1/2 is administratively down, line protocol is down
 Hardware is C6k 1000Mb 802.3, address is 0030.9629.9f88 (bia 0030.9629.9f88)
 MTU 9216 bytes, BW 1000000 Kbit, DLY 10 usec,
 <...Output Truncated...>
switch#
```

For details on how to configure IP MTU size, refer to [Configuring MTU Sizes, page 6-25](#).

## Interacting with Baby Giants

The baby giants feature, introduced in Cisco IOS Release 12.1(12c)EW, uses the global command **system mtu <size>** to set the global baby giant MTU. This feature also allows certain interfaces to support Ethernet payload size of up to 1552 bytes.

Both the **system mtu** command and the per-interface **mtu** command can operate on interfaces that can support jumbo frames, but the per-interface **mtu** command takes precedence.

For example, before setting the per-interface MTU for interface gi1/1, you issue the **system mtu 1550** command to change the MTU for gi1/1 to 1550 bytes. Next, you issue the per-interface **mtu** command to change the MTU for gi1/1 to 9198 bytes. Now, if you change the baby giant MTU to 1540 bytes with the command **system mtu 1540**, the MTU for gi1/1 remains unchanged at 9198 bytes.

## Configuring the Port Debounce Timer

### Note

You can configure port debounce only on 10 Gigabit Ethernet ports.

The port debounce timer suppresses notification of short link-down events. Link-down events that are shorter than the port debounce timer are not notified to Layer 2 or Layer 3 protocols, decreasing traffic loss due to network reconfiguration. You can configure the port debounce timer separately on each LAN port.

### Caution

Enabling the port debounce timer causes a delay in link down detections, resulting in loss of traffic during the debouncing period. This situation might affect the convergence and reconvergence of some Layer 2 and Layer 3 protocols.

To configure the debounce timer on a port, perform this task:

|        | Command                                                       | Purpose                         |
|--------|---------------------------------------------------------------|---------------------------------|
| Step 1 | Switch(config)# <b>interface tengigabitethernet slot/port</b> | Selects the port to configure.  |
| Step 2 | Switch(config-if)# <b>link debounce [time debounce_time]</b>  | Configures the debounce timer.  |
|        | Switch(config-if)# <b>no link debounce</b>                    | Reverts to the default setting. |
| Step 3 | Switch# <b>show interfaces debounce</b>                       | Verifies the configuration.     |

### Note

The default time is 10ms for E-series supervisor engines and line cards (including Catalyst 4900M, Catalyst 4948-E, Supervisor Engine 6-E, and Supervisor Engine 6L-E. All other supervisor engines use a default of 100ms.

When configuring the debounce timer on a port, you can increase the port debounce timer value between 10 milliseconds and 5000 milliseconds on the tengigabitethernet ports.

### Note

By default, debounce is disabled. If you configure debounce without a time, the value is set at 100ms.

This example shows how to enable the port debounce timer on TenGigabit Ethernet port 2/1 and to accept the default value (10 ms):

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface tenGigabitEthernet 2/1
Switch(config-if)# link debounce
Warning: Enabling debounce feature causes link down detection to be delayed
Switch(config-if)# exit
```

This example shows how to enable the port debounce timer of 5000 ms on TenGigabit Ethernet port 2/2 and to verify the setting:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface tenGigabitEthernet 2/2
```

```
Switch(config-if)# link debounce time 5000
Warning: Enabling debounce feature causes link down detection to be delayed
Switch(config-if)# end
Switch#
Switch# show interfaces debounce | include enable
Te2/1 enable 10
Te2/2 enable 5000
Switch#
```

## Configuring auto-MDIX on a Port

When automatic medium-dependent-interface crossover (auto-MDIX) is enabled on an port, the port automatically detects the required cable connection type (straight through or crossover) and configures the connection appropriately. When connecting switches without the auto-MDIX feature, you must use straight-through cables to connect to devices such as servers, workstations, or routers and crossover cables to connect to other switches or repeaters. With auto-MDIX enabled, you can use either type of cable to connect to other devices, and the interface automatically corrects for any incorrect cabling. For more information about cabling requirements, see the hardware installation guide.

Auto-MDIX is enabled by default. When you enable auto-MDIX, you must also set the speed on the port to **auto** so that for the feature to operate correctly. auto-MDIX is supported on copper media ports. It is not supported on fiber media ports.

Note

The following linecards support Auto-MDIX by default, when port auto-negotiation is enabled: WS-X4424-GB-RJ45, WS-X4448-GB-RJ45, WS-X4548-GB-RJ45 and WS-X4412-2GB-T. You cannot disable them with the **mdix** command.

Note

The following linecards do not support Auto-MDIX, neither by default nor by CLI: WS-X4548-GB-RJ45V, WS-X4524-GB-RJ45V, WS-X4506-GB-T, WS-X4148-RJ, WS-X4248-RJ21V, WS-X4248-RJ45V, WS-X4224-RJ45V and WS-X4232-GB-RJ.

Note

The following linecards support Auto-MDIX through the CLI on their copper media ports: WS-X4124-RJ45, WS-X4148-RJ45 (hardware revision 3.0 or higher), and WS-X4232-GB-RJ45 (hardware revision 3.0, or higher), WS-X4920-GE-RJ45 and WS-4648-RJ45V+E (Auto-MDIX support when inline power is disabled on the port).

Table 6-1 shows the link states that results from auto-MDIX settings and correct and incorrect cabling.

**Table 6-1** Link Conditions and auto-MDIX Settings

| Local Side auto-MDIX | Remote Side auto-MDIX | With Correct Cabling | With Incorrect Cabling |
|----------------------|-----------------------|----------------------|------------------------|
| On                   | On                    | Link up              | Link up                |
| On                   | Off                   | Link up              | Link up                |
| Off                  | On                    | Link up              | Link up                |
| Off                  | Off                   | Link up              | Link down              |

To configure auto-MDIX on a port, perform the following task:

|        | Command                                                     | Purpose                                                                          |
|--------|-------------------------------------------------------------|----------------------------------------------------------------------------------|
| Step 1 | Switch# <b>configure terminal</b>                           | Enters global configuration mode                                                 |
| Step 2 | Switch(config)# <b>interface</b><br><i>interface-id</i>     | Enters interface configuration mode for the physical interface to be configured. |
| Step 3 | Switch(config-if)# <b>speed auto</b>                        | Configures the port to autonegotiate speed with the connected device.            |
| Step 4 | Switch(config-if)# <b>mdix auto</b>                         | Enables auto-MDIX on the port.                                                   |
| Step 5 | Switch(config-if)# <b>end</b>                               | Returns to privileged EXEC mode.                                                 |
| Step 6 | Switch# <b>show interfaces</b><br><i>interface-id</i>       | Verifies the configuration of the auto-MDIX feature on the interface.            |
| Step 7 | Switch# <b>copy running-config</b><br><b>startup-config</b> | (Optional) Saves your entries in the configuration file.                         |

To disable auto-MDIX, use the **no mdix auto** interface configuration command.

This example shows how to enable auto-MDIX on a port:

```
Switch# configure terminal
Switch(config)# interface fastethernet 6/5
Switch(config-if)# speed auto
Switch(config-if)# mdix auto
Switch(config-if)# end
```

## Displaying the Interface auto-MDIX Configuration

To display the interface speed and duplex mode configuration for an interface, perform this task:

|        | Command                                                   | Purpose                                                                                                             |
|--------|-----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Step 1 | Switch> <b>enable</b>                                     | Enables privileged EXEC mode.<br><ul style="list-style-type: none"><li>• Enter your password if prompted.</li></ul> |
| Step 2 | Switch# <b>show interfaces type</b> <i>slot/interface</i> | Displays the interface auto-MDIX configuration setting and operational state.                                       |

Depending on how the **speed auto** and the **mdix auto** commands are configured on a supported linecard interface, the **show interfaces** command displays the following possible auto-MDIX statuses:

Table 6-2 shows the auto-MDIX setting and operational state and the status of auto-MDIX.

**Table 6-2** Auto-MDIX and Operational State

| Auto-MDIX Setting And Operational State on an Interface | Description                                                                                                                                                                    |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto-MDIX on (operational: on)                          | Auto-MDIX is enabled and is fully functioning.                                                                                                                                 |
| Auto-MDIX on (operational: off)                         | Auto-MDIX is enabled on this interface but it is not functioning. To allow auto-MDIX feature to function properly, you must also set the interface speed to be autonegotiated. |
| Auto-MDIX off                                           | Auto-MDIX has been disabled with the <b>no mdix auto</b> command.                                                                                                              |

This example shows how to display the auto-MDIX configuration setting and its operational state on Fast Ethernet interface 6/1:

```
Switch# show interfaces fastethernet 6/1
FastEthernet6/1 is up, line protocol is up (connected)
 Hardware is Fast Ethernet Port, address is 0001.64fe.e5d0 (bia 0001.64fe.e5d0)
 MTU 1500 bytes, BW 100000 Kbit, DLY 100 usec,
 reliability 255/255, txload 1/255, rxload 1/255
 Encapsulation ARPA, loopback not set
 Keepalive set (10 sec)
 Full-duplex, 100Mb/s, link type is auto, media type is 10/100BaseTX
 input flow-control is unsupported output flow-control is unsupported
Auto-MDIX on (operational: on)
 ARP type: ARPA, ARP Timeout 04:00:00
 Last input 00:00:16, output never, output hang never
 Last clearing of "show interface" counters never
 Input queue: 0/2000/0/0 (size/max/drops/flushes); Total output drops: 0
 Queueing strategy: fifo
 Output queue: 0/40 (size/max)
 5 minute input rate 0 bits/sec, 0 packets/sec
 5 minute output rate 0 bits/sec, 0 packets/sec
 511 packets input, 74464 bytes, 0 no buffer
 Received 511 broadcasts (511 multicasts)
 0 runs, 0 giants, 0 throttles
 0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
 0 input packets with dribble condition detected
 3552 packets output, 269088 bytes, 0 underruns
 0 output errors, 0 collisions, 0 interface resets
 0 babbles, 0 late collision, 0 deferred
 1 lost carrier, 0 no carrier
 0 output buffer failures, 0 output buffers swapped out
Switch#
```

## Understanding Online Insertion and Removal

The online insertion and removal (OIR) feature supported on the Catalyst 4500 series switch allows you to remove and replace modules while the system is online. You can shut down the module before removal and restart it after insertion without causing other software or interfaces to shut down.

You do not need to enter a command to notify the software that you are going to remove or install a module. The system notifies the supervisor engine that a module has been removed or installed and scans the system for a configuration change. The newly installed module is initialized, and each interface type is verified against the system configuration; then the system runs diagnostics on the new interface. There is no disruption to normal operation during module insertion or removal.

If you remove a module and then replace it, or insert a different module of the same type into the same slot, no change to the system configuration is needed. An interface of a type that has been configured previously will be brought online immediately. If you remove a module and insert a module of a different type, the interface(s) on that module will be administratively up with the default configuration for that module.

## Monitoring and Maintaining the Interface

The following sections describe how to monitor and maintain the interfaces:

- [Monitoring Interface and Controller Status, page 6-31](#)

- [Clearing and Resetting the Interface, page 6-31](#)
- [Shutting Down and Restarting an Interface, page 6-32](#)
- [Configuring Interface Link Status and Trunk Status Events, page 6-32](#)
- [Resetting the Interface to the Default Configuration, page 6-35](#)

## Monitoring Interface and Controller Status

The Cisco IOS software for the Catalyst 4500 series switch contains commands that you can enter at the EXEC prompt to display information about the interface, including the version of the software and the hardware, the controller status, and statistics about the interfaces. The following table lists some of the interface monitoring commands. (You can display the full list of **show** commands by entering the **show ?** command at the EXEC prompt.) These commands are fully described in the *Interface Command Reference*.

To display information about the interface, perform this task:

|        | Command                                                       | Purpose                                                                                                                   |
|--------|---------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Switch# <b>show interfaces</b> [ <i>type slot/interface</i> ] | Displays the status and configuration of all interfaces or of a specific interface.                                       |
| Step 2 | Switch# <b>show running-config</b>                            | Displays the configuration currently running in RAM.                                                                      |
| Step 3 | Switch# <b>show protocols</b> [ <i>type slot/interface</i> ]  | Displays the global (system-wide) and interface-specific status of any configured protocol.                               |
| Step 4 | Switch# <b>show version</b>                                   | Displays the hardware configuration, software version, the names and sources of configuration files, and the boot images. |

This example shows how to display the status of Fast Ethernet interface 5/5:

```
Switch# show protocols fastethernet 5/5
FastEthernet5/5 is up, line protocol is up
Switch#
```

## Clearing and Resetting the Interface

To clear the interface counters shown with the **show interfaces** command, enter the following command:

| Command                                                      | Purpose                    |
|--------------------------------------------------------------|----------------------------|
| Switch# <b>clear counters</b> [ <i>type slot/interface</i> ] | Clears interface counters. |

This example shows how to clear and reset the counters on Fast Ethernet interface 5/5:

```
Switch# clear counters fastethernet 5/5
Clear "show interface" counters on this interface [confirm] y
Switch#
*Sep 30 08:42:55: %CLEAR-5-COUNTERS: Clear counter on interface FastEthernet5/5
by vty1 (171.69.115.10)
Switch#
```

The **clear counters** command (without any arguments) clears all the current interface counters from all interfaces.

#### Note

The **clear counters** command does not clear counters retrieved with SNMP; it clears only those counters displayed with the EXEC **show interfaces** command.

## Shutting Down and Restarting an Interface

You can disable an interface, which disables all functions on the specified interface and marks the interface as unavailable on all monitoring command displays. This information is communicated to other network servers through all dynamic routing protocols. The interface will not be mentioned in any routing updates.

To shut down an interface and then restart it, perform this task:

|        | Command                                                                                                                                                                                                                         | Purpose                                   |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| Step 1 | Switch(config)# <b>interface</b> { <b>vlan</b> <i>vlan_ID</i> }  <br>{ <b>fastethernet</b>   <b>gigabitethernet</b>  <br><b>tengigabitethernet</b> } <i>slot/port</i> }   { <b>port-channel</b><br><i>port_channel_number</i> } | Specifies the interface to be configured. |
| Step 2 | Switch(config-if)# <b>shutdown</b>                                                                                                                                                                                              | Shuts down the interface.                 |
| Step 3 | Switch(config-if)# <b>no shutdown</b>                                                                                                                                                                                           | Reenables the interface.                  |

This example shows how to shut down Fast Ethernet interface 5/5:

```
Switch(config)# interface fastethernet 5/5
Switch(config-if)# shutdown
Switch(config-if)#
*Sep 30 08:33:47: %LINK-5-CHANGED: Interface FastEthernet5/5, changed state to a
administratively down
Switch(config-if)#
```

This example shows how to reenabale Fast Ethernet interface 5/5:

```
Switch(config-if)# no shutdown
Switch(config-if)#
*Sep 30 08:36:00: %LINK-3-UPDOWN: Interface FastEthernet5/5, changed state to up
Switch(config-if)#
```

To verify whether an interface is disabled, enter the EXEC **show interfaces** command. An interface that has been shut down will appear as “administratively down.”

## Configuring Interface Link Status and Trunk Status Events

You can configure interface link status and trunk status events. On the Catalyst 4500 series switch, the following interface logging event notifications are supported both globally and per interface:

- Enable/disable notification on the interface whenever its data link status is changed.
- Enable/disable notification on the trunk interface whenever its trunking status is changed.

Use the **[no] logging event link-status [use-global]** command to enable/disable the interface link status event. Use the **[no] logging event trunk-status [use-global]** command to enable/disable the interface trunk status event.

Each interface link status logging event can be configured in one of the following states:

- **logging event link-status** - Link status logging event is enabled explicitly on the interface regardless of the switch global setting.
- **no logging event link-status** - Link status logging event is disabled explicitly on the interface regardless of the switch global setting.
- **logging event link-status use-global** - This is the default link status logging event configuration on the interface; its configuration should follow the switch global link status logging event setting.

The interface trunk status logging event can be configured in the same configuration states.

## Configuring Link Status Event Notification for an Interface

To enable/disable a link status logging event, enter one of the following commands:

| Command                                                         | Purpose                                                                 |
|-----------------------------------------------------------------|-------------------------------------------------------------------------|
| Switch(config-if) # <b>logging event link-status</b>            | Enables interface link status logging.                                  |
| Switch(config-if) # <b>no logging event link-status</b>         | Disables interface link status logging.                                 |
| Switch(config-if) # <b>logging event link-status use-global</b> | Specifies the global default setting for interface link status logging. |

## Global Settings

You can also provide a global configuration for the corresponding logging event. A global configuration provides default logging settings for all interfaces. The **[no] logging event link-status global** command lets you enable/disable the interface link status logging for the entire switch. The **[no] logging event trunk-status global** command lets you enable/disable interface trunk status logging for the entire switch.

Each interface link status logging event, if not configured at the interface level, will use the following global logging event setting:

- **logging event link-status global** - Link status logging event is enabled, if not configured on the interface.
- **no logging event link-status global** - Link status logging event is disabled, if not configured on the interface.

The interface trunk status logging event has similar global configurations.

## Configuring a Switch Global Link Status Logging Event

To enable/disable the global link status logging event, enter one of the following commands:

| Command                                                        | Purpose                              |
|----------------------------------------------------------------|--------------------------------------|
| Switch(config-if) # <b>logging event link-status global</b>    | Enables global link status logging.  |
| Switch(config-if) # <b>no logging event link-status global</b> | Disables global link status logging. |

## Result

The following example displays a summary of the operating states for the interface logging event under different combinations of global and interface logging settings:

| global setting | interface setting   | actual logging state |
|----------------|---------------------|----------------------|
| -----          | -----               | -----                |
| on             | on                  | on                   |
| off            | on                  | on                   |
| on             | off                 | off                  |
| off            | off                 | off                  |
| on             | default(use-global) | on                   |
| off            | default(use-global) | off                  |

The following example displays the configuration and logging message output for link status and trunk status logging events:

```
//
// The global link status and trunk status logging events are enabled.
//
Switch# show running | include logging
show running | include logging
logging event link-status global
logging event trunk-status global
Switch#

//
// The interface link status and trunk status logging settings
// are set to default values, which follow regardless of the global
// setting.
//
Switch# show running interface g1/4
Building configuration...

Current configuration: 97 bytes
!
interface GigabitEthernet1/4
 switchport trunk encapsulation dot1q
 switchport mode trunk
end
Switch#

//
// The trunk status logging messages for the interface are
// displayed whenever the interface trunking status is changed.
// Here we change the other end node's trunking encapsulation
// from dot1q to isl.
//
3d00h: %DTP-5-ILGLCFG: Illegal config(on,isl--on,dot1q) on Gi1/4
3d00h: %DTP-5-ILGLCFG: Illegal config(on,isl--on,dot1q) on Gi1/4
3d00h: %DTP-5-ILGLCFG: Illegal config(on,isl--on,dot1q) on Gi1/4

//
// The link and trunk status logging message for the interface
// are displayed whenever the interface link status is changed.
// Here we do a "shut" and "no shut" on the other end link node.
//
3d00h: %DTP-5-NONTRUNKPORTON: Port Gi1/4 has become non-trunk
3d00h: %LINEPROTO-5-UPDOWN: Line protocol on Interface
GigabitEthernet1/4, changed state to down
3d00h: %LINK-3-UPDOWN: Interface GigabitEthernet1/4, changed state to
down
3d00h: %LINK-3-UPDOWN: Interface GigabitEthernet1/4, changed state to up
```

```
3d00h: %DTP-5-TRUNKPORTON: Port Gi1/4 has become dot1q trunk
3d00h: %LINEPROTO-5-UPDOWN: Line protocol on Interface
GigabitEthernet1/4, changed state to up
```

## Resetting the Interface to the Default Configuration

If you have configured a interface with many command lines and you want to clear all the configuration on that interface, you can use the **default interface** global configuration command, as follows:

```
Switch(config)# default interface fastEthernet 3/5
Interface FastEthernet3/5 set to default configuration
```

This command will clear all the configurations and shutdown the interface:

```
Switch# show run interface fastethernet 3/5
Building configuration...

Current configuration : 58 bytes
!
interface FastEthernet3/5
 no ip address
 shutdown
end
```

# CHAPTER 7

## Checking Port Status and Connectivity

---

This chapter describes how to check switch port status and connectivity on the Catalyst 4500 series switch.

This chapter includes the following major sections:

- [Checking Module Status, page 7-2](#)
- [Checking Interfaces Status, page 7-2](#)
- [Displaying MAC Addresses, page 7-3](#)
- [Checking Cable Status Using Time Domain Reflectometer, page 7-3](#)
- [Using Telnet, page 7-5](#)
- [Changing the Logout Timer, page 7-6](#)
- [Monitoring User Sessions, page 7-6](#)
- [Using Ping, page 7-7](#)
- [Using IP Traceroute, page 7-8](#)
- [Using Layer 2 Traceroute, page 7-9](#)
- [Configuring ICMP, page 7-11](#)

### Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

---

## Checking Module Status

The Catalyst 4500 series switch is a multimodule system. You can see which modules are installed, as well as the MAC address ranges and version numbers for each module, by using the **show module** command. You can use the `[mod_num]` argument to specify a particular module number to see detailed information on that module.

This example shows how to check module status for all modules on your switch:

```
Switch# show module all
```

| Mod | Ports | Card Type                          | Model            | Serial No.  |
|-----|-------|------------------------------------|------------------|-------------|
| 1   | 2     | 1000BaseX (GBIC) Supervisor Module | WS-X4014         | JAB012345AB |
| 5   | 24    | 10/100/1000BaseTX (RJ45)           | WS-X4424-GB-RJ45 | JAB045304EY |
| 6   | 48    | 10/100BaseTX (RJ45)                | WS-X4148         | JAB023402QK |

| M | MAC addresses                    | Hw  | Fw                | Sw            | Stat |
|---|----------------------------------|-----|-------------------|---------------|------|
| 1 | 0004.dd46.9f00 to 0004.dd46.a2ff | 0.0 | 12.1(10r)EW(1.21) | 12.1(10)EW(1) | Ok   |
| 5 | 0050.3e7e.1d70 to 0050.3e7e.1d87 | 0.0 |                   |               | Ok   |
| 6 | 0050.0f10.2370 to 0050.0f10.239f | 1.0 |                   |               | Ok   |

```
Switch#
```

## Checking Interfaces Status

You can view summary or detailed information on the switch ports using the **show interfaces status** command. To see summary information on all ports on the switch, enter the **show interfaces status** command with no arguments. Specify a particular module number to see information on the ports on that module only. Enter both the module number and the port number to see detailed information about the specified port.

To apply configuration commands to a particular port, you must specify the appropriate logical module. For more information, see the [“Checking Module Status” section on page 7-2](#).

This example shows how to display the status of all interfaces on a Catalyst 4500 series switch, including transceivers. Output of this command displays “Unapproved GBIC” for non-Cisco transceivers:

```
Switch# show interfaces status
```

| Port  | Name | Status     | Vlan | Duplex | Speed | Type           |
|-------|------|------------|------|--------|-------|----------------|
| Gi1/1 |      | notconnect | 1    | auto   | auto  | No Gbic        |
| Gi1/2 |      | notconnect | 1    | auto   | auto  | No Gbic        |
| Gi5/1 |      | notconnect | 1    | auto   | auto  | 10/100/1000-TX |
| Gi5/2 |      | notconnect | 1    | auto   | auto  | 10/100/1000-TX |
| Gi5/3 |      | notconnect | 1    | auto   | auto  | 10/100/1000-TX |
| Gi5/4 |      | notconnect | 1    | auto   | auto  | 10/100/1000-TX |
| Fa6/1 |      | connected  | 1    | a-full | a-100 | 10/100BaseTX   |
| Fa6/2 |      | connected  | 2    | a-full | a-100 | 10/100BaseTX   |
| Fa6/3 |      | notconnect | 1    | auto   | auto  | 10/100BaseTX   |
| Fa6/4 |      | notconnect | 1    | auto   | auto  | 10/100BaseTX   |

```
Switch#
```

This example shows how to display the status of interfaces in error-disabled state:

```
Switch# show interfaces status err-disabled
```

| Port  | Name | Status       | Reason    |
|-------|------|--------------|-----------|
| Fa9/4 |      | err-disabled | link-flap |

informational error message when the timer expires on a cause

```

5d04h:%PM-SP-4-ERR_RECOVER:Attempting to recover from link-flap err-disable state on Fa9/4
Switch#
```

## Displaying MAC Addresses

In addition to displaying the MAC address range for a module using the **show module** command, you can display the MAC address table information of a specific MAC address or a specific interface in the switch using the **show mac-address-table address** and **show mac-address-table interface** commands.

This example shows how to display MAC address table information for a specific MAC address:

```
Switch# show mac-address-table address 0050.3e8d.6400
vlan mac address type protocol qos ports
-----+-----+-----+-----+-----+-----
200 0050.3e8d.6400 static assigned -- Switch
100 0050.3e8d.6400 static assigned -- Switch
5 0050.3e8d.6400 static assigned -- Switch
4 0050.3e8d.6400 static ipx -- Switch
1 0050.3e8d.6400 static ipx -- Switch
1 0050.3e8d.6400 static assigned -- Switch
4 0050.3e8d.6400 static assigned -- Switch
5 0050.3e8d.6400 static ipx -- Switch
100 0050.3e8d.6400 static ipx -- Switch
200 0050.3e8d.6400 static ipx -- Switch
100 0050.3e8d.6400 static other -- Switch
200 0050.3e8d.6400 static other -- Switch
5 0050.3e8d.6400 static other -- Switch
4 0050.3e8d.6400 static ip -- Switch
1 0050.3e8d.6400 static ip -- Route
1 0050.3e8d.6400 static other -- Switch
4 0050.3e8d.6400 static other -- Switch
5 0050.3e8d.6400 static ip -- Switch
200 0050.3e8d.6400 static ip -- Switch
100 0050.3e8d.6400 static ip -- Switch
Switch#
```

This example shows how to display MAC address table information for a specific interface:

```
Switch# show mac-address-table interface gigabit 1/1
Multicast Entries
vlan mac address type ports
-----+-----+-----+-----
1 ffff.ffff.ffff system Switch,Gi6/1,Gi6/2,Gi6/9,Gi1/1
Switch#
```

## Checking Cable Status Using Time Domain Reflectometer

### Note

Interfaces on a Supervisor Engine 6-E or Supervisor Engine 6L-E do not support TDR; the line cards do.

You can use the Time Domain Reflectometer (TDR) feature to determine if cabling is at fault when you cannot establish a link.

**Note**

This test is especially important when replacing an existing switch, upgrading to Gigabit Ethernet, or installing new cable plants.

## Overview

With TDR, you can check the status of copper cables on the 48-port 10/100/1000 BASE-T modules for the Catalyst 4500 series switch (WS-X4548-GB-RJ45, WS-X4548-GB-RJ45V, WS-X4524-GB-RJ45V, WS-X4548-GB-RJ45V+, WS-X4013+TS, WS-C4948, and WS-C4948-10GE). TDR detects a cable fault by sending a signal through the cable and reading the signal that is reflected back. All or part of the signal can be reflected back either by cable defects or by the end of the cable.

**Note**

There are four pairs of standard category 5 cable. Each pair can assume one of the following states: open (not connected), broken, shorted, or terminated. The TDR test detects all four states and displays the first three as “Fault” conditions, and displays the fourth as “Terminated.” Although the CLI output is shown, the cable length is shown only if the state is “Faulty.”

## Running the TDR Test

To start the TDR test, perform this task in privileged mode:

|        | Command                                                                                                 | Purpose                                    |
|--------|---------------------------------------------------------------------------------------------------------|--------------------------------------------|
| Step 1 | Switch# <b>test cable-diagnostics tdr</b><br>{ <b>interface</b> { <i>interface interface-number</i> } } | Starts the TDR test.                       |
| Step 2 | Switch# <b>show cable-diagnostics tdr</b><br>{ <b>interface</b> { <i>interface interface-number</i> } } | Displays the TDR test counter information. |

This example shows how to start the TDR test on port 1 on module 2:

```
Switch# test cable-diagnostics tdr int gi2/1
Switch#
```

This example shows the message that displays when the TDR test is not supported on a module:

```
Switch# test cable-diagnostics tdr int gi2/1
00:03:15:%C4K_IOSDIAGMAN-4-TESTNOTSUPPORTEDONMODULE: Online cable
diag tdr test is not supported on this module
Switch#
```

This example shows how to display TDR test results for a port:

```
Switch# show cable-diagnostics tdr interface gi4/13
Interface Speed Local pair Cable length Remote channel Status
Gi4/13 0Mbps 1-2 102 +-2m Unknown Fault
 3-6 100 +-2m Unknown Fault
 4-5 102 +-2m Unknown Fault
 7-8 102 +-2m Unknown Fault
```

**Note**

This command will be deprecated in future releases of Cisco IOS software. Use the diagnostic start and the **show diagnostic result** commands to run the TDR test and display the test results.

**Note**

TDR is a port test; the port cannot handle traffic for the duration of the test (generally, 1 minute).

## TDR Guidelines

The following guidelines apply to the use of TDR:

- If you connect a port undergoing a TDR test to an Auto-MDIX enabled port, the TDR result might be invalid. In those instances, the port on the WS-X4148-RJ45V should be administratively down before the start of the TDR test.
- If you connect a port undergoing a TDR test to a 100BASE-T port such as that on the WS-X4148-RJ45V, the unused pairs (4-5 and 7-8) will be reported as faulty because the remote end does not terminate these pairs.
- Do not change the port configuration while the TDR test is running.
- Due to cable characteristics, you should run the TDR test multiple times to get accurate results.
- Do not change port status (for example, remove the cable at the near or far end) because the results might be inaccurate.

## Using Telnet

You can access the switch command-line interface (CLI) using Telnet. In addition, you can use Telnet from the switch to access other devices in the network. You can have up to eight simultaneous Telnet sessions.

Before you can open a Telnet session to the switch, you must first set the IP address (and in some cases the default gateway) for the switch. For information about setting the IP address and default gateway, see [Chapter 3, “Configuring the Switch for the First Time.”](#)

**Note**

To establish a Telnet connection to a host by using the hostname, configure and enable DNS.

To establish a Telnet connection to another device on the network from the switch, perform this task:

| Command                                           | Purpose                                  |
|---------------------------------------------------|------------------------------------------|
| Switch# <b>telnet</b> <i>host</i> [ <i>port</i> ] | Opens a Telnet session to a remote host. |

This example shows how to establish a Telnet connection from the switch to the remote host named labsparc:

```
Switch# telnet labsparc
Trying 172.16.10.3...
Connected to labsparc.
Escape character is '^]'.

UNIX(r) System V Release 4.0 (labsparc)

login:
```

## Changing the Logout Timer

The logout timer automatically disconnects a user from the switch when the user is idle for longer than the specified time. To set the logout timer, perform this task:

| Command                             | Purpose                                                                                                                                                                          |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch# <b>logoutwarning number</b> | Changes the logout timer value (a timeout value of 0 prevents idle sessions from being disconnected automatically).<br>Use the <b>no</b> keyword to return to the default value. |

## Monitoring User Sessions

You can display the currently active user sessions on the switch using the **show users** command. The command output lists all active console port and Telnet sessions on the switch.

To display the active user sessions on the switch, perform this task in privileged EXEC mode:

| Command                         | Purpose                                                    |
|---------------------------------|------------------------------------------------------------|
| Switch# <b>show users [all]</b> | Displays the currently active user sessions on the switch. |

This example shows the output of the **show users** command when local authentication is enabled for console and Telnet sessions (the asterisk [\*] indicates the current session):

```
Switch# show users
 Line User Host(s) Idle Location
* 0 con 0 idle 00:00:00

 Interface User Mode Idle Peer Address

Switch# show users all
 Line User Host(s) Idle Location
* 0 con 0 idle 00:00:00
 1 vty 0 idle 00:00:00
 2 vty 1 idle 00:00:00
 3 vty 2 idle 00:00:00
 4 vty 3 idle 00:00:00
 5 vty 4 idle 00:00:00

 Interface User Mode Idle Peer Address
Switch#
```

To disconnect an active user session, perform this task:

| Command                                       | Purpose                                           |
|-----------------------------------------------|---------------------------------------------------|
| Switch# <b>disconnect {console   ip_addr}</b> | Disconnects an active user session on the switch. |

This example shows how to disconnect an active console port session and an active Telnet session:

```
Switch> disconnect console
Console session disconnected.
Console> (enable) disconnect tim-nt.bigcorp.com
Telnet session from tim-nt.bigcorp.com disconnected. (1)
Switch# show users
 Session User Location
 ----- -
telnet jake jake-mac.bigcorp.com
* telnet suzy suzy-pc.bigcorp.com
Switch#
```

## Using Ping

These sections describe how to use IP ping:

- [Understanding How Ping Works, page 7-7](#)
- [Running Ping, page 7-7](#)

## Understanding How Ping Works

You can use the **ping** command to verify connectivity to remote hosts. If you attempt to ping a host in a different IP subnetwork, you must define a static route to the network or configure a router to route between those subnets.

The **ping** command is configurable from normal executive and privileged EXEC mode. Ping returns one of the following responses:

- Normal response—The normal response (*hostname is alive*) occurs in 1 to 10 seconds, depending on network traffic.
- Destination does not respond—If the host does not respond, a No Answer message is returned.
- Unknown host—If the host does not exist, an Unknown Host message is returned.
- Destination unreachable—If the default gateway cannot reach the specified network, a Destination Unreachable message is returned.
- Network or host unreachable—If there is no entry in the route table for the host or network, a Network or Host Unreachable message is returned.

To stop a ping in progress, press **Ctrl-C**.

## Running Ping

To ping another device on the network from the switch, perform this task in normal executive and privileged EXEC mode:

| Command                  | Purpose                               |
|--------------------------|---------------------------------------|
| Switch# <b>ping host</b> | Checks connectivity to a remote host. |

This example shows how to ping a remote host from normal executive mode:

```
Switch# ping labsparc
labsparc is alive
Switch> ping 72.16.10.3
12.16.10.3 is alive
Switch#
```

This example shows how to enter a **ping** command in privileged EXEC mode specifying the number of packets, the packet size, and the timeout period:

```
Switch# ping
Target IP Address []: 12.20.5.19
Number of Packets [5]: 10
Datagram Size [56]: 100
Timeout in seconds [2]: 10
Source IP Address [12.20.2.18]: 12.20.2.18
!!!!!!!!!!!!

----12.20.2.19 PING Statistics----
10 packets transmitted, 10 packets received, 0% packet loss
round-trip (ms) min/avg/max = 1/1/1
Switch
```

## Using IP Traceroute

These sections describe how to use IP traceroute feature:

- [Understanding How IP Traceroute Works, page 7-8](#)
- [Running IP Traceroute, page 7-9](#)

## Understanding How IP Traceroute Works

You can use IP traceroute to identify the path that packets take through the network on a hop-by-hop basis. The command output displays all network layer (Layer 3) devices, such as routers, that the traffic passes through on the way to the destination.

Layer 2 switches can participate as the source or destination of the **trace** command but will not appear as a hop in the **trace** command output.

The **trace** command uses the Time To Live (TTL) field in the IP header to cause routers and servers to generate specific return messages. Traceroute starts by sending a User Datagram Protocol (UDP) datagram to the destination host with the TTL field set to 1. If a router finds a TTL value of 1 or 0, it drops the datagram and sends back an Internet Control Message Protocol (ICMP) Time-Exceeded message to the sender. Traceroute determines the address of the first hop by examining the source address field of the ICMP Time-Exceeded message.

To identify the next hop, traceroute sends a UDP packet with a TTL value of 2. The first router decrements the TTL field by 1 and sends the datagram to the next router. The second router sees a TTL value of 1, discards the datagram, and returns the Time-Exceeded message to the source. This process continues until the TTL is incremented to a value large enough for the datagram to reach the destination host or until the maximum TTL is reached.

To determine when a datagram reaches its destination, traceroute sets the UDP destination port in the datagram to a very large value that the destination host is unlikely to be using. When a host receives a datagram with an unrecognized port number, it sends an ICMP Port Unreachable error message to the source. The Port Unreachable error message indicates to traceroute that the destination has been reached.

## Running IP Traceroute

To trace the path that packets take through the network, perform this task in EXEC or privileged EXEC mode:

| Command                                                         | Purpose                                                                     |
|-----------------------------------------------------------------|-----------------------------------------------------------------------------|
| Switch# <b>trace</b> [ <i>protocol</i> ] [ <i>destination</i> ] | Runs IP traceroute to trace the path that packets take through the network. |

This example shows use the **trace** command to display the route a packet takes through the network to reach its destination:

```
Switch# trace ip ABA.NYC.mil
```

Type escape sequence to abort.

Tracing the route to ABA.NYC.mil (26.0.0.73)

```
 1 DEBRIS.CISCO.COM (192.180.1.6) 1000 msec 8 msec 4 msec
 2 BARRNET-GW.CISCO.COM (192.180.16.2) 8 msec 8 msec 8 msec

 6 MOFFETT-FLD-MB.in.MIL (192.52.195.1) 216 msec 120 msec 132 msec
 7 ABA.NYC.mil (26.0.0.73) 412 msec 628 msec 664 msec
```

```
Switch#
```

## Using Layer 2 Traceroute

The Layer 2 traceroute feature allows the switch to identify the physical path that a packet takes from a source device to a destination device. Layer 2 traceroute supports only unicast source and destination MAC addresses. It determines the path by using the MAC address tables of the switches in the path. When the switch detects a device in the path that does not support Layer 2 traceroute, the switch continues to send Layer 2 trace queries and lets them time out.

If you want the switch to trace the path from a host on a source device to a host on a destination device, the switch can identify only the path from the source device to the destination device. It cannot identify the path that a packet takes from source host to the source device or from the destination device to the destination host.

These sections describe how to use the Layer 2 traceroute feature:

- [Layer 2 Traceroute Usage Guidelines, page 7-10](#)
- [Running Layer 2 Traceroute, page 7-11](#)

## Layer 2 Traceroute Usage Guidelines

These are the Layer 2 traceroute usage guidelines:

- CDP must be enabled on all the devices in the network. For Layer 2 traceroute to function properly, do not disable CDP.

If any devices in the physical path are transparent to CDP, the switch cannot identify the path through these devices.

**Note** For more information about enabling CDP, see [Chapter 26, “Configuring CDP.”](#)

- All switches in the physical path must have IP connectivity. When a switch is reachable from another switch, you can test connectivity by using the **ping** command in privileged EXEC mode.
- The maximum number of hops identified in the path is ten.
- You can enter the **traceroute mac** or the **traceroute mac ip** command in privileged EXEC mode on a switch that is not in the physical path from the source device to the destination device. All switches in the path must be reachable from this switch.
- The **traceroute mac** command output shows the Layer 2 path only when the specified source and destination MAC addresses belong to the same VLAN. If you specify source and destination MAC addresses that belong to different VLANs, the Layer 2 path is not identified, and an error message appears.
- If you specify a multicast source or destination MAC address, the path is not identified, and an error message appears.
- If the source or destination MAC address belongs to multiple VLANs, you must specify the VLAN to which both the source and destination MAC addresses belong. If the VLAN is not specified, the path is not identified, and an error message appears.
- The **traceroute mac ip** command output shows the Layer 2 path when the specified source and destination IP addresses belong to the same subnet. When you specify the IP addresses, the switch uses Address Resolution Protocol (ARP) to associate the IP address with the corresponding MAC address and the VLAN ID.
  - If an ARP entry exists for the specified IP address, the switch uses the associated MAC address and identifies the physical path.
  - If an ARP entry does not exist, the switch sends an ARP query and tries to resolve the IP address. If the IP address is not resolved, the path is not identified, and an error message appears.
- When multiple devices are attached to one port through hubs (for example, multiple CDP neighbors are detected on a port), the Layer 2 traceroute feature is not supported. When more than one CDP neighbor is detected on a port, the Layer 2 path is not identified, and an error message appears.
- This feature is not supported in Token Ring VLANs.

## Running Layer 2 Traceroute

To display the physical path that a packet takes from a source device to a destination device, perform either one of these tasks in privileged EXEC mode:

| Command                                                                         | Purpose                                                                          |
|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Switch# <b>traceroute mac</b> {source-mac-address}<br>{destination-mac-address} | Runs Layer 2 traceroute to trace the path that packets take through the network. |

or

| Command                                                                            | Purpose                                                                     |
|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|
| Switch# <b>traceroute mac ip</b> {source-mac-address}<br>{destination-mac-address} | Runs IP traceroute to trace the path that packets take through the network. |

These examples show how to use the **traceroute mac** and **traceroute mac ip** commands to display the physical path a packet takes through the network to reach its destination:

```
Switch# traceroute mac 0000.0201.0601 0000.0201.0201

Destination 0000.0201.0201 found on con2[WS-C3550-24] (2.2.2.2)
Layer 2 trace completed.
Switch#
```

## Configuring ICMP

Internet Control Message Protocol (ICMP) provides many services that control and manage IP connections. ICMP messages are sent by routers or access servers to hosts or other routers when a problem is discovered with the Internet header. For detailed information on ICMP, refer to RFC 792.

## Enabling ICMP Protocol Unreachable Messages

If the Cisco IOS software receives a nonbroadcast packet that uses an unknown protocol, it sends an ICMP Protocol Unreachable message back to the source.

Similarly, if the software receives a packet that it is unable to deliver to the ultimate destination because it knows of no route to the destination address, it sends an ICMP Host Unreachable message to the source. This feature is enabled by default.

To enable the generation of ICMP Protocol Unreachable and Host Unreachable messages, enter the following command in interface configuration mode:

| Command                                        | Purpose                                                                                                                               |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Switch (config-if)# <b>[no] ip unreachable</b> | Enables ICMP destination unreachable messages.<br><br>Use the <b>no</b> keyword to disable the ICMP destination unreachable messages. |

### Caution

If you enter the **no ip unreachable** command, you will break the path MTU discovery” functionality. Routers in the middle of the network might be forced to fragment packets.

To limit the rate that Internet Control Message Protocol (ICMP) destination unreachable messages are generated, perform this task:

| Command                                                                       | Purpose                                                                                                                                           |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch (config)# <b>[no] ip icmp rate-limit unreachable [df] milliseconds</b> | Limits the rate that ICMP destination messages are generated.<br><br>Use the <b>no</b> keyword to remove the rate limit and reduce the CPU usage. |

## Enabling ICMP Redirect Messages

Data routes are sometimes less than optimal. For example, it is possible for the router to be forced to resend a packet through the same interface on which it was received. If this occurs, the Cisco IOS software sends an ICMP Redirect message to the originator of the packet telling the originator that the router is on a subnet directly connected to the receiving device, and that it must forward the packet to another system on the same subnet. The software sends an ICMP Redirect message to the packet's originator because the originating host presumably could have sent that packet to the next hop without involving this device at all. The Redirect message instructs the sender to remove the receiving device from the route and substitute a specified device representing a more direct path. This feature is enabled by default.

However, when Hot Standby Router Protocol (HSRP) is configured on an interface, ICMP Redirect messages are disabled (by default) for the interface. For more information on HSRP, refer to the following URL:

[http://www.cisco.com/en/US/docs/ios/ipapp/configuration/guide/ipapp\\_hsrp\\_ps6350\\_TSD\\_Products\\_Configuration\\_Guide\\_Chapter.html](http://www.cisco.com/en/US/docs/ios/ipapp/configuration/guide/ipapp_hsrp_ps6350_TSD_Products_Configuration_Guide_Chapter.html)

To enable the sending of ICMP Redirect messages if the Cisco IOS software is forced to resend a packet through the same interface on which it was received, enter the following command in interface configuration mode:

| Command                                      | Purpose                                                                                                                      |
|----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|
| Switch (config-if)# <b>[no] ip redirects</b> | Enables ICMP Redirect messages.<br><br>Use the <b>no</b> keyword to disable the ICMP Redirect messages and reduce CPU usage. |

## Enabling ICMP Mask Reply Messages

Occasionally, network devices must know the subnet mask for a particular subnetwork in the internetwork. To obtain this information, devices can send ICMP Mask Request messages. These messages are responded to by ICMP Mask Reply messages from devices that have the requested information. The Cisco IOS software can respond to ICMP Mask Request messages if the ICMP Mask Reply function is enabled.

To have the Cisco IOS software respond to ICMP mask requests by sending ICMP Mask Reply messages, perform this task:

| Command                                       | Purpose                                                                                                             |
|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Switch (config-if)# <b>[no] ip mask-reply</b> | Enables response to ICMP destination mask requests.<br><br>Use the <b>no</b> keyword to disable this functionality. |

## CHAPTER 8

# Configuring Supervisor Engine Redundancy Using RPR and SSO

Catalyst 4500 series switches allow a redundant supervisor engine to take over if the active supervisor engine fails. In software, supervisor engine redundancy is enabled by running the redundant supervisor engine in route processor redundancy (RPR) or stateful switchover (SSO) operating mode.

Note

The minimum ROMMON requirement for running SSO is Cisco IOS Release 12.1(20r)EW1 or Cisco IOS Release 12.2(20r)EW1.

This chapter describes how to configure supervisor engine redundancy on the Catalyst 4507R and Catalyst 4510R switches.

Note

For information on Cisco nonstop forwarding (NSF) with SSO, see [Chapter 9, “Configuring Cisco NSF with SSO Supervisor Engine Redundancy.”](#)

This chapter contains these major sections:

- [About Supervisor Engine Redundancy, page 8-2](#)
- [About Supervisor Engine Redundancy Synchronization, page 8-5](#)
- [Supervisor Engine Redundancy Guidelines and Restrictions, page 8-6](#)
- [Configuring Supervisor Engine Redundancy, page 8-8](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*

and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

## About Supervisor Engine Redundancy

These sections describe supervisor engine redundancy:

- [Overview, page 8-2](#)
- [RPR Operation, page 8-3](#)
- [SSO Operation, page 8-3](#)

### Overview

With supervisor engine redundancy enabled, if the active supervisor engine fails or if a manual switchover is performed, the redundant supervisor engine becomes the active supervisor engine. The redundant supervisor engine has been automatically initialized with the startup configuration of the active supervisor engine, shortening the switchover time (30 seconds or longer in RPR mode, depending on the configuration; subsecond in SSO mode).

In addition to the reduced switchover time, supervisor engine redundancy supports the following:

- Online insertion and removal (OIR) of the redundant supervisor engine.

Supervisor engine redundancy allows OIR of the redundant supervisor engine for maintenance. When the redundant supervisor engine is inserted, the active supervisor engine detects its presence, and the redundant supervisor engine boots into a partially-initialized state in RPR mode and a fully-initialized state in SSO mode.

- Software upgrade. (See the [“Performing a Software Upgrade” section on page 8-14.](#))

To minimize down time during software changes on the supervisor engine, load the new image on the redundant supervisor engine, and conduct a switchover.

When power is first applied to a switch, the supervisor engine that boots first becomes the active supervisor engine and remains active until a switchover occurs.

A switchover will occur when one or more of the following events take place:

- The active supervisor engine fails (due to either hardware or software function) or is removed.
- A user forces a switchover.
- A user reloads the active supervisor engine.

[Table 8-1](#) provides information about chassis and supervisor engine support for redundancy.

**Table 8-1 Chassis and Supervisor Support**

| Chassis<br>(Product Number)   | Supported Supervisor Engines                                                                                                                                                                                                               |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Catalyst 4507R<br>(WS-C4507R) | Supports redundant Supervisor Engine II-Plus (WS-X4013+), redundant Supervisor Engine II-Plus (WS-X4013+GE), Supervisor Engine IV (WS-X4515), redundant Supervisor Engine V (WS-X4516), and redundant Supervisor Engine V (WS-X4516-10GE). |
| Catalyst 4510R<br>(WS-C4510R) | Supports redundant Supervisor Engine V (WS-X4516) and redundant Supervisor Engine V (WS-X4516-10GE).                                                                                                                                       |

## RPR Operation

RPR is supported in Cisco IOS Release 12.2(12c)EW and later releases. When a redundant supervisor engine runs in RPR mode, it starts up in a partially-initialized state and is synchronized with the persistent configuration of the active supervisor engine.

### Note

Persistent configuration includes the following components: startup-config, boot variables, config-register, and VLAN database.

The redundant supervisor engine pauses the startup sequence after basic system initialization, and in the event that the active supervisor engine fails, the redundant supervisor engine becomes the new active supervisor engine.

In a supervisor engine switchover, traffic is disrupted because in the RPR mode all of the physical ports restart since there is no state maintained between supervisor engines relating to module types and statuses. When the redundant supervisor engine completes its initialization, it will read hardware information directly from the module.

## SSO Operation

SSO is supported in Cisco IOS Release 12.2(20)EWA and later releases. When a redundant supervisor engine runs in SSO mode, the redundant supervisor engine starts up in a fully-initialized state and synchronizes with the persistent configuration and the running configuration of the active supervisor engine. It subsequently maintains the state on the protocols listed below, and all changes in hardware and software states for features that support stateful switchover are kept in synchronization. Consequently, it offers zero interruption to Layer 2 sessions in a redundant supervisor engine configuration.

Because the redundant supervisor engine recognizes the hardware link status of every link, ports that were active before the switchover will remain active, including the uplink ports. However, because uplink ports are physically on the supervisor engine, they will be disconnected if the supervisor engine is removed.

If the active supervisor engine fails, the redundant supervisor engine become active. This newly active supervisor engine uses existing Layer 2 switching information to continue forwarding traffic. Layer 3 forwarding will be delayed until the routing tables have been repopulated in the newly active supervisor engine.

SSO supports stateful switchover of the following Layer 2 features. The state of these features is preserved between both the active and redundant supervisor engines:

- 802.3
- 802.3u
- 802.3x (Flow Control)
- 802.3ab (GE)
- 802.3z (Gigabit Ethernet including CWDM)
- 802.3ad (LACP)
- 802.1p (Layer 2 QoS)
- 802.1q
- 802.1X (Authentication)
- 802.1D (Spanning Tree Protocol)
- 802.3af (Inline power)
- PAgP
- VTP
- Dynamic ARP Inspection
- DHCP snooping
- IP source guard
- IGMP snooping (versions 1 and 2)
- DTP (802.1q and ISL)
- MST
- PVST+
- Rapid-PVST
- PortFast/UplinkFast/BackboneFast
- BPDU guard and filtering
- Voice VLAN
- Port security
- Unicast MAC filtering
- ACL (VACLs, PACLS, RACLs)
- QOS (DBL)
- Multicast storm control/broadcast storm control

SSO is compatible with the following list of features. However, the protocol database for these features is not synchronized between the redundant and active supervisor engines:

- 802.1Q tunneling with Layer 2 Protocol Tunneling (L2PT)
- Baby giants

- Jumbo frame support
- CDP
- Flood blocking
- UDLD
- SPAN/RSPAN
- NetFlow

The following features are learned on the redundant supervisor engine if the SSO feature is enabled:

- All Layer 3 protocols on Catalyst 4500 series switches (Switch Virtual Interfaces)

## About Supervisor Engine Redundancy Synchronization

During normal operation, the persistent configuration (RPR and SSO) and the running configuration (SSO only) are synchronized by default between the two supervisor engines. In a switchover, the new active supervisor engine uses the current configuration.

---

**Note** You cannot enter CLI commands on the redundant supervisor engine console.

---

These sections describe supervisor engine redundancy synchronization:

- [RPR Supervisor Engine Configuration Synchronization, page 8-5](#)
- [SSO Supervisor Engine Configuration Synchronization, page 8-6](#)

## RPR Supervisor Engine Configuration Synchronization

Because the redundant supervisor engine is only partially initialized in RPR mode, it interacts with the active supervisor engine only to receive configuration changes at startup and upon saving the configuration changes.

When a redundant supervisor engine is running in RPR mode, the following events trigger synchronization of the configuration information:

- When the redundant supervisor engine boots, the **auto-sync** command synchronizes the persistent configuration. This command is enabled by default. For details, refer to [“Synchronizing the Supervisor Engine Configurations” section on page 8-12](#).
- When the active supervisor engine detects the redundant supervisor engine, the configuration information is synchronized from the active supervisor engine to the redundant supervisor engine. This synchronization overwrites any existing startup configuration file on the redundant supervisor engine.
- When you make changes to the configuration, you must use the **write** command to save and synchronize the startup configuration of the redundant supervisor engine.

## SSO Supervisor Engine Configuration Synchronization

When a redundant supervisor engine runs in SSO mode, the following events trigger synchronization of the configuration information:

- When the active supervisor detects the redundant supervisor engine, synchronization of the persistent and running configuration takes place, allowing the redundant supervisor engine to arrive at a fully-initiated state.
- When real-time changes occur, the active supervisor engine synchronizes the running-config and (or) the persistent configuration (if necessary) with the redundant supervisor engine.
- When you change the configuration, you must use the **write** command to allow the active supervisor engine to save and synchronize the startup configuration of the redundant supervisor engine.

## Supervisor Engine Redundancy Guidelines and Restrictions

The following guidelines and restrictions apply to supervisor engine redundancy:

- If SSO mode cannot be established between the active and standby supervisor engines because of an incompatibility in the configuration file, a mismatched command list (MCL) is generated at the active supervisor engine and a reload into RPR mode is forced for the standby supervisor engine. Subsequent attempts to establish SSO, after removing the offending configuration and rebooting the standby supervisor engine with the exact same image, might cause the C4K\_REDUNDANCY-2-IOS\_VERSION\_CHECK\_FAIL and ISSU-3-PEER\_IMAGE\_INCOMPATIBLE messages to appear because the peer image is listed as incompatible. If the configuration problem can be corrected, you can clear the peer image from the incompatible list with the **redundancy config-sync ignore mismatched-commands EXEC** command while the peer is in a standby cold (RPR) state. This action allows the standby supervisor engine to boot in standby hot (SSO) state when it reloads.

Here are the steps:

- 
- |        |                                                                                                                            |
|--------|----------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Clear the offending configuration (that caused an MCL) while the standby supervisor engine is in standby cold (RPR) state. |
| Step 2 | Enter the <b>redundancy config-sync ignore mismatched-commands EXEC</b> command at the active standby supervisor engine.   |
| Step 3 | Perform <b>write memory</b> .                                                                                              |
| Step 4 | Reload the standby supervisor engine with the <b>redundancy reload peer</b> command.                                       |
- 

- If you configure Supervisor Engine V-10GE to use both Gigabit Ethernet and 10-Gigabit Ethernet uplinks without WS-X4302-GB in slot 10, module 10 is disabled and you cannot rollback the configuration to use Gigabit Ethernet ports.

Enter the following commands to recover:

```
config t
hw-module uplink select tengigabitethernet // This sets the switch back to default
mode
!
ctrl z
wr me
redundancy reload shelf // The switch will reload with all 10 modules working ok
```

```
//The switch reloads

config t
hw-module uplink select gigabitethernet // This sets the switch to the desired link
!
ctrl z
wr me
redundancy reload shelf // The switch reloads with module 10 active with the gigabit
ethernet port(s) ON and the ten gigabit ethernet port(s) Off
```

- RPR requires Cisco IOS Release 12.1(12c)EW, Release 12.1(19)E or later releases. SSO requires Cisco IOS Release 12.2(20)EWA or later releases.
- The Catalyst 4507R switch and the 4510R switch are the only Catalyst 4500 series switches that support supervisor engine redundancy.
- The Catalyst 4510R series switch only supports the WS-X4516 and WS-X4516-10GE supervisor engines. The Catalyst 4507R series switch supports supervisor engines WS-X4013+, WS-X4013+10GE, WS-X4515, WS-X4516, and WS-X4516-10GE.
- In Cisco IOS Release 12.2(25)SG and later releases on a Catalyst 4507R series switch, 10-Gigabit Ethernet and Gigabit Ethernet uplinks are concurrently usable on the Supervisor Engine V-10GE (WS-X4516-10GE) and the Supervisor Engine II+10GE (WS-4013+10GE). In Cisco IOS releases earlier than 12.2(25)SG, you need to use the **hw-module uplink select** configuration command to select either the 10-Gigabit Ethernet or Gigabit Ethernet uplinks.
- In Cisco IOS Release 12.2(25)SG and later releases, when using a Supervisor Engine V-10GE (WS-X4516-10GE) on a Catalyst 4510R series switch, you can select to use both the 10-Gigabit Ethernet and Gigabit Ethernet uplinks concurrently, but only with a WS-X4302-GB in slot 10. If either the 10-Gigabit Ethernet or Gigabit Ethernet uplinks are selected, then any linecard is allowed in slot 10. To select the uplinks, use the **hw-module uplink select** configuration command. In Cisco IOS releases earlier than 12.2(25)SG, you cannot use the 10-Gigabit Ethernet and Gigabit Ethernet uplinks concurrently.
- When you select 10-Gigabit Ethernet uplinks on WS-X4516-10GE and WS-X4013+10GE Supervisor Engines in RPR or SSO mode, only TenGigabitEthernet 1/1 and 2/1 interfaces are available. Similarly, when you select Gigabit Ethernet uplinks, only GigabitEthernet 1/3, 1/4, 2/3, and 2/4 interfaces are available. When you select to use both uplinks concurrently, TenGigabitEthernet 1/1 and 2/1 interfaces and GigabitEthernet 1/3, 1/4, 2/3, and 2/4 interfaces are available.
- Redundancy requires both supervisor engines in the chassis to have the same components ( model, memory, NFL daughter card), and to use the same Cisco IOS software image.
- When you use the WS-X4013+ and WS-X4515 supervisor engines in RPR or SSO mode, only the Gig1/1 and Gig2/1 Gigabit Ethernet interfaces are available, but the Gig1/2 and Gig2/2 uplink ports are unavailable.
- When the WS-X4516 active and redundant supervisor engines are installed in the same chassis, the four uplink ports (Gig1/1, Gig2/1, Gig 1/2, and Gig2/2) are available.
- The active and redundant supervisor engines in the chassis must be in slots 1 and 2.
- Each supervisor engine in the chassis must have its own flash device and console port connections to operate the switch on its own.
- Each supervisor engine must have a unique console connection. Do not connect a Y cable to the console ports.
- Supervisor engine redundancy does not provide supervisor engine load balancing.

- The Cisco Express Forwarding (CEF) table is cleared on a switchover. As a result, routed traffic is interrupted until route tables reconverge. This reconvergence time is minimal because the SSO feature reduces the supervisor engine redundancy switchover time from 30+ seconds to subsecond, so Layer 3 also has a faster failover time if the switch is configured for SSO.
- Static IP routes are maintained across a switchover because they are configured from entries in the configuration file.
- Information about Layer 3 dynamic states that is maintained on the active supervisor engine is not synchronized to the redundant supervisor engine and is lost on switchover.
- Starting with Cisco IOS Release 12.2, if an unsupported condition is detected (such as when the active supervisor engine is running Cisco IOS Release 12.2(20)EW and the redundant supervisor engine is running Cisco IOS Release 12.1(20)EW), the redundant supervisor engine will be reset multiple times and then be placed in ROMMON mode. Therefore, it is important to follow the exact procedures outlined in the [“Performing a Software Upgrade” section on page 8-14](#).
- If you are running (or upgrading to) Cisco IOS Release 12.2(20)EWA or Cisco IOS Release 12.2(25)EW and are using a single supervisor engine in a redundant chassis (Catalyst 4507R or Catalyst 4510R series switch), and you intend to use routed ports, do one of the following:
  - Use SVIs instead of routed ports.
  - Change the redundancy mode from SSO to RPR.
- Configuration changes made to the redundant supervisor engine through SNMP synchronization and SNMP set operations in SSO mode are not synchronized to the redundant supervisor engine. Even though you can still perform SNMP set operations in SSO mode, you might experience unexpected behavior.

After you configure the switch through SNMP in SSO mode, copy the running-config file to the startup-config file on the active supervisor engine to trigger synchronization of the startup-config file on the redundant supervisor engine. Then, reload the redundant supervisor engine so that the new configuration is applied on the redundant supervisor engine.

- You cannot perform configuration changes during the startup (bulk) synchronization. If you attempt to make configuration changes during this process, the following message is generated:
- ```
Config mode locked out till standby initializes
```
- If configuration changes occur at the same time as a supervisor engine switchover, these configuration changes are lost.
 - If you remove a line card from a redundant switch and initiate an SSO switchover, then reinsert the line card, and all interfaces are shutdown. The rest of the original line card configuration is preserved.

This situation only occurs if a switch had reached SSO before you removed the line card.

Configuring Supervisor Engine Redundancy

These sections describe how to configure supervisor engine redundancy:

- [Configuring Redundancy, page 8-9](#)
- [Virtual Console for Standby Supervisor Engine, page 8-11](#)
- [Synchronizing the Supervisor Engine Configurations, page 8-12](#)

Configuring Redundancy

To configure redundancy, perform this task:

	Command	Purpose
Step 1	Switch(config)# redundancy	Enters redundancy configuration mode.
Step 2	Switch(config-red)# mode {sso rpr}	Configures SSO or RPR. When this command is entered, the redundant supervisor engine is reloaded and begins to work in SSO or RPR mode.
Step 3	Switch# show running-config	Verifies that SSO or RPR is enabled.
Step 4	Switch# show redundancy [clients counters history states]	Displays the redundancy information (counter, state, and so on) for the active and redundant supervisor engines.

When configuring redundancy, note the following:

- The **sso** keyword is supported in Cisco IOS Release 12.2(20)EWA and later releases.
- The **rpr** keyword is supported in Cisco IOS Release 12.1(12c)EW and later releases.

This example shows how to configure the system for SSO and display the redundancy facility information:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)# end
Switch# show redundancy
Redundant System Information :
-----
        Available system uptime = 2 days, 2 hours, 39 minutes
Switchovers system experienced = 0
        Standby failures = 0
        Last switchover reason = none

        Hardware Mode = Duplex
        Configured Redundancy Mode = Stateful Switchover
        Operating Redundancy Mode = Stateful Switchover
        Maintenance Mode = Disabled
        Communications = Up

Current Processor Information :
-----
        Active Location = slot 1
        Current Software state = ACTIVE
        Uptime in current state = 2 days, 2 hours, 39 minutes
        Image Version = Cisco Internetwork Operating System Software
IOS (tm) Catalyst 4000 L3 Switch Software (cat4000-I5S-M), Version 12.2(20)EWA(3
.92), CISCO INTERNAL USE ONLY ENHANCED PRODUCTION VERSION
Copyright (c) 1986-2004 by cisco Systems, Inc.
Compiled Wed 14-Jul-04 04:42 by esi
        BOOT = bootflash:cat4000-i5s-mz.122_20_EWA_392,1
        Configuration register = 0x2002
```

```

Peer Processor Information :
-----
          Standby Location = slot 2
          Current Software state = STANDBY HOT
          Uptime in current state = 2 days, 2 hours, 39 minutes
          Image Version = Cisco Internetwork Operating System Software
IOS (tm) Catalyst 4000 L3 Switch Software (cat4000-I5S-M), Version 12.2(20)EWA(3
.92), CISCO INTERNAL USE ONLY ENHANCED PRODUCTION VERSION
Copyright (c) 1986-2004 by cisco Systems, Inc.
Compiled Wed 14-Jul-04 0
          BOOT = bootflash:cat4000-i5s-mz.122_20_EWA_392,1
          Configuration register = 0x2002

```

Switch#

This example shows how to display redundancy facility state information:

```

Switch# show redundancy states
my state = 13 -ACTIVE
    peer state = 8 -STANDBY HOT
        Mode = Duplex
        Unit = Primary
        Unit ID = 2

Redundancy Mode (Operational) = Stateful Switchover
Redundancy Mode (Configured) = Stateful Switchover
    Split Mode = Disabled
    Manual Swact = Enabled
    Communications = Up

    client count = 21
    client_notification_TMR = 240000 milliseconds
        keep_alive TMR = 9000 milliseconds
        keep_alive count = 0
        keep_alive threshold = 18
        RF debug mask = 0x0

```

Switch#

This example shows how to change the system configuration from RPR to SSO mode:

```

Switch(config)# redundancy
Switch(config-red)# mode
Switch(config-red)# mode sso
Changing to sso mode will reset the standby. Do you want to continue?[confirm]
Switch(config-red)# end
Switch#
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-COMMUNICATION: Communication with the peer Supervisor
has been lost
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-SIMPLEX_MODE: The peer Supervisor has been lost

```

This example shows how to change the system configuration from SSO to RPR mode:

```

Switch(config)# redundancy
Switch(config-red)# mode rpr
Changing to rpr mode will reset the standby. Do you want to continue?[confirm]
Switch(config-red)# end
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-COMMUNICATION: Communication with the peer Supervisor
has been lost
*Aug 1 13:11:16: %C4K_REDUNDANCY-3-SIMPLEX_MODE: The peer Supervisor has been lost

```

Virtual Console for Standby Supervisor Engine

Catalyst 4500 series switches can be configured with 2 supervisor engines to provide redundancy. When the switch is powered, one of the supervisor engines becomes active and remains active until a switchover occurs. The other supervisor engine remains in standby mode.

Each supervisor engine has its own console port. Access to the standby supervisor engine is possible only through the console port of the standby supervisor engine. Therefore, you must connect to the standby console to access, monitor or debug the standby supervisor.

Virtual Console for Standby Supervisor Engine enables you to access the standby console from the active supervisor engine without requiring a physical connection to the standby console. It uses IPC over EOBC to communicate with the standby supervisor engine and thus emulate the standby console on the active supervisor engine. Only one active standby console session is active at any time.

The Virtual Console for Standby Supervisor Engine allows users who are logged onto the active supervisor engine to remotely execute **show** commands on the standby supervisor engine and view the results on the active supervisor engine. Virtual Console is available only from the active supervisor engine.

You can access the standby virtual console from the active supervisor engine with the **attach module**, **session module**, or **remote login** commands on the active supervisor engine. You must be in privilege EXEC mode (level 15) to run these commands to access the standby console.

Once you enter the standby virtual console, the terminal prompt automatically changes to *hostname-standby-console* where *hostname* is the configured name of the switch. The prompt is restored back to the original prompt when you exit the virtual console.

You exit the virtual console with the **exit** or **quit** commands. When the inactivity period of the terminal on the active supervisor engine where you logged in exceeds the configured idle time, you are automatically logged out of the terminal on the active supervisor engine. In such a case, the virtual console session is also terminated. Virtual console session is also automatically terminated when the standby is rebooted. After the standby boots up, you need to create another virtual console session.

To log in to the standby supervisor engine using a virtual console, do the following:

```
Switch# session module 2
Connecting to standby virtual console
Type "exit" or "quit" to end this session

Switch-standby-console# exit
Switch#
```

If the standby console is not enabled, the following message appears:

```
Switch-standby-console#
Standby console disabled.
Valid commands are: exit, logout
```

Note

The standby virtual console provides the standard features that are available from the supervisor console such as command history, command completion, command help and partial command keywords.

The following limitations apply to the standby virtual console:

- All commands on the virtual console run to completion. It does not provide the auto-more feature; it behaves as if the **terminal length 0** command has been executed. It is also non-interactive. Therefore, a running command cannot be interrupted or aborted by any key sequence on the active supervisor engine. If a command produces considerable output, the virtual console displays it on the supervisor engine screen.

- The virtual console is non-interactive. Because the virtual console does not detect the interactive nature of a command, any command that requires user interaction causes the virtual console to wait until the RPC timer aborts the command.

The virtual console timer is set to 60 seconds. The virtual console returns to its prompt after 60 seconds. During this time, you cannot abort the command from the key board. You must wait for the timer to expire before you continue.

- You cannot use virtual console to view debug and syslog messages that are being displayed on the standby supervisor engine. The virtual console only displays the output of commands that are executed from the virtual console. Other information that is displayed on the real standby console does not appear on the virtual console.

Synchronizing the Supervisor Engine Configurations

To manually synchronize the configurations used by the two supervisor engines, perform this task on the active supervisor engine:

	Command	Purpose
Step 1	Switch(config)# redundancy	Enters redundancy configuration mode.
Step 2	Switch(config-red)# main-cpu	Enters main-cpu configuration submode.
Step 3	Switch(config-r-mc)# auto-sync {startup-config config-register bootvar standard}	Synchronizes the configuration elements.
Step 4	Switch(config-r-mc)# end	Returns to privileged EXEC mode.
Step 5	Switch# copy running-config startup-config	Synchronizes the running configuration in dynamic random-access memory (DRAM) to the startup configuration file in NVRAM. Note This step is not required to synchronize the running configuration file in (DRAM).

Note

Configuration changes made to the active supervisor engine through SNMP are not synchronized to the redundant supervisor engine. For information on how to handle this situation, see the [“Supervisor Engine Redundancy Guidelines and Restrictions”](#) section on page 8-6.

Note

The **auto-sync** command controls the synchronization of the config-reg, bootvar, and startup/private configuration files only. The calendar and VLAN database files are always synchronized when they change. In SSO mode, the running-config is always synchronized.

This example shows how to reenable the default automatic synchronization feature using the **auto-sync standard** command to synchronize the startup-config and config-register configuration of the active supervisor engine with the redundant supervisor engine. Updates for the boot variables are automatic and cannot be disabled.

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
Switch(config-r-mc)# end
Switch# copy running-config startup-config
```

**Note**

To manually synchronize individual elements of the standard auto-sync configuration, disable the default automatic synchronization feature.

**Note**

When you configure the auto-sync standard, the individual sync options such as no auto-sync startup-config are ignored.

This example shows how to disable default automatic synchronization and allow only automatic synchronization of the config-registers of the active supervisor engine to the redundant supervisor engine, while disallowing synchronization of the startup configuration:

```
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# no auto-sync standard
Switch(config-r-mc)# auto-sync config-register
Switch(config-r-mc)# end
```

Performing a Manual Switchover

This section describes how to perform a manual switchover (from the active supervisor engine to the redundant supervisor engine) for test purposes. We recommend that you perform a manual switchover prior to deploying SSO in your production environment.

**Note**

This discussion assumes that SSO has been configured as the redundant mode.

To perform a manual switchover, perform this task on the active supervisor engine:

	Command	Purpose
Step 1	Switch# show redundancy	Verifies that the peer state is in the standby hot state. See the example of the show redundancy states command on page 6-10.
Step 2	Switch# redundancy force-switchover	Launches switchover from the active supervisor engine to the redundant supervisor engine. If the state of the redundant supervisor engine is not standby hot, this command will not execute.

Be aware of these usage guidelines:

- To force a switchover, the redundant supervisor engine must be in a standby hot state. You can verify the state with the **show redundancy** command. If the state is not standby hot, the **redundancy force-switchover** command will not execute.
- Use the **redundancy force-switchover** command, rather than the **reload** command, to initiate a switchover. The **redundancy force-switchover** command will first check that the redundant supervisor engine is in the correct state. If you issue the **reload** command and the status is not standby hot, the **reload** command will reset the current supervisor engine only.

After an initial switchover, there might be occasions when you want to make the supervisor engine in slot 1 of the chassis the active supervisor engine. If the image on supervisor engine 1 is the one you intend to run on both supervisor engines, it is not necessary to reboot the image on the supervisor engine in slot 1 to make it redundant. Instead, you can force another switchover. However, if you want a newer version of the image to run on both supervisor engines, follow the steps under “Performing a Software Upgrade” on page 14. Use the **show module** command to see which slot contains the active supervisor engine, and force another switchover if necessary.

Performing a Software Upgrade

The software upgrade procedure supported by supervisor engine redundancy allows you to reload the Cisco IOS software image on the redundant supervisor engine, and once complete, reload the active supervisor engine once.

The software upgrade procedure supported by supervisor engine redundancy allows you to reload the Cisco IOS software image on the redundant supervisor engine, and once complete, reloads the active supervisor engine once.

The following scenario is not supported: An active supervisor engine running Cisco IOS Release 12.1(x)E, and a standby supervisor engine running Cisco IOS Release 12.2(x)S. The standby supervisor engine resets repeatedly.

If you are trying to upgrade redundant supervisor engines from Cisco IOS Release 12.1(x)E to 12.2(x)S, this requires a full system reboot.

To perform a software upgrade, perform this task:

	Command	Purpose
Step 1	Switch# copy <i>source_device:source_filename</i> slot0:target_filename Or: Switch# copy <i>source_device:source_filename</i> bootflash:target_filename	Copies the new Cisco IOS software image to bootflash on the supervisor engine.
Step 2	Switch# copy <i>source_device:source_filename</i> slaveslot0:target_filename Or: Switch# copy <i>source_device:source_filename</i> slavebootflash:target_filename	Copies the new image to a slave device (such as slavebootflash and slaveslot0).
Step 3	Switch# config terminal Switch(config)# config-register 0x2 Switch(config)# boot system flash <i>device:file_name</i>	Configures the supervisor engines to boot the new image. If your system was configured to autoboot an earlier image, issue the following command string to boot the new image instead: no boot system flash device:old_file_name
Step 4	Switch(config)# redundancy	Enters redundancy configuration mode.
Step 5	Switch(config-red)# main-cpu	Enters main-cpu configuration submode.
Step 6	Switch(config-r-mc)# auto-syn standard	Synchronizes the configuration elements.
Step 7	Switch(config-r-mc)# end	Returns to privileged EXEC mode.

	Command	Purpose
Step 8	Switch# copy running-config start-config	Saves the configuration.
Step 9	Switch# redundancy reload peer	Reloads the redundant supervisor engine and brings it back online (using the new release of the Cisco IOS software). Note Before proceeding to Step 10, ensure that the switch is operating in RPR mode.
Step 10	Switch# redundancy force-switchover	Conducts a manual switchover to the redundant supervisor engine. The redundant supervisor engine becomes the new active supervisor engine using the new Cisco IOS software image. The old active supervisor engine reboots with the new image and becomes the redundant supervisor engine.

This example shows how to perform a software upgrade:

```
Switch# config terminal
Switch(config)# config-register 0x2
Switch(config)# boot system flash slot0:cat4000-i5s-mz.122-20.EWA
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-syn standard
Switch(config-r-mc)# end
Switch# copy running-config start-config
Switch# redundancy reload peer
Switch# redundancy force-switchover
Switch#
```

This example illustrates how to verify that the running configuration on the active supervisor engine has successfully synchronized with the redundant supervisor engine:

```
Switch# config terminal
Switch(config)# redundancy
Switch(config-red)# main-cpu
Switch(config-r-mc)# auto-sync standard
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The bootvar has been successfully synchronized to the
standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The config-reg has been successfully synchronized to
the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The startup-config has been successfully synchronized
to the standby supervisor
4d01h: %C4K_REDUNDANCY-5-CONFIGSYNC: The private-config has been successfully synchronized
to the standby supervisor
```

The example above shows that the boot variable, the config-register, and the startup configuration from the active supervisor engine have successfully synchronized to the redundant supervisor engine.

Manipulating Bootflash on the Redundant Supervisor Engine

Note

The console port on the redundant supervisor engine is not available.

To manipulate the redundant supervisor engine bootflash, perform one or more of the following tasks:

Command	Purpose
Switch# dir slaveslot0: <i>target_filename</i> or Switch# dir slavebootflash: <i>target_filename</i>	Lists the contents of the slot0: device on the redundant supervisor engine. Lists the contents of the bootflash: device on the redundant supervisor engine.
Switch# delete slaveslot0: <i>target_filename</i> or Switch# delete slave bootflash: <i>target_filename</i>	Deletes specific files from the slot0: device on the redundant supervisor engine. Deletes specific files from the bootflash: device on the redundant supervisor engine.
Switch# squeeze slaveslot0: or Switch# squeeze slavebootflash:	Squeezes the slot0: device on the redundant supervisor engine. Squeezes the bootflash: device on the redundant supervisor engine.
Switch# format slaveslot0: or Switch# format slavebootflash:	Formats the slot0: device on the redundant supervisor engine. Formats the bootflash: device on the redundant supervisor engine.
Switch# copy source_device:source_filename slaveslot0:target_filename or Switch# copy source_device:source_filename slavebootflash:target_filename	Copies a file from the active supervisor engine to the slot0: device on the redundant supervisor engine. Copies a file to the bootflash: device on a redundant supervisor engine. Note Source could be the active supervisor engine or a TFTP server.

CHAPTER 9

Configuring Cisco NSF with SSO Supervisor Engine Redundancy

This chapter describes how to configure supervisor engine redundancy using Cisco nonstop forwarding (NSF) with stateful switchover (SSO).

Note

Starting with Cisco IOS Release 12.2(52)SG, the Catalyst 4500 switch supports VRF lite NSF support with routing protocols OSPF/EIGRP/BGP.

This chapter consists of these sections:

- [About NSF with SSO Supervisor Engine Redundancy, page 9-1](#)
- [Configuring NSF with SSO Supervisor Engine Redundancy, page 9-10](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

About NSF with SSO Supervisor Engine Redundancy

These sections describe supervisor engine redundancy using NSF with SSO:

- [About Cisco IOS NSF-Aware and NSF-Capable Support, page 9-2](#)
- [NSF with SSO Supervisor Engine Redundancy Overview, page 9-4](#)
- [SSO Operation, page 9-4](#)
- [NSF Operation, page 9-5](#)
- [Cisco Express Forwarding, page 9-5](#)

- [Routing Protocols, page 9-5](#)
- [NSF Guidelines and Restrictions, page 9-9](#)

About Cisco IOS NSF-Aware and NSF-Capable Support

Cisco IOS Nonstop Forwarding (NSF) has two primary components:

- NSF-awareness—If neighboring router devices detect that an NSF router can still forward packets when a supervisor engine switchover happens, this capability is referred to as NSF-awareness. Cisco IOS enhancements to the Layer 3 routing protocols (OSPF, BGP, EIGRP and IS-IS) are designed to prevent route-flapping so that the CEF routing table does not time out or the NSF router does not drop routes. An NSF-aware router helps to send routing protocol information to the neighboring NSF router.
- NSF-capability—NSF works with SSO to minimize the amount of time that a Layer 3 network is unavailable following a supervisor engine switchover by continuing to forward IP packets. Reconvergence of Layer 3 routing protocols (BGP, EIGRP, OSPF v2, and IS-IS) is transparent to the user and happens automatically in the background. The routing protocols recover routing information from neighbor devices and rebuild the Cisco Express Forwarding (CEF) table.

Note NSF does not support IPv6.

Note

NSF capable devices include Catalyst 4500 series switches, Catalyst 6500 series switches, Cisco 7500 series routers, Cisco 10000 series routers, and Cisco 12000 series routers.

A typical topology for NSF and NSF-aware routers is given below.

Figure 9-1 *Topology for NSF and NSF-Capable Switches*

Table 9-1 lists the supervisor engines and Catalyst 4500 series switches that support NSF-awareness:

Table 9-1 NSF-Aware Supervisor Engines

NSF-Aware Supervisor Engine	Switch Support
Supervisor Engine II-Plus (WS-X4013)	Catalyst 4507R series switch, Catalyst 4506 series switch, and Catalyst 4503 series switch
Supervisor Engine II-Plus+TS (WS-X4013+TS)	Catalyst 4507R series switch, Catalyst 4506 series switch, and Catalyst 4503 series switch
Supervisor Engine II-Plus+10GE (WS-X4013+10GE)	Catalyst 4507R series switch, Catalyst 4506 series switch, and Catalyst 4503 series switch
Supervisor Engine IV (WS-X4515)	Catalyst 4507R series switch, Catalyst 4506 series switch, and Catalyst 4503 series switch
Supervisor Engine V (WS-X4516)	Catalyst 4507R series switch and Catalyst 4510R series switch
Supervisor Engine V-10GE (WS-X4516-10GE)	Catalyst 4506 series switch, Catalyst 4507R series switch, and Catalyst 4510R series switch
Fixed Switchs (WS-C4948 and WS-C4948-10GE)	Catalyst 4948 and 4948-10GE switches

Starting with Cisco IOS Release 12.2(20)EWA, the Catalyst 4500 series switch supported NSF-awareness for the EIGRP, IS-IS, OSPF, and BGP protocols. Starting with Cisco IOS Release 12.2(31)SG, the Catalyst 4500 series switch supported NSF-awareness for the EIGRP-stub in IP Base image for all supervisor engines. NSF-awareness is turned on by default for EIGRP-stub, EIGRP, IS-IS, and OSPF protocols. For BGP, you need to turn it on manually.

If the supervisor engine is configured for BGP (with the **graceful-restart** command), EIGRP, OSPF, or IS-IS routing protocols, routing updates are automatically sent during the supervisor engine switchover of a neighboring NSF capable switch (typically a Catalyst 6500 series switch).

Starting with Cisco IOS Release 12.2(31)SG, the Catalyst 4500 series switch supports NSF-capability. Table 9-2 lists the supervisor engines and Catalyst 4500 series switches that support NSF-capable.

Table 9-2 NSF-Capable Supervisor Engines

NSF-Capable Supervisor Engine	Switch Support
Supervisor Engine IV (WS-X4515)	Catalyst 4507R series switch
Supervisor Engine V (WS-X4516)	Catalyst 4507R series switch and Catalyst 4510R series switch
Supervisor Engine V-10GE (WS-X4516-10GE)	Catalyst 4507R series switch and Catalyst 4510R series switch
Supervisor Engine 6-E (WS-X45-Sup6-E)	Catalyst 4500 E-series switch Supervisor Engine 6-E

NSF with SSO Supervisor Engine Redundancy Overview

Catalyst 4500 series switches support fault resistance by allowing a redundant supervisor engine to take over if the primary supervisor engine fails. NSF works with SSO to minimize the amount of time a network is unavailable to its users following a switchover.

NSF provides these benefits:

- Improved network availability
NSF continues forwarding network traffic and application state information so that user session information is maintained after a switchover.
- Overall network stability
Network stability may be improved with the reduction in the number of route flaps, which were created when routers in the network failed and lost their routing tables.
- Neighboring routers do not detect a link flap
Because the interfaces remain up during a switchover, neighboring routers do not detect a link flap (the link does not go down and come back up).
- Prevents routing flaps
Because SSO continues forwarding network traffic during a switchover, routing flaps are avoided.
- Maintains user sessions established prior to the switchover

Catalyst 4500 series switches also support route processor redundancy (RPR). For information about these redundancy modes, see [Chapter 8, “Configuring Supervisor Engine Redundancy Using RPR and SSO.”](#)

SSO Operation

SSO establishes one of the supervisor engines as active while the other supervisor engine is designated as standby, and then SSO synchronizes information between them. A switchover from the active to the redundant supervisor engine occurs when the active supervisor engine fails, or is removed from the switch, or is manually shut down for maintenance.

In networking devices running SSO, both supervisor engines must be running the same Cisco IOS software version and ROMMON version so that the redundant supervisor engine is always ready to assume control following a fault on the active supervisor engine. SSO switchover also preserves FIB and adjacency entries and can forward Layer 3 traffic after a switchover. Configuration information and data structures are synchronized from the active to the redundant supervisor engine at startup and whenever changes to the active supervisor engine configuration occur. Following an initial synchronization between the two supervisor engines, SSO maintains state information between them, including forwarding information.

During switchover, system control and routing protocol execution is transferred from the active supervisor engine to the redundant supervisor engine.

Note

Be aware that you can use the **[no] service slave-log** configuration command to forward all error messages from the standby supervisor engine to the active engine. By default, this capability is enabled. For details, refer to the *Catalyst 4500 Series Switch Cisco IOS System Error Message Guide*, Release 12.2(37)SG.

NSF Operation

NSF always runs with SSO and provides redundancy for Layer 3 traffic. NSF is supported by the BGP, OSPF, IS-IS, and EIGRP routing protocols and is supported by Cisco Express Forwarding (CEF) for forwarding. The routing protocols have been enhanced with NSF-capability and awareness, which means that routers running these protocols can detect a switchover and take the necessary actions to continue forwarding network traffic and to recover route information from the peer devices. The IS-IS protocol can be configured to use state information that has been synchronized between the active and the redundant supervisor engine to recover route information following a switchover instead of information received from peer devices.

A networking device is NSF-aware if it is running NSF-compatible software. A device is NSF-capable if it has been configured to support NSF; it rebuilds routing information from NSF-aware or NSF-capable neighbors.

Each protocol depends on CEF to continue forwarding packets during switchover while the routing protocols rebuild the Routing Information Base (RIB) tables. After the routing protocols have converged, CEF updates the FIB table and removes stale route entries. CEF then updates the line cards with the new FIB information.

Cisco Express Forwarding

A key element of NSF is packet forwarding. In a Cisco networking device, packet forwarding is provided by Cisco Express Forwarding (CEF). CEF maintains the FIB and uses the FIB information that was current at the time of the switchover to continue forwarding packets during a switchover. This feature reduces traffic interruption during the switchover.

During normal NSF operation, CEF on the active supervisor engine synchronizes its current FIB and adjacency databases with the FIB and adjacency databases on the redundant supervisor engine. Upon switchover of the active supervisor engine, the redundant supervisor engine initially has FIB and adjacency databases that are mirror images of those that were current on the active supervisor engine. For platforms with forwarding engines, CEF keeps the forwarding engine on the redundant supervisor engine current with changes that are sent to it by CEF on the active supervisor engine. The forwarding engine can continue forwarding after a switchover as soon as the interfaces and a data path are available.

As the routing protocols start to repopulate the RIB on a prefix-by-prefix basis, the updates cause prefix-by-prefix updates to CEF, which it uses to update the FIB and adjacency databases. Existing and new entries receive the new version (“epoch”) number, indicating that they have been refreshed. The forwarding information is updated on the forwarding engine during convergence. The supervisor engine signals when the RIB has converged. The software removes all FIB and adjacency entries that have an epoch older than the current switchover epoch. The FIB now represents the newest routing protocol forwarding information.

Routing Protocols

Note

Use of the routing protocols require the Enterprise Services Cisco IOS Software image for the Catalyst 4500 series switch.

The routing protocols run only on the active supervisor engine, and they receive routing updates from their neighbor routers. Routing protocols do not run on the standby supervisor engine. Following a switchover, the routing protocols request that the NSF-aware neighbor devices send state information to

help rebuild the routing tables. Alternately, the IS-IS protocol can be configured to synchronize state information from the active to the redundant supervisor engine to help rebuild the routing table on the NSF-capable device in environments where neighbor devices are not NSF-aware. NSF supports the BGP, OSPF, IS-IS, and EIGRP protocols.

**Note**

For NSF operation, the routing protocols depend on CEF to continue forwarding packets while the routing protocols rebuild the routing information.

BGP Operation

When an NSF-capable router begins a BGP session with a BGP peer, it sends an OPEN message to the peer. Included in the message is a statement that the NSF-capable device has “graceful” restart capability. Graceful restart is the mechanism by which BGP routing peers avoid a routing flap following a switchover. If the BGP peer has received this capability, it is aware that the device sending the message is NSF-capable. Both the NSF-capable router and its BGP peers need to exchange the graceful restart capability in their OPEN messages at the time of session establishment. If both the peers do not exchange the graceful restart capability, the session will not be capable of a graceful restart.

If the BGP session is lost during the supervisor engine switchover, the NSF-aware BGP peer marks all the routes associated with the NSF-capable router as stale; however, it continues to use these routes to make forwarding decisions for a set period of time. This functionality prevents packets from being lost while the newly active supervisor engine is waiting for convergence of the routing information with the BGP peers.

After a supervisor engine switchover occurs, the NSF-capable router reestablishes the session with the BGP peer. In establishing the new session, it sends a new graceful restart message that identifies the NSF-capable router as having restarted.

At this point, the routing information is exchanged between the two BGP peers. After this exchange is complete, the NSF-capable device uses the routing information to update the RIB and the FIB with the new forwarding information. The NSF-aware device uses the network information to remove stale routes from its BGP table; the BGP protocol then is fully converged.

If a BGP peer does not support the graceful restart capability, it ignores the graceful restart capability in an OPEN message but establishes a BGP session with the NSF-capable device. This function allows interoperability with non-NSF-aware BGP peers (and without NSF functionality), but the BGP session with non-NSF-aware BGP peers is not capable of a graceful restart.

**Note**

BGP support in NSF requires that neighbor networking devices be NSF-aware; that is, the devices must have the graceful restart capability and advertise that capability in their OPEN message during session establishment. If an NSF-capable router discovers that a particular BGP neighbor does not have graceful restart capability, it does not establish an NSF-capable session with that neighbor. All other neighbors that have graceful restart capability continue to have NSF-capable sessions with this NSF-capable networking device.

OSPF Operation

When an OSPF NSF-capable router performs a supervisor engine switchover, it must perform the following tasks in order to resynchronize its link state database with its OSPF neighbors:

- Relearn the available OSPF neighbors on the network without causing a reset of the neighbor relationship
- Reacquire the contents of the link state database for the network

As quickly as possible after a supervisor engine switchover, the NSF-capable router sends an OSPF NSF signal to neighboring NSF-aware devices. Neighbor networking devices recognize this signal as an indicator that the neighbor relationship with this router should not be reset. As the NSF-capable router receives signals from other routers on the network, it can begin to rebuild its neighbor list.

After neighbor relationships are reestablished, the NSF-capable router begins to resynchronize its database with all of its NSF-aware neighbors. At this point, the routing information is exchanged between the OSPF neighbors. Once this exchange is complete, the NSF-capable device uses the routing information to remove stale routes, update the RIB, and update the FIB with the new forwarding information. The OSPF protocols are then fully converged.

Note

OSPF support in NSF requires that all neighbor networking devices be NSF-aware. If an NSF-capable router discovers that it has non-NSF-aware neighbors on a particular network segment, it disables NSF capabilities for that segment. Other network segments composed entirely of NSF-capable or NSF-aware routers continue to provide NSF capabilities.

IS-IS Operation

When an IS-IS NSF-capable router performs a supervisor engine switchover, it must perform the following tasks in order to resynchronize its link state database with its IS-IS neighbors:

- Relearn the available IS-IS neighbors on the network without causing a reset of the neighbor relationship
- Reacquire the contents of the link state database for the network

The IS-IS NSF feature offers two options when you configure NSF:

- Internet Engineering Task Force (IETF) IS-IS
- Cisco IS-IS

If neighbor routers on a network segment are running a software version that supports the IETF Internet draft for router restartability, they assist an IETF NSF router that is restarting. With IETF, neighbor routers provide adjacency and link-state information to help rebuild the routing information following a switchover. A benefit of IETF IS-IS configuration is operation between peer devices based on a proposed standard.

Note

If you configure IETF on the networking device, but neighbor routers are not IETF-compatible, NSF aborts following a switchover.

If the neighbor routers on a network segment are not NSF-aware, you must use the Cisco configuration option. The Cisco IS-IS configuration transfers both protocol adjacency and link-state information from the active to the redundant supervisor engine. An advantage of Cisco configuration is that it does not rely on NSF-aware neighbors.

IETF IS-IS Configuration

As quickly as possible after a supervisor engine switchover, the NSF-capable router sends IS-IS NSF restart requests to neighboring NSF-aware devices using the IETF IS-IS configuration. Neighbor networking devices recognize this restart request as an indicator that the neighbor relationship with this router should not be reset, but that they should initiate database resynchronization with the restarting router. As the restarting router receives restart request responses from routers on the network, it can begin to rebuild its neighbor list.

After this exchange is complete, the NSF-capable device uses the link-state information to remove stale routes, update the RIB, and update the FIB with the new forwarding information; IS-IS is then fully converged.

The switchover from one supervisor engine to the other happens within seconds. IS-IS reestablishes its routing table and resynchronizes with the network within a few additional seconds. At this point, IS-IS waits for a specified interval before it attempts a second NSF restart. During this time, the new redundant supervisor engine boots up and synchronizes its configuration with the active supervisor engine. The IS-IS NSF operation waits for a specified interval to ensure that connections are stable before attempting another restart of IS-IS NSF. This functionality prevents IS-IS from attempting back-to-back NSF restarts with stale information.

Cisco IS-IS Configuration

Using the Cisco configuration option, full adjacency and LSP information is saved, or *checkpointed*, to the redundant supervisor engine. Following a switchover, the newly active supervisor engine maintains its adjacencies using the check-pointed data, and can quickly rebuild its routing tables.

Note

Following a switchover, Cisco IS-IS NSF has complete neighbor adjacency and LSP information; however, it must wait for all interfaces to come on line that had adjacencies prior to the switchover. If an interface does not come on line within the allocated interface wait time, the routes learned from these neighbor devices are not considered in routing table recalculation. IS-IS NSF provides a command to extend the wait time for interfaces that, for whatever reason, do not come on line in a timely fashion.

The switchover from one supervisor engine to the other happens within seconds. IS-IS reestablishes its routing table and resynchronizes with the network within a few additional seconds. At this point, IS-IS waits for a specified interval before it attempts a second NSF restart. During this time, the new redundant supervisor engine boots up and synchronizes its configuration with the active supervisor engine. After this synchronization is completed, IS-IS adjacency and LSP data is check-pointed to the redundant supervisor engine; however, a new NSF restart is not attempted by IS-IS until the interval time expires. This functionality prevents IS-IS from attempting back-to-back NSF restarts.

EIGRP Operation

When an EIGRP NSF-capable router initially re-boots after an NSF restart, it has no neighbor and its topology table is empty. The router is notified by the redundant (now active) supervisor engine when it needs to bring up the interfaces, reacquire neighbors, and rebuild the topology and routing tables. The restarting router and its peers must accomplish these tasks without interrupting the data traffic directed toward the restarting router. EIGRP peer routers maintain the routes learned from the restarting router and continue forwarding traffic through the NSF restart process.

To prevent an adjacency reset by the neighbors, the restarting router uses a new Restart (RS) bit in the EIGRP packet header to indicate a restart. The RS bit is set in the hello packets and in the initial INIT update packets during the NSF restart period. The RS bit in the hello packets allows the neighbors to be

quickly notified of the NSF restart. Without seeing the RS bit, the neighbor can only detect an adjacency reset by receiving an INIT update or by the expiration of the hello hold timer. Without the RS bit, a neighbor does not know if the adjacency reset should be handled using NSF or the normal startup method.

When the neighbor receives the restart indication, either by receiving the hello packet or the INIT packet, it recognizes the restarting peer in its peer list and maintains the adjacency with the restarting router. The neighbor then sends its topology table to the restarting router with the RS bit set in the first update packet indicating that it is NSF-aware and is helping out the restarting router. The neighbor does not set the RS bit in their hello packets, unless it is also a NSF restarting neighbor.

**Note**

A router may be NSF-aware but may not be helping the NSF restarting neighbor because booting from a cold start.

If at least one of the peer routers is NSF-aware, the restarting router would then receive updates and rebuild its database. The restarting router must then find out if it had converged so that it can notify the routing information base (RIB). Each NSF-aware router is required to send an end of table (EOT) marker in the last update packet to indicate the end of the table content. The restarting router knows it has converged when it receives the EOT marker. The restarting router can then begin sending updates.

An NSF-aware peer would know when the restarting router had converged when it receives an EOT indication from the restarting router. The peer then scans its topology table to search for the routes with the restarted neighbor as the source. The peer compares the route timestamp with the restart event timestamp to determine if the route is still available. The peer then goes active to find alternate paths for the routes that are no longer available through the restarted router.

When the restarting router has received all EOT indications from its neighbors or when the NSF converge timer expires, EIGRP notifies the RIB of convergence. EIGRP waits for the RIB convergence signal and then floods its topology table to all awaiting NSF-aware peers.

NSF Guidelines and Restrictions

NSF with SSO has these restrictions:

- For NSF operation, you must have SSO configured on the device.
- NSF with SSO supports IP Version 4 traffic and protocols only; NSF with SSO does not support IPv6 traffic.
- The Virtual Redundancy Routing Protocols (VRRP) is not SSO-aware, meaning state information is not maintained between the active and standby supervisor engine during normal operation. VRRP and SSO can coexist but both features work independently. Traffic that relies on VRRP may switch to the VRRP standby in the event of a supervisor engine switchover.
- All neighboring devices participating in BGP NSF must be NSF-capable and configured for BGP graceful restart.
- OSPF NSF for virtual links is not supported.
- All OSPF networking devices on the same network segment must be NSF-aware (running an NSF software image).
- For IETF IS-IS, all neighboring devices must be running an NSF-aware software image.

Configuring NSF with SSO Supervisor Engine Redundancy

The following sections describe the configuration tasks for the NSF feature:

- [Configuring SSO, page 9-10](#)
- [Configuring CEF NSF, page 9-11](#)
- [Verifying CEF NSF, page 9-11](#)
- [Configuring BGP NSF, page 9-12](#)
- [Verifying BGP NSF, page 9-12](#)
- [Configuring OSPF NSF, page 9-13](#)
- [Verifying OSPF NSF, page 9-13](#)
- [Configuring IS-IS NSF, page 9-14](#)
- [Verifying IS-IS NSF, page 9-15](#)
- [Configuring EIGRP NSF, page 9-17](#)
- [Verifying EIGRP NSF, page 9-17](#)

Configuring SSO

You must configure SSO in order to use NSF with any supported protocol. To configure SSO, perform this task:

	Command	Purpose
Step 1	Switch(config)# redundancy	Enters redundancy configuration mode.
Step 2	Switch(config-red)# mode sso	Configures SSO. When this command is entered, the redundant supervisor engine is reloaded and begins to work in SSO mode.
Step 3	Switch(config-red)# end	Returns to EXEC mode.
Step 4	Switch# show running-config	Verifies that SSO is enabled.
Step 5	Switch# show redundancy states	Displays the operating redundancy mode.

**Note**

The **sso** keyword is supported in Cisco IOS Release 12.2(20)EWA and later releases.

This example shows how to configure the system for SSO and display the redundancy state:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# redundancy
Switch(config-red)# mode sso
Switch(config-red)# end
```

```
Switch# show redundancy states
my state = 13 -ACTIVE
    peer state = 8 -STANDBY HOT
        Mode = Duplex
        Unit = Primary
        Unit ID = 5

Redundancy Mode (Operational) = sso
Redundancy Mode (Configured) = sso
    Split Mode = Disabled
    Manual Swact = Enabled
    Communications = Up

    client count = 29
    client_notification_TMR = 30000 milliseconds
        keep_alive TMR = 9000 milliseconds
        keep_alive count = 1
    keep_alive threshold = 18
        RF debug mask = 0x0
Switch#
```

Configuring CEF NSF

The CEF NSF feature operates by default while the networking device is running in SSO mode. No configuration is necessary.

Verifying CEF NSF

To verify that CEF is NSF-capable, enter the **show cef state** command:

```
Switch# show cef state

CEF Status [RP]
CEF enabled/running
dCEF enabled/running
CEF switching enabled/running
CEF default capabilities:
Always FIB switching:      yes
Default CEF switching:    yes
Default dCEF switching:   yes
Update HWIDB counters:    no
Drop multicast packets:   no
.
.
.
CEF NSF capable:          yes
IPC delayed func on SSO:  no
RRP state:
I am standby RRP:         no
My logical slot:          0
RF PeerComm:              no
```

Configuring BGP NSF

Note You must configure BGP graceful restart on all peer devices participating in BGP NSF.

To configure BGP for NSF, perform this task (repeat this procedure on each of the BGP NSF peer devices):

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# router bgp <i>as-number</i>	Enables a BGP routing process, which places the switch in switch configuration mode.
Step 3	Switch(config-router)# bgp graceful-restart	Enables the BGP graceful restart capability, starting BGP NSF. If you enter this command after the BGP session has been established, you must restart the session for the capability to be exchanged with the BGP neighbor. Use this command on the restarting switch and all of its peers.

Verifying BGP NSF

To verify BGP NSF, you must check that BGP graceful restart is configured on the SSO-enabled networking device and on the neighbor devices. To verify, follow these steps:

- Step 1

Verify that “bgp graceful-restart” appears in the BGP configuration of the SSO-enabled switch by entering the **show running-config** command:

Switch# **show running-config**

.
.
.
router bgp 120
.
.
.
bgp graceful-restart
 neighbor 10.2.2.2 remote-as 300
.
.
.
- Step 2

Repeat Step 1 on each of the BGP neighbors.

- Step 3** On the SSO device and the neighbor device, verify that the graceful restart function is shown as both advertised and received, and confirm the address families that have the graceful restart capability. If no address families are listed, BGP NSF does not occur either:

```
Switch# show ip bgp neighbors x.x.x.x

BGP neighbor is 192.168.2.2, remote AS YY, external link
  BGP version 4, remote router ID 192.168.2.2
  BGP state = Established, up for 00:01:18
  Last read 00:00:17, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    Route refresh:advertised and received(new)
    Address family IPv4 Unicast:advertised and received
    Address family IPv4 Multicast:advertised and received
    Graceful Restart Capability:advertised and received
      Remote Restart timer is 120 seconds
    Address families preserved by peer:
      IPv4 Unicast, IPv4 Multicast
  Received 1539 messages, 0 notifications, 0 in queue
  Sent 1544 messages, 0 notifications, 0 in queue
  Default minimum time between advertisement runs is 30 seconds
```

Configuring OSPF NSF

Note

All peer devices participating in OSPF NSF must be made OSPF NSF-aware, which happens automatically when you install an NSF software image on the device.

To configure OSPF NSF, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# router ospf <i>processID</i>	Enables an OSPF routing process, which places the switch in router configuration mode.
Step 3	Switch(config-router)# nsf	Enables NSF operations for OSPF.

Verifying OSPF NSF

To verify OSPF NSF, you must check that the NSF function is configured on the SSO-enabled networking device. To verify OSPF NSF, follow these steps:

- Step 1** Verify that 'nsf' appears in the OSPF configuration of the SSO-enabled device by entering the **show running-config** command:

```
Switch# show running-config

route ospf 120
log-adjacency-changes
```

```

nsf
network 192.168.20.0 0.0.0.255 area 0
network 192.168.30.0 0.0.0.255 area 1
network 192.168.40.0 0.0.0.255 area 2
.
.
.

```

Step 2 Enter the **show ip ospf** command to verify that NSF is enabled on the device:

```
Switch> show ip ospf
```

```

Routing Process "ospf 1" with ID 192.168.2.1 and Domain ID 0.0.0.1
Supports only single TOS(TOS0) routes
Supports opaque LSA
SPF schedule delay 5 secs, Hold time between two SPFs 10 secs
Minimum LSA interval 5 secs. Minimum LSA arrival 1 secs
Number of external LSA 0. Checksum Sum 0x0
Number of opaque AS LSA 0. Checksum Sum 0x0
Number of DCbitless external and opaque AS LSA 0
Number of DoNotAge external and opaque AS LSA 0
Number of areas in this router is 1. 1 normal 0 stub 0 nssa
External flood list length 0
Non-Stop Forwarding enabled, last NSF restart 00:02:06 ago (took 44 secs)
Area BACKBONE(0)
Number of interfaces in this area is 1 (0 loopback)
Area has no authentication
SPF algorithm executed 3 times

```

Configuring IS-IS NSF

To configure IS-IS NSF, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# router isis [<i>tag</i>]	Enables an IS-IS routing process, which places the switch in router configuration mode.
Step 3	Switch(config-router)# nsf [cisco ietf]	Enables NSF operation for IS-IS. Enter the ietf keyword to enable IS-IS in a homogeneous network where adjacencies with networking devices supporting IETF draft-based restartability is guaranteed. Enter the cisco keyword to run IS-IS in heterogeneous networks that might not have adjacencies with NSF-aware networking devices.
Step 4	Switch(config-router)# nsf interval [<i>minutes</i>]	(Optional) Specifies the minimum time between NSF restart attempts. The default time between <i>consecutive</i> NSF restart attempts is 5 minutes.

	Command	Purpose
Step 5	Switch(config-router)# nsf t3 { manual [<i>seconds</i>] adjacency }	(Optional) Specifies the time IS-IS waits for the IS-IS database to synchronize before generating overloaded link-state information for itself and flooding that information out to its neighbors. The t3 keyword applies only if you selected IETF operation. When you specify adjacency , the switch that is restarting obtains its wait time from neighboring devices.
Step 6	Switch(config-router)# nsf interface wait <i>seconds</i>	(Optional) Specifies how long an IS-IS NSF restart waits for all interfaces with IS-IS adjacencies to come up before completing the restart. The default is 10 seconds.

Verifying IS-IS NSF

To verify IS-IS NSF, you must check that the NSF function is configured on the SSO-enabled networking device. To verify IS-IS NSF, follow these steps:

- Step 1** Verify that “nsf” appears in the IS-IS configuration of the SSO-enabled device by entering the **show running-config** command. The display shows either the Cisco IS-IS or the IETF IS-IS configuration. The following display indicates that the device uses the Cisco implementation of IS-IS NSF:
- Step 2** If the NSF configuration is set to **cisco**, enter the **show isis nsf** command to verify that NSF is enabled on the device. Using the Cisco configuration, the display output differs on the active and redundant RPs. The following display shows sample output for the Cisco configuration on the active RP. In this example, note the presence of “NSF restart enabled”:

```
Switch# show running-config
<...Output Truncated...>
router isis
nsf cisco
<...Output Truncated...>
```

```
Switch# show isis nsf

NSF is ENABLED, mode 'cisco'

RP is ACTIVE, standby ready, bulk sync complete
NSF interval timer expired (NSF restart enabled)
Checkpointing enabled, no errors
Local state:ACTIVE, Peer state:STANDBY HOT, Mode:SSO
```

The following display shows sample output for the Cisco configuration on the standby RP. In this example, note the presence of “NSF restart enabled”:

```
Switch# show isis nsf

NSF enabled, mode 'cisco'
RP is STANDBY, chkpt msg receive count:ADJ 2, LSP 7
NSF interval timer notification received (NSF restart enabled)
Checkpointing enabled, no errors
Local state:STANDBY HOT, Peer state:ACTIVE, Mode:SSO
```

- Step 3** If the NSF configuration is set to **ietf**, enter the **show isis nsf** command to verify that NSF is enabled on the device. The following display shows sample output for the IETF IS-IS configuration on the networking device:

```
Switch# show isis nsf

NSF is ENABLED, mode IETF
NSF pdb state:Inactive
NSF L1 active interfaces:0
NSF L1 active LSPs:0
NSF interfaces awaiting L1 CSNP:0
Awaiting L1 LSPs:
NSF L2 active interfaces:0
NSF L2 active LSPs:0
NSF interfaces awaiting L2 CSNP:0
Awaiting L2 LSPs:
Interface:Serial3/0/2
    NSF L1 Restart state:Running
    NSF p2p Restart retransmissions:0
    Maximum L1 NSF Restart retransmissions:3
    L1 NSF ACK requested:FALSE
    L1 NSF CSNP requested:FALSE
    NSF L2 Restart state:Running
    NSF p2p Restart retransmissions:0
    Maximum L2 NSF Restart retransmissions:3
    L2 NSF ACK requested:FALSE
Interface:GigabitEthernet2/0/0
    NSF L1 Restart state:Running
    NSF L1 Restart retransmissions:0
    Maximum L1 NSF Restart retransmissions:3
    L1 NSF ACK requested:FALSE
    L1 NSF CSNP requested:FALSE
    NSF L2 Restart state:Running
    NSF L2 Restart retransmissions:0
    Maximum L2 NSF Restart retransmissions:3
    L2 NSF ACK requested:FALSE
    L2 NSF CSNP requested:FALSE
Interface:Loopback1
    NSF L1 Restart state:Running
    NSF L1 Restart retransmissions:0
    Maximum L1 NSF Restart retransmissions:3
    L1 NSF ACK requested:FALSE
    L1 NSF CSNP requested:FALSE
    NSF L2 Restart state:Running
    NSF L2 Restart retransmissions:0
    Maximum L2 NSF Restart retransmissions:3
    L2 NSF ACK requested:FALSE
    L2 NSF CSNP requested:FALSE
```

Configuring EIGRP NSF

To configure EIGRP NSF, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# router eigrp <i>as-number</i>	Enables an EIGRP routing process, which places the switch in router configuration mode.
Step 3	Switch(config-router)# nsf	Enables EIGRP NSF. Use this command on the “restarting” switch and all of its peers.

Verifying EIGRP NSF

To verify EIGRP NSF, you must check that the NSF function is configured on the SSO-enabled networking device. To verify EIGRP NSF, follow these steps:

- Step 1** Verify that “nsf” appears in the EIGRP configuration of the SSO-enabled device by entering the **show running-config** command:

```
Switch# show running-config
```

```
.
.
.
router eigrp 100
  auto-summary
  nsf
.
.
.
```

- Step 2** Enter the **show ip protocols** command to verify that NSF is enabled on the device:

```
Switch# show ip protocols
```

```
*** IP Routing is NSF aware ***
```

```
Routing Protocol is "eigrp 100"
```

```
  Outgoing update filter list for all interfaces is not set
```

```
  Incoming update filter list for all interfaces is not set
```

```
  Default networks flagged in outgoing updates
```

```
  Default networks accepted from incoming updates
```

```
  EIGRP metric weight K1=1, K2=0, K3=1, K4=0, K5=0
```

```
  EIGRP maximum hopcount 100
```

```
  EIGRP maximum metric variance 1
```

```
  Redistributing: eigrp 100
```

```
  EIGRP NSF-aware route hold timer is 240s
```

```
  EIGRP NSF enabled
```

```
    NSF signal timer is 20s
```

```
    NSF converge timer is 120s
```

```
  Automatic network summarization is in effect
```

```
  Maximum path: 4
```

```
  Routing for Networks:
```

```
  Routing Information Sources:
```

```
    Gateway         Distance      Last Update
```

```
  Distance: internal 90 external 170
```

CHAPTER 10

Environmental Monitoring and Power Management

Note

Before reading this chapter, read the “Preparing for Installation” section of the *Catalyst 4500 Series Installation Guide*. It is important to ensure that your installation site has enough power and cooling to accommodate the additional electrical load and heat introduced by Power over Ethernet (PoE).

This chapter describes power management and environmental monitoring features in the Catalyst 4500 series switches. It provides guidelines, procedures, and configuration examples.

This chapter consists of the following major sections:

- [About Environmental Monitoring, page 10-1](#)
- [Power Management, page 10-6](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

About Environmental Monitoring

This section contains the following subsections:

- [Using CLI Commands to Monitor your Environment, page 10-2](#)
- [Displaying Environment Conditions, page 10-2](#)
- [Emergency Actions, page 10-3](#)
- [System Alarms, page 10-4](#)

Environmental monitoring of chassis components provides early warning indications of possible component failure. This warning helps you to ensure the safe and reliable operation of your system and avoid network interruptions.

This section describes how to monitor critical system components so that you can identify and rapidly correct hardware-related problems.

Using CLI Commands to Monitor your Environment

Use the **show environment** CLI command to monitor the system. This section gives a basic overview of the command and keywords you will need.

Enter the **show environment [alarm | status | temperature]** command to display system status information. Keyword descriptions are listed in [Table 10-1](#).

Table 10-1 *show environment Keyword Descriptions*

Keyword	Purpose
alarm	Displays environmental alarms for the system.
status	Displays field-replaceable unit (FRU) operational status and power and power supply fan sensor information.
temperature	Displays temperature of the chassis.

Displaying Environment Conditions

Topics include:

- [Conditions on Supervisor Engines II-Plus to V-10GE, page 10-2](#)
- [Conditions on Supervisor Engine 6-E, page 10-3](#)

Conditions on Supervisor Engines II-Plus to V-10GE

The following example shows how to display the environment condition on Supervisor Engines II-Plus to V-10GEs. The output indicates that the power supplies differ. The switch uses only one power supply and disables the other.

```
Switch# show environment
no alarm
```

```
Chassis Temperature           = 35 degrees Celsius
Chassis Over Temperature Threshold = 75 degrees Celsius
Chassis Critical Temperature Threshold = 95 degrees Celsius
```

```
Power
Supply  Model No          Type      Status      Fan      Inline
-----  -
PS1     PWR-C45-2800AC          AC 2800W    good       good     good
→ PS2     PWR-C45-1000AC          AC 1000W    err-disable good     n.a.
```

```
*** Power Supplies of different types have been detected***
Switch#
```

Conditions on Supervisor Engine 6-E

Supervisor Engine 6-E and its associated linecards support multiple temperature sensors per card. The environment condition output includes the temperature reading from each sensor and the temperature thresholds for each sensor. These linecards support three thresholds: warning, critical, and shutdown. (Supervisor Engines II-Plus to V-10GE support two threshold.)

The following example illustrates how to display the environment condition on a Supervisor Engine 6-E. The thresholds appear within parentheses.

```
Switch# show environment
no temperature alarms
```

Module	Sensor	Temperature	Status
2	air inlet	23C (51C, 65C, 68C)	ok
2	air outlet	29C (69C, 83C, 86C)	ok
5	air inlet	38C (51C, 65C, 68C)	ok
5	air outlet	38C (69C, 83C, 86C)	ok
6	air inlet	34C (51C, 65C, 68C)	ok
6	air outlet	37C (69C, 83C, 86C)	ok

Power Supply	Model No	Type	Status	Fan Sensor	Inline Status
PS1	PWR-C45-2800AC	AC 2800W	good	good	good
PS2	none	--	--	--	--

```
Power supplies needed by system : 1
Power supplies currently available : 1
```

```
Chassis Type : WS-C4510R-E
```

```
Power consumed by backplane : 40 Watts
```

```
Switch Bandwidth Utilization : 0%
```

```
Supervisor Led Color : Green
```

```
Module 2 Status Led Color : Green
Module 5 Status Led Color : Green
Module 6 Status Led Color : Orange
Module 10 Status Led Color : Green
```

```
Fantray : Good
```

```
Power consumed by Fantray : 80 Watts
```

Emergency Actions

Chassis with Supervisor Engine 6-E can power down a single card, providing a detailed response to over-temperature conditions on linecards. However, Supervisor Engine 6-E *cannot* safely operate when the temperature of the supervisor itself exceeds the critical threshold. Therefore, the supervisor engine will turn off the chassis' power supplies to protect itself from overheating. When this happens, you can recover the switch only by cycling the power on and off switches on the power supplies or by cycling the AC or DC inputs to the power supplies.

Critical and shutdown temperature emergencies trigger the same action. Table 10-2 lists temperature emergencies but does not distinguish between critical and shutdown emergencies.

Table 10-2 *Emergency and Action for Supervisor Engines 6-E*

Case 1. Complete fan failure emergency.	Power down the chassis.
Case 2. Temperature emergency on a linecard.	Power down the linecard.
Case 3. Temperature emergency on the standby supervisor engine.	Power down the standby supervisor engine.
Case 4. Temperature emergency on the active supervisor engine with the standby supervisor engine in the hot standby or cold standby redundancy state.	Reset the active supervisor engine.
Case 5. Temperature emergency on the active supervisor engine with no standby supervisor engine or with a standby supervisor engine that is not in hot standby or cold standby redundancy state.	Power down the chassis.

In Case 4, the standby supervisor engine takes over when the active engine resets itself. Then, if the temperature emergency remains, the newly active supervisor engine resets the standby supervisor engine.

Case 5 applies to nonredundant chassis and to chassis with a standby supervisor engine that has been shutdown or which has not fully booted.

System Alarms

Any system has two types of alarms: major and minor. A major alarm indicates a critical problem that could lead to system shutdown. A minor alarm is informational—it alerts you to a problem that could become critical if corrective action is not taken.

[Table 10-3](#) lists the possible environment alarms.

Table 10-3 *Possible Environmental Alarms*

A temperature sensor over its warning threshold	minor
A temperature sensor over its critical threshold	major
A temperature sensor over its shutdown threshold	major
A partial fan failure	minor
A complete fan failure	major

Fan failure alarms are issued as soon as the fan failure condition is detected and are canceled when the fan failure condition clears. Temperature alarms are issued as soon as the temperature reaches the threshold temperature and are canceled when the temperature drops more than 5 degree C below the threshold. 5 degree C is a hysteresis value designed to prevent toggling alarms.

An LED on the supervisor engine indicates whether an alarm has been issued.

When the system issues a major alarm, it starts a timer whose duration depends on the alarm. If the alarm is not canceled before the timer expires, the system takes emergency action to protect itself from the effects of overheating. The timer values and the emergency actions depend on the type of supervisor engine.

**Note**

Refer to the *Catalyst 4500 Series Switch Module Installation Guide* for information on LEDs, including the startup behavior of the supervisor engine system LED.

Table 10-4 describes the alarms on Supervisor Engines II-Plus to V-10GE.

Table 10-4 Alarms on Supervisor Engines II-Plus to V-10GE

Event	Alarm Type	Supervisor LED Color	Timeout	Description and Action
Chassis temperature exceeds the critical threshold.	Major	Red	5 min	Syslog message displays when the alarm is issued. Linecards are put in reset when the timeout expires.
Supervisor fails power on self-test (POST).	Major	Red	—	Syslog message is displayed. The supervisor fails to come up.
Chassis fan tray fails.	Major	Red	4 min	Syslog message displays when the alarm is issued. Linecards are put in reset when the timeout expires.
Chassis temperature exceeds the warning threshold.	Minor	Orange	—	Syslog message displays when the alarm is issued.
Chassis fan tray experiences partial failure.	Minor	Orange	—	Syslog message displays when the alarm is issued.

Table 10-5 describes the alarms on Supervisor Engine 6-E.

Table 10-5 Alarms on Supervisor Engine 6-E

Event	Alarm Type	Supervisor LED Color	Timeout	Description and Action
Card temperature exceeds the critical threshold.	Major	Red	15 min	Syslog message displays when the alarm is issued. See Table 10-2 for the action on timeout.
Card temperature exceeds the shutdown threshold.	Major	Red	30 sec	Syslog message displays when the alarm is issued. See Table 10-2 for the action on timeout.
Supervisor engine fails power-on self-test (POST).	Major	Red	—	Syslog message displays. Supervisor engine fails to come up.

Table 10-5 *Alarms on Supervisor Engine 6-E*

Event	Alarm Type	Supervisor LED Color	Timeout	Description and Action
Chassis fan tray fails.	Major	Red	30 sec	Syslog message displays when the alarm is issued. See Table 10-2 for the action on timeout.
Chassis temperature exceeds the warning threshold.	Minor	Orange	—	Syslog message when the alarm is issued.
Chassis fan tray experiences partial failure.	Minor	Orange	—	Syslog message when the alarm is issued.

Power Management

This section describes the power management feature in the Catalyst 4500 series switches. It includes the following topics:

- [Power Management for the Catalyst 4500 Series Switches, page 10-6](#)
- [Powering Down a Module, page 10-20](#)
- [Power Management for the Catalyst 4948 Switches, page 10-21](#)

Note

For power consumption of all Catalyst 4000/4500 family modules, see [“Appendix A, Specifications,” in the Catalyst 4500 Series Module Installation Guide](#). Enter the **show power** command to display the current power redundancy and the current system power usage.

Power Management for the Catalyst 4500 Series Switches

This section includes the following subsections:

- [Supported Power Supplies, page 10-7](#)
- [Power Management Modes for the Catalyst 4500 Switch, page 10-8](#)
- [Selecting a Power Management Mode, page 10-8](#)
- [Power Management Limitations in Catalyst 4500 Series Switches, page 10-9](#)
- [Available Power for Catalyst 4500 Series Switches Power Supplies, page 10-13](#)
- [Insufficient Inline Power Handling for Supervisor Engine II-TS, page 10-19](#)
- [Combined Mode Power Resiliency, page 10-16](#)
- [Special Considerations for the 1400 W DC Power Supply, page 10-17](#)
- [Special Considerations for the 1400 W DC SP Triple Input Power Supply, page 10-18](#)
- [Insufficient Inline Power Handling for Supervisor Engine II-TS, page 10-19](#)
- [Power Management Modes for the Catalyst 4948 Switch, page 10-21](#)

Supported Power Supplies

You can select from several different power supplies to ensure that you have enough power for the modules installed in your switch.

Note

You should select a power supply based on the modules and the amount of PoE desired using the Cisco Power Calculator:

<http://tools.cisco.com/cpc/>

The choice between 1000 AC and 1400 AC should depend on the type of linecards that the customer plans to use in the chassis.

The Catalyst 4500 series switches support the following power supplies:

- Fixed Wattage—These power supplies always deliver a fixed amount of PoE and system power.
 - 1000 W AC—Supports up to 1050 W of system power. (Not recommended on the Catalyst 4510R switch, PoE not supported)
 - 1400 W AC—Supports up to 1400 W system power. (PoE not supported)
 - 2800 W AC—Supports up to 1400 W of system power and up to 1400 W of PoE.
- Variable Wattage—These power supplies automatically adjust the wattage to accommodate PoE and system power requirements.
 - 1300 W AC—Supports up to 1050 W of system power and 800 W of PoE, limited to a total of 1300 W.
 - 1400 W DC—Supports up to 1400 W of system power and variable amounts of PoE, depending on the input feed to the power supply. See “[Special Considerations for the 1400 W DC Power Supply](#)” section on page 10-17 for more information.
 - 1400 W DC Service Provider—Uses up to three lines (12.5 A, 15 A, 15 A) of DC input and delivers varying amounts of system power ranging from 400 W to 1400 W depending on the lines powered. See “[Special Considerations for the 1400 W DC SP Triple Input Power Supply](#)” section on page 10-18 for more information. (PoE not supported)
 - 4200 W AC and 6000 W AC—Supports varying amounts of system power and PoE depending on the number of inputs powered and input voltage.

Note

All Catalyst 4500 series switch AC-input power supplies require single-phase source AC. The source AC can be out of phase between multiple power supplies or multiple AC-power plugs on the same power supply because all AC power supply inputs are isolated. Each chassis power supply should ideally have its own dedicated branch circuit sized to local and national codes.

When you insert power supplies in your switch, use power supplies that are of the same wattage. Multi-input power supplies such as 1400 W DC triple-input, 4200 W AC, and 6000 W AC have additional restrictions. Read the sections on special considerations for these power supplies. If you mix power supplies, the switch uses the one with the higher wattage and ignores the other power supply. The power supply status displays as err-disable and the summary displays as all zeros (0) for wattage values in the output for the **show power** command.

The following example shows the output for the **show power** command for mixed power supplies:

```
Switch# show power
Power                               Fan      Inline
```

```

Supply  Model No      Type      Status      Sensor      Status
-----  -
PS1     PWR-C45-2800AC      AC 2800W    good        good        good
→ PS2     PWR-C45-1000AC      AC 1000W    err-disable good        n.a.

*** Power Supplies of different type have been detected***

Switch#

```

Power Management Modes for the Catalyst 4500 Switch

The Catalyst 4500 series switches support two power management modes:

- **Redundant mode**—Redundant mode uses one power supply as a primary power supply and the second power supply as a back-up. If the primary power supply fails, the second power supply immediately supports the switch without any disruption in the network. Both power supplies must be the same wattage. A single power supply must have enough power to support the switch configuration.
- **Combined mode**—Combined mode uses the power from all installed power supplies to support the switch configuration power requirements. However, combined mode has no power redundancy. If a power supply fails, one or more modules might shut down.

Note

On the Catalyst 4510R switch, the 1000 W AC power supply is not enough to support redundant mode for all possible configurations. It is able to support redundant mode for limited configurations that require less than 1050 W.

Note

The 1400 W DC power supply supports combined mode for data power. It does not support combined mode for PoE power.

Selecting a Power Management Mode

By default, a switch is set to redundant mode. In the **show power** command, if the **power supplies needed by system** is 1, the switch is in redundant mode; if the **power supplies needed by system** is 2, the switch is in combined mode.

Your switch hardware configuration will dictate which power supply or supplies you should use. For example, if your switch configuration requires more power than a single power supply provides, use the combined mode. In combined mode, however, the switch has no power redundancy. Consider the following possibilities:

- The supervisor engine consumes 110 W, the fan boxes for the Catalyst 4503 switch consume 30 W each, the fan boxes for the Catalyst 4506 and Catalyst 4507 switches consume 50 W each, the backplane for the Catalyst 4503 and Catalyst 4506 switches consumes 10 W, and the backplane for the Catalyst 4507 switch consumes 40 W.
- 1000 W can support a fully loaded Catalyst 4503 switch with no powered device support.
- 1300 W can support a fully loaded Catalyst 4503 switch with Cisco powered devices.
- Each PoE port on a WS-X4148-RJ45V module requires 6.3 W. Five fully loaded WS-X4148-RJ45V modules in a switch comprise 240 ports. This configuration requires 1512 W of PoE, plus 300 W for the modules.

Power Management Limitations in Catalyst 4500 Series Switches

Limitation 1

It is possible to configure a switch that requires more power than the power supplies provide. The two ways you could configure a switch to exceed the power capabilities are as follows:

- The power requirements for the installed modules exceed the power provided by the power supplies.

If you insert a single power supply and then set the switch to combined mode, the switch displays this error message:

```
Insufficient power supplies present for specified configuration.
```

This error message also displays in the output for the **show power** command. This error message displays because, by definition, combined mode requires that two working power supplies be installed in your switch.

If the power requirements for the installed modules exceeds the power provided by the power supplies, the switch displays this error message:

```
Insufficient power available for the current chassis configuration.
```

This error message also appears in the **show power** command output.

If you attempt to insert additional modules into your switch and exceed the power supply, the switch immediately places the newly inserted module into reset mode, and the switch displays these error messages:

```
Module has been inserted  
Insufficient power supplies operating.
```

Additionally, if you power down a functioning switch and insert an additional module or change the module configuration so that the power requirements exceed the available power, one or more modules enter reset mode when you power on the switch again.

- The power requirements for the PoE exceed the PoE provided by the power supplies.

If you have too many IP phones drawing power from the system, power to IP phones is cut, and some phones may be powered down to reduce the power requirements to match the power supplies.

In the first scenario (power requirements exceed the power supplied), the system attempts to resolve this power usage limitation by evaluating the type and number of modules installed. During the evaluation cycle, beginning from the bottom of the chassis, the system puts the modules that it is unable to support

(for lack of power) into reset mode. The supervisor engine and modules for which there is adequate power always remain enabled, with no disruption of network connectivity. Modules placed in reset mode still consume some power and can be removed from the chassis to further reduce power requirements. If you configure the chassis correctly, the system will not enter the evaluation cycle.

A module in reset mode continues to draw power as long as it is installed in the chassis; you can use the **show power module** command to determine how much power is required to bring the module online.

To compute the power requirements for your system and verify that your system has enough power, add the power consumed by the supervisor engine module(s), the fan box(es), and the installed modules (including PoE). For PoE, total the requirements for all the phones. See the [“Powering Down a Module” section on page 10-20](#) for more information on the power consumption for the various components of your switch.

The 802.3af-compliant PoE modules can consume up to 20 W of PoE to power FPGAs and other hardware components on the module. Be sure to add at least 20 W to your PoE requirements for each 802.3af-compliant PoE module to ensure that the system has adequate power for the PDs connected to the switch.

On the WS-X4148-RJ45V PoE module, PoE consumption cannot be measured. Therefore, for all PoE calculations, the PoE consumption on this module is presumed to be equal to its administrative PoE.

You can use the **show module** command to verify which modules are active and which, if any, have been placed in reset.

The following example shows the **show module** command output for a system with inadequate power for all installed modules. The system does not have enough power for Module 5; the *Status* displays it as *PwrDeny*.

If the PoE that is consumed by the module is more than 50 W above the PoE you allocated using the **power inline consumption default** command, the Status displays as *PwrOver*. If the PoE consumed by the module is more than 50 W above the PoE module limit, the Status displays as *PwrFault*.

```
Switch# show module

Switch#
```

Limitation 2

Certain configurations on the Catalyst 4507R and Catalyst 4510R chassis exceeds the maximum amount of data power available. These configurations include the combination of the follow PIDs:

- 7-slot configuration
- Chassis: WS-C4507R-E, WS-C4510R-E
- Dual supervisor engines: WS-X45-Sup6-E

- One or more: WS-X4448-GB-RJ45 or WS-X4148-FX-MT

To maximize the 10/100/1000 port density of 7 and 10 slot chassis when using redundant Supervisor engine 6-E install WS-X4548-GB-RJ45 linecards instead of WS-X4448-GB-RJ45 linecards. If WS-X4448-GB-RJ45 linecards are required two options are available.

- Option 1

Only 4 linecard slots can be used on the Cat4507R and 6 linecard slots on the Cat4510R chassis.

- Option 2

When all slots are required only one WS-X4448-GB-RJ45 linecard can be used.

To maximize the 100-BASE-FX port density of 7 and 10 slot chassis when using Supervisor engine 6-E install WS-4248-FE-SFP linecards with FX optics instead of WS-X4148-FX-MT linecards. If WS-X4148-FX-MT linecards are required two options are available.

- Option 1

Only 4 linecard slots can be used on the Cat4507R and 6 linecard slots on the Cat4510R chassis.

- Option 2

When all slots are required only one WS-X4448-GB-RJ45 linecard can be used.

Configuring Redundant Mode on a Catalyst 4500 Series Switch

By default, the power supplies in a Catalyst 4500 series switch are set to operate in redundant mode. To effectively use redundant mode, follow these guidelines:

- Use two power supplies of the same type.
- If you have the power management mode set to redundant mode and only one power supply installed, your switch will accept the configuration but operates without redundancy.

Caution

If you have power supplies with different types or different wattages installed in your switch, the switch will not recognize one of the power supplies and will not have power redundancy.

- For fixed power supplies, choose a power supply that by itself is powerful enough to support the switch configuration.
- For variable power supplies, choose a power supply that provides enough power so that the chassis and PoE requirements are less than the maximum available power. Variable power supplies automatically adjust the power resources at startup to accommodate the chassis and PoE requirements. Modules are brought up first, followed by IP phones.
- The maximum available power for chassis and PoE for each power supply are listed in [Table 10-6 on page 10-13](#).

To configure redundant mode on your Catalyst 4500 series switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# power redundancy-mode redundant	Sets the power management mode to redundant mode.

	Command	Purpose
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show power supplies	Verifies the power redundancy mode for the switch.

The following example shows how to set the power management mode to redundant mode.

```
Switch (config)# power redundancy-mode redundant
Switch (config)# end
Switch#
```

The following example shows how to display the current power redundancy mode. The power supplies needed by system: 1 indicates that the switch is in redundant mode.

```
Switch# show power supplies
Power supplies needed by system:1
Switch#
```

An option in the combined mode provides a form of redundancy available with only the 4200 W AC and 6000 W AC power supplies. Refer to the section “Combined Mode Power Resiliency” on page 16.

Configuring Combined Mode on a Catalyst 4500 Series Switch

If your switch configuration requires more power than a single power supply can provide, set the power management mode to combined mode. Combined mode utilizes the available power for both power supplies; however, your switch will have no power redundancy.

To effectively use combined mode, follow these guidelines:

- Use power supplies of the same type and wattage (fixed or variable and AC or DC).
- If you use power supplies with different types or wattages, the switch will utilize only one of the power supplies.
- For variable power supplies, choose a power supply that provides enough power so that the chassis and PoE requirements are less than the maximum available power. Variable power supplies automatically adjust the power resources at startup to accommodate the chassis and PoE requirements.
- If you have the power management mode set to combined mode and only one power supply installed, your switch will accept the configuration, but power is available from only one power supply.
- When your switch is configured to combined mode, the total available power is not the mathematical sum of the individual power supplies. The power supplies have a predetermined current sharing ratio (See [Table 10-6 on page 10-13](#) for more information.)
- The maximum available power for chassis and PoE for each power supply are listed in [Table 10-6 on page 10-13](#).

To configure combined mode on your Catalyst 4500 series switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# power redundancy-mode combined	Sets the power management mode to combined mode.

	Command	Purpose
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show power supplies	Verifies the power redundancy mode for the switch.

The following example shows how to set the power management mode to combined mode.

```
Switch (config)# power redundancy-mode combined
Switch (config)# end
Switch#
```

The following example shows how to display the current power redundancy mode. The power supplies needed by system: 2 indicates that the switch is in combined mode.

```
Switch# show power supplies
Power supplies needed by system:2
Switch#
```

Available Power for Catalyst 4500 Series Switches Power Supplies

Table 10-6 lists the power available for use in the various Catalyst 4500 series switches power supplies. When your switch is configured to combined mode, the total available power is not the mathematical sum of the individual power supplies. The power supplies have a sharing ratio predetermined by the hardware. In combined mode, the total power available is $P + (P * \text{sharing-ratio})$, where P is the amount of power in the power supply.

Table 10-6 Available Power for Switch Power Supplies

Power Supply	Redundant Mode (W)	Combined Mode (W)	Sharing Ratio
1000 W AC	Chassis ¹ = 1050 PoE = 0	Chassis = 1667 PoE = 0	2/3
1300 W AC	Chassis (max) = 1050 PoE (max) = 800 Chassis + PoE + Backplane ≤ 1300	Chassis (min) = 767 PoE (max) = 1333 Chassis (max) = 1667 PoE (min) = 533 Chassis + PoE + Backplane ≤ 2200	2/3
1400 W DC	Chassis (min) = 200 Chassis (max) = 1360 $\text{PoE (max)}^2 = (\text{DC Input}^3 - [\text{Chassis (min)} + \text{Backplane}] / 0.75) * 0.96$	Chassis = 2267 ⁴ PoE ⁵	Chassis—2/3 PoE—0
1400 W AC	Chassis = 1360 PoE = 0 ⁶	Chassis = 2473 PoE = 0	9/11
2800 W AC	Chassis = 1360 PoE = 1400	Chassis = 2473 PoE = 2333	Chassis ⁷ —9/11 PoE ⁸ —2/3

1. Chassis power includes power for the supervisor(s), all linecards, and the fan tray.

2. The efficiency for the 1400 W DC power supply is 0.75, and 0.96 is applied to PoE.
3. DC input can vary for the 1400 W DC power supply and is configurable. For more information, see “Special Considerations for the 1400 W DC Power Supply” on page 17.
4. Not available for PoE.
5. Not available for PoE.
6. No voice power.
7. Data-only.
8. Inline power.

Special Considerations for the 4200 W AC and 6000 W AC Power Supplies

The 4200 W AC and 6000 W AC power supply has two inputs: each can be powered at 110 or 220 V.

The output of the **show power** command for the 4200 W AC and 6000 W AC power supplies are similar to that of 1400 W DC triple-input power supply (that is, the status of the sub-modules (multiple inputs) is displayed). With these two power supplies, you can distinguish sub-module “failed” versus “off,” and the status of the sub-modules (good, bad, or off):

Switch# **show power**

Power Supply	Model No	Type	Status	Fan Sensor	Inline Status
PS1	PWR-C45-4200ACV	AC 4200W	good	good	good
PS1-1		220V	good		
PS1-2			off		
PS2	PWR-C45-4200ACV	AC 4200W	bad/off	good	bad/off
PS2-1		220V	good		
PS2-2		220V	bad		

Power supplies needed by system : 1

Power supplies currently available : 2

Power Summary (in Watts)	Used	Maximum Available
System Power (12V)	140	1360
Inline Power (-50V)	0	1850
Backplane Power (3.3V)	0	40
Total	140	(not to exceed Total Maximum Available = 2100)

Switch#

As with other power supplies, the two power supplies must be of the same type (6000 W AC or 4200 W AC or 1400 W DC). Otherwise, the right power supply will be put in err-disable state and the left one will be selected. In addition, all the inputs to the chassis must be at the same voltage. In redundant mode, the inputs to the left and right power supplies must be identical. If the left and right power supplies are powered in redundant mode, the power values will be based on the power supply that has higher output wattage.

Note

When the system is powered with a 4200 W or 6000 W power supply either in 110 V or 220 V combined mode operation, the available power is determined by the configuration of the system (the type of linecards, the number of linecards, number of ports consuming inline power etc.) and does not reflect the absolute maximum power.

**Note**

In a matched redundant power supply configuration, if a power supply sub-module fails, the other (good) power supply will provide power to its full capability.

Table 10-7 illustrates how the 4200 W AC power supply is evaluated in redundant mode.

Table 10-7 Power Output in Redundant Mode for the 4200 W AC Power Supply

Power Supply	12 V	3.3 V	-50 V	Total
110 V	660	40	700	1050
110 V+110 V or 220 V	1360	40	1850	2100
220 V+220 V	1360	40	3700	4200

In combined mode, all the inputs to the chassis must be at the same voltage.

Table 10-8 illustrates how the 4200 W AC power supply is evaluated in combined mode.

Table 10-8 Combined Mode Output for the 4200 W AC Power Supply

Power Supply	12 V	3.3 V	-50 V	Maximum
Both sides (bays) at 110 V	1200	40	1320	1870
110 V+110 V, other side 110 V	1800	40	2000	2730
Both sides at 110 V+110 V	2200	40	3100	3800
Both sides at 220 V	2200	40	3100	3800
220 V+220 V, other side 220 V	2200	40	4700	5500
Both sides at 220 V+220 V	2200	40	6200	7600

Table 10-9 illustrates how the 6000 W AC power supply is evaluated in redundant mode.

Table 10-9 Power Output in Redundant Mode for the 6000 W AC Power Supply

Power Supply	12 V	3.3 V	-50 V	Total
110 V	850	40	922	1050
110 V+110 V or 220V	1700	40	1850	2100
220 V+220 V	2200	40	4800	6000

In combined mode, all the inputs to the chassis must be at the same voltage.

Table 10-10 illustrates how the 6000 W AC power supply is evaluated in combined mode.

Table 10-10 Combined Mode Output for the 6000 W AC Power Supply

Power Supply	12 V	3.3 V	-50 V	Maximum
Both sides (bays) at 110 V	1400	40	1670	1700
110 V+110 V, other side 110 V	2360	40	2560	2800

Table 10-10 Combined Mode Output for the 6000 W AC Power Supply

Power Supply	12 V	3.3 V	-50 V	Maximum
Both sides at 110 V+110 V	3090	40	3360	3700
Both sides at 220 V	4000	40	4360	5400
220 V+220 V, other side 220 V	4000	40	6600	6200
Both sides at 220 V+220 V	4000	40	8700	10900

Combined Mode Power Resiliency

Note

This feature only applies in combined mode when both power supply bays contain the 4200 W AC or 6000 W AC power supply.

Using the combined mode power resiliency feature, you can limit the power usage to a maximum of two or three (configurable) inputs.

With two 4200 W AC or 6000 W AC power supplies, a maximum of four inputs are available. This feature allows you to cap the power usage to that of two or three inputs. If one of the power supplies fails, no loss of power occurs because you have capped its usage to a smaller number of inputs.

To configure the combined mode resiliency feature, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode
Step 2	Switch(config)# power redundancy combined max inputs {2 3}	Limits the power usage to two or three inputs. Note The max inputs part of the command is ignored by all power supplies other than the 4200 W AC or 6000 W AC.
Step 3	Switch(config)# end	Exits configuration mode.

Let's say that you have **max inputs 3** configured with 4 "good" (220 V) inputs and you limit the user to 5500 W instead of 7600 W with the following configuration. If one sub-unit fails or is powered off, the user would have three "good" inputs providing 5500 W and the chassis is powered at the same rate as it was prior to the failure event.

```
Switch# configuration terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# power redundancy combined max inputs 3
Switch(config)# end
Switch#
14:32:01: %SYS-5-CONFIG_I: Configured from console by console
```

Here is the output of the **show power** command prior to invoking this feature:

```
Switch# show power
sh power
Power
Supply  Model No          Type      Status      Fan      Inline
-----  -
PS1     PWR-C45-4200ACV      AC 4200W  good        good      good
```

```

PS1-1                110V    good
PS1-2                110V    good
PS2      PWR-C45-4200ACV  AC 4200W    good      good      good
PS2-1                110V    good
PS2-2                110V    good

```

```

Power supplies needed by system : 1
Power supplies currently available : 2

```

```

Power Summary
(in Watts)      Used      Maximum
-----
System Power (12V)      140      1360
Inline Power (-50V)      0      1850
Backplane Power (3.3V)   0      40
-----
Total              140 (not to exceed Total Maximum Available = 2100)

```

Here is the output after invoking this features: Whereas before combined mode was indicated as **Power supplies needed = 2** in the output of the **show power** command, combined mode is now indicated by the phrase **Power supplies needed by system : 2 Maximum Inputs = 3**.

```
Switch# show power
```

```

sh power
Power
Supply  Model No      Type      Status      Fan      Inline
-----
PS1      PWR-C45-4200ACV  AC 4200W  good        good      good
PS1-1                110V    good
PS1-2                110V    good
PS2      PWR-C45-4200ACV  AC 4200W  good        good      good
PS2-1                110V    good
PS2-2                110V    good

```

```

Power supplies needed by system : 2 Maximum Inputs = 3
Power supplies currently available : 2

```

```

Power Summary
(in Watts)      Used      Maximum
-----
System Power (12V)      140      2400
Inline Power (-50V)      0      2000
Backplane Power (3.3V)   0      40
-----
Total              140 (not to exceed Total Maximum Available = 2728)

```

```
Switch#
```

Special Considerations for the 1400 W DC Power Supply

Caution

Do not mix the 1400 W DC power supply with any other power supply, even for a hot swap or other short-term emergency. Doing so can seriously damage your switch.

Keep in mind the following guidelines when using a 1400 W DC power supply with your Catalyst 4500 series switch:

- The 1400 W DC power supply works with a variety of DC sources. The DC input can vary from 300 W to 7500 W. Refer to the power supply documentation for additional information.

- The supervisor engine cannot detect the DC source plugged into the 1400 W DC power supply. If you are using the 1400 W DC power supply, use the **power dc input** command to set the DC input power. For more information on this command, see the “[Configuring the DC Input for a Power Supply](#)” section on page 10-18.
- The software automatically adjusts between system power (for modules, backplane, and fans) and PoE. Although PoE is 96 percent efficient, system power has only 75 percent efficiency. For example, each 120 W of system power requires 160 W from the DC input. This requirement is reflected in the “**Power Used**” column of the output for the **show power available** command.
- The 1400 W DC power supply has a separate power on or off switch for PoE. The power supply fan status and main power supply status are tied together. If either of them fails, both the power supply and its fan report as bad/off. You should verify that the main power is on before turning on the power for the inline switch. In addition, you should verify that the power for the inline switch is off before turning off the main power.

Configuring the DC Input for a Power Supply

To configure the DC input power for the 1400 W DC power supply or a power shelf, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode
Step 2	Switch(config)# power dc input watts	Sets the capacity of the DC input source.
Step 3	Switch(config)# end	Exits configuration mode.

The same configuration is applied to both power slots. For example, if you set the **dc power input** to 1000 W, the switch expects 1000 W as the external DC source for both slot 1 and slot 2 (if present) respectively.

The following example shows how to set the external DC power source to 1000 W:

```
Switch# configure terminal
Switch (config)# power dc input 1000
Switch (config)# end
Switch#
```

If you use the 1400 W DC SP power supply in combined mode, the inputs do not have to match.

Special Considerations for the 1400 W DC SP Triple Input Power Supply

Unlike the 1400 W DC power supply, the 1400 W DC SP power supply has sub-modules (multiple inputs) that can be powered on or off. With Cisco IOS Release 12.2(25)EW, the output of the **show power** command is modified to display the status of these sub-modules:

```
Switch# show power
Power
Supply  Model No          Type      Status      Fan      Inline
-----  -
PS1     PWR-C45-1400DC      DCSP1400W good        good      n.a.
PS1-1                   12.5A     good
PS1-2                   15.0A     bad
PS1-3                   15.0A     off
PS2     none                --        --        --        --
```

Keep in mind the following guidelines when using a 1400 W DC SP power supply with your Catalyst 4500 series switch:

- When you use two 48 V power rails to drive two power supplies, you might employ cross-wiring to connect the power supplies (to rails) to minimize the "inrush" current drawn during an initial power up. In this situation, you should configure the switch in combined mode before you take a rail down for maintenance.
- Ordinarily, when configured for redundancy, two power supplies must be matched (have identical inputs). For example, you might provide power to inputs 1 and 3 on both PS1 and PS2. If power supplies are mismatched upon bootup, the right (second) power supply will be in err-disable state.

In a matched redundant power supply configuration, if a power supply sub-module fails, the other (good) power supply will provide power to its full capability.

Insufficient Inline Power Handling for Supervisor Engine II-TS

When the Supervisor Engine II-TS is used with the 1400 W DC power supply (PWR-C45-1400DC), and only one 12.5 A input of the power supply is used, the supervisor engine's power consumption may vary depending on the type of linecard used and on whether a linecard is inserted at slots 2 and 3. The power consumption varies between 155 W and 330 W, which also affects the maximum amount of available inline power through the supervisor engine (0 W to 175 W). Consequently, it is possible for the supervisor engine to deny inline power to a connected inline power device when one or more linecards are inserted into the chassis.

The output of the **show power detail** and **show power module** commands reveals the variable amount of power consumption attributable to the supervisor engine and summarizes the supervisor engine's inline power.

Switch# **show power detail**

Switch#

Powering Down a Module

If your system does not have enough power for all modules installed in the switch, you can power down a module, and place it in low power mode. To power down a module, perform this task:

Command	Purpose
Switch(config)# no hw-module module num power	Turns power down to the specified module by placing it in low power mode.

To power on a module that has been powered down, perform this task:

Command	Purpose
Switch(config)# hw-module module num power	Turns power on to the specified module.

This example shows how to power down module 6:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no hw-module module 6 power
Switch(config)# end
Switch#
```

Power Management for the Catalyst 4948 Switches

You can select from AC or DC power supplies to ensure that you have enough power for your switch. The Catalyst 4948 switches support the following power supplies:

- 300 W AC
- 300 W DC

These power supplies are incompatible with Catalyst 4500 series switches. Since Power over Ethernet (PoE) is not supported on the Catalyst 4948 switch, only a limited wattage is needed. (For information on PoE, see [Chapter 11, “Configuring Power over Ethernet.”](#)) When you insert power supplies in your switch, the EEPROM on the power supplies can be read by the system software even if the supply is not powered on. You may mix AC and DC power supplies.

Power Management Modes for the Catalyst 4948 Switch

The Catalyst 4948 switches support the redundant power management mode. In this mode, if both power supplies are operating normally, each provides from 20/80 to 45/55 percent of the total system power requirements at all times. If one power supply fails, the other unit increases power to 100 percent of the total power requirement.

CHAPTER 11

Configuring Power over Ethernet

Note

Before reading this chapter, read the "Preparing for Installation" section of the *Catalyst 4500 Series Installation Guide*. You must ensure that your installation site has enough power and cooling to accommodate the additional electrical load and heat introduced by PoE.

This chapter describes how to configure Power over Ethernet (PoE) on the Catalyst 4500 series switch.

This chapter contains the following sections:

- [Overview, page 11-1](#)
- [Power Management Modes, page 11-2](#)
- [Configuring Power Consumption for Powered Devices on an Interface, page 11-5](#)
- [Displaying the Operational Status for an Interface, page 11-6](#)
- [Displaying the PoE Consumed by a Module, page 11-7](#)
- [PoE Policing and Monitoring, page 11-11](#)
- [Enhanced Power PoE Support on the E-Series Chassis, page 11-15](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview

The Catalyst 4500 series switch provides support for Power over Ethernet (PoE) for both Cisco Prestandard PoE and the IEEE 802.3af standard (ratified in 2003). PoE is supported by all Catalyst 4500 series chassis and requires a PoE module and power supply. The amount of PoE power available depends

on the PoE capabilities of individual power supplies. Support for PoE enables the system to power inline devices, such as IP phones, IP video phones, and wireless access points over standard copper cabling (Category 5, 5e, or 6 cabling).

In addition, with PoE, you do not need to provide wall power for each PoE enabled device. This eliminates the cost for additional electrical cabling that would otherwise be necessary for connected devices. Moreover, PoE enables you to isolate critical devices on a single power system, enabling the entire system to be supported by UPS backup.

You typically deploy a Catalyst 4500 series switch in one of two deployment scenarios. The first scenario is data-only, which requires power to operate the switch and the associated modules. The second scenario supports data and PoE (also termed “inline power”) for deployments where the attached device derives power from the Ethernet port.

Catalyst 4500 series switches can sense if a powered device is connected to a PoE module. They can supply PoE to the powered device if there is no power on the circuit. (If there is power on the circuit, the switch does not supply it.) The powered device can also be connected to an AC power source and supply its own power to the voice circuit.

**Note**

You should select the amount of PoE desired using the Cisco Power Calculator:

<http://tools.cisco.com/cpc/>

Hardware Requirements

To power a device using PoE, your chassis must use at least one of the power supplies listed in [Table 11-1](#), and connect the device to at least one of the switching modules listed in [Table 11-1](#).

Table 11-1 *Hardware Requirements*

Switching Modules	Power Supplies
WS-X4148-RJ45V	PWR-C45-1300ACV=

WS-X4648-RJ45V-E	
WS-X4648-RJ45V+E	

Power Management Modes

If your switch has a module capable of providing PoE to end stations, you can set each interface on the module to automatically detect and apply PoE if the end station requires power.

The Catalyst 4500 series switch has three PoE modes:

- **auto**—PoE interface. The supervisor engine directs the switching module to power up the interface *only* if the switching module discovers the phone and the switch has enough power. You can specify the maximum wattage that is allowed on the interface. If you do not specify a wattage, then the switch will deliver no more than the hardware-supported maximum value. This mode has no effect if the interface is not capable of providing PoE.
- **static**—High priority PoE interface. The supervisor engine preallocates power to the interface, even when nothing is connected, guaranteeing that there will be power for the interface. You can specify the maximum wattage that is allowed on the interface. If you do not specify a wattage, then the switch preallocates the hardware-supported maximum value. If the switch does not have enough power for the allocation, the command will fail. The supervisor engine directs the switching module to power up the interface *only* if the switching module discovers the powered device.
- **never**—Data interface only. The supervisor engine never powers up the interface, even if an unpowered phone is connected. This mode is only needed when you want to make sure power is never applied to a PoE-capable interface.

The switch can measure the actual PoE consumption for an 802.3af-compliant PoE module, and displays this in the **show power module** command.

PoE consumption cannot be measured on the WS-X4148-RJ45V PoE module. Therefore, for all PoE calculations, the PoE consumption on this module is presumed to be equal to its administrative PoE.

For more information, see the [“Displaying the PoE Consumed by a Module” section on page 11-7](#).

For most users, the default configuration of “auto” works well, providing plug and play capability. No further configuration is required. However, to make an interface higher priority or data only, or to specify a maximum wattage, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/port</i>	Selects the interface to configure.
Step 2	Switch(config-if)# power inline { auto [max milli-watts] never static [max milli-watts]}	<p>The auto keyword sets the interface to automatically detect and supply power to the powered device. This is the default configuration.</p> <p>The static keyword sets the interface to higher priority than auto.</p> <p>If necessary, you can use the max keyword to specify the maximum wattage allowed on the interface (4000 to 15400 milliwatts for most switching modules. As of Cisco IOS release 12.2(44)SG the WS-X4648-RJ45V+E can support up to 30 W available per port and the WS-X4648-RJ45V-E will support up to 20 W. For more information, see “Enhanced Power PoE Support on the E-Series Chassis” on page 15).</p> <p>Use the never keyword to disable detection and power for the PoE capable interface.</p>
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show power inline { fastethernet gigabitethernet } <i>slot/port</i>	Displays the PoE state for the switch.

**Note**

If you set a non-PoE-capable interface to automatically detect and apply power, an error message indicates that the configuration is not valid.

The following example shows how to set the Fast Ethernet interface 4/1 to automatically detect PoE and send power through that interface, and to verify the PoE configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 4/1
Switch(config-if)# power inline auto
Switch(config-if)# end
Switch# show power inline fastethernet 4/1
Available:677(w)  Used:11(w)  Remaining:666(w)
```

Interface	Admin	Oper	Power (Watts)		Device	Class
			From PS	To Device		
Fa4/1	auto	on	11.2	10.0	Ieee PD	0

```
Interface  AdminPowerMax  AdminConsumption
              (Watts)           (Watts)
-----
Fa4/1              15.4              10.0
Switch#
```

The following example shows how to configure an interface so that it never supplies power through the interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/2
Switch(config-if)# power inline never
Switch(config-if)# end
Switch#
```

Intelligent Power Management

All Catalyst 4500 PoE-capable modules use Intelligent Power Management to provide power on each interface. When a powered device (PD) is attached to a PoE-capable port, the port will detect the PD and provision power accordingly. If a Cisco PD is used, the switch and PD negotiate power using CDP packets to determine the precise amount of power needed by the PD. If the PD is 802.3af compatible, the difference between what is mandated by the 802.3af class and what is actually needed by the PD is returned to the power budget for use by additional devices. In this way, power negotiation enables customers to stretch their power budget and use it more effectively.

Power negotiation also enables the interoperability of newer Cisco powered devices with older legacy PoE-capable ports from Cisco. Newer Cisco PDs do not consume more than what the switch port can provide.

Configuring Power Consumption for Powered Devices on an Interface

By default, when the switch detects a powered device on an interface, it assumes the powered device consumes the maximum the port can provide (7 W on a legacy Power over Ethernet (PoE) module and 15.4W on the IEEE PoE modules introduced in Cisco IOS Release 12.2(18)EW). Then, when the switch receives a CDP packet from the powered device, the wattage automatically adjusts downward to the specific amount required by that device. Normally, this automatic adjustment works well, and no further configuration is required or recommended. However, you can specify the powered device's consumption for a particular interface to provide extra functionality from your switch. This behavior is useful when CDP is disabled or not available.

Note

When manually configuring the consumption for powered devices, you need to account for the power loss over the cable between the switch and the powered device.

To change the power consumption of a single powered device, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/port</i>	Selects the interface to configure.
Step 2	Switch(config-if)# [no] power inline consumption <i>milli-watts</i>	Sets the PoE consumption (in milliwatts) of the powered device connected to a specific interface. The power consumption can range from 4000 to 15,400. To re-enable the automatic adjustment of consumption, either use the no keyword or specify 15,400 milliwatts.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show power inline consumption { fastethernet gigabitethernet } <i>slot/port</i>	Displays the PoE consumption for the interface.

This example shows how to set the PoE consumption to 5000 milliwatts for interface gi 7/1 regardless what is mandated by the 802.3af class of the discovered device, or by any CDP packet received from the powered device. This example also verifies the PoE consumption on interface gi 7/1.

The following output displays the initial power consumption of the interface.

```
Switch# show power inline gi 7/1
Available:627(w)  Used:267(w)  Remaining:360(w)

Interface Admin  Oper          Power(Watts)  Device      Class
          From PS    To Device
-----
Gi7/1      auto   on           7.9          7.0         IP Phone 7941  3

Interface  AdminPowerMax  AdminConsumption
          (Watts)      (Watts)
-----
Gi7/1              15.4           15.4

Switch# conf t
Enter configuration commands, one per line.  End with CNTL/Z.
```

```
Switch(config)# int gi 7/1
Switch(config-if)# power inline consumption 5000
Switch(config-if)# exit
Switch(config)# exit
```

The following output displays the power consumption after issuing the **power inline consumption** command against the interface:

```
Switch# sh power inline gi 7/1
Available:627(w)  Used:265(w)  Remaining:362(w)
```

Interface	Admin	Oper	Power (Watts)		Device	Class
			From PS	To Device		
Gi7/1	auto	on	5.6	5.0	Ieee PD	3

Interface	AdminPowerMax (Watts)	AdminConsumption (Watts)
Gi7/1	15.4	5.0

Displaying the Operational Status for an Interface

Each interface has an operational status which reflects the PoE status for an interface. The operational status for an interface is defined as one of the following:

- on—Power is supplied by the port.
- off—Power is not supplied by the port. If a powered device is connected to an interface with external power, the switch does not recognize the powered device. The “Device” column in the **show power inline** command displays as n/a.
- Power-deny—The supervisor engine does not have enough power to allocate to the port, or the power that is configured for the port is less than the power required by the port; power is not being supplied by the port.
- err-disable—The port is unable to provide power to the connected device that is configured in static mode.
- faulty—The port failed diagnostics tests.

You can use the **show power inline** command to view the operational status for an interface.

This example shows how to display the operational status for all interfaces on module 3.

```
Switch# show power inline module 3
Available:677(w)  Used:117(w)  Remaining:560(w)
```

Displaying the PoE Consumed by a Module

A Catalyst 4500 series switch can measure the actual PoE consumption for an 802.3af-compliant PoE module. You can observe this consumption with the **show power module** and **show power detail** commands. For all PoE calculations, presume that the PoE consumption on the WS-X4148-RJ45V module equals its administrative PoE.

The 802.3af-compliant PoE modules can consume up to 20 W of PoE to power FPGAs and other hardware components on the module. To ensure that the system has sufficient power for the PDs connected to the switch, add at least 20 W to your PoE requirements for each 802.3af-compliant PoE module.

The following example uses the **show power module** command to display the PoE consumption for an 802.3af-compliant module:

Switch# **show power module**

Watts Used of System Power (12V)

Mod	Model	currently	out of reset	in reset
1	WS-X4013+TS	330	330	330
2	WS-X4548-GB-RJ45V	60	60	20
3	WS-X4548-GB-RJ45V	60	60	20
--	Fan Tray	30	--	--
Total		480	450	370

3	WS-X4548-GB-RJ45V	0	0	22	20	89
Total		138	123	95	85	

Watts used of Module Inline Power (12V -> -50V)

Mod	Model	Inline Power Admin		Inline Power Oper		Efficiency
		PS	Device	PS	Device	
1	WS-X4013+TS	128	128	63	63	100

Switch#

The Inline Power Oper column displays the amount of PoE consumed by the powered devices that are attached to the module, in addition to the PoE consumed by the FPGAs and other hardware components on the module.

The Inline Power Admin column displays only the amount of PoE allocated by the powered devices attached to the module.

Note

The operating PoE consumption for an 802.3af-compliant module can be non-zero, even when there are no powered devices attached to the module, because of the PoE consumed by FPGAs and other hardware components on the module. In addition, the operating PoE can vary because of fluctuations in the PoE consumed by the hardware components.

The following example uses the **show power detail** and **show power inline** commands to display the PoE consumption for an 802.3af-compliant module:

Switch# **show power detail**

PoE Policing and Monitoring

Note

This functionality is supported on the WS-X4548-RJ45V+, WS-X4648-RJ45V-E, and WS-X4648-RJ45V+E linecards.

PoE policing protects a switch from faulty inline powered devices that may draw more current than they were designed for. When a device is connected to a port, a linecard detects the type of device connected and allocates the appropriate amount of power. It sets a PoE policing threshold to a value 5 per cent greater than the allocated power. If the device consumes more power than specified by the policing threshold for a more than 1 second, the port shuts down. Depending on the policing action configured, the port may then be error-disabled, or a message might be logged to the console and the port restarted.

PoE monitoring lets you display the true power consumption of inline powered devices attached to the switch, allowing you determine your actual power consumption.

Topics include:

- [PoE Policing Modes, page 11-12](#)
- [Configuring Power Policing on an Interface, page 11-12](#)
- [Displaying Power Policing on an Interface, page 11-13](#)
- [Configuring Errdisable Recovery, page 11-14](#)

PoE Policing Modes

PoE policing comprises two modes, which determine the action to take on the interface after a port shuts down because of an inline-power policing violation:

Logging - An error message is logged to the console and the interface restarts; the device powers up.

Errdisable (Default) - In addition to logging an error message to the console, the interface is placed in an errdisable state so that the device attached to the port does not receive inline-power until you restart the port or configure an errdisable autorecovery mechanism.

Note

After an inline-power policing violation occurs and the port shuts down, PoE policing automatically turns on again when the port restarts. So, if the connected device exceeds its allocated power again, the port once again shuts down.

Configuring Power Policing on an Interface

The default policing levels are determined by the discovery and power allocation methods (listed in order of priority):

- Configured consumption values, in case any exist
- CDP allocated values (for Cisco devices using CDP)
- Allocated power from IEEE discovery (for devices using this mechanism)

To activate default PoE policing, enter the following:

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int g2/1
Switch(config-if)# power inline police
Switch(config-if)# end
Switch# show power inline police g2/1
Available:800(w)  Used:32(w)  Remaining:768(w)
```

Interface	Admin State	Oper State	Admin Police	Oper Police	Cutoff Power	Oper Power
-----	-----	-----	-----	-----	-----	-----
Gi2/1	auto	on	errdisable	ok	17.2	16.7

The default action for power policing is to set the port to errdisable; the **power inline police** command is equivalent to the **power inline police action errdisable** command, as the above example illustrates. The following example illustrates how to configure the logging policing action:

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int g2/1
Switch(config-if)# power inline police action log
Switch(config-if)# end
Switch# show power inline police g2/1
Available:800(w) Used:32(w) Remaining:768(w)
```

Interface	Admin State	Oper State	Admin Police	Oper Police	Cutoff Power	Oper Power
Gi2/1	auto	on	log	ok	17.2	16.7

When a PD consumes more than its allocated power, the port shuts down and a warning message similar to the following appears on the console.

For the WS-X4648-GB-RJ45V and WS-X4648-GB-RJ45V+:

```
*Sep 12 09:15:28.583: %C4K_ETHPORTMAN-3-INLINEPOWEROVERDRAWN: Inline powered
device connected on port Gi3/25 exceeded its policed threshold.
```

For the WS-X4548-RJ45V+:

```
*Sep 26 09:23:21.355: %C4K_SWITCHMANAGER-3-INLINEPOWEROVERDRAWN: Inline
powered device connected on port Gi2/1 exceeded its policed threshold.
```

For actions of Log type, the port restarts itself and the device reboots. In contrast, when the action is to set the port in an errdisable state, a log message like the following appears:

```
*Sep 26 09:30:20.463: %PM-4-ERR_DISABLE: inline-power error detected on Gi2/1, putting
Gi2/1 in err-disable state
```

```
Switch# show power inline police g2/1
Available:800(w) Used:16(w) Remaining:784(w)
```

Interface	Admin State	Oper State	Admin Police	Oper Police	Cutoff Power	Oper Power
Gi2/1	auto	errdisable	errdisable	overdrawn	0.0	0.0

Displaying Power Policing on an Interface

You can display power policing on an interface, on a module, or for all the PoE-capable linecards in a chassis.

The following example shows output for the **show power inline police** command:

```
Switch# show power inline police
Available:623(w) Used:6(w) Remaining:617(w)
```

Interface	Admin State	Oper State	Admin Police	Oper Police	Cutoff Power	Oper Power
Gi2/1	auto	off	none	n/a	n/a	0.0
Gi2/2	auto	on	none	n/a	n/a	16.7
Gi2/3	auto	off	errdisable	n/a	0.0	0.0

```

Gi2/4      auto   on      errdisable ok      16.6  11.4
Gi2/5      auto   on      log      ok      16.6  11.2
Gi2/6      auto   on      errdisable overdrawn 0.0    0.0

```

The following table lists the interface and the status.

Interface Configuration	State
Gi2/1	No PD connected, no policing configured.
Gi2/2	PD connected, no policing configured.
Gi2/3	No PD connected, policing configured (will get enabled when PD is connected). Policing action is errdisable.
Gi2/4	PD connected, policing configured. Configured policing action is errdisable. Port is currently operating within policing limits.
Gi2/5	PD connected, policing configured. Configured policing action is log. Port is currently operating within policing limits.
Gi2/6	PD connected, policing configured. Configured policing action is errdisable. Port is currently in "errdisable" state as it has overdrawn its policed power level.

If you enter the **show power inline** command at the global level (**show power inline police**), the last line of the output under the Oper Power field displays the total of true inline power consumption of all devices connected to the switch.

Configuring Errdisable Recovery

By default, errdisable auto recovery for inline-power is disabled; when an interface is placed in an errdisable state because of an inline-power policing violation, it remains in that state. You must enter **shut** and **no shut** on the affected interface to revive it.

The errdisable autorecovery mechanism allows you to configure a timer for errdisable recovery so that when an interface enters errdisable state (after the timer expires), the interface returns from the errdisable state.

errdisable detection

By default, errdisable detection for inline-power is enabled, as the following example illustrates:

```

Switch# show errdisable detect
ErrDisable Reason    Detection    Mode
-----
inline-power         Enabled      port

```

Note

If detection is disabled (through the **errdisable detect cause inline-power** command), the port is not placed in errdisable state when it exceeds its power policing threshold.

errdisable recovery

By default, errdisable recovery for inline-power is disabled. To enable errdisable recovery, enter the **errdisable detect cause line-power** command:

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# errdisable detect cause inline-power
Switch(config)# end
Switch# show errdisable recovery
ErrDisable Reason      Timer Status
-----
inline-power           Enabled
```

Enhanced Power PoE Support on the E-Series Chassis

The WS-X4648-RJ45V-E, WS-X4648-RJ45V+E, and WS-X4548-RJ45V+ switching modules support IEEE 802.3af PoE as well as the Cisco proprietary Inline Power standard. With Cisco IOS Release 12.2(44)SG, the WS-X4648-RJ45V+E linecard can also support the IEEE 802.3at standard with up to 30 W available per port. Furthermore, the WS-X4648-RJ45V-E linecard will support up to 20 W. The WS-X4548-RJ45V+ switching module is supported with Cisco IOS Release 12.2(50)SG and can provide up to 30 W of inline power per port.

For these switching modules, the valid milliwatt ranges for the **power inline** command have been increased appropriately for the module, as the following table illustrates:

Linecard	Standard	Max Power/Port	Cisco IOS Release
WS-X4648-RJ45V-E	IEEE 802.3af	20 W	12.2(44)SG
	IEEE 802.3at		
WS-X4648-RJ45V+E	IEEE 802.3af	30 W	12.2(44)SG
	IEEE 802.3at		
WS-X4548-RJ45V+	IEEE 802.3af	30 W	12.2(50)SG
	IEEE 802.3at		

Ordinarily, the default power inline configurations suffice; no additional configuration is required even for high power consumption Cisco powered devices (for example, a Cisco AP1250 Wireless Access Point). When a high power consumption device is attached to a port on a WS-X4648-RJ45V-E or WS-X4648-RJ45V+E linecard, the switch and device negotiate power using CDP packets to automatically determine the extended amount of power needed by the device.

Depending on the deployment requirements and design, you specify a specific configuration with the **power inline** command.

The following example shows how to pre-allocate PoE allocation to 16500 mW for Gi 2/1, regardless of what is mandated either by the 802.3af class of the discovered device or by any CDP packet that is received from the powered device:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 2/1
Switch(config-if)# power inline static max 16500
Switch(config-if)# end
Switch#
```

CHAPTER 12

Configuring Cisco EnergyWise

This chapter describes how to configure Cisco EnergyWise on a Catalyst 4500 series switch.

Cisco EnergyWise is an energy-management technology added onto Cisco switching solutions to help you measure, report, and reduce energy consumption across your entire infrastructure. With EnergyWise's management interface, network management applications can communicate with endpoints and each other, using the network as the unifying fabric.

This chapter includes the following sections:

- [About EnergyWise, page 12-1](#)
- [Configuration Guidelines, page 12-5](#)
- [Managing Single Entities, page 12-6](#)
- [Managing Multiple Entities, page 12-15](#)
- [Managing Power in a LAN, page 12-20](#)
- [Managing Power with IP Routing, page 12-20](#)
- [Using CLI Commands, page 12-22](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

For more details on EnergyWise, go to the URL:

http://www.cisco.com/en/US/products/ps10195/tsd_products_support_series_home.html.

About EnergyWise

This section defines the key terms associated with EnergyWise. The following topics are included:

- [EnergyWise Entity, page 12-2](#)
- [EnergyWise Domain, page 12-2](#)
- [EnergyWise Network, page 12-2](#)
- [EnergyWise Power Level, page 12-3](#)
- [EnergyWise Query, page 12-4](#)
- [EnergyWise Importance, page 12-5](#)

EnergyWise Entity

An EnergyWise entity is a physical or logical device on which EnergyWise is enabled, such as a Catalyst switch, a power over Ethernet (PoE) port, or a PoE device. The PoE ports are considered child entities of the switch which is the parent entity.

EnergyWise uses a distributed model to monitor and manage energy usage.

- Switches are grouped in an EnergyWise domain and become domain entities. All entities monitor their own energy usage and potentially monitor the energy usage for their child entities. They can receive, respond to, and forward EnergyWise traffic from other entities in the same domain.
- When an entity is in the EnergyWise domain, it responds to queries. It can also generate queries initiated by the user.
- When an entity participates in EnergyWise, it controls the power usage of connected PoE devices such as an IP phone, an IP camera, or a PoE-enabled device. For example, a Catalyst switch sends a message to an IP phone to power it off.

On an EnergyWise-enabled entity

- The parent entity always participates in EnergyWise.
- PoE ports can participate in EnergyWise.
- Non-PoE ports do not participate in EnergyWise.

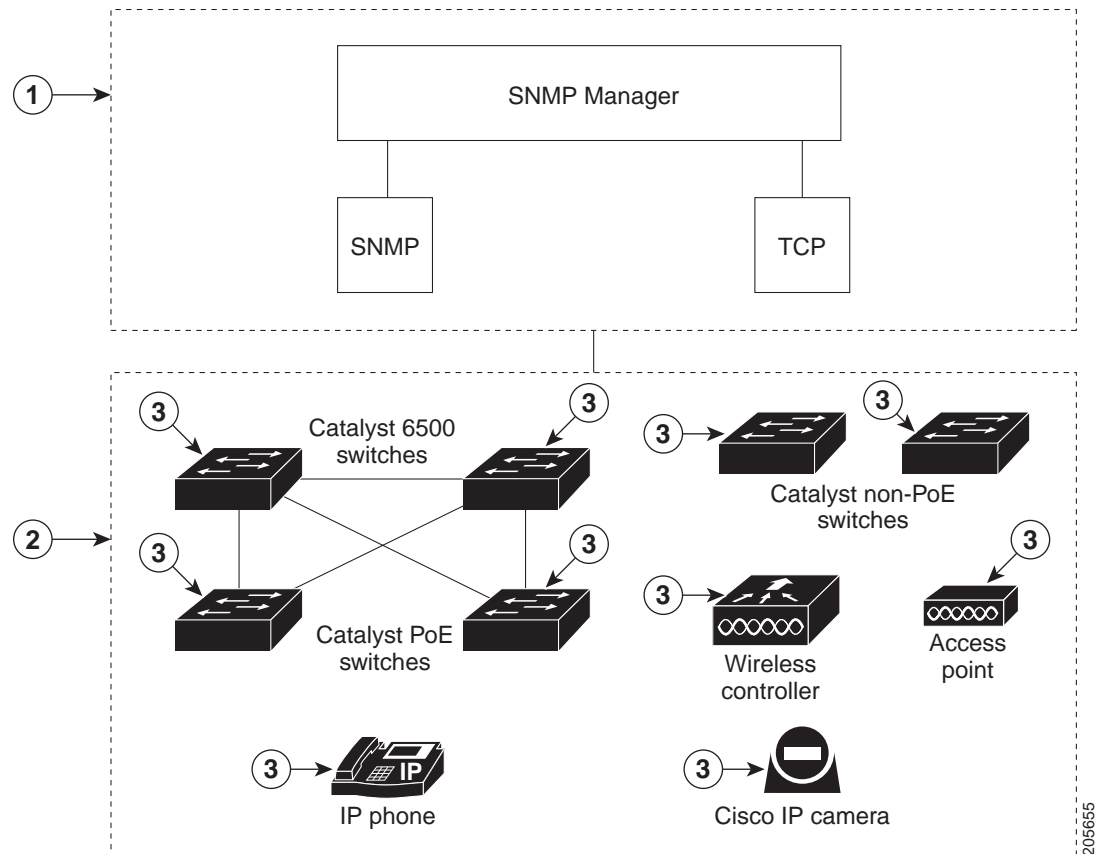

EnergyWise Domain

An EnergyWise domain is a logical group of EnergyWise entities for the purpose of power management. All the entities in a domain can be managed collectively. Each independent domain must be managed independently. There is no default domain for a switch; it must be explicitly configured. A switch can only belong to a single domain. PoE ports belong to the same domain as their parent switch.

EnergyWise Network

In a typical EnergyWise network, EnergyWise entities comprise a domain, whose power is managed by another entity ([Figure 12-1](#)).

Figure 12-1 Typical Network

In [Figure 12-1](#), the numbers correspond to the following:

1	Entity that can manage power usage
2	Domain
3	Entities

EnergyWise Power Level

You can define EnergyWise power levels for PoE ports and other EnergyWise entities (by using the **energywise level** command).

- The range is from 0 to 10 (default).
- If the power level is 0, the port is powered off.
- If the power level is between 1 to 10, the port is powered. You can enter any value in this range to power the PoE port or the switch.

A Catalyst 4500 series switch does not support level 0. A PoE port supports levels 0 and 10.

Note Because line cards are not EnergyWise entities, you cannot use EnergyWise to power them on and off.

Table 12-1 *Power Levels*

Level	auto	never
10	Full	Operational
9	High	
8	Reduced	
7	Medium	
6	Frugal	
5	Low	
4	Ready	Standby
3	Standy	
2	Sleep	
1	Hibernate	Nonoperational
0	Shut	

When the power level changes, the port locally determines the action for the new power level.

EnergyWise Names, Roles, and Keywords

You can set an EnergyWise-specific entity name to identify the domain entity.

- For a PoE port, the default is a short version of the port name (for example, "FastEthernet9/10" becomes "Fa9.10").
- For a switch, the default is the hostname.

You can set the role of the domain entity to differentiate it from other entities.

- For a PoE port, the default is interface.
- For a switch, the default is the model number.

You can set at least one keyword that describes an entity to differentiate it from other entities.

EnergyWise Query

You can run EnergyWise queries (with the **energywise query** command) to do the following:

- Collect power usage information.
- Summarize power information from entities.
- Set parameters.

To filter the results of an EnergyWise query, use the following attributes:

- Importance ([“EnergyWise Importance” section on page 12-5](#))
- Entity name ([“Configuring Entity Attributes” section on page 12-9](#))
- One or more keywords for a port or for a group of ports

Use EnergyWise importance values to select entities in a query. For example, an office phone is less important than an emergency phone that should never be in sleep mode.

When you run a query, the result has entities (perhaps PoE ports), with importance values less than or equal to the specified value in the query.

When a query is forwarded to all the entities in a domain, the entity that forwarded the query receives the results.

EnergyWise Importance

You can set an EnergyWise importance value on a PoE port or a switch to rank domain entities.

You can select entities in a query through EnergyWise importance values (with the **energywise importance** command). For example, an emergency phone that should never be in sleep mode is more important than an office phone.

When you run a query, the result provides entities with importance values less than or equal to the specified value in the query. The entities can be PoE ports.

The range is from 1 to 100. The default is 1.

Configuration Guidelines

When configuring EnergyWise, follow these guidelines:

- By default, EnergyWise is disabled.
- When you add an EnergyWise entity to a domain, EnergyWise is enabled on both the entity and its PoE ports.
- To power off a PoE port, enter the **energywise level 0** interface configuration command. You cannot use the **energywise level 0** as a global configuration command.
- If you schedule the entity to power the PoE port at 7:00 a.m. (0700), the port powers within 1 minute, between 7:00 a.m.(0700) and 7:01 a.m. (0701) local time.

Note To perform an ISSU downgrade to a previous release, you must first disable EnergyWise in the configuration.

- If a port is err-disabled, it appears as an EnergyWise entity, but it will not respond to EnergyWise queries; a query that sets the level to 10 will not turn on power to the port. The collect query displays the port in the list with 0 Watts usage, but the set query will have no effect as long as the port remains in the err-disable state.
- If EnergyWise is disabled, you cannot configure EnergyWise and all existing EnergyWise configuration is lost. The entity can use PoE to manage port power.
- After you configure EnergyWise on a port and then configure the port power level, the new level takes effect after you change the port PoE mode to **auto** or **static**.
- On a redundant chassis operating in redundant mode, the **energywise neighbor hostname port-name** command fails. Instead of using **hostname** in the command, specify the **IP address** of the host.
- When running with a redundant supervisor switch operating in redundant mode, the command **energywise neighbor hostname port-name** fails. Instead of using **hostname** in the command, specify the **hostname** of the host.

EnergyWise and PoE work together to manage power usage. [Table 12-2](#) illustrates the conditions when a port participates in EnergyWise.

Table 12-2 *Port Participation in EnergyWise*

EnergyWise Entity	PoE Mode		
	auto	never	static
PoE port	Yes	No	Yes
Non-PoE port	No	No	No

Note

If the PoE port mode is **never**, port power is off, but EnergyWise is not disabled.

You can do the following:

- Configure EnergyWise on the port.
- Configure the port power level. The new level takes effect after you change the port mode to auto or static.

Note

If a port is errdisabled, it appears as an EnergyWise entity, but it will not respond to EnergyWise queries; a query that sets the level to 10 will not turn on power to the port. The collect query displays the port in the list with 0 Watts usage, but the set query will have no effect as long as the port remains in the errdisable state.

Managing Single Entities

EnergyWise enables you to manage the energy usage of single entities in an EnergyWise network.

This section includes the following topics:

- [Single PoE Switch Scenario, page 12-6](#)
- [Manually Managing Power, page 12-7](#)
- [Automatically Managing Power \(Recurrence\), page 12-12](#)
- [Examples, page 12-14](#)

Single PoE Switch Scenario

In a single PoE switch scenario, also termed a *recurrence scenario*, a PoE switch applies an EnergyWise policy to power connected entities (see [Figure 12-2](#)). The specified local times are based on the PoE-entity time zones.

In the following topology, IP phones are powered on at 7:00 a.m. (0700) local time, and powered off at 7:00 p.m. (1900) local time.

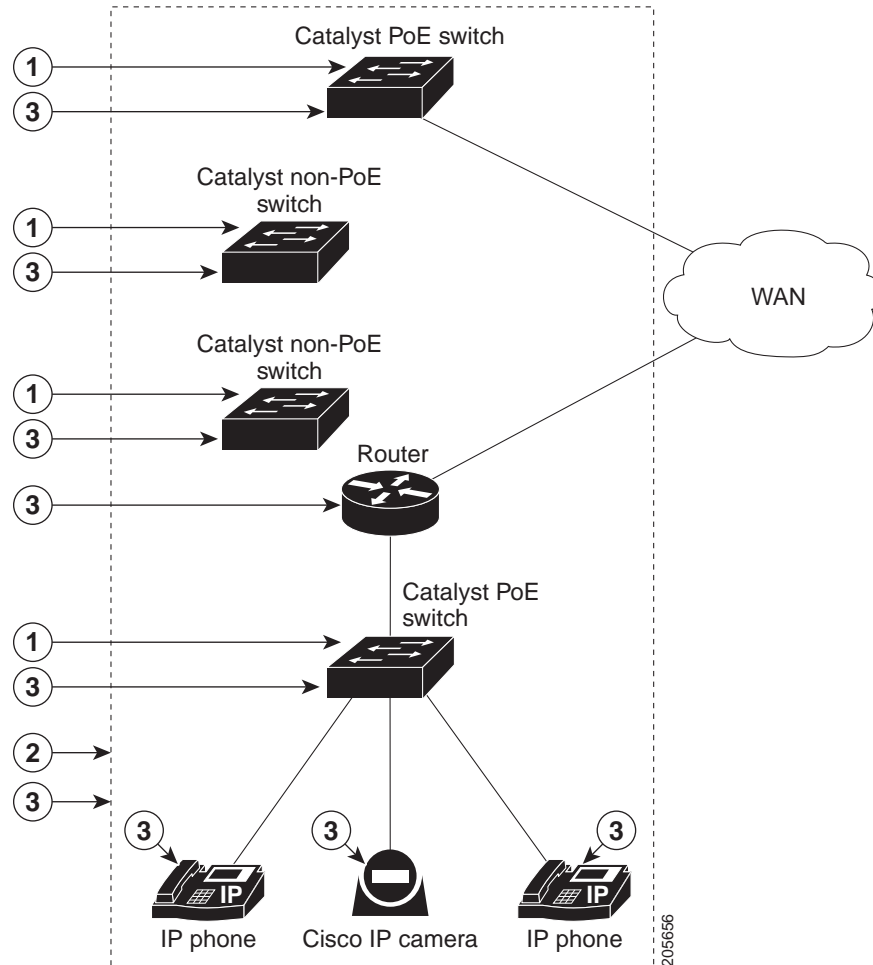

Note

If you schedule the entity to power the PoE port at 7:00 a.m. (0700), the port powers on within 1 minute, between 7:00 a.m.(0700) and 7:01 a.m. (0701) local time.

**Note**

Use the UNIX-based cron field formats when entering the **energywise level recurrence importance at** interface configuration command.

Figure 12-2 *Single PoE Switch Example*

In [Figure 12-2](#), the numbers correspond to the following:

1	Entity that can manage power usage
2	Domain
3	Entities

Manually Managing Power

The following topics pertain to manually managing power with EnergyWise:

- [Powering the EnergyWise Entity, page 12-8](#)
- [Configuring Entity Attributes, page 12-9](#)

- [Powering the PoE Port, page 12-10](#)
- [Configuring PoE Port Attributes, page 12-11](#)

Powering the EnergyWise Entity

To power an EnergyWise entity, perform this task:

	Command	Purpose
Step 1	Switch# show energywise	(Optional) Verifies that EnergyWise is disabled (the default).
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# energywise domain <i>domain-name</i> secret [0 7] <i>password</i> [protocol udp port <i>udp-port-number</i> [interface <i>interface-id</i> / ip <i>ip-address</i>]]	<p>Enables EnergyWise on the entity, assigns the entity to a domain with the specified <i>domain name</i>, and sets the <i>password</i> for secure communication among the entities in the domain.</p> <ul style="list-style-type: none"> • (Optional) 0—Use an unencrypted password. This is the default. • (Optional) 7—Use an hidden password. This requires that you enable "service password-encryption". If you do not enter 0 or 7, the entity uses the default value of 0. • (Optional) port <i>udp-port-number</i>—Specify the UDP port that sends and receives queries. The range is from 1 to 65,000. • (Optional) interface <i>interface-id</i>—In a bridged network, specify the interface which you would prefer for communicating with other EnergyWise switches rather than allowing a switch to select an interface by default. You should have an IP address assigned to that interface. • (Optional) ip <i>ip-address</i>—In a routed network, specify the IP address to be used while communicating with EnergyWise peers instead of allowing the system to choose a default. <p>For the <i>domain name</i> and <i>password</i> values:</p> <ul style="list-style-type: none"> • You can enter alphanumeric characters and symbols such as #, (, %, ! or &. • Do not use an asterisk (*) or a blank space between the characters and symbols. <p>A domain and password are required to enable EnergyWise. There are no defaults. EnergyWise entities cannot communicate with one another unless they share the same domain and password.</p> <p>Note The interface and ip options are mutually exclusive.</p>
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show energywise Switch# show energywise domain	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring Entity Attributes

To configure entity attributes, perform this task:

	Command	Purpose
Step 1	Switch# show energywise	(Optional) Verifies that EnergyWise is enabled.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# energywise importance <i>importance</i>	(Optional) Sets the importance of the entity. The range is from 1 to 100. The default is 1.
Step 4	Switch(config)# energywise keywords <i>word,word,...</i>	(Optional) Assigns one or more keywords for the entity. You can use one or more keywords in a query to filter the switches that respond to that query. When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords. For the <i>word</i> value: <ul style="list-style-type: none"> You can enter alphanumeric characters and symbols such as #, (, %, ! or &. Do not use an asterisk (*) or a blank space between the characters and symbols. By default, no keywords are defined.
Step 5	Switch(config)# energywise management <i>tcp-port-number</i>	(Optional) Specifies the TCP port for sending and receiving queries from a management station. The range is from 1 to 65,000.
Step 6	Switch(config)# energywise name <i>name</i>	(Optional) Specifies the EnergyWise-specific entity name. For the <i>name</i> value: <ul style="list-style-type: none"> You can enter alphanumeric characters and symbols such as #, (, %, ! or &. Do not use an asterisk (*) or a blank space between the characters and symbols. The default is the hostname.
Step 7	Switch# energywise neighbor [<i>hostname</i> <i>ip-address</i>] <i>udp-port-number</i>	(Optional) Assigns a static neighbor. <ul style="list-style-type: none"> Hostname (<i>hostname</i>) or IP address (<i>ip-address</i>). UDP port (<i>udp-port-number</i>) that sends and receives queries. The range is from 1 to 65,000. By default, no static neighbors are assigned.

	Command	Purpose
Step 8	Switch# energywise role <i>role</i>	(Optional) Specifies the role of the entity in the EnergyWise domain. For example, lobby.b20. For the <i>role</i> value: <ul style="list-style-type: none"> You can enter alphanumeric characters and symbols such as #, (, %, ! or &. Do not use an asterisk (*) or a blank space between the characters and symbols. The default is the model number of the switch for a fixed configuration switch and the model number of the supervisor engine for a modular switch.
Step 9	Switch(config)# end	Returns to privileged EXEC mode.
Step 10	Switch# show energywise Switch# show energywise domain	Verifies your entries.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Powering the PoE Port

To power a PoE port, in privileged EXEC mode, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Specifies the port or the range of ports to be configured, and enters interface configuration mode. <ul style="list-style-type: none"> Go to Step 3 to power off the port. Go to Step 4 to power on the port.
Step 3	energywise level 0	(Optional) Manually powers off the port.
Step 4	energywise level 10	(Optional) Manually powers on the port.
Step 5	end	Returns to privileged EXEC mode.
Step 6	show energywise domain show energywise children	Verifies your entries. In this context, the PoE ports are the child entities and the switch is the parent entity.
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file. Note The power level that you set in Step 3 or Step 4 is the default power level when the switch restarts.

Configuring PoE Port Attributes

Note

Use this procedure to configure at least one attribute

To configure PoE-port attributes, in privileged EXEC mode, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Specifies the port or the range of ports to be configured, and enters interface configuration mode.
Step 3	energywise importance <i>importance</i>	(Optional) Sets the importance of the port. The range is from 1 to 100. The default is 1.
Step 4	energywise keywords <i>word,word,...</i>	<p>(Optional) Assigns at least one keyword for the port. You can use keywords in a query to filter the PoE ports that respond to a query.</p> <p>When assigning multiple keywords, separate the keywords with commas, and do not use spaces between keywords.</p> <p>For the <i>word</i> value:</p> <ul style="list-style-type: none"> You can enter alphanumeric characters and symbols such as #, (, %, ! or &. Do not use an asterisk (*) or a blank space between the characters and symbols. <p>By default, no keywords are defined.</p>
Step 5	energywise name <i>name</i>	<p>(Optional) Specifies the EnergyWise-specific port name.</p> <p>For the <i>name</i> value:</p> <ul style="list-style-type: none"> You can enter alphanumeric characters and symbols such as #, (, %, ! or &. Do not use an asterisk (*) or a blank space between the characters and symbols. <p>The default is a short version of the interface name; for example, Gi3.20.</p>
Step 6	energywise role <i>role</i>	<p>(Optional) Specifies the role of the port in the domain. For example, lobbyport.</p> <p>For the <i>role</i> value:</p> <ul style="list-style-type: none"> You can enter alphanumeric characters and symbols such as #, (, %, ! or &. Do not use an asterisk (*) or a blank space between the characters and symbols. <p>By default, the role is interface.</p>
Step 7	end	Returns to privileged EXEC mode.
Step 8	show energywise domain show energywise children	Verifies your entries.
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Automatically Managing Power (Recurrence)

To automatically manage power on EnergyWise entities, in privileged EXEC mode, perform this task:

	Command	Purpose
Step 1	show energywise	(Optional) Verifies that EnergyWise is enabled.
Step 2	configure terminal	Enters global configuration mode.
Step 3	energywise domain <i>domain-name</i> secret [0 7] <i>password</i> [protocol udp port <i>udp-port-number</i> [interface <i>interface-id</i> / ip <i>ip-address</i>]]	<p>Enables EnergyWise on the entity, assigns the entity to a domain with the specified <i>domain name</i>, and sets the <i>password</i> for secure communication among the entities in the domain.</p> <ul style="list-style-type: none"> (Optional) 0—Use an unencrypted password. This is the default. (Optional) 7—Use an hidden password. This requires that you enable "service password-encryption". <p>If you do not enter 0 or 7, the entity uses the default value of 0.</p> <ul style="list-style-type: none"> (Optional) port <i>udp-port-number</i>—Specify the UDP port that sends and receives queries. <p>The range is from 1 to 65000. The default is 43440.</p> <ul style="list-style-type: none"> (Optional) interface <i>interface-id</i>—In a bridged network, specify the interface that you would prefer for communicating with other EnergyWise switches rather than allowing the switch to select an interface by default. (Optional) ip <i>ip-address</i>—In a routed network, specify the IP address to be used while communicating with EnergyWise peers instead of allowing the system to choose a default. <p>For the <i>domain-name</i> and <i>password</i> value:</p> <ul style="list-style-type: none"> You can enter alphanumeric characters and symbols such as #, (, %, ! or &. Do not use an asterisk (*) or a blank space between the characters and symbols. <p>Note The interface and ip options are mutually exclusive.</p>
Step 4	interface <i>interface-id</i>	Specifies the port or a range of ports to be configured, and enters interface configuration mode.

	Command	Purpose
Step 5	energywise level 10 recurrence importance <i>importance at minute hour day_of_month</i> <i>month day_of_week</i>	<p>(Optional) Schedules the power-on recurrence.</p> <ul style="list-style-type: none"> • importance importance—Set the importance of the port in the domain. The range is from 1 to 100. • <i>minute</i>—The range is from 0 to 59. Use * for the wildcard. • <i>hour</i>—The range is from 0 to 23. Use * for the wildcard. • <i>day_of_month</i>—The range is from 1 to 31. Use * for the wildcard. • <i>month</i>—The range is from 1 (January) to 12 (December). Use * for the wildcard. • <i>day_of_week</i>—The range is from 0 to 7 (0 and 7 both represent Sunday). Use * for the wildcard. <p>Note The specified time is the local time based on the PoE-entity time zone.</p> <p>Note If the day_of_week and day_of_month are both specified (that is, aren't "*"), the recurrence executed when either field matches the current time.</p>
Step 6	energywise level 0 recurrence importance <i>importance at minute hour day_of_month</i> <i>month day_of_week</i>	<p>(Optional) Schedules the power-off recurrence.</p> <ul style="list-style-type: none"> • importance importance—Set the importance of the port in the domain. The range is from 1 to 100. The default is 1. • <i>minute</i>—The range is from 0 to 59. Use * for the wildcard. • <i>hour</i>—The range is from 0 to 23. Use * for the wildcard. • <i>day_of_month</i>—The range is from 1 to 31. Use * for the wildcard. • <i>month</i>—The range is from 1 (January) to 12 (December). Use * for the wildcard. • <i>day_of_week</i>—The range is from 0 to 7 (0 and 7 both represent Sunday). Use * for the wildcard. <p>Note The specified time is the local time based on the PoE-entity time zone.</p> <p>If the day_of_week and day_of_month are both specified (that is, aren't "*"), then the recurrence executed when either field matches the current time.>>>>this sentence does not make sense<<<<what are trying to say here?</p>
Step 7	end	Returns to privileged EXEC mode.
Step 8	show energywise recurrence	Verifies your entries.
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Examples

This section describes how to do the following:

- [Establishing the Domain, page 12-14](#)
- [Manually Managing Power, page 12-14](#)
- [Automatically Managing Power, page 12-15](#)

Establishing the Domain

This examples shows how to set up a domain:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# energywise importance 50
Switch(config)# energywise keywords lab1,devlab
Switch(config)# energywise name LabSwitch
Switch(config)# energywise neighbor 4510-21 43440
Switch(config)# energywise role role.labaccess
Switch(config)# end
Switch# show energywise domain
Name      : 4510-41
Domain    : cisco
Protocol  : udp
IP        : 2.2.2.21

Port      : 43440
Switch# show energywise neighbors
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, r - Repeater, P - Phone

```

Id	Neighbor Name	Ip:Port	Prot	Capability
1	4510-21	2.2.2.21:43440	udp	S I
2	4510-31	2.2.4.31:43440	static	S I
3	4510-22	2.2.2.22:43440	cdp	S I

Manually Managing Power

This examples shows how to power your laboratory Cisco IP phones now:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# interface Gi 2/1
Switch(config-if)# energywise importance 65
Switch(config-if)# energywise level 10
Switch(config-if)# energywise name labphone.5
Switch(config-if)# energywise role role.labphone
Switch(config)# end
```

Automatically Managing Power

This example shows how to automatically power Cisco IP phones at 8:00 a.m. (0800) local time and power off at 8:00 p.m.(2000) local time, perform the following task:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# energywise domain cisco secret cisco protocol udp port 43440 ip 2.2.4.30
Switch(config)# interface Gi 2/14
Switch(config-if)# energywise level 10 recurrence importance 90 at 0 8 * * *
Switch(config-if)# energywise level 0 recurrence importance 90 at 0 20 * * *
Switch(config-if)# energywise importance 50
Switch(config-if)# energywise name lobbyInterface.3
Switch(config-if)# energywise role role.lobbyaccess
Switch(config-if)# end
Switch# show energywise recurrences
Id      Addr      Class Action Lvl Cron
--      ---      -
5       Gi3/14     QUERY SET    10 minutes: 0 hour: 8 day: * month: * weekday: *
6       Gi3/14     QUERY SET    0  minutes: 0 hour: 20 day: * month: * weekday: *

Switch# show running-config
<output truncated>
interface GigabitEthernet2/1
 energywise level 10 recurrence at 0 8 * * *
 energywise level 0 recurrence at 0 20 * * *
 energywise importance 50
 energywise role role.lobbyaccess
 energywise name lobbyInterface.3
end
<output truncated>
```

Managing Multiple Entities

EnergyWise enables you to manage the energy usage of multiple entities in an EnergyWise network.

This section includes the following topics:

- [Multiple PoE Switch Scenario, page 12-15](#)
- [Managing Power in a Domain with Queries, page 12-17](#)
- [Examples of Managing Multiple Entities, page 12-18](#)

Multiple PoE Switch Scenario

[Figure 12-3](#) shows a typical scenario where you manage multiple PoE switch entities.

Figure 12-3 Multiple PoE Switches Example

In [Figure 12-3](#), the numbers correspond to the following:

1	An entity that can manage power usage
2	A domain
3	Entities

Managing Power in a Domain with Queries

To manage the power in a domain with queries, in privileged EXEC mode, perform this task:

	Command	Purpose
Step 1	<pre>energywise query importance importance {keywords word,word,... name name} collect {delta usage} or energywise query importance importance {keywords word,word,... name name} sum {delta usage}</pre>	<p>(Optional) Runs a query to display power information for the entities and PoE ports in the domain.</p> <ul style="list-style-type: none"> • importance <i>importance</i>—Filter the results based on the importance value. Only entities with values less than or equal to the specified value appear. The importance range is from 1 to 100. • (Optional) keywords <i>word,word,...</i>—Filter the results based on one or more of the specified keywords. • (Optional) name <i>name</i> —Filter the results based on the name. For the wildcard, use * or name* with the asterisk at the end of the name phrase. • collect {delta usage}—Display the delta or usage values for the entity or PoE ports. <ul style="list-style-type: none"> – delta—Display only the differences between the current and available power usage. – usage—Display only the current power usage. • sum {delta usage}—Display the sum of the delta or usage values for the entity or PoE ports. <ul style="list-style-type: none"> – delta—Display only the sum of the differences between the current and available power levels. – usage—Display the sum of the current power usage. <p>Note In the results with the sum keyword, the Responded total is inaccurate. Instead, the Queried total is accurate and is the total number of entities that respond to the query.</p> <p>Note In the results with the collect keyword, the Queried total is the number of entities that received the query. The Responded total is the total number of entities that responded to the query. Some entities may not have responded because they were not selected by the filters in the query.</p> <p>Repeat this step to run another query.</p>

Command	Purpose
Step 2 <code>energywise query importance importance</code> <code>{keywords word,word,... name name} set</code> <code>level level</code>	<p>(Optional) Runs a query to power the entities or PoE ports in a domain.</p> <hr/> <p> Caution Use this query with care because it affects the entity on which you enter the command and other entities in the domain that match the query criteria.</p> <hr/> <ul style="list-style-type: none"> • importance importance—Filter the results based on the importance value. Only entities with values less than or equal to the specified value appear. The importance range is from 1 to 100. • (Optional) keywords word,word,...—Filter the results based on one or more of the specified keywords. • (Optional) name name —Filter the results based on the name. For the wildcard, use * or name* with the asterisk at the end of the name phrase. • set level level—Set the power level of the entities or PoE ports. For switches, the only valid value is 10. For the ports, the valid values are 0 to 10. <p>Repeat this step to run another query.</p>

Examples of Managing Multiple Entities

This section includes the following examples of running EW queries:

- [Querying with the Name Attribute, page 12-18](#)
- [Querying with Keywords, page 12-19](#)
- [Querying to Set Power Levels, page 12-19](#)

In these examples, Switch 1 and Switch 2 are in the same domain. The entity called **shipping.1** is a PoE port on Switch 1, and the entity called **shipping.2** is a poE port on Switch 2.

Querying with the Name Attribute

To display the power usage of the domain entities with names beginning with *shipping* and with importance values less than or equal to 80, enter the following command on Switch 1:

```
Switch# energywise query importance 80 name shipping.* collect usage
EnergyWise query, timeout is 3 seconds:
```

Host	Name	Usage
----	----	-----
192.168.20.1	shipping.1	6.3 (W)
192.168.20.2	shipping.2	8.5 (W)

```
Queried: 2    Responded: 2    Time: 0.4 seconds
```

The first row (shipping.1) is from Switch 1. The second row (shipping.2) is from Switch 2, a neighbor of Switch 1.

Querying with Keywords

To display the power usage of Cisco IP phones with different names, different roles, and importance values less than or equal to 80, but all with the Admin keyword, run this query on Switch 1:

```
Switch# energywise query importance 80 keyword Admin collect usage
EnergyWise query, timeout is 3 seconds:
```

Host	Name	Usage
----	----	-----
192.168.40.2	shipping.1	6.3 (W)
192.168.50.2	orders.1	10.3 (W)

```
Queried: 2    Responded: 2    Time: 0.5 seconds
```

Switch 1 reports two phones are connected to Switch 2, a neighbor of Switch 1.

Querying to Set Power Levels

Enter the following commands on Switch 1 to set power levels:

- Set the power level of the shipping.2 entity to 0:

```
Switch# energywise query importance 80 name shipping.2 set level 0
```

- Manually set the power level of the shipping.1 entity and the shipping.2 entity to 0:

```
Switch# energywise query importance 90 name shipping.* set level 0
```

- Set the power level of entities with the keyword Admin to 10:

```
Switch# energywise query importance 60 keyword Admin set level 10
EnergyWise query, timeout is 3 seconds:
!!!!
Success rate is (2/2) setting entities
```

```
Queried: 2    Responded: 2    Time: 0.15 seconds
```

- Verify the power levels:

```
Switch# energywise query importance 85 keyword Admin collect usage
EnergyWise query, timeout is 3 seconds:
```

Host	Name	Usage
----	----	-----
192.168.40.2	shipping.1	0.0 (W)
192.168.50.2	orders.1	0.0 (W)

```
Queried: 2    Responded: 2    Time: 0.9 seconds
```

You can also use the **show energywise usage** privileged EXEC command on Switch 1 and Switch 2 to verify the power levels.

Managing Power in a LAN

In this scenario, you connect multiple switches in the same LAN and in the same EnergyWise domain.

In this example, the domain configuration includes the following:

- UDP default port (43440)
- Gigabit Ethernet port 1/0/23 on Switch 2 to which a Catalyst PoE switch is connected

Figure 12-4 EnergyWise with LANs

On Switch 1, configure the domain with the following command:

```
Switch(config)# energywise domain cisco secret 0 cisco protocol udp port 43440 interface
gigabitethernet1/0/24
```

On Switch 1, verify that the neighbors discovered by the EnergyWise protocols with the following command:

```
Switch# show energywise neighbors
Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
                  S - Switch, H - Host, I - IGMP, r - Repeater, P - Phone
Id    Neighbor Name      Ip:Port          Prot    Capability
--    -
4     Switch-2           192.168.20.2:43440  udp     S I
```

Managing Power with IP Routing

In this scenario, your switches (Switch 1 and Switch 2) are in a *disjointed domain*. Neighbors might not be discovered automatically (Figure 12-5).

Figure 12-5 *EnergyWise with IP Routing*

On Switch 1, to prevent a disjointed domain, manually assign Switch 2 as a static neighbor, or the reverse:

```
Switch(config)# energywise neighbor 192.168.2.2 43440
```

Switch 1 discovers Switch 3 as a neighbor because they are in the same LAN.

On Switch 1, verify that neighbors are discovered:

```
Switch# show energywise neighbors
Capability Codes: R-Router, T-Trans Bridge, B-Source Route Bridge
                  S-Switch, H-Host, I-IGMP, r-Repeater, P-Phone
```

Id	Neighbor Name	Ip:Port	Prot	Capability
6	Switch-2	192.168.2.2:43440	static	S I
9	Switch-3	192.168.1.3:43440	cdp	S I

Switch 1 uses both static and dynamic protocols to detect neighbors.

Verify that switches are in the same domain:

```
Switch# energywise query name * collect usage
EnergyWise query, timeout is 3 seconds:
Host      Name      Usage
----      -
192.168.1.2  Switch-1  96.0 (W)
192.168.40.2 shipping.1  6.3 (W)
192.168.40.2 guest.1    10.3 (W)
192.168.50.2 shipping.2  8.5 (W)
192.168.50.2 lobby.1    10.3 (W)

Queried:  72    Responded:  72    Time:  0.65 second
```

In a routed network, a switch port assigned to a VLAN can be connected to a router interface. The IP address of the VLAN SVI is 192.168.1.2, and the IP address of the router interface is 192.168.1.1.

Configure the domain as follows:

```
Switch(config)# energywise domain cisco secret 0 cisco protocol udp port 43440 ip 192.168.1.2
```

**Note**

To prevent a disjointed domain, you can also configure a helper address on Router A and specify that the router use UDP to forward broadcast packets with these commands

ip helper-address *address* interface configuration command

ip forward-protocol udp [*port*] global configuration command

Command Usage to Verify CLI Functioning

Topics include:

- [Using CLI Commands, page 12-22](#)
- [Verifying the Power Usage, page 12-23](#)

Using CLI Commands

To delete the EnergyWise neighbor tables on an entity, use the **clear energywise neighbors** command. A table is automatically repopulated when the neighbors are rediscovered.

To disable EnergyWise, use the **no energywise** command as follows ([Table 12-3](#)).

Table 12-3 *Disabling EnergyWise*

Device	Command	Command Mode
Entity	no energywise domain	global configuration
PoE port	no energywise	interface configuration

To display critical information about your network, use the following **show** commands ([Table 12-4](#)).

Table 12-4 *show Privileged EXEC Commands*

Command	Purpose
show cdp neighbors	Displays the neighbors discovered by CDP. Note This is not an EnergyWise command but may still be useful for troubleshooting.
show energywise	Displays the settings and status for the entity.
show energywise children	Display the status of the entity and the PoE ports in the domain.
show energywise domain	Displays the domain to which the entity belongs.
show energywise events	Displays the last ten events (messages) sent to other entities in the domain.
show energywise neighbors	Displays the neighbor tables for the domains to which the entity belongs.
show energywise recurrences	Displays the EnergyWise settings and status for recurrence.

Table 12-4 *show Privileged EXEC Commands (continued)*

Command	Purpose
show energywise statistics	Displays the counters for events and errors.
show energywise usage	Displays the current power usage on the entity.
show energywise version	Displays the current EnergyWise version.
show power inline	Displays the PoE status.

Verifying the Power Usage

This example shows that the Cisco 7960 IP Phone uses 6.3 watts and that the Cisco 7970G IP Phone uses 10.3 watts:

```
Switch# show energywise usage children
```

Interface	Name	Usage	Caliber
-----	----	-----	-----
	Switch	144.0 (W)	max
Gi4/1	Gi4.1	7.5 (W)	trusted
Gi4/2	Gi4.2	12.9 (W)	trusted
Gi4/3	Gi4.3	12.9 (W)	trusted
Gi4/4	Gi4.4	16.6 (W)	trusted
Gi4/5	Gi4.5	6.3 (W)	trusted
Gi4/6	Gi4.6	10.3 (W)	trusted

```
Switch# show power inline
```

```
Available:210(w) Used:69(w) Remaining:141(w)
```

Interface	Admin	Oper	Power(Watts)		Device	Class
			From PS	To Device		
-----	-----	-----	-----	-----	-----	-----
Gi4/1	auto	on	7.5	7.0	Ieee PD	2
Gi4/2	auto	on	13.9	12.9	IP Phone 7961	3
Gi4/3	auto	on	13.9	12.9	IP Phone 7961	3
Gi4/4	auto	on	16.6	15.4	Ieee PD	0

CHAPTER 13

Configuring the Catalyst 4500 Series Switch with Cisco Network Assistant

This chapter describes how to install Network Assistant on the workstation and configure the Catalyst 4500 (or 4900) series switch to communicate with Network Assistant. (Heretofore, the term *Catalyst 4500 series switch* will be used to refer to both switch types.) It also describes how to create communities and clusters. These are two technologies used by Network Assistant to manage a group of network devices, including the Catalyst 4500 series switch.

Network Assistant is a free network management tool that enables you to configure and manage Catalyst 4500 series switches using a Graphical User Interface (GUI). Network Assistant works in both secure and unsecure environments. Network Assistant manages standalone devices or groups of devices or switches (in communities or clusters) from anywhere in your intranet. Using Network Assistant, you can perform multiple configuration tasks without having to remember commands.

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Configuring and Using the Network Assistant

This chapter contains these topics:

- [Network Assistant-Related Features and Their Defaults, page 13-2](#)
- [Overview of the CLI Commands, page 13-2](#)
- [Configuring Your Switch for Network Assistant, page 13-3](#)
- [Managing a Network using Community, page 13-5](#)
- [Converting a Cluster into a Community, page 13-9](#)
- [Managing a Network using Cluster, page 13-10](#)

- [Configuring Network Assistant in Community or Cluster Mode, page 13-13](#)

**Note**

The Network Assistant is not bundled with an online software image on Cisco.com. You can download the Network Assistant at:
<http://www.cisco.com/en/US/products/ps5931/index.html>

**Note**

For information on software and hardware requirements, installing Network Assistant, launching Network Assistant, and connecting Network Assistant to a device, refer to *Getting Started with Cisco Network Assistant*, available at the URL

http://www.cisco.com/en/US/products/ps5931/prod_installation_guides_list.html.

Network Assistant-Related Features and Their Defaults

[Table 13-1](#) lists the Network Assistant-related configuration parameters on a Catalyst 4500 series switch.

Table 13-1 *Network Assistant-Related Configuration on a Catalyst 4500 Series Switch*

Feature	Default Value	Recommended Value
Authentication	Disabled	Optional
IP address	Depends on community or discovery option ¹	User selectable
IP HTTP port number	80	Optional ²
IP HTTPS port number	443	Optional ³
IP HTTP server	Disabled	Enabled ⁴
Cluster run	Disabled	Enabled ⁵

1. You need to set an IP address in each switch for community device discovery and for the cluster commander.
2. Port number on the Network Assistant and the Catalyst 4500 series switch must match.
3. You can only change this value for a cluster of devices. Port number on the Network Assistant and on the Catalyst 4500 series switch must match. Value can be changed to any non-default number above 1024.
4. Required for Network Assistant to access the device.
5. Enabled only if you want to manage a cluster of devices.

Overview of the CLI Commands

[Table 13-2](#) is an overview of the Network Assistant-related CLI commands.

Table 13-2 CLI Commands

Command	Functions
<code>[no] cluster enable</code>	Names the cluster.
<code>[no] cluster run</code>	Enables clustering. Note This command is used strictly for clustering.
<code>[no] ip http server</code>	Configures the HTTP on a switch.
<code>[no] ip http port port_number</code>	Configures the HTTP port.
<code>[no] ip domain-name domain_name</code>	Configures the domain on the switch.
<code>[no] ip http secure-server</code>	Configures and enable HTTPS on a switch.
<code>[no] ip http secure-port port_number</code>	Configures the HTTPS port.
<code>[no] ip http max-connections connection_number</code>	Configures the maximum concurrent connections to the HTTP server.
<code>[no] ip http timeout-policy idle idle_time life life_time requests requests</code>	Configures the HTTPS port. A idle value of 180 seconds is recommended. A life value of 180 seconds is recommended. The recommended maximum number of requests allowed is 25.
<code>line vty</code>	Configures additional VTYS for use by CNA.
<code>show version</code>	Displays the Cisco IOS release.
<code>show running-config</code>	Displays the switch configuration.
<code>vtp domain</code>	Creates a VTP domain to manage VLANs.
<code>vtp mode</code>	Sets the behavior for VTP management of the VLANs.

Configuring Your Switch for Network Assistant

The following topics are discussed:

- [\(Minimum\) Configuration Required to Access Catalyst 4500 Accessible from CNA, page 13-3](#)
- [\(Additional\) Configuration Required to use Community, page 13-4](#)
- [\(Additional\) Configuration Required to use Cluster, page 13-5](#)

(Minimum) Configuration Required to Access Catalyst 4500 Accessible from CNA

If you use the default configuration, access the Catalyst 4500 series switch and enter the **ip http server** (for HTTP) or **ip http secure-server** (for HTTPS) global configuration command.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip http server or Switch(config)# ip domain-name domain_name	(HTTP only) Enables the HTTP server on the switch. By default, the HTTP server is disabled. Enables the domain name on the switch to configure HTTPS.
Step 3	Switch(config)# ip http secure-server	Enables the HTTPS server on the switch. By default, the HTTPS server is disabled.
Step 4	Switch(config)# ip http max-connections connection_number	Configures the maximum concurrent connections to the HTTP server. A <i>connection_number</i> of 16 is recommended.
Step 5	Switch(config)# ip http timeout-policy idle idle_time life life_time requests requests	Configures the HTTPS port. The idle keyword specifies the maximum amount of time a connection can stay idle. A idle value of 180 seconds is recommended. The life keyword specifies the maximum amount of time a connection can stay open since it was established. A life value of 180 seconds is recommended. The requests keyword specifies the maximum amount of requests on a connection. The recommended maximum number of requests allowed is 25.
Step 6	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 7	Switch# show running-config	Verifies the configuration.

**Note**

If you have enabled clustering, disable clustering before configuring a community (see [Table 13-2](#)).

(Additional) Configuration Required to use Community

If you plan to use community, define an IP address on each switch:

	Command	Purpose
Step 1	Switch# configuration terminal	Enters global configuration mode.
Step 2	Switch(config)# interface {vlan vlan_ID {fastethernet gigabitethernet} slot/interface Port-channel number}	Selects an interface.
Step 3	Switch(config-if)# ip address ip_address address_mask	(Optional) Assigns an IP address to the Catalyst 4500 series Note This step is mandatory if the switch is part of community or is a cluster command switch. This step is optional if the switch is a cluster member candidate.

	Command	Purpose
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show running-config	Verifies the configuration.

(Additional) Configuration Required to use Cluster

If you plan to use clustering, enter the **cluster run** global configuration command on each device and enter the **ip address** interface configuration command on the cluster commander.

	Command	Purpose
Step 1	Switch# configuration terminal	Enters global configuration mode.
Step 2	Switch(config)# cluster run	Enables clustering.
		 Note Enable clustering on all switches that are part of the potential cluster.
Step 3	Switch(config)# cluster enable	Names the cluster.
Step 4	Switch(config)# interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i> }	Selects an interface.
Step 5	Switch(config-if)# ip address <i>ip_address</i> <i>address_mask</i>	(Optional) Assigns an IP address to the Catalyst 4500 series switch cluster master.
		 Note This step is mandatory if the switch is part of a community or is a cluster command switch. This step is optional if the switch is a cluster member candidate.
Step 6	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 7	Switch# show running-config	Verifies the configuration.

Managing a Network using Community

This section describes how to use communities to manage *devices* (including Catalyst 4500 series switches, routers, access points, and PIX firewalls) using the Network Assistant application.

When you use communities to group the switches in your network, the only requirements are an HTTP server and that you configure an IP address on each switch.

The total number of devices in the community cannot exceed 20 total devices (including up to 4 Catalyst 4500 series switches (modular), 16 Catalyst 2900/3500 or Catalyst 4948/4948-10GE switches ((non-modular), 2 routers, and 2 PIX firewalls).

Note

Access points have been eliminated from the device limits. There is no current limit for the number of access points that can be managed by CNA.

**Note**

The **Add to Community** dialog display any number of devices, but only allows you to select 20 devices. If you try to add a 21st device, the dialog displays the 21st device and prompts you to select the unwanted device.

**Note**

For complete procedures for using Network Assistant to configure switch communities, refer to *Getting Started with Cisco Network Assistant*, available at:

http://www.cisco.com/en/US/products/ps5931/prod_installation_guides_list.html.

This section describes the guidelines, requirements, and caveats that you should understand before you create a community. This section contains the following topics:

- [Candidate and Member Characteristics, page 13-6](#)
- [Automatic Discovery of Candidates and Members, page 13-7](#)
- [Community Names, page 13-7](#)
- [Hostnames, page 13-7](#)
- [Passwords, page 13-8](#)
- [Access Modes in Network Assistant, page 13-8](#)
- [Community Information, page 13-8](#)

Candidate and Member Characteristics

Candidates are network devices that have IP addresses but are not part of a community. Members are network devices that are currently part of a community.

To join a community, a candidate must meet these requirements:

- It has an IP address.
- Cisco Discovery Protocol (CDP) version 2 is enabled (the default) - if you want the device to be autodiscovered.
- It has HTTP (or HTTPS) enabled.

**Note**

A cluster member can be added to a community, but the reverse is not possible.

**Note**

If the cluster commander is added to a community, the other member devices of the cluster are not added automatically. The cluster members must be added to the community on an individual basis in order to be managed.

Automatic Discovery of Candidates and Members

Network Assistant forms a community using CDP to locate or discover all the available devices in the network. Beginning with the IP address for a starting device and the port numbers for HTTP (or HTTPS) protocols, Network Assistant uses CDP to compile a list of community candidates that neighbor the starting device. Network Assistant can discover candidate and member devices across multiple networks and VLANs as long as they have valid IP addresses.

**Note**

By default, Network Assistant in community mode discovers up to four hops away.

See the [“Candidate and Member Characteristics” section on page 13-6](#) for a list of requirements that network devices must meet in order to be discovered.

**Note**

Do not disable CDP on candidates, members, or on any network devices that you might want Network Assistant to discover.

**Note**

PIX firewalls do not support the CDP, so they are not automatically shown as neighbors in the Topology view. They are shown only after you add them to a community with the Create Community or Modify Community window. To see a PIX firewall link to another community member, you must add the link manually by selecting ADD Link in a Topology popup menu.

You can edit the list of discovered devices to fit your needs and add them to the community. As each device is added to the community, its neighbors are discovered and added to the list of candidate devices. If Network Assistant fails to discover a device you can add it manually through the IP management IP address.

Community Names

When you apply the community configuration information to the list of member devices, Network Assistant requests that you enter a name (or IP address) for the community. You need to assign a name to the community before you can manage it. Network Assistant saves the name to your PC.

The community name can consist of the characters 0-9, a-z and A-Z, with spaces allowed between the characters.

**Note**

You can connect to a cluster only through an IP address. When you select a name it is always for the community.

Hostnames

You do not need to assign a hostname to a starting device or a community member. However, Cisco recommends it and Network Assistant does not assign one by default. If a discovered device does have a hostname, Network Assistant saves it to your PC as identifying information for that device along with its IP address, communication protocol, and designated protocol port.

Passwords

Although you do not need to assign a password to a device if it will become a community member, Cisco recommends that you do so.

Community members can have different passwords.

Communication Protocols

Network Assistant uses the HTTP (or HTTPS) protocols to communicate with network devices. It attempts communication with HTTP (or HTTPS) when using CDP to discover candidate devices.

Access Modes in Network Assistant

When Network Assistant is connected to a community or cluster, two access modes are available: read-write and read-only, depending on the password.

Community Information

Network Assistant saves all community configuration information and individual device information such as IP address, hostname, and communication protocol to your local PC. When Network Assistant connects to a community, it uses the locally saved data to rediscover the member devices.

If you attempt to use a different PC to manage an existing community, the member device information will not be available. You will need to create the community again and add the same member devices.

Adding Devices

There are three ways to add members to a community.

The first uses the Devices Found window on Network Assistant to add devices that you discovered to a new community:

- a. In the Devices Found window, select candidate devices that you wish to add.
To add more than one candidate, press **Ctrl** and make your choices, or press **Shift** and choose the first and last device in a range.
- b. Click **Add**.

The second way uses the Modify Community window to add devices to an existing community:

- a. Choose **Application > Communities** to open the Communities window.
- b. In the Communities window, select the name of the community to which you would like to add a device, and click **Modify**.
- c. To add a single device manually, enter the IP address for the desired device in the Modify Community window, and click **Add**.
- d. To discover candidate devices, enter the IP address for the starting device, and click **Discover**.
- e. Select a candidate device from the list, click **Add**, and click **OK**.
To add more than one candidate, press **Ctrl** and make your choices, or press **Shift** and choose the first and last device in a range.

The third way to add a device uses the Topology view:

- a. If the Topology view is not displayed, choose **View window > Topology** from the feature bar.
- b. Right-click a candidate icon, and select **Add to Community**.

Candidates are cyan; members are green. To add more than one candidate, press **Ctrl** and left-click the candidates that you want to add.

When a community has 20 members, the **Add to Community** option is not available for that community. In this case, you must remove a member before adding a new one.

Note

If you are logged into a community and you delete that community from some other CNA instance, then unless you close that community session, you can perform all the configurations through that session. After you close that session (and thereby delete the community), you will not be able to connect to that community.

Converting a Cluster into a Community

The Cluster Conversion wizard helps you convert a cluster into a community. When you complete the conversion, you can immediately manage the device group as a community. The benefits of managing a community is that the communication with the devices in a community is more secure (through multiple passwords and HTTPS) than in a cluster. Moreover, device availability is greater, and the range of devices that can be members is broader.

Note

The Cluster Conversion wizard does not alter your cluster definition. This means that you can still manage the devices as a cluster.

To launch the Cluster Conversion Wizard, follow these steps:

- Step 1** Start Network Assistant and connect to an existing cluster through its commander IP address.
- Step 2** In the feature bar, click **Configure > Cluster > Cluster Conversion Wizard**.
You will see the query "Do you want to convert this cluster to a community?"
- Step 3** Select **Yes** to proceed or **No** if you want to manually bring up the Cluster Conversion Wizard.
If you select **Yes**, the Welcome screen appears, providing information about clusters, communities, and their benefits.
Next, a table appears listing the devices in the cluster starting with those that have no IP address and subnet mask. Be aware that all the devices in the cluster must have an IP address and subnet mask to be members of a community.
- Note** If a device has more than one interface with an IP address and subnet mask, you see more than one interface listed when you click in the cell. You can choose a different interface from the one originally shown.
- Step 4** In the IP Address column, enter an IP address for each device that does not have one.
- Step 5** In the Subnet Mask column, click in the cell for each device that does not have a subnet mask and select one.

Step 6 Enter a name for the community.

Step 7 Click **Finish** to begin the conversion.

When the conversion completes, Network Assistant restarts and automatically connects to the newly created community.

Note

If you have enabled clustering, you should disable clustering before configuring a community (see [Table 13-2](#)).

Managing a Network using Cluster

This section describes how to use clustering to create and manage Catalyst 4500 series switches using the standalone Network Assistant application or the command-line interface (CLI).

You can use clustering to group the switches in your network. You must enter the cluster run command on each switch to be managed. The major advantage is that you can manage 16 devices with one IP address.

Note

Clustering is the auto- discovering mechanism used in CNA 1.0.

Note

For complete procedures for using Network Assistant to configure switch clusters, refer to *Getting Started with Cisco Network Assistant*, available at:

http://www.cisco.com/en/US/products/ps5931/prod_installation_guides_list.html.

This section contains the following topics:

- [Understanding Switch Clusters, page 13-10](#)
- [Using the CLI to Manage Switch Clusters, page 13-12](#)

Understanding Switch Clusters

These sections describe:

- [Clustering Overview, page 13-10](#)
- [Cluster Command Switch Characteristics, page 13-11](#)
- [Candidate Switch and Cluster Member Switch Characteristics, page 13-12](#)

Clustering Overview

A *switch cluster* is a set of up to 16 connected, cluster-capable Catalyst switches that are managed as a single entity. The switches in the cluster use the switch clustering technology so that you can configure and troubleshoot a group of different Catalyst 4500 series switch platforms through a single IP address.

Using switch clusters simplifies the management of multiple switches, regardless of their physical location and platform families.

**Note**

By default, Network Assistant in clustering mode discovers up to seven hops away.

In a switch cluster, one switch must be the *cluster commander switch*, and up to 15 other switches can be *cluster member switches*. The total number of switches in a cluster cannot exceed 16 switches. The cluster command switch is the single point of access used to configure, manage, and monitor the cluster member switches. Cluster members can belong to only one cluster at a time.

**Note**

Always choose a Catalyst 4500 or 4948 series switch as the cluster command switch.

Cluster Command Switch Characteristics

A cluster command switch must meet these requirements:

- It is using Cisco IOS Release 12.2(20)EWA or later.
- It has an IP address.
- It has Cisco Discovery Protocol (CDP) version 2 enabled (the default).
- It is using cluster-capable software and has clustering enabled.
- It has IP HTTP (or HTTPS) server enabled.

**Note**

On a Catalyst 4500 series switch, neither HTTP or HTTPS is enabled by default.

- It has 16 VTY lines.

**Note**

On a Catalyst 4500 series switch, the default is 4 lines. You configure the switch to set the value to 16.

- It is not a command or cluster member switch of another cluster.

**Note**

If your switch cluster contains a Catalyst 4500 series switch, the cluster command switch must also be a Catalyst 4500 series switch.

Network Assistant and VTY

Network Assistant uses virtual terminal (VTY) lines to communicate with the cluster command device. Catalyst 4500 series switches have 5 VTY lines configured by default. Network Assistant can employ an additional 8 lines. Therefore, you should configure the maximum number of lines (or at least, $8 + 5 = 13$) so that Network Assistant can communicate with the switch and not use VTY lines that might be needed for telnet.

You can configure the Catalyst 4500 series switch to support an appropriate number of VTY lines with the **line vty** configuration command. For example, the **line vty 6 15** command configures the switch to include 9 VTY lines.

**Note**

If your existing VTY lines have non-default configurations, you might want to apply those configurations to the new VTY lines.

Candidate Switch and Cluster Member Switch Characteristics

Candidate switches are cluster-capable switches that are not part of a cluster. Cluster member switches are switches that are currently part of a switch cluster. Although not required, a candidate or cluster member switch can have its own IP address and password.

Note

The hostname of a candidate should not be in the form [a-zA-Z0-9]-*n*, where *n* is 0-16. These names are reserved.

To join a cluster, a candidate switch must meet these requirements:

- It is running cluster-capable software and has clustering enabled.
- It has CDP version 2 enabled.
- It has HTTP server enabled.

Note

Even when HTTP is enabled on the commander switch, communication between the commander switch and member switch is still carried over HTTP. So, it is not secure.

- It has 16 VTY lines.
- It is not a command or cluster member switch of another cluster.
- It is connected to the cluster command switch through at least one common VLAN.

It is recommended that you configure the Catalyst 4500 candidate and cluster member switches with an SVI on the VLAN connection to the cluster command switch.

Using the CLI to Manage Switch Clusters

You can configure cluster member switches from the CLI by first logging in to the cluster command switch. Enter the **rcommand** user EXEC command and the cluster member switch number to start a Telnet session (through a console or Telnet connection) and to access the cluster member switch CLI. The command mode changes and the Cisco IOS commands operate as usual. Enter the **exit** privileged EXEC command on the cluster member switch to return to the command-switch CLI.

This example shows how to log in to member-switch 3 from the command-switch CLI:

```
switch# rcommand 3
```

If you do not know the member-switch number, enter the **show cluster members** privileged EXEC command on the cluster command switch. For more information about the **rcommand** command and all other cluster commands, refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

The Telnet session accesses the member-switch CLI at the same privilege level as on the cluster command switch. The Cisco IOS commands then operate as usual. For instructions on configuring the switch for a Telnet session, see the [“Accessing the CLI Through Telnet” section on page 2-2](#).

Note

CISCO-CLUSTER_MIB is not supported.

Configuring Network Assistant in Community or Cluster Mode

This section provides a detailed explanation of the CLI used to configure Network Assistant to work in a community or cluster. Network Assistant communicates with a Catalyst 4500 series switch by sending Cisco IOS commands over an HTTP (or HTTPS) connection.

The following topics are discussed:

- [Configuring Network Assistant in on a Networked Switch in Community Mode, page 13-13](#)
- [Configuring Network Assistant in a Networked Switch in Cluster Mode, page 13-17](#)

Configuring Network Assistant in on a Networked Switch in Community Mode

To configure Network Assistant on a networked switch in community mode, perform this step:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# enable password <i>name</i>	Enables password protection of configuration mode.
Step 3	Switch(config)# vtp domain <i>name</i>	Creates a VTP domain to manage VLAN.
Step 4	Switch(config)# vlan <i>vlan_id</i>	Creates a VLAN.
Step 5	Switch(config-vlan)# interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i> }	Selects the interface that will connect to your CNA-enabled PC.
Step 6	Switch(config-if)# switchport access vlan <i>vlan_id</i>	Enables the selected interface to be in the specified VLAN.
Step 7	Switch(config-if)# interface { vlan <i>vlan_ID</i> <i>slot/interface</i> Port-channel <i>number</i> }	Select the VLAN instance for configuration.
Step 8	Switch(config-if)# ip address <i>ip_address</i>	Assigns an IP address to the SVI.
Step 9	Switch(config-if)# no shutdown	Enables the interface.
Step 10	Switch(config-if)# ip http server	Starts the HTTP server so that Network Assistant can talk to the switch.
Step 11	Switch(config)# ip domain-name <i>domain_name</i>	Enables the domain name on the switch to configure HTTPS.
Step 12	Switch(config)# ip http secure-server	Enables the HTTPS server on the switch. By default, the HTTPS server is disabled.
Step 13	Switch(config)# ip http max-connections <i>connection_number</i>	Configures the maximum concurrent connections to the HTTP server. A <i>connection_number</i> of 16 is recommended.

	Command	Purpose
Step 14	Switch(config)# ip http timeout-policy idle idle_time life life_time requests requests	Configures the HTTPS port. The idle keyword specifies the maximum amount of time a connection can stay idle. A idle value of 180 seconds is recommended. The life keyword specifies the maximum amount of time a connection can stay open since it was established. A life value of 180 seconds is recommended. The requests keyword specifies the maximum number of requests on a connection. A requests value of 25 recommended.
Step 15	Switch(config-if)# ip http secure-server	(Optionally) Enables the switch to accept HTTPS connections from Network Assistant.
Step 16	Switch(config)# ip route a.b.c	Establishes the route to the default router, usually supplied by the local Internet Provider. Note This line represents the only difference between the configuration for a standalone and a networked switch.
Step 17	Switch(config)# line con 0	Select the console port to perform the configuration.
Step 18	Switch(config-line)# exec-timeout x y	Configures an automatic session logout if no keyboard input or output is displayed on the terminal.
Step 19	Switch(config-line)# password password	Specifies a password for the console port.
Step 20	Switch(config-line)# login	Allows login to the console port.
Step 21	Switch(config-line)# line vty x y	Creates additional VTY lines for CNA to access the switch.
Step 22	Switch(config-line)# password password	Specifies a password for the switch.
Step 23	Switch(config-line)# login	Allows login to the switch.
Step 24	Switch(config-line)# line vty x y	Creates additional VTY lines for CNA to access the switch.
Step 25	Switch(config-line)# password password	Specifies a password for the switch.
Step 26	Switch(config-line)# login	Allows login to the switch.
Step 27	Switch(config-line)# end	Returns to privileged EXEC mode.
Step 28	Switch# show running-config	Verifies the configuration.

This example shows how to configure Network Assistant on a networked switch in community mode:

```
Switch# configure terminal
Switch(config)# vtp domain cnadoc
Changing VTP domain name from cisco to cnadoc
Switch(config)# vlan 2
Switch(config-vlan)# exit
Switch(config)# interface GigabitEthernet 2/1
Switch(config-if)# switchport access vlan 2
Switch(config-if)# exit
Switch(config)# interface vlan 2
Switch(config-if)# ip address 123.123.123.1 255.255.255.0
```

```

Switch(config-if)# no shutdown
Switch(config-if)# exit
Switch(config)# ip http server
Switch(config)# ip domain-name cisco.com
Switch(config)# ip http secure-server
Switch(config)# ip http max-connections 16
Switch(config)# ip http timeout-policy idle 180 life 180 requests 25
Switch(config)# ip route 0.0.0.0 0.0.0.0 123.123.123.2
Switch(config)# line con 0
Switch(config-line)# exec-timeout 0 0
Switch(config-line)# password keepout
Switch(config-line)# login
Switch(config-line)# line vty 5 15
Switch(config-line)# password keepout
Switch(config-line)# login
Switch(config-line)# line vty 5 15
Switch(config-line)# end
Switch# show running-config

Configuring Network Assistant in a Networked Switch in Cluster Mode

To configure Network Assistant on a networked switch in cluster mode, perform this task on the switch:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# enable password <i>name</i>	Enables password protection of configuration mode.
Step 3	Switch(config)# vtp domain <i>name</i>	Creates a VTP domain to manage VLANs and names.
Step 4	Switch(config)# cluster run	Launches the cluster on the cluster commander.
Step 5	Switch(config)# cluster enable <i>cluster_name</i>	Makes the switch the cluster commander.
Step 6	Switch(config)# vlan <i>vlan_id</i>	Creates a VLAN.
Step 7	Switch(config-vlan)# interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i> }	Selects the interface that will connect to your CNA-enabled PC.
Step 8	Switch(config-if)# switchport access vlan <i>vlan_id</i>	Enables the physical port to be in the specified VLAN.
Step 9	Switch(config-if)# interface { vlan <i>vlan_ID</i> <i>slot/interface</i> Port-channel <i>number</i> }	Select the VLAN instance for configuration.
Step 10	Switch(config-if)# ip address <i>ip_address</i>	Assigns an IP address to the SVI.

	Command	Purpose
Step 11	Switch(config-if)# no shut	Enables the interface.
Step 12	Switch(config-if)# ip http server	Starts the HTTP server so that Network Assistant can talk to the switch.
Step 13	Switch(config)# ip http secure-server	(Optionally) Enables the switch to accept HTTPS connections from Network Assistant.
Step 14	Switch(config)# ip route a.b.c	Establishes the route to the default router, usually supplied by the local Internet Provider. Note This line represents the only difference between the configuration for a standalone and a networked switch.
Step 15	Switch(config)# line con 0	Select the console port to perform the configuration.
Step 16	Switch(config-line)# exec-timeout x y	Configures an automatic session logout if no keyboard input or output is displayed on the terminal.
Step 17	Switch(config-line)# password password	Specifies a password for the console port.
Step 18	Switch(config-line)# login	Allows login to the console port.
Step 19	Switch(config-line)# line vty x y	Creates additional VTY lines for CNA to access the switch.
Step 20	Switch(config-line)# password password	Specifies a password for the switch.
Step 21	Switch(config-line)# login	Allows login to the switch.
Step 22	Switch(config-line)# line vty x y	Creates additional VTY lines for CNA to access the switch.
Step 23	Switch(config-line)# password password	Specifies a password for the switch.
Step 24	Switch(config-line)# login	Allows login to the switch.
Step 25	Switch(config-line)# end	Returns to privileged EXEC mode.
Step 26	Switch# show running-config include http	Verifies that the HTTP server is enabled.

This example shows how to configure Network Assistant on a networked switch in cluster mode:

```
Switch# configure terminal
Switch(config)# vtp domain cnadoc
Switch(config)# cluster run
Switch(config)# cluster enable cnadoc
Switch(config)# vlan 10
Switch(config-vlan)# interface GigabitEthernet 2/1
Switch(config-if)# switchport access vlan 10
Switch(config-if)# interface vlan10
Switch(config-if)# ip address aa.bb.cc.dd
Switch(config-if)# no shut
Switch(config-if)# ip http server
Switch(config-if)# ip http secure-server
Switch(config)# ip route 0.0.0.0 0.0.0.0 123.123.123.2
Switch(config)# line con 0
Switch(config-line)# exec-timeout 0 0
Switch(config-line)# password keepout
Switch(config-line)# login
Switch(config-line)# line vty 5 15
Switch(config-line)# password keepout
```

```
Switch(config-line)# login
Switch(config-line)# line vty 5 15
Switch(config-line)# end
Switch# show running-config

CHAPTER 14

Configuring VLANs, VTP, and VMPS

This chapter describes VLANs on Catalyst 4500 series switches. It also describes how to enable the VLAN Trunking Protocol (VTP) and to configure the Catalyst 4500 series switch as a VMPS client.

This chapter includes the following major sections:

- [VLANs, page 14-1](#)
- [VLAN Trunking Protocol, page 14-8](#)
- [VLAN Membership Policy Server, page 14-21](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

VLANs

This section includes the following major subsections:

- [Overview of VLANs, page 14-1](#)
- [VLAN Configuration Guidelines and Restrictions, page 14-3](#)
- [VLAN Default Configuration, page 14-4](#)
- [Configuring VLANs, page 14-5](#)

Overview of VLANs

A VLAN is a group of devices on one or more LANs that are configured to communicate as if they were attached to the same wire, when in fact they are located on a number of different LAN segments. Because VLANs are based on logical instead of physical connections, they are extremely flexible.

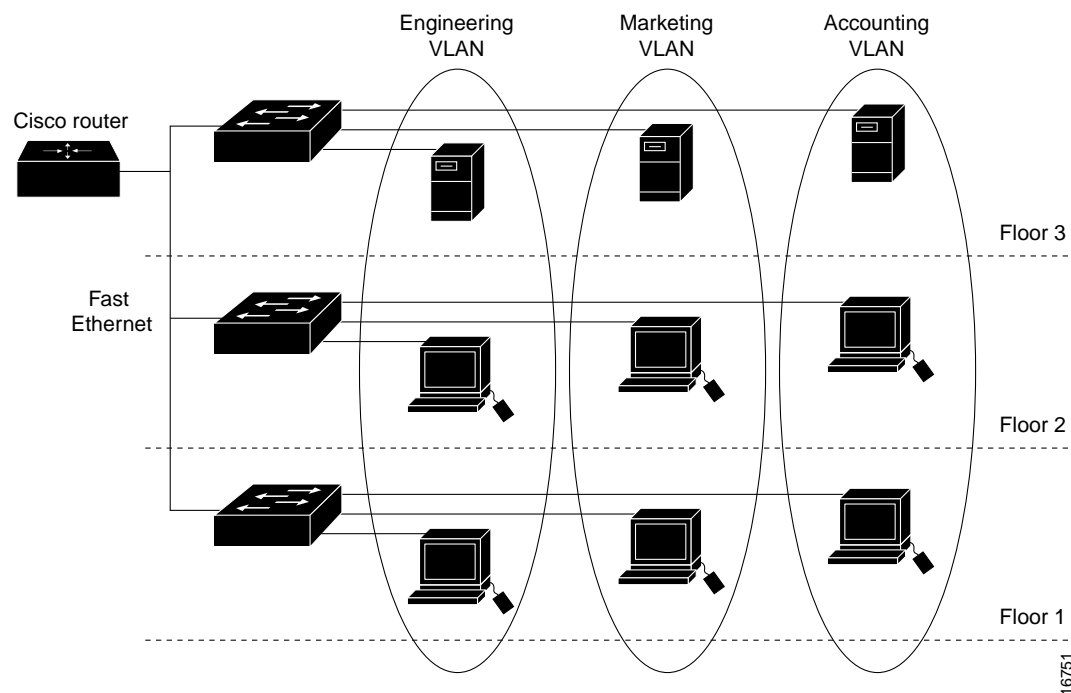

Note VTP version 3 updates do not pass through promiscuous trunk ports.

VLANs define broadcast domains in a Layer 2 network. A broadcast domain is the set of all devices that will receive broadcast frames originating from any device within the set. Broadcast domains are typically bounded by switches because switches do not forward broadcast frames. Layer 2 switches create broadcast domains based on the configuration of the switch. Switches are multiport bridges that allow you to create multiple broadcast domains. Each broadcast domain is like a distinct virtual bridge within a switch.

You can define one or many virtual bridges within a switch. Each virtual bridge you create in the switch defines a new broadcast domain (VLAN). Traffic cannot pass directly to another VLAN (between broadcast domains) within the switch or between two switches. To interconnect two different VLANs, you must use switches or Layer 3 switches. See the [“Overview of Layer 3 Interfaces”](#) section on [page 30-1](#) for information on inter-VLAN routing on Catalyst 4500 series switches.

Figure 14-1 shows an example of three VLANs that create logically defined networks.

Figure 14-1 Sample VLANs

VLANs are often associated with IP subnetworks. For example, all of the end stations in a particular IP subnet belong to the same VLAN. Traffic between VLANs must be routed. You must assign LAN interface VLAN membership on an interface-by-interface basis (this is known as interface-based or static VLAN membership).

You can set the following parameters when you create a VLAN in the management domain:

- VLAN number
- VLAN name
- VLAN type

- VLAN state (active or suspended)
- Maximum transmission unit (MTU) for the VLAN
- Security Association Identifier (SAID)
- VLAN number to use when translating from one VLAN type to another

**Note**

When the software translates from one VLAN type to another, it requires a different VLAN number for each media type.

VLAN Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when creating and modifying VLANs in your network:

- Before creating a VLAN, put the Catalyst 4500 series switch in VTP server mode or VTP transparent mode. If the Catalyst 4500 series switch is a VTP server, you must define a VTP domain. For information on configuring VTP, see the section [VLAN Trunking Protocol, page 14-8](#).
- The Cisco IOS **end** command is not supported in VLAN database mode.
- You cannot use **Ctrl-Z** to exit VLAN database mode.
- If a Catalyst 4948 switch running MSTP and configured with all possible VLANs (4094) is in the path of two HSRP peers with the timeout set below 500 ms., HSRP flaps.

Workarounds:

- Use fewer VLANs.
- Set the timers greater than 600 ms.
- Enter the commands **no igmp snooping** (globally) and **access-list hardware capture mode VLAN**.

VLAN Ranges

**Note**

You must enable the extended system ID to use 4094 VLANs. See the [“Understanding the Bridge ID” section on page 18-2](#).

With Cisco IOS Release 12.2(25)EWA and later, Catalyst 4500 series switches support 4096 VLANs in compliance with the IEEE 802.1Q standard. These VLANs are organized into three ranges: reserved, normal, and extended.

Some of these VLANs are propagated to other switches in the network when you use the VLAN Trunking Protocol (VTP). The extended-range VLANs are not propagated, so you must configure extended-range VLANs manually on each network device.

Table 14-1 describes the uses for VLAN ranges.

Table 14-1 VLAN Ranges

VLANs	Range	Usage	Propagated by VTP
0, 4095	Reserved	For system use only. You cannot see or use these VLANs.	—
1	Normal	Cisco default. You can use this VLAN but you cannot delete it.	Yes
2–1001	Normal	Used for Ethernet VLANs; you can create, use, and delete these VLANs.	Yes
1002–1005	Normal	Cisco defaults for FDDI and Token Ring. You cannot delete VLANs 1002–1005.	Yes
1006–4094	Extended	For Ethernet VLANs only. When configuring extended-range VLANs, note the following: <ul style="list-style-type: none"> Layer 3 ports and some software features require internal VLANs. Internal VLANs are allocated from 1006 and up. You cannot use a VLAN that has been allocated for such use. To display the VLANs used internally, enter the show vlan internal usage command. Switches running Catalyst product family software do not support configuration of VLANs 1006–1024. If you configure VLANs 1006–1024, ensure that the VLANs do not extend to any switches running Catalyst product family software. You must enable the extended system ID to use extended range VLANs. 	No

Configurable Normal-Range VLAN Parameters

Note

Ethernet VLANs 1 and 1006 through 4094 use only default values.

You can configure the following parameters for VLANs 2 through 1001:

- VLAN name
- VLAN type
- VLAN state (active or suspended)
- SAID
- STP type for VLANs

VLAN Default Configuration

The following table shows the default VLAN configuration values.

Table 14-2 Ethernet VLAN Defaults and Ranges

Parameter	Default	Valid Values
VLAN ID	1	1–4094
VLAN name	VLANx, where x is a number assigned by the software.	No range
802.10 SAID	100,001	1–4,294,967,294
MTU size	1500	1500–18,190
Translational bridge 1	1002	0–1005
Translational bridge 2	1003	0–1005
VLAN state	active	active; suspend; shutdown

**Note**

Catalyst 4500 series switches do not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-NET, TrCRF, or TrBRF traffic, but it does propagate the VLAN configuration via VTP. The software reserves parameters for these media types, but they are not truly supported.

Configuring VLANs

**Note**

Before you configure VLANs, you must use VLAN Trunking Protocol (VTP) to maintain global VLAN configuration information for your network. For complete information on VTP, see the [“VLAN Trunking Protocol” section on page 8](#).

**Note**

VLANs support a number of parameters that are not discussed in detail in this section. For complete information, refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

**Note**

The VLAN configuration is stored in the **vlan.dat** file, which is stored in nonvolatile memory. You can cause inconsistency in the VLAN database if you manually delete the **vlan.dat** file. If you want to modify the VLAN configuration or VTP, use the commands described in the following sections and in the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

The following sections describe how to configure VLANs:

- [Configuring VLANs in Global Configuration Mode, page 14-6](#)
- [Assigning a Layer 2 LAN Interface to a VLAN, page 14-8](#)

Configuring VLANs in Global Configuration Mode

If the switch is in VTP server or transparent mode (see the “[VLAN Trunking Protocol](#)” section on [page 14-8](#)), you can configure VLANs in global and VLAN configuration modes. When you configure VLANs in global and config-vlan configuration modes, the VLAN configuration is saved in the **vlan.dat** files, not the **running-config** or **startup-config** files. To display the VLAN configuration, enter the **show vlan** command.

If the switch is in VLAN transparent mode, use the **copy running-config startup-config** command to save the VLAN configuration to the **startup-config** file. After you save the running configuration as the startup configuration, the **show running-config** and **show startup-config** commands display the VLAN configuration.

**Note**

When the switch boots, if the VTP domain name and VTP mode in the **startup-config** and **vlan.dat** files do not match, the switch uses the configuration in the **vlan.dat** file.

You use the interface configuration command mode to define the port membership mode and add and remove ports from a VLAN. The results of these commands are written to the **running-config** file, and you can display the contents of the file by entering the **show running-config** command.

User-configured VLANs have unique IDs from 1 to 4094. To create a VLAN, enter the **vlan** command with an unused ID. To verify whether a particular ID is in use, enter the **show vlan id ID** command. To modify a VLAN, enter the **vlan** command for an existing VLAN.

See the “[VLAN Default Configuration](#)” section on [page 14-4](#) for the list of default parameters that are assigned when you create a VLAN. If you do not use the **media** keyword when specifying the VLAN type, the VLAN is an Ethernet VLAN.

To create a VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# vlan <i>vlan_ID</i> Switch(config-vlan)#	<p>Adds an Ethernet VLAN.</p> <p>Note You cannot delete the default VLANs for these media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.</p> <p>When you delete a VLAN, any LAN interfaces configured as access ports assigned to that VLAN become inactive. They remain associated with the VLAN (and thus inactive) until you assign them to a new VLAN.</p> <p>You can use the no keyword to delete a VLAN.</p> <p>When the prompt reads <i>Switch(config-vlan)#</i>, you are in vlan-configuration mode. If you wish to change any of the parameters for the newly created VLAN, use this mode.</p>
Step 3	Switch(config-vlan)# end	Returns to enable mode from vlan-configuration mode.
Step 4	Switch# show vlan [<i>id</i> <i>name</i>] <i>vlan_name</i>	Verifies the VLAN configuration.

When you create or modify an Ethernet VLAN, note the following:

- Because Layer 3 ports and some software features require internal VLANs allocated from 1006 and up, configure extended-range VLANs starting with 4094 and work downward.
- You can configure extended-range VLANs only in global configuration mode. You cannot configure extended-range VLANs in VLAN database mode.
- Layer 3 ports and some software features use extended-range VLANs. If the VLAN you are trying to create or modify is being used by a Layer 3 port or a software feature, the switch displays a message and does not modify the VLAN configuration.
- When you create VLANs with the VLAN configuration command, they are automatically added to the existing VTP domain; no action is required of the user.

This example shows how to create an Ethernet VLAN in global configuration mode and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 3
Switch(config-vlan)# end
Switch# show vlan id 3
```

VLAN	Name	Status	Ports
3	VLAN0003	active	

```
VLAN Type SAID MTU Parent RingNo BridgeNo Stp BrdgMode Trans1 Trans2
3 enet 100003 1500 - - - - - 0 0
Primary Secondary Type Interfaces
```

```
Switch#
```

Assigning a Layer 2 LAN Interface to a VLAN

A VLAN created in a management domain remains unused until you assign one or more LAN interfaces to the VLAN.

**Note**

Make sure you assign LAN interfaces to a VLAN of the proper type. Assign Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces to Ethernet-type VLANs.

To assign one or more LAN interfaces to a VLAN, complete the procedures in the [“Configuring Ethernet Interfaces for Layer 2 Switching”](#) section on page 16-5.

VLAN Trunking Protocol

This section describes the VLAN Trunking Protocol (VTP) on the Catalyst 4500 series switches.

This section includes the following major subsections:

- [Overview of VTP, page 14-8](#)
- [VTP Configuration Guidelines and Restrictions, page 14-13](#)
- [VTP Default Configuration, page 14-14](#)
- [Configuring VTP, page 14-14](#)

Overview of VTP

VTP is a Layer 2 messaging protocol that maintains VLAN configuration consistency by managing the addition, deletion, and renaming of VLANs within a VTP domain. A VTP domain (also called a VLAN management domain) is made up of one or more network devices that share the same VTP domain name and that are interconnected with trunks. VTP minimizes misconfigurations and configuration inconsistencies that can result in a number of problems, such as duplicate VLAN names, incorrect VLAN-type specifications, and security violations.

Before you create VLANs, you must decide whether you want to use VTP in your network. With VTP, you can make configuration changes centrally on one or more network devices and have those changes automatically communicated to all the other network devices in the network. For details on configuring VLANs, see [VLANs, page 14-1](#)

These sections describe how VTP works:

- [Understanding the VTP Domain, page 14-9](#)
- [Understanding VTP Modes, page 14-9](#)
- [Understanding VTP Advertisements, page 14-10](#)
- [Understanding VTP Versions, page 14-10](#)
- [Understanding VTP Pruning, page 14-11](#)

Understanding the VTP Domain

A VTP domain is made up of one or more interconnected network devices that share the same VTP domain name. A network device can be configured to be in only one VTP domain. You make global VLAN configuration changes for the domain using either the command-line interface (CLI) or Simple Network Management Protocol (SNMP).

By default, the Catalyst 4500 series switch is in VTP server mode and the domain is set to NULL until the switch receives an advertisement for a domain over a trunk link or you configure a management domain. You cannot create or modify VLANs on a VTP server until the management domain name is specified or learned.

If the switch receives a VTP advertisement over a trunk link, it inherits the management domain name and the VTP configuration revision number. The switch ignores advertisements with a different management domain name or an earlier configuration revision number.

If you configure the switch as VTP transparent, you can create and modify VLANs, but the changes affect only the individual switch.

When you make a change to the VLAN configuration on a VTP server, the change is propagated to all network devices in the VTP domain. VTP advertisements are transmitted out all Inter-Switch Link (ISL) and IEEE 802.1Q trunk connections.

VTP maps VLANs dynamically across multiple LAN types with unique names and internal index associations. Mapping eliminates unnecessary device administration for network administrators.

Understanding VTP Modes

You can configure a Catalyst 4500 series switch to operate in any one of these VTP modes:

- **Server**—In VTP server mode, you can create, modify, and delete VLANs and specify other configuration parameters (such as VTP version and VTP pruning) for the entire VTP domain. VTP servers advertise their VLAN configuration to other network devices in the same VTP domain and synchronize their VLAN configuration with other network devices based on advertisements received over trunk links. VTP server is the default mode.

Note In VTP version 3, manipulation of VLANs can be done only to primary servers.

- **Client**—VTP clients behave the same way as VTP servers, but you cannot create, change, or delete VLANs on a VTP client.
- **Transparent**—VTP transparent network devices do not participate in VTP. A VTP transparent network device does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. However, in VTP version 2, transparent network devices do forward VTP advertisements that they receive on their trunking LAN interfaces.
- **Off**—In VTP off mode, a network device functions in the same manner as a VTP transparent device except that it does not forward VTP advertisements.

Note

Catalyst 4500 series switches automatically change from VTP server mode to VTP client mode if the switch detects a failure while writing configuration to NVRAM. If this happens, the switch cannot be returned to VTP server mode until the NVRAM is functioning.

Understanding VTP Advertisements

Each network device in the VTP domain sends periodic advertisements out each trunking LAN interface to a reserved multicast address. VTP advertisements are received by neighboring network devices, which update their VTP and VLAN configurations as necessary.

The following global configuration information is distributed in VTP advertisements:

- VLAN IDs (ISL and 802.1Q)
- Emulated LAN names (for ATM LANE)
- 802.10 SAID values (FDDI)
- VTP domain name
- VTP configuration revision number
- VLAN configuration, including maximum transmission unit (MTU) size for each VLAN
- Frame format

Understanding VTP Versions

VTP Version 2

If you use VTP in your network, you must decide whether to use VTP version 1 or version 2.

**Note**

Catalyst 4500 series switches do not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-Net, Token Ring Concentrator Relay Function [TrCRF], or Token Ring Bridge Relay Function [TrBRF] traffic, but it does propagate the VLAN configuration via VTP.

VTP version 2 supports the following features, which are not supported in version 1:

- Token Ring support—VTP version 2 supports Token Ring LAN switching and VLANs (TrBRF and TrCRF).
- Unrecognized Type-Length-Value (TLV) Support—A VTP server or client propagates configuration changes to its other trunks, even for TLVs it is not able to parse. The unrecognized TLV is saved in NVRAM.
- Version-Dependent Transparent Mode—In VTP version 1 and version 2, a VTP transparent network device forwards VTP messages in transparent mode without checking the version.
- Consistency Checks—In VTP version 2, VLAN consistency checks (such as VLAN names and values) are performed only when you enter new information through the CLI or SNMP. Consistency checks are not performed when new information is obtained from a VTP message or when information is read from NVRAM. If the digest on a received VTP message is correct, its information is accepted without consistency checks.

VTP Version 3

VTP version 3 supports the following features not supported in version 1 or version 2:

- **Hidden Password Support**—VTP version 3 supports the option of configuring the password as **hidden** or **secret**.

When the **hidden** keyword is specified, that password must be reentered if a takeover command is issued in the domain. The secret key generated from the password string is saved in the `const_nvram:vlan.dat` file. When configured with this option, the password does not appear in plain text in the configuration. Instead, the secret key associated with the password is saved in hexadecimal format in the running configuration. If the **hidden** keyword is not specified, the password is saved in clear text in the `const_nvram:vlan.dat` file as in VTP version 1 and VTP version 2.

When the **secret** keyword is specified, the password secret key can be directly configured.

- **Support for extended VLAN Database Propagation**—In VTP version 2, VLAN configuration information is propagated only for VLANs numbered 1 to 1000. In VTP version 3, information also is propagated for extended-range VLANs (VLANs numbered 1006 to 4094).
- On Catalyst 4500 series switches running VTP version 1, VTP version 2, or VTP version 3, default VLANs 1 and 1002 to 1005 cannot be modified.

Note VTP pruning continues to apply only to VLANs numbered 1 to 1000.

- **Propagation of Any Database in a Domain**—In addition to propagating VLAN database information, VTP can propagate Multiple Spanning Tree (MST) protocol database information.
- **Disabling VTP**—When VTP is disabled on a trunking port, it applies to all VTP instances on that port. When VTP is disabled globally, the setting applies to all the trunking ports in the system.
- **In VTP version 1 and VTP version 2**, the role of a VTP server is to back up the database to NVRAM and to allow the administrator to change database information. VTP version 3 introduces the roles of VTP Primary Server and VTP Secondary Server. A VTP Primary Server is used to update the database information. The updates sent out are honored by all the devices in the system. A VTP Secondary Server can only back up to its NVRAM the VTP configuration received via updates from the VTP Primary Server.

The status of primary and secondary servers is a runtime status and is not a configurable option. By default, all devices are initiated as secondary servers. Primary server status is needed only when database updates are needed, and is obtained when the administrator issues a takeover message in the domain. (See the [“Starting a Takeover”](#) section on page 14-20.)

Primary server status is lost upon reload of the device, or when switchover or domain parameters change. Secondary servers back up the configuration and continue to propagate it. Because of that, it is possible to have a working VTP domain without any primary servers.

Understanding VTP Pruning

VTP pruning enhances network bandwidth use by reducing unnecessary flooded traffic, such as broadcast, multicast, and unicast packets. VTP pruning increases available bandwidth by restricting flooded traffic to those trunk links that the traffic must use to access the appropriate network devices. By default, VTP pruning is disabled.

For VTP pruning to be effective, all devices in the management domain must either support VTP pruning or, on devices that do not support VTP pruning, you must manually configure the VLANs allowed on trunks.

Figure 14-2 shows a switched network without VTP pruning enabled. Interface 1 on Switch 1 and Interface 2 on Switch 4 are assigned to the Red VLAN. A broadcast is sent from the host connected to Switch 1. Switch 1 floods the broadcast and every network device in the network receives it, even though Switches 3, 5, and 6 have no interfaces in the Red VLAN.

You can enable pruning globally on the Catalyst 4500 series switch (see the “Enabling VTP Pruning” section on page 14-16).

Figure 14-2 Flooding Traffic without VTP Pruning

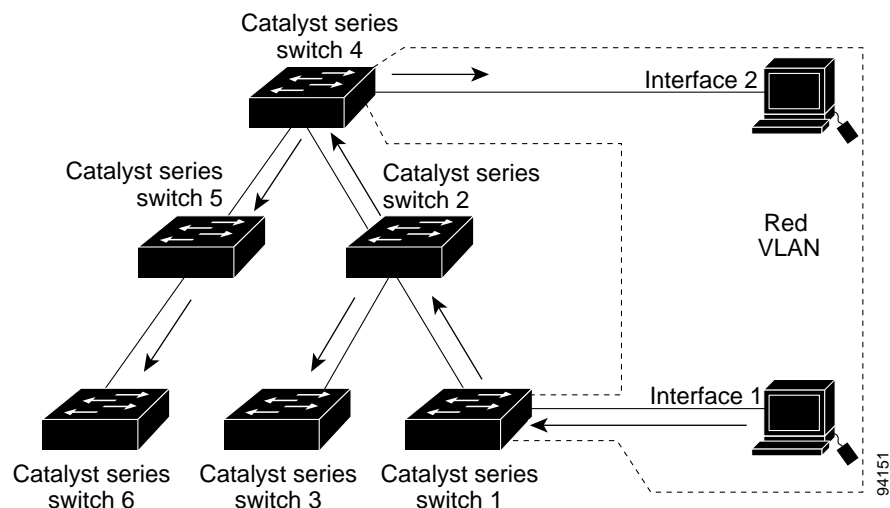

Figure 14-3 shows the same switched network with VTP pruning enabled. The broadcast traffic from Switch 1 is not forwarded to Switches 3, 5, and 6 because traffic for the Red VLAN has been pruned on the links indicated (Interface 5 on Switch 2 and Interface 4 on Switch 4).

Figure 14-3 Flooding Traffic with VTP Pruning

Enabling VTP pruning on a VTP server enables pruning for the entire management domain. VTP pruning takes effect several seconds after you enable it. By default, VLANs 2 through 1000 are eligible for pruning. VTP pruning does not prune traffic from pruning-ineligible VLANs. VLAN 1 is always ineligible for pruning; traffic from VLAN 1 cannot be pruned.

To configure VTP pruning on a trunking LAN interface, use the **switchport trunk pruning vlan** command. VTP pruning operates when a LAN interface is trunking. You can set VLAN pruning eligibility regardless of whether VTP pruning is enabled or disabled for the VTP domain, whether any given VLAN exists, and regardless of whether the LAN interface is currently trunking.

VTP Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when implementing VTP in your network:

- Supervisor engine redundancy does not support nondefault VLAN data file names or locations. Do not enter the **vtp file *file_name*** command on a switch that has a redundant supervisor engine.
- Before installing a redundant supervisor engine, enter the **no vtp file** command to return to the default configuration.
- When a VTP version 3 device on a trunk port receives messages from a VTP version 2 device, it will send a scaled-down version of the VLAN database on that particular trunk in a VTP version 2 format. A VTP version 3 device will not send out VTP version 2 formatted packets on a trunk port unless it first receives VTP version 2 packets on that trunk.
- Even when a VTP version 3 device detects a VTP version 2 device on a trunk port, it will continue to send VTP version 3 packets in addition to VTP version 2 packets, to allow co-existence of two kinds of neighbors off the trunk.
- A VTP version 3 device will not accept configuration information from a VPT version 2 or version 1 device.
- Unlike in VPT version 2, when VTP is configured to be version 3, this will not configure all the version-3-capable devices in the domain to start behaving as VPT version 3 systems.
- When a VTP version 1 device, capable of version 2 or version 3, receives a VTP version 3 packet, the device is configured as a VTP version 2 device provided a VTP version 2 conflict does not exist.
- Devices that are only VTP version 1 capable cannot interoperate with VTP version 3 devices.
- In a Token Ring environment, you must enable VTP version 2 or version 3 for Token Ring VLAN switching to function properly.
- Two VPT version 3 regions can only communicate in transparent mode over a VTP version 1 or VTP version 2 region.
- All network devices in a VTP domain must run the same VTP version.
- You must configure a password on each network device in the management domain when VTP is in secure mode.

Caution

If you configure VTP in secure mode, the management domain will not function properly if you do not assign a management domain password to each network device in the domain.

- A VTP version 2-capable network device can operate in the same VTP domain as a network device running VTP version 1 if VTP version 2 is disabled on the VTP version 2-capable network device (VTP version 2 is disabled by default).

- Do not enable VTP version 2 on a network device unless all of the network devices in the same VTP domain are version 2-capable. When you enable VTP version 2 on a server, all of the version 2-capable network devices in the domain enable VTP version 2.
- Enabling or disabling VTP pruning on a VTP server enables or disables VTP pruning for the entire management domain.
- Configuring VLANs as eligible for pruning on a Catalyst 4500 series switch affects pruning eligibility for those VLANs on that switch only, not on all network devices in the VTP domain.
- The VLAN database is saved in the NVRAM file in a format compliant with the VTP version running on the system. Since older images supporting only VTP version 2 do not recognize the VTP version 3 file format, the NVRAM VLAN database information is lost if the system is downgraded from a new image supporting VTP to one that does not.

VTP Default Configuration

Table 14-3 shows the default VTP configuration.

Table 14-3 VTP Default Configuration

Feature	Default Value
VTP domain name	Null
VTP mode	Server
VTP version 2 enable state	Version 2 is disabled
VTP password	None
VTP pruning	Disabled

The default VTP mode for newly manufactured Catalyst 4500 supervisor engines, Catalyst 4900 series switches, and the Cisco ME 4924-10GE switch is transparent. Deleting `vlan.dat` or issuing the **erase cat4000_flash:** command, and resetting the switch will change the VTP mode to server.

Configuring VTP

These sections describe how to configure VTP:

- [Configuring VTP Global Parameters, page 14-15](#)
- [Configuring the VTP Mode, page 14-17](#)
- [Starting a Takeover, page 14-20](#)
- [Displaying VTP Statistics, page 14-20](#)
- [Displaying VTP Devices in a Domain, page 14-21](#)

Configuring VTP Global Parameters

These sections describe configuring the VTP global parameters:

- [Configuring a VTP Password, page 14-15](#)
- [Enabling VTP Pruning, page 14-16](#)
- [Enabling the VTP Version Number, page 14-16](#)

Note

You can enter the VTP global parameters in either global configuration mode or in EXEC mode.

Configuring a VTP Password

To configure the VTP global parameters, use these commands:

Command	Purpose
Switch(config)# vtp password <i>password_string</i> [hidden secret]	Sets a password, which can be from 8 to 64 characters long, for the VTP domain. In VTP version 3 the keywords hidden and secret are available. <ul style="list-style-type: none"> • If the hidden keyword is used, the secret key generated from the password string is saved in the const_nvram:vlan.dat file. If a takeover command is issued, that password must be reentered. • If the secret keyword is used, the password secret key can be directly configured. The secret password must contain 32 hexadecimal characters.
Switch(config)# no vtp password	Clears the password.

This example shows one way to configure a VTP password in global configuration mode:

```
Switch# configure terminal
Switch(config)# vtp password WATER
Setting device VLAN database password to WATER.
Switch#
```

This example shows how to configure a VTP password in EXEC mode:

```
Switch# vtp password WATER
Setting device VLAN database password to WATER.
Switch#
```

Note

The password is not stored in the running-config file.

This example shows how to configure a **hidden** password:

```
Switch# configure terminal
Switch(config)# vtp password WATER hidden
Generating the secret associated to the password.
Switch(config)#
```

This example shows how the password WATER is displayed when it is configured with the **hidden** keyword.

```
Switch# show vtp password
VTP Password: 89914640C8D90868B6A0D8103847A733
Switch#
```

Enabling VTP Pruning

To enable VTP pruning in the management domain, perform this task:

	Command	Purpose
Step 1	Switch(config)# vtp pruning	Enables VTP pruning in the management domain.
Step 2	Switch# show vtp status include pruning	(Optional) Verifies the configuration.

This example shows one way to enable VTP pruning in the management domain:

```
Switch# configure terminal
Switch(config)# vtp pruning
Pruning switched ON
```

This example shows how to enable VTP pruning in the management domain with any release:

```
Switch# vtp pruning
Pruning switched ON
```

This example shows how to verify the configuration:

```
Switch# show vtp status | include Pruning
VTP Pruning Mode: Enabled
Switch#
```

For information about configuring prune eligibility, see the [“Understanding VTP Pruning” section on page 14-11](#).

Enabling the VTP Version Number

VTP version 2 is disabled by default on VTP version-2-capable network devices. When you enable VTP version 2 on a network device, every VTP version-2-capable network device in the VTP domain enables version 2.

Caution

VTP version 1 and VTP version 2 are not interoperable on network devices in the same VTP domain. Every network device in the VTP domain must use the same VTP version. Do not enable VTP version 2 unless every network device in the VTP domain supports version 2.

Note

In a Token Ring environment, you must enable VTP version 2 or VTP version 3 for Token Ring VLAN switching to function properly on devices that support Token Ring interfaces.

To enable the VTP version, perform this task:

	Command	Purpose
Step 1	Switch(config)# vtp version {1 2 3}	Enables the VTP version.
Step 2	Switch# show vtp status include {v1 v2 v3}	(Optional) Verifies the configuration.

This example shows one way to enable VTP version 2:

```
Switch# configure terminal
Switch(config)# vtp version 2
V2 mode enabled.
Switch(config)#
```

This example shows how to enable VTP version 2 with any release:

```
Switch# vtp version 2
V2 mode enabled.
Switch#
```

This example shows how to verify the configuration:

```
Switch# show vtp status | include V2
VTP V2 Mode: Enabled
Switch#
```

Configuring the VTP Mode

To configure the VTP mode, perform this task:

	Command	Purpose
Step 1	Switch(config)# vtp mode {client server transparent off}	Configures the VTP mode.
Step 2	Switch(config)# vtp domain <i>domain_name</i>	(Optional; for server mode only) Defines the VTP domain name, which can be up to 32 characters long. VTP server mode requires a domain name. If the switch has a trunk connection to a VTP domain, the switch learns the domain name from the VTP server in the domain. Note You cannot clear the domain name.
Step 3	Switch(config)# end	Exits VLAN configuration mode.
Step 4	Switch# show vtp status	(Optional) Verifies the configuration.

Note

When VTP is disabled, you can enter VLAN configuration commands in configuration mode instead of the VLAN database mode and the VLAN configuration is stored in the startup configuration file.

This example shows how to configure the switch as a VTP server:

```
Switch# configure terminal
Switch(config)# vtp mode server
Setting device to VTP SERVER mode.
Switch(config)# vtp domain Lab_Network
Setting VTP domain name to Lab_Network
Switch(config)# end
Switch#
```

This example shows how to configure the switch as a VTP client:

```
Switch# configure terminal
Switch(config)# vtp mode client
Setting device to VTP CLIENT mode.
Switch(config)# end
Switch#
```

This example shows how to disable VTP on the switch:

```
Switch# configure terminal
Switch(config)# vtp mode transparent
Setting device to VTP TRANSPARENT mode.
Switch(config)# end
Switch#
```

This example shows how to disable VTP on the switch and to disable VTP advertisement forwarding:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vtp mode off
Setting device to VTP OFF mode.
Switch(config)# end
Switch#
```

This example shows an example of the VTP configuration parameters when the device is running VTP version 1:

```
Switch# show vtp status
VTP Version capable          : 1 to 3
VTP version running         : 1
VTP Domain Name              : Lab_Network
VTP Pruning Mode             : Enabled
VTP Traps Generation         : Disabled
Device ID                    : 0016.9c6d.5300
Configuration last modified by 127.0.0.12 at 10-18-07 10:12:42
Local updater ID is 127.00.12 at 10-18-07 10:2:42

Switch#
```

This example shows an example of the VTP configuration parameters when the device is running VTP version 3:

```
Switch# show vtp status
VTP Version capable      : 1 to 3
VTP version running      : 3
VTP Domain Name          : Lab_Network
VTP Pruning Mode         : Disabled
VTP Traps Generation     : Disabled
Device ID                : 0012.44dc.b800

Feature VLAN:
-----
VTP Operating Mode       : Server
Number of existing VLANs : 1005
Number of existing extended VLANs: 3074
Configuration Revision   : 18
Primary ID               : 0012.4371.9ec0
Primary Description      :

Switch#
```

Starting a Takeover

This process applies to VTP version 3 only. To start a takeover, perform this task:

Command	Purpose
Switch# vtp primary-server [vlan mst] [force]	<p>Changes the operational state of a switch from a secondary to a primary server and advertises the configuration to the whole domain. (If the password for this device is configured with the hidden keyword, the user is prompted to re-enter it.)</p> <p>Note Using the force keyword overwrites the configuration of any conflicting servers. If not using the force keyword, you will be prompted for confirmation prior to proceeding with the takeover.</p> <p>Specify where to direct the takeover by selecting the appropriate feature (vlan or mst). If no feature is selected, the takeover is directed to the VLAN database.</p>

This example shows how to start a takeover and direct it to the **vlan** database:

```
Switch# vtp primary-server vlan
Enter VTP password:password
This system is becoming primary for feature vlan

VTP Feature Conf Revision Primary Server Device ID      Description
-----
MST          Yes   4          0012.4371.9ec0=0012.4371.9ec0 R1
Do you want to continue? (confirm)
Switch#
```

Displaying VTP Statistics

To display VTP statistics, including VTP advertisements sent and received and VTP errors, perform this task:

Command	Purpose
Switch# show vtp counters	Displays VTP statistics.

This example shows how to display VTP statistics:

```
Switch# show vtp counters
VTP statistics:
Summary advertisements received      : 7
Subset advertisements received      : 5
Request advertisements received      : 0
Summary advertisements transmitted : 997
Subset advertisements transmitted    : 13
```

```
Request advertisements transmitted : 3
Number of config revision errors   : 0
Number of config digest errors     : 0
Number of V1 summary errors        : 0
```

VTP pruning statistics:

Trunk	Join Transmitted	Join Received	Summary advts received from non-pruning-capable device
-----	-----	-----	-----
Fa5/8	43071	42766	5

Displaying VTP Devices in a Domain

To display information for all the VTP devices in a domain, perform this task:

Command	Purpose
Switch# show vtp devices [conflicts]	<p>Gathers and displays information for all the VTP devices in the domain.</p> <p>Note No information is gathered or displayed from switches set to vtp modes off or to transparent for a particular feature.</p> <p>The conflicts keyword (optional) displays the information of devices that have conflicting primary servers.</p>

This example shows how to display information for VTP devices in a domain:

```
Switch# show vtp devices
Retrieving information from the VTP domain, please wait for 5 seconds.
VTP Feature Conf Revision Primary Server Device ID      Device Description
-----
VLAN          No    18          0016.9c6d.5300 0012.011a.0d00    R2
VLAN          No    18          0016.9c6d.5300 0012.4371.9ec0    R1
MST           Yes    4          0012.4371.9ec0=0012.4371.9ec0    R1

Switch#
```

VLAN Membership Policy Server

This section describes how to configure dynamic port VLAN membership through the VLAN Membership Policy Server (VMPS).

This section includes the following subsections:

- [Overview of VMPS, page 14-22](#)
- [Overview of VMPS Clients, page 14-24](#)
- [Dynamic Port VLAN Membership Configuration Example, page 14-30](#)
- [VMPS Database Configuration File Example, page 14-33](#)

Overview of VMPS

These subsections describe what a VMPS server does and how it operates:

- [Understanding the VMPS Server, page 14-22](#)
- [Security Modes for VMPS Server, page 14-23](#)
- [Fallback VLAN, page 14-24](#)
- [Illegal VMPS Client Requests, page 14-24](#)

Understanding the VMPS Server

A VLAN Membership Policy Server (VMPS) provides a centralized server for selecting the VLAN for a port dynamically based on the MAC address of the device connected to the port. When the host moves from a port on one switch in the network to a port on another switch in the network, that switch dynamically assigns the new port to the proper VLAN for that host.

A Catalyst 4500 series switch running Cisco IOS software does not support the functionality of a VMPS. It can only function as a VLAN Query Protocol (VQP) client, which communicates with a VMPS through the VQP. For VMPS functionality, you need to use a Catalyst 4500 series switch (or Catalyst 6500 series switch) running Catalyst operating system (OS) software.

VMPS uses a UDP port to listen to VQP requests from clients, so, it is not necessary for VMPS clients to know if the VMPS resides on a local or remote device on the network. Upon receiving a valid request from a VMPS client, a VMPS server searches its database for an entry of a MAC-address to VLAN mapping.

In response to a request, the VMPS takes one of the following actions:

- If the assigned VLAN is restricted to a group of ports, the VMPS verifies the requesting port against this group and responds as follows:
 - If the VLAN is allowed on the port, the VMPS sends the VLAN name to the client in response.
 - If the VLAN is not allowed on the port and the VMPS is not in secure mode, the VMPS sends an “access-denied” response.
 - If the VLAN is not allowed on the port and the VMPS is in secure mode, the VMPS sends a “port-shutdown” response.
- If the VLAN in the database does not match the current VLAN on the port and there are active hosts on the port, the VMPS sends an “access-denied” (open), a “fallback VLAN name” (open with fallback VLAN configured), a “port-shutdown” (secure), or a “new VLAN name” (multiple) response, depending on the secure mode setting of the VMPS.

If the switch receives an “access-denied” response from the VMPS, the switch continues to block traffic from the MAC address to or from the port. The switch continues to monitor the packets directed to the port and sends a query to the VMPS when it identifies a new address. If the switch receives a “port-shutdown” response from the VMPS, the switch disables the port. The port must be manually re-enabled by using the CLI, Cisco Visual Switch Manager (CVSM), or SNMP.

You can also use an explicit entry in the configuration table to deny access to specific MAC addresses for security reasons. If you enter the **none** keyword for the VLAN name, the VMPS sends an “access-denied” or “port-shutdown” response.

Security Modes for VMPS Server

VMPS operates in three different modes. The way a VMPS server responds to illegal requests depends on the mode in which the VMPS is configured:

- [Open Mode, page 14-23](#)
- [Secure Mode, page 14-23](#)
- [Multiple Mode, page 14-23](#)

Open Mode

If no VLAN is assigned to this port, VMPS verifies the requesting MAC address against this port:

- If the VLAN associated with this MAC address is allowed on the port, the VLAN name is returned to the client.
- If the VLAN associated with this MAC address is not allowed on the port, the host receives an “access denied” response.

If a VLAN is already assigned to this port, VMPS verifies the requesting MAC address against this port:

- If the VLAN associated with this MAC address in the database does not match the current VLAN assigned on the port, and a fallback VLAN name is configured, VMPS sends the fallback VLAN name to the client.
- If a VLAN associated with this MAC address in the database does not match the current VLAN assigned on the port, and a fallback VLAN name is not configured, the host receives an “access denied” response.

Secure Mode

If no VLAN is assigned to this port, VMPS verifies the requesting MAC address against this port:

- If the VLAN associated with this MAC address is allowed on the port, the VLAN name is returned to the client.
- If the VLAN associated with this MAC address is not allowed on the port, the port is shut down.

If a VLAN is already assigned to this port, VMPS verifies the requesting MAC address against this port:

- If a VLAN associated with this MAC address in the database does not match the current VLAN assigned on the port, the port is shutdown, even if a fallback VLAN name is configured.

Multiple Mode

Multiple hosts (MAC addresses) can be active on a dynamic port if they are all in the same VLAN. If the link fails on a dynamic port, the port returns to the unassigned state. Any hosts that come online through the port are checked again with VMPS before the port is assigned to a VLAN.

If multiple hosts connected to a dynamic port belong to different VLANs, the VLAN matching the MAC address in the last request is returned to the client provided that multiple mode is configured on the VMPS server.

Note

Although Catalyst 4500 series and Catalyst 6500 series switches running Catalyst operating system software support VMPS in all three operation modes, the User Registration Tool (URT) supports open mode only.

Fallback VLAN

You can configure a fallback VLAN name on a VMPS server.

If no VLAN has been assigned to this port, VMPS compares the requesting MAC address to this port:

- If you connect a device with a MAC address that is not in the database, the VMPS sends the fallback VLAN name to the client.
- If you do not configure a fallback VLAN name and the MAC address does not exist in the database, the VMPS sends an “access-denied” response.

If a VLAN is already assigned to this port, VMPS compares the requesting MAC address to this port:

- If the VMPS is in secure mode, it sends a “port-shutdown” response, whether a fallback VLAN has been configured on the server.

Illegal VMPS Client Requests

Two examples of illegal VMPS client requests are as follows:

- When a MAC-address mapping is not present in the VMPS database and “no fall back” VLAN is configured on the VMPS.
- When a port is already assigned a VLAN (and the VMPS mode is not “multiple”) but a second VMPS client request is received on the VMPS for a different MAC-address.

Overview of VMPS Clients

The following subsections describe how to configure a switch as a VMPS client and configure its ports for dynamic VLAN membership.

The following topics are included:

- [Understanding Dynamic VLAN Membership, page 14-24](#)
- [Default VMPS Client Configuration, page 14-25](#)
- [Configuring a Switch as a VMPS Client, page 14-25](#)
- [Administering and Monitoring the VMPS, page 14-29](#)
- [Troubleshooting Dynamic Port VLAN Membership, page 14-30](#)

Understanding Dynamic VLAN Membership

When a port is configured as “dynamic,” it receives VLAN information based on the MAC-address that is on the port. The VLAN is not statically assigned to the port; it is dynamically acquired from the VMPS based on the MAC-address on the port.

A dynamic port can belong to one VLAN only. When the link becomes active, the switch does not forward traffic to or from this port until the port is assigned to a VLAN. The source MAC address from the first packet of a new host on the dynamic port is sent to the VMPS as part of the VQP request, which attempts to match the MAC address to a VLAN in the VMPS database. If there is a match, the VMPS sends the VLAN number for that port. If there is no match, the VMPS either denies the request or shuts down the port (depending on the VMPS security mode setting). See the [“Overview of VMPS” section on page 14-22](#) for a complete description of possible VMPS responses.

Multiple hosts (MAC addresses) can be active on a dynamic port if all are in the same VLAN. If the link goes down on a dynamic port, the port returns to the unassigned state and does not belong to a VLAN. Any hosts that come online through the port are checked again with the VMPS before the port is assigned to a VLAN.

For this behavior to work, the client device must be able to reach the VMPS. A VMPS client sends VQP requests as UDP packets, trying a certain number of times before giving up. For details on how to set the retry interval, refer to section “Configuring the Retry Interval” on page 28.

The VMPS client also periodically reconfirms the VLAN membership. For details on how to set the reconfirm frequency, refer to section “Administering and Monitoring the VMPS” on page 29.

A maximum of 50 hosts are supported on a given port at any given time. Once this maximum is exceeded, the port is shut down, irrespective of the operating mode of the VMPS server.

**Note**

The VMPS shuts down a dynamic port if more than 50 hosts are active on that port.

Default VMPS Client Configuration

Table 14-4 shows the default VMPS and dynamic port configuration on client switches.

Table 14-4 Default VMPS Client and Dynamic Port Configuration

Feature	Default Configuration
VMPS domain server	None
VMPS reconfirm interval	60 minutes
VMPS server retry count	3
Dynamic ports	None configured

Configuring a Switch as a VMPS Client

This section contains the following topics:

- [Configuring the IP Address of the VMPS Server, page 14-25](#)
- [Configuring Dynamic Access Ports on a VMPS Client, page 14-26](#)
- [Reconfirming VLAN Memberships, page 14-27](#)
- [Configuring Reconfirmation Interval, page 14-27](#)
- [Reconfirming VLAN Memberships, page 14-27](#)

Configuring the IP Address of the VMPS Server

To configure a Catalyst 4500 series switch as a VMPS client, you must enter the IP address or hostname of the switch acting as the VMPS.

To define the primary and secondary VMPS on a Catalyst 4500 series switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# vmps server {ipaddress hostname} primary	Specifies the IP address or hostname of the switch acting as the primary VMPS server.
Step 3	Switch(config)# vmps server {ipaddress hostname}	Specifies the IP address or hostname of the switch acting as a secondary VMPS server.
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show vmps	Verifies the VMPS server entry.

This example shows how to define the primary and secondary VMPS devices:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vmps server 172.20.128.179 primary
Switch(config)# vmps server 172.20.128.178
Switch(config)# end
```

Note

You can configure up to four VMPS servers using this CLI on the VMPS client.

```
Switch# show vmps
VQP Client Status:
-----
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.128.179 (primary, current)
                   172.20.128.178

Reconfirmation status
-----
VMPS Action:          No Dynamic Port
```

Configuring Dynamic Access Ports on a VMPS Client

To configure a dynamic access port on a VMPS client switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface interface	Enters interface configuration mode and specifies the port to be configured.
Step 3	Switch(config-if)# switchport mode access	Sets the port to access mode.
Step 4	Switch(config-if)# switchport access vlan dynamic	Configures the port as eligible for dynamic VLAN access.
Step 5	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 6	Switch# show interface interface switchport	Verifies the entry.

This example shows how to configure a dynamic access port and to verify the entry:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa1/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan dynamic
Switch(config-if)# end

Switch# show interface fa1/1 switchport
Name: Fa0/1
Switchport: Enabled
Administrative mode: dynamic auto
Operational Mode: dynamic access
Administrative Trunking Encapsulation: isl
Operational Trunking Encapsulation: isl
Negotiation of Trunking: Disabled
Access Mode VLAN: 0 ((Inactive))
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: NONE
Pruning VLANs Enabled: NONE
```

Voice Ports

If a VVID (voice VLAN ID) is configured on a dynamic access port, the port can belong to both an access VLAN and a voice VLAN. Consequently, an access port configured for connecting an IP phone can have separate VLANs for the following:

- Data traffic to and from the PC that is connected to the switch through the access port of the IP phone (access VLAN)
- Voice traffic to and from the IP phone (voice VLAN)

Reconfirming VLAN Memberships

To confirm the dynamic port VLAN membership assignments that the switch has received from the VMPS, perform this task:

	Command	Purpose
Step 1	Switch# vmmps reconfirm	Reconfirms dynamic port VLAN membership.
Step 2	Switch# show vmmps	Verifies the dynamic VLAN reconfirmation status.

Configuring Reconfirmation Interval

VMPS clients periodically reconfirm the VLAN membership information received from the VMPS. You can set the number of minutes the VMPS client waits before reconfirming the VLAN-to-MAC-address assignments.

To configure the reconfirmation interval, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# vmmps reconfirm <i>minutes</i>	Specifies the number of minutes between reconfirmations of the dynamic VLAN membership.

	Command	Purpose
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show vmmps	Verifies the dynamic VLAN reconfirmation status.

This example shows how to change the reconfirmation interval to 60 minutes and verify the change:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vmmps reconfirm 60
Switch(config)# end
Switch# show vmmps
VQP Client Status:
-----
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 10
VMPS domain server: 172.20.130.50 (primary, current)

Reconfirmation status
-----
VMPS Action: No Host
```

Configuring the Retry Interval

You can set the number of times that the VMPS client attempts to contact the VMPS before querying the next server.

To configure the retry interval, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# vmmps retry count	Specifies the retry count for the VPQ queries. Default is 3. Range is from 1 to 10.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show vmmps	Verifies the retry count.

This example shows how to change the retry count to 5 and to verify the change:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vmmps retry 5
Switch(config)# end

Switch# show vmmps
VQP Client Status:
-----
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 5
VMPS domain server: 172.20.130.50 (primary, current)

Reconfirmation status
-----
VMPS Action: No Host
```

Administering and Monitoring the VMPS

You can display the following information about the VMPS with the **show vmps** command:

VQP Version	The version of VQP used to communicate with the VMPS. The switch queries the VMPS using VQP Version 1.
Reconfirm Interval	The number of minutes the switch waits before reconfirming the VLAN-to-MAC-address assignments.
Server Retry Count	The number of times VQP resends a query to the VMPS. If no response is received after this many tries, the switch starts to query the secondary VMPS.
VMPS domain server	The IP address of the configured VLAN membership policy servers. The switch currently sends queries to the one marked “current.” The one marked “primary” is the primary server.
VMPS Action	The result of the most-recent reconfirmation attempt. This action can occur automatically when the reconfirmation interval expired, or you can force it by entering the vmps reconfirm command or its CVSM or SNMP equivalent.

The following example shows how to display VMPS information:

```
Switch# show vmps
VQP Client Status:
-----
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server:
```

```
Reconfirmation status
-----
VMPS Action:          other
```

The following example shows how to display VMPS statistics:

```
Switch# show vmps statistics
VMPS Client Statistics
-----
VQP  Queries:          0
VQP  Responses:        0
VMPS  Changes:          0
VQP  Shutdowns:        0
VQP  Denied:           0
VQP  Wrong Domain:     0
VQP  Wrong Version:    0
VQP  Insufficient Resource: 0
```

Note

Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* for details on VMPS statistics.

Troubleshooting Dynamic Port VLAN Membership

VMPS errdisables a dynamic port under the following conditions:

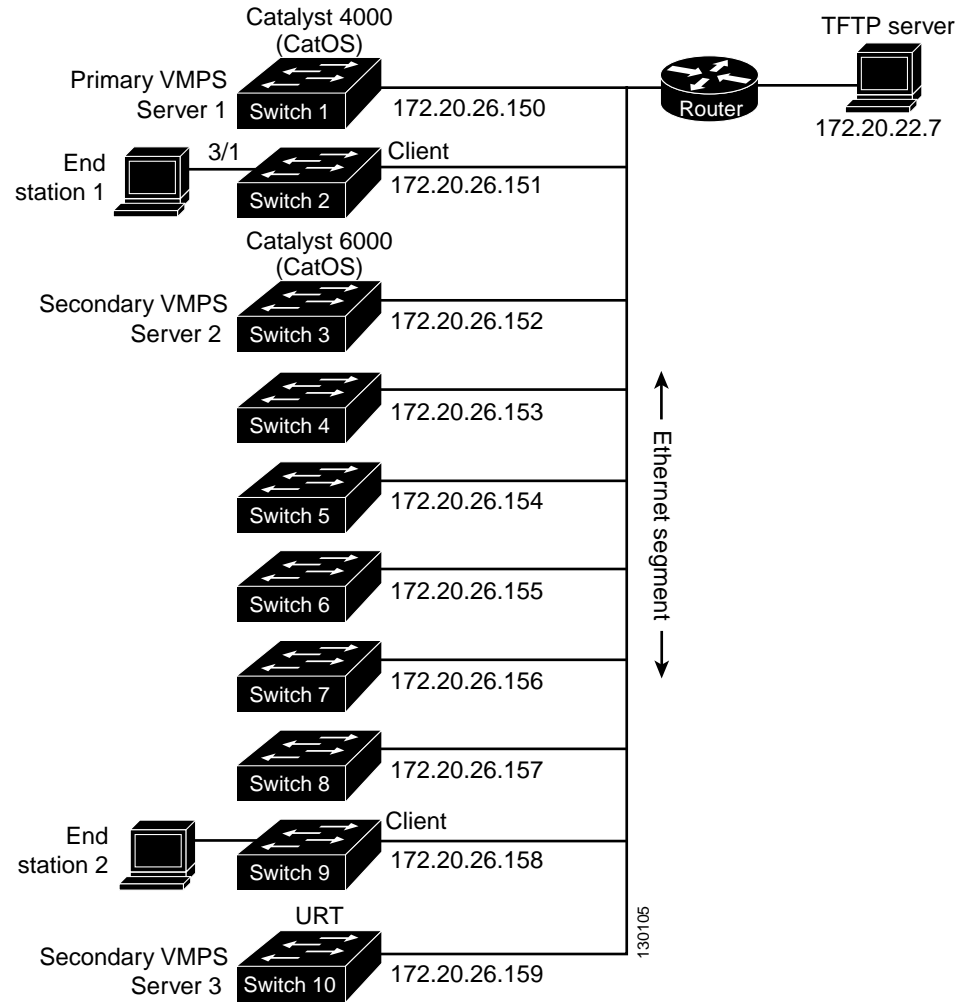

- The VMPS is in secure mode, and it will not allow the host to connect to the port. The VMPS errdisables the port to prevent the host from connecting to the network.
- More than 50 active hosts reside on a dynamic port.

For information on how to display the status of interfaces in error-disabled state, refer to [Chapter 7, “Checking Port Status and Connectivity.”](#) To recover an errdisabled port, use the **errdisable recovery cause vmps** global configuration command.

Dynamic Port VLAN Membership Configuration Example

[Figure 14-4 on page 14-31](#) shows a network with a VMPS servers and VMPS client switches with dynamic ports. In this example, these assumptions apply:

- The VMPS server and the VMPS client are separate switches.
- The Catalyst 4000 family Switch 1 (running CatOS) is the primary VMPS server.
- The Catalyst 6000 family Switch 3 (running CatOS) and the URT are secondary VMPS servers.
- End stations are connected to these clients:
 - Catalyst 4500 series XL Switch 2 (running Catalyst IOS)
 - Catalyst 4500 series XL Switch 9 (running Catalyst IOS)
- The database configuration file is called Bldg-G.db and is stored on the TFTP server with the IP address 172.20.22.7.

Figure 14-4 Dynamic Port VLAN Membership Configuration

Two topologies are possible. [Figure 14-5](#) illustrates a topology with one end station attached directly to a Catalyst 4500 series switch operating as a VMPS client. [Figure 14-6](#) illustrates a topology with an end station attached to a Cisco IP Phone, which is attached to a Catalyst 4500 series switch.

Figure 14-5 Topology with an End Station Attached Directly to a Catalyst 4500 Series Switch Operating as a VMPS Client

Figure 14-6 *Topology with an End Station Attached to a Cisco IP Phone that is Attached to a Catalyst 4500 Series Switch*

In the following procedure, the Catalyst 4000 and Catalyst 6000 series switches (running CatOS) are the VMPS servers. Use this procedure to configure the Catalyst 4500 series switch clients in the network:

Step 1 Configure the VMPS server addresses on Switch 2, the client switch.

- a. Starting from privileged EXEC mode, enter global configuration mode:

```
switch# configuration terminal
```

- b. Enter the primary VMPS server IP address:

```
switch(config)# vmps server 172.20.26.150 primary
```

- c. Enter the secondary VMPS server IP addresses:

```
switch(config)# vmps server 172.20.26.152
```

- d. To verify your entry of the VMPS IP addresses, return to privileged EXEC mode:

```
switch(config)# exit
```

- e. Display VMPS information configured for the switch:

```
switch# show vmps
VQP Client Status:
-----
VMPS VQP Version: 1
Reconfirm Interval: 60 min
Server Retry Count: 3
VMPS domain server: 172.20.26.152
                    172.20.26.150 (primary, current)
```

Step 2 Configure port Fa0/1 on Switch 2 as a dynamic port.

- a. Return to global configuration mode:

```
switch# configuration terminal
```

- b. Enter interface configuration mode:

```
switch(config)# interface fa2/1
```

- c. Configure the VLAN membership mode for static-access ports:

```
switch(config-if)# switchport mode access
```

- d. Assign the port dynamic VLAN membership:

```
switch(config-if)# switchport access vlan dynamic
```

- e. Return to privileged EXEC mode:

```
switch(config-if)# exit  
switch#
```

Step 3 Connect End Station 2 on port Fa2/1. When End Station 2 sends a packet, Switch 2 sends a query to the primary VMPS server, Switch 1. Switch 1 responds with the VLAN ID for port Fa2/1. If spanning-tree PortFast mode is enabled on Fa2/1, port Fa2/1 connects immediately and begins forwarding.

Step 4 Set the VMPS reconfirmation period to 60 minutes. The reconfirmation period is the number of minutes the switch waits before reconfirming the VLAN to MAC address assignments.

```
switch# config terminal  
switch(config)# vmmps reconfirm 60
```

Step 5 Confirm the entry from privileged EXEC mode:

```
switch# show vmmps  
VQP Client Status:  
-----  
VMPS VQP Version: 1  
Reconfirm Interval: 60 min  
Server Retry Count: 3  
VMPS domain server:  
  
Reconfirmation status  
-----  
VMPS Action: No Dynamic Port
```

Step 6 Repeat Steps 1 and 2 to configure the VMPS server addresses, and assign dynamic ports on each VMPS client switch.

VMPS Database Configuration File Example

This example shows a sample VMPS database configuration file as it appears on a VMPS server. A VMPS database configuration file is an ASCII text file that is stored on a TFTP server accessible to the switch that functions as the VMPS server.

```
!vmmps domain <domain-name>  
! The VMPS domain must be defined.  
!vmmps mode { open | secure }  
! The default mode is open.  
!vmmps fallback <vlan-name>  
!vmmps no-domain-req { allow | deny }  
!  
! The default value is allow.  
vmmps domain WBU  
vmmps mode open  
vmmps fallback default  
vmmps no-domain-req deny  
!  
!
```

```

CHAPTER 15

Configuring IP Unnumbered Interface

This chapter discusses the IP Unnumbered Interface feature, which allows you to enable IP processing on an interface without assigning an explicit IP address.

This chapter contains these sections:

- [Overview of IP Unnumbered Support, page 15-2](#)
- [Limitations and Restrictions, page 15-4](#)
- [Configuring IP Unnumbered Interface Support with DHCP Server, page 15-5](#)
- [Configuring IP Unnumbered Interface Support with Connected Host Polling, page 15-7](#)
- [Displaying IP Unnumbered Interface Settings, page 15-8](#)
- [Troubleshooting IP Unnumbered, page 15-9](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of IP Unnumbered Support

Before you configure VLANs and LAN interfaces with IP unnumbered interfaces, you should understand the following concepts:

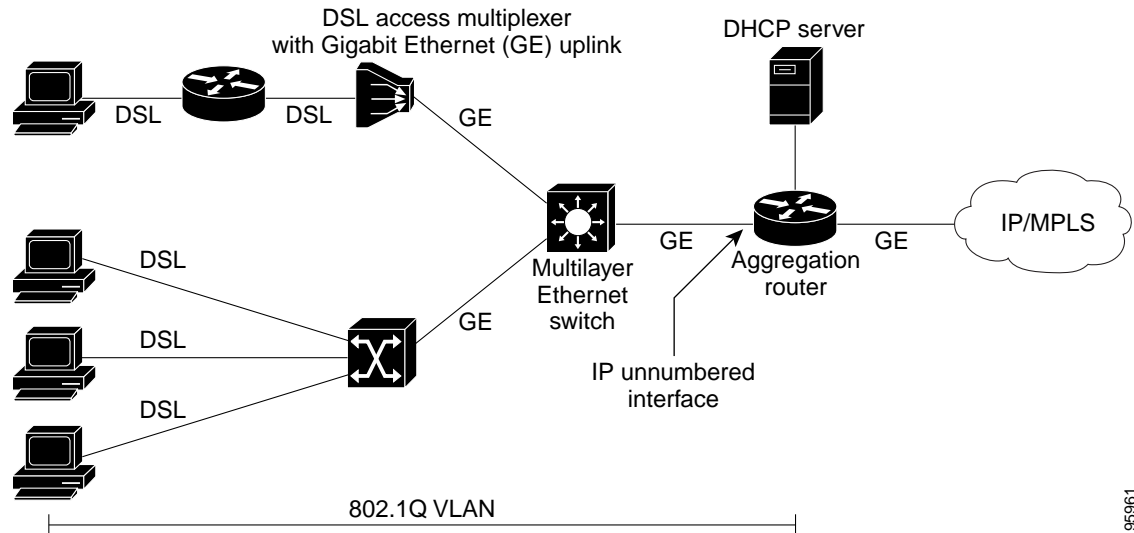

- [IP Unnumbered Interface Support with DHCP Server and Relay Agent, page 15-2](#)
- [IP Unnumbered with Connected Host Polling, page 15-4](#)

IP Unnumbered Interface Support with DHCP Server and Relay Agent

The IP unnumbered interface configuration allows you to enable IP processing on an interface without assigning it an explicit IP address. The IP unnumbered interface can “borrow” the IP address from another interface that is already configured on the Catalyst 4500 series switch, thereby conserving network and address space. When employed with the DHCP server/relay agent, this feature allows a host address assigned by the DHCP server to be learned dynamically at the DHCP relay agent.

[Figure 15-1](#) shows a sample network topology implementing the IP Unnumbered Interface feature. In this topology, IP routes are dynamically established by the aggregation switch when the DHCP server assigns IP addresses to the hosts.

Figure 15-1 Sample Network Topology Using the VLANs over IP Unnumbered Interfaces Feature

95961

DHCP Option 82

DHCP provides a framework for passing configuration information to hosts on a TCP/IP network. Configuration parameters and other control information are carried in tagged data items that are stored in the options field of the DHCP message. The data items are also called *options*. Option 82 is organized as a single DHCP option that contains information known by the relay agent.

The IP Unnumbered Interface feature communicates information to the DHCP server using a suboption of the DHCP relay agent information option called *agent remote ID*. The information sent in the agent remote ID includes an IP address identifying the relay agent and information about the interface and the connection over which the DHCP request entered. The DHCP server can use this information to make IP address assignments and security policy decisions.

Figure 15-2 shows the agent remote ID suboption format that is used with the IP Unnumbered Interfaces feature.

Figure 15-2 Format of the Agent Remote ID Suboption

Table 15-1 describes the agent remote ID suboption fields displayed in Figure 15-2.

Table 15-1 Agent Remote ID Suboption Field Descriptions

Field	Description
Type	Format type. The value 2 specifies the format for use with this feature. (1 byte)
Length	Length of the Agent Remote ID suboption, not including the type and length fields. (1 byte)
Reserved	Reserved. (2 bytes)
NAS IP Address	IP address of the interface specified by the ip unnumbered command. (4 bytes)
Interface	Physical interface. This field has the following format: slot (4 bits) module (1 bit) port (3 bits). For example, if the interface name is interface ethernet 2/1/1, the slot is 2, the module is 1, and the port is 1. (1 byte)
Reserved	Reserved. (1 byte)
VLAN ID	VLAN identifier for the Ethernet interface. (2 bytes)

IP Unnumbered with Connected Host Polling

Note

This feature option is applicable to LAN and VLAN interfaces only.

In some cases, the host IP address is assigned statically. The IP Unnumbered Interfaces feature can learn the static host IP address dynamically.

Limitations and Restrictions

Limitations and restrictions include:

- For IP unnumbered interfaces, the following features are not supported:
 - Dynamic routing protocols
 - HSRP/VRRP
 - Static arp
 - Unnumbered interface and Numbered interface in different VRFs
- The option to add *dhcp host routes* as connected routes is available in Cisco IOS. When using connected mode, however, the **clear ip route *** command deletes the dhcp host connected routes permanently.

Workarounds:

- For a layer 3 interface (SVI), enter **shut** then **no shut**.
- To enable IP unnumbered to use static routes, enter the **ip dhcp route static** command.
- IP Redirect is not sent by an interface configured with IP unnumbered. (CSCse75660).
- An IP unnumbered interface is unable to forward multicast source packets. (CSCse61766)

Configuring IP Unnumbered Interface Support with DHCP Server

Note

DHCP must be configured and operational.

This section contains the following procedures:

- [Configuring IP Unnumbered Interface Support on LAN and VLAN Interfaces, page 15-5](#)
- [Configuring IP Unnumbered Interface Support on a Range of Ethernet VLANs, page 15-6](#)

Configuring IP Unnumbered Interface Support on LAN and VLAN Interfaces

To configure IP unnumbered interface support on a single LAN or VLAN interface, perform this task.

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface** [fastethernet | gigabitethernet | tengigabitethernet | vlan *vlan*] **port-channel** | **loopback**
4. **ip unnumbered** *type number*

DETAILED STEPS

	Command	Purpose
Step 1	Switch# enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# interface [fastethernet gigabitethernet tengigabitethernet vlan <i>vlan</i> port-channel loopback]	Enters interface configuration mode and the interface to be configured as a tunnel port.
Step 4	Switch(config-if)# ip unnumbered <i>type number</i>	Enables IP processing on an interface without assigning an explicit IP address to the interface. The <i>type</i> and <i>number</i> arguments specify another interface on which the switch has an assigned IP address. The interface specified cannot be another unnumbered interface.
Step 5	Switch(config-if)# exit	Returns to global configuration mode.
Step 6	Switch(config)# end	Returns to privileged EXEC mode.
Step 7	Switch# show running-config	Verifies that IP unnumbered support has been configured correctly.

In the following example, Ethernet VLAN 10 is configured as an IP unnumbered interfaces:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 10
Switch(config-if)# ip unnumbered Lookback 0
```

Configuring IP Unnumbered Interface Support on a Range of Ethernet VLANs

To configure IP unnumbered interface support on a range of Ethernet VLAN interfaces, perform this task:

SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface range** {{**fastethernet** | **gigabitethernet** | **vlan vlan**} *slot/interface* {**fastethernet** | **gigabitethernet** | **vlan vlan**} *slot/interface macro macro-name*}
4. **ip unnumbered** *type number*

DETAILED STEPS

	Command or Action	Purpose
Step 1	Switch# enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# interface range {{ fastethernet gigabitethernet vlan vlan } <i>slot/interface</i> { fastethernet gigabitethernet vlan vlan } <i>slot/interface macro macro-name</i> }	Executes commands on multiple interfaces at the same time. A hyphen must be entered with a space on either side to separate the range information.
Step 4	Switch(config-if)# ip unnumbered <i>type number</i>	Enables IP processing on an interface without assigning an explicit IP address to the interface. The <i>type</i> and <i>number</i> arguments specify another interface on which the switch has an assigned IP address. The specified interface cannot be another unnumbered interface.
Step 5	Switch(config-if)# exit	Returns to global configuration mode.
Step 6	Switch(config)# end	Returns to privileged EXEC mode.
Step 7	Switch# show running-config	Verifies that IP unnumbered support has been configured correctly.

In the following example, Vlan in the range from 1 to 10 are configured as IP unnumbered interfaces, sharing ip address of fastethernet 3/1:

```
Switch> enable
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface range vlan 1 - 10
Switch(config-if)# ip unnumbered fastethernet 3/1
Switch(config-if)# exit
Switch(config)# end
```

Configuring IP Unnumbered Interface Support with Connected Host Polling

To configure IP unnumbered interface support with connected host polling, perform this task:

	Command	Purpose
Step 1	Switch# enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# interface vlan <i>vlan-id</i>	Enters interface configuration mode and the interface to be configured as a tunnel port.
Step 4	Switch(config-if)# ip unnumbered <i>type number</i> poll	Enables IP processing and connected host polling on an interface without assigning an explicit IP address to the interface <i>type</i> and <i>number</i> specify another interface on which the switch has an assigned IP address. The interface specified cannot be another unnumbered interface. The <i>type</i> argument can have the values: <i>loopback</i> , <i>fastethernet</i> , <i>gigabitethernet</i> , <i>svi</i> , and <i>portchannel</i> .
Step 5	Switch(config-if)# exit	Returns to global configuration mode.
Step 6	Switch(config)# ip arp poll queue <10-10000>	Configures the global backlog queue of host addresses to be discovered. Default for the queue size is 1000
Step 7	Switch(config)# ip arp poll rate <10-10000>	Configures the maximum number of arp requests sent over unnumbered interfaces. Default number of arp requests is 1000 packet per second
Step 8	Switch(config)# end	Returns to privileged EXEC mode.
Step 9	Switch# show running-config	Verifies that IP unnumbered support has been configured correctly.

The following example shows how to enable IP processing and connected host polling on Fast Ethernet interface 6/2. It also shows how to set the global backlog queue to 2000 and the maximum number of arp requests to 500:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastEthernet 6/2
Switch(config-if)# no switchport
Switch(config-if)# ip unnumbered loopback 0 poll
Warning: dynamic routing protocols will not work on non-point-to-point interfaces with IP
unnumbered configured.
Switch(config-if)# exit
Switch(config)# ip arp poll queue 2000
Switch(config)# ip arp poll rate 500
Switch(config)# end
```

Displaying IP Unnumbered Interface Settings

Use the **show ip interface unnumbered** command to display status of an unnumbered interface with connected host polling for the switch.

To display **status of an unnumbered interface**, perform one or more of these tasks:

Command	Purpose
Switch# show ip interface [type number] unnumbered [detail]	Displays the status of unnumbered interface with connected host polling for the Catalyst 4500 series switch.

The following example shows how to display the status of unnumbered interface with connected host polling:

```
Switch# show ip interface loopback 0 unnumbered detail
Number of unnumbered interfaces with polling: 1
Number of IP addresses processed for polling: 2
10.1.1.7
10.1.1.8
Number of IP addresses in queue for polling: 2(high water mark: 3)
10.1.1.17
10.1.1.18
```

To display key statistic for the backlog of unnumbered interface with connected host polling for the switch, use the **show ip arp poll** command.

Command	Purpose
Switch# show ip arp poll [detail]	display key statistic for the backlog of unnumbered interface with connected host polling for the switch

The following example shows how to display key statistic for the backlog of unnumbered interface with connected host polling:

```
Switch# show ip arp poll
Number of IP addresses processed for polling: 439
Number of IP addresses in queue for polling: 3 (high water mark: 0, max: 1000)
Number of requests dropped:
  Queue was full: 0
  Request was throttled by incomplete ARP: 0
  Duplicate request was found in queue: 0
```

To clear the key statistic for the backlog of unnumbered interface, use the **clear ip arp poll statistic** command, as follows:

```
Switch# clear ip arp poll statistic
Switch# show ip arp poll
Number of IP addresses processed for polling: 0
Number of IP addresses in queue for polling: 0 (high water mark: 0, max: 1000)
Number of requests dropped:
  Queue was full: 0
  Request was throttled by incomplete ARP: 0
  Duplicate request was found in queue: 0
```

Troubleshooting IP Unnumbered

To understand how to debug connect host polling, see the IOS documentation of the **debug arp** command on cisco.com.

When an IP unnumbered interface shares the IP address of a loopback interface whose prefix is advertised in an OSPF network, you must modify the loopback interface as a point to point interface. Otherwise, only the loopback interface host route will be advertised to an OSPF neighbor.

```
Switch(config)# int loopback 0
Switch(config-if)# ip address
Switch(config-if)# ip address 10.1.0.1 255.255.0.0
Switch(config-if)# ip ospf network point-to-point
Switch(config-if)# end
```

CHAPTER 16]

Configuring Layer 2 Ethernet Interfaces

This chapter describes how to use the command-line interface (CLI) to configure Fast Ethernet and Gigabit Ethernet interfaces for Layer 2 switching on Catalyst 4500 series switches. It also provides guidelines, procedures, and configuration examples. The configuration tasks in this chapter apply to Fast Ethernet and Gigabit Ethernet interfaces on any module, including the uplink ports on the supervisor engine.

This chapter includes the following major sections:

- [Overview of Layer 2 Ethernet Switching, page 16-1](#)
- [Default Layer 2 Ethernet Interface Configuration, page 16-4](#)
- [Layer 2 Interface Configuration Guidelines and Restrictions, page 16-5](#)
- [Configuring Ethernet Interfaces for Layer 2 Switching, page 16-5](#)

Note

To configure Layer 3 interfaces, see [Chapter 30, “Configuring Layer 3 Interfaces.”](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Layer 2 Ethernet Switching

The following sections describe how Layer 2 Ethernet switching works on Catalyst 4500 series switches:

- [Understanding Layer 2 Ethernet Switching, page 16-2](#)
- [Understanding VLAN Trunks, page 16-3](#)
- [Layer 2 Interface Modes, page 16-4](#)

Understanding Layer 2 Ethernet Switching

Catalyst 4500 series switches support simultaneous, parallel connections between Layer 2 Ethernet segments. Switched connections between Ethernet segments last only for the duration of the packet. New connections can be made between different segments for successive packets.

**Note**

With release 12.1(13)EW, the Catalyst 4500 series switches can handle packets of 1600 bytes, rather than treat them as “oversized” and discard them. This size is larger than the usual IEEE Ethernet Maximum Transmission Unit (MTU) (1518 bytes) and 802.1q MTU (1522 bytes). The ability to handle larger packets is required to support two nested 802.1q headers and Multiprotocol Label Switching (MPLS) on a network.

The Catalyst 4500 series solves congestion problems caused by high-bandwidth devices and a large number of users by assigning each device (for example, a server) to its own 10-, 100-, or 1000-Mbps segment. Because each Ethernet interface on the switch represents a separate Ethernet segment, servers in a properly configured switched environment achieve full access to the bandwidth.

Because collisions are a major bottleneck in Ethernet networks, an effective solution is full-duplex communication. Normally, Ethernet operates in half-duplex mode, which means that stations can either receive or transmit. In full-duplex mode, two devices can transmit and receive at the same time. When packets can flow in both directions simultaneously, effective Ethernet bandwidth doubles to 20 Mbps for 10-Mbps interfaces and to 200 Mbps for Fast Ethernet interfaces. Gigabit Ethernet interfaces on the Catalyst 4500 series switch are full-duplex mode only, providing 2-Gbps effective bandwidth.

Switching Frames Between Segments

Each Ethernet interface on a Catalyst 4500 series switch can connect to a single workstation or server, or to a hub through which workstations or servers connect to the network.

On a typical Ethernet hub, all ports connect to a common backplane within the hub, and the bandwidth of the network is shared by all devices attached to the hub. If two devices establish a session that uses a significant level of bandwidth, the network performance of all other stations attached to the hub is degraded.

To reduce degradation, the switch treats each interface as an individual segment. When stations on different interfaces need to communicate, the switch forwards frames from one interface to the other at wire speed to ensure that each session receives full bandwidth.

To switch frames between interfaces efficiently, the switch maintains an address table. When a frame enters the switch, it associates the MAC address of the sending station with the interface on which it was received.

Building the MAC Address Table

The Catalyst 4500 series builds the MAC address table by using the source address of the frames received. When the switch receives a frame for a destination address not listed in its MAC address table, it floods the frame to all interfaces of the same VLAN except the interface that received the frame. When the destination device replies, the switch adds its relevant source address and interface ID to the address table. The switch then forwards subsequent frames to a single interface without flooding to all interfaces.

The address table can store at least 32,000 address entries without flooding any entries. The switch uses an aging mechanism, defined by a configurable aging timer, so if an address remains inactive for a specified number of seconds, it is removed from the address table.

Understanding VLAN Trunks

A trunk is a point-to-point link between one or more Ethernet switch interfaces and another networking device such as a router or a switch. Trunks carry the traffic of multiple VLANs over a single link and allow you to extend VLANs across an entire network.

Two trunking encapsulations are available on all Ethernet interfaces:

- Inter-Switch Link (ISL) Protocol—ISL is a Cisco-proprietary trunking encapsulation.

Note Supervisor Engine 6-E does *not* support ISL trunking, so the **switchport trunk encapsulate** command is not supported.

Note The blocking Gigabit ports on the WS-X4418-GB and WS-X4412-2GB-T modules do not support ISL. Ports 3 to 18 are blocking Gigabit ports on the WS-X4418-GB module. Ports 1 to 12 are blocking Gigabit ports on the WS-X4412-2GB-T module.

- 802.1Q—802.1Q is an industry-standard trunking encapsulation.

You can configure a trunk on a single Ethernet interface or on an EtherChannel bundle. For more information about EtherChannel, see [Chapter 22, “Configuring EtherChannel.”](#)

Ethernet trunk interfaces support different trunking modes (see [Table 16-2](#)). You can specify whether the trunk uses ISL encapsulation, 802.1Q encapsulation, or if the encapsulation type is autonegotiated.

To autonegotiate trunking, make sure your interfaces are in the same VTP domain. Use the **trunk** or **nonegotiate** keywords to force interfaces in different domains to trunk. For more information on VTP domains, see [Chapter 14, “Configuring VLANs, VTP, and VMPS.”](#)

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP). DTP supports autonegotiation of both ISL and 802.1Q trunks.

Encapsulation Types

[Table 16-1](#) lists the Ethernet trunk encapsulation types.

Table 16-1 Ethernet Trunk Encapsulation Types

Encapsulation Type	Encapsulation Command	Purpose
ISL	switchport trunk encapsulation isl	Specifies ISL encapsulation on the trunk link.
802.1Q	switchport trunk encapsulation dot1q	Specifies 802.1Q encapsulation on the trunk link.
Negotiate	switchport trunk encapsulation negotiate	Specifies that the interface negotiate with the neighboring interface to become an ISL (preferred) or 802.1Q trunk, depending on the configuration and capabilities of the neighboring interface.

The trunking mode, the trunk encapsulation type, and the hardware capabilities of the two connected interfaces determine whether a link becomes an ISL or 802.1Q trunk.

Layer 2 Interface Modes

Table 16-2 lists the Layer 2 interface modes and describes how they function on Ethernet interfaces.

Table 16-2 Layer 2 Interface Modes

Mode	Purpose
switchport mode access	Puts the interface into permanent nontrunking mode and negotiates to convert the link into a nontrunking link. The interface becomes a nontrunk interface even if the neighboring interface does not change.
switchport mode dynamic desirable	Makes the interface actively attempt to convert the link to a trunking link. The interface becomes a trunk interface if the neighboring interface is set to trunk , desirable , or auto mode.
switchport mode dynamic auto	Makes the interface convert the link to a trunking link if the neighboring interface is set to trunk or desirable mode. This is the default mode for all Ethernet interfaces.
switchport mode trunk	Puts the interface into permanent trunking mode and negotiates to convert the link into a trunking link. The interface becomes a trunk interface even if the neighboring interface does not change.
switchport nonegotiate	Puts the interface into permanent trunking mode but prevents the interface from generating DTP frames. You must configure the neighboring interface manually as a trunk interface to establish a trunking link.

Note

DTP is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly. To avoid this problem, ensure that interfaces connected to devices that do not support DTP are configured with the **access** keyword if you do not intend to trunk across those links. To enable trunking to a device that does not support DTP, use the **nonegotiate** keyword to cause the interface to become a trunk without generating DTP frames.

Default Layer 2 Ethernet Interface Configuration

Table 16-3 shows the Layer 2 Ethernet interface default configuration.

Table 16-3 Layer 2 Ethernet Interface Default Configuration

Feature	Default Value
Interface mode	switchport mode dynamic auto
Trunk encapsulation	switchport trunk encapsulation negotiate
Allowed VLAN range	VLANs 1–1005
VLAN range eligible for pruning	VLANs 2–1001
Default VLAN (for access ports)	VLAN 1

Table 16-3 *Layer 2 Ethernet Interface Default Configuration (continued)*

Feature	Default Value
Native VLAN (for 802.1Q only trunks)	VLAN 1
STP ¹	Enabled for all VLANs
STP port priority	128
STP port cost	<ul style="list-style-type: none"> • 100 for 10-Mbps Ethernet LAN ports • 19 for 10/100-Mbps Fast Ethernet ports • 19 for 100-Mbps Fast Ethernet ports • 4 for 1000-Mbps Gigabit Ethernet ports • 2 for 10,000-Mbps 10-Gigabit Ethernet LAN ports

1. STP = Spanning Tree Protocol

Layer 2 Interface Configuration Guidelines and Restrictions

Keep the following guidelines and restrictions in mind when you configure Layer 2 interfaces:

- In a network of Cisco switches connected through 802.1Q trunks, the switches maintain one instance of spanning tree for each VLAN allowed on the trunks. Non-Cisco 802.1Q switches maintain only one instance of spanning tree for all VLANs allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device through an 802.1Q trunk, the Cisco switch combines the spanning tree instance of the native VLAN of the trunk with the spanning tree instance of the non-Cisco 802.1Q switch. However, spanning tree information for each VLAN is maintained by Cisco switches separated by a cloud of non-Cisco 802.1Q switches. The non-Cisco 802.1Q cloud separating the Cisco switches is treated as a single trunk link between the switches.

- Make sure the native VLAN for an 802.1Q trunk is the same on both ends of the trunk link. If the VLAN on one end of the trunk is different from the VLAN on the other end, spanning tree loops might result.
- Disabling spanning tree on any VLAN of an 802.1Q trunk can cause spanning tree loops.

Configuring Ethernet Interfaces for Layer 2 Switching

The following sections describe how to configure Layer 2 switching on a Catalyst 4500 series switch:

- [Configuring an Ethernet Interface as a Layer 2 Trunk, page 16-6](#)
- [Configuring an Interface as a Layer 2 Access Port, page 16-8](#)
- [Clearing Layer 2 Configuration, page 16-9](#)

Configuring an Ethernet Interface as a Layer 2 Trunk

Note

The default for Layer 2 interfaces is **switchport mode dynamic auto**. If the neighboring interface supports trunking and is configured to trunk mode or dynamic desirable mode, the link becomes a Layer 2 trunk. By default, trunks negotiate encapsulation. If the neighboring interface supports ISL and 802.1Q encapsulation and both interfaces are set to negotiate the encapsulation type, the trunk uses ISL encapsulation.

Note

Supervisor Engine 6-E does *not* support ISL trunking.

To configure an interface as a Layer 2 trunk, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Specifies the interface to configure.
Step 2	Switch(config-if)# shutdown	(Optional) Shuts down the interface to prevent traffic flow until configuration is complete.
Step 3	Switch(config-if)# switchport trunk encapsulation { isl dot1q negotiate }	(Optional) Specifies the encapsulation. Note You must enter this command with either the isl or dot1q keyword to support the switchport mode trunk command, which is not supported by the default mode (negotiate). Note Supervisor Engine 6-E does <i>not</i> support ISL trunking.
Step 4	Switch(config-if)# switchport mode { dynamic { auto desirable } trunk }	Configures the interface as a Layer 2 trunk. (Required only if the interface is a Layer 2 access port or to specify the trunking mode.)
Step 5	Switch(config-if)# switchport access vlan <i>vlan_num</i>	(Optional) Specifies the access VLAN, which is used if the interface stops trunking. The access VLAN is not used as the native VLAN. Note The <i>vlan_num</i> parameter is either a single VLAN number from 1 to 1005 or a range of VLANs described by two VLAN numbers, the lesser one first, separated by a dash. Do not enter any spaces between comma-separated <i>vlan</i> parameters or in dash-specified ranges.
Step 6	Switch(config-if)# switchport trunk native vlan <i>vlan_num</i>	For 802.1Q trunks, specifies the native VLAN. Note If you do not set the native VLAN, the default is used (VLAN 1).
Step 7	Switch(config-if)# switchport trunk allowed vlan { add except all remove } <i>vlan_num[, vlan_num[, vlan_num[, ...]]]</i>	(Optional) Configures the list of VLANs allowed on the trunk. All VLANs are allowed by default. You cannot remove any of the default VLANs from a trunk.

	Command	Purpose
Step 8	Switch(config-if)# switchport trunk pruning vlan {add except none remove} vlan_num[,vlan_num[,vlan_num[,...]]	(Optional) Configures the list of VLANs allowed to be pruned from the trunk (see the “VLAN Trunking Protocol” section on page 14-8). The default list of VLANs allowed to be pruned contains all VLANs, except for VLAN 1.
Step 9	Switch(config-if)# no shutdown	Activates the interface. (Required only if you shut down the interface.)
Step 10	Switch(config-if)# end	Exits interface configuration mode.
Step 11	Switch# show running-config interface {fastethernet gigabitethernet tengigabitethernet} slot/port	Displays the running configuration of the interface.
Step 12	Switch# show interfaces [fastethernet gigabitethernet tengigabitethernet] slot/port switchport	Displays the switch port configuration of the interface.
Step 13	Switch# show interfaces [{fastethernet gigabitethernet tengigabitethernet} slot/port] trunk	Displays the trunk configuration of the interface.

This example shows how to configure the Fast Ethernet interface 5/8 as an 802.1Q trunk. This example assumes that the neighbor interface is configured to support 802.1Q trunking and that the native VLAN defaults to VLAN 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/8
Switch(config-if)# shutdown
Switch(config-if)# switchport mode dynamic desirable
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# exit
```

This example shows how to verify the running configuration:

```
Switch# show running-config interface fastethernet 5/8
Building configuration...
Current configuration:
!
interface FastEthernet5/8
    switchport mode dynamic desirable
    switchport trunk encapsulation dot1q
end
```

This example shows how to verify the switch port configuration:

```
Switch# show interfaces fastethernet 5/8 switchport
Name: Fa5/8
Switchport: Enabled
Administrative Mode: dynamic desirable
Operational Mode: trunk
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: dot1q
Negotiation of Trunking: Enabled
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
```

This example shows how to verify the trunk configuration:

```
Switch# show interfaces fastethernet 5/8 trunk
```

```
Port      Mode      Encapsulation  Status      Native vlan
Fa5/8     desirable n-802.1q       trunking    1

Port      Vlans allowed on trunk
Fa5/8     1-1005

Port      Vlans allowed and active in management domain
Fa5/8     1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-802,850,917,999,1002-1005

Port      Vlans in spanning tree forwarding state and not pruned
Fa5/8     1-6,10,20,50,100,152,200,300,303-305,349-351,400,500,521,524,570,801-802,850,917,999,1002-1005
```

```
Switch#
```

Configuring an Interface as a Layer 2 Access Port

Note

If you assign an interface to a VLAN that does not exist, the interface is not operational until you create the VLAN in the VLAN database (see the [“Configuring VLANs in Global Configuration Mode”](#) section on page 14-6).

To configure an interface as a Layer 2 access port, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Specifies the interface to configure.
Step 2	Switch(config-if)# shutdown	(Optional) Shuts down the interface to prevent traffic flow until configuration is complete.
Step 3	Switch(config-if)# switchport	Configures the interface for Layer 2 switching: <ul style="list-style-type: none"> You must enter the switchport command once without any keywords to configure the interface as a Layer 2 port before you can enter additional switchport commands with keywords. Required only if you previously entered the no switchport command for the interface.
Step 4	Switch(config-if)# switchport mode access	Configures the interface as a Layer 2 access port.
Step 5	Switch(config-if)# switchport access vlan <i>vlan_num</i>	Place the interface in a VLAN.
Step 6	Switch(config-if)# no shutdown	Activates the interface. (Required only if you had shut down the interface.)
Step 7	Switch(config-if)# end	Exits interface configuration mode.

	Command	Purpose
Step 8	Switch# show running-config interface { fastethernet gigabitethernet } <i>slot/port</i>	Displays the running configuration of the interface.
Step 9	Switch# show interfaces [{ fastethernet gigabitethernet tengigabitethernet] <i>slot/port</i>] switchport	Displays the switch port configuration of the interface.

This example shows how to configure the Fast Ethernet interface 5/6 as an access port in VLAN 200:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/6
Switch(config-if)# shutdown
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 200
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch# exit
```

This example shows how to verify the running configuration:

```
Switch# show running-config interface fastethernet 5/6
Building configuration...
!
Current configuration :33 bytes
interface FastEthernet 5/6
  switchport access vlan 200
  switchport mode access
end
```

This example shows how to verify the switch port configuration:

```
Switch# show interface fastethernet 5/6 switchport
Name:Fa5/6
Switchport:Enabled
Administrative Mode:dynamic auto
Operational Mode:static access
Administrative Trunking Encapsulation:negotiate
Operational Trunking Encapsulation:native
Negotiation of Trunking:On
Access Mode VLAN:1 (default)
Trunking Native Mode VLAN:1 (default)
Administrative private-vlan host-association:none
Administrative private-vlan mapping:none
Operational private-vlan:none
Trunking VLANs Enabled:ALL
Pruning VLANs Enabled:2-1001
Switch#
```

Clearing Layer 2 Configuration

To clear the Layer 2 configuration on an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# default interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Specifies the interface to clear.
Step 2	Switch(config-if)# end	Exits interface configuration mode.

	Command	Purpose
Step 3	Switch# show running-config interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Displays the running configuration of the interface.
Step 4	Switch# show interfaces [{ fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>] switchport	Displays the switch port configuration of the interface.

This example shows how to clear the Layer 2 configuration on the Fast Ethernet interface 5/6:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# default interface fastethernet 5/6
Switch(config)# end
Switch# exit
```

This example shows how to verify that the Layer 2 configuration was cleared:

```
Switch# show running-config interface fastethernet 5/6
Building configuration...
Current configuration:
!
interface FastEthernet5/6
end
```

This example shows how to verify the switch port configuration:

```
Switch# show interfaces fastethernet 5/6 switchport
Name: Fa5/6
Switchport: Enabled
Switch#
```

CHAPTER 17

Configuring SmartPort Macros

This chapter describes how to configure and apply SmartPort macros on your switch. It consists of these sections:

- [Understanding SmartPort Macros, page 17-1](#)
- [Configuring SmartPort Macros, page 17-2](#)
- [Displaying SmartPort Macros, page 17-13](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding SmartPort Macros

SmartPort macros provide a convenient way to save and share common configurations. You can use SmartPort macros to enable features and settings based on the location of a switch in the network and for mass configuration deployments across the network.

Each SmartPort macro is a set of CLI commands that you define. SmartPort macro sets do not contain new CLI commands; Each SmartPort macro is a group of existing CLI commands.

When you apply a SmartPort macro on an interface, the CLI commands contained within the macro are configured on the interface. When the macro is applied to an interface, the existing interface configurations are not lost. The new commands are added to interface and are saved in the running configuration file.

There are Cisco-default SmartPorts macros embedded in the switch software (see [Table 17-1](#)). You can display these macros and the commands they contain by using the **show parser macro** user EXEC command.

Table 17-1 *Cisco-Default SmartPorts Macros*

Macro Name ¹	Description
cisco-global	Use this global configuration macro to enable rapid PVST+, loop guard, and dynamic port error recovery for link state failures.
cisco-desktop	Use this interface configuration macro for increased network security and reliability when connecting a desktop device, such as a PC, to a switch port.
cisco-phone	Use this interface configuration macro when connecting a desktop device such as a PC with a Cisco IP Phone to a switch port. This macro is an extension of the cisco-desktop macro and provides the same security and resiliency features, but with the addition of dedicated voice VLANs to ensure proper treatment of delay-sensitive voice traffic.
cisco-switch	Use this interface configuration macro when connecting an access switch and a distribution switch or between access switches connected using GigaStack modules or GBICs.
cisco-router	Use this interface configuration macro when connecting the switch and a WAN router.

1. Cisco-default SmartPorts macros vary depending on the software version running on your switch.

Cisco also provides a collection of pretested, Cisco-recommended baseline configuration templates for Catalyst switches. The online reference guide templates provide the CLI commands that you can use to create SmartPorts macros based on the usage of the port. You can use the configuration templates to create SmartPorts macros to build and deploy Cisco-recommended network designs and configurations.

Configuring SmartPort Macros

You can create a new SmartPort macro or use an existing macro as a template to create a new macro that is specific to your application. After you create the macro, you can apply it to an interface or a range of interfaces.

This section includes information about these topics:

- [Passing Parameters Through the Macro, page 17-2](#)
- [Default SmartPort Macro Configuration, page 17-3](#)
- [SmartPort Macro Configuration Guidelines, page 17-6](#)
- [Creating SmartPorts Macros, page 17-7](#)
- [Applying SmartPorts Macros, page 17-8](#)

Passing Parameters Through the Macro

Some commands might not be sufficiently generic for all the interfaces; for example, VLAN ID for Layer 2 interfaces and the IP address for Layer 3 interface. Retaining such commands in macro definitions requires that you change the value of such parameters (like VLAN ID or IP address) before applying the macro to different interfaces. Alternatively, it requires that you create different macros for each possible value of its parameters.

The macro infrastructure can be enhanced to support accepting parameters while applying a macro. The parameters are passed as *keyword-value* pairs.

The CLI limits the number of keyword-value pairs to a maximum of three, where the first parameter must be the keyword, the second is its corresponding value, and the third parameter would be the keyword for the second keyword-value pair. Here is an example of how to pass parameters to a command-macro:

```
Switch(config)# macro name parameter-test  
Enter macro commands one per line. End with the character '@'.  
switchport mode access  
switchport access vlan $VLANID  
switchport port-security  
switchport port-security maximum $MAXHOST
```

If the above macro is applied to some interface without parameters, the invalid commands fail. Instead, you should apply the macro with appropriate keyword-value pair parameters, as follows:

```
Switch(config-if)# macro apply parameter-test $VLANID 1 $MAXHOST 5
```

The above command applies the macro after replacing \$VLANID with 1 and \$MAXHOST with 5. Be aware that you can specify any string in the macro as a keyword.

Macro Parameter Help

It is often difficult to remember the macro keywords while applying a macro to an interface or switch. Macros can contain the definitions for mandatory keywords. If you apply a macro without those keyword values, the commands are considered invalid and they will fail.

You can enhance the macro infrastructure to provide help on keywords defined in macros. While creating a macro, you can specify a help string (as a comment) to list the mandatory keywords for that macro.

The following example illustrates how to specify the help string for the keywords:

```
Switch(config)# macro name test  
switchport access vlan $VLANID  
switchport port-security maximum $MAX  
#macro keywords $VLANID $MAX
```

Help string can be anywhere in the macro. The following example illustrates an alternate way to specify the help string:

```
Switch(config)# macro name test  
switchport access vlan $VLANID  
#macro keywords $VLANID  
switchport port-security maximum $MAX  
#macro keywords $MAX
```

Default SmartPort Macro Configuration

This section illustrates the default configurations for the four supported macros. These macros can only be viewed and applied; they cannot be modified by the user.

- [cisco-global, page 17-4](#)
- [cisco-desktop, page 17-4](#)
- [cisco-phone, page 17-4](#)
- [cisco-router, page 17-5](#)

- [cisco-switch, page 17-5](#)

cisco-global

This is the example for the cisco-global macro:

```
# Enable dynamic port error recovery for link state failures.
errdisable recovery cause link-flap
errdisable recovery interval 60

# VTP requires Transparent mode for future 802.1x Guest VLAN
# and current Best Practice
vtp domain [smartports]
vtp mode transparent

# Enable aggressive mode UDLD on all fiber uplinks
udld aggressive

# Enable Rapid PVST+ and Loopguard
spanning-tree mode rapid-pvst
spanning-tree loopguard default
spanning-tree extend system-id
```

cisco-desktop

This is the example for the cisco-desktop macro:

```
# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
# Ensure port-security age is greater than one minute
# and use inactivity timer
# "Port-security maximum 1" is the default and will not
# Show up in the config
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
```

cisco-phone

This is the example for the cisco-phone macro:

```
# VoIP enabled interface - Enable data VLAN
# and voice VLAN (VVID)
# Recommended value for access vlan (AVID) should not be 1\
switchport access vlan $AVID
switchport mode access
# Update the Voice VLAN (VVID) value which should be
# different from data VLAN
# Recommended value for voice vlan (VVID) should not be 1
switchport voice vlan $VVID
# Enable port security limiting port to a 2 MAC
# addresses -- One for desktop and two for phone
switchport port-security
```

```
switchport port-security maximum 2
# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Enable auto-qos to extend trust to attached Cisco phone
auto qos voip cisco-phone
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable@
```

cisco-router

This is the example for the cisco-router macro:

```
# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
# switchport trunk allowed vlan $VRANGE
# Hardcode trunk and disable negotiation to
# speed up convergence
# Hardcode speed and duplex to router
switchport mode trunk
switchport nonegotiate
speed 100
duplex full
# Configure qos to trust this interface
auto qos voip trust
qos trust dscp
# Ensure fast access to the network when enabling the interface.
# Ensure that switch devices cannot become active on the interface.
spanning-tree portfast
spanning-tree bpduguard enable
```

cisco-switch

This is the example for the cisco-switch macro:

```
# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
# switchport trunk allowed vlan $VRANGE
# Hardcode trunk and disable negotiation to
# speed up convergence
switchport mode trunk
switchport nonegotiate
# Configure qos to trust this interface
auto qos voip trust
# 802.1w defines the link as pt-pt for rapid convergence
spanning-tree link-type point-to-point
```

SmartPort Macro Configuration Guidelines

Follow these guidelines when configuring macros on your switch:

- If a command fails when you apply a macro, either due to a syntax error or to a configuration error, the macro continues to apply the remaining commands to the interface.
- **cisco-global** needs to be applied at the global configuration mode. Cisco recommends that you apply this macro before any other interface level macro.
- Specific keywords are required when you apply the system-defined macros (**cisco-desktop**, **cisco-phone**, **cisco-switch**, and **cisco-router**) on an interface.
- When using the **cisco-phone** macro to apply port security, the port security maximum is 2 (**switchport port-security maximum 2**).
- At most, 3 keyword-value pairs are allowed per system-defined macro.
- When creating a macro, do not use the **exit** or **end** commands or change the command mode by using **interface interface-id**. This could cause commands that follow **exit**, **end**, or **interface interface-id** to execute in a different command mode.
- When creating a macro, ensure that all CLI commands are in the same configuration mode.
- When creating a macro that requires the assignment of unique values, use the **parameter value** keywords to designate values specific to the interface. Keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value. Any full match of a keyword, even if it is part of a larger string, is considered a match and is replaced by the corresponding value.
- Macro names are case sensitive. For example, the commands **macro name Sample-Macro** and **macro name sample-macro** result in two separate macros.
- Some macros might contain keywords that require a parameter value. You can use the **macro global apply macro-name ?** global configuration command or the **macro apply macro-name ?** interface configuration command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.
- When a macro is applied globally to a switch or to a switch interface, all existing configuration on the interface is retained. This is helpful when applying an incremental configuration.
- If you modify a macro definition by adding or deleting commands, the changes are not reflected on the interface where the original macro was applied. You need to reapply the updated macro on the interface to apply the new or changed commands.
- You can use the **macro global trace macro-name** global configuration command or the **macro trace macro-name** interface configuration command to apply and debug a macro to find any syntax or configuration errors. If a command fails because of a syntax error or a configuration error, the macro continues to apply the remaining commands.
- Some CLI commands are specific to certain interface types. If a macro is applied to an interface that does not accept the configuration, the macro will fail the syntax check or the configuration check, and the switch will return an error message.
- Applying a macro to an interface range is the same as applying a macro to a single interface. When you use an interface range, the macro is applied sequentially to each interface within the range. If a macro command fails on one interface, it is still applied to the remaining interfaces.

- When you apply a macro to a switch or a switch interface, the macro name is automatically added to the macro description of the switch or interface. You can display the applied commands and macro names by using the **show parser macro description** user EXEC command.
- The user-configurable macro has a buffer that can take commands and comments up to 3000 characters. Each newline would take 2 characters and empty lines are counted as is.

There are Cisco-default SmartPorts macros embedded in the switch software (see [Table 17-1](#)). You can display these macros and the commands they contain by using the **show parser macro** user EXEC command.

Follow these guidelines when you apply a Cisco-default SmartPorts macro on an interface:

- Display all macros on the switch by using the **show parser macro** user EXEC command. Display the contents of a specific macro by using the **show parser macro macro-name** user EXEC command.
- Keywords that begin with \$ mean that a unique parameter value is required. Append the Cisco-default macro with the required values by using the **parameter value** keywords.

The Cisco-default macros use the \$ character to help identify required keywords. There is no restriction on using the \$ character to define keywords when you create a macro.

Creating SmartPorts Macros

To create a SmartPorts macro, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# macro name <i>macro-name</i>	<p>Creates a macro definition, and enter a macro name. A macro definition can contain up to 3000 characters.</p> <p>Enter the macro commands with one command per line. Use the @ character to end the macro. Use the # character at the beginning of a line to enter comment text within the macro.</p> <p>Macro names are case sensitive. For example, the commands macro name Sample-Macro and macro name sample-macro result in two separate macros.</p> <p>We recommend that you do not use the exit or end commands or change the command mode by using interface interface-id in a macro. This could cause any commands following exit, end, or interface interface-id to execute in a different command mode. For best results, all commands in a macro should be in the same configuration mode.</p> <p>Note The no form of the macro name global configuration command only deletes the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied.</p>
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show parser macro name <i>macro-name</i>	Verifies that the macro was created.

Applying SmartPorts Macros

To apply a SmartPorts macro, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# macro global { apply trace } <i>macro-name</i> [parameter { <i>value</i> }] [parameter { <i>value</i> }] [parameter { <i>value</i> }]	<p>Applies each individual command defined in the macro to the switch by entering macro global apply macro-name. Specify macro global trace macro-name to apply and debug a macro to find any syntax or configuration errors.</p> <p>(Optional) Specify unique parameter values that are specific to the switch. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.</p> <p>Some macros might contain keywords that require a parameter value. You can use the macro global apply macro-name ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.</p>
Step 3	Switch(config)# macro global description <i>text</i>	(Optional) Enters a description about the macro that is applied to the switch.
Step 4	Switch(config-if)# interface <i>interface-id</i>	(Optional) Enters interface configuration mode, and specify the interface on which to apply the macro.
Step 5	Switch(config-if)# default interface <i>interface-id</i>	(Optional) Clears all configuration from the specified interface.
Step 6	Switch(config-if)# macro { apply trace } <i>macro-name</i> [parameter { <i>value</i> }] [parameter { <i>value</i> }] [parameter { <i>value</i> }]	<p>Applies each individual command defined in the macro to the interface by entering macro apply macro-name. Specify macro trace macro-name to apply and debug a macro to find any syntax or configuration errors.</p> <p>(Optional) Specify unique parameter values that are specific to the interface. You can enter up to three keyword-value pairs. Parameter keyword matching is case sensitive. All matching occurrences of the keyword are replaced with the corresponding value.</p> <p>Some macros might contain keywords that require a parameter value. You can use the macro apply macro-name ? command to display a list of any required values in the macro. If you apply a macro without entering the keyword values, the commands are invalid and are not applied.</p> <p>For example, here is how you apply this command:</p> <pre>Switch(config-if)# macro apply cisco-phone ? WORD Keyword to replace with a value e.g. \$AVID, \$VVID <cr></pre>
Step 7	Switch(config-if)# macro description <i>text</i>	(Optional) Enters a description about the macro that is applied to the interface.
Step 8	Switch(config-if)# end	Returns to privileged EXEC mode.

	Command	Purpose
Step 9	Switch# show parser macro description [<i>interface interface-id</i>]	Verifies that the macro is applied to the interface.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

You can delete a global macro-applied configuration on a switch only by entering the **no** version of each command that is in the macro. You can delete a macro-applied configuration on an interface by entering the **default interface** *interface-id* interface configuration command.

The **no** form of the **macro name** global configuration command deletes only the macro definition. It does not affect the configuration of those interfaces on which the macro is already applied. You can delete a macro-applied configuration on an interface by entering the **default interface** *interface-id* interface configuration command. Alternatively, you can create an *anti-macro* for an existing macro that contains the **no** form of all the corresponding commands in the original macro. Then, apply the anti-macro to the interface.

The following sections illustrate how to apply and display the attachments on each of the supported macros:

- [cisco-global, page 17-9](#)
- [cisco-desktop, page 17-10](#)
- [cisco-phone, page 17-10](#)
- [cisco-switch, page 17-11](#)
- [cisco-router, page 17-12](#)

cisco-global

This example shows how to use the system-defined macro **cisco-global**:

```
Switch(config)# macro global apply cisco-global
Changing VTP domain name from gsg-switch to [smartports]
Setting device to VTP TRANSPARENT mode.
Switch(config)# end
Switch# show parser macro name cisco-global
Macro name : cisco-global
Macro type : default global
# Enable dynamic port error recovery for link state failures.
errdisable recovery cause link-flap
errdisable recovery interval 60

# VTP requires Transparent mode for future 802.1x Guest VLAN
# and current Best Practice vtp domain [smartports] vtp mode transparent

# Enable aggressive mode UDLD on all fiber uplinks udld aggressive

# Enable Rapid PVST+ and Loopguard
spanning-tree mode rapid-pvst
spanning-tree loopguard default
spanning-tree extend system-id
```

cisco-desktop

This example shows how to use the system-defined macro **cisco-desktop** to assign a value of 35 to the access VLAN of the Fast Ethernet interface 2/9.

Note

This macro requires the **\$AVID** keyword, which is the access VLAN of the port.

```
Switch(config)# interface fastethernet2/9
Switch(config-if)# macro apply cisco-desktop $AVID 35
Switch(config-if)# end
Switch# show parser macro name cisco-desktop
Macro name : cisco-desktop
Macro type : customizable

# Basic interface - Enable data VLAN only
# Recommended value for access vlan (AVID) should not be 1
switchport access vlan $AVID [access_vlan_id]
switchport mode access
# Enable port security limiting port to a single
# MAC address -- that of desktop
switchport port-security
# Ensure port-security age is greater than one minute
# and use inactivity timer
# "Port-security maximum 1" is the default and will not
# Show up in the config
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable
Switch# show parser macro description
Interface      Macro Description
-----
Fa2/9          cisco-desktop
-----
```

cisco-phone

This example shows how to use the system-defined macro **cisco-phone** to assign a value of 35 to the access VLAN and 56 to the voice VLAN on the Fast Ethernet interface 2/9.

Note

This macro requires the **\$AVID** and **\$VVID** keywords, which are the access and voice VLANs of the port.

```
Switch(config)# interface fastethernet2/9
Switch(config-if)# macro apply cisco-phone
Switch(config-if)# macro description cisco-phone $AVID 35 $VVID 56
Switch(config-if)# end
Switch# show parser macro name cisco-phone
Macro name : cisco-phone
```

Macro type : customizable

```
# VoIP enabled interface - Enable data VLAN
# and voice VLAN (VVID)
# Recommended value for access vlan (AVID) should not be 1\
switchport access vlan $AVID [access_vlan_id]
switchport mode access
# Update the Voice VLAN (VVID) value which should be
# different from data VLAN
# Recommended value for voice vlan (VVID) should not be 1
switchport voice vlan $VVID [voice_vlan_id]
# Enable port security limiting port to a 2 MAC
# addressess -- One for desktop and one for phone
switchport port-security
switchport port-security maximum 2
# Ensure port-security age is greater than one minute
# and use inactivity timer
switchport port-security violation restrict
switchport port-security aging time 2
switchport port-security aging type inactivity
# Enable auto-qos to extend trust to attached Cisco phone
auto qos voip cisco-phone
# Configure port as an edge network port
spanning-tree portfast
spanning-tree bpduguard enable@
```

Switch# **show parser macro description**

Interface	Macro Description
Fa2/9	cisco-phone

cisco-switch

This example shows how to use the system-defined macro **cisco-switch** to assign a value of 38 to the native VLAN on the Fast Ethernet interface 2/9.

Note

This macro requires the **\$NVID** keyword, which is the native VLANs of the port.

```
Switch(config)# interface fastethernet2/9
Switch(config-if)# macro apply cisco-switch
Switch(config-if)# macro description cisco-switch $NVID 38
Switch(config-if)# end
Switch# show parser macro name cisco-switch
Macro name : cisco-switch
Macro type : customizable

# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID [native_vlan_id]
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
# switchport trunk allowed vlan $VRANGE [vlan_range]
# Hardcode trunk and disable negotiation to
```

```
# speed up convergence
switchport mode trunk
switchport nonegotiate
# Configure qos to trust this interface
auto qos voip trust
# 802.1w defines the link as pt-pt for rapid convergence
spanning-tree link-type point-to-point
```

```
Switch# show parser macro description
```

```
Interface      Macro Description
```

```
-----
Fa2/9          cisco-switch
-----
```

cisco-router

This example shows how to use the system-defined macro **cisco-router** to assign a value of 451 to the native VLAN on the Fast Ethernet interface 2/9.

Note

This macro requires the **\$NVID** keyword, which is the native VLANs of the port.

```
Switch(config)# interface fastethernet2/9
Switch(config-if)# macro apply cisco-router
Switch(config-if)# macro description cisco-router $NVID 451
Switch(config-if)# end
Switch# show parser macro name cisco-router
Macro name : cisco-router
Macro type : customizable

# Access Uplink to Distribution
switchport trunk encapsulation dot1q
# Define unique Native VLAN on trunk ports
# Recommended value for native vlan (NVID) should not be 1
switchport trunk native vlan $NVID [native_vlan_id]
# Update the allowed VLAN range (VRANGE) such that it
# includes data, voice and native VLANs
# switchport trunk allowed vlan $VRANGE [vlan_range]
# Hardcode trunk and disable negotiation to
# speed up convergence
# Hardcode speed and duplex to router
switchport mode trunk
switchport nonegotiate
speed 100
duplex full
# Configure qos to trust this interface
auto qos voip trust
qos trust dscp
# Ensure fast access to the network when enabling the interface.
# Ensure that switch devices cannot become active on the interface.
spanning-tree portfast
spanning-tree bpduguard enable
```

```
Switch# show parser macro description
```

```
Interface      Macro Description
```

```
-----
Fa2/9          cisco-router
-----
```

Displaying SmartPort Macros

To display the SmartPort macros, use one or more of the privileged EXEC commands in [Table 17-2](#).

Table 17-2 *Commands for Displaying SmartPort Macros*

Command	Purpose
<code>show parser macro</code>	Displays all configured macros.
<code>show parser macro name <i>macro-name</i></code>	Displays a specific macro.
<code>show parser macro brief</code>	Displays the configured macro names.
<code>show parser macro description [<i>interface</i> <i>interface-id</i>]</code>	Displays the macro description for all interfaces or for a specified interface.

CHAPTER 18

Configuring STP and MST

This chapter describes how to configure the Spanning Tree Protocol (STP) on a Catalyst 4500 series switch. This chapter also describes how to configure the IEEE 802.1s Multiple Spanning Tree (MST) protocol on the Catalyst 4500 series switch. MST is a new IEEE standard derived from Cisco's proprietary Multi-Instance Spanning-Tree Protocol (MISTP) implementation. With MST, you can map a single spanning-tree instance to several VLANs.

This chapter provides guidelines, procedures, and configuration examples. It includes the following major sections:

- [Overview of STP, page 18-1](#)
- [Default STP Configuration, page 18-6](#)
- [Configuring STP, page 18-7](#)
- [Overview of MST, page 18-21](#)
- [MST Configuration Restrictions and Guidelines, page 18-29](#)
- [Configuring MST, page 18-29](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of STP

STP is a Layer 2 link management protocol that provides path redundancy while preventing undesirable loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. A loop-free subset of a network topology is called a spanning tree. The operation of a spanning tree is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

A Catalyst 4500 series switch use STP (the IEEE 802.1D bridge protocol) on all VLANs. By default, a single spanning tree runs on each configured VLAN (provided you do not manually disable the spanning tree). You can enable and disable a spanning tree on a per-VLAN basis.

When you create fault-tolerant internetworks, you must have a loop-free path between all nodes in a network. The spanning tree algorithm calculates the best loop-free path throughout a switched Layer 2 network. Switches send and receive spanning tree frames at regular intervals. The switches do not forward these frames, but use the frames to construct a loop-free path.

Multiple active paths between end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages and switches might learn end station MAC addresses on multiple Layer 2 interfaces. These conditions result in an unstable network.

A spanning tree defines a tree with a root switch and a loop-free path from the root to all switches in the Layer 2 network. A spanning tree forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the spanning tree algorithm recalculates the spanning tree topology and activates the standby path.

When two ports on a switch are part of a loop, the spanning tree port priority and port path cost setting determine which port is put in the forwarding state and which port is put in the blocking state. The spanning tree port priority value represents the location of an interface in the network topology and how well located it is to pass traffic. The spanning tree port path cost value represents media speed.

Understanding the Bridge ID

Each VLAN on each network device has a unique 64-bit bridge ID consisting of a bridge priority value, an extended system ID, and an STP MAC address allocation.

Bridge Priority Value

The bridge priority value determines whether a given redundant link will be given priority and considered part of a given span in a spanning tree. Preference is given to lower values, and if you want to manually configure a preference, assign a lower bridge priority value to a link than to its redundant possibility. With Cisco IOS releases prior to 12.1(12c)EW, the bridge priority is a 16-bit value (see [Table 18-1](#)). With Cisco IOS Release 12.1(12c)EW and later releases, the bridge priority is a 4-bit value when the extended system ID is enabled (see [Table 18-2](#)). See the “[Configuring the Bridge Priority of a VLAN](#)” section on page 18-16.

Extended System ID

Extended system IDs are VLAN IDs between 1025 and 4096. Cisco IOS Releases 12.1(12c)EW and later releases support a 12-bit extended system ID field as part of the bridge ID (see [Table 18-2](#)). Chassis that support only 64 MAC addresses always use the 12-bit extended system ID. On chassis that support 1024 MAC addresses, you can enable use of the extended system ID. STP uses the VLAN ID as the extended system ID. See the “[Enabling the Extended System ID](#)” section on page 18-8.

Table 18-1 Bridge Priority Value with the Extended System ID Disabled

Bridge Priority Value															
Bit 16	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1
32768	16384	8192	4096	2048	1024	512	256	128	64	32	16	8	4	2	1

Table 18-2 Bridge Priority Value and Extended System ID with the Extended System ID Enabled

Bridge Priority Value				Extended System ID (Set Equal to the VLAN ID)											
Bit 16	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1
32768	16384	8192	4096	VLAN ID											

STP MAC Address Allocation

A Catalyst 4500 series switch chassis has either 64 or 1024 MAC addresses available to support software features like STP. Enter the **show module** command to view the MAC address range on your chassis.

Cisco IOS Release 12.1(12c)EW and later releases support chassis with 64 or 1024 MAC addresses. For chassis with 64 MAC addresses, STP uses the extended system ID plus a MAC address to make the bridge ID unique for each VLAN.

Earlier releases support chassis with 1024 MAC addresses. With earlier releases, STP uses one MAC address per VLAN to make the bridge ID unique for each VLAN.

Bridge Protocol Data Units

The following elements determine the stable active spanning tree topology of a switched network:

- The unique bridge ID (bridge priority and MAC address) associated with each VLAN on each switch
- The spanning tree path cost (or bridge priority value) to the root bridge
- The port identifier (port priority and MAC address) associated with each Layer 2 interface

Bridge protocol data units (BPDUs) contain information about the transmitting bridge and its ports, including the bridge and MAC addresses, bridge priority, port priority, and path cost. The system computes the spanning tree topology by transmitting BPDUs among connecting switches, and in one direction from the root switch. Each configuration BPDU contains at least the following:

- The unique bridge ID of the switch that the transmitting switch believes to be the root switch
- The spanning tree path cost to the root
- The bridge ID of the transmitting bridge
- The age of the message
- The identifier of the transmitting port
- Values for the *hello*, *forward delay*, and *max-age* protocol timers

When a switch transmits a BPDU frame, all switches connected to the LAN on which the frame is transmitted receive the BPDU. When a switch receives a BPDU, it does not forward the frame but instead uses the information in the frame to calculate a BPDU and, if the topology changes, initiate a BPDU transmission.

A BPDU exchange results in the following:

- One switch is elected as the root bridge.
- The shortest distance to the root bridge is calculated for each switch based on the path cost.
- A designated bridge for each LAN segment is selected. This is the switch closest to the root bridge through which frames are forwarded to the root.
- A root port is selected. This is the port providing the best path from the bridge to the root bridge.

- Ports included in the spanning tree are selected.

Election of the Root Bridge

For each VLAN, the switch with the highest bridge priority (the lowest numerical priority value) is elected as the root bridge. If all switches are configured with the default priority value (32,768), the switch with the lowest MAC address in the VLAN becomes the root bridge.

The spanning tree root bridge is the logical center of the spanning tree topology in a switched network. All paths that are not required to reach the root bridge from anywhere in the switched network are placed in spanning tree blocking mode.

A spanning tree uses the information provided by BPDUs to elect the root bridge and root port for the switched network, as well as the root port and designated port for each switched segment.

STP Timers

Table 18-3 describes the STP timers that affect the performance of the entire spanning tree.

Table 18-3 *Spanning Tree Protocol Timers*

Variable	Description
<i>hello_time</i>	Determines how often the switch broadcasts hello messages to other switches.
<i>forward_time</i>	Determines how long each of the listening and learning states will last before the port begins forwarding.
<i>max_age</i>	Determines the amount of time that protocol information received on a port is stored by the switch.

Creating the STP Topology

The goal of the spanning tree algorithm is to make the most direct link the root port. When the spanning tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be optimal according to link speed. For instance, connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change.

In Figure 18-1, Switch A is elected as the root bridge. (This could happen if the bridge priority of all the switches is set to the default value [32,768] and Switch A has the lowest MAC address.) However, due to traffic patterns, the number of forwarding ports, or link types, Switch A might not be the ideal root bridge. By increasing the STP port priority (lowering the numerical value) of the ideal switch so that it becomes the root bridge, you force a spanning tree recalculation to form a new spanning tree topology with the ideal switch as the root.

Figure 18-1 Spanning Tree Topology

RP = Root Port
DP = Designated Port

For example, assume that one port on Switch B is a fiber-optic link, and another port on Switch B (an unshielded twisted-pair [UTP] link) is the root port. Network traffic might be more efficient over the high-speed fiber-optic link. By changing the spanning tree port priority on the fiber-optic port to a higher priority (lower numerical value) than the priority set for the root port, the fiber-optic port becomes the new root port.

STP Port States

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When a Layer 2 interface transitions directly from nonparticipation in the spanning tree topology to the forwarding state, it can create temporary data loops. Ports must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for frames that have been forwarded under the old topology.

Each Layer 2 interface on a switch that uses spanning tree exists in one of the following five states:

- **Blocking**—In this state, the Layer 2 interface does not participate in frame forwarding.
- **Listening**—This state is the first transitional state after the blocking state when spanning tree determines that the Layer 2 interface should participate in frame forwarding.
- **Learning**—In this state, the Layer 2 interface prepares to participate in frame forwarding.
- **Forwarding**—In this state, the Layer 2 interface forwards frames.
- **Disabled**—In this state, the Layer 2 interface does not participate in spanning tree and does not forward frames.

MAC Address Allocation

The supervisor engine has a pool of 1024 MAC addresses that are used as the bridge IDs for the VLAN spanning trees. You can use the **show module** command to view the MAC address range (allocation range for the supervisor) that the spanning tree uses for the algorithm.

MAC addresses for the Catalyst 4506 switch are allocated sequentially, with the first MAC address in the range assigned to VLAN 1, the second MAC address in the range assigned to VLAN 2, and so forth. For example, if the MAC address range is 00-e0-1e-9b-2e-00 to 00-e0-1e-9b-31-ff, the VLAN 1 bridge ID is 00-e0-1e-9b-2e-00, the VLAN 2 bridge ID is 00-e0-1e-9b-2e-01, the VLAN 3 bridge ID is 00-e0-1e-9b-2e-02, and so on. On other Catalyst 4500 series platforms, all VLANs map to the same MAC address rather than mapping to separate MAC addresses.

STP and IEEE 802.1Q Trunks

802.1Q VLAN trunks impose some limitations on the spanning tree strategy for a network. In a network of Cisco switches connected through 802.1Q trunks, the switches maintain one instance of spanning tree for each VLAN allowed on the trunks. However, non-Cisco 802.1Q switches maintain only one instance of spanning tree for all VLANs allowed on the trunks.

When you connect a Cisco switch to a non-Cisco device (that supports 802.1Q) through an 802.1Q trunk, the Cisco switch combines the spanning tree instance of the 802.1Q native VLAN of the trunk with the spanning tree instance of the non-Cisco 802.1Q switch. However, all per-VLAN spanning tree information is maintained by Cisco switches separated by a network of non-Cisco 802.1Q switches. The non-Cisco 802.1Q network separating the Cisco switches is treated as a single trunk link between the switches.

**Note**

For more information on 802.1Q trunks, see [Chapter 16, “Configuring Layer 2 Ethernet Interfaces.”](#)

Per-VLAN Rapid Spanning Tree

Per-VLAN Rapid Spanning Tree (PVRST+) is the same as PVST+, although PVRST+ utilizes a rapid STP based on IEEE 802.1w rather than 802.1D to provide faster convergence. PVRST+ uses roughly the same configuration as PVST+ and needs only minimal configuration. In PVRST+, dynamic CAM entries are flushed immediately on a per-port basis when any topology change is made. UplinkFast and BackboneFast are enabled but not active in this mode, because the functionality is built into the Rapid STP. PVRST+ provides for rapid recovery of connectivity following the failure of a bridge, bridge port, or LAN.

**Note**

When you interconnect PVST and Rapid-PVST bridges, if the PVST bridge has a higher priority than the Rapid PVST bridge, then the Rapid PVST bridge transitions directly to the forwarding state, bypassing the intermediate transition states.

Like Per Vlan Spanning Tree (PVST+), Per Vlan Rapid Spanning Tree (PVRST+) instances are equal to the number of vlans configured on the switch and can go up to a maximum of 4094 instances.

For enabling information, see “Enabling Per-VLAN Rapid Spanning Tree” on page 20.

Default STP Configuration

[Table 18-4](#) shows the default spanning tree configuration.

Table 18-4 Spanning Tree Default Configuration Values

Feature	Default Value
Enable state	Spanning tree enabled for all VLANs
Bridge priority value	32,768
Spanning tree port priority value (configurable on a per-interface basis—used on interfaces configured as Layer 2 access ports)	128

Table 18-4 *Spanning Tree Default Configuration Values (continued)*

Feature	Default Value
Spanning tree port cost (configurable on a per-interface basis—used on interfaces configured as Layer 2 access ports)	<ul style="list-style-type: none"> 10-Gigabit Ethernet: 2 Gigabit Ethernet: 4 Fast Ethernet: 19
Spanning tree VLAN port priority value (configurable on a per-VLAN basis—used on interfaces configured as Layer 2 trunk ports)	128
Spanning tree VLAN port cost (configurable on a per-VLAN basis—used on interfaces configured as Layer 2 trunk ports)	<ul style="list-style-type: none"> 10-Gigabit Ethernet: 2 Gigabit Ethernet: 4 Fast Ethernet: 19
Hello time	2 sec
Forward delay time	15 sec
Maximum aging time	20 sec

Configuring STP

The following sections describe how to configure spanning tree on VLANs:

- [Enabling STP, page 18-7](#)
- [Enabling the Extended System ID, page 18-8](#)
- [Configuring the Root Bridge, page 18-9](#)
- [Configuring a Secondary Root Switch, page 18-12](#)
- [Configuring STP Port Priority, page 18-13](#)
- [Configuring STP Port Cost, page 18-15](#)
- [Configuring the Bridge Priority of a VLAN, page 18-16](#)
- [Configuring the Hello Time, page 18-17](#)
- [Configuring the Maximum Aging Time for a VLAN, page 18-18](#)
- [Configuring the Forward-Delay Time for a VLAN, page 18-18](#)
- [Disabling Spanning Tree Protocol, page 18-19](#)
- [Enabling Per-VLAN Rapid Spanning Tree, page 18-20](#)

Note

The spanning tree commands described in this chapter can be configured on any interface except those configured with the **no switchport** command.

Enabling STP

Note

By default, spanning tree is enabled on all the VLANs.

You can enable a spanning tree on a per-VLAN basis. The switch maintains a separate instance of spanning tree for each VLAN (except on VLANs on which you have disabled a spanning tree).

To enable a spanning tree on a per-VLAN basis, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# spanning-tree vlan <i>vlan_ID</i>	Enables spanning tree for VLAN <i>vlan_id</i> . The <i>vlan_ID</i> value can range from 1 to 4094.
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show spanning-tree vlan <i>vlan_ID</i>	Verifies that spanning tree is enabled.

This example shows how to enable a spanning tree on VLAN 200:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200
Switch(config)# end
Switch#
```

Note

Because spanning tree is enabled by default, issuing a **show running** command to view the resulting configuration will not display the command you entered to enable spanning tree.

This example shows how to verify that spanning tree is enabled on VLAN 200:

```
Switch# show spanning-tree vlan 200
```

```
VLAN200 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0050.3e8d.6401
Configured hello time 2, max age 20, forward delay 15
Current root has priority 16384, address 0060.704c.7000
Root port is 264 (FastEthernet5/8), cost of root path is 38
Topology change flag not set, detected flag not set
Number of topology changes 0 last change occurred 01:53:48 ago
Times: hold 1, topology change 24, notification 2
      hello 2, max age 14, forward delay 10
Timers: hello 0, topology change 0, notification 0
```

```
Port 264 (FastEthernet5/8) of VLAN200 is forwarding
Port path cost 19, Port priority 128, Port Identifier 129.9.
Designated root has priority 16384, address 0060.704c.7000
Designated bridge has priority 32768, address 00e0.4fac.b000
Designated port id is 128.2, designated path cost 19
Timers: message age 3, forward delay 0, hold 0
Number of transitions to forwarding state: 1
BPDUs: sent 3, received 3417
```

```
Switch#
```

Enabling the Extended System ID

Note

The extended system ID is enabled permanently on chassis that support 64 MAC addresses.

You can use the **spanning-tree extend system-id** command to enable the extended system ID on chassis that support 1024 MAC addresses. See the [“Understanding the Bridge ID”](#) section on page 18-2.

To enable the extended system ID, perform this task:

	Command	Purpose
Step 1	Switch(config)# spanning-tree extend system-id	Enables the extended system ID. Disables the extended system ID. Note You cannot disable the extended system ID on chassis that support 64 MAC addresses or when you have configured extended range VLANs (see “Table 18-4Spanning Tree Default Configuration Values” section on page 18-6).
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree vlan <i>vlan_ID</i>	Verifies the configuration.

Note

When you enable or disable the extended system ID, the bridge IDs of all active STP instances are updated, which might change the spanning tree topology.

This example shows how to enable the extended system ID:

```
Switch# configure terminal
Switch(config)# spanning-tree extend system-id
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree summary | include extended
Extended system ID is enabled.
```

Configuring the Root Bridge

A Catalyst 4000 family switch maintains an instance of spanning tree for each active VLAN configured on the switch. A bridge ID, consisting of the bridge priority and the bridge MAC address, is associated with each instance. For each VLAN, the switch with the lowest bridge ID will become the root bridge for that VLAN. Whenever the bridge priority changes, the bridge ID also changes. This results in the recomputation of the root bridge for the VLAN.

To configure a switch to become the root bridge for the specified VLAN, use the **spanning-tree vlan *vlan-ID* root** command to modify the bridge priority from the default value (32,768) to a significantly lower value. The bridge priority for the specified VLAN is set to 8192 if this value will cause the switch to become the root for the VLAN. If any bridge for the VLAN has a priority lower than 8192, the switch sets the priority to 1 less than the lowest bridge priority.

For example, assume that all the switches in the network have the bridge priority for VLAN 100 set to the default value of 32,768. Entering the **spanning-tree vlan 100 root primary** command on a switch will set the bridge priority for VLAN 100 to 8192, causing this switch to become the root bridge for VLAN 100.

**Note**

The root switch for each instance of spanning tree should be a backbone or distribution switch. Do not configure an access switch as the spanning tree primary root.

Use the **diameter** keyword to specify the Layer 2 network diameter (the maximum number of bridge hops between any two end stations in the network). When you specify the network diameter, a switch automatically picks an optimal hello time, forward delay time, and maximum age time for a network of that diameter. This can significantly reduce the spanning tree convergence time.

Use the **hello-time** keyword to override the automatically calculated hello time.

**Note**

We recommend that you avoid manually configuring the hello time, forward delay time, and maximum age time after configuring the switch as the root bridge.

To configure a switch as the root switch, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree vlan vlan_ID root primary [diameter hops [hello-time seconds]]	Configures a switch as the root switch. You can use the no keyword to restore the defaults.
Step 2	Switch(config)# end	Exits configuration mode.

This example shows how to configure a switch as the root bridge for VLAN 10, with a network diameter of 4:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 10 root primary diameter 4
Switch(config)# end
Switch#
```

This example shows how the configuration changes when a switch becomes a spanning tree root. This is the configuration before the switch becomes the root for VLAN 1:

```
Switch#show spanning-tree vlan 1

VLAN1 is executing the ieee compatible Spanning Tree protocol
Bridge Identifier has priority 32768, address 0030.94fc.0a00
Configured hello time 2, max age 20, forward delay 15
Current root has priority 32768, address 0001.6445.4400
Root port is 323 (FastEthernet6/3), cost of root path is 19
Topology change flag not set, detected flag not set
Number of topology changes 2 last change occurred 00:02:19 ago
    from FastEthernet6/1
Times: hold 1, topology change 35, notification 2
    hello 2, max age 20, forward delay 15
Timers:hello 0, topology change 0, notification 0, aging 300

Port 323 (FastEthernet6/3) of VLAN1 is forwarding
Port path cost 19, Port priority 128, Port Identifier 129.67.
Designated root has priority 32768, address 0001.6445.4400
Designated bridge has priority 32768, address 0001.6445.4400
Designated port id is 129.67, designated path cost 0
Timers:message age 2, forward delay 0, hold 0
Number of transitions to forwarding state:1
BPDU:sent 3, received 91
```

```

Port 324 (FastEthernet6/4) of VLAN1 is blocking
  Port path cost 19, Port priority 128, Port Identifier 129.68.
  Designated root has priority 32768, address 0001.6445.4400
  Designated bridge has priority 32768, address 0001.6445.4400
  Designated port id is 129.68, designated path cost 0
  Timers:message age 2, forward delay 0, hold 0
  Number of transitions to forwarding state:0
  BPDU:sent 1, received 89

```

Now, you can set the switch as the root:

```

Switch# configure terminal
Switch(config)# spanning-tree vlan 1 root primary
Switch(config)# spanning-tree vlan 1 root primary
  VLAN 1 bridge priority set to 8192
  VLAN 1 bridge max aging time unchanged at 20
  VLAN 1 bridge hello time unchanged at 2
  VLAN 1 bridge forward delay unchanged at 15
Switch(config)# end

```

This is the configuration after the switch becomes the root:

```

Switch# show spanning-tree vlan 1

VLAN1 is executing the ieee compatible Spanning Tree protocol
  Bridge Identifier has priority 8192, address 0030.94fc.0a00
  Configured hello time 2, max age 20, forward delay 15
  We are the root of the spanning tree
  Topology change flag set, detected flag set
  Number of topology changes 3 last change occurred 00:00:09 ago
  Times: hold 1, topology change 35, notification 2
        hello 2, max age 20, forward delay 15
  Timers:hello 0, topology change 25, notification 0, aging 15

Port 323 (FastEthernet6/3) of VLAN1 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 129.67.
  Designated root has priority 8192, address 0030.94fc.0a00
  Designated bridge has priority 8192, address 0030.94fc.0a00
  Designated port id is 129.67, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  BPDU:sent 9, received 105

Port 324 (FastEthernet6/4) of VLAN1 is listening
  Port path cost 19, Port priority 128, Port Identifier 129.68.
  Designated root has priority 8192, address 0030.94fc.0a00
  Designated bridge has priority 8192, address 0030.94fc.0a00
  Designated port id is 129.68, designated path cost 0
  Timers:message age 0, forward delay 5, hold 0
  Number of transitions to forwarding state:0
  BPDU:sent 6, received 102

```

Switch#

Note

Because the bridge priority is now set at 8192, this switch becomes the root of the spanning tree.

Configuring a Secondary Root Switch

When you configure a switch as the secondary root, the spanning tree bridge priority is modified from the default value (32,768) to 16,384. This means that the switch is likely to become the root bridge for the specified VLANs if the primary root bridge fails (assuming the other switches in the network use the default bridge priority of 32,768).

You can run this command on more than one switch to configure multiple backup root switches. Use the same network diameter and hello time values that you used when configuring the primary root switch.

Note

We recommend that you avoid manually configuring the hello time, forward delay time, and maximum age time after configuring the switch as the root bridge.

To configure a switch as the secondary root switch, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree vlan vlan_ID root secondary [diameter hops [hello-time seconds]]	Configures a switch as the secondary root switch. You can use the no keyword to restore the defaults.
Step 2	Switch(config)# end	Exits configuration mode.

This example shows how to configure the switch as the secondary root switch for VLAN 10, with a network diameter of 4:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 10 root secondary diameter 4
VLAN 10 bridge priority set to 16384
VLAN 10 bridge max aging time set to 14
VLAN 10 bridge hello time unchanged at 2
VLAN 10 bridge forward delay set to 10
Switch(config)# end
Switch#
```

This example shows how to verify the configuration of VLAN 1:

```
Switch#sh spanning-tree vlan 1

VLAN0001

Switch#
```

Configuring STP Port Priority

In the event of a loop, a spanning tree considers port priority when selecting an interface to put into the forwarding state. You can assign higher priority values to interfaces that you want a spanning tree to select first and lower priority values to interfaces that you want a spanning tree to select last. If all interfaces have the same priority value, a spanning tree puts the interface with the lowest interface number in the forwarding state and blocks other interfaces. The possible priority range is 0 through 240, configurable in increments of 16 (the default is 128).

Note

The Cisco IOS software uses the port priority value when the interface is configured as an access port and uses VLAN port priority values when the interface is configured as a trunk port.

To configure the spanning tree port priority of an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {{fastethernet gigabitethernet tengigabitethernet} slot/port} {port-channel port_channel_number}	Specifies an interface to configure.
Step 2	Switch(config-if)# [no] spanning-tree port-priority port_priority	Configures the port priority for an interface. The <i>port_priority</i> value can be from 0 to 240, in increments of 16. You can use the no keyword to restore the defaults.
Step 3	Switch(config-if)# [no] spanning-tree vlan vlan_ID port-priority port_priority	Configures the VLAN port priority for an interface. The <i>port_priority</i> value can be from 0 to 240, in increments of 16. You can use the no keyword to restore the defaults.
Step 4	Switch(config-if)# end	Exits configuration mode.
Step 5	Switch# show spanning-tree interface {{fastethernet gigabitethernet} slot/port} {port-channel port_channel_number} show spanning-tree vlan vlan_ID	Verifies the configuration.

This example shows how to configure the spanning tree port priority of a Fast Ethernet interface:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree port-priority 100
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration of a Fast Ethernet interface when it is configured as an access port:

```
Switch# show spanning-tree interface fastethernet 3/1
```

```

Vlan          Role Sts Cost      Prio.Nbr Status
-----
VLAN0001      Desg FWD 19        128.129 P2p
VLAN1002      Desg FWD 19        128.129 P2p

Switch#
```

This example shows how to display the details of the interface configuration when the interface is configured as an access port:

```
Switch# show spanning-tree interface fastethernet 3/1 detail
Port 129 (FastEthernet3/1) of VLAN0001 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.e800
  Designated bridge has priority 32768, address 0003.6b10.e800
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 187, received 1

Port 129 (FastEthernet3/1) of VLAN1002 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.ebe9
  Designated bridge has priority 32768, address 0003.6b10.ebe9
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 94, received 2

Port 129 (FastEthernet3/1) of VLAN1003 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.ebea
  Designated bridge has priority 32768, address 0003.6b10.ebea
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 94, received 2

Port 129 (FastEthernet3/1) of VLAN1004 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.ebeb
  Designated bridge has priority 32768, address 0003.6b10.ebeb
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 95, received 2

Port 129 (FastEthernet3/1) of VLAN1005 is forwarding
  Port path cost 19, Port priority 128, Port Identifier 128.129.
  Designated root has priority 32768, address 0003.6b10.ebec
  Designated bridge has priority 32768, address 0003.6b10.ebec
  Designated port id is 128.129, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  Link type is point-to-point by default
  BPDU:sent 95, received 2
Switch#
```

Note

The **show spanning-tree port-priority** command displays only information for ports with an active link. If there is no port with an active link, enter a **show running-config interface** command to verify the configuration.

This example shows how to configure the spanning tree VLAN port priority of a Fast Ethernet interface:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree vlan 200 port-priority 64
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration of VLAN 200 on the interface when it is configured as a trunk port:

```
Switch# show spanning-tree vlan 200
<...output truncated...>

Port 264 (FastEthernet5/8) of VLAN200 is forwarding
Port path cost 19, Port priority 64, Port Identifier 129.8.
  Designated root has priority 32768, address 0010.0d40.34c7
  Designated bridge has priority 32768, address 0010.0d40.34c7
  Designated port id is 128.1, designated path cost 0
  Timers: message age 2, forward delay 0, hold 0
  Number of transitions to forwarding state: 1
  BPDU: sent 0, received 13513

<...output truncated...>
Switch#
```

Configuring STP Port Cost

The default value for spanning tree port path cost is derived from the interface media speed. In the event of a loop, spanning tree considers port cost when selecting an interface to put into the forwarding state. You can assign lower cost values to interfaces that you want spanning tree to select first, and higher cost values to interfaces that you want spanning tree to select last. If all interfaces have the same cost value, spanning tree puts the interface with the lowest interface number in the forwarding state and blocks other interfaces. The possible cost range is 1 through 200,000,000 (the default is media-specific).

Spanning tree uses the port cost value when the interface is configured as an access port and uses VLAN port cost values when the interface is configured as a trunk port.

To configure the spanning tree port cost of an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {{ fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i> } { port-channel <i>port_channel_number</i> }	Specifies an interface to configure.
Step 2	Switch(config-if)# [no] spanning-tree cost <i>port_cost</i>	Configures the port cost for an interface. The <i>port_cost</i> value can be from 1 to 200,000,000. You can use the no keyword to restore the defaults.
Step 3	Switch(config-if)# [no] spanning-tree vlan <i>vlan_ID</i> cost <i>port_cost</i>	Configures the VLAN port cost for an interface. The <i>port_cost</i> value can be from 1 to 200,000,000. You can use the no keyword to restore the defaults.
Step 4	Switch(config-if)# end	Exits configuration mode.
Step 5	Switch# show spanning-tree interface {{ fastethernet gigabitethernet } <i>slot/port</i> } { port-channel <i>port_channel_number</i> } show spanning-tree vlan <i>vlan_ID</i>	Verifies the configuration.

This example shows how to change the spanning tree port cost of a Fast Ethernet interface:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree cost 18
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration of the interface when it is configured as an access port:

```
Switch# show spanning-tree interface fastethernet 5/8
Port 264 (FastEthernet5/8) of VLAN200 is forwarding
  Port path cost 18, Port priority 100, Port Identifier 129.8.
  Designated root has priority 32768, address 0010.0d40.34c7
  Designated bridge has priority 32768, address 0010.0d40.34c7
  Designated port id is 128.1, designated path cost 0
  Timers: message age 2, forward delay 0, hold 0
  Number of transitions to forwarding state: 1
  BPDU: sent 0, received 13513
Switch#
```

This example shows how to configure the spanning tree VLAN port cost of a Fast Ethernet interface:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree vlan 200 cost 17
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration of VLAN 200 on the interface when it is configured as a trunk port:

```
Switch# show spanning-tree vlan 200
<...output truncated...>
Port 264 (FastEthernet5/8) of VLAN200 is forwarding
Port path cost 17, Port priority 64, Port Identifier 129.8.
  Designated root has priority 32768, address 0010.0d40.34c7
  Designated bridge has priority 32768, address 0010.0d40.34c7
  Designated port id is 128.1, designated path cost 0
  Timers: message age 2, forward delay 0, hold 0
  Number of transitions to forwarding state: 1
  BPDU: sent 0, received 13513

<...output truncated...>
Switch#
```

Note

The **show spanning-tree** command displays only information for ports with an active link (green light is on). If there is no port with an active link, you can issue a **show running-config** command to confirm the configuration.

Configuring the Bridge Priority of a VLAN

Note

Exercise care when configuring the bridge priority of a VLAN. In most cases, we recommend that you enter the **spanning-tree vlan *vlan_ID* root primary** and the **spanning-tree vlan *vlan_ID* root secondary** commands to modify the bridge priority.

To configure the spanning tree bridge priority of a VLAN, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree vlan <i>vlan_ID</i> priority <i>bridge_priority</i>	Configures the bridge priority of a VLAN. The <i>bridge_priority</i> value can be from 1 to 65,534. You can use the no keyword to restore the defaults.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree vlan <i>vlan_ID</i> bridge [brief]	Verifies the configuration.

This example shows how to configure the bridge priority of VLAN 200 to 33,792:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200 priority 33792
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree vlan 200 bridge brief

Vlan                Bridge ID          Hello Time  Max Age  Fwd Delay  Protocol
-----
VLAN200             33792 0050.3e8d.64c8    2         20        15       ieee
Switch#
```

Configuring the Hello Time

Note

Exercise care when configuring the hello time. In most cases, we recommend that you use the **spanning-tree vlan** *vlan_ID* **root primary** and the **spanning-tree vlan** *vlan_ID* **root secondary** commands to modify the hello time.

To configure the spanning tree hello time of a VLAN, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree vlan <i>vlan_ID</i> hello-time <i>hello_time</i>	Configures the hello time of a VLAN. The <i>hello_time</i> value can be from 1 to 10 seconds. You can use the no keyword to restore the defaults.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree vlan <i>vlan_ID</i> bridge [brief]	Verifies the configuration.

This example shows how to configure the hello time for VLAN 200 to 7 seconds:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200 hello-time 7
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree vlan 200 bridge brief
                                Hello Max  Fwd
                                Time  Age Delay  Protocol
-----
VLAN200          49152 0050.3e8d.64c8    7   20   15  ieee
Switch#
```

Configuring the Maximum Aging Time for a VLAN

Note

Exercise care when configuring aging time. In most cases, we recommend that you use the **spanning-tree vlan *vlan_ID* root primary** and the **spanning-tree vlan *vlan_ID* root secondary** commands to modify the maximum aging time.

To configure the spanning tree maximum aging time for a VLAN, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree vlan <i>vlan_ID</i> max-age <i>max_age</i>	Configures the maximum aging time of a VLAN. The <i>max_age</i> value can be from 6 to 40 seconds. You can use the no keyword to restore the defaults.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree vlan <i>vlan_ID</i> bridge [brief]	Verifies the configuration.

This example shows how to configure the maximum aging time for VLAN 200 to 36 seconds:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200 max-age 36
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree vlan 200 bridge brief
                                Hello Max  Fwd
                                Time  Age Delay  Protocol
-----
VLAN200          49152 0050.3e8d.64c8    2   36   15  ieee
Switch#
```

Configuring the Forward-Delay Time for a VLAN

Note

Exercise care when configuring forward-delay time. In most cases, we recommend that you use the **spanning-tree vlan *vlan_ID* root primary** and the **spanning-tree vlan *vlan_ID* root secondary** commands to modify the forward delay time.

To configure the spanning tree forward delay time for a VLAN, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree vlan <i>vlan_ID</i> forward-time <i>forward_time</i>	Configures the forward time of a VLAN. The <i>forward_time</i> value can be from 4 to 30 seconds. You can use the no keyword to restore the defaults.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree vlan <i>vlan_ID</i> bridge [brief]	Verifies the configuration.

This example shows how to configure the forward delay time for VLAN 200 to 21 seconds:

```
Switch# configure terminal
Switch(config)# spanning-tree vlan 200 forward-time 21
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree vlan 200 bridge brief

Vlan                Bridge ID          Hello Time  Max Age  Fwd Delay  Protocol
-----
VLAN200             49152 0050.3e8d.64c8  2         20       21        ieee
Switch#
```

This example shows how to display spanning tree information for the bridge:

```
Switch# show spanning-tree bridge

Vlan                Bridge ID          Hello Time  Max Age  Fwd Dly  Protocol
-----
VLAN200             49152 0050.3e8d.64c8  2         20       15        ieee
VLAN202             49152 0050.3e8d.64c9  2         20       15        ieee
VLAN203             49152 0050.3e8d.64ca  2         20       15        ieee
VLAN204             49152 0050.3e8d.64cb  2         20       15        ieee
VLAN205             49152 0050.3e8d.64cc  2         20       15        ieee
VLAN206             49152 0050.3e8d.64cd  2         20       15        ieee
Switch#
```

Disabling Spanning Tree Protocol

To disable spanning tree on a per-VLAN basis, perform this task:

	Command	Purpose
Step 1	Switch(config)# no spanning-tree vlan <i>vlan_ID</i>	Disables spanning tree on a per-VLAN basis.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree vlan <i>vlan_ID</i>	Verifies that spanning tree is disabled.

This example shows how to disable spanning tree on VLAN 200:

```
Switch# configure terminal
Switch(config)# no spanning-tree vlan 200
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show spanning-tree vlan 200
Spanning tree instance for VLAN 200 does not exist.
Switch#
```

Enabling Per-VLAN Rapid Spanning Tree

Per-VLAN Rapid Spanning Tree (PVRST+) uses the existing PVST+ framework for configuration purposes and for interaction with other features. It also supports some of the PVST+ extensions.

To configure PVRST+, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spantree mode rapid-pvst	Enables rapid-PVST+.
Step 2	Switch(config)# interface <i>interface/port</i>	Switches to interface configuration mode.
Step 3	Switch(config)# spanning-tree link-type point-to-point	Sets the link-type to point-to-point mode for the port.
Step 4	Switch(config-if)# exit	Exits interface mode.
Step 5	Switch(config)# exit	Exits configuration mode.
Step 6	Switch(config-if)# clear spantree detected-protocols <i>mod/port</i>	Detects any legacy bridges on the port
Step 7	Switch# show spanning-tree summary totals	Verifies the rapid-PVST+ configuration.

The following example shows how to configure Rapid-PVST+:

```
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# spanning-tree mode rapid-pvst
Switch(config)# int fa 6/4
Switch(config-if)# spanning-tree link-type point-to-point
Switch(config-if)# end
Switch(config)# end
Switch#
23:55:32:%SYS-5-CONFIG_I:Configured from console by console
Switch# clear spanning-tree detected-protocols
```

The following example shows how to verify the configuration:

```
Switch# show spanning-tree summary totals
Switch is in rapid-pvst mode
Root bridge for:VLAN0001
Extended system ID          is disabled
Portfast Default            is disabled
PortFast BPDU Guard Default is disabled
Portfast BPDU Filter Default is disabled
Loopguard Default           is disabled
```

```

EtherChannel misconfig guard is enabled
UplinkFast                is disabled
BackboneFast              is disabled
Pathcost method used      is short
Name                      Blocking Listening Learning Forwarding STP Active
-----
1 vlan                    0          0          0          2          2
Switch#

```

Specifying the Link Type

Rapid connectivity is established only on point-to-point links. Spanning tree views a point-to-point link as a segment connecting only two switches running the spanning tree algorithm. Because the switch assumes that all full-duplex links are point-to-point links and that half-duplex links are shared links, you can avoid explicitly configuring the link type. To configure a specific link type, use the **spanning-tree linktype** command.

Restarting Protocol Migration

A switch running both MSTP and RSTP supports a built-in protocol migration process that enables the switch to interoperate with legacy 802.1D switches. If this switch receives a legacy 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only 802.1D BPDUs on that port. Furthermore, when an MSTP switch receives a legacy BPDU, it can also detect the following:

- that a port is at the boundary of a region
- an MST BPDU (version 3) associated with a different region, or
- an RST BPDU (version 2).

The switch, however, does not automatically revert to the MSTP mode if it no longer receives 802.1D BPDUs because it cannot determine whether or not the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

To restart the protocol migration process on the entire switch (that is, to force renegotiation with neighboring switches), use the **clear spanning-tree detected-protocols** commands in privileged EXEC mode. To restart the protocol migration process on a specific interface, enter the **clear spanning-tree detected-protocols interface** *command in interface-id* privileged EXEC mode.

Overview of MST

The following sections describe how MST works on a Catalyst 4000 family switch:

- [IEEE 802.1s MST, page 18-22](#)
- [IEEE 802.1w RSTP, page 18-23](#)
- [MST-to-SST Interoperability, page 18-24](#)
- [Common Spanning Tree, page 18-25](#)
- [MST Instances, page 18-26](#)

- [MST Configuration Parameters, page 18-26](#)
- [MST Regions, page 18-26](#)
- [Message Age and Hop Count, page 18-28](#)
- [MST-to-PVST+ Interoperability, page 18-28](#)

IEEE 802.1s MST

MST extends the IEEE 802.1w rapid spanning tree (RST) algorithm to multiple spanning trees. This extension provides both rapid convergence and load balancing in a VLAN environment. MST converges faster than Per VLAN Spanning Tree Plus (PVST+) and is backward compatible with 802.1D STP, 802.1w (Rapid Spanning Tree Protocol [RSTP]), and the Cisco PVST+ architecture.

MST allows you to build multiple spanning trees over trunks. You can group and associate VLANs to spanning tree instances. Each instance can have a topology independent of other spanning tree instances. This architecture provides multiple forwarding paths for data traffic and enables load balancing. Network fault tolerance is improved because a failure in one instance (forwarding path) does not affect other instances.

In large networks, you can more easily administer the network and use redundant paths by locating different VLAN and spanning tree instance assignments in different parts of the network. A spanning tree instance can exist only on bridges that have compatible VLAN instance assignments. You must configure a set of bridges with the same MST configuration information, which allows them to participate in a specific set of spanning tree instances. Interconnected bridges that have the same MST configuration are referred to as an *MST region*.

MST uses the modified RSTP, MSTP. MST has the following characteristics:

- MST runs a variant of spanning tree called Internal Spanning Tree (IST). IST augments Common Spanning Tree (CST) information with internal information about the MST region. The MST region appears as a single bridge to adjacent single spanning tree (SST) and MST regions.
- A bridge running MST provides interoperability with SST bridges as follows:
 - MST bridges run IST, which augments CST information with internal information about the MST region.
 - IST connects all the MST bridges in the region and appears as a subtree in the CST that includes the whole bridged domain. The MST region appears as a virtual bridge to adjacent SST bridges and MST regions.
 - The Common and Internal Spanning Tree (CIST) is the collection of the following: ISTs in each MST region, the CST that interconnects the MST regions, and the SST bridges. CIST is identical to an IST inside an MST region and identical to a CST outside an MST region. The STP, RSTP, and MSTP together elect a single bridge as the root of the CIST.
- MST establishes and maintains additional spanning trees within each MST region. These spanning trees are termed MST instances (MSTIs). The IST is numbered 0, and the MSTIs are numbered 1, 2, 3, and so on. Any MSTI is local to the MST region and is independent of MSTIs in another region, even if the MST regions are interconnected.

MST instances combine with the IST at the boundary of MST regions to become the CST as follows:

- Spanning tree information for an MSTI is contained in an MSTP record (M-record).

M-records are always encapsulated within MST bridge protocol data units (BPDUs). The original spanning trees computed by MSTP are called M-trees, which are active only within the MST region. M-trees merge with the IST at the boundary of the MST region and form the CST.

- MST provides interoperability with PVST+ by generating PVST+ BPDUs for the non-CST VLANs.
- MST supports some of the PVST+ extensions in MSTP as follows:
 - UplinkFast and BackboneFast are not available in MST mode; they are part of RSTP.
 - PortFast is supported.
 - BPDU filter and BPDU guard are supported in MST mode.
 - Loop guard and root guard are supported in MST. MST preserves the VLAN 1 disabled functionality except that BPDUs are still transmitted in VLAN 1.
 - MST switches operate as if MAC reduction is enabled.
 - For private VLANs (PVLANS), you must map a secondary VLAN to the same instance as the primary.

IEEE 802.1w RSTP

RSTP, specified in 802.1w, supersedes STP specified in 802.1D, but remains compatible with STP. You configure RSTP when you configure the MST feature. For more information, see the [“Configuring MST” section on page 18-29](#).

RSTP provides the structure on which the MST operates, significantly reducing the time to reconfigure the active topology of a network when its physical topology or configuration parameters change. RSTP selects one switch as the root of a spanning-tree-connected active topology and assigns port roles to individual ports of the switch, depending on whether that port is part of the active topology.

RSTP provides rapid connectivity following the failure of a switch, switch port, or a LAN. A new root port and the designated port on the other side of the bridge transition to the forwarding state through an explicit handshake between them. RSTP allows switch port configuration so the ports can transition to forwarding directly when the switch reinitializes.

RSTP provides backward compatibility with 802.1D bridges as follows:

- RSTP selectively sends 802.1D-configured BPDUs and Topology Change Notification (TCN) BPDUs on a per-port basis.
- When a port initializes, the migration delay timer starts and RSTP BPDUs are transmitted. While the migration delay timer is active, the bridge processes all BPDUs received on that port.
- If the bridge receives an 802.1D BPDU after a port’s migration delay timer expires, the bridge assumes it is connected to an 802.1D bridge and starts using only 802.1D BPDUs.
- When RSTP uses 802.1D BPDUs on a port and receives an RSTP BPDU after the migration delay expires, RSTP restarts the migration delay timer and begins using RSTP BPDUs on that port.

RSTP Port Roles

In RSTP, the port roles are defined as follows:

- Root—A forwarding port elected for the spanning tree topology.
- Designated—A forwarding port elected for every switched LAN segment.
- Alternate—An alternate path to the root bridge to that provided by the current root port.
- Backup—A backup for the path provided by a designated port toward the leaves of the spanning tree. Backup ports can exist only where two ports are connected together in a loopback mode or bridge with two or more connections to a shared LAN segment.

- Disabled—A port that has no role within the operation of spanning tree.

The system assigns port roles as follows:

- A root port or designated port role includes the port in the active topology.
- An alternate port or backup port role excludes the port from the active topology.

RSTP Port States

The port state controls the forwarding and learning processes and provides the values of discarding, learning, and forwarding. [Table 18-5](#) shows the STP port states and RSTP port states.

Table 18-5 *Comparison Between STP and RSTP Port States*

Operational Status	STP Port State	RSTP Port State	Port Included in Active Topology
Enabled	Blocking ¹	Discarding ²	No
Enabled	Listening	Discarding	No
Enabled	Learning	Learning	Yes
Enabled	Forwarding	Forwarding	Yes
Disabled	Disabled	Discarding	No

1. IEEE 802.1D port state designation.

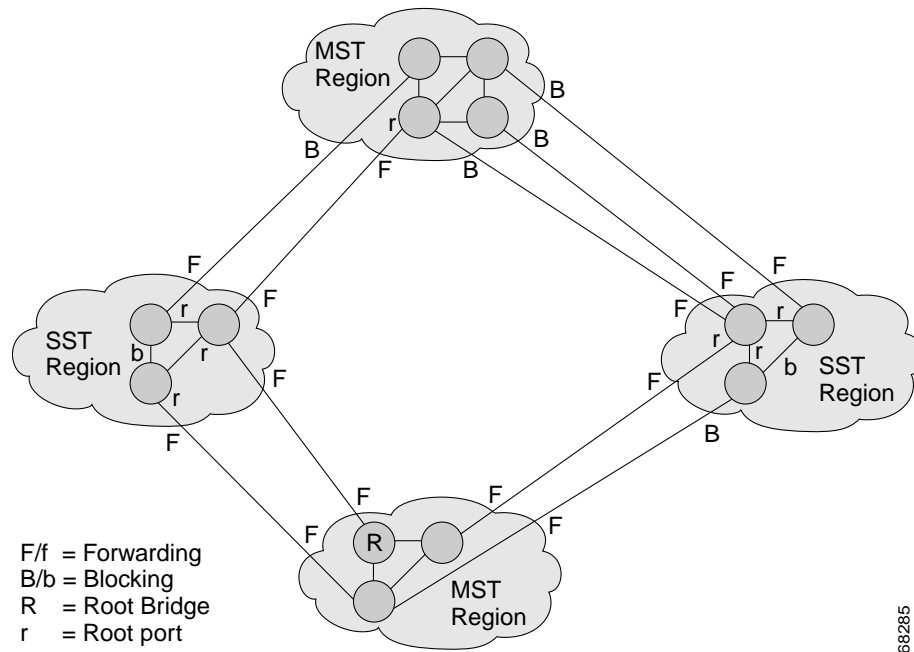

2. IEEE 802.1w port state designation. Discarding is the same as blocking in MST.

In a stable topology, RSTP ensures that every root port and designated port transitions to the forwarding state while all alternate ports and backup ports are always in the discarding state.

MST-to-SST Interoperability

A virtual bridged LAN may contain interconnected regions of SST and MST bridges. [Figure 18-2](#) shows this relationship.

Figure 18-2 Network with Interconnected SST and MST Regions

To STP running in the SST region, an MST region appears as a single SST or pseudobridge, which operates as follows:

- Although the values for root identifiers and root path costs match for all BPDUs in all pseudobridges, a pseudobridge differs from a single SST bridge as follows:
 - The pseudobridge BPDUs have different bridge identifiers. This difference does not affect STP operation in the neighboring SST regions because the root identifier and root cost are the same.
 - BPDUs sent from the pseudobridge ports may have significantly different message ages. Because the message age increases by one second for each hop, the difference in the message age is measured in seconds.
- Data traffic from one port of a pseudobridge (a port at the edge of a region) to another port follows a path entirely contained within the pseudobridge or MST region. Data traffic belonging to different VLANs might follow different paths within the MST regions established by MST.
- The system prevents looping by doing either of the following:
 - Blocking the appropriate pseudobridge ports by allowing one forwarding port on the boundary and blocking all other ports.
 - Setting the CST partitions to block the ports of the SST regions.

Common Spanning Tree

CST (802.1Q) is a single spanning tree for all the VLANs. In a Catalyst 4500 series switch running PVST+, the VLAN 1 spanning tree corresponds to CST. In a Catalyst 4500 series switch running MST, IST (instance 0) corresponds to CST.

MST Instances

We support 65 instances including instance 0. Each spanning tree instance is identified by an instance ID that ranges from 0 to 4094. Instance 0 is mandatory and is always present. Rest of the instances are optional.

MST Configuration Parameters

MST configuration has three parts, as follows:

- Name—A 32-character string (null padded) that identifies the MST region.
- Revision number—An unsigned 16-bit number that identifies the revision of the current MST configuration.

**Note**

You must set the revision number when required as part of the MST configuration. The revision number is not incremented automatically each time you commit the MST configuration.

- MST configuration table—An array of 4096 bytes. Each byte, interpreted as an unsigned integer, corresponds to a VLAN. The value is the instance number to which the VLAN is mapped. The first byte that corresponds to VLAN 0 and the 4096th byte that corresponds to VLAN 4095 are unused and always set to zero.

You must configure each byte manually. You can use SNMP or the CLI to perform the configuration.

MST BPDUs contain the MST configuration ID and the checksum. An MST bridge accepts an MST BPDU only if the MST BPDU configuration ID and the checksum match its own MST region configuration ID and checksum. If either value is different, the MST BPDU is considered to be an SST BPDU.

MST Regions

These sections describe MST regions:

- [MST Region Overview, page 18-26](#)
- [Boundary Ports, page 18-27](#)
- [IST Master, page 18-27](#)
- [Edge Ports, page 18-27](#)
- [Link Type, page 18-28](#)

MST Region Overview

Interconnected bridges that have the same MST configuration are referred to as an MST region. There is no limit on the number of MST regions in the network.

To form an MST region, bridges can be either of the following:

- An MST bridge that is the only member of the MST region.

- An MST bridge interconnected by a LAN. A LAN's designated bridge has the same MST configuration as an MST bridge. All the bridges on the LAN can process MST BPDUs.

If you connect two MST regions with different MST configurations, the MST regions do the following:

- Load balance across redundant paths in the network. If two MST regions are redundantly connected, all traffic flows on a single connection with the MST regions in a network.
- Provide an RSTP handshake to enable rapid connectivity between regions. However, the handshaking is not as fast as between two bridges. To prevent loops, all the bridges inside the region must agree upon the connections to other regions. This situation introduces a delay. We do not recommend partitioning the network into a large number of regions.

Boundary Ports

A boundary port is a port that connects to a LAN, the designated bridge of which is either an SST bridge or a bridge with a different MST configuration. A designated port knows that it is on the boundary if it detects an STP bridge or receives an agreement message from an RST or MST bridge with a different configuration.

At the boundary, the role of MST ports do not matter; their state is forced to be the same as the IST port state. If the boundary flag is set for the port, the MSTP Port Role selection mechanism assigns a port role to the boundary and the same state as that of the IST port. The IST port at the boundary can take up any port role except a backup port role.

IST Master

The IST master of an MST region is the bridge with the lowest bridge identifier and the least path cost to the CST root. If an MST bridge is the root bridge for CST, then it is the IST master of that MST region. If the CST root is outside the MST region, then one of the MST bridges at the boundary is selected as the IST master. Other bridges on the boundary that belong to the same region eventually block the boundary ports that lead to the root.

If two or more bridges at the boundary of a region have an identical path to the root, you can set a slightly lower bridge priority to make a specific bridge the IST master.

The root path cost and message age inside a region stay constant, but the IST path cost is incremented and the IST remaining hops are decremented at each hop. Enter the **show spanning-tree mst** command to display the information about the IST master, path cost, and remaining hops for the bridge.

Edge Ports

A port that is connected to a nonbridging device (for example, a host or a switch) is an edge port. A port that connects to a hub is also an edge port if the hub or any LAN that is connected to it does not have a bridge. An edge port can start forwarding as soon as the link is up.

MST requires that you configure each port connected to a host. To establish rapid connectivity after a failure, you need to block the non-edge designated ports of an intermediate bridge. If the port connects to another bridge that can send back an agreement, then the port starts forwarding immediately. Otherwise, the port needs twice the forward delay time to start forwarding again. You must explicitly configure the ports that are connected to the hosts and switches as edge ports while using MST.

To prevent a misconfiguration, the PortFast operation is turned off if the port receives a BPDU. You can display the configured and operational status of PortFast by using the **show spanning-tree mst interface** command.

Link Type

Rapid connectivity is established only on point-to-point links. You must configure ports explicitly to a host or switch. However, cabling in most networks meets this requirement, and you can avoid explicit configuration by treating all full-duplex links as point-to-point links by entering the **spanning-tree linktype** command.

Message Age and Hop Count

IST and MST instances do not use the message age and maximum age timer settings in the BPDU. IST and MST use a separate hop count mechanism that is very similar to the IP time-to live (TTL) mechanism. You can configure each MST bridge with a maximum hop count. The root bridge of the instance sends a BPDU (or M-record) with the remaining hop count that is equal to the maximum hop count. When a bridge receives a BPDU (or M-record), it decrements the received remaining hop count by one. The bridge discards the BPDU (M-record) and ages out the information held for the port if the count reaches zero after decrementing. The nonroot bridges propagate the decremented count as the remaining hop count in the BPDUs (M-records) they generate.

The message age and maximum age timer settings in the RST portion of the BPDU remain the same throughout the region, and the same values are propagated by the region's designated ports at the boundary.

MST-to-PVST+ Interoperability

Keep these guidelines in mind when you configure MST switches (in the same region) to interact with PVST+ switches:

- Configure the root for all VLANs inside the MST region as shown in this example:

```
Switch# show spanning-tree mst interface gigabitethernet 1/1

GigabitEthernet1/1 of MST00 is root forwarding
Edge port: no (trunk) port guard : none (default)
Link type: point-to-point (auto) bpdu filter: disable (default)
Boundary : boundary (PVST) bpdu guard : disable (default)
Bpdus sent 10, received 310

Instance Role Sts Cost Prio.Nbr Vlns mapped
-----
0 Root FWD 20000 128.1 1-2,4-2999,4000-4094
3 Boun FWD 20000 128.1 3,3000-3999
```

The ports that belong to the MST switch at the boundary simulate PVST+ and send PVST+ BPDUs for all the VLANs.

If you enable loop guard on the PVST+ switches, the ports might change to a loop-inconsistent state when the MST switches change their configuration. To correct the loop-inconsistent state, you must disable and renewable loop guard on that PVST+ switch.

- Do not locate the root for some or all of the VLANs inside the PVST+ side of the MST switch because when the MST switch at the boundary receives PVST+ BPDUs for all or some of the VLANs on its designated ports, root guard sets the port to the blocking state.

When you connect a PVST+ switch to two different MST regions, the topology change from the PVST+ switch does not pass beyond the first MST region. In such a case, the topology changes are propagated only in the instance to which the VLAN is mapped. The topology change stays local to the first MST

region, and the Cisco Access Manager (CAM) entries in the other region are not flushed. To make the topology change visible throughout other MST regions, you can map that VLAN to IST or connect the PVST+ switch to the two regions through access links.

MST Configuration Restrictions and Guidelines

Follow these restrictions and guidelines to avoid configuration problems:

- Do not disable spanning tree on any VLAN in any of the PVST bridges.
- Do not use PVST bridges as the root of CST.
- Do not connect switches with access links, because access links may partition a VLAN.
- Ensure that all PVST root bridges have lower (numerically higher) priority than the CST root bridge.
- Ensure that trunks carry all of the VLANs mapped to an instance or do not carry any VLANs at all for this instance.
- Complete any MST configuration that incorporates a large number of either existing or new logical VLAN ports during a maintenance window because the complete MST database gets reinitialized for any incremental change (such as adding new VLANs to instances or moving VLANs across instances).

Configuring MST

The following sections describe how to configure MST:

- [Enabling MST, page 18-29](#)
- [Configuring MST Instance Parameters, page 18-31](#)
- [Configuring MST Instance Port Parameters, page 18-32](#)
- [Restarting Protocol Migration, page 18-33](#)
- [Displaying MST Configurations, page 18-33](#)

Enabling MST

To enable and configure MST on a Catalyst 4500, perform this task:

	Command	Purpose
Step 1	Switch(config)# spanning-tree mode mst	Enters MST mode.
Step 2	Switch(config)# spanning-tree mst configuration	Enters MST configuration submode. You can use the no keyword to clear the MST configuration.
Step 3	Switch(config-mst)# show current	Displays the current MST configuration.
Step 4	Switch(config-mst)# name name	Sets the MST region name.
Step 5	Switch(config-mst)# revision revision_number	Sets the MST configuration revision number.

	Command	Purpose
Step 6	Switch(config-mst)# instance <i>instance_number</i> vlan <i>vlan_range</i>	Maps the VLANs to an MST instance. If you do not specify the vlan keyword, you can use the no keyword to unmap all the VLANs that were mapped to an MST instance. If you specify the vlan keyword, you can use the no keyword to unmap a specified VLAN from an MST instance.
Step 7	Switch(config-mst)# show pending	Displays the new MST configuration to be applied.
Step 8	Switch(config-mst)# end	Applies the configuration and exit MST configuration submode.
Step 9	Switch# show spanning-tree mst configuration	Displays the current MST configuration.

This example show how to enable MST:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# spanning-tree mode mst
```

```
Switch(config)# spanning-tree mst configuration
```

```
Switch(config-mst)# show current

Configuring MST Instance Parameters

To configure MST instance parameters, perform this task:

	Command	Purpose
Step 1	Switch(config)# spanning-tree mst X priority Y	Configures the priority for an MST instance.
Step 2	Switch(config)# spanning-tree mst X root [primary secondary]	Configures the bridge as root for an MST instance.
Step 3	Switch(config)# Ctrl-Z	Exits configuration mode.
Step 4	Switch# show spanning-tree mst	Verifies the configuration.

This example shows how to configure MST instance parameters:

```

Switch(config)# spanning-tree mst 1 priority ?
<0-61440> bridge priority in increments of 4096

Switch(config)# spanning-tree mst 1 priority 1
% Bridge Priority must be in increments of 4096.
% Allowed values are:
   0      4096  8192  12288  16384  20480  24576  28672
 32768  36864  40960  45056  49152  53248  57344  61440

Switch(config)# spanning-tree mst 1 priority 49152
Switch(config)#

Switch(config)# spanning-tree mst 0 root primary
mst 0 bridge priority set to 24576
mst bridge max aging time unchanged at 20
mst bridge hello time unchanged at 2
mst bridge forward delay unchanged at 15
Switch(config)# ^Z
Switch#

Switch# show spanning-tree mst

Configuring MST Instance Port Parameters

To configure MST instance port parameters, perform this task:

	Command	Purpose
Step 1	Switch(config-if)# spanning-tree mst x cost y	Configures the MST instance port cost.
Step 2	Switch(config-if)# spanning-tree mst x port-priority y	Configures the MST instance port priority.
Step 3	Switch(config-if)# Ctrl-Z	Exits configuration mode.
Step 4	Switch# show spanning-tree mst x interface y	Verifies the configuration.

This example shows how to configure MST instance port parameters:

```

Switch(config)# interface fastethernet 4/4
Switch(config-if)# spanning-tree mst 1 ?
    cost          Change the interface spanning tree path cost for an instance
    port-priority  Change the spanning tree port priority for an instance

Switch(config-if)# spanning-tree mst 1 cost 1234567

Switch(config-if)# spanning-tree mst 1 port-priority 240
Switch(config-if)# ^Z

Switch# show spanning-tree mst 1 interface fastethernet 4/4

```

Restarting Protocol Migration

RSTP and MST have built-in compatibility mechanisms that allow them to interact properly with other regions or other versions of IEEE spanning-tree. For example, an RSTP bridge connected to a legacy bridge can send 802.1D BPDUs on one of its ports. Similarly, when an MST bridge receives a legacy BPDU or an MST BPDU associated with a different region, it is also to detect that a port is at the boundary of a region.

Unfortunately, these mechanisms cannot always revert to the most efficient mode. For example, an RSTP bridge designated for a legacy 802.1D will stay in 802.1D mode even after the legacy bridge has been removed from the link. Similarly, an MST port still assumes that it is a boundary port when the bridge(s) to which it is connected have joined the same region. To force a Catalyst 4500 series switch to renegotiate with the neighbors (that is, to restart protocol migration), you must enter the **clear spanning-tree detected-protocols** command, as follows:

```
Switch# clear spanning-tree detected-protocols fastethernet 4/4
Switch#
```

Displaying MST Configurations

To display MST configurations, perform this task:

	Command	Purpose
Step 1	Switch# show spanning-tree mst configuration	Displays the active region configuration information.
Step 2	Switch# show spanning-tree mst [detail]	Displays detailed MST protocol information.
Step 3	Switch# show spanning-tree mst instance-id [detail]	Displays information about a specific MST instance.
Step 4	Switch# show spanning-tree mst interface interface [detail]	Displays information for a given port.
Step 5	Switch# show spanning-tree mst instance-id interface interface [detail]	Displays MST information for a given port and a given instance.
Step 6	Switch# show spanning-tree vlan vlan_ID	Displays VLAN information in MST mode.

The following examples show how to display spanning tree VLAN configurations in MST mode:

```
Switch(config)# spanning-tree mst configuration
Switch(config-mst)# instance 1 vlan 1-10
Switch(config-mst)# name cisco
Switch(config-mst)# revision 1

CHAPTER 19

Configuring Flex Links and the MAC Address-Table Move Update Feature

Flex Links provide a fast and simplified Layer 2 Link redundancy mechanism. This chapter describes how to configure Flex Links on the Catalyst 4500 series switch. It also describes how to configure the MAC address-table move update feature (MMU), also referred to as the Flex Links bidirectional fast convergence feature.

The chapter consists of these sections:

- [Flex Links and the MAC Address-Table Move Update, page 19-1](#)
- [Configuring Flex Links and the MAC Address-Table Move Update, page 19-5](#)
- [Monitoring Flex Links and the MAC Address-Table Move Update, page 19-11](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Flex Links and the MAC Address-Table Move Update

This section contains this information:

- [Flex Links, page 19-2](#)
- [VLAN Flex Link Load Balancing and Support, page 19-2](#)
- [MAC Address-Table Move Update, page 19-3](#)
- [Flex Link Failover Actions, page 19-4](#)

Flex Links

Flex Links are a pair of Layer 2 interfaces (switch ports or port channels) where one interface is configured to act as a backup to the other. Users can disable STP and still retain basic link redundancy. Flex Links are typically configured in service provider or enterprise networks where customers do not want to run STP on some interfaces.

You configure Flex Links on one Layer 2 interface (the active link) by assigning another Layer 2 interface as the Flex Link or backup link. When one of the links is up and forwarding traffic, the other link is in standby mode, ready to begin forwarding traffic if the other link fails. At any given time, only one of the interfaces is in the forwarding state and forwarding traffic. If the primary link fails, the standby link starts forwarding traffic. When the active link reactivates, it enters standby mode and does not forward traffic. STP is disabled on Flex Link interfaces.

In [Figure 19-1](#), ports 1 and 2 on switch A are connected to uplink switches B and C. Because they are configured as Flex Links, only one of the interfaces is forwarding traffic; the other is in standby mode. If port 1 is the active link, it begins forwarding traffic between port 1 and switch B; the link between port 2 (the backup link) and switch C is not forwarding traffic. If port 1 shuts down, port 2 activates and starts forwarding traffic to switch C. When port 1 reactivates, it enters standby mode and does not forward traffic; port 2 continues forwarding traffic.

You can also choose to configure a preemption mechanism, specifying the preferred port for forwarding traffic. In [Figure 19-1](#), for example, you can configure the Flex Link pair with preemption mode so that after port 1 reactivates in the scenario, and it has greater bandwidth than port 2, port 1 begins forwarding after a duration equal to the preemption delay; and port 2 becomes the standby. You do this by entering the interface configuration **switchport backup interface preempt mode bandwidth** and **switchport backup interface preempt delay** commands.

Figure 19-1 Flex Links Configuration Example

If a primary (forwarding) link shuts down, a trap notifies the network management stations. If the standby link shuts down, a trap notifies the users.

Flex Links are supported only on Layer 2 ports and port channels. Because Flex Links fully operate with PVLANS they may be configured on a pair of PVLAN trunks.

VLAN Flex Link Load Balancing and Support

VLAN Flex Link load-balancing allows you to configure a Flex Link pair so that both ports simultaneously forward the traffic for mutually exclusive VLANs. For example, if Flex Link ports are configured for 1-100 VLANs, the traffic of the first 50 VLANs can be forwarded on one port and the rest on the other port. If one of the ports fail, the other active port forwards all the traffic. When the failed

port reactivates, it resumes forwarding traffic in the preferred VLANs. This way, apart from providing the redundancy, this Flex Link pair can be used for load balancing. Also, Flex Link VLAN load-balancing does not impose any restrictions on uplink switches (Figure 19-2).

Figure 19-2 VLAN Flex Links Load Balancing Configuration Example

Note

A static MAC address must point to a Flex Link interface that is forwarding for given VLAN. For example, if a backup interface is forwarding VLAN X, then a static MAC address in VLAN X must point to the backup interface. Misconfiguration might cause unexpected results.

MAC Address-Table Move Update

In Figure 19-3, ports 1 and 2 on switch A are connected to uplink switches B and D through a Flex Linkpair. Port 1 is forwarding traffic, and port 2 is in the blocking state. Traffic from the PC to the server is forwarded from port 1 to port 3. The MAC address of the PC has been learnt on port 3 of switch C. Traffic from the server to the PC is forwarded from port 3 to port 1.

If port 1 shuts down, port 2 starts forwarding traffic. If there is no traffic from PC to the server after failover to port 2, switch C does not learn MAC address of the PC on port 4. As a result, switch C keeps forwarding traffic from the server to the PC out of port 3. There is traffic loss from server to PC because port 1 is down. This problem is alleviated by sending out a dummy multicast packet with source MAC address of the PC over port 2. Switch C learns the PC MAC address on port 4 and start forwarding traffic from server to the PC out of port 4. One dummy multicast packet is sent out for every MAC address. This is the default flexlink behavior. The MAC address-table Move Update (MMU) feature may be enabled to further expedite downstream convergence. MMUs are special packets that carry multiple MAC addresses. Switch A is configured to transmit these packets and switches B, C and D are configured to receive such packets. If MMU transmit is enabled on Switch A, MAC move updates are transmitted before dummy multicast packets over port 2. Switch D processes and floods MMUs over to Switch C. Switch C processes these packets, and moves the MAC addresses contained within the packets from port 3 to port 4. Because one packet carries multiple MAC addresses, downstream convergence is faster.

Figure 19-3 *MAC Address-Table Move Update Example*

Flex Link Failover Actions

Following are important actions that are performed when a Flex Link primary fails:

- Detect Link failure.
- Move static unicast MAC addresses configured on the primary link to the standby link.
- Move dynamic unicast MAC addresses learned on the primary link to the standby link.
- Move the standby link to a forwarding state.
- Transmit MAC Address-table Move updates over new active, if **Mac move update transmit** is enabled.
- Transmit dummy multicast packets over new active interface.

Note

Local administrative shut down or a link becoming forwarding again due to preemption is not considered a link failure. The action in such cases is to flush dynamic hosts and not move them.

Static MAC address move on a Flex Link failover. Static MAC addresses configured on a Flex Link member interface are moved over to the backup, provided it fails. Static MAC addresses configured on a Flex Link member interface are restored when it becomes forwarding again.

Note

The **sh mac address-table** command always shows static MAC addresses as associated with the interface on which it was configured even if it may have been moved to the standby link because of a Flex Link failover.

Configuring Flex Links and the MAC Address-Table Move Update

These sections contains the following information:

- [Default Configuration, page 19-5](#)
- [Configuration Guidelines, page 19-5](#)
- [Configuring Flex Links, page 19-6](#)
- [Configuring VLAN Load Balancing on Flex Links, page 19-8](#)
- [Configuring the MAC Address-Table Move Update Feature, page 19-9](#)

Default Configuration

Observe the following points:

- Flex Links are not configured on any interface.
- Preemption mode is off.
- If preemption is enabled, preemption delay is 35 seconds.
- The MAC address-table move update feature is disabled.

Configuration Guidelines

Follow these guidelines to configure Flex Links:

- You can configure only one Flex Link backup link for any active link, and it must be a different interface from the active interface.
- An interface can belong to only one Flex Link pair. An interface can be a backup link for only one active link, but an active link cannot belong to another Flex Link pair.
- Neither of the links can be a port that belongs to an EtherChannel. However, you can configure two port channels (EtherChannel logical interfaces) as Flex Links. Moreover, you can configure a port channel and a physical interface as Flex Links, with either the port channel or the physical interface as the active link.
- The types (Fast Ethernet, Gigabit Ethernet, or port channel) of the backup link and the active link can differ. However, you should configure both Flex Links with similar characteristics so that there are no loops or changes in behavior if the standby link begins to forward traffic.

- STP is disabled on Flex Link ports. A Flex Link port does not participate in STP, even if the VLANs present on the port are configured for STP. When STP is not enabled, ensure that there are no loops in the configured topology.
- Configure any static MAC addresses on a Flex Link member interface after enabling Flex Link.

Follow these guidelines to configure VLAN load balancing on the Flex Links feature:

- For Flex Link VLAN load balancing, you must choose the preferred VLANs on the backup interface.
- You cannot configure preemption and VLAN load balancing for the same Flex Links pair.

Follow these guidelines to configure the MAC address-table move update feature:

- Enable **mac address-table move transmit** on the switch with flexlinks configured to send MAC address-table move updates.
- Enable **mac address-table move receive** on all upstream switches to process MAC address-table move updates.

Configuring Flex Links

To configure a pair of Flex Links, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(conf)# interface <i>interface-id</i>	Specifies the interface, and enters interface configuration mode. The interface might be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 64.
Step 3	Switch(conf-if)# switchport backup interface <i>interface-id</i>	Configures a physical Layer 2 interface (or port channel) as part of a Flex Link pair with the interface. When one link is forwarding traffic, the other interface is in standby mode.
Step 4	Switch(conf-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show interface [<i>interface-id</i>] switchport backup	Verifies the configuration.
Step 6	Switch# copy running-config startup config	(Optional) Saves your entries in the switch startup configuration file.

To disable a Flex Link backup interface, enter the **no switchport backup interface *interface-id*** interface configuration command.

This example shows how to configure an interface with a backup interface and to verify the configuration:

```
Switch# configure terminal
Switch(conf)# interface fastethernet1/1
Switch(conf-if)# switchport backup interface fastethernet1/2
Switch(conf-if)# end
Switch# show interface switchport backup
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
FastEthernet1/1	FastEthernet1/2	Active Up/Backup Standby
FastEthernet1/3	FastEthernet1/4	Active Up/Backup Standby
Port-channel1	GigabitEthernet1/1	Active Up/Backup Standby

To configure a preemption scheme for a pair of Flex Links, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(conf)# interface <i>interface-id</i>	Specifies the interface, and enters interface configuration mode. The interface might be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 64.
Step 3	Switch(conf-if)# switchport backup interface <i>interface-id</i>	Configures a physical Layer 2 interface (or port channel) as part of a Flex Link pair with the interface. When one link is forwarding traffic, the other interface is in standby mode.
Step 4	Switch(conf-if)# switchport backup interface <i>interface-id</i> <i>preemption mode</i> [<i>forced</i> <i>bandwidth</i> <i>off</i>]	Configures a preemption mechanism and delay for a Flex Link interface pair. You can configure the preemption mode as: <ul style="list-style-type: none"> • forced—the active interface always preempts the backup • bandwidth—the interface with higher bandwidth always acts as the active interface • off—no preemption happens from active to backup
Step 5	Switch(conf-if)# switchport backup interface <i>interface-id</i> <i>preemption delay</i> <i>delay-time</i>	Configures the delay time until a port preempts another port. Note Setting a delay time work only with forced and bandwidth modes.
Step 6	Switch(conf)# end	Returns to privileged EXEC mode.
Step 7	Switch# show interface [<i>interface-id</i>] switchport backup	Verifies the configuration.
Step 8	Switch# copy running-config startup config	(Optional) Saves your entries in the switch startup configuration file.

To remove a preemption scheme, enter the **no switchport backup interface *interface-id* preempt mode** interface configuration command. To reset the delay time to the default, enter the **no switchport backup interface *interface-id* preempt delay** interface configuration command.

This example shows how to configure preemption mode as bandwidth for a backup interface pair and to verify the configuration:

```
Switch# configure terminal
Switch(conf)# interface gigabitethernet1/0/1
Switch(conf-if)# switchport backup interface gigabitethernet1/2
Switch(conf-if)# switchport backup interface gigabitethernet1/2 preempt mode forced
Switch(conf-if)# switchport backup interface gigabitethernet1/2 preempt delay 50
Switch(conf-if)# end
Switch# show interface switchport backup detail
Active Interface      Backup Interface      State
-----
GigabitEthernet1/21  GigabitEthernet1/2    Active Down/Backup Down
Interface Pair       : Gi1/21, Gi1/2
Preemption Mode      : forced
Preemption Delay     : 50 seconds
Bandwidth             : 10000 Kbit (Gi1/1), 10000 Kbit (Gi1/2)
Mac Address Move Update Vlan : auto
```

<output truncated>

Configuring VLAN Load Balancing on Flex Links

To configure VLAN load balancing on Flex Links, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(conf)# interface <i>interface-id</i>	Specifies the interface, and enters interface configuration mode. The interface might be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 48.
Step 3	Switch(conf-if)# switchport backup interface <i>interface-id</i> prefer vlan <i>vlan-range</i>	Configures a physical Layer 2 interface (or port channel) as part of a Flex Links pair with the interface, and specifies the VLANs carried on the interface. The VLAN ID range is 1 to 4094.
Step 4	Switch(conf-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show interfaces [<i>interface-id</i>] switchport backup	Verifies the configuration.
Step 6	Switch# copy running-config startup config	(Optional) Saves your entries in the switch startup configuration file.

To disable the VLAN load balancing feature, enter the **no switchport backup interface *interface-id* prefer vlan *vlan-range*** interface configuration command.

In this example, VLANs 1 to 50, 60, and 100 to 120 are configured on the switch:

```
Switch(config)# interface fastethernet 1/6
Switch(config-if)# switchport backup interface fastethernet 1/0/8 prefer vlan 60,100-120
```

When both interfaces are up, Fast Ethernet port 1/0/8 forwards traffic for VLANs 60 and 100 to 120 and Fast Ethernet port 1/0/6 forwards traffic for VLANs 1 to 50.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
FastEthernet1/6	FastEthernet1/8	Active Up/Backup Standby

```
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Link interface shuts down, VLANs preferred on this interface are moved to the peer interface of the Flex Link pair. In this example, if interface 1/6 shuts down, interface 1/8 carries all VLANs of the Flex Link pair.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
FastEthernet1/6	FastEthernet1/8	Active Down/Backup VLB all

```
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

When a Flex Link interface becomes active, VLANs preferred on this interface are blocked on the peer interface and moved to the forwarding state on the interface that has just come up. In this example, if interface Fast Ethernet port 1/6 becomes active, VLANs preferred on this interface are blocked on the peer interface Fast Ethernet port 1/8 and forwarded on Fast Ethernet port 1/6.

```
Switch# show interfaces switchport backup
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
FastEthernet1/6	FastEthernet1/8	Active VLB cfg/Backup VLB cfg

```
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
```

```
Switch# show interfaces switchport backup detail
Switch Backup Interface Pairs:
```

Active Interface	Backup Interface	State
FastEthernet1/6	FastEthernet1/8	Active VLB cfg/Backup VLB cfg

```
Vlans Preferred on Active Interface: 1-50
Vlans Preferred on Backup Interface: 60, 100-120
Preemption Mode : off
Bandwidth : 10000 Kbit (Fa1/6), 100000 Kbit (Fa1/8)
Mac Address Move Update Vlan : auto
```

Configuring the MAC Address-Table Move Update Feature

This section contains this information:

- Configuring a switch to send MAC address-table move updates
- Configuring a switch to receive MAC address-table move updates

To configure an access switch to send MAC address-table move updates, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(conf)# interface <i>interface-id</i>	Specifies the interface, and enters interface configuration mode. The interface might be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 64.
Step 3	Switch(conf-if)# switchport backup interface <i>interface-id</i> or Switch(conf-if)# switchport backup interface <i>interface-id</i> mmu primary vlan <i>vlan-id</i>	Configures a physical Layer 2 interface (or port channel), as part of a Flex Link pair with the interface. The MAC address-table move update VLAN is the lowest VLAN ID on the interface. Configures a physical Layer 2 interface (or port channel) and specifies the VLAN ID on the interface, which is used for sending the MAC address-table move update. When one link is forwarding traffic, the other interface is in standby mode.
Step 4	Switch(conf-if)# end	Returns to global configuration mode.
Step 5	Switch(conf)# mac address-table move update transmit	Enables the access switch to send MAC address-table move updates to other switches in the network if the primary link shuts down and the switch starts forwarding traffic through the standby link.
Step 6	Switch(conf)# end	Returns to privileged EXEC mode.
Step 7	Switch# show mac address-table move update	Verifies the configuration.
Step 8	Switch# copy running-config startup config	(Optional) Saves your entries in the switch startup configuration file.

To disable the MAC address-table move update feature on the access switch, enter the **no mac address-table move update transmit** interface configuration command. To display the MAC address-table move update information, enter the **show mac address-table move update** command.

This example shows how to configure an access switch to send MAC address-table move update messages and to verify the configuration:

```
Switch# configure terminal
Switch(conf)# interface fastethernet1/1
Switch(conf-if)# switchport backup interface fastethernet1/0/2 mmu primary vlan 2
Switch(conf-if)# end
Switch(conf)# mac address-table move update transmit
Switch(conf)# end
Switch# show mac-address-table move update
Switch-ID : 01d0.2bfc.3180
Dst mac-address : 0180.c200.0010
Vlans/Macs supported : 4096/55000
Default/Current settings: Rcv Off/Off, Xmt Off/On
Max packets per min : Rcv 100, Xmt 120
Rcv packet count : 0
Rcv conforming packet count : 0
```

```

Rcv invalid packet count : 0
Rcv packet count this min : 0
Rcv threshold exceed count : 0
Rcv last sequence# this min : 0
Rcv last interface : None
Rcv last src-mac-address : 0000.0000.0000
Rcv last switch-ID : 0000.0000.0000
Xmt packet count : 0
Xmt packet count this min : 0
Xmt threshold exceed count : 0
Xmt pak buf unavail cnt : 0
Xmt last interface : fa1/2

```

To configure a switch to receive and process MAC address-table move update messages, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(conf)# mac address-table move update receive	Enables the switch to receive and process the MAC address-table move updates.
Step 3	Switch(conf)# end	Returns to privileged EXEC mode.
Step 4	Switch# show mac address-table move update	Verifies the configuration.
Step 5	Switch# copy running-config startup config	(Optional) Saves your entries in the switch startup configuration file.

To disable the MAC address-table move update feature on the access switch, enter the **no mac address-table move update receive** configuration command. To display the MAC address-table move update information, enter the **show mac address-table move update** command.

This example shows how to configure a switch to receive and process MAC address-table move update messages:

```

Switch# configure terminal
Switch(conf)# mac address-table move update receive
Switch(conf)# end

```

Monitoring Flex Links and the MAC Address-Table Move Update

Table 19-1 shows the commands for monitoring the Flex Links configuration and the MAC address-table move update information.

Table 19-1 Flex Links and MAC Address-Table Move Update Monitoring Commands

Command	Purpose
Switch# show interface [<i>interface-id</i>] switchport backup	Displays the Flex Link backup interface configured for an interface or all the configured Flex Links and the state of each active and backup interface (up or standby mode).
Switch# show mac address-table move update	Displays the MAC address-table move update information on the switch.

CHAPTER 20

Configuring Resilient Ethernet Protocol

This chapter describes how to use Resilient Ethernet Protocol (REP) on the Catalyst 4500 series switch. REP is a Cisco proprietary protocol that provides an alternative to Spanning Tree Protocol (STP) to control network loops, handle link failures, and improve convergence time. REP controls a group of ports connected in a segment, ensures that the segment does not create any bridging loops, and responds to link failures within the segment. REP provides a basis for constructing more complex networks and supports VLAN load balancing.

This chapter includes these sections:

- [Understanding REP, page 20-1](#)
- [Configuring REP, page 20-6](#)
- [Monitoring REP, page 20-13](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding REP

One REP segment is a chain of ports connected to each other and configured with a segment ID. Each segment consists of standard (non-edge) segment ports and two user-configured edge ports. A switch can have no more than two ports that belong to the same segment, and each segment port can have only one external neighbor. A segment can go through a shared medium, but on any link only two ports can belong to the same segment. REP is supported only on Layer 2 trunk and PVLAN promiscuous trunk interfaces.

[Figure 20-1](#) shows an example of a segment consisting of six ports spread across four switches. Ports E1 and E2 are configured as edge ports. When all ports are operational (as in the segment on the left), a single port is blocked, shown by the diagonal line. When there is a failure in the network, as shown in the diagram on the right, the blocked port returns to the forwarding state to minimize network disruption.

Figure 20-1 REP Open Segments

The segment shown in Figure 20-1 is an open segment; there is no connectivity between the two edge ports. The REP segment cannot cause a bridging loop and it is safe to connect the segment edges to any network. All hosts connected to switches inside the segment have two possible connections to the rest of the network through the edge ports, but only one connection is accessible at any time. If a failure causes a host to be unable to access its usual gateway, REP unblocks all ports to ensure that connectivity is available through the other gateway.

The segment shown in Figure 20-2, with both edge ports located on the same switch, is a ring segment. In this configuration, there is connectivity between the edge ports through the segment. With this configuration, you can create a redundant connection between any two switches in the segment.

Figure 20-2 REP Ring Segment

REP segments have these characteristics:

- If all ports in the segment are operational, one port (referred to as the *alternate* port) is in the blocked state for each VLAN. If VLAN load balancing is configured, two ports in the segment control the blocked state of VLANs.
- If one or more ports in a segment is not operational, causing a link failure, all ports forward traffic on all VLANs to ensure connectivity.
- In case of a link failure, the alternate ports are unblocked as quickly as possible. When the failed link comes back up, a logically blocked port per VLAN is selected with minimal disruption to the network.

You can construct almost any type of network based on REP segments. REP also supports VLAN load-balancing, controlled by the primary edge port but occurring at any port in the segment.

REP has these limitations:

- You must configure each segment port; an incorrect configuration can cause forwarding loops in the networks.
- REP can manage only a single failed port within the segment; multiple port failures within the REP segment cause loss of network connectivity.
- You should configure REP only in networks with redundancy. Configuring REP in a network without redundancy causes loss of connectivity.

Link Integrity

REP does not use an end-to-end polling mechanism between edge ports to verify link integrity. It implements local link failure detection. When enabled on an interface, the REP Link Status Layer (LSL) detects its REP-aware neighbor and establishes connectivity within the segment. All VLANs are blocked on an interface until it detects the neighbor. After the neighbor is identified, REP determines which neighbor port should become the alternate port and which ports should forward traffic.

Each port in a segment has a unique port ID. The port ID format is similar to that used by the spanning tree algorithm: a port number (unique on the bridge), associated to a MAC address (unique in the network). When a segment port is coming up, its LSL starts sending packets that include the segment ID and the port ID. The port is declared as operational after it performs a three-way handshake with a neighbor in the same segment. A segment port does not become operational if

- No neighbor has the same segment ID.
- More than one neighbor has the same segment ID.
- The neighbor does not acknowledge the local port as a peer.

Each port creates an adjacency with its immediate neighbor. Once the neighbor adjacencies are created, the ports negotiate to determine one blocked port for the segment, the alternate port. All other ports become unblocked. By default, REP packets are sent to a BPDU class MAC address. The packets can also be sent to the Cisco multicast address, which at present is used only to send blocked port advertisement (BPA) messages when there is a failure in the segment. The packets are dropped by devices not running REP.

Fast Convergence

Because REP runs on a physical link basis and not a per-VLAN basis, only one hello message is required for all VLANs, reducing the load on the protocol. We recommend that you create VLANs consistently on all switches in a given segment and configure the same allowed VLANs on the REP trunk and PVLAN promiscuous trunk ports. To avoid the delay introduced by relaying messages in software, REP also allows some packets to be flooded to a regular multicast address. These messages operate at the hardware flood layer (HFL) and are flooded to the whole network, not just the REP segment. Switches that do not belong to the segment treat them as data traffic. You can control flooding of these messages by configuring a dedicated administrative VLAN for the whole domain.

The estimated convergence recovery time is less than 200 ms for the local segment.

VLAN Load Balancing

One edge port in the REP segment acts as the primary edge port; the other as the secondary edge port. It is the primary edge port that always participates in VLAN load balancing in the segment. REP VLAN balancing is achieved by blocking some VLANs at a configured alternate port and all other VLANs at the primary edge port. When you configure VLAN load balancing, you can specify the alternate port in one of three ways:

- By entering the port ID of the interface. To identify the port ID of a port in the segment, enter the **show interface rep detail** interface configuration command for the port.
- By entering the neighbor offset number of a port in the segment, which identifies the downstream neighbor port of an edge port. The neighbor offset number range is -256 to +256; a value of 0 is invalid. The primary edge port has an offset number of 1; positive numbers above 1 identify downstream neighbors of the primary edge port. Negative numbers indicate the secondary edge port (offset number -1) and its downstream neighbors.

Note

You configure offset numbers on the primary edge port by identifying a port's downstream position from the primary (or secondary) edge port. You would never enter an offset value of 1 because that is the offset number of the primary edge port itself.

Figure 20-3 shows neighbor offset numbers for a segment where E1 is the primary edge port and E2 is the secondary edge port. The red numbers inside the ring are numbers offset from the primary edge port; the black numbers outside of the ring show the offset numbers from the secondary edge port. Note that you can identify all ports (except the primary edge port) by either a positive offset number (downstream position from the primary edge port) or a negative offset number (downstream position from the secondary edge port). If E2 became the primary edge port, its offset number would then be 1 and E1 would be -1.

- By entering the **preferred** keyword to select the port that you previously configured as the preferred alternate port with the **rep segment segment-id preferred** interface configuration command.

Figure 20-3 Neighbor Offset Numbers in a Segment

201890

When the REP segment is complete, all VLANs are blocked. When you configure VLAN load balancing, it is triggered in one of two ways:

- You can manually trigger VLAN load balancing at any time by entering the **rep preempt segment *segment-id*** privileged EXEC command on the switch that has the primary edge port.
- You can configure a preempt delay time by entering the **rep preempt delay *seconds*** interface configuration command. After a link failure and recovery, VLAN load balancing begins after the configured preemption time period elapses. Note that the delay timer restarts if another port fails before the time has elapsed.

**Note**

When VLAN load balancing is configured, it does not start working until triggered by either manual intervention or a link failure and recovery.

When VLAN load balancing is triggered, the primary edge port then sends out a message to alert all interfaces in the segment about the preemption. When the message is received by the secondary edge port, it is reflected into the network to notify the alternate port to block the set of VLANs specified in the message and to notify the primary edge port to block the remaining VLANs.

You can also configure a particular port in the segment to block all VLANs. VLAN load balancing is initiated only by the primary edge port and is not possible if the segment is not terminated by an edge port on each end. The primary edge port determines the local VLAN load balancing configuration.

To reconfigure load balancing, you reconfigure the primary edge port. When you change the load balancing configuration, the primary edge port again waits for the **rep preempt segment** command or for the configured preempt delay period after a port failure and recovery before executing the new configuration. If you change an edge port to a regular segment port, the existing VLAN load balancing status does not change. Configuring a new edge port might cause a new topology configuration.

Spanning Tree Interaction

REP does not interact with STP, but can coexist with it. A port that belongs to a segment is removed from spanning tree control and STP BPDUs are not accepted or sent from segment ports. Therefore, STP cannot run on a segment.

To migrate from an STP ring configuration to REP segment configuration, begin by configuring a single port in the ring as part of the segment and continue by configuring contiguous ports to minimize the number of segments. Each segment always contains a blocked port, so multiple segments means multiple blocked ports and a potential loss of connectivity. When the segment has been configured in both directions up to the location of the edge ports, you then configure the edge ports.

REP Ports

Ports in REP segments take one of three roles or states: Failed, Open, or Alternate.

- A port configured as a regular segment port starts as a failed port.
- Once the neighbor adjacencies are determined, the port transitions to alternate port state, blocking all VLANs on the interface. Blocked port negotiations occur and when the segment settles, one blocked port remains in the alternate role and all other ports become open ports.
- When a failure occurs in a link, all ports move to the failed state. When the alternate port receives the failure notification, it changes to the open state, forwarding all VLANs.

A regular segment port converted to an edge port, or an edge port converted to a regular segment port, does not always result in a topology change. If you convert an edge port into a regular segment port, VLAN load balancing is not implemented unless it has been configured. For VLAN load balancing, you must configure two edge ports in the segment.

A segment port that is reconfigured as a spanning tree port restarts according the spanning tree configuration. By default, this is a designated blocking port. If PortFast is configured or if STP is disabled, the port goes into the forwarding state.

Configuring REP

A segment is a collection of ports connected one to the other in a chain and configured with a segment ID. To configure REP segments, you should configure the REP administrative VLAN (or use the default VLAN 1) and then add the ports to the segment using interface configuration mode. You should configure two edge ports in the segment, with one of them the primary edge port and the other by default the secondary edge port. A segment has only one primary edge port. If you configure two ports in a segment as the primary edge port, for example ports on different switches, the REP selects one of them to serve as the segment primary edge port. You can also optionally configure where to send segment topology change notices (STCNs) and VLAN load balancing.

This section includes this information:

- [Default REP Configuration, page 20-6](#)
- [REP Configuration Guidelines, page 20-7](#)
- [Configuring the REP Administrative VLAN, page 20-8](#)
- [Configuring REP Interfaces, page 20-9](#)
- [Setting Manual Preemption for VLAN Load Balancing, page 20-12](#)
- [Configuring SNMP Traps for REP, page 20-13](#)

Default REP Configuration

REP is disabled on all interfaces. When enabled, the interface is a regular segment port unless it is configured as an edge port.

When REP is enabled, the sending of segment topology change notices (STCNs) is disabled, all VLANs are blocked, and the administrative VLAN is VLAN 1.

When VLAN load balancing is enabled, the default is manual preemption with the delay timer disabled. If VLAN load balancing is not configured, the default after manual preemption is to block all VLANs at the primary edge port.

REP Configuration Guidelines

Follow these guidelines when configuring REP:

- We recommend that you begin by configuring one port and then configure the contiguous ports to minimize the number of segments and the number of blocked ports.
- If more than two ports in a segment fail when no external neighbors are configured, one port goes into a forwarding state for the data path to help maintain connectivity during configuration. In the show rep interface privileged EXEC command output, the Port Role for this port shows as *Fail Logical Open*; the Port Role for the other failed port shows as *Fail No Ext Neighbor*. When the external neighbors for the failed ports are configured, the ports go through the alternate port state transitions and eventually go to an open state or remain as the alternate port, based on the alternate port election mechanism.
- REP ports must be Layer 2 dot1Q trunk or PVLAN promiscuous trunk ports.
- Be careful when configuring REP through a Telnet connection. Because REP blocks all VLANs until another REP interface sends a message to unblock it, you might lose connectivity to the switch if you enable REP in a Telnet session that accesses the switch through the same interface.
- You cannot run REP and STP on the same segment or interface.
- If you connect an STP network to the REP segment, be sure that the connection is at the segment edge. An STP connection that is not at the edge could cause a bridging loop because STP does not run on REP segments. All STP BPDUs are dropped at REP interfaces.
- You must configure all trunk and PVLAN promiscuous trunk ports in the segment with the same set of allowed VLANs, or a misconfiguration occurs.
- If REP is enabled on two ports on a switch, both ports must be either regular segment ports or edge ports. REP ports follow these rules:
 - If only one port on a switch is configured in a segment, the port should be an edge port.
 - If two ports on a switch belong to the same segment, both ports must be edge ports or both ports must be regular segment ports.
 - If two ports on a switch belong to the same segment and one is configured as an edge port and one as a regular segment port (a misconfiguration), the edge port is treated as a regular segment port.
- REP interfaces come up in a blocked state and remains in a blocked state until notified that it is safe to unblock. You need to be aware of this to avoid sudden connection losses.
- REP sends all LSL PDUs in untagged frames on the native VLAN. The BPA message sent to the Cisco multicast address is sent on the administration VLAN, which is VLAN 1 by default.
- REP ports can not be configured as one of these port types:
 - SPAN destination port
 - Private VLAN port
 - Tunnel port
 - Access port
- REP is supported on EtherChannels, but not on an individual port that belongs to an EtherChannel.
- There is a maximum of 384 REP segments per switch.

Configuring the REP Administrative VLAN

To avoid the delay introduced by relaying messages in software for link-failure or VLAN-blocking notification during load balancing, REP floods packets at the hardware flood layer (HFL) to a regular multicast address. These messages are flooded to the whole network, not just the REP segment. You can control flooding of these messages by configuring an administrative VLAN for the whole domain.

Follow these guidelines when configuring the REP administrative VLAN:

- If you do not configure an administrative VLAN, the default is VLAN 1.
- There can be only one administrative VLAN on a switch and on a segment. However, this is not enforced by software.
- The administrative VLAN cannot be the RSPAN VLAN.

To configure the REP administrative VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enter global configuration mode.
Step 2	Switch(conf)# rep admin vlan <i>vlan-id</i>	Specify the administrative VLAN. The range is 2 to 4094. The default is VLAN 1. To set the admin VLAN to 1, enter the no rep admin vlan global configuration command.
Step 3	Switch(conf)# end	Return to privileged EXEC mode.
Step 4	Switch# show interface [<i>interface-id</i>] rep detail	Verify the configuration on one of the REP interfaces.
Step 5	Switch# copy running-config startup config	(Optional) Save your entries in the switch startup configuration file.

This example shows how to configure the administrative VLAN as VLAN 100 and verify the configuration by entering the **show interface rep detail** command on one of the REP interfaces:

```
Switch# configure terminal
Switch (conf)# rep admin vlan 100
Switch (conf-if)# end

Switch# show interface gigabitethernet0/1 rep detail
GigabitEthernet0/1 REP enabled
Segment-id: 2 (Edge)
PortID: 00010019E7144680
Preferred flag: No
Operational Link Status: TWO_WAY
Current Key: 0002001121A2D5800E4D
Port Role: Open
Blocked Vlan: <empty>
Admin-vlan: 100
Preempt Delay Timer: disabled
Load-balancing block port: none
Load-balancing block vlan: none
STCN Propagate to: none
LSL PDU rx: 3322, tx: 1722
HFL PDU rx: 32, tx: 5
BPA TLV rx: 16849, tx: 508
BPA (STCN, LSL) TLV rx: 0, tx: 0
BPA (STCN, HFL) TLV rx: 0, tx: 0
```

```
EPA-ELECTION TLV rx: 118, tx: 118
EPA-COMMAND TLV rx: 0, tx: 0
EPA-INFO TLV rx: 4214, tx: 4190
```

Configuring REP Interfaces

For REP operation, you need to enable it on each segment interface and identify the segment ID. This step is required and must be done before other REP configuration. You must also configure a primary and secondary edge port on each segment. All other steps are optional.

To enable and configure REP on an interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(conf)# interface <i>interface-id</i>	Specifies the interface, and enter interface configuration mode. The interface can be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 48.
Step 3	Switch(conf-if)# switchport mode trunk or, switchport mode private-vlan trunk promiscuous	<p>Configures the Layer 2 interface as a Layer 2 trunk port.</p> <p>Configures the Layer 2 interface as a PVLAN promiscuous trunk port.</p> <p>For information on command options for PVLAN promiscuous trunk ports, refer to Configuring a Layer 2 Interface as a Promiscuous PVLAN Trunk Port, page 39-19.</p> <p>Note With REP, only the switchport mode private-vlan trunk promiscuous command is supported; other PVLAN trunk related configurations <i>are not</i> supported.</p>

Command	Purpose
Step 4 Switch(config-if)# rep segment <i>segment-id</i> [edge [primary]] [preferred]	<p>Enables REP on the interface, and identify a segment number. The segment ID range is from 1 to 1024. These optional keywords are available.</p> <p>Note You must configure two edge ports, including one primary edge port for each segment.</p> <ul style="list-style-type: none"> Enter edge to configure the port as an edge port. Entering edge without the primary keyword configures the port as the secondary edge port. Each segment has only two edge ports. (Optional) On an edge port, enter primary to configure the port as the primary edge port, the port on which you can configure VLAN load balancing. <p>Note Although each segment can have only one primary edge port, if you configure edge ports on two different switches and enter the primary keyword on both switches, the configuration is allowed. However, REP selects only one of these ports as the segment primary edge port. You can identify the primary edge port for a segment by entering the show rep topology privileged EXEC command.</p> <ul style="list-style-type: none"> (Optional) Enter preferred to indicate that the port is the preferred alternate port or the preferred port for VLAN load balancing. <p>Note Configuring a port as preferred does not guarantee that it becomes the alternate port; it merely gives it a slight edge among equal contenders. The alternate port is usually a previously failed port.</p>
Step 5 Switch(config-if)# rep stcn { interface <i>interface-id</i> segment <i>id-list</i> stp }	<p>(Optional) Configures the edge port to send segment topology change notices (STCNs).</p> <ul style="list-style-type: none"> Enter interface <i>interface-id</i> to designate a physical interface or port channel to receive STCNs. Enter segment <i>id-list</i> to identify one or more segments to receive STCNs. The range is 1 to 1024. Enter stp to send STCNs to STP networks.

	Command	Purpose
Step 6	Switch(conf-if)# rep block port { id <i>port-id</i> <i>neighbor_offset</i> preferred } vlan { <i>vlan-list</i> all }	<p>(Optional) Configures VLAN load balancing on the primary edge port, identify the REP alternate port in one of three ways, and configure the VLANs to be blocked on the alternate port.</p> <ul style="list-style-type: none"> Enter the id <i>port-id</i> to identify the alternate port by port ID. The port ID is automatically generated for each port in the segment. You can view interface port IDs by entering the show interface interface-id rep [detail] privileged EXEC command. Enter a <i>neighbor_offset</i> number to identify the alternate port as a downstream neighbor from an edge port. The range is from -256 to 256, with negative numbers indicating the downstream neighbor from the secondary edge port. A value of 0 is invalid. Enter -1 to identify the secondary edge port as the alternate port. See Figure 20-3 on page 20-4 for an example of neighbor offset numbering. <p>Note Because you enter this command at the primary edge port (offset number 1), you would never enter an offset value of 1 to identify an alternate port.</p> <ul style="list-style-type: none"> Enter preferred to select the regular segment port previously identified as the preferred alternate port for VLAN load balancing. Enter vlan <i>vlan-list</i> to block one VLAN or a range of VLANs. Enter vlan all to block all VLANs. <p>Note Enter this command only on the REP primary edge port.</p>
Step 7	Switch(conf-if)# rep preempt delay <i>seconds</i>	<p>(Optional) You must enter this command and configure a preempt time delay if you want VLAN load balancing to automatically trigger after a link failure and recovery. The time delay range is 15 to 300 seconds. The default is manual preemption with no time delay.</p> <p>Note Enter this command only on the REP primary edge port.</p>
Step 8	Switch(conf-if)# end	Returns to privileged EXEC mode.
Step 9	Switch# show interface [<i>interface-id</i>] rep [detail]	Verifies the REP interface configuration.
Step 10	Switch# copy running-config startup config	(Optional) Saves your entries in the switch startup configuration file.

Enter the **no** form of each command to return to the default configuration. Enter the **show rep topology** privileged EXEC command to see which port in the segment is the primary edge port.

This example shows how to configure an interface as the primary edge port for segment 1, to send STCNs to segments 2 through 5, and to configure the alternate port as the port with port ID 0009001818D68700 to block all VLANs after a preemption delay of 60 seconds after a segment port failure and recovery.

```
Switch# configure terminal
Switch(conf)# interface gigabitethernet0/1
Switch(conf-if)# rep segment 1 edge primary
Switch(conf-if)# rep stcn segment 2-5
Switch(conf-if)# rep block port 0009001818D68700 vlan all
Switch(conf-if)# rep preempt delay 60
Switch(conf-if)# end
```

This example shows how to configure the VLAN blocking configuration shown in Figure 20-4. The alternate port is the neighbor with neighbor offset number 4. After manual preemption, VLANs 100-200 are blocked at this port and all other VLANs are blocked at the primary edge port E1 (Gigabit Ethernet port 0/1).

```
Switch# configure terminal
Switch (conf)# interface gigabitethernet0/1
Switch (conf-if)# rep segment 1 edge primary
Switch (conf-if)# rep block port 4 vlan 100-200
Switch (conf-if)# end
```

Figure 20-4 Example of VLAN Blocking

Setting Manual Preemption for VLAN Load Balancing

If you do not enter the **rep preempt delay seconds** interface configuration command on the primary edge port to configure a preemption time delay, the default is to manually trigger VLAN load balancing on the segment. Be sure that all other segment configuration has been completed before manually preempting VLAN load balancing. When you enter the **rep preempt segment segment-id** command, a confirmation message appears before the command is executed because preemption can cause network disruption.

To manually trigger VLAN load balancing on a segment on the switch that has the segment primary edge port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(conf)# interface interface-id	Specifies the interface, and enter interface configuration mode. The interface can be a physical Layer 2 interface or a port channel (logical interface). The port-channel range is 1 to 48.
Step 3	Switch(conf-if)# rep preempt segment segment-id	Manually triggers VLAN load balancing on the segment. You will need to confirm the command before it is executed.
Step 4	Switch(conf-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show rep topology	Displays REP topology information.

Configuring SNMP Traps for REP

To configure the switch to send REP-specific traps to notify the SNMP server of link operational status changes and port role changes, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# snmp mib rep trap-rate value	Enables the switch to send REP traps, and set the number of traps sent per second. The range is from 0 to 1000. The default is 0 (no limit imposed; a trap is sent at every occurrence).
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show running-config	Verifies the REP trap configuration.
Step 5	Switch# copy running-config startup config	(Optional) Saves your entries in the switch startup configuration file.

To remove the trap, enter the **no snmp mib rep trap-rate** global configuration command.

This example configures the switch to send REP traps at a rate of 10 per second:

```
Switch(config)# snmp mib rep trap-rate 10
```

Monitoring REP

To monitor REP, enter the following privileged EXEC commands (Table 20-1).

Table 20-1 REP Monitoring Commands

Command	Purpose
Switch# show interface [interface-id] rep [detail]	Displays REP configuration and status for a specified interface or for all interfaces.
Switch# show rep topology [segment segment_id] [archive] [detail]	Displays REP topology information for a segment or for all segments, including the primary and secondary edge ports in the segment.

CHAPTER 21

Configuring Optional STP Features

This chapter describes the Spanning Tree Protocol (STP) features supported on the Catalyst 4500 series switch. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- [Overview of Root Guard, page 21-2](#)
- [Enabling Root Guard, page 21-2](#)
- [Overview of Loop Guard, page 21-3](#)
- [Enabling Loop Guard, page 21-5](#)
- [Overview of EtherChannel Guard, page 21-6](#)
- [Enabling EtherChannel Guard \(Optional\), page 21-6](#)
- [Overview of PortFast, page 21-7](#)
- [Enabling PortFast, page 21-7](#)
- [Overview of BPDU Guard, page 21-8](#)
- [Enabling BackboneFast, page 21-16](#)
- [Overview of PortFast BPDU Filtering, page 21-9](#)
- [Enabling BackboneFast, page 21-16](#)
- [Overview of UplinkFast, page 21-11](#)
- [Enabling UplinkFast, page 21-12](#)
- [Overview of BackboneFast, page 21-13](#)
- [Enabling BackboneFast, page 21-16](#)

Note

For information on configuring STP, see [Chapter 18, “Configuring STP and MST.”](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*

and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Root Guard

Spanning Tree root guard forces an interface to become a designated port, to protect the current root status and prevent surrounding switches from becoming the root switch.

When you enable root guard on a per-port basis, it is automatically applied to all of the active VLANs to which that port belongs. When you disable root guard, it is disabled for the specified port and the port automatically goes into the listening state.

When a switch that has ports with root guard enabled detects a new root, the ports goes into root-inconsistent state. Then, when the switch no longer detects a new root, its ports automatically go into the listening state.

Enabling Root Guard

To enable root guard on a Layer 2 access port (to force it to become a designated port), perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {{fastethernet gigabitethernet tengigabitethernet} slot/port}	Specifies an interface to configure.
Step 2	Switch(config-if)# [no] spanning-tree guard root	Enables root guard. You can use the no keyword to disable Root Guard.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show spanning-tree	Verifies the configuration.

This example shows how to enable root guard on Fast Ethernet interface 5/8:

```
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree guard root
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show running-config interface fastethernet 5/8
Building configuration...

Current configuration: 67 bytes
!
interface FastEthernet5/8
 switchport mode access
 spanning-tree guard root
end

Switch#
```

This example shows how to determine whether any ports are in root inconsistent state:

```
Switch# show spanning-tree inconsistentports
```

Name	Interface	Inconsistency
VLAN0001	FastEthernet3/1	Root Inconsistent
VLAN0001	FastEthernet3/2	Root Inconsistent
VLAN1002	FastEthernet3/1	Root Inconsistent
VLAN1002	FastEthernet3/2	Root Inconsistent
VLAN1003	FastEthernet3/1	Root Inconsistent
VLAN1003	FastEthernet3/2	Root Inconsistent
VLAN1004	FastEthernet3/1	Root Inconsistent
VLAN1004	FastEthernet3/2	Root Inconsistent
VLAN1005	FastEthernet3/1	Root Inconsistent
VLAN1005	FastEthernet3/2	Root Inconsistent

```
Number of inconsistent ports (segments) in the system :10
```

Overview of Loop Guard

Loop guard helps prevent bridging loops that could occur because of a unidirectional link failure on a point-to-point link. When enabled globally, loop guard applies to all point-to-point ports on the system. Loop guard detects root ports and blocked ports and ensures that they keep receiving BPDUs from their designated port on the segment. If a loop-guard-enabled root or blocked port stop receiving BPDUs from its designated port on the segment, it transitions to the blocking state, assuming there is a physical link error on this port. The port recovers from this state as soon as it receives a BPDU.

You can enable loop guard on a per-port basis. When you enable loop guard, it is automatically applied to all of the active instances or VLANs to which that port belongs. When you disable loop guard, it is disabled for the specified ports. Disabling loop guard moves all loop-inconsistent ports to the listening state.

If you enable loop guard on a channel and the first link becomes unidirectional, loop guard blocks the entire channel until the affected port is removed from the channel. [Figure 21-1](#) shows loop guard in a triangular switch configuration.

Figure 21-1 Triangular Switch Configuration with Loop Guard

55772

Figure 21-1 illustrates the following configuration:

- Switches A and B are distribution switches.
- Switch C is an access switch.
- Loop guard is enabled on ports 3/1 and 3/2 on Switches A, B, and C.

Enabling loop guard on a root switch has no effect but provides protection when a root switch becomes a nonroot switch.

Follow these guidelines when using loop guard:

- Do not enable loop guard on PortFast-enabled or dynamic VLAN ports.
- Do not enable loop guard if root guard is enabled.

Loop guard interacts with other features as follows:

- Loop guard does not affect the functionality of UplinkFast or BackboneFast.
- Enabling loop guard on ports that are not connected to a point-to-point link does not work.
- Root guard forces a port to always be the root port. Loop guard is effective only if the port is a root port or an alternate port. You cannot enable loop guard and root guard on a port at the same time.
- Loop guard uses the ports known to spanning tree. Loop guard can take advantage of logical ports provided by the Port Aggregation Protocol (PAgP). However, to form a channel, all the physical ports grouped in the channel must have compatible configurations. PAgP enforces uniform configurations of root guard or loop guard on all the physical ports to form a channel.

These caveats apply to loop guard:

- Spanning tree always chooses the first operational port in the channel to send the BPDUs. If that link becomes unidirectional, loop guard blocks the channel, even if other links in the channel are functioning properly.
- If a set of ports that are already blocked by loop guard are grouped together to form a channel, spanning tree loses all the state information for those ports and the new channel port may obtain the forwarding state with a designated role.
- If a channel is blocked by loop guard and the channel breaks, spanning tree loses all the state information. The individual physical ports may obtain the forwarding state with the designated role, even if one or more of the links that formed the channel are unidirectional.

**Note**

You can enable UniDirectional Link Detection (UDLD) to help isolate the link failure. A loop may occur until UDLD detects the failure, but loop guard is not able to detect it.

- Loop guard has no effect on a disabled spanning tree instance or a VLAN.

Enabling Loop Guard

You can enable loop guard globally or per port.

To enable loop guard globally on the switch, perform this task:

	Command	Purpose
Step 1	Switch(config)# spanning-tree loopguard default	Enables loop guard globally on the switch.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning tree interface 4/4 detail	Verifies the configuration impact on a port.

This example shows how to enable loop guard globally:

```
Switch(config)# spanning-tree loopguard default
Switch(config)# Ctrl-Z
```

This example shows how to verify the previous configuration of port 4/4:

```
Switch# show spanning-tree interface fastethernet 4/4 detail
Port 196 (FastEthernet4/4) of VLAN0010 is forwarding
Port path cost 1000, Port priority 160, Port Identifier 160.196.
Designated root has priority 32768, address 00d0.00b8.140a
Designated bridge has priority 32768, address 00d0.00b8.140a
Designated port id is 160.196, designated path cost 0
Timers:message age 0, forward delay 0, hold 0
Number of transitions to forwarding state:1
The port is in the portfast mode by portfast trunk configuration
Link type is point-to-point by default
Bpdu filter is enabled
Loop guard is enabled by default on the port
BPDU:sent 0, received 0
```

To enable loop guard on an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {type slot/port} {port-channel port_channel_number}	Selects an interface to configure.
Step 2	Switch(config-if)# spanning-tree guard loop	Configures loop guard.
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show spanning tree interface 4/4 detail	Verifies the configuration impact on that port.

This example shows how to enable loop guard on port 4/4:

```
Switch(config)# interface fastEthernet 4/4
Switch(config-if)# spanning-tree guard loop
Switch(config-if)# ^Z
```

This example shows how to verify the configuration impact on port 4/4:

```
Switch# show spanning-tree interface fastEthernet 4/4 detail
Port 196 (FastEthernet4/4) of VLAN0010 is forwarding
  Port path cost 1000, Port priority 160, Port Identifier 160.196.
  Designated root has priority 32768, address 00d0.00b8.140a
  Designated bridge has priority 32768, address 00d0.00b8.140a
  Designated port id is 160.196, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  The port is in the portfast mode by portfast trunk configuration
  Link type is point-to-point by default
  Bpdu filter is enabled
  Loop guard is enabled on the port
  BPDU:sent 0, received 0
Switch#
```

Overview of EtherChannel Guard

You can use EtherChannel guard to detect an EtherChannel misconfiguration between the switch and a connected device. A misconfiguration can occur if the interfaces of a switch are manually configured in an EtherChannel, and one or more interfaces on the other device are not. For EtherChannel configuration guidelines, see the “[EtherChannel Configuration Guidelines and Restrictions](#)” section on page 22-5.

Note

EtherChannel guard applies only to EtherChannels in forced mode (that is, “manually configured”) rather than through PAgP or LACP.

If the switch detects a misconfiguration on the other device, EtherChannel guard error-disables all interfaces in the EtherChannel bundle, and displays an error message.

You can enable this feature with the **spanning-tree etherchannel guard misconfig** global configuration command.

Enabling EtherChannel Guard (Optional)

You can enable EtherChannel guard to detect an EtherChannel misconfiguration if your switch is running PVST+, rapid PVST+, or MSTP.

To enable EtherChannel guard, perform this task:

	Command	Purpose
Step 1	Switch(config)# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# spanning-tree etherchannel guard misconfig	Enables EtherChannel guard.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch(config)# show spanning-tree summary	Verifies your entries.
Step 5	Switch(config)# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable the EtherChannel guard feature, use the **no spanning-tree etherchannel guard misconfig** global configuration command.

You can use the **show interfaces status err-disabled** privileged EXEC command to show which switch ports are disabled because of an EtherChannel misconfiguration. On the remote device, you can enter the **show etherchannel summary** privileged EXEC command to verify the EtherChannel configuration.

After the configuration is corrected, enter the **shutdown** and **no shutdown** interface configuration commands on the port-channel interfaces that were misconfigured.

Overview of PortFast

Spanning Tree PortFast causes an interface configured as a Layer 2 access port to enter the forwarding state immediately, bypassing the listening and learning states. You can use PortFast on Layer 2 access ports connected to a single workstation or server to allow those devices to connect to the network immediately, rather than waiting for spanning tree to converge. Even if the interface receives a bridge protocol data unit (BPDU), spanning tree will not place the port into the blocking state but it will set the port's operating state to *non-port fast* even if the configured state remains *port fast* and starts participating in the Topology change.

Note

Because the purpose of PortFast is to minimize the time that access ports must wait for spanning tree to converge, it is most effective when used on access ports. If you enable PortFast on a port connecting to another switch, you risk creating a spanning tree loop.

Enabling PortFast

Caution

Use PortFast *only* when connecting a single end station to a Layer 2 access port. Otherwise, you might create a network loop.

To enable PortFast on a Layer 2 access port to force it to enter the forwarding state immediately, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {{fastethernet gigabitethernet tengigabitethernet} slot/port} {port-channel port_channel_number}	Specifies an interface to configure.
Step 2	Switch(config-if)# [no] spanning-tree portfast	Enables PortFast on a Layer 2 access port connected to a single workstation or server. You can use the no keyword to disable PortFast.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show running interface {{fastethernet gigabitethernet tengigabitethernet} slot/port} {port-channel port_channel_number}	Verifies the configuration.

This example shows how to enable PortFast on Fast Ethernet interface 5/8:

```
Switch(config)# interface fastethernet 5/8
Switch(config-if)# spanning-tree portfast
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show running-config interface fastethernet 5/8
Building configuration...

Current configuration:
!
interface FastEthernet5/8
 no ip address
 switchport
 switchport access vlan 200
 switchport mode access
 spanning-tree portfast
end

Switch#
```

Overview of BPDU Guard

Spanning Tree BPDU guard shuts down PortFast-configured interfaces that receive BPDUs, rather than putting them into the spanning tree blocking state. In a valid configuration, PortFast-configured interfaces do not receive BPDUs. Reception of a BPDU by a PortFast-configured interface signals an invalid configuration, such as connection of an unauthorized device. BPDU guard provides a secure response to invalid configurations, because the administrator must manually put the interface back in service.

Note

When the BPDU guard feature is enabled, spanning tree applies the BPDU guard feature to all PortFast-configured interfaces.

To prevent the port from shutting down, you can use the **errdisable detect cause bpduguard shutdown vlan** global configuration command to shut down just the offending VLAN on the port where the violation occurred.

Enabling BPDU Guard

To enable BPDU guard to shut down PortFast-configured interfaces that receive BPDUs, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree portfast bpduguard	Enables BPDU guard on all the switch's PortFast-configured interfaces. You can use the no keyword to disable BPDU guard.

	Command	Purpose
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree summary totals	Verifies the BPDU configuration.

This example shows how to enable BPDU guard:

```
Switch(config)# spanning-tree portfast bpduguard
Switch(config)# end
Switch#
```

This example shows how to verify the BPDU configuration:

```
Switch# show spanning-tree summary totals
```

```
Root bridge for: none.
PortFast BPDU Guard is enabled
Etherchannel misconfiguration guard is enabled
UplinkFast is disabled
BackboneFast is disabled
Default pathcost method used is short
```

Name	Blocking	Listening	Learning	Forwarding	STP Active
-----	-----	-----	-----	-----	-----
34 VLANs	0	0	0	36	36

Switch#

Overview of PortFast BPDU Filtering

Cisco IOS Release 12.2(25)EW and later support PortFast BPDU filtering, which allows the administrator to prevent the system from sending or even receiving BPDUs on specified ports.

When configured globally, PortFast BPDU filtering applies to all operational PortFast ports. Ports in an operational PortFast state are supposed to be connected to hosts that typically drop BPDUs. If an operational PortFast port receives a BPDU, it immediately loses its operational PortFast status. In that case, PortFast BPDU filtering is disabled on this port and STP resumes sending BPDUs on this port.

PortFast BPDU filtering can also be configured on a per-port basis. When PortFast BPDU filtering is explicitly configured on a port, it does not send any BPDUs and drops all BPDUs it receives.

Caution

Explicitly configuring PortFast BPDU filtering on a port that is not connected to a host can result in bridging loops, because the port ignores any BPDU it receives and goes to the forwarding state.

When you enable PortFast BPDU filtering globally and set the port configuration as the default for PortFast BPDU filtering (see the [“Enabling BackboneFast”](#) section on page 21-16), PortFast enables or disables PortFast BPDU filtering.

If the port configuration is not set to default, then the PortFast configuration does not affect PortFast BPDU filtering. [Table 21-1](#) lists all the possible PortFast BPDU filtering combinations. PortFast BPDU filtering allows access ports to move directly to the forwarding state as soon as the end hosts are connected.

Table 21-1 PortFast BPDU Filtering Port Configurations

Per-Port Configuration	Global Configuration	PortFast State	PortFast BPDU Filtering State
Default	Enable	Enable	Enable ¹
Default	Enable	Disable	Disable
Default	Disable	Not applicable	Disable
Disable	Not applicable	Not applicable	Disable
Enable	Not applicable	Not applicable	Enable

1. The port transmits at least 10 BPDUs. If this port receives any BPDUs, then PortFast and PortFast BPDU filtering are disabled.

Enabling PortFast BPDU Filtering

To enable PortFast BPDU filtering globally, perform this task:

	Command	Purpose
Step 1	Switch(config)# spanning-tree portfast bpdufilter default	Enables BPDU filtering globally on the switch.
Step 2	Switch# show spanning-tree summary totals	Verifies the BPDU configuration.

This example shows how to enable PortFast BPDU filtering on a port:

```
Switch(config)# spanning-tree portfast bpdufilter default
Switch(config)# Ctrl-Z
```

This example shows how to verify the BPDU configuration in PVST+ mode:

```
Switch# show spanning-tree summary totals
Root bridge for:VLAN0010
EtherChannel misconfiguration guard is enabled
Extended system ID is disabled
Portfast is enabled by default
PortFast BPDU Guard is disabled by default
Portfast BPDU Filter is enabled by default
Loopguard is disabled by default
UplinkFast is disabled
BackboneFast is disabled
Pathcost method used is long

Name Blocking Listening Learning Forwarding STP Active
-----
2 vlans 0 0 0 3 3

Switch#
```

Note

For PVST+ information, see [Chapter 18, “Configuring STP and MST.”](#)

To enable PortFast BPDU filtering, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface fastEthernet 4/4	Selects the interface to configure.
Step 2	Switch(config-if)# spanning-tree bpdupfilter enable	Enables BPDU filtering.
Step 3	Switch# show spanning-tree interface fastethernet 4/4	Verifies the configuration.

This example shows how to enable PortFast BPDU filtering on port 4/4:

```
Switch(config)# interface fastethernet 4/4
Switch(config-if)# spanning-tree bpdupfilter enable
Switch(config-if)# ^Z
```

This example shows how to verify that PortFast BPDU filtering is enabled:

```
Switch# show spanning-tree interface fastethernet 4/4
```

Vlan	Role	Sts	Cost	Prio.Nbr	Status
-----	-----	-----	-----	-----	-----
VLAN0010	Desg	FWD	1000	160.196	Edge P2p

This example shows more detail on the port:

```
Switch# show spanning-tree interface fastEthernet 4/4 detail
Port 196 (FastEthernet4/4) of VLAN0010 is forwarding
  Port path cost 1000, Port priority 160, Port Identifier 160.196.
  Designated root has priority 32768, address 00d0.00b8.140a
  Designated bridge has priority 32768, address 00d0.00b8.140a
  Designated port id is 160.196, designated path cost 0
  Timers:message age 0, forward delay 0, hold 0
  Number of transitions to forwarding state:1
  The port is in the portfast mode by portfast trunk configuration
  Link type is point-to-point by default
  Bpdu filter is enabled
  BPDU:sent 0, received 0
Switch#
```

Overview of UplinkFast

Note

UplinkFast is most useful in wiring-closet switches. This feature might not be useful for other types of applications.

Spanning Tree UplinkFast provides fast convergence after a direct link failure and uses uplink groups to achieve load balancing between redundant Layer 2 links. Convergence is the speed and ability of a group of internetworking devices running a specific routing protocol to agree on the topology of an internetwork after a change in that topology. An uplink group is a set of Layer 2 interfaces (per VLAN), only one of which is forwarding at any given time. Specifically, an uplink group consists of the root port (which is forwarding) and a set of blocked ports, except for self-looping ports. The uplink group provides an alternate path in case the currently forwarding link fails.

Figure 21-2 shows an example of a topology with no link failures. Switch A, the root switch, is connected directly to Switch B over link L1 and to Switch C over link L2. The Layer 2 interface on Switch C that is connected directly to Switch B is in the blocking state.

Figure 21-2 UplinkFast Before Direct Link Failure

If Switch C detects a link failure on the currently active link L2 on the root port (a direct link failure), UplinkFast unblocks the blocked port on Switch C and transitions it to the forwarding state without going through the listening and learning states, as shown in Figure 21-3. This switchover takes approximately one to five seconds.

Figure 21-3 UplinkFast After Direct Link Failure

Enabling UplinkFast

UplinkFast increases the bridge priority to 49,152 and adds 3000 to the spanning tree port cost of all interfaces on the switch, making it unlikely that the switch becomes the root switch. The *max_update_rate* value represents the number of multicast packets transmitted per second (the default is 150 packets per second [pps]).

UplinkFast cannot be enabled on VLANs that have been configured for bridge priority. To enable UplinkFast on a VLAN with bridge priority configured, restore the bridge priority on the VLAN to the default value by entering a **no spanning-tree vlan *vlan_ID* priority** command in global configuration mode.

Note

When you enable UplinkFast, it affects all VLANs on the switch. You cannot configure UplinkFast on an individual VLAN.

To enable UplinkFast, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree uplinkfast [max-update-rate max_update_rate]	Enables UplinkFast. You can use the no keyword to disable UplinkFast and restore the default rate, use the command
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree vlan vlan_ID	Verifies that UplinkFast is enabled on that VLAN.

This example shows how to enable UplinkFast with a maximum update rate of 400 pps:

```
Switch(config)# spanning-tree uplinkfast max-update-rate 400
Switch(config)# exit
Switch#
```

This example shows how to verify which VLANs have UplinkFast enabled:

```
Switch# show spanning-tree uplinkfast
UplinkFast is enabled

Station update rate set to 150 packets/sec.

Overview of BackboneFast

BackboneFast is a complementary technology to UplinkFast. Whereas UplinkFast is designed to quickly respond to failures on links directly connected to leaf-node switches, it does not help with indirect failures in the backbone core. BackboneFast optimizes based on the Max Age setting. It allows the default convergence time for indirect failures to be reduced from 50 seconds to 30 seconds. However, it never eliminates forward delays and offers no assistance for direct failures.

Note

BackboneFast should be enabled on every switch in your network.

Sometimes a switch receives a BPDU from a designated switch that identifies the root bridge and the designated bridge as the same switch. Because this shouldn't happen, the BPDU is considered inferior.

BPDU is considered inferior when a link from the designated switch has lost its link to the root bridge. The designated switch transmits the BPDUs with the information that it is now the root bridge as well as the designated bridge. The receiving switch ignores the inferior BPDU for the time defined by the Max Age setting.

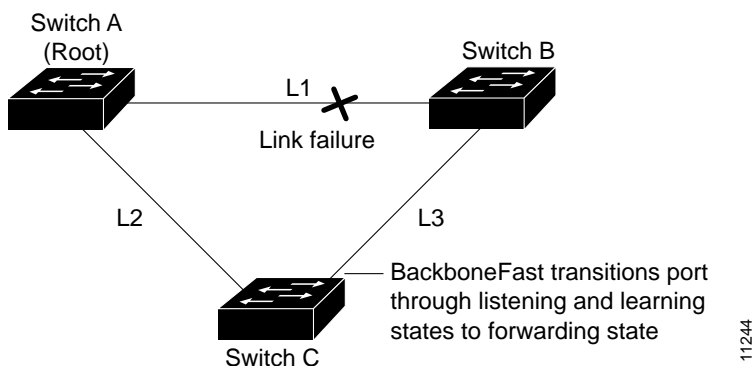

After receiving inferior BPDUs, the receiving switch tries to determine if there is an alternate path to the root bridge.

- If the port that the inferior BPDUs are received on is already in blocking mode, then the root port and other blocked ports on the switch become alternate paths to the root bridge.
- If the inferior BPDUs are received on a root port, then all presently blocking ports become the alternate paths to the root bridge. Also, if the inferior BPDUs are received on a root port and there are no other blocking ports on the switch, the receiving switch assumes that the link to the root bridge is down and the time defined by the Max Age setting expires, which turns the switch into the root switch.

If the switch finds an alternate path to the root bridge, it uses this new alternate path. This new path, and any other alternate paths, are used to send a Root Link Query (RLQ) BPDU. When BackboneFast is enabled, the RLQ BPDUs are sent out as soon as an inferior BPDU is received. This process can enable faster convergence in the event of a backbone link failure.

Figure 21-4 shows an example of a topology with no link failures. Switch A, the root switch, connects directly to Switch B over link L1 and to Switch C over link L2. In this example, because switch B has a lower priority than A but higher than C, switch B becomes the designated bridge for L3. Consequently, the Layer 2 interface on Switch C that connects directly to Switch B must be in the blocking state.

Figure 21-4 BackboneFast Before Indirect Link Failure

Next, assume that L1 fails. Switch A and Switch B, the switches directly connected to this segment, instantly know that the link is down. The blocking interface on Switch C must enter the forwarding state for the network to recover by itself. However, because L1 is not directly connected to Switch C, Switch C does not start sending any BPDUs on L3 under the normal rules of STP until the time defined by the Max Age setting has expired.

In an STP environment without BackboneFast, if L1 should fail, Switch C cannot detect this failure because it is not connected directly to link L1. However, because Switch B is directly connected to the root switch over L1, Switch B detects the failure and elects itself the root. Then Switch B begins sending configuration BPDUs to Switch C, listing itself as the root.

Here is what happens additionally when you use BackboneFast to eliminate the time defined by the Max Age setting (20-second) delay:

1. When Switch C receives the inferior configuration BPDUs from Switch B, Switch C infers that an indirect failure has occurred.
2. Switch C then sends out an RLQ.
3. Switch A receives the RLQ. Because Switch A is the root bridge, it replies with an RLQ response, listing itself as the root bridge.
4. When Switch C receives the RLQ response on its existing root port, it knows that it still has a stable connection to the root bridge. Because Switch C originated the RLQ request, it does not need to forward the RLQ response on to other switches.
5. BackboneFast allows the blocked port on Switch C to move immediately to the listening state without waiting for the time defined by the Max Age setting for the port to expire.
6. BackboneFast transitions the Layer 2 interface on Switch C to the forwarding state, providing a path from Switch B to Switch A.

This switchover takes approximately 30 seconds, twice the Forward Delay time if the default forward delay time of 15 seconds is set.

Figure 21-5 shows how BackboneFast reconfigures the topology to account for the failure of link L1.

Figure 21-5 BackboneFast after Indirect Link Failure

If a new switch is introduced into a shared-medium topology as shown in Figure 21-6, BackboneFast is not activated, because the inferior BPDUs did not come from the recognized designated bridge (Switch B). The new switch begins sending inferior BPDUs that say it is the root switch. However, the other switches ignore these inferior BPDUs, and the new switch learns that Switch B is the designated bridge to Switch A, the root switch.

Figure 21-6 Adding a Switch in a Shared-Medium Topology

Enabling BackboneFast

Note

For BackboneFast to work, you must enable it on all switches in the network. BackboneFast is supported for use with third-party switches but it is not supported on Token Ring VLANs.

To enable BackboneFast, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] spanning-tree backbonefast	Enables BackboneFast. You can use the no keyword to disable BackboneFast.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show spanning-tree backbonefast	Verifies that BackboneFast is enabled.

This example shows how to enable BackboneFast:

```
Switch(config)# spanning-tree backbonefast
Switch(config)# end
Switch#
```

This example shows how to verify that BackboneFast is enabled:

```
Switch# show spanning-tree backbonefast
BackboneFast is enabled

BackboneFast statistics
-----

CHAPTER 22

Configuring EtherChannel

This chapter describes how to use the command-line interface (CLI) to configure EtherChannel on the Catalyst 4500 series switch Layer 2 or Layer 3 interfaces. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- [EtherChannel Overview, page 22-1](#)
- [EtherChannel Configuration Guidelines and Restrictions, page 22-5](#)
- [Configuring EtherChannel, page 22-6](#)
- [Displaying EtherChannel to a Virtual Switch System, page 22-15](#)

Note

The commands in the following sections can be used on all Ethernet interfaces on a Catalyst 4500 series switch, including the uplink ports on the supervisor engine.

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

EtherChannel Overview

EtherChannel bundles up to eight individual Ethernet links into a single logical link that provides an aggregate bandwidth of up to 800 Mbps (Fast EtherChannel), 8 Gbps (Gigabit EtherChannel), or 80 Gbps (10 Gigabit EtherChannel) between a Catalyst 4500 or 4500X series switch and another switch or host.

**Note**

Because some linecards have a maximum bandwidth capacity toward the backplane, they can limit the aggregate bandwidth of an Etherchannel when all the Etherchannel members belong to the same linecard.

A Catalyst 4500 series switch supports a maximum of 64 EtherChannels. You can form an EtherChannel with up to eight compatibly configured Ethernet interfaces across modules in a Catalyst 4500 series switch. All interfaces in each EtherChannel must be the same speed and must be configured as either Layer 2 or Layer 3 interfaces.

**Note**

The network device to which a Catalyst 4500 series switch is connected may impose its own limits on the number of interfaces in an EtherChannel.

If a segment within an EtherChannel fails, traffic previously carried over the failed link switches to the remaining segments within the EtherChannel. When the segment fails, an SNMP trap is sent, identifying the switch, the EtherChannel, and the failed link. Inbound broadcast and multicast packets on one segment in an EtherChannel are blocked from returning on any other segment of the EtherChannel.

**Note**

The port channel link failure switchover for the Catalyst 4500 series switch was measured at 50 ms, giving you SONET-like link failure switchover time.

These subsections describe how EtherChannel works:

- [Port-Channel Interfaces, page 22-2](#)
- [How EtherChannels Are Configured, page 22-2](#)
- [Load Balancing, page 22-5](#)

Port-Channel Interfaces

Each EtherChannel has a numbered port-channel interface. A configuration applied to the port-channel interface affects all physical interfaces assigned to that interface.

**Note**

QoS does not propagate to members. The defaults, QoS cos = 0 and QoS dscp = 0, apply on the portchannel. Input or output policies applied on individual interfaces are ignored.

After you configure an EtherChannel, the configuration that you apply to the port-channel interface affects the EtherChannel; the configuration that you apply to the physical interfaces affects only the interface where you apply the configuration. To change the parameters of all ports in an EtherChannel, apply configuration commands to the port-channel interface (such commands can be STP commands or commands to configure a Layer 2 EtherChannel as a trunk).

How EtherChannels Are Configured

These subsections describe how EtherChannels are configured:

- [EtherChannel Configuration Overview, page 22-3](#)
- [Manual EtherChannel Configuration, page 22-3](#)

- [PAgP EtherChannel Configuration, page 22-3](#)
- [IEEE 802.3ad LACP EtherChannel Configuration, page 22-4](#)

EtherChannel Configuration Overview

You can configure EtherChannels manually or you can use the Port Aggregation Control Protocol (PAgP) or, with Cisco IOS Release 12.2(25)EWA and later, the Link Aggregation Control Protocol (LACP) to form EtherChannels. The EtherChannel protocols allow ports with similar characteristics to form an EtherChannel through dynamic negotiation with connected network devices. PAgP is a Cisco-proprietary protocol and LACP is defined in IEEE 802.3ad.

PAgP and LACP do not interoperate. Ports configured to use PAgP cannot form EtherChannels with ports configured to use LACP and vice versa.

[Table 22-1](#) lists the user-configurable EtherChannel modes.

Table 22-1 *EtherChannel Modes*

Mode	Description
on	Mode that forces the LAN port to channel unconditionally. In the on mode, a usable EtherChannel exists only when a LAN port group in the on mode is connected to another LAN port group in the on mode. Because ports configured in the on mode do not negotiate, there is no negotiation traffic between the ports.
auto	PAgP mode that places a LAN port into a passive negotiating state in which the port responds to PAgP packets it receives but does not initiate PAgP negotiation.
desirable	PAgP mode that places a LAN port into an active negotiating state in which the port initiates negotiations with other LAN ports by sending PAgP packets.
passive	LACP mode that places a port into a passive negotiating state in which the port responds to LACP packets it receives but does not initiate LACP negotiation.
active	LACP mode that places a port into an active negotiating state in which the port initiates negotiations with other ports by sending LACP packets.

Manual EtherChannel Configuration

Manually configured EtherChannel ports do not exchange EtherChannel protocol packets. A manually configured EtherChannel forms only when you configure all ports in the EtherChannel compatibly.

PAgP EtherChannel Configuration

PAgP supports the automatic creation of EtherChannels by exchanging PAgP packets between LAN ports. PAgP packets are exchanged only between ports in **auto** and **desirable** modes.

The protocol learns the capabilities of LAN port groups dynamically and informs the other LAN ports. Once PAgP identifies correctly matched Ethernet links, it facilitates grouping the links into an EtherChannel. The EtherChannel is then added to the spanning tree as a single bridge port.

Both the **auto** and **desirable** modes allow PAgP to negotiate between LAN ports to determine if they can form an EtherChannel, based on criteria such as port speed and trunking state. Layer 2 EtherChannels also use VLAN numbers.

LAN ports can form an EtherChannel when they are in different PAgP modes if the modes are compatible. For example:

- A LAN port in **desirable** mode can form an EtherChannel successfully with another LAN port that is in **desirable** mode.
- A LAN port in **desirable** mode can form an EtherChannel with another LAN port in **auto** mode.
- A LAN port in **auto** mode cannot form an EtherChannel with another LAN port that is also in **auto** mode because neither port initiates negotiation.

IEEE 802.3ad LACP EtherChannel Configuration

Cisco IOS Release 12.2(25)EWA and later releases support IEEE 802.3ad LACP EtherChannels. LACP supports the automatic creation of EtherChannels by exchanging LACP packets between LAN ports. LACP packets are exchanged only between ports in **passive** and **active** modes.

The protocol learns the capabilities of LAN port groups dynamically and informs the other LAN ports. Once LACP identifies correctly matched Ethernet links, it facilitates grouping the links into an EtherChannel. The EtherChannel is then added to the spanning tree as a single bridge port.

Both the **passive** and **active** modes allow LACP to negotiate between LAN ports to determine if they can form an EtherChannel, based on criteria such as port speed and trunking state. Layer 2 EtherChannels also use VLAN numbers.

LAN ports can form an EtherChannel when they are in different LACP modes as long as the modes are compatible. For example:

- A LAN port in **active** mode can form an EtherChannel successfully with another LAN port that is in **active** mode.
- A LAN port in **active** mode can form an EtherChannel with another LAN port in **passive** mode.
- A LAN port in **passive** mode cannot form an EtherChannel with another LAN port that is also in **passive** mode, because neither port initiates negotiation.

LACP uses the following parameters:

- LACP system priority—You may configure an LACP system priority on each switch running LACP. The system priority can be configured automatically or through the CLI. See the [“Configuring the LACP System Priority and System ID” section on page 22-12](#). LACP uses the system priority with the switch MAC address to form the system ID and also during negotiation with other systems.

Note The LACP system ID is the combination of the LACP system priority value and the MAC address of the switch.

- LACP port priority—You must configure an LACP port priority on each port configured to use LACP. The port priority can be configured automatically or through the CLI. See the [“Configuring Layer 2 EtherChannels” section on page 22-10](#). LACP uses the port priority with the port number to form the port identifier.
- LACP administrative key—LACP automatically configures an administrative key value equal to the channel group identification number on each port configured to use LACP. The administrative key defines the ability of a port to aggregate with other ports. A port’s ability to aggregate with other ports is determined by these factors:
 - Port physical characteristics, such as data rate, duplex capability, and point-to-point or shared medium
 - Configuration restrictions that you establish

LACP tries to configure the maximum number of compatible ports in an EtherChannel up to the maximum allowed by the hardware (eight ports). If a port cannot be actively included in a channel, it is not included automatically if a channelled port fails.

Note Standby and “sub-channeling” are not supported in LACP and PAGP.

Load Balancing

EtherChannel can balance the traffic load across the links in the channel by reducing part of the binary pattern formed from the addresses or ports in the frame to a numerical value that selects one of the links in the channel. To balance the load, EtherChannel uses MAC addresses, IP addresses, or Layer 4 port numbers, and either the message source or message destination, or both.

Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going only to a single MAC address, using the destination MAC address always chooses the same link in the channel; using source addresses or IP addresses might result in better load balancing.

Note Load balancing can only be configured globally. As a result, all channels (manually configured, PagP, or LACP) use the same load balancing method.

For additional information on load balancing, see the [“Configuring EtherChannel Load Balancing” section on page 22-13](#).

EtherChannel Configuration Guidelines and Restrictions

If improperly configured, some EtherChannel interfaces are disabled automatically to avoid network loops and other problems. Follow these guidelines and restrictions to avoid configuration problems:

- All Ethernet interfaces on all modules support EtherChannel (maximum of eight interfaces) with no requirement that interfaces be physically contiguous or on the same module.
- Configure all interfaces in an EtherChannel to operate at the same speed and duplex mode.
- Enable all interfaces in an EtherChannel. Putting down an interface in an Ether Channel is treated as a link failure, and its traffic is transferred to one of the remaining interfaces in the EtherChannel.
- An EtherChannel does not form if one of the interfaces is a Switched Port Analyzer (SPAN) destination port.
- For Layer 3 EtherChannels:
 - Assign Layer 3 addresses to the port-channel logical interface, not to the physical interfaces in the channel.
- For Layer 2 EtherChannels:
 - Assign all interfaces in the EtherChannel to the same VLAN, or configure them as trunks.
 - If you configure an EtherChannel from trunk interfaces, verify that the trunking mode and the native VLAN is the same on all the trunks. Interfaces in an EtherChannel with different trunk modes or different native VLANs can have unexpected results.

- An EtherChannel supports the same allowed range of VLANs on all the interfaces in a trunking Layer 2 EtherChannel. If the allowed ranges differ for selected interface differ, they do not form an EtherChannel.
- Interfaces with different Spanning Tree Protocol (STP) port path costs can form an EtherChannel as long they are otherwise compatibly configured. Setting different STP port path costs does not, by itself, make interfaces incompatible for the formation of an EtherChannel.
- After you configure an EtherChannel, any configuration that you apply to the port-channel interface affects the EtherChannel; any configuration that you apply to the physical interfaces affects only the interface you configure.

Storm Control is an exception to this rule. For example, you cannot configure Storm Control on some of the members of an EtherChannel; Storm Control must be configured on all or none of the ports. If you configure Storm Control on only some of the ports, those ports will be dropped from the EtherChannel interface (put in suspended state). Therefore, you should configure Storm Control at the port-channel interface level, and not at the physical interface level.
- A physical interface with port security enabled can join a Layer 2 EtherChannel only if port security is also enabled on the EtherChannel; otherwise the command is rejected by the CLI.
- You cannot configure a 802.1X port in an EtherChannel.

Configuring EtherChannel

These sections describe how to configure EtherChannel:

- [Configuring Layer 3 EtherChannels, page 22-6](#)
- [Configuring Layer 2 EtherChannels, page 22-10](#)
- [Configuring the LACP System Priority and System ID, page 22-12](#)
- [Configuring EtherChannel Load Balancing, page 22-13](#)
- [Removing an Interface from an EtherChannel, page 22-14](#)
- [Removing an EtherChannel, page 22-15](#)

Note

Ensure that the interfaces are configured correctly. (See the [“EtherChannel Configuration Guidelines and Restrictions”](#) section on page 22-5.)

Configuring Layer 3 EtherChannels

To configure Layer 3 EtherChannels, create the port-channel logical interface and then put the Ethernet interfaces into the portchannel.

These sections describe Layer 3 EtherChannel configuration:

- [Creating Port-Channel Logical Interfaces, page 22-7](#)
- [Configuring Physical Interfaces as Layer 3 EtherChannels, page 22-8](#)

Creating Port-Channel Logical Interfaces

**Note**

To move an IP address from a physical interface to an EtherChannel, you must delete the IP address from the physical interface before configuring it on the port-channel interface.

To create a port-channel interface for a Layer 3 EtherChannel, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface port-channel <i>port_channel_number</i>	Creates the port-channel interface. The value for <i>port_channel_number</i> can range from 1 to 64.
Step 2	Switch(config-if)# ip address <i>ip_address mask</i>	Assigns an IP address and subnet mask to the EtherChannel.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show running-config interface port-channel <i>port_channel_number</i>	Verifies the configuration.

This example shows how to create port-channel interface 1:

```
Switch# configure terminal
Switch(config)# interface port-channel 1
Switch(config-if)# ip address 172.32.52.10 255.255.255.0
Switch(config-if)# end
```

This example shows how to verify the configuration of port-channel interface 1:

```
Switch# show running-config interface port-channel 1
Building configuration...

Current configuration:
!
interface Port-channel1
 ip address 172.32.52.10 255.255.255.0
 no ip directed-broadcast
 end

Switch#
```

Configuring Physical Interfaces as Layer 3 EtherChannels

To configure physical interfaces as Layer 3 EtherChannels, perform this task for each interface:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Selects a physical interface to configure.
Step 2	Switch(config-if)# no switchport	Makes this a Layer 3 routed port.
Step 3	Switch(config-if)# no ip address	Ensures that no IP address is assigned to the physical interface.
Step 4	Switch(config-if)# channel-group <i>port_channel_number</i> mode { active on auto passive desirable }	Configures the interface in a portchannel and specifies the PAgP or LACP mode. If you use PAgP, enter the keywords auto or desirable . If you use LACP, enter the keywords active or passive .

	Command	Purpose
Step 5	Switch(config-if)# end	Exits configuration mode.
Step 6	Switch# show running-config interface port-channel <i>port_channel_number</i> Switch# show running-config interface {fastethernet gigabitethernet tengigabitethernet} slot/port Switch# show interfaces {fastethernet gigabitethernet tengigabitethernet} slot/port etherchannel Switch# show etherchannel 1 port-channel	Verifies the configuration.

This example shows how to configure Fast Ethernet interfaces 5/4 and 5/5 into port-channel 1 with PAgP mode **desirable**:

```
Switch# configure terminal
Switch(config)# interface range fastethernet 5/4 - 5 (Note: Space is mandatory.)
Switch(config-if)# no switchport
Switch(config-if)# no ip address
Switch(config-if)# channel-group 1 mode desirable
Switch(config-if)# end
```

Note

See the [“Configuring a Range of Interfaces”](#) section on page 6-4 for information about the **range** keyword.

The following two examples show how to verify the configuration of Fast Ethernet interface 5/4:

```
Switch# show running-config interface fastethernet 5/4
Building configuration...
```

Current configuration:

```
!
interface FastEthernet5/4
 no ip address
 no switchport
 no ip directed-broadcast
 channel-group 1 mode desirable
end
```

```
Switch# show interfaces fastethernet 5/4 etherchannel
```

```
Port state      = EC-Enbld Up In-Bndl Usr-Config
Channel group = 1          Mode = Desirable      Gcchange = 0
Port-channel   = Po1       GC   = 0x00010001     Pseudo-port-channel = Po1
Port indx      = 0         Load = 0x55
```

```
Flags:  S - Device is sending Slow hello.    C - Device is in Consistent state.
        A - Device is in Auto mode.          P - Device learns on physical port.
Timers: H - Hello timer is running.          Q - Quit timer is running.
        S - Switching timer is running.      I - Interface timer is running.
```

Local information:

Port	Flags	State	Timers	Hello Interval	Partner Count	PAgP Priority	Learning Method	Group Ifindex
Fa5/4	SC	U6/S7		30s	1	128	Any	55

Partner's information:

Port	Partner Name	Partner Device ID	Partner Port	Partner Age	Partner Flags	Partner Group Cap.
Fa5/4	JAB031301	0050.0f10.230c	2/45	1s	SAC	2D

Age of the port in the current state: 00h:54m:52s

Switch#

This example shows how to verify the configuration of port-channel interface 1 after the interfaces have been configured:

Switch# **show etherchannel 1 port-channel**

```

Channel-group listing:
-----
Group: 1
-----

Port-channels in the group:
-----
Port-channel: Po1
-----

Age of the Port-channel      = 01h:56m:20s
Logical slot/port           = 10/1             Number of ports = 2
GC                           = 0x00010001      HotStandBy port = null
Port state                   = Port-channel L3-Ag Ag-Inuse

Ports in the Port-channel:

Index   Load   Port
-----
    1     00    Fa5/6
    0     00    Fa5/7

Time since last port bundled:  00h:23m:33s    Fa5/6

Switch#
```

Configuring Layer 2 EtherChannels

To configure Layer 2 EtherChannels, configure the Ethernet interfaces with the **channel-group** command. This creates the port-channel logical interface.

Note

Cisco IOS software creates port-channel interfaces for Layer 2 EtherChannels when you configure Layer 2 Ethernet interfaces with the **channel-group** command.

To configure Layer 2 Ethernet interfaces as Layer 2 EtherChannels, perform this task for each interface:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Selects a physical interface to configure.
Step 2	Switch(config-if)# channel-group <i>port_channel_number</i> mode { active on auto passive desirable }	Configures the interface in a portchannel and specifies the PAgP or LACP mode. If you use PAgP, enter the keywords auto or desirable . If you use LACP, enter the keywords active or passive .
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show running-config interface { fastethernet gigabitethernet } <i>slot/port</i> Switch# show interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port etherchannel</i>	Verifies the configuration.

This example shows how to configure Fast Ethernet interfaces 5/6 and 5/7 into port-channel 2 with PAgP mode **desirable**:

```
Switch# configure terminal
Switch(config)# interface range fastethernet 5/6 - 7 (Note: Space is mandatory.)
Switch(config-if-range)# channel-group 2 mode desirable
Switch(config-if-range)# end
Switch# end
```

Note

See the “[Configuring a Range of Interfaces](#)” section on page 6-4 for information about the **range** keyword.

This example shows how to verify the configuration of port-channel interface 2:

```
Switch# show running-config interface port-channel 2
Building configuration...

Current configuration:
!
interface Port-channel2
 switchport access vlan 10
 switchport mode access
end

Switch#
```

The following two examples show how to verify the configuration of Fast Ethernet interface 5/6:

```
Switch# show running-config interface fastethernet 5/6
Building configuration...

Current configuration:
!
interface FastEthernet5/6
 switchport access vlan 10
 switchport mode access
 channel-group 2 mode desirable
end
```

```
Switch# show interfaces fastethernet 5/6 etherchannel
Port state      = EC-Enbld Up In-Bndl Usr-Config
Channel group = 1          Mode = Desirable      Gcchange = 0
Port-channel    = Po1      GC      = 0x00010001
Port indx       = 0          Load = 0x55

Flags:  S - Device is sending Slow hello.  C - Device is in Consistent state.
        A - Device is in Auto mode.        P - Device learns on physical port.
        d - PAgP is down.

Timers: H - Hello timer is running.        Q - Quit timer is running.
        S - Switching timer is running.    I - Interface timer is running.

Local information:
```

Port	Flags	State	Timers	Hello Interval	Partner Count	PAgP Priority	Learning Method	Group Ifindex
Fa5/6	SC	U6/S7		30s	1	128	Any	56

```
Partner's information:
```

Port	Partner Name	Partner Device ID	Partner Port	Partner Age	Partner Flags	Partner Group Cap.
Fa5/6	JAB031301	0050.0f10.230c	2/47	18s	SAC	2F

```
Age of the port in the current state: 00h:10m:57s
```

This example shows how to verify the configuration of port-channel interface 2 after the interfaces have been configured:

```
Switch# show etherchannel 2 port-channel
Port-channels in the group:
-----

Port-channel: Po2
-----

Age of the Port-channel    = 00h:23m:33s
Logical slot/port          = 10/2          Number of ports in agport = 2
GC                          = 0x00020001    HotStandBy port = null
Port state                  = Port-channel Ag-Inuse

Ports in the Port-channel:
```

Index	Load	Port
1	00	Fa5/6
0	00	Fa5/7

```
Time since last port bundled:    00h:23m:33s    Fa5/6

Switch#
```

Configuring the LACP System Priority and System ID

The LACP system ID is the LACP system priority value combined with the MAC address of the switch.

To configure the LACP system priority and system ID, perform this task:

	Command	Purpose
Step 1	Switch(config)# lacp system-priority <i>priority_value</i>	(Optional for LACP) Sets the LACP system priority and system ID. Valid values are 1 through 65535. Higher numbers have lower priority. The default is 32768.
	Switch(config)# no system port-priority	Reverts to the default.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show lacp sys-id	Verifies the configuration.

This example shows how to configure the LACP system priority:

```
Switch# configure terminal
Switch(config)# lacp system-priority 23456
Switch(config)# end
Switch# show module
```

Mod	Ports	Card Type	Model	Serial No.
1	2	1000BaseX (GBIC) Supervisor (active)	WS-X4014	JAB063808YZ
2	48	10/100BaseTX (RJ45)	WS-X4148-RJ	JAB0447072W
3	48	10/100BaseTX (RJ45)V	WS-X4148-RJ45V	JAE061704J6
4	48	10/100BaseTX (RJ45)V	WS-X4148-RJ45V	JAE061704ML

M	MAC addresses	Hw	Fw	Sw	Status
1	0005.9a39.7a80 to 0005.9a39.7a81	2.1	12.1 (12r)	EW 12.1 (13) EW (0.26)	Ok
2	0002.fd80.f530 to 0002.fd80.f55f	0.1			Ok
3	0009.7c45.67c0 to 0009.7c45.67ef	1.6			Ok
4	0009.7c45.4a80 to 0009.7c45.4aaf	1.6			Ok

This example shows how to verify the configuration:

```
Switch# show lacp sys-id
23456,0050.3e8d.6400
Switch#
```

The system priority is displayed first, followed by the MAC address of the switch.

Configuring EtherChannel Load Balancing

Note

Load balancing can only be configured globally. As a result, all channels (manually configured, PagP, or LACP) use the same load balancing method.

To configure EtherChannel load balancing, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] port-channel load-balance {src-mac dst-mac src-dst-mac src-ip dst-ip src-dst-ip src-port dst-port src-dst-port}	Configures EtherChannel load balancing. Use the no keyword to return EtherChannel load balancing to the default configuration.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show etherchannel load-balance	Verifies the configuration.

The load-balancing keywords are:

- **src-mac**—Source MAC addresses
- **dst-mac**—Destination MAC addresses
- **src-dst-mac**—Source and destination MAC addresses
- **src-ip**—Source IP addresses
- **dst-ip**—Destination IP addresses
- **src-dst-ip**—Source and destination IP addresses (Default)
- **src-port**—Source Layer 4 port
- **dst-port**—Destination Layer 4 port
- **src-dst-port**—Source and destination Layer 4 port

This example shows how to configure EtherChannel to use source and destination IP addresses:

```
Switch# configure terminal
Switch(config)# port-channel load-balance src-dst-ip
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show etherchannel load-balance
EtherChannel Load-Balancing Configuration:
    src-dst-ip

EtherChannel Load-Balancing Addresses Used Per-Protocol:
Non-IP: Source XOR Destination MAC address
IPv4: Source XOR Destination IP address
IPv6: Source XOR Destination IP address
Switch#
```

Removing an Interface from an EtherChannel

To remove an Ethernet interface from an EtherChannel, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {fastethernet gigabitethernet tengigabitethernet} slot/port	Selects a physical interface to configure.
Step 2	Switch(config-if)# no channel-group	Removes the interface from the port-channel interface.

	Command	Purpose
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show running-config interface {fastethernet gigabitethernet tengigabitethernet} slot/port Switch# show interface {fastethernet gigabitethernet tengigabitethernet} slot/port etherchannel	Verifies the configuration.

This example shows how to remove Fast Ethernet interfaces 5/4 and 5/5 from port-channel 1:

```
Switch# configure terminal
Switch(config)# interface range fastethernet 5/4 - 5 (Note: Space is mandatory.)
Switch(config-if)# no channel-group 1
Switch(config-if)# end
```

Removing an EtherChannel

If you remove an EtherChannel, the member ports are shut down and removed from the channel group.

Note

If you want to change an EtherChannel from Layer 2 to Layer 3, or Layer 3 to Layer 2, you must remove the EtherChannel and recreate it in the desired configuration.

To remove an EtherChannel, perform this task:

	Command	Purpose
Step 1	Switch(config)# no interface port-channel <i>port_channel_number</i>	Removes the port-channel interface.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show etherchannel summary	Verifies the configuration.

This example shows how to remove port-channel 1:

```
Switch# configure terminal
Switch(config)# no interface port-channel 1
Switch(config)# end
```

Displaying EtherChannel to a Virtual Switch System

Catalyst 4500 series switches support enhanced PAgP. If a Catalyst 4500 series switch is connected to a Catalyst 6500 series Virtual Switch System (VSS) via a PAgP EtherChannel, the Catalyst 4500 series switch will automatically serve as a VSS client, using enhanced PAgP on this EtherChannel for dual-active detection. This VSS client feature has no impact on the performance of Catalyst 4500 series switches and does not require any user configuration.

Topics include:

- [Understanding VSS Client, page 22-16](#)
- [Displaying EtherChannel Links to VSS, page 22-18](#)

Understanding VSS Client

Topics covered include:

- [Virtual Switch System, page 22-16](#)
- [Dual-Active Scenarios, page 22-16](#)
- [Dual-Active Detection Using Enhance PAgP, page 22-16](#)

Virtual Switch System

The Cisco Catalyst 6500 Series VSS 1440 allows for the combination of two Cisco Catalyst 6500 Series switches into a single, logical network entity from the network control-plane and management perspectives. Within the Cisco VSS, one chassis is designated as the active virtual switch, acting as the single management point of the entire system, and the other is designated as the standby virtual switch. These two chassis are bound together by a special link, called Virtual Switch Link (VSL), which carries the internal signaling and control information between them.

Dual-Active Scenarios

One of the failure scenarios in a VSS is called *dual-active*, which occurs when the VSL fails completely. In this case, neither virtual switch knows of the other's status. From the perspective of the active virtual switch, the standby chassis is lost. The standby virtual switch also views the active chassis as failed and transitions to active state via an SSO switchover. So, two active virtual switches will exist in the network with identical configurations, causing duplicate IP addresses and bridge identifiers. This scenario has adverse effects on the network topology and traffic if it persists.

Dual-Active Detection Using Enhance PAgP

One mechanism for detecting a dual-active scenario is based on enhanced PAgP (PAgP+). Specifically, the VSS sends regularly scheduled PAgP messages with Type-Length-Values (TLVs) containing the ID of the current active virtual switch ([Figure 22-1](#)). When the VSL fails completely, the standby virtual switch immediately sends asynchronous PAgP messages with TLVs containing its own ID on all port channels enabled for enhanced PAgP dual-active detection ([Figure 22-2](#)). The remote switch (the VSS client) connected to both VSS components via EtherChannel links, compares every received active ID with its stored active ID. If they match, the remote switch simply sends TLVs containing its stored active ID back to the VSS in its regularly scheduled PAgP messages. If they do not match, the remote switch stores the new active ID and immediately transmits asynchronous PAgP messages with TLVs containing the new active ID. Upon receiving the new active ID from the remote switch, the original active virtual switch detects the dual-active scenario and takes appropriate actions.

Figure 22-1 *Enhanced PAGP in VSS Normal Operation***Figure 22-2** *Enhanced PAGP in VSS Dual-active Scenario*

As a remote switch, the Catalyst 4500 series switch supports stateful VSS client. In particular, the ID of the current active virtual switch is synchronized from the active supervisor engine to the redundant supervisor engine of the Catalyst 4500 series switch. This ensures that dual-active detection is not disrupted even when the active supervisor engine switches over to the redundant supervisor engine.

Displaying EtherChannel Links to VSS

To display the dual-active detection capability of the configured PAgP portchannel, use the **show pagp port_channel_number dual-active** command.

It indicates whether:

- A switch uses enhanced PAgP for dual-active detection.
You should always see “Yes” after “PAgP dual-active diction enabled” on a Catalyst 4500 switch.
- The configured PAgP EtherChannel is connected to a Catalyst 6500 switch VSS.
You will see “N/A” below “Partner Version” if this EtherChannel is *not* connected to a VSS. Otherwise, user will see the version of enhanced PAgP dual-active detection implemented in the VSS.
- This switch is capable of detecting dual-active scenarios in the connected VSS.
You will see “Yes” below “Dual-Active Detect Capable” if and only if the configured EtherChannel is connected to a Catalyst 6500 series VSS that uses the same version of enhanced PAgP dual-active detection.

Note

You can also see the name of the neighboring switch (Partner Name) and the ports to which this EtherChannel is connected (Partner Port).

If a Catalyst 4500 switch is connected to a Catalyst 6500 series VSS with the same version of enhanced PAgP dual-active detection, the switch *can* detect a dual-active scenario:

```
Switch# show pagp 1 dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1
```

Channel group 1				
	Dual-Active	Partner	Partner	Partner
Port	Detect Capable	Name	Port	Version
Gi6/5	Yes	VSS	Gi1/8/1	1.1
Gi6/6	Yes	VSS	Gi2/8/1	1.1

If a Catalyst 4500 switch is not connected to a Catalyst 6500 series VSS, the switch *cannot* detect a dual-active scenario:

```
Switch# show pagp 1 dual-active
PAgP dual-active detection enabled: Yes
PAgP dual-active version: 1.1
```

Channel group 1				
	Dual-Active	Partner	Partner	Partner
Port	Detect Capable	Name	Port	Version
Gi6/5	No	Switch	Fa6/5	N/A
Gi6/6	No	Switch	Fa6/6	N/A

CHAPTER 23

Configuring IGMP Snooping and Filtering

This chapter describes how to configure Internet Group Management Protocol (IGMP) snooping on the Catalyst 4500 series switch. It provides guidelines, procedures, and configuration examples.

This chapter consists of the following major sections:

- [Overview of IGMP Snooping, page 23-1](#)
- [Configuring IGMP Snooping, page 23-5](#)
- [Displaying IGMP Snooping Information, page 23-15](#)
- [Configuring IGMP Filtering, page 23-20](#)
- [Displaying IGMP Filtering Configuration, page 23-24](#)

Note

To support Cisco Group Management Protocol (CGMP) client devices, configure the switch as a CGMP server. For more information, see the chapters “IP Multicast” and “Configuring IP Multicast Routing” in the *Cisco IOS IP and IP Routing Configuration Guide*, at this location:

http://www.cisco.com/en/US/products/ps6350/products_installation_and_configuration_guides_list.html

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of IGMP Snooping

This section includes the following subsections:

- [Immediate-Leave Processing, page 23-3](#)
- [IGMP Configurable-Leave Timer, page 23-4](#)

- [IGMP Snooping Querier, page 23-4](#)
- [Explicit Host Tracking, page 23-4](#)

**Note**

Quality of service does not apply to IGMP packets.

IGMP snooping allows a switch to snoop or capture information from IGMP packets transmitted between hosts and a router. Based on this information, a switch adds or deletes multicast addresses from its address table, thereby enabling (or disabling) multicast traffic from flowing to individual host ports. IGMP snooping supports all versions of IGMP: IGMPv1, IGMPv2, and IGMPv3.

In contrast to IGMPv1 and IGMPv2, IGMPv3 snooping provides immediate-leave processing by default. It provides Explicit Host Tracking (EHT) and allows network administrators to deploy SSM functionality on Layer 2 devices that truly support IGMPv3. (See the [“Explicit Host Tracking” section on page 23-4](#).)

In subnets where IGMP is configured, IGMP snooping manages multicast traffic at Layer 2. You can configure interfaces to dynamically forward multicast traffic only to those interfaces that are interested in receiving it by using the **switchport** keyword.

IGMP snooping restricts traffic in MAC multicast groups 0100.5e00.0001 to 01-00-5e-ff-ff-ff. IGMP snooping does not restrict Layer 2 multicast packets generated by routing protocols.

**Note**

For more information on IP multicast and IGMP, refer to RFC 1112, RFC 2236, RFC 3376 (for IGMPv3).

IGMP (configured on a router) periodically sends out IGMP general queries. A host responds to these queries with IGMP membership reports for groups that it is interested in. When IGMP snooping is enabled, the switch creates one entry per VLAN in the Layer 2 forwarding table for each Layer 2 multicast group from which it receives an IGMP join request. All hosts interested in this multicast traffic send IGMP membership reports and are added to the forwarding table entry.

Layer 2 multicast groups learned through IGMP snooping are dynamic. However, you can statically configure Layer 2 multicast groups using the **ip igmp snooping static** command. If you specify group membership statically, your setting supersedes any automatic manipulation by IGMP snooping. Multicast group membership lists can contain both user-defined and IGMP snooping settings.

Groups with IP addresses in the range 224.0.0.0 to 224.0.0.255, which map to the multicast MAC address range 0100.5E00.0001 to 0100.5E00.00FF, are reserved for routing control packets. These groups are flooded to all forwarding ports of the VLAN with the exception of 224.0.0.22, which is used for IGMPv3 membership reports.

**Note**

If a VLAN experiences a spanning-tree topology change, IP multicast traffic floods on all VLAN ports where PortFast is not enabled, as well as on ports with the **no igmp snooping tcn flood** command configured for a period of TCN query count.

For a Layer 2 IGMPv2 host interface to join an IP multicast group, a host sends an IGMP membership report for the IP multicast group. For a host to leave a multicast group, it can either ignore the periodic IGMP general queries or it can send an IGMP leave message. When the switch receives an IGMP leave message from a host, it sends out an IGMP group-specific query to determine whether any devices connected to that interface are interested in traffic for the specific multicast group. The switch then updates the table entry for that Layer 2 multicast group so that only those hosts interested in receiving multicast traffic for the group are listed.

In contrast, IGMPv3 hosts send IGMPv3 membership reports (with the **allow** group record mode) to join a specific multicast group. When IGMPv3 hosts send membership reports (with the **block** group record) to reject traffic from all sources in the previous source list, the last host on the port is removed by immediate-leave if EHT is enabled.

Immediate-Leave Processing

IGMP snooping immediate-leave processing allows the switch to remove an interface from the forwarding-table entry without first sending out IGMP group-specific queries to the interface. The VLAN interface is pruned from the multicast tree for the multicast group specified in the original IGMP leave message. Immediate-leave processing ensures optimal bandwidth management for all hosts on a switched network, even when multiple multicast groups are being used simultaneously.

When a switch with IGMP snooping enabled receives an IGMPv2 or IGMPv3 leave message, it sends an IGMP group-specific query from the interface where the leave message was received to determine when there are other hosts attached to that interface that are interested in joining the MAC multicast group. If the switch does not receive an IGMP join message within the query response interval, the interface is removed from the port list of the (MAC-group, VLAN) entry in the Layer 2 forwarding table.

Note

By default all IGMP joins are forwarded to all multicast router ports.

With immediate-leave processing enabled on the VLAN, an interface can be removed immediately from the port list of the Layer 2 entry when the IGMP leave message is received, unless a multicast router was learned on the port.

Note

When using IGMPv2 snooping, use immediate-leave processing only on VLANs where just one host is connected to each interface. If immediate-leave processing is enabled on VLANs where multiple hosts are connected to an interface, some hosts might be dropped inadvertently. When using IGMPv3, immediate-leave processing is enabled by default, and due to Explicit Host Tracking (see below), the switch can detect when a port has single or multiple hosts maintained by the switch for IGMPv3 hosts. As a result, the switch can perform immediate-leave processing when it detects a single host behind a given port.

Note

IGMPv3 is interoperable with older versions of IGMP.

Use the **show ip igmp snooping querier vlan** command to display the IGMP version on a particular VLAN.

Use the **show ip igmp snooping vlan** command to display whether the switch supports IGMPv3 snooping.

Use the **ip igmp snooping immediate-leave** command to enable immediate-leave for IGMPv2.

Note

Immediate-leave processing is enabled by default for IGMPv3.

IGMP Configurable-Leave Timer

Immediate-leave processing cannot be used on VLANs where multiple hosts may be connected to a single interface. To reduce leave latency in such a scenario, IGMPv3 provides a configurable leave timer.

In Cisco IOS Release 12.2(25)SG and earlier, the IGMP snooping leave time was based on query response time. If membership reports were not received by the switch before the query response time of the query expired, a port was removed from the multicast group membership.

In Cisco IOS Release 12.2(31)SG and later, you can configure the length of time that the switch waits after sending a group-specific query to determine if hosts are still interested in a specific multicast group. The IGMP leave response time can be configured from 100 to 5000 milliseconds. The timer can be set either globally or per VLAN. The VLAN configuration of the leave time overrides the global configuration.

For configuration steps, see the [“Configuring the IGMP Leave Timer” section on page 23-9](#).

IGMP Snooping Querier

IGMP Snooping Querier support was introduced in Cisco IOS Release 12.2(50)SG. This is a Layer 2 feature required to support IGMP snooping in a VLAN where PIM and IGMP are not configured because the multicast traffic does not require routing.

In a network where IP multicast routing is configured, the IP multicast router acts as the IGMP querier by sending general queries. If the IP-multicast traffic in a VLAN only needs to be Layer 2-switched, an IP-multicast router is not required. Without an IP-multicast router on the VLAN, you must configure another switch as the IGMP querier so that it can send queries.

When enabled, the IGMP snooping querier sends out periodic IGMPv2 queries that trigger IGMP report messages from the switch that requests IP multicast traffic. IGMP snooping listens to these IGMP reports to establish appropriate forwarding.

On switches that use IGMP to report interest in IP multicast traffic, configure at least one switch as the IGMP snooping querier in each supported VLAN.

You can configure a switch to generate IGMP queries on a VLAN regardless of whether IP multicast routing is enabled.

Explicit Host Tracking

Explicit Host Tracking (EHT) monitors group membership by tracking hosts that are sending IGMPv3 membership reports. This tracking enables a switch to detect host information associated with the groups of each port. Furthermore, EHT enables the user to track the membership and various statistics.

EHT enables a switch to track membership on a per-port basis. Consequently, a switch is aware of the hosts residing on each port and can perform immediate-leave processing when there is only one host behind a port.

To determine whether EHT is enabled on a VLAN, use the **show ip igmp snoop vlan** command.

Configuring IGMP Snooping

**Note**

When configuring IGMP, configure the VLAN in the VLAN database mode. (See [Chapter 14](#), “Configuring VLANs, VTP, and VMPS”.)

IGMP snooping allows switches to examine IGMP packets and make forwarding decisions based on their content.

These sections describe how to configure IGMP snooping:

- [Default IGMP Snooping Configuration](#), page 23-5
- [Enabling IGMP Snooping Globally](#), page 23-6
- [Enabling IGMP Snooping on a VLAN](#), page 23-6
- [Configuring Learning Methods](#), page 23-7
- [Configuring a Static Connection to a Multicast Router](#), page 23-8
- [Enabling IGMP Immediate-Leave Processing](#), page 23-8
- [Configuring the IGMP Leave Timer](#), page 23-9
- [Configuring IGMP Snooping Querier](#), page 23-10
- [Configuring Explicit Host Tracking](#), page 23-11
- [Configuring a Host Statically](#), page 23-12
- [Suppressing Multicast Flooding](#), page 23-12

Default IGMP Snooping Configuration

[Table 23-1](#) shows the IGMP snooping default configuration values.

Table 23-1 IGMP Snooping Default Configuration Values

Feature	Default Value
IGMP snooping	Enabled
Multicast routers	None configured
Explicit Host Tracking	Enabled for IGMPv3; Not available for IGMPv2
Immediate-leave processing	Enabled for IGMPv3; Disabled for IGMPv2
Report Suppression	Enabled
IGMP snooping learning method	PIM/DVMRP ¹

1. PIM/DVMRP = Protocol Independent Multicast/Distance Vector Multicast Routing Protocol

Enabling IGMP Snooping Globally

Note

You can enable and disable IGMP snooping on a per-VLAN basis. However, if you globally disable IGMP snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

To enable IGMP snooping globally, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] ip igmp snooping	Enables IGMP snooping. Use the no keyword to disable IGMP snooping.
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show ip igmp snooping include	Verifies the configuration.

This example shows how to enable IGMP snooping globally and verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping
Switch(config)# end
Switch# show ip igmp snooping
Global IGMP Snooping configuration:
-----
IGMP snooping           : Enabled
IGMPv3 snooping         : Enabled
Report suppression      : Enabled
TCN solicit query       : Disabled
TCN flood query count   : 2

Vlan 1:
-----
IGMP snooping           : Enabled
IGMPv2 immediate leave  : Disabled
Explicit host tracking   : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode : IGMP_ONLY

Vlan 2:
-----
IGMP snooping           : Enabled
IGMPv2 immediate leave  : Disabled
Explicit host tracking   : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode : IGMP_ONLY
```

Enabling IGMP Snooping on a VLAN

Note

You can enable and disable IGMP snooping on a per-VLAN basis. However, if you globally disable IGMP snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

To enable IGMP snooping on a VLAN, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] ip igmp snooping vlan vlan_ID	Enables IGMP snooping. Use the no keyword to disable IGMP snooping.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show ip igmp snooping vlan vlan_ID	Verifies the configuration.

This example shows how to enable IGMP snooping on VLAN 2 and verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 2
Switch(config)# end
Switch# show ip igmp snooping vlan 2
Global IGMP Snooping configuration:
-----
IGMP snooping           : Enabled
IGMPv3 snooping         : Enabled
Report suppression      : Enabled
TCN solicit query       : Disabled
TCN flood query count    : 2

Vlan 2:
-----
IGMP snooping           : Enabled
IGMPv2 immediate leave  : Disabled
Explicit host tracking   : Enabled
Multicast router learning mode : pim-dvmrp
CGMP interoperability mode : IGMP_ONLY
```

Configuring Learning Methods

The following sections describe IGMP snooping learning methods:

- [Configuring PIM/DVMRP Learning, page 23-7](#)
- [Configuring CGMP Learning, page 23-8](#)

Configuring PIM/DVMRP Learning

To configure IGMP snooping to learn from PIM/DVMRP packets, perform this task:

Command	Purpose
Switch(config)# ip igmp snooping vlan vlan_ID mrouter learn [cgmp pim-dvmrp]	Specifies the learning method for the VLAN.

This example shows how to configure IP IGMP snooping to learn from PIM/DVMRP packets:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 1 mrouter learn pim-dvmrp
Switch(config)# end
Switch#
```

Configuring CGMP Learning

To configure IGMP snooping to learn from CGMP self-join packets, perform this task:

Command	Purpose
Switch(config)# ip igmp snooping vlan <i>vlan_ID</i> mrouter learn [cgmp pim-dvmrp]	Specifies the learning method for the VLAN.

This example shows how to configure IP IGMP snooping to learn from CGMP self-join packets:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 1 mrouter learn cgmp
Switch(config)# end
Switch#
```

Configuring a Static Connection to a Multicast Router

To configure a static connection to a multicast router, enter the **ip igmp snooping vlan mrouter interface** command on the switch.

To configure a static connection to a multicast router, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip igmp snooping vlan <i>vlan_ID</i> mrouter interface <i>interface_num</i>	Specifies a static connection to a multicast router for the VLAN. Note The interface to the router must be in the VLAN where you are entering the command. The router and the line protocol must be up.
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show ip igmp snooping mrouter vlan <i>vlan_ID</i>	Verifies the configuration.

This example shows how to configure a static connection to a multicast router:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 mrouter interface fastethernet 2/10
Switch# show ip igmp snooping mrouter vlan 200
vlan    ports
-----+-----
 200    Fa2/10
Switch#
```

Enabling IGMP Immediate-Leave Processing

When you enable IGMP immediate-leave processing on a VLAN, a switch removes an interface from the multicast group when it detects an IGMPv2 leave message on that interface.

Note

For IGMPv3, immediate-leave processing is enabled by default with EHT.

To enable immediate-leave processing on an IGMPv2 interface, perform this task:

Command	Purpose
Switch(config)# ip igmp snooping vlan <i>vlan_ID</i> immediate-leave	Enables immediate-leave processing in the VLAN. Note This command applies only to IGMPv2 hosts.

This example shows how to enable IGMP immediate-leave processing on interface VLAN 200 and to verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 immediate-leave
Configuring immediate leave on vlan 200
Switch(config)# end
Switch# show ip igmp interface vlan 200 | include immediate leave
Immediate leave           : Disabled
Switch(config)#
```

Configuring the IGMP Leave Timer

Follows these guidelines when configuring the IGMP leave timer:

- You can configure the leave time globally or per VLAN.
- Configuring the leave time on a VLAN overrides the global setting.
- The default leave time is 1000 milliseconds.
- The IGMP configurable leave time is only supported on hosts running IGMP Version 2.
- The actual leave latency in the network is usually the configured leave time. However, the leave time *might* vary around the configured time, depending on real-time CPU load conditions, network delays and the amount of traffic sent through the interface.

To enable the IGMP configurable-leave timer, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip igmp snooping last-member-query-interval <i>time</i>	Configure the IGMP leave timer globally. The range is 100 to 5000 milliseconds. The default is 1000 seconds. To globally reset the IGMP leave timer to the default setting, use the global configuration command no ip igmp snooping last-member-query-interval .
Step 3	Switch(config)# ip igmp snooping vlan <i>vlan_ID</i> last-member-query-interval <i>time</i>	(Optional) Configure the IGMP leave time on the VLAN interface. The range is 100 to 5000 milliseconds. To remove the configured IGMP leave-time setting from the specified VLAN, use the global configuration command no ip igmp snooping vlan <i>vlan-id</i> last-member-query-interval Note Configuring the leave time on a VLAN overrides the globally configured timer.

	Command	Purpose
Step 4	Switch(config)# end	Return to privileged EXEC mode.
Step 5	Switch# show ip igmp snooping	(Optional) Display the configured IGMP leave time.
Step 6	Switch# copy running-config startup-config	(Optional) Save your entries in the configuration file.

This example shows how to enable the IGMP configurable-leave timer and to verify the configuration:

```
Switch# configure terminal
Switch(config)# ip igmp snooping last-member-query-interval 200
Switch(config)# ip igmp snooping vlan 10 last-member-query-interval 500
Switch(config)# end
Switch# show ip igmp snooping show ip igmp snooping
Global IGMP Snooping configuration:
-----

IGMP snooping           : Enabled
IGMPv3 snooping         : Enabled
Report suppression      : Enabled
TCN solicit query       : Disabled
TCN flood query count   : 2
Last Member Query Interval : 200

Vlan 1:
-----
IGMP snooping           : Enabled
IGMPv2 immediate leave  : Disabled
Explicit host tracking   : Enabled
Multicast router learning mode : pim-dvmrp
Last Member Query Interval : 200
CGMP interoperability mode : IGMP_ONLY

Vlan 10:
-----
IGMP snooping           : Enabled
IGMPv2 immediate leave  : Disabled
Explicit host tracking   : Enabled
Multicast router learning mode : pim-dvmrp
Last Member Query Interval : 500
CGMP interoperability mode : IGMP_ONLY

Switch#
```

Configuring IGMP Snooping Querier

The IGMP Snooping Querier feature can be enabled either globally (i.e. they affect every VLAN) or on a per-vlan basis.

Note

The IGMP snooping querier is disabled by default.

To configure IGMP Snooping Querier, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] ip igmp snooping [vlan vlan_id] querier	Enables IGMP Snooping Querier.
Step 3	Switch(config)# [no] ip igmp snooping [vlan vlan_id] querier address abcd	Configures the IGMP Snooping Querier source IP address.
Step 4	Switch(config)# [no] ip igmp snooping [vlan vlan_id] querier version [1 2]	Configures IGMP Snooping Querier IGMP version.
Step 5	Switch(config)# ip igmp snooping [vlan vlan_id] querier query-interval interval	Configures IGMP Snooping Querier query interval.
Step 6	Switch(config)# ip igmp snooping [vlan vlan_id] querier max-response-time value	Configures IGMP Snooping Querier query maximum response time.
Step 7	Switch(config)# ip igmp snooping [vlan vlan_id] querier timer expiry value	Configures IGMP Snooping Querier expiry time out.
Step 8	Switch(config)# ip igmp snooping [vlan vlan_id] querier tcn query count value	Configures IGMP Snooping Querier tcn query count.
Step 9	Switch(config)# ip igmp snooping [vlan vlan_id] querier tcn query interval value	Configures IGMP Snooping Querier tcn query interval.
Step 10	Switch(config)# end	Returns to privileged EXEC mode.

For an example of how to display Querier information, refer to the [“Displaying IGMP Snooping Querier Information”](#) section on page 23-19.

Configuring Explicit Host Tracking

For IGMPv3, EHT is enabled by default and can be disabled on a per-VLAN basis.

To disable EHT processing on a VLAN, perform this task:

Command	Purpose
Switch(config)# [no] ip igmp snooping vlan vlan_ID explicit-tracking	Enables EHT on a VLAN. The no keyword disables EHT.

This example shows how to disable IGMP EHT on VLAN 200 and to verify the configuration:

```
Switch# configure terminal
Switch(config)# no ip igmp snooping vlan 200 explicit-tracking
Switch(config)# end
Switch# show ip igmp snooping vlan 200 | include Explicit host tracking
Explicit host tracking           : Disabled
```

Configuring a Host Statically

Hosts normally join multicast groups dynamically, but you can also configure a host statically on an interface.

To configure a host statically on an interface, perform this task:

Command	Purpose
Switch(config-if)# ip igmp snooping vlan <i>vlan_ID static mac_address interface</i> <i>interface_num</i>	Configures a host statically in the VLAN. Note This command cannot be configured to receive traffic for specific source IP addresses.

This example shows how to configure a host statically in VLAN 200 on interface FastEthernet 2/11:

```
Switch# configure terminal
Switch(config)# ip igmp snooping vlan 200 static 0100.5e02.0203 interface fastethernet
2/11
Configuring port FastEthernet2/11 on group 0100.5e02.0203 vlan 200
Switch(config)# end
```

Suppressing Multicast Flooding

An IGMP snooping-enabled switch floods multicast traffic to all ports in a VLAN when a spanning-tree Topology Change Notification (TCN) is received. Multicast flooding suppression enables a switch to stop sending such traffic. To support flooding suppression, the following interface and global commands were introduced in Cisco IOS Release 12.1(11b)EW.

The interface command is as follows:

[no | default] ip igmp snooping tcn flood

The global commands are as follows:

[no | default] ip igmp snooping tcn flood query count [1 - 10]

[no | default] ip igmp snooping tcn query solicit

Prior to Cisco IOS Release 12.1(11b)EW, when a spanning tree topology change notification (TCN) was received by a switch, the multicast traffic was flooded to all the ports in a VLAN for a period of three IGMP query intervals. This was necessary for redundant configurations. In Cisco IOS Release 12.1(11b)EW, the default time period the switch waits before multicast flooding stops was changed to two IGMP query intervals.

This flooding behavior is undesirable if the switch that does the flooding has many ports that are subscribed to different groups. The traffic could exceed the capacity of the link between the switch and the end host, resulting in packet loss.

With the **no ip igmp snooping tcn flood** command, you can disable multicast flooding on a switch interface following a topology change. Only the multicast groups that have been joined by a port are sent to that port, even during a topology change.

With the **ip igmp snooping tcn flood query count** command, you can enable multicast flooding on a switch interface for a short period of time following a topology change by configuring an IGMP query threshold.

Typically, if a topology change occurs, the spanning tree root switch issues a global IGMP leave message (referred to as a “query solicitation”) with the group multicast address 0.0.0.0. When a switch receives this solicitation, it floods this solicitation on all ports in the VLAN where the spanning tree change occurred. When the upstream router receives this solicitation, it immediately issues an IGMP general query.

With the **ip igmp snooping tcn query solicit** command, you can now direct a non-spanning tree root switch to issue the same query solicitation.

The following sections provide additional details on the new commands and illustrate how you can use them.

IGMP Snooping Interface Configuration

A topology change in a VLAN may invalidate previously learned IGMP snooping information. A host that was on one port before the topology change may move to another port after the topology change. When the topology changes, the Catalyst 4500 series switch takes special actions to ensure that multicast traffic is delivered to all multicast receivers in that VLAN.

When the spanning tree protocol is running in a VLAN, a spanning tree topology change notification (TCN) is issued by the root switch in the VLAN. A Catalyst 4500 series switch that receives a TCN in a VLAN for which IGMP snooping has been enabled immediately enters into “multicast flooding mode” for a period of time until the topology restabilizes and the new locations of all multicast receivers are learned.

While in “multicast flooding mode,” IP multicast traffic is delivered to all ports in the VLAN, and not restricted to those ports on which multicast group members have been detected.

Starting with Cisco IOS Release 12.1(11b)EW, you can manually prevent IP multicast traffic from being flooded to a switchport by using the **no ip igmp snooping tcn flood** command on that port.

For trunk ports, the configuration applies to all VLANs.

By default, multicast flooding is enabled. Use the **no** keyword to disable flooding, and use **default** to restore the default behavior (flooding is enabled).

To disable multicast flooding on an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Selects the interface to configure.
Step 2	Switch(config-if)# no ip igmp snooping tcn flood	Disables multicast flooding on the interface when TCNs are received by the switch. To enable multicast flooding on the interface, enter this command: default ip igmp snooping tcn flood
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show running interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Verifies the configuration.

This example shows how to disable multicast flooding on interface FastEthernet 2/11:

```
Switch(config)# interface fastethernet 2/11
Switch(config-if)# no ip igmp snooping tcn flood
Switch(config-if)# end
Switch#
```

IGMP Snooping Switch Configuration

By default, “flooding mode” persists until the switch receives two IGMP general queries. You can change this period of time by using the

ip igmp snooping tcn flood query count *n* command, where *n* is a number between 1 and 10.

This command operates at the global configuration level.

The default number of queries is 2. The **no** and **default** keywords restore the default.

To establish an IGMP query threshold, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip igmp snooping tcn flood query count <n>	Modifies the number of IGMP queries the switch waits for before it stops flooding multicast traffic. To return the switch to the default number of IGMP queries, enter this command: default ip igmp snooping tcn flood query count .
Step 2	Switch(config)# end	Exits configuration mode.

This example shows how to modify the switch to stop flooding multicast traffic after four queries:

```
Switch(config)# ip igmp snooping tcn flood query count 4
Switch(config)# end
Switch#
```

When a spanning tree root switch receives a topology change in an IGMP snooping-enabled VLAN, the switch issues a query solicitation that causes an IOS router to send out one or more general queries. The new command **ip igmp snooping tcn query solicit** causes the switch to send the query solicitation whenever it notices a topology change, even if that switch is not the spanning tree root.

This command operates at the global configuration level.

By default, query solicitation is disabled unless the switch is the spanning tree root. The **default** keyword restores the default behavior.

To direct a switch to send a query solicitation, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip igmp snooping tcn query solicit	Configures the switch to send a query solicitation when a TCN is detected. To stop the switch from sending a query solicitation (if it's not a spanning tree root switch), enter this command: no ip igmp snooping tcn query solicit
Step 2	Switch(config)# end	Exits configuration mode.

This example shows how to configure the switch to send a query solicitation upon detecting a TCN:

```
Switch(config)# ip igmp snooping tcn query solicit
Switch(config)# end
Switch#
```

Displaying IGMP Snooping Information

The following sections show how to display IGMP snooping information:

- [Displaying Querier Information, page 23-15](#)
- [Displaying IGMP Host Membership Information, page 23-15](#)
- [Displaying Group Information, page 23-16](#)
- [Displaying Multicast Router Interfaces, page 23-18](#)
- [Displaying MAC Address Multicast Entries, page 23-18](#)
- [Displaying IGMP Snooping Information on a VLAN Interface, page 23-19](#)
- [Configuring IGMP Filtering, page 23-20](#)

Displaying Querier Information

To display querier information, perform this task:

Command	Purpose
Switch# show ip igmp snooping querier [vlan <i>vlan_ID</i>]	Displays multicast router interfaces.

This example shows how to display the IGMP snooping querier information for all VLANs on the switch:

```
Switch# show ip igmp snooping querier
Vlan      IP Address      IGMP Version      Port
-----
2          10.10.10.1       v2                 Router
3          172.20.50.22     v3                 Fa3/15
```

This example shows how to display the IGMP snooping querier information for VLAN 3:

```
Switch# show ip igmp snooping querier vlan 3
Vlan      IP Address      IGMP Version      Port
-----
3          172.20.50.22     v3                 Fa3/15
```

Displaying IGMP Host Membership Information

Note

By default, EHT maintains a maximum of 1000 entries in the EHT database. Once this limit is reached, no additional entries are created. To create additional entries, clear the database with the **clear ip igmp snooping membership vlan** command.

To display host membership information, perform this task:

Command	Purpose
Switch# show ip igmp snooping membership [interface <i>interface_num</i>] [vlan <i>vlan_ID</i>] [reporter <i>a.b.c.d</i>] [source <i>a.b.c.d</i> group <i>a.b.c.d</i>]	Displays Explicit Host Tracking information. Note This command is valid only if EHT is enabled on the switch.

This example shows how to display host membership information for VLAN 20 and to delete the EHT database:

```
Switch# show ip igmp snooping membership vlan 20
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave

40.40.40.2/224.10.10.10 Gi4/1 20.20.20.20 00:23:37 00:06:50 00:20:30
40.40.40.3/224.10.10.10 Gi4/2 20.20.20.20 00:23:37 00:06:50 00:20:30
40.40.40.4/224.10.10.10Gi4/1 20.20.20.20 00:39:42 00:09:17 -

40.40.40.5/224.10.10.10Fa2/1 20.20.20.20 00:39:42 00:09:17 -
40.40.40.6/224.10.10.10 Fa2/1 20.20.20.20 00:09:47 00:09:17 -

Switch# clear ip igmp snooping membership vlan 20
```

This example shows how to display host membership for interface gi4/1:

```
Switch# show ip igmp snooping membership interface gi4/1
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave

40.40.40.2/224.10.10.10 Gi4/1 20.20.20.20 00:23:37 00:06:50 00:20:30
40.40.40.4/224.10.10.10Gi4/1 20.20.20.20 00:39:42 00:09:17 -
```

This example shows how to display host membership for VLAN 20 and group 224.10.10.10:

```
Switch# show ip igmp snooping membership vlan 20 source 40.40.40.2 group 224.10.10.10
#channels: 5
#hosts : 1
Source/Group Interface Reporter Uptime Last-Join Last-Leave

40.40.40.2/224.10.10.10 Gi4/1 20.20.20.20 00:23:37 00:06:50 00:20:30
```

Displaying Group Information

To display detailed IGMPv3 information associated with a group, perform one of the following tasks:

Command	Purpose
Switch# show ip igmp snooping groups [vlan <i>vlan_ID</i>]	Displays groups, the type of reports that were received for the group (Host Type), and the list of ports on which reports were received. The report list includes neither the multicast router ports nor the complete forwarding port set for the group. Rather, it lists the ports on which the reports have been received. To display the complete forwarding port set for the group, display the CLI output for the MAC address that maps to this group by using the show mac-address-table multicast command.
Switch# show ip igmp snooping groups [vlan <i>vlan_ID</i> <i>a.b.c.d</i>] [<i>summary</i> <i>sources</i> <i>hosts</i>]	Displays information specific to a group address, providing details about the current state of the group with respect to sources and hosts. Note This command applies only to full IGMPv3 snooping support and can be used for IGMPv1, IGMPv2, or IGMPv3 groups.
Switch# show ip igmp snooping groups [vlan <i>vlan_ID</i>] [<i>count</i>]	Displays the total number of group addresses learned by the system on a global or per-VLAN basis.

This example shows how to display the host types and ports of a group in VLAN 1:

```
Switch# show ip igmp snooping groups vlan 10 226.6.6.7
Vlan      Group      Version  Ports
-----
10        226.6.6.7    v3       Fa7/13, Fa7/14
Switch>
```

This example shows how to display the current state of a group with respect to a source IP address:

```
Switch# show ip igmp snooping groups vlan 10 226.6.6.7 sources
Source information for group 226.6.6.7:
Timers: Expired sources are deleted on next IGMP General Query

SourceIP      Expires    Uptime     Inc Hosts  Exc Hosts
-----
2.0.0.1       00:03:04   00:03:48   2          0
2.0.0.2       00:03:04   00:02:07   2          0
Switch>
```

This example shows how to display the current state of a group with respect to a host MAC address:

```
Switch# show ip igmp snooping groups vlan 10 226.6.6.7 hosts
IGMPv3 host information for group 226.6.6.7
Timers: Expired hosts are deleted on next IGMP General Query

Host (MAC/IP)  Filter mode  Expires    Uptime     # Sources
-----
175.1.0.29     INCLUDE     stopped    00:00:51    2
175.2.0.30     INCLUDE     stopped    00:04:14    2
```

This example shows how to display summary information for an IGMPv3 group:

```
Switch# show ip igmp snooping groups vlan 10 226.6.6.7 summary
Group Address (Vlan 10)      : 226.6.6.7
Host type                    : v3
Member Ports                 : Fa7/13, Fa7/14
Filter mode                  : INCLUDE
Expires                      : stopped
Sources                      : 2
Reporters (Include/Exclude) : 2/0
```

This example shows how to display the total number of group addresses learned by the system globally:

```
Switch# show ip igmp snooping groups count
Total number of groups: 54
```

This example shows how to display the total number of group addresses learned on VLAN 5:

```
Switch# show ip igmp snooping groups vlan 5 count
Total number of groups: 30
```

Displaying Multicast Router Interfaces

When you enable IGMP snooping, the switch automatically learns to which interface the multicast routers are connected.

To display multicast router interfaces, perform this task:

Command	Purpose
Switch# show ip igmp snooping mrouter vlan <i>vlan_ID</i>	Displays multicast router interfaces.

This example shows how to display the multicast router interfaces in VLAN 1:

```
Switch# show ip igmp snooping mrouter vlan 1
vlan          ports
-----+-----
1             Gi1/1,Gi2/1,Fa3/48,Router
Switch#
```

Displaying MAC Address Multicast Entries

To display MAC address multicast entries for a VLAN, perform this task:

Command	Purpose
Switch# show mac-address-table multicast <i>vlan vlan_ID</i> [<i>count</i>]	Displays MAC address multicast entries for a VLAN.

This example shows how to display MAC address multicast entries for VLAN 1:

```
Switch# show mac-address-table multicast vlan 1
Multicast Entries
vlan  mac address      type      ports
-----+-----+-----+-----
1      0100.5e01.0101    igmp      Switch,Gi6/1
1      0100.5e01.0102    igmp      Switch,Gi6/1
1      0100.5e01.0103    igmp      Switch,Gi6/1
```

```

1      0100.5e01.0104      igmp Switch,Gi6/1
1      0100.5e01.0105      igmp Switch,Gi6/1
1      0100.5e01.0106      igmp Switch,Gi6/1
Switch#

```

This example shows how to display a total count of MAC address entries for VLAN 1:

```

Switch# show mac-address-table multicast vlan 1 count
Multicast MAC Entries for vlan 1:      4
Switch#

```

Displaying IGMP Snooping Information on a VLAN Interface

To display IGMP snooping information on a VLAN, perform this task:

Command	Purpose
Switch# show ip igmp snooping vlan <i>vlan_ID</i>	Displays IGMP snooping information on a VLAN interface.

This example shows how to display IGMP snooping information on VLAN 5:

```

Switch# show ip igmp snooping vlan 5
Global IGMP Snooping configuration:
-----
IGMP snooping                :Enabled
IGMPv3 snooping support      :Full
Report suppression           :Enabled
TCN solicit query            :Disabled
TCN flood query count        :2

Vlan 5:
-----
IGMP snooping                :Enabled
Immediate leave               :Disabled
Explicit Host Tracking        :Disabled
Multicast router learning mode :pim-dvmrp
CGMP interoperability mode    :IGMP_ONLY

```

Displaying IGMP Snooping Querier Information

To display IGMP Snooping Querier information, perform this task:

Command	Purpose
Switch# show ip igmp snooping querier [<i>vlan vlan_ID</i>] [detail]	Displays the IGMP Snooping Querier state.

This example shows how to display Querier information:

```

switch# show ip igmp snooping querier vlan 2 detail
IP address      : 1.2.3.4
IGMP version    : v2
Port            : Router/Switch
Max response time : 12s

```

```

Global IGMP switch querier status
-----
admin state           : Enabled
admin version         : 2
source IP address     : 1.2.3.4
query-interval (sec)  : 130
max-response-time (sec) : 10
querier-timeout (sec) : 100
tcn query count       : 2
tcn query interval (sec) : 10

Vlan 2: IGMP switch querier status
-----
admin state           : Enabled
admin version         : 2
source IP address     : 1.2.3.4
query-interval (sec)  : 55
max-response-time (sec) : 12
querier-timeout (sec) : 70
tcn query count       : 10
tcn query interval (sec) : 8
operational state     : Querier
operational version   : 2
tcn query pending count : 0

```

Configuring IGMP Filtering

This section includes the following subsections:

- [Default IGMP Filtering Configuration, page 23-21](#)
- [Configuring IGMP Profiles, page 23-21](#)
- [Applying IGMP Profiles, page 23-22](#)
- [Setting the Maximum Number of IGMP Groups, page 23-23](#)

Note

The IGMP filtering feature works for IGMPv1 and IGMPv2 only.

In some environments, for example metropolitan or multiple-dwelling unit (MDU) installations, an administrator might want to control the multicast groups to which a user on a switch port can belong. This allows the administrator to control the distribution of multicast services, such as IP/TV, based on some type of subscription or service plan.

With the IGMP filtering feature, an administrator can exert this type of control. With this feature, you can filter multicast joins on a per-port basis by configuring IP multicast profiles and associating them with individual switch ports. An IGMP profile can contain one or more multicast groups and specifies whether access to the group is permitted or denied. If an IGMP profile denying access to a multicast group is applied to a switch port, the IGMP join report requesting the stream of IP multicast traffic is dropped, and the port is not allowed to receive IP multicast traffic from that group. If the filtering action permits access to the multicast group, the IGMP report from the port is forwarded for normal processing.

IGMP filtering controls only IGMP membership join reports and has no relationship to the function that directs the forwarding of IP multicast traffic.

You can also set the maximum number of IGMP groups that a Layer 2 interface can join with the **ip igmp max-groups <n>** command.

Default IGMP Filtering Configuration

Table 23-2 shows the default IGMP filtering configuration.

Table 23-2 Default IGMP Filtering Settings

Feature	Default Setting
IGMP filters	No filtering
IGMP maximum number of IGMP groups	No limit
IGMP profiles	None defined

Configuring IGMP Profiles

To configure an IGMP profile and to enter IGMP profile configuration mode, use the **ip igmp profile** global configuration command. From the IGMP profile configuration mode, you can specify the parameters of the IGMP profile to be used for filtering IGMP join requests from a port. When you are in IGMP profile configuration mode, you can create the profile using these commands:

- **deny**: Specifies that matching addresses are denied; this is the default condition.
- **exit**: Exits from igmp-profile configuration mode.
- **no**: Negates a command or sets its defaults.
- **permit**: Specifies that matching addresses are permitted.
- **range**: Specifies a range of IP addresses for the profile. You can enter a single IP address or a range with starting and ending addresses.

By default, no IGMP profiles are configured. When a profile is configured with neither the **permit** nor the **deny** keyword, the default is to deny access to the range of IP addresses.

To create an IGMP profile for a port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip igmp profile <i>profile number</i>	Enters IGMP profile configuration mode, and assigns a number to the profile you are configuring. The range is from 1 to 4,294,967,295.
Step 3	Switch(config-igmp-profile)# permit deny	(Optional) Sets the action to permit or deny access to the IP multicast address. If no action is configured, the default for the profile is to deny access.
Step 4	Switch(config-igmp-profile)# range <i>ip multicast address</i>	Enters the IP multicast address or range of IP multicast addresses to which access is being controlled. If entering a range, enter the low IP multicast address, a space, and the high IP multicast address. You can use the range command multiple times to enter multiple addresses or ranges of addresses.
Step 5	Switch(config-igmp-profile)# end	Returns to privileged EXEC mode.

	Command	Purpose
Step 6	Switch# show ip igmp profile <i>profile number</i>	Verifies the profile configuration.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To delete a profile, use the **no ip igmp profile** *profile number* global configuration command.

To delete an IP multicast address or range of IP multicast addresses, use the **no range ip multicast address** IGMP profile configuration command.

This example shows how to create IGMP profile 4 (allowing access to the single IP multicast address) and how to verify the configuration. If the action were to deny (the default), it would not appear in the **show ip igmp profile** command output.

```
Switch# configure terminal
Switch(config)# ip igmp profile 4
Switch(config-igmp-profile)# permit
Switch(config-igmp-profile)# range 229.9.9.0
Switch(config-igmp-profile)# end
Switch# show ip igmp profile 4
IGMP Profile 4
    permit
    range 229.9.9.0 229.9.9.0
```

Applying IGMP Profiles

To control access as defined in an IGMP profile, use the **ip igmp filter** interface configuration command to apply the profile to the appropriate interfaces. You can apply a profile to multiple interfaces, but each interface can only have one profile applied to it.

Note

You can apply IGMP profiles to Layer 2 ports only. You cannot apply IGMP profiles to routed ports (or SVIs) or to ports that belong to an EtherChannel port group.

To apply an IGMP profile to a switch port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode, and enter the physical interface to configure, for example fastethernet2/3 . The interface must be a Layer 2 port that does not belong to an EtherChannel port group.
Step 3	Switch(config-if)# ip igmp filter <i>profile number</i>	Applies the specified IGMP profile to the interface. The profile number can be from 1 to 4,294,967,295.
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show running configuration interface <i>interface-id</i>	Verifies the configuration.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To remove a profile from an interface, use the **no ip igmp filter** command.

This example shows how to apply IGMP profile 4 to an interface and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet2/12
Switch(config-if)# ip igmp filter 4
Switch(config-if)# end
Switch# show running-config interface fastethernet2/12
Building configuration...

Current configuration : 123 bytes
!
interface FastEthernet2/12
 no ip address
 shutdown
 snmp trap link-status
 ip igmp max-groups 25
 ip igmp filter 4
end
```

Setting the Maximum Number of IGMP Groups

You can set the maximum number of IGMP groups that a Layer 2 interface can join by using the **ip igmp max-groups** interface configuration command. Use the **no** form of this command to set the maximum back to the default, which is no limit.

Note

This restriction can be applied to Layer 2 ports only. You cannot set a maximum number of IGMP groups on routed ports (or SVIs) or on ports that belong to an EtherChannel port group.

To apply an IGMP profile on a switch port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode, and enter the physical interface to configure, for example gigabitethernet1/1 . The interface must be a Layer 2 port that does not belong to an EtherChannel group.
Step 3	Switch(config-if)# ip igmp max-groups <i>number</i>	Sets the maximum number of IGMP groups that the interface can join. The range is from 0 to 4,294,967,294. By default, no maximum is set. To remove the maximum group limitation and return to the default of no maximum, use the no ip igmp max-groups command.
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show running-configuration interface <i>interface-id</i>	Verifies the configuration.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to limit the number of IGMP groups that an interface can join to 25:

```
Switch# configure terminal
Switch(config)# interface fastethernet2/12
Switch(config-if)# ip igmp max-groups 25
Switch(config-if)# end
Switch# show running-config interface fastethernet2/12
Building configuration...

Current configuration : 123 bytes
!
interface FastEthernet2/12
 no ip address
 shutdown
 snmp trap link-status
 ip igmp max-groups 25
 ip igmp filter 4
end
```

Displaying IGMP Filtering Configuration

You can display IGMP profile and maximum group configuration for all interfaces on the switch or for a specified interface.

To display IGMP profiles, perform this task:

Command	Purpose
Switch# show ip igmp profile [<i>profile number</i>]	Displays the specified IGMP profile or all IGMP profiles defined on the switch.

To display interface configuration, perform this task:

Command	Purpose
Switch# show running-configuration [interface <i>interface-id</i>]	Displays the configuration of the specified interface or all interfaces on the switch, including (if configured) the maximum number of IGMP groups to which an interface can belong and the IGMP profile applied to the interface.

This is an example of the **show ip igmp profile** privileged EXEC command when no profile number is entered. All profiles defined on the switch are displayed.

```
Switch# show ip igmp profile
IGMP Profile 3
  range 230.9.9.0 230.9.9.0
IGMP Profile 4
  permit
  range 229.9.9.0 229.255.255.255
```

This is an example of the **show running-config** privileged EXEC command when an interface is specified with IGMP maximum groups configured and IGMP profile 4 has been applied to the interface:

```
Switch# show running-config interface fastethernet2/12
Building configuration...
Current configuration : 123 bytes
!
interface FastEthernet2/12
  no ip address
  shutdown
  snmp trap link-status
  ip igmp max-groups 25
  ip igmp filter 4
end
```

■ Displaying IGMP Filtering Configuration

CHAPTER 24

Configuring IPv6 MLD Snooping

Note

IPv6 MLD Snooping is only supported on Supervisor Engine 6-E and the Catalyst 4900 chassis.

You can use Multicast Listener Discovery (MLD) snooping to enable efficient distribution of IP version 6 (IPv6) multicast data to clients and routers in a switched network on the Catalyst 4500 series switch.

This chapter includes these sections:

- “Understanding MLD Snooping” section on page 24-1
- “Configuring IPv6 MLD Snooping” section on page 24-5
- “Displaying MLD Snooping Information” section on page 24-11

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding MLD Snooping

In IP version 4 (IPv4), Layer 2 switches can use Internet Group Management Protocol (IGMP) snooping to limit the flooding of multicast traffic by dynamically configuring Layer 2 interfaces so that multicast traffic is forwarded to only those interfaces associated with IP multicast devices. In IPv6, MLD snooping performs a similar function. With MLD snooping, IPv6 multicast data is selectively forwarded to a list of ports that want to receive the data, instead of being flooded to all ports in a VLAN. This list is constructed by snooping IPv6 multicast control packets.

MLD is a protocol used by IPv6 multicast routers to discover the presence of multicast listeners (nodes wishing to receive IPv6 multicast packets) on its directly attached links and to discover which multicast packets are of interest to neighboring nodes. MLD is derived from IGMP; MLD version 1 (MLDv1) is equivalent to IGMPv2 and MLD version 2 (MLDv2) is equivalent to IGMPv3. MLD is a subprotocol of Internet Control Message Protocol version 6 (ICMPv6), and MLD messages are a subset of ICMPv6 messages, identified in IPv6 packets by a preceding Next Header value of 58.

The switch supports two versions of MLD snooping:

- MLDv1 snooping detects MLDv1 control packets and sets up traffic bridging based on IPv6 destination multicast addresses.
- MLDv2 basic snooping (MBSS) uses MLDv2 control packets to set up traffic forwarding based on IPv6 destination multicast addresses.

The switch can snoop on both MLDv1 and MLDv2 protocol packets and bridge IPv6 multicast data based on destination IPv6 multicast addresses.

**Note**

The switch does not support MLDv2 enhanced snooping (MESS), which sets up IPv6 source and destination multicast address-based forwarding.

MLD snooping can be enabled or disabled globally or per VLAN. When MLD snooping is enabled, a per-VLAN IPv6 multicast MAC address table is constructed in software and a per-VLAN IPv6 multicast address table is constructed in software and hardware. The switch then performs IPv6 multicast-address based bridging in hardware.

These sections describe some parameters of IPv6 MLD snooping:

- [MLD Messages, page 24-2](#)
- [MLD Queries, page 24-3](#)
- [Multicast Client Aging Robustness, page 24-3](#)
- [Multicast Router Discovery, page 24-3](#)
- [MLD Reports, page 24-4](#)
- [MLD Done Messages and Immediate-Leave, page 24-4](#)
- [Topology Change Notification Processing, page 24-4](#)

MLD Messages

MLDv1 supports three types of messages:

- Listener Queries are the equivalent of IGMPv2 queries and are either General Queries or Multicast-Address-Specific Queries (MASQs).
- Multicast Listener Reports are the equivalent of IGMPv2 reports
- Multicast Listener Done messages are the equivalent of IGMPv2 leave messages.

MLDv2 supports MLDv2 queries and reports, as well as MLDv1 Report and Done messages.

Message timers and state transitions resulting from messages being sent or received are the same as those of IGMPv2 messages. MLD messages that do not have valid link-local IPv6 source addresses are ignored by MLD routers and switches.

MLD Queries

The switch sends out MLD queries, constructs an IPv6 multicast address database, and generates MLD group-specific and MLD group-and-source-specific queries in response to MLD Done messages. The switch also supports report suppression, report proxying, Immediate-Leave functionality, and static IPv6 multicast MAC-address configuration.

When MLD snooping is disabled, all MLD queries are flooded in the ingress VLAN.

When MLD snooping is enabled, received MLD queries are flooded in the ingress VLAN, and a copy of the query is sent to the CPU for processing. From the received query, MLD snooping builds the IPv6 multicast address database. It detects multicast router ports, maintains timers, sets report response time, learns the querier IP source address for the VLAN, learns the querier port in the VLAN, and maintains multicast-address aging.

When a group exists in the MLD snooping database, the switch responds to a group-specific query by sending an MLDv1 report. When the group is unknown, the group-specific query is flooded to the ingress VLAN.

When a host wants to leave a multicast group, it can send out an MLD Done message (equivalent to IGMP Leave message). When the switch receives an MLDv1 Done message, if Immediate-Leave is not enabled, the switch sends an MASQ to the port from which the message was received to determine if other devices connected to the port should remain in the multicast group.

Multicast Client Aging Robustness

You can configure port membership removal from addresses based on the number of queries. A port is removed from membership to an address only when there are no reports to the address on the port for the configured number of queries. The default number is 2.

Multicast Router Discovery

Like IGMP snooping, MLD snooping performs multicast router discovery, with these characteristics:

- Ports configured by a user never age out.
- Dynamic port learning results from MLDv1 snooping queries and IPv6 PIMv2 packets.
- If there are multiple routers on the same Layer 2 interface, MLD snooping tracks a single multicast router on the port (the router that most recently sent a router control packet).
- Dynamic multicast router port aging is based on a default timer of 5 minutes; the multicast router is deleted from the router port list if no control packet is received on the port for 5 minutes.
- IPv6 multicast router discovery only takes place when MLD snooping is enabled on the switch.
- Received IPv6 multicast router control packets are always flooded to the ingress VLAN, whether MLD snooping is enabled on the switch.
- After the discovery of the first IPv6 multicast router port, unknown IPv6 multicast data is forwarded only to the discovered router ports (before that time, all IPv6 multicast data is flooded to the ingress VLAN).

MLD Reports

The processing of MLDv1 join messages is essentially the same as with IGMPv2. When no IPv6 multicast routers are detected in a VLAN, reports are not processed or forwarded from the switch. When IPv6 multicast routers are detected and an MLDv1 report is received, an IPv6 multicast group address and an IPv6 multicast MAC address are entered in the VLAN MLD database. Then all IPv6 multicast traffic to the group within the VLAN is forwarded using this address. When MLD snooping is disabled, reports are flooded in the ingress VLAN.

When MLD snooping is enabled, MLD report suppression, called listener message suppression, is automatically enabled. With report suppression, the switch forwards the first MLDv1 report received by a group to IPv6 multicast routers; subsequent reports for the group are not sent to the routers. When MLD snooping is disabled, report suppression is disabled, and all MLDv1 reports are flooded to the ingress VLAN.

The switch also supports MLDv1 proxy reporting. When an MLDv1 MASQ is received, the switch responds with MLDv1 reports for the address on which the query arrived if the group exists in the switch on another port and if the port on which the query arrived is not the last member port for the address.

MLD Done Messages and Immediate-Leave

When the Immediate-Leave feature is enabled and a host sends an MLDv1 Done message (equivalent to an IGMP leave message), the port on which the Done message was received is immediately deleted from the group. You enable Immediate-Leave on VLANs and (as with IGMP snooping), you should only use the feature on VLANs where a single host is connected to the port. If the port was the last member of a group, the group is also deleted, and the leave information is forwarded to the detected IPv6 multicast routers.

When Immediate Leave is not enabled in a VLAN (which would be the case when there are multiple clients for a group on the same port) and a Done message is received on a port, an MASQ is generated on that port. The user can control when a port membership is removed for an existing address in terms of the number of MASQs. A port is removed from membership to an address when there are no MLDv1 reports to the address on the port for the configured number of queries.

The number of MASQs generated is configured by using the **ipv6 mld snooping last-listener-query count** global configuration command. The default number is 2.

The MASQ is sent to the IPv6 multicast address for which the Done message was sent. If there are no reports sent to the IPv6 multicast address specified in the MASQ during the switch maximum response time, the port on which the MASQ was sent is deleted from the IPv6 multicast address database. The maximum response time is the time configured by using the **ipv6 mld snooping last-listener-query-interval** global configuration command. If the deleted port is the last member of the multicast address, the multicast address is also deleted, and the switch sends the address leave information to all detected multicast routers.

Topology Change Notification Processing

When topology change notification (TCN) solicitation is enabled by using the **ipv6 mld snooping tcn query solicit** global configuration command, MLDv1 snooping sets the VLAN to flood all IPv6 multicast traffic with a configured number of MLDv1 queries before it begins sending multicast data only to selected ports. You set this value by using the **ipv6 mld snooping tcn flood query count** global

configuration command. The default is to send two queries. The switch also generates MLDv1 global Done messages with valid link-local IPv6 source addresses when the switch becomes the STP root in the VLAN or when it is configured by the user. This is same as done in IGMP snooping.

Configuring IPv6 MLD Snooping

These sections describe how to configure IPv6 MLD snooping:

- [Default MLD Snooping Configuration, page 24-5](#)
- [MLD Snooping Configuration Guidelines, page 24-6](#)
- [Enabling or Disabling MLD Snooping, page 24-6](#)
- [Configuring a Static Multicast Group, page 24-7](#)
- [Configuring a Multicast Router Port, page 24-7](#)
- [Enabling MLD Immediate Leave, page 24-8](#)
- [Configuring MLD Snooping Queries, page 24-9](#)
- [Disabling MLD Listener Message Suppression, page 24-10](#)

Default MLD Snooping Configuration

[Table 24-1](#) shows the default MLD snooping configuration.

Table 24-1 Default MLD Snooping Configuration

Feature	Default Setting
MLD snooping (Global)	Disabled.
MLD snooping (per VLAN)	Enabled. MLD snooping must be globally enabled for VLAN MLD snooping to take place.
IPv6 Multicast addresses	None configured.
IPv6 Multicast router ports	None configured.
MLD snooping Immediate Leave	Disabled.
MLD snooping robustness variable	Global: 2; Per VLAN: 0. Note The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.
Last listener query count	Global: 2; Per VLAN: 0. Note The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global count.
Last listener query interval	Global: 1000 (1 second); VLAN: 0. Note The VLAN value overrides the global setting. When the VLAN value is 0, the VLAN uses the global interval.
TCN query solicit	Disabled.
TCN query count	2.
MLD listener suppression	Disabled.

MLD Snooping Configuration Guidelines

When configuring MLD snooping, consider these guidelines:

- You can configure MLD snooping characteristics at any time, but you must globally enable MLD snooping by using the **ipv6 mld snooping** global configuration command for the configuration to take effect.
- MLD snooping and IGMP snooping act independently of each other. You can enable both features at the same time on the switch. The total number of IPv4 and IPv6 multicast groups entries that can coexist on the Catalyst 4500 series switch is limited to 16384.
- The Supervisor Engine 6-E with 512MB of memory supports about 11000 MLD Snooping multicast groups whereas a Supervisor Engine 6-E with 1GB memory supports 16384 MLD Snooping multicast groups.

Enabling or Disabling MLD Snooping

By default, IPv6 MLD snooping is globally disabled on the switch and enabled on all VLANs. When MLD snooping is globally disabled, it is also disabled on all VLANs. When you globally enable MLD snooping, the VLAN configuration overrides the global configuration. That is, MLD snooping is enabled only on VLAN interfaces in the default state (enabled).

You can enable and disable MLD snooping on a per-VLAN basis, but if you globally disable MLD snooping, it is disabled in all VLANs. If global snooping is enabled, you can enable or disable VLAN snooping.

To globally enable MLD snooping on the switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ipv6 mld snooping	Globally enables MLD snooping on the switch.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To globally disable MLD snooping on the switch, use the **no ipv6 mld snooping** global configuration command.

To enable MLD snooping on a VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ipv6 mld snooping	Globally enables MLD snooping on the switch.
Step 3	Switch(config)# ipv6 mld snooping vlan vlan-id	Enables MLD snooping on the VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
		Note MLD snooping must be globally enabled for VLAN snooping to be enabled.

	Command	Purpose
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable MLD snooping on a VLAN interface, use the **no ipv6 mld snooping vlan *vlan-id*** global configuration command for the specified VLAN number.

Configuring a Static Multicast Group

Hosts or Layer 2 ports normally join multicast groups dynamically, but you can also statically configure an IPv6 multicast address and member ports for a VLAN.

To add a Layer 2 port as a member of a multicast group, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode
Step 2	Switch(config)# ipv6 mld snooping vlan <i>vlan-id</i> static <i>ipv6_multicast_address</i> interface <i>interface-id</i>	Statically configures a multicast group with a Layer 2 port as a member of a multicast group: <ul style="list-style-type: none"> <i>vlan-id</i> is the multicast group VLAN ID. The VLAN ID range is 1 to 1001 and 1006 to 4094. <i>ipv6_multicast_address</i> is the 128-bit group IPv6 address. The address must be in the form specified in RFC 2373. <i>interface-id</i> is the member port. It can be a physical interface or a port channel (1 to 64).
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show mac-address-table multicast mld-snooping	Verifies the static member port and the IPv6 address.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To remove a Layer 2 port from the multicast group, use the **no ipv6 mld snooping vlan *vlan-id* static *mac-address* interface *interface-id*** global configuration command. If all member ports are removed from a group, the group is deleted.

This example shows how to statically configure an IPv6 MAC address:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 2 static 3333.0000.0003 interface
gigabitethernet1/1
Switch(config)# end
```

Configuring a Multicast Router Port

Although MLD snooping learns about router ports through MLD queries and PIMv6 queries, you can also use the command-line interface (CLI) to add a multicast router port to a VLAN. To add a multicast router port (add a static connection to a multicast router), use the **ipv6 mld snooping vlan *mrouter*** global configuration command on the switch.

**Note**

Static connections to multicast routers are supported only on switch ports.

To add a multicast router port to a VLAN, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i>	Specifies the multicast router VLAN ID, and specify the interface to the multicast router. <ul style="list-style-type: none"> The VLAN ID range is 1 to 1001 and 1006 to 4094. The interface can be a physical interface or a port channel. The port-channel range is 1 to 64.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show ipv6 mld snooping mrouter [vlan <i>vlan-id</i>]	Verifies that IPv6 MLD snooping is enabled on the VLAN interface.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To remove a multicast router port from the VLAN, use the **no ipv6 mld snooping vlan** *vlan-id* **mrouter interface** *interface-id* global configuration command.

This example shows how to add a multicast router port to VLAN 200:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 mrouter interface gigabitethernet1/0/2
Switch(config)# exit
```

Enabling MLD Immediate Leave

When you enable MLDv1 Immediate Leave, the switch immediately removes a port from a multicast group when it detects an MLD Done message on that port. You should only use the Immediate-Leave feature when there is a single receiver present on every port in the VLAN. When there are multiple clients for a multicast group on the same port, you should not enable Immediate-Leave in a VLAN.

To enable MLDv1 Immediate Leave, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ipv6 mld snooping vlan <i>vlan-id</i> immediate-leave	Enables MLD Immediate Leave on the VLAN interface.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show ipv6 mld snooping vlan <i>vlan-id</i>	Verifies that Immediate Leave is enabled on the VLAN interface.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable MLD Immediate Leave on a VLAN, use the **no ipv6 mld snooping vlan *vlan-id* immediate-leave** global configuration command.

This example shows how to enable MLD Immediate Leave on VLAN 130:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 130 immediate-leave
Switch(config)# exit
```

Configuring MLD Snooping Queries

When Immediate Leave is not enabled and a port receives an MLD Done message, the switch generates MASQs on the port and sends them to the IPv6 multicast address for which the Done message was sent. You can optionally configure the number of MASQs that are sent and the length of time the switch waits for a response before deleting the port from the multicast group.

To configure MLD snooping query characteristics for the switch or for a VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ipv6 mld snooping robustness-variable <i>value</i>	(Optional) Sets the number of queries that are sent before switch will deletes a listener (port) that does not respond to a general query. The range is 1 to 3; the default is 2.
Step 3	Switch(config)# ipv6 mld snooping vlan <i>vlan-id</i> robustness-variable <i>value</i>	(Optional) Sets the robustness variable on a VLAN basis, which determines the number of general queries that MLD snooping sends before aging out a multicast address when there is no MLD report response. The range is 1 to 3; the default is 0. When set to 0, the number used is the global robustness variable value.
Step 4	Switch(config)# ipv6 mld snooping last-listener-query-count <i>count</i>	(Optional) Sets the number of MASQs that the switch sends before aging out an MLD client. The range is 1 to 7; the default is 2. The queries are sent 1 second apart.
Step 5	Switch(config)# ipv6 mld snooping vlan <i>vlan-id</i> last-listener-query-count <i>count</i>	(Optional) Sets the last-listener query count on a VLAN basis. This value overrides the value configured globally. The range is 1 to 7; the default is 0. When set to 0, the global count value is used. Queries are sent 1 second apart.
Step 6	Switch(config)# ipv6 mld snooping last-listener-query-interval <i>interval</i>	(Optional) Sets the maximum response time that the switch waits after sending out a MASQ before deleting a port from the multicast group. The range is 100 to 32,768 thousands of a second. The default is 1000 (1 second).
Step 7	Switch(config)# ipv6 mld snooping vlan <i>vlan-id</i> last-listener-query-interval <i>interval</i>	(Optional) Sets the last-listener query interval on a VLAN basis. This value overrides the value configured globally. The range is 0 to 32,768 thousands of a second. The default is 0. When set to 0, the global last-listener query interval is used.
Step 8	Switch(config)# ipv6 mld snooping tcn query solicit	(Optional) Enables topology change notification (TCN) solicitation, which means that VLANs flood all IPv6 multicast traffic for the configured number of queries before sending multicast data to only those ports requesting to receive it. The default is for TCN to be disabled.
Step 9	Switch(config)# ipv6 mld snooping tcn flood query count <i>count</i>	(Optional) When TCN is enabled, specifies the number of TCN queries to be sent. The range is from 1 to 10; the default is 2.

	Command	Purpose
Step 10	Switch(config)# end	Returns to privileged EXEC mode.
Step 11	Switch# show ipv6 mld snooping querier [vlan vlan-id]	(Optional) Verifies that the MLD snooping querier information for the switch or for the VLAN.
Step 12	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to set the MLD snooping global robustness variable to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping robustness-variable 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query count for a VLAN to 3:

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping vlan 200 last-listener-query-count 3
Switch(config)# exit
```

This example shows how to set the MLD snooping last-listener query interval (maximum response time) to 2000 (2 seconds):

```
Switch# configure terminal
Switch(config)# ipv6 mld snooping last-listener-query-interval 2000
Switch(config)# exit
```

Disabling MLD Listener Message Suppression

MLD snooping listener message suppression is enabled by default. When it is enabled, the switch forwards only one MLD report per multicast router query. When message suppression is disabled, multiple MLD reports could be forwarded to the multicast routers.

To disable MLD listener message suppression, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# no ipv6 mld snooping listener-message-suppression	Disables MLD message suppression.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show ipv6 mld snooping	Verifies that IPv6 MLD snooping report suppression is disabled.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To re-enable MLD message suppression, use the **ipv6 mld snooping listener-message-suppression** global configuration command.

Displaying MLD Snooping Information

You can display MLD snooping information for dynamically learned and statically configured router ports and VLAN interfaces. You can also display MAC address multicast entries for a VLAN configured for MLD snooping.

To display MLD snooping information, use one or more of the privileged EXEC commands in [Table 24-2](#).

Table 24-2 *Commands for Displaying MLD Snooping Information*

Command	Purpose
<code>show ipv6 mld snooping [vlan vlan-id]</code>	Displays the MLD snooping configuration information for all VLANs on the switch or for a specified VLAN. (Optional) Enter vlan vlan-id to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
<code>show ipv6 mld snooping mrouter [vlan vlan-id]</code>	Displays information on dynamically learned and manually configured multicast router interfaces. When you enable MLD snooping, the switch automatically learns the interface to which a multicast router is connected. These are dynamically learned interfaces. (Optional) Enter vlan vlan-id to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.
<code>show ipv6 mld snooping querier [vlan vlan-id]</code>	Displays information about the IPv6 address and incoming port for the most-recently received MLD query messages in the VLAN. (Optional) Enter vlan vlan-id to display information for a single VLAN. The VLAN ID range is 1 to 1001 and 1006 to 4094.

CHAPTER 25

Configuring 802.1Q and Layer 2 Protocol Tunneling

Virtual private networks (VPNs) provide enterprise-scale connectivity on a shared infrastructure, often Ethernet-based, with the same security, prioritization, reliability, and manageability requirements of private networks. Tunneling is a feature designed for service providers who carry traffic of multiple customers across their networks and who are required to maintain the VLAN and Layer 2 protocol configurations of each customer without impacting the traffic of other customers. The Catalyst 4500 series switch supports IEEE 802.1Q tunneling and Layer 2 protocol tunneling.

Note

Be aware that 802.1Q requires WS-C4948, WS-C4948-10GE, ME-4924-10GE, WS-C4928-10GE, WS-C4900M, WS-X4013+10GE, WS-X4516, WS-X4516-10GE, or WS-X45-SUP6-E; Layer 2 protocol tunneling is supported on all supervisor engines.

This chapter contains these sections:

- [Understanding 802.1Q Tunneling, page 25-2](#)
- [Configuring 802.1Q Tunneling, page 25-3](#)
- [Understanding Layer 2 Protocol Tunneling, page 25-7](#)
- [Configuring Layer 2 Protocol Tunneling, page 25-9](#)
- [Monitoring and Maintaining Tunneling Status, page 25-12](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding 802.1Q Tunneling

The VLAN ranges required by different customers in the same Service Provider network might overlap, and customer traffic through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations and could easily exceed the VLAN limit (4096) of the 802.1Q specification.

802.1Q tunneling enables Service Providers to use a single VLAN to support customers who have multiple VLANs, while preserving customer VLAN IDs and keeping traffic in different customer VLANs segregated.

A port configured to support 802.1Q tunneling is called a tunnel port. When you configure tunneling, you assign a tunnel port to a VLAN ID that is dedicated to tunneling. Each customer requires a separate Service Provider VLAN ID, but that Service Provider VLAN ID supports VLANs of all the customers.

Customer traffic tagged in the normal way with appropriate VLAN IDs comes from an 802.1Q trunk port on the customer device and into a tunnel port on the Service Provider edge switch. The link between the customer device and the edge switch is asymmetric because one end is configured as an 802.1Q trunk port, and the other end is configured as a tunnel port. You assign the tunnel port interface to an access VLAN ID that is unique to each customer. See [Figure 25-1](#).

Figure 25-1 802.1Q Tunnel Ports in a Service Provider Network

Packets coming from the customer trunk port into the tunnel port on the Service Provider edge switch are normally 802.1Q-tagged with the appropriate VLAN ID. When the tagged packets exit the trunk port into the Service Provider network, they are encapsulated with another layer of an 802.1Q tag (called the *metro tag*) that contains the VLAN ID that is unique to the customer. The original customer 802.1Q tag is preserved in the encapsulated packet. Therefore, packets entering the Service Provider network are double-tagged, with the metro tag containing the customer's access VLAN ID, and the inner VLAN ID being that of the incoming traffic.

When the double-tagged packet enters another trunk port in a Service Provider core switch, the metro tag is stripped as the switch processes the packet. When the packet exits another trunk port on the same core switch, the same metro tag is again added to the packet. [Figure 25-2](#) shows the tag structures of the Ethernet packets starting with the original, or normal, frame.

Figure 25-2 Original (Normal), 802.1Q, and Double-Tagged Ethernet Packet Formats

When the packet enters the trunk port of the Service Provider egress switch, the metro tag is again stripped as the switch processes the packet. However, the metro tag is not added when the packet is sent out the tunnel port on the edge switch into the customer network. The packet is sent as a normal 802.1Q-tagged frame to preserve the original VLAN numbers in the customer network.

All packets entering the Service Provider network through a tunnel port on an edge switch are treated as untagged packets, whether they are untagged or already tagged with 802.1Q headers. The packets are encapsulated with the metro tag VLAN ID (set to the access VLAN of the tunnel port) when they are sent through the Service Provider network on an 802.1Q trunk port. The priority field on the metro tag is set to the interface class of service (CoS) priority configured on the tunnel port. (The default is zero if none is configured.)

In [Figure 25-1](#), Customer A was assigned VLAN 30, and Customer B was assigned VLAN 40. Packets entering the edge-switch tunnel ports with 802.1Q tags are double-tagged when they enter the Service Provider network, with the metro tag containing VLAN ID 30 or 40, appropriately, and the inner tag containing the original customer VLAN number, for example, VLAN 100. Even if Customers A and B both have VLAN 100 in their networks, the traffic remains segregated within the Service Provider network because the metro tag is different. Each customer controls its own VLAN numbering space, which is independent of the VLAN numbering space used by other customers and the VLAN numbering space used by the Service Provider network.

Configuring 802.1Q Tunneling

These sections describe 802.1Q tunneling configuration:

- [802.1Q Tunneling Configuration Guidelines, page 25-3](#)
- [802.1Q Tunneling and Other Features, page 25-5](#)
- [Configuring an 802.1Q Tunneling Port, page 25-6](#)

Note

By default, 802.1Q tunneling is disabled because the default switch port mode is dynamic auto. Tagging of 802.1Q native VLAN packets on all 802.1Q trunk ports is also disabled.

802.1Q Tunneling Configuration Guidelines

When you configure 802.1Q tunneling, you should always use asymmetrical links for traffic going through a tunnel and should dedicate one VLAN for each tunnel. You should also be aware of configuration requirements for native VLANs and maximum transmission units (MTUs). For more information about MTUs, see the [“System MTU” section on page 25-5](#).

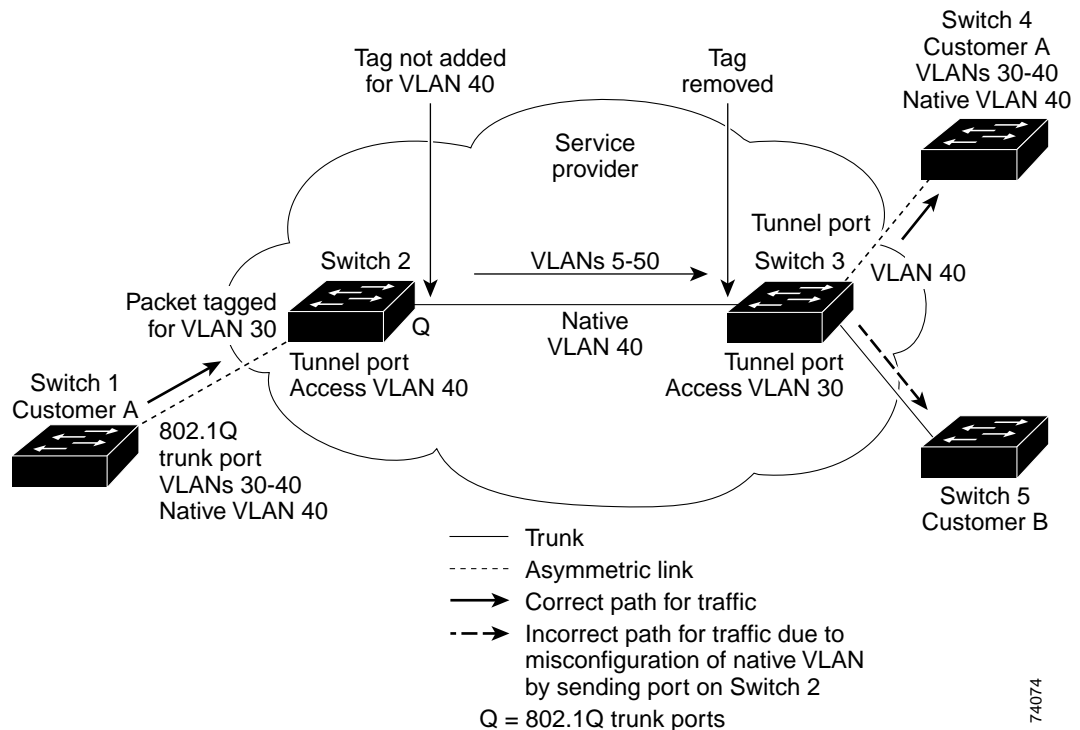

Native VLANs

When configuring 802.1Q tunneling on an edge switch, you must use 802.1Q trunk ports for sending packets into the Service Provider network. However, packets going through the core of the Service Provider network can be carried through 802.1Q trunks, ISL trunks, or nontrunking links. When 802.1Q trunks are used in these core switches, the native VLANs of the 802.1Q trunks must not match any native VLAN of the nontrunking (tunneling) port on the same switch because traffic on the native VLAN would not be tagged on the 802.1Q sending trunk port.

See [Figure 25-3](#). VLAN 40 is configured as the native VLAN for the 802.1Q trunk port from Customer A at the ingress edge switch in the Service Provider network (Switch 2). Switch 1 of Customer A sends a tagged packet on VLAN 30 to the ingress tunnel port of Switch 2 in the Service Provider network, which belongs to access VLAN 40. Because the access VLAN of the tunnel port (VLAN 40) is the same as the native VLAN of the edge-switch trunk port (VLAN 40), the metro tag is not added to tagged packets received from the tunnel port. The packet carries only the VLAN 30 tag through the Service Provider network to the trunk port of the egress-edge switch (Switch 3) and is misdirected through the egress switch tunnel port to Customer B.

These are some ways to solve this problem:

- Use ISL trunks between core switches in the Service Provider network. Although customer interfaces connected to edge switches must be 802.1Q trunks, we recommend using ISL trunks for connecting switches in the core layer.
- Use the **switchport trunk native vlan tag** per-port command and the **vlan dot1q tag native** global configuration command to configure the edge switch so that all packets going out an 802.1Q trunk, including the native VLAN, are tagged. If the switch is configured to tag native VLAN packets on all 802.1Q trunks, the switch ensures that all packets exiting the trunk are tagged and prevents the reception of untagged packets on the trunk port.
- Ensure that the native VLAN ID on the edge-switch trunk port is not within the customer VLAN range. For example, if the trunk port carries traffic of VLANs 100 to 200, assign the native VLAN a number outside that range.

Figure 25-3 Potential Problem with 802.1Q Tunneling and Native VLANs

System MTU

The default system MTU for traffic on the Catalyst 4500 series switch is 1500 bytes. You can configure the switch to support larger frames by using the **system mtu** global configuration command. Because the 802.1Q tunneling feature increases the frame size by 4 bytes when the metro tag is added, you must configure all switches in the Service Provider network to be able to process larger frames by increasing the switch system MTU size to at least 1504 bytes. The maximum allowable system MTU for Catalyst 4500 Gigabit Ethernet switches is 9198 bytes; the maximum system MTU for Fast Ethernet switches is 1552 bytes.

802.1Q Tunneling and Other Features

Although 802.1Q tunneling works well for Layer 2 packet switching, there are incompatibilities between some Layer 2 features and Layer 3 switching.

- A tunnel port cannot be a routed port.
- IP routing is not supported on a VLAN that includes 802.1Q ports. Packets received from a tunnel port are forwarded based only on Layer 2 information. If routing is enabled on a switch virtual interface (SVI) that includes tunnel ports, untagged IP packets received from the tunnel port are recognized and routed by the switch. Customers can access the Internet through the native VLAN. If this access is not needed, you should not configure SVIs on VLANs that include tunnel ports.
- Tunnel ports do not support IP access control lists (ACLs).
- Layer 3 quality of service (QoS) ACLs and other QoS features related to Layer 3 information are not supported on tunnel ports. MAC-based QoS is supported on tunnel ports.

- EtherChannel port groups are compatible with tunnel ports as long as the 802.1Q configuration is consistent within an EtherChannel port group.
- Port Aggregation Protocol (PAgP), Link Aggregation Control Protocol (LACP), and UniDirectional Link Detection (UDLD) are supported on 802.1Q tunnel ports.
- Dynamic Trunking Protocol (DTP) is not compatible with 802.1Q tunneling because you must manually configure asymmetric links with tunnel ports and trunk ports.
- Loopback detection is supported on 802.1Q tunnel ports.
- When a port is configured as an 802.1Q tunnel port, spanning-tree bridge protocol data unit (BPDU) filtering is automatically enabled on the interface. Cisco Discovery Protocol (CDP) is automatically disabled on the interface.

Configuring an 802.1Q Tunneling Port

To configure a port as an 802.1Q tunnel port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and the interface to be configured as a tunnel port. This should be the edge port in the Service Provider network that connects to the customer switch. Valid interfaces include physical interfaces and port-channel logical interfaces (port channels 1 to 64).
Step 3	Switch(config-if)# switchport access vlan <i>vlan-id</i>	Specifies the default VLAN, which is used if the interface stops trunking. This VLAN ID is specific to the particular customer.
Step 4	Switch(config-if)# switchport mode dot1q-tunnel	Sets the interface as an 802.1Q tunnel port.
Step 5	Switch(config-if)# exit	Returns to global configuration mode.
Step 6	Switch(config)# vlan dot1q tag native	(Optional) Sets the switch to enable tagging of native VLAN packets on all 802.1Q trunk ports. When not set, and a customer VLAN ID is the same as the native VLAN, the trunk port does not apply a metro tag, and packets could be sent to the wrong destination.
Step 7	Switch(config)# end	Returns to privileged EXEC mode.
Step 8	Switch# show dot1q-tunnel	Displays the tunnel ports on the switch.
Step 9	Switch# show vlan dot1q tag native	Displays 802.1Q native-VLAN tagging status.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no vlan dot1q tag native** global command and the **no switchport mode dot1q-tunnel** interface configuration command to return the port to the default state of dynamic auto. Use the **no vlan dot1q tag native** global configuration command to disable tagging of native VLAN packets.

This example shows how to configure an interface as a tunnel port, enable tagging of native VLAN packets, and verify the configuration. In this configuration, the VLAN ID for the customer connected to Gigabit Ethernet interface 2/7 is VLAN 22.

```
Switch(config)# interface gigabitethernet2/7
Switch(config-if)# switchport access vlan 22
% Access VLAN does not exist. Creating vlan 22
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# exit
Switch(config)# vlan dot1q tag native
Switch(config)# end
Switch# show dot1q-tunnel interface gigabitethernet2/7
Port
-----
LAN Port(s)
-----
Gi2/7
Switch# show vlan dot1q tag native
dot1q native vlan tagging is enabled globally
```

Understanding Layer 2 Protocol Tunneling

Customers at different sites connected across a Service Provider network need to use various Layer 2 protocols to scale their topologies to include all remote and local sites. STP must run properly, and every VLAN should build a proper spanning tree that includes the local site and all remote sites across the Service Provider network. Cisco Discovery Protocol (CDP) must discover neighboring Cisco devices from local and remote sites. VLAN Trunking Protocol (VTP) must provide consistent VLAN configuration throughout all sites in the customer network.

When protocol tunneling is enabled, edge switches on the inbound side of the Service Provider network encapsulate Layer 2 protocol packets with a special MAC address and send them across the Service Provider network. Core switches in the network do not process these packets but forward them as normal packets. Layer 2 protocol data units (PDUs) for CDP, STP, or VTP cross the Service Provider network and are delivered to customer switches on the outbound side of the Service Provider network. Identical packets are received by all customer ports on the same VLANs with these results:

- Users on each of a customer's sites can properly run STP, and every VLAN can build a correct spanning tree, based on parameters from all sites and not just from the local site.
- CDP discovers and shows information about the other Cisco devices connected through the Service Provider network.
- VTP provides consistent VLAN configuration throughout the customer network, propagating to all switches through the Service Provider.

Layer 2 protocol tunneling can be enabled on trunk, access and tunnel ports. If protocol tunneling is not enabled, remote switches at the receiving end of the Service Provider network do not receive the PDUs and cannot properly run STP, CDP, and VTP. When protocol tunneling is enabled, Layer 2 protocols within each customer's network are totally separate from those running within the Service Provider network.

As an example, Customer A in [Figure 25-4](#) has four switches in the same VLAN that are connected through the Service Provider network. If the network does not tunnel PDUs, switches on the far ends of the network cannot properly run STP, CDP, and VTP. For example, STP for a VLAN on a switch in Customer A's Site 1 will build a spanning tree on the switches at that site without considering convergence parameters based on Customer A's switch in Site 2. [Figure 25-5](#) shows one possible spanning tree topology.

Figure 25-4 Layer 2 Protocol Tunneling

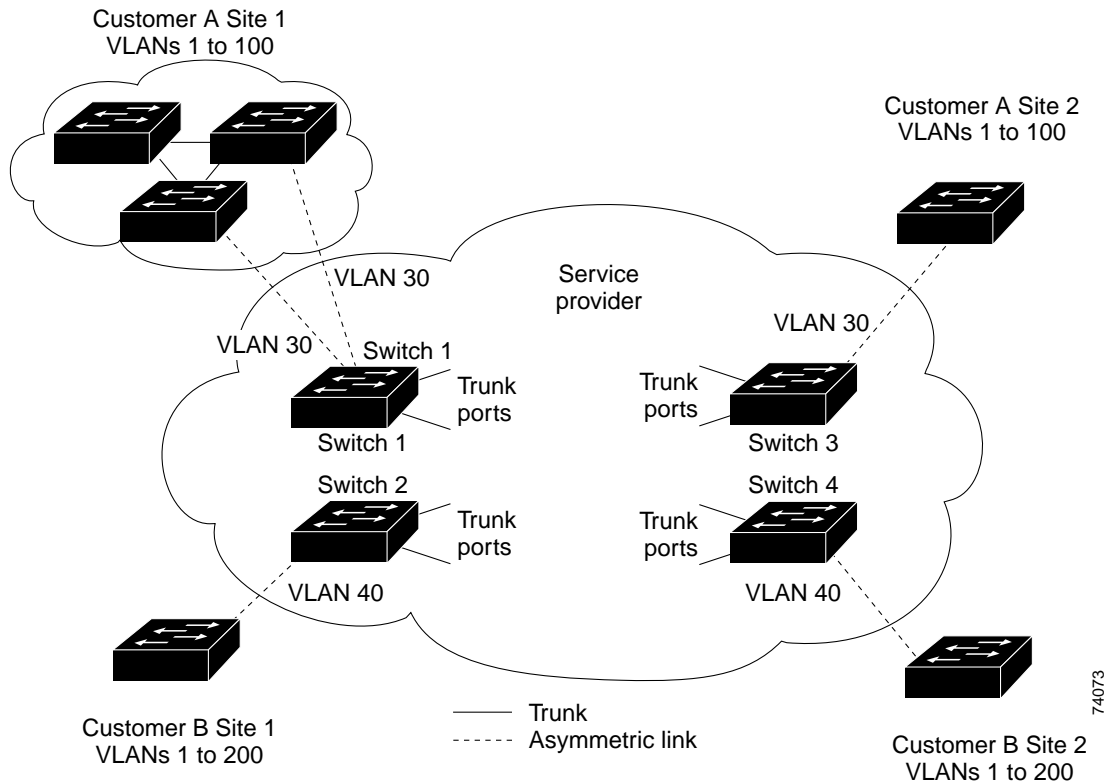

Figure 25-5 Layer 2 Network Topology without Proper Convergence

Configuring Layer 2 Protocol Tunneling

You can enable Layer 2 protocol tunneling (by protocol) on access ports, tunnel ports, or trunk ports that are connected to the customer in the edge switches of the Service Provider network. The Service Provider edge switches connected to the customer switch perform the tunneling process. Edge-switch tunnel ports or normal trunk ports can be connected to customer 802.1Q trunk ports. Edge-switch access ports are connected to customer access ports.

When the Layer 2 PDUs that entered the Service Provider inbound edge switch through the tunnel port or the access port exit through its the trunk port into the Service Provider network, the switch overwrites the customer PDU-destination MAC address with a well-known Cisco proprietary multicast address (01-00-0c-cd-cd-d0). If 802.1Q tunneling is enabled, packets are also double-tagged; the outer tag is the customer metro tag, and the inner tag is the customer's VLAN tag. The core switches ignore the inner tags and forward the packet to all trunk ports in the same metro VLAN. The edge switches on the outbound side restore the proper Layer 2 protocol and MAC address information and forward the packets to all tunnel or access ports in the same metro VLAN. Therefore, the Layer 2 PDUs remain intact and are delivered across the Service Provider network to the other side of the customer network.

See [Figure 25-4](#), with Customer A and Customer B in access VLANs 30 and 40, respectively.

Asymmetric links connect the Customers in Site 1 to edge switches in the Service Provider network. The Layer 2 PDUs (for example, BPDUs) coming into Switch 2 from Customer B in Site 1 are forwarded to the infrastructure as double-tagged packets with the well-known MAC address as the destination MAC address. These double-tagged packets have the metro VLAN tag of 40, as well as an inner VLAN tag (for example, VLAN 100). When the double-tagged packets enter Switch 4, the metro VLAN tag 40 is removed. The well-known MAC address is replaced with the respective Layer 2 protocol MAC address, and the packet is sent to Customer B on Site 2 as a single-tagged frame in VLAN 100.

You can also enable Layer 2 protocol tunneling on access ports on the edge switch connected to access ports on the customer switch. In this case, the encapsulation and de-encapsulation process is the same as described in the previous paragraph, except that the packets are not double-tagged in the Service Provider network. The single tag is the customer-specific access VLAN tag.

This section contains the following subsections:

- [Default Layer 2 Protocol Tunneling Configuration, page 25-9](#)
- [Layer 2 Protocol Tunneling Configuration Guidelines, page 25-10](#)
- [Configuring Layer 2 Tunneling, page 25-11](#)

Default Layer 2 Protocol Tunneling Configuration

[Table 25-1](#) shows the default configuration for Layer 2 protocol tunneling.

Table 25-1 *Default Layer 2 Ethernet Interface VLAN Configuration*

Feature	Default Setting
Layer 2 protocol tunneling	Disabled.
Shutdown threshold	None set.
Drop threshold	None set.
CoS value	If a CoS value is configured on the interface for data packets, that value is the default used for Layer 2 PDUs. If none is configured, the default is 5.

Layer 2 Protocol Tunneling Configuration Guidelines

These are some configuration guidelines and operating characteristics of Layer 2 protocol tunneling:

- The switch supports tunneling of CDP, STP, including multiple STP (MSTP), and VTP. Protocol tunneling is disabled by default but can be enabled for the individual protocols on 802.1Q tunnel ports, access ports or trunk ports.
- Dynamic Trunking Protocol (DTP) is not compatible with Layer 2 protocol tunneling because you must manually configure asymmetric links with tunnel ports and trunk ports.
- EtherChannel port groups are compatible with tunnel ports when the 802.1Q configuration is consistent within an EtherChannel port group.
- If an encapsulated PDU (with the proprietary destination MAC address) is received on a port with Layer 2 tunneling enabled, the port is shut down to prevent loops.
- The port also shuts down when a configured shutdown threshold for the protocol is reached. You can manually re-enable the port (by entering a shutdown and a no shutdown command sequence). If errdisable recovery is enabled, the operation is retried after a specified time interval.
- Only decapsulated PDUs are forwarded to the customer network. The spanning-tree instance running on the Service Provider network does not forward BPDUs to Layer 2 protocol tunneling ports. CDP packets are not forwarded from Layer 2 protocol tunneling ports.
- When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, shutdown threshold for the PDUs generated by the customer network. If the limit is exceeded, the port shuts down. You can also limit the BPDU rate by using QoS ACLs and policy maps on a Layer 2 protocol tunneling port.
- When protocol tunneling is enabled on an interface, you can set a per-protocol, per-port, drop threshold for the PDUs generated by the customer network. If the limit is exceeded, the port drops PDUs until the rate at which it receives them is below the drop threshold.
- Because tunneled PDUs (especially STP BPDUs) must be delivered to all remote sites so that the customer virtual network operates properly, you can give PDUs higher priority within the Service Provider network than data packets received from the same tunnel port. By default, the PDUs use the same CoS value as data packets.
- The following caveat applies to non-Supervisor 6-E supervisors when applying QoS on L2PT packets.

Because of a hardware limitation, such supervisors cannot police control packets on ports enabled for port security. Because learning behavior for L2PT src MAC is influenced by configuring protocol tunneling on any switch interface, this limitation for L2PT packets translates into the following: When L2PT tunneling is configured on any port in the system, non-Supervisor 6-E systems cannot police L2PT packets on a port enabled for port security. L2PT packets are treated as control packets (source MAC not learnt) once L2PT tunneling is configured for any supported control protocol.

Note

If L2PT tunneling is not configured on a system, L2PT packets are treated as data packets and this caveat does not apply.

Configuring Layer 2 Tunneling

To configure a port for Layer 2 protocol tunneling, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode, and enter the interface to be configured as a tunnel port. This should be the edge port in the Service Provider network that connects to the customer switch. Valid interfaces can be physical interfaces and port-channel logical interfaces (port channels 1 to 64).
Step 3	Switch(config-if)# switchport mode access or, Switch(config-if)# switchport mode dot1q-tunnel or, Switch(config-if)# switchport mode trunk	Configures the interface as an access port, an 802.1Q tunnel port or a trunk port.
Step 4	Switch(config-if)# l2protocol-tunnel [cdp stp vtp]	Enables protocol tunneling for the desired protocol. If no keyword is entered, tunneling is enabled for all three Layer 2 protocols.
Step 5	Switch(config-if)# l2protocol-tunnel shutdown-threshold [cdp stp vtp] <i>value</i>	(Optional) Configures the threshold for packets-per-second accepted for encapsulation. The interface is disabled if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured. Note If you also set a drop threshold on this interface, the shutdown-threshold value must be greater than or equal to the drop-threshold value.
Step 6	Switch(config-if)# l2protocol-tunnel drop-threshold [cdp stp vtp] <i>value</i>	(Optional) Configures the threshold for packets-per-second accepted for encapsulation. The interface drops packets if the configured threshold is exceeded. If no protocol option is specified, the threshold applies to each of the tunneled Layer 2 protocol types. The range is 1 to 4096. The default is to have no threshold configured. Note If you also set a shutdown threshold on this interface, the drop-threshold value must be less than or equal to the shutdown-threshold value.
Step 7	Switch(config-if)# exit	Returns to global configuration mode.
Step 8	Switch(config)# errdisable recovery cause l2ptguard	(Optional) Configures the recovery mechanism from a Layer 2 maximum-rate error so that the interface is re-enabled and can try again. Errdisable recovery is disabled by default; when enabled, the default time interval is 300 seconds.
Step 9	Switch(config)# l2protocol-tunnel cos <i>value</i>	(Optional) Configures the CoS value for all tunneled Layer 2 PDUs. The range is 0 to 7; the default is the default CoS value for the interface. If none is configured, the default is 5.
Step 10	Switch(config)# end	Returns to privileged EXEC mode.

	Command	Purpose
Step 11	Switch# show l2protocol	Displays the Layer 2 tunnel ports on the switch, including the protocols configured, the thresholds, and the counters.
Step 12	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no l2protocol-tunnel [cdp | stp | vtp]** interface configuration command to disable protocol tunneling for one of the Layer 2 protocols or for all three. Use the **no l2protocol-tunnel shutdown-threshold [cdp | stp | vtp]** and the **no l2protocol-tunnel drop-threshold [cdp | stp | vtp]** commands to return the shutdown and drop thresholds to the default settings.

This example shows how to configure Layer 2 protocol tunneling on an 802.1Q tunnel port for CDP, STP, and VTP and how to verify the configuration:

```
Switch(config)# interface FastEthernet2/1
Switch(config-if)# switchport mode dot1q-tunnel
Switch(config-if)# l2protocol-tunnel cdp
Switch(config-if)# l2protocol-tunnel stp
Switch(config-if)# l2protocol-tunnel vtp
Switch(config-if)# l2protocol-tunnel shutdown-threshold 1500
Switch(config-if)# l2protocol-tunnel drop-threshold 1000
Switch(config-if)# exit
Switch(config)# l2protocol-tunnel cos 7
Switch(config)# end
Switch# show l2protocol
```

COS for Encapsulated Packets: 7

Port	Protocol	Shutdown Threshold	Drop Threshold	Encapsulation Counter	Decapsulation Counter	Drop Counter
Fa2/11	cdp	1500	1000	2288	2282	0
	stp	1500	1000	116	13	0
	vtp	1500	1000	3	67	0

Monitoring and Maintaining Tunneling Status

Table 25-2 shows the commands for monitoring and maintaining 802.1Q and Layer 2 protocol tunneling.

Table 25-2 Commands for Monitoring and Maintaining Tunneling

Command	Purpose
Switch# clear l2protocol-tunnel counters	Clears the protocol counters on Layer 2 protocol tunneling ports.
Switch# show dot1q-tunnel	Displays 802.1Q tunnel ports on the switch.
Switch# show dot1q-tunnel interface interface-id	Verifies if a specific interface is a tunnel port.
Switch# show l2protocol-tunnel	Displays information about Layer 2 protocol tunneling ports.
Switch# show errdisable recovery	Verifies if the recovery timer from a Layer 2 protocol-tunnel error disable state is enabled.
Switch# show l2protocol-tunnel interface interface-id	Displays information about a specific Layer 2 protocol tunneling port.
Switch# show l2protocol-tunnel summary	Displays only Layer 2 protocol summary information.
Switch# show vlan dot1q native	Displays the status of native VLAN tagging on the switch.

**Note**

With Cisco IOS Release 12.2(20)EW, the BPDU filtering configuration for both dot1q and Layer 2 protocol tunneling is no longer visible in the running configuration as "spanning-tree bpdupfilter enable." Instead, it is visible in the output of the **show spanning tree int detail** command as shown below.

```
Switch# show spann int f6/1 detail
Port 321 (FastEthernet6/1) of VLAN0001 is listening
  Port path cost 19, Port priority 128, Port Identifier 128.321.
  Designated root has priority 32768, address 0008.e341.4600
  Designated bridge has priority 32768, address 0008.e341.4600
  Designated port id is 128.321, designated path cost 0
  Timers: message age 0, forward delay 2, hold 0
  Number of transitions to forwarding state: 0
  Link type is point-to-point by default
  ** Bpdu filter is enabled internally **
  BPDU: sent 0, received 0
```

CHAPTER 26

Configuring CDP

This chapter describes how to configure Cisco Discovery Protocol (CDP) on the Catalyst 4500 series switch. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- [Overview of CDP, page 26-1](#)
- [Configuring CDP, page 26-2](#)

Note

For complete syntax and usage information for the commands used in this chapter, refer to the *Cisco IOS Configuration Fundamentals Configuration Guide*, Release 12.4:

http://www.cisco.com/en/US/docs/ios/fundamentals/configuration/guide/12_4/cf_12_4_book.html

and the *Cisco IOS Configuration Fundamentals Command Reference*, Release 12.2:

http://www.cisco.com/en/US/docs/ios/12_2/configfun/command/reference/ffun_r.html

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of CDP

CDP is a protocol that runs over Layer 2 (the data link layer) on all Cisco routers, bridges, access servers, and switches. CDP allows network management applications to discover Cisco devices that are neighbors of already known devices, in particular, neighbors running lower-layer, transparent protocols. With CDP, network management applications can learn the device type and the SNMP agent address of neighboring devices. CDP enables applications to send SNMP queries to neighboring devices.

CDP runs on all LAN and WAN media that support Subnetwork Access Protocol (SNAP).

Each CDP-configured device sends periodic messages to a multicast address. Each device advertises at least one address at which it can receive SNMP messages. The advertisements also contain the time-to-live, or holdtime information, which indicates the length of time a receiving device should hold CDP information before discarding it.

Configuring CDP

The following sections describe how to configure CDP:

- [Enabling CDP Globally, page 26-2](#)
- [Displaying the CDP Global Configuration, page 26-2](#)
- [Enabling CDP on an Interface, page 26-3](#)
- [Displaying the CDP Interface Configuration, page 26-3](#)
- [Monitoring and Maintaining CDP, page 26-3](#)

Enabling CDP Globally

To enable CDP globally, perform this task:

Command	Purpose
Switch(config)# [no] cdp run	Enables CDP globally. Use the no keyword to disable CDP globally.

This example shows how to enable CDP globally:

```
Switch(config)# cdp run
```

Displaying the CDP Global Configuration

To display the CDP configuration, perform this task:

Command	Purpose
Switch# show cdp	Displays global CDP information.

This example shows how to display the CDP configuration:

```
Switch# show cdp
Global CDP information:
  Sending CDP packets every 120 seconds
  Sending a holdtime value of 180 seconds
  Sending CDPv2 advertisements is enabled
Switch#
```

For additional CDP **show** commands, see the “[Monitoring and Maintaining CDP](#)” section on page 26-3.

Enabling CDP on an Interface

To enable CDP on an interface, perform this task:

Command	Purpose
Switch(config-if)# [no] cdp enable	Enables CDP on an interface. Use the no keyword to disable CDP on an interface.

This example shows how to enable CDP on Fast Ethernet interface 5/1:

```
Switch(config)# interface fastethernet 5/1
Switch(config-if)# cdp enable
```

This example shows how to disable CDP on Fast Ethernet interface 5/1:

```
Switch(config)# interface fastethernet 5/1
Switch(config-if)# no cdp enable
```

Displaying the CDP Interface Configuration

To display the CDP configuration for an interface, perform this task:

Command	Purpose
Switch# show cdp interface <i>[type/number]</i>	Displays information about interfaces where CDP is enabled.

This example shows how to display the CDP configuration of Fast Ethernet interface 5/1:

```
Switch# show cdp interface fastethernet 5/1
FastEthernet5/1 is up, line protocol is up
  Encapsulation ARPA
  Sending CDP packets every 120 seconds
  Holdtime is 180 seconds
Switch#
```

Monitoring and Maintaining CDP

To monitor and maintain CDP on your device, perform one or more of these tasks:

Command	Purpose
Switch# clear cdp counters	Resets the traffic counters to zero.
Switch# clear cdp table	Deletes the CDP table of information about neighbors.
Switch# show cdp	Displays global information such as frequency of transmissions and the holdtime for packets being transmitted.

Command	Purpose
Switch# show cdp entry <i>entry_name</i> [protocol version]	Displays information about a specific neighbor. The display can be limited to protocol or version information.
Switch# show cdp interface [<i>type/number</i>]	Displays information about interfaces on which CDP is enabled.
Switch# show cdp neighbors [<i>type/number</i>] [detail]	Displays information about neighboring equipment. The display can be limited to neighbors on a specific interface and expanded to provide more detailed information.
Switch# show cdp traffic	Displays CDP counters, including the number of packets sent and received and checksum errors.
Switch# show debugging	Displays information about the types of debugging that are enabled for your switch.

This example shows how to clear the CDP counter configuration on your switch:

```
Switch# clear cdp counters
```

This example shows how to display information about the neighboring equipment:

```
Switch# show cdp neighbors
```

Capability Codes: R - Router, T - Trans Bridge, B - Source Route Bridge
S - Switch, H - Host, I - IGMP, r - Repeater

CHAPTER 27

Configuring LLDP, LLDP-MED, and Location Service

This chapter describes how to configure the Link Layer Discovery Protocol (LLDP), LLDP Media Endpoint Discovery (LLDP-MED), and Location Service on the Catalyst 4500 series switch.

Note

For complete syntax and usage information for the commands used in this chapter, see the command reference for this release and the “System Management Commands” section in the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.2*.

This chapter consists of these sections:

- [Understanding LLDP, LLDP-MED, and Location Service, page 27-1](#)
- [Configuring LLDP and LLDP-MED, and Location Service, page 27-4](#)
- [Monitoring and Maintaining LLDP, LLDP-MED, and Location Service, page 27-11](#)

Understanding LLDP, LLDP-MED, and Location Service

This section contains this conceptual information:

- [Understanding LLDP, page 27-1](#)
- [Understanding LLDP-MED, page 27-2](#)
- [Understanding Location Service, page 27-3](#)

Understanding LLDP

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the IEEE 802.1AB LLDP. LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

LLDP supports a set of attributes that it uses to discover neighbor devices. These attributes contain type, length, and value descriptions and are referred to as *TLVs*. LLDP supported devices can use TLVs to receive and send information to their neighbors. Details such as configuration information, device capabilities, and device identity can be advertised using this protocol.

The switch supports the following basic management TLVs, which are optional:

- Port description TLV
- System name TLV
- System description TLV
- System capabilities TLV
- Management address TLV

These organizationally specific LLDP TLVs are also advertised to support LLDP-MED.

- Port VLAN ID TLV ((IEEE 802.1 organizationally specific TLVs)
- MAC/PHY configuration/status TLV(IEEE 802.3 organizationally specific TLVs)

Understanding LLDP-MED

LLDP for Media Endpoint Devices (LLDP-MED) is an extension to LLDP that operates between endpoint devices such as IP phones and network devices such as switches. It specifically provides support for voice over IP (VoIP) applications and provides additional TLVs for capabilities discovery, network policy, Power over Ethernet, inventory management, and location information. By default, all LLDP-MED TLVs are enabled.

LLDP-MED supports these TLVs:

- LLDP-MED capabilities TLV

Allows LLDP-MED endpoints to determine the capabilities that the connected device supports and what capabilities the device has enabled.

- Network policy TLV

Allows both network connectivity devices and endpoints to advertise VLAN configurations and associated Layer 2 and Layer 3 attributes for the specific application on that port. For example, the switch can notify a phone of the VLAN number that it should use. The phone can connect into any switch, obtain its VLAN number, and then start communicating with the call control

- Power management TLV

Enables advanced power management between LLDP-MED endpoint and network connectivity devices. Allows switches and phones to convey power information, such as how the device is powered, power priority, and how much power the device needs.

Note Power Management TLV only exchanges power information; it does not perform power negotiation, which is handled by CDP.

- Inventory management TLV

Allows an endpoint to send detailed inventory information about itself to the switch, including information hardware revision, firmware version, software version, serial number, manufacturer name, model name, and asset ID TLV.

- Location TLV

Provides location information from the switch to the endpoint device. The location TLV can send this information:

- Civic location information

Provides the civic address information and postal information. Examples of civic location information are street address, road name, and postal community name information.

- ELIN location information

Provides the location information for a caller. The location is determined by the Emergency location identifier number (ELIN), which is a phone number that routes an emergency call to the local public safety answering point (PSAP) and which the PSAP can use to call back the emergency caller.

**Note**

A switch cannot send LLDP and LLDP-MED simultaneously to an end-point device. By default, a network device sends only LLDP packets until it receives LLDP-MED packets from an end-point device. The network device then sends LLDP-MED packets until it receives only LLDP packets.

Understanding Location Service

The location service feature enables the switch to provide location and attachment tracking information for its connected devices to a Cisco Mobility Services Engine (MSE). The tracked device can be a wireless endpoint, a wired endpoint, or a wired switch or controller. The switch informs device link up and link down events through Network Mobility Services Protocol (NMSP) location and attachment notifications to the MSE.

The MSE initiates the NMSP connection to the switch. When the MSE connects to the switch messages are exchanged to establish version compatibility, service exchange, and location information synchronization. After the connection is established, the switch sends location and attachment notifications periodically to the MSE. Any link up event, link down event, or location configuration change detected during the interval are aggregated and sent at the end of the interval using attachment or location notifications.

When the switch discovers the presence or absence of a device on a link-up or link-down event on a port, it obtains the client's MAC address, IP address, and 802.1x username if applicable. If the device is LLDP-MED or CDP enabled, then the switch further gathers client-specific information such as the model number and software version.

Depending on the device capabilities, the switch obtains this client attachment information at link up:

- Slot, port, and port-type
- Client's MAC address
- Client's IP address
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *Connected*
- Serial number, UDI

- Model number
- Software version
- VLAN ID and VLAN name

Depending on the device capabilities, the switch obtains this client information at link down:

- Slot and port that was disconnected
- Client's MAC address
- Client's IP address
- 802.1X username if applicable
- Device category is specified as a *wired station*
- State is specified as *Disconnected*
- Serial number, UDI
- Model number
- Software version
- VLAN id and VLAN name

If an administrator changes a location address at the switch, the information is reported to the MSE. The switch sends a NMSP location notification message that identifies the list of ports affected by the change and the changed address information.

Configuring LLDP and LLDP-MED, and Location Service

This section contains this configuration information:

- [Default LLDP Configuration, page 27-4](#)
- [Configuring LLDP Characteristics, page 27-5](#)
- [Disabling and Enabling LLDP Globally, page 27-6](#)
- [Disabling and Enabling LLDP on an Interface, page 27-7](#)
- [Configuring LLDP-MED TLVs, page 27-8](#)
- [Configuring Location TLV and Location Service, page 27-9](#)
- [Monitoring and Maintaining LLDP, LLDP-MED, and Location Service, page 27-11](#)

Default LLDP Configuration

[Table 27-1](#) shows the default LLDP configuration. To change the default settings, use the LLDP global configuration and LLDP interface configuration commands.

Table 27-1 **Default LLDP Configuration**

Feature	Default Setting
LLDP global state	Disabled
LLDP holdtime (before discarding)	120 seconds
LLDP timer (packet update frequency)	30 seconds

Table 27-1 *Default LLDP Configuration*

Feature	Default Setting
LLDP reinitialization delay	2 seconds
LLDP tlv-select	Enabled to send and receive all TLVs.
LLDP interface state	Enabled
LLDP receive	Enabled
LLDP transmit	Enabled
LLDP med-tlv-select	Enabled to send all LLDP-MED TLVs

Configuring LLDP Characteristics

You can configure the frequency of LLDP updates, the amount of time to hold the information before discarding it, the initialization delay time. You can also select the LLDP and LLDP-MED TLVs for sending and receiving. The location service feature is available only when the switch is running the cryptographic (encrypted) software image.

To configure these characteristics, perform this task:

**Note**

Steps 2 through 5 can be performed in any order.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# lldp holdtime <i>seconds</i>	(Optional) Specifies the amount of time a receiving device should hold the information sent by your device before discarding it. The range is 0 to 65535 seconds; the default is 120 seconds.
Step 3	Switch(config)# lldp reinit	(Optional) Specific the delay time in seconds for LLDP to initialize on any interface. The range is 2 to 5 seconds; the default is 2 seconds.
Step 4	Switch(config)# lldp timer <i>seconds</i>	(Optional) Sets the transmission frequency of LLDP updates in seconds. The range is 5 to 65534 seconds; the default is 30 seconds.
Step 5	Switch(config)# lldp tlv-select	(Optional) Specifies the LLDP TLVs to send or receive.
Step 6	Switch(config)# copy running-config startup-config	Saves your entries in the configuration file.
Step 7	Switch(config)# lldp med-tlv-select	(Optional) Specifies the LLDP-MED TLVs to send or receive.

**Note**

Use the **no** form of each of the LLDP commands to return to the default setting.

This example shows how to configure a holdtime of 120 second, a delay time of 2 seconds and an update frequency of 30:

```
Switch# configure terminal
Switch(config)# lldp holdtime 120
Switch(config)# lldp reinit 2
Switch(config)# lldp timer 30
Switch(config)# end
```

This example shows how to transmit only LLDP packets:

```
switch# configure terminal
siwtch(config)# no lldp receive
switch(config)# end
```

If you want to receive LLDP packets again, do the following:

```
switch# configure terminal
siwtch(config)# lldp receive
switch(config)# end
```

For additional LLDP **show** commands, see the [“Monitoring and Maintaining LLDP, LLDP-MED, and Location Service” section on page 27-11](#).

Disabling and Enabling LLDP Globally

Note

LLDP is disabled by default.

To disable LLDP globally, do the following:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config) # no lldp run	Disables LLDP.
Step 3	Switch(config) # end	Returns to privileged EXEC mode.

To enable LLDP once it has been disabled, do the following:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config) # lldp run	Enables LLDP.
Step 3	Switch(config) # end	Returns to privileged EXEC mode.

This example shows how to globally disable LLDP.

```
Switch# configure terminal
Switch(config)# no lldp run
Switch(config)# end
```

This example shows how to globally enable LLDP.

```
Switch# configure terminal
Switch(config)# lldp run
Switch(config)# end
```

Disabling and Enabling LLDP on an Interface

LLDP is disabled globally on all supported interfaces. You must enable LLDP globally to allow a device to send LLDP packets. However, no changes are required at the interface level.

You can configure the interface to selectively not to send and receive LLDP packets with the **no lldp transmit** and **no lldp receive** commands.

Note

If the interface is configured as a tunnel port, LLDP is automatically disabled.

To disable LLDP on an interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Specifies the interface on which you are disabling LLDP, and enter interface configuration mode.
Step 3	Switch(config)# no lldp transmit	Disallows sending LLDP packets on the interface.
Step 4	Switch(config)# no lldp receive	Disallows receiving LLDP packets on the interface.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch(config)# copy running-config startup-config	Saves your entries in the configuration file.

To enable LLDP on an interface once it has been disabled, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Specifies the interface on which you are enabling LLDP, and enter interface configuration mode.
Step 3	Switch(config)# lldp transmit	Sends LLDP packets on the interface.
Step 4	Switch(config)# lldp receive	Receives LLDP packets on the interface.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# copy running-config startup-config	Saves your entries in the configuration file.

This example shows how to enable LLDP on an interface.

```
Switch# configure terminal
Switch(config)# interface GigabitEthernet 1/1
Switch(config-if)# lldp transmit
Switch(config-if)# lldp receive
Switch(config-if)# end
```

Configuring LLDP-MED TLVs

By default, the switch only sends LLDP packets until it receives LLDP-MED packets from the end device. The switch continues to send LLDP-MED packets until it only receives LLDP packets.

By using the **lldp** interface configuration command, you can configure the interface not to send the TLVs listed in [Table 27-2](#).

Table 27-2 *LLDP-MED TLVs*

LLDP-MED TLV	Description
inventory-management	LLDP-MED inventory management TLV
location	LLDP-MED location TLV
network-policy	LLDP-MED network policy TLV
power-management	LLDP-MED power management TLV

To disable a TLV on an interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Specifies the interface on which you are configuring a LLDP-MED TLV, and enter interface configuration mode.
Step 3	Switch(config-if)# no lldp med-tlv-select tlv	Specifies the TLV to disable.
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To enable a TLV on an interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Specifies the interface on which you are configuring an LLDP-MED TLV, and enter interface configuration mode.
Step 3	Switch(config-if)# lldp med-tlv-select tlv	Specifies the TLV to enable.
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable a TLV on an interface when it has been disabled.

```
Switch# configure terminal
Switch(config)# interface GigabitEthernet0/1
Switch(config-if)# lldp med-tlv-select inventory management
Switch(config-if)# end
```

Configuring Location TLV and Location Service

To configure location information for an end-point and to apply it to an interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# location { admin-tag <i>string</i> civic-location identifier <i>id</i> elin-location <i>string</i> identifier <i>id</i> }	Specifies the location information for an endpoint. <ul style="list-style-type: none"> • admin-tag—Specify an administrative tag or site information. • civic-location—Specify civic location information. <p>Note The civic location identifier in the LLDP-MED TLV is limited to 250 bytes or less. To avoid receiving error messages regarding available buffer space during switch configuration, never allow the total length of all civic location information specified for each civic-location identifier to exceed 250 bytes.</p> <ul style="list-style-type: none"> • elin-location—Specify emergency location information (ELIN). • identifier <i>id</i>—Specify the ID for the civic location. • <i>string</i>—specify the site or location information in alphanumeric format.
Step 3	Switch(config-civic)# exit	Returns to global configuration mode.
Step 4	Switch(config)# interface <i>interface-id</i>	Specifies the interface on which you are configuring the location information, and enter interface configuration mode.
Step 5	Switch(config-if)# location { additional-location-information <i>word</i> civic-location-id <i>id</i> elin-location-id <i>id</i> }	Enters location information for an interface: <ul style="list-style-type: none"> additional-location-information—Specifies additional information for a location or place. civic-location-id—Specifies global civic location information for an interface. elin-location-id—Specifies emergency location information for an interface. <i>id</i>—Specifies the ID for the civic location or the ELIN location. The ID range is 1 to 4095. <i>word</i>—Specifies a word or phrase that provides additional location information.
Step 6	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 7	Switch# show location	Verifies the configuration.
Step 8	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no** form of each command to return to the default setting.

This example shows how to configure civic location information on the switch:

```
Switch# configure terminal
Switch(config)# location civic-location identifier 1
Switch(config-civic)# number 3550
Switch(config-civic)# primary-road-name "Cisco Way"
```

```
Switch(config-civic)# city "San Jose"
Switch(config-civic)# state CA
Switch(config-civic)# building 19
Switch(config-civic)# room C6
Switch(config-civic)# county "Santa Clara"
Switch(config-civic)# country US
Switch(config-civic)# end
```

To enable location service on the switch, follow these steps, beginning in privileged EXEC mode:

**Note**

Your switch must be running the cryptographic (encrypted) software image in order to enable the location service feature. Your Cisco Mobility Service Engine (MSE) must be running Heitz 6.0 or later software image to support wired location service

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# nmosp enable	Enables the NMSP features on the switch.
Step 3	Switch(config)# ip device tracking	Enables IP device tracking.
Step 4	Switch(config)# nmosp notification interval {attachment location} interval-seconds	Specifies the NMSP notification interval. attachment —Specify the attachment notification interval. location —Specify the location notification interval. <i>interval-seconds</i> —Duration in seconds before a switch sends the location or attachment updates to the MSE. The range is 1 to 30; the default is 30.
Step 5	Switch(config)# interface interface-id	Specifies the interface on which you want to prevent all learned attachment information from being sent to the MSE.
Step 6	Switch(config-if)# nmosp attachment suppress	Prevents the attachment information learned on this interface from being sent to the MSE. Note Location service is intended for tracking end devices directly connected to the switch. Please apply this command on all trunk interfaces to avoid inaccurate tracking information.
Step 7	Switch# end	Returns to privileged EXEC mode.
Step 8	Switch# show nmosp notification	Verifies the notification interval configuration.
Step 9	Switch# show nmosp status	Verifies if NMSP is enabled.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable NMSP on a switch and set the location notification time to 10 seconds:

```
Switch# configure terminal
Switch(config)# nmosp enable
Switch(config)# ip device tracking
Switch(config)# nmosp notification interval location 10
Switch(config)# end
```

**Note**

Location service tracks IP devices only on Layer 2 and Layer 3 physical ports. IP devices that are connected through SVIs or port-channels are not tracked and reported to the MSE.

Monitoring and Maintaining LLDP, LLDP-MED, and Location Service

To monitor and maintain LLDP, LLDP-MED, and location service on your device, perform one or more of the following commands in privileged EXEC mode:

Command	Description
clear lldp counters	Resets the traffic and error counters to zero.
clear lldp table	Deletes the LLDP table of information about neighbors.
clear nmstp statistics	Clears the NMSP statistic counters.
show lldp	Displays global information, such as frequency of transmissions, the holdtime for packets being sent, and the delay time for LLDP to initialize on an interface.
show lldp entry <i>entry-name</i>	Displays information about a specific neighbor. You can enter an asterisk (*) to display all neighbors, or you can enter the name of the neighbor about which you want information.
show lldp errors	Displays LLDP computational errors and overflows.
show lldp interface [<i>interface-id</i>]	Displays information about interfaces where LLDP is enabled. You can limit the display to the interface about which you want information.
show lldp neighbors [<i>interface-id</i>] [<i>detail</i>]	Displays information about neighbors, including device type, interface type and number, holdtime settings, capabilities, and port ID. You can limit the display to neighbors of a specific interface or expand the display to provide more detailed information.
show lldp traffic	Displays LLDP counters, including the number of packets sent and received, number of packets discarded, and number of unrecognized TLVs.
show location	Displays the location information for an endpoint.
show nmstp	Displays the NMSP information.

CHAPTER 28

Configuring UDLD

This chapter describes how to configure the UniDirectional Link Detection (UDLD) and Unidirectional Ethernet on the Catalyst 4500 series switch. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- [Overview of UDLD, page 28-1](#)
- [Default UDLD Configuration, page 28-2](#)
- [Configuring UDLD on the Switch, page 28-3](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of UDLD

UDLD is a layer 2 protocol that enables devices connected through fiber-optic or twisted-pair Ethernet cables. It monitors a physical connection (such as wrong cabling) to detect unidirectional links to avoid spanning-tree topology loops or silent drop traffic.

All connected devices must support UDLD for the protocol to successfully identify the unidirectional links. When UDLD detects a unidirectional link, it can administratively shut down the affected port and send you a warning message.

Modes of Operation

UDLD supports two operation modes: normal and aggressive.

normal A UDLD-capable port A periodically sends a UDLD probe to port B. If port B is not UDLD capable, no unidirectional link detection occurs. If both devices are UDLD capable and bi-directional connectivity exists, probe messages travel in both direction at a rate of 1 every few seconds (through the **UDLD message time interval** global configuration command). Upon receiving the probe, the UDLD protocol attempts to synchronize the devices by sending echo messages to the peer port and waiting for answer during the detection window. If the unidirectional traffic is detected when the port link is still up (port B no longer sends traffic to port A), port B enters errdisable mode. Port A is marked Undetermined but does not enter errdisable mode. It continues to operate under its current STP status because this mode is informational only; it is potentially less disruptive although it does not prevent STP loops.

aggressive If port A loses its neighbor connectivity, it actively tries to re-establish the relationship by sending a probe to port B. If port B does not respond, it is considered unidirectional and port A will enter errdisable state to avoid silent drop traffic.

UDLD aggressive mode can interoperate with UDLD normal mode. When the unidirectional condition is detected, only the aggressive mode link shuts down.

By default,

- UDLD is locally disabled on copper LAN ports to avoid sending unnecessary control traffic (BPDU control packets) on this type of media; this protocol is most often used for access ports.
- UDLD is enabled on a fiber port if global UDLD is activated.

Figure 28-1 illustrates a unidirectional link condition. Each switch can send packets to a neighbor switch but cannot receive packets from the switch it is sending packets to. UDLD detects and disables these one-way connections.

Figure 28-1 Unidirectional Link

144608

Default UDLD Configuration

Table 28-1 shows the UDLD default configuration.

Table 28-1 UDLD Default Configuration

Feature	Default Status
UDLD global enable state	Globally disabled
UDLD per-interface enable state for fiber-optic media	Enabled on all Ethernet fiber-optic interfaces
UDLD per-interface enable state for twisted-pair (copper) media	Disabled on all Ethernet 10/100 and 1000BaseTX interfaces

Configuring UDLD on the Switch

The following sections describe how to configure UDLD:

- [Enabling UDLD Globally, page 28-4](#)
- [Enabling UDLD on Individual Interfaces, page 28-4](#)
- [Disabling UDLD on Non-Fiber-Optic Interfaces, page 28-4](#)
- [Configuring the UDLD Probe Message Interval, page 28-5](#)
- [Resetting Disabled LAN Interfaces, page 28-5](#)

Enabling UDLD Globally

To enable UDLD in the aggressive or normal mode and to set the configurable message timer on all fiber-optic interfaces on the switch, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters the global configuration mode.
Step 2	Switch(config)# udld {aggressive enable message time message-timer-interval}	<p>Specifies the UDLD mode of operation:</p> <ul style="list-style-type: none"> • aggressive Enables UDLD in aggressive mode on all fiber-optic interfaces. • enable Enables UDLD in normal mode on all fiber-optic interfaces on the switch. UDLD is disabled by default. <p>An individual interface configuration overrides the setting of the udld enable global configuration command.</p> <p>For more information about aggressive and normal modes, see the Modes of Operation, page 28-1 section.</p> <ul style="list-style-type: none"> • message time message-timer-interval—Configures the period of time between UDLD probe messages on ports that are in the advertisement phase and are determined to be bidirectional. The range is from 1 to 90 seconds. <p>Note Prior to Cisco IOS Release 12.2(31)SGA, the timer range is 7 to 90 seconds. With Cisco IOS Release 12.2(31)SGA, the timer range is 1 to 90 seconds</p>
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show udld	Verifies the configuration.

Enabling UDLD on Individual Interfaces

To enable UDLD on individual interfaces, perform this task:

	Command	Purpose
Step 1	Switch(config-if)# udld enable	Enables UDLD on a specific interface. On a fiber-optic interface, this command overrides the udld enable global configuration command setting.
Step 2	Switch# show udld interface	Verifies the configuration.

Disabling UDLD on Non-Fiber-Optic Interfaces

To disable UDLD on individual non-fiber-optic interfaces, perform this task:

	Command	Purpose
Step 1	Switch(config-if)# no udld enable	Disables UDLD on a non-fiber-optic interface. Note On fiber-optic interfaces, the no udld enable command reverts the interface configuration to the udld enable global configuration command setting.
Step 2	Switch# show udld interface	Verifies the configuration.

Configuring the UDLD Probe Message Interval

To configure the time between UDLD probe messages on ports that are in advertisement mode and are currently determined to be bidirectional, perform this task:

	Command	Purpose
Step 1	Switch(config)# udld message time interval	Configures the time between UDLD probe messages on ports that are in advertisement mode and are currently determined to be bidirectional; valid values are from 1 to 90 seconds. Note Prior to Cisco IOS Release 12.2(31)SGA, the time interval is 7-90 seconds. With Cisco IOS Release 12.2(31)SGA, the time interval is 1-90 second. The no udld message command returns to the default value (60 seconds).
Step 2	Switch# show udld type-slot/interface	Verifies the configuration.

Resetting Disabled LAN Interfaces

To reset all LAN ports that have been shut down by UDLD, perform this task:

Command	Purpose
Switch(config)# udld reset	Resets all LAN ports that have been shut down by UDLD.

CHAPTER 29

Configuring Unidirectional Ethernet

Note

Unidirectional Ethernet is not supported on either Supervisor Engine 6-E or a Catalyst 4900M chassis.

This chapter describes how to configure Unidirectional Ethernet on the Catalyst 4000 family switch and contains these sections:

- [Overview of Unidirectional Ethernet, page 29-1](#)
- [Configuring Unidirectional Ethernet, page 29-2](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Unidirectional Ethernet

You can set stubless Gigabit Ethernet ports to unidirectionally transmit or receive traffic. Unidirectional Ethernet uses only one strand of fiber for either transmitting or receiving one-way traffic for the GigaPort, instead of two strands of fiber for a full-duplex GigaPort Ethernet. Configuring your GigaPorts either to transmit or receive traffic effectively doubles the amount of traffic capabilities for applications, such as video streaming, where most traffic is sent as unacknowledged unidirectional video broadcast streams.

Configuring Unidirectional Ethernet

Note

You must configure Unidirectional Ethernet on the non-blocking GigaPort, which will automatically disable UDLD on the port.

To enable Unidirectional Ethernet, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet tengigabitethernet } <i>slot/interface</i> Port-channel <i>number</i> }	Selects the interface to configure.
Step 2	Switch(config-if)# [no] unidirectional { send-only receive-only }	Enables Unidirectional Ethernet. Use the no keyword to disable Unidirectional Ethernet.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet tengigabitethernet } <i>slot/interface</i> } unidirectional	Verifies the configuration.

This example shows how to set Gigabit Ethernet interface 1/1 to unidirectionally send traffic:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# unidirectional send-only
Switch(config-if)# end
```

Warning!

Enable 12 port unidirectional mode will automatically disable port udld. You must manually ensure that the unidirectional link does not create a spanning tree loop in the network.

Enable 13 port unidirectional mode will automatically disable ip routing on the port. You must manually configure static ip route and arp entry in order to route ip traffic.

This example shows how to set Gigabit Ethernet interface 1/1 to receive traffic unidirectionally:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# unidirectional receive-only
Switch(config-if)# end
```

Warning!

Enable 12 port unidirectional mode will automatically disable port udld. You must manually ensure that the unidirectional link does not create a spanning tree loop in the network.

Enable 13 port unidirectional mode will automatically disable ip routing on the port. You must manually configure static ip route and arp entry in order to route ip traffic.

This example shows how to verify the configuration

```
Switch> show interface gigabitethernet 1/1 unidirectional  
show interface gigabitethernet 1/1 unidirectional  
Unidirectional configuration mode: send only  
CDP neighbor unidirectional configuration mode: receive only
```

This example shows how to disable Unidirectional Ethernet on Gigabit Ethernet interface 1/1:

```
Switch# configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
Switch(config)# interface gigabitethernet 1/1  
Switch(config-if)# no unidirectional  
Switch(config-if)# end
```

This example shows the result of issuing the **show interface** command for a port that does not support Unidirectional Ethernet:

```
Switch#show interface f6/1 unidirectional  
Unidirectional Ethernet is not supported on FastEthernet6/1
```

CHAPTER 30

Configuring Layer 3 Interfaces

This chapter describes the Layer 3 interfaces on a Catalyst 4500 series switch. It also provides guidelines, procedures, and configuration examples.

This chapter includes the following major sections:

- [Overview of Layer 3 Interfaces, page 30-1](#)
- [Configuration Guidelines, page 30-4](#)
- [Configuring Logical Layer 3 VLAN Interfaces, page 30-5](#)
- [Configuring VLANs as Layer 3 Interfaces, page 30-6](#)
- [Configuring Physical Layer 3 Interfaces, page 30-10](#)
- [Configuring EIGRP Stub Routing, page 30-11](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Layer 3 Interfaces

This section contains the following subsections:

- [Logical Layer 3 VLAN Interfaces, page 30-2](#)
- [Physical Layer 3 Interfaces, page 30-2](#)
- [Understanding SVI Autostate Exclude, page 30-3](#)
- [Understanding Layer 3 Interface Counters, page 30-3](#)

The Catalyst 4500 family switch supports Layer 3 interfaces with the Cisco IOS IP and IP routing protocols. Layer 3, the *network* layer, is primarily responsible for the routing of data in packets across logical internetwork paths.

Layer 2, the *data link* layer, contains the protocols that control the *physical* layer (Layer 1) and how data is framed before being transmitted on the medium. The Layer 2 function of filtering and forwarding data in frames between two segments on a LAN is known as *bridging*.

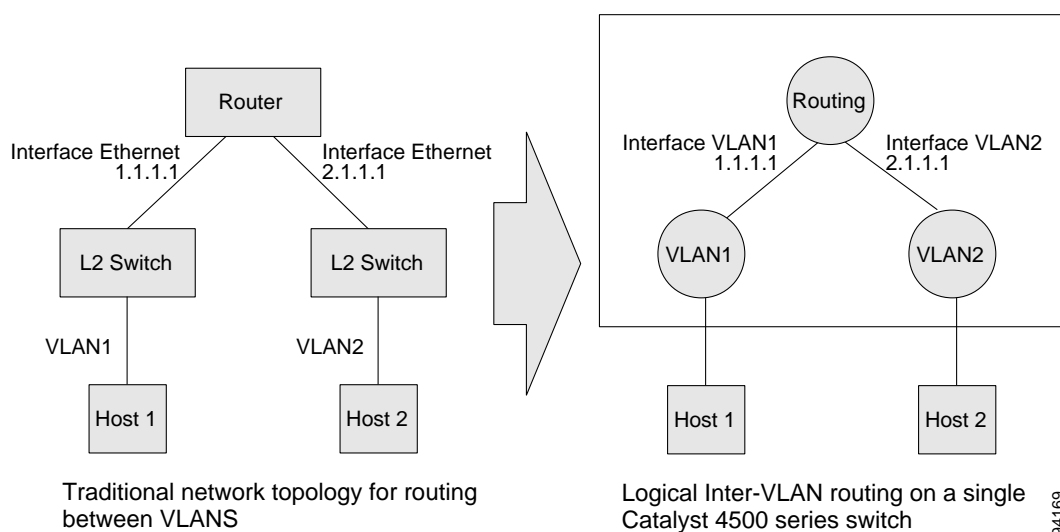

The Catalyst 4500 series switch supports two types of Layer 3 interfaces. The logical Layer 3 VLAN interfaces integrate the functions of routing and bridging. The physical Layer 3 interfaces allow the Catalyst 4500 series switch to be configured like a traditional router.

Logical Layer 3 VLAN Interfaces

The logical Layer 3 VLAN interfaces provide logical routing interfaces to VLANs on Layer 2 switches. A traditional network requires a physical interface from a router to a switch to perform inter-VLAN routing. The Catalyst 4500 series switch supports inter-VLAN routing by integrating the routing and bridging functions on a single Catalyst 4500 series switch.

Figure 30-1 shows how the routing and bridging functions in the three physical devices of the traditional network are performed logically on one Catalyst 4500 series switch.

Figure 30-1 Logical Layer 3 VLAN Interfaces for the Catalyst 4500 Series Switch

Physical Layer 3 Interfaces

The physical Layer 3 interfaces support capabilities equivalent to a traditional router. These Layer 3 interfaces provide hosts with physical routing interfaces to a Catalyst 4500 series switch.

Figure 30-2 shows how the Catalyst 4500 series switch functions as a traditional router.

Figure 30-2 Physical Layer 3 Interfaces for the Catalyst 4500 Series Switch

Understanding SVI Autostate Exclude

To be “up/up,” a router VLAN interface must fulfill the following general conditions:

- The VLAN exists and is “active” on the VLAN database of the switch.
- The VLAN interface exists on the router and is not administratively down.
- At least one Layer 2 (access port or trunk) port exists, has a link “up” on this VLAN and is in spanning-tree forwarding state on the VLAN.

Note

The protocol line state for the VLAN interfaces will come up when the first switchport belonging to the corresponding VLAN link comes up and is in spanning-tree forwarding state.

Ordinarily, when a VLAN interface has multiple ports in the VLAN, the SVI will go “down” when all the ports in the VLAN go “down.” The SVI Autostate exclude feature provides a knob to mark a port so that it is not counted in the SVI “up and down” calculation and applies to all VLANs that are enabled on that port.

A VLAN interface will be brought up after the Layer 2 port has had time to converge (that is, transition from listening-learning to forwarding). This will prevent routing protocols and other features from using the VLAN interface as if it were fully operational. This also prevents other problems from occurring, such as routing black holes.

Understanding Layer 3 Interface Counters

Note

Supervisor Engine 6-E does *not* support Layer 2 Interface Counters. However, it does support Layer 3 (SVI) Interface Counters.

With Supervisor Engine 6-E, IPv4 and v6 packets are routed in hardware by the forwarding engine. This engine supports statistics for counting routed packets for up to 4095 interfaces. These statistics include:

- Input unicast
- Input multicast

- Output unicast
- Output multicast

For each type of counter, both the number of packets and the total number of bytes received or transmitted are counted.

Because the total number of counters supported is lower than the total number of Layer 3 interfaces supported, it is not always possible for all Layer 3 interfaces to have counters. For this reason, the user assigns counters to Layer 3 interfaces, and the default configuration for a Layer 3 interface will have no counters.

Note

To enable Layer 3 Interface Counters, you need to issue the **counter** command in interface mode. Refer to the “Configuring Layer 3 Interface Counters” section on page 30-9 for instructions on how to configure Layer 3 Interface Counters.

These hardware counters are displayed in the output of the **show interface** command. For example:

```
Switch# show interface vlan 1
Vlan1 is up, line protocol is up
  Hardware is Ethernet SVI, address is 0005.9a38.6cff (bia 0005.9a38.6cff)
  Internet address is 10.0.0.1/8
  MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
  Keepalive not supported
  ARP type: ARPA, ARP Timeout 04:00:00
  Last input never, output never, output hang never
  Last clearing of "show interface" counters never
  Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
  Queueing strategy: fifo
  Output queue: 0/40 (size/max)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 0 bits/sec, 0 packets/sec
  L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes      <====
  L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes    <====
    0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts (0 IP multicasts)
    0 runts, 0 giants, 0 throttles
    0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
    1 packets output, 46 bytes, 0 underruns
    0 output errors, 0 interface resets
    0 output buffer failures, 0 output buffers swapped out
```

Configuration Guidelines

The Catalyst 4500 series switch supports AppleTalk routing and IPX routing. For AppleTalk routing and IPX routing information, refer to “Configuring AppleTalk” and “Configuring Novell IPX” in the *Cisco IOS AppleTalk* and *Novell IPX* configuration guides at the following URLs:

http://www.cisco.com/en/US/docs/ios/at/configuration/guide/12_4/atk_12_4_book.html

http://www.cisco.com/en/US/docs/ios/novipx/configuration/guide/config_novellipx_ps6350_TSD_Products_Configuration_Guide_Chapter.html

Note

Supervisor Engine 6-E does *not* support AppleTalk and IPX routing.

A Catalyst 4500 series switch does not support subinterfaces or the **encapsulation** keyword on Layer 3 Fast Ethernet, Gigabit Ethernet, TenGigabitEthernet interfaces.

**Note**

As with any Layer 3 interface running Cisco IOS software, the IP address and network assigned to an SVI cannot overlap those assigned to any other Layer 3 interface on the switch.

Configuring Logical Layer 3 VLAN Interfaces

**Note**

Before you can configure logical Layer 3 VLAN interfaces, you must create and configure the VLANs on the switch, assign VLAN membership to the Layer 2 interfaces, enable IP routing if IP routing is disabled, and specify an IP routing protocol.

To configure logical Layer 3 VLAN interfaces, perform this task:

	Command	Purpose
Step 1	Switch(config)# vlan <i>vlan_ID</i>	Creates the VLAN.
Step 2	Switch(config)# interface vlan <i>vlan_ID</i>	Selects an interface to configure.
Step 3	Switch(config-if)# ip address <i>ip_address subnet_mask</i>	Configures the IP address and IP subnet.
Step 4	Switch(config-if)# no shutdown	Enables the interface.
Step 5	Switch(config-if)# end	Exits configuration mode.
Step 6	Switch# copy running-config startup-config	Saves your configuration changes to NVRAM.
Step 7	Switch# show interfaces [<i>type slot/interface</i>] Switch# show ip interfaces [<i>type slot/interface</i>] Switch# show running-config interfaces [<i>type slot/interface</i>] Switch# show running-config interfaces vlan <i>vlan_ID</i>	Verifies the configuration.

This example shows how to configure the logical Layer 3 VLAN interface vlan 2 and assign an IP address:

```
Switch> enable
Switch# config term
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vlan 2
Switch(config)# interface vlan 2
Switch(config-if)# ip address 10.1.1.1 255.255.255.248
Switch(config-if)# no shutdown
Switch(config-if)# end
```

This example uses the **show interfaces** command to display the interface IP address configuration and status of Layer 3 VLAN interface vlan 2:

```
Switch# show interfaces vlan 2
Vlan2 is up, line protocol is down
  Hardware is Ethernet SVI, address is 00D.588F.B604 (bia 00D.588F.B604)
  Internet address is 172.20.52.106/29
  MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
    reliability 255/255, txload 1/255, rxload 1/255
  Encapsulation ARPA, loopback not set
```

```

ARP type: ARPA, ARP Timeout 04:00:00
Last input never, output never, output hang never
Last clearing of "show interface" counters never
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: fifo
Output queue: 0/40 (size/max)
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
  0 packets input, 0 bytes, 0 no buffer
    Received 0 broadcasts, 0 runts, 0 giants, 0 throttles
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored
  0 packets output, 0 bytes, 0 underruns
  0 output errors, 0 interface resets
  0 output buffer failures, 0 output buffers swapped out
Switch#

```

This example uses the **show running-config** command to display the interface IP address configuration of Layer 3 VLAN interface vlan 2:

```

Switch# show running-config
Building configuration...

Current configuration : !
interface Vlan2
 ip address 10.1.1.1 255.255.255.248
 !
 ip classless
 no ip http server
 !
 !
 line con 0
 line aux 0
 line vty 0 4
 !
end

```

Configuring VLANs as Layer 3 Interfaces

This section consists of the following subsections:

- [Configuring SVI Autostate Exclude, page 30-6](#)
- [Configuring IP MTU Sizes, page 30-8](#)
- [Configuring Layer 3 Interface Counters, page 30-9](#)

Configuring SVI Autostate Exclude

Note

The SVI Autostate exclude feature is enabled by default and is synchronized with the STP state.

The SVI Autostate exclude feature shuts down (or brings up) the Layer 3 interfaces of a switch when the following port configuration changes occur:

- When the last port on a VLAN goes down, the Layer 3 interface on that VLAN is shut down (SVI- autostated).

- When the first port on the VLAN is brought back up, the Layer 3 interface on the VLAN that was previously shut down is brought up.

SVI Autostate exclude enables you to exclude the access ports/trunks in defining the status of the SVI (up or down) even if it belongs to the same VLAN. Moreover, even if the excluded access port/trunk is in up state and other ports are in down state in the VLAN, the SVI state is changed to down.

At least one port in the VLAN should be up and not excluded to make the SVI state “up.” This will help to exclude the monitoring port status when you are determining the status of the SVI.

To apply SVI Autostate exclude, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface interface-id	Enters interface configuration mode.
Step 3	Switch(config-if)# switchport autostate exclude	Exclude the access ports/trunks in defining the status of an SVI (up or down).
Step 4	Switch(config)# end	Exits configuration mode.
Step 5	Switch# show run int g3/4	Displays the running configuration.
Step 6	Switch# show int g3/4 switchport	Verifies the configuration.

The following example shows how to apply SVI Autostate Exclude on interface g3/1:

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g3/1
Switch(config-if)# switchport autostate exclude
Switch(config-if)# end
Switch# show run int g3/4
Building configuration...

Current configuration : 162 bytes
!
interface GigabitEthernet3/4
 switchport trunk encapsulation dot1q
 switchport trunk allowed vlan 2,3
 switchport autostate exclude
 switchport mode trunk
end

Switch# show int g3/4 switchport

Switch#
```

Configuring IP MTU Sizes

You can set the protocol-specific maximum transmission unit (MTU) size of IPv4 or IPv6 packets sent on an interface.

For information on MTU limitations, refer to [Maximum Transmission Units](#), page 6-24.

Note

To set the nonprotocol-specific MTU value for an interface, use the **mtu** interface configuration command. Changing the MTU value (with the **mtu** interface configuration command) can affect the IP MTU value. If the current IP MTU value matches the MTU value, and you change the MTU value, the IP MTU value will be modified automatically to match the new MTU. However, the reverse is not true; changing the IP MTU value has no effect on the value for the **mtu** command.

For information on how to configure MTU size, refer to [Configuring MTU Sizes](#), page 6-25.

To set the protocol-specific maximum transmission unit (MTU) size of IPv4 or IPv6 packets sent on an interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 3	Switch(config-if)# [no] ip mtu <i>mtu_size</i> or Switch(config-if)# [no] ipv6 mtu <i>mtu_size</i>	Configures the IPv4 MTU size Configures the IPv6 MTU size. The no form of the command reverts to the default MTU size (1500 bytes).
Step 4	Switch(config-if)# exit	Exits configuration interface mode.
Step 5	Switch(config)# end	Exits configuration mode.
Step 6	Switch# show run interface <i>interface-id</i>	Displays the running configuration.

The following example shows how to configure IPv4 MTU on an interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# ip mtu 68
Switch(config-if)# exit
Switch(config)# end
Switch# show ip interface vlan 1
Vlan1 is up, line protocol is up
  Internet address is 10.10.10.1/24
  Broadcast address is 255.255.255.255
  Address determined by setup command
  MTU is 68 bytes
  Helper address is not set
  .....(continued)
```

The following example shows how to configure ipv6 mtu on an interface

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# ipv6 mtu 1280
Switch(config)# end
Switch# show ipv6 interface vlan 1
```

This example shows how to verify the configuration

```
Vlan1 is up, line protocol is up
IPv6 is enabled, link-local address is FE80::214:6AFF:FEBC:DEEA
Global unicast address(es):
  1001::1, subnet is 1001::/64
Joined group address(es):
  FF02::1
  FF02::1:FF00:1
  FF02::1:FFBC:DEEA
MTU is 1280 bytes
.....(continued)
```

Note

When ipv6 is enabled on an interface via any CLI, it is possible to see the following message:
% Hardware MTU table exhausted In such a scenario, the ipv6 MTU value programmed in hardware will differ from the ipv6 interface MTU value. This will happen if there is no room in the hardware MTU table to store additional values. You must free up some space in the table by unconfiguring some unused MTU values and subsequently disable/re-enable ipv6 on the interface or reapply the MTU configuration.

Configuring Layer 3 Interface Counters

Note

Supervisor Engine 6-E does not support interface counters.

Note

When a linecard is *removed*, the Layer 3 counters previously enabled on ports of that line card are unconfigured. This means that to re-enable Layer 3 counters upon re-insertion of the linecard, you need to reconfigure the counter CLI for Layer 3 ports of that line card.

To configure Layer 3 Interface Counters (assign counters to a Layer 3 interface), perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 3	Switch(config-if)# counter	Enables counters.
Step 4	Switch(config)# end	Exits configuration mode.
Step 5	Switch# show run interface <i>interface-id</i>	Displays the running configuration.

The following example shows how to enable counters on interface VLAN 1

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 1
Switch(config-if)# counter
Switch(config-if)# end
Switch#
00:17:15: %SYS-5-CONFIG_I: Configured from console by console
Switch# show run interface vlan 1
Building configuration...

Current configuration : 63 bytes
!
interface Vlan1
 ip address 10.0.0.1 255.0.0.0
 counter
end
```

Note

To remove the counters, use the "no" form of the **counter** command.

If the maximum number of counters has already been assigned, the **counter** command fails and displays an error message:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa3/2
Switch(config-if)# no switchport
Switch(config-if)# counter
Counter resource exhausted
Switch(config-if)# end
Switch#
00:24:18: %SYS-5-CONFIG_I: Configured from console by console
```

In this situation, you must release a counter from another interface for use by the new interface.

Configuring Physical Layer 3 Interfaces

Note

Before you can configure physical Layer 3 interfaces, you must enable IP routing if IP routing is disabled, and specify an IP routing protocol.

To configure physical Layer 3 interfaces, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip routing	Enables IP routing (Required only if disabled.)
Step 2	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i> { port-channel <i>port_channel_number</i> }	Selects an interface to configure.
Step 3	Switch(config-if)# no switchport	Converts this port from physical Layer 2 port to physical Layer 3 port.
Step 4	Switch(config-if)# ip address <i>ip_address subnet_mask</i>	Configures the IP address and IP subnet.

	Command	Purpose
Step 5	Switch(config-if)# no shutdown	Enables the interface.
Step 6	Switch(config-if)# end	Exits configuration mode.
Step 7	Switch# copy running-config startup-config	Saves your configuration changes to NVRAM.
Step 8	Switch# show interfaces [type slot/interface] Switch# show ip interfaces [type slot/interface] Switch# show running-config interfaces [type slot/interface]	Verifies the configuration.

This example shows how to configure an IP address on Fast Ethernet interface 2/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface fastethernet 2/1
Switch(config-if)# no switchport
Switch(config-if)# ip address 10.1.1.1 255.255.255.248
Switch(config-if)# no shutdown
Switch(config-if)# end
Switch#
```

This example uses the **show running-config** command to display the interface IP address configuration of Fast Ethernet interface 2/1:

```
Switch# show running-config
Building configuration...
!
interface FastEthernet2/1
  no switchport
  ip address 10.1.1.1 255.255.255.248
!
...
ip classless
no ip http server
!
!
line con 0
line aux 0
line vty 0 4
!
end
```

Configuring EIGRP Stub Routing

This section consists of the following subsections:

- [Overview, page 30-12](#)
- [How to Configure EIGRP Stub Routing, page 30-12](#)
- [Monitoring and Maintaining EIGRP, page 30-17](#)
- [EIGRP Configuration Examples, page 30-18](#)

Overview

The EIGRP stub routing feature, available in all images, reduces resource utilization by moving routed traffic closer to the end user.

The IP base image contains only EIGRP stub routing. The IP services image contains complete EIGRP routing.

In a network using EIGRP stub routing, the only route for IP traffic to follow to the user is through a switch that is configured with EIGRP stub routing. The switch sends the routed traffic to interfaces that are configured as user interfaces or are connected to other devices.

When using EIGRP stub routing, you need to configure the distribution and remote switches to use EIGRP, and to configure only the switch as a stub. Only specified routes are propagated from the switch. The switch responds to all queries for summaries, connected routes, and routing updates.

Any neighbor that receives a packet informing it of the stub status does not query the stub switch for any routes, and a switch that has a stub peer does not query that peer. The stub switch depends on the distribution switch to send the proper updates to all peers.

In [Figure 30-3](#), switch B is configured as an EIGRP stub switch. Switches A and C are connected to the rest of the WAN. Switch B advertises connected, static, redistribution, and summary routes from switch A and C to Hosts A, B, and C. Switch B does not advertise any routes learned from switch A (and the reverse).

Figure 30-3 EIGRP Stub Switch Configuration

For more information about EIGRP stub routing, see “Configuring EIGRP Stub Routing” part of the *Cisco IOS IP Configuration Guide, Volume 2 of 3: Routing Protocols*, Release 12.2.

How to Configure EIGRP Stub Routing

The EIGRP Stub Routing feature improves network stability, reduces resource utilization, and simplifies stub switch configuration.

Stub routing is commonly used in a hub-and-spoke network topology. In a hub-and-spoke network, one or more end (stub) networks are connected to a remote switch (the spoke) that is connected to one or more distribution switches (the hub). The remote switch is adjacent only to one or more distribution

switches. The only route for IP traffic to follow into the remote switch is through a distribution switch. This type of configuration is commonly used in WAN topologies where the distribution switch is directly connected to a WAN. The distribution switch can be connected to many more remote switches. Often, the distribution switch will be connected to 100 or more remote routers. In a hub-and-spoke topology, the remote router must forward all nonlocal traffic to a distribution router, so it becomes unnecessary for the remote router to hold a complete routing table. Generally, the distribution router need not send anything more than a default route to the remote router.

When using the EIGRP Stub Routing feature, you need to configure the distribution and remote routers to use EIGRP, and to configure only the remote router as a stub. Only specified routes are propagated from the remote (stub) router. The stub router responds to all queries for summaries, connected routes, redistributed static routes, external routes, and internal routes with the message “inaccessible.” A router that is configured as a stub will send a special peer information packet to all neighboring routers to report its status as a stub router.

Any neighbor that receives a packet informing it of the stub status will not query the stub router for any routes, and a router that has a stub peer will not query that peer. The stub router will depend on the distribution router to send the proper updates to all peers.

Figure 30-4 shows a simple hub-and-spoke configuration.

Figure 30-4 Simple Hub-and-Spoke Network

The stub routing feature by itself does not prevent routes from being advertised to the remote router. In the example in Figure 30-4, the remote router can access the corporate network and the Internet through the distribution router only. Having a full route table on the remote router, in this example, would serve no functional purpose because the path to the corporate network and the Internet would always be through the distribution router. The larger route table would only reduce the amount of memory required by the remote router. Bandwidth and memory can be conserved by summarizing and filtering routes in the distribution router. The remote router need not receive routes that have been learned from other networks because the remote router must send all nonlocal traffic, regardless of destination, to the distribution router. If a true stub network is desired, the distribution router should be configured to send only a default route to the remote router. The EIGRP Stub Routing feature does not automatically enable summarization on the distribution router. In most cases, the network administrator will need to configure summarization on the distribution routers.

**Note**

When configuring the distribution router to send only a default route to the remote router, you must use the **ip classless** command on the remote router. By default, the **ip classless** command is enabled in all Cisco IOS images that support the EIGRP Stub Routing feature.

Without the stub feature, even after the routes that are sent from the distribution router to the remote router have been filtered or summarized, a problem might occur. If a route is lost somewhere in the corporate network, EIGRP could send a query to the distribution router, which in turn will send a query to the remote router even if routes are being summarized. If there is a problem communicating over the WAN link between the distribution router and the remote router, an EIGRP stuck in active (SIA) condition could occur and cause instability elsewhere in the network. The EIGRP Stub Routing feature allows a network administrator to prevent queries from being sent to the remote router.

Dual-Homed Remote Topology

In addition to a simple hub-and-spoke network where a remote router is connected to a single distribution router, the remote router can be dual-homed to two or more distribution routers. This configuration adds redundancy and introduces unique issues, and the stub feature helps to address some of these issues.

A dual-homed remote router will have two or more distribution (hub) routers. However, the principles of stub routing are the same as they are with a hub-and-spoke topology. [Figure 30-5](#) shows a common dual-homed remote topology with one remote router, but 100 or more routers could be connected on the same interfaces on distribution router 1 and distribution router 2. The remote router will use the best route to reach its destination. If distribution router 1 experiences a failure, the remote router can still use distribution router 2 to reach the corporate network.

Figure 30-5 Simple Dual-Homed Remote Topology

[Figure 30-5](#) shows a simple dual-homed remote with one remote router and two distribution routers. Both distribution routers maintain routes to the corporate network and stub network 10.1.1.0/24.

Dual-homed routing can introduce instability into an EIGRP network. In [Figure 30-6](#), distribution router 1 is directly connected to network 10.3.1.0/24. If summarization or filtering is applied on distribution router 1, the router will advertise network 10.3.1.0/24 to all of its directly connected EIGRP neighbors (distribution router 2 and the remote router).

Figure 30-6 *Dual-Homed Remote Topology With Distribution Router 1 Connected to Two Networks*

Figure 30-6 shows a simple dual-homed remote router where distribution router 1 is connected to both network 10.3.1.0/24 and network 10.2.1.0/24.

If the 10.2.1.0/24 link between distribution router 1 and distribution router 2 has failed, the lowest cost path to network 10.3.1.0/24 from distribution router 2 is through the remote router (see Figure 30-7). This route is not desirable because the traffic that was previously traveling across the corporate network 10.2.1.0/24 would now be sent across a much lower bandwidth connection. The over utilization of the lower bandwidth WAN connection can cause a number of problems that might affect the entire corporate network. The use of the lower bandwidth route that passes through the remote router might cause WAN EIGRP distribution routers to be dropped. Serial lines on distribution and remote routers could also be dropped, and EIGRP SIA errors on the distribution and core routers could occur.

Figure 30-7 *Dual-Homed Remote Topology with a Failed Route to a Distribution Router*

It is not desirable for traffic from distribution router 2 to travel through any remote router in order to reach network 10.3.1.0/24. If the links are sized to handle the load, it would be acceptable to use one of the backup routes. However, most networks of this type have remote routers located at remote offices with relatively slow links. This problem can be prevented if proper summarization is configured on the distribution router and remote router.

It is typically undesirable for traffic from a distribution router to use a remote router as a transit path. A typical connection from a distribution router to a remote router would have much less bandwidth than a connection at the network core. Attempting to use a remote router with a limited bandwidth connection as a transit path would generally produce excessive congestion to the remote router. The EIGRP Stub Routing feature can prevent this problem by preventing the remote router from advertising core routes back to distribution routers. Routes learned by the remote router from distribution router 1 will not be advertised to distribution router 2. Since the remote router will not advertise core routes to distribution router 2, the distribution router will not use the remote router as a transit for traffic destined for the network core.

The EIGRP Stub Routing feature can help to provide greater network stability. In the event of network instability, this feature prevents EIGRP queries from being sent over limited bandwidth links to nontransit routers. Instead, distribution routers to which the stub router is connected answer the query on behalf of the stub router. This feature greatly reduces the chance of further network instability due to congested or problematic WAN links. The EIGRP Stub Routing feature also simplifies the configuration and maintenance of hub-and-spoke networks. When stub routing is enabled in dual-homed remote configurations, it is no longer necessary to configure filtering on remote routers to prevent those remote routers from appearing as transit paths to the hub routers.

**Caution**

EIGRP Stub Routing should only be used on stub routers. A stub router is defined as a router connected to the network core or distribution layer through which core transit traffic should not flow. A stub router should not have any EIGRP neighbors other than distribution routers. Ignoring this restriction will cause undesirable behavior.

**Note**

Multi-access interfaces, such as ATM, Ethernet, Frame Relay, ISDN PRI, and X.25, are supported by the EIGRP Stub Routing feature only when all routers on that interface, except the hub, are configured as stub routers.

EIGRP Stub Routing Configuration Task List

To configure EIGRP Stub Routing, perform the tasks described in the following sections. The tasks in the first section are required; the task in the last section is optional.

- [Configuring EIGRP Stub Routing](#) (required)
- [Verifying EIGRP Stub Routing](#) (optional)

Configuring EIGRP Stub Routing

To configure a remote or spoke router for EIGRP stub routing, use the following commands beginning in router configuration mode:

	Command	Purpose
Step 1	Switch(config)# router eigrp 1	Configures a remote or distribution router to run an EIGRP process.
Step 2	Switch(config-router)# network network-number	Specifies the network address of the EIGRP distribution router.
Step 3	Switch(config-router)# eigrp stub [receive-only connected static summary]	Configures a remote router as an EIGRP stub router.

Verifying EIGRP Stub Routing

To verify that a remote router has been configured as a stub router with EIGRP, use the **show ip eigrp neighbor detail** command from the distribution router in privileged EXEC mode. The last line of the output will show the stub status of the remote or spoke router. The following example shows output from the **show ip eigrp neighbor detail** command:

```
router# show ip eigrp neighbor detail

IP-EIGRP neighbors for process 1
H   Address                  Interface    Hold Uptime    SRTT   RTO   Q   Seq Type
                               (sec)          (ms)          Cnt  Num
0   10.1.1.2                  Se3/1        11 00:00:59    1   4500   0   7
Version 12.1/1.2, Retrans: 2, Retries: 0
Stub Peer Advertising ( CONNECTED SUMMARY ) Routes
```

Monitoring and Maintaining EIGRP

To delete neighbors from the neighbor table, use the following command in EXEC mode:

Command	Purpose
Switch# clear ip eigrp neighbors [<i>ip-address</i> <i>interface</i>]	Deletes neighbors from the neighbor table.

To display various routing statistics, use the following commands in EXEC mode:

Command	Purpose
Switch# show ip eigrp interfaces [<i>interface</i>] [<i>as-number</i>]	Displays information about interfaces configured for EIGRP.
Switch# show ip eigrp neighbors [<i>type number static</i>]	Displays the EIGRP discovered neighbors.
Switch# show ip eigrp topology [<i>autonomous-system-number</i> [<i>ip-address</i>] <i>mask</i>]	Displays the EIGRP topology table for a given process.
Switch# show ip eigrp traffic [<i>autonomous-system-number</i>]	Displays the number of packets sent and received for all or a specified EIGRP process.

EIGRP Configuration Examples

This section contains the following examples:

- [Route Summarization Example](#)
- [Route Authentication Example](#)
- [Stub Routing Example](#)

Route Summarization Example

The following example configures route summarization on the interface and also configures the autosummary feature. This configuration causes EIGRP to summarize network 10.0.0.0 out Ethernet interface 0 only. In addition, this example disables autosummarization.

```
interface Ethernet 0
 ip summary-address eigrp 1 10.0.0.0 255.0.0.0
!
router eigrp 1
 network 172.16.0.0
 no auto-summary
```

Note

You should not use the **ip summary-address eigrp** summarization command to generate the default route (0.0.0.0) from an interface. This causes the creation of an EIGRP summary default route to the null 0 interface with an administrative distance of 5. The low administrative distance of this default route can cause this route to displace default routes learned from other neighbors from the routing table. If the default route learned from the neighbors is displaced by the summary default route, or if the summary route is the only default route present, all traffic destined for the default route will not leave the router, instead, this traffic will be sent to the null 0 interface where it is dropped.

The recommended way to send only the default route out a given interface is to use a **distribute-list** command. You can configure this command to filter all outbound route advertisements sent out the interface with the exception of the default (0.0.0.0).

Route Authentication Example

The following example enables MD5 authentication on EIGRP packets in autonomous system 1.

Router A

```
interface ethernet 1
 ip authentication mode eigrp 1 md5
 ip authentication key-chain eigrp 1 holly
key chain holly
key 1
 key-string 0987654321
 accept-lifetime 04:00:00 Dec 4 1996 infinite
 send-lifetime 04:00:00 Dec 4 1996 04:48:00 Dec 4 1996
exit
key 2
 key-string 1234567890
 accept-lifetime 04:00:00 Dec 4 1996 infinite
 send-lifetime 04:45:00 Dec 4 1996 infinite
```

Router B

```
interface ethernet 1
 ip authentication mode eigrp 1 md5
 ip authentication key-chain eigrp 1 mikel
 key chain mikel
 key 1
  key-string 0987654321
  accept-lifetime 04:00:00 Dec 4 1996 infinite
  send-lifetime 04:00:00 Dec 4 1996 infinite
 exit
 key 2
  key-string 1234567890
  accept-lifetime 04:00:00 Dec 4 1996 infinite
  send-lifetime 04:45:00 Dec 4 1996 infinite
```

Router A will accept and attempt to verify the MD5 digest of any EIGRP packet with a key equal to 1. It will also accept a packet with a key equal to 2. All other MD5 packets will be dropped. Router A will send all EIGRP packets with key 2.

Router B will accept key 1 or key 2, and will send key 1. In this scenario, MD5 will authenticate.

Stub Routing Example

A router that is configured as a stub with the **eigrp stub** command shares connected and summary routing information with all neighbor routers by default. Four optional keywords can be used with the **eigrp stub** command to modify this behavior:

- **receive-only**
- **connected**
- **static**
- **summary**

This section provides configuration examples for all forms of the **eigrp stub** command. The **eigrp stub** command can be modified with several options, and these options can be used in any combination except for the **receive-only** keyword. The **receive-only** keyword will restrict the router from sharing any of its routes with any other router in that EIGRP autonomous system, and the **receive-only** keyword will not permit any other option to be specified because it prevents any type of route from being sent. The three other optional keywords (**connected**, **static**, and **summary**) can be used in any combination but cannot be used with the **receive-only** keyword. If any of these three keywords is used individually with the **eigrp stub** command, connected and summary routes will not be sent automatically.

The **connected** keyword will permit the EIGRP Stub Routing feature to send connected routes. If the connected routes are not covered by a network statement, it may be necessary to redistribute connected routes with the **redistribute connected** command under the EIGRP process. This option is enabled by default.

The **static** keyword will permit the EIGRP Stub Routing feature to send static routes. Without this option, EIGRP will not send any static routes, including internal static routes that normally would be automatically redistributed. It will still be necessary to redistribute static routes with the **redistribute static** command.

The **summary** keyword will permit the EIGRP Stub Routing feature to send summary routes. Summary routes can be created manually with the **summary address** command or automatically at a major network border router with the **auto-summary** command enabled. This option is enabled by default.

In the following example, the **eigrp stub** command is used to configure the router as a stub that advertises connected and summary routes:

```
router eigrp 1
network 10.0.0.0
eigrp stub
```

In the following example, the **eigrp stub connected static** command is used to configure the router as a stub that advertises connected and static routes (sending summary routes will not be permitted):

```
router eigrp 1
network 10.0.0.0
eigrp stub connected static
```

In the following example, the **eigrp stub receive-only** command is used to configure the router as a stub, and connected, summary, or static routes will not be sent:

```
router eigrp 1
network 10.0.0.0 eigrp
stub receive-only
```

CHAPTER 31

Configuring Cisco Express Forwarding

This chapter describes Cisco Express Forwarding (CEF) on the Catalyst 4000 family switch. It also provides guidelines, procedures, and examples to configure this feature.

This chapter includes the following major sections:

- [Overview of CEF, page 31-1](#)
- [Catalyst 4500 Series Switch Implementation of CEF, page 31-3](#)
- [CEF Configuration Restrictions, page 31-6](#)
- [Configuring CEF, page 31-6](#)
- [Monitoring and Maintaining CEF, page 31-8](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of CEF

This section contains information on the two primary components that comprise the CEF operation:

- [Benefits of CEF, page 31-2](#)
- [Forwarding Information Base, page 31-2](#)
- [Adjacency Tables, page 31-2](#)

Benefits of CEF

CEF is advanced Layer 3 IP switching technology that optimizes performance and scalability for large networks with dynamic traffic patterns or networks with intensive web-based applications and interactive sessions.

CEF provides the following benefits:

- Improves performance over the caching schemes of multilayer switches, which often flush the entire cache when information changes in the routing tables.
- Provides load balancing that distributes packets across multiple links based on Layer 3 routing information. If a network device discovers multiple paths to a destination, the routing table is updated with multiple entries for that destination. Traffic to that destination is then distributed among the various paths.

CEF stores information in several data structures rather than the route cache of multilayer switches. The data structures optimize lookup for efficient packet forwarding.

Forwarding Information Base

The Forwarding Information Base (FIB) is a table that contains a copy of the forwarding information in the IP routing table. When routing or topology changes occur in the network, the route processor updates the IP routing table and CEF updates the FIB. Because there is a one-to-one correlation between FIB entries and routing table entries, the FIB contains all known routes and eliminates the need for route cache maintenance that is associated with switching paths, such as fast switching and optimum switching. CEF uses the FIB to make IP destination-based switching decisions and maintain next-hop address information based on the information in the IP routing table.

On the Catalyst 4500 series switches, CEF loads the FIB in to the Integrated Switching Engine hardware to increase the performance of forwarding. The Integrated Switching Engine has a finite number of forwarding slots for storing routing information. If this limit is exceeded, CEF is automatically disabled and all packets are forwarded in software. In this situation, you should reduce the number of routes on the switch and then reenabling hardware switching with the **ip cef** command.

Adjacency Tables

In addition to the FIB, CEF uses adjacency tables to prepend Layer 2 addressing information. Nodes in the network are said to be *adjacent* if they are within a single hop from each other. The adjacency table maintains Layer 2 next-hop addresses for all FIB entries.

Adjacency Discovery

The adjacency table is populated as new adjacent nodes are discovered. Each time an adjacency entry is created (such as through the Address Resolution Protocol (ARP)), a link-layer header for that adjacent node is stored in the adjacency table. Once a route is determined, the link-layer header points to a next hop and corresponding adjacency entry. The link-layer header is subsequently used for encapsulation during CEF switching of packets.

Adjacency Resolution

A route might have several paths to a destination prefix, such as when a router is configured for simultaneous load balancing and redundancy. For each resolved path, a pointer is added for the adjacency corresponding to the next-hop interface for that path. This mechanism is used for load balancing across several paths.

Adjacency Types That Require Special Handling

In addition to adjacencies for next-hop interfaces (host-route adjacencies), other types of adjacencies are used to expedite switching when certain exception conditions exist. When the prefix is defined, prefixes requiring exception processing are cached with one of the special adjacencies listed in [Table 31-1](#).

Table 31-1 Adjacency Types for Exception Processing

This adjacency type...	Receives this processing...
Null adjacency	Packets destined for a Null0 interface are dropped. A Null0 interface can be used as an effective form of access filtering.
Glean adjacency	When a router is connected directly to several hosts, the FIB table on the router maintains a prefix for the subnet rather than for each individual host. The subnet prefix points to a glean adjacency. When packets need to be forwarded to a specific host, the adjacency database is gleaned for the specific prefix.
Punt adjacency	Features that require special handling or features that are not yet supported by CEF switching are sent (punted) to the next higher switching level.
Discard adjacency	Packets are discarded.
Drop adjacency	Packets are dropped.

Unresolved Adjacency

When a link-layer header is prepended to packets, FIB requires the prepend to point to an adjacency corresponding to the next hop. If an adjacency was created by FIB and was not discovered through a mechanism such as ARP, the Layer 2 addressing information is not known and the adjacency is considered incomplete. When the Layer 2 information is known, the packet is forwarded to the route processor, and the adjacency is determined through ARP.

Catalyst 4500 Series Switch Implementation of CEF

This section contains the following subsections:

- [Hardware and Software Switching, page 31-4](#)
- [Load Balancing, page 31-6](#)
- [Software Interfaces, page 31-6](#)

Catalyst 4000 Family switches support an ASIC-based Integrated Switching Engine that provides these features:

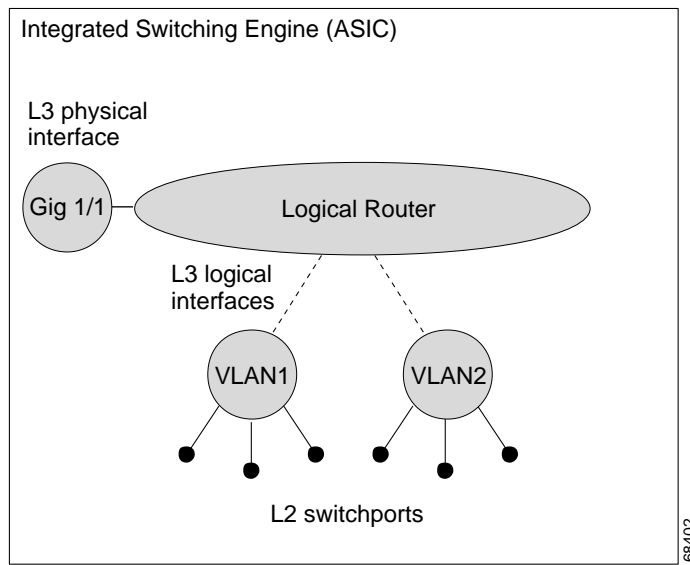

- Ethernet bridging at Layer 2

- IP routing at Layer 3

Because the ASIC is specifically designed to forward packets, the Integrated Switching Engine hardware can run this process much faster than CPU subsystem software.

Figure 31-1 shows a high-level view of the ASIC-based Layer 2 and Layer 3 switching process on the Integrated Switching Engine.

Figure 31-1 Logical L2/L3 Switch Components

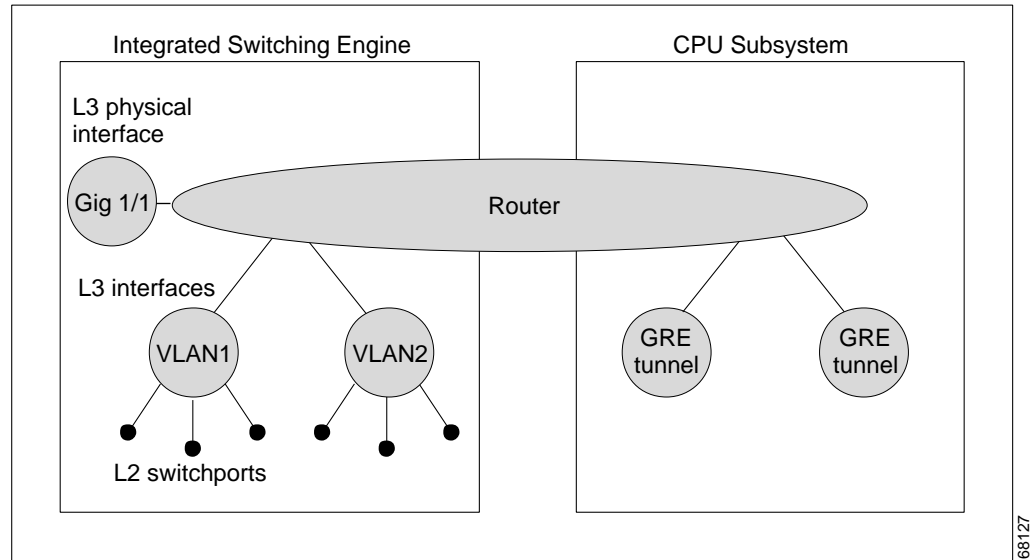

The Integrated Switching Engine performs inter-VLAN routing on logical Layer 3 interfaces with the ASIC hardware. The ASIC hardware also supports a physical Layer 3 interface that can be configured to connect with a host, a switch, or a router.

Hardware and Software Switching

For the majority of packets, the Integrated Switching Engine performs the packet forwarding function in hardware. These packets are hardware-switched at very high rates. Exception packets are forwarded by the CPU subsystem software. Statistic reports should show that the Integrated Switching Engine is forwarding the vast majority of packets in hardware. Software forwarding is significantly slower than hardware forwarding, but packets forwarded by the CPU subsystem do not reduce hardware forwarding speed.

Figure 31-2 shows a logical view of the Integrated Switching Engine and the CPU subsystem switching components.

Figure 31-2 Hardware and Software Switching Components

The Integrated Switching Engine performs inter-VLAN routing in hardware. The CPU subsystem software supports Layer 3 interfaces to VLANs that use Subnetwork Access Protocol (SNAP) encapsulation. The CPU subsystem software also supports generic routing encapsulation (GRE) tunnel.

Hardware Switching

Hardware switching is the normal operation for the Supervisor Engine III and Supervisor Engine IV.

Software Switching

Software switching occurs when traffic cannot be processed in hardware. The following types of exception packets are processed in software at a much slower rate:

- Packets that use IP header options

Note Packets that use TCP header options are switched in hardware because they do not affect the forwarding decision.

- Packets that have an expiring IP time-to-live (TTL) counter
- Packets that are forwarded to a tunnel interface
- Packets that arrive with non-supported encapsulation types
- Packets that are routed to an interface with non-supported encapsulation types
- Packets that exceed the MTU of an output interface and must be fragmented
- Packets that require an IGMP redirect to be routed
- 802.3 Ethernet packets

Load Balancing

The Catalyst 4000 family switch supports load balancing for routing packets in the Integrated Switching Engine hardware. Load balancing is always enabled. It works when multiple routes for the same network with different next-hop addresses are configured. These routes can be configured either statically or through a routing protocol such as OSPF or EIGRP.

The hardware makes a forwarding decision by using a hardware load sharing hash function to compute a value, based on the source and destination IP addresses and the source and destination TCP port numbers (if available). This load sharing hash value is then used to select which route to use to forward the packet. All hardware switching within a particular flow (such as a TCP connection) will be routed to the same next hop, thereby reducing the chance that packet reordering will occur. Up to eight different routes for a particular network are supported.

Software Interfaces

Cisco IOS for the Catalyst 4000 family switch supports GRE and IP tunnel interfaces that are not part of the hardware forwarding engine. All packets that flow to or from these interfaces must be processed in software and will have a significantly lower forwarding rate than that of hardware-switched interfaces. Also, Layer 2 features are not supported on these interfaces.

CEF Configuration Restrictions

The Integrated Switching Engine supports only ARPA and ISL/802.1q encapsulation types for Layer 3 switching in hardware. The CPU subsystem supports a number of encapsulations such as SNAP for Layer 2 switching that you can use for Layer 3 switching in software.

Configuring CEF

These sections describe how to configure CEF:

- [Enabling CEF, page 31-6](#)
- [Configuring Load Balancing for CEF, page 31-7](#)

Enabling CEF

By default, CEF is enabled globally on the Catalyst 4000 family switch. No configuration is required. To reenabling CEF, perform this task:

Command	Purpose
Switch(config)# ip cef distributed	Enables standard CEF operation.

Configuring Load Balancing for CEF

CEF load balancing is based on a combination of source and destination packet information; it allows you to optimize resources by distributing traffic over multiple paths for transferring data to a destination. You can configure load balancing on a per-destination basis. Load-balancing decisions are made on the outbound interface. You can configure per-destination load balancing for CEF on outbound interfaces.

The following topics are discussed:

- [Configuring Per-Destination Load Balancing, page 31-7](#)
- [Configuring Load Sharing Hash Function, page 31-7](#)
- [Viewing CEF Information, page 31-8](#)

Configuring Per-Destination Load Balancing

Per-destination load balancing is enabled by default when you enable CEF. To use per-destination load balancing, you do not perform any additional tasks once you enable CEF.

Per-destination load balancing allows the router to use multiple paths to achieve load sharing. Packets for a given source-destination host pair are guaranteed to take the same path, even if multiple paths are available. Traffic destined for different pairs tend to take different paths. Per-destination load balancing is enabled by default when you enable CEF; it is the load balancing method of choice in most situations.

Because per-destination load balancing depends on the statistical distribution of traffic, load sharing becomes more effective as the number of source-destination pairs increases.

You can use per-destination load balancing to ensure that packets for a given host pair arrive in order. All packets for a certain host pair are routed over the same link or links.

Configuring Load Sharing Hash Function

When multiple unicast routes exist to a particular destination IP prefix, the hardware will send packets matching that prefix across all possible routes, thereby sharing the load across all next hop routers. By default, the route used is chosen by computing a hash of the source and destination IP addresses and using the resulting value to select the route. This preserves packet ordering for packets within a flow by ensuring that all packets within a single IP source/destination flow are sent on the same route, but it provides a near-random distribution of flows to routes.

The load-sharing hash function can be changed, so that in addition to the source and destination IP addresses, the source TCP/UDP port, the destination TCP/UDP port, or both can also be included in the hash.

To the configure load sharing hash function to use the source and/or destination ports, perform this task:

Command	Purpose
Switch (config)# [no] ip cef load-sharing algorithm include-ports source destination	Enables load sharing hash function to use source and destination ports. Use the no keyword to set the switch to use the default Cisco IOS load-sharing algorithm.

**Note**

The **include-ports** option does not apply to software-switched traffic on the Catalyst 4500 series switches.

Viewing CEF Information

You can view the collected CEF information. To view CEF information, perform this task:

Command	Purpose
Switch# show ip cef	Displays the collected CEF information.

Monitoring and Maintaining CEF

To display information about IP traffic, perform this task:

Command	Purpose
Switch# show interface <i>type slot/interface</i> begin L3	Displays a summary of IP unicast traffic.

This example shows how to display information about IP unicast traffic on interface Fast Ethernet 3/3:

```
Switch# show interface fastethernet 3/3 | begin L3
  L3 in Switched: ucast: 0 pkt, 0 bytes - mcast: 12 pkt, 778 bytes mcast
  L3 out Switched: ucast: 0 pkt, 0 bytes - mcast: 0 pkt, 0 bytes
    4046399 packets input, 349370039 bytes, 0 no buffer
    Received 3795255 broadcasts, 2 runts, 0 giants, 0 throttles
<...output truncated...>
Switch#
```

**Note**

The IP unicast packet count is updated approximately every five seconds.

Displaying IP Statistics

IP unicast statistics are gathered on a per-interface basis. To display IP statistics, perform this task:

Command	Purpose
Switch# show interface <i>type number</i> counters detail	Displays IP statistics.

This example shows how to display IP unicast statistics for Part 3/1:

Switch# **show interface fastethernet 3/1 counters detail**

```

Fa3/1                0
Switch#

```

To display CEF (software switched) and hardware IP unicast adjacency table information, perform this task:

Command	Purpose
Switch# show adjacency [<i>interface</i>] [detail internal summary]	Displays detailed adjacency information, including Layer 2 information, when the optional detail keyword is used.

This example shows how to display adjacency statistics:

```

Switch# show adjacency gigabitethernet 3/5 detail
Protocol Interface          Address
IP          GigabitEthernet9/5  172.20.53.206(11)
                                     504 packets, 6110 bytes
                                     00605C865B82
                                     000164F83FA50800
ARP          03:49:31

```

Note

Adjacency statistics are updated approximately every 10 seconds.

CHAPTER 32

Configuring Unicast Reverse Path Forwarding

Note

The feature is only supported on Supervisor Engine 6-E and on the Catalyst 4900M switch.

This chapter describes the Unicast Reverse Path Forwarding (Unicast RPF) feature. The Unicast RPF feature helps to mitigate problems that are caused by malformed or forged IP source addresses that are passing through a switch.

For a complete description of the Unicast RPF commands in this chapter, refer to the chapter “Unicast Reverse Path Forwarding Commands” of the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the “Identifying Supported Platforms” section in the chapter “Using Cisco IOS Software.”

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

In This Chapter

This chapter has the following sections:

- [About Unicast Reverse Path Forwarding](#)
- [Unicast RPF Configuration Task List](#)
- [Monitoring and Maintaining Unicast RPF](#)
- [Monitoring and Maintaining Unicast RPF](#)

- [Unicast RPF Configuration Example: Inbound and Outbound Filters](#)

About Unicast Reverse Path Forwarding

The Unicast RPF feature helps to mitigate problems that are caused by the introduction of malformed or forged (spoofed) IP source addresses into a network by discarding IP packets that lack a verifiable IP source address. For example, a number of common types of denial-of-service (DoS) attacks, including Smurf and Tribal Flood Network (TFN), can take advantage of forged or rapidly changing source IP addresses to allow attackers to thwart efforts to locate or filter the attacks. For Internet service providers (ISPs) that provide public access, Unicast RPF deflects such attacks by forwarding only packets that have source addresses that are valid and consistent with the IP routing table. This action protects the network of the ISP, its customer, and the rest of the Internet.

This section covers the following information:

- [How Unicast RPF Works](#)
- [Implementing Unicast RPF](#)
- [Restrictions](#)
- [Related Features and Technologies](#)
- [Prerequisites to Configuring Unicast RPF](#)

How Unicast RPF Works

When Unicast RPF is enabled on an interface, the switch examines all packets received as input on that interface to make sure that the source address and source interface appear in the routing table and match the interface on which the packet was received. This “look backwards” ability is available only when Cisco express forwarding (CEF) is enabled on the switch, because the lookup relies on the presence of the Forwarding Information Base (FIB). CEF generates the FIB as part of its operation.

**Note**

Unicast RPF is an input function and is applied only on the input interface of a switch at the upstream end of a connection.

Unicast RPF checks to see if any packet received at a switch interface arrives on the best return path (return route) to the source of the packet. Unicast RPF does this by doing a reverse lookup in the CEF table. If the packet was received from one of the best reverse path routes, the packet is forwarded as normal. If there is no reverse path route on the same interface from which the packet was received, it might mean that the source address was modified. If Unicast RPF does not find a reverse path for the packet, the packet is dropped.

**Note**

With Unicast RPF, all equal-cost “best” return paths are considered valid. This means that Unicast RPF works in cases where multiple return paths exist, provided that each path is equal to the others in terms of the routing cost (number of hops, weights, and so on) and as long as the route is in the FIB. Unicast RPF also functions where EIGRP variants are being used and unequal candidate paths back to the source IP address exist.

When a packet is received at the interface where Unicast RPF and ACLs have been configured, the following actions occur:

-
- Step 1** Input ACLs configured on the inbound interface are checked.
- Step 2** Unicast RPF checks to see if the packet has arrived on the best return path to the source, which it does by doing a reverse lookup in the FIB table.
- Step 3** CEF table (FIB) lookup is carried out for packet forwarding.
- Step 4** Output ACLs are checked on the outbound interface.
- Step 5** The packet is forwarded.
-

This section provides information about Unicast RPF enhancements:

- Access Control Lists and Logging
- Per-Interface Statistics

Figure 32-1 illustrates how Unicast RPF and CEF work together to validate IP source addresses by verifying packet return paths. In this example, a customer has sent a packet having a source address of 192.168.1.1 from interface Gigabit Ethernet 1/1. Unicast RPF checks the FIB to see if 192.168.1.1 has a path to Gigabit Ethernet 1/1. If there is a matching path, the packet is forwarded. If there is no matching path, the packet is dropped.

Figure 32-1 Unicast RPF Validating IP Source Addresses

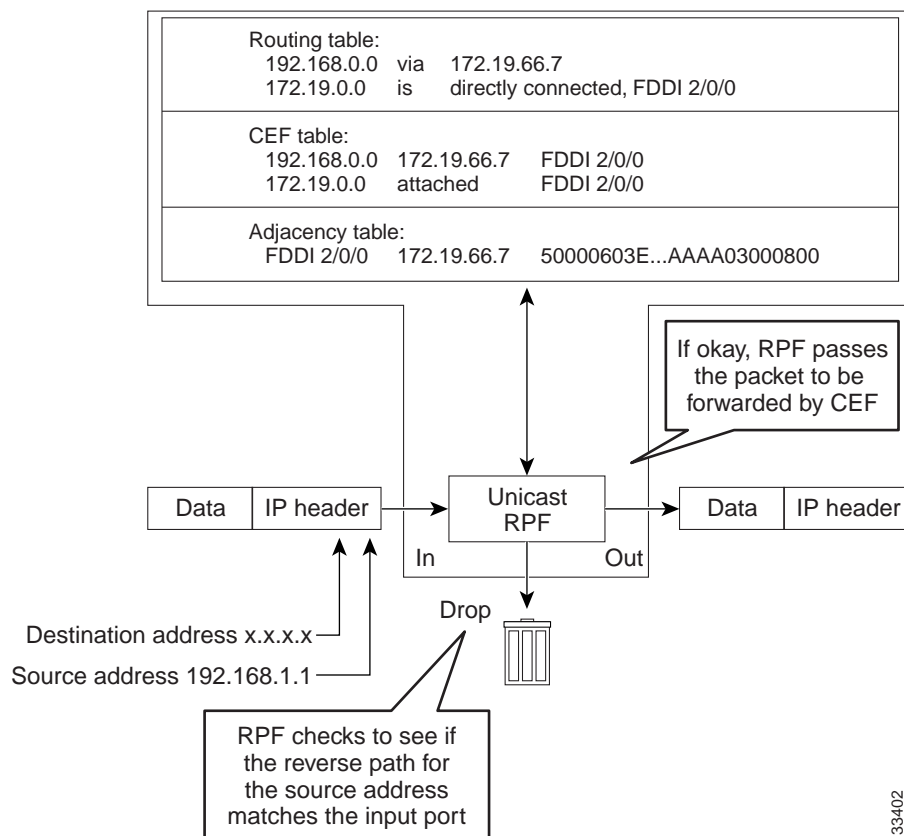

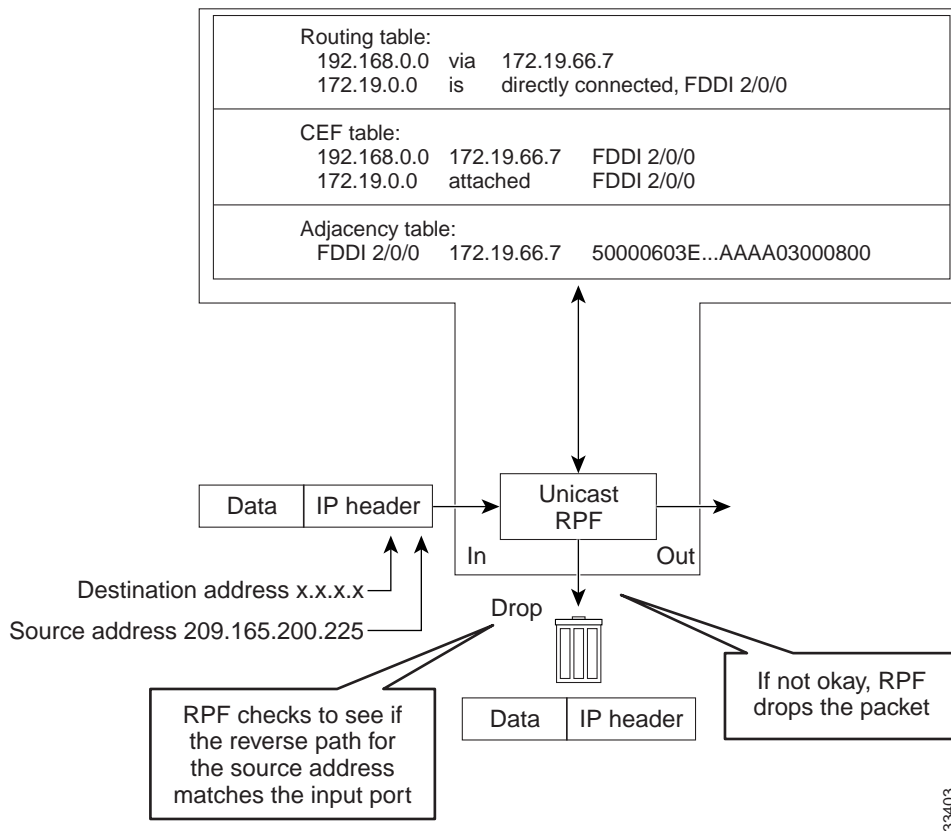

Figure 32-2 illustrates how Unicast RPF drops packets that fail validation. In this example, a customer has sent a packet having a source address of 209.165.200.225, which is received at interface Gigabit Ethernet 1/1. Unicast RPF checks the FIB to see if 209.165.200.225 has a return path to Gigabit Ethernet 1/1. If there is a matching path, the packet is forwarded. In this case, there is no reverse entry in the routing table that routes the customer packet back to source address 209.165.200.225 on interface Gigabit Ethernet 1/1, and so the packet is dropped.

Figure 32-2 Unicast RPF Dropping Packets That Fail Verification

Implementing Unicast RPF

Unicast RPF has several key implementation principles:

- The packet must be received at an interface that has the best return path (route) to the packet source (a process called *symmetric routing*). There must be a route in the FIB matching the route to the receiving interface. Adding a route in the FIB can be done via static route, network statement, or dynamic routing. (ACLs permit Unicast RPF to be used when packets are known to be arriving by specific, less optimal asymmetric input paths.)
- IP source addresses at the receiving interface must match the routing entry for the interface.
- Unicast RPF is an input function and is applied only on the input interface of a switch at the upstream end of a connection.

Given these implementation principles, Unicast RPF becomes a tool that network administrators can use not only for their customers but also for their downstream network or ISP, even if the downstream network or ISP has other connections to the Internet.

**Caution**

Using optional BGP attributes such as weight and local preference, the best path back to the source address can be modified. Modification would affect the operation of Unicast RPF.

This section provides information about the implementation of Unicast RPF:

- [Security Policy and Unicast RPF](#)
- [Where to Use Unicast RPF](#)
- [Routing Table Requirements](#)
- [Where Not to Use Unicast RPF](#)
- [Unicast RPF with BOOTP and DHCP](#)

Security Policy and Unicast RPF

Consider the following points in determining your policy for deploying Unicast RPF:

- Unicast RPF must be applied at the interface downstream from the larger portion of the network, preferably at the edges of your network.
- The further downstream you apply Unicast RPF, the finer the granularity you have in mitigating address spoofing and in identifying the sources of spoofed addresses. For example, applying Unicast RPF on an aggregation switch helps mitigate attacks from many downstream networks or clients and is simple to administer, but it does not help identify the source of the attack. Applying Unicast RPF at the network access server helps limit the scope of the attack and trace the source of the attack; however, deploying Unicast RPF across many sites does add to the administration cost of operating the network.
- The more entities that deploy Unicast RPF across Internet, intranet, and extranet resources, the better the chances of mitigating large-scale network disruptions throughout the Internet community, and the better the chances of tracing the source of an attack.
- Unicast RPF will not inspect IP packets encapsulated in tunnels, such as GRE, LT2P, or PPTP. Unicast RPF must be configured at a home gateway so that Unicast RPF processes network traffic only after the tunneling and encryption layers have been stripped off the packets.

Where to Use Unicast RPF

Unicast RPF can be used in any “single-homed” environment where there is essentially only one access point out of the network; that is, one upstream connection. Networks having one access point offer the best example of symmetric routing, which means that the interface where a packet enters the network is also the best return path to the source of the IP packet. Unicast RPF is best used at the network perimeter for Internet, intranet, or extranet environments, or in ISP environments for customer network terminations.

Enterprise Networks with a Single Connection to an ISP

In enterprise networks, one objective of using Unicast RPF for filtering traffic at the input interface (a process called *ingress filtering*) is for protection from malformed packets arriving from the Internet. Traditionally, local networks that have one connection to the Internet would use ACLs at the receiving interface to prevent spoofed packets from the Internet from entering their local network.

ACLs work well for many single-homed customers; however, there are trade-offs when ACLs are used as ingress filters, including two commonly referenced limitations:

- Packet per second (PPS) performance at very high packet rates

Note This restriction applies only to software packet forwarding. Hardware packet forwarding is the same on both ACL and uRPF.

- Maintenance of the ACL (whenever there are new addresses added to the network)

Unicast RPF is one tool that addresses both of these limitations. With Unicast RPF, ingress filtering is done at CEF PPS rates. This processing speed makes a difference when the link is more than 1 Mbps. Additionally, since Unicast RPF uses the FIB, no ACL maintenance is necessary, and thus the administration overhead of traditional ACLs is reduced. The following figure and example demonstrate how Unicast RPF is configured for ingress filtering.

[Figure 32-3](#) illustrates an enterprise network that has a single link to an upstream ISP. In this example, Unicast RPF is applied at interface Gigabit Ethernet 1/1 on the Enterprise switch for protection from malformed packets arriving from the Internet. Unicast RPF is also applied at interface Gigabit Ethernet 2/1 on the ISP switch for protection from malformed packets arriving from the enterprise network.

Figure 32-3 Enterprise Network Using Unicast RPF for Ingress Filtering

Using the topography in [Figure 32-3](#), a typical configuration (assuming that CEF is turned on) on the ISP switch would be as follows:

```
interface Gigabit Ethernet 2/1
  description Link to Enterprise Network
  ip address 192.168.3.1 255.255.255.255
  no switchport
  ip address 10.1.1.2 255.255.255.0
  ip verify unicast source reachable-via rx allow-default
```

The gateway switch configuration of the enterprise network (assuming that CEF is turned on) would look similar to the following:

```
interface Gigabit Ethernet 1/2
  description ExampleCorp LAN
  ip address 192.168.10.1 255.255.252.0
  no ip redirects
  no ip directed-broadcast
  no ip proxy-arp

interface Gigabit Ethernet 1/1
```

```
description Link to Internet
no switchport
ip address 10.1.1.1 255.255.255.0
ip verify unicast source reachable-via allow-default
no ip proxy-arp
no ip redirects
no ip directed-broadcast
```

Notice that Unicast RPF works with a single default route. There are no additional routes or routing protocols. Network 192.168.10.0/22 is a connected network. Hence, packets coming from the Internet with a source address in the range 192.168.10.0/22 will be dropped by Unicast RPF.

Routing Table Requirements

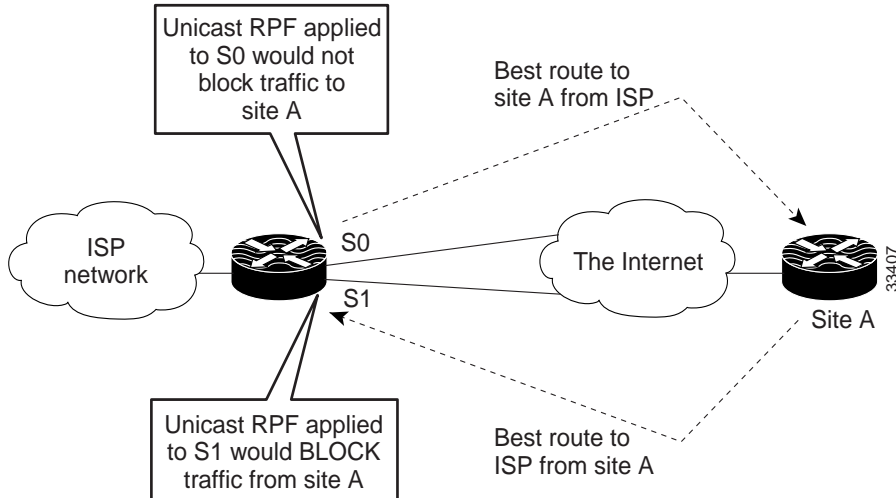

To work correctly, Unicast RPF needs proper information in the CEF tables. This requirement does not mean that the switch must have the entire Internet routing table. The amount of routing information needed in the CEF tables depends on where Unicast RPF is configured and what functions the switch performs in the network. For example, in an ISP environment, a switch that is a leased-line aggregation switch for customers needs only the information based on the static routes redistributed into the IGP or IBGP (depending on which technique is used in the network). Unicast RPF would be configured on the customer interfaces—hence the requirement for minimal routing information. In another scenario, a single-homed ISP could place Unicast RPF on the gateway link to the Internet. The full Internet routing table would be required. Requiring the full routing table would help protect the ISP from external DoS attacks that use addresses that are not in the Internet routing table.

Where Not to Use Unicast RPF

Unicast RPF should not be used on interfaces that are internal to the network. Internal interfaces are likely to have routing asymmetry (see [Figure 32-4](#)), meaning multiple routes to the source of a packet. Unicast RPF should be applied only where there is natural or configured symmetry. As long as administrators carefully plan which interfaces they activate Unicast RPF on, routing asymmetry is not a serious problem.

For example, switches at the edge of the network of an ISP are more likely to have symmetrical reverse paths than switches that are in the core of the ISP network. Switches that are in the core of the ISP network have no guarantee that the best forwarding path out of the switch will be the path selected for packets returning to the switch. Hence, it is not recommended that you apply Unicast RPF where there is a chance of asymmetric routing, unless you use ACLs to allow the switch to accept incoming packets. ACLs permit Unicast RPF to be used when packets are known to be arriving by specific, less optimal asymmetric input paths. However, it is simplest to place Unicast RPF only at the edge of a network or, for an ISP, at the customer edge of the network.

[Figure 32-4](#) illustrates how Unicast RPF can block legitimate traffic in an asymmetrical routing environment.

Figure 32-4 Unicast RPF Blocking Traffic in an Asymmetrical Routing Environment

Unicast RPF with BOOTP and DHCP

Unicast RPF will allow packets with 0.0.0.0 source and 255.255.255.255 destination to pass so that Bootstrap Protocol (BOOTP) and Dynamic Host Configuration Protocol (DHCP) functions work properly.

Restrictions

There are some basic restrictions to applying Unicast RPF to multihomed clients:

- Clients should not be multihomed to the same switch because multihoming defeats the purpose of building a redundant service for the client.
- Customers must ensure that the packets flowing up the link (out to the Internet) match the route advertised out the link. Otherwise, Unicast RPF filters those packets as malformed packets.

Limitations

There are some basic limitations associated with applying Unicast RPF:

- Unicast loose mode is not supported.

Related Features and Technologies

For more information about Unicast RPF-related features and technologies, review the following:

- Unicast RPF requires Cisco express forwarding (CEF) to function properly on the switch. For more information about CEF, refer to the *Cisco IOS Switching Services Configuration Guide*.
- Unicast RPF can be more effective at mitigating spoofing attacks when combined with a policy of *ingress* and *egress* filtering using Cisco IOS access control lists (ACLs).

- Ingress filtering applies filters to traffic received at a network interface from either internal or external networks. With ingress filtering, packets that arrive from other networks or the Internet and that have a source address that matches a local network, private, or broadcast address are dropped. In ISP environments, for example, ingress filtering can apply to traffic received at the switch from either the client (customer) or the Internet.
- Egress filtering applies filters to traffic exiting a network interface (the sending interface). By filtering packets on switches that connect your network to the Internet or to other networks, you can permit only packets with valid source IP addresses to leave your network.

For more information on network filtering, refer to RFC 2267 and to the *Cisco IOS IP Configuration Guide*.

Prerequisites to Configuring Unicast RPF

Prior to configuring Unicast RPF, configure ACLs:

- Configure standard or extended ACLs to mitigate transmission of invalid IP addresses (perform egress filtering). Permit only valid source addresses to leave your network and get onto the Internet. Prevent all other source addresses from leaving your network for the Internet.
- Configure standard or extended ACLs entries to drop (deny) packets that have invalid source IP addresses (perform ingress filtering). Invalid source IP addresses include the following types:
 - Reserved addresses
 - Loopback addresses
 - Private addresses (RFC 1918, *Address Allocation for Private Internets*)
 - Broadcast addresses (including multicast addresses)
 - Source addresses that fall outside the range of valid addresses associated with the protected network

Unicast RPF Configuration Task List

The following sections describe the configuration tasks for Unicast RPF. Each task in the list is identified as either optional or required.

- [Configuring Unicast RPF](#) (Required)
- [Verifying Unicast RPF](#) (Optional)

See the section “[Unicast RPF Configuration Example: Inbound and Outbound Filters](#)” at the end of this chapter.

Configuring Unicast RPF

Unicast RPF is an input-side function that is enabled on an interface operates on IP packets received by the switch.

To configure Unicast RPF, perform the following task:

	Command	Purpose
Step 1	Switch(config-if)# interface <i>type</i>	Selects the input interface on which you want to apply Unicast RPF. This is the receiving interface, which allows Unicast RPF to verify the best return path before forwarding the packet on to the next destination. The interface type is specific to your switch and the types of interface cards installed on the switch. To display a list of available interface types, enter the interface ? command.
Step 2	Switch(config-if)# ip verify unicast source reachable-via rx allow-default	Enables Unicast RPF on the interface.
Step 3	Switch(config-if)# exit	Exits interface configuration mode. Repeat Steps 2 and 3 for each interface on which you want to apply Unicast RPF.

Verifying Unicast RPF

To verify that Unicast RPF is operational, use the **show cef interface** command. The following example shows that Unicast RPF is enabled at interface Gigabit Ethernet 3/1.

```
Switch# show cef interface gigabitEthernet 3/1
GigabitEthernet3/1 is up (if_number 79)
  Corresponding hwidb fast_if_number 79
  Corresponding hwidb firstsw->if_number 79
  Internet address is 10.1.1.1/24
  ICMP redirects are always sent
  IP unicast RPF check is enabled <=====
  Input features: uRPF <=====
  Inbound access list is not set
  Outbound access list is not set
  IP policy routing is disabled
  BGP based policy accounting on input is disabled
  BGP based policy accounting on output is disabled
  Hardware idb is GigabitEthernet3/1
  Fast switching type 1, interface type 155
  IP CEF switching enabled
  IP CEF switching turbo vector
  IP Null turbo vector
  IP prefix lookup IPv4 mtrie 8-8-8-8 optimized
  Input fast flags 0x4000, Output fast flags 0x0
  ifindex 78(78)
  Slot 3 Slot unit 1 VC -1
  Transmit limit accumulator 0x0 (0x0)
  IP MTU 1500
```

Monitoring and Maintaining Unicast RPF

This section describes commands used to monitor and maintain Unicast RPF.

Command	Purpose
Switch# show ip traffic	Displays global switch statistics about Unicast RPF drops and suppressed drops.
Switch(config-if)# no ip verify unicast	Disables Unicast RPF at the interface.

Unicast RPF counts the number of packets dropped or suppressed because of malformed or forged source addresses. Unicast RPF counts dropped or forwarded packets that include the following global and per-interface information:

- Global Unicast RPF drops
- Per-interface Unicast RPF drops
- Per-interface Unicast RPF suppressed drops

The **show ip traffic** command shows the total number (global count) of dropped or suppressed packets for all interfaces on the switch. The Unicast RPF drop count is included in the IP statistics section.

```
Switch# show ip traffic
```

```
IP statistics:
```

```

Rcvd:  1471590 total, 887368 local destination
        0 format errors, 0 checksum errors, 301274 bad hop count
        0 unknown protocol, 0 not a gateway
        0 security failures, 0 bad options, 0 with options
Opts:  0 end, 0 nop, 0 basic security, 0 loose source route
        0 timestamp, 0 extended security, 0 record route
        0 stream ID, 0 strict source route, 0 alert, 0 other
Frgs:  0 reassembled, 0 timeouts, 0 couldn't reassemble
        0 fragmented, 0 couldn't fragment
Bcast: 205233 received, 0 sent
Mcast: 463292 received, 462118 sent
Sent:  990158 generated, 282938 forwarded
! The second line below ("0 unicast RPF") displays Unicast RPF packet dropping
information.
Drop:  3 encapsulation failed, 0 unresolved, 0 no adjacency
        0 no route, 0 unicast RPF, 0 forced drop
```

A nonzero value for the count of dropped or suppressed packets can mean one of two things:

- Unicast RPF is dropping or suppressing packets that have a bad source address (normal operation).
- Unicast RPF is dropping or suppressing legitimate packets because the route is misconfigured to use Unicast RPF in environments where asymmetric routing exists; that is, where multiple paths can exist as the best return path for a source address.

The **show ip interface** command shows the total of dropped or suppressed packets at a specific interface. If Unicast RPF is configured to use a specific ACL, that ACL information is displayed along with the drop statistics.

```
Switch> show ip interface fast 2/1
```

```

Unicast RPF ACL 197
1 unicast RPF drop
1 unicast RPF suppressed drop
```

The **show access-lists** command displays the number of matches found for a specific entry in a specific access list.

```
Switch> show access-lists
```

```
Extended IP access list 197
  deny ip 192.168.201.0 0.0.0.63 any log-input (1 match)
  permit ip 192.168.201.64 0.0.0.63 any log-input (1 match)
  deny ip 192.168.201.128 0.0.0.63 any log-input
  permit ip 192.168.201.192 0.0.0.63 any log-input
```

Unicast RPF Configuration Example: Inbound and Outbound Filters

The following example uses a very simple single-homed ISP to demonstrate the concepts of ingress and egress filters used in conjunction with Unicast RPF. The example illustrates an ISP-allocated classless interdomain routing (CIDR) block 209.165.202.128/28 that has both inbound and outbound filters on the upstream interface. Be aware that ISPs are usually not single-homed. Hence, provisions for asymmetrical flows (when outbound traffic goes out one link and returns via a different link) need to be designed into the filters on the border switches of the ISP.

```
ip cef distributed
!
interface Serial 5/0/0
  description Connection to Upstream ISP
  ip address 209.165.200.225 255.255.255.252
  no ip redirects
  no ip directed-broadcast
  no ip proxy-arp
  ip verify unicast reverse-path rx allow-default
  ip access-group 111 in
  ip access-group 110 out
!
access-list 110 permit ip 209.165.202.128 0.0.0.31 any
access-list 110 deny ip any any log
access-list 111 deny ip host 0.0.0.0 any log
access-list 111 deny ip 127.0.0.0 0.255.255.255 any log
access-list 111 deny ip 10.0.0.0 0.255.255.255 any log
access-list 111 deny ip 172.16.0.0 0.15.255.255 any log
access-list 111 deny ip 192.168.0.0 0.0.255.255 any log
access-list 111 deny ip 209.165.202.128 0.0.0.31 any log
access-list 111 permit ip any any
```

CHAPTER 33

Configuring IP Multicast

This chapter describes IP multicast routing on the Catalyst 4500 series switch. It also provides procedures and examples to configure IP multicast routing.

Note

For more detailed information on IP Multicast, refer to this URL:

http://www.cisco.com/en/US/products/ps6552/products_ios_technology_home.html

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the *Catalyst 4500 Command Reference*, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

This chapter includes the following major sections:

- [Overview of IP Multicast, page 33-1](#)
- [Configuring IP Multicast Routing, page 33-13](#)
- [Monitoring and Maintaining IP Multicast Routing, page 33-23](#)
- [Configuration Examples, page 33-28](#)

Overview of IP Multicast

This section includes these subsections:

- [IP Multicast Protocols, page 33-2](#)
- [IP Multicast on the Catalyst 4500 Series Switch, page 33-5](#)
- [Unsupported Feature, page 33-13](#)

At one end of the IP communication spectrum is IP unicast, where a source IP host sends packets to a specific destination IP host. In IP unicast, the destination address in the IP packet is the address of a single, unique host in the IP network. These IP packets are forwarded across the network from the source to the destination host by routers. At each point on the path between source and destination, a router uses a unicast routing table to make unicast forwarding decisions, based on the IP destination address in the packet.

At the other end of the IP communication spectrum is an IP broadcast, where a source host sends packets to all hosts on a network segment. The destination address of an IP broadcast packet has the host portion of the destination IP address set to all ones and the network portion set to the address of the subnet. IP hosts, including routers, understand that packets, which contain an IP broadcast address as the destination address, are addressed to all IP hosts on the subnet. Unless specifically configured otherwise, routers do not forward IP broadcast packets, so IP broadcast communication is normally limited to a local subnet.

IP multicasting falls between IP unicast and IP broadcast communication. IP multicast communication enables a host to send IP packets to a *group* of hosts anywhere within the IP network. To send information to a specific group, IP multicast communication uses a special form of IP destination address called an *IP multicast group address*. The IP multicast group address is specified in the IP destination address field of the packet.

To multicast IP information, Layer 3 switches and routers must forward an incoming IP packet to all output interfaces that lead to *members* of the IP multicast group. In the multicasting process on the Catalyst 4500 Series switch, a packet is replicated in the Integrated Switching Engine, forwarded to the appropriate output interfaces, and sent to each member of the multicast group.

It is not uncommon for people to think of IP multicasting and video conferencing as almost the same thing. Although the first application in a network to use IP multicast is often video conferencing, video is only one of many IP multicast applications that can add value to a company's business model. Other IP multicast applications that have potential for improving productivity include multimedia conferencing, data replication, real-time data multicasts, and simulation applications.

This section contains the following subsections:

- [IP Multicast Protocols, page 33-2](#)
- [IP Multicast on the Catalyst 4500 Series Switch, page 33-5](#)
- [Unsupported Feature, page 33-13](#)

IP Multicast Protocols

The Catalyst 4500 Series switch primarily uses these protocols to implement IP multicast routing:

- Internet Group Management Protocol (IGMP)
- Protocol Independent Multicast (PIM)
- IGMP snooping and Cisco Group Management Protocol

[Figure 33-1](#) shows where these protocols operate within the IP multicast environment.

Figure 33-1 IP Multicast Routing Protocols

Internet Group Management Protocol

IGMP messages are used by IP multicast hosts to send their local Layer 3 switch or router a request to join a specific multicast group and begin receiving multicast traffic. With some extensions in IGMPv2, IP hosts can also send a request to a Layer 3 switch or router to leave an IP multicast group and not receive the multicast group traffic.

Using the information obtained via IGMP, a Layer 3 switch or router maintains a list of multicast group memberships on a per-interface basis. A multicast group membership is active on an interface if at least one host on the interface sends an IGMP request to receive multicast group traffic.

Protocol-Independent Multicast

PIM is *protocol independent* because it can leverage whichever unicast routing protocol is used to populate the unicast routing table, including EIGRP, OSPF, BGP, or static route, to support IP multicast. PIM also uses a unicast routing table to perform the reverse path forwarding (RPF) check function instead of building a completely independent multicast routing table. PIM does not send and receive multicast routing updates between routers like other routing protocols do.

PIM Dense Mode

PIM Dense Mode (PIM-DM) uses a *push* model to flood multicast traffic to every corner of the network. PIM-DM is intended for networks in which most LANs need to receive the multicast, such as LAN TV and corporate or financial information broadcasts. It can be an efficient delivery mechanism if there are active receivers on every subnet in the network.

For more detailed information on PIM Dense Mode, refer to this URL:

http://www.cisco.com/en/US/docs/ios-xml/ios/ipmulti_optim/configuration/12-2sx/imc_pim_dense_rfrsh.html.

Note

Supervisor Engine 6-E and Catalyst 4900M do not increment counters for (*, G) in PIM Dense Mode. (*, G) counters are incremented only when running Bidirectional PIM Mode.

PIM Sparse Mode

PIM Sparse Mode (PIM-SM) uses a *pull* model to deliver multicast traffic. Only networks with active receivers that have explicitly requested the data will be forwarded the traffic. PIM-SM is intended for networks with several different multicasts, such as desktop video conferencing and collaborative computing, that go to a small number of receivers and are typically in progress simultaneously.

**Note**

Supervisor Engine 6-E and Catalyst 4900M do not increment counters for (*, G) in PIM Sparse Mode. (*, G) counters are incremented only when running Bidirectional PIM Mode.

Bidirectional PIM Mode

In bidirectional PIM (Bidir-PIM) mode, traffic is routed only along a bidirectional shared tree that is rooted at the rendezvous point (RP) for the group. The IP address of the RP functions as a key enabling all routers to establish a loop-free spanning tree topology rooted in that IP address.

Bidir-PIM is intended for many-to-many applications within individual PIM domains. Multicast groups in bidirectional mode can scale to an arbitrary number of sources without incurring overhead due to the number of sources.

**Note**

Supervisor Engine 6-E and Catalyst 4900M do not increment counters for (*, G) in PIM Dense or Sparse Mode. (*, G) counters are incremented only when running Bidirectional PIM Mode.

For more detailed information on Bidirectional Mode, refer to this URL:

http://www.cisco.com/en/US/prod/collateral/iosswrel/ps6537/ps6552/ps6592/prod_white_paper0900aecd80310db2.pdf.

Rendezvous Point (RP)

If you configure PIM to operate in sparse mode, you must also choose one or more routers to be rendezvous points (RPs). Senders to a multicast group use RPs to announce their presence. Receivers of multicast packets use RPs to learn about new senders. You can configure Cisco IOS software so that packets for a single multicast group can use one or more RPs.

The RP address is used by first hop routers to send PIM register messages on behalf of a host sending a packet to the group. The RP address is also used by last hop routers to send PIM join and prune messages to the RP to inform it about group membership. You must configure the RP address on all routers (including the RP router).

A PIM router can be an RP for more than one group. Only one RP address can be used at a time within a PIM domain for the same group. The conditions specified by the access list determine for which groups the router is an RP (as different groups can have different RPs).

IGMP Snooping

IGMP snooping is used for multicasting in a Layer 2 switching environment. With IGMP snooping, a Layer 3 switch or router examines Layer 3 information in the IGMP packets in transit between hosts and a router. When the switch receives the IGMP Host Report from a host for a particular multicast group, the switch adds the host's port number to the associated multicast table entry. When the switch receives the IGMP Leave Group message from a host, it removes the host's port from the table entry.

Because IGMP control messages are transmitted as multicast packets, they are indistinguishable from multicast data if only the Layer 2 header is examined. A switch running IGMP snooping examines every multicast data packet to determine whether it contains any pertinent IGMP control information. If IGMP snooping is implemented on a low end switch with a slow CPU, performance could be severely impacted when data is transmitted at high rates. On the Catalyst 4500 series switches, IGMP snooping is implemented in the forwarding ASIC, so it does not impact the forwarding rate.

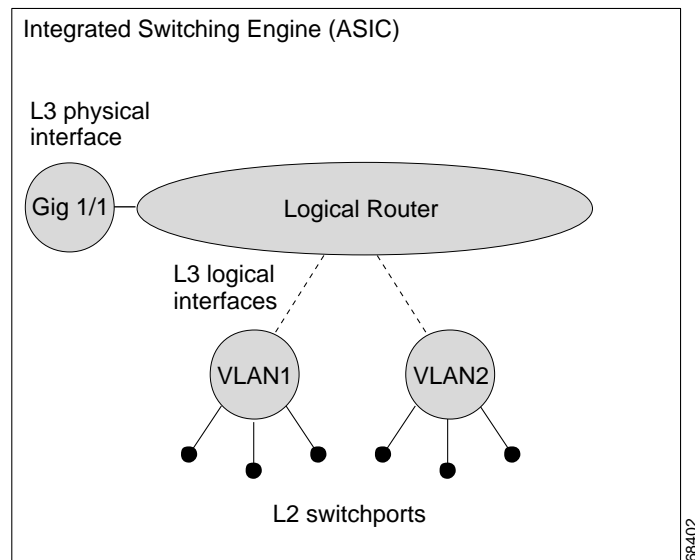

IP Multicast on the Catalyst 4500 Series Switch

The Catalyst 4500 Series switch supports an ASIC-based Integrated Switching Engine that provides Ethernet bridging at Layer 2 and IP routing at Layer 3. Because the ASIC is specifically designed to forward packets, the Integrated Switching Engine hardware provides very high performance with ACLs and QoS enabled. At wire-speed, forwarding in hardware is significantly faster than the CPU subsystem software, which is designed to handle exception packets.

The Integrated Switching Engine hardware supports interfaces for inter-VLAN routing and switchports for Layer 2 bridging. It also provides a physical Layer 3 interface that can be configured to connect with a host, a switch, or a router.

Figure 33-2 shows a logical view of Layer 2 and Layer 3 forwarding in the Integrated Switching Engine hardware.

Figure 33-2 Logical View of Layer 2 and Layer 3 Forwarding in Hardware

This section contains the following subsections:

- [CEF, MFIB, and Layer 2 Forwarding, page 33-6](#)
- [IP Multicast Tables, page 33-8](#)
- [Hardware and Software Forwarding, page 33-9](#)
- [Non-Reverse Path Forwarding Traffic, page 33-10](#)

- [Multicast Fast Drop, page 33-11](#)
- [Multicast Forwarding Information Base, page 33-12](#)
- [S/M, 224/4, page 33-13](#)

CEF, MFIB, and Layer 2 Forwarding

The implementation of IP multicast on the Catalyst 4500 Series switch is an extension of centralized Cisco Express Forwarding (CEF). CEF extracts information from the unicast routing table, which is created by unicast routing protocols, such as BGP, OSPF, and EIGR and loads it into the hardware Forwarding Information Base (FIB). With the unicast routes in the FIB, when a route is changed in the upper-layer routing table, only one route needs to be changed in the hardware routing state. To forward unicast packets in hardware, the Integrated Switching Engine looks up source and destination routes in ternary content addressable memory (TCAM), takes the adjacency index from the hardware FIB, and gets the Layer 2 rewrite information and next-hop address from the hardware adjacency table.

The new Multicast Forwarding Information Base (MFIB) subsystem is the multicast analog of the unicast CEF. The MFIB subsystem extracts the multicast routes that PIM and IGMP create and refines them into a protocol-independent format for forwarding in hardware. The MFIB subsystem removes the protocol-specific information and leaves only the essential forwarding information. Each entry in the MFIB table consists of an (S,G) or (*,G) route, an input RPF VLAN, and a list of Layer 3 output interfaces. The MFIB subsystem, together with platform-dependent management software, loads this multicast routing information into the hardware FIB and hardware multicast expansion table (MET).

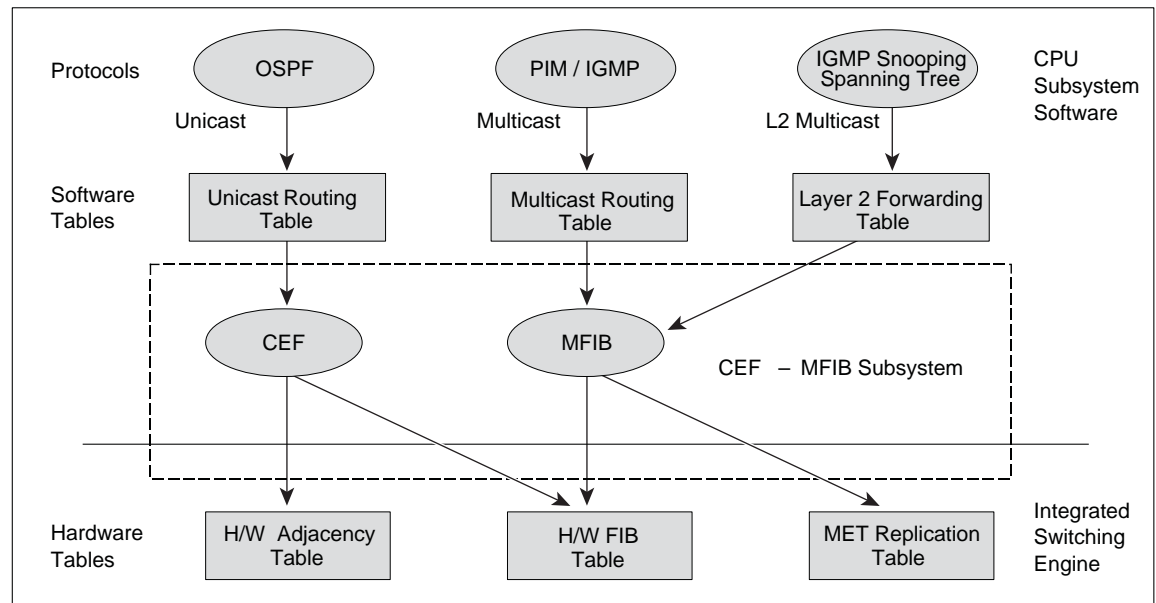

Note

On the Supervisor Engine 6-E, MET has been replaced by the RET (Replica Expansion Table).

The Catalyst 4500 Series switch performs Layer 3 routing and Layer 2 bridging at the same time. There can be multiple Layer 2 switchports on any VLAN interface. To determine the set of output switchports on which to forward a multicast packet, the Supervisor Engine III combines Layer 3 MFIB information with Layer 2 forwarding information and stores it in the hardware MET for packet replication.

[Figure 33-3](#) shows a functional overview of how the Catalyst 4500 Series switch combines unicast routing, multicast routing, and Layer 2 bridging information to forward in hardware.

Figure 33-3 Combining CEF, MFIB, and Layer 2 Forwarding Information in Hardware

Like the CEF unicast routes, the MFIB routes are Layer 3 and must be merged with the appropriate Layer 2 information. The following example shows an MFIB route:

```
(* ,224.1.2.3)
RPF interface is Vlan3
Output Interfaces are:
Vlan 1
Vlan 2
```

The route (*,224.1.2.3) is loaded in the hardware FIB table and the list of output interfaces is loaded into the MET. A pointer to the list of output interfaces, the MET index, and the RPF interface are also loaded in the hardware FIB with the (*,224.1.2.3) route. With this information loaded in hardware, merging of the Layer 2 information can begin. For the output interfaces on VLAN1, the Integrated Switching Engine must send the packet to all switchports in VLAN1 that are in the spanning tree forwarding state. The same process applies to VLAN 2. To determine the set of switchports in VLAN 2, the Layer 2 Forwarding Table is used.

When the hardware routes a packet, in addition to sending it to all of the switchports on all output interfaces, the hardware also sends the packet to all switchports (other than the one it arrived on) in the input VLAN. For example, assume that VLAN 3 has two switchports in it, Gig 3/1 and Gig 3/2. If a host on Gig 3/1 sends a multicast packet, the host on Gig 3/2 might also need to receive the packet. To send a multicast packet to the host on Gig 3/2, all of the switchports in the ingress VLAN must be added to the portset that is loaded in the MET.

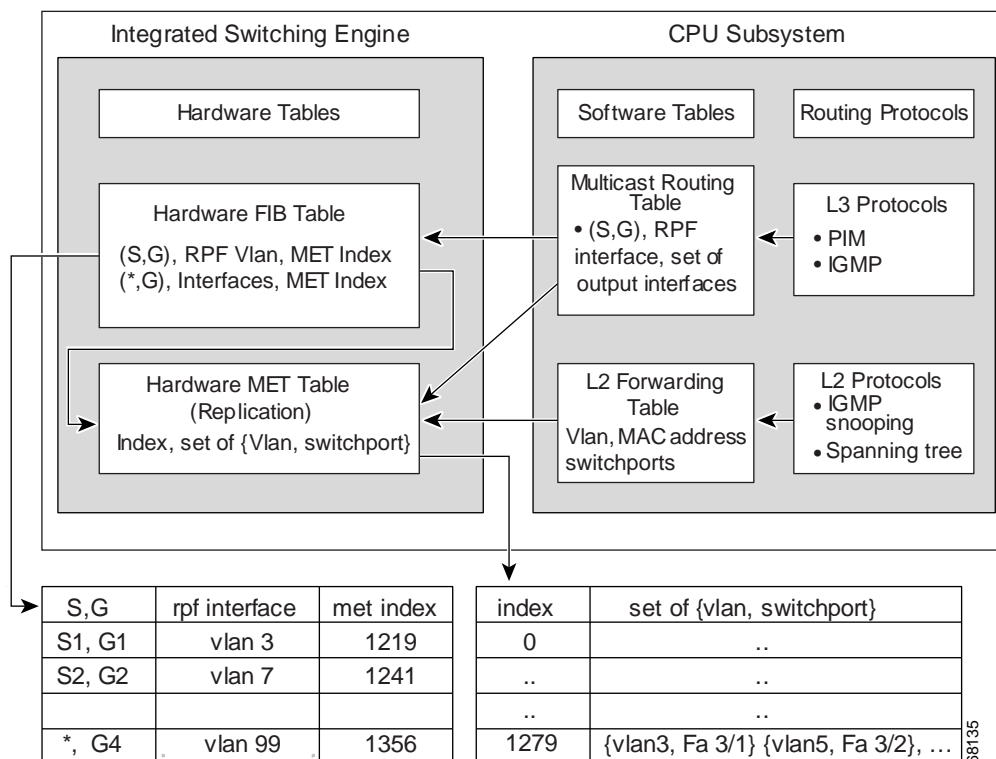

If VLAN 1 contains 1/1 and 1/2, VLAN 2 contains 2/1 and 2/2, and VLAN 3 contains 3/1 and 3/2, the MET chain for this route would contain these switchports: (1/1,1/2,2/1,2/2,3/1, and 3/2).

If IGMP snooping is on, the packet should not be forwarded to all output switchports on VLAN 2. The packet should be forwarded only to switchports where IGMP snooping has determined that there is either a group member or router. For example, if VLAN 1 had IGMP snooping enabled, and IGMP snooping determined that only port 1/2 had a group member on it, then the MET chain would contain these switchports: (1/1,1/2, 2/1, 2/2, 3/1, and 3/2).

IP Multicast Tables

Figure 33-4 shows some key data structures that the Catalyst 4500 Series switch uses to forward IP multicast packets in hardware.

Figure 33-4 IP Multicast Tables and Protocols

The Integrated Switching Engine maintains the hardware FIB table to identify individual IP multicast routes. Each entry consists of a destination group IP address and an optional source IP address. Multicast traffic flows on primarily two types of routes: (S,G) and (*,G). The (S,G) routes flow from a source to a group based on the IP address of the multicast source and the IP address of the multicast group destination. Traffic on a (*,G) route flows from the PIM RP to all receivers of group G. Only sparse-mode groups use (*,G) routes. The Integrated Switching Engine hardware contains space for a total of 128,000 routes, which are shared by unicast routes, multicast routes, and multicast fast-drop entries.

Output interface lists are stored in the multicast expansion table (MET). The MET has room for up to 32,000 output interface lists. (For RET, we can have up to 102K entries (32K used for floodsets, 70,000 used for multicast entries)). The MET resources are shared by both Layer 3 multicast routes and by Layer 2 multicast entries. The actual number of output interface lists available in hardware depends on the specific configuration. If the total number of multicast routes exceed 32,000, multicast packets might not be switched by the Integrated Switching Engine. They would be forwarded by the CPU subsystem at much slower speeds.

Note

For RET, a maximum of 102K entries is supported (32K used for floodsets, 70K used for multicast entries).

**Note**

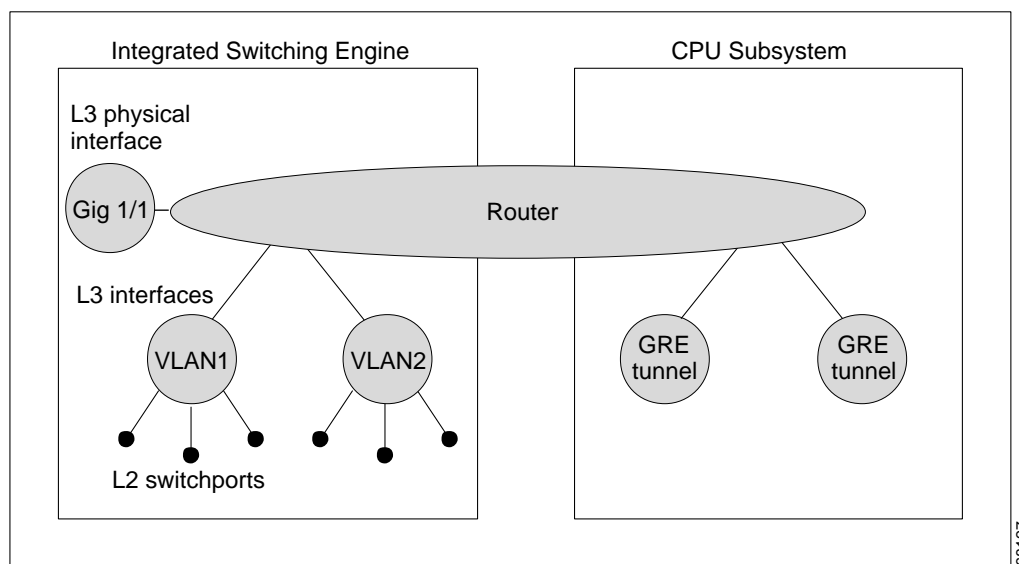

Partial routing is not supported on Supervisor Engine 6-ME' only hardware and software routing are supported.

Hardware and Software Forwarding

The Integrated Switching Engine forwards the majority of packets in hardware at very high rates of speed. The CPU subsystem forwards exception packets in software. Statistical reports should show that the Integrated Switching Engine is forwarding the vast majority of packets in hardware.

Figure 33-5 shows a logical view of the hardware and software forwarding components.

Figure 33-5 Hardware and Software Forwarding Components

In the normal mode of operation, the Integrated Switching Engine performs inter-VLAN routing in hardware. The CPU subsystem supports generic routing encapsulation (GRE) tunnels for forwarding in software.

Replication is a particular type of forwarding where, instead of sending out one copy of the packet, the packet is replicated and multiple copies of the packet are sent out. At Layer 3, replication occurs only for multicast packets; unicast packets are never replicated to multiple Layer 3 interfaces. In IP multicasting, for each incoming IP multicast packet that is received, many replicas of the packet are sent out.

IP multicast packets can be transmitted on the following types of routes:

- Hardware routes
- Software routes
- Partial routes

Hardware routes occur when the Integrated Switching Engine hardware forwards all replicas of a packet. Software routes occur when the CPU subsystem software forwards all replicas of a packet. Partial routes occur when the Integrated Switching Engine forwards some of the replicas in hardware and the CPU subsystem forwards some of the replicas in software.

Partial Routes

Note

The conditions listed below cause the replicas to be forwarded by the CPU subsystem software, but the performance of the replicas that are forwarded in hardware is not affected.

The following conditions cause some replicas of a packet for a route to be forwarded by the CPU subsystem:

- The switch is configured with the **ip igmp join-group** command as a member of the IP multicast group on the RPF interface of the multicast source.
- The switch is the first-hop to the source in PIM sparse mode. In this case, the switch must send PIM-register messages to the RP.

Software Routes

Note

If any one of the following conditions is configured on the RPF interface or the output interface, all replication of the output is performed in software.

The following conditions cause all replicas of a packet for a route to be forwarded by the CPU subsystem software:

- The interface is configured with multicast helper.
- The interface is a generic routing encapsulation (GRE) or Distance Vector Multicast Routing Protocol (DVMRP) tunnel.
- The interface uses non-Advanced Research Products Agency (ARPA) encapsulation.

The following packets are always forwarded in software:

- Packets sent to multicast groups that fall into the range 224.0.0.* (where * is in the range from 0 to 255). This range is used by routing protocols. Layer 3 switching supports all other multicast group addresses.
- Packets with IP options.

Non-Reverse Path Forwarding Traffic

Traffic that fails an Reverse Path Forwarding (RPF) check is called non-RPF traffic. Non-RPF traffic is forwarded by the Integrated Switching Engine by filtering (persistently dropping) or rate limiting the non-RPF traffic.

In a redundant configuration where multiple Layer 3 switches or routers connect to the same LAN segment, only one device forwards the multicast traffic from the source to the receivers on the outgoing interfaces. [Figure 33-6](#) shows how Non-RPF traffic can occur in a common network configuration.

Figure 33-6 Redundant Multicast Router Configuration in a Stub Network

In this kind of topology, only Router A, the PIM designated router (PIM DR), forwards data to the common VLAN. Router B receives the forwarded multicast traffic, but must drop this traffic because it has arrived on the wrong interface and fails the RPF check. Traffic that fails the RPF check is called non-RPF traffic.

Multicast Fast Drop

In IP multicast protocols, such as PIM-SM and PIM-DM, every (S,G) or (*,G) route has an incoming interface associated with it. This interface is referred to as the reverse path forwarding interface. In some cases, when a packet arrives on an interface other than the expected RPF interface, the packet must be forwarded to the CPU subsystem software to allow PIM to perform special protocol processing on the packet. One example of this special protocol processing that PIM performs is the PIM Assert protocol.

By default, the Integrated Switching Engine hardware sends all packets that arrive on a non-RPF interface to the CPU subsystem software. However, processing in software is not necessary in many cases, because these non-RPF packets are often not needed by the multicast routing protocols. The problem is that if no action is taken, the non-RPF packets that are sent to the software can overwhelm the CPU.

To prevent this from happening, the CPU subsystem software loads fast-drop entries in the hardware when it receives an RPF failed packet that is not needed by the PIM protocols running on the switch. A fast-drop entry is keyed by (S,G, incoming interface). Any packet matching a fast-drop entry is bridged in the ingress VLAN, but is not sent to the software, so the CPU subsystem software is not overloaded by processing these RPF failures unnecessarily.

Protocol events, such as a link going down or a change in the unicast routing table, can impact the set of packets that can safely be fast dropped. A packet that was correctly fast dropped before might, after a topology change, need to be forwarded to the CPU subsystem software so that PIM can process it. The CPU subsystem software handles flushing fast-drop entries in response to protocol events so that the PIM code in IOS can process all the necessary RPF failures.

The use of fast-drop entries in the hardware is critical in some common topologies because it is possible to have persistent RPF failures. Without the fast-drop entries, the CPU would be exhausted by RPF failed packets that it did not need to process.

Multicast Forwarding Information Base

The Multicast Forwarding Information Base (MFIB) subsystem supports IP multicast routing in the Integrated Switching Engine hardware on the Catalyst 4500 Series switch. The MFIB logically resides between the IP multicast routing protocols in the CPU subsystem software (PIM, IGMP, MSDP, MBGP, and DVMRP) and the platform-specific code that manages IP multicast routing in hardware. The MFIB translates the routing table information created by the multicast routing protocols into a simplified format that can be efficiently processed and used for forwarding by the Integrated Switching Engine hardware.

To display the information in the multicast routing table, use the **show ip mroute** command. To display the MFIB table information, use the **show ip mfib** command.

The MFIB table contains a set of IP multicast routes. There are several types of IP multicast routes, including (S,G) and (*,G) routes. Each route in the MFIB table can have one or more optional flags associated with it. The route flags indicate how a packet that matches a route should be forwarded. For example, the Internal Copy (IC) flag on an MFIB route indicates that a process on the switch needs to receive a copy of the packet. The following flags can be associated with MFIB routes:

- Internal Copy (IC) flag—set on a route when a process on the router needs to receive a copy of all packets matching the specified route
- Signalling (S) flag—set on a route when a process needs to be notified when a packet matching the route is received; the expected behavior is that the protocol code updates the MFIB state in response to receiving a packet on a signalling interface
- Connected (C) flag—when set on an MFIB route, has the same meaning as the Signalling (S) flag, except that the C flag indicates that only packets sent by directly connected hosts to the route should be signalled to a protocol process

A route can also have a set of optional flags associated with one or more interfaces. For example, an (S,G) route with the flags on VLAN 1 indicates how packets arriving on VLAN 1 should be treated, and they also indicate whether packets matching the route should be forwarded onto VLAN 1. The per-interface flags supported in the MFIB include the following:

- Accepting (A)—set on the interface that is known in multicast routing as the RPF interface. A packet that arrives on an interface that is marked as Accepting (A) is forwarded to all Forwarding (F) interfaces.
- Forwarding (F)—used in conjunction with the Accepting (A) flag as described above. The set of Forwarding interfaces that form what is often referred to as the multicast “olist” or output interface list.
- Signalling (S)—set on an interface when some multicast routing protocol process in IOS needs to be notified of packets arriving on that interface.

Note

When PIM-SM routing is in use, the MFIB route might include an interface like in this example: PimTunnel [1.2.3.4]. This is a virtual interface that the MFIB subsystem creates to indicate that packets are being tunnelled to the specified destination address. A PimTunnel interface cannot be displayed with the normal **show interface** command.

S/M, 224/4

An (S/M, 224/4) entry is created in the MFIB for every multicast-enabled interface. This entry ensures that all packets sent by directly connected neighbors can be Register-encapsulated to the PIM-SM RP. Typically, only a small number of packets would be forwarded using the (S/M,224/4) route, until the (S,G) route is established by PIM-SM.

For example, on an interface with IP address 10.0.0.1 and netmask 255.0.0.0, a route would be created matching all IP multicast packets in which the source address is anything in the class A network 10. This route can be written in conventional subnet/masklength notation as (10/8,224/4). If an interface has multiple assigned IP addresses, then one route is created for each such IP address.

Restrictions on using Bidirectional PIM

Restrictions include the following:

- IPv4 Bidirectional (Bidir) PIM is supported on Supervisor Engine 6L-E, Supervisor Engine 6-E and Catalyst 4900M. IPv6 Bidir PIM is not supported.
- The Catalyst 4500 switch enables you to forward Bidir PIM traffic in hardware up to a maximum of seven RPs. If you configure more than seven Bidir RPs, only the first seven RPs can forward traffic in hardware. The traffic directed to the remaining RPs is forwarded in software.

Unsupported Feature

The following IP multicast feature is not supported in this release:

- Controlling the transmission rate to a multicast group

Configuring IP Multicast Routing

The following sections describe IP multicast routing configuration tasks:

- [Default Configuration in IP Multicast Routing, page 33-13](#)
- [Enabling IP Multicast Routing, page 33-14](#)
- [Enabling PIM on an Interface, page 33-14](#)
- [Enabling Bidirectional Mode, page 33-16](#)
- [Enabling PIM-SSM Mapping, page 33-17](#)
- [Configuring a Rendezvous Point, page 33-17](#)
- [Configuring a Single Static RP, page 33-20](#)
- [Load Splitting of IP Multicast Traffic, page 33-22](#)

For more detailed information on IP multicast routing, such as Auto-RP, PIM Version 2, and IP multicast static routes, refer to the *Cisco IOS IP and IP Routing Configuration Guide, Cisco IOS Release 12.3*.

Default Configuration in IP Multicast Routing

[Table 33-1](#) shows the IP multicast default configuration.

Table 33-1 *Default IP Multicast Configuration*

Feature	Default Value
Rate limiting of RPF	Enabled globally
IP multicast routing	Disabled globally Note When IP multicast routing is disabled, IP multicast traffic data packets are not forwarded by the Catalyst 4500 Series switch. However, IP multicast control traffic will continue to be processed and forwarded. Therefore, IP multicast routes can remain in the routing table even if IP multicast routing is disabled.
PIM	Disabled on all interfaces
IGMP snooping	Enabled on all VLAN interfaces Note If you disable IGMP snooping on an interface, all output ports are forwarded by the Integrated Switching Engine. When IGMP snooping is disabled on an input VLAN interface, multicast packets related to that interface are sent to all forwarding switchports in the VLAN.

**Note**

Source-specific multicast and IGMP v3 are supported.

For more information about source-specific multicast with IGMPv3 and IGMP, see the following URL:
http://www.cisco.com/en/US/docs/ios/ipmulti/configuration/guide/imc_cfg_ssm.html

Enabling IP Multicast Routing

Enabling IP multicast routing allows the Catalyst 4500 Series switch to forward multicast packets. To enable IP multicast routing on the router, perform this task in global configuration mode:

Command	Purpose
Switch(config)# ip multicast-routing	Enables IP multicast routing.

Enabling PIM on an Interface

Enabling PIM on an interface also enables IGMP operation on that interface. An interface can be configured to be in dense mode, sparse mode, or sparse-dense mode. The mode determines how the Layer 3 switch or router populates its multicast routing table and how the Layer 3 switch or router forwards multicast packets it receives from its directly connected LANs. You must enable PIM in one of these modes for an interface to perform IP multicast routing.

When the switch populates the multicast routing table, dense-mode interfaces are always added to the table. Sparse-mode interfaces are added to the table only when periodic join messages are received from downstream routers, or when there is a directly connected member on the interface. When forwarding from a LAN, sparse-mode operation occurs if there is an RP known for the group. If so, the packets are

encapsulated and sent toward the RP. When no RP is known, the packet is flooded in a dense-mode fashion. If the multicast traffic from a specific source is sufficient, the receiver's first-hop router can send join messages toward the source to build a source-based distribution tree.

There is no default mode setting. By default, multicast routing is disabled on an interface.

Enabling Dense Mode

To configure PIM on an interface to be in dense mode, perform this task:

Command	Purpose
Switch(config-if)# ip pim dense-mode	Enables dense-mode PIM on the interface.

See the “[PIM Dense Mode: Example](#)” section at the end of this chapter for an example of how to configure a PIM interface in dense mode.

Enabling Sparse Mode

To configure PIM on an interface to be in sparse mode, perform this task:

Command	Purpose
Switch(config-if)# ip pim sparse-mode	Enables sparse-mode PIM on the interface.

See the “[PIM Sparse Mode: Example](#)” section at the end of this chapter for an example of how to configure a PIM interface in sparse mode.

Enabling Sparse-Dense Mode

When you enter either the **ip pim sparse-mode** or **ip pim dense-mode** command, sparseness or denseness is applied to the interface as a whole. However, some environments might require PIM to run in a single region in sparse mode for some groups and in dense mode for other groups.

An alternative to enabling only dense mode or only sparse mode is to enable sparse-dense mode. In this case, the interface is treated as dense mode if the group is in dense mode; the interface is treated in sparse mode if the group is in sparse mode. If you want to treat the group as a sparse group, and the interface is in sparse-dense mode, you must have an RP.

If you configure sparse-dense mode, the idea of sparseness or denseness is applied to the group on the switch, and the network manager should apply the same concept throughout the network.

Another benefit of sparse-dense mode is that Auto-RP information can be distributed in a dense-mode manner; yet, multicast groups for user groups can be used in a sparse-mode manner. Thus, there is no need to configure a default RP at the leaf routers.

When an interface is treated in dense mode, it is populated in a multicast routing table's outgoing interface list when either of the following is true:

- When there are members or DVMRP neighbors on the interface
- When there are PIM neighbors and the group has not been pruned

When an interface is treated in sparse mode, it is populated in a multicast routing table's outgoing interface list when either of the following is true:

- When there are members or DVMRP neighbors on the interface
- When an explicit join has been received by a PIM neighbor on the interface

To enable PIM to operate in the same mode as the group, perform this task:

Command	Purpose
Switch(config-if)# ip pim sparse-dense-mode	Enables PIM to operate in sparse or dense mode, depending on the group.

Enabling Bidirectional Mode

Most of the configuration requirements for Bidir-PIM are the same as those for configuring PIM-SM. You need not enable or disable an interface for carrying traffic for multicast groups in bidirectional mode. Instead, you configure which multicast groups you want to operate in bidirectional mode. Similar to PIM-SM, you can perform this configuration with Auto-RP, static RP configurations, or the PIM Version 2 bootstrap router (PIMv2 BSR) mechanism.

To enable bidir-PIM, use the following command in global configuration mode:

Command	Purpose
Switch(config)# ip pim bidir-enable	Enables bidir-PIM on a switch.

To configure Bidir-PIM, use the following commands in global configuration mode, depending on which method you use to distribute group-to-RP mappings:

Command	Purpose
Switch(config)# ip pim rp-address rp-address [access-list] [override] bidir	Configures the address of a PIM RP for a particular group, and specifies bidirectional mode. Use this command when you are not distributing group-to-RP mappings using either Auto-RP or the PIMv2 BSR mechanism
Switch(config)# ip pim rp-candidate type number [group-list access-list] bidir	Configures the router to advertise itself as a PIM Version 2 candidate RP to the BSR, and specifies bidirectional mode. Use this command when you are using the PIMv2 BSR mechanism to distribute group-to-RP mappings.
Switch(config)# ip pim send-rp-address type number scope ttl-value [group-list access-list] [interval seconds] bidir	Configures the router to use Auto-RP to configure for which groups the router is willing to act as RP, and specifies bidirectional mode. Use this command when you are using Auto-RP to distribute group-to-RP mappings.

For an example of how to configure bidir-PIM, see the [Bidirectional PIM Mode: Example, page 33-29](#) section.

Enabling PIM-SSM Mapping

The Catalyst 4500 series switch supports SSM mapping, enabling an SSM transition in cases either where neither URD nor IGMP v3-lite is available, or when supporting SSM on the end system is impossible or unwanted due to administrative or technical reasons. With SSM mapping, you can leverage SSM for video delivery to legacy set-top boxes (STBs) that do not support IGMPv3 or for applications that do not take advantage of the IGMPv3 host stack.

For more details, refer to this URL:

http://www.cisco.com/en/US/docs/ios-xml/ios/ipmulti_pim/configuration/15-s/ip6-mcast-ssm-map.html

Configuring a Rendezvous Point

A rendezvous point (RP) is required in networks running Protocol Independent Multicast sparse mode (PIM-SM). In PIM-SM, traffic will be forwarded only to network segments with active receivers that have explicitly requested multicast data.

There are different ways to configure a Rendezvous Point. The most commonly used, described here, are the usage of Static RP and the usage of the Auto-RP protocol. Another way, not described here, are the use of the Bootstrap Router (BSR) protocol.

Configuring Auto-RP

Auto-rendezvous point (Auto-RP) automates the distribution of group-to-rendezvous point (RP) mappings in a PIM network. To make Auto-RP work, a router must be designated as an RP mapping agent, which receives the RP announcement messages from the RPs and arbitrates conflicts. The RP mapping agent then sends the consistent group-to-RP mappings to all other routers by way of dense mode flooding.

Thus, all routers automatically discover which RP to use for the groups they support. The Internet Assigned Numbers Authority (IANA) has assigned two group addresses, 224.0.1.39 and 224.0.1.40, for Auto-RP.

The mapping agent receives announcements of intention to become the RP from Candidate-RPs. The mapping agent then announces the winner of the RP election. This announcement is made independently of the decisions by the other mapping agents.

To configure a rendezvous point, perform the following task:

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# ip multicast-routing	Enables IP multicast routing.
Step 4	Switch(config)# interface [FastEthernet GigabitEthernet Loopback Null Port-channel TenGigabitEthernet Tunnel Vlan] <i>number</i>	Selects an interface that is connected to hosts on which PIM can be enabled.
Step 5	Switch(config-if)# ip pim [sparse-mode sparse-dense-mode]	Enables PIM sparse or sparse-dense mode on an interface. When configuring Auto-RP in sparse mode, you must also configure the Auto-RP listener in the next step.

	Command or Action	Purpose
Step 6	Switch(config-if)# exit	Returns to global configuration mode.
Step 7	Repeat Steps 4 and 5 on all PIM interfaces.	—
Step 8	Switch(config)# ip pim autorp listener	Causes IP multicast traffic for the two Auto-RP groups 224.0.1.39 and 224.0.1.40 to be PIM dense mode flooded across interfaces operating in PIM sparse mode. <ul style="list-style-type: none"> • Skip this step if you are configuring sparse-dense mode in Step 8.
Step 9	Switch(config)# ip pim send-rp-announce { <i>interface-type</i> <i>interface-number</i> <i>ip-address</i> } scope <i>tvl-value</i> [group-list <i>access-list</i>] [interval <i>seconds</i>] [bidir]	Sends RP announcements out all PIM-enabled interfaces. <ul style="list-style-type: none"> • Perform this step on the RP router only. • Use the <i>interface-type</i> and <i>interface-number</i> arguments to define which IP address is to be used as the RP address. • Use the <i>ip-address</i> argument to specify a directly connected IP address as the RP address. <p>Note If the <i>ip-address</i> argument is configured for this command, the RP-announce message will be sourced by the interface to which this IP address is connected (that is, the source address in the IP header of the RP-announce message is the IP address of that interface).</p> <ul style="list-style-type: none"> • This example shows that the interface is enabled with a maximum of 31 hops. The IP address by which the router wants to be identified as RP is the IP address associated with loopback interface 0. Access list 5 describes the groups for which this router serves as RP.

	Command or Action	Purpose
Step 10	Switch(config)# ip pim send-rp-discovery [<i>interface-type interface-number</i>] scope <i>ttl-value [interval seconds]</i>	<p>Configures the router to be an RP mapping agent.</p> <ul style="list-style-type: none"> Perform this step on the RP router only. Use the optional <i>interface-type</i> and <i>interface-number</i> arguments to define which IP address is to be used as the source address of the RP mapping agent. Use the scope keyword and <i>ttl-value</i> argument to specify the Time-to-Live (TTL) value in the IP header of Auto-RP discovery messages. Use the optional interval keyword and <i>seconds</i> argument to specify the interval at which Auto-RP discovery messages are sent. <p>Note Lowering the interval at which Auto-RP discovery messages are sent from the default value of 60 seconds results in more frequent floodings of the group-to-RP mappings. In some network environments, the disadvantages of lowering the interval (more control packet overhead) may outweigh the advantages (more frequent group-to-RP mapping updates).</p> <ul style="list-style-type: none"> The example shows limiting the Auto-RP discovery messages to 31 hops on loopback interface 1.
Step 11	Switch(config)# ip pim rp-announce-filter rp-list access-list group-list access-list	<p>Filters incoming Auto-RP announcement messages coming from the RP.</p> <ul style="list-style-type: none"> Perform this step on the RP router only. Two example access lists that apply to this step could be: <pre>access-list 1 permit 10.0.0.1 access-list 1 permit 10.0.0.2 access-list 2 permit 224.0.0.0 15.255.255.255</pre>
Step 12	Switch(config)# interface <i>type number</i>	Selects an interface that is connected to hosts on which PIM can be enabled.
Step 13	Switch(config-if)# interface ethernet 1 ip multicast boundary access-list [filter-autorp]	<p>Configures an administratively scoped boundary.</p> <ul style="list-style-type: none"> Perform this step on the interfaces that are boundaries to other routers. The access list is not shown in this task. An access list entry that uses the deny keyword creates a multicast boundary for packets that match that entry.
Step 14	Switch(config-if)# end	Returns to EXEC mode.
Step 15	Switch# show ip pim autorp	(Optional) Displays the Auto-RP information.
Step 16	Switch# show ip pim rp [mapping] [rp-address]	(Optional) Displays RPs known in the network and shows how the router learned about each RP.

	Command or Action	Purpose
Step 17	Switch# show ip igmp groups [<i>group-name</i> <i>group-address</i> <i>interface-type</i> <i>interface-number</i>] [detail]	(Optional) Displays the multicast groups having receivers that are directly connected to the router and that were learned through Internet Group Management Protocol (IGMP). <ul style="list-style-type: none"> A receiver must be active on the network at the time that this command is issued in order for receiver information to be present on the resulting display.
Step 18	Switch# show ip mroute [<i>group-address</i> <i>group-name</i>] [<i>source-address</i> <i>source-name</i>] [<i>interface-type</i> <i>interface-number</i>] [summary] [count] [active <i>kbps</i>]	(Optional) Displays the contents of the IP multicast routing (mroute) table.

This example illustrates how to configure Auto-RP:

```
Switch> enable
Switch# configure terminal
Switch(config)# ip multicast-routing
Switch(config)# interface ethernet 1
Switch(config-if)# ip pim sparse-mode
Switch(config-if)# end
Switch(config)# ip pim autorp listener
Switch(config)# ip pim send-rp-announce loopback0 scope 31 group-list 5
Switch(config)# ip pim send-rp-discovery loopback 1 scope 31
Switch(config)# ip pim rp-announce-filter rp-list 1 group-list 2
Switch(config)# interface ethernet 1
Switch(config-if)# ip multicast boundary 10 filter-autorp
Switch(config-if)# end
Switch# show ip pim autorp
Switch# show ip pim rp mapping
Switch# show ip igmp groups
Switch# show ip mroute cbone-audio
```

Configuring a Single Static RP

If you are configuring PIM sparse mode, you must configure a PIM RP for a multicast group. An RP can either be configured statically in each device, or learned through a dynamic mechanism. This task explains how to statically configure an RP, as opposed to the router learning the RP through a dynamic mechanism such as Auto-RP.

PIM designated routers (DRs) forward data from directly connected multicast sources to the RP for distribution down the shared tree. Data is forwarded to the RP in one of two ways. It is encapsulated in register packets and unicast directly to the RP, or, if the RP has itself joined the source tree, it is multicast forwarded per the RPF forwarding algorithm. Last hop routers directly connected to receivers may, at their discretion, join themselves to the source tree and prune themselves from the shared tree.

A single RP can be configured for multiple groups that are defined by an access list. If no RP is configured for a group, the router treats the group as dense using the PIM dense mode techniques. (You can prevent this occurrence by configuring the `no ip pim dm-fallback` command.)

If a conflict exists between the RP configured with the `ip pim rp-address` command and one learned by Auto-RP, the Auto-RP information is used, unless the `override` keyword is configured.

To configure a single static RP, perform the following task:

	Command or Action	Purpose
Step 1	Switch> enable	Enables privileged EXEC mode.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# ip multicast-routing	Enables IP multicast routing.
Step 4	Switch(config)# interface <i>type number</i>	Selects an interface that is connected to hosts on which PIM can be enabled.
Step 5	Switch(config-if)# ip pim [sparse-mode sparse-dense-mode]	Enables PIM on an interface. You must use sparse mode.
Step 6	Repeat Steps 4 and 5 on every interface that uses IP multicast.	—
Step 7	Switch(config-if)# exit	Returns to global configuration mode.
Step 8	Switch(config)# ip pim rp-address <i>rp-address</i> [<i>access-list</i>] [override]	Configures the address of a PIM RP for a particular group. <ul style="list-style-type: none"> • Perform this step on any router. • The <i>access-list</i> argument specifies the number or name of an access list that defines for which multicast groups the RP should be used. • The override keyword specifies that if there is a conflict between the RP configured with this command and one learned by Auto-RP, the RP configured with this command prevails.
Step 9	Switch(config)# end	Ends the current configuration session and returns to EXEC mode.
Step 10	Switch# show ip pim rp [mapping] [<i>rp-address</i>]	(Optional) Displays RPs known in the network and shows how the router learned about each RP.
Step 11	Switch# show ip igmp groups [<i>group-name</i> <i>group-address</i> <i>interface-type interface-number</i>] [detail]	(Optional) Displays the multicast groups having receivers that are directly connected to the router and that were learned through IGMP. <ul style="list-style-type: none"> • A receiver must be active on the network at the time that this command is issued in order for receiver information to be present on the resulting display.
Step 12	Switch# show ip mroute [<i>group-address</i> <i>group-name</i>] [<i>source-address</i> <i>source-name</i>] [<i>interface-type interface-number</i>] [summary] [count] [active <i>kbps</i>]	(Optional) Displays the contents of the IP multicast routing (mroute) table.

This example shows how to configure a single-static RP:

```
Switch> enable
Switch# configure terminal
Switch(config)# ip multicast-routing
Switch(config)# interface ethernet 1
Switch(config-if)# ip pim sparse-mode
Switch(config-if)# exit
Switch(config)# ip pim rp-address 192.168.0.0
Switch(config)# end
Switch# show ip pim rp mapping
Switch# show ip igmp groups
Switch# show ip mroute cbone-audio
```

Load Splitting of IP Multicast Traffic

If two or more equal-cost paths from a source are available, unicast traffic will be load split across those paths. However, by default, multicast traffic is not load split across multiple equal-cost paths. In general, multicast traffic flows down from the reverse path forwarding (RPF) neighbor. According to the Protocol Independent Multicast (PIM) specifications, this neighbor must have the highest IP address if more than one neighbor has the same metric.

Use the **ip multicast multipath** command to enable load splitting of IP multicast traffic across multiple equal-cost paths.

Note

The **ip multicast multipath** command does not work with bidirectional Protocol Independent Multicast (PIM).

To enable IP multicast multipath, perform this task:

	Command	Purpose
Step 1	Switch# config t	Enters configuration mode.
Step 2	Switch(config)# ip multicast multipath	Enables IP multicast multipath.
Step 3	Switch(config)# end	Exits configuration mode.

Note

The **ip multicast multipath** command load splits the traffic but does not load balance the traffic. Traffic from a source will use only one path, even if the traffic far outweighs traffic from other sources.

Configuring load splitting with the **ip multicast multipath** command causes the system to load split multicast traffic across multiple equal-cost paths based on source address using the S-hash algorithm. When the **ip multicast multipath** command is configured and multiple equal-cost paths exist, the path in which multicast traffic will travel is selected based on the source IP address. Multicast traffic from different sources will be load split across the different equal-cost paths. Load splitting will not occur across equal-cost paths for multicast traffic from the same source sent to different multicast groups.

The following example shows how to enable ECMP multicast load splitting on a router based on a source address using the S-hash algorithm:

```
Switch(config)# ip multicast multipath
```

The following example shows how to enable ECMP multicast load splitting on a router based on a source and group address using the basic S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash basic
```

The following example shows how to enable ECMP multicast load splitting on a router based on a source, group, and next-hop address using the next-hop-based S-G-hash algorithm:

```
Switch(config)# ip multicast multipath s-g-hash next-hop-based
```

Monitoring and Maintaining IP Multicast Routing

You can remove all contents of a particular cache, table, or database. You also can display specific statistics. The following sections describe how to monitor and maintain IP multicast:

- [Displaying System and Network Statistics, page 33-23](#)
- [Displaying the Multicast Routing Table, page 33-23](#)
- [Displaying IP MFIB, page 33-26](#)
- [Displaying Bidirectional PIM Information, page 33-27](#)
- [Displaying PIM Statistics, page 33-27](#)
- [Clearing Tables and Databases, page 33-28](#)

Displaying System and Network Statistics

You can display specific statistics, such as the contents of IP routing tables and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path your device's packets are taking through the network.

To display various routing statistics, you can perform any of these tasks:

Command	Purpose
Switch# ping [<i>group-name</i> <i>group-address</i>]	Sends an ICMP Echo Request to a multicast group address.
Switch# show ip mroute [<i>hostname</i> <i>group_number</i>]	Displays the contents of the IP multicast routing table.
Switch# show ip pim interface [<i>type number</i>] [<i>count</i>]	Displays information about interfaces configured for PIM.
Switch# show ip interface	Displays PIM information for all interfaces.

Displaying the Multicast Routing Table

The following is sample output from the **show ip mroute** command for a router operating in dense mode. This command displays the contents of the IP multicast FIB table for the multicast group named cbone-audio.

```
Switch# show ip mroute cbone-audio
```

```
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
R - RP-bit set, F - Register flag, T - SPT-bit set
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.0.255.1), uptime 0:57:31, expires 0:02:59, RP is 0.0.0.0, flags: DC
  Incoming interface: Null, RPF neighbor 0.0.0.0, Dvmrp
  Outgoing interface list:
    Ethernet0, Forward/Dense, 0:57:31/0:02:52
    Tunnel0, Forward/Dense, 0:56:55/0:01:28

(198.92.37.100/32, 224.0.255.1), uptime 20:20:00, expires 0:02:55, flags: C
  Incoming interface: Tunnel0, RPF neighbor 10.20.37.33, Dvmrp
  Outgoing interface list:
    Ethernet0, Forward/Dense, 20:20:00/0:02:52
```

The following is sample output from the **show ip mroute** command for a router operating in sparse mode:

```
Switch# show ip mroute
```

```
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
R - RP-bit set, F - Register flag, T - SPT-bit set
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.0.255.3), uptime 5:29:15, RP is 198.92.37.2, flags: SC
  Incoming interface: Tunnel0, RPF neighbor 10.3.35.1, Dvmrp
  Outgoing interface list:
    Ethernet0, Forward/Sparse, 5:29:15/0:02:57

(198.92.46.0/24, 224.0.255.3), uptime 5:29:15, expires 0:02:59, flags: C
  Incoming interface: Tunnel0, RPF neighbor 10.3.35.1
  Outgoing interface list:
    Ethernet0, Forward/Sparse, 5:29:15/0:02:57
```

Note

Interface timers are not updated for hardware-forwarded packets. Entry timers are updated approximately every five seconds.

The following is sample output from the **show ip mroute** command with the **summary** keyword:

```
Switch# show ip mroute summary
```

```
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, C - Connected, L - Local, P - Pruned
       R - RP-bit set, F - Register flag, T - SPT-bit set, J - Join SPT
Timers: Uptime/Expires
Interface state: Interface, Next-Hop, State/Mode

(*, 224.255.255.255), 2d16h/00:02:30, RP 171.69.10.13, flags: SJPC

```

**Note**

Multicast route byte and packet statistics are supported only for the first 1024 multicast routes. Output interface statistics are not maintained.

Displaying IP MFIB

You can display all routes in the MFIB, including routes that might not exist directly in the upper-layer routing protocol database but that are used to accelerate fast switching. These routes appear in the MFIB, even if dense-mode forwarding is in use.

To display various MFIB routing routes, perform one of these tasks:

Command	Purpose
Switch# show ip mfib	Displays the (S,G) and (*,G) routes that are used for packet forwarding. Displays counts for fast, slow, and partially-switched packets for every multicast route.
Switch# show ip mfib all	Displays all routes in the MFIB, including routes that may not exist directly in the upper-layer routing protocol database, but that are used to accelerate fast switching. These routes include the (S/M,224/4) routes.
Switch# show ip mfib log [n]	Displays a log of the most recent n MFIB related events, most recent first.
Switch# show ip mfib counters	Displays counts of MFIB related events. Only non-zero counters are shown.

The following is sample output from the **show ip mfib** command.

```

IP Multicast Forwarding Information Base
Entry Flags: C - Directly Connected, S - Signal,
             IC - Internal Copy
Interface Flags: A - Accept, F - Forward, S - Signal,
                NP - Not platform switched
Packets: Fast/Partial/Slow Bytes: Fast/Partial/Slow:
(171.69.10.13, 224.0.1.40), flags (IC)
  Packets: 2292/2292/0, Bytes: 518803/0/518803
  Vlan7 (A)
  Vlan100 (F NS)
  Vlan105 (F NS)
(*, 224.0.1.60), flags ()
  Packets: 2292/0/0, Bytes: 518803/0/0
  Vlan7 (A NS)
(*, 224.0.1.75), flags ()

```

```

Vlan7 (A NS)
(10.34.2.92, 239.192.128.80), flags ()
Packets: 24579/100/0, 2113788/15000/0 bytes
Vlan7 (F NS)
Vlan100 (A)
(*, 239.193.100.70), flags ()
Packets: 1/0/0, 1500/0/0 bytes
Vlan7 (A)
..

```

The fast-switched packet count represents the number of packets that were switched in hardware on the corresponding route.

The partially switched packet counter represents the number of times that a fast-switched packet was also copied to the CPU for software processing or for forwarding to one or more non-platform switched interfaces (such as a PimTunnel interface).

The slow-switched packet count represents the number of packets that were switched completely in software on the corresponding route.

Displaying Bidirectional PIM Information

To display Bidir-PIM information, use the following commands, as needed:

Command	Purpose
Switch(config)# show ip pim interface [type number] [df count] [rp-address]	Displays information about the elected DF for each RP of an interface, along with the unicast routing metric associated with the DF.
Switch(config)# show ip pim rp [mapping metric] [rp-address]	Displays information about configured RPs, learned via Auto-RP or BSR, along with their unicast routing metric.

Displaying PIM Statistics

The following is sample output from the **show ip pim interface** command:

```
Switch# show ip pim interface
```

Address	Interface	Mode	Neighbor Count	Query Interval	DR
198.92.37.6	Ethernet0	Dense	2	30	198.92.37.33
198.92.36.129	Ethernet1	Dense	2	30	198.92.36.131
10.1.37.2	Tunnel0	Dense	1	30	0.0.0.0

The following is sample output from the **show ip pim interface** command with a **count**:

```
Switch# show ip pim interface count
```

Address	Interface	FS	Mpackets	In/Out
171.69.121.35	Ethernet0	*	548305239	13744856
171.69.121.35	Serial0.33	*	8256	67052912
198.92.12.73	Serial0.1719	*	219444	862191

The following is sample output from the **show ip pim interface** command with a **count** when IP multicast is enabled. The example lists the PIM interfaces that are fast-switched and process-switched, and the packet counts for these. The H is added to interfaces where IP multicast is enabled.

```
Switch# show ip pim interface count

States: FS - Fast Switched, H - Hardware Switched
Address      Interface      FS  Mpackets In/Out
192.1.10.2   Vlan10         * H 40886/0
192.1.11.2   Vlan11         * H 0/40554
192.1.12.2   Vlan12         * H 0/40554
192.1.23.2   Vlan23         *   0/0
192.1.24.2   Vlan24         *   0/0
```

Clearing Tables and Databases

You can remove all contents of a particular cache, table, or database. Clearing a cache, table, or database might be necessary when the contents of the particular structure have become, or are suspected to be, invalid.

To clear IP multicast caches, tables, and databases, perform one of these tasks:

Command	Purpose
Switch# clear ip mroute	Deletes entries from the IP routing table.
Switch# clear ip mfib counters	Deletes all per-route and global MFIB counters.

Note

IP multicast routes can be regenerated in response to protocol events and as data packets arrive.

Configuration Examples

The following sections provide IP multicast routing configuration examples:

- [PIM Dense Mode: Example, page 33-28](#)
- [PIM Sparse Mode: Example, page 33-29](#)
- [Bidirectional PIM Mode: Example, page 33-29](#)
- [Sparse Mode with a Single Static RP: Example, page 33-29](#)
- [Sparse Mode with Auto-RP: Example, page 33-30](#)

PIM Dense Mode: Example

This example is a configuration of dense-mode PIM on an Ethernet interface:

```
ip multicast-routing
interface ethernet 0
 ip pim dense-mode
```

PIM Sparse Mode: Example

This example is a configuration of sparse-mode PIM. The RP router is the router with the address 10.8.0.20.

```
ip multicast-routing
 ip pim rp-address 10.8.0.20 1
interface ethernet 1
 ip pim sparse-mode
```

Bidirectional PIM Mode: Example

By default a bidirectional RP advertises all groups as bidirectional. Use an access list on the RP to specify a list of groups to be advertised as bidirectional. Groups with the **deny** keyword will operate in *dense* mode. A different, nonbidirectional RP address, is required for groups that operate in *sparse* mode, because a single access list only allows either a **permit** or **deny** keyword.

The following example shows how to configure an RP for both *sparse* and *bidirectional* mode groups. 224/8 and 227/8 are bidirectional groups, 226/8 is sparse mode, and 225/8 is dense mode. The RP must be configured to use different IP addresses for sparse and bidirectional mode operations. Two loopback interfaces are used to allow this configuration and the addresses of these interfaces must be routed throughout the PIM domain so that the other routers in the PIM domain can receive Auto-RP announcements and communicate with the RP:

```
ip multicast-routing !Enable IP multicast routing
ip pim bidir-enable !Enable bidir-PIM
!
interface loopback 0
 description One Loopback address for this routers Bidir Mode RP function
 ip address 10.0.1.1 255.255.255.0
 ip pim sparse-dense-mode
!
interface loopback 1
 description One Loopback address for this routers Sparse Mode RP function
 ip address 10.0.2.1 255.255.255.0
 ip pim sparse-dense-mode
ip pim send-rp-announce Loopback0 scope 10 group-list 45 bidir
ip pim send-rp-announce Loopback1 scope 10 group-list 46
ip pim send-rp-discovery scope 10
access-list 45 permit 224.0.0.0 0.255.255.255
access-list 45 permit 227.0.0.0 0.255.255.255
access-list 45 deny 225.0.0.0 0.255.255.255
access-list 46 permit 226.0.0.0 0.255.255.255
```

Sparse Mode with a Single Static RP: Example

The following example sets the PIM RP address to 192.168.1.1 for all multicast groups and defines all groups to operate in sparse mode:

```
ip multicast-routing
interface ethernet 1
 ip pim sparse-mode
ip pim rp-address 192.168.1.1
no ip pim dm-fallback
```

Note

The same RP cannot be used for both bidirectional and sparse mode groups.

The following example sets the PIM RP address to 172.16.1.1 for the multicast group 225.2.2.2 only:

```
access-list 1 225.2.2.2 0.0.0.0
ip pim rp-address 172.17.1.1
```

Sparse Mode with Auto-RP: Example

The following example configures sparse mode with Auto-RP:

```
ip multicast-routing
ip pim autorp listener
ip pim send-rp-announce Loopback0 scope 16 group-list 1
ip pim send-rp-discovery Loopback1 scope 16
no ip pim dm-fallback
access-list 1 permit 239.254.2.0 0.0.0.255
access-list 1 permit 239.254.3.0 0.0.0.255
.
.
.
access-list 10 permit 224.0.1.39
access-list 10 permit 224.0.1.40
access-list 10 permit 239.254.2.0 0.0.0.255
access-list 10 permit 239.254.3.0 0.0.0.255
```

CHAPTER 34

Configuring ANCP Client

This chapter describes ANCP Client on Catalyst 4500 series switches. It includes the following sections:

- [Overview, page 34-1](#)
- [Enabling and Configuring ANCP Client, page 34-2](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview

ANCP Multicast enables you to control multicast traffic on a Catalyst 4500 series switch using either ANCP (rather than IGMP) or direct static configuration on the CLI. You can configure the switch as an ANCP client that connects to a remote ANCP server with multicast enabled. You can then initiate joins and leaves from that server. So, you can use the switch in a system in which a subscriber requests that a digital right management (DRM) server receive a given channel (multicast) *potentially* through any private protocol mechanism.

Note

The ANCP client does not allow more than four multicast streams per port per VLAN. If a fifth join arrives, it is rejected.

If the DRM server determines that a subscriber is allowed to receive a multicast, it requests that the ANCP server sends an ANCP join command to the ANCP client (Catalyst 4500 series switch) for the port on which the subscriber is connected.

**Note**

IGMP Snooping must be enabled on an ANCP Client (Catalyst 4500 series switch) for processing multicast commands (join, leave, leave all requests, and request for active flows report) from the ANCP server. For information on enabling IGMP snooping. Refer to [Chapter 23, “Configuring IGMP Snooping and Filtering.”](#)

The ANCP protocol must be able to identify the port on which multicast must be added. (This port can be identified either through the identifier configured on the CLI or with the DHCP option 82 that was inserted by the Catalyst 4500 switch while the subscriber received an IP address with DHCP. Either way, the administrator should be consistent in identifying a given port.

Enabling and Configuring ANCP Client

**Note**

If you intend to use DHCP option 82 rather than CLI mapping (with the **ancp client port identif...** command) you must enter the **ip dhcp snooping** command before configuring the ANCP client.

You can identify a port with the **ancp mode client** command or with DHCP option 82.

Topics include:

- [Identifying a Port with the ANCP Protocol, page 34-2](#)
- [Identifying a Port with DHCP Option 82, page 34-4](#)

Identifying a Port with the ANCP Protocol

To make the Catalyst 4500 series switch operate as an ANCP client and to build and initialize its relevant data, enter the **ancp mode client** command. The **no** version of this command disables ANCP. This command disconnects the ANCP client from the ANCP server and terminates any existing multicast streams that have been enabled with ANCP.

To configure a switch to communicate with a single ANCP server, use the **[no] ancp client server interface** command. This command directs the ANCP client to initiate a TCP connection to the remote ANCP server identified with the IP address. If the TCP connection fails, the connection times out and retries for the connection every 120 seconds until it succeeds. The **interface** command specifies the interface from which the local ANCP client obtains its IP address. The **no** command causes the command to terminate the TCP connection to the ANCP server but retain any existing ANCP activated multicast stream.

Separate commands enable the ANCP client and configure the IP address of the ANCP server. Therefore, you can re-configure the IP address of the remote ANCP server without losing existing ANCP activated multicast streams.

Step 1 Enable ANCP as follows:

```
Switch(config)> ancp mode client
```

Step 2 Configure the IP address of the remote server as the interface to acquire the source IP address:

```
Switch(config)> ancp client server <ipaddress of server> interface <interface>
```

The interface might be a loopback; this allows the client to reach the server through the interface.

- Step 3** (Optional) Enable the ANCP multicast client to identify this VLAN interface using the port-identifier as opposed to the Option 82 circuit-id:

```
Switch(config)> ancp client port identifier [port-identifier] vlan [number] interface
[interface]
```

The **no** version of this command prompts a warning message if any multicast stream is activated by ANCP using the port-identifier on a port:

```
Switch(config)# no ancp client port identifier bbb vlan 10 interface GigabitEthernet3/5
Warning: Multicast flows seems to exist for this port, remove mapping and delete flows
anyway?[confirm]y
Switch(config)#
```

The ANCP client tries to connect to the server. If it fails, it tries again 10 seconds later. If it fails again, it tries at 20 seconds intervals, until it reaches the timeout setting (120 seconds). It remains timed out until it reconnects.

Note

If the connection fails again and the client attempts to reconnect and it fails, the wait time returns to 10 seconds (and so on).

To determine whether the ANCP client is successfully connected to the server, enter the **show ancp status** command, which displays the status of the ANCP TCP connection with the remote ANCP server.

```
Switch# show ancp status
ANCP enabled on following interfaces

Et0/0
  ANCP end point(s) on this interface:
  =====

  ANCP state ESTAB
  Neighbor 10.1.1.1 Neighbor port 6068
  Hello interval 100 Sender instance 1 Sender name 372F61C
  Sender port 0 Partition ID 0 TCB 36E27E8
  Capabilities negotiated: Transactional Multicast

Switch#
```

In the preceding example, only one capability is negotiated (supported): transactional multicast. This is the only one that the ANCP client supports. This means that the server also supports this capability and that the two entities can now communicate.

The server can send ANCP multicast commands (join, leave, leave all requests, and request for active flows report) as defined in the multicast portion of the ANCP protocol. At any time, an administrator can use to the **show ancp multicast [interface vlan] [group | source]** command to see the information the ANCP client has obtained about the current multicast flows.

Example 1

```
ANCP_Client# show ancp multicast group 239.6.6.6
ANCP Multicast Streams
ClientID          VLAN  Interface          Joined on
  Group 239.6.6.6
0x0106000700130103  19   Gi1/3              15:06:23 UTC Tue Aug 26 2008
ANCP_Client#
```

Example 2

```
ANCP_Client# show ancp multicast interface Fa2/3 vlan 19
ANCP Multicast Streams
Interface FastEthernet2/3          VLAN 19: client ID 0x0106000700130203
  Group          Source          Joined on
  239.5.6.7      -              15:03:14 UTC Tue Aug 26 2008
ANCP_Client#
```

Note

Specifying the **show ancp multicast** command without parameters or keywords lists everything.

Identifying a Port with DHCP Option 82

Note

To use DHCP option 82, you need to enable DHCP and DHCP snooping (see [Chapter 45, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts”](#)).

If you identify the port with DHCP option 82, you need to configure the Catalyst 4500 series switch as a DHCP relay to insert the DHCP option 82. This action adds a tag in the DHCP packet from the DHCP client so that the DHCP server knows the port connected to this specific DHCP client. The DHCP server can then map the IP address it is providing to the client with the DHCP option 82 it received from the switch. The DHCP server only needs to lookup the DHCP option 82 associated with a given IP address and provide it to the ANCP server. This allows the ANCP client on the switch to identify the proper port using an identifier the switch understands. The configure DHCP snooping on the Catalyst 4500 series switch, use the following commands:

```
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan <vlan-range>
```

By default, DHCP option 82 is inserted when DHCP snooping is activated. Turning this default off could cause ANCP to function improperly with the DHCP circuit-id; it must remain active. To activate it, enter the command:

```
Switch(config)# ip dhcp snooping information option
```

Note

The DHCP option 82 circuit-ID is inserted in the Active-Flow report (when queried for all multicast flows) even if a configured circuit-ID exists.

ANCP allows a remote server to request the list of active flows from the ANCP client (Catalyst 4500 series switch is the ANCP client). This is very similar to the output from the **show ancp multicast** command except that it follows the ANCP protocol packet format (see IETF.org). Observe that the **show ancp multicast** command provides the flows that have been activated with the **anyp port client identifier** command while the ANCP active flow request only reports the client ID in DHCP option 82 circuit-ID format, regardless of the activation mechanism.

Refer to [Chapter 45, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts”](#) for details on the CLI.

Guidelines and Restrictions

Follow these guidelines when applying ANCP functionality:

- Entering a **shut** command on a port removes ANCP activated multicast streams from the port. They must be reactivated by the ANCP server.
- Entering a **suspend** or **shut** command on a VLAN removes ANCP-activated multicast streams from the VLAN.
- Deleting a VLAN removes ANCP-activated multicast streams from the VLAN.
- If a port enters the errdisable or blocked state, ANCP-activated multicast streams are removed from the port.
- Disabling IGMP snooping globally or per VLAN might disrupt ANCP client functionality.
- An ANCP client does not account for the Layer 3 interface state changes (if PIM interface at Layer 3 shuts down, ANCP does not remove the streams). When a PIM interface is running again, multicast streams are received by subscribers.

CHAPTER 35

Configuring Policy-Based Routing

This chapter describes the tasks for configuring policy-based routing (PBR) on a router and includes these major sections:

- [Overview of Policy-Based Routing, page 35-1](#)
- [Policy-Based Routing Configuration Task List, page 35-3](#)
- [Policy-Based Routing Configuration Examples, page 35-5](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Note

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release.

Overview of Policy-Based Routing

This section contains the following subsections:

- [Understanding PBR, page 35-2](#)
- [Understanding PBR Flow Switching, page 35-3](#)
- [Using Policy-Based Routing, page 35-3](#)

PBR gives you a flexible means of routing packets by allowing you to configure a defined policy for traffic flows, lessening reliance on routes derived from routing protocols. To this end, PBR gives you more control over routing by extending and complementing the existing mechanisms provided by routing protocols. PBR allows you to specify a path for certain traffic, such as priority traffic over a high-cost link.

You can set up PBR as a way to route packets based on configured policies. For example, you can implement routing policies to allow or deny paths based on the identity of a particular end system, an application protocol, or the size of packets.

PBR allows you to perform the following tasks:

- Classify traffic based on extended access list criteria. Access lists, then establish the match criteria.
- Route packets to specific traffic-engineered paths.

Policies can be based on IP address, port numbers, or protocols. For a simple policy, you can use any one of these descriptors; for a complicated policy, you can use all of them.

Understanding PBR

All packets received on an interface with PBR enabled are passed through enhanced packet filters known as route maps. The route maps used by PBR dictate the policy, determining to where the packets are forwarded.

Route maps are composed of statements. The route map statements can be marked as permit or deny, and they are interpreted in the following ways:

- If a statement is marked as deny, the packets meeting the match criteria are sent back through the normal forwarding channels and destination-based routing is performed.
- If the statement is marked as permit and a packet matches the access-lists, then the first valid set clause is applied to that packet.

You specify PBR on the incoming interface (the interface on which packets are received), not outgoing interface.

Understanding PBR on Supervisor Engine 6-E

The Catalyst 4500 Supervisor Engine 6-E supports matching route-map actions with a packet by installing entries in the TCAM that match the set of packets described by the ACLs in the match criteria of the route map. These TCAM entries point at adjacencies that either perform the necessary output actions or forward the packet to software if either hardware does not support the action or its resources are exhausted.

Note

The scale of hardware-based PBR is determined by TCAM size and the time required for the CPU to flatten the ACL before programming into hardware. The latter will noticeably increase if a PBR policy requires a considerable number of class-maps. For example, a PBR policy of 1,200 class-maps may require 60-90 minutes of "flatten" time before programming into hardware. This process may repeat if an adjacency change requires PBR reprogramming.

Note

Packets matching a PBR policy and specified with **set interface** and/or **set default interface** actions are software switched and forwarded at the CEF forwarding rate.

Understanding PBR Flow Switching

**Note**

The Supervisor Engine 6-E does not implement PBR using flow switching.

The Catalyst 4500 switching engine supports matching a "set next-hop" route-map action with a packet on a permit ACL. All other route-map actions, as well as matches of deny ACLs, are supported by a flow switching model. In this model, the first packet on a flow that matches a route-map is delivered to the software for forwarding. Software determines the correct destination for the packet and installs an entry into the TCAM so that future packets on that flow are switched in hardware. The Catalyst 4500 switching engine supports a maximum of 4096 flows.

Using Policy-Based Routing

You can enable PBR to change the routing path of certain packets from the obvious shortest path. For example, PBR can be used to provide the following functionality:

- equal access
- protocol-sensitive routing
- source-sensitive routing
- routing based on interactive versus batch traffic
- routing based on dedicated links

Some applications or traffic can benefit from source-specific routing; for example, you can transfer stock records to a corporate office on a higher-bandwidth, higher-cost link for a short time while sending routine application data, such as e-mail, over a lower-bandwidth, lower-cost link.

**Note**

PBR configuration is only allowed on interfaces belonging to the global routing table. Else, the global VRF policy cannot be attached to a VRF-aware interface.

Policy-Based Routing Configuration Task List

To configure PBR, perform the tasks described in the following sections. The task in the first section is required; the tasks in the remaining sections are optional. See the end of this chapter for the section [“Policy-Based Routing Configuration Examples.”](#)

- [Enabling PBR](#) (Required)
- [Enabling Local PBR](#) (Optional)

Enabling PBR

To enable PBR, you must create a route map that specifies the match criteria and the resulting action if all of the match clauses are met. Then you must enable PBR for that route map on a particular interface. All packets arriving on the specified interface matching the match clauses are subject to PBR.

To enable PBR on an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# route-map <i>map-tag</i> [permit deny] [<i>sequence-number</i>]	Defines a route map to control where packets are output. This command puts the router into route-map configuration mode.
Step 2	Switch(config-route-map)# match ip address { <i>access-list-number</i> <i>name</i> } [... <i>access-list-number</i> <i>name</i>]	Specifies the match criteria. Matches the source and destination IP address that is permitted by one or more standard or extended access lists.
Perform Step 3, 4, 5, or 6		
Step 3	Switch(config-route-map)# set ip next-hop <i>ip-address</i> [... <i>ip-address</i>]	Specifies the action or actions to take on the packets that match the criteria. Specifies the next hop for which to route the packet (the next hop must be adjacent). This behavior is identical to a next hop specified in the normal routing table.
Or		
Step 4	Switch(config-route-map)# set interface <i>interface-type interface-number</i> [... <i>type number</i>]	Specifies the action or actions to take on the packets that match the criteria. Sets output interface for the packet. This action specifies that the packet is forwarded out of the local interface. The interface must be a Layer 3 interface (no switchports), and the destination address in the packet must lie within the IP network assigned to that interface. If the destination address for the packet does not lie within that network, the packet is dropped.
Or		
Step 5	Switch(config-route-map)# set ip default next-hop <i>ip-address</i> [... <i>ip-address</i>]	Specifies the action or actions to take on the packets that match the criteria. Sets next hop to which to route the packet if there is no explicit route for this destination. Before forwarding the packet to the next hop, the switch looks up the packet's destination address in the unicast routing table. If a match is found, the packet is forwarded by way of the routing table. If no match is found, the packet is forwarded to the specified next hop.
Or		
Step 6	Switch(config-route-map)# set default interface <i>interface-type interface-number</i> [... <i>type</i> ... <i>number</i>]	Specifies the action or actions to take on the packets that match the criteria. Sets output interface for the packet if there is no explicit route for this destination. Before forwarding the packet to the next hop, the switch looks up the packet's destination address in the unicast routing table. If a match is found, the packet is forwarded via the routing table. If no match is found, the packet is forwarded to the specified output interface. If the destination address for the packet does not lie within that network, the packet is dropped.

	Command	Purpose
Step 7	Switch(config-route-map)# interface <i>interface-type interface-number</i>	Specifies the interface. This command puts the router into interface configuration mode.
Step 8	Switch(config-if)# ip policy route-map <i>map-tag</i>	Identifies the route map to use for PBR. One interface can only have one route map tag, but you can have multiple route map entries with different sequence numbers. These entries are evaluated in sequence number order until the first match. If there is no match, packets are routed as usual.

The **set** commands can be used in conjunction with each other. These commands are evaluated in the order shown in Step 3 in the previous task table. A usable next hop implies an interface. Once the local router finds a next hop and a usable interface, it routes the packet.

Enabling Local PBR

Packets that are generated by the router are not normally policy-routed. To enable local PBR for such packets, indicate which route map the router should use by performing this task:

Command	Purpose
Switch(config)# ip local policy route-map <i>map-tag</i>	Identifies the route map to use for local PBR.

All packets originating on the router are then be subject to local PBR.

Use the **show ip local policy** command to display the route map used for local PBR, if one exists.

Unsupported Commands

The following PBR commands in config-route-map mode are in the CLI but not supported in Cisco IOS for the Catalyst 4500 series switches. If you attempt to use these commands, an error message displays.

- match-length
- set ip qos
- set ip tos
- set ip precedence

Policy-Based Routing Configuration Examples

The following sections provide PBR configuration examples:

- [Equal Access, page 35-6](#)
- [Differing Next Hops, page 35-6](#)
- [Deny ACE, page 35-6](#)

For information on how to configure policy-based routing, see the section “[Policy-Based Routing Configuration Task List](#)” in this chapter.

Equal Access

The following example provides two sources with equal access to two different service providers. Packets arriving on interface fastethernet 3/1 from the source 1.1.1.1 are sent to the router at 6.6.6.6 if the router has no explicit route for the destination of the packet. Packets arriving from the source 2.2.2.2 are sent to the router at 7.7.7.7 if the router has no explicit route for the destination of the packet. All other packets for which the router has no explicit route to the destination are discarded.

```
Switch (config)# access-list 1 permit ip 1.1.1.1
access-list 1 permit ip 1.1.1.1
!
interface fastethernet 3/1
 ip policy route-map equal-access
!

route-map equal-access permit 10
 match ip address 1
 set ip default next-hop 6.6.6.6
route-map equal-access permit 20
 match ip address 2
 set ip default next-hop 7.7.7.7
route-map equal-access permit 30
 set default interface null0
```

**Note**

If the packets you want to drop do not match either of the first two route-map clauses, then change | **set default interface null0** to **set interface null0**.

Differing Next Hops

The following example illustrates how to route traffic from different sources to different places (next hops). Packets arriving from source 1.1.1.1 are sent to the next hop at 3.3.3.3; packets arriving from source 2.2.2.2 are sent to the next hop at 3.3.3.5.

```
access-list 1 permit ip 1.1.1.1
access-list 2 permit ip 2.2.2.2
!
interface fastethernet 3/1
 ip policy route-map Texas
!
route-map Texas permit 10
 match ip address 1
 set ip next-hop 3.3.3.3
!
route-map Texas permit 20
 match ip address 2
 set ip next-hop 3.3.3.5
```

Deny ACE

The following example illustrates how to stop processing a given route map sequence, and to jump to the next sequence. Packets arriving from source 1.1.1.1 skip sequence 10 and jump to sequence 20. All other packets from subnet 1.1.1.0 follow the set statement in sequence 10.

```
access-list 1 deny ip 1.1.1.1
access-list 1 permit ip 1.1.1.0 0.0.0.255
access-list 2 permit ip 1.1.1.1
```

```
access-list 2 permit ip 2.2.2.2
!
interface fastethernet 3/1
ip policy route-map Texas
!
route-map Texas permit 10
match ip address 1
set ip next-hop 3.3.3.3
!
route-map Texas permit 20
match ip address 2
set ip next-hop 3.3.3.5
```

CHAPTER 36

Configuring VRF-lite

Virtual Private Networks (VPNs) provide a secure way for customers to share bandwidth over an ISP backbone network. A VPN is a collection of sites sharing a common routing table. A customer site is connected to the service provider network by one or more interfaces, and the service provider associates each interface with a VPN routing table. A VPN routing table is called a VPN routing/forwarding (VRF) table.

With the VRF-lite feature, the Catalyst 4500 series switch supports multiple VPN routing/forwarding instances in customer edge devices. (VRF-lite is also termed multi-VRF CE, or multi-VRF Customer Edge Device). VRF-lite allows a service provider to support two or more VPNs with overlapping IP addresses using one interface.

Note

Starting with Cisco IOS Release 12.2(52)SG, the Catalyst 4500 switch supports VRF lite NSF support with routing protocols OSPF/EIGRP/BGP.

Note

The switch does not use Multiprotocol Label Switching (MPLS) to support VPNs. For information about MPLS VRF, refer to the *Cisco IOS Switching Services Configuration Guide* at:

http://www.cisco.com/en/US/docs/ios/mpls/configuration/guide/mp_vpn_ipv4_ipv6_ps6922_TSD_Products_Configuration_Guide_Chapter.html

This chapter includes these topics:

- [VRF-lite Overview, page 36-2](#)
- [Default VRF-lite Configuration, page 36-4](#)
- [VRF-lite Configuration Guidelines, page 36-5](#)
- [Configuring VRFs, page 36-6](#)
- [Configuring VRF-Aware Services, page 36-6](#)
- [Configuring Multicast VRFs, page 36-10](#)
- [Configuring a VPN Routing Session, page 36-11](#)
- [Configuring BGP PE to CE Routing Sessions, page 36-12](#)
- [VRF-lite Configuration Example, page 36-13](#)
- [Displaying VRF-lite Status, page 36-17](#)

**Note**

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

VRF-lite Overview

VRF-lite is a feature that enables a service provider to support two or more VPNs, where IP addresses can be overlapped among the VPNs. VRF-lite uses input interfaces to distinguish routes for different VPNs and forms virtual packet-forwarding tables by associating one or more Layer 3 interfaces with each VRF. Interfaces in a VRF can be either physical, such as Ethernet ports, or logical, such as VLAN SVIs, but a Layer 3 interface cannot belong to more than one VRF at any time.

**Note**

VRF-lite interfaces must be Layer 3 interfaces.

VRF-lite includes these devices:

- Customer edge (CE) devices provide customer access to the service provider network over a data link to one or more provider edge routers. The CE device advertises the site's local routes to the provider edge router and learns the remote VPN routes from it. A Catalyst 4500 series switch can be a CE.
- Provider edge (PE) routers exchange routing information with CE devices by using static routing or a routing protocol such as BGP, RIPv1, or RIPv2.
- The PE is only required to maintain VPN routes for those VPNs to which it is directly attached, eliminating the need for the PE to maintain all of the service provider VPN routes. Each PE router maintains a VRF for each of its directly connected sites. Multiple interfaces on a PE router can be associated with a single VRF if all of these sites participate in the same VPN. Each VPN is mapped to a specified VRF. After learning local VPN routes from CEs, a PE router exchanges VPN routing information with other PE routers by using internal BGP (iBGP).
- Provider routers (or core routers) are any routers in the service provider network that do not attach to CE devices.

With VRF-lite, multiple customers can share one CE, and only one physical link is used between the CE and the PE. The shared CE maintains separate VRF tables for each customer and switches or routes packets for each customer based on its own routing table. VRF-lite extends limited PE functionality to a CE device, giving it the ability to maintain separate VRF tables to extend the privacy and security of a VPN to the branch office.

Figure 36-1 shows a configuration where each Catalyst 4500 series switch acts as multiple virtual CEs. Because VRF-lite is a Layer 3 feature, each interface in a VRF must be a Layer 3 interface.

Figure 36-1 Catalyst 4500 Series Switches Acting as Multiple Virtual CEs

This is the packet-forwarding process in a VRF-lite CE-enabled network as shown in [Figure 36-1](#):

- When the CE receives a packet from a VPN, it looks up the routing table based on the input interface. When a route is found, the CE forwards the packet to the PE.
- When the ingress PE receives a packet from the CE, it performs a VRF lookup. When a route is found, the router adds a corresponding MPLS label to the packet and sends it to the MPLS network.
- When an egress PE receives a packet from the network, it strips the label and uses the label to identify the correct VPN routing table. Then the egress PE performs the normal route lookup. When a route is found, it forwards the packet to the correct adjacency.
- When a CE receives a packet from an egress PE, it uses the input interface to look up the correct VPN routing table. If a route is found, the CE forwards the packet within the VPN.

To configure VRF, create a VRF table and specify the Layer 3 interface associated with the VRF. Then configure the routing protocols in the VPN and between the CE and the PE. BGP is the preferred routing protocol used to distribute VPN routing information across the provider's backbone. The VRF-lite network has three major components:

- VPN route target communities—Lists of all other members of a VPN community. You need to configure VPN route targets for each VPN community member.
- Multiprotocol BGP peering of VPN community PE routers—Propagates VRF reachability information to all members of a VPN community. You need to configure BGP peering in all PE routers within a VPN community.
- VPN forwarding—Transports all traffic between all VPN community members across a VPN service-provider network.

Default VRF-lite Configuration

[Table 36-1](#) shows the default VRF configuration.

Table 36-1 *Default VRF Configuration*

Feature	Default Setting
VRF	Disabled. No VRFs are defined.
Maps	No import maps, export maps, or route maps are defined.
VRF maximum routes	None.
Forwarding table	The default for an interface is the global routing table.

VRF-lite Configuration Guidelines

Consider these points when configuring VRF in your network:

- A switch with VRF-lite is shared by multiple customers, and all customers have their own routing tables.
- Because customers use different VRF tables, the same IP addresses can be reused. Overlapped IP addresses are allowed in different VPNs.
- VRF-lite lets multiple customers share the same physical link between the PE and the CE. Trunk ports with multiple VLANs separate packets among customers. All customers have their own VLANs.
- VRF-lite does not support all MPLS-VRF functionality: label exchange, LDP adjacency, or labeled packets.
- For the PE router, there is no difference between using VRF-lite or using multiple CEs. In [Figure 36-1](#), multiple virtual Layer 3 interfaces are connected to the VRF-lite device.
- The Catalyst 4500 series switch supports configuring VRF by using physical ports, VLAN SVIs, or a combination of both. The SVIs can be connected through an access port or a trunk port.
- A customer can use multiple VLANs as long as they do not overlap with those of other customers. A customer's VLANs are mapped to a specific routing table ID that is used to identify the appropriate routing tables stored on the switch.
- The Layer 3 TCAM resource is shared between all VRFs. To ensure that any one VRF has sufficient CAM space, use the **maximum routes** command.
- A Catalyst 4500 series switch using VRF can support one global network and up to 64 VRFs. The total number of routes supported is limited by the size of the TCAM.
- Most routing protocols (BGP, OSPF, EIGRP, RIP and static routing) can be used between the CE and the PE. However, we recommend using external BGP (EBGP) for these reasons:
 - BGP does not require multiple algorithms to communicate with multiple CEs.
 - BGP is designed for passing routing information between systems run by different administrations.
 - BGP makes it easy to pass attributes of the routes to the CE.
- VRF-lite does not support IGRP and ISIS.
- VRF-lite does not affect the packet switching rate.
- Starting with Cisco IOS Release 12.2(50)SG, Multicast and VRF can be configured together on a Layer 3 interface.
- The Catalyst 4500 series switch supports all the PIM protocols (PIM-SM, PIM-DM, PIM-SSM, PIM BiDIR).
- Multicast VRF is supported on Supervisor Engine 6-E and Catalyst 4900M.
- The **capability vrf-lite** subcommand under **router ospf** should be used when configuring OSPF as the routing protocol between the PE and the CE.

Configuring VRFs

To configure one or more VRFs, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip routing	Enables IP routing.
Step 3	Switch(config)# ip vrf vrf-name	Names the VRF, and enter VRF configuration mode.
Step 4	Switch(config-vrf)# rd route-distinguisher	Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y).
Step 5	Switch(config-vrf)# route-target {export import both} route-target-ext-community	Creates a list of import, export, or import and export route target communities for the specified VRF. Enter either an AS system number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y). Note This command is effective only if BGP is running.
Step 6	Switch(config-vrf)# import map route-map	(Optional) Associates a route map with the VRF.
Step 7	Switch(config-vrf)# interface interface-id	Enters interface configuration mode and specify the Layer 3 interface to be associated with the VRF. The interface can be a routed port or SVI.
Step 8	Switch(config-if)# ip vrf forwarding vrf-name	Associates the VRF with the Layer 3 interface.
Step 9	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 10	Switch# show ip vrf [brief detail interfaces] [vrf-name]	Verifies the configuration. Display information about the configured VRFs.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Note

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference for Release 12.2*.

Use the **no ip vrf vrf-name** global configuration command to delete a VRF and to remove all interfaces from it. Use the **no ip vrf forwarding** interface configuration command to remove an interface from the VRF.

Configuring VRF-Aware Services

IP services can be configured on global interfaces, and these services run within the global routing instance. IP services are enhanced to run on multiple routing instances; they are VRF-aware. Any configured VRF in the system can be specified for a VRF-aware service.

VRF-Aware services are implemented in platform-independent modules. VRF means multiple routing instances in Cisco IOS. Each platform has its own limit on the number of VRFs it supports.

VRF-aware services have the following characteristics:

- The user can ping a host in a user-specified VRF.
- ARP entries are learned in separate VRFs. The user can display Address Resolution Protocol (ARP) entries for specific VRFs.

These services are VRF-Aware:

- ARP
- Ping
- Simple Network Management Protocol (SNMP)
- Unicast Reverse Path Forwarding (uRPF)
- Syslog
- Traceroute
- FTP and TFTP
- Telnet and SSH
- NTP

User Interface for ARP

To configure VRF-aware ARP, follow these steps.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

Command	Purpose
Switch(config)# arp vrf <i>vrf-name</i> <i>ip-address mac-address ARPA</i>	Create a static arp entry in the specified VRF.
Switch# show ip arp vrf <i>vrf-name</i>	Displays the ARP table (static and dynamic entries) in the specified VRF.

User Interface for PING

To perform a VRF-aware ping, do the following:

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

Command	Purpose
Switch# ping vrf <i>vrf-name ip-host</i>	Ping an IP host or address in the specified VRF.

User Interface for SNMP

To configure VRF-aware services for SNMP, follow these steps.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# snmp-server trap authentication vrf	Enables SNMP traps for packets on a VRF.
Step 3	Switch(config)# snmp-server engineID remote host vrf vpn-instance engine-id string	Configures a name for the remote SNMP engine on a switch.
Step 4	Switch(config)# snmp-server host host vrf vpn-instance traps community	Specifies the recipient of an SNMP trap operation and specify the VRF table to be used for sending SNMP traps.
Step 5	Switch(config)# snmp-server host host vrf vpn-instance informs community	Specifies the recipient of an SNMP inform operation and specify the VRF table to be used for sending SNMP informs.
Step 6	Switch(config)# snmp-server user user group remote host vrf vpn-instance security model	Adds a user to an SNMP group for a remote host on a VRF for SNMP access.
Step 7	Switch(config)# end	Returns to privileged EXEC mode.

User Interface for uRPF

You can configure uRPF on an interface assigned to a VRF. Source lookup is performed in the VRF table.

To configure VRF-aware services for uRPF, follow these steps.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface interface-id	Enters interface configuration mode, and specify the Layer 3 interface to configure.
Step 3	Switch(config-if)# no switchport	Removes the interface from Layer 2 configuration mode if it is a physical interface.
Step 4	Switch(config-if)# ip vrf forwarding vrf-name	Configures VRF on the interface.
Step 5	Switch(config-if-vrf)# ip address ip-address subnet-mask	Enters the IP address for the interface.
Step 6	Switch(config-if-vrf)# ip verify unicast source reachable-via rx allow-default	Enables uRPF on the interface.
Step 7	Switch(config-if-vrf)# end	Returns to privileged EXEC mode.

User Interface for Syslog

To configure VRF-aware services for Syslog, follow these steps

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# logging on	Enables or temporarily disable logging of storage router event message.
Step 3	Switch(config)# logging host <i>ip-address vrf vrf-name</i>	Specifies the host address of the syslog server where logging messages are to be sent.
Step 4	Switch(config)# logging buffered <i>logging buffered size debugging</i>	Logs messages to an internal buffer.
Step 5	Switch(config)# logging trap <i>debugging</i>	Limits the logging messages sent to the syslog server.
Step 6	Switch(config)# logging facility <i>facility</i>	Sends system logging messages to a logging facility.
Step 7	Switch(config)# end	Returns to privileged EXEC mode.

User Interface for Traceroute

To configure VRF-aware services for traceroute, perform this task.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

Command	Purpose
traceroute vrf <i>vrf-name ipaddress</i>	Specifies the name of a VPN VRF in which to find the destination address.

User Interface for FTP and TFTP

So that FTP and TFTP are VRF-aware, you must configure some FTP/TFTP CLIs. For example, if you want to use a VRF table that is attached to an interface, say E1/0, you need to configure the CLI **ip [t]ftp source-interface E1/0** to inform [t]ftp to use a specific routing table. In this example, the VRF table is used to look up the destination IP address. These changes are backward-compatible and do not affect existing behavior. That is, you can use the source-interface CLI to send packets out a particular interface even if no VRF is configured on that interface.

To specify the source IP address for FTP connections, use the **ip ftp source-interface** show mode command. To use the address of the interface where the connection is made, use the **no** form of this command.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip ftp source-interface <i>interface-type</i> <i>interface-number</i>	Specifies the source IP address for FTP connections.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.

To specify the IP address of an interface as the source address for TFTP connections, use the **ip tftp source-interface** show mode command. To return to the default, use the **no** form of this command.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip tftp source-interface <i>interface-type</i> <i>interface-number</i>	Specifies the source IP address for TFTP connections.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.

User Interface for Telnet and SSH

To configure VRF-aware Telnet and SSH, follow these steps.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

Command	Purpose
Switch# telnet <i><ip-address>/vrf</i> <i>vrf-name</i>	Telnet to an ip host or address in the specified VRF.
Switch# ssh -l <i><username></i> -vrf <i>vrf-name</i> ip-host	SSH to an ip host or address in the specified VRF.

User Interface for NTP

To configure VRF-aware NTP, follow these steps.

For complete syntax and usage information for the commands, refer to the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

Command	Purpose
Switch# ntp server vrf <i>vrf-name</i> ip-host	Configure NTP server in the specified VRF.
Switch# ntp peer vrf <i>vrf-name</i> ip-host	Configure NTP peer in the specified VRF.

Configuring Multicast VRFs

To configure multicast within a VRF table, follow these steps.

For complete syntax and usage information for the following commands, see the switch command reference for this release and the *Cisco IOS Switching Services Command Reference, Release 12.2*.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip routing	Enables IP routing.
Step 3	Switch(config)# ip vrf vrf-name	Names the VRF, and enter VRF configuration mode.
Step 4	Switch(config-vrf)# ip multicast-routing vrf vrf-name	(Optional) Enables global multicast routing for VRF table.
Step 5	Switch(config-vrf)# rd route-distinguisher	Creates a VRF table by specifying a route distinguisher. Enter either an AS number and an arbitrary number (xxx:y) or an IP address and arbitrary number (A.B.C.D:y).
Step 6	Switch(config-vrf)# route-target {export import both} route-target-ext-community	Creates a list of import, export, or import and export route target communities for the specified VRF. Enter either an AS system number and an arbitrary number (xxx:y) or an IP address and an arbitrary number (A.B.C.D:y). The <i>route-target-ext-community</i> should be the same as the <i>route-distinguisher</i> entered in Step 4.
Step 7	Switch(config-vrf)# import map route-map	(Optional) Associates a route map with the VRF.
Step 8	Switch(config-vrf)# interface interface-id	Enters interface configuration mode and specifies the Layer 3 interface to be associated with the VRF. The interface can be a routed port or a SVI.
Step 9	Switch(config-if)# ip vrf forwarding vrf-name	Associates the VRF with the Layer 3 interface.
Step 10	Switch(config-if)# ip address ip-address mask	Configures IP address for the Layer 3 interface.
Step 11	Switch(config-if)# ip pim [sparse-dense mode dense-mode sparse-mode]	Enables PIM on the VRF-associated Layer 3 interface.
Step 12	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 13	Switch# show ip vrf [brief detail interfaces] [vrf-name]	Verifies the configuration. Display information about the configured VRFs.
Step 14	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

For more information about configuring a multicast within a Multi-VRF CE, see the *Cisco IOS IP Multicast Configuration Guide, Release 12.4*.

Use the **no ip vrf vrf-name** global configuration command to delete a VRF and to remove all interfaces from it. Use the **no ip vrf forwarding** interface configuration command to remove an interface from the VRF.

Configuring a VPN Routing Session

Routing within the VPN can be configured with any supported routing protocol (RIP, OSPF, or BGP) or with static routing. The configuration shown here is for OSPF, but the process is the same for other protocols.

To configure OSPF in the VPN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# router ospf <i>process-id vrf vrf-name</i>	Enables OSPF routing, specifies a VPN forwarding table, and enters router configuration mode.
Step 3	Switch(config-router)# log-adjacency-changes	(Optional) Logs changes in the adjacency state. This is the default state.
Step 4	Switch(config-router)# redistribute bgp <i>autonomous-system-number</i> subnets	Sets the switch to redistribute information from the BGP network to the OSPF network.
Step 5	Switch(config-router)# network <i>network-number area area-id</i>	Defines a network address and mask on which OSPF runs and the area ID for that network address.
Step 6	Switch(config-router)# end	Returns to privileged EXEC mode.
Step 7	Switch# show ip ospf <i>process-id</i>	Verifies the configuration of the OSPF network.
Step 8	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no router ospf process-id vrf vrf-name** global configuration command to disassociate the VPN forwarding table from the OSPF routing process.

Configuring BGP PE to CE Routing Sessions

To configure a BGP PE to CE routing session, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# router bgp <i>autonomous-system-number</i>	Configures the BGP routing process with the AS number passed to other BGP routers and enters router configuration mode.
Step 3	Switch(config-router)# network <i>network-number mask network-mask</i>	Specifies a network and mask to announce using BGP.
Step 4	Switch(config-router)# redistribute ospf <i>process-id</i> match internal	Sets the switch to redistribute OSPF internal routes.
Step 5	Switch(config-router)# network <i>network-number area area-id</i>	Defines a network address and mask on which OSPF runs and the area ID for that network address.
Step 6	Switch(config-router-af)# address-family ipv4 vrf <i>vrf-name</i>	Defines BGP parameters for PE to CE routing sessions and enters VRF address-family mode.
Step 7	Switch(config-router-af)# neighbor <i>address remote-as as-number</i>	Defines a BGP session between PE and CE routers.
Step 8	Switch(config-router-af)# neighbor <i>address activate</i>	Activates the advertisement of the IPv4 address family.
Step 9	Switch(config-router-af)# end	Returns to privileged EXEC mode.

	Command	Purpose
Step 10	Switch# show ip bgp [ipv4] [neighbors]	Verifies BGP configuration.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no router bgp autonomous-system-number** global configuration command to delete the BGP routing process. Use the command with keywords to delete routing characteristics.

VRF-lite Configuration Example

Figure 36-2 is a simplified example of the physical connections in a network similar to that in Figure 36-1. OSPF is the protocol used in VPN1, VPN2, and the global network. BGP is used in the CE to PE connections. The example commands show how to configure the CE switch S8 and include the VRF configuration for switches S20 and S11 and the PE router commands related to traffic with switch S8. Commands for configuring the other switches are not included but would be similar.

Figure 36-2 VRF-lite Configuration Example

Configuring Switch S8

On switch S8, enable routing and configure VRF.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# ip vrf v11
Switch(config-vrf)# rd 800:1
Switch(config-vrf)# route-target export 800:1
Switch(config-vrf)# route-target import 800:1
Switch(config-vrf)# exit
Switch(config)# ip vrf v12
Switch(config-vrf)# rd 800:2
Switch(config-vrf)# route-target export 800:2
Switch(config-vrf)# route-target import 800:2
Switch(config-vrf)# exit
```

Configure the loopback and physical interfaces on switch S8. Fast Ethernet interface 3/5 is a trunk connection to the PE. Interfaces 3/7 and 3/11 connect to VPNs:

```
Switch(config)# interface loopback1
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 8.8.1.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface loopback2
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 8.8.2.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface FastEthernet3/5
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface FastEthernet3/8
Switch(config-if)# switchport access vlan 208
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface FastEthernet3/11
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit
```

Configure the VLANs used on switch S8. VLAN 10 is used by VRF 11 between the CE and the PE. VLAN 20 is used by VRF 12 between the CE and the PE. VLANs 118 and 208 are used for VRF for the VPNs that include switch S11 and switch S20, respectively:

```
Switch(config)# interface Vlan10
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 38.0.0.8 255.255.255.0
Switch(config-if)# exit
```

```

Switch(config)# interface Vlan20
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 83.0.0.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface Vlan118
Switch(config-if)# ip vrf forwarding v12
Switch(config-if)# ip address 118.0.0.8 255.255.255.0
Switch(config-if)# exit

Switch(config)# interface Vlan208
Switch(config-if)# ip vrf forwarding v11
Switch(config-if)# ip address 208.0.0.8 255.255.255.0
Switch(config-if)# exit

```

Configure OSPF routing in VPN1 and VPN2:

```

Switch(config)# router ospf 1 vrf v11
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit
Switch(config)# router ospf 2 vrf v12
Switch(config-router)# redistribute bgp 800 subnets
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# exit

```

Configure BGP for CE to PE routing:

```

Switch(config)# router bgp 800
Switch(config-router)# address-family ipv4 vrf v12
Switch(config-router-af)# redistribute ospf 2 match internal
Switch(config-router-af)# neighbor 83.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 83.0.0.3 activate
Switch(config-router-af)# network 8.8.2.0 mask 255.255.255.0
Switch(config-router-af)# exit

Switch(config-router)# address-family ipv4 vrf v11
Switch(config-router-af)# redistribute ospf 1 match internal
Switch(config-router-af)# neighbor 38.0.0.3 remote-as 100
Switch(config-router-af)# neighbor 38.0.0.3 activate
Switch(config-router-af)# network 8.8.1.0 mask 255.255.255.0
Switch(config-router-af)# end

```

Configuring Switch S20

Configure S20 to connect to CE:

```

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface Fast Ethernet 0/7
Switch(config-if)# no switchport
Switch(config-if)# ip address 208.0.0.20 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 208.0.0.0 0.0.0.255 area 0
Switch(config-router)# end

```

Configuring Switch S11

Configure S11 to connect to CE:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip routing
Switch(config)# interface Gigabit Ethernet 0/3
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# no ip address
Switch(config-if)# exit

Switch(config)# interface Vlan118
Switch(config-if)# ip address 118.0.0.11 255.255.255.0
Switch(config-if)# exit

Switch(config)# router ospf 101
Switch(config-router)# network 118.0.0.0 0.0.0.255 area 0
Switch(config-router)# end
```

Configuring the PE Switch S3

On switch S3 (the router), these commands configure only the connections to switch S8:

```
Router# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)# ip vrf v1
Router(config-vrf)# rd 100:1
Router(config-vrf)# route-target export 100:1
Router(config-vrf)# route-target import 100:1
Router(config-vrf)# exit

Router(config)# ip vrf v2
Router(config-vrf)# rd 100:2
Router(config-vrf)# route-target export 100:2
Router(config-vrf)# route-target import 100:2
Router(config-vrf)# exit

Router(config)# ip cef
Router(config)# interface Loopback1
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 3.3.1.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Loopback2
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 3.3.2.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Fast Ethernet3/0.10
Router(config-if)# encapsulation dot1q 10
Router(config-if)# ip vrf forwarding v1
Router(config-if)# ip address 38.0.0.3 255.255.255.0
Router(config-if)# exit

Router(config)# interface Fast Ethernet3/0.20
Router(config-if)# encapsulation dot1q 20
Router(config-if)# ip vrf forwarding v2
Router(config-if)# ip address 83.0.0.3 255.255.255.0
Router(config-if)# exit
```

```

Router(config)# router bgp 100
Router(config-router)# address-family ipv4 vrf v2
Router(config-router-af)# neighbor 83.0.0.8 remote-as 800
Router(config-router-af)# neighbor 83.0.0.8 activate
Router(config-router-af)# network 3.3.2.0 mask 255.255.255.0
Router(config-router-af)# exit
Router(config-router)# address-family ipv4 vrf v1
Router(config-router-af)# neighbor 83.0.0.8 remote-as 800
Router(config-router-af)# neighbor 83.0.0.8 activate
Router(config-router-af)# network 3.3.1.0 mask 255.255.255.0
Router(config-router-af)# end

```

Displaying VRF-lite Status

To display information about VRF-lite configuration and status, perform one of the following tasks:

Command	Purpose
Switch# show ip protocols vrf <i>vrf-name</i>	Displays routing protocol information associated with a VRF.
Switch# show ip route vrf <i>vrf-name</i> [connected] [<i>protocol</i> [<i>as-number</i>]] [list] [mobile] [odr] [profile] [static] [summary] [supernets-only]	Displays IP routing table information associated with a VRF.
Switch# show ip vrf [brief detail interfaces] [<i>vrf-name</i>]	Displays information about the defined VRF instances.
Switch# show ip mroute vrf <i>instance-name</i> < <i>a.b.c.d</i> active bidirectional count dense interface proxy pruned sparse ssm static summary >	Displays information about the defined VRF instances.

This example shows how to display multicast route table information within a VRF instance:

```

Switch# show ip mroute vrf mcast2 234.34.10.18
IP Multicast Routing Table
Flags: D - Dense, S - Sparse, B - Bidir Group, s - SSM Group, C - Connected,
       L - Local, P - Pruned, R - RP-bit set, F - Register flag,
       T - SPT-bit set, J - Join SPT, M - MSDP created entry,
       X - Proxy Join Timer Running, A - Candidate for MSDP Advertisement,
       U - URD, I - Received Source Specific Host Report,
       Z - Multicast Tunnel, z - MDT-data group sender,
       Y - Joined MDT-data group, y - Sending to MDT-data group
       V - RD & Vector, v - Vector
Outgoing interface flags: H - Hardware switched, A - Assert winner
Timers: Uptime/Expires
Interface state: Interface, Next-Hop or VCD, State/Mode

(*, 234.34.10.18), 13:39:21/00:02:58, RP 1.1.1.1, flags: BC
  Bidir-Upstream: Vlan134, RPF nbr 172.16.34.1
  Outgoing interface list:
    Vlan45, Forward/Sparse-Dense, 00:00:02/00:02:57, H
    Vlan134, Bidir-Upstream/Sparse-Dense, 13:35:54/00:00:00, H

```

Note

For more information about the information in the displays, refer to the *Cisco IOS Switching Services Command Reference* at:

http://www.cisco.com/en/US/docs/ios/ipswitch/command/reference/isw_book.html

CHAPTER 37

Configuring Quality of Service

Note

QoS functionality on the Catalyst 4900M and the Supervisor Engine 6-E are equivalent.

This chapter describes how to configure quality of service (QoS) by using automatic QoS (auto-QoS) commands or by using standard QoS commands on a Catalyst 4500 series switch. It describes how to specify QoS configuration on different types of interfaces (access, Layer 2 trunk, Layer 3 routed, Etherchannel) as well as VLANs. It also describes how to specify different QoS configurations on different VLANs on a given interface (per-port per-VLAN QoS). This chapter describes QoS support on Supervisor Engines II-Plus to V-10GE and on Supervisor Engine 6-E.

The QoS configuration model supported on Supervisor Engines II-Plus to V-10G is called the *switch qos* model. However, the Supervisor Engine 6-E supports a different QoS configuration model known as *MQC* (Modular QoS CLI). Please refer to the appropriate configuration section for the supervisor engine on which QoS will be configured. For more information about MQC, see the "Modular Quality of Service Command-Line Interface" section of the *Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.3*.

This chapter consists of these sections:

- [Overview of QoS on the Catalyst 4500 Series Switch, page 37-2](#)
- [Configuring QoS on Supervisor Engines II-Plus, II+10GE, IV, V, V-10GE, 4924, 4948, and 4948-10GE, page 37-18](#)
- [Configuring Auto-QoS on Supervisor Engines II-Plus, II+10GE, IV, V, V-10GE, 4924, 4948, and 4948-10GE, page 37-61](#)
- [Configuring QoS on Supervisor Engine 6-E and Catalyst 4900M, page 37-68](#)
- [Configuring Auto-QoS on Supervisor Engine 6-E and Catalyst 4900M, page 37-93](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of QoS on the Catalyst 4500 Series Switch

Typically, networks operate on a *best-effort* delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

QoS selects network traffic (both unicast and multicast), prioritizes it according to its relative importance, and uses congestion avoidance to provide priority-indexed treatment; QoS can also limit the bandwidth used by network traffic. QoS can make network performance more predictable and bandwidth utilization more effective.

This section contains the following subsections:

- [Prioritization, page 37-2](#)
- [QoS Terminology, page 37-3](#)
- [Basic QoS Model, page 37-5](#)
- [Classification, page 37-6](#)
- [Policing and Marking, page 37-10](#)
- [Mapping Tables, page 37-15](#)
- [Queueing and Scheduling, page 37-15](#)
- [Packet Modification, page 37-17](#)
- [Per Port Per VLAN QoS, page 37-17](#)
- [QoS and Software Processed Packets, page 37-17](#)

Prioritization

QoS implementation is based on the DiffServ architecture. This architecture specifies that each packet is classified upon entry into the network. The classification is carried in the IP packet header, using 6 bits from the deprecated IP type of service (TOS) field to carry the classification (*class*) information. Classification can also be carried in the Layer 2 frame. These special bits in the Layer 2 frame or a Layer 3 packet are described here and shown in [Figure 37-1](#):

- Prioritization values in Layer 2 frames:

Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p class of service (CoS) value in the three least-significant bits. On interfaces configured as Layer 2 ISL trunks, all traffic is in ISL frames.

Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most-significant bits, which are called the User Priority bits. On interfaces configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

Other frame types cannot carry Layer 2 CoS values.

Layer 2 CoS values range from 0 for low priority to 7 for high priority.

- Prioritization bits in Layer 3 packets:

Layer 3 IP packets can carry either an IP precedence value or a Differentiated Services Code Point (DSCP) value. QoS supports the use of either value because DSCP values are backward-compatible with IP precedence values.

IP precedence values range from 0 to 7.

DSCP values range from 0 to 63.

Figure 37-1 QoS Classification Layers in Frames and Packets

Encapsulated Packet

Layer 2 ISL Frame

Layer 2 802.1Q/P Frame

Layer 3 IPv4 Packet

All switches and routers across the Internet rely on the class information to provide the same forwarding treatment to packets with the same class information and different treatment to packets with different class information. The class information in the packet can be assigned by end hosts or by switches or routers along the way, based on a configured policy, detailed examination of the packet, or both. Detailed examination of the packet is expected to happen closer to the edge of the network so that the core switches and routers are not overloaded.

Switches and routers along the path can use the class information to limit the amount of resources allocated per traffic class. The behavior of an individual device when handling traffic in the DiffServ architecture is called per-hop behavior. If all devices along a path provide a consistent per-hop behavior, you can construct an end-to-end QoS solution.

Implementing QoS in your network can be a simple or complex task and depends on the QoS features offered by your internetworking devices, the traffic types and patterns in your network, and the granularity of control you need over incoming and outgoing traffic.

QoS Terminology

The following terms are used when discussing QoS features:

- *Packets* carry traffic at Layer 3.
- *Frames* carry traffic at Layer 2. Layer 2 frames carry Layer 3 packets.

- *Labels* are prioritization values carried in Layer 3 packets and Layer 2 frames:
 - Layer 2 class of service (CoS) values, which range between zero for low priority and seven for high priority:

Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p CoS value in the three least significant bits.

Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most significant bits, which are called the User Priority bits.

Other frame types cannot carry Layer 2 CoS values.

Note On interfaces configured as Layer 2 ISL trunks, all traffic is in ISL frames. On interfaces configured as Layer 2 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

- Layer 3 IP precedence values—The IP version 4 specification defines the three most significant bits of the 1-byte ToS field as IP precedence. IP precedence values range between zero for low priority and seven for high priority.
- Layer 3 differentiated services code point (DSCP) values—The Internet Engineering Task Force (IETF) has defined the six most significant bits of the 1-byte IP ToS field as the DSCP. The per-hop behavior represented by a particular DSCP value is configurable. DSCP values range between 0 and 63. See the [“Configuring DSCP Maps” section on page 37-53](#).

Note Layer 3 IP packets can carry either an IP precedence value or a DSCP value. QoS supports the use of either value, since DSCP values are backwards compatible with IP precedence values. See [Table 37-1](#).

Table 37-1 IP Precedence and DSCP Values

3-bit IP Precedence	6 MSb ¹ of ToS						6-bit DSCP		3-bit IP Precedence	6 MSb ¹ of ToS						6-bit DSCP

1. MSb = most significant bit

- *Classification* is the selection of traffic to be marked.
- *Marking*, according to RFC 2475, is the process of setting a Layer 3 DSCP value in a packet; in this publication, the definition of marking is extended to include setting Layer 2 CoS values.
- *Scheduling* is the assignment of Layer 2 frames to a queue. QoS assigns frames to a queue based on internal DSCP values as shown in [Internal DSCP Values, page 37-14](#).
- *Policing* is limiting bandwidth used by a flow of traffic. Policing can mark or drop traffic.

Basic QoS Model

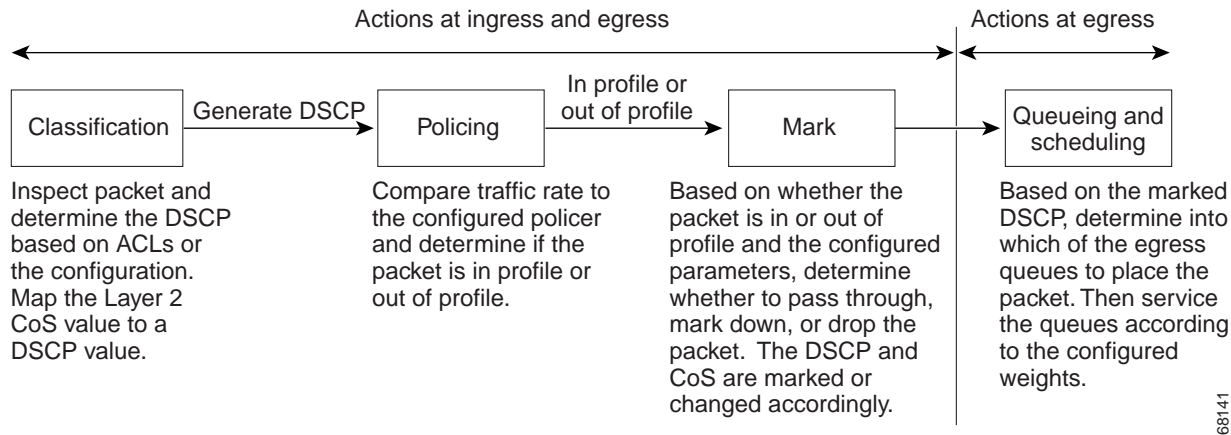

[Figure 37-2](#) shows the basic QoS model (also referred to as Switch QoS model; it is not MQC compliant). Actions at the ingress and egress interfaces include classifying traffic, policing, and marking:

- Classifying distinguishes one kind of traffic from another. The process generates an internal DSCP for a packet, which identifies all the future QoS actions to be performed on this packet. For more information, see the [“Classification” section on page 37-6](#).
- Policing determines whether a packet is in or out of profile by comparing the traffic rate to the configured policer, which limits the bandwidth consumed by a flow of traffic. The result of this determination is passed to the marker. For more information, see the [“Policing and Marking” section on page 37-10](#).
- Marking evaluates the policer configuration information regarding the action to be taken when a packet is out of profile and decides what to do with the packet (pass through a packet without modification, mark down the DSCP value in the packet, or drop the packet). For more information, see the [“Policing and Marking” section on page 37-10](#).

Actions at the egress interface include queueing and scheduling:

- Queueing evaluates the internal DSCP and determines which of the four egress queues in which to place the packet.
- Scheduling services the four egress (transmit) queues based on the sharing and shaping configuration of the egress (transmit) port. Sharing and shaping configurations are described in the [“Queueing and Scheduling”](#) section on page 37-15.

Figure 37-2 Basic QoS Model

Classification

Classification is the process of distinguishing one kind of traffic from another by examining the fields in the packet. Classification is enabled only if QoS is globally enabled on the switch. By default, QoS is globally disabled, so no classification occurs.

You specify which fields in the frame or packet that you want to use to classify incoming traffic.

Classification options are shown in [Figure 37-3](#).

For non-IP traffic, you have the following classification options:

- Use the port default. If the packet is a non-IP packet, assign the default port DSCP value to the incoming packet.
- Trust the CoS value in the incoming frame (configure the port to trust CoS). Then use the configurable CoS-to-DSCP map to generate the internal DSCP value. Layer 2 ISL frame headers carry the CoS value in the three least-significant bits of the 1-byte User field. Layer 2 802.1Q frame headers carry the CoS value in the three most-significant bits of the Tag Control Information field. CoS values range from 0 for low priority to 7 for high priority. If the frame does not contain a CoS value, assign the default port CoS to the incoming frame.

The trust DSCP configuration is meaningless for non-IP traffic. If you configure a port with trust DSCP and non-IP traffic is received, the switch assigns the default port DSCP.

**Note**

On a Catalyst 4948-10GE, Supervisor V-10GE, and Supervisor V, when you send non-IP traffic (such as IPX) from port 1 with .1Q tag and a Pri=x value, for all x values, the transmit CoS at the output interface varies as srcMac changes.

"trust dscp" in a policy-map only works for IP packets. If a non-IP packet is matched by class with the "trust dscp" action, it could be transmitted with a random CoS value rather than treating the "trust dscp" as no-OP as assumed otherwise.

Workaround: Make the classification criteria in you class-maps more granular so that "trust dscp" is applied to a class that won't match non-IP packet. Separate the class-map matching both IP and non-IP packets into a set of class-maps so that "trust dscp" is applied to a class that matches only IPv4 traffic. For class-maps match non-IPv4 traffic, "trust cos" can be used.

For IP traffic, you have the following classification options:

- Trust the IP DSCP in the incoming packet (configure the port to trust DSCP), and assign the same DSCP to the packet for internal use. The IETF defines the six most-significant bits of the 1-byte Type of Service (ToS) field as the DSCP. The priority represented by a particular DSCP value is configurable. DSCP values range from 0 to 63.
- Trust the CoS value (if present) in the incoming packet, and generate the DSCP by using the CoS-to-DSCP map.
- Perform the classification based on a configured IP standard or extended ACL, which examines various fields in the IP header. If no ACL is configured, the packet is assigned the default DSCP based on the trust state of the ingress port; otherwise, the policy map specifies the DSCP to assign to the incoming frame.

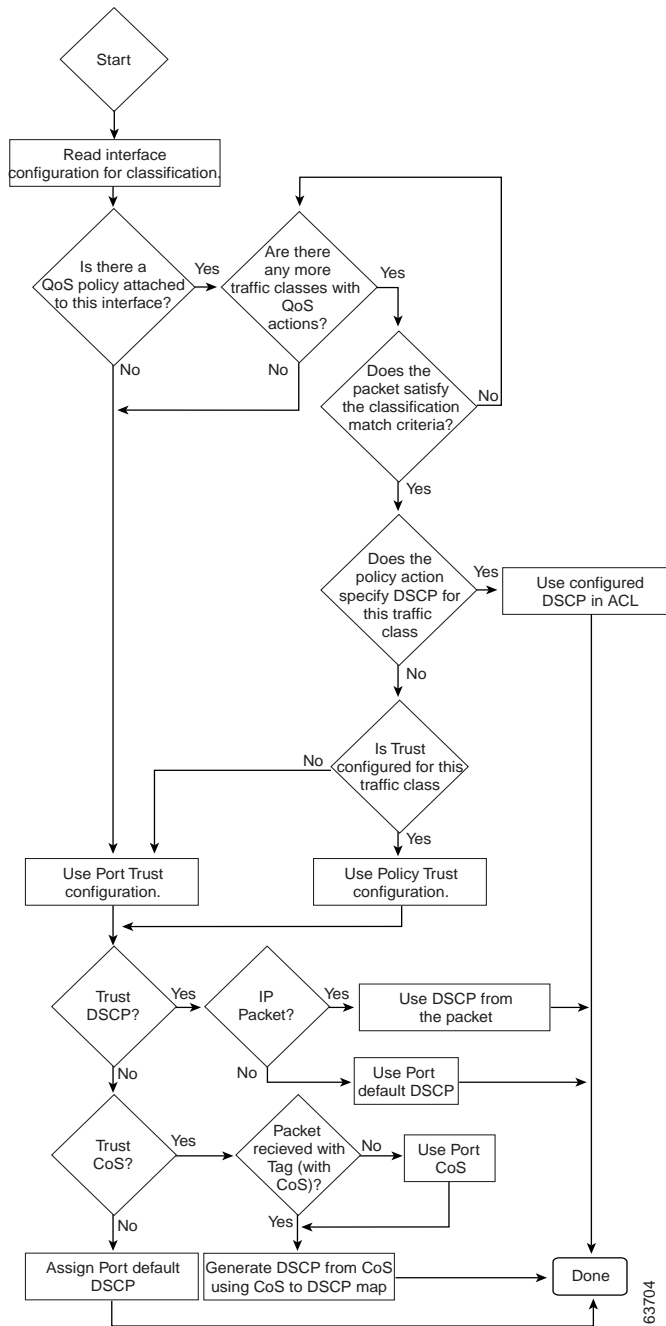

**Note**

It is not possible to classify traffic based on the markings performed by an input QoS policy. In the Catalyst 4500 platform, the input and output QoS lookup happen in parallel, and therefore, input marked DSCP value cannot be used to classify traffic in the output QoS policy.

**Note**

It is not possible to classify traffic based on *internal DSCP*. The *internal DSCP* is purely an internal classification mechanism used for all packets to determine transmit queue and transmit CoS values only.

For information on the maps described in this section, see the [“Mapping Tables” section on page 37-15](#). For configuration information on port trust states, see the [“Configuring the Trust State of Interfaces” section on page 37-48](#).

Figure 37-3 Classification Flowchart

63704

Classification Based on QoS ACLs

A packet can be classified for QoS using multiple match criteria, and the classification can specify whether the packet should match all of the specified match criteria or at least one of the match criteria. To define a QoS classifier, you can provide the match criteria using the *match* statements in a class map. In the 'match' statements, you can specify the fields in the packet to match on, or you can use IP standard or IP extended ACLs. For more information, see the [“Classification Based on Class Maps and Policy Maps” section on page 37-9](#).

If the class map is configured to match all the match criteria, then a packet must satisfy all the match statements in the class map before the QoS action is taken. The QoS action for the packet is not taken if the packet does not match even one match criterion in the class map.

If the class map is configured to match at least one match criterion, then a packet must satisfy at least one of the match statements in the class map before the QoS action is taken. The QoS action for the packet is not taken if the packet does not match any match criteria in the class map.

**Note**

When you use the IP standard and IP extended ACLs, the permit and deny ACEs in the ACL have a slightly different meaning in the QoS context.

- If a packet encounters (and satisfies) an ACE with a “permit,” then the packet “matches” the match criterion in the QoS classification.
- If a packet encounters (and satisfies) an ACE with a “deny,” then the packet “does not match” the match criterion in the QoS classification.
- If no match with a permit action is encountered and all the ACEs have been examined, then the packet “does not match” the criterion in the QoS classification.

**Note**

When creating an access list, remember that, by default, the end of the access list contains an implicit deny statement for everything if it did not find a match before reaching the end.

After a traffic class has been defined with the class map, you can create a policy that defines the QoS actions for a traffic class. A policy might contain multiple classes with actions specified for each one of them. A policy might include commands to classify the class as a particular aggregate (for example, assign a DSCP) or rate limit the class. This policy is then attached to a particular port on which it becomes effective.

You implement IP ACLs to classify IP traffic by using the **access-list** global configuration command. For configuration information, see the [“Configuring a QoS Policy” section on page 37-29](#).

Classification Based on Class Maps and Policy Maps

A class map is a mechanism that you use to isolate and name a specific traffic flow (or class) from all other traffic. The class map defines the criterion used to match against a specific traffic flow to further classify it; the criteria can include matching the access group defined by the ACL or matching a specific list of DSCP, IP precedence, or L2 CoS values. If you have more than one type of traffic that you want to classify, you can create another class map and use a different name. After a packet is matched against the class-map criteria, you can specify the QoS actions via a policy map.

A policy map specifies the QoS actions for the traffic classes. Actions can include trusting the CoS or DSCP values in the traffic class; setting a specific DSCP or IP precedence value in the traffic class; or specifying the traffic bandwidth limitations and the action to take when the traffic is out of profile. Before a policy map can be effective, you must attach it to an interface.

You create a class map by using the **class-map** global configuration command. When you enter the **class-map** command, the switch enters the class-map configuration mode. In this mode, you define the match criteria for the traffic by using the **match** class-map configuration command.

You create and name a policy map by using the **policy-map** global configuration command. When you enter this command, the switch enters the policy-map configuration mode. In this mode, you specify the actions to take on a specific traffic class by using the **trust** or **set** policy-map configuration and policy-map class configuration commands. To make the policy map effective, you attach it to an interface by using the **service-policy** interface configuration command.

The policy map can also contain commands that define the policer, (the bandwidth limitations of the traffic) and the action to take if the limits are exceeded. For more information, see the [“Policing and Marking” section on page 37-10](#).

A policy map also has these characteristics:

- A policy map can contain up to 255 class statements.
- You can have different classes within a policy map.
- A policy-map trust state supersedes an interface trust state.

For configuration information, see the [“Configuring a QoS Policy” section on page 37-29](#).

Policing and Marking

After a packet is classified and has an internal DSCP value assigned to it, the policing and marking process can begin as shown in [Figure 37-4](#).

Policing involves creating a policer that specifies the bandwidth limits for the traffic. Packets that exceed the limits are *out of profile* or *nonconforming*. Each policer specifies the action to take for packets that are in or out of profile. These actions, carried out by the marker, include passing through the packet without modification, dropping the packet, or marking down the packet with a new DSCP value that is obtained from the configurable policed-DSCP map. For information on the policed-DSCP map, see the [“Mapping Tables” section on page 37-15](#).

You can create these types of policers:

- Individual

QoS applies the bandwidth limits specified in the policer separately to each matched traffic class for each port/VLAN to which the policy map is attached to. You configure this type of policer within a policy map by using the **police** command under policy-map class configuration mode.

- Aggregate

QoS applies the bandwidth limits specified in an aggregate policer cumulatively to all matched traffic flows. You configure this type of policer by specifying the aggregate policer name within a policy map by using the **police aggregate** policy-map configuration command. You specify the bandwidth limits of the policer by using the **qos aggregate-policer** global configuration command. In this way, the aggregate policer is shared by multiple classes of traffic within a policy map.

- Flow or Microflow

With flow-based policing, all the identified flows are policed to the specified rate individually. Because the flows are dynamic, key distinguishing fields must be configured in class maps. Two flow-matching options are provided: *source ip based* (each flow with unique source IP address is treated as a new flow) and *destination ip based* (each flow with unique destination IP address is treated as new flow). For information on flow-based policer configuration, see “Configuring User Based Rate Limiting” on page 38.

When configuring policing and policers, keep these items in mind:

- On Supervisor Engines 6-E/6L-E and on the Catalyst 4900M switch, policers account only for the Layer 2 header length when calculating policer rates. In contrast, shapers account for header length as well as IPG in rate calculations.

By default, on Supervisor Engine V-10GE and earlier supervisor engines, policer or shaping computation involves only IP payload information. You can include Layer 2 lengths and any overhead with the **qos account l2 encapsulation** command.

For non-IP packets, the Layer 2 length as specified in the Layer 2 Header is used by the policer for policing computation. To specify additional Layer 2 encapsulation length when policing IP packets, use the **qos account layer2 encapsulation** command.

- By default, no policers are configured.
- Only the average rate and committed burst parameters are configurable.
- Policing for individual and aggregate policers can occur in ingress and egress interfaces.
 - With the Supervisor Engine V-10GE (WS-X4516-10GE), 8192 policers are supported on ingress and on egress.
 - With all other supervisor engines, 1024 policers are supported on ingress and on egress.
 - The accuracy of the policer configured is +/- 1.5 per cent.

Note Four policers in ingress and egress direction are reserved.

- Policers can be of individual or aggregate type. On the Supervisor Engine V-10GE, flow based policers are supported.
- Policing for flow policers can occur on ingress Layer 3 interfaces only.
 - 512 unique flow policers can be configured on the Supervisor Engine V-10GE.

Note Because one flow policer is reserved by software, 511 unique flow policers can be defined.

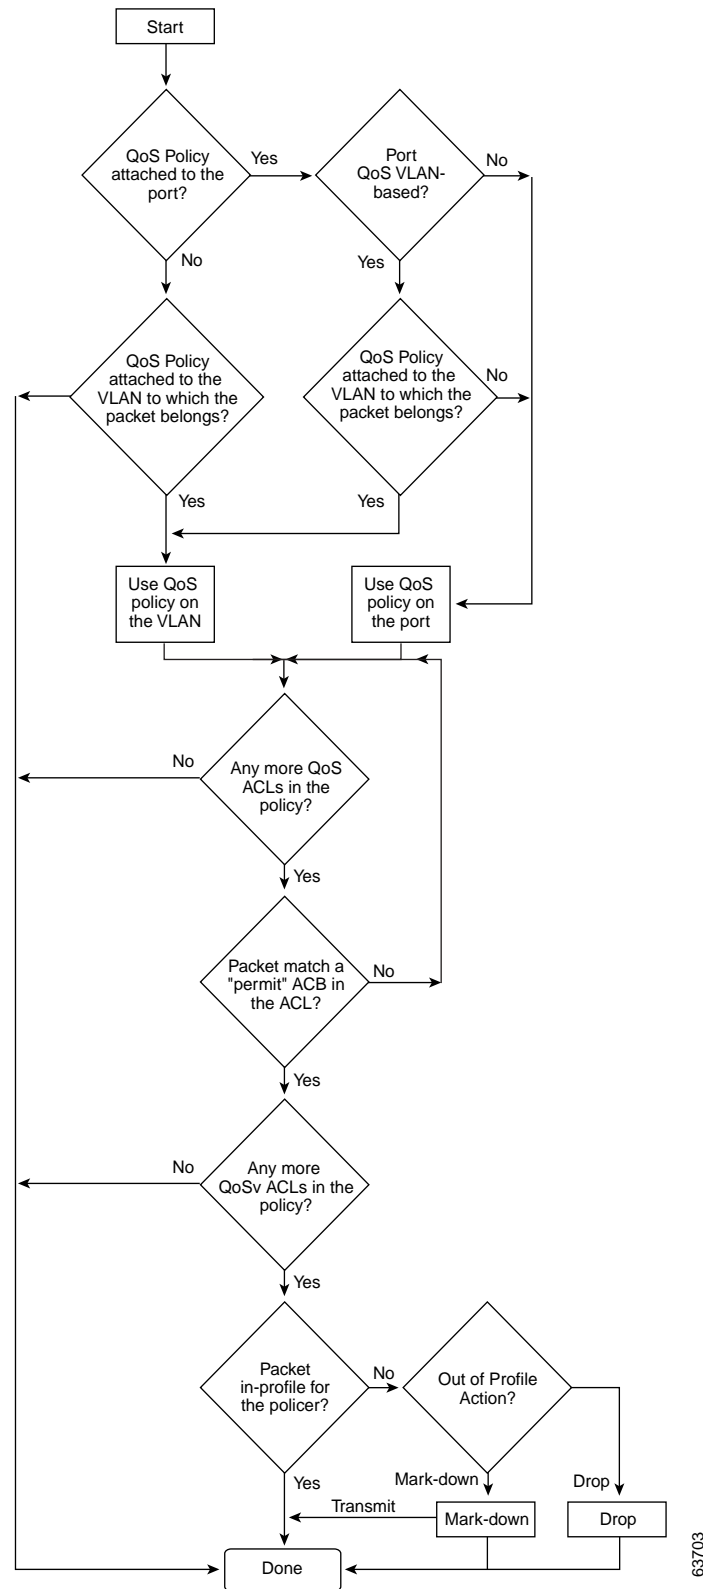

- Greater than 100,000 flows can be microflow policed.

Note Microflow currently supports two flow matching options (source IP address based and destination IP address based). When microflow policing is used together with Netflow Statistics Collection, full flow statistics for the flows matching the source IP address or destination IP address are not available. For information on configuring Netflow Statistics, refer to [“Enabling NetFlow Statistics Collection” section on page 54-7](#).

- On an interface configured for QoS, all traffic received or sent through the interface is classified, policed, and marked according to the policy map attached to the interface. However, if the interface is configured to use VLAN-based QoS (using the **qos vlan-based** command), the traffic received or sent through the interface is classified, policed, and marked according to the policy map attached to the VLAN (configured on the VLAN interface) to which the packet belongs. If there is no policy map attached to the VLAN to which the packet belongs, the policy map attached to the interface is used.

After you configure the policy map and policing actions, attach the policy to an ingress or egress interface by using the **service-policy** interface configuration command. For configuration information, see the [“Configuring a QoS Policy” section on page 37-29](#) and the [“Creating Named Aggregate Policers” section on page 37-27](#).

Figure 37-4 Policing and Marking Flowchart

63703

Internal DSCP Values

The following sections describe the internal DSCP values:

- [Internal DSCP Sources, page 37-14](#)
- [Egress ToS and CoS Sources, page 37-14](#)

Internal DSCP Sources

During processing, QoS represents the priority of all traffic (including non-IP traffic) with an internal DSCP value. QoS derives the internal DSCP value from the following:

- For trust-CoS traffic, from received or ingress interface Layer 2 CoS values
- For trust-DSCP traffic, from received or ingress interface DSCP values
- For untrusted traffic, from ingress interface DSCP value

The trust state of traffic is the trust state of the ingress interface unless set otherwise by a policy action for this traffic class.

QoS uses configurable mapping tables to derive the internal 6-bit DSCP value from CoS, which are 3-bit values (see the [“Configuring DSCP Maps” section on page 37-53](#)).

Egress ToS and CoS Sources

For egress IP traffic, QoS creates a ToS byte from the internal DSCP value and sends it to the egress interface to be written into IP packets. For **trust-dscp** and **untrusted** IP traffic, the ToS byte includes the original 2 least-significant bits from the received ToS byte.

Note

The internal ToS value can mimic an IP precedence value (see [Table 37-1 on page 37-4](#)).

For all egress traffic, QoS uses a configurable mapping table to derive a CoS value from the internal ToS value associated with traffic (see the [“Configuring the DSCP-to-CoS Map” section on page 37-55](#)). QoS sends the CoS value to be written into ISL and 802.1Q frames.

For traffic received on an ingress interface configured to *trust CoS* using the **qos trust cos** command, the transmit CoS is always the incoming packet CoS (or the ingress interface default CoS if the packet is received untagged).

When the interface trust state is not configured to *trust dscp* using the **qos trust dscp** command, the security and QoS ACL classification always use the interface DSCP and not the incoming packet DSCP.

Mapping Tables

During QoS processing, the switch represents the priority of all traffic (including non-IP traffic) with an internal DSCP value:

- During classification, QoS uses configurable mapping tables to derive the internal DSCP (a 6-bit value) from received CoS. These maps include the CoS-to-DSCP map.
- During policing, QoS can assign another DSCP value to an IP or non-IP packet (if the packet is out of profile and the policer specifies a marked down DSCP value). This configurable map is called the policed-DSCP map.
- Before the traffic reaches the scheduling stage, QoS uses the internal DSCP to select one of the four egress queues for output processing. The DSCP-to-egress queue mapping can be configured using the **qos map dscp to tx-queue** command.

The CoS-to-DSCP and DSCP-to-CoS map have default values that might or might not be appropriate for your network.

For configuration information, see the [“Configuring DSCP Maps” section on page 37-53](#).

Queueing and Scheduling

Each physical port has four transmit queues (egress queues). Each packet that needs to be transmitted is enqueued to one of the transmit queues. The transmit queues are then serviced based on the transmit queue scheduling algorithm.

Once the final transmit DSCP is computed (including any markdown of DSCP), the transmit DSCP to transmit queue mapping configuration determines the transmit queue. The packet is placed in the transmit queue of the transmit port, determined from the transmit DSCP. Use the **qos map dscp to tx-queue** command to configure the transmit DSCP to transmit queue mapping. The transmit DSCP is the internal DSCP value if the packet is a non-IP packet as determined by the QoS policies and trust configuration on the ingress and egress ports.

For configuration information, see the [“Configuring Transmit Queues” section on page 37-50](#).

Active Queue Management

Active queue management (AQM) is the pro-active approach of informing you about congestion before a buffer overflow occurs. AQM is done using Dynamic buffer limiting (DBL). DBL tracks the queue length for each traffic flow in the switch. When the queue length of a flow exceeds its limit, DBL drop packets or set the Explicit Congestion Notification (ECN) bits in the packet headers.

DBL classifies flows in two categories, adaptive and aggressive. Adaptive flows reduce the rate of packet transmission once it receives congestion notification. Aggressive flows do not take any corrective action in response to congestion notification. For every active flow the switch maintains two parameters, “buffersUsed” and “credits”. All flows start with “max-credits”, a global parameter. When a flow with credits less than “aggressive-credits” (another global parameter) it is considered an aggressive flow and is given a small buffer limit called “aggressiveBufferLimit”.

Queue length is measured by the number of packets. The number of packets in the queue determines the amount of buffer space that a flow is given. When a flow has a high queue length the computed value is lowered. This allows new incoming flows to receive buffer space in the queue. This allows all flows to get a proportional share of packets through the queue.

Because 4 transmit queues exist per interface and DBL is a per-queue mechanism, DSCP values can make DBL application more complex.

The following table provides the default DSCP-to-transmit queue mapping:

DSCP	txQueue
0-15	1
16-31	2
32-48	3
49-63	4

For example, if you are sending two streams, one with a DSCP of 16 and other with a value of 0, they will transmit from different queues. Even though an aggressive flow in txQueue 2 (packets with DSCP of 16) can saturate the link, packets with a DSCP of 0 will not be blocked by the aggressive flow, as they will transmit from txQueue 1. Thus, even without DBL, packets whose DSCP value places them in txQueue 1, 3, or 4 will not be dropped due to the aggressive flow.

Sharing Link Bandwidth Among Transmit Queues

The four transmit queues for a transmit port share the available link bandwidth of that transmit port. You can set the link bandwidth to be shared differently among the transmit queues using **bandwidth** command in interface transmit queue configuration mode. With this command, you assign the minimum guaranteed bandwidth for each transmit queue.

By default, all queues are scheduled in a round robin manner.

For systems using Supervisor Engine II-Plus, Supervisor Engine II-Plus TS, Supervisor Engine III, and Supervisor Engine IV, bandwidth can be configured on these ports only:

- Uplink ports on supervisor engines
- Ports on the WS-X4306-GB GBIC module
- Ports on the WS-X4506-GB-T CSFP module
- The 2 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first 2 ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module

For systems using Supervisor Engine V, bandwidth can be configured on all ports (10/100 Fast Ethernet, 10/100/1000BASE-T, and 1000BASE-X).

Strict Priority / Low Latency Queueing

You can configure transmit queue 3 on each port with higher priority using the **priority high** tx-queue configuration command in the interface configuration mode. When transmit queue 3 is configured with higher priority, packets in transmit queue 3 are scheduled ahead of packets in other queues.

When transmit queue 3 is configured at a higher priority, the packets are scheduled for transmission before the other transmit queues only if it has not met the allocated bandwidth sharing configuration. Any traffic that exceeds the configured shape rate is queued and transmitted at the configured rate. If the burst of traffic, exceeds the size of the queue, packets are dropped to maintain transmission at the configured shape rate.

Traffic Shaping

Traffic Shaping provides the ability to control the rate of outgoing traffic in order to make sure that the traffic conforms to the maximum rate of transmission contracted for it. Traffic that meets certain profile can be shaped to meet the downstream traffic rate requirements to handle any data rate mismatches.

Each transmit queue can be configured to transmit a maximum rate using the **shape** command. The configuration allows you to specify the maximum rate of traffic. Any traffic that exceeds the configured shape rate is queued and transmitted at the configured rate. If the burst of traffic exceeds the size of the queue, packets are dropped to maintain transmission at the configured shape rate.

Packet Modification

A packet is classified, policed, and queued to provide QoS. Packet modifications can occur during this process:

- For IP packets, classification involves assigning a DSCP to the packet. However, the packet is not modified at this stage; only an indication of the assigned DSCP is carried along. The reason for this is that QoS classification and ACL lookup occur in parallel, and it is possible that the ACL specifies that the packet should be denied and logged. In this situation, the packet is forwarded with its original DSCP to the CPU, where it is again processed through ACL software.
- For non-IP packets, classification involves assigning an internal DSCP to the packet, but because there is no DSCP in the non-IP packet, no overwrite occurs. Instead, the internal DSCP is used both for queueing and scheduling decisions and for writing the CoS priority value in the tag if the packet is being transmitted on either an ISL or 802.1Q trunk port.
- During policing, IP and non-IP packets can have another DSCP assigned to them (if they are out of profile and the policer specifies a markdown DSCP). Once again, the DSCP in the packet is not modified, but an indication of the marked-down value is carried along. For IP packets, the packet modification occurs at a later stage.

Note

If you are running Supervisor Engines II-Plus, II-Plus-10GE, IV, V, V-10GE, or using a ME Catalyst 4900, Catalyst 4900, or Catalyst 4900-10GE series switch, you must enter the **qos rewrite ip dscp** command to enable update of packets and DSCP/ToS fields based on the switch's QoS policies.

Per Port Per VLAN QoS

Per-port per-VLAN QoS (PVQoS) offers differentiated quality-of-services to individual VLANs on a trunk port. It enables service providers to rate limit individual VLAN-based services on each trunk port to a business or a residence. In an enterprise Voice-over-IP environment, it can be used to rate limit voice VLAN even if an attacker impersonates an IP phone. A per-port per-VLAN service policy can be separately applied to either ingress or egress traffic.

QoS and Software Processed Packets

The Catalyst 4500 platform does not apply the QoS marking or policing configuration for any packets that are forwarded or generated by the Cisco IOS software. This means that any input or output QoS policy configured on the port or VLAN is not applied to packets if the Cisco IOS is forwarding or generating packets.

However, Cisco IOS marks all the generated control packets appropriately and uses the internal IP DSCP to determine the transmit queue on the output transmission interface. For IP packets, the internal IP DSCP is the IP DSCP field in the IP packet. For non-IP packets, Cisco IOS assigns a packet priority internally and maps it to an internal IP DSCP value.

Cisco IOS assigns an IP precedence of 6 to routing protocol packets on the control plane. As noted in RFC 791, "The Internetwork Control designation is intended for use by gateway control originators only." Specifically, Cisco IOS marks the following IP-based control packets: Open Shortest Path First (OSPF), Routing Information Protocol (RIP), Enhanced Interior Gateway Routing Protocol (EIGRP) hellos, and keepalives. Telnet packets to and from the router also receive an IP precedence value of 6. The assigned value remains with the packets when the output interface transmits them into the network.

For Layer 2 control protocols, the software assigns an internal IP DSCP. Typically, Layer 2 control protocol packets are assigned an internal DSCP value of 48 (corresponding to an IP precedence value of 6).

The internal IP DSCP is used to determine the transmit queue to which the packet is enqueued on the transmission interface. See "Configuring Transmit Queues" on page 50 for details on how to configure the DSCP to transmit queues.

The internal IP DSCP is also used to determine the transmit CoS marking if the packet is transmitted with a IEEE 802.1q or ISL tag on a trunk interface. See "Configuring the DSCP-to-CoS Map" on page 55 for details on how to configure the DSCP to CoS mapping.

Configuring QoS on Supervisor Engines II-Plus, II+10GE, IV, V, V-10GE, 4924, 4948, and 4948-10GE

Before configuring QoS, you must have a thorough understanding of these items:

- The types of applications used and the traffic patterns on your network.
- Traffic characteristics and needs of your network. Is the traffic bursty? Do you need to reserve bandwidth for voice and video streams?
- Bandwidth requirements and speed of the network.
- Location of congestion points in the network.

These sections describe how to configure QoS on the Catalyst 4000 family switch:

- [Default QoS Configuration, page 37-19](#)
- [Configuration Guidelines, page 37-20](#)
- [Enabling QoS Globally, page 37-21](#)
- [Enabling IP DSCP Rewrite, page 37-21](#)

Default QoS Configuration

[Table 37-2](#) shows the QoS default configuration.

Table 37-2 QoS Default Configuration

Feature	Default Value
Global QoS configuration	Disabled
Interface QoS configuration (port based)	Enabled when QoS is globally enabled
Interface CoS value	0
Interface DSCP value	0
CoS to DSCP map (DSCP set from CoS values)	CoS 0 = DSCP 0 CoS 1 = DSCP 8 CoS 2 = DSCP 16 CoS 3 = DSCP 24 CoS 4 = DSCP 32 CoS 5 = DSCP 40 CoS 6 = DSCP 48 CoS 7 = DSCP 56
DSCP to CoS map (CoS set from DSCP values)	DSCP 0–7 = CoS 0 DSCP 8–15 = CoS 1 DSCP 16–23 = CoS 2 DSCP 24–31 = CoS 3 DSCP 32–39 = CoS 4 DSCP 40–47 = CoS 5 DSCP 48–55 = CoS 6 DSCP 56–63 = CoS 7
Marked-down DSCP from DSCP map (Policed-DSCP)	Marked-down DSCP value equals original DSCP value (no markdown)
Policers	None
Policy maps	None
Transmit queue sharing	1/4 of the link bandwidth
Transmit queue size	1/4 of the transmit queue entries for the port. The transmit queue size of a port depends on the type of port, ranging from 240 packets per transmit queue to 1920 packets per transmit queue.
Transmit queue shaping	None

Table 37-2 QoS Default Configuration (continued)

Feature	Default Value
DCSP-to-Transmit queue map	DSCP 0–15 Queue 1 DSCP 16–31 Queue 2 DSCP 32–47 Queue 3 DSCP 48–63 Queue 4
High priority transmit queue	Disabled
With QoS disabled	
Interface trust state	Trust DSCP
With QoS enabled	With QoS enabled and all other QoS parameters at default values, QoS sets IP DSCP to zero and Layer 2 CoS to zero in all traffic transmitted.
Interface trust state	Untrusted

Configuration Guidelines

Before beginning the QoS configuration, you should be aware of this information:

- If you have EtherChannel ports configured on your switch, you must configure QoS classification and policing on the EtherChannel. The transmit queue configuration must be configured on the individual physical ports that comprise the EtherChannel.
- If the ip fragments match the source and destination configured in the ACL used to classify the traffic for quality of service, but do not match the layer 4 port numbers in the ACL, they are still matched with the ACL and may get prioritized. If the desired behavior is to give best effort service to ip fragments, following two ACEs should be added to the ACL used to classify the traffic.

```
access-list xxx deny udp any any fragments
access-list xxx deny tcp any any fragments
```

- It is not possible to match IP options against configured IP extended ACLs to enforce QoS. These packets are sent to the CPU and processed by software. IP options are denoted by fields in the IP header.
- Control traffic (such as spanning-tree BPDUs and routing update packets) received by the switch are subject to all ingress QoS processing.
- You cannot use **set** commands in policy maps if ip routing is disabled (enabled by default).
- On a dot1q tunnel port, only Layer 2 match criteria can be applied to tagged packets. However, all match criteria can be applied for untagged packets.
- On a trunk port, only Layer 2 match criteria can be applied to packets with multiple 802.1q tags.

Note

QoS processes both unicast and multicast traffic.

Enabling QoS Globally

To enable QoS globally, perform this task:

	Command	Purpose
Step 1	Switch# conf terminal	Enter configuration mode.
Step 2	Switch(config)# qos	Enables QoS on the switch. Use the no qos command to globally disable QoS.
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show qos	Verifies the configuration.

This example shows how to enable QoS globally and verify the configuration:

```
Switch# conf terminal
Switch(config)# qos
Switch(config)# end
Switch#
Switch# show qos
  QoS is enabled globally

Switch#
```

Enabling IP DSCP Rewrite

You must enter the **qos rewrite ip dscp** command to enable update of packets cos, DSCP/ToS fields based on the switch's QoS policies.

To enable IP DSCP rewrite, perform this task:

	Command	Purpose
Step 1	Switch# conf terminal	Enter configuration mode.
Step 2	Switch(config)# [no] qos rewrite ip dscp	Enables IP DSCP rewrite on the switch. Use the no command to disable IP DSCP rewrite
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show qos	Verifies the configuration.

This example shows how to enable IP DSCP rewrite and to verify the configuration:

```
Switch# conf terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# qos rewrite ip dscp
Switch(config)# end
Switch# show qos
  QoS is enabled globally
  IP header DSCP rewrite is enabled

Switch#
```

**Note**

The **qos rewrite ip dscp** command is not supported on the Supervisor Engine 6-E and Catalyst 4900M chassis.

If you disable IP DSCP rewrite and enable QoS globally, the following events occur:

- The ToS byte on the IP packet is not modified.
- Marked and marked-down DSCP values are used for queueing.
- The internally derived DSCP (as per the trust configuration on the interface or VLAN policy) is used for transmit queue and Layer 2 CoS determination. The DSCP is not rewritten on the IP packet header.

If you disable QoS, the DSCP of the incoming packet are preserved and are not rewritten.

Configuring a Trusted Boundary to Ensure Port Security

In a typical network, you connect a Cisco IP phone to a switch port as discussed in [Chapter 38, “Configuring Voice Interfaces.”](#) Traffic sent from the telephone to the switch is typically marked with a tag that uses the 802.1Q header. The header contains the VLAN information and the class of service (CoS) 3-bit field, which determines the priority of the packet. For most Cisco IP phone configurations, the traffic sent from the telephone to the switch is trusted to ensure that voice traffic is properly prioritized over other types of traffic in the network. By using the **qos trust cos** interface configuration command, you can configure the switch port to which the telephone is connected to trust the CoS labels of all traffic received on that port.

**Note**

Starting with Cisco IOS Release 12.2(31)SG, Supervisor Engine V-10GE enables you to classify traffic based on packet's IP DSCP value irrespective of the port trust state. Because of this, even when a Cisco IP phone is not detected, data traffic can be classified based on IP DSCP values. Output queue selection is not impacted by this new behavior. It is still based on the incoming port trust configuration. For information on configuring transmit queues, refer to the [“Configuring Transmit Queues” section on page 37-50](#).

In some situations, you also might connect a PC or workstation to the IP phone. In this case, you can use the **switchport priority extend cos** interface configuration command to configure the telephone through the switch CLI to override the priority of the traffic received from the PC. With this command, you can prevent a PC from taking advantage of a high-priority data queue.

However, if a user bypasses the telephone and connects the PC directly to the switch, the CoS labels generated by the PC are trusted by the switch (because of the trusted CoS setting) and can allow misuse of high-priority queues. The trusted boundary feature solves this problem by using the CDP to detect the presence of a Cisco IP phone (such as the Cisco IP Phone 7910, 7935, 7940, and 7960) on a switch port.

**Note**

If CDP is not running on the switch globally or on the port in question, trusted boundary does not work.

When you configure trusted boundary on a port, trust is disabled. Then, when a phone is plugged in and detected, trust is enabled. (It may take a few minutes to detect the phone.) Now, when a phone is unplugged (and not detected), the trusted boundary feature disables the trusted setting on the switch port and prevents misuse of a high-priority queue.

**Note**

On a given port, the Cisco IP phone discovery information is not maintained on the standby supervisor engine. When the standby engine becomes active, it rediscovers the Cisco IP phone thru CDP. So, for a short time, the port will not be in the trust state after the SSO switchover.

To enable trusted boundary on a port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode, and specifies the interface connected to the IP phone. Valid interfaces include physical interfaces.
Step 3	Switch(config)# qos trust [cos dscp]	Configures the interface to trust the CoS value in received traffic. By default, the port is not trusted.
Step 4	Switch(config)# qos trust device cisco-phone	Specifies that the Cisco IP phone is a trusted device. You cannot enable both trusted boundary and auto-QoS (auto qos voip interface configuration command) at the same time; they are mutually exclusive.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show qos interface <i>interface-id</i>	Verifies your entries.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable the trusted boundary feature, use the **no qos trust device cisco-phone** interface configuration command.

Enabling Dynamic Buffer Limiting

**Note**

Supervisor Engine 6-E and Catalyst 4900M support DBL through the MQC CLI, but not with the older *qos dbl* CLI.

Dynamic Buffer Limiting (DBL) provides active queue management on Cat4500 platforms. (Refer to [“Active Queue Management”](#) section on page 37-15 for details.)

Through “selective” DBL, you can select the flows that would be subjected (or would not be subjected) to the DBL algorithm. You can enable DBL globally, on specific IP DSCP values, or on specific CoS values.

The following tasks are discussed:

- [Enabling DBL Globally, page 37-24](#)
- [Selectively Enable DBL, page 37-24](#)

Enabling DBL Globally

To enable DBL globally on the switch, perform this task:

	Command	Purpose
Step 1	Switch(config)# qos db1	Enables DBL on the switch. Use the no qos db1 command to disable AQM.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show qos db1	Verifies the configuration.

This example shows how to enable DBL globally and verify the configuration:

```
Switch# configure terminal
Switch(config)# qos db1
Global DBL enabled
Switch(config)# end
Switch# show qos db1
  QoS is enabled globally
  DBL is enabled globally on DSCP values:
    0-63
  DBL flow includes vlan
  DBL flow includes layer4-ports
  DBL does not use ecn to indicate congestion DBL exceed-action probability: 15% DBL max
  credits: 15 DBL aggressive credit limit: 10 DBL aggressive buffer limit: 2 packets
Switch#
```

You can enable DBL on the egress interface direction by applying a service-policy:

```
Switch# conf terminal
Switch(config)# policy-map db1
Switch(config-pmap)# class class-default
Switch(config-pmap-c)# db1
Switch(config-pmap-c)# end
Switch#
00:08:12: %SYS-5-CONFIG_I: Configured from console by console
Switch# conf terminal
Switch(config)# int gig 1/2
Switch(config-if)# service-policy output db1
Switch(config-if)# end
Switch#
```

Selectively Enable DBL

Note

Selective DBL is not supported on Supervisor Engine 6-E and Catalyst 4900M.

DSCP values enable you to selectively apply DBL for IP Packets only (single or untagged). (Refer to the [“Enable DBL on Specific IP DSCP Values”](#) section on page 37-25.) To selectively apply DBL for non-IP packets or double-tagged packets (like Q-in-Q), you must use COS values as in the following section. (Refer to the [“Enable DBL on Specific CoS Values”](#) section on page 37-26.)

You can do the following:

- [Enable DBL on Specific IP DSCP Values, page 37-25](#)
- [Enable DBL on Specific CoS Values, page 37-26](#)

Enable DBL on Specific IP DSCP Values

DBL action is performed on transmit queues (4 per interface). You govern the mapping from IP DSCP to transmit queues with the **qos map dscp dscp-values to tx-queue queue-id** command. (Refer to [“Configuring Transmit Queues”](#) section on page 37-50 for details on how to do this.)

To enable DBL on specific IP DSCP values, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] qos dbl dscp-based <value, value_range>	Enables DBL on specific IP DSCP values.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show qos dbl	Verifies the configuration.

This example shows how to selectively enable DBL on the DSCP values 1 through 10:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos dbl dscp-based 1-10
Switch(config)# end
Switch# show qos dbl
QOS is enabled globally
DBL is enabled globally on DSCP values:
    1-10
DBL flow includes vlan
DBL flow includes layer4-ports
DBL does not use ecn to indicate congestion DBL exceed-action probability: 15%
DBL max credits: 15
DBL aggressive credit limit: 10
DBL aggressive buffer limit: 2 packets
Switch#
```

This example shows how to selectively disable DBL on DSCP values 1 through 10 and to verify the configuration:

```
Switch# configure terminal
Switch(config)# no qos dbl dscp-based 1-5, 7
Switch(config)# end
Switch# show qos dbl
QOS is enabled globally
DBL is enabled globally on DSCP values:
    6,8-10
DBL flow includes vlan
DBL flow includes layer4-ports
DBL does not use ecn to indicate congestion DBL exceed-action probability: 15% DBL max
credits: 15 DBL aggressive credit limit: 10 DBL aggressive buffer limit: 2 packets
Switch#
```

Although you apply DBL based on class attributes other than DSCP, you still need to attach a policy-map to an egress interface ([“Configuring Policy-Map Class Actions”](#) section on page 37-32).

Provided the value has been set according to your network policies, you must configure “trust DSCP” on the ingress interface of the aggressive flow that DBL will throttle:

```
Interface <ingress>
  qos trust dscp
```

Enable DBL on Specific CoS Values

You might need to use COS values to selectively applying DBL if you intend to use non-IP packets or double-tagged packets (for example, Q-in-Q).

For single-tagged IP packets, use the following approach. Specify the global **qos db1** dscp-based command as shown in the [“Enable DBL on Specific IP DSCP Values”](#) section on page 37-25).

```
Interface <ingress>
  switchport mode trunk
  qos trust cos
```

For non-IP packets or double-tagged packets, use the following method:

	Command	Purpose
Step 1	Switch(config)# qos db1	Enables DBL globally.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch(config)# class-map cos	Defines a traffic class.
Step 4	Switch(config-cmap)# match cos x y	Specifies CoS values used as match criteria.
Step 5	Switch(config-cmap)# exit	Returns to global configuration mode.
Step 6	Switch(config)# policy-map cos	Creates a policy map with a user-specified name.
Step 7	Switch(config-pmap)# class cos	Specifies the class map to be used by the policy map.
Step 8	Switch(config-pmap-c)# dbl	Enables DBL on the policy.
Step 9	Switch(config-pmap-c)# end	Returns to EXEC mode.
Step 10	Switch# show policy-map cos	Verifies configuration.
Step 11	Switch# configure terminal	Enters global configuration mode.
Step 12	Switch(config)# interface gigabitEthernet 1/20	Applies the configuration to an interface.
Step 13	Switch(config-if)# service-policy output cos	Attaches the policy map to the interface.
Step 14	Switch# show policy-map interface	Verifies the configuration.

Note

For more details on using CoS Mutation, refer to the [“Configuring CoS Mutation”](#) section on page 37-37.

To selectively enable DBL on CoS values 2 and 3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos db1
Switch(config)# end
Switch# configure terminal
Switch(config)# class-map cos
Switch(config-cmap)# match cos 2 3
Switch(config-cmap)# exit
Switch(config)# policy-map cos
Switch(config-pmap)# class cos
Switch(config-pmap-c)# dbl
Switch(config-pmap-c)# end
Switch# show policy-map cos
  Policy Map cos
    Class cos
      dbl
```

```

Switch# configure terminal
Switch(config)# interface gigabitEthernet 1/20
Switch(config-if)# service-policy output cos
Switch# show policy-map interface
GigabitEthernet1/20

Service-policy output: cos

Class-map: cos (match-all)
  0 packets
  Match: cos 2 3
  dbl

Class-map: class-default (match-any)
  0 packets
  Match: any
  0 packets

```

Creating Named Aggregate Policers

To create a named aggregate policer, perform this task:

Command	Purpose
<pre> Switch(config)# qos aggregate-policer <i>policer_name</i> rate burst [[conform-action {transmit drop}] [exceed-action {transmit drop policed-dscp-transmit}]] </pre>	Creates a named aggregate policer.

An aggregate policer can be applied to one or more interfaces. However, if you apply the same policer to the input direction on one interface and to the output direction on a different interface, then you have created the equivalent of two different aggregate policers in the switching engine. Each policer has the same policing parameters, with one policing the ingress traffic on one interface and the other policing the egress traffic on another interface. If an aggregate policer is applied to multiple interfaces in the same direction, then only one instance of the policer is created in the switching engine.

Similarly, an aggregate policer can be applied to a port or to a VLAN. If you apply the same aggregate policer to a port and to a VLAN, then you have created the equivalent of two different aggregate policers in the switching engine. Each policer has the same policing parameters, with one policing the traffic on the configured port and the other policing the traffic on the configured VLAN. If an aggregate policer is applied to only ports or only VLANs, then only one instance of the policer is created in the switching engine.

In effect, if you apply a single aggregate policer to ports and VLANs in different directions, then you have created the equivalent of four aggregate policers; one for all ports sharing the policer in input direction, one for all ports sharing the policer in output direction, one for all VLANs sharing the policer in input direction and one for all VLANs sharing the policer in output direction.

When creating a named aggregate policer, note the following:

- The valid range of values for the *rate* parameter is as follows:
 - Minimum—32 kilobits per second
 - Maximum—32 gigabits per second

See the [“Configuration Guidelines” section on page 37-20](#).

- Rates can be entered in bits-per-second, or you can use the following abbreviations:

- k to denote 1000 bps
- m to denote 1000000 bps
- g to denote 1000000000 bps

Note You can also use a decimal point. For example, a rate of 1,100,000 bps can be entered as 1.1m.

- The valid range of values for the *burst* parameter is as follows:
 - Minimum—1 kilobyte
 - Maximum—512 megabytes
- Bursts can be entered in bytes, or you can use the following abbreviation:
 - k to denote 1000 bytes
 - m to denote 1000000 bytes
 - g to denote 1000000000 bytes

Note You can also use a decimal point. For example, a burst of 1,100,000 bytes can be entered as 1.1m.

- Optionally, you can specify a conform action for matched in-profile traffic as follows:
 - The default conform action is **transmit**.
 - Enter the **drop** keyword to drop all matched traffic.

Note When you configure **drop** as the conform action, QoS configures **drop** as the exceed action.

- Optionally, for traffic that exceeds the CIR, you can specify an exceed action as follows:
 - The default exceed action is **drop**.
 - Enter the **policed-dscp-transmit** keyword to cause all matched out-of-profile traffic to be marked down as specified in the markdown map.
 - For no policing, enter the **transmit** keyword to transmit all matched out-of-profile traffic.
- You can enter the **no qos aggregate-policer** *policer_name* command to delete a named aggregate policer.

This example shows how to create a named aggregate policer with a 10 Mbps rate limit and a 1-MB burst size that transmits conforming traffic and marks down out-of-profile traffic.

```
Switch# config terminal
Switch(config)# qos aggregate-policer aggr-1 10000000 1000000 conform-action transmit
exceed-action policed-dscp-transmit
Switch(config)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show qos aggregate-policer aggr-1
Policer aggr-1
  Rate(bps):10000000 Normal-Burst(bytes):1000000
  conform-action:transmit exceed-action:policed-dscp-transmit
  Policymaps using this policer:
```

Switch#

Configuring a QoS Policy

The following subsections describe QoS policy configuration:

- [Overview of QoS Policy Configuration, page 37-29](#)
- [Configuring a Class Map \(Optional\), page 37-29](#)
- [Configuring a Policy Map, page 37-31](#)
- [Attaching a Policy Map to an Interface, page 37-36](#)

Note

QoS policies process both unicast and multicast traffic.

Overview of QoS Policy Configuration

Configuring a QoS policy requires you to configure traffic classes and the policies that will be applied to those traffic classes, and to attach the policies to interfaces using these commands:

- **access-list** (optional for IP traffic—you can filter IP traffic with **class-map** commands):
 - QoS supports these access list types:

Protocol	Numbered Access Lists?	Extended Access Lists?	Named Access Lists?
IP	Yes: 1 to 99 1300 to 1999	Yes: 100 to 199 2000 to 2699	Yes

- See [Chapter 47, “Configuring Network Security with ACLs,”](#) for information about ACLs on the Catalyst 4500 series switches.
- **class-map** (optional)—Enter the **class-map** command to define one or more traffic classes by specifying the criteria by which traffic is classified. (See the [“Configuring a Class Map \(Optional\)” section on page 37-29.](#))
- **policy-map**—Enter the **policy-map** command to define the following for each class of traffic:
 - Internal DSCP source
 - Aggregate or individual policing and marking
- **service-policy**—Enter the **service-policy** command to attach a policy map to an interface.

Configuring a Class Map (Optional)

The following subsections describe class map configuration:

- [Creating a Class Map, page 37-30](#)
- [Configuring Filtering in a Class Map, page 37-30](#)
- [Verifying Class Map Configuration, page 37-31](#)

Enter the **class-map** configuration command to define a traffic class and the match criteria that will be used to identify traffic as belonging to that class. Match statements can include criteria such as an ACL, an IP precedence value, or a DSCP value. The match criteria are defined with one match statement entered within the class-map configuration mode.

Creating a Class Map

To create a class map, perform this task:

Command	Purpose
Switch(config)# [no] class-map [match-all match-any] <i>class_name</i>	Creates a named class map. Use the no keyword to delete a class map.

Configuring Filtering in a Class Map

To configure filtering in a class map, perform one of these tasks:

Command	Purpose
Switch(config-cmap)# [no] match access-group { <i>acl_index</i> name <i>acl_name</i> }	(Optional) Specifies the name of the ACL used to filter traffic. Use the no keyword to remove the statement from a class map. Note Access lists are not documented in this publication. See the reference under access-list in the “Configuring a QoS Policy” section on page 37-29 .
Switch (config-cmap)# [no] match ip precedence <i>ipp_value1</i> [<i>ipp_value2</i> [<i>ipp_valueN</i>]]	(Optional—for IP traffic only) Specifies up to eight IP precedence values used as match criteria. Use the no keyword to remove the statement from a class map.
Switch (config-cmap)# [no] match ip dscp <i>dscp_value1</i> [<i>dscp_value2</i> [<i>dscp_valueN</i>]]	(Optional—for IP traffic only) Specifies up to eight DSCP values used as match criteria. Use the no keyword to remove the statement from a class map.
Switch (config-cmap)# [no] match cos <i>value1</i> [<i>value2</i>] [<i>value3</i>] [<i>value4</i>]	(Optional—for non-IPV4 traffic only) Specifies up to eight CoS values used as match criteria. Use the no keyword to remove the statement from a class map. For information on non-IPV4 traffic, see “Configuration Guidelines” section on page 37-63 .
Switch (config-cmap)# [no] match any	(Optional) Matches any IP traffic or non-IP traffic.
Switch (config-cmap)# match flow ip { source-address destination-address }	(Optional) Treats each flow with a unique IP source address or destination address as a new flow.

Note

Any Input or Output policy that uses a class map with the **match ip precedence** or **match ip dscp** class-map commands, requires that you configure the port on which the packet is received to **trust dscp**. If not, the IP packet DSCP/IP-precedence is not used for matching the traffic; instead, the receiving port's default DSCP is used. Starting with Cisco IOS Release 12.2(31)SG, the Supervisor Engine V-10GE enables you to classify traffic based on packet's IP DSCP value irrespective of port trust state.

**Note**

With Cisco IOS Release 12.2(31), the Catalyst 4500 series switch supports Match CoS.

**Note**

The interfaces on the Catalyst 4000 family switch do not support the **match classmap**, **match destination-address**, **match input-interface**, **match mpls**, **match not**, **match protocol**, **match qos-group**, and **match source-address** keywords.

Verifying Class Map Configuration

To verify class-map configuration, perform this task:

	Command	Purpose
Step 1	Switch (config-cmap)# end	Exits configuration mode.
Step 2	Switch# show class-map <i>class_name</i>	Verifies the configuration.

This example shows how to create a class map named *ipp5* and how to configure filtering to match traffic with IP precedence 5:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map ipp5
Switch(config-cmap)# match ip precedence 5
Switch(config-cmap)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show class-map ipp5
Class Map match-all ipp5 (id 1)
  Match ip precedence 5

Switch#
```

This example shows how to configure match CoS for non-IPV4 traffic and how to configure filtering to match traffic with CoS value of 5:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map maptwo
Switch(config-cmap)# match cos 5
Switch(config-cmap)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show class-map maptwo
Class Map match-all maptwo (id 1)
  Match cos 5

Switch#
```

Configuring a Policy Map

You can attach only one policy map to an interface. Policy maps can contain one or more policy-map classes, each with different match criteria and policers.

Configure a separate policy-map class in the policy map for each type of traffic that an interface receives. Put all commands for each type of traffic in the same policy-map class. QoS does not attempt to apply commands from more than one policy-map class to matched traffic.

The following sections describe policy-map configuration:

- [Creating a Policy Map, page 37-32](#)
- [Configuring Policy-Map Class Actions, page 37-32](#)

Creating a Policy Map

To create a policy map, perform this task:

Command	Purpose
Switch(config)# [no] policy-map <i>policy_name</i>	Creates a policy map with a user-specified name. Use the no keyword to delete the policy map.

Configuring Policy-Map Class Actions

These sections describe policy-map class action configuration:

- [Configuring the Policy-Map Marking State, page 37-32](#)
- [Configuring the Policy-Map Class Trust State, page 37-32](#)
- [Configuring the Policy Map Class DBL State, page 37-33](#)
- [Configuring Policy-Map Class Policing, page 37-33](#)
- [Using a Named Aggregate Policer, page 37-33](#)
- [Configuring a Per-Interface Policer, page 37-34](#)

Configuring the Policy-Map Marking State

To configure the policy map to mark the IP precedence or dscp of a packet, perform this task:

Command	Purpose
Switch(config-pmap-c)# [no] set ip [precedence <i>prec_value</i> dscp <i>dscp_value</i>	Configures the policy-map marking state, which decides the internal DSCP of the packet for subsequent processing. Use the no keyword to clear a configured value and return to the default.

Configuring the Policy-Map Class Trust State

To configure the policy-map class trust state, perform this task:

Command	Purpose
Switch(config-pmap-c) # [no] trust { cos dscp }	Configures the policy-map class trust state, which selects the value that QoS uses as the source of the internal DSCP value (see the “Internal DSCP Values” section on page 37-14). Use the no keyword to clear a configured value and return to the default.

When configuring the policy-map class trust state, note the following:

- You can enter the **no trust** command to use the trust state configured on the ingress interface (this is the default).
- With the **cos** keyword, QoS sets the internal DSCP value from received or interface CoS.
- With the **dscp** keyword, QoS uses received DSCP.

Configuring the Policy Map Class DBL State

To configure the policy map class DBL state, perform this task:

Command	Purpose
Switch(config-pmap-c) # [no] dbl	Configures the policy-map class DBL state, which tracks the queue length of traffic flows (see the “Active Queue Management” section on page 37-15). Use the no keyword to clear an DBL value and return to the default.

When configuring the policy-map class DBL state, note the following:

- Any class that uses a named aggregate policer must have the same DBL configuration to work.

Configuring Policy-Map Class Policing

These sections describe configuration of policy-map class policing:

- [Using a Named Aggregate Policer, page 37-33](#)
- [Configuring a Per-Interface Policer, page 37-34](#)

Using a Named Aggregate Policer

To use a named aggregate policer (see the [“Creating Named Aggregate Policers”](#) section on page 37-27), perform this task:

Command	Purpose
Switch(config-pmap-c) # [no] police aggregate <i>aggregate_name</i>	Uses a previously defined aggregate policer. Use the no keyword to delete the policer from the policy map class.

Configuring a Per-Interface Policer

To configure a per-interface policer (see the [“Policing and Marking” section on page 37-10](#)), perform this task:

Command	Purpose
Switch(config-pmap-c)# [no] police rate burst [[conform-action { transmit drop }] [exceed-action { transmit drop policed-dscp-transmit }]	Configures a per-interface policer. Use the no keyword to delete a policer from the policy map class.

When configuring a per-interface policer, note the following:

- The valid range of values for the *rate* parameter is as follows:
 - Minimum—32 kilobits per second, entered as 32000
 - Maximum—32 gigabits per second, entered as 32000000000

Note See the [“Configuration Guidelines” section on page 37-20](#).

- Rates can be entered in bits-per-second, or you can use the following abbreviations:
 - k to denote 1000 bps
 - m to denote 1000000 bps
 - g to denote 1000000000 bps

Note You can also use a decimal point. For example, a rate of 1,100,000 bps can be entered as 1.1m.

- The valid range of values for the *burst* parameter is as follows:
 - Minimum—1 kilobyte
 - Maximum—512 megabytes
- Bursts can be entered in bytes, or you can use the following abbreviation:
 - k to denote 1000 bytes
 - m to denote 1000000 bytes
 - g to denote 1000000000 bytes

Note You can also use a decimal point. For example, a burst of 1,100,000 bytes can be entered as 1.1m.

- Optionally, you can specify a conform action for matched in-profile traffic as follows:
 - The default conform action is **transmit**.
 - You can enter the **drop** keyword to drop all matched traffic.
- Optionally, for traffic that exceeds the CIR, you can enter the **policed-dscp-transmit** keyword to cause all matched out-of-profile traffic to be marked down as specified in the markdown map. See [“Configuring the Policed-DSCP Map” section on page 37-54](#).

- For no policing, you can enter the **transmit** keyword to transmit all matched out-of-profile traffic.

This example shows how to create a policy map named *ipp5-policy* that uses the class map named *ipp5*. The class map *ipp5* is configured to rewrite the packet precedence to 6 and to aggregate police the traffic that matches IP precedence value of 5:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# policy-map ipp5-policy
Switch(config-pmap)# class ipp5
Switch(config-pmap-c)# set ip precedence 6
Switch(config-pmap-c)# dbl
Switch(config-pmap-c)# police 2000000000 2000000 conform-action transmit exceed-action
policed-dscp-transmit
Switch(config-pmap-c)# end
```

This example shows how to create a policy map named *cs2-policy* that uses class map named *cs2*. The class map *cos5* is configured to match on CoS 5 and to aggregate policing the traffic:

```
Switch(config)# class-map cs2
Switch(config-cmap)# match cos 5
Switch(config-cmap)# exit

Switch(config)# policy-map cs2-policy
Switch(config-pmap)# class cs2
police 2000000000 2000000 conform-action transmit exceed-action policed-dscp-transmit

Switch(config)# int g5/1
Switch(config-if)# service-policy input cs2-policy
Switch(config-if)# end

Switch# sh class-map cs2
Class Map match-all cs2 (id 2)
Match cos 5

Switch# sh policy-map cs2-policy
Policy Map cs2-policy
Class cs2
police 2000000000 bps 2000000 byte conform-action transmit exceed-action
policed-dscp-transmit Switch#
```

Verifying Policy-Map Configuration

To verify policy-map configuration, perform this task:

	Command	Purpose
Step 1	Switch(config-pmap-c) # end	Exits policy-map class configuration mode.
		Note Enter additional class commands to create additional classes in the policy map.
Step 2	Switch# show policy-map <i>policy_name</i>	Verifies the configuration.

This example shows how to verify the configuration:

```
Switch# show policy-map ipp5-policy
show policy ipp5-policy
Policy Map ipp5-policy
class ipp5
set ip precedence 6
```

```

    dbl
    police 2000000000 2000000 conform-action transmit exceed-action
    policed-dscp-transmit
Switch#

```

Attaching a Policy Map to an Interface

To attach a policy map to an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i> }	Selects the interface to configure.
Step 2	Switch(config-if)# [no] service-policy input <i>policy_map_name</i>	Attaches a policy map to the input direction of the interface. Use the no keyword to detach a policy map from an interface.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show policy-map interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet } <i>slot/interface</i> }	Verifies the configuration.

Note

You cannot enable marking commands on an interface until IP routing is enabled globally. If IP routing is disabled globally and you try to configure the service policy on an interface, the configuration is accepted but it does not take effect. You are prompted with the message: “Set command will not take effect since CEF is disabled. Please enable IP routing and CEF globally.” To enable IP routing globally, issue the **ip routing** and **ip cef global** configuration commands. After you do this, the marking commands take effect.

This example shows how to attach the policy map named *pmap1* to Fast Ethernet interface 5/36 and to verify the configuration:

```

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/36
Switch(config-if)# service-policy input pmap1
Switch(config-if)# end
Switch# show policy-map interface fastethernet 5/36
FastEthernet6/1

  service-policy input:p1

    class-map:c1 (match-any)
      238474 packets
      match:access-group 100
        38437 packets
      police:aggr-1
        Conform:383934 bytes Exceed:949888 bytes

    class-map:class-default (match-any)
      0 packets
      match:any
        0 packets
Switch#

```

Configuring CoS Mutation

Service providers providing Layer 2 VPNs carry double tagged or Q in Q traffic with the outer tag representing service provider's VLAN and the inner tag representing the customer's VLAN. Differentiated levels of service can be provided inside the SP network based on the CoS present in the outer tag.

By using CoS Mutation on a dot1q tunnel port, the CoS value on the outer tag of dot1q tunneled packets entering the provider core network can be derived from the CoS of the customer VLAN tag. This allows providers to preserve customer QoS semantics through their network.

CoS mutation is achieved through explicit user configuration to match on specific incoming CoS values and specifying the internal DSCP that is associated for matched packets. This internal DSCP gets converted to CoS through DSCP-CoS mapping during exit from the switch and is the CoS value that gets marked on the outer VLAN tag.

During the process, the CoS in inner tag is preserved and is carried across in the service provider's network.

The following example shows how a policy-map preserves customer VLAN IDs and CoS values throughout the network:

```
Class Map match-any c0
  Match cos 0

Class Map match-any c1
  Match cos 1

Class Map match-any c2
  Match cos 2

Class Map match-any c3
  Match cos 3

Class Map match-any c4
  Match cos 4

Class Map match-any c5
  Match cos 5

Class Map match-any c6
  Match cos 6

Class Map match-any c7
  Match cos 7

Policy Map cos_mutation
  Class c0
    set dscp default

  Class c1
    set dscp cs1

  Class c2
    set dscp cs2

  Class c3
    set dscp cs3

  Class c4
    set dscp cs4
```

```

Class c5
  set dscp cs5

Class c6
  set dscp cs6

Class c7
  set dscp cs7

interface GigabitEthernet5/1
  switchport access vlan 100

  switchport mode dot1q-tunnel
  service-policy input cos_mutation

```

Configuring User Based Rate Limiting

User Based Rate Limiting (UBRL) adopts microflow policing capability to dynamically learn traffic flows and rate limit each unique flow to an individual rate. UBRL is available on Supervisor Engine V-10GE with the built-in NetFlow support. UBRL can be applied to ingress traffic on routed interfaces with source or destination flow masks. It can support up to 85,000 individual flows and 511 rates. UBRL is typically used in environments where a per-user, granular rate-limiting mechanism is required; for example, the per-user outbound traffic rate could differ from the per-user inbound traffic rate.

Note

By default, UBRL polices only routed IP traffic. You can use the **ip flow ingress layer2-switched** global command to police switched IP traffic. However, UBRL configuration must remain on a Layer 3 interface. With the UBRL configurations and the **ip flow ingress layer2-switched** global command, you will also be able to police intra-vlan flows. You do not need to enter the **ip flow ingress** command.

A flow is defined as a five-tuple (IP source address, IP destination address, IP head protocol field, Layer 4 source, and destination ports). Flow-based policers enable you to police traffic on a per flow basis. Because flows are dynamic, they require distinguishing values in the class map.

When you specify the **match flow** command with the **source-address** keyword, each flow with a unique source address is treated as a new flow. When you specify the **match flow** command with the **destination-address** keyword, each flow with a unique destination address is treated as a new flow. If the class map used by the policy map has any flow options configured, it is treated as a flow-based policy map. When you specify the **match flow** command with the **ip destination-address ip protocol L4 source-address L4 destination-address** keyword, each flow with unique IP source, destination, protocol, and Layer 4 source and destination address is treated as a new flow.

Note

Microflow is only supported on Supervisor Engine V-10GE.

To configure the flow-based class maps and policy maps, perform this task:

	Command	Purpose
Step 1	Switch(config)# class-map match-all class_name	Creates a named class map.
Step 2	Switch(config-cmap)# match flow ip {source-address ip destination-address ip protocol L4 source-address L4 destination-address destination-address}	Specifies the key fields of the flow.
Step 3	Switch(config-cmap)# end	Exits class-map configuration mode.
Step 4	Switch# show class-map class-name	Verifies the configuration.

Examples

Example 1

This example shows how to create a flow-based class map associated with a source address:

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match flow ip {source-address [ip destination_address ip protocol L4
source-address L4 destination address]}
Switch(config-cmap)# end
Switch#
Switch# show class-map c1
Class Map match-all c1 (id 2)
  Match flow  ip source-address
```

Example 2

This example shows how to create a flow-based class map associated with a destination address:

```
Switch(config)# class-map match-all c1
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# end
Switch#

Switch# show class-map c1
Class Map match-all c1 (id 2)
  Match flow  ip destination-address
```

Example 3

Assume there are two active flows on the Fast Ethernet interface 6/1 with source addresses 192.168.10.20 and 192.168.10.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```
Switch# conf t
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fa6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
```

```

Switch# write memory

Switch# show policy-map interface
FastEthernet6/1

Service-policy input: p1

Class-map: c1 (match-all)
  15432182 packets
  Match: flow ip source-address
  police: Per-interface
    Conform: 64995654 bytes Exceed: 2376965424 bytes

Class-map: class-default (match-any)
  0 packets
  Match: any
    0 packets

```

Example 4

Assume there are two active flows on the Fast Ethernet interface 6/1 with destination addresses of 192.168.20.20 and 192.168.20.21. The following example shows how to maintain each flow to 1 Mbps with an allowed burst value of 9000 bytes:

```

Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip destination-address
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fa6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory

Switch# show policy-map interface
FastEthernet6/1

Service-policy input: p1

Class-map: c1 (match-all)
  2965072 packets
  Match: flow ip destination-address
  police: Per-interface
    Conform: 6105636 bytes Exceed: 476652528 bytes

Class-map: class-default (match-any)
  0 packets
  Match: any
    0 packets

```

Example 5

Assume that there are two active flows on FastEthernet interface 6/1:

SrcIp	DstIp	IpProt	SrcL4Port	DstL4Port
192.168.10.10	192.168.20.20	20	6789	81
192.168.10.10	192.168.20.20	20	6789	21

With the following configuration, each flow is policed to 1000000 bps with an allowed 9000 burst value.

Note

If you use the **match flow ip source-address | destination-address** command, these two flows are consolidated into one flow because they have the same source and destination address.

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# class-map c1
Switch(config-cmap)# match flow ip source-address ip destination-address ip protocol 14
source-port 14 destination-port
Switch(config-cmap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class c1
Switch(config-pmap-c)# police 1000000 9000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface fastEthernet 6/1
Switch(config-if)# service-policy input p1
Switch(config-if)# end
Switch# write memory
Switch# show policy-map interface
FastEthernet6/1

class-map c1
  match flow ip source-address ip destination-address ip protocol 14 source-port 14
  destination-port
!
  policy-map p1
    class c1
      police 1000000 bps 9000 byte conform-action transmit exceed-action drop
!
interface FastEthernet 6/1
  service-policy input p1

Switch# show class-map c1
Class Map match-all c1 (id 2)
  Match flow ip source-address ip destination-address ip protocol 14 source-port 14
  destination-port

Switch# show policy-map p1
Policy Map p1
  Class c1
    police 1000000 bps 9000 byte conform-action transmit exceed-action drop

Switch# show policy-map interface
FastEthernet6/1

Service-policy input: p1

Class-map: c1 (match-all)
  15432182 packets
  Match: flow ip source-address ip destination-address ip protocol 14 source-port 14
  destination-port
  police: Per-interface
    Conform: 64995654 bytes Exceed: 2376965424 bytes
```

```

Class-map: class-default (match-any)
  0 packets
Match: any
  0 packets

```

Configuring Hierarchical Policers

Note

Hierarchical policers are only supported on Supervisor Engine V-10GE.

You can tie flow policers with the existing policers to create dual policing rates on an interface. For example, using dual policing, you can limit all incoming traffic rates on a given interface to 50 Mbps and can limit the rate of each flow that is part of this traffic to 2 Mbps.

You can configure hierarchical policers with the **service-policy** policy-map config command. A policy map is termed *flow based* if the class map it uses matches any of the flow-based match criteria (such as **match flow ip source-address**). Each child policy map inherits all the match access-group commands of the parent.

Note

You can configure only *flow based* policy maps as child policy maps. A parent policy map cannot be a flow-based policy map. Both the child policy map and parent policy map must have **match-all** in their class-map configuration.

To configure a flow based policy map as a child of an individual or aggregate policer, perform this task:

	Command	Purpose
Step 1	Switch(config) # policy-map policy_name	Specifies the individual or aggregate policy-map name.
Step 2	Switch(config-pmap) # class class_name	Specifies the class-map name of this policy map.
Step 3	Switch(config-flow-cache) # service-policy service_policy_name	Specifies the name of the flow-based policy map.

Note

In a hierarchal policer configuration with parent as aggregate policer and child as microflow policer, child microflow policer matched packets report only the packets that are in the profile (that is, match the policing rate). Packets that exceed the policing rate are not reported in the class-map packet match statistics.

This example shows how to create a hierarchical policy map. A policy map with the name *aggregate-policy* has a class map with the name *aggregate-class*. A flow-based policy map with the name *flow-policy* is attached to this policy map as a child policy map.

```

Switch# config terminal
Switch(config) # policy-map aggregate-policy
Switch(config-pmap) # class aggregate-class
Switch(config-pmap-c) # service-policy flow-policy
Switch(config-pmap-c) # end
Switch#

```

In the following example, traffic in the IP address range of 101.237.0.0 to 101.237.255.255 is policed to 50 Mbps. Flows ranging from 101.237.10.0 to 101.237.10.255 are individually policed to a rate of 2 Mbps. This traffic goes through two policers: the aggregate policer and the other flow-based policer.

The following example shows the configuration for this scenario:

```
class-map match-all flow-class
  match flow ip source-address
  match access-group 20
!
class-map match-all aggregate-class
  match access-group 10
!
policy-map flow-policy
  class flow-class
    police 2000000 bps 10000 byte conform-action transmit exceed-action drop
!
policy-map aggregate-policy
  class aggregate-class
    police 50000000 bps 40000 byte conform-action transmit exceed-action drop
    service-policy flow-policy
!
access-list 10 permit 101.237.0.0 0.0.255.255
access-list 20 permit 0.0.10.0 255.255.0.255
```

The following example shows how to verify the configuration:

```
Switch# show policy-map flow-policy
Policy Map flow-policy
  Class flow-class
    police 2000000 bps 10000 byte conform-action transmit exceed-action drop
Switch# show policy-map aggregate-policy
Policy Map aggregate-policy
  Class aggregate-class
    police 50000000 bps 40000 byte conform-action transmit exceed-action drop
    service-policy flow-policy

Switch# show policy-map interface
FastEthernet6/1
Service-policy input: aggregate-policy

  Class-map: aggregate-class (match-all)
    132537 packets
    Match: access-group 10
    police: Per-interface
      Conform: 3627000 bytes Exceed: 0 bytes

  Service-policy : flow-policy

    Class-map: flow-class (match-all)
      8867 packets
      Match: access-group 20
      Match: flow ip source-address
      police: Per-interface
      Conform: 1649262 bytes Exceed: 59601096 bytes

    Class-map: class-default (match-any)
      0 packets
      Match: any          0 packets

  Class-map: class-default (match-any)
    5 packets
    Match: any          5 packets
```

Enabling Per-Port Per-VLAN QoS

The per-port per-VLAN QoS feature enables you to specify different QoS configurations on different VLANs on a given interface. Typically, you use this feature on trunk or voice VLANs (Cisco IP Phone) ports, as they belong to multiple VLANs.

To configure per-port per-VLAN QoS, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/interface</i> Port-channel <i>number</i>	Selects the interface to configure.
Step 2	Switch(config-if)# vlan-range <i>vlan_range</i>	Specifies the VLANs involved.
Step 3	Switch(config-if-vlan-range)# service-policy { input output } <i>policy-map</i>	Specifies the policy-map and direction.
Step 4	Switch(config-if-vlan-range)# exit	Exits class-map configuration mode.
Step 5	Switch(config-if)# end	Exits configuration interface mode.
Step 6	Switch# show policy-map interface <i>interface_name</i>	Verifies the configuration.

Example 1

Figure 37-5 displays a sample topology for configuring PVQoS. The trunk port gi3/1 is comprised of multiple VLANs (101 and 102). Within a port, you can create your own service policy per VLAN. This policy, performed in hardware, might consist of ingress and egress Policing, trusting DSCP, or giving precedence to voice packet over data.

Figure 37-5 Per-Port Per-VLAN Topology

The following configuration file shows how to perform ingress and egress policing per VLAN using the policy-map P31_QOS applied to port Gigabit Ethernet 3/1:

```

ip access-list 101 permit ip host 1.2.2.2 any
ip access-list 103 permit ip any any

Class-map match-all RT
  match ip access-group 101

Class-map Match all PD
  match ip access-group 103

Policy-map P31_QoS
  Class RT
    Police 200m 16k conform transmit exceed drop
  Class PD
    Police 100m 16k conform transmit exceed drop

Interface Gigabit 3/1
Switchport

Switchport trunk encapsulation dot1q
Switchport trunk allowed vlan 101-102
  Vlan range 101
    Service-policy input P31_QoS
    Service-policy output P31_QoS
  Vlan range 102
    Service-policy input P32_QoS
    Service-policy output P32_QoS

```

Example 2

Let us assume that interface Gigabit Ethernet 6/1 is a trunk port and belongs to VLANs 20, 300-301, and 400. The following example shows how to apply policy-map p1 for traffic in VLANs 20 and 400 and policy map p2 to traffic in VLANs 300 through 301:

```

Switch# configure terminal
Switch(config)# interface gigabitethernet 6/1
Switch(config-if)# vlan-range 20,400
Switch(config-if-vlan-range)# service-policy input p1
Switch(config-if-vlan-range)# exit
Switch(config-if)# vlan-range 300-301
Switch(config-if-vlan-range)# service-policy output p2
Switch(config-if-vlan-range)# end
Switch#

```

Example 3

The following command shows how to display policy-map statistics on VLAN 20 configured on Gigabit Ethernet interface 6/1:

```

Switch# show policy-map interface gigabitethernet 6/1 vlan 20
GigabitEthernet6/1 vlan 20

Service-policy input: p1

Class-map: class-default (match-any)
  0 packets
  Match: any
    0 packets
  police: Per-interface
    Conform: 0 bytes Exceed: 0 bytes

```

Example 4

The following command shows how to display policy-map statistics on all VLANs configured on Gigabit Ethernet interface 6/1:

```
Switch# show policy-map interface gigabitethernet 6/1
GigabitEthernet6/1 vlan 20

  Service-policy input: p1

    Class-map: class-default (match-any)
      0 packets
      Match: any
        0 packets
      police: Per-interface
        Conform: 0 bytes Exceed: 0 bytes

GigabitEthernet6/1 vlan 300

  Service-policy output: p2

    Class-map: class-default (match-any)
      0 packets
      Match: any
        0 packets
      police: Per-interface
        Conform: 0 bytes Exceed: 0 bytes

GigabitEthernet6/1 vlan 301

  Service-policy output: p2

    Class-map: class-default (match-any)
      0 packets
      Match: any
        0 packets
      police: Per-interface
        Conform: 0 bytes Exceed: 0 bytes

GigabitEthernet6/1 vlan 400

  Service-policy input: p1

    Class-map: class-default (match-any)
      0 packets
      Match: any
        0 packets
      police: Per-interface
        Conform: 0 bytes Exceed: 0 bytes
```

Enabling or Disabling QoS on an Interface

The **qos** interface command reenables any previously configured QoS features. The **qos** interface command does not affect the interface queueing configuration.

To enable or disable QoS features for traffic from an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i> }	Selects the interface to configure.
Step 2	Switch(config-if)# [no] qos	Enables QoS on the interface. Use the no keyword to disable QoS on an interface.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show qos interface	Verifies the configuration.

This example shows how to disable QoS on interface VLAN 5:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface vlan 5
Switch(config-if)# no qos
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show qos | begin QoS is disabled
QoS is disabled on the following interfaces:
V15
<...Output Truncated...>
Switch#
```

Configuring VLAN-Based QoS on Layer 2 Interfaces

By default, QoS uses policy maps attached to physical interfaces. For Layer 2 interfaces, you can configure QoS to use policy maps attached to a VLAN. (See the [“Attaching a Policy Map to an Interface” section on page 37-36.](#))

To configure VLAN-based QoS on a Layer 2 interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i>	Selects the interface to configure.
Step 2	Switch(config-if)# [no] qos vlan-based	Configures VLAN-based QoS on a Layer 2 interface. Use the no keyword to disable VLAN-based QoS on an interface.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show qos	Verifies the configuration.

Note

If no input QoS policy is attached to a Layer 2 interface, then the input QoS policy attached to the VLAN (on which the packet is received), if any, is used even if the port is not configured as VLAN-based. If you do not want this default, attach a placeholder input QoS policy to the Layer 2 interface. Similarly, if no output QoS policy is attached to a Layer 2 interface, then the output QoS policy attached to the

VLAN (on which the packet is transmitted), if any, is used even if the port is not configured as VLAN-based. If you do not want this default, attach a placeholder output QoS policy to the layer 2 interface.

This example shows how to configure VLAN-based QoS on Fast Ethernet interface 5/42:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/42
Switch(config-if)# qos vlan-based
Switch(config-if)# end
```

This example shows how to verify the configuration:

```
Switch# show qos | begin QoS is vlan-based
QoS is vlan-based on the following interfaces:
    Fa5/42
Switch#
```

Note

When a layer 2 interface is configured with VLAN-based QoS, and if a packet is received on the port for a VLAN on which there is no QoS policy, then the QoS policy attached to the port, if any is used. This applies for both Input and Output QoS policies.

Configuring the Trust State of Interfaces

This command configures the trust state of interfaces. By default, all interfaces are untrusted.

To configure the trust state of an interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { vlan <i>vlan_ID</i> { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i> }	Selects the interface to configure.
Step 2	Switch(config-if)# [no] qos trust [dscp cos]	Configures the trust state of an interface. Use the no keyword to clear a configured value and return to the default.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show qos	Verifies the configuration.

When configuring the trust state of an interface, note the following:

- You can use the **no qos trust** command to set the interface state to untrusted.
- For traffic received on an ingress interface configured to *trust CoS* using the **qos trust cos** command, the transmit CoS is always the incoming packet CoS (or the ingress interface default CoS if the packet is received untagged).
- When the interface trust state is not configured to *trust dscp* using the **qos trust dscp** command, the security and QoS ACL classification always use the interface DSCP and not the incoming packet DSCP.

- Starting with Cisco IOS Release 12.2(31)SG, the Supervisor Engine V-10GE enables you to classify a packet based on the packet's IP DSCP value irrespective of the port trust state. Packet transmit queuing isn't impacted by this behavior. For information on transmit queues, refer to the [“Configuring Transmit Queues” section on page 37-50](#).

This example shows how to configure Gigabit Ethernet interface 1/1 with the **trust cos** keywords:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# qos trust cos
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show qos interface gigabitethernet 1/1 | include trust
Trust state: trust COS
Switch#
```

Configuring the CoS Value for an Interface

QoS assigns the CoS value specified with this command to untagged frames from ingress interfaces configured as trusted and to all frames from ingress interfaces configured as untrusted.

To configure the CoS value for an ingress interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {fastethernet gigabitethernet} slot/interface Port-channel number}	Selects the interface to configure.
Step 2	Switch(config-if)# [no] qos cos default_cos	Configures the ingress interface CoS value. Use the no keyword to clear a configured value and return to the default.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show qos interface {fastethernet gigabitethernet} slot/interface	Verifies the configuration.

This example shows how to configure the CoS 5 as the default on Fast Ethernet interface 5/24:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/24
Switch(config-if)# qos cos 5
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show qos interface fastethernet 5/24 | include Default COS
Default COS is 5
Switch#
```

Configuring DSCP Values for an Interface

QoS assigns the DSCP value specified with this command to non IPv4 frames received on interfaces configured to trust DSCP and to all frames received on interfaces configured as untrusted.

To configure the DSCP value for an ingress interface, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/interface</i> Port-channel <i>number</i>	Selects the interface to configure.
Step 2	Switch(config-if)# [no] qos dscp <i>default_dscp</i>	Configures the ingress interface DSCP value. Use the no keyword to clear a configured value and return to the default.
Step 3	Switch(config-if)# end	Exits configuration mode.
Step 4	Switch# show qos interface { fastethernet gigabitethernet } <i>slot/interface</i>	Verifies the configuration.

This example shows how to configure the DSCP 5 as the default on Fast Ethernet interface 5/24:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/24
Switch(config-if)# qos dscp 5
Switch(config-if)# end
Switch#
```

This example shows how to verify the configuration:

```
Switch# show qos interface fastethernet 6/1
QoS is enabled globally
Port QoS is enabled
  Port Trust State:CoS
  Default DSCP:0 Default CoS:0

  Tx-Queue   Bandwidth   ShapeRate   Priority   QueueSize
             (bps)        (bps)
  1          31250000 disabled    N/A        240
  2          31250000 disabled    N/A        240
  3          31250000 disabled    normal     240
  4          31250000 disabled    N/A        240
Switch#
```

Configuring Transmit Queues

The following sections describe how to configure transmit queues:

- [Mapping DSCP Values to Specific Transmit Queues, page 37-51](#)
- [Allocating Bandwidth Among Transmit Queues, page 37-52](#)
- [Configuring Traffic Shaping of Transmit Queues, page 37-52](#)
- [Configuring a High Priority Transmit Queue, page 37-53](#)

Depending on the complexity of your network and your QoS solution, you might need to perform all of the procedures in the following sections. However, you will first need to answer the following questions:

- Which packets are assigned (by DSCP value) to each queue?
- What is the size of a transmit queue relative to other queues for a given port?
- How much of the available bandwidth is allotted to each queue?
- What is the maximum rate and burst of traffic that can be transmitted out of each transmit queue?

Independent of the QoS state of an interface, a switch ensures that all the transmit queues are enabled. Because the DSCP values are trusted by default, a switch uses the appropriate transmit queues based on the DSCP to map them. This queue selection is based on the internal DSCP to transmit queue mapping table.

Mapping DSCP Values to Specific Transmit Queues

To map the DSCP values to a transmit queue, perform this task:

	Command	Purpose
Step 1	Switch(config)# [no] qos map dscp dscp-values to tx-queue queue-id	Maps the DSCP values to the transit queue. <i>dscp-list</i> can contain up to 8 DSCP values. The <i>queue-id</i> can range from 1 to 4. Use the no qos map dscp to tx-queue command to clear the DSCP values from the transit queue.
Step 2	Switch(config)# end	Exits configuration mode.
Step 3	Switch# show qos maps dscp tx-queues	Verifies the configuration.

This example shows how to map DSCP values to transit queue 2.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos map dscp 50 to tx-queue 2
Switch(config)# end
Switch#
```

This example shows how to verify the configuration.

```
Switch# show qos maps dscp tx-queue
DSCP-TxQueue Mapping Table (dscp = d1d2)
d1 :d2  0  1  2  3  4  5  6  7  8  9
-----
0 :   02 02 02 01 01 01 01 01 01 01
1 :   01 01 01 01 01 01 02 02 02 02
2 :   02 02 02 02 02 02 02 02 02 02
3 :   02 02 03 03 03 03 03 03 03 03
4 :   03 03 03 03 03 03 03 03 04 04
5 :   04 04 04 04 04 04 04 04 04 04
6 :   04 04 04 04
Switch#
```

Allocating Bandwidth Among Transmit Queues

To configure the transmit queue bandwidth, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface gigabitethernet <i>slot/interface</i>	Selects the interface to configure.
Step 2	Switch(config-if)# tx-queue <i>queue_id</i>	Selects the transmit queue to configure.
Step 3	Switch(config-if-tx-queue)# [no] [bandwidth rate percent percent]	Sets the bandwidth rate for the transmit queue. Use the no keyword to reset the transmit queue bandwidth ratios to the default values.
Step 4	Switch(config-if-tx-queue)# end	Exits configuration mode.
Step 5	Switch# show qos interface	Verifies the configuration.

The bandwidth rate varies with the interface.

For systems using Supervisor Engine II-Plus, Supervisor Engine II-Plus TS, Supervisor Engine III, and Supervisor Engine IV, bandwidth can be configured on these ports only:

- Uplink ports on supervisor engines
- Ports on the WS-X4306-GB GBIC module
- Ports on the WS-X4506-GB-T CSFP module
- The 2 1000BASE-X ports on the WS-X4232-GB-RJ module
- The first 2 ports on the WS-X4418-GB module
- The two 1000BASE-X ports on the WS-X4412-2GB-TX module

For systems using Supervisor Engine V, bandwidth can be configured on all ports (10/100 Fast Ethernet, 10/100/1000BASE-T, and 1000BASE-X).

This example shows how to configure the bandwidth of 1 Mbps on transmit queue 2.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if)# tx-queue 2
Switch(config-if-tx-queue)# bandwidth 1000000
Switch(config-if-tx-queue)# end
Switch#
```

Configuring Traffic Shaping of Transmit Queues

To guarantee that packets transmitted from a transmit queue do not exceed a specified maximum rate, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/interface</i>	Selects the interface to configure.
Step 2	Switch(config-if)# tx-queue <i>queue_id</i>	Selects the transmit queue to configure.

	Command	Purpose
Step 3	Switch(config-if-tx-queue)# [no] [shape rate percent percent]	Sets the transmit rate for the transmit queue. Use the no keyword to clear the transmit queue maximum rate.
Step 4	Switch(config-if-tx-queue)# end	Exits configuration mode.
Step 5	Switch# show qos interface	Verifies the configuration.

This example shows how to configure the shape rate to 1 Mbps on transmit queue 2.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if-tx-queue)# tx-queue 2
Switch(config-if-tx-queue)# shape 1000000
Switch(config-if-tx-queue)# end
Switch#
```

Configuring a High Priority Transmit Queue

To configure transmit queue 3 at a higher priority, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface {fastethernet gigabitethernet} slot/interface	Selects the interface to configure.
Step 2	Switch(config-if)# tx-queue 3	Selects transmit queue 3 to configure.
Step 3	Switch(config-if)# [no] priority high	Sets the transmit queue to high priority. Use the no keyword to clear the transmit queue priority.
Step 4	Switch(config-if)# end	Exits configuration mode.
Step 5	Switch# show qos interface	Verifies the configuration.

This example shows how to configure transmit queue 3 to high priority.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet 1/1
Switch(config-if-tx-queue)# tx-queue 3
Switch(config-if-tx-queue)# priority high
Switch(config-if)# end
Switch#
```

Configuring DSCP Maps

The following sections describes how to configure the DSCP maps. It contains this configuration information:

- [Configuring the CoS-to-DSCP Map, page 37-54](#)
- [Configuring the Policed-DSCP Map, page 37-54](#)
- [Configuring the DSCP-to-CoS Map, page 37-55](#)

All the maps are globally defined and are applied to all ports.

Configuring the CoS-to-DSCP Map

You use the CoS-to-DSCP map to map CoS values in incoming packets to a DSCP value that QoS uses internally to represent the priority of the traffic.

Table 37-3 shows the default CoS-to-DSCP map.

Table 37-3 Default CoS-to-DSCP Map

CoS value	0	1	2	3	4	5	6	7
DSCP value	0	8	16	24	32	40	48	56

If these values are not appropriate for your network, you need to modify them.

To modify the CoS-to-DSCP map, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# qos map cos cos1 ... cos8 to dscp dscp	Modifies the CoS-to-DSCP map. For <i>cos1...cos8</i> , you can enter up to 8 CoS; valid values range from 0 to 7. Separate each CoS value with a space. The <i>dscp</i> range is 0 to 63.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show qos maps cos-dscp	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure the ingress CoS-to-DSCP mapping for CoS 0:

```
Switch# configure terminal
Switch(config)# qos map cos 0 to dscp 20
Switch(config)# end
Switch# show qos maps cos dscp

CoS-DSCP Mapping Table:
CoS:  0   1   2   3   4   5   6   7
-----
DSCP: 20   8  16  24  32  40  48  56
Switch(config)#
```

Note

To return to the default map, use the **no qos cos to dscp** global configuration command.

This example shows how to clear the entire CoS-to-DSCP mapping table:

```
Switch(config)# no qos map cos to dscp
Switch(config)#
```

Configuring the Policed-DSCP Map

You use the policed-DSCP map to mark down a DSCP value to a new value as the result of a policing and marking action.

The default policed-DSCP map is a null map, which maps an incoming DSCP value to the same DSCP value.

To modify the CoS-to-DSCP map, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# qos map dscp policed <i>dscp-list to dscp mark-down-dscp</i>	Modifies the policed-DSCP map. <ul style="list-style-type: none"> For <i>dscp-list</i>, enter up to 8 DSCP values separated by spaces. Then enter the to keyword. For <i>mark-down-dscp</i>, enter the corresponding policed (marked down) DSCP value.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show qos maps dscp policed	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To return to the default map, use the **no qos dscp policed** global configuration command.

This example shows how to map DSCP 50 to 57 to a marked-down DSCP value of 0:

```
Switch# configure terminal
Switch(config)# qos map dscp policed 50 51 52 53 54 55 56 57 to dscp 0
Switch(config)# end
Switch# show qos maps dscp policed
Policed-dscp map:
  d1 : d2 0  1  2  3  4  5  6  7  8  9
-----
  0 :    00 01 02 03 04 05 06 07 08 09
  1 :    10 11 12 13 14 15 16 17 18 19
  2 :    20 21 22 23 24 25 26 27 28 29
  3 :    30 31 32 33 34 35 36 37 38 39
  4 :    40 41 42 43 44 45 46 47 48 49
  5 :    00 00 00 00 00 00 00 00 58 59
  6 :    60 61 62 63
```

Note

In the previous policed-DSCP map, the marked-down DSCP values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the original DSCP; the d2 row specifies the least-significant digit of the original DSCP. The intersection of the d1 and d2 values provides the marked-down value. For example, an original DSCP value of 53 corresponds to a marked-down DSCP value of 0.

Configuring the DSCP-to-CoS Map

You use the DSCP-to-CoS map to generate a CoS value.

Table 37-4 shows the default DSCP-to-CoS map.

Table 37-4 Default DSCP-to-CoS Map

DSCP value	0–7	8–15	16–23	24–31	32–39	40–47	48–55	56–63
CoS value	0	1	2	3	4	5	6	7

If the values above are not appropriate for your network, you need to modify them.

To modify the DSCP-to-CoS map, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] qos map dscp dscp-list to cos cos	Modifies the DSCP-to-CoS map. <ul style="list-style-type: none"> For <i>dscp-list</i>, enter up to 8 DSCP values separated by spaces. Then enter the to keyword. For <i>cos</i>, enter only one CoS value to which the DSCP values correspond. <p>The DSCP range is 0 to 63; the CoS range is 0 to 7.</p> <p>To return to the default map, use the no qos dscp to cos global configuration command.</p>
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show qos maps dscp to cos	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to map DSCP values 0, 8, 16, 24, 32, 40, 48, and 50 to CoS value 0 and to display the map:

```
Switch# configure terminal
Switch(config)# qos map dscp 0 8 16 24 32 40 48 50 to cos 0
Switch(config)# end
Switch# show qos maps dscp cos
Dscp-cos map:
  d1 : d2 0  1  2  3  4  5  6  7  8  9
-----
  0 :    00 00 00 00 00 00 00 00 00 01
  1 :    01 01 01 01 01 01 00 02 02 02
  2 :    02 02 02 02 00 03 03 03 03 03
  3 :    03 03 00 04 04 04 04 04 04 04
  4 :    00 05 05 05 05 05 05 05 00 06
  5 :    00 06 06 06 06 06 07 07 07 07
  6 :    07 07 07 07
```

Note

In the previous DSCP-to-CoS map, the CoS values are shown in the body of the matrix. The d1 column specifies the most-significant digit of the DSCP; the d2 row specifies the least-significant digit of the DSCP. The intersection of the d1 and d2 values provides the CoS value. For example, in the DSCP-to-CoS map, a DSCP value of 08 corresponds to a CoS value of 0.

Enabling Layer 2 Control Packet QoS

Note

Layer 2 Control Packet QoS is *not* supported on Supervisor Engine 6-E and Catalyst 4900M.

This feature solves the problem of high CPU utilization due to the ingress of a large amount of control packets. It does this by invalidating the QoS static entries corresponding to the protocol that you want to control (installed in the QoS CAM).

With this solution, hardware applies the actions corresponding to any user defined service policies that match the Layer 2 control traffic. You can deploy this mode of control through the CLI because the default mode will be the existing one.

You should configure policies to match on the required Layer 2 packets and police them to the desired level. Layer 2 control packets are essentially identified by a destination MAC address. When this feature is enabled on that packet type, if MACs matching the desired control packets and the corresponding class-maps matching these MACs are not already present, they will be auto-generated.

You are only required to use these class-maps in the policy-maps you create to police the control packets. You can then apply the policy-map on a per port, per vlan, or per-port-per-vlan just like any other policy-maps.

To enable Layer 2 Control Packet QoS, perform the following task:

	Command	Purpose
Step 1	Switch# interface t	Enters configuration mode.
Step 2	Switch(config)# qos control-packets [bpdu-range cdp-vtp sstp lldp]	Enables Layer 2 Control Policing. You can specify the packet type that you will enable the feature on. The default is to select all packet types.
Step 3	Switch(config)# end	Exits configuration mode.
Step 4	Switch# show run inc qos control-packets	Verifies the configuration.

The following table lists the types of packets impacted by this feature.

Table 37-5 Packet Type and Actionable Address Range

Type of packet the feature is enabled on	Range of address it acts on
BPDU-range	0180.C200.0000 BPDU 0180.C200.0002 OAM, LACP 0180.C200.0003 Eapol
CDP-VTP	0100.0CCC.CCCC
SSTP	0100.0CCC.CCCD
LLDP	0180.C200.000E

The following example illustrates how to configure Layer 2Control Packet QoS on cdp-vtp packets:

```
Switch# config terminal
Switch(config)# qos control-packets cdp-vtp
Switch(config)# end
Switch# show run | inc qos control-packets
qos control-packets cdp-vtp
```

Note

If you enter **qos control-packet** without specifying any control packet types, the feature is enabled for all of them.

When the feature is enabled on all the packet types, the **qos control-packets** string appears in the output of the **show running** command:

```
Switch# show running | inc qos control-packets
qos control-packets
```

Now, if you disable the feature for sstp packets, you'll observe the following output:

```
Switch# show running | inc qos control-packets
qos control-packets bpd-range
qos control-packets cdp-vtp
```

You can observe the status of the MACL and of the user-configured policies that will likely capture and drop/police the desired control packets with the **show running** and common relative commands.

To disable the feature, issue the **no qos control-packets [bpd-range | cdp-vtp | sstp]** command. For example, to disable the feature on CDP-VTP packets, issue the **no qos control-packets cdp-vtp** command.

Note

When you un-configure this feature for a specified protocol-type, the user- configured policies dealing with that protocol-type are immediately rendered ineffective. To save TCAM resources, you can remove the policies as well as the MACLs and class-maps (auto generated or user defined).

Note

When an interface is in down state, TCAMs are not consumed for RACLs, but are for PACLs.

The following table displays the auto-generated MACLs and class-maps that are created when the feature is enabled on the corresponding packet type.

Table 37-6 *Packet Types and Auto-Generated MACL/Class-Maps*

Packet Type	Auto-Generated MACL/Class-Map
BPDU-range	mac access-list extended system-control-packet-bpdu-range permit any 0180.c200.0000 0000.0000.000c class-map match-any system-control-packet-bpdu-range match access-group name system-control-packet-bpdu-range
SSTP	mac access-list extended system-control-packet-sstp permit any host 0100.0ccc.cccd class-map match-any system-control-packet-sstp match access-group name system-control-packet-sstp
CDP-VTP	mac access-list extended system-control-packet-cdp-vtp permit any host 0100.0ccc.cccc class-map match-any system-control-packet-cdp-vtp match access-group name system-control-packet-cdp-vtp

The following example illustrates how to apply a MACL and policer configuration to BPDUs-range packets:

- Enable the feature on the bpdus-range:

```
qos control-packets bpdus-range
```

- Create the corresponding MACL / class-maps (happens automatically):

```
mac access-list extended system-control-packet-bpdus-range
  permit any 0180.C200.0000 0000.0000.000C
```

```
class-map match-any system-control-packet-bpdus-range
  match access-group name system-control-packet-bpdus-range
```

- Create the policy-map and attach it to the desired interface / VLAN:

```
policy-map police-bpdus
  class system-control-packet-bpdus-range
    police 32000 bps 1000 byte conform-action transmit exceed-action drop

interface GigabitEthernet 1/1
  switchport trunk encapsulation dot1q
  switchport mode trunk
  vlan-range 100
  service-policy input police_bpdus
```

You should not modify the class-maps and MACLs that are generated by the system. Doing so might lead to unexpected behavior when the switch reloads or when the running configuration is updated from a file.

If you need to refine or modify these system generated class-maps or MACLs, you should create user-defined class-maps and MACLs. You can then use the newly created user-defined MACLs / class-maps to accomplish the desired policing.

Note

The only restriction is that user-defined class-map names must begin with the prefix **system-control-packet-**. If the class-map does not begin with **system-control-packet-**, the configured QoS action may not be taken on certain supervisor engines.

Note

There are no restrictions on the names you can use for user-defined MACLs.

For example, here are valid user defined class-maps names to police the control packets:

```
system-control-packet-bpdus1
system-control-packet-control-packet
system-control-packet-bla
```

Creating the user-defined MACLs / class-maps (as the example above) might be useful, for example, if you plan to define different class-maps for EAPOL, OAM, or BPDUs packets because the auto generated class-map `system-control-packet-bpdus-range` will match all of them:

```
mac access-list extended system-control-packet-bpdus
  permit any 0180.c200.0000
class-map match-any system-control-packet-bpdus
  match access-group name system-control-packet-bpdus

mac access-list extended system-control-packet-eapol
  permit any 0180.c200.0003
class-map match-any system-control-packet-eapol
  match access-group name system-control-packet-eapol
```

```

mac access-list extended system-control-packet-oam
    permit any 0180.c200.0002
class-map match-any system-control-packet-oam
    match access-group name system-control-packet-oam

```

Subsequently, you could use these class-maps to define different policers for each, instead of applying a common policer to the system-control-packet-bpdu-range.

Usage Guidelines

When this feature is enabled, you need to ensure that the existing policies applied to ports and VLANs are such that the Layer 2 control packets that you want to control are not inadvertently subjected to undesired QoS actions, and that the functionality of this feature is not impacted by other policies configured on the switch.

Before enabling QoS on the above mentioned control packets, you must examine and edit your new and existing policies to ensure that the classifiers in the policy-map matching the selected control packets are defined and configured in the correct sequence. To prevent undesirable results from actions of another classifier that may appear later in the same policy-map, you should place the classifiers matching control packets at the beginning of the policy map.

For actions associated with the class class-default, the behavior will depend on the type of supervisor engine:

- Supervisor Engine V-10GE with the built-in NetFlow support

The actions associated with the class-default will never be applied on unmatched control packets, and a default permit action will be applied in case no control-packet class-maps are catching the control-packets before. Only the actions associated to policers that use the class-maps beginning with system-control-packet- will be applied on control packets.

- All other supervisor engines

Actions associated with class-default are applied on unmatched control packets.

Note

On Supervisor Engine V-10GE with the built-in NetFlow support, no micro-flow stats will be available for these types of packets.

Note

When the feature is enabled on BPDU-range, you can police EAPOL packets only after that initial 802.1X authentication phase has completed.

Note

When port security is enabled on a port that is in forwarding spanning tree state, Layer 2 control packets cannot be policed on that port.

Feature Interaction

After applying user-configured policies on each single flow, you might configure a CoPP policy *on top of* Layer 2 Control Packet QoS to rate limit the aggregate flow coming to the CPU. If so, CoPP essentially provides another level of protection for CPU by further rate-limiting on the egress side the packets already filtered in ingress on a per port per VLAN basis by the user defined policies. CoPP becomes the second level of defense while user-defined policies applied on ports and VLANs become the first level of defense.

For example, if you configure a policy-map matching and policing the BPDU-range traffic coming from interface Gigabit 1/1, VLAN 1 as follows:

```
policy-map police_bpdu_1
  class system-control-packet-bpdu-range
  police 32000 bps 1000 byte conform-action transmit exceed-action drop

interface GigabitEthernet1/1
  switchport trunk encapsulation dot1q
  switchport mode trunk
  vlan-range 1
  service-policy input police_bpdu_1
```

and configure a second one on interface Gigabit 1/2 VLAN 2, matching and policing BPUD-range packets as follows:

```
policy-map police_bpdu_2
  class system-control-packet-bpdu-range
  police 34000 bps 1000 byte conform-action transmit exceed-action drop

interface GigabitEthernet1/2
  switchport trunk encapsulation dot1q
  switchport mode trunk
  vlan-range 2
  service-policy input police_bpdu_2
```

the CoPP would be configured as follows:

```
policy-map system-cpp-policy
  class system-cpp-bpdu-range
  police 50000 bps 1000 byte conform-action transmit exceed-action drop
```

Note the following:

- On interface 1/1, VLAN 1, the BPDU-range packets will be policed accordingly to police_bpdu_1 at the rate of 32000 bit per second.
- On interface 1/2, VLAN 2, the BPDU-range packets will be policed accordingly to police_bpdu_2 at the rate of 34000 bit per second.
- The aggregate flow will be policed from CoPP at the CPU port at the rate of 50000 bit per second.

It is also possible to use named-aggregate policers applied to a group of ports or of VLANs to reduce the consumption of policer resources.

Note

When port security is enabled on a port that is in forwarding spanning tree state, Layer 2 control packets cannot be policed on that port.

Configuring Auto-QoS on Supervisor Engines II-Plus, II+10GE, IV, V, V-10GE, 4924, 4948, and 4948-10GE

You can use the auto-QoS feature to simplify the deployment of existing QoS features. Auto-QoS makes assumptions about the network design, and as a result, the switch can prioritize different traffic flows and appropriately use the egress queues instead of using the default QoS behavior. (The default is that QoS is disabled. The switch then offers best-effort service to each packet, regardless of the packet content or size, and sends it from a single queue.)

When you enable auto-QoS, it automatically classifies traffic based on ingress packet label. The switch uses the resulting classification to choose the appropriate egress queue.

You use auto-QoS commands to identify ports connected to Cisco IP phones and to identify ports that receive trusted voice over IP (VoIP) traffic through an uplink. Auto-QoS then performs these functions:

- Detects the presence or absence of IP phones
- Configures QoS classification
- Configures egress queues

These sections describe how to configure auto-QoS on your switch:

- [Generated Auto-QoS Configuration, page 37-62](#)
- [Effects of Auto-QoS on the Configuration, page 37-63](#)
- [Configuration Guidelines, page 37-63](#)
- [Enabling Auto-QoS for VoIP, page 37-64](#)

Generated Auto-QoS Configuration

By default, auto-QoS is disabled on all interfaces.

When you enable the auto-QoS feature on the first interface, these automatic actions occur:

- QoS is globally enabled (**qos** global configuration command).
- DBL is enabled globally (**qos dbl** global configuration command)
- When you enter the **auto qos voip trust** interface configuration command, the ingress classification on the specified interface is set to trust the CoS label received in the packet if the specified interface is configured as Layer 2 (and is set to trust DSCP if the interface is configured as Layer 3). (See [Table 37-7](#).)
- When you enter the **auto qos voip cisco-phone** interface configuration command, the trusted boundary feature is enabled. It uses the Cisco Discovery Protocol (CDP) to detect the presence or absence of a Cisco IP phone. When a Cisco IP phone is detected, the ingress classification on the interface is set to trust the CoS label received in the packet, if the interface is configured as Layer 2. (The classification is set to trust DSCP if the interface is configured as Layer 3.) When a Cisco IP phone is absent, the ingress classification is set to not trust the CoS label in the packet.

Note

On a given port, the Cisco IP phone discovery information is not maintained on the standby supervisor engine. When the standby engine becomes active, it rediscovers the Cisco IP phone thru CDP. So, for a short time, the port will not be in the trust state after the SSO switchover.

For information about the trusted boundary feature, see the [“Configuring a Trusted Boundary to Ensure Port Security”](#) section on page 37-22.

When you enable auto-QoS by using the **auto qos voip cisco-phone** or the **auto qos voip trust** interface configuration commands, the switch automatically generates a QoS configuration based on the traffic type and ingress packet label and applies the commands listed in [Table 37-7](#) to the interface.

Table 37-7 *Generated Auto-QoS Configuration*

Description	Automatically Generated Command
The switch automatically enables standard QoS and DBL configures the CoS-to-DSCP map (maps CoS values in incoming packets to a DSCP value).	Switch(config)# qos Switch(config)# qos map cos 3 to 24 Switch(config)# qos db1 Switch(config)# qos map cos 5 to 46
The switch automatically configures the DSCP-to-Tx-queue mapping.	Switch(config)# qos map dscp 24 25 26 27 b28 29 30 31 to tx-queue 4 Switch(config)# qos map dscp 32 33 34 35 36 37 38 39 to tx-queue 4
The switch automatically sets the ingress classification on the interface to trust the CoS/DSCP value received in the packet.	Switch(config-if)# qos trust cos or Switch(config-if)# qos trust dscp
The switch automatically creates a QoS service policy, enables DBL on the policy, and attaches it to the interface.	Switch(config)# policy-map autoqos-voip-policy Switch(config-pmap)# class class-default Switch(config-pmap-c)# dbl
If you entered the auto qos voip cisco-phone command, the switch automatically enables the trusted boundary feature, which uses the CDP to detect the presence or absence of a Cisco IP phone.	Switch(config-if)# qos trust device cisco-phone
The switch assigns a higher priority for queue 3. Limit for shaping on queue 3 is selected so that it is 33 percent of the link speed. Configure shaping as 33 percent on those ports where sharing is supported. This procedure ensures that the higher-priority queue does not starve other queues.	Switch(config-if)# tx-queue 3 Switch(config-if-tx-queue)# priority high Switch(config-if-tx-queue)# shape percent 33 Switch(config-if-tx-queue)# bandwidth percent 33

Effects of Auto-QoS on the Configuration

When auto-QoS is enabled, the **auto qos voip** interface configuration command and the generated configuration are added to the running configuration.

Configuration Guidelines

Before configuring auto-QoS, you should be aware of this information:

- In this release, auto-QoS configures the switch only for VoIP with Cisco IP phones.
- To take advantage of the auto-QoS defaults, do not configure any standard-QoS commands before entering the auto-QoS commands. If necessary, you can fine-tune the QoS configuration, but we recommend that you do so only after the auto-QoS configuration is completed.
- You can enable auto-QoS on static, dynamic-access, voice VLAN access, and trunk ports.
- By default, the CDP is enabled on all interfaces. For auto-QoS to function properly, do not disable the CDP.
- To enable **auto qos voip trust** on Layer 3 interfaces, change the port to Layer 3, then apply auto-QoS to make it trust DSCP.

Enabling Auto-QoS for VoIP

To enable auto-QoS for VoIP within a QoS domain, perform this task:

	Command	Purpose
Step 1	Switch# <code>debug auto qos</code>	(Optional) Enables debugging for auto-QoS. When debugging is enabled, the switch displays the QoS commands that are automatically generated and applied when auto-QoS is enabled or disabled.
Step 2	Switch# <code>configure terminal</code>	Enters global configuration mode.
Step 3	Switch(config)# <code>interface interface-id</code>	Enters interface configuration mode, and specify the interface that is connected to a Cisco IP phone or the uplink interface that is connected to another switch or router in the interior of the network.
Step 4	Switch(config-if)# <code>auto qos voip</code> { <code>cisco-phone</code> <code>trust</code> }	Enables auto-QoS. The keywords have these meanings: <ul style="list-style-type: none"> • cisco-phone—If the interface is connected to a Cisco IP phone, the CoS labels of incoming packets are trusted only when the telephone is detected. • trust—The uplink interface is connected to a trusted switch or router, and the VoIP traffic classification in the ingress packet is trusted.
Step 5	Switch(config)# <code>end</code>	Returns to privileged EXEC mode.
Step 6	Switch# <code>show auto qos interface interface-id</code>	Verifies your entries. This command displays the auto-QoS configuration that was initially applied; it does not display any user changes to the configuration that might be in effect.

To disable auto-QoS on an interface, use the **no auto qos voip** interface configuration command. When you enter this command, the switch changes the auto-QoS settings to the standard-QoS default settings for that interface. It does not change any global configuration performed by auto-QoS. Global configuration remains the same.

This example shows how to enable auto-QoS and to trust the CoS labels in incoming packets when the device connected to Fast Ethernet interface 1/1 is detected as a Cisco IP phone:

```
Switch(config)# interface fastethernet1/1
Switch(config-if)# auto qos voip cisco-phone
```

This example shows how to enable auto-QoS and to trust the CoS/DSCP labels in incoming packets when the switch or router connected to Gigabit Ethernet interface 1/1 is a trusted device:

```
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip trust
```

This example shows how to display the QoS commands that are automatically generated when auto-QoS is enabled:

```
Switch# debug auto qos
AutoQoS debugging is on
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# auto qos voip cisco-phone
```

Displaying Auto-QoS Information

To display the initial auto-QoS configuration, use the **show auto qos [interface interface-id]** privileged EXEC command. To display any user changes to that configuration, use the **show running-config** privileged EXEC command. You can compare the **show auto qos** and the **show running-config** command output to identify the user-defined QoS settings.

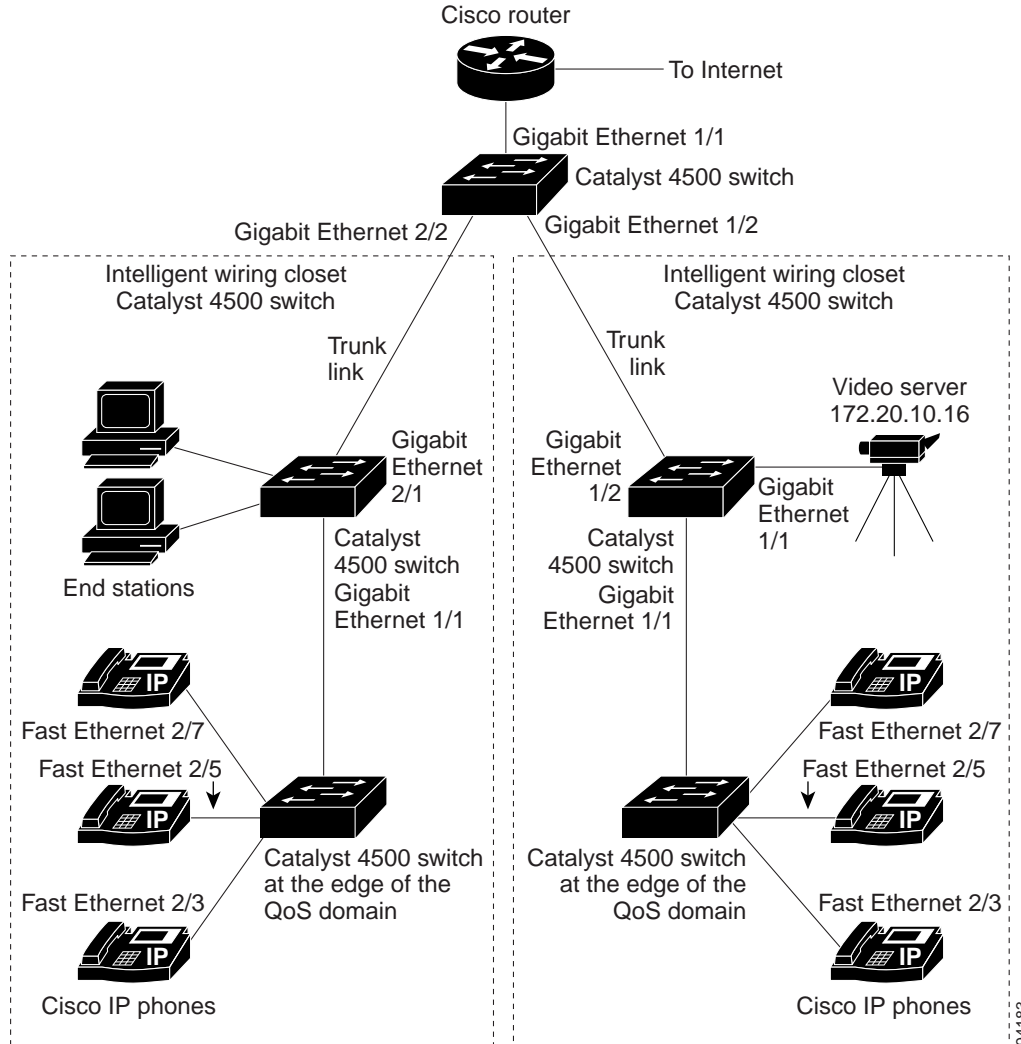

To display information about the QoS configuration that might be affected by auto-QoS, use one of these commands:

- **show qos**
- **show qos map**
- **show qos interface [interface-id]**

For more information about these commands, refer to the command reference for this release.

Auto-QoS Configuration Example

This section describes how you could implement auto-QoS in a network, as shown in [Figure 37-6](#).

Figure 37-6 Auto-QoS Configuration Example Network

The intelligent wiring closets in [Figure 37-6](#) are composed of Catalyst 4500 switches. The object of this example is to prioritize the VoIP traffic over all other traffic. To do so, enable auto-QoS on the switches at the edge of the QoS domains in the wiring closets.

**Note**

You should not configure any standard QoS commands before entering the auto-QoS commands. You can fine-tune the QoS configuration, but we recommend that you do so only after the auto-QoS configuration is completed.

To configure the switch at the edge of the QoS domain to prioritize the VoIP traffic over all other traffic, perform this task:

	Command	Purpose
Step 1	Switch# debug auto qos	Enables debugging for auto-QoS. When debugging is enabled, the switch displays the QoS configuration that is automatically generated when auto-QoS is enabled.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# cdp enable	Enables CDP globally. By default, CDP is enabled.
Step 4	Switch(config)# interface fastethernet2/3	Enters interface configuration mode.
Step 5	Switch(config-if)# auto qos voip cisco-phone	Enables auto-QoS on the interface, and specifies that the interface is connected to a Cisco IP phone. The CoS labels of incoming packets are trusted only when the IP phone is detected.
Step 6	Switch(config)# interface fastethernet2/5	Enters interface configuration mode.
Step 7	Switch(config)# auto qos voip cisco-phone	Enables auto-QoS on the interface, and specifies that the interface is connected to a Cisco IP phone.
Step 8	Switch(config)# interface fastethernet2/7	Enters interface configuration mode.
Step 9	Switch(config)# auto qos voip cisco-phone	Enables auto-QoS on the interface, and specifies that the interface is connected to a Cisco IP phone.
Step 10	Switch(config)# interface gigabit1/1	Enters interface configuration mode.
Step 11	Switch(config)# auto qos voip trust	Enables auto-QoS on the interface, and specifies that the interface is connected to a trusted router or switch.
Step 12	Switch(config)# end	Returns to privileged EXEC mode.
Step 13	Switch# show auto qos	Verifies your entries. This command displays the auto-QoS configuration that is initially applied; it does not display any user changes to the configuration that might be in effect. For information about the QoS configuration that might be affected by auto-QoS, see the “Displaying Auto-QoS Information” section on page 37-65.
Step 14	Switch# show auto qos interface interface-id	Verifies your entries. This command displays the auto-QoS configuration that was initially applied; it does not display any user changes to the configuration that might be in effect.
Step 15	Switch# copy running-config startup-config	Saves the auto qos voip interface configuration commands and the generated auto-QoS configuration in the configuration file.

Configuring QoS on Supervisor Engine 6-E and Catalyst 4900M

**Note**

QoS functionality on the Catalyst 4900M and the Supervisor Engine 6-E are equivalent.

**Note**

HQoS is not supported on Supervisor Engine 6-E and Catalyst 4900M.

Topics include:

- MQC-based QoS Configuration, page 37-68
- Overview, page 37-69
- Platform-supported Classification Criteria and QoS Features, page 37-70
- Platform Hardware Capabilities, page 37-71

MQC-based QoS Configuration

Starting with Cisco IOS Release 12.2(40)SG, Catalyst 4900M or a Catalyst 4500 Series Switch using Supervisor Engine 6-E employs the MQC model of QoS. To apply QoS, you use the Modular QoS Command-Line Interface (MQC), which is a CLI structure that allows you to complete the following tasks:

- Specify the matching criteria used to define a traffic class.
- Create a traffic policy (policy map). The traffic policy defines the QoS policy actions to be taken for each traffic class.
- Apply the policy actions specified in the policy map to an interface, VLAN, or port and VLAN.

For more information about the MQC, see the “Modular Quality of Service Command-Line Interface” section of the *Cisco IOS Quality of Service Solutions Configuration Guide, Release 12.3*.

**Note**

The MQC model does not support the *trust* feature, which is available in the *switch qos* model on Supervisor Engines II-Plus through V-10GE. In the MQC model supported on the Supervisor Engine 6-E or Catalyst 4900M, the incoming traffic is considered trusted by default. Only when the *trusted boundary* feature is enabled on an interface can the port enter untrusted mode. In this mode, the switch marks the DSCP value of an IP packet and the CoS value of the VLAN tag on the Ethernet frame as “0”.

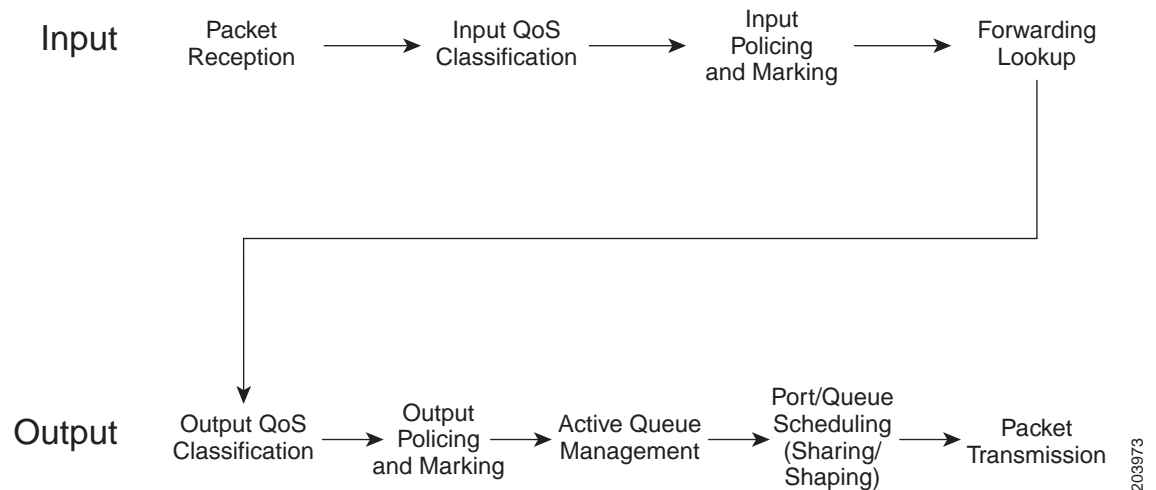

Overview

Catalyst 4900M and Supervisor Engine 6-E support the best effort and DiffServ types of QoS deployment (RFCs 2597, 2598, 2474, 2475 define the DiffServ standards). A high level QoS model for Catalyst 4900M or Supervisor Engine 6-E is as follows:

-
- | | |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | The incoming packet is classified (based on different packet fields, receive port and/or VLAN) to belong to a traffic class. |
| Step 2 | Depending on the traffic class, the packet is rate-limited/policed and its priority is optionally <i>marked</i> (typically at the edge of the network) so that lower priority packets are dropped or marked with lower priority in the packet fields (DSCP and CoS). |
| Step 3 | After the packet has been marked, it is <i>looked up</i> for forwarding. This action obtains the transmit port and VLAN to transmit the packet. |
| Step 4 | The packet is classified in the output direction based on the transmit port and/or VLAN. The classification takes into account any marking of the packet by input QoS. |
| Step 5 | Depending on the output classification, the packet is policed, its priority is optionally (<i>re-</i>) <i>marked</i> , and the transmit queue for the packet is determined depending on the traffic class. |
| Step 6 | The transmit queue state is dynamically monitored via the AQM (Active Queue Management) algorithm and drop threshold configuration to determine whether the packet should be dropped or enqueued for transmission. |
| Step 7 | If eligible for transmission, the packet is enqueued to a transmit queue. The transmit queue is selected based on output QoS classification criteria. The selected queue provides the desired behavior in terms of latency and bandwidth. |
-

Figure 37-1 illustrates a high level model of Supervisor Engine 6-E and Catalyst 4900M.

Figure 37-7 QoS Packet Processing

Platform-supported Classification Criteria and QoS Features

The following table provides a summary of various classification criteria and actions supported on Catalyst 4900M or Supervisor Engine 6-E. For details, refer to the *Catalyst 4500 Series Switch Command Reference*.

Supported classification actions	Descriptions
match access-group	Configures the match criteria for a class map on the basis of the specified ACL.
match any	Configures the match criteria for a class map to be successful match criteria for all packets.
match cos	Matches a packet based on a Layer 2 class of service (CoS) marking.
match destination-address mac	Uses the destination MAC address as a match criterion.
match source-address mac	Uses the source MAC address as a match criterion.
match [ip] dscp	Identifies a specific IP differentiated service code point (DSCP) value as a match criterion. Up to eight DSCP values can be included in one match statement.
match [ip] precedence	Identifies IP precedence values as match criteria.
match protocol	Configures the match criteria for a class map on the basis of the specified protocol.
match qos-group	Identifies a specific QoS group value as a match criterion. Applies only on the egress direction.
Supported Qos Features	Descriptions
police	Configures traffic policing.
police (percent)	Configures traffic policing on the basis of a percentage of bandwidth available on an interface.
police (two rates)	Configures traffic policing using two rates, the committed information rate (CIR) and the peak information rate (PIR).
set cos	Sets the Layer 2 class of service (CoS) value of an outgoing packet.
set dscp	Marks a packet by setting the differentiated services code point (DSCP) value in the type of service (ToS) byte of IPv4 or traffic class byte of IPv6 packet.
set precedence	Sets the precedence value in the packet header.
set qos-group	Sets a QoS group identifier (ID) that can be used later to classify packets.
table map support	Unconditional marking of one packet field based on another packet field.
priority	Gives priority to a class of traffic belonging to a policy map.
shape	Shapes traffic to the indicated bit rate according to the algorithm specified.
bandwidth	Provides a guaranteed minimum bandwidth to each of the eight queues.
dbl	Dynamic buffer limit.
queue-limit	Specifies the maximum number of packets a transmit queue can hold.

Platform Hardware Capabilities

Qos Actions	Numbers of entries supported
Classification	64k input and 64k output classification entries are supported. A given policy can use at most 24k ACLs
Policing	16K policers are supported. Policers are allocated to given direction in blocks of 2k. For example, 2k policers can be used in for input and 14k policers can be used for output. Single rate policers uses one policer entry. Single Rate Three Color Marker (srTCM) (RFC 2697) and Two Rate Three Color Marker (trTCM) (RFC 2698) uses two policer entries
Marking	Marking of Cos and DSCP/Precedence is supported through two marking tables, each capable of supporting 512 entries. There are separate tables for each direction.
Queuing	The queue size is Configurable with the maximum number of entries configurable per port depending on the chassis and line card type.
DBL	You can enable DBL action on all configured class-maps.

Prerequisites for Applying a QoS Service Policy

Unlike the Switch QoS model, there is no prerequisite for enabling QoS on various targets. Just the attachment of a service policy enables QoS and detachment of that policy disables QoS on that target.

Restrictions for Applying a QoS Service Policy

Traffic marking can be configured on an interface, a VLAN, or a port and VLAN. An interface can be a Layer 2 access port, a Layer 2 switch trunk, a Layer 3 routed port, or an EtherChannel. A policy is attached to a VLAN using the *vlan configuration* mode.

Attaching QoS service policy to VLANs and EtherChannel is described in the ["Policy Associations" section on page 37-90](#).

Classification

Supervisor Engine 6-E supports classification of Layer 2, IP, IPv6 packets, and ARP packets. Packet marking performed on input can be matched in the output direction. The previous table lists the full set of capabilities. By default, the Supervisor Engine 6-E also supports classification resources sharing.

By default, when the same policy is attached to a port or a VLAN or on per-port per-vlan targets, ACL entries are shared on the Supervisor Engine 6-E. Even though CAM entries are shared, QoS actions is unique on each target.

For example:

```
class-map c1
  match ip any
Policy Map p1
  class ipp5
    police rate 1 m burst 200000
```

If policy-map p1 is applied to interfaces Gig 1/1 and Gig 1/2, 1 CAM entry is used (one ACE that matches IP packets), but 2 policers are allocated (one per target). So, all IP packets are policed to 1 mbps on interface Gig 1/1 and packets on interface Gig 1/2 are policed to 1 mbps.

Note

With Cisco IOS Release 12.2(46)SG, you can issue the **match protocol arp** command. For details, see the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

Classification Statistics

Supervisor 6-E and 6L-E support only packet based classification statistics.

They support TCAM resource sharing. When a policy-map is applied on multiple targets, the command **show policy-map interface** displays the aggregate classification statistics, not those specific to an interface.

Note

To obtain per interface policy-map stats, you should configure a unique policy-map name on each interface.

When a policy-map is attached to a port-channel member ports, classification statistics are not displayed.

Policing

Supervisor Engine 6-E supports policers in the following operation modes:

- Single Rate Policer Two Color Marker

This kind of policer is configured with just the committed rate (CIR) and normal burst and it has only conform and exceed actions.

This is the only form supported in the Supervisor Engine II-Plus to V-10GE based systems.

- Single Rate Three Color Marker (srTCM) (RFC 2697)
- Two Rate Three Color Marker (trTCM) (RFC 2698)
- Color Blind Mode

Policing accuracy of 0.75% of configured policer rate.

Supervisor Engine 6-E supports 16384 (16 x 1024, 16K) single rate, single burst policers. 16K policers are organized as 8 banks of 2K policers. The policer banks are dynamically assigned (input or output policer bank) by the software depending on the QoS configuration. So, the 16K policers are dynamically partitioned by software as follows:

- 0 Input Policers and 16K Output Policers
- 2K Input Policers and 14K Output Policers
- 4K Input Policers and 12K Output Policers
- 6K Input Policers and 10K Output Policers
- 8K Input Policers and 8K Output Policers
- 10K Input Policers and 6K Output Policers
- 12K Input Policers and 4K Output Policers
- 14K Input Policers and 2K Output Policers

- 16K Input Policers and 0 Output Policers

These numbers represent individual policer entries in the hardware that support a single rate and burst parameter. Based on this, Supervisor Engines 6-E supports the following number of policers:

- 16K Single Rate Policer with Single Burst (Two Color Marker)
- 8K Single Rate Three Color Marker (srTCM)
- 8K Two Rate Three Color Marker (trTCM)

These policers are partitioned between Input and Output in chunks of 2K policer banks. The different types of policers can all co-exist in the system. However, a given type of policer (srTCM, trTCM etc.) is configurable as a block of 128 policers.

How to Implement Policing

For details on how to implement the policing features on a Catalyst 4500 series switch, refer to the Cisco IOS documentation at the following link:

http://www.cisco.com/en/US/docs/ios/12_2/qos/configuration/guide/qcfcplsh.html

Platform Restrictions

Platform restrictions include the following:

- Multi-policer actions can be specified (setting CoS and IP DSCP is supported).
- Simultaneous unconditional and policer based marking is not supported.
- If policer based service-policy is attached to both a port and a VLAN, port-based policed is preferred by default. To over-ride a specific VLAN policy on a given port, then you must configure a per-port per-vlan policy.
- When you delete a port-channel with a per-port per-VLAN QoS policy, the switch crashes.

Workaround: Before deleting the port-channel, do the following:

1. Remove any per-port per-VLAN QoS policies, if any.
2. Remove the VLAN configuration on the port-channel with the **no vlan-range** command.

Marking Network Traffic

Marking network traffic allows you to set or modify the attributes of traffic (that is, packets) belonging to a specific class or category. When used in conjunction with network traffic classification, marking network traffic is the foundation for enabling many quality of service (QoS) features on your network. This module contains conceptual information and the configuration tasks for marking network traffic.

Information About Marking Network Traffic

To mark network traffic, you should understand the following concepts:

- “Purpose of Marking Network Traffic” section on page 37-74
- “Benefits of Marking Network Traffic” section on page 37-74
- “Two Methods for Marking Traffic Attributes” section on page 37-75

Purpose of Marking Network Traffic

Traffic marking is used to identify certain traffic types for unique handling, effectively partitioning network traffic into different categories.

After the network traffic is organized into classes by traffic classification, traffic marking allows you to mark (that is, set or change) a value (attribute) for the traffic belonging to a specific class. For instance, you may want to change the class of service (CoS) value from 2 to 1 in one class, or you may want to change the differentiated services code point (DSCP) value from 3 to 2 in another class. In this module, these values are referred to as attributes or marking fields.

Attributes that can be set and modified include the following:

- CoS value of a tagged Ethernet frame
- DSCP/Precedence value in the Type of Service (ToS) byte of IPv4.
- QoS group identifier (ID)
- DSCP /Precedence value in the traffic class byte of IPv6

Benefits of Marking Network Traffic

Traffic marking allows you to fine-tune the attributes for traffic on your network. This increased granularity helps isolate traffic that requires special handling, and thus, helps to achieve optimal application performance.

Traffic marking allows you to determine how traffic will be treated, based on how the attributes for the network traffic are set. It allows you to segment network traffic into multiple priority levels or classes of service based on those attributes, as follows:

- Traffic marking is often used to set the IP precedence or IP DSCP values for traffic entering a network. Networking devices within your network can then use the newly marked IP precedence values to determine how traffic should be treated. For example, voice traffic can be marked with a particular IP precedence or DSCP and strict priority can then be configured to put all packets of that marking into that queue. In this case, the marking was used to identify traffic for strict priority queue.
- Traffic marking can be used to identify traffic for any class-based QoS feature (any feature available in policy map class configuration mode, although some restrictions exist).
- Traffic marking can be used to assign traffic to a QoS group within a switch. The switch can use the QoS groups to determine how to prioritize traffic for transmission. The QoS group value is usually used for one of the two following reasons:

- To leverage a large range of traffic classes. The QoS group value has 64 different individual markings, similar to DSCP.
- If changing the Precedence or DSCP value is undesirable.

Two Methods for Marking Traffic Attributes

Note

This section describes *Unconditional* marking, which differs from *Policer-based* marking. Unconditional marking is based solely on classification.

Method One: Unconditional Explicit Marking (using the set command)

You specify the traffic attribute you want to change with a set command configured in a policy map. The following table lists the available set commands and the corresponding attribute. For details on the set command, refer to the *Catalyst 4500 Series Switch Command Reference*.

Table 37-8 *set Commands and Applicable Packet Types*

set Commands	Traffic Attribute	Packet Type
set cos	Layer 2 CoS value of the outgoing traffic	Ethernet IPv4, IPv6
set dscp	DSCP value in the ToS byte	IPv4, IPv6
set precedence	precedence value in the packet header	IPv4, IPv6
set qos-group	QoS group ID	Ethernet, IPv4, IPv6

If you are using individual **set** commands, those set commands are specified in a policy map. The following is a sample of a policy map configured with one of the set commands listed in Table 37-8.

In this sample configuration, the **set cos** command has been configured in the policy map (policy1) to mark the CoS attribute:

```
enable
configure terminal
policy map p1
  class class1
    set cos 3
end
```

For information on configuring a policy map, see the “Creating a Policy Map” section on page 37-32.

The final task is to attach the policy map to the interface. For information on attaching the policy map to the interface, see the “Attaching a Policy Map to an Interface” section on page 37-36.

Method Two: Unconditional Tablemap-based Marking

You can create a table map that can be used to mark traffic attributes. A table map is a kind of two-way conversion chart that lists and maps one traffic attribute to another. A table map supports a many-to-one type of conversion and mapping scheme. The table map establishes a to-from relationship for the traffic attributes and defines the change to be made to the attribute. That is, an attribute is set to one value that is taken from another value. The values are based on the specific attribute being changed. For instance, the Precedence attribute can be a number from 0 to 7, while the DSCP attribute can be a number from 0 to 63.

The following is a sample table map configuration:

```
table-map table-map1
map from 0 to 1
```

```
map from 2 to 3
exit
```

The following table lists the traffic attributes for which a to-from relationship can be established using the table map.

Table 37-9 Traffic Attributes for Which a To-From Relationship Can Be Established

The "To" Attribute	The "From" Attribute
Precedence	CoS, QoS group, DSCP, Precedence
DSCP	COS, QoS group, DSCP, Precedence
CoS	DSCP, QoS group, CoS, Precedence

The following is an example of a policy map (policy2) configured to use the table map (table-map1) created earlier:

```
Policy map policy
  class class-default
    set cos dscp table table-map
exit
```

In this example, a mapping relationship was created between the CoS attribute and the DSCP attribute as defined in the table map.

For information on configuring a policy map to use a table map, “Configuring a Policy Map” section on page 37-31.

The final task is to attach the policy map to the interface. For information on attaching the policy map to the interface, see the “Attaching a Policy Map to an Interface” section on page 37-36.

Marking Action Drivers

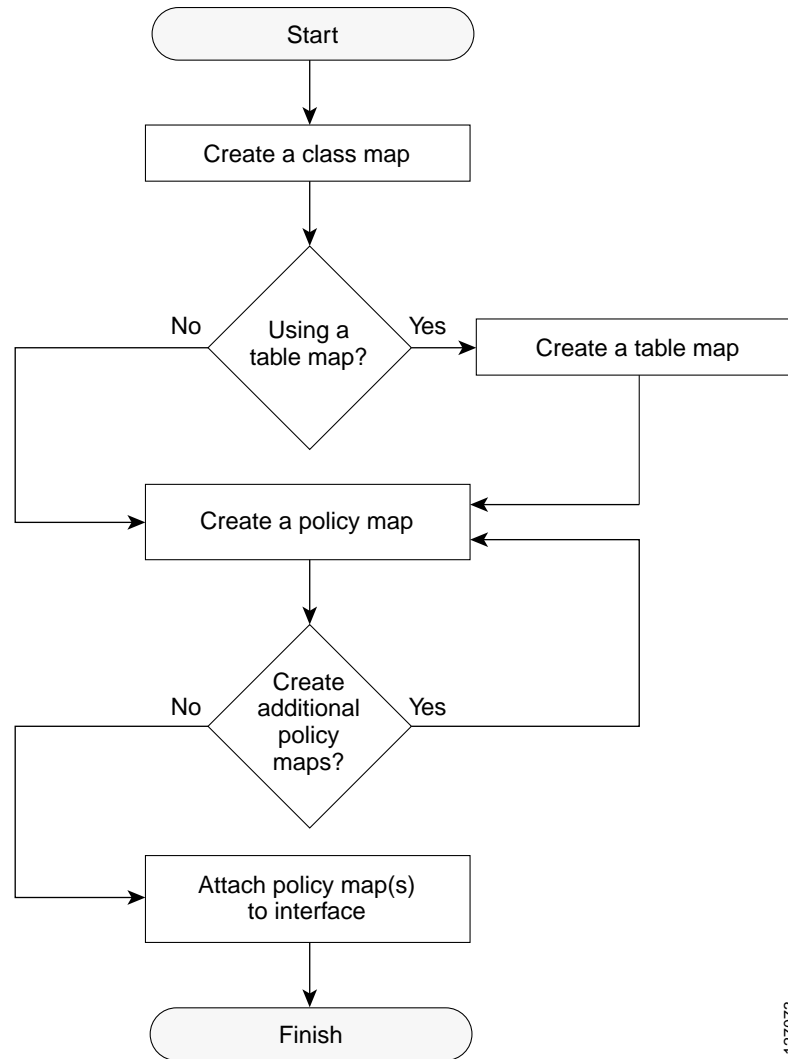

A marking action can be triggered based on one of the two QoS processing steps.

Classification based: In this case, all the traffic matching a class is marked using either explicit or tablemap based method. This method is referred to as *unconditional* marking.

Policer result-based: In this case, a class of traffic is marked differently based on the policer result (conform/exceed/violate) applicable to that packet. This method is referred to as *conditional* marking.

Traffic Marking Procedure Flowchart

Figure 37-8 illustrates the order of the procedures for configuring traffic marking.

Figure 37-8 Traffic marking Procedure Flowchart

127073

Restrictions for Marking Network Traffic

The following restrictions apply to packet marking actions:

- QoS-group can be marked only in the input direction and can only support unconditional explicit marking.
- Only explicit marking is supported for policer-based marking.

Multi-attribute Marking Support

Supervisor Engine 6-E can mark more than one QoS attribute of a packet matching a class of traffic. For example, DSCP, CoS, and QoS-group can all be set together, using either explicit or tablemap-based marking.

**Note**

When using unconditional explicit marking of multiple fields or policer-based multifield, multi-region (conform/exceed/violate) marking the number of tablemaps that can be setup in TOS or COS marking tables will be less than the maximum supported.

Hardware Capabilities for Marking

Supervisor Engine 6-E provides a 128 entry marking action table where each entry specifies the type of marking actions on COS and DSCP/precedence fields as well as policer action to transmit/markdown/drop a packet. One such table is supported for each direction, input and output. This table is used for both unconditional marking as well as policer-based marking. It can be used to support 128 unique marking actions or 32 unique policer-based actions or a combinations of the two.

For each of the marking fields (COS and DSCP), the Supervisor Engine 6-E provides 512 entry marking tables for each direction. These are similar to mapping tables available on supervisor engines that support the switch QoS model. However, these provide an ability to have multiple unique mapping tables that are setup by the user.

For example, the TOS marking table provides marking of DSCP/Precedence fields and can be used as one of the following:

- 8 different tablemaps with each mapping the 64 DSCP or qos-group values to another DSCP
- 64 (32) different tablemaps with each one mapping 8 CoS (16 CoS and CFi) values to DSCP in input (output) direction
- a combination of above two types of tablemaps

Similar mappings are available on the 512 entry COS marking table.

Configuring the Policy Map Marking Action

This section describes how to establish unconditional marking action for network traffic.

Prerequisites

Perform the following:

- Create a class map (*ipp5*) and a policy map. (Refer to the “Configuring a QoS Policy” section on page 37-29)
- Configure the marking action. (Refer to the “Configuring Policy-Map Class Actions” section on page 37-32)

**Note**

On the Supervisor Engine 6-E, the marking action command options have been extended (refer to Table 37-8 on page 37-75 and Table 37-9 on page 37-76).

Configuring Tablemap-based Unconditional Marking

To configure table-map based unconditional marking, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# table-map name	Configures a tablemap.

	Command	Purpose
Step 3	Switch(config-tablemap)# map from <i>from_value</i> to <i>to_value</i>	Creates a map from a <i>from_value</i> to a <i>to_value</i>
Step 4	Switch(config-tablemap)# exit	Exits table-map configuration mode.
Step 5	Switch(config)# policy-map <i>name</i>	Enters policy-map configuration mode.
Step 6	Switch(config-p)# class <i>name</i>	Selects the class for QoS actions.
Step 7	Switch(config-p-c)# set cos dscp prec cos dscp prec qos-group [table <i>name</i>]	Selects the marking action based on an implicit or explicit table-map.
Step 8	Switch(config-p-c)# end	Exits configuration mode.
Step 9	Switch# show policy-map <i>name</i>	Verifies the configuration of the policy-map.
Step 10	Switch# show table-map <i>name</i>	Verifies the configuration of the table-map.

The following example shows how to enable marking action using table-map.

```
Switch(config)# table-map dscp2Cos
Switch(config-tablemap)# map from 8 to 1
Switch(config-tablemap)# exit
Switch(config)# policy-map p1
Switch(config-pmap)# class ip5
Switch(config-pmap-c)# set cos dscp table dscp2Cos
Switch(config-pmap-c)# end
Switch# show policy-map p1

Policy Map p1
  Class ip5
    set cos dscp table dscp2Qos

Switch# show table-map dscp2Cos

Table Map dscp2Cos
  from 8 to 1
  default copy
```

Configuring Policer Result-based Conditional Marking

To configure policer result-based conditional marking, setup a single rate or dual rate policer. Refer to the “How to Implement Policing” section on page 37-73.

This example shows how to configure a two rate three-color policer with explicit actions for each policer region:

```
Switch# configure terminal
Switch(config-pmap-c)# policer cir percent 20 pir percent 30
Switch(config-pmap-c-policer)# conform-action set-cos-transmit 3 set-dscp-transmit 10
Switch(config-pmap-c-policer)# exceed-action set-cos-transmit 4 set-dscp-transmit 20
Switch(config-pmap-c-policer)# violate action drop
Switch# show policy-map p1

Policy Map police
  Class ip5
    police cir percent 20 pir percent 30
      conform-action set-cos-transmit 3
      conform-action set-dscp-transmit af11
      exceed-action set-cos-transmit 4
      exceed-action set-dscp-transmit af22
      violate-action drop
```

Marking Statistics

The marking statistics indicate the number of packets that are *marked*.

For unconditional marking, the *classification entry* points to an entry in the marking action table that in turn indicates the fields in the packet that are marked. Therefore, the classification statistics by itself indicates the unconditional marking statistics.

For a conditional marking using policer, provided the policer is a packet rate policer, you cannot determine the number packets marked because the policer only provides byte statistics for different policing results.

Shaping, Sharing (Bandwidth), Priority Queuing, Queue-limiting and DBL

Supervisor Engine 6-E supports the Classification-based (class-based) mode for transmit queue selection. In this mode, the transmit queue selection is based on the Output QoS classification lookup.

Note

Only output (egress) queuing is supported.

The Supervisor Engine 6-E hardware supports 8 transmit queues per port. Once the forwarding decision has been made to forward a packet out a port, the output QoS classification determines the transmit queue into which the packet needs to be enqueued.

By default, in Supervisor Engine 6-E, without any service policies associated with a port, there are two queues (a control packet queue and a default queue) with no guarantee as to the bandwidth or kind of prioritization. The only exception is that system generated control packets are enqueued into control packet queue so that control traffic receives some minimum link bandwidth.

Queues are assigned when an output policy attached to a port with one or more queuing related actions for one or more classes of traffic. Because there are only eight queues per port, there can be at most eight classes of traffic (including the reserved class, class-default) with queuing action(s). Classes of traffic that do not have any queuing action are referred to as *non-queuing* classes. Non-queuing class traffic ends up using the queue corresponding to class class-default.

When a queuing policy (a policy with queuing action) is attached, the control packet queue is deleted and the control packets are enqueued into respective queue per their classification. Note that this differs from the way control-traffic was prioritized in the Catalyst 4924, Catalyst 4948, Catalyst 4948-10GE, and the Supervisor Engines II+, II+10GE, IV, V, and V-10GE. On these platforms, by default, control traffic was guaranteed 25 per cent of the link bandwidth whether QoS was configured. If this same behavior is required on Supervisor Engine 6-E, an egress QoS class must be configured to match IP Precedence 6 and 7 traffic, and a bandwidth guarantee must be configured.

Dynamic resizing of queues (queue limit class-map action) is supported through the use of the **queue-limit** command. Based on the chassis and line card type, all eight queues on a port are configured with equal queue size.

Shaping

Shaping enables you to delay out-of-profile packets in queues so that they conform to a specified profile. Shaping is distinct from policing. Policing drops packets that exceed a configured threshold, whereas shaping *buffers* packets so that traffic remains within a given threshold. Shaping offers greater *smoothness* in handling traffic than policing. You enable average-rate traffic shaping on a traffic class with the **policy-map** class configuration command.

Supervisor Engine 6-E supports a range of 32kbps to 10 gbps for shaping, with a precision of approximately with a precision of approximately +/- 0.75 per cent.

When a queuing class is configured without any explicit shape configuration, the queue shape is set to the link rate.

To configure class-level shaping in a service policy, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# policy-map <i>policy-map-name</i>	Creates a policy map by entering the policy-map name, and enter policy-map configuration mode. By default, no policy maps are defined.
Step 3	Switch(config-pmap)# class <i>class-name</i>	Specifies the name of the class whose traffic policy you want to create or change, and enter policy-map class configuration mode. By default, no traffic classes are defined.
Step 4	Switch(config-pmap-class)# shape average { <i>cir-bps kbps</i> percent <i>percent</i> }	Enables average-rate traffic shaping. You can specify the bandwidth in kbps or as a percentage: <ul style="list-style-type: none"> For <i>cir-bps</i>, specify the committed information rate, the bit rate that traffic is shaped to, in bps. The range is 32000 to 10000000000 bps. For <i>percent</i>, specify the percentage of link rate to shape the class of traffic. The range is 1 to 100. By default, average-rate traffic shaping is disabled.
Step 5	Switch(config-pmap-class)# exit	Returns to policy-map configuration mode.
Step 6	Switch(config-pmap)# exit	Returns to global configuration mode.
Step 7	Switch(config)# interface <i>interface-id</i>	Specifies a physical port and enter interface configuration mode.
Step 8	Switch(config-interface)# service-policy output <i>policy-map-name</i>	Specifies the policy-map name, and apply it a physical interface.
Step 9	Switch(config-interface)# end	Returns to privileged EXEC mode.
Step 10	Switch# show policy-map [<i>policy-map-name</i> [class <i>class-map-name</i>]] or Switch# show policy-map interface <i>interface-id</i>	Verifies your entries.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To delete an existing policy map, use the **no policy-map policy-map-name** global configuration command. To delete an existing class, use the **no class class-name policy-map** configuration command. To disable the average-rate traffic shaping, use the **no shape average policy-map** class configuration command.

This example shows how to configure class-level, average-rate shaping. It limits traffic class class1 to a data transmission rate of 256 kbps:

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch#

Switch# show policy-map policy1
  Policy Map policy1
    Class class1
      shape average 256000
```

This example shows how to configure class-level, average shape percentage to 32% of link bandwidth for queuing-class traffic:

```
Switch# configure terminal
Switch(config)# policy-map queuing-policy
Switch(config-pmap)# class queuing-class
Switch(config-pmap-c)# shape average percent 32
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output queuing-policy1
Switch(config-if)# end
Switch #

Switch# show policy-map queuing-policy
  Policy Map queuing-policy
    Class queuing-class
      Average Rate Traffic Shaping
        cir 32%
```

Sharing(bandwidth)

The bandwidth assigned to a class of traffic is the minimum bandwidth that is guaranteed to the class during congestion. Transmit Queue Sharing is the process by which output link bandwidth is shared among multiple queues of a given port.

Supervisor Engine 6-E supports a range of 32 kbps to 10 gbps for sharing, with a precision of approximately +/- 0.75 per cent. The sum of configured bandwidth across all queuing classes should not exceed the link bandwidth.

To configure class-level bandwidth action in a service policy, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# policy-map <i>policy-map-name</i>	Creates a policy map by entering the policy-map name, and enter policy-map configuration mode. By default, no policy maps are defined.

	Command	Purpose
Step 3	Switch(config-pmap)# class <i>class-name</i>	Specifies the name of the class whose traffic policy you want to create or change, and enter policy-map class configuration mode. By default, no traffic classes are defined.
Step 4	Switch(config-pmap-class)# bandwidth { <i>bandwidth-kbps</i> percent <i>percent</i> }	Specifies the minimum bandwidth provided to a class belonging to the policy map when there is traffic congestion in the switch. If the switch is not congested, the class receives more bandwidth than you specify with the bandwidth command. By default, no bandwidth is specified. You can specify the bandwidth in kbps or as a percentage: o For <i>bandwidth-kbps</i> , specify the bandwidth amount in kbps assigned to the class. The range is 32 to 10000000. o For <i>percent</i> , specify the percentage of available bandwidth assigned to the class. The range is 1 to 100. Specify all the class bandwidths in either kbps or in percentages, but not a mix of both.
Step 5	Switch(config-pmap-class)# exit	Returns to policy-map configuration mode.
Step 6	Switch(config-pmap)# exit	Returns to global configuration mode.
Step 7	Switch(config)# interface <i>interface-id</i>	Specifies a physical port and enter interface configuration mode.
Step 8	Switch(config-interface)# service-policy output <i>policy-map-name</i>	Specifies the policy-map name, and apply it a physical interface.
Step 9	Switch(config-interface)# end	Returns to privileged EXEC mode.
Step 10	Switch# show policy-map [<i>policy-map-name</i> [class <i>class-map-name</i>]] or Switch# show policy-map interface <i>interface-id</i>	Verifies your entries.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To delete an existing policy map, use the **no policy-map policy-map-name** global configuration command. To delete an existing class, use the **no class class-name policy-map** configuration command. To return to the default bandwidth, use the **no bandwidth policy-map** class configuration command.

This example shows how to create a class-level policy map called policy11 for three classes called prec1, prec2, and prec3. In the policy for these classes, 30 percent of the available bandwidth is assigned to the queue for the first class, 20 percent is assigned to the queue for the second class, and 10 percent is assigned to the queue for the third class.

```
Switch # configure terminal
Switch(config)# policy-map policy11
Switch(config-pmap)# class prec1
Switch(config-pmap-c)# bandwidth percent 30
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec2
```

```

Switch(config-pmap-c)# bandwidth percent 20
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec3
Switch(config-pmap-c)# bandwidth percent 10
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy11
Switch(config-if)# end
Switch #

Switch# show policy-map policy11
  Policy Map policy11
    Class prec1
      bandwidth percent 30
    Class prec2
      bandwidth percent 20
    Class prec3
      bandwidth percent 10

```

This example shows how to create a class-level policy map called policy11 for three classes called prec1, prec2, and prec3. In the policy for these classes, 300 mbps of the available bandwidth is assigned to the queue for the first class, 200 mbps is assigned to the queue for the second class, and 100 mbps is assigned to the queue for the third class.

```

Switch # configure terminal
Switch(config)# policy-map policy11
Switch(config-pmap)# class prec1
Switch(config-pmap-c)# bandwidth 300000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec2
Switch(config-pmap-c)# bandwidth 200000
Switch(config-pmap-c)# exit
Switch(config-pmap)# class prec3
Switch(config-pmap-c)# bandwidth 100000
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy11
Switch(config-if)# end
Switch #

Switch# show policy-map policy11
  Policy Map policy11
    Class prec1
      bandwidth 300000 (kbps)
    Class prec2
      bandwidth 200000 (kbps)
    Class prec3
      bandwidth 100000 (kbps)

```

When a queuing class is configured without any explicit share/bandwidth configuration, because the queue is not guaranteed any minimum bandwidth, the hardware queue is programmed to get a share of any unallocated bandwidth on the port as shown in the following example.

If there is no bandwidth remaining for the new queue or if the unallocated bandwidth is not sufficient to meet the minimum configurable rate (32kbps) for all queues which do not have any explicit share/bandwidth configuration, then the policy association is rejected.

For example, if there are two queues as given below

```
policy-map queue-policy
  class q1
    bandwidth percent 10

  class q2
    bandwidth percent 20
```

then the bandwidth allocation for the queues is as follows

```
q1 = 10%
      q2 = 20%
class-default = 70%
```

Similarly, when another queuing class (say q3) is added without any explicit bandwidth (say, just a shape command), then the bandwidth allocation is

```
q1 = 10%
      q2 = 20%
      q3 = min(35%, q3-shape-rate)
class-default = max(35%, (100 - (q1 + q2 + q3)))
```

Priority queuing

On Supervisor Engine 6-E only one transmit queue on a port can be configured as *strict priority* (termed Low Latency Queue, or LLQ).

LLQ provides strict-priority queuing for a traffic class. It enables delay-sensitive data, such as voice, to be sent *before* packets in other queues. The priority queue is serviced first until it is empty or until it is under its shape rate. Only one traffic stream can be destined for the priority queue per class-level policy. You enable the priority queue for a traffic class with the **priority policy-map class** configuration command at the class mode.

A LLQ can starve other queues unless it is rate limited. Supervisor Engine 6-E does not support *conditional policing* where a 2-parameter policer (rate, burst) becomes effective when the queue is *congested* (based on queue length). However, it supports application of an unconditional policer to rate limit packets enqueued to the strict priority queue.

When a priority queue is configured on one class of a policy map, only *bandwidth remaining* is accepted on other classes, guaranteeing a minimum bandwidth for other classes from the remaining bandwidth of what is left after using the priority queue. When a priority queue is configured with a policer, then either *bandwidth* or *bandwidth remaining* is accepted on other classes.

Note

Use *bandwidth* or *bandwidth remaining* on all classes. You cannot apply *bandwidth* on one class and *bandwidth remaining* on another class within a policy map.

To enable class-level priority queuing in a service policy, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# policy-map <i>policy-map-name</i>	Creates a policy map by entering the policy-map name, and enter policy-map configuration mode. By default, no policy maps are defined.

	Command	Purpose
Step 3	Switch(config-pmap)# class <i>class-name</i>	Specifies the name of the class whose traffic policy you want to create or change, and enter policy-map class configuration mode. By default, no traffic classes are defined.
Step 4	Switch(config-pmap-class)# priority	Enables the strict-priority queue, and give priority to a class of traffic. By default, strict-priority queueing is disabled.
Step 5	Switch(config-pmap-class)# exit	Returns to policy-map configuration mode.
Step 6	Switch(config-pmap)# exit	Returns to global configuration mode.
Step 7	Switch(config)# interface <i>interface-id</i>	Specifies a physical port and enter interface configuration mode.
Step 8	Switch(config-interface)# service-policy output <i>policy-map-name</i>	Specifies the policy-map name, and apply it a physical interface.
Step 9	Switch(config-interface)# end	Returns to privileged EXEC mode.
Step 10	Switch# show policy-map [<i>policy-map-name</i> [<i>class</i> <i>class-map-name</i>]] or Switch# show policy-map interface <i>interface-id</i>	Verifies your entries.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To delete an existing policy map, use the **no policy-map policy-map-name** global configuration command. To delete an existing class, use the **no class class-name policy-map** configuration command. To disable the priority queue, use the **no priority policy-map class** configuration command.

This example shows how to configure a class-level policy called policy1. Class 1 is configured as the priority queue, which is serviced first until it is empty.

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# priority
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch #

Switch# show policy-map policy1
Policy Map policy1
  Class class1
    priority
```

Queue-limiting

When a class-based queue is instantiated on a physical port, it is set up with a default size. This size represents the number of queue entries in which packets belonging to that class of traffic can be queued. The scheduler moves packets from the queue that are ready for transmission, based on the queue shape, bandwidth, and priority configuration.

The `queue-limit` provides the maximum number of packets that can be in the queue at any given time. When the queue is full, an attempt to enqueue any further packets results in tail drop. However, if dynamic buffer limiting (DBL) is enabled on the queue, packets get a probabilistic drop based on the DBL algorithm, even when the queue is not full.

The **`queue-limit`** command can be configured under a class only when queue scheduling, such as bandwidth, shape, or priority is already configured. The only exception to this requirement is the support of the stand-alone **`queue-limit`** command on the class-default class.

Queue Memory

The number of queue entries that can be allocated has to be a multiple of 8 and can range from 16 to 8184. When a class-based queue is instantiated on a physical port, it is given a default number of entries. This default queue size is based on the number of slots in the chassis and the number of front-panel ports in each slot.

The Supervisor Engine 6-E has 512K (524,288) queue entries of which the system sets aside 100K (102,400) queue entries in a free reserve pool. Of the remaining 412K (421,88), the drop port is provided 8184 entries and the CPU ports are assigned 11704 entries. The remaining entries are divided equally among the slots in the chassis. In a redundant chassis the two supervisor slots are treated as one for the purpose of this entries distribution. Within each slot the number of queue entries are equally divided among the front-panel ports present on the line card in that slot.

When the user configuration for queue entries on an interface exceeds its dedicated quota, the system attempts to satisfy the configuration from the free reserve pool. The entries from the free reserve pool are allocated to interfaces on a first-come first-served basis.

Service Policy Association

When a QoS service-policy with queuing actions is configured, but no explicit `queue-limit` command is attached in the egress direction on a physical interface, each of the class-based queues gets the same number of queue entries from within the dedicated quota for that physical port. When a queue is explicitly given a size using the `queue-limit` command, the switch tries to allocate all the entries from within the dedicated quota for the interface. If the required number of entries is greater than the dedicated quota for the interface, the switch tries to allocate the entries from the free reserve.

The queue entries associated with a queue always have to be consecutive. This requirement can result in fragmentation of the 512K of the queue entries that are shared across the switch. For example, an interface may not have enough entries for a queue in its dedicated quota and thus have to use the free reserve to set up that queue. In this case, the queue entries from the dedicated quota remain unused because they cannot be shared with any other port or slot.

When the QoS service-policy associated with an interface is removed, any queue entries taken from the free reserve are returned to the free reserve pool. The interface queuing configuration reverts to two queues — class-default and the control-packet queue with default shape, bandwidth, and size. The control-packet queue is set up with size 16 whereas the default queue is set up with the maximum size possible based on the dedicated quota for that interface.

Queue Allocation Failure

The switch might not be able to satisfy the explicit queue size required on one or more queues on an interface because of fragmentation of queue memory or lack of enough free reserve entries. In this scenario, the switch logs an error message to notify you of the failure. The QoS service-policy is left configured on the interface. You can fix the error by removing the QoS service-policy and examining the current usage of the queue entries from the free reserve by other ports on the switch.

To configure class-level queue-limit in a service policy, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# policy-map <i>policy-map-name</i>	Creates a policy map by entering the policy-map name, and enter policy-map configuration mode. By default, no policy maps are defined.
Step 3	Switch(config-pmap)# class <i>class-name</i>	Specifies the name of the class whose traffic policy you want to create or change, and enter policy-map class configuration mode. By default, no traffic classes are defined.
Step 4	Switch(config-pmap-class)# shape average { <i>cir-bps kbps</i> percent <i>percent</i> }	Enables average-rate traffic shaping. You can specify the bandwidth in kbps or as a percentage: <ul style="list-style-type: none"> For <i>cir-bps</i>, specify the committed information rate, the bit rate that traffic is shaped to, in bps. The range is 32000 to 10000000000 bps. For <i>percent</i>, specify the percentage of link rate to shape the class of traffic. The range is 1 to 100. By default, average-rate traffic shaping is disabled.
Step 5	Switch(config-pmap-class)# queue-limit <i>number-of-packets</i>	Provides an explicit queue size in packets. The size must be a multiple of 8 and ranging from 16 to 8184.
Step 6	Switch(config-pmap-class)# exit	Returns to policy-map configuration mode.
Step 7	Switch(config-pmap)# exit	Returns to global configuration mode.
Step 8	Switch(config)# interface <i>interface-id</i>	Specifies a physical port and enter interface configuration mode.
Step 9	Switch(config-interface)# service-policy output <i>policy-map-name</i>	Specifies the policy-map name, and apply it a physical interface.
Step 10	Switch(config-interface)# end	Returns to privileged EXEC mode.
Step 11	Switch# show policy-map [<i>policy-map-name</i> [class <i>class-map-name</i>]] or Switch# show policy-map interface <i>interface-id</i>	Verifies your entries.
Step 12	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To remove the explicit queue size use the **no queue-limit** command under the class in a policy-map.

This example shows how to configure a class-based queue with an explicit **queue-limit** command. It limits traffic class class1 to a queue of size 4048:

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
```

```

Switch(config-pmap-c)# queue-limit 4048
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch#

Switch# show policy-map policy1
  Policy Map policy1
    Class class1
      shape average 256000
      queue-limit 4048
Switch#

```

Active Queue Management (AQM) via Dynamic Buffer Limiting (DBL)

AQM provides buffering control of traffic flows prior to queuing a packet into a transmit queue of a port. This is of significant interest in a shared memory switch, ensuring that certain flows do not hog the switch packet memory.

Note

Supervisor Engine 6-E supports active switch buffer management via DBL.

Except for the default class of traffic (class class-default), you can configure DBL action only when at least one of the other queuing action is configured.

To configure class-level dbl action along with shaping in a service policy, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# policy-map <i>policy-map-name</i>	Creates a policy map by entering the policy-map name, and enter policy-map configuration mode. By default, no policy maps are defined.
Step 3	Switch(config-pmap)# class <i>class-name</i>	Specifies the name of the class whose traffic policy you want to create or change, and enter policy-map class configuration mode. By default, no traffic classes are defined.
Step 4	Switch(config-pmap-class)# shape average <i>cir-bps</i>	Enables average-rate traffic shaping. Specify the committed information rate, the bit rate that traffic is shaped to, in bps. The range is 32000 to 10000000000 bps. By default, average-rate traffic shaping is disabled.
Step 5	Switch(config-pmap-class)# dbl	Enables DBL on the queue associated with this class of traffic
Step 6	Switch(config-pmap-class)# exit	Returns to policy-map configuration mode.
Step 7	Switch(config-pmap)# exit	Returns to global configuration mode.
Step 8	Switch(config)# interface <i>interface-id</i>	Specifies a physical port and enter interface configuration mode.
Step 9	Switch(config-interface)# service-policy output <i>policy-map-name</i>	Specifies the policy-map name, and apply it a physical interface.
Step 10	Switch(config-interface)# end	Returns to privileged EXEC mode.

	Command	Purpose
Step 11	<pre>Switch# show policy-map [<i>policy-map-name</i> [<i>class</i> <i>class-map-name</i>]] or Switch# show policy-map interface <i>interface-id</i></pre>	Verifies your entries.
Step 12	<pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

To delete an existing policy map, use the **no policy-map *policy-map-name*** global configuration command. To delete an existing class, use the **no class *class-name* policy-map** configuration command. To disable DBL on the associated queue, use the **no dbL policy-map *class*** configuration command.

The following example shows how to configure class-level, DBL action along with average-rate shaping. It enables DBL on the queue associated with traffic-class *class1*.

```
Switch# configure terminal
Switch(config)# policy-map policy1
Switch(config-pmap)# class class1
Switch(config-pmap-c)# shape average 256000
Switch(config-pmap-c)# dbL
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# service-policy output policy1
Switch(config-if)# end
Switch#

Switch# show policy-map policy1
  Policy Map policy1
    Class class1
      shape average 256000
      dbL
```

Transmit Queue Statistics

Transmit queue statistics are visible via the **show policy-map interface** command.

Policy Associations

Supervisor Engine 6-E supports per-port, per-VLAN policies. The associated policies are attached to the interface, VLAN, and a specific VLAN on a given port, respectively.

A policy can be associated with a variety of objects. The following table lists the objects and the actions allowed.

Table 37-1 Table QoS Policy Associations

Object	Action
Physical port	Policing, marking, and queuing
VLAN	Policing and marking
Port and VLAN (PV)	Policing and marking

Table 37-1 Table QoS Policy Associations

Object	Action
EtherChannel	Policing and marking
EtherChannel member port	Queuing

Qos Action Restrictions

- The same actions cannot be performed multiple times in a given direction on different targets. In other words, it is not possible to police the packets both on port and VLAN in the input direction. However, the user can police on the input port and on the output VLAN.
- Queuing actions are only allowed in the egress direction and only on the physical port.
- Percentage-based actions like policer cannot be configured on a VLAN.
- Port channel or VLAN configuration can only have a policing or a marking action, not a queueing action.

Qos Policy priorities

- If a policy on a port and a VLAN are configured with conflicting actions (such as policing or marking actions on both a port and VLAN), the port policy is picked.
- If policy on a VLAN on a given port must be over-written, the user can configure PV policy.

Qos Policy merging

Applicable policies are applied to a given packet in given direction. For example, if you configure egress VLAN-based police and marking, followed by selective queuing on the port, then actions from both policies will be applied for this packet.

The following policy-map configuration restrictions are imposed on an EtherChannel:

- only policing and marking actions are supported at the EtherChannel level
- only queuing actions are supported at the physical member port level

A packet can be marked (dscp or cos fields) by the EtherChannel policy. If the physical member port policy uses a classification based on dscp or cos fields, it must be based on the marked (modified) value. To ensure proper operation, the following restriction is placed on the EtherChannel.

The classification criteria for the policy-map on the physical member ports has to based only on one type of field:

- dscp
- precedence
- cos
- any non marking field (no dscp or cos based classification)

Classification criteria for the policy-map on the physical member ports cannot be based on a combination of fields. This restriction ensures that if the EtherChannel policy is marking down dscp or cos, the marked (modified) value-based classification can be implemented in hardware.

Auto-QoS is not supported on EtherChannel or its member ports. A physical port configured with Auto-QoS is not allowed to become a member of a physical port.

Software QoS

At the highest level, there are two types of locally sourced traffic (such as control protocol packets, pings, and telnets) from the switch: high priority traffic (typically the control protocol packets like OSPF Hellos and STP) and low priority packets (all other packet types).

The QoS treatment for locally-sourced packets differs for the two types.

Supervisor Engine 6-E provides a way to apply QoS to packets processed in the software path. The packets that get this QoS treatment in software can be classified into two types: software switched packets and software generated packets.

On reception, software switched packets are sent to the CPU that in turn sends them out of another interface. For such packets, input software QoS provides input marking and output software QoS provides output marking and queue selection.

The software generated packets are the ones locally sourced by the switch. The type of output software QoS processing applied to these packets is the same as the one applied to software switched packets. The only difference in the two is that the software switched packets take input marking of the packet into account for output classification purpose.

High Priority Packets

High priority packets are marked as one of the following:

- internally with PAK_PRIORITY
- with IP Precedence of 6 (for IP packets)
- with CoS of 6 (for VLAN Tagged packets)

These packets behave as follows:

- They are not dropped because of any policing, AQM, drop thresholds (or any feature that can drop a packet) configured as per the egress service policy. However, they might be dropped because of hardware resource constraints (packet buffers, queue full, etc.).
- They are classified and marked as per the marking configuration of the egress service policy that could be a port or VLAN (refer to the “Policy Associations” section on page 37-90).
- These high priority packets are enqueued to queue on the egress port based on the following criteria:
 - If there is no egress queuing policy on the port, the packet is queued to a control packet queue that is setup separately from the default queue and has 5 percent of the link bandwidth reserved for it.
 - If there is an egress queuing policy on the port, the queue is selected based on the classification criteria applicable to the packet.

Low Priority Packets

Packets that are not considered high priority (as described previously) are considered *unimportant*. These include locally sourced pings, telnet, and other protocol packets. They undergo the same treatment as any other packet that is transiting the given transmit port including egress classification, marking and queuing.

Configuring CoS Mutation

CoS reflection and CoS mutation are supported on Supervisor Engine 6-E and Catalyst 4900M. Below is an example of how to apply CoS reflection.

Let us say that traffic arrives on interface gigabit 2/5 with VLAN 10 and COS 1, 2, We want traffic to egress interface gigabit 2/6 with outer tag VLAN 11 and CoS copied from C-tag, where C-tag is VLAN 10 and COS 1, 2, ...

```
class-map match-all c2

    match cos 2

class-map match-all c1

    match cos 1

!

policy-map my

class c1

    set cos 1

class c2

    set cos 2

interface GigabitEthernet2/5

switchport mode trunk

switchport vlan mapping 10 dot1q-tunnel 11

spanning-tree bpdupfilter enable

service-policy input my

!

interface GigabitEthernet2/6

switchport mode trunk
```

Configuring Auto-QoS on Supervisor Engine 6-E and Catalyst 4900M

Note

Auto-QoS cannot be applied to EtherChannel interfaces or VLANs.

Unlike auto-QoS on Supervisor Engines II-Plus to V-10GE, auto-QoS on Supervisor Engine 6-E employs the MQC model. This means that instead of using certain global configurations (like qos and qos dbl), auto-QoS applied to any interface on a switch with Supervisor Engine 6-E configures several global class-maps and policy-maps.

The class-maps are as follows:

```
class-map match-all AutoQos-VoIP-Control-Dscp26
  match dscp af31
class-map match-all AutoQos-VoIP-Control-Dscp24
  match dscp cs3
class-map match-all AutoQos-VoIP-Bearer-Cos
  match cos 5
class-map match-all AutoQos-VoIP-Control-QosGroup24
  match qos-group 24
class-map match-all AutoQos-VoIP-Control-QosGroup26
  match qos-group 26
class-map match-all AutoQos-VoIP-Bearer-QosGroup
  match qos-group 46
class-map match-all AutoQos-VoIP-Bearer-Dscp
  match dscp ef
class-map match-all AutoQos-VoIP-Control-Cos
  match cos 3
```

The class maps are intended to identify control and data (bearer) voice traffic for either an Layer 2 or Layer 3 interface.

The policy maps are as follows:

```
policy-map AutoQos-VoIP-Input-Dscp-Policy
  class AutoQos-VoIP-Bearer-Dscp
    set qos-group 46
  class AutoQos-VoIP-Control-Dscp26
    set qos-group 26
  class AutoQos-VoIP-Control-Dscp24
    set qos-group 24
policy-map AutoQos-VoIP-Input-Cos-Policy
  class AutoQos-VoIP-Bearer-Cos
    set qos-group 46
  class AutoQos-VoIP-Control-Cos
    set qos-group 24
policy-map AutoQos-VoIP-Output-Policy
  class AutoQos-VoIP-Bearer-QosGroup
    set dscp ef
    set cos 5
    priority
    police cir percent 33
  class AutoQos-VoIP-Control-QosGroup26
    set dscp af31
    set cos 3
    bandwidth remaining percent 5
  class AutoQos-VoIP-Control-QosGroup24
    set dscp cs3
    set cos 3
    bandwidth remaining percent 5
  class class-default
    dbl
```

The three policy maps are defined as follows:

- **policy-map AutoQos-VoIP-Input-Dscp-Policy**
This policy map is applied as an input service policy on an Layer 3 interface (such as an uplink connection to a neighboring switch) when auto-QoS is configured on the port.
- **policy-map AutoQos-VoIP-Input-Cos-Policy**
This policy map is applied as an input service policy on an Layer 2 interface that could be either an uplink connection or a port hooked to a Cisco IP Phone.

- `policy-map AutoQos-VoIP-Output-Policy`

This policy map is applied as an output policy for any port on which auto-QoS is configured, establishing policy governing egress traffic on the port based on whether it is voice data or control traffic.

The purpose of the input policy maps is to identify voice data or control traffic and mark it as such as it traverses the switch. The output policy map matches the packets on the marking occurring on ingress and then applies egress parameters such as bandwidth, policing and/or priority queuing.

The invocation of auto-QoS on a switch employing Supervisor Engine 6-E uses the same config commands used on Supervisor Engines II-Plus to V-10GE.

For switch-to-switch connections, the **[no] auto qos voip trust** command is used to apply an input and output service policy on the interface:

```
service-policy input AutoQos-VoIP-Input-Cos-Policy
```

OR

```
service-policy input AutoQos-VoIP-Input-Dscp-Policy
```

AND

```
service-policy output AutoQos-VoIP-Output-Policy
```

The selection of the input policy depends on whether the port is Layer 2 or Layer 3. For Layer 2, the policy trusts the Cos setting in the received packets. For Layer 3 ports, it relies on the DSCP value contained in the packets.

For phone connected ports, the **[no] auto qos voice cisco-phone** command is used to apply the following service policy to the port:

```
qos trust device cisco-phone
```

```
service-policy input AutoQos-VoIP-Input-Cos-Policy
```

AND

```
service-policy output AutoQos-VoIP-Output-Policy
```

It establishes a trusted boundary that recognizes Cisco IP Phones and trusts the Cos setting of the packets from the phone. If a Cisco IP Phone is not detected, the Cos field is ignored and the packets are not classified as voice traffic. Upon detecting a Cisco phone, the ingress packets are marked based on the Cos value in the packets. This marking is used on egress for proper traffic classification and handling.

CHAPTER 38

Configuring Voice Interfaces

This chapter describes how to configure voice interfaces for the Catalyst 4500 series switches.

This chapter includes the following major sections:

- [Overview of Voice Interfaces, page 38-1](#)
- [Configuring a Port to Connect to a Cisco 7960 IP Phone, page 38-3](#)
- [Configuring Voice Ports for Voice and Data Traffic, page 38-3](#)
- [Overriding the CoS Priority of Incoming Frames, page 38-5](#)
- [Configuring Power, page 38-5](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Voice Interfaces

Catalyst 4500 series switches can connect to a Cisco 7960 IP phone and carry IP voice traffic. If necessary, the switch can supply electrical power to the circuit connecting it to the Cisco 7960 IP phone.

Because the sound quality of an IP telephone call can deteriorate if the data is unevenly sent, the switch uses quality of service (QoS) based on IEEE 802.1p class of service (CoS). QoS uses classification and scheduling to transmit network traffic from the switch in a predictable manner. See [Chapter 37, “Configuring Quality of Service,”](#) for more information on QoS.

You can configure the Cisco 7960 IP phone to forward traffic with an 802.1p priority. You can use the CLI to configure a Catalyst 4000 Family to honor or ignore a traffic priority assigned by a Cisco 7960 IP phone.

The Cisco 7960 IP phone contains an integrated three-port 10/100 switch. The ports are dedicated connections as described below:

- Port 1 connects to the Catalyst 4500 series switch or other device that supports voice-over-IP.
- Port 2 is an internal 10/100 interface that carries the phone traffic.
- Port 3 connects to a PC or other device.

Figure 38-1 shows one way to configure a Cisco 7960 IP phone.

Figure 38-1 Cisco 7960 IP Phone Connected to a Catalyst 4500 Series Switch

Cisco IP Phone Voice Traffic

You can configure an access port with an attached Cisco IP Phone to use one VLAN for voice traffic and another VLAN for data traffic from a device attached to the phone. You can configure access ports on the switch to send Cisco Discovery Protocol (CDP) packets that instruct an attached phone to send voice traffic to the switch in any of these ways:

- In the voice VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN tagged with a Layer 2 CoS priority value
- In the access VLAN, untagged (no Layer 2 CoS priority value)

Note

In all configurations, the voice traffic carries a Layer 3 IP precedence value (the default is 5 for voice traffic and 3 for voice control traffic).

Cisco IP Phone Data Traffic

The switch can also process tagged data traffic (traffic in IEEE 802.1Q or IEEE 802.1p frame types) from the device attached to the access port on the Cisco IP Phone (see Figure 38-1). You can configure Layer 2 access ports on the switch to send CDP packets that instruct the attached phone to configure the phone access port in one of these modes:

- In trusted mode, all traffic received through the access port on the Cisco IP Phone passes through the phone unchanged.
- In untrusted mode, all traffic in IEEE 802.1Q or IEEE 802.1p frames received through the access port on the Cisco IP Phone receive a configured Layer 2 CoS value. The default Layer 2 CoS value is 0. Untrusted mode is the default.

Note

Untagged traffic from the device attached to the Cisco IP Phone passes through the phone unchanged, regardless of the trust state of the access port on the phone.

Configuring a Port to Connect to a Cisco 7960 IP Phone

Because a Cisco 7960 IP phone also supports connection to a PC or another device, an interface connecting a Catalyst 4500 series switch to a Cisco 7960 IP phone can carry a mix of voice and data traffic.

There are three configurations for a port connected to a Cisco 7960 IP phone:

- All traffic is transmitted according to the default CoS priority of the port. This is the default.
- Voice traffic is given a higher priority by the phone (CoS priority is always 5), and all traffic is in the same VLAN.
- Voice and data traffic are carried on separate VLANs.

To configure a port to instruct the phone to give voice traffic a higher priority and to forward all traffic through the 802.1Q native VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/port</i>	Specifies the interface to configure.
Step 3	Switch(config-if)# switchport voice vlan dot1p	Instructs the switch to use 802.1p priority tagging for voice traffic and to use VLAN 1 (default native VLAN) to carry all traffic.
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show interface { fastethernet gigabitethernet } <i>slot/port</i> switchport	Verifies the port configuration.

Configuring Voice Ports for Voice and Data Traffic

Because voice and data traffic can travel through the same voice port, you should specify a different VLAN for each type of traffic. You can configure a switch port to forward voice and data traffic on different VLANs.

Note For information on configuring sticky port security on voice VLANs, see the [Configuring Port Security on Voice Ports, page 43-22](#).

Note For information on using 802.1X with voice VLANs, see the [“Using 802.1X with Voice VLAN Ports” section on page 40-19](#).

To configure a port to receive voice and data traffic from a Cisco IP Phone on different VLANs, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/port</i>	Specifies the interface to configure.

	Command	Purpose
Step 3	Switch(config-if)# switchport mode access	Configures the interface as an access port. The voice VLAN is active only on access ports.
Step 4	Switch(config-if)# switchport voice vlan <i>vlan_num</i>	Instructs the Cisco IP phone to forward all voice traffic through a specified VLAN. The Cisco IP phone forwards the traffic with an 802.1p priority of 5.
Step 5	Switch(config-if)# switchport access vlan <i>data_vlan_num</i>	Configures the access VLAN (the data VLAN) on the port
Step 6	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 7	Switch# show interface { fastEthernet gigabitEthernet } <i>slot/port</i> switchport	Verifies the configuration.

In the following example, VLAN 1 carries data traffic, and VLAN 2 carries voice traffic. In this configuration, you must connect all Cisco IP phones and other voice-related devices to switch ports that belong to VLAN 2.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastEthernet 3/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 2
Switch(config-if)# switchport access vlan 3
Switch(config-if)# end
Switch# show interfaces fastEthernet 3/1 switchport
Name: Fa3/1

Switch#
```

Overriding the CoS Priority of Incoming Frames

A PC or another data device can connect to a Cisco 7960 IP phone port. The PC can generate packets with an assigned CoS value. You can also use the switch CLI to override the priority of frames arriving on the phone port from connected devices, and you can set the phone port to accept (trust) the priority of frames arriving on the port.

To override the CoS priority setting received from the non-voice port on the Cisco 7960 IP phone, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# interface { fastethernet gigabitethernet } <i>slot/port</i>	Specifies the interface to configure.
Step 3	Switch(config-if)# [no] qos trust extend cos 3	Sets the phone port to override the priority received from the PC or the attached device and forward the received data with a priority of 3. Use the no keyword to return the port to its default setting.
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show interface { fastethernet gigabitethernet } <i>slot/port</i> switchport	Verifies the change.

Configuring Power

The Catalyst 4500 series switch senses if it is connected to a Cisco 7960 IP phone. The Catalyst 4500 series switch can supply Power over Ethernet (PoE) to the Cisco 7960 IP phone if there is no power on the circuit. The Cisco 7960 IP phone can also be connected to an AC power source and supply its own power to the voice circuit. If there is power on the circuit, the switch does not supply it.

You can configure the switch not to supply power to the Cisco 7960 IP phone and to disable the detection mechanism. For information on the CLI commands that you can use to supply PoE to a Cisco 7960 IP phone, see [Chapter 11, “Configuring Power over Ethernet.”](#)

CHAPTER 39

Configuring Private VLANs

This chapter describes how to implement private VLANs (PVLANS) on Catalyst 4500 series switches. It also provides restrictions, procedures, and configuration examples.

This chapter includes the following major sections:

- [Command List, page 39-1](#)
- [Private VLANs, page 39-2](#)
- [Configuring PVLANS, page 39-10](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Command List

This table lists the commands most commonly used with PVLANS.

Command	Purpose	Location
private-vlan { community isolated primary }	Configures a VLAN as a PVLAN.	Configuring a VLAN as a PVLAN, page 39-13
private-vlan association { <i>secondary_vlan_list</i> add <i>secondary_vlan_list</i> remove <i>secondary_vlan_list</i> }	Associates the secondary VLAN with the primary VLAN. The list can contain only one isolated VLAN ID; it can also contain multiple community VLAN IDs.	Associating a Secondary VLAN with a Primary VLAN, page 39-14

Command	Purpose	Location
show vlan private-vlan [type]	Verifies the configuration.	Configuring a VLAN as a PVLAN, page 39-13 Associating a Secondary VLAN with a Primary VLAN, page 39-14
show interface private-vlan mapping	Verifies the configuration.	Permitting Routing of Secondary VLAN Ingress Traffic, page 39-21
switchport mode private-vlan {host promiscuous trunk promiscuous trunk [secondary]}	Configures a Layer 2 interface as a PVLAN port.	Configuring PVLANS, page 39-10
switchport private-vlan mapping [trunk] primary_vlan_ID {secondary_vlan_list add secondary_vlan_list remove secondary_vlan_list}	Maps the PVLAN promiscuous port to a primary VLAN and to selected secondary VLANs.	Configuring a Layer 2 Interface as a PVLAN Promiscuous Port, page 39-16 Configuring a Layer 2 Interface as a Promiscuous PVLAN Trunk Port, page 39-19
Switch(config-if)# switchport private-vlan host-association primary_vlan_ID secondary_vlan_ID	Associates the Layer 2 interface with a PVLAN. Note You can associate only one primary-secondary VLAN pair to the isolated port.	Configuring a Layer 2 Interface as a PVLAN Host Port, page 39-17
switchport private-vlan association trunk primary_vlan_ID secondary_vlan_ID	Configures association between primary VLANs and secondary VLANs the PVLAN trunk port with a PVLAN. Note You can configure the isolated trunk port with multiple primary-secondary pair.	Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port, page 39-18
switchport private-vlan trunk allowed vlan vlan_list all none [add remove except] vlan_atom[,vlan_atom...]	Configures a list of allowed normal VLANs on a PVLAN trunk port.	Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port, page 39-18
switchport private-vlan trunk native vlan vlan_id	Configures a VLAN to which untagged packets (as in IEEE 802.1Q tagging) are assigned on a PVLAN trunk port.	Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port, page 39-18

Private VLANs

The private VLAN feature addresses two problems that service providers face when using VLANs:

- The switch supports up to 1005 active VLANs. If a service provider assigns one VLAN per customer, this limits the numbers of customers the service provider can support.
- To enable IP routing, each VLAN is assigned a subnet address space or a block of addresses, which can result in wasting the unused IP addresses, and cause IP address management problems.

Using private VLANs provides scalability and IP address management benefits for service providers and Layer 2 security for customers. Private VLANs partition a regular VLAN domain into subdomains. A subdomain is represented by a pair of VLANs: a *primary* VLAN and a *secondary* VLAN. A private VLAN can have multiple VLAN pairs, one pair for each subdomain. All VLAN pairs in a private VLAN share the same primary VLAN. The secondary VLAN ID differentiates one subdomain from another. See [Figure 39-1](#).

Figure 39-1 Private-VLAN Domain

There are two types of secondary VLANs:

- **Isolated VLANs**—Ports within an isolated VLAN cannot communicate with each other at the Layer 2 level.
- **Community VLANs**—Ports within a community VLAN can communicate with each other but cannot communicate with ports in other communities at the Layer 2 level.

A promiscuous port can serve only one primary VLAN, one isolated VLAN, and multiple community VLANs. Layer 3 gateways are typically connected to the switch through a promiscuous port.

In a switched environment, you can assign an individual private VLAN and associated IP subnet to each individual or common group of end stations. The end stations need to communicate only with a default gateway to communicate outside the private VLAN.

You can use private VLANs to control access to end stations in these ways:

- Configure selected interfaces connected to end stations as isolated ports to prevent any communication at Layer 2. For example, if the end stations are servers, this configuration prevents Layer 2 communication between the servers.
- Configure interfaces connected to default gateways and selected end stations (such as, backup servers) as promiscuous ports to allow all end stations access to a default gateway.

- Reduce VLAN and IP subnet consumption; you can prevent traffic between end stations even though they are in the same VLAN and IP subnet.

With a promiscuous port, you can connect a wide range of devices as access points to a PVLAN. For example, you can connect a promiscuous port to the server port of a LocalDirector to connect an isolated VLAN or a number of community VLANs to the server. LocalDirector can load balance the servers present in the isolated or community VLANs, or you can use a promiscuous port to monitor or back up all the PVLAN servers from an administration workstation.

This section includes the following topics:

- [Definition Table, page 39-4](#)
- [Private VLANs across Multiple Switches, page 39-5](#)
- [Private-VLAN Interaction with Other Features, page 39-8](#)

Definition Table

Term	Definition
Private VLANs	Private VLANs are sets of VLAN pairs that share a common primary identifier and provide a mechanism for achieving layer-2 separation between ports while sharing a single layer-3 router port and IP subnet.
Secondary VLAN	A type of VLAN used to implement private VLANs. Secondary VLANs are associated with a primary VLAN, and are used to carry traffic from hosts to other allowed hosts or to routers.
Community Port	A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with promiscuous ports. These interfaces are isolated at Layer 2 from all other interfaces in other communities and from isolated ports within their private VLAN.
Community VLAN	Community VLAN—A community VLAN is a secondary VLAN that carries upstream traffic from the community ports to the promiscuous port gateways and to other host ports in the same community. You can configure multiple community VLANs in a private VLAN.
Isolated Port	An isolated port is a host port that belongs to an isolated secondary VLAN. It has complete Layer 2 separation from other ports within the same private VLAN, except for the promiscuous ports. Private VLANs block all traffic to isolated ports except traffic from promiscuous ports. Traffic received from an isolated port is forwarded only to promiscuous ports.
Isolated VLAN	Isolated VLAN —A private VLAN has only one isolated VLAN. An isolated VLAN is a secondary VLAN that carries unidirectional traffic upstream from the hosts toward the promiscuous ports and the gateway.

Term	Definition
Primary VLAN	Primary VLAN—A private VLAN has only one primary VLAN. Every port in a private VLAN is a member of the primary VLAN. The primary VLAN carries unidirectional traffic downstream from the promiscuous ports to the (isolated and community) host ports and to other promiscuous ports.
Private VLAN Trunk Port	A PVLAN trunk port can carry multiple secondary (isolated only) and non-PVLANS. Packets are received and transmitted with secondary or regular VLAN tags on the PVLAN trunk ports. Note Only IEEE 802.1q encapsulation is supported.
Promiscuous Port	A promiscuous port belongs to the primary VLAN and can communicate with all interfaces, including the community and isolated host ports and private VLAN trunk ports that belong to the secondary VLANs associated with the primary VLAN.
Promiscuous Trunk Port	A promiscuous trunk port can carry multiple primary and normal VLANs. Packets are received and transmitted with primary or regular VLAN tags. Other than that, the port behaves just like a promiscuous access port. Note Only IEEE 802.1q encapsulation is supported.

Private VLANs across Multiple Switches

This section discusses the following topics:

- [Standard Trunk Ports, page 39-5](#)
- [Isolated Private VLAN Trunk Ports, page 39-6](#)
- [Promiscuous Private VLAN Trunk Ports, page 39-8](#)

Standard Trunk Ports

As with regular VLANs, private VLANs can span multiple switches. A trunk port carries the primary VLAN and secondary VLANs to a neighboring switch. The trunk port treats the private VLAN as any other VLAN. A feature of private VLANs across multiple switches is that traffic from an isolated port in switch A does not reach an isolated port on Switch B. See [Figure 39-2](#).

To maintain the security of your private-VLAN configuration and to avoid other use of the VLANs configured as private VLANs, configure private VLANs on all intermediate devices, including devices that have no private-VLAN ports.

Note

Trunk ports carry traffic from regular VLANs and also from primary, isolated, and community VLANs.

Note

You should use standard trunk ports if both switches undergoing trunking support PVLANS.

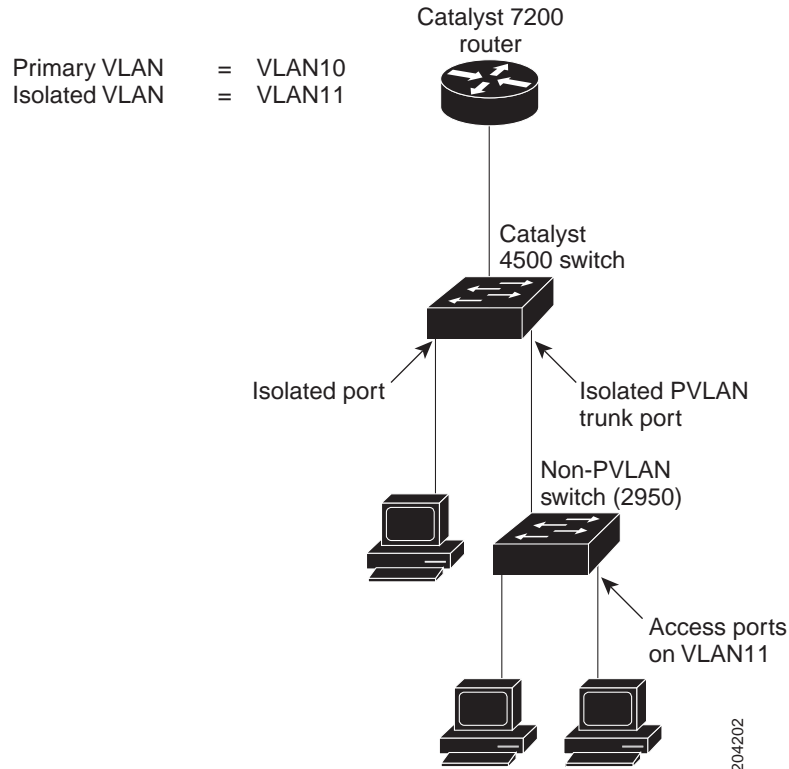

Figure 39-2 Private VLANs across Switches

VLAN 100 = Primary VLAN
 VLAN 201 = Secondary isolated VLAN
 VLAN 202 = Secondary community VLAN

Because VTP does not support private VLANs, you must manually configure private VLANs on all switches in the Layer 2 network. If you do not configure the primary and secondary VLAN association in some switches in the network, the Layer 2 databases in these switches are not merged. This can result in unnecessary flooding of private-VLAN traffic on those switches.

Isolated Private VLAN Trunk Ports

You would use a isolated PVLAN trunk ports when you would anticipate using PVLAN isolated host ports to carry multiple VLANs, either normal VLANs or for multiple PVLAN domains. This makes it useful for connecting a downstream switch that does not support PVLANS (like Catalyst 2950).

Figure 39-3 Isolated PVLAN Trunk Ports

In this illustration, a Catalyst 4500 switch is being used to connect a downstream switch that does not support PVLANS.

Traffic being sent in the downstream direction towards host1 from the router is received by the Catalyst 4500 series switch on the promiscuous port and in the primary VLAN (VLAN 10). The packets are then switched out of the isolated PVLAN trunk, but rather than being tagged with the primary VLAN (VLAN 10) they are instead transmitted with the isolated VLAN's tag (VLAN 11). In this way, when the packets arrive on the non-PVLAN switch, they can be bridged to the destination host's access port.

Traffic in the upstream direction is sent by host1 to the non-PVLAN switch, arriving in VLAN 11. The packets are then transmitted to the Catalyst 4500 series switch tagged with that VLAN's tag (VLAN 11) over the trunk port. On the Catalyst 4500 series switch, VLAN 11 is configured as the isolated vlan, and the traffic is forwarded as if it came from an isolated host port.

**Note**

When an isolated trunk is used in this fashion, the Catalyst 4500 series switch provides isolation between the isolated trunk and directly connected hosts (such as host3), but not between hosts connected to the non-PVLAN switch (such as host1 and host2). Isolation between these hosts must be provided by the non-PVLAN switch, using a feature such as protected ports on a Catalyst 2950.

For details on protected ports, see the URL:

http://www.cisco.com/en/US/docs/switches/lan/catalyst2950/software/release/12.1_22_ea11x/configuration/guide/swtrafc.html#wp1158863

Promiscuous Private VLAN Trunk Ports

PVLAN Promiscuous Trunks are used in situations where one would normally use a PVLAN promiscuous host port but where it is necessary to carry multiple vlans, either normal vlans or for multiple PVLAN domains. This makes it useful for connecting an upstream router that does not support Private VLANs, such as a Cisco 7200.

Figure 39-4 Promiscuous PVLAN Trunk Ports

In this illustration, a Catalyst 4500 series switch is being used to connect a PVLAN domain to an upstream router which does not support PVLANs. Traffic being sent upstream by host1 arrives on the Catalyst 4500 series switch in the community VLAN (VLAN 12). When this traffic is bridged onto the promiscuous PVLAN trunk towards the router, it is tagged with the primary VLAN (VLAN 10), so that it can be routed via the correct subinterface configured on the router.

Traffic in the downstream direction is received on the promiscuous PVLAN trunk port by the Catalyst 4500 switch in the primary VLAN (VLAN 10), just as if it had been received on a promiscuous host port. It can then be bridged to the destination host as in any PVLAN domain.

PVLAN promiscuous trunks interact with VLAN QoS. Refer to the section [“PVLANs and VLAN ACL/QoS”](#) section on page 39-9.

Private-VLAN Interaction with Other Features

Private VLANs have specific interaction with some other features, described in these sections:

- [PVLANs and VLAN ACL/QoS, page 39-9](#)
- [Private VLANs and Unicast, Broadcast, and Multicast Traffic, page 39-9](#)
- [Private VLANs and SVIs, page 39-10](#)
- [Per-Virtual-Port Error Disable on Private VLANs, page 39-10](#)

For details, see the section “PVLAN Configuration Guidelines and Restrictions” on page 11.

PVLANs and VLAN ACL/QoS

PVLAN ports use primary and secondary VLANs, as follows:

- A packet received on a PVLAN host port belongs to the secondary VLAN.
- A packet received on a PVLAN trunk port belongs to the secondary VLAN if the packet is tagged with a secondary VLAN or if the packet is untagged and the native VLAN on the port is a secondary VLAN.

A packet received on a PVLAN host or trunk port and assigned to a secondary VLAN is bridged on the secondary VLAN. Because of this bridging, the secondary VLAN ACL as well as the secondary VLAN QoS (on input direction) apply.

When a packet is transmitted out of a PVLAN host or trunk port, the packet logically belongs to the primary VLAN. This relationship applies even though the packet may be transmitted with the secondary VLAN tagging for PVLAN trunk ports. In this situation, the primary VLAN ACL and the primary VLAN QoS on output apply to the packet.

- Similarly, a packet received on a PVLAN promiscuous access port belongs to primary VLAN.
- A packet received on a PVLAN promiscuous trunk port could belong to the primary VLAN or normal VLAN depending on incoming VLAN.

For traffic flowing in normal VLAN on promiscuous trunk ports, normal VLAN ACL and QoS policies apply. For traffic flowing in a private VLAN domain, a packet received on a promiscuous port is bridged in primary VLAN. Therefore, the primary VLAN ACL and QoS policies apply on input.

When a packet is transmitted out of a promiscuous trunk port, the packet could logically belong to secondary VLAN if received from a secondary port, or in primary VLAN if bridged from another promiscuous port. Because we cannot differentiate between both packets, all VLAN QoS policies are ignored on packets egressing promiscuous trunk ports.

Private VLANs and Unicast, Broadcast, and Multicast Traffic

In regular VLANs, devices in the same VLAN can communicate with each other at the Layer 2 level, but devices connected to interfaces in different VLANs must communicate at the Layer 3 level. In private VLANs, the promiscuous ports are members of the primary VLAN, while the host ports belong to secondary VLANs. Because the secondary VLAN is associated to the primary VLAN, members of the these VLANs can communicate with each other at the Layer 2 level.

In a regular VLAN, broadcasts are forwarded to all ports in that VLAN. Private VLAN broadcast forwarding depends on the port sending the broadcast:

- An isolated port sends a broadcast only to the promiscuous ports or trunk ports.
- A community port sends a broadcast to all promiscuous ports, trunk ports, and ports in the same community VLAN.
- A promiscuous port sends a broadcast to all ports in the private VLAN (other promiscuous ports, trunk ports, isolated ports, and community ports).

Multicast traffic is routed or bridged across private-VLAN boundaries and within a single community VLAN. Multicast traffic is not forwarded between ports in the same isolated VLAN or between ports in different secondary VLANs.

Private VLANs and SVIs

In a Layer 3 switch, a switch virtual interface (SVI) represents the Layer 3 interface of a VLAN. Layer 3 devices communicate with a private VLAN only through the primary VLAN and not through secondary VLANs. Configure Layer 3 VLAN interfaces (SVIs) only for primary VLANs. You cannot configure Layer 3 VLAN interfaces for secondary VLANs. SVIs for secondary VLANs are inactive while the VLAN is configured as a secondary VLAN.

- If you try to configure a VLAN with an active SVI as a secondary VLAN, the configuration is not allowed until you disable the SVI.
- If you try to create an SVI on a VLAN that is configured as a secondary VLAN and the secondary VLAN is already mapped at Layer 3, the SVI is not created, and an error is returned. If the SVI is not mapped at Layer 3, the SVI is created, but it is automatically shut down.

When the primary VLAN is associated with and mapped to the secondary VLAN, any configuration on the primary VLAN is propagated to the secondary VLAN SVIs. For example, if you assign an IP subnet to the primary VLAN SVI, this subnet is the IP subnet address of the entire private VLAN.

Per-Virtual-Port Error Disable on Private VLANs

For private VLANs, per-virtual-port error disable behavior is defined as follows:

- On a PVLAN promiscuous or promiscuous trunk ports, if a violation occurs on the primary VLAN, it is error disabled.
- On a PVLAN host or trunk port, if a violation occurs on the secondary VLAN, the associated primary VLAN is error disabled.
- On a standard trunk port that carries both primary and secondary VLANs, if a violation occurs on the primary VLAN, this VLAN and all its associated secondary VLANs are error disabled. If a violation occurs on a secondary VLAN, the associated primary VLAN and all its associated secondary VLANs are error disabled.

Configuring PVLANS

These sections describe how to configure PVLANS:

- [Tasks for Configuring Private VLANs, page 39-11](#)
- [Default Private-VLAN Configuration, page 39-11](#)
- [PVLAN Configuration Guidelines and Restrictions, page 39-11](#)
- [Configuring a VLAN as a PVLAN, page 39-13](#)
- [Associating a Secondary VLAN with a Primary VLAN, page 39-14](#)
- [Configuring a Layer 2 Interface as a PVLAN Promiscuous Port, page 39-16](#)
- [Configuring a Layer 2 Interface as a PVLAN Host Port, page 39-17](#)
- [Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port, page 39-18](#)
- [Configuring a Layer 2 Interface as a Promiscuous PVLAN Trunk Port, page 39-19](#)
- [Permitting Routing of Secondary VLAN Ingress Traffic, page 39-21](#)

Tasks for Configuring Private VLANs

To configure a PVLAN, follow these steps:

-
- Step 1** Set VTP mode to transparent. See the [“VLAN Trunking Protocol”](#) section on page 14-8.
 - Step 2** Create the secondary VLANs. See the [“Configuring a VLAN as a PVLAN”](#) section on page 39-13.
 - Step 3** Create the primary VLAN. See the [“Configuring a VLAN as a PVLAN”](#) section on page 39-13.
 - Step 4** Associate the secondary VLAN to the primary VLAN. See the [“Associating a Secondary VLAN with a Primary VLAN”](#) section on page 39-14.

Note Only one isolated VLAN can be mapped to a primary VLAN, but more than one community VLAN can be mapped to a primary VLAN.

- Step 5** Configure an interface as an isolated or community host or trunk port. See the [“Configuring a Layer 2 Interface as a PVLAN Host Port”](#) section on page 39-17 and [“Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port”](#) section on page 39-18.
 - Step 6** Associate the isolated port or community port to the primary-secondary VLAN pair. See the [“Associating a Secondary VLAN with a Primary VLAN”](#) section on page 39-14.
 - Step 7** Configure an interface as a promiscuous port. See the [“Configuring a Layer 2 Interface as a PVLAN Promiscuous Port”](#) section on page 39-16.
 - Step 8** Map the promiscuous port to the primary-secondary VLAN pair. See the [“Configuring a Layer 2 Interface as a PVLAN Promiscuous Port”](#) section on page 39-16.
 - Step 9** If you plan to use inter-VLAN routing, configure the primary SVI, and map secondary VLANs to the primary. See the [“Permitting Routing of Secondary VLAN Ingress Traffic”](#) section on page 39-21.
 - Step 10** Verify private-VLAN configuration. See the [“Switch#”](#) section on page 39-22.
-

Default Private-VLAN Configuration

No private VLANs are configured.

PVLAN Configuration Guidelines and Restrictions

Follow these guidelines when configuring PVLANS:

- To configure a PVLAN correctly, enable VTP in transparent mode in VTP version 1 and VTP version 2. (VTP version 3 enables you to create it in server mode).

You cannot change the VTP mode to client or server for PVLANS.

- Do not include VLAN 1 or VLANs 1002 through 1005 in PVLANS.
- Use only PVLAN commands to assign ports to primary, isolated, or community VLANs.

Layer 2 interfaces on primary, isolated, or community VLANs are inactive in PVLANS. Layer 2 trunk interfaces remain in the STP forwarding state.

- You cannot configure Layer 3 VLAN interfaces for secondary VLANs.
Layer 3 VLAN interfaces for isolated and community (secondary) VLANs are inactive while the VLAN is configured as an isolated or community VLAN.
- Do not configure private VLAN ports as EtherChannels. While a port is part of the private VLAN configuration, its associated EtherChannel configuration is inactive.
- Do not apply dynamic access control entries (ACEs) to primary VLANs.
Cisco IOS dynamic ACL configuration applied to a primary VLAN is inactive while the VLAN is part of the PVLAN configuration.
- To prevent spanning tree loops due to misconfigurations, enable PortFast on the PVLAN trunk ports with the **spanning-tree portfast trunk** command.
- Any VLAN ACL configured on a secondary VLAN is effective in the input direction, and any VLAN ACL configured on the primary VLAN associated with the secondary VLAN is effective in the output direction.
- You can stop Layer 3 switching on an isolated or community VLAN by deleting the mapping of that VLAN with its primary VLAN.
- PVLAN ports can be on different network devices as long as the devices are trunk-connected and the primary and secondary VLANs remain associated with the trunk
- Isolated ports on two different devices cannot communicate with each other, but community VLAN ports can.
- Private VLANs support the following SPAN features:
 - You can configure a private VLAN port as a SPAN source port.
 - You can use VLAN-based SPAN (VSPAN) on primary, isolated, and community VLANs or use SPAN on only one VLAN to monitor egress or ingress traffic separately.

For more information about SPAN, see [Chapter 50, “Configuring SPAN and RSPAN.”](#)

- A primary VLAN can be associated with multiple community VLANs, but only one isolated VLAN.
- An isolated or community VLAN can be associated with only one primary VLAN.
- If you delete a VLAN used in a private VLAN configuration, the private VLAN ports associated with the VLAN become inactive.
- VTP does not support private VLANs. You must configure private VLANs on each device in which you plan to use private VLAN ports.
- To maintain the security of your PVLAN configuration and avoid other use of VLANs configured as PVLANS, configure PVLANS on all intermediate devices, even if the devices have no PVLAN ports.
- Prune the PVLANS from trunks on devices that carry no traffic in the PVLANS.
- With port ACLS functionality available, you can apply Cisco IOS ACLS to secondary VLAN ports and Cisco IOS ACLS to PVLANS (VACLs). For more information on VACLs, see [Chapter 47, “Configuring Network Security with ACLs.”](#)
- You can apply different quality of service (QoS) configurations to primary, isolated, and community VLANs. (See [Chapter 37, “Configuring Quality of Service.”](#)) Cisco IOS ACLs applied to the Layer 3 VLAN interface of a primary VLAN automatically apply to the associated isolated and community VLANs.
- On a PVLAN trunk port a secondary VLAN ACL is applied on ingress traffic and a primary VLAN ACL is applied on egress traffic.

- On a promiscuous port the primary VLAN ACL is applied on ingress traffic.
- Both PVLAN secondary and promiscuous trunk ports support only IEEE 802.1q encapsulation.
- Community VLANs cannot be propagated or carried over private VLAN trunks.
- ARP entries learned on Layer 3 PVLAN interfaces are termed “sticky” ARP entries (we recommend that you display and verify PVLAN interface ARP entries).
- For security reasons, PVLAN port sticky ARP entries do not age out. Connecting a device with a different MAC address but with the same IP address generates an error message and the ARP entry is not created.
- Because PVLAN port sticky ARP entries do not age out, you must manually remove the entries if you change the MAC address. To overwrite a sticky ARP entry, first delete the entry with the **no arp** command, then overwrite the entry with the **arp** command.
- In a DHCP environment, if you shut down your PC, it is not possible to give your IP address to someone else. To solve this problem, the Catalyst 4500 series switch supports the **no ip sticky-arp** command. This command promotes IP address overwriting and reuse in a DHCP environment.
- Normal VLANs can be carried on a promiscuous or isolated trunk port.
- The default native VLAN for promiscuous trunk port is VLAN 1, the management VLAN. All untagged packets are forwarded in the native VLAN. Either the primary VLANs or a regular VLAN can be configured as native VLAN.
- Promiscuous trunks cannot be configured to carry secondary VLANs. If a secondary VLAN is specified in the allowed VLAN list, the configuration is accepted but the port is not operational/forwarding in the secondary VLAN. This includes even those VLANs that are of secondary but not associated with any primary VLAN on given port.
- On a promiscuous trunk port, the primary VLAN ACL and QoS are applied on ingress traffic coming in primary VLANs.
- On a promiscuous trunk port, no VLAN ACL or QoS is applied to the egress traffic. This is because for upstream direction, traffic in private VLAN logically flows in the secondary VLAN. Due to VLAN translation in hardware, information about received secondary VLANs has been lost. Hence, no policies are applied. This restriction also applies to traffic bridged from other ports in the same primary VLANs.
- Do not configure port security on PVLAN promiscuous trunk port and vice versa.
If port security is enabled on a promiscuous trunk port, that port may behave in an unpredictable manner because this functionality is not supported.
- Do not configure IEEE 802.1X on a PVLAN promiscuous trunk port.

**Note**

Community private VLAN trunk ports are not supported.

Configuring a VLAN as a PVLAN

To configure a VLAN as a PVLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# vlan <i>vlan_ID</i>	Enters VLAN configuration mode.

	Command	Purpose
Step 3	Switch(config-vlan)# private-vlan {community isolated primary}	Configures a VLAN as a PVLAN. <ul style="list-style-type: none"> This command does not take effect until you exit VLAN configuration submode. You can use the no keyword to clear PVLAN status.
Step 4	Switch(config-vlan)# end	Exits VLAN configuration mode.
Step 5	Switch# show vlan private-vlan [type]	Verifies the configuration.

This example shows how to configure VLAN 202 as a primary VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# end
Switch# show vlan private-vlan
Primary Secondary Type Interfaces
-----
202 primary
```

This example shows how to configure VLAN 303 as a community VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 303
Switch(config-vlan)# private-vlan community
Switch(config-vlan)# end
Switch# show vlan private-vlan

Primary Secondary Type Interfaces
-----
202 primary
303 community
```

This example shows how to configure VLAN 440 as an isolated VLAN and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 440
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# end
Switch# show vlan private-vlan

Primary Secondary Type Interfaces
-----
202 primary
303 community
440 isolated
```

Associating a Secondary VLAN with a Primary VLAN

To associate secondary VLANs with a primary VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# vlan primary_vlan_ID	Enters VLAN configuration mode for the primary VLAN.

	Command	Purpose
Step 3	Switch(config-vlan)# private-vlan association { <i>secondary_vlan_list</i> add <i>secondary_vlan_list</i> remove <i>secondary_vlan_list</i> }	Associates the secondary VLAN with the primary VLAN. The list can contain only one isolated VLAN ID; it can also contain multiple community VLAN IDs. You can use the no keyword to clear all secondary associations.
Step 4	Switch(config-vlan)# end	Exits VLAN configuration mode.
Step 5	Switch# show vlan private-vlan [<i>type</i>]	Verifies the configuration.

When you associate secondary VLANs with a primary VLAN, note the following:

- The *secondary_vlan_list* parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs.
- The *secondary_vlan_list* parameter can contain multiple community VLAN IDs.
- The *secondary_vlan_list* parameter can contain only one isolated VLAN ID.
- Enter a *secondary_vlan_list* or use the **add** keyword with a *secondary_vlan_list* to associate secondary VLANs with a primary VLAN.
- Use the **remove** keyword with a *secondary_vlan_list* to clear the association between secondary VLANs and a primary VLAN.
- The command does not take effect until you exit VLAN configuration submode.

This example shows how to associate community VLANs 303 through 307 and 309 and isolated VLAN 440 with primary VLAN 202 and verify the configuration:

```
Switch# configure terminal
Switch(config)# vlan 202
Switch(config-vlan)# private-vlan association 303-307,309,440
Switch(config-vlan)# end
Switch# show vlan private-vlan
```

Primary	Secondary	Type	Interfaces
202	303	community	
202	304	community	
202	305	community	
202	306	community	
202	307	community	
202	309	community	
202	440	isolated	
	308	community	

Note

The secondary VLAN 308 has no associated primary VLAN.

Configuring a Layer 2 Interface as a PVLAN Promiscuous Port

To configure a Layer 2 interface as a PVLAN promiscuous port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Specifies the LAN interface to configure.
Step 3	Switch(config-if)# switchport mode private-vlan { host promiscuous trunk promiscuous trunk [secondary] }	Configures a Layer 2 interface as a PVLAN promiscuous port.
Step 4	Switch(config-if)# [no] switchport private-vlan mapping [trunk] <i>primary_vlan_ID</i> { <i>secondary_vlan_list</i> add <i>secondary_vlan_list</i> remove <i>secondary_vlan_list</i> }	Maps the PVLAN promiscuous port to a primary VLAN and to selected secondary VLANs.
Step 5	Switch(config-if)# end	Exits configuration mode.
Step 6	Switch# show interfaces { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i> switchport	Verifies the configuration.

Note

The maximum number of unique PVLAN pairs supported by the **switchport private-vlan mapping** command is 1000.

When you configure a Layer 2 interface as a PVLAN promiscuous port, note the following:

- The *secondary_vlan_list* parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.
- Enter a *secondary_vlan_list* or use the **add** keyword with a *secondary_vlan_list* to map the secondary VLANs to the PVLAN promiscuous port.
- Use the **remove** keyword with a *secondary_vlan_list* to clear the mapping between secondary VLANs and the PVLAN promiscuous port.

This example shows how to configure interface FastEthernet 5/2 as a PVLAN promiscuous port, map it to a PVLAN, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport private-vlan mapping 200 2
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
Name:Fa5/2
Switchport:Enabled
Administrative Mode:private-vlan promiscuous
Operational Mode:private-vlan promiscuous
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation:native
Negotiation of Trunking:Off
Access Mode VLAN:1 (default)
Trunking Native Mode VLAN:1 (default)
Voice VLAN:none
Administrative Private VLAN Host Association:none
Administrative Private VLAN Promiscuous Mapping:200 (VLAN0200) 2 (VLAN0002)
Private VLAN Trunk Native VLAN:none
```

```

Administrative Private VLAN Trunk Encapsulation:dot1q
Administrative Private VLAN Trunk Normal VLANs:none
Administrative Private VLAN Trunk Private VLANs:none
Operational Private VLANs:
  200 (VLAN0200) 2 (VLAN0002)
Trunking VLANs Enabled:ALL
Pruning VLANs Enabled:2-1001
Capture Mode Disabled
Capture VLANs Allowed:ALL

```

Configuring a Layer 2 Interface as a PVLAN Host Port

To configure a Layer 2 interface as a PVLAN host port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Specifies the LAN port to configure.
Step 3	Switch(config-if)# switchport mode private-vlan { host promiscuous trunk promiscuous trunk [secondary] }	Configures a Layer 2 interface as a PVLAN host port.
Step 4	Switch(config-if)# [no] switchport private-vlan host-association <i>primary_vlan_ID secondary_vlan_ID</i>	Associates the Layer 2 interface with a PVLAN. You can use the no keyword to delete all associations from the primary VLAN.
Step 5	Switch(config-if)# end	Exits configuration mode.
Step 6	Switch# show interfaces { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i> switchport	Verifies the configuration.

This example shows how to configure interface FastEthernet 5/1 as a PVLAN host port and verify the configuration:

```

Switch# configure terminal
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 202 440
Switch(config-if)# end

Switch# show interfaces fastethernet 5/1 switchport
Name: Fa5/1
Switchport: Enabled
Administrative Mode: private-vlan host
Operational Mode: private-vlan host
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: native
Negotiation of Trunking: Off
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Voice VLAN: none
Appliance trust: none
Administrative Private Vlan
  Host Association: 202 (VLAN0202) 440 (VLAN0440)
  Promiscuous Mapping: none
  Trunk encapsulation : dot1q
  Trunk vlans:

```

```
Operational private-vlan(s):
  202 (VLAN0202) 440 (VLAN0440)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
```

Configuring a Layer 2 Interface as an Isolated PVLAN Trunk Port

To configure a Layer 2 interface as an isolated PVLAN trunk port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Specifies the LAN port to configure.
Step 3	Switch(config-if)# switchport mode private-vlan { host promiscuous trunk promiscuous trunk [secondary] }	Configures a Layer 2 interface as a PVLAN trunk port.
Step 4	Switch(config-if)# [no] switchport private-vlan association trunk <i>primary_vlan_ID secondary_vlan_ID</i>	<p>Configures association between primary VLANs and secondary VLANs the PVLAN trunk port with a PVLAN.</p> <p>Note Multiple PVLAN pairs can be specified using this command so that a PVLAN trunk port can carry multiple secondary VLANs. If an association is specified for the existing primary VLAN, the existing association is replaced. If there is no trunk association, any packets received on secondary VLANs are dropped.</p> <p>You can use the no keyword to delete all associations from the primary VLAN.</p>
Step 5	Switch(config-if)# [no] switchport private-vlan trunk allowed vlan <i>vlan_list</i> all none [add remove except] <i>vlan_atom[,vlan_atom...]</i>	<p>Configures a list of allowed normal VLANs on a PVLAN trunk port.</p> <p>You can use the no keyword to remove all allowed normal VLANs on a PVLAN trunk port.</p>
Step 6	Switch(config-if)# switchport private-vlan trunk native vlan <i>vlan_id</i>	<p>Configures a VLAN to which untagged packets (as in IEEE 802.1Q tagging) are assigned on a PVLAN trunk port.</p> <p>If there is no native VLAN configured, all untagged packets are dropped.</p> <p>If the native VLAN is a secondary VLAN and the port does not have the association for the secondary VLAN, the untagged packets are dropped.</p> <p>You can use the no keyword to remove all native VLANs on a PVLAN trunk port.</p>
Step 7	Switch(config-if)# end	Exits configuration mode.
Step 8	Switch# show interfaces { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i> switchport	Verifies the configuration.

This example shows how to configure interface FastEthernet 5/2 as a secondary trunk port, and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk secondary
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10. 3-4
Switch(config-if)# switchport private-vlan association trunk 3 301
Switch(config-if)# end
Switch# show interfaces fastethernet 5/2 switchport
Name: Fa5/2
  Switchport: Enabled
  Administrative Mode: private-vlan trunk secondary
  Operational Mode: private-vlan trunk secondary
  Administrative Trunking Encapsulation: negotiate
  Operational Trunking Encapsulation: dot1q
  Negotiation of Trunking: On
  Access Mode VLAN: 1 (default)
  Trunking Native Mode VLAN: 1 (default)
  Administrative Native VLAN tagging: enabled
  Voice VLAN: none
  Administrative private-vlan host-association: none A
  Administrative private-vlan mapping: none
  Administrative private-vlan trunk native VLAN: 10
  Administrative private-vlan trunk Native VLAN tagging: enabled
  Administrative private-vlan trunk encapsulation: dot1q
  Administrative private-vlan trunk normal VLANs: none
  Administrative private-vlan trunk associations:
    3 (VLAN0003) 301 (VLAN0301)
  Administrative private-vlan trunk mappings: none
  Operational private-vlan: none
  Operational Normal VLANs: none
  Trunking VLANs Enabled: ALL
  Pruning VLANs Enabled: 2-1001
  Capture Mode Disabled Capture VLANs Allowed: ALL

  Unknown unicast blocked: disabled
  Unknown multicast blocked: disabled
  Appliance trust: none
```

Configuring a Layer 2 Interface as a Promiscuous PVLAN Trunk Port

To configure a Layer 2 interface as a promiscuous PVLAN trunk port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i>	Specifies the LAN interface to configure.
Step 3	Switch(config-if)# switchport mode private-vlan { host promiscuous trunk promiscuous trunk [secondary] }	Configures a Layer 2 interface as a PVLAN promiscuous trunk port.
Step 4	Switch(config-if)# [no] switchport private-vlan mapping [trunk] <i>primary_vlan_ID</i> { <i>secondary_vlan_list</i> add <i>secondary_vlan_list</i> remove <i>secondary_vlan_list</i> }	Maps the promiscuous PVLAN port to a primary VLAN and to selected secondary VLANs. This command offers 3 levels of removal. See the examples that follow this table.

	Command	Purpose
Step 5	Switch(config-if)# end	Exits configuration mode.
Step 6	Switch# show interfaces { fastethernet gigabitethernet tengigabitethernet } <i>slot/port</i> switchport	Verifies the configuration.

**Note**

The maximum number of unique PVLAN pairs supported by the **switchport private-vlan mapping trunk** command is 500. For example, 500 isolated secondary VLANs could map to 500 primary VLANs, because only one isolated VLAN association per primary VLAN is supported. Or, 500 community secondary VLANs could map to one primary VLAN. Or, 250 community secondary VLANs could map to 1 primary VLAN, and another 250 community secondary VLANs could map to another primary VLAN for a total of 500 pairs.

**Note**

By default, when you configure the mode to private VLAN trunk **promiscuous**, the native VLAN is set to 1.

The **[no] switchport private-vlan mapping** command provides the following three levels of removal:

- Remove one or more secondary VLANs from the list. For example:
Switch(config-if)# **switchport private-vlan mapping trunk 2 remove 222**
- Remove the entire mapping of PVLAN promiscuous trunk port to the specified primary VLAN (and all of its selected secondary VLANs). For example:
Switch(config-if)# **no switchport private-vlan mapping trunk 2**
- Remove the mapping of a PVLAN promiscuous trunk port to all previously configured primary VLANs (and all of their selected secondary VLANs). For example:
Switch(config-if)# **no switchport private-vlan mapping trunk**

When you configure a Layer 2 interface as a PVLAN promiscuous port, note the following:

- Multiple private VLAN pairs can be specified using the **switchport private-vlan mapping trunk** command so that a promiscuous trunk port can carry multiple primary VLANs.
- The *secondary_vlan_list* parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single PVLAN ID or a hyphenated range of PVLAN IDs.
- Enter a *secondary_vlan_list* or use the **add** keyword with a *secondary_vlan_list* to map the secondary VLANs to the PVLAN promiscuous port.
- Use the **remove** keyword with a *secondary_vlan_list* to clear the mapping between secondary VLANs and the PVLAN promiscuous port.

This example shows how to configure interface FastEthernet 5/2 as a promiscuous trunk port and to verify the configuration:

```
Switch# configure terminal
Switch(config)# interface fastethernet 5/2
Switch(config-if)# switchport mode private-vlan trunk promiscuous
Switch(config-if)# switchport private-vlan trunk native vlan 10
Switch(config-if)# switchport private-vlan trunk allowed vlan 10, 3-4
Switch(config-if)# switchport private-vlan mapping trunk 3 301, 302
Switch(config-if)# end
```

```

Switch# show interfaces fastethernet 5/2 switchport
Name: Fa5/2
Switchport: Enabled
Administrative Mode: private-vlan trunk promiscuous
Operational Mode: private-vlan trunk promiscuous
Administrative Trunking Encapsulation: negotiate
Operational Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Administrative Native VLAN tagging: enabled
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: 10
Administrative private-vlan trunk Native VLAN tagging: enabled
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: 3-4,10
Administrative private-vlan trunk associations: none
Administrative private-vlan trunk mappings:
    3 (VLAN0003) 301 (VLAN0301) 302 (VLAN0302)
Operational private-vlan:
    3 (VLAN0003) 301 (VLAN0301) 302 (VLAN0302)
Trunking VLANs Enabled: ALL
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL

Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Appliance trust: none

```

Permitting Routing of Secondary VLAN Ingress Traffic

Note

Isolated and community VLANs are both called secondary VLANs.

To permit routing of secondary VLAN ingress traffic, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface vlan <i>primary_vlan_ID</i>	Enters interface configuration mode for the primary VLAN.
Step 3	Switch(config-if)# [no] private-vlan mapping <i>primary_vlan_ID</i> { <i>secondary_vlan_list</i> add <i>secondary_vlan_list</i> remove <i>secondary_vlan_list</i> }	To permit routing on the secondary VLAN ingress traffic, map the secondary VLAN to the primary VLAN. You can use the no keyword to delete all associations from the primary VLAN.
Step 4	Switch(config-if)# end	Exits configuration mode.
Step 5	Switch# show interface private-vlan mapping	Verifies the configuration.

When you permit routing on the secondary VLAN ingress traffic, note the following:

- The **private-vlan mapping** interface configuration command only affects private VLAN ingress traffic that is Layer 3 switched.
- The *secondary_vlan_list* parameter cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single private VLAN ID or a hyphenated range of private VLAN IDs.
- Enter a *secondary_vlan_list* parameter or use the **add** keyword with a *secondary_vlan_list* parameter to map the secondary VLANs to the primary VLAN.
- Use the **remove** keyword with a *secondary_vlan_list* parameter to clear the mapping between secondary VLANs and the primary VLAN.

This example shows how to permit routing of secondary VLAN ingress traffic from private VLANs 303 through 307, 309, and 440 and verify the configuration:

```
Switch# configure terminal
Switch(config)# interface vlan 202
Switch(config-if)# private-vlan mapping add 303-307,309,440
Switch(config-if)# end
Switch# show interfaces private-vlan mapping
Interface Secondary VLAN Type
-----
vlan202    303          community
vlan202    304          community
vlan202    305          community
vlan202    306          community
vlan202    307          community
vlan202    309          community
vlan202    440          isolated

Switch#
```

CHAPTER 40

Configuring 802.1X Port-Based Authentication

This chapter describes how to configure IEEE 802.1X port-based authentication on the Catalyst 4500 series switch to prevent unauthorized client devices from gaining access to the network.

This chapter includes the following major sections:

- [Understanding 802.1X Port-Based Authentication, page 40-1](#)
- [Configuring 802.1X Port-Based Authentication, page 40-22](#)
- [Displaying 802.1X Statistics and Status, page 40-77](#)
- [Displaying Authentication Details, page 40-77](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding 802.1X Port-Based Authentication

802.1X defines 802.1X port-based authentication as a client-server based access control and authentication protocol that restricts unauthorized clients from connecting to a LAN through publicly accessible ports. An authentication server validates each supplicant (client) connected to an authenticator (network access switch) port before making available any services offered by the switch or the LAN.

Note

802.1X support requires an authentication server that is configured for Remote Authentication Dial-In User Service (RADIUS). 802.1X authentication does not work unless the network access switch can route packets to the configured RADIUS server. To verify that the switch can route packets, you must ping the server from the switch.

Until a client is authenticated, only Extensible Authentication Protocol over LAN (EAPOL) traffic is allowed through the port to which the client is connected. After authentication succeeds, normal traffic can pass through the port.

To configure 802.1X port-based authentication, you need to understand the concepts in these sections:

- [Device Roles, page 40-2](#)
- [802.1X and Network Access Control, page 40-3](#)
- [Authentication Initiation and Message Exchange, page 40-4](#)
- [Ports in Authorized and Unauthorized States, page 40-5](#)
- [802.1X Host Mode, page 40-6](#)
- [802.1X Violation Mode, page 40-9](#)
- [Using 802.1X with VLAN Assignment, page 40-9](#)
- [Using 802.1X for Guest VLANs, page 40-10](#)
- [Using 802.1X with MAC Authentication Bypass, page 40-11](#)
- [Using 802.1X with Web-Based Authentication, page 40-13](#)
- [Using 802.1X with Inaccessible Authentication Bypass, page 40-13](#)
- [Using 802.1X with Unidirectional Controlled Port, page 40-14](#)
- [Using 802.1X with Authentication Failed VLAN Assignment, page 40-14](#)
- [Using 802.1X with Port Security, page 40-16](#)
- [Using 802.1X Authentication with ACL Assignments and Redirect URLs, page 40-17](#)
- [Using 802.1X with RADIUS-Provided Session Timeouts, page 40-18](#)
- [Using 802.1X with Voice VLAN Ports, page 40-19](#)
- [Using Multiple Domain Authentication and Multiple Authentication, page 40-20](#)
- [How 802.1X Fails on a Port, page 40-21](#)
- [Supported Topologies, page 40-21](#)

Device Roles

With 802.1X port-based authentication, network devices have specific roles. [Figure 40-1](#) shows the role of each device, which is described below.

Figure 40-1 802.1X Device Roles

- **Client**—The workstation that requests access to the LAN, and responds to requests from the switch. The workstation must be running 802.1X-compliant client software.
- **Authenticator**—Controls physical access to the network based on the authentication status of the client. The Catalyst 4500 series switch acts as an intermediary between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. The switch encapsulates and decapsulates the Extensible Authentication Protocol (EAP) frames and interacts with the RADIUS authentication server.

When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped and the remaining EAP frame is reencapsulated in the RADIUS format. The EAP frames are not modified or examined during encapsulation, and the authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the frame header is removed from the server, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

Note The Catalyst 4500 series switches must be running software that supports the RADIUS client and 802.1X.

- **Authentication server**—Performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and switch services. (The only supported authentication server is the RADIUS authentication server with EAP extensions; it is available in Cisco Secure Access Control Server version 3.2 and later.)

802.1X and Network Access Control

Network Access Control is a feature that allows port access policies to be influenced by the anti-virus posture of the authenticating device.

Anti-virus posture includes such elements as the operating system running on the device, the operating system version, whether anti-virus software is installed, what version of anti-virus signatures is available, etc. If the authenticating device has a NAC-aware 802.1X supplicant and the authentication server is configured to support NAC via 802.1X, anti-virus posture information is automatically included as part of the 802.1X authentication exchange.

For information on NAC, refer to the URL:

<http://www.cisco.com/en/US/products/ps6128/index.html>

Authentication Initiation and Message Exchange

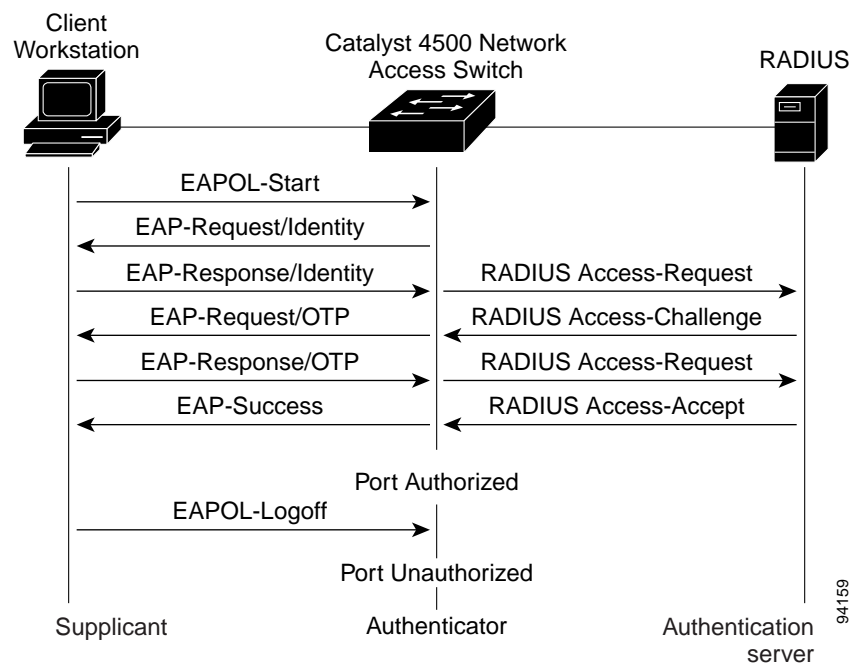

The switch or the client can initiate authentication. If you enable authentication on a port with the **authentication port-control auto** interface configuration command (**dot1x port-control auto** command in Cisco IOS Release 12.2(46)SG and earlier releases), the switch must initiate authentication when it determines that the port link state has changed. It then sends an EAP-request/identity frame to the client to request its identity (typically, the switch sends an initial identity/request frame followed by one or more requests for authentication information). Upon receipt of the frame, the client responds with an EAP-response/identity frame.

However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity.

If 802.1X is not enabled or supported on the network access switch, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client transmits frames as if the port is in the authorized state. A port in the authorized state means that the client has been successfully authenticated. When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized.

The specific exchange of EAP frames depends on the authentication method being used. [Figure 40-2](#) shows a message exchange that is initiated by the client using the One-Time Password (OTP) authentication method with an authentication server.

Figure 40-2 Message Exchange

Ports in Authorized and Unauthorized States

The switch port state determines whether the client is granted access to the network. The port starts in the unauthorized state. While in this state, the port disallows all ingress and egress traffic except for 802.1X protocol packets. When a client is successfully authenticated, the port transitions to the authorized state, allowing all traffic for the client to flow normally.

If a non-802.1X capable client is connected to an unauthorized 802.1X port, the switch requests the client's identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network. If a guest VLAN is configured on a port that connects to a client that does not support 802.1X, the port is placed in the configured guest VLAN and in the authorized state. For more information, see the [“Using 802.1X for Guest VLANs” section on page 40-10](#).

In contrast, when an 802.1X-enabled client connects to a port that is not running the 802.1X protocol, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

You can control the port authorization state with the **authentication port-control** interface configuration command (**dot1x port-control auto** command in Cisco IOS Release 12.2(46)SG and earlier releases) and these keywords:

- **force-authorized**—Disables 802.1X authentication and causes the port to transition to the authorized state without requiring authentication exchange. The port transmits and receives normal traffic without 802.1X-based authentication of the client. This setting is the default.
- **force-unauthorized**—Causes the port to remain in the unauthorized state, ignoring all attempts by the client to authenticate. The switch cannot provide authentication services to the client through the interface.
- **auto**—Enables 802.1X authentication and causes the port to begin in the unauthorized state, allowing only EAPOL frames to be sent and received through the port. The authentication process begins when the link state of the port transitions from down to up or when an EAPOL-start frame is received. The switch requests the identity of the client and begins relaying authentication messages between the client and the authentication server. The switch can uniquely identify each client attempting to access the network by the client's MAC address.

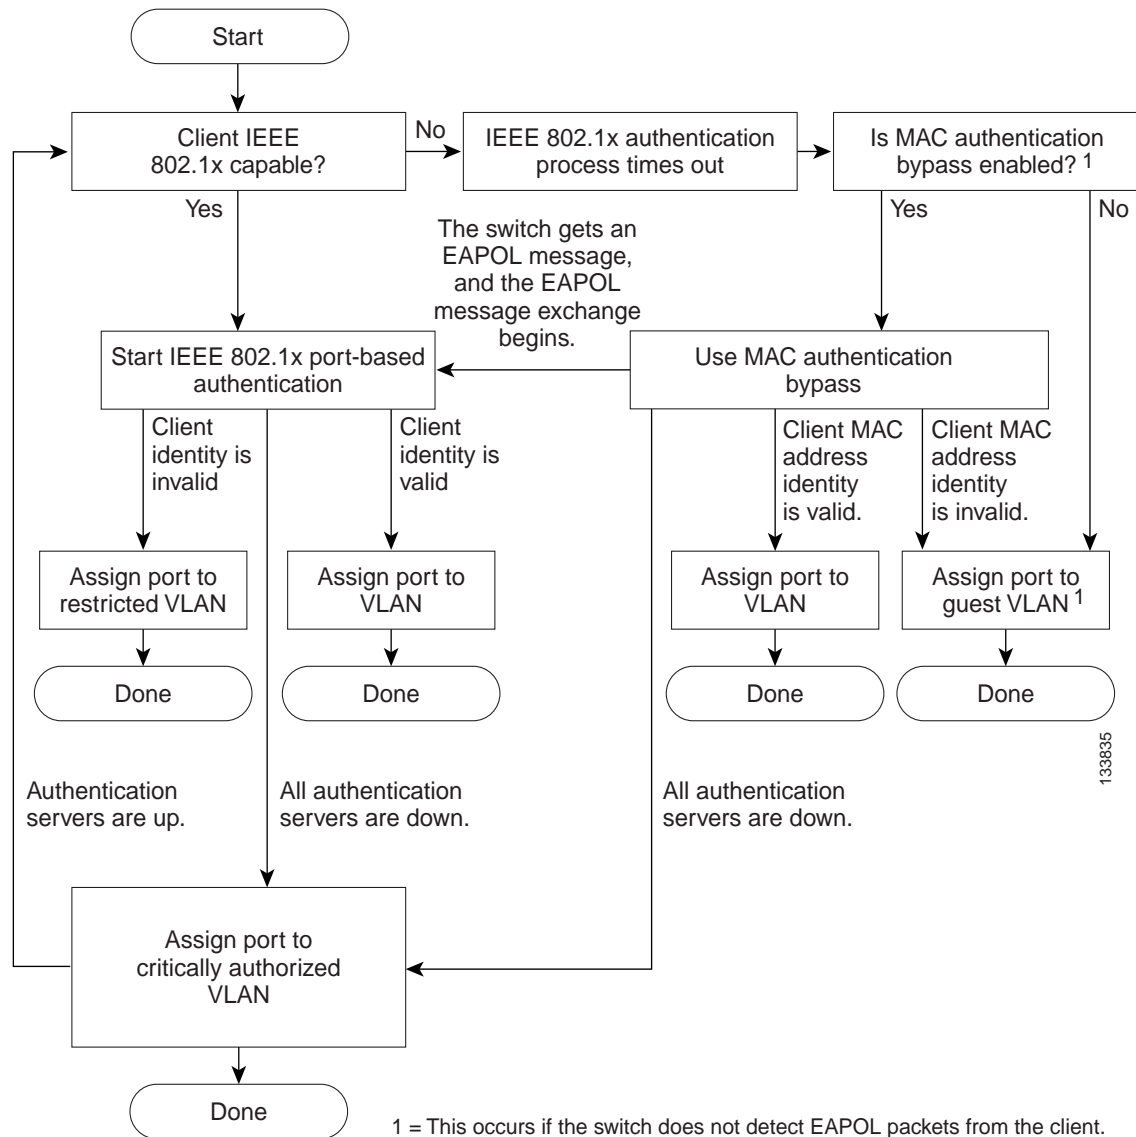

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can retransmit the request. If no response is received from the server after the specified number of attempts, authentication fails and network access is not granted.

If the link state of a port transitions from up to down, or if an EAPOL-logoff frame is received by the port, the port returns to the unauthorized state.

[Figure 40-3](#) shows the authentication process.

If Multidomain Authentication (MDA) is enabled on a port, this flow can be used with some exceptions that are applicable to voice authorization. For more information on MDA, see the [“Using Multiple Domain Authentication and Multiple Authentication” section on page 40-20](#).

Figure 40-3 Authentication Flowchart

802.1X Host Mode

The 802.1X port's host mode determines whether more than one client can be authenticated on the port and how authentication is enforced. You can configure an 802.1X port to use any of the five host modes described in the following sections. In addition, each mode may be modified to allow pre-authentication open access:

- [Single-Host Mode, page 40-7](#)
- [Multiple-Hosts Mode, page 40-7](#)
- [Multidomain Authentication Mode, page 40-7](#)
- [Multiauthentication Mode, page 40-8](#)
- [Pre-Authentication Open Access, page 40-8](#)

Single-Host Mode

You can configure an 802.1X port for single-host or multiple-hosts mode. In single-host mode (see [Figure 40-1 on page 40-3](#)), only one client can be connected to the 802.1X-enabled switch port. The switch detects the client by sending an EAPOL frame when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

Multiple-Hosts Mode

In multiple-hosts mode, you can attach multiple hosts to a single 802.1X-enabled port. [Figure 40-4 on page 40-7](#) shows 802.1X port-based authentication in a wireless LAN. In this mode, only one of the attached clients must be authorized for all clients to be granted network access. If the port becomes unauthorized (re-authentication fails or an EAPOL-logoff message is received), the switch denies network access to all of the attached clients. In this topology, the wireless access point is responsible for authenticating the clients attached to it, and it also acts as a client to the switch.

With multiple-hosts mode enabled, you can use 802.1X authentication to authenticate the port and port security to manage network access for all MAC addresses, including that of the client.

Figure 40-4 Multiple Host Mode Example

Multidomain Authentication Mode

Cisco IOS Release 12.2(37)SG and later releases support Multidomain Authentication (MDA), which allows an IP phone (Cisco or third-party) and a single host behind the IP phone to authenticate independently, using 802.1X, MAC authentication bypass (MAB) or (for the host only) web-based authentication. In this application, *multidomain* refers to two domains — data and voice — and only two MAC addresses are allowed per port. A switch can place the host in the data VLAN and the IP phone in the voice VLAN, even though they appear on the same switch port. The data VLAN and the voice VLAN can be specified in the CLI configuration. The devices are identified as either data or voice depending on the vendor-specific-attributes (VSAs) received from the authentication, authorization, and accounting (AAA) server. The data and voice VLANs can also be obtained from the VSAs received from the (AAA) server during authentication.

Figure 40-5 *Multidomain Authentication Mode Example*

Figure 40-5 shows a typical MDA application with a single host behind an IP phone connected to the 802.1X-enabled port. Because the client is not directly connected to the switch, the switch cannot detect a loss of port link if the client is disconnected. To prevent another device from using the established authentication of the disconnected client later, Cisco IP phones send a Cisco Discovery Protocol (CDP) host presence type length value (TLV) to notify the switch of changes in the attached client's port link state.

For details on how to configure MDA, see the [“Using Multiple Domain Authentication and Multiple Authentication”](#) section on page 40-20.

Multiauthentication Mode

Available starting in Cisco IOS Release 12.2(50)SG, multiauthentication mode allows one client on the voice VLAN and multiple authenticated clients on the data VLAN. When a hub or access point is connected to an 802.1X port, multiauthentication mode provides enhanced security over multiple-hosts mode by requiring authentication of each connected client. For non-802.1X devices, you can use MAB or web-based authentication as the fallback method for individual host authentications, allowing you to authenticate different hosts through different methods on a single port.

Multiauthentication also supports MDA functionality on the voice VLAN by assigning authenticated devices to either a data or voice VLAN depending on the VSAs received from the authentication server.

Note

When a port is in multiauthentication mode, all VLAN assignment features including RADIUS server supplied VLAN assignment, Guest VLAN, Inaccessible Authentication Bypass, and Authentication Failed VLAN will not activate for data devices. However, RADIUS server supplied VLAN assignment is possible for voice devices.

Pre-Authentication Open Access

Starting with Cisco IOS Release 12.2(50)SG, any of the four host modes may be additionally configured to allow a device to gain network access before authentication. This pre-authentication open access is useful in an application such as the Pre-boot eXecution Environment (PXE), where a device must access the network to download a bootable image containing an authentication client.

Enable pre-authentication open access by entering the **authentication open** command after host mode configuration. It acts as an extension to the configured host mode. For example, if pre-authentication open access is enabled with single-host mode, then the port allows only one MAC address. When pre-authentication open access is enabled, initial traffic on the port is restricted only by whatever other access restriction, independent of 802.1X, is configured on the port. If no access restriction other than 802.1X is configured on the port, then a client device will have full access on the configured VLAN.

802.1X Violation Mode

You can use the **authentication violation** interface configuration command to configure the violation mode: restrict or shutdown.

In single-host mode, a security violation is triggered when more than one device are detected on the data vlan. In multidomain authentication mode, a security violation is triggered when more than one device are detected on the data or voice VLAN.

Security violation cannot be triggered in multiple-host mode or multiauthentication mode.

When security violation occurs, the port is protected depending on the configured violation action:

Shutdown—Errdisables the port; the default behavior on a port.

Restrict—The port state is unaffected. However the platform is notified to restrict the traffic from offending MAC-address.

For more information see the [“Configuring Violation Action” section on page 40-49](#).

Using 802.1X with VLAN Assignment

You can use the VLAN assignment to limit network access for certain users. With the VLAN assignment, 802.1X-authenticated ports are assigned to a VLAN based on the username of the client connected to that port. The RADIUS server database maintains the username-to-VLAN mappings. After successful 802.1X authentication of the port, the RADIUS server sends the VLAN assignment to the switch. The VLAN can be a standard VLAN or a private VLAN (PVLAN).

On platforms that support PVLANS, you can isolate hosts by assigning ports into PVLANS.

When configured on the switch and the RADIUS server, 802.1X with VLAN assignment has these characteristics:

- If no VLAN is supplied by the RADIUS server, the port is configured in its access VLAN or isolated PVLAN when authentication succeeds.
- If the authentication server provides invalid VLAN information, the port remains unauthorized. This situation prevents ports from appearing unexpectedly in an inappropriate VLAN due to a configuration error.
- If the multiauthentication mode is enabled on an 802.1X port, the VLAN assignment is ignored for data devices. VLAN assignment is possible for voice device even if the port is configured in multiauthentication mode.
- If the authentication server provides valid VLAN information, the port is authorized and placed in the specified VLAN when authentication succeeds.
- If the multiple-hosts mode is enabled, all hosts are in the same VLAN as the first authenticated user.
- If 802.1X is disabled on the port, the port is returned to the configured access VLAN.
- A port must be configured as an access port (which can be assigned only into “regular” VLANs), or as a PVLAN host port (which can be assigned only into PVLANS). Configuring a port as a PVLAN host port implies that all hosts on the port are assigned into PVLANS, whether their posture is compliant or non-compliant. If the type of the VLAN named in the Access-Accept does not match the type of VLAN expected to be assigned to the port (regular VLAN to access port, secondary PVLAN to PVLAN host port), the VLAN assignment fails.

- If a guest VLAN is configured to handle non-responsive hosts, the type of VLAN configured as the guest VLAN must match the port type (that is, guest VLANs configured on access ports must be standard VLANs, and guest VLANs configured on PVLAN host ports must be PVLANs). If the guest VLAN's type does not match the port type, non-responsive hosts are treated as if no guest VLAN is configured (that is, they are denied network access).
- To assign a port into a PVLAN, the named VLAN must be a secondary PVLAN. The switch determines the implied primary VLAN from the locally configured secondary-primary association.

**Note**

If you change the access VLAN or PVLAN host VLAN mapping on a port that is already authorized in a RADIUS assigned VLAN, the port remains in the RADIUS assigned VLAN.

To configure VLAN assignment you need to perform these tasks:

- Enable AAA authorization with the **network** keyword to allow interface configuration from the RADIUS server. For an illustration of how to apply the **aaa authorization network group radius** command, refer to the section “Enabling 802.1X Authentication” on page 24.
- Enable 802.1X. (The VLAN assignment feature is automatically enabled when you configure 802.1X on an access port.)
- Assign vendor-specific tunnel attributes in the RADIUS server. To ensure proper VLAN assignment, the RADIUS server must return these attributes to the switch:
 - Tunnel-Type = VLAN
 - Tunnel-Medium-Type = 802
 - Tunnel-Private-Group-ID = VLAN NAME

Using 802.1X for Guest VLANs

You can use guest VLANs to enable non-802.1X-capable hosts to access networks that use 802.1X authentication. For example, you can use guest VLANs while you are upgrading your system to support 802.1X authentication.

Guest VLANs are supported on a per-port basis, and you can use any VLAN as a guest VLAN as long as its type matches the type of the port. If a port is already forwarding on the guest VLAN and you enable 802.1X support on the network interface of the host, the port is immediately moved out of the guest VLAN and the authenticator waits for authentication to occur.

Enabling 802.1X authentication on a port starts the 802.1X protocol. If the host fails to respond to packets from the authenticator within a certain amount of time, the authenticator brings the port up in the configured guest VLAN.

If the port is configured as a PVLAN host port, the guest VLAN must be a secondary PVLAN. If the port is configured as an access port, the guest VLAN must be a regular VLAN. If the guest VLAN configured on a port is not appropriate for the type of the port, the switch behaves as if no guest VLAN is configured (that is, non-responsive hosts are denied network access).

For details on how to configure guest VLANs, see the [“Configuring 802.1X with Guest VLANs” section on page 40-49](#).

Usage Guidelines for Using 802.1X Authentication with Guest VLANs

The usage guidelines for using 802.1X authentication with guest VLANs are as follows:

- When you reconfigure a guest VLAN to a different VLAN, any authentication failed ports are also moved and the ports stay in their current authorized state.
- When you shut down or remove a guest VLAN from the VLAN database, any authentication failed ports are immediately moved to an unauthorized state and the authentication process is restarted.

**Note**

No periodic reauthentication is allowed with guest VLANs.

Usage Guidelines for Using 802.1X Authentication with Guest VLANs on Windows-XP Hosts

The usage guidelines for using 802.1X authentication with guest VLANs on Windows-XP hosts are as follows:

- If the host fails to respond to the authenticator, the port attempts to connect three times (with a 30 second timeout between each attempt). After this time, the login/password window does not appear on the host, so you must unplug and reconnect the network interface cable.
- Hosts responding with an incorrect login/password fail authentication. Hosts failing authentication are not put in the guest VLAN. The first time that a host fails authentication, the quiet-period timer starts, and no activity occurs for the duration of the quiet-period timer. When the quiet-period timer expires, the host is presented with the login/password window. If the host fails authentication for the second time, the quiet-period timer starts again, and no activity occurs for the duration of the quiet-period timer. The host is presented with the login/password window a third time. If the host fails authentication the third time, the port is placed in the unauthorized state, and you must disconnect and reconnect the network interface cable.

Using 802.1X with MAC Authentication Bypass

The 802.1X protocol has 3 entities: client (supplicant), authenticator, and authentication server. Typically, the host PC runs the supplicant software and tries to authenticate itself by sending its credentials to the authenticator which in turn relays that info to the authentication server for authentication.

However, not all hosts may have supplicant functionality. Devices that cannot authenticate themselves using 802.1X but still need network access can use MAC Authentication Bypass (MAB), which uses the connecting device's MAC address to grant or deny network access.

Typically, you would use this feature on ports where devices such as printers are connected. Such devices do not have 802.1X supplicant functionality.

In a typical deployment, the RADIUS server maintains a database of MAC addresses that require access. When this feature detects a new MAC address on a port, it generates a RADIUS request with both username and password as the device's MAC address. After authorization succeeds, the port is accessible to the particular device through the same code path that 802.1X authentication would take when processing an 802.1X supplicant. If authentication fails, the port moves to the guest VLAN if configured, or it remains unauthorized.

The Catalyst 4500 series switch also supports re-authentication of MACs on a per port level. Be aware that the re-authentication functionality is provided by 802.1X and is not MAB specific. In the re-authentication mode, a port stays in the previous RADIUS-sent VLAN and tries to re-authenticate itself. If the re-authentication succeeds, the port stays in the RADIUS-sent VLAN. Otherwise, the port becomes unauthorized and moves to the guest VLAN if one is configured.

For details on how to configure MAB, see the [“Configuring 802.1X with MAC Authentication Bypass” section on page 40-53](#).

Feature Interaction

This section lists feature interactions and restrictions when MAB is enabled. If a feature is not listed, assume that it interacts seamlessly with MAB (such as Unidirectional Controlled Port).

- MAB can only be enabled if 802.1X is configured on a port. MAB functions as a fall back mechanism for authorizing MACs. If you configure both MAB and 802.1X on a port, the port attempts to authenticate using 802.1X. If the host fails to respond to EAPOL requests and MAB is configured, the 802.1X port is opened up to listen to packets and to grab a MAC address, rather than attempt to authenticate endlessly.

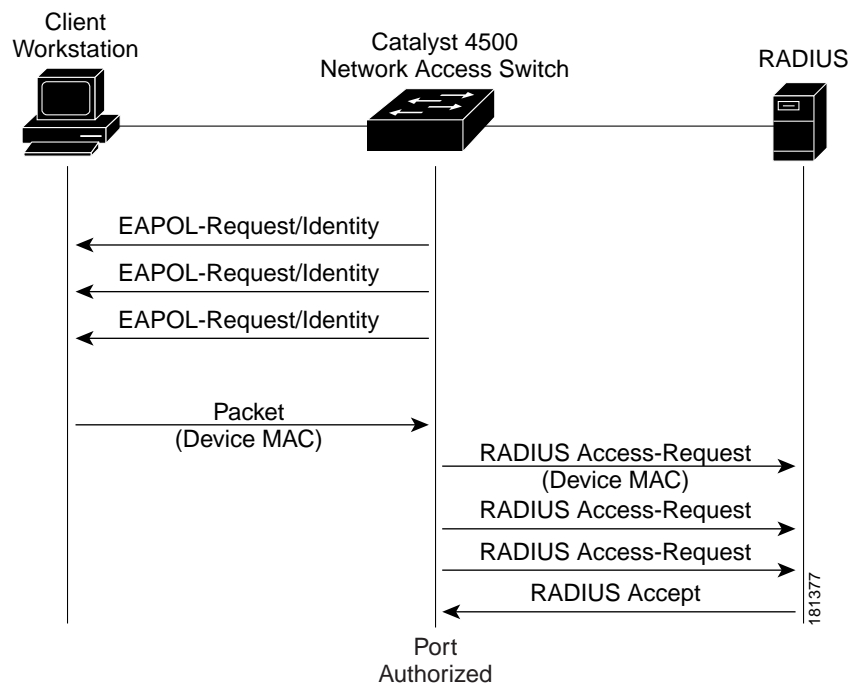

Based on the default 802.1X timer values, the transition between mechanisms takes approximately 90 seconds. You can shorten the time by reducing the value of the transmission period time, which affects the frequency of EAPOL transmission. A smaller timer value results in EAPOLs sent during a shorter period of time. With MAB enabled, after 802.1X performs one full set of EAPOLs, the learned MAC address is forwarded to the authentication server for processing.

The MAB module performs authorization for the first MAC address detected on the wire. The port is considered authorized once a valid MAC address is received that RADIUS approves of.

802.1X authentication can re-start if an EAPOL packet is received on a port that was initially authorized as a result of MAB.

Figure 40-6 shows the message exchange during MAB.

Figure 40-6 Message Exchange during MAC Authentication Bypass

- The authentication-failed VLAN is used only with dot1x-authentication-failed users. MAB is not attempted with dot1x-authentication-failed users. If 802.1X authentication fails, a port moves to the authentication-failed VLAN (if configured) whether MAB is configured or not.

- When both MAB and guest VLAN are configured and no EAPOL packets are received on a port, the 802.1X state-machine is moved to a MAB state where it opens the port to listen to traffic and grab MAC addresses. The port remains in this state forever waiting to see a MAC on the port. A detected MAC address that fails authorization causes the port to be moved to the guest VLAN if configured.

While in a guest VLAN, a port is open to all traffic on the specified guest VLAN. Therefore, non-802.1X supplicants that normally would be authorized but are in guest VLAN due to the earlier detection of a device that failed authorization, would remain in the guest VLAN indefinitely. However, loss of link or the detection of an EAPOL on the wire causes a transition out of the guest VLAN and back to the default 802.1X mode.

- Once a new MAC has been authenticated by MAB, the responsibility to limit access falls upon the 802.1X Authenticator (or port security) to secure the port. The 802.1X default host parameter is defined only for a single host. If the port is changed to multi-user host, port security must be employed to enforce the number of MAC addresses allowed thru this port.
- Catalyst 4500 series switch supports MAB with VVID, with the restriction that the MAC address appears on a port data VLAN only. All IP phone MACs learned via CDP are allowed on voice VLANs.
- MAB and VMPS are mutually exclusive because their functionality overlaps.

Using 802.1X with Web-Based Authentication

The web-based authentication feature, known as Web Authentication Proxy, enables you to authenticate end users on host systems that do not run the IEEE 802.1X supplicant.

When configuring web-based authentication, note the following guidelines:

- Fallback to web-based authentication is configured on switch ports in access mode. Ports in trunk mode are not supported.
- Fallback to web-based authentication is not supported on EtherChannels or EtherChannel members.
- Although fallback to web-based authentication is an interface-specific configuration, the web-based authentication fallback behavior is defined in a global fallback profile. If the global fallback configuration changes, the new profile is not used until the next instance of authentication fallback.

For detailed information on configuring web-based authentication, see [Chapter 42, “Configuring Web-Based Authentication.”](#)

Using 802.1X with Inaccessible Authentication Bypass

When a switch cannot reach the configured RADIUS servers and clients (supplicants) cannot be authenticated, you can configure a switch to allow network access to hosts connected to *critical* ports that are enabled for Inaccessible Authentication Bypass.

When this feature is enabled, a switch monitors the status of the configured RADIUS servers. If no RADIUS servers are available, ports with Inaccessible Authentication Bypass enabled are authorized. You can specify a Inaccessible Authentication Bypass VLAN on a per-port basis.

Ports that were already authorized when RADIUS becomes unavailable are unaffected by Inaccessible Authentication Bypass.

When RADIUS becomes available, critically-authorized ports may be configured to automatically reauthenticate themselves.

For details on how to configure Inaccessible Authentication Bypass, see the [“Configuring 802.1X with Inaccessible Authentication Bypass”](#) section on page 40-55.

Using 802.1X with Unidirectional Controlled Port

Unidirectional Controlled Port is a combined hardware/software feature that allows dormant PCs to be “powered on” based on the receipt of a specific Ethernet frame, known as the *magic packet*. Generally, Unidirectional Controlled Port is used in environments where administrators plan to manage remote systems during off-hours, when it’s likely that the systems have been powered down.

Use of Unidirectional Controlled Port with hosts attached through 802.1X ports presents a unique problem; when the host powers down, a 802.1X port becomes unauthorized. In this state, the port allows the receipt and transmission of EAPoL packets only. Therefore, the Unidirectional Controlled Port magic packet cannot reach the host; without powering up, the PC cannot authenticate and open the port.

Unidirectional Controlled Port solves this problem by allowing packets to be transmitted on unauthorized 802.1X ports.

Note

Unidirectional Controlled Port only works when Spanning Tree Portfast is enabled on the port.

For details on how to configure 802.1X with Unidirectional Controlled Port, see the [“Configuring 802.1X with Unidirectional Controlled Port”](#) section on page 40-58

Unidirectional State

A unidirectional controlled port is typically configured when a connected host might enter a sleeping mode or power-down state. When either occurs, the host does not exchange traffic with other devices in the network. A host connected to the unidirectional port cannot send traffic to the network; it can only receive traffic from other devices in the network.

When you configure a port as unidirectional (with the **authentication control-direction in** interface configuration command), the port will receive traffic in VLANs on that port, but it is not put into a spanning-tree forwarding state. If a VLAN contains only unauthenticated ports, any SVI on that VLAN will be in a down state, during which packets will not be routed into the VLAN. For the SVI to be up, and so enable packets to be routed into the VLAN, at least one port in the VLAN must either be authenticated or in the spanning-tree forwarding state.

Bidirectional State

When you configure a port as bidirectional with the **authentication control-direction both** interface configuration command (or the **dot1x control-direction both** interface configuration command for Cisco IOS Release 12.2(46) or earlier), the port is access-controlled in both directions. In this state, except for EAPoL packets, a switch port does not receive or send packets.

Using 802.1X with Authentication Failed VLAN Assignment

You can use authentication-failed VLAN assignment on a per-port basis to provide access for authentication failed users. Authentication failed users are end hosts that are 802.1X- capable but do not have valid credentials in an authentication server or end hosts that do not give any username and password combination in the authentication pop-up window on the user side.

If a user fails the authentication process, that port is placed in the authentication-failed VLAN. The port remains in the authentication-failed VLAN until the reauthentication timer expires. When the reauthentication timer expires the switch starts sending the port re-authentication requests. If the port fails reauthentication it remains in the authentication-failed VLAN. If the port is successfully reauthenticated, the port is moved either to the VLAN sent by RADIUS server or to the newly authenticated ports configured VLAN; the location depends on whether RADIUS is configured to send VLAN information.

**Note**

When enabling periodic reauthentication (see the [“Enabling Periodic Reauthentication” section on page 40-69](#)), only local reauthentication timer values are allowed. You cannot use a RADIUS server to assign the reauthentication timer value.

You can set the maximum number of authentication attempts that the authenticator sends before moving a port into the authentication-failed VLAN. The authenticator keeps a count of the failed authentication attempts for each port. A failed authentication attempt is either an empty response or an EAP failure. The authenticator tracks any mix of failed authentication attempts towards the authentication attempt count. After the maximum number of attempts is reached the port is placed in the authentication-failed VLAN until the reauthentication timer expires again.

**Note**

RADIUS may send a response without an EAP packet in it when it does not support EAP, and sometimes third party RADIUS servers also send empty responses. When this happens, the authentication attempt counter is incremented.

For details on how to configure Authentication Failed VLAN Assignment, see the [“Configuring 802.1X with Authentication Failed” section on page 40-60](#).

Usage Guidelines for Using Authentication Failed VLAN Assignment

- You should enable reauthentication. The ports in authentication-failed VLANs do not receive reauthentication attempts if reauthentication is disabled. In order to start the reauthentication process the authentication-failed VLAN must receive a link down event or an EAP logoff event from the port. If the host is behind a hub, you may never get a link down event and may not detect the new host until the next reauthentication occurs. Therefore, it is recommended to have re-authentication enabled in that case.
- EAP failure messages are not sent to the user. If the user fails authentication the port is moved to an authentication-failed VLAN and a EAP success message is sent to the user. Because the user is not notified of the authentication failure there may be confusion as to why there is restricted access to the network. A EAP Success message is sent for the following reasons:
 - If the EAP Success message is not sent, the user tries to authenticate every 60 seconds (by default) by sending an EAP-start message.
 - In some cases, users have configured DHCP to EAP-Success and unless the user sees a success, DHCP does not work on the port.
- Sometimes a user caches an incorrect username and password combination after receiving a EAP success message from the authenticator and reuses that information in every re-authentication. Until the user passes the correct username and password combination the port remains in the authentication-failed VLAN.

- When an authentication failed port is moved to an unauthorized state the authentication process is restarted. If you should fail the authentication process again the authenticator waits in the held state. After you have correctly reauthenticated all 802.1X ports are reinitialized and treated as normal 802.1X ports.
- When you reconfigure an authentication-failed VLAN to a different VLAN, any authentication failed ports are also moved and the ports stay in their current authorized state.
- When you shut down or remove an authentication-failed VLAN from the VLAN database, any authentication failed ports are immediately moved to an unauthorized state and the authentication process is restarted. The authenticator does not wait in a held state because the authentication-failed VLAN configuration still exists. While the authentication-failed VLAN is inactive, all authentication attempts are counted, and as soon as the VLAN becomes active the port is placed in the authentication-failed VLAN.
- If you reconfigure the maximum number of authentication failures allowed by the VLAN, the change takes affect after the reauthentication timer expires.
- Internal VLANs that are used for Layer 3 ports cannot be configured as authentication-failed VLANs.
- The authentication-failed VLAN is supported only in single-host mode (the default port mode).
- When a port is placed in an authentication-failed VLAN the user's MAC address is added to the mac-address-table. If a new MAC address appears on the port, it is treated as a security violation.
- When an authentication failed port is moved to an authentication-failed VLAN, the Catalyst 4500 series switch does not transmit a RADIUS-Account Start Message like it does for regular 802.1X authentication.

Using 802.1X with Port Security

You can enable port security on an 802.1X port in either single- or multiple-host mode. (To do so, you must configure port security with the **switchport port-security** interface configuration command.) When you enable port security and 802.1X on a port, 802.1X authenticates the port, and port security manages the number of MAC addresses allowed on that port, including that of the client. Hence, you can use an 802.1X port with port security enabled to limit the number or group of clients that can access the network.

For information on selecting multi-host mode, see the [“Resetting the 802.1X Configuration to the Default Values” section on page 40-76](#).

These examples describe the interaction between 802.1X and port security on a switch:

- When a client is authenticated, and the port security table is not full, the client's MAC address is added to the port security list of secure hosts. The port then proceeds to come up normally.

When a client is authenticated and manually configured for port security, it is guaranteed an entry in the secure host table (unless port security static aging has been enabled).

A security violation occurs if an additional host is learned on the port. The action taken depends on which feature (802.1X or port security) detects the security violation:

- If 802.1X detects the violation, the action is to err-disable the port.
- If port security detects the violation, the action is to shutdown or restrict the port (the action is configurable).

The following describes when port security and 802.1X security violations occur:

- In single host mode, after the port is authorized, any MAC address received other than the client's causes a 802.1X security violation.
- In single host mode, if installation of an 802.1X client's MAC address fails because port security has already reached its limit (due to a configured secure MAC addresses), a port security violation is triggered.
- In multi host mode, once the port is authorized, any additional MAC addresses that cannot be installed because the port security has reached its limit triggers a port security violation.
- When an 802.1X client logs off, the port transitions back to an unauthenticated state, and all dynamic entries in the secure host table are cleared, including the entry for the client. Normal authentication then ensues.
- If you administratively shut down the port, the port becomes unauthenticated, and all dynamic entries are removed from the secure host table.
- Only 802.1X can remove the client's MAC address from the port security table. Note that in multi host mode, with the exception of the client's MAC address, all MAC addresses that are learned by port security can be deleted using port security CLIs.
- Whenever port security ages out a 802.1X client's MAC address, 802.1X attempts to reauthenticate the client. Only if the reauthentication succeeds is the client's MAC address be retained in the port security table.
- All of the 802.1X client's MAC addresses are tagged with (dot1x) when you display the port security table by using CLI.

Using 802.1X Authentication with ACL Assignments and Redirect URLs

Starting with Cisco IOS Release 12.2(50)SG, you can download per-host policies such as ACLs and redirect URLs to the switch from the RADIUS server during 802.1X or MAB authentication of the host. ACL download is also supported with web authentication after a fallback from 802.1X or MAB.

When the 802.1X host mode of the port is either single-host, MDA, or multiauthentication, the downloaded ACLs (DACLs) are modified to use the authenticated host's IP address as the source address. When the host mode is multiple-hosts, the source address is configured as ANY, and the downloaded ACLs or redirects apply to all devices on the port.

If no ACLs are provided during the authentication of a host, the static default ACL configured on the port is applied to the host. On a voice VLAN port, only the static default ACL of the port is applied to the phone.

Topics include:

- [Cisco Secure ACS and AV Pairs for URL-Redirect, page 40-17](#)
- [ACLs, page 40-18](#)

For details on how to configure downloadable ACL and URL redirect, refer to the [“Configuring 802.1X Authentication with ACL Assignments and Redirect URLs” section on page 40-34](#).

Cisco Secure ACS and AV Pairs for URL-Redirect

When downloadable ACL is enabled, Cisco Secure ACS provides AAA services through RADIUS.

You can set these Attribute-Value (AV) pairs on the Cisco Secure ACS with RADIUS *cisco-av-pair* vendor-specific attributes (VSAs).

CiscoSecure-Defined-ACL specifies the names of the DACLs on the Cisco Secure ACS. The switch receives the ACL name through the CiscoSecure-Defined-ACL AV pair in the format:

#ACL#-IP-name-number

name is the ACL name. *number* is the version number (like 3f783768).

The Auth-Manager code verifies whether the access control entries (ACEs) of the specified downloadable ACL were previously downloaded. If not, the Auth-Manager code sends an AAA request with the downloadable ACL name as the username so that the ACEs are downloaded. The downloadable ACL is then created as a named ACL on the switch. This ACL has ACEs with a source address of any and does not have an implicit deny statement at the end. When the downloadable ACL is applied to an interface after authentication completes, the source address changes from any to the host source IP address depending on the host mode of the interface. The ACEs are prepended to the downloadable ACL applied to the switch interface to which the endpoint device is connected. If traffic matches the CiscoSecure-Defined-ACL ACEs, the appropriate actions are taken.

url-redirect and url-redirect-acl specify the local URL policy on the switch. The switches use these cisco-av-pair VSAs as follows:

- url-redirect = <HTTP or HTTPS URL>
- url-redirect-acl = switch ACL name or number

These AV pairs enable the switch to intercept an HTTP or HTTPS request from the endpoint device and forward the client web browser to the specified redirect address from which the latest antivirus files can be downloaded. The url-redirect AV pair on the Cisco Secure ACS contains the URL to which the web browser is redirected. The url-redirect-acl AV pair contains the name or number of an ACL that specifies the HTTP or HTTPS traffic to be redirected. Traffic that matches a permit entry in the redirect ACL is redirected.

**Note**

The redirect or default ACL must be defined on the switch.

ACLs

If downloadable ACL is configured for a particular client on the authentication server, you must configure a default port ACL on a client-facing switch port.

If the default ACL is configured on the switch and the Cisco Secure ACS sends a host access policy to the switch, it applies the policy to traffic from the host connected to a switch port. If the policy does not apply, the switch applies the default ACL. If the Cisco Secure ACS sends the switch a downloadable ACL, this ACL takes precedence over the default ACL already configured on the switch port. However, if the switch receives a host access policy from the Cisco Secure ACS, but the default ACL is not configured, the authorization failure is declared.

For details on how to configure a downloadable policy, refer to the [“Configuring a Downloadable Policy” section on page 40-39](#).

Using 802.1X with RADIUS-Provided Session Timeouts

You can specify whether a switch uses a locally configured or a RADIUS-provided reauthentication timeout. If the switch is configured to use the local timeout, it reauthenticates the host when the timer expires.

If the switch is configured to use the RADIUS-provided timeout, it scans the RADIUS Access-Accept message for the Session-Timeout and optional Termination-Action attributes. The switch uses the value of the Session-Timeout attribute to determine the duration of the session, and it uses the value of the Termination-Action attribute to determine the switch action when the session's timer expires.

If the Termination-Action attribute is present and its value is RADIUS-Request, the switch reauthenticates the host. If the Termination-Action attribute is not present, or its value is Default, the switch terminates the session.

**Note**

The supplicant on the port detects that its session has been terminated and attempts to initiate a new session. Unless the authentication server treats this new session differently, the client may see only a brief interruption in network connectivity as the switch sets up a new session.

If the switch is configured to use the RADIUS-supplied timeout, but the Access-Accept message does not include a Session-Timeout attribute, the switch never reauthenticates the supplicant. This behavior is consistent with Cisco's wireless access points.

For details on how to configure RADIUS-provided session timeouts, see the [“Configuring RADIUS-Provided Session Timeouts”](#) section on page 40-47.

Using 802.1X with Voice VLAN Ports

A voice VLAN port is a special access port associated with two VLAN identifiers:

- Voice VLAN ID (VVID) to carry voice traffic to and from the IP phone. The VVID is used to configure the IP phone connected to the port.
- Port VLAN ID (PVID) to carry the data traffic to and from the workstation connected to the switch through the IP phone. The PVID is the native VLAN of the port.

Each port that you configure for a voice VLAN is associated with a VVID and a PVID. This configuration allows voice traffic and data traffic to be separated onto different VLANs.

A voice VLAN port becomes active when a link exists whether the port is AUTHORIZED or UNAUTHORIZED. All traffic exiting the voice VLAN is obtained correctly and appears in the MAC address table. Cisco IP phones do not relay CDP messages from other devices. So, if several Cisco IP phones are connected in a series, the switch recognizes only the one directly connected to it. When 802.1X is enabled on a voice VLAN port, the switch drops packets from unrecognized Cisco IP phones more than one hop away.

When 802.1X is enabled on a port, you cannot configure a PVID that is equal to a VVID. For more information about voice VLANs, see [Chapter 38, “Configuring Voice Interfaces.”](#)

Observe the following feature interactions:

- 802.1X VLAN assignment cannot assign to the port the same VLAN as the voice VLAN; otherwise, the 802.1X authentication fails. The same holds true for dynamic VLAN assignment.
- 802.1X guest VLAN works with the 802.1X voice VLAN port feature. However, the guest VLAN cannot be the same as the voice VLAN.
- 802.1X port security works with the 802.1X voice VLAN port feature and is configured per port. Two MAC addresses must be configured: one for the Cisco IP phone MAC address on the VVID and one for the PC MAC address on PVID.

However, you cannot use the 802.1X voice VLAN port feature with 802.1X port security's sticky MAC address configuration and statically configured MAC address configuration.

- 802.1X accounting is unaffected by the 802.1X voice VLAN port feature.
- When 802.1X is configured on a port, you cannot connect multiple IP phones to a Catalyst 4500 series switch through a hub.
- Because voice VLANs cannot be configured as PVLAN host ports, and because only PVLANS can be assigned to PVLAN host ports, VLAN assignment cannot assign a PVLAN to a port with a voice VLAN configured.

For details on how to configure 802.1X with voice VLANs, see the [“Configuring 802.1X with Voice VLAN” section on page 40-62](#).

Using Multiple Domain Authentication and Multiple Authentication

Multiple Domain Authentication (MDA) allows both a data device and a voice device, such as an IP phone (Cisco or 3rd party non-Cisco), to authenticate on the same switch port, which is divided into a data domain and a voice domain.

Multiple Authentication allows multiple data devices and a voice device. When a voice VLAN is configured on a multi-authentication port, the port can perform authentication in the voice domain as on an MDA port.

MDA does not enforce the order of device authentication. For best results, however, you should authenticate a voice device before you authenticate a data device on an MDA-enabled port.

Observe the following guidelines for configuring MDA:

Note

The same guidelines also apply for Multiple Authentication when voice VLAN is configured.

- It is highly recommended that you enable CoPP on an MDA-enabled port to protect against a DoS attack. Refer to [Chapter 44, “Configuring Control Plane Policing.”](#)
- To configure a switch port for MDA or Multiple Authentication, see the [“Configuring Multiple Domain Authentication and Multiple Authorization” section on page 40-30](#).
- You must configure the voice VLAN for the IP phone when the host mode is set to multidomain. For more information, see [Chapter 38, “Configuring Voice Interfaces.”](#)
- To authorize a voice device, the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of `device-traffic-class=voice`. Without this value, the switch treats the voice device as a data device.
- The guest VLAN and restricted VLAN features only apply to the data devices on an MDA-enabled port. The switch treats a voice device that fails authorization as a data device.
- If more than one device attempts authorization on either the voice or the data domain of a port, it is error disabled.
- Until a device is authorized, the port drops its traffic. Non-Cisco IP phones or voice devices are allowed into both the data and voice VLANs. The data VLAN allows the voice device to contact a DHCP server to obtain an IP address and acquire the voice VLAN information. After the voice device starts sending on the voice VLAN, its access to the data VLAN is blocked. A security violation may occur in MDA if the voice device continues to send traffic on the data VLAN.
- MDA can use MAC authentication bypass as a fallback mechanism to allow the switch port to connect to devices that do not support 802.1X authentication. This is especially useful for 3rd-party phones without 802.1X supplicant. For more information, see the [“Using 802.1X with MAC Authentication Bypass” section on page 40-11](#).

- When a *data* or a *voice* device is detected on a port, its MAC address is blocked until authorization succeeds. If the authorization fails, the MAC address remains blocked for 5 minutes.
- If more than one device is detected on the *data* VLAN or more than one voice device is detected on the *voice* VLAN while a port is unauthorized, the port is error disabled.
- When a port host mode is changed from single- or multihost to multidomain mode, an authorized data device remains authorized on the port. However, a Cisco IP phone that has been allowed on the port in the voice VLAN is automatically removed and must be reauthenticated on that port.
- Active fallback mechanisms such as guest VLAN and restricted VLAN remain configured after a port changes from single- or multihost mode to multidomain mode.
- Switching a port host mode from multidomain to single- or multihost mode removes all authorized devices from the port.
- If a data domain is authorized first and placed in the guest VLAN, non-802.1X-capable voice devices need to tag their packets on the voice VLAN to trigger authentication.
- We do not recommend per-user ACLs with an MDA-enabled port. An authorized device with a per-user ACL policy might impact traffic on both the voice and data VLANs of the port. If used, only one device on the port should enforce per-user ACLs.

How 802.1X Fails on a Port

802.1X may fail on a port in three ways: timeout, explicit failure, and protocol timeout.

Timeout—A switch attempts 802.1X at link up but the attached endpoint is not 802.1X-capable. After the configured number of retries and timeouts, the switch attempts the next authentication method if one is configured (like MAB). If MAB fails, the switch deploys the Guest VLAN (also called the no-response VLAN), if configured. The Guest VLAN is configured with the **authentication event no-response** interface command.

Explicit Failure—A switch and the endpoint perform the entire 802.1X authentication sequence and the result is an explicit failure (usually indicated by an Access-Reject from the RADIUS server to the switch and an EAP-Failure sent from the switch to the endpoint). In this case, the switch attempts MAB (if "authentication event failure action next-method" is configured) or deploy the AuthFail VLAN (if "authentication event failure action authorize vlan" is configured).

Protocol Timeout—A switch and the endpoint start the 802.1X authentication process but do not complete it. For example, the endpoint may send an 802.1X EAPoL-Start message and then stop responding to the switch (perhaps, because the endpoint lacks a credential or because it is waiting for end user to enter some information). In this case, the switch knows that the connected device is EAPoL-capable, so it will not deploy the Guest VLAN after timing out. Instead, it restarts authentication after a timeout. The switch continues to label the port as EAPoL-capable until a physical link down event is detected. To force the switch to deploy the Guest VLAN in the case of a protocol timeout, configure **dot1x guest-vlan supplicant** globally. If the port is configured for hostmode multi-domain authentication, the switch behaves as if **dot1x guest-vlan supplicant** is configured.

Supported Topologies

The 802.1X port-based authentication supports two topologies:

- Point-to-point
- Wireless LAN

In a point-to-point configuration (see [Figure 40-1 on page 40-3](#)), only one client can be connected to the 802.1X-enabled switch port when the multi-host mode is not enabled (the default). The switch detects the client when the port link state changes to the up state. If a client leaves or is replaced with another client, the switch changes the port link state to down, and the port returns to the unauthorized state.

For 802.1X port-based authentication in a wireless LAN ([Figure 40-7](#)), you must configure the 802.1X port as a multiple-host port that is authorized as a wireless access point once the client is authenticated. (See the [“Resetting the 802.1X Configuration to the Default Values”](#) section on page 40-76.) When the port is authorized, all other hosts that are indirectly attached to the port are granted access to the network. If the port becomes unauthorized (reauthentication fails or an EAPOL-logoff message is received), the switch denies access to the network for all wireless access point-attached clients. In this topology, the wireless access point is responsible for authenticating clients attached to it, and the wireless access point acts as a client to the switch.

Figure 40-7 Wireless LAN Example

Configuring 802.1X Port-Based Authentication

To configure 802.1X, follow this procedure:

-
- | | |
|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Enable 802.1X authentication. See the “Enabling 802.1X Authentication” section on page 40-24. |
| Step 2 | Configure switch to RADIUS server communication. See the “Configuring Switch-to-RADIUS-Server Communication” section on page 40-28. |
| Step 3 | Adjust the 802.1X timer values. See the “Changing the Quiet Period” section on page 40-72. |
| Step 4 | Configure optional features. See the “Configuring RADIUS-Provided Session Timeouts” section on page 40-47. |
-

Default 802.1X Configuration

Table 40-1 shows the default 802.1X configuration.

Table 40-1 *Default 802.1X Configuration*

Feature	Default Setting
Authentication, authorization, and accounting (AAA)	Disabled
RADIUS server <ul style="list-style-type: none"> • IP address • UDP authentication port • Key 	<ul style="list-style-type: none"> • None specified • 1645 • None specified
Per-interface 802.1X protocol enable state	Force-authorized The port transmits and receives normal traffic without 802.1X-based authentication of the client.
Periodic reauthentication	Disabled
Time between reauthentication attempts	3600 sec

Table 40-1 *Default 802.1X Configuration (continued)*

Feature	Default Setting
Quiet period	60 sec Number of seconds that the switch remains in the quiet state following a failed authentication exchange with the client.
Retransmission time	30 sec Number of seconds that the switch should wait for a response to an EAP request/identity frame from the client before retransmitting the request.
Maximum retransmission number	2 Number of times that the switch sends an EAP-request/identity frame before restarting the authentication process.
Multiple host support	Disabled
Client timeout period	30 sec When relaying a request from the authentication server to the client, the amount of time that the switch waits for a response before retransmitting the request to the client.
Authentication server timeout period	30 sec When relaying a response from the client to the authentication server, the amount of time that the switch waits for a reply before retransmitting the response to the server. This setting is not configurable.

802.1X Configuration Guidelines

This section describes the guidelines for configuring 802.1X authentication:

- The 802.1X protocol is supported only on Layer 2 static access, PVLAN host ports, and Layer 3 routed ports. You cannot configure 802.1X for any other port modes.
- If you are planning to use VLAN assignment, be aware that the features use general AAA commands. For information on how to configure AAA, refer to the [“Enabling 802.1X Authentication” section on page 40-24](#). Alternatively, you can refer to the Cisco IOS security documentation:
 - http://www.cisco.com/en/US/products/ps6586/products_ios_technology_home.html

Enabling 802.1X Authentication

To enable 802.1X port-based authentication, you first must enable 802.1X globally on your switch, then enable AAA and specify the authentication method list. A method list describes the sequence and authentication methods that must be queried to authenticate a user.

The software uses the first method listed in the method list to authenticate users; if that method fails to respond, the software selects the next authentication method in the list. This process continues until there is successful communication with a listed authentication method or until all defined methods are exhausted. If authentication fails at any point in this cycle, the authentication process stops, and no other authentication methods are attempted.

**Note**

To allow VLAN assignment, you must enable AAA authorization to configure the switch for all network-related service requests.

To configure 802.1X port-based authentication, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# dot1x system-auth-control	Enables 802.1X on your switch. To disable 802.1X globally on the switch, use the no dot1x system-auth-control command.
Step 3	Switch(config)# aaa new-model	Enables AAA. To disable AAA, use the no aaa new-model command.
Step 4	Switch(config)# aaa authentication dot1x {default} method1 [method2...]	Creates an 802.1X AAA authentication method list. To create a default list that is used when a named list is not specified in the authentication command, use the default keyword followed by the methods that are to be used in default situations. The default method list is automatically applied to all interfaces. Enter at least one of these keywords: <ul style="list-style-type: none"> • group radius—Use the list of all RADIUS servers for authentication. • none—Use no authentication. The client is automatically authenticated by the switch without using the information supplied by the client. To disable 802.1X AAA authentication, use the no aaa authentication dot1x {default list-name} method1 [method2...] global configuration command.
Step 5	Switch(config)# aaa authorization network {default} group radius	(Optional) Configures the switch for user RADIUS authorization for all network-related service requests, such as VLAN assignment.
Step 6	Switch(config)# interface interface-id	Enters interface configuration mode and specifies the interface to be enabled for 802.1X authentication.
Step 7	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 8	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23 .

	Command	Purpose
Step 9	<p>Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication port-control auto</p> <p>Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x port-control auto</p>	Enables 802.1X authentication on the interface.
Step 10	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 11	Switch # show dot1x interface interface-id details	Verifies your entries. Check the PortControl row in the 802.1X port summary section of this display. The PortControl value is set to auto .
Step 12	Switch# show running-config	Verifies your entries.
Step 13	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

**Note**

Enabling Spanning Tree PortFast ensures that a port comes up immediately after authorization.

**Note**

Whenever you configure any 802.1X parameter on a port, a dot1x authenticator is automatically created on the port. As a result **dot1x pae authenticator** appears in the configuration. This is to ensure that dot1x authentication still works on legacy configurations without manual intervention. This is likely to change in future releases.

This example shows how to enable 802.1X and AAA on Fast Ethernet port 2/1, and how to verify the configuration:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# dot1x system-auth-control
Switch(config)# aaa new-model
Switch(config)# aaa authentication dot1x default group radius
Switch(config)# interface fastethernet2/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
```

```
Switch# show authentication sessions interface f9/2
      Interface:  FastEthernet9/2
      MAC Address:  0007.e95d.83c4
      IP Address:   Unknown
      Status:      Running
      Domain:      UNKNOWN
      Oper host mode:  single-host

```

Configuring Switch-to-RADIUS-Server Communication

A RADIUS security server is identified by its host name or IP address, host name and specific UDP port number, or IP address and specific UDP port numbers. The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service—for example, authentication—the second host entry configured acts as the fail-over backup to the first one. The RADIUS host entries are tried in the order they were configured.

To configure the RADIUS server parameters on the switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# radius-server host {hostname ip-address} auth-port port-number [acct-port port-number] [test username name] [ignore-auth-port] [ignore-acct-port] [idle-time min] key string	<p>Configures the RADIUS server parameters on the switch.</p> <p>For <i>hostname</i> <i>ip-address</i>, specify the hostname or IP address of the remote RADIUS server.</p> <p>To delete the specified RADIUS server, use the no radius-server host {hostname ip-address} global configuration command.</p> <p>The auth-port <i>port-number</i> specifies the UDP destination port for authentication requests. The default is 1645.</p> <p>The acct-port <i>port-number</i> specifies the UDP destination port for accounting requests. The default is 1646.</p> <p>Use test username <i>name</i> to enable automated RADIUS server testing, and to detect the RADIUS server going up and down. The name parameter is the username used in the test access request sent to the RADIUS server; it does not need to be a valid user configured on the server. The ignore-auth-port and ignore-acct-port options disable testing on the authentication and accounting ports respectively.</p> <p>The idle-time <i>min</i> parameter specifies the number of minutes before an idle RADIUS server is tested to verify that it is still up. The default is 60 minutes.</p> <p>The key <i>string</i> specifies the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.</p> <p>Note Always configure the key as the last item in the radius-server host command syntax because leading spaces are ignored, but spaces within and at the end of the key are used. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.</p> <p>If you want to use multiple RADIUS servers, use this command multiple times.</p>
Step 3	Switch(config-if)# radius deadtime min	(Optional) Configures the number of minutes before a dead RADIUS server is tested to check whether it has come back up. The default is 1 minute.
Step 4	Switch(config-if)# radius dead-criteria time seconds tries num	<p>(Optional) Configures the criteria used to decide whether a RADIUS server is dead. The time parameter specifies the number of seconds after which a request to the server is unanswered before it is considered dead. The tries parameter specifies the number of times a request to the server is unanswered before it is considered dead.</p> <p>The recommended values for these parameters are tries equal to radius-server retransmit and time equal to radius-server retransmit x radius-server timeout.</p>

	Command	Purpose
Step 5	Switch(config-if)# ip radius source-interface m/p	Establishes the IP address to be used as the source address for all outgoing RADIUS packets.
Step 6	Switch(config)# end	Returns to privileged EXEC mode.
Step 7	Switch# show running-config	Verifies your entries.
Step 8	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to specify the server with IP address 172.120.39.46 as the RADIUS server. The first command specifies port 1612 as the authorization port, sets the encryption key to rad123.

The second command dictates that key matches are performed on the RADIUS server:

```
Switch# configure terminal
Switch(config)# radius-server host 172.120.39.46 auth-port 1612 key rad123
Switch(config)# ip radius source-interface g3/2
Switch(config)# end
Switch#
```

You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers by using the **radius-server host** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, **radius-server retransmit**, and the **radius-server key** global configuration commands.

You also need to create a AAA client setting on the RADIUS server. These settings include the IP address of the switch and the key string to be shared by both the server and the switch.

Configuring Multiple Domain Authentication and Multiple Authorization

Note

Multiple Authentication requires Cisco IOS Release 12.2(50)SG and later releases.

To configure MDA and Multiple Authentication, perform this task.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# radius-server vsa send authentication	Configures the network access server to recognize and use vendor-specific attributes (VSAs).
Step 3	Switch(config)# interface interface-id	Specifies the port to which multiple hosts are indirectly attached, and enters interface configuration mode.

	Command	Purpose
Step 4	<p><u>Cisco IOS Release 12.2(50)SG and later</u></p> <pre>Switch(config-if)# [no] authentication host-mode {single-host multi-host multi-domain} multi-auth</pre> <p><u>Cisco IOS Release 12.2(46)SG or earlier releases</u></p> <pre>Switch(config-if)# [no] dot1x host-mode {single-host multi-host multi-domain}</pre>	<p>The keywords allow the following:</p> <ul style="list-style-type: none"> • single-host—Single host (client) on an IEEE 802.1X-authorized port. • multi-host—Multiple hosts on an 802.1X-authorized port after authenticating a single host. • multi-domain—Both a host and a voice device (like an IP phone, Cisco or non-Cisco), to authenticate on an IEEE 802.1X-authorized port. <p>Note You must configure a voice VLAN for an IP phone when the host mode is set to multi-domain. For more information, see Chapter 38, “Configuring Voice Interfaces.”</p> <ul style="list-style-type: none"> • multi-auth—Allows multiple hosts and a voice device, such as an IP phone (Cisco or non-Cisco), to be authenticated on an IEEE 802.1x-authorized port. This keyword requires Cisco IOS Release 12.2(50)SG or a later release. <p>Ensure that the dot1x port-control interface configuration command is set to auto for the specified interface.</p> <p>To disable multiple hosts on the port, use the no authentication host-mode {multi-host multi-domain multi-auth} interface configuration command (for earlier releases, use the no dot1x host-mode {multi-host multi-domain} interface configuration command).</p>
Step 5	Switch(config-if)# switchport voice vlan <i>vlan-id</i>	(Optional) Configures the voice VLAN.
Step 6	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 7	Switch# show dot1x interface <i>interface-id</i> [detail]	Verifies your entries.
Step 8	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable 802.1X authentication and to allow multiple hosts:

Cisco IOS Release 12.2(50)SG and later

```
Switch(config)# interface gigabitethernet2/1
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication host-mode multi-host
Switch(config-if)# end
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch(config)# interface gigabitethernet2/1
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-host
Switch(config-if)# end
```

This example shows how to enable MDA and to allow both a host and a 802.1X voice device (a Cisco or third-party phone with 802.1X supplicant) on the port:

Cisco IOS Release 12.2(50)SG and later

```
Switch# conf terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# no shut
Switch(config-if)# end
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
Switch(config-if)# no shut
Switch(config-if)# end
```

This example shows how to enable MDA and to allow both a host and a non-802.1X voice device on the port:

Cisco IOS Release 12.2(50)SG and later

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# mab eap
Switch(config-if)# no shut
Switch(config-if)# end
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface FastEthernet3/1
Switch(config-if)# shut
Switch(config-if)# switchport access vlan 12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
```

```
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x host-mode multi-domain
Switch(config-if)# dot1x mac-auth-bypass
Switch(config-if)# no shut
Switch(config-if)# end
```

This example shows how to verify the dot1x MDA settings on interface FastEthernet3/1:

```
Switch# show dot1x interface FastEthernet3/1 detail
```

```

Configuring 802.1X Authentication with ACL Assignments and Redirect URLs

Topics include:

- [Downloadable ACL, page 40-34](#)
- [URL-Redirect, page 40-36](#)
- [Configuring a Downloadable Policy, page 40-39](#)

Downloadable ACL

The Downloadable ACL feature enables you to download device specific authorization policies from the authentication server. These policies activate after authentication succeeds for the respective client and the client's IP address has been populated in the IP device tracking table. (Downloadable ACL is applied on the port, once the port is authenticated and the IP device tracking table has the host IP address entry).

The following sections illustrates the configuration needed to complement the related authentication (802.1X or MAB) configuration. (No unique configuration is required on the switch. All of the configuration is on the ACS.) After authentication succeeds, enter the **show ip access-list** command to display the downloadable ACLs.

Switch Configuration

Step 1 Configure the IP device tracking table.

```
Switch(config) # ip device tracking
```

Step 2 Configure RADIUS VSA to forward authentication.

```
Switch(config) # radius-server vsa send authentication
```

Step 3 Configure Static ACL (PACL) for the interface.

```
Switch(config) # int g2/9
Switch(config-if) # ip access-group pacl-4 in
```

Sample Interface Configuration

```
Switch# show running-configuration interface g2/9
Building configuration...
```

```
Current configuration : 617 bytes
!
interface GigabitEthernet2/9
 switchport
 switchport access vlan 29
 switchport mode access
 switchport voice vlan 1234
 access-group mode prefer port
 ip access-group pacl-4 in
```

```

speed 100
duplex full
authentication event fail action authorize vlan 111
authentication event server dead action authorize vlan 333
authentication event server alive action reinitialize
authentication host-mode multi-auth
authentication order dot1x
authentication port-control auto
authentication timer restart 100
authentication timer reauthenticate 20
authentication timer inactivity 200
mab eap
dot1x pae authenticator
end

Switch#
Switch# show ip access-list pacl-4
    10 permit ip host 1.1.1.1 host 2.2.2.2
    20 permit icmp host 1.1.1.1 host 2.2.2.2
Switch#

```

Debug Commands for DACL

The IP device tracking table contains the host IP address learned through ARP or DHCP.

The following commands displays the constraints on the IP device tracking table:

```

Switch# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30
-----
   IP Address      MAC Address      Interface      STATE
-----
50.0.0.12         0015.60a4.5e84 GigabitEthernet2/9  ACTIVE

```

The following command shows that the EPM (Policy Enforced Module) session contains the DACL downloaded from ACS:

```

Switch# show epm session ip 50.0.0.12
Admission feature      : DOT1X
AAA Policies           :
ACS ACL                : xACSACLx-IP-auth-48b79b6e

```

The following command reveals the contents of the downloadable ACL:

```

Switch# show ip accesslists xACSACLx-IP-auth-48b79b6e
Extended IP access list xACSACLx-IP-auth-48b79b6e (per-user)
    10 permit udp any any
Switch(config)#

```

Cisco ACS Configuration for DACL

Note

Only Cisco ACS supports DACL.

Follow these steps to ensure correct functioning of the ACS configuration required for DACL:

- Step 1** Configure a downloadable IP ACL on the window that appears when you select **Radius Shared Profile > Downloadable IP ACL Content**:

Figure 40-8 Shared Profile Components

Edit

Shared Profile Components

Downloadable IP ACL Content

Name:

ACL Definitions

```

permit ip any host 10.10.10.10

```

Step 2 Attach this DACL with the USER on the window that appears when you select **User > DACLs**:

Figure 40-9 Downloadable ACLs

Downloadable ACLs

☒ Assign IP ACL:

Cisco IOS/PIX 6.x RADIUS Attributes

URL-Redirect

This configuration consists of two configurations: one on ACS, and one on the switch.

ACS configuration

To configure two Cisco-AV pairs, add the following statements under the user or group Cisco IOS/PIX 6x RADIUS attributes:

```

url-redirect-acl=urlacl1
url-redirect=http://www.cisco.com

```

Note A default port **ACL** must be configured on the interface.

Switch configuration

To configure the switch for URL redirect, do the following:

-
- Step 1** Configure the IP device tracking table.
- ```
Switch(config)# ip device tracking
```
- Step 2** Configure RADIUS with the **send authentication** command.
- ```
Switch(config)# radius-server vsa send authentication
```
- Step 3** Configure the URL redirect ACL (URLACL).
- ```
Switch# ip access-list urlacl
 10 permit tcp any any
Switch#
```
- Step 4** Configure static ACL (PACL) for the interface.
- ```
Switch(config)# int g2/9
Switch(config-if)# ip access-group pacl-4 in
```
-

Sample Interface Configuration

```
Switch# show running-configuration int g2/9
Building configuration...

Current configuration : 617 bytes
!
interface GigabitEthernet2/9
  switchport
  switchport access vlan 29
  switchport mode access
  switchport voice vlan 1234
  access-group mode prefer port
  ip access-group pacl-4 in
  speed 100
  duplex full
  authentication event fail action authorize vlan 111
  authentication event server dead action authorize vlan 333
  authentication event server alive action reinitialize
  authentication host-mode multi-auth
  authentication order dot1x
  authentication port-control auto
  authentication timer restart 100
  authentication timer reauthenticate 20
  authentication timer inactivity 200
  mab
  dot1x pae authenticator
end

Switch#

Switch# show access-list pacl-4
      10 permit ip host 1.1.1.1 host 2.2.2.2
      20 permit icmp host 1.1.1.1 host 2.2.2.2
Switch#
```

Verify URL-redirect with the following commands.

The **show ip device tracking** command illustrates the constraints on the IP device tracking table:

```
Switch(config)# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30
```

IP Address	MAC Address	Interface	STATE
50.0.0.12	0015.60a4.5e84	GigabitEthernet2/9	ACTIVE

The **show epm session ip** command displays the EPM session table for a particular host. Observe the URL- redirect-acl and URL-redirect URL information that downloads from the ACS.

```
Switch# show epm session ip 50.0.0.12
Admission feature      : DOT1X
AAA Policies           :
URL Redirect ACL       : urlacl
URL Redirect           : http://www.cisco.com
```

For more information about AV pairs that are supported by Cisco IOS software, see the ACS configuration and command reference documentation about the software releases running on the AAA clients.

Guidelines and Restrictions for DACL and URL Redirect

For downloadable ACL or URL redirect, the ACL source must be ANY (permit TCP ANY host 1.1.1.1 eq 80 or permit TCP ANY host 1.1.1.1 eq 443).

Configuring a Downloadable Policy

To configure downloadable policies, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# access-list <i>access-list-number</i> { deny permit } <i>source</i> [<i>source-wildcard</i>] [log]	<p>Defines the default port ACL through a source address and wildcard.</p> <p>The <i>access-list-number</i> is a decimal from 1 to 99 or 1300 to 1999.</p> <p>Enter deny or permit to specify whether to deny or permit access if conditions match.</p> <p><i>source</i> is the address of the network or host from which the packet is sent, specified as follows:</p> <ul style="list-style-type: none"> The 32-bit quantity in dotted-decimal format The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255 You do not need a source-wildcard value. The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. <p>(Optional) Applies the source-wildcard wildcard bits to the source.</p> <p>(Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.</p>
Step 3	Switch(config-if)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 4	Switch(config-if)# ip access-group { <i>access-list-number</i> <i>name</i> } in	<p>Controls access to the specified interface.</p> <p>This step is mandatory for a functioning downloaded policy.</p>
Step 5	Switch(config)# exit	Returns to global configuration mode.
Step 6	Switch(config)# aaa new-model	Enables AAA.
Step 7	Switch(config)# aaa authorization network default local	Sets the authorization method to local. To remove the authorization method, use the no aaa authorization network default local command.
Step 8	Switch(config)# ip device tracking	<p>Enables the IP device tracking table.</p> <p>To disable the IP device tracking table, use the no ip device tracking global configuration commands.</p>
Step 9	Switch(config)# ip device tracking [probe { count <i>count</i> <i>interval</i> <i>interval</i> }]	<p>(Optional) Configures these parameters for the IP device tracking table:</p> <ul style="list-style-type: none"> count - Number of times that the switch sends the ARP probe. The range is 1 to 5. The default is 3. interval - Number of seconds that the switch waits for a response before resending the ARP probe. The range is 30 to 300 seconds. The default is 30 seconds.
Step 10	Switch(config)# ip device tracking [probe { <i>delay interval</i> }]	<p>(Optional) Configures the optional probe delay parameter for the IP device tracking table:</p> <ul style="list-style-type: none"> interval—Number of seconds that the switch delays sending an ARP probe, triggered by link-up and ARP probe generation by the tracked device. The range is 1 to 120 seconds. The default is 0 seconds.

	Command	Purpose
Step 11	Switch(config)# radius-server vsa send authentication	Configures the network access server to recognize and use vendor-specific attributes. Note The downloadable ACL must be operational.
Step 12	Switch(config)# end	Returns to privileged EXEC mode.
Step 13	Switch# show ip device tracking {all interface interface-id ip ip-address mac mac-address}	Displays information about the entries in the IP device tracking table.
Step 14	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The following example illustrates how to configure a switch for downloadable policy:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# aaa new-model
Switch(config)# aaa authorization network default local
Switch(config)# ip device tracking
Switch(config)# ip access-list extended default_acl
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# radius-server vsa send authentication
Switch(config)# int fastEthernet 2/13
Switch(config-if)# ip access-group default_acl in
Switch(config-if)# exit
```

Configuring 802.1X Authentication with Per-User ACL and Filter-ID ACL

Topics include:

- [Per-User ACL and Filter-ID ACL, page 40-40](#)
- [Configuring a Per-User ACL and Filter-ID ACL, page 40-46](#)

Per-User ACL and Filter-ID ACL

Prior to Cisco IOS Release 12.2(52)SG, the Cat4K platform only supported downloadable ACLs, which work with the Cisco ACS server but not with third-party AAA servers. With Cisco IOS Release 12.2(52)SG, the Catalyst 4500 switch offers the Filter-ID/Per-user-acl enhancement(s), which allow ACL policy enforcement using a third-party AAA server.

The Filter-ID feature provides the following capabilities:

Filter-ID option allows an administrator to define the ACL name on the AAA server using IETF standard Radius attribute. The ACL itself must be pre-configured locally on the switch.

The Per-user-acl feature provides the following capabilities:

Per-user ACL allows an administrator to define the per-user ACL on the AAA server using Cisco Radius AV pairs. This allows third-party AAA server to interoperate by loading Cisco Radius dictionary. Cisco radius dictionary will have **Cisco Radius AV pairs** configured as a VSA.

Note The Radius Vendor-specific attributes (VSAs) allow vendors to support their own proprietary RADIUS attributes that are not included in standard radius attributes.

Switch Configuration

-
- Step 1** Configure the IP device tracking table.
- ```
Switch(config)# ip device tracking
```
- Step 2** Configure Static ACL (PACL) for the interface.
- ```
Switch(config)# int g2/9
Switch(config-if)# ip access-group pacl-4 in
```
-

Sample Interface Configuration

```
Switch# show running-configuration interface g2/9
Building configuration...

Current configuration : 617 bytes
!

Per-User-Acl configuration in ACS

In the Group/User Setting page, scroll down to the Cisco IOS/PIX 6.x RADIUS Attributes section. Select the box next to [009\001 cisco-av-pair] and enter the elements of the per-user ACL. Per-user ACLS take this format:

```
<protocol>:inacl#<sequence number>=<ACE>
<protocol> can be either "ip" for IP-based ACLs or "mac" for MAC-based ACLs.
```

In the following example, members of the group you are configuring are denied all access to the 10.100.60.0 subnet, denied http access to the server at 10.100.10.116, and permitted everywhere else.

Figure 40-10 Define the ACEs for the per-user ACL

The screenshot shows the 'Group Setup' configuration page in Cisco ACS. The left sidebar contains navigation links: User Setup, Group Setup, Shared Profile Components, Network Configuration, System Configuration, Interface Configuration, Administration Control, External User Databases, Posture Validation, Network Access Profiles, Reports and Activity, and Online Documentation. The main content area has a 'Jump To' dropdown set to 'Access Restrictions'. Below this are two sections:

IP Assignment

- ☐ No IP address assignment
- ☒ Assigned by dialup client
- ☐ Assigned from AAA Client pool

Cisco IOS/PIX 6.x RADIUS Attributes

- ☒ [009\001] cisco-av-pair

```
ip:inacl#10=deny ip any
10.100.60.0 0.0.0.255
ip:inacl#20=deny tcp any host
10.100.10.116 eq www
ip:inacl#30=permit ip any any
```
- ☐ [009\101] cisco-h323-credit-amount
- ☐ [009\102] cisco-h323-credit-time
- ☐ [009\103] cisco-h323-return-code
- ☐ [009\104] cisco-h323-prompt-id

At the bottom are buttons: Submit, Submit + Restart, and Cancel.

**Note**

outbound ACLs (outacl) are not supported.

Filter-Id configuration in ACS:

In the Group/User Setting page, scroll down to the " IETF RADIUS Attributes" section. Select the box next to [011] Filter-Id and enter the ACL to apply for members of this group (Figure 40-11).

The Filter-Id takes this format:

<ACL>.in

<ACL> is the number of the ACL that was configured on the switch in the previous step

Figure 40-11 Configuring the Filter-ID Attribute

The screenshot shows the Cisco Group Setup configuration page. On the left is a navigation pane with options: User Setup, Group Setup, Shared Profile Components, Network Configuration, System Configuration, Interface Configuration, Administration Control, External User Databases, Posture Validation, Network Access Profiles, Reports and Activity, and Online. The main area is titled 'Group Setup' and has a 'Jump To' dropdown menu set to 'Access Restrictions'. Below this is a section titled 'IETF RADIUS Attributes' with a help icon. It contains several attributes with checkboxes and input fields:

- ☐ [006] Service-Type: Authenticate only
- ☐ [007] Framed-Protocol: Ascend MPP
- ☐ [009] Framed-IP-Netmask: 0.0.0.0
- ☐ [010] Framed-Routing: None
- ☒ [011] Filter-ID: 100.in

At the bottom are three buttons: Submit, Submit + Restart, and Cancel. A small number '274491' is visible in the bottom right corner of the configuration area.

Note Outbound ACLs (e.g. "100.out") are not supported.

Debug Commands for Per-User ACL and Filter-ID ACL

The IP device tracking table contains the host IP address learned through ARP or DHCP. The following command displays the constraints on the IP device tracking table:

```
Switch# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30
-----
IP Address MAC Address Interface STATE
-----
50.0.0.12 0015.60a4.5e84 GigabitEthernet2/9 ACTIVE
```

The following command shows that the EPM (Policy Enforced Module) session contains the per-user-acl from ACS:

```
Switch# show epm session ip 50.0.0.12
Admission feature : DOT1X
AAA Policies :
Per-User ACL      : deny ip any host 20.20.10.10
```

The following command reveals the contents of the per-user-acl (note that per-user-acl are shown above the default port ACL configured on the interface, 151 is the default port ACL in the following example):

```
Switch# show access-list
Extended IP access list 151

    deny ip host 20.20.0.3 host 20.20.10.10

    10 permit ip any any (57 estimate matches)
```

The following commands reveals the number of sessions and the corresponding client ip addresses,

```
Switch# show epm session summary
EPM Session Information
-----
Total sessions seen so far : 1
Total active sessions      : 1
Session IP Address :
-----
50.0.0.12
```

The following command shows that the EPM (Policy Enforced Module) session contains the per-user-acl(both ip and mac acl from ACS):

```
Switch# show epm session ip 50.0.0.12
Admission feature : DOT1X
AAA Policies :
Per-User ACL      : deny ip any host 20.20.10.10
Per-User ACL      : deny any host 0000.AAAA.AAAA
```

The following command reveals the contents of the per-user-acl (note that per-user-acl are shown above the default port acl configured on the interface, 151 is the default port acl in the example below):

```
Switch# show access-list
Extended IP access list 151

    deny ip host 20.20.0.3 host 20.20.10.10

    10 permit ip any any (57 estimate matches)
..
..
..(check for the mac access-list created)..
..
Extended MAC access list PerUser_MAC_ACL-589079192 (per-user)
    deny  any host 0000.aaaa.aaaa
..
```

The following command shows that the EPM (Policy Enforced Module) session contains the Filter-Id 155 from ACS:

Note The 156 IP extended acl is to be pre-configured on the switch, so that the policy enforcement can happen.

```
Switch# show ip access-list 156
Extended IP access list 156
 10 deny ip any host 155.155.155.156
 20 deny ip any 156.100.60.0 0.0.0.255
 30 deny tcp any host 156.100.10.116 eq www
```

```
Switch# show epm session ip 50.0.0.12
Admission feature : DOT1X
AAA Policies :
Filter-Id          : 155
```

The following command reveals the contents of the Filter-Id applied on the interface:

```
Switch# show ip access-list int <gi6/3>
```

```
Switch# show ip access-list interface gi6/3
deny ip host 20.20.0.2 host 155.155.155.156
deny ip host 20.20.0.2 156.100.60.0 0.0.0.255
deny tcp host 20.20.0.2 host 156.100.10.116 eq www
```

Guidelines and Restrictions for Per-User-ACL and Filter-ID ACL

For Per-User-ACL and Filter-ID ACL, the ACL source must be ANY (permit TCP ANY host 1.1.1.1 eq 80 or permit TCP ANY host 1.1.1.1 eq 443).

Configuring a Per-User ACL and Filter-ID ACL

To configure Per-User-ACL and Filter-ID ACL, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# access-list <i>access-list-number</i> { deny permit } <i>source</i> [<i>source-wildcard</i>] [log]	<p>Defines the default port ACL through a source address and wildcard.</p> <p>The <i>access-list-number</i> is a decimal from 1 to 99 or 1300 to 1999.</p> <p>Enter deny or permit to specify whether to deny or permit access if conditions match.</p> <p><i>source</i> is the address of the network or host from which the packet is sent, specified as follows:</p> <ul style="list-style-type: none"> The 32-bit quantity in dotted-decimal format The keyword any as an abbreviation for source and source-wildcard value of 0.0.0.0 255.255.255.255 <p>You do not need a source-wildcard value.</p> <ul style="list-style-type: none"> The keyword host as an abbreviation for source and source-wildcard of source 0.0.0.0. <p>(Optional) Applies the source-wildcard wildcard bits to the source.</p> <p>(Optional) Enters log to cause an informational logging message about the packet that matches the entry to be sent to the console.</p>
Step 3	Switch(config-if)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 4	Switch(config-if)# ip access-group { <i>access-list-number</i> <i>name</i> } in	<p>Controls access to the specified interface.</p> <p>This step is mandatory for a functioning downloaded policy.</p>
Step 5	Switch(config)# exit	Returns to global configuration mode.
Step 6	Switch(config)# aaa new-model	Enables AAA.
Step 7	Switch(config)# aaa authorization network default local	Sets the authorization method to local. To remove the authorization method, use the no aaa authorization network default local command.
Step 8	Switch(config)# ip device tracking	<p>Enables the IP device tracking table.</p> <p>To disable the IP device tracking table, use the no ip device tracking global configuration commands.</p>
Step 9	Switch(config)# ip device tracking [probe { count <i>count</i> interval <i>interval</i> }]	<p>(Optional) Configures these parameters for the IP device tracking table:</p> <ul style="list-style-type: none"> count - Number of times that the switch sends the ARP probe. The range is 1 to 5. The default is 3. interval - Number of seconds that the switch waits for a response before resending the ARP probe. The range is 30 to 300 seconds. The default is 30 seconds.
Step 10	Switch(config)# ip device tracking [probe { <i>delay interval</i> }]	<p>(Optional) Configures the optional probe delay parameter for the IP device tracking table:</p> <ul style="list-style-type: none"> interval—Number of seconds that the switch delays sending an ARP probe, triggered by link-up and ARP probe generation by the tracked device. The range is 1 to 120 seconds. The default is 0 seconds.

	Command	Purpose
Step 11	Switch(config)# end	Returns to privileged EXEC mode.
Step 12	Switch# show ip device tracking { all interface <i>interface-id</i> ip <i>ip-address</i> mac <i>mac-address</i> }	Displays information about the entries in the IP device tracking table.
Step 13	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The following example illustrates how to configure a switch for downloadable policy:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# aaa new-model
Switch(config)# aaa authorization network default local
Switch(config)# ip device tracking
Switch(config)# ip access-list extended default_acl
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# int fastEthernet 2/13
Switch(config-if)# ip access-group default_acl in
Switch(config-if)# exit
```

Configuring RADIUS-Provided Session Timeouts

You can configure the Catalyst 4500 series switch to use a RADIUS-provided reauthentication timeout.

To configure RADIUS-provided timeouts, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 3	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication timer reauthenticate {interface / server} <u>Cisco IOS Release 12.2(46)SG or earlier</u> <u>releases</u> Switch(config-if)# dot1x timeout reauth-attempts {interface / server}	Sets the re-authentication period (seconds).
Step 6	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 7	Switch# show dot1x interface <i>interface-id</i> details	Verifies your entries.
Step 8	Switch # copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure a switch to derive the re-authentication period from the server and to verify the configuration:

Cisco IOS Release 12.2(50):

```
Switch# configure terminal
Switch(config)# interface f7/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication timer reauthenticate server
Switch(config-if)# end
Switch# show dot1x interface f7/1 det
```

```

Port Status                = AUTHORIZED

Switch#

```

Configuring Violation Action

You can configure 802.1X security violation behavior as either shutdown or restrict mode, based on the response to the violation.

To configure the violation action, performing the following task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 3	Switch(config-if)# authentication violation [restrict shutdown]	(Optional) Configures the disposition of the port if a security violation occurs. The default action is to shut down the port. If the restrict keyword is configured, the port does not shut down.
Step 4	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 5	Switch# show run	Verifies your entries.
Step 6	Switch # copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure violation mode shutdown on a switch:

```

Switch# configure terminal
Switch(config)# authentication violation shutdown

```

A port is error-disabled when a security violation triggers on shutdown mode. The following syslog messages displays:

```

%AUTHMGR-5-SECURITY_VIOLATION: Security violation on the interface <interface name>, new
MAC address <mac-address> is seen.
%PM-4-ERR_DISABLE: security-violation error detected on <interface name>, putting
<interface name> in err-disable state

```

Configuring 802.1X with Guest VLANs

You can configure a guest VLAN for each 802.1X port on the Catalyst 4500 series switch to provide limited services to clients, such as downloading the 802.1X client. These clients might be upgrading their system for 802.1X authentication, and some hosts, such as Windows 98 systems, might not be 802.1X-capable.

When you enable a guest VLAN on an 802.1X port, the Catalyst 4500 series switch assigns clients to a guest VLAN provided (1) the authentication server does not receive a response to its EAPOL request or identity frame, or (2) the EAPOL packets are not sent by the client.

Starting with Cisco IOS Release 12.2(25)EWA, the Catalyst 4500 series switch maintains the EAPOL packet history. If another EAPOL packet is detected on the interface during the lifetime of the link, network access is denied. The EAPOL history is reset upon loss of the link.

Any number of 802.1X-incapable clients are allowed access when the switch port is moved to the guest VLAN. If an 802.1X-capable client joins the same port on which the guest VLAN is configured, the port is put into the unauthorized state in the user-configured access VLAN, and authentication is restarted.

Guest VLANs are supported on 802.1X ports in single-host or multiple-hosts mode.

**Note**

When a port is put into a guest VLAN, it is automatically placed into multihost mode, and an unlimited number of hosts can connect through the port. Changing the multihost configuration does not effect a port in a guest VLAN.

**Note**

Except for an RSPAN VLAN or a voice VLAN, you can configure any active VLAN as an 802.1X guest VLAN.

To configure 802.1X with guest VLAN on a port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to be enabled for 802.1X authentication.
Step 3	Switch(config-if)# switchport mode access or Switch(config-if)# switchport mode private-vlan host	Specifies a nontrunking, nontagged single VLAN Layer 2 interface. Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication event no-response action authorize vlan <i>vlan-id</i> Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x guest-vlan <i>vlan-id</i>	Enables a guest VLAN on a particular interface. To disable the guest VLAN feature on a particular port, use the no authentication event no-response action authorize vlan interface configuration command (for earlier releases, use the no dot1x guest-vlan interface configuration command).
Step 6	Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication port-control auto Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x port-control auto	Enables 802.1X authentication on the interface.
Step 7	Switch(config-if)# end	Returns to configuration mode.
Step 8	Switch(config)# end	Returns to privileged EXEC mode.

This example shows how to enable regular VLAN 50 on Fast Ethernet 4/3 as a guest VLAN on a static access port:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication event no-response action authorize vlan 50
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x guest-vlan 50
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

This example shows how to enable a secondary PVLAN 100 as a guest VLAN on a PVLAN host port:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication event no-response action authorize vlan 100
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fa4/3
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x guest-vlan 100
Switch(config-if)# end
Switch#
```

To allow supplicants into a guest VLAN on a switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch# dot1x guest-vlan supplicant	(Optional) Enables supplicants to be allowed into the guest VLANs globally on the switch. Note Although not visible in the CLI for Cisco IOS Release 12.3(31)SG, legacy configurations that include the dot1x guest-vlan supplicant command still work. Using this command is not recommended, however, because the authentication failed VLAN option makes it unnecessary. To disable the supplicant guest VLAN feature on a switch, use the no dot1x guest-vlan supplicant global configuration command.
Step 3	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to be enabled for 802.1X authentication.
Step 4	Switch(config-if)# switchport mode access or Switch(config-if)# switchport mode private-vlan host	Specifies a nontrunking, nontagged single VLAN Layer 2 interface. Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.
Step 5	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “ Default 802.1X Configuration ” section on page 40-23.
Step 6	Switch(config-if)# dot1x guest-vlan <i>vlan-id</i>	Specifies an active VLAN as an 802.1X guest VLAN. The range is 1 to 4094.
Step 7	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication port-control auto <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x port-control auto	Enables 802.1X authentication on the interface.
Step 8	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 9	Switch# show dot1x interface <i>interface-id</i>	Verifies your entries.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable the guest VLAN feature and to specify VLAN 5 as a guest VLAN:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication event no-response action authorize vlan 5
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```

Switch# configure terminal
Switch(config)# dot1x guest-vlan supplicant
Switch(config)# interface gigabitethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x guest-vlan 5
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#

```

Configuring 802.1X with MAC Authentication Bypass

To enable MAB, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Specifies the port to be configured, and enters interface configuration mode.
Step 3	Switch(config-if)# switchport mode access or Switch(config-if)# switchport mode private-vlan host	Specifies a nontrunking, nontagged single VLAN Layer 2 interface. Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication port-control auto <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x port-control auto	Enables 802.1X authentication on the interface.
Step 6	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# mab [eap] <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x mac-auth-bypass [eap]	Enables MAB on a switch. The eap option specifies that a complete EAP conversation should be used, as opposed to standard RADIUS Access-Request, Access-Accept conversation. By default, the eap option is not enabled for MAB.
Step 7	Switch(config)# end	Returns to privileged EXEC mode.
Step 8	Switch# show mab interface <i>interface-id details</i>	(Optional) Verifies your entries.
Step 9	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Note

Removing a 802.1X MAB configuration from a port does not impact the authorized or authenticated state of the port. If the port is in an unauthenticated state, it remains in that state. If the port is in an authenticated state because of MAB, the switch reverts to the 802.1X Authenticator. If the port was

already authorized with a MAC address and the MAB configuration was removed, the port remains in an authorized state until re-authentication occurs. At that time, if an 802.1X supplicant is detected on the wire, the MAC address is removed.

This example shows how to enable MAB on Gigabit Ethernet interface 3/3 and to verify the configuration:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface gigabitethernet3/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# mab

Switch#

Configuring 802.1X with Inaccessible Authentication Bypass

Caution

You must configure the switch to monitor the state of the RADIUS server as described in the section [Configuring Switch-to-RADIUS-Server Communication, page 40-28](#) for Inaccessible Authentication Bypass to work properly. Specifically, you must configure the RADIUS test username, idle-time, deadtime and dead-criteria. Failure to do so results in the switch failing to detect that the RADIUS server has gone down, or prematurely marking a dead RADIUS server as alive again.

To configure a port as a critical port and to enable the Inaccessible Authentication Bypass feature, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	<p>Cisco IOS Release 12.2(50)SG and later Switch(config)# authentication critical eapol</p> <p>Cisco IOS Release 12.2(46)SG or earlier releases Switch(config)# dot1x critical eapol</p>	<p>(Optional) Configures whether to send an EAPOL-Success packet when a port is critically authorized partway through an EAP exchange.</p> <p>Note Some supplicants require this.</p> <p>The default is not to send EAPOL-Success packets when ports are critically authorized.</p>
Step 3	<p>Cisco IOS Release 12.2(50)SG and later Switch(config)# authentication critical recovery delay msec</p> <p>Cisco IOS Release 12.2(46)SG or earlier releases Switch(config)# dot1x critical recovery delay msec</p>	(Optional) Specifies a throttle rate for the reinitialization of critically authorized ports when the RADIUS server becomes available. The default throttle rate is 100 milliseconds. This means that 10 ports reinitialize per second.
Step 4	Switch(config)# interface interface-id	Specifies the port to be configured and enters interface configuration mode.
Step 5	<p>Switch(config-if)# switchport mode access</p> <p>or</p> <p>Switch(config-if)# switchport mode private-vlan host</p>	<p>Specifies a nontrunking, nontagged single VLAN Layer 2 interface.</p> <p>Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.</p>
Step 6	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 7	Switch(config-if)# authentication port-control auto	Enables 802.1X authentication on the interface.

	Command	Purpose
Step 8	<p>Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication event server dead action authorize [vlan vlan-id]</p> <p>Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x critical</p>	<p>Enables the Inaccessible Authentication Bypass feature on the port.</p> <p>To disable the feature, use the no authentication event server dead action authorize vlan interface configuration command (for earlier releases, use the no dot1x critical interface configuration command).</p>
Step 9	<p>Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x critical vlan vlan</p>	<p>(Optional) Specifies a VLAN into which the port is assigned when it is critically authorized.</p> <p>The default is to use the configured VLAN on the port.</p>
Step 10	<p>Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication event server alive action reinitialize</p> <p>Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x critical recovery action reinitialize</p>	<p>(Optional) Specifies that the port should be reinitialized if it is critically authorized and RADIUS becomes available.</p> <p>The default is not to reinitialize the port.</p>
Step 11	Switch(config)# end	Returns to privileged EXEC mode.
Step 12	Switch# show dot1x interface interface-id details	(Optional) Verifies your entries.
Step 13	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The following example shows a full configuration of 802.1X with Inaccessible Authentication Bypass, including required AAA and RADIUS configuration as specified in the [“Enabling 802.1X Authentication”](#) section on page 40-24 and [“Configuring Switch-to-RADIUS-Server Communication”](#) section on page 40-28.

The RADIUS server configured is at IP address 10.1.2.3, using port 1645 for authentication and 1646 for accounting. The RADIUS secret key is *mykey*. The username used for the test server probes is *randomuser*. The test probes for both living and dead servers are generated once per minute. The interface FastEthernet 3/1 is configured to critically authenticate into VLAN 17 when AAA becomes unresponsive, and to reinitialize automatically when AAA becomes available again.

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal

Configuring 802.1X with Unidirectional Controlled Port

To configure unidirectional controlled port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Specifies the port to be configured and enters interface configuration mode.
Step 3	Switch(config-if)# switchport mode access or Switch(config-if)# switchport mode private-vlan host	Specifies a nontrunking, nontagged single VLAN Layer 2 interface. Specifies that the ports with a valid PVLAN trunk association become active host PVLAN trunk ports.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	Switch(config-if)# authentication port-control auto	Enables 802.1X authentication on the interface.
Step 6	Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication control-direction {in both} Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x control-direction {in both}	Enables unidirectional port control on each port.
Step 7	Switch(config)# end	Returns to privileged EXEC mode.
Step 8	Switch# show dot1x interface <i>interface-id details</i>	(Optional) Verifies your entries.
Step 9	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

**Note**

Unidirectional Controlled Port only works when Spanning Tree Portfast is enabled on the port. Unidirectional Controlled Port and Spanning Tree Portfast should be configured on a switch port that connects to a host. If two such ports are connected together with an Ethernet cable, high CPU utilization may result because host learning will be flapping between the two ports.

This example shows how to enable unidirectional port control:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface gigabitethernet3/3
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator

Switch#
```

Configuring 802.1X with Authentication Failed

By configuring authentication-failed VLAN alignment on any Layer 2 port on the Catalyst 4500 series switch, you can provide limited network services to clients that fail the authentication process.

Note

You can use authentication-failed VLAN assignment with other security features, such as Dynamic ARP Inspection (DAI), Dynamic Host Configuration Protocol (DHCP) snooping, and IP Source Guard. Each of these features can be enabled and disabled independently on the authentication-failed VLAN.

To configure 802.1X with authentication-failed VLAN assignment, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to be enabled for 802.1X authentication.
Step 3	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 4	Switch(config-if)# authentication port-control auto	Enables 802.1X authentication on the interface.
Step 5	Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication event fail action authorize vlan <i>vlan-id</i> Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x auth-fail vlan <i>vlan-id</i>	Enables authentication-failed VLAN on a particular interface. To disable the authentication-failed VLAN feature on a particular port, use the no authentication event fail action authorize vlan interface configuration command.
Step 6	Cisco IOS Release 12.2(50)SG and later Switch(config-if)# authentication event fail retry <i>max-attempts</i> action [authorize vlan <i>vlan-id</i> next-method] Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x auth-fail max-attempts <i>max-attempts</i>	Configure a maximum number of attempts before the port is moved to authentication-failed VLAN. Default is 3 attempts.
Step 7	Switch(config-if)# end	Returns to configuration mode.
Step 8	Switch(config)# end	Returns to privileged EXEC mode.
Step 9	Switch# show dot1x interface <i>interface-id</i> details	(Optional) Verifies your entries.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable a regular VLAN 40 on Fast Ethernet 4/3 as a authentication-failed VLAN on a static access port:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface gigabitEthernet3/1
```

```

Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication port-control auto
Switch(config-if)# authentication event fail retry 5 action authorize vlan 40
Switch(config-if)# end
Switch# show dot1x all
Sysauthcontrol          Enabled
Dot1x Protocol Version    2

Dot1x Info for GigabitEthernet3/1

Auth-Fail-Max-attempts   = 3

```

Switch#

Configuring 802.1X with Voice VLAN

Note

You must configure 802.1X and voice VLAN simultaneously.

Note

You cannot configure an authentication-failed VLAN and a voice VLAN on the same port. When you try to configure these two features on the same port, a syslog message appears.

To enable 802.1X with voice VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 3	Switch(config-if)# switchport access vlan <i>vlan-id</i>	Sets the VLAN for a switched interface in access mode.
Step 4	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 5	Switch(config-if)# switchport voice vlan <i>vlan-id</i>	Sets the voice VLAN for the interface.
Step 6	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 7	Cisco IOS Release 12.2(50)SG and later and later Switch(config-if)# authentication port-control auto Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x port-control auto	Enables 802.1X authentication on the interface.
Step 8	Switch(config-if)# end	Returns to configuration mode.
Step 9	Switch(config)# end	Returns to privileged EXEC mode.
Step 10	Switch# show dot1x interface <i>interface-id</i> details	(Optional) Verifies your entries.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable 802.1X with voice VLAN feature on Fast Ethernet interface 5/9:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport access vlan 2
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
```

```
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch(config)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport access vlan 2
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 10
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch(config)# end
Switch#
```

Configuring 802.1X with VLAN Assignment

For enabling dynamic VLAN assignment, there is no additional configuration required in the switch. For configuring MDA or Multi-authentication refer "Configuring Multiple Domain Authentication and Multiple Authorization" section on page 39-29. To enable VLAN assignment, Cisco ACS Server has to be configured correspondingly.

To enable 802.1X with VLAN assignment, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode.
Step 3	Switch(config-if)# switchport access vlan-id	Sets the VLAN for a switched interface in access mode.
Step 4	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 5	Switch(config-if)# switchport voice vlan vlan-id	Sets the voice VLAN for the interface.
Step 6	Switch(config-if)# authentication host-mode multi-domain	Enables MDA on the interface.
Step 7	Switch(config-if)# authentication port-control auto	Enables 802.1X authentication on the interface.
Step 8	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 9	Switch(config)# end	Returns to privileged EXEC mode.
Step 10	Switch# show dot1x interface <i>interface-id details</i>	(Optional) Verifies your entries.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The following example shows how to configure MDA on an interface and 802.1X as the authentication mechanism:

Note You must configure VLAN assignment in the ACS server. No configuration changes are required on the switch.

```
Switch(config)# interface FastEthernet3/3
Switch(config-if)# switchport access vlan 10
Switch(config-if)# switchport mode access
Switch(config-if)# switchport voice vlan 16
Switch(config-if)# authentication host-mode multi-domain
Switch(config-if)# authentication port-control auto
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# end
```

Cisco ACS Configuration for VLAN Assignment

The procedure for enabling MDA with Voice VLAN assignment is the same as that for activating MDA except for one step: Configure a VLAN for dynamic VLAN Assignment after selecting **User > IETF RADIUS Attributes** (Figure 40-12). This step ensures correct functioning of the ACS configuration required for dynamic VLAN assignment.

Figure 40-12 User Setup

Note The procedure is the same for voice devices except that the AAA server must be configured to send a Cisco Attribute-Value (AV) pair attribute with a value of device-traffic-class=voice.

Enabling Fallback Authentication

On a port in multiauthentication mode, either or both of MAB and web-based authentication can be configured as fallback authentication methods for non-802.1X hosts (those that do not respond to EAPOL). You can configure the order and priority of the authentication methods.

For detailed configuration information for MAB, see the [“Configuring 802.1X with MAC Authentication Bypass”](#) section on page 40-53.

For detailed configuration information for web-based authentication, see [Chapter 42, “Configuring Web-Based Authentication.”](#)

Note

When Webauth and other authentication methods are configured on an MDA or multiauthentication port, downloadable ACL policies must be configured for all devices attached to that port.

To enable fallback authentication, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip admission name <i>rule-name</i> proxy http	Configures an authentication rule for web-based authentication.
Step 2	Switch(config)# fallback profile <i>profile-name</i>	Creates a fallback profile for web-based authentication.
Step 3	Switch(config-fallback-profile)# ip access-group <i>rule-name</i> in	Specifies the default ACL to apply to network traffic before web-based authentication.
Step 4	Switch(config-fallback-profile)# ip admission name <i>rule-name</i>	Associates an IP admission rule with the profile and specifies that a client connecting by web-based authentication uses this rule.
Step 5	Switch(config-fallback-profile)# exit	Returns to global configuration mode.
Step 6	Switch(config)# interface <i>type slot/port</i>	Specifies the port to be configured and enters interface configuration mode. <i>type</i> = fastethernet , gigabitethernet , or tengigabitethernet
Step 7	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication port-control auto <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x port-control auto	Enables authentication on the port.
Step 8	Switch(config-if)# authentication order <i>method1</i> [<i>method2</i>] [<i>method3</i>]	(Optional) Specifies the fallback order of authentication methods to be used. The three values of <i>method</i> , in the default order, are dot1x , mab , and webauth . The specified order also determines the relative priority of the methods for reauthentication (highest to lowest).
Step 9	Switch(config-if)# authentication priority <i>method1</i> [<i>method2</i>] [<i>method3</i>]	(Optional) Overrides the relative priority of authentication methods to be used. The three values of <i>method</i> , in the default order of priority, are dot1x , mab , and webauth .
Step 10	Switch(config-if)# authentication event fail action next-method	Specifies that the next configured authentication method be applied if authentication fails.

	Command	Purpose
Step 11	Cisco IOS Release 12.2(50)SG and later Switch(config-if)# mab [eap] Cisco IOS Release 12.2(46)SG or earlier releases Switch(config-if)# dot1x mac-auth-bypass [eap]	Enables MAC authentication bypass. The optional eap keyword specifies that the EAP extension be used during RADIUS authentication.
Step 12	Switch(config-if)# authentication fallback <i>profile-name</i>	Enables web-based authentication using the specified profile.
Step 13	Switch(config-if)# authentication violation [shutdown restrict]	(Optional) Configures the disposition of the port if a security violation occurs. The default action is to shut down the port. If the restrict keyword is configured, the port does not shutdown, but trap entries are installed for the violating MAC address, and traffic from that MAC address is dropped.
Step 14	Switch(config-if)# authentication timer inactivity { <i>seconds</i> server }	(Optional) Configures the inactivity timeout value for MAB and 802.1X. By default, inactivity aging is disabled for a port. <ul style="list-style-type: none"> <i>seconds</i>—Specifies inactivity timeout period. The range is from 1 to 65535 seconds. server—Specifies that the inactivity timeout period value be obtained from the authentication server.
Step 15	Switch(config-if)# authentication timer restart <i>seconds</i>	(Optional) Specifies a period after which the authentication process restarts in an attempt to authenticate an unauthorized port. <ul style="list-style-type: none"> <i>seconds</i>—Specifies the restart period. The range is from 1 to 65535 seconds.
Step 16	Switch(config-if)# exit	Returns to global configuration mode.
Step 17	Switch(config)# ip device tracking	Enables the IP device tracking table, which is required for web-based authentication.
Step 18	Switch(config)# exit	Returns to privileged EXEC mode.
Step 19	Switch# show dot1x interface <i>type slot/port</i>	Verifies your entries.

This example shows how to enable 802.1X fallback to MAB, and then to enable web-based authentication, on an 802.1X-enabled port:

```
Switch(config)# ip admission name rule1 proxy http
Switch(config)# fallback profile fallback1
Switch(config-fallback-profile)# ip access-group default-policy in
Switch(config-fallback-profile)# ip admission rule1
Switch(config-fallback-profile)# exit
Switch(config)# interface gigabit5/9
Switch(config-if)# switchport mode access
Switch(config-if)# authentication port-control auto
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication order dot1x mab webauth
Switch(config-if)# mab eap
Switch(config-if)# authentication fallback fallback1
Switch(config-if)# exit
Switch(config)# ip device tracking
Switch(config)# exit
```

To determine if a host has been authenticated using 802.1X when fallback authentication is configured on the port, enter the following commands:

Switch# **show authentication sessions interface g7/2**

```

      Interface: GigabitEthernet7/2
      MAC Address: 0060.b057.4687
      IP Address: Unknown
      User-Name: test2
      Status: Authz Success
      Domain: DATA
      Oper host mode: multi-auth
      Oper control dir: both
      Authorized By: Authentication Server
      Vlan Policy: N/A
      Session timeout: N/A
      Idle timeout: N/A
      Common Session ID: C0A8013F0000000901BAB560
      Acct Session ID: 0x0000000B
      Handle: 0xE8000009

```

Runnable methods list:

```

      Method   State
      dot1x    Authc Success
      mab       Not run

```

Switch# **show dot1x interfaces g7/2 detail**

Dot1x Info for GigabitEthernet7/2

```

-----
PAE = AUTHENTICATOR
PortControl = AUTO
ControlDirection = Both
HostMode = MULTI_AUTH
QuietPeriod = 60
ServerTimeout = 0

MaxReq = 2
TxPeriod = 2

```

Dot1x Authenticator Client List

```

-----
Supplicant = 0060.b057.4687
Session ID = C0A8013F0000000901BAB560
  Auth SM State = AUTHENTICATED
  Auth BEND SM State = IDLE
Port Status = AUTHORIZED

```

To determine if a host has been authenticated using MAB when fallback authentication is configured on the port, enter the following commands:

Switch# **show authentication sessions interface g7/2**

```

      Interface: GigabitEthernet7/2
      MAC Address: 0060.b057.4687
      IP Address: 192.168.22.22
      User-Name: 0060b0574687
      Status: Authz Success
      Domain: DATA

```

```

    Oper host mode: multi-auth
    Oper control dir: both
    Authorized By: Authentication Server
    Vlan Policy: N/A
    Session timeout: N/A
    Idle timeout: N/A
    Common Session ID: C0A8013F0000000B01BBD278
    Acct Session ID: 0x0000000D
    Handle: 0xF500000B

Runnable methods list:
  Method  State
  dot1x   Failed over
  mab      Authc Success

Switch# show mab interface g7/2 detail

MAB details for GigabitEthernet7/2
-----
Mac-Auth-Bypass           = Enabled

MAB Client List
-----
Client MAC                 = 0060.b057.4687
Session ID                 = C0A8013F0000000B01BBD278
MAB SM state               = TERMINATE
Auth Status                = AUTHORIZED

To determine if a host has been authenticated using web authentication when fallback authentication is configured on the port, enter the following commands:

Switch# show authentication sessions interface G4/3
    Interface: GigabitEthernet4/3
    MAC Address: 0015.e981.0531
    IP Address: 10.5.63.13
    Status: Authz Success
    Domain: DATA
    Oper host mode: single-host
    Oper control dir: both
    Authorized By: Authentication Server
    Vlan Policy: N/A
    Session timeout: N/A
    Idle timeout: N/A
    Common Session ID: 0A053F0F0000000200112FFC
    Acct Session ID: 0x00000003
    Handle: 0x09000002

Runnable methods list:
  Method  State
  dot1x   Failed over
  mab      Failed over
  webauth  Authc Success

```

Cisco IOS Release 12.2(46)SG or earlier

```

Switch(config)# ip admission name rule1 proxy http
Switch(config)# fallback profile fallback1
Switch(config-fallback-profile)# ip access-group default-policy in
Switch(config-fallback-profile)# ip admission rule1
Switch(config-fallback-profile)# exit
Switch(config)# interface gigabit5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x port-control auto
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication order dot1x mab webauth
Switch(config-if)# dot1x mac-auth-bypass eap
Switch(config-if)# adot1x fallback fallback1
Switch(config-if)# exit
Switch(config)# ip device tracking
Switch(config)# exit

```

Enabling Periodic Reauthentication

You can enable periodic 802.1X client reauthentication and specify how often it occurs. If you do not specify a time value before enabling reauthentication, the interval between reauthentication attempts is 3600 seconds.

Automatic 802.1X client reauthentication is a per-interface setting and can be set for clients connected to individual ports. To manually reauthenticate the client connected to a specific port, see the [“Changing the Quiet Period”](#) section on page 40-72.

To enable periodic reauthentication of the client and to configure the number of seconds between reauthentication attempts, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to be enabled for periodic reauthentication.
Step 3	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication periodic <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x reauthentication	Enables periodic reauthentication of the client, which is disabled by default. To disable periodic reauthentication, use the no authentication periodic interface configuration command (for earlier releases, use the no dot1x reauthentication interface configuration command).

	Command	Purpose
Step 6	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication timer reauthenticate {seconds / server}	Specifies the number of seconds between reauthentication attempts or have the switch use a RADIUS-provided session timeout. The range is 1 to 65,535; the default is 3600 seconds.
	<u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x timeout reauth-period {seconds / server}	To return to the default number of seconds between reauthentication attempts, use the no authentication timer reauthenticate global configuration command (for earlier releases, use the dot1x timeout reauth-attempts command). This command affects the behavior of the switch only if periodic reauthentication is enabled.
Step 7	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication port-control auto <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x port-control auto	Enables 802.1X authentication on the interface.
Step 8	Switch(config-if)# end	Returns to privileged EXEC mode.

This example shows how to enable periodic reauthentication and set the number of seconds between reauthentication attempts to 4000:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication periodic
Switch(config-if)# authentication timer reauthenticate 4000
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x reauthentication
Switch(config-if)# dot1x timeout reauth-period 4000
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

Enabling Multiple Hosts

You can attach multiple hosts (clients) to a single 802.1X-enabled port as shown in [Figure 40-7 on page 40-22](#). In this mode, when the port is authorized, all other hosts that are indirectly attached to the port are granted access to the network. If the port becomes unauthorized (reauthentication fails or an EAPOL-logoff message is received), the switch denies access to the network for all wireless access point-attached clients.

To allow multiple hosts (clients) on an 802.1X-authorized port that has the **dot1x port-control** interface configuration command set to **auto**, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to which multiple hosts are indirectly attached.
Step 3	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication host-mode multi-host <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x host-mode multi-host	Allows multiple hosts (clients) on an 802.1X-authorized port. Note Ensure that the dot1x port-control interface configuration command set is set to auto for the specified interface. To disable multiple hosts on the port, use the no authentication host-mode multi-host interface configuration command (for earlier releases, use the no dot1x host-mode multi-host interface configuration command).
Step 6	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication port-control auto <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x port-control auto	Enables 802.1X authentication on the interface.
Step 7	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 8	Switch# show dot1x all interface <i>interface-id</i>	Verifies your entries.
Step 9	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to enable 802.1X on Fast Ethernet interface 5/9 and to allow multiple hosts:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# authentication host-mode multi-host
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
```

```
Switch(config-if)# dot1x host-mode multi-host
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

Changing the Quiet Period

When the switch cannot authenticate the client, the switch remains idle for a set period of time, and then tries again. The idle time is determined by the **quiet-period** value. A failed authentication of the client might occur because the client provided an invalid password. You can provide a faster response time to the user by entering a number smaller than the default.

To change the quiet period, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to be enabled for timeout quiet-period .
Step 3	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	Switch(config-if)# dot1x timeout quiet-period <i>seconds</i>	Sets the number of seconds that the switch remains in the quiet-period following a failed authentication exchange with the client. To return to the default quiet-period, use the no dot1x timeout quiet-period configuration command. The range is 0 to 65,535 seconds; the default is 60.
Step 6	Switch(config-if)# authentication port-control auto	Enables 802.1X authentication on the interface.
Step 7	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 8	Switch# show dot1x all	Verifies your entries.
Step 9	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to set the quiet period on the switch to 30 seconds:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fastethernet4/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout quiet-period 30
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fastethernet4/1
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout quiet-period 30
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

Changing the Switch-to-Client Retransmission Time

The client responds to the EAP-request/identity frame from the switch with an EAP-response/identity frame. If the switch does not receive this response, it waits a set period of time (known as the retransmission time) and then retransmits the frame.

**Note**

You should change the default value of this command only to adjust for unusual circumstances, such as unreliable links or specific behavioral problems with certain clients and authentication servers.

To change the amount of time that the switch waits for client notification, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to be enabled for timeout tx-period.
Step 3	Switch(config-if)# switchport mode access	Specifies a nontrunking, nontagged single VLAN Layer 2 interface.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.
Step 5	Switch(config-if)# dot1x timeout tx-period <i>seconds</i>	Sets the number of seconds that the switch waits for a response to an EAP-request/identity frame from the client before retransmitting the request. The range is 1 to 65,535 seconds; the default is 30. To return to the default retransmission time, use the no dot1x timeout tx-period interface configuration command.
Step 6	<u>Cisco IOS Release 12.2(50)SG and later</u> Switch(config-if)# authentication port-control auto <u>Cisco IOS Release 12.2(46)SG or earlier releases</u> Switch(config-if)# dot1x port-control auto	Enables 802.1X authentication on the interface.
Step 7	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 8	Switch# show dot1x all	Verifies your entries.
Step 9	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to set the retransmission time to 60 seconds:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout tx-period 60
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x timeout tx-period 60
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

Setting the Switch-to-Client Frame-Retransmission Number

In addition to changing the switch-to-client retransmission times, you can change the number of times that the switch sends EAP-Request/Identity and other EAP-Request frames to the client before restarting the authentication process. The number of EAP-Request/Identity retransmissions is controlled by the **dot1x max-reauth-req** command; the number of retransmissions for other EAP-Request frames is controlled by the **dot1x max-req** command.

Note

You should change the default values of these commands only to adjust for unusual circumstances such as unreliable links or specific behavioral problems with certain clients and authentication servers.

To set the switch-to-client frame-retransmission numbers, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and specifies the interface to be enabled for max-reauth-req and/or max-req .
Step 3	Switch(config-if)# switchport mode access	Specifies a non-trunking, nontagged single VLAN Layer 2 interface.
Step 4	Switch(config-if)# dot1x pae authenticator	Enables 802.1X authentication on the port with default parameters. Refer to the “Default 802.1X Configuration” section on page 40-23.

	Command	Purpose
Step 5	<pre>Switch(config-if)# dot1x max-req count</pre> <p>or</p> <pre>Switch(config-if)# dot1x max-reauth-req count</pre>	<p>Specifies the number of times EAPOL DATA packets are re-transmitted (if lost or not replied to). For example, if you have a supplicant in the midst of authenticating and it experiences a problem, the authenticator re-transmits requests for data three times before abandoning the authentication request. The range for <i>count</i> is 1 to 10; the default is 2.</p> <p>Specifies the timer for EAPOL-Identity-Request frames (only). If you plug in a device incapable of 802.1X, three EAPOL-Id-Req frames are sent before the state machine resets. Alternatively, if you have configured Guest-VLAN, three frames are sent before the port is enabled. This parameter has a default value of 2.</p> <p>To return to the default retransmission number, use the no dot1x max-req and no dot1x max-reauth-req global configuration command.</p>
Step 6	<pre>Switch(config-if)# authentication port-control auto</pre>	Enables 802.1X authentication on the interface.
Step 7	<pre>Switch(config-if)# end</pre>	Returns to privileged EXEC mode.
Step 8	<pre>Switch# show dot1x all</pre>	Verifies your entries.
Step 9	<pre>Switch# copy running-config startup-config</pre>	(Optional) Saves your entries in the configuration file.

This example shows how to set 5 as the number of times that the switch retransmits an EAP-request/identity request before restarting the authentication process:

Cisco IOS Release 12.2(50)SG and later

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)# authentication port-control auto
Switch(config-if)# end
Switch#
```

Cisco IOS Release 12.2(46)SG or earlier

```
Switch# configure terminal
Switch(config)# interface fastethernet5/9
Switch(config-if)# switchport mode access
Switch(config-if)# dot1x pae authenticator
Switch(config-if)# dot1x max-reauth-req 5
Switch(config-if)# dot1x port-control auto
Switch(config-if)# end
Switch#
```

Manually Reauthenticating a Client Connected to a Port

You can manually reauthenticate a client connected to a specific port at any time by entering the **dot1x re-authenticate interface** privileged EXEC command. If you want to enable or disable periodic reauthentication, see the [“Enabling Periodic Reauthentication” section on page 40-69](#).

This example shows how to manually reauthenticate the client connected to Fast Ethernet port 1/1:

```
Switch# dot1x re-authenticate interface fastethernet1/1
Starting reauthentication on FastEthernet1/1
```

Initializing the 802.1X Authentication State

The **dot1x initialize** command causes the authentication process to be restarted irrespective of the state it is in currently.

This example shows how to restart the authentication process on Fast Ethernet port 1/1:

```
Switch# dot1x initialize interface fastethernet1/1
```

This example shows how to restart the authentication process on all ports of the switch:

```
Switch# dot1x initialize
```

Removing 802.1X Client Information

The **clear dot1x** command causes all existing supplicants to be completely deleted from an interface or from all the interfaces on a switch.

This example shows how to remove 802.1X client information on Fast Ethernet port 1/1:

```
Switch# clear dot1x interface fastethernet1/1
```

This example shows how to remove 802.1X client information on all ports of the switch:

```
Switch# clear dot1x all
```

Resetting the 802.1X Configuration to the Default Values

To reset the 802.1X configuration to the default values, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# dot1x default	Resets the configurable 802.1X parameters to the default values.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show dot1x all	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Displaying 802.1X Statistics and Status

To display 802.1X statistics for all interfaces, use the **show dot1x all statistics** privileged EXEC command.

To display the 802.1X administrative and operational status for the switch, use the **show dot1x all details** privileged EXEC command. To display the 802.1X administrative and operational status for a specific interface, use the **show dot1x interface details** privileged EXEC command.

Displaying Authentication Details

Topics in this section include:

- [Determining the Authentication Methods Registered with the Auth Manager, page 40-77](#)
- [Displaying the Auth Manager Summary for an Interface, page 40-77](#)
- [Displaying the Summary of All Auth Manager Sessions on the Switch, page 40-78](#)
- [Displaying a Summary of All Auth Manager Sessions on the Switch Authorized for a Specified Authentication Method, page 40-78](#)
- [Verifying the Auth Manager Session for an Interface, page 40-78](#)
- [Displaying MAB Details, page 40-80](#)
- [EPM Logging, page 40-80](#)

Determining the Authentication Methods Registered with the Auth Manager

Enter the following:

```
Switch# show authentication registrations
Handle Priority Name
      3         0      dot1x
      2         1      mab
      1         2      webauth
```

Displaying the Auth Manager Summary for an Interface

In the following example, MAB has been configured for a higher priority (lower value) than 802.1X:

```
Switch# show authentication int gi1/5
Client list:
Interface  MAC Address      Method  Domain  Status      Session ID
Gi1/5      000f.23c4.a401    mab     DATA   Authz Success 0A3462B10000000D24F80B58
Gi1/5      0014.bf5d.d26d    dot1x   DATA   Authz Success 0A3462B10000000E29811B94

Available methods list:
Handle Priority Name
      3         0      dot1x
      2         1      mab
Runnable methods list:
Handle Priority Name
      2         0      mab
      3         1      dot1x
```

Displaying the Summary of All Auth Manager Sessions on the Switch

Enter the following:

```
Switch# show authentication sessions
Interface  MAC Address      Method  Domain  Status      Session ID
Gi1/48     0015.63b0.f676   dot1x   DATA   Authz Success 0A3462B1000000102983C05C
Gi1/5      000f.23c4.a401   mab     DATA   Authz Success 0A3462B10000000D24F80B58
Gi1/5      0014.bf5d.d26d   dot1x   DATA   Authz Success 0A3462B10000000E29811B94
```

Displaying a Summary of All Auth Manager Sessions on the Switch Authorized for a Specified Authentication Method

Enter the following:

```
Switch# show authentication method dot1x
Interface  MAC Address      Method  Domain  Status      Session ID
Gi1/48     0015.63b0.f676   dot1x   DATA   Authz Success 0A3462B1000000102983C05C
Gi1/5      0014.bf5d.d26d   dot1x   DATA   Authz Success 0A3462B10000000E29811B94
```

Verifying the Auth Manager Session for an Interface

The Auth manage session could be verified with the **show authentication sessions** command.

```
Switch# show authentication sessions int gi1/5
Interface: GigabitEthernet1/5
MAC Address: 000f.23c4.a401
IP Address: Unknown
User-Name: 000f23c4a401
Status: Authz Success
Domain: DATA
Oper host mode: multi-auth
Oper control dir: both
Authorized By: Authentication Server
Vlan Policy: N/A
Session timeout: N/A
Idle timeout: N/A
Common Session ID: 0A3462B10000000D24F80B58
Acct Session ID: 0x0000000F
Handle: 0x2400000D
Runnable methods list:
Method State
dot1x Failed over
mab Authc Success
-----
Interface: GigabitEthernet1/5
MAC Address: 0014.bf5d.d26d
IP Address: 20.0.0.7
User-Name: johndoe
Status: Authz Success
Domain: DATA
Oper host mode: multi-auth
Oper control dir: both
Authorized By: Authentication Server
Vlan Policy: N/A
Session timeout: N/A
```

```
Idle timeout: N/A
Common Session ID: 0A3462B10000000E29811B94
Acct Session ID: 0x00000010
Handle: 0x1100000E
Runnable methods list:
Method State
dot1x Authc Success
mab Not run
```

The individual output could be further refined with the **handle**, **interface**, **MAC**, **session-id**, or **method** keywords:

```
Switch# show authentication sessions mac 000f.23c4.a401
Interface: GigabitEthernet1/5
MAC Address: 000f.23c4.a401
IP Address: Unknown
User-Name: 000f23c4a401
Status: Authz Success
Domain: DATA
Oper host mode: multi-auth
Oper control dir: both
Authorized By: Authentication Server
Vlan Policy: N/A
Session timeout: N/A
Idle timeout: N/A
Common Session ID: 0A3462B10000000D24F80B58
Acct Session ID: 0x0000000F
Handle: 0x2400000D
Runnable methods list:
Method State
dot1x Failed over
mab Authc Success
```

```
Switch# show authentication sessions session-id 0A3462B10000000D24F80B58
Interface: GigabitEthernet1/5
MAC Address: 000f.23c4.a401
IP Address: Unknown
User-Name: 000f23c4a401
Status: Authz Success
Domain: DATA
Oper host mode: multi-auth
Oper control dir: both

Handle: 0x2400000D
Runnable methods list:
Method State
dot1x Failed over
mab uthc Success
```

```
Switch# show authentication session method dot1x int gi1/5
Interface: GigabitEthernet1/5
MAC Address: 0014.bf5d.d26d
IP Address: 20.0.0.7
User-Name: johndoe
Status: Authz Success
Domain: DATA
```

```

Oper host mode: multi-auth
Oper control dir: both
Authorized By: Authentication Server
Vlan Policy: N/A
Session timeout: N/A
Idle timeout: N/A
Common Session ID: 0A3462B10000000E29811B94
Acct Session ID: 0x00000010
Handle: 0x1100000E
Runnable methods list:
Method State
dot1x Authc Success
mab Not run

```

Displaying MAB Details

Enter one of the following commands:

```

Switch# show mab all
MAB details for FastEthernet5/9
-----
Mac-Auth-Bypass           = Enabled
Inactivity Timeout        = None

Switch# show mab all detail
MAB details for FastEthernet5/9
-----
Mac-Auth-Bypass           = Enabled
Inactivity Timeout        = None
MAB Client List
-----
Client MAC                 = 000f.23c4.a401
MAB SM state               = TERMINATE
Auth Status                = AUTHORIZED

Switch# show mab int fa5/9
MAB details for FastEthernet5/9
-----
Mac-Auth-Bypass           = Enabled
Inactivity Timeout        = None

Switch# show mab int fa5/9 detail
MAB details for FastEthernet5/9
-----
Mac-Auth-Bypass           = Enabled
Inactivity Timeout        = None
MAB Client List
-----
Client MAC                 = 000f.23c4.a401
MAB SM state               = TERMINATE
Auth Status                = AUTHORIZED

```

EPM Logging

EPM logging enables you to display EPM logging messages with the **epm logging** command in global configuration mode. To disable EPM logging, enter **no epm logging**.

Logging messages are displayed during the following events:

POLICY_APP_SUCCESS - Policy application success events on Named ACLs, Proxy ACLs, and service policies, URL redirect policies.

POLICY_APP_FAILURE - Policy application failure conditions like unconfigured policies, wrong policies, download request failures and download failures from AAA.

IPEVENT - IP assignment, IP release and IP wait events for clients.

AAA - AAA events (like download requests, or download successes from AAA)

Example 1

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# epm logging
Switch# clear dot1x all
Switch#
*May 15 08:31:26.561: %EPM-6-POLICY_REQ: IP=100.0.0.222| MAC=0000.0000.0001|
    AUDITSESID=0A050B2C000000030004956C| AUTHTYPE=DOT1X|
    EVENT=REMOVE
*May 15 08:31:26.581: %AUTHMGR-5-START: Starting 'dot1x' for client (0000.0000.0001) on
Interface Fa9/25
*May 15 08:31:26.681: %DOT1X-5-SUCCESS: Authentication successful for client
(0000.0000.0001) on Interface Fa9/25
*May 15 08:31:26.681: %AUTHMGR-7-RESULT: Authentication result 'success' from 'dot1x' for
client (0000.0000.0001) on Interface Fa9/25
```

Example 2

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# epm logging
Switch(config)# int f9/25
Switch(config-if)# shut
Switch(config-if)# no shut
*May 15 08:41:56.329: %EPM-6-IPEVENT: IP=100.0.0.222| MAC=0000.0000.0001|
    AUDITSESID=0A050B2C0000026108FB7924| AUTHTYPE=DOT1X|
    EVENT=IP-RELEASE
*May 15 08:41:56.333: %EPM-6-IPEVENT: IP=100.0.0.222| MAC=0000.0000.0001|
    AUDITSESID=0A050B2C0000026108FB7924| AUTHTYPE=DOT1X|
    EVENT=IP-WAIT
```

CHAPTER 41

Configuring the PPPoE Intermediate Agent

DSL Forum TR-101 [1] offers a means by which the PPPoE Discovery packets are tagged at the service provider's access switch with subscriber line specific information. The mechanism specifies using VSA of the PPPoE Discovery packets to add the line specific information at the switch. Even though you can perform Subscriber Line Identification (SLI) in another way (recreating virtual paths and circuits using stacked VLAN tags), DSL Forum 2004-071 [4] recommends the PPPoE Intermediate Agent mechanism. It cites lower provisioning costs and simpler co-ordination between OSS systems in charge of access switch and BRAS. PPPoE Intermediate Agent helps the service provider, BRAS, distinguish between end hosts connected over Ethernet to an access switch.

This chapter describes PPPoE Intermediate Agent on Catalyst 4500 series switches. It includes the following sections:

- [Overview, page 41-1](#)
- [Enabling PPPoE IA on a Switch, page 41-2](#)
- [Configuring the Access Node Identifier for PPPoE IA on a Switch, page 41-2](#)
- [Configuring the Identifier String, Option, and Delimiter for PPPoE IA on a Switch, page 41-2](#)
- [Configuring the Generic Error Message for PPPoE IA on a Switch, page 41-2](#)
- [Enabling PPPoE IA on an Interface, page 41-3](#)
- [Configuring the PPPoE IA Trust Setting on an Interface, page 41-3](#)
- [Configuring PPPoE IA Rate Limiting Setting on an Interface, page 41-4](#)
- [Configuring PPPoE IA Vendor-tag Stripping on an Interface, page 41-4](#)
- [Configuring PPPoE IA Circuit-ID and Remote-ID on an Interface, page 41-4](#)
- [Enabling PPPoE IA for a Specific VLAN on an Interface, page 41-5](#)
- [Configuring PPPoE IA Circuit-ID and Remote-ID for a VLAN on an Interface, page 41-5](#)

Overview

PPPoE Intermediate Agent (PPPoE IA) is placed between a subscriber and BRAS to help the service provider BRAS distinguish between end hosts connected over Ethernet to an access switch. On the access switch, PPPoE IA enables Subscriber Line Identification by appropriately tagging Ethernet frames of different users. (The tag contains specific information like which subscriber is connected to the switch and VLAN.) PPPoE IA acts as mini security firewall between host and BRAS by intercepting all PPPoE Active Discovery (PAD) messages on a per-port per-vlan basis. It provides specific security feature such as verifying the intercepted PAD message from untrusted port, performing per port PAD message rate limiting, inserting and removing VSA Tags into and from PAD messages, respectively.

Enabling PPPoE IA on a Switch

This functionality allows you to enable or disable PPPoE IA globally on the switch:

```
Switch> enable
Switch# configure terminal
Switch(config)# pppoe intermediate-agent
```

By default, PPPoE IA is disabled globally.

Configuring the Access Node Identifier for PPPoE IA on a Switch

This functionality allows you to set the Access Node Identifier of the switch. If unspecified, this parameter is derived automatically with the IP address of the management interface.

The following example shows how to set an access node identifier of **abcd**:

```
Switch> enable
Switch# configure terminal
Switch(config)# pppoe intermediate-agent format-type access-node-id string abcd
```

By default, *access-node-id* is not set.

Configuring the Identifier String, Option, and Delimiter for PPPoE IA on an Switch

This functionality overrides the default automatic generation of circuit-id by the system.

The options available are sp, sv, pv and spv denoting slot:port, slot-vlan, port-vlan, and slot-port-vlan combinations, respectively. Valid delimiters include # . , ; / space.

The **no** form of this command without *WORD*, *options*, and *delimiters*, reverts to the default automatic generation of circuit-id.

The following example shows how to set an identifier string **word** with option **spv** delimited by “:”:

```
Switch> enable
Switch# configure terminal
Switch(config)# pppoe intermediate-agent format-type
                identifier-string string word
                option spv delimiter :
```

This command does not affect the circuit-id configured explicitly per-interface or per-interface-per-vlan with the **pppoe intermediate-agent format-type circuit-id** or **pppoe intermediate-agent vlan num format-type circuit-id** commands.

Configuring the Generic Error Message for PPPoE IA on an Switch

This functionality sets the Generic-Error message of the switch. PPPoE IA sends this message only on a specific error condition. If you do not specify **string {WORD}**, the error message is not added.

The following example shows how to configure a generic message of **packet_length>1484**:

```
Switch> enable
Switch# configure terminal
Switch(config) pppoe intermediate-agent format-type
                generic-error-message string packet_length>1484
PPPoE Discover packet too large to process. Try reducing the number of tags added.
```

By default the **generic-error-message** is not set. The **string** value is converted to UTF-8 before it is added to the response. The message like the following will appear:

PPPoE Discover packet too large to process. Try reducing the number of tags added.

Note

This TAG (0x0203 Generic-Error) indicates an error. It can be added to PADO or PADS packets generated by PPPoE IA and then sent back to user in reply of PADI or PADR, when a PPPoE discovery packet received by PPPoE IA with PPPoE payload greater than 1484 bytes. Error data must be a UTF-8 string.

Enabling PPPoE IA on an Interface

This functionality enables the PPPoE IA feature on an interface. The **pppoe intermediate-agent** command has an effect only if the PPPoE IA feature was enabled globally with this command. (You need to enable *globally* to activate PPPoE IA static ACL and on an interface for PPPoE IA processing of PPPoE discovery packets received on that interface.)

This setting applies to all frames passing through this interface, irrespective of the VLAN they belong to. By default the PPPoE IA feature is disabled on all interfaces. You need to run this command on every interface that requires this feature.

The following example shows how to enable PPPoE IA on FastEthernet 3/1:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/1
Switch(config-if) pppoe intermediate-agent
```

Note

Enabling PPPoE IA on an interface does not ensure that incoming packets are tagged. The necessary criteria: (a) PPPoE IA must be enabled globally, (b) At least one interface that connects the switch to PPPoE Server must have a trusted PPPoE IA setting. (See the following section.)

Configuring the PPPoE IA Trust Setting on an Interface

This functionality sets a physical interface as trusted. The following example shows how to set FastEthernet interface 3/2 as trusted:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/2
Switch(config-if) pppoe intermediate-agent trust
```

This setting is disabled by default.

**Note**

Interfaces that connect the switch to PPPoE Server are configured as trusted. Interfaces that connect the switch to Users (PPPoE clients) are untrusted.

Configuring PPPoE IA Rate Limiting Setting on an Interface

This functionality limits the rate (per second) at which PPPoE Discovery packets (PADI, PADO, PADR, PADS, or PADT) are received on an interface. When the incoming packet rate achieves or exceeds the configured limit, a port enters an err-disabled state.

The following example shows how to set a rate limit of 30 at FastEthernet 3/1:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/1
Switch(config-if) pppoe intermediate-agent limit rate 30
```

**Note**

The parameter for rate limiting is the number of packets per second. If the incoming packet rate exceeds this value, the port shuts down.

Configuring PPPoE IA Vendor-tag Stripping on an Interface

This functionality enables an administrator to strip the vendor-specific tag (VSA) from PADO, PADS, and PADT packets received on an interface before forwarding them to the user.

The following example shows how to enable stripping on FastEthernet 3/2:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/2
Switch(config-if) pppoe intermediate-agent vendor-tag strip
```

This setting is disabled by default.

**Note**

Generally, you would configure vendor-tag stripping on an interfaces connected to PPPoE Server. If you configure stripping, incoming packets are stripped of their VSAs (which carry subscriber and line identification information). Necessary criteria: (a) the PPPoE Intermediate agent must be enabled on the interface for the **pppoe intermediate-agent vendor-tag strip** command to be effective, and (b) the interface must be set to trust. Alone, the command has no effect.

Configuring PPPoE IA Circuit-ID and Remote-ID on an Interface

The **[no] pppoe intermediate-agent format-type circuit-id** command sets the circuit-id on an interface and overrides the automatic generation of circuit-id by the switch. Without this command, one default tag (for example, Ethernet x/y:z on the PPPoE to which the user is connected) inserted by an intermediate-agent.

The **[no] pppoe intermediate-agent format-type remote-id** command sets the remote-id on an interface.

This functionality causes tagging of PADI, PADR, and PADT packets (belonging to PPPoE Discovery stage) received on this physical interface with circuit-id or remote-i. This happens irrespective of their VLAN provided PPPoE IA is not enabled for that VLAN.

You should use remote-id instead of circuit-id for subscriber line identification. You should configure this setting on every interface where you enabled PPPoE IA because it is not set by default. The default value for remote-id is the switch MAC address (for all physical interfaces).

The following example shows how to configure the circuit-id as root and the remote-id as granite:

```
Switch> enable
Switch# configure terminal
Switch(config) interface FastEthernet 3/1
Switch(config-if) pppoe intermediate-agent format-type circuit-id string root
Switch(config-if) pppoe intermediate-agent format-type remote-id string granite
```

Enabling PPPoE IA for a Specific VLAN on an Interface

This functionality allows you to enable PPPoE IA on either (a) a specific VLAN, (b) a comma separated list like “x,y,” or (c) a range like “x-y.”

Specific VLAN:

```
Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

Comma-separated VLAN list:

```
Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5,6
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

VLAN range:

```
Switch# configure terminal
Switch(config)# interface FastEthernet 3/1
Switch(config-if)# vlan-range 5-9
Switch(config-if-vlan-range)# pppoe intermediate-agent
```

Note

The **pppoe intermediate-agent** command in the vlan-range mode is not dependent on the same command in interface mode. The **pppoe intermediate-agent** command will take effect independently of the command in the interface mode. The necessary criteria: (a) PPPoE IA must be enabled globally, and (b) at least one interface connected to the PPPoE Server.

Configuring PPPoE IA Circuit-ID and Remote-ID for a VLAN on an Interface

In this section you set the circuit ID and remote ID for a specific VLAN on an interface. The command overrides the circuit ID and remote ID specified for this physical interface and the switch uses the *WORD* value to tag packets received on this VLAN. This parameter is unset by default.

The default value of **remote-id** is the switch MAC address (for all VLANs). You would set this parameter to encode subscriber-specific information.

**Note**

The **circuit-id** and **remote-id** configurations in **vlan-range** mode are affected only if PPPoE IA is enabled globally and in **vlan-range** mode.

This example shows how to set the circuit-id to *aaa* and the remote-id as *ccc* on interface *g3/7*:

```
Switch(config)# int g3/7
Switch(config-if)# vlan-range 5
Switch(config-if)# pppoe intermediate-agent
Switch(config-if-vlan-range)# pppoe intermediate-agent format-type circuit-id string aaa
Switch(config-if-vlan-range)# pppoe intermediate-agent format-type remote-id string ccc
```

**Note**

The **vlan-range** mode commands configure PPPoE IA for either a specific VLAN, multiple VLANs, or VLAN range, depending on what you specify in the syntax.

Displaying Configuration Parameters

The **show pppoe intermediate-agent [info|statistics] [interface {interface}]** command displays the various configuration parameters, statistics, and counters stored for PPPoE.

The **info** keyword appears if the PPPoE Intermediate Agent is enabled globally on an interface or on a VLAN (in an interface). It also informs you about the access node ID and generic error message of the switch, as well as the identifier string options and delimiter values configured globally by the following command:

```
Switch(config)# pppoe intermediate-agent format-type ?
  access-node-id      Access Node Identifier
  generic-error-message  Generic Error Message
  identifier-string    Identifier String
```

The **info** keyword also displays the circuit ID, remote ID, trust and rate limit configurations, and vendor tag strip setting for all interfaces and for all VLANs pertaining to those interfaces. If any of these parameters are not set, they are not displayed.

The **statistics** option displays the number of PADI/PADR/PADT packets received, and the time the last packet was received on all interfaces and on all VLANs pertaining to those interfaces.

If **interface** is specified, information or statistics applicable only to that physical interface and pertaining VLANs is displayed.

Although PPoE IA is supported on PVLANS, be aware that no PVLAN association (primary and secondary VLAN mapping) information is displayed.

The PPPoE IA show commands (like **show pppoe intermediate-agent info**, **show pppoe intermediate-agent info interface g3/7**, or **show pppoe intermediate-agent statistics**) do not provide information about private VLAN association (primary and secondary VLAN mapping). However, they do provide information about VLANs irrespective of private or normal VLANs, as the following example illustrate:

```
Switch# show pppoe intermediate-agent info
Switch PPPOE Intermediate-Agent is enabled
```

PPPOE Intermediate-Agent trust/rate is configured on the following Interfaces:

```

Interface          IA          Trusted    Vsa Strip    Rate limit (pps)
-----
GigabitEthernet3/4    no          yes         yes          unlimited
PPPOE Intermediate-Agent is configured on following VLANs:
2-3
GigabitEthernet3/7    no          no          no           unlimited
PPPOE Intermediate-Agent is configured on following VLANs:
2-3

Switch# show pppoe intermediate-agent info interface g3/7
Interface          IA          Trusted    Vsa Strip    Rate limit (pps)
-----
GigabitEthernet3/7    yes         no          no           unlimited
PPPoE Intermediate-Agent is configured on following VLANs:
2-3

Switch# show pppoe intermediate-agent statistics

PPPOE IA Per-Port Statistics
-----

Interface : GigabitEthernet3/7
Packets received
  All = 0
  PADI = 0 PADO = 0
  PADR = 0 PADS = 0
  PADT = 0
Packets dropped:
  Rate-limit exceeded = 0
  Server responses from untrusted ports = 0
  Client requests towards untrusted ports = 0
  Malformed PPPoE Discovery packets = 0
Vlan 2: Packets received PADI = 0 PADO = 0 PADR = 0 PADS = 0 PADT = 0
Vlan 3: Packets received PADI = 0 PADO = 0 PADR = 0 PADS = 0 PADT = 0

Switch# show pppoe intermediate-agent statistics interface g3/7
Interface : GigabitEthernet3/7
Packets received
  All = 3
  PADI = 0 PADO = 0
  PADR = 0 PADS = 0
  PADT = 3
Packets dropped:
  Rate-limit exceeded = 0
  Server responses from untrusted ports = 0
  Client requests towards untrusted ports = 0
  Malformed PPPoE Discovery packets = 0
Vlan 2: Packets received PADI = 6 PADO = 0 PADR = 6 PADS = 0 PADT = 6
Vlan 3: Packets received PADI = 4 PADO = 0 PADR = 4 PADS = 0 PADT = 4

```

Clearing Packet Counters

This section illustrates how to clear packet counters on all interfaces (per-port and per-port-per-vlan).

The following example illustrates how to do this:

```
Switch# clear pppoe intermediate-agent statistics
```

Issuing of the above command clears the counters for all PPPoE discovery packets (PADI, PADO, PADR, PADS, PADT) received on DUT.

```
Switch# show pppoe intermediate-agent statistics interface g3/7
Interface : GigabitEthernet3/7
Packets received
  All = 0
  PADI = 0 PADO = 0
  PADR = 0 PADS = 0
  PADT = 0
Packets dropped:
  Rate-limit exceeded = 0
  Server responses from untrusted ports = 0
  Client requests towards untrusted ports = 0
  Malformed PPPoE Discovery packets = 0
Vlan 2: Packets received PADI = 0 PADO = 0 PADR = 0 PADS = 0 PADT = 0
Vlan 3: Packets received PADI = 0 PADO = 0 PADR = 0 PADS = 0 PADT = 0
```

Debugging PPPoE Intermediate Agent

The **debug pppoe intermediate-agent [packet | event | all]** command enables you to display useful PPPoE information that assists in debugging. This command is disabled by default.

The **packet** option of the command displays the contents of a packet received in the software: source and destination MAC address of Ethernet frame, code, version and type of PPPoE Discovery packet and a list of TAGs present.

The **event** option of the command echoes important messages (interface state change to errdisabled due to PPPoE discovery packets entering at a rate exceeding the configured limit). This is the only event shown by the **debug pppoe intermediate-agent event** command.

The **all** option enables both package and event options.

The following example illustrates how to enter the debug command with the **packet** option:

```
Switch# debug pppoe intermediate-agent packet
PPPOE IA Packet debugging is on

*Sep  2 06:12:56.133: PPPOE_IA: Process new PPPoE packet, Message type: PADI, input
interface: Gi3/7, vlan : 2 MAC da: ffff.ffff.ffff, MAC sa: aabb.cc00.0000
*Sep  2 06:12:56.137: PPPOE_IA: received new PPPOE packet from inputinterface
(GigabitEthernet3/4)
*Sep  2 06:12:56.137: PPPOE_IA: received new PPPOE packet from inputinterface
(GigabitEthernet3/8)
*Sep  2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADO, input
interface: Gi3/4, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
*Sep  2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADO, input
interface: Gi3/8, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: aabb.cc80.0000
*Sep  2 06:12:56.137: PPPOE_IA: received new PPPOE packet from inputinterface
(GigabitEthernet3/7)
*Sep  2 06:12:56.137: PPPOE_IA: Process new PPPoE packet, Message type: PADR, input
interface: Gi3/7, vlan : 2 MAC da: 001d.e64c.6512, MAC sa: aabb.cc00.0000
*Sep  2 06:12:56.145: PPPOE_IA: received new PPPOE packet from inputinterface
(GigabitEthernet3/4)
*Sep  2 06:12:56.145: PPPOE_IA: Process new PPPoE packet, Message type: PADS, input
interface: Gi3/4, vlan : 2 MAC da: aabb.cc00.0000, MAC sa: 001d.e64c.6512
```

The following example illustrates how to enter the debug command with the **event** option:

```
Switch# debug pppoe intermediate-agent event
PPPOE IA Event debugging is on
```

```
*Jul 30 19:00:10.254: %PPPOE_IA-4-PPPOE_IA_ERRDISABLE_WARNING: PPPOE IA received 5 PPPOE
packets on interface Gi3/7
*Jul 30 19:00:10.254: %PPPOE_IA-4-PPPOE_IA_RATE_LIMIT_EXCEEDED: The interface Gi3/7 is
receiving more than the threshold set
*Jul 30 19:00:10.394: %PM-4-ERR_DISABLE: STANDBY:pppoe-ia-rate-limit error detected on
Gi3/7, putting Gi3/7 in err-disable stat
```

Troubleshooting Tips

When the **radius-server attribute 31 remote-id** global configuration command is entered in the PPPoE Agent Remote-ID Tag and DSL Line Characteristics feature configuration on the BRAS, the **debug radius** privileged EXEC command can be used to generate a report that includes information about the incoming access interface, where discovery frames are received, and about the session being established in PPPoE extended NAS-Port format (format d).

CHAPTER 42

Configuring Web-Based Authentication

This chapter describes how to configure web-based authentication. It consists of these sections:

- [Understanding Web-Based Authentication, page 42-1](#)
- [Configuring Web-Based Authentication, page 42-5](#)
- [Displaying Web-Based Authentication Status, page 42-14](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding Web-Based Authentication

The web-based authentication feature, known as Web Authentication Proxy, enables you to authenticate end users on host systems that do not run the IEEE 802.1X supplicant.

Note

You can configure web-based authentication on Layer 2 and Layer 3 interfaces.

When you initiate an HTTP session, web-based authentication intercepts ingress HTTP packets from the host and sends an HTML login page to the user. The user keys in their credentials, which the web-based authentication feature sends to the AAA server for authentication.

If authentication succeeds, web-based authentication sends a Login-Successful HTML page to the host and applies the access policies returned by the AAA server.

If authentication fails, web-based authentication forwards a Login-Fail HTML page to the user, prompting the user to retry the login. If the user exceeds the maximum number of attempts, web-based authentication forwards a Login-Expired HTML page to the host and the user is placed on a watch list for a waiting period.

These sections describe the role of web-based authentication as part of the authentication, authorization, and accounting (AAA) system:

- [Device Roles, page 42-2](#)
- [Host Detection, page 42-2](#)
- [Session Creation, page 42-3](#)
- [Authentication Process, page 42-3](#)
- [Customization of the Authentication Proxy Web Pages, page 42-4](#)
- [Web-based Authentication Interactions with Other Features, page 42-4](#)

Device Roles

With web-based authentication, the devices in the network have specific roles ([Figure 42-1](#)).

Figure 42-1 Web-Based Authentication Device Roles

The roles are as follows:

- *Client*—The device (workstation) that requests access to the LAN and switch services and responds to requests from the switch. The workstation must be running an HTML browser with Java Script enabled.
- *Authentication server*—Performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch that the client is authorized to access the LAN and switch services or that the client is denied.
- *Switch*—Controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client.

Host Detection

The switch maintains an IP device tracking table to store information about detected hosts.

Note

By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.

For Layer 3 interfaces, web-based authentication sets an HTTP intercept ACL when the feature is configured on the interface (or when the interface is put in service).

For Layer 2 interfaces, web-based authentication detects IP hosts using the following mechanisms:

- ARP based trigger—ARP redirect ACL allows web-based authentication to detect hosts with static IP address or dynamically acquired IP address.
- Dynamic ARP Inspection
- DHCP snooping—Web-based authentication is notified when the switch creates a DHCP binding entry for the host.

Session Creation

When web-based authentication detects a new host, it creates a session as follows:

- Checks for Auth bypass

If the host IP is not on the exception list, web-based authentication sends a nonresponsive host (NRH) request to the server.

If the server response is Access Accepted, authorization is bypassed for this host. The session is established.
- Sets up the HTTP Intercept ACL

If the server response to the NRH request is Access Rejected, the HTTP intercept ACL is activated and the session waits for HTTP traffic from the host.

Authentication Process

When you enable web-based authentication, the following events occur:

- The user initiates an HTTP session.
- The HTTP traffic is intercepted, and authorization is initiated. The switch sends the login page to the user. The user enters a username and password on the login page, and the switch sends the entries to the authentication server.
- If the client identity is valid and the authentication succeeds, the switch downloads and activates the user's access policy from the authentication server. The login success page is sent to the user.
- If the authentication fails, the switch sends the login fail page. The user retries the login. If the maximum number of attempts fails, the switch sends the login expired page and the host is placed in a watch list. After the watch list times out, the user can retry the authentication process.
- If the authentication server does not respond to the switch, and if an AAA fail policy is configured, the switch applies the failure access policy to the host. The login success page is sent to the user. (See the [“Customization of the Authentication Proxy Web Pages”](#) section on page 42-4.)
- The switch reauthenticates a client when the host does not respond to an ARP probe on a Layer 2 interface, or the host does not send any traffic within the idle timeout on a Layer 3 interface.
- The feature applies the downloaded timeout or the locally configured session timeout.
- If the terminate action is RADIUS, the feature sends a nonresponsive host (NRH) request to the server. The terminate action is included in the response from the server.
- If the terminate action is default, the session is dismantled and the applied policy is removed.

Customization of the Authentication Proxy Web Pages

During the web-based authentication process, the internal HTTP server of the switch hosts four HTML pages for delivery to an authenticating client. The four pages allow the server to notify you of the following four states of the authentication process:

- Login—Your credentials are requested
- Success—The login was successful
- Fail—The login failed
- Expire—The login session has expired because of excessive login failures

In Cisco IOS Release 12.2(50)SG, you can substitute your custom HTML pages for the four default internal HTML pages, or you can specify a URL to which you are redirected upon successful authentication, effectively replacing the internal Success page.

Web-based Authentication Interactions with Other Features

These sections describe web-based authentication interactions with these features:

- [Port Security, page 42-4](#)
- [LAN Port IP, page 42-4](#)
- [Gateway IP, page 42-5](#)
- [ACLs, page 42-5](#)
- [Context-Based Access Control, page 42-5](#)
- [802.1X Authentication, page 42-5](#)
- [EtherChannel, page 42-5](#)
- [Switchover, page 42-5](#)

Port Security

You can configure web-based authentication and port security on the same port. (You configure port security on the port with the **switchport port-security** interface configuration command.) When you enable port security and web-based authentication on a port, web-based authentication authenticates the port, and port security manages network access for all MAC addresses, including that of the client. You can then limit the number or group of clients that can access the network through the port.

For more information about enabling port security, see [Chapter 43, “Configuring Port Security.”](#)

LAN Port IP

You can configure LAN port IP (LPIP) and Layer 2 web-based authentication on the same port. The host is authenticated using web-based authentication first, followed by LPIP posture validation. The LPIP host policy overrides the web-based authentication host policy.

If the web-based authentication idle timer expires, the NAC policy is removed. The host is authenticated and posture is validated again.

Gateway IP

You cannot configure Gateway IP on a Layer 3 VLAN interface if web-based authentication is configured on any of the switch ports in the VLAN.

You can configure web-based authentication on the same Layer 3 interface as Gateway IP. The host policies for both features are applied in software. The GWIP policy overrides the web-based authentication host policy.

ACLs

If you configure a VLAN ACL or Cisco IOS ACL on an interface, the ACL is applied to the host traffic only after the web-based authentication host policy is applied.

For Layer 2 web-based authentication, you must configure a port ACL (PACL) as the default access policy for ingress traffic from hosts connected to the port. After authentication, the web-based authentication host policy overrides the PACL.

You cannot configure a MAC ACL and web-based authentication on the same interface.

You cannot configure web-based authentication on a port whose access VLAN is configured for VACL capture.

Context-Based Access Control

Web-based authentication cannot be configured on a Layer 2 port if context-based access control (CBAC) is configured on the Layer 3 VLAN interface of the port's VLAN.

802.1X Authentication

You cannot configure web-based authentication on the same port as 802.1X authentication except as a fallback authentication method.

EtherChannel

You can configure web-based authentication on a Layer 2 EtherChannel interface. The web-based authentication configuration applies to all member channels.

Switchover

On Catalyst 4500 series switches with redundant supervisor engines in RPR mode, information about currently authenticated hosts is maintained during a switchover. You do not need to reauthenticate.

Configuring Web-Based Authentication

These sections describe how to configure web-based authentication:

- [Default Web-Based Authentication Configuration, page 42-6](#)
- [Web-Based Authentication Configuration Guidelines and Restrictions, page 42-6](#)
- [Web-Based Authentication Configuration Task List, page 42-7](#)

- [Configuring the Authentication Rule and Interfaces, page 42-7](#)
- [Configuring AAA Authentication, page 42-8](#)
- [Configuring Switch-to-RADIUS-Server Communication, page 42-9](#)
- [Configuring the HTTP Server, page 42-11](#)
- [Configuring the Web-Based Authentication Parameters, page 42-13](#)
- [Removing Web-Based Authentication Cache Entries, page 42-14](#)

Default Web-Based Authentication Configuration

Table 42-1 shows the default web-based authentication configuration.

Table 42-1 *Default Web-based Authentication Configuration*

Feature	Default Setting
AAA	Disabled
RADIUS server <ul style="list-style-type: none"> • IP address • UDP authentication port • Key 	<ul style="list-style-type: none"> • None specified • 1812 • None specified
Default value of inactivity timeout	3600 seconds
Inactivity timeout	Enabled

Web-Based Authentication Configuration Guidelines and Restrictions

These are the web-based authentication configuration guidelines:

- Web authentication requires two Cisco Attribute-Value (AV) pair attributes:

The first attribute, `priv-lvl=15`, must always be set to 15. This sets the privilege level of the user who is logging into the switch.

The second attribute is an access list to be applied for web-authenticated hosts. The syntax is similar to 802.1x per-user access control lists (ACLs). However, instead of `ip:inacl`, this attribute must begin with `proxyacl`, and the source field in each entry must be any. (After authentication, the client IP address replaces the any field when the ACL is applied.)

For example:

```
proxyacl# 10=permit ip any 10.0.0.0 255.0.0.0
proxyacl# 20=permit ip any 11.1.0.0 255.255.0.0
proxyacl# 30=permit udp any any eq syslog
proxyacl# 40=permit udp any any eq tftp
```

Note The `proxyacl` entry determines the type of allowed network access.

- Web-based authentication is an ingress-only feature.
- You can configure web-based authentication only on access ports. Web-based authentication is not supported on trunk ports, EtherChannel member ports, or dynamic trunk ports.

- You must configure the default ACL on the interface before configuring web-based authentication. Configure a port ACL for a Layer 2 interface, or a Cisco IOS ACL for a Layer 3 interface.
- On Layer 2 interfaces, you cannot authenticate hosts with static ARP cache assignment. These hosts are not detected by the web-based authentication feature, because they do not send ARP messages.
- By default, the IP device tracking feature is disabled on a switch. You must enable the IP device tracking feature to use web-based authentication.
- You must configure at least one IP address to run the HTTP server on the switch. You must also configure routes to reach each host IP address. The HTTP server sends the HTTP login page to the host.
- Hosts that are more than one hop away may experience traffic disruption if an STP topology change results in the host traffic arriving on a different port. This is because ARP and DHCP updates may not be sent after a Layer 2 (STP) topology change.
- Web-based authentication does not support VLAN assignment as a downloadable host policy.
- Cisco IOS Release 12.2(50)SG supports downloadable ACLs (DACLS) from the RADIUS server.
- Web-based authentication is not supported for IPv6 traffic.

Web-Based Authentication Configuration Task List

To configure the web-based authentication feature, perform the following tasks:

- [Configuring the Authentication Rule and Interfaces, page 42-7](#)
- [Configuring AAA Authentication, page 42-8](#)
- [Configuring Switch-to-RADIUS-Server Communication, page 42-9](#)
- [Configuring the HTTP Server, page 42-11](#)
- [Configuring the Web-Based Authentication Parameters, page 42-13](#)
- [Removing Web-Based Authentication Cache Entries, page 42-14](#)

Configuring the Authentication Rule and Interfaces

To configure web-based authentication, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip admission name <i>name</i> proxy http	Configures an authentication rule for web-based authorization.
	Switch(config)# no ip admission name <i>name</i>	Removes the authentication rule.
Step 2	Switch(config)# interface <i>type slot/port</i>	Enters interface configuration mode and specifies the ingress Layer 2 or Layer 3 interface to be enabled for web-based authentication. <i>type</i> can be fastethernet, gigabit ethernet, or tengigabitethernet
Step 3	Switch(config-if)# ip access-group <i>name</i>	Applies the default ACL.
Step 4	Switch(config-if)# ip admission <i>name</i>	Configures web-based authentication on the specified interface.

	Command	Purpose
Step 5	Switch(config-if)# exit	Returns to configuration mode.
Step 6	Switch(config)# ip device tracking	Enables the IP device tracking table.
Step 7	Switch(config)# ip device tracking [probe { <i>delay interval</i> }]	(Optional) Configures the optional probe delay parameter for the IP device tracking table: <ul style="list-style-type: none"> interval—Number of seconds that the switch delays sending an ARP probe, triggered by link-up and ARP probe generation by the tracked device. The range is 1 to 120 seconds. The default is 0 seconds.
Step 8	Switch(config)# end	Returns to privileged EXEC mode.
Step 9	Switch# show ip admission configuration	Displays the configuration.

This example shows how to enable web-based authentication on Fast Ethernet port 5/1:

```
Switch(config)# ip admission name webauth1 proxy http
Switch(config)# interface fastethernet 5/1
Switch(config-if)# ip admission webauth1
Switch(config-if)# exit
Switch(config)# ip device tracking
```

This example shows how to verify the configuration:

```
Switch# show ip admission configuration
Authentication Proxy Banner not configured
Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Watch-list is disabled

Authentication Proxy Rule Configuration
Auth-proxy name webauth1
http list not specified inactivity-time 60 minutes

Authentication Proxy Auditing is disabled
Max Login attempts per user is 5
```

Configuring AAA Authentication

To enable web-based authentication, perform this task:

	Command	Purpose
Step 1	Switch(config)# aaa new-model	Enables AAA functionality.
	Switch(config)# no aaa new-model	Disables AAA functionality.
Step 2	Switch(config)# aaa authentication login default group { <i>tacacs+ radius</i> }	Defines the list of authentication methods at login.
Step 3	Switch(config)# aaa authorization auth-proxy default group { <i>tacacs+ radius</i> }	Creates an authorization method list for web-based authorization.
	Switch(config)# no aaa authorization auth-proxy default group { <i>tacacs+ radius</i> }	Clears the configured method list.

	Command	Purpose
Step 4	Switch(config)# tacacs-server host {hostname ip_address}	Specifies an AAA server. For RADIUS servers, see the section “Configuring Switch-to-RADIUS-Server Communication” section on page 42-9.
Step 5	Switch(config)# tacacs-server key {key-data}	Configures the authorization and encryption key used between the switch and the TACACS server.

This example shows how to enable AAA:

```
Switch(config)# aaa new-model
Switch(config)# aaa authentication login default group tacacs+
Switch(config)# aaa authorization auth-proxy default group tacacs+
```

Configuring Switch-to-RADIUS-Server Communication

RADIUS security servers are identified by one of the following:

- Host name
- Host IP address
- Host name and specific UDP port numbers
- IP address and specific UDP port numbers

The combination of the IP address and UDP port number creates a unique identifier, which enables RADIUS requests to be sent to multiple UDP ports on a server at the same IP address. If two different host entries on the same RADIUS server are configured for the same service (for example, authentication) the second host entry that is configured functions as the failover backup to the first one. The RADIUS host entries are chosen in the order that they were configured.

To configure the RADIUS server parameters, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip radius source-interface interface_name	Specifies that the RADIUS packets have the IP address of the indicated interface.
	Switch(config)# no ip radius source-interface	Prevents the RADIUS packets from having the IP address of the previously indicated interface.
Step 2	Switch(config)# radius-server host {hostname ip-address} test username username	Specifies the host name or IP address of the remote RADIUS server. The test username username option enables automated testing of the RADIUS server connection. The specified username does not need to be a valid user name. The key option specifies an authentication and encryption key to be used between the switch and the RADIUS server. To use multiple RADIUS servers, reenter this command.
	Switch(config)# no radius-server host {hostname ip-address}	Deletes the specified RADIUS server.

	Command	Purpose
Step 3	Switch(config)# radius-server key <i>string</i>	Configures the authorization and encryption key used between the switch and the RADIUS daemon running on the RADIUS server.
Step 4	Switch(config)# radius-server vsa send authentication	Enables downloading of an ACL from the RADIUS server. This feature is supported in Cisco IOS Release 12.2(50)SG.
Step 5	Switch(config)# radius-server dead-criteria tries <i>num-tries</i>	Specifies the number of unanswered transmits to a RADIUS server before considering the server to be inactive. The range of <i>num-tries</i> is 1 to 100.

When you configure the RADIUS server parameters, do the following:

- Specify the **key** *string* on a separate command line.
- For **key** *string*, specify the authentication and encryption key used between the switch and the RADIUS daemon running on the RADIUS server. The key is a text string that must match the encryption key used on the RADIUS server.
- When you specify the **key** *string*, use spaces within and at the end of the key. If you use spaces in the key, do not enclose the key in quotation marks unless the quotation marks are part of the key. This key must match the encryption used on the RADIUS daemon.
- You can globally configure the timeout, retransmission, and encryption key values for all RADIUS servers with the **radius-server host** global configuration command. If you want to configure these options on a per-server basis, use the **radius-server timeout**, **radius-server retransmit**, and the **radius-server key** global configuration commands. For more information, see the *Cisco IOS Security Configuration Guide*, Release 12.2, publication and the *Cisco IOS Security Command Reference*, Release 12.2, publication at this URL:

http://www.cisco.com/en/US/docs/ios/12_2/security/command/reference/fsecur_r.html

Note

You need to configure some settings on the RADIUS server, including: the IP address of the switch, the key string to be shared by both the server and the switch, and the downloadable ACL (DACL). (Cisco IOS Release 12.2(50)SG supports DACLs.) For more information, see the RADIUS server documentation.

This example shows how to configure the RADIUS server parameters on a switch:

```
Switch(config)# ip radius source-interface Vlan80
Switch(config)# radius-server host 172.120.39.46 test username user1
Switch(config)# radius-server key rad123
Switch(config)# radius-server dead-criteria tries 2
```

Configuring the HTTP Server

To use web-based authentication, you must enable the HTTP server within the switch. You can enable the server for either HTTP or HTTPS.

To enable the server, perform one of these tasks:

Command	Purpose
Switch(config) # ip http server	Enables the HTTP server. The web-based authentication feature uses the HTTP server to communicate with the hosts for user authentication.
Switch(config) # ip http secure-server	Enables HTTPS.

Starting with Cisco IOS Release 12.2(50)SG, you can optionally configure custom authentication proxy web pages or specify a redirection URL for successful login, as described in the following sections:

- [Customizing the Authentication Proxy Web Pages](#)
- [Specifying a Redirection URL for Successful Login](#)

Customizing the Authentication Proxy Web Pages

With Cisco IOS Release 12.2(50)SG, you have the option to display four substitute HTML pages to the user in place of the switch's internal default HTML pages during web-based authentication.

To specify the use of your custom authentication proxy web pages, first store your custom HTML files on the switch's internal disk or flash memory, then perform this task in global configuration mode:

	Command	Purpose
Step 1	Switch(config) # ip admission proxy http login page file <i>device:login-filename</i>	Specifies the location in the switch memory file system of the custom HTML file to use in place of the default login page. The <i>device:</i> is either disk or flash memory, such as <i>disk0:</i> .
Step 2	Switch(config) # ip admission proxy http success page file <i>device:success-filename</i>	Specifies the location of the custom HTML file to use in place of the default login success page.
Step 3	Switch(config) # ip admission proxy http failure page file <i>device:fail-filename</i>	Specifies the location of the custom HTML file to use in place of the default login failure page.
Step 4	Switch(config) # ip admission proxy http login expired page file <i>device:expired-filename</i>	Specifies the location of the custom HTML file to use in place of the default login expired page.

When configuring customized authentication proxy web pages, observe the following guidelines:

- To enable the custom web pages feature, specify all four custom HTML files. If you specify fewer than four files, the internal default HTML pages are used.
- The four custom HTML files must be present on the disk or flash of the switch. The maximum size of each HTML file is 8 KB.
- Any images on the custom pages must be located on an accessible HTTP server. An intercept ACL must be configured within the admission rule to allow access to the HTTP server.

- Any external link from a custom page requires configuration of an intercept ACL within the admission rule.
- Any name resolution required for external links or images requires configuration of an intercept ACL within the admission rule to access a valid DNS server.
- If the custom web pages feature is enabled, a configured auth-proxy-banner is not used.
- If the custom web pages feature is enabled, the redirection URL for successful login feature is not available.
- To remove the specification of a custom file, use the **no** form of the command.

Because the custom login page is a public web form, consider the following guidelines for this page:

- The login form must accept user input for the username and password and must POST the data as **uname** and **pwd**.
- The custom login page should follow best practices for a web form, such as page timeout, hidden password, and prevention of redundant submissions.

The following example shows how to configure custom authentication proxy web pages:

```
Switch(config)# ip admission proxy http login page file disk1:login.htm
Switch(config)# ip admission proxy http success page file disk1:success.htm
Switch(config)# ip admission proxy http fail page file disk1:fail.htm
Switch(config)# ip admission proxy http login expired page file disk1:expired.htm
```

The following example shows how to verify the configuration of custom authentication proxy web pages:

```
Switch# show ip admission configuration

Authentication proxy webpage
  Login page           : disk1:login.htm
  Success page         : disk1:success.htm
  Fail Page            : disk1:fail.htm
  Login expired Page   : disk1:expired.htm

Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Session ratelimit is 100
Authentication Proxy Watch-list is disabled
Authentication Proxy Auditing is disabled
Max Login attempts per user is 5
```

Specifying a Redirection URL for Successful Login

With Cisco IOS Release 12.2(50)SG, you have the option to specify a URL to which the user is redirected upon successful authentication, effectively replacing the internal Success HTML page.

To specify a redirection URL for successful login, perform this task:

Command	Purpose
Switch(config)# ip admission proxy http success redirect <i>url-string</i>	Specifies a URL for redirection of the user in place of the default login success page.

When configuring a redirection URL for successful login, consider the following guidelines:

- If the custom authentication proxy web pages feature is enabled, the redirection URL feature is disabled and is not available in the CLI. You can perform redirection in the custom login success page.
- If the redirection URL feature is enabled, a configured auth-proxy-banner is not used.
- To remove the specification of a redirection URL, use the **no** form of the command.

The following example shows how to configure a redirection URL for successful login:

```
Switch(config)# ip admission proxy http success redirect www.cisco.com
```

The following example shows how to verify the redirection URL for successful login:

```
Switch# show ip admission configuration
```

```
Authentication Proxy Banner not configured
Customizable Authentication Proxy webpage not configured
HTTP Authentication success redirect to URL: http://www.cisco.com
Authentication global cache time is 60 minutes
Authentication global absolute time is 0 minutes
Authentication global init state time is 2 minutes
Authentication Proxy Watch-list is disabled
Authentication Proxy Max HTTP process is 7
Authentication Proxy Auditing is disabled
Max Login attempts per user is 5
```

Configuring the Web-Based Authentication Parameters

You can configure the maximum number of failed login attempts allowed before the client is placed in a watch list for a waiting period.

To configure the web-based authentication parameters, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip admission max-login-attempts <i>number</i>	Sets the maximum number of failed login attempts. The default is 5. Note A typical custom setting for this value should not exceed 50.
Step 2	Switch(config)# end	Returns to privileged EXEC mode.
Step 3	Switch# show ip admission configuration	Displays the authentication proxy configuration.
Step 4	Switch# show ip admission cache	Displays the list of authentication entries.

This example shows how to set the maximum number of failed login attempts to 10:

```
Switch(config)# ip admission max-login-attempts 10
```

Removing Web-Based Authentication Cache Entries

To delete existing session entries, perform either of these tasks:

Command	Purpose
Switch# clear ip auth-proxy cache { * <i>host ip address</i> }	Deletes authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.
Switch# clear ip admission cache { * <i>host ip address</i> }	Deletes authentication proxy entries. Use an asterisk to delete all cache entries. Enter a specific IP address to delete the entry for a single host.

This example shows how to remove the web-based authentication session for the client at IP address 209.165.201.1:

```
Switch# clear ip auth-proxy cache 209.165.201.1
```

Displaying Web-Based Authentication Status

To display the web-based authentication settings for all interfaces or for specific ports, perform this task:

	Command	Purpose
Step 1	Switch# show authentication sessions [interface <i>type slot/port</i>]	Displays the web-based authentication settings. type = fastethernet, gigabitethernet, or tengigabitethernet (Optional) Use the interface keyword to display the web-based authentication settings for a specific interface.

This example shows how to view only the global web-based authentication status:

```
Switch# show authentication sessions
```

This example shows how to view the web-based authentication settings for interface Gi 3/27:

```
Switch# show authentication sessions interface gigabitethernet 3/27
```

CHAPTER 43

Configuring Port Security

This chapter describes how to configure port security on the Catalyst 4500 series switch. It provides an overview of port security on the Catalyst 4500 series switch and details the configuration on various types of ports such as access, voice, trunk and private VLAN (PVLAN).

This chapter consists of these sections:

- [Command List, page 43-1](#)
- [Port Security, page 43-3](#)
- [Configuring Port Security on Access Ports, page 43-7](#)
- [Configuring Port Security on PVLAN Ports, page 43-14](#)
- [Configuring Port Security on Trunk Ports, page 43-17](#)
- [Configuring Port Security on Voice Ports, page 43-22](#)
- [Displaying Port Security Settings, page 43-27](#)
- [Configuring Port Security with Other Features/Environments, page 43-31](#)
- [Guidelines and Restrictions, page 43-33](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Command List

This table lists the commands most commonly used with Port Security.

Command	Purpose	Navigation
errdisable recovery cause psecure-violation	Brings a secure port out of error-disabled state	Violation Actions, page 43-6
errdisable recovery interval	Customizes the time to recover from a specified error disable cause	Violation Actions, page 43-6
port-security mac-address	Configures all secure MAC addresses on each VLAN	Secure MAC Addresses, page 43-3
port-security maximum	Configures a maximum number of MAC addresses on an interface	Configuring Port Security on Access Ports, page 43-7
private-vlan association add	Creates an association between a secondary VLAN and a primary VLAN	Example of Port Security on an Isolated Private VLAN Host Port, page 43-16
private-vlan isolated	Designates the VLAN as a private VLAN	Configuring Port Security on an Isolated Private VLAN Host Port, page 43-14
private-vlan primary	Specifies the VLAN as the primary private VLAN	Configuring Port Security on an Isolated Private VLAN Host Port, page 43-14
switchport mode private-vlan host	Specifies that ports with valid private VLAN trunk association become active host private VLAN trunk ports	Configuring Port Security on an Isolated Private VLAN Host Port, page 43-14
switchport private-vlan host-association	Defines a host association on an isolated host port	Configuring Port Security on an Isolated Private VLAN Host Port, page 43-14
switchport private-vlan mapping	Defines a private VLAN for the promiscuous ports	Configuring Port Security on an Isolated Private VLAN Host Port, page 43-14
switchport port-security	Enables port security	Configuring Port Security on Access Ports, page 43-7
switchport port-security aging static	Configures static aging of MAC address.	Aging Secure MAC Addresses, page 43-5
switchport port-security aging time	Specifies an aging time for a port	Example 3: Setting the Aging Timer, page 43-11
switchport port-security limit rate invalid-source-mac	Sets the rate limit for bad packets	Example 7: Setting a Rate Limit for Bad Packets, page 43-13
switchport port-security mac-address	Configures a secure MAC address for an interface	Example 5: Configuring a Secure MAC Address, page 43-12
switchport port-security mac-address <mac_address> sticky	Specifies the sticky MAC address for an interface	Configuring Port Security on Access Ports, page 43-7
switchport port-security mac-address sticky	Enables sticky Port Security	Sticky Addresses on a Port, page 43-5
no switchport port-security mac-address sticky	Converts a sticky secure MAC address to a dynamic MAC secure address	Configuring Port Security on Access Ports, page 43-7

Command	Purpose	Navigation
switchport port-security maximum	Sets the maximum number of secure MAC addresses for an interface	Example 1: Setting Maximum Number of Secure Addresses, page 43-11
switchport port-security violation	Sets the violation mode	Example 2: Setting a Violation Mode, page 43-11
no switchport port-security violation	Sets the violation mode	Configuring Port Security on Access Ports, page 43-7
switchport trunk encapsulation dot1q	Sets the encapsulation mode to dot1q	Example 1: Configuring a Maximum Limit of Secure MAC Addresses for all VLANs, page 43-19

Port Security

Port security enables you to restrict the number of MAC addresses (termed *secure MAC addresses*) on a port, allowing you to prevent access by unauthorized MAC addresses. It also allows you to configure a maximum number of secure MAC addresses on a given port (and optionally for a VLAN for trunk ports). When a secure port exceeds the maximum, a security violation is triggered, and a violation action is performed based on the violation action mode configured on the port.

If you configure the maximum number of secure MAC addresses as 1 on the port, the device attached to the secure port is assured sole access to the port.

If a secure MAC address is secured on a port, that MAC address is not allowed to enter on any other port off that VLAN. If it does, the packet is dropped unnoticed in the hardware. Other than through the interface or port counters, you do not receive a log message reflecting this fact. Be aware that this condition does not trigger a violation. Dropping these packets in the hardware is more efficient and can be done without putting additional load on the CPU.

Port Security has the following characteristics:

- It allows you to age out secure MAC addresses. Two types of aging are supported: inactivity and absolute.
- It supports a sticky feature whereby the secure MAC addresses on a port are retained through switch reboots and link flaps.
- It can be configured on various types of ports such as access, voice, trunk, EtherChannel, and private VLAN ports.

This overview contains the following topics:

- [Secure MAC Addresses, page 43-3](#)
- [Maximum Number of Secure MAC Addresses, page 43-4](#)
- [Aging Secure MAC Addresses, page 43-5](#)
- [Sticky Addresses on a Port, page 43-5](#)
- [Violation Actions, page 43-6](#)

Secure MAC Addresses

Port Security supports the following types of secure MAC addresses:

- **Dynamic or Learned**—Dynamic secure MAC addresses are learned when packets are received from the host on the secure port. You might want to use this type if the user's MAC address is not fixed (laptop).
- **Static or Configured**—Static secure MAC addresses are configured by the user through CLI or SNMP. You might want to use this type if your MAC address remains fixed (PC).
- **Sticky**—Sticky addresses are learned like dynamic secure MAC addresses, but persist through switch reboots and link flaps like static secure MAC addresses. You might want to use this type if a large number of fixed MAC addresses exist and you do not want to configure MAC addresses manually (100 PCs secured on their own ports).

If a port has reached its maximum number of secure MAC addresses and you try to configure a static secure MAC address, your configuration is rejected and an error message displays. If a port has reached its maximum number of secure MAC addresses and a new dynamic secure MAC address is added, a violation action is triggered.

You can clear dynamic secure MAC addresses with the **clear port-security** command. You can clear sticky and static secure MAC addresses one at a time with the **no** form of the **switchport port-security mac-address** command.

Maximum Number of Secure MAC Addresses

A secure port has a default of one MAC address. You can change the default to any value between 1 and 3,000. The upper limit of 3,000 guarantees one MAC address per port and an additional 3,000 across all ports in the system.

After you have set the maximum number of secure MAC addresses on a port, you can include the secure addresses in an address table in one of the following ways:

- You can configure the secure MAC addresses with the **switchport port-security mac-address mac_address** interface configuration command.
- You can configure all secure MAC addresses on a range of VLANs with the **port-security mac-address VLAN range** configuration command for trunk ports.
- You can allow the port to dynamically configure secure MAC addresses with the MAC addresses of connected devices.
- You can configure some of the addresses and allow the rest to be dynamically configured.

Note

If a port's link goes down, all dynamically secured addresses on that port are no longer secure.

- *You can configure* MAC addresses to be sticky. These can be dynamically learned or manually configured, stored in the address table, and added to the running configuration. After these addresses are saved in the configuration file, the interface does not need to dynamically relearn them when the switch restarts. Although you can manually configure sticky secure addresses, this action is not recommended.

Note

On a trunk port, a maximum number of secure MAC addresses can be configured on both the port and port VLAN. The port's maximum value can be greater than or equal to the port VLAN maximum(s) but not less than the port VLAN maximum(s). If the port's maximum value is less than at least one of the port VLAN's maximum (for example, if we have max set to 3 on VLAN 10 while no "sw port max" is set (defaults to 1)), the port shuts down when dynamic adds reaches 2 on VLAN 10 (see "Guidelines and Restrictions" on page 33). The port VLAN maximum enforces the maximum allowed on a given port on

a given VLAN. If the maximum is exceeded on a given VLAN but the port's maximum is not exceeded, the port still shuts down. The entire port is shut down even if one of the VLANs on the port has actually caused the violation.

Aging Secure MAC Addresses

You might want to age secure MAC addresses when the switch may be receiving more than 3,000 MAC addresses ingress.

Note

Aging of sticky addresses is not supported.

By default, port security does not age out the secure MAC addresses. After learned, the MAC addresses remain on the port until either the switch reboots or the link goes down (unless the sticky feature is enabled). However, port security does allow you to configure aging based on the absolute or inactivity mode and aging interval (in minutes, from 1 to n).

- Absolute mode: ages between n and n+1
- Inactivity mode: ages between n+1 and n+2

Use this feature to remove and add PCs on a secure port without manually deleting the existing secure MAC addresses, while still limiting the number of secure addresses on a port.

Unless static aging is explicitly configured with the **switchport port-security aging static** command, static addresses are not aged even if aging is configured on the port.

Note

The aging increment is one minute.

Sticky Addresses on a Port

By enabling *sticky port security*, you can configure an interface to convert the dynamic MAC addresses to sticky secure MAC addresses and to add them to the running configuration. You might want to do this if you do not expect the user to move to another port, and you want to avoid statically configuring a MAC address on every port.

Note

If you use a different chassis, you might need another MAC address.

To enable *sticky port security*, enter the **switchport port-security mac-address sticky** command. When you enter this command, the interface converts all the dynamic secure MAC addresses, including those that were dynamically learned before sticky learning was enabled, to sticky secure MAC addresses.

The sticky secure MAC addresses do not automatically become part of the configuration file, which is the startup configuration used each time the switch restarts. If you save the running config file to the configuration file, the interface does not need to relearn these addresses when the switch restarts. If you do not save the configuration, they are lost.

If *sticky port security* is disabled, the sticky secure MAC addresses are converted to dynamic secure addresses and are removed from the running configuration.

After the maximum number of secure MAC addresses is configured, they are stored in an address table. To ensure that an attached device has sole access of the port, configure the MAC address of the attached device and set the maximum number of addresses to one, which is the default.

A security violation occurs if the maximum number of secure MAC addresses to a port has been added to the address table and a workstation whose MAC address is not in the address table attempts to access the interface.

Violation Actions

A security violation is triggered when the number of secure MAC addresses on the port exceeds the maximum number of secure MAC addresses allowed on the port.

Note

A secure violation is not triggered if the host secured on one port shows up on another port. The Catalyst 4500 series switch drops such packets on the new port silently in the hardware and does not overload the CPU.

You can configure the interface for one of following violation modes, which are based on the response to the violation:

- **Restrict**—A port security violation restricts data (that is, packets are dropped in software), causes the SecurityViolation counter to increment, and causes an SNMP Notification to be generated. You might want to configure this mode in order to provide uninterrupted service/access on a secure port.

The rate at which SNMP traps are generated can be controlled by the **snmp-server enable traps port-security trap-rate** command. The default value (“0”) causes an SNMP trap to be generated for every security violation.

- **Shutdown**—A port security violation causes the interface to shut down immediately. You might want to configure this mode in a highly secure environment, where you do not want unsecured MAC addresses to be denied in software and service interruption is not an issue.
- **Shutdown VLAN**—Use to set the security violation mode for each VLAN. In this mode, the offending VLAN is error disabled instead of the entire port when a violation occurs.

When a secure port is in the error-disabled state, you can bring it out of this state automatically by configuring the **errdisable recovery cause psecure-violation** global configuration command or you can manually reenable it by entering the **shutdown** and **no shut down** interface configuration commands. This is the default mode. If a port is in per-VLAN errdisable mode, you can also use **clear errdisable interface name vlan range** command to re-enable the VLAN on the port.

You can also customize the time to recover from the specified error disable cause (default is 300 seconds) by entering the **errdisable recovery interval interval** command.

Invalid Packet Handling

You might want to rate limit invalid source MAC address packets on a secure port if you anticipate that a device will send invalid packets (such as traffic generator, sniffer, and bad NICs). Port security considers packets with all zero MAC addresses, as well as multicast or broadcast source MAC address, as invalid packets. Traffic from either an address learned or configured on one secure interface is observed on another secure interface in the same VLAN. You can chose to rate limit these packets, and if the rate is exceeded, trigger a violation action for the port.

Configuring Port Security on Access Ports

These sections describe how to configure port security:

- [Configuring Port Security on Access Ports, page 43-7](#)
- [Examples, page 43-10](#)

Note

Port security can be enabled on a Layer 2 port channel interface configured in access mode. The port security configuration on an EtherChannel is kept independent of the configuration of any physical member ports.

Configuring Port Security on Access Ports

To restrict traffic through a port by limiting and identifying MAC addresses of the stations allowed to the port, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface <i>interface_id</i> interface <i>port-channel port_channel_number</i>	Enters interface configuration mode and specifies the interface to configure. Note The interface can be a Layer 2 port channel logical interface.
Step 2	Switch(config-if)# switchport mode access	Sets the interface mode. Note An interface in the default mode (dynamic auto) cannot be configured as a secure port.
Step 3	Switch(config-if)# [no] switchport port-security	Enables port security on the interface. To return the interface to the default condition as nonsecure port, use the no switchport port-security command.
Step 4	Switch(config-if)# [no] switchport port-security maximum <i>value</i>	(Optional) Sets the maximum number of secure MAC addresses for the interface. The range is 1 to 3072; the default is 1. To return the interface to the default number of secure MAC addresses, use the no switchport port-security maximum value .

Command	Purpose (continued)
<div>Step 5</div> <pre>Switch(config-if)# switchport port-security [aging {static time aging_time type {absolute inactivity}}]</pre>	<p>Sets the aging time and aging type for all secure addresses on a port.</p> <p>Use this feature to remove and add PCs on a secure port without manually deleting the existing secure MAC addresses while still limiting the number of secure addresses on a port.</p> <p>The static keyword enables aging for statically configured secure addresses on this port.</p> <p>The time <i>aging_time</i> keyword specifies the aging time for this port. Valid range for <i>aging_time</i> is from 0 to 1440 minutes. If the time is equal to 0, aging is disabled for this port.</p> <p>The type keyword sets the aging type as absolute or inactive.</p> <ul style="list-style-type: none"> absolute—All the secure addresses on this port age out exactly after the time (minutes) specified and are removed from the secure address list. inactive—The secure addresses on this port age out only if there is no data traffic from the secure source address for the specified time period. <p>To disable port security aging for all secure addresses on a port, use the no switchport port-security aging time interface configuration command.</p>

	Command	Purpose (continued)
Step 6	<pre>Switch(config-if)# [no] switchport port-security violation {restrict shutdown shutdown vlan}</pre>	<p>(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these:</p> <ul style="list-style-type: none"> • restrict—A port security violation restricts data and causes the SecurityViolation counter to increment and send an SNMP trap notification. • shutdown—The interface is error-disabled when a security violation occurs. • shutdown vlan—Use to set the security violation mode for each VLAN. In this mode, the VLAN is error-disabled instead of the entire port when a violation occurs. <p>Note When a secure port is in the error-disabled state, you can bring it out of this state by entering the errdisable recovery cause psecure-violation global configuration command or you can manually reenable it by entering the shutdown and no shut down interface configuration commands.</p> <p>To return the violation mode to the default condition (shutdown mode), use the no switchport port-security violation shutdown command.</p>
Step 7	<pre>Switch(config-if)# switchport port-security limit rate invalid-source-mac packets_per_sec</pre>	<p>Sets the rate limit for bad packets.</p> <p>Default is 10 pps.</p>
Step 8	<pre>Switch(config-if)# [no] switchport port-security mac-address mac_address</pre>	<p>(Optional) Enters a secure MAC address for the interface. You can use this command to configure a secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.</p> <p>To delete a MAC address from the address table, use the no switchport port-security mac-address mac_address command.</p> <p>Note This command only applies to access, PVLAN host, and PVLAN promiscuous mode. For more details on PVLAN, trunk, or regular trunk mode, refer to the “Configuring Port Security on Trunk Ports” section on page 43-17.</p>
Step 9	<pre>Switch(config-if)# [no] switchport port-security mac-address sticky</pre>	<p>(Optional) Enables sticky learning on the interface.</p> <p>To disable sticky learning on an interface, use the no switchport port-security mac-address sticky command. The interface converts the sticky secure MAC addresses to dynamic secure addresses.</p>

	Command	Purpose (continued)
Step 10	Switch(config-if)# [no] switchport port-security mac-address <i>mac_address</i> sticky [vlan [voice / access]]	<p>Specifies the sticky mac-address for the interface.</p> <p>When you specify the vlan keyword, the mac-address becomes sticky in the specified VLAN.</p> <p>To delete a sticky secure MAC addresses from the address table, use the no switchport port-security mac-address <i>mac_address</i> sticky command. To convert sticky to dynamic addresses, use the no switchport port-security mac-address sticky command.</p> <p>Note This command only applies to access, PVLAN host, and PVLAN promiscuous mode. For more details on PVLAN or trunk or regular trunk mode, refer to the “Configuring Port Security on Trunk Ports” section on page 43-17.</p>
Step 11	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 12	Switch# show port-security address Switch# show port-security address	Verifies your entries.

**Note**

To clear dynamically learned port security MAC addresses in the CAM table, use the **clear port-security dynamic** command. The **address** keyword enables you to clear a secure MAC addresses. The **interface** keyword enables you to clear all secure addresses on any interface (including any port channel interface). The **VLAN** keyword allows you to clear port security MACs on a per-VLAN per-port basis.

Examples

The following examples are provided:

- [Example 1: Setting Maximum Number of Secure Addresses, page 43-11](#)
- [Example 2: Setting a Violation Mode, page 43-11](#)
- [Example 3: Setting the Aging Timer, page 43-11](#)
- [Example 4: Setting the Aging Timer Type, page 43-12](#)
- [Example 5: Configuring a Secure MAC Address, page 43-12](#)
- [Example 6: Configuring Sticky Port Security, page 43-13](#)
- [Example 7: Setting a Rate Limit for Bad Packets, page 43-13](#)
- [Example 8: Clearing Dynamic Secure MAC Addresses, page 43-14](#)

Example 1: Setting Maximum Number of Secure Addresses

This example shows how to enable port security on the Fast Ethernet interface 3/12 and how to set the maximum number of secure addresses to 5. The violation mode is the default, and no secure MAC addresses are configured.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# end
Switch# show port-security interface fastethernet 3/12
Port Security                : Enabled
Port Status                   : Secure-up
Violation Mode                 : Shutdown
Aging Time                    : 0 mins
Aging Type                     : Absolute
SecureStatic Address Aging    : Enabled
Maximum MAC Addresses         : 5
Total MAC Addresses           : 0
Configured MAC Addresses      : 0
Sticky MAC Addresses          : 0
Last Source Address:Vlan     : 0000.0000.0000:0
Security Violation Count      : 0
```

Example 2: Setting a Violation Mode

This example shows how to set the violation mode on the Fast Ethernet interface 3/12 to restrict.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport port-security violation restrict
Switch(config-if)# end
Switch#
```

SNMP traps can be enabled with a rate-limit to detect port-security violations due to restrict mode. The following example shows how to enable traps for port-security with a rate of 5 traps per second:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# snmp-server enable traps port-security trap-rate 5
Switch(config)# end
Switch#
```

Example 3: Setting the Aging Timer

This example shows how to set the aging time to 2 hours (120 minutes) for the secure addresses on the Fast Ethernet interface 5/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport port-security aging time 120
Switch(config-if)# end
Switch#
```

This example shows how to set the aging time to 2 minutes:

```
Switch(config-if)# switchport port-security aging time 2
```

You can verify the previous commands with the **show port-security interface** command.

Example 4: Setting the Aging Timer Type

This example shows how to set the aging timer type to Inactivity for the secure addresses on the Fast Ethernet interface 3/5:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 3/5
Switch(config-if)# switchport port-security aging type inactivity
Switch(config-if)# end
Switch# show port-security interface fastethernet 3/5
Port Security                : Enabled
Port Status                  : Secure-up
Violation Mode                : Shutdown
Aging Time                   : 0 mins
Aging Type                   : Inactivity
SecureStatic Address Aging   : Disabled
Maximum MAC Addresses        : 1
Total MAC Addresses          : 0
Configured MAC Addresses     : 0
Sticky MAC Addresses         : 0
Last Source Address:Vlan     : 0000.0000.0000:0
Security Violation Count     : 0
```

Example 5: Configuring a Secure MAC Address

This example shows how to configure a secure MAC address on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 10
Switch(config-if)# switchport port-security mac-address 0000.0000.0003 (Static secure MAC)
Switch(config-if)# end
Switch#show port address
Secure Mac Address Table
-----
```

Vlan	Mac Address	Type	Ports	Remaining Age (mins)
1	0000.0000.0003	SecureConfigured	Fa5/1	-

```
-----
Total Addresses in System (excluding one mac per port) : 2
Max Addresses limit in System (excluding one mac per port) : 3072
```

Example 6: Configuring Sticky Port Security

This example shows how to configure a sticky MAC address on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# end
```

Note

Sending traffic to the ports causes the system to configure the port with sticky secure addresses.

```
Switch# show port-security address
Secure Mac Address Table
-----
Vlan    Mac Address      Type                Ports    Remaining Age
(mins)
-----
1       0000.0000.0001   SecureSticky        Fa5/1    -
1       0000.0000.0002   SecureSticky        Fa5/1    -
1       0000.0000.0003   SecureSticky        Fa5/1    -
-----
Total Addresses in System (excluding one mac per port) : 2
Max Addresses limit in System (excluding one mac per port) : 3072
Switch# show running-config interface fastEthernet 5/1
Building configuration...

Current configuration : 344 bytes
!
interface FastEthernet5/1
 switchport mode access
 switchport port-security
 switchport port-security maximum 5
 switchport port-security mac-address sticky

 switchport port-security mac-address sticky 0000.0000.0002
 switchport port-security mac-address sticky 0000.0000.0003
end

Switch#
```

Example 7: Setting a Rate Limit for Bad Packets

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet interface 5/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport port-security limit rate invalid-source-mac 100
Switch(config-if)# end
Switch#
```

The following example shows how to configure rate limit for invalid source packets on Fast Ethernet interface 5/1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fastethernet 5/1
Switch(config-if)# switchport port-security limit rate invalid-source-mac none
Switch(config-if)# end
Switch#
```

Example 8: Clearing Dynamic Secure MAC Addresses

The following example shows how to clear a dynamic secure MAC address:

```
Switch# clear port-security dynamic address 0000.0001.0001
```

The following example shows how to clear all dynamic secure MAC addresses on Fast Ethernet interface 2/1:

```
Switch# clear port-security dynamic interface fa2/1
```

The following example shows how to clear all dynamic secure MAC addresses in the system:

```
Switch# clear port-security dynamic
```

Configuring Port Security on PVLAN Ports

You can configure port security on a private VLAN port to take advantage of private VLAN functionality as well as to limit the number of MAC addresses.

Note

This section follows the same configuration model that was presented for access ports.

These sections describe how to configure trunk port security on host and promiscuous ports:

- [Configuring Port Security on an Isolated Private VLAN Host Port, page 43-14](#)
- [Example of Port Security on an Isolated Private VLAN Host Port, page 43-16](#)
- [Configuring Port Security on a Private VLAN Promiscuous Port, page 43-16](#)
- [Example of Port Security on a Private VLAN Promiscuous Port, page 43-17](#)

Configuring Port Security on an Isolated Private VLAN Host Port

[Figure 43-1](#) illustrates a typical topology for port security implemented on private VLAN host ports. In this topology, the PC connected through port a on the switch can communicate only with the router connected through the promiscuous port on the switch. The PC connected through port a cannot communicate with the PC connected through port b.

Figure 43-1 Port Security on Isolated Private VLAN Host Ports

Note Dynamic addresses secured on an isolated private VLAN host port on private VLANs are secured on the secondary VLANs, and not primary VLANs.

To configure port security on an isolated private VLAN host port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enter global configuration mode.
Step 2	Switch(config)# vlan sec_vlan_id	Specifies a secondary VLAN.
Step 3	Switch(config-vlan)# private-vlan isolated	Sets the private VLAN mode to isolated.
Step 4	Switch(config-vlan)# exit	Returns to global configuration mode.
Step 5	Switch(config)# vlan pri_vlan_id	Specifies a primary VLAN.
Step 6	Switch(config-vlan)# private-vlan primary	Specifies the VLAN as the primary private VLAN.
Step 7	Switch(config-vlan)# private-vlan association add sec_vlan_id	Creates an association between a secondary VLAN and a primary VLAN.
Step 8	Switch(config-vlan)# exit	Returns to global configuration mode.
Step 9	Switch(config)# interface interface_id	Enters interface configuration mode and specifies the physical interface to configure.
Step 10	Switch(config-if)# switchport mode private-vlan host	Specifies that the ports with a valid private VLAN trunk association become active host private VLAN trunk ports.
Step 11	Switch(config-if)# switchport private-vlan host-association primary_vlan secondary_vlan	Establishes a host association on an isolated host port.
Step 12	Switch(config-if)# [no] switchport port-security	Enables port security on the interface.
Step 13	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 14	Switch# show port-security address interface interface_id Switch# show port-security address	Verifies your entries.

Example of Port Security on an Isolated Private VLAN Host Port

The following example shows how to configure port security on an isolated private VLAN host port, Fast Ethernet interface 3/12:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vlan 6
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 3
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# private-vlan association add 6
Switch(config-vlan)# exit
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan association host 3 6
Switch(config-if)# switchport port-security
Switch(config-if)# end
```

Configuring Port Security on a Private VLAN Promiscuous Port

To configure port security on a private VLAN promiscuous port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# vlan <i>sec_vlan_id</i>	Specifies the VLAN.
Step 3	Switch(config-vlan)# private-vlan isolated	Sets the private VLAN mode to isolated.
Step 4	Switch(config-vlan)# exit	Returns to global configuration mode.
Step 5	Switch(config)# vlan <i>pri_vlan_id</i>	Specifies the VLAN.
Step 6	Switch(config-vlan)# private-vlan primary	Designates the VLAN as the primary private VLAN.
Step 7	Switch(config-vlan)# private-vlan association add <i>sec_vlan_id</i>	Creates an association between a secondary VLAN and a primary VLAN.
Step 8	Switch(config-vlan)# exit	Returns to global configuration mode.
Step 9	Switch(config)# interface <i>interface_id</i>	Enters interface configuration mode and specifies the physical interface to configure.
Step 10	Switch(config-if)# switchport mode private-vlan promiscuous	Specifies that the ports with a valid PVLAN mapping become active promiscuous ports.
Step 11	Switch(config-if)# switchport private-vlan mapping <i>primary_vlan secondary_vlan</i>	Configures a private VLAN for the promiscuous ports
Step 12	Switch(config-if)# switchport port-security	Enables port security on the interface.
Step 13	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 14	Switch# show port-security address Switch# show port-security address	Verifies your entries.

Example of Port Security on a Private VLAN Promiscuous Port

The following example shows how to configure port security on a private VLAN promiscuous port, Fast Ethernet interface 3/12:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# vlan 6
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 3
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# private-vlan association add 6
Switch(config-vlan)# exit
Switch(config)# interface fastethernet 3/12
Switch(config-if)# switchport mode private-vlan promiscuous
Switch(config-if)# switchport mode private-vlan mapping 3 6
Switch(config-if)# switchport port-security
Switch(config-if)# end
```

Configuring Port Security on Trunk Ports

You might want to configure port security on trunk ports in metro aggregation to limit the number of MAC addresses per VLAN. Trunk port security extends port security to trunk ports. It restricts the allowed MAC addresses or the maximum number of MAC addresses to individual VLANs on a trunk port. Trunk port security enables service providers to block the access from a station with a different MAC address than the ones specified for that VLAN on that trunk port. Trunk port security is also supported on private VLAN trunk ports.

Note

Port security can be enabled on a Layer 2 port channel interface configured in mode. The port security configuration on an EtherChannel is kept independent of the configuration of any physical member ports.

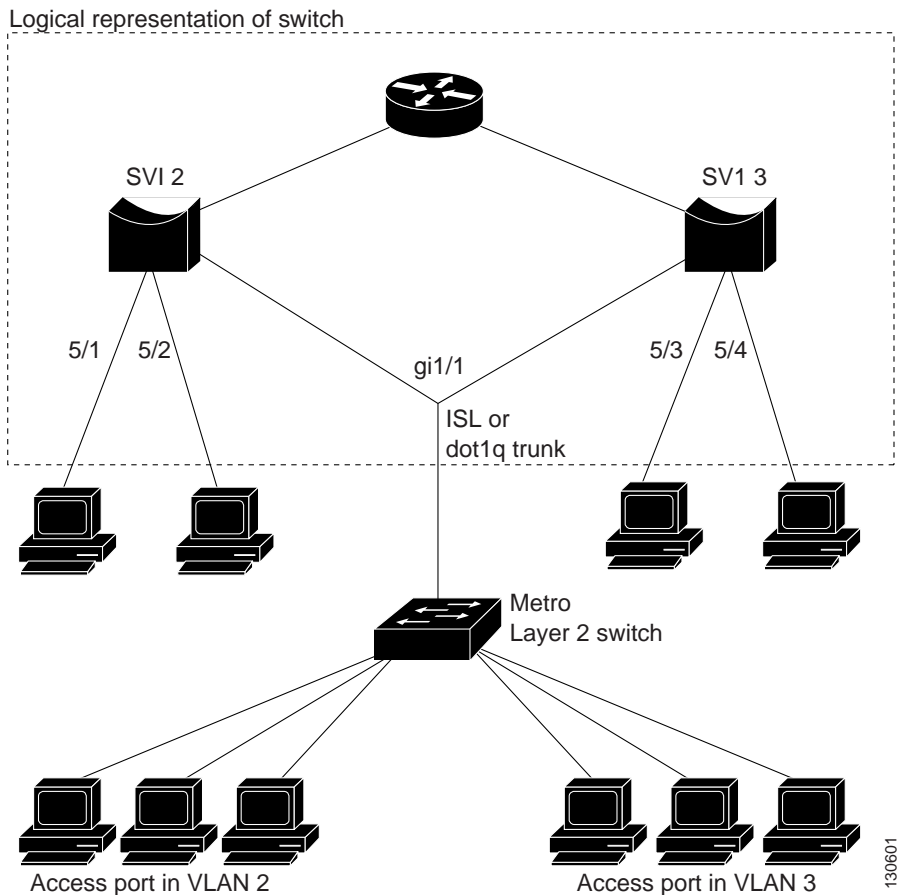

These sections describe how to configure trunk port security:

- [Configuring Trunk Port Security, page 43-17](#)
- [Examples of Trunk Port Security, page 43-19](#)
- [Trunk Port Security Guidelines and Restrictions, page 43-21](#)

Configuring Trunk Port Security

Trunk port security is used when a Catalyst 4500 series switch has a dot1q or isl trunk attached to a neighborhood Layer 2 switch. This may be used, for example, in metro aggregation networks ([Figure 43-2](#)).

Figure 43-2 Trunk Port Security

You can configure various port security related parameters on a per-port per-VLAN basis.

Note

The steps involved in configuring port security parameters is similar to those for access ports. In addition to those steps, the following per-port per-VLAN configuration steps are supported for trunk ports.

To configure port security related parameters on a per-VLAN per-port basis, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface <i>interface_id</i> interface <i>port-channel port_channel_number</i>	Enters interface configuration mode and specifies the interface to configure. Note The interface can be a Layer 2 port channel logical interface.
Step 2	Switch(config-if)# switchport trunk encapsulation dot1q	Sets the trunk encapsulation format to 802.1Q.
Step 3	Switch(config-if)# switchport mode trunk	Sets the interface mode. Note An interface in the default mode (dynamic auto) cannot be configured as a secure port.

	Command	Purpose (continued)
Step 4	Switch(config-if)# switchport port-security maximum value vlan	Configures a maximum number of secure mac-addresses for each VLAN on the interface that are not explicitly configured with a maximum mac-address limit. (See the “Maximum Number of Secure MAC Addresses” section on page 43-4.)
Step 5	Switch(config-if)# vlan-range range	Enters VLAN range sub-mode. Note You can specify single or multiple VLANs.
Step 6	Switch(config-if-vlan-range)# port-security maximum value	Configures a maximum number of secure MAC addresses for each VLAN.
Step 7	Switch(config-if-vlan-range)# no port-security maximum	Removes a maximum number of secure MAC addresses configuration for all the VLANs. Subsequently, the maximum value configured on the port will be used for all the VLANs.
Step 8	Switch(config-if-vlan-range)# [no] port-security mac-address mac_address	Configures a secure MAC-address on a range of VLANs.
Step 9	Switch(config-if-vlan-range)# [no] port-security mac-address sticky mac_address	Configures a sticky MAC-address on a range of VLANs.
Step 10	Switch(config-if-vlan-range)# end	Returns to interface configuration mode.
Step 11	Switch(config-if)# end	Returns to privileged EXEC mode.

Examples of Trunk Port Security

The following examples are provided:

- [Example 1: Configuring a Maximum Limit of Secure MAC Addresses for all VLANs, page 43-19](#)
- [Example 2: Configuring a Maximum Limit of Secure MAC Addresses for Specific VLANs, page 43-20](#)
- [Example 3: Configuring Secure MAC Addresses in a VLAN Range, page 43-20](#)

Example 1: Configuring a Maximum Limit of Secure MAC Addresses for all VLANs

This example shows how to configure a secure MAC-address and a maximum limit of secure MAC addresses on Gigabit Ethernet interface 1/1 for all VLANs:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# sw mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 3

Switch# show port-security in g1/1 vlan
Default maximum: 3
VLAN  Maximum      Current
    1         3         0
    2         3         0
    3         3         0
    4         3         0
```

```

      5          3          0
      6          3          0
Switch#

Switch# show running interface g1/1
Building configuration...

Current configuration : 161 bytes
!
interface GigabitEthernet1/1
 switchport trunk encapsulation dot1q
 switchport mode trunk
 switchport port-security
 switchport port-security maximum 3 vlan
end

```

Example 2: Configuring a Maximum Limit of Secure MAC Addresses for Specific VLANs

This example shows how to configure a secure MAC-address on interface g1/1 in a specific VLAN or range of VLANs:

```

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# sw mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security maximum 3
Switch(config-if)# exit

Switch# show port-security interface g1/1 vlan
Default maximum: not set, using 3072
VLAN  Maximum    Current
    2         3         0
    3         3         0
    4         3         0
    5         3         0
    6         3         0
Switch#

```

Example 3: Configuring Secure MAC Addresses in a VLAN Range

This example shows how to configure a secure MAC-address in a VLAN on interface g1/1:

```

Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g1/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# sw mode trunk
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# vlan-range 2-6
Switch(config-if-vlan-range)# port-security mac-address 1.1.1
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.2
Switch(config-if-vlan-range)# port-security mac-address sticky 1.1.3
Switch(config-if-vlan-range)# exit

```

```
Switch# show port-security interface g1/1 address vlan 2-4
Secure Mac Address Table
```

Vlan	Mac Address	Type	Ports	Remaining Age (mins)
2	0001.0001.0001	SecureConfigured	Gi1/1	-

```

Trunk Port Security Guidelines and Restrictions

Follow these guidelines when configuring port security related parameters on a per-port per-VLAN basis:

- A secure MAC-address cannot be configured on a VLAN that is not allowed on a regular trunk port.
- The configuration on the primary VLAN on the private VLAN trunk is not allowed. The CLI is rejected and an error message is displayed.
- If a specific VLAN on a port is not configured with a maximum value (directly or indirectly), the maximum configured for the port is used for that VLAN. In this situation, the maximum number of addresses that can be secured on this VLAN is limited to the maximum value configured on the port.

Each VLAN can be configured with a maximum count that is greater than the value configured on the port. Also, the sum of the maximum configured values for all the VLANs can exceed the maximum configured for the port. In either of these situations, the number of MAC addresses secured on each VLAN is limited to the lesser of the VLAN configuration maximum and the port configuration maximum. Also, the number of addresses secured on the port across all VLANs cannot exceed a maximum that is configured on the port.

- For private VLAN trunk ports, the VLAN on which the configuration is being performed must be in either the allowed VLAN list of the private VLAN trunk or the secondary VLAN list in the association pairs. (The CLI is rejected if this condition is not met.) The allowed VLAN list on a private VLAN trunk is intended to hold the VLAN-IDs of all the regular VLANs that are allowed on the private VLAN trunk.
- Removal of an association pair from a PVLAN trunk causes all static and sticky addresses associated with the secondary VLAN of the pair to be removed from the running configuration. Dynamic addresses associated with the secondary VLAN are deleted from the system.

Similarly, when a VLAN is removed from the list of allowed PVLAN trunks, the addresses associated with that VLAN are removed.

Note

For a regular or private VLAN trunk port, if the VLAN is removed from the allowed VLAN list, all the addresses associated with that VLAN are removed.

Port Mode Changes

Generally, when a port mode changes, all dynamic addresses associated with that port are removed. All static or sticky addresses and other port security parameters configured on the native VLAN are moved to the native VLAN of the port in the new mode. All the addresses on the non-native VLANs are removed.

The native VLAN refers to the following VLAN on the specified port type:

Port Type	Native VLAN
access	access VLAN
trunk	native VLAN
isolated	secondary VLAN (from host association)
promiscuous	primary VLAN (from mapping)
private VLAN trunk	private VLAN trunk native VLAN
.1Q tunnel	access VLAN

For example, when the mode changes from access to private VLAN trunk, all the static or sticky addresses configured on the access VLAN of the access port are moved to the private VLAN native VLAN of the private VLAN trunk port. All other addresses are removed.

Similarly, when the mode changes from private VLAN trunk to access mode, all the static or sticky addresses configured on the private VLAN native VLAN are moved to the access VLAN of the access port. All other addresses are removed.

When a port is changed from trunk to private VLAN trunk, addresses associated with a VLAN on the trunk are retained if that VLAN is present in the allowed list of private VLAN trunk or the secondary VLAN of an association on the private VLAN trunk. If the VLAN is not present in either of them, the address is removed from the running configuration.

When a port is changed from private VLAN trunk to trunk, a static or sticky address is retained if the VLAN associated with the address is present in the allowed VLAN list of the trunk. If the VLAN is not present in the allowed list, the address is removed from running configuration.

Configuring Port Security on Voice Ports

You might want to configure port security in an IP Telephony environment when a port is configured with a data VLAN for a PC and a voice VLAN for a Cisco IP Phone.

These sections describe how to configure port security on voice ports:

- [Configuring Port Security on Voice Ports, page 43-23](#)
- [Examples of Voice Port Security, page 43-25](#)
- [Voice Port Security Guidelines and Restrictions, page 43-27](#)

Configuring Port Security on Voice Ports

To configure port security on a voice port, perform this task:

	Command	Purpose
Step 1	Switch(config)# interface <i>interface_id</i>	Enters interface configuration mode and specifies the physical interface to configure.
Step 2	Switch(config-if)# switchport mode access	Sets the interface mode. Note An interface in the default mode (dynamic auto) cannot be configured as a secure port.
Step 3	Switch(config-if)# [no] switchport port-security	Enables port security on the interface. To return the interface to the default condition as nonsecure port, use the no switchport port-security command.
Step 4	Switch(config-if)# [no] switchport port-security violation {restrict shutdown}	(Optional) Sets the violation mode, the action to be taken when a security violation is detected, as one of these: <ul style="list-style-type: none"> • restrict—A port security violation restricts data and causes the SecurityViolation counter to increment and send an SNMP trap notification. • shutdown—The interface is error-disabled when a security violation occurs. Note When a secure port is in the error-disabled state, you can bring it out of this state by entering the errdisable recovery cause psecure-violation global configuration command or you can manually reenabling it by entering the shutdown and no shut down interface configuration commands. To return the violation mode to the default condition (shutdown mode), use the no switchport port-security violation shutdown command.
Step 5	Switch(config-if)# switchport port-security limit rate invalid-source-mac <i>packets_per_sec</i>	Sets the rate limit for bad packets. Default is 10 pps.

Command	Purpose (continued)
Step 6 Switch(config-if)# [no] switchport port-security mac-address <i>mac_address</i> [vlan { voice access }]	<p>(Optional) Specifies a secure MAC address for the interface.</p> <p>When you specify the vlan keyword, addresses are configured in the specified VLAN.</p> <ul style="list-style-type: none"> • voice—MAC address is configured in the voice VLAN. • access—MAC address is configured in the access VLAN. <p>You can use this command to configure secure MAC addresses. If you configure fewer secure MAC addresses than the maximum, the remaining MAC addresses are dynamically learned.</p> <p>To delete a MAC address from the address table, use the no switchport port-security mac-address <i>mac_address</i> command.</p> <p>Note This command only applies to access, PVLAN host, and PVLAN promiscuous mode. For more details on PVLAN, trunk, or regular trunk mode, refer to the “Configuring Port Security on Trunk Ports” section on page 43-17.</p>
Step 7 Switch(config-if)# [no] switchport port-security mac-address sticky	<p>(Optional) Enables sticky learning on the interface.</p> <p>To disable sticky learning on an interface, use the no switchport port-security mac-address sticky command. The interface converts the sticky secure MAC addresses to dynamic secure addresses.</p>
Step 8 Switch(config-if)# [no] switchport port-security mac-address <i>mac_address</i> sticky [vlan { voice access }]	<p>Specifies the sticky mac-address for the interface.</p> <p>When you specify the vlan keyword, the mac-address becomes sticky in the specified VLAN.</p> <ul style="list-style-type: none"> • voice—MAC address becomes sticky in the voice VLAN. • access—MAC address becomes sticky in the access VLAN. <p>To delete a sticky secure MAC addresses from the address table, use the no switchport port-security mac-address <i>mac_address</i> sticky command. To convert sticky to dynamic addresses, use the no switchport port-security mac-address sticky command.</p> <p>Note This command only applies to access, PVLAN host, and PVLAN promiscuous mode. For more details on PVLAN or trunk or regular trunk mode, refer to the “Configuring Port Security on Trunk Ports” section on page 43-17.</p>

	Command	Purpose (continued)
Step 9	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 10	Switch# show port-security address Switch# show port-security address Switch# show port-security address	Verifies your entries.

**Note**

To clear dynamically learned port security MAC addresses in the CAM table, use the **clear port-security dynamic** command. The **address** keyword enables you to clear a secure MAC addresses. The **interface** keyword enables you to clear all secure addresses on an interface (including any port channel interface). The **VLAN** keyword allows you to clear port security MACs on a per-VLAN per-port basis.

**Note**

Each port-security configured interface accepts one mac-address by default. With port-security port level port-security configuration takes precedence over VLAN level port-security configuration. So, to allow one mac-address each for voice and data VLAN, configure the port for a maximum of greater than or equal to two addresses.

Examples of Voice Port Security

The following examples are provided:

- [Example 1: Configuring Maximum MAC Addresses for Voice and Data VLANs, page 43-25](#)
- [Example 2: Configuring Sticky MAC Addresses for Voice and Data VLANs, page 43-26](#)

Example 1: Configuring Maximum MAC Addresses for Voice and Data VLANs

This example shows how to designate a maximum of one MAC address for a voice VLAN (for a Cisco IP Phone, let's say) and one MAC address for the data VLAN (for a PC, let's say) on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 2
Switch(config-if)# switchport port-security mac-address sticky
Switch(config-if)# switchport port-security maximum 1 vlan voice
Switch(config-if)# switchport port-security maximum 1 vlan access
Switch(config-if)# end
```

**Note**

Sending traffic to the ports causes the system to configure the port with sticky secure addresses.

```
Switch# show port-security address
      Secure Mac Address Table
-----
Vlan    Mac Address      Type                Ports    Remaining Age
      (mins)

 switchport port-security mac-address sticky 0000.0000.0001
 switchport port-security mac-address sticky 0000.0000.0004 vlan voice
end

Switch#
```

Example 2: Configuring Sticky MAC Addresses for Voice and Data VLANs

This example shows how to configure sticky MAC addresses for voice and data VLANs on Fast Ethernet interface 5/1 and to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface fa5/1
Switch(config-if)# switchport mode access
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 3072
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.obob vlan voice
Switch(config-if)# switchport port-security mac-address sticky 0000.0000.0005 vlan access
Switch(config-if)# end
```

Note

Sending traffic to the ports causes the system to configure the port with sticky secure addresses.

```
Switch# show port-security address

Switch#
```

Voice Port Security Guidelines and Restrictions

Port security as implemented on voice ports behaves the same as port security on access ports:

- You can configure sticky port security on voice ports. If sticky port security is enabled on a voice port, addresses secured on data and voice VLANs are secured as sticky addresses.
- You can configure maximum secure addresses per VLAN. You can set a maximum for either the data VLAN or the voice VLAN. You can also set a maximum per-port, just as with access ports.
- You can configure port security MAC addresses on a per-VLAN basis on either the data or voice VLANs.
- Prior to Cisco IOS Release 12.2(31)SG, you required three MAC addresses as the maximum parameter to support an IP Phone and a PC. With Cisco IOS Release 12.2(31)SG and later releases, the maximum parameter must be configured to two, one for the phone and one for the PC.

Displaying Port Security Settings

Use the **show port-security** command to display port-security settings for an interface or for the switch.

To display traffic control information, perform one or more of these tasks:

Command	Purpose
Switch# show interface status err-disable	Displays interfaces that have been error-disabled along with the cause for which they were disabled.
Switch# show port-security [interface <i>interface_id</i> / interface <i>port_channel port_channel_number</i>]	Displays port security settings for the switch or for the specified interface, including the maximum allowed number of secure MAC addresses for each interface, the number of secure MAC addresses on the interface, the number of security violations that have occurred, and the violation mode. The interface can be a port channel logical interface.
Switch# show port-security [interface <i>interface_id</i> / interface <i>port_channel port_channel_number</i>] address	Displays all secure MAC addresses configured on all switch interfaces or on a specified interface with aging information for each address.
Switch# show port-security [interface <i>interface_id</i> / interface <i>port_channel port_channel_number</i>] vlan <i>vlan_list</i>	Displays the maximum allowed number of secure MAC addresses and the current number of secure MAC addresses on a specific VLAN-list and a specific interface.
Switch# show port-security [interface <i>interface_id</i> / interface <i>port_channel port_channel_number</i>] [address [vlan <i>vlan_list</i>]]	Displays all secure MAC addresses configured on a specific VLAN-list and a specific interface.

Examples

The following examples are provided:

- [Example 1: Displaying Security Settings for the Entire Switch, page 43-28](#)
- [Example 2: Displaying Security Settings for an Interface, page 43-29](#)
- [Example 3: Displaying all Secure Addresses for the Entire Switch, page 43-29](#)
- [Example 4: Displaying a Maximum Number of MAC Addresses on an Interface, page 43-30](#)
- [Example 5: Displaying Security Settings on an Interface for a VLAN Range, page 43-30](#)
- [Example 6: Displaying Secured MAC Addresses and Aging Information on an Interface, page 43-30](#)
- [Example 7: Displaying Secured MAC Addresses for a VLAN Range on an Interface, page 43-31](#)

Example 1: Displaying Security Settings for the Entire Switch

This example shows how to display port security settings for the entire switch:

```
Switch# show port-security
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
          (Count)         (Count)         (Count)
-----
      Fa3/1           2             2             0             Restrict
      Fa3/2           2             2             0             Restrict
      Fa3/3           2             2             0             Shutdown
      Fa3/4           2             2             0             Shutdown
      Fa3/5           2             2             0             Shutdown
```

```

Fa3/6          2          2          0          Shutdown
Fa3/7          2          2          0          Shutdown
Fa3/8          2          2          0          Shutdown
Fa3/10         1          0          0          Shutdown
Fa3/11         1          0          0          Shutdown
Fa3/12         1          0          0          Restrict
Fa3/13         1          0          0          Shutdown
Fa3/14         1          0          0          Shutdown
Fa3/15         1          0          0          Shutdown
Fa3/16         1          0          0          Shutdown
Po2            3          0          0          Shutdown
-----
Total Addresses in System (excluding one mac per port) :8
Max Addresses limit in System (excluding one mac per port) :3072
Global SNMP trap control for port-security :20 (traps per second)

```

Example 2: Displaying Security Settings for an Interface

This example shows how to display port security settings for Fast Ethernet interface 5/1:

```

Switch# show port-security interface fastethernet 5/1
Port Security          : Enabled
Port Status            : Secure-up
Violation Mode         : Shutdown
Aging Time             : 0 mins
Aging Type             : Absolute
SecureStatic Address Aging : Disabled
Maximum MAC Addresses  : 1
Total MAC Addresses    : 1
Configured MAC Addresses : 0
Sticky MAC Addresses   : 1
Last Source Address:Vlan : 0000.0001.001a:1
Security Violation Count : 0

```

Example 3: Displaying all Secure Addresses for the Entire Switch

This example shows how to display all secure MAC addresses configured on all switch interfaces:

```

Switch# show port-security address
Secure Mac Address Table
-----
Vlan    Mac Address      Type                Ports    Remaining Age
      (mins)
-----
1       0000.0001.0000   SecureConfigured   Fa3/1    15 (I)
1       0000.0001.0001   SecureConfigured   Fa3/1    14 (I)

```

```

1      0000.0001.1201      SecureSticky      Fa3/7      -
1      0000.0001.1300      SecureSticky      Fa3/8      -
1      0000.0001.1301      SecureSticky      Fa3/8      -
1      0000.0001.2000      SecureSticky      Po2        -
-----
Total Addresses in System (excluding one mac per port)      :8
Max Addresses limit in System (excluding one mac per port) :3072

```

Example 4: Displaying a Maximum Number of MAC Addresses on an Interface

This example shows how to display the maximum allowed number of secure MAC addresses and the current number of secure MAC addressees on Gigabit Ethernet interface 1/1:

```

Switch# show port-security interface g1/1 vlan
Default maximum: 22
VLAN  Maximum      Current
2          22          3
3          22          3
4          22          3
5          22          1
6          22          2

```

Example 5: Displaying Security Settings on an Interface for a VLAN Range

This example shows how to display the port security settings on Gigabit Ethernet interface 1/1 for VLANs 2 and 3:

```

Switch# show port-security interface g1/1 vlan 2-3
Default maximum: 22
VLAN  Maximum      Current
2          22          3
3          22          3

```

Example 6: Displaying Secured MAC Addresses and Aging Information on an Interface

This example shows how to display all secure MAC addresses configured on Gigabit Ethernet interface 1/1 with aging information for each address.

```

Switch# show port-security interface g1/1 address

          Secure Mac Address Table
-----
Vlan      Mac Address      Type      Ports      Remaining Age(mins)
----      -
2      0001.0001.0001      SecureConfigured      Gi1/1      -
2      0001.0001.0002      SecureSticky      Gi1/1      -
2      0001.0001.0003      SecureSticky      Gi1/1      -
3      0001.0001.0001      SecureConfigured      Gi1/1      -

Configuring Port Security with Other Features/Environments

The following topics are discussed:

- [DHCP and IP Source Guard, page 43-31](#)
- [802.1X Authentication, page 43-32](#)
- [Configuring Port Security in a Wireless Environment, page 43-32](#)
- [Configuring Port Security over Layer 2 EtherChannel, page 43-33](#)

DHCP and IP Source Guard

You might want to configure port security with DHCP and IP Source Guard to prevent IP spoofing by unsecured MAC addresses. IP Source Guard supports two levels of IP traffic filtering:

- Source IP address filtering
- Source IP and MAC address filtering

When used in source IP and MAC address filtering, IP Source Guard uses private ACLs to filter traffic based on the source IP address, and uses port security to filter traffic based on the source MAC address. So, port security must be enabled on the access port in this mode.

When both features are enabled, the following limitations apply:

- The DHCP packet is not subject to port security dynamic learning.
- If multiple IP clients are connected to a single access port, port security cannot enforce exact binding of source IP and MAC address for each client.

Let's say that clients reside on an access port with the following IP/MAC address:

- client1: MAC1 <---> IP1
- client2: MAC2 <---> IP2

Then, any combination of the source MAC and IP address traffic is allowed:

- MAC1 <---> IP1, valid
- MAC2 <---> IP2, valid
- MAC1 <---> IP2, invalid
- MAC2 <---> IP1, invalid

IP traffic with the correct source IP and MAC address binding will be permitted and port security will dynamically learn its MAC address. IP traffic with source addresses that are not in the binding will be treated as invalid packets and dropped by port security. To prevent a denial of service attack, you must configure port security rate limiting for the invalid source MAC address.

802.1X Authentication

You might want to configure port security with 802.1X authentication to prevent MAC spoofing. 802.1X is not supported on regular or private VLAN trunks. On access ports and PVLAN host or promiscuous ports, both port security and 802.1X can be configured simultaneously. When both are configured, hosts must be 802.1X authenticated before port security can secure the MAC address of the host. Both 802.1X and port security must approve of the host or a security violation will be triggered. The type of security violation will depend on which feature rejects the port: if the host is allowed by 802.1X (for example, because the port is in multi-host mode) but is disallowed by port security, the port-security violation action will be triggered. If the host is allowed by port security but rejected by 802.1X (for example, because the host is non-authorized on a single-host mode port) then the 802.1X security violation action will be triggered.

Note

802.1X, port-security and VVID can all be configured on the same port.

For more information on the interaction between 802.1X and Port Security, see “Using 802.1X with Port Security” on page 16.

Configuring Port Security in a Wireless Environment

If access points are connected to a secure port, do not configure a static MAC address for your users. A MAC address might move from one access point to another and might cause security violations if both the access points are connected on the same switch.

Figure 43-3 illustrates a typical topology of port security in a wireless environment.

Figure 43-3 Port Security in a Wireless Environment

Configuring Port Security over Layer 2 EtherChannel

Note

Supervisor Engine 6-E does not support this feature.

Port security can be enabled on an EtherChannel in either trunk or access mode. (Refer to the [“Configuring Port Security on Access Ports”](#) section on page 43-7 and the [“Configuring Port Security on Trunk Ports”](#) section on page 43-17 for configuration steps.) When you do this in trunking mode, the MAC address restrictions apply to the entire port-channel on a per VLAN basis.

In general, be aware of the following:

- Port security on Layer 2 EtherChannel works only on access mode or trunk mode and is independent of the configuration on any physical member ports.
- If at least one member port is secured, port security cannot be disabled on the channel interface; it is rejected by the CLI.
- A secure port cannot join a non-secure EtherChannel; it is rejected by the CLI.
- Port security over EtherChannel is supported in both PAgP and LACP modes. It does not apply to Layer 3 EtherChannels.

Guidelines and Restrictions

Follow these guidelines when configuring port security:

- After port security is configured on a port along with a "denying" PACL, the CPU will neither see any of the PACL packets denied from the given port nor learn the source MAC addresses from the denied packets. Therefore, the port security feature will not be aware of such packets.
- A secure port cannot be a destination port for the Switch Port Analyzer (SPAN).
- A secure port and a static MAC address configuration for an interface are mutually exclusive.

- When you enter a maximum secure address value for an interface, and the new value is greater than the previous value, the new value overwrites the previously configured value. If the new value is less than the previous value and the number of configured secure addresses on the interface exceeds the new value, the command is rejected.
- While configuring trunk port security on a trunk port, you do not need to account for the protocol packets (like CDP and BPDU) because they are not learned and secured.
- You cannot enable port security aging on sticky secure MAC addresses.
- To restrict MAC spoofing using port security, you must enable 802.1X authentication.
- You cannot configure port security on dynamic ports. You must change the mode to access before you enable port security.
- When port security is enabled on an EtherChannel, 802.1X cannot be enabled.
- A secure EtherChannel does not work in PVLAN mode.

CHAPTER 44

Configuring Control Plane Policing

This chapter contains information on how to protect your Catalyst 4000 family switch using control plane policing (CoPP). The information covered in this chapter is unique to the Catalyst 4500 series switches, and it supplements the network security information and procedures in [Chapter 47, “Configuring Network Security with ACLs.”](#) This information also supplements the network security information and procedures in these publications:

- *Cisco IOS Security Configuration Guide, Cisco IOS Release 12.4*, at this URL:
http://www.cisco.com/en/US/docs/ios/security/configuration/guide/12_4/sec_12_4_book.html
- *Cisco IOS Security Command Reference, Cisco IOS Release 12.4*, at this URL:
http://www.cisco.com/en/US/docs/ios/security/command/reference/sec_book.html

This chapter includes the following major sections:

- [Understanding How Control Plane Policing Works, page 44-2](#)
- [Caveats for Control Plane Policing, page 44-3](#)
- [CoPP Default Configuration, page 44-4](#)
- [Configuring CoPP, page 44-4](#)
- [CoPP Configuration Guidelines and Restrictions, page 44-8](#)
- [Monitoring CoPP, page 44-8](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, see the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the *Cisco Catalyst 4500 Command Reference*, you can locate it in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding How Control Plane Policing Works

The control plane policing (CoPP) feature increases security on the Catalyst 4000 family switch by protecting the CPU from unnecessary or DoS traffic and giving priority to important control plane and management traffic. The classification TCAM and QoS policers provide CoPP hardware support.

Note

CoPP is supported on the following: Classic Series supervisor engines and switches beginning with Cisco IOS Release 12.2(31)SG; Supervisor 6-E and Catalyst 4900M beginning with Cisco IOS Release 12.2(50)SG; and Supervisor 6L-E in Cisco IOS Release 12.2(52)X0.

The traffic managed by the CPU is divided into three functional components or *planes*:

- Data plane
- Management plane
- Control plane

You can use CoPP to protect most of the CPU bound traffic and ensure routing stability, reachability and packet delivery. Most importantly, CoPP is often used to protect the CPU from the DoS attack. There is a list of pre-defined ACLs matching a selected set of Layer 2 and Layer 3 control plane packets. You can define your preferred policing parameters to each of these control packets but you cannot modify the matching criteria of these pre-defined ACLs. Following is the list of pre-defined ACLs:

Pre-defined Named ACL	Description
system-cpp-dot1x	MAC DA = 0180.C200.0003
system-cpp-ldp	MAC DA=0180.c200.000E
system-cpp-mcast-cfm	MAC DA=0100.0ccc.ccc0 - 0100.0ccc.ccc7
system-cpp-ucast-cfm	MAC DA=0100.0ccc.ccc0
system-cpp-bpdu-range	MAC DA = 0180.C200.0000 - 0180.C200.000F
system-cpp-cdp	MAC DA = 0100.0CCC.CCCC (UDLD/DTP/VTP/Pagp)
system-cpp-sstp	MAC DA = 0100.0CCC.CCCD
system-cpp-cgmp	MAC DA = 01-00-0C-DD-DD-DD
system-cpp-hsrpv2	IP Protocol = UDP, IPDA = 224.0.0.102
system-cpp-ospf	IP Protocol = OSPF, IPDA matches 224.0.0.0/24
system-cpp-igmp	IP Protocol = IGMP, IPDA matches 224.0.0.0/3
system-cpp-pim	IP Protocol = PIM, IPDA matches 224.0.0.0/24
system-cpp-all-systems-on-subnet	IPDA = 224.0.0.1
system-cpp-all-routers-on-subnet	IPDA = 224.0.0.2
system-cpp-ripv2	IPDA = 224.0.0.9
system-cpp-ip-mcast-linklocal	IP DA = 224.0.0.0/24
system-cpp-dhcp-cs	IP Protocol = UDP, L4SrcPort = 68, L4DstPort = 67
system-cpp-dhcp-sc	IP Protocol = UDP, L4SrcPort = 67, L4DstPort = 68
system-cpp-dhcp-ss	IP Protocol = UDP, L4SrcPort = 67, L4DstPort = 67

For the Data Plane and Management Plane traffic, you can define your own ACLs to match the traffic class that you want to police.

CoPP uses MQC to define traffic classification criteria and to specify the configurable policy actions for the classified traffic. MQC uses class maps to define packets for a particular traffic class. After you have classified the traffic, you can create policy maps to enforce policy actions for the identified traffic. The control-plane global configuration command allows the CoPP service policy to be directly attached to the control plane.

The only policy-map that you can attach to the control-plane is *system-cpp-policy*. It must contain the pre-defined class-maps in the pre-defined order at the beginning of the policy map. The best way to create the system-cpp-policy policy-map is through the global macro *system-cpp*.

The system-cpp-policy contains the pre-defined class maps for the control plane traffic. The names of all system defined CoPP class maps and their matching ACLs contain the prefix “system-cpp-”. By default, no action is specified for each traffic class. You can define your own class maps matching CPU bound data plane and management plane traffic. You can add your defined class maps to the system-cpp-policy policy-map.

Caveats for Control Plane Policing

- Port Security might cancel its effect for non-IP control packets.

Although Source MAC Learning on the Catalyst 4500 series switch is performed in software, learning of source MAC addresses from control packets (e.g.: IEEE BPDU/CDP/SSDP BPDU/GARP/etc) is disallowed. Once you configure Port Security on a port where you expect to receive a high rate of such (possibly rogue) control packets, the system generates a copy of the packet to the CPU (until the source address is learned, how Port Security is implemented), rather than forward it.

The current architecture of the Catalyst 4500 switching engine does not allow you to apply policing on the copy of packets sent to the CPU; policing can only be applied on packets that are forwarded to CPU. So, copies of packets are sent to the CPU at the rate control packets arrive and Port Security is not triggered because learning from control packets is disallowed. Furthermore, policing will not be applied because the packet copy, not the original, is sent to the CPU.

- As of Cisco IOS Release 12.2(31)SGA1, the GARP class is no longer part of the CoPP. (Due to the fix associated with CSCsg08775, even though the system-cpp-garp-range entry still appears in the CPP configuration, it is merely idling and will be removed in future releases.) Henceforward, you can manipulate GARP traffic with user ACLs and QoS. If you want to protect CPU against GARP packets, you also can “police down” GARP packets using CoPP after you define the user class for the GARP packet. (This is now possible because GARP is no longer part of the Static CAM area.)

Due to tight integration of CPP implementation between IOS and platform code, an error message will always appear during boot-up and CPP will not be applied when downgrading IOS software from a version where this caveat is integrated to a previous release (where this fix is not present):

```
%Invalid control plane policy-map; Please unconfigure policy-map attached to
control-plane, and associated class-maps, and execute config command "macro global
apply system-cpp" error: failed to install policy map system-cpp-policy
```

As a workaround do the following:

1. Back-up your configuration when performing software downgrading.
2. Remove all CPP entries manually from the config and then re-apply the **macro global apply system-cpp** command.

There should be no problem associated with this caveat while upgrading between releases.

- ARP policing is not supported on either Classic series supervisor engines or fixed configuration switches. It is, however, supported on the Supervisor Engine 6-E and the Catalyst 4900M switch.
- You cannot remove a macro populated class from the list of classes within a control plane policy.
- Prior to Cisco IOS Release 12.2(50)SG, on switches with Supervisor Engines V, V-10GE and earlier, class-map hit statistics on a user defined class-map in system-cpp-policy are not updated properly. With Cisco IOS Release 12.2(50)SG, the hit statistics for user-defined class-map in the system-cpp-policy are updated properly. However, in per-vlan capture mode, the hit stats for system defined in system-cpp-policy are not updated. In the global capture mode, hit stats for all class-maps (user-defined and system-defined) in the system-cpp-policy are updated properly.

CoPP Default Configuration

CoPP is disabled by default.

Configuring CoPP

This section includes the following tasks:

- [Configure CoPP for Control Plane Traffic, page 44-4](#)
- [Configure CoPP for Data Plane and Management Plane Traffic, page 44-6](#)

Configure CoPP for Control Plane Traffic

To configure CoPP for Control Plane traffic, perform this task:

	Command	Purpose
Step 1	Switch# config terminal	Enters global configuration mode.
Step 2	Switch(config)# qos	(Optional) Enables QoS globally.
Step 3	Switch(config)# macro global apply system-cpp	(Optional) Creates the system-cpp-policy policy-map and attaches it to the control-plane.

	Command	Purpose
Step 4	<pre>Switch(config)# policy-map system-cpp-policy Switch(config-pmap)# class {system-cpp-dot1x system-cpp-bpdu-range system-cpp-cdp service system-cpp-sstp system-cpp-cgmp system-cpp-ospf system-cpp-igmp system-cpp-pim system-cpp-all-systems-on-subnet system-cpp-all-routers-on-subnet system-cpp-ripv2 system-cpp-hsrpv2 system-cpp-ip-mcast-linklocal system-cpp-dhcp-cs system-cpp-dhcp-sc system-cpp-dhcp-ss} Switch(config-pmap-c)# police [aggregate name] rate burst [conform-action {drop transmit}] [{exceed-action {drop transmit}}}]</pre>	Associates actions to one or multiple system defined control plane traffic in the service policy map. Repeat this step if necessary.
Step 5	<pre>Switch# show policy-map system-cpp-policy</pre>	(Optional) Verifies the configuration

The following example shows how to police CDP packets:

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos
Switch(config)# macro global apply system-cpp
Switch(config)# policy-map system-cpp-policy
Switch(config-pmap)# class system-cpp-cdp
Switch(config-pmap-c)# police 32000 1000 conform-action transmit exceed-action drop
Switch(config-pmap-c)# end
Switch# show policy-map system-cpp-policy
Policy Map system-cpp-policy
Class system-cpp-dot1x
Class system-cpp-bpdu-range
* Class system-cpp-cdp
  police 32000 bps 1000 byte conform-action transmit exceed-action drop *
Class system-cpp-sstp
Class system-cpp-cgmp
Class system-cpp-ospf
Class system-cpp-hsrpv2
Class system-cpp-igmp
Class system-cpp-pim
Class system-cpp-all-systems-on-subnet
Class system-cpp-all-routers-on-subnet

Class system-cpp-dhcp-cs
Class system-cpp-dhcp-sc
Class system-cpp-dhcp-ss
Switch#
```

Configure CoPP for Data Plane and Management Plane Traffic

To configure CoPP for Data Plane and Management Plane traffic, perform this task:

	Command	Purpose
Step 1	Switch(config)# qos	(Optional) Enables QoS globally.
Step 2	Switch(config)# macro global apply system-cpp	(Optional) Attaches the system-cpp-policy policy-map to the control-plane.
Step 3	<p>Switch(config)# {ip mac} access-list extended {access-list-name}</p> <p>For an ip access list, issue Switch(config-ext-nacl)#{permit deny} {protocol} source {source-wildcard} destination {destination-wildcard}</p> <p>For a mac access list, issue Switch(config-ext-macl)#{permit deny} source {source-wildcard} destination {destination-wildcard} [protocol-family]</p> <p>OR</p> <p>Switch(config)# access-list {access-list-name} {permit deny} {type-code wild-mask address mask}</p>	<p>Defines ACLs to match traffic:</p> <ul style="list-style-type: none"> permit - sets the conditions under which a packet passes a named ACL deny - sets the conditions under which a packet does not pass a name ACL <p>Note You must configure ACLs in most cases to identify the important or unimportant traffic.</p> <ul style="list-style-type: none"> type-code - 16-bit hexadecimal number written with a leading 0x; for example, 0x6000. Specify either a Link Service Access Point (LSAP) type code for 802-encapsulated packets or a SNAP type code for SNAP-encapsulated packets. (LSAP, sometimes called SAP, refers to the type codes found in the DSAP and SSAP fields of the 802 header.) wild-mask - 16-bit hexadecimal number whose ones bits correspond to bits in the type-code argument. The wild-mask indicates which bits in the type-code argument should be ignored when making a comparison. (A mask for a DSAP/SSAP pair should always be 0x0101 because these two bits are used for purposes other than identifying the SAP code.) address - 48-bit Token Ring address written as a dotted triple of four-digit hexadecimal numbers. This field is used for filtering by vendor code. mask - 48-bit Token Ring address written as a dotted triple of four-digit hexadecimal numbers. The ones bits in mask are the bits to be ignored in address. This field is used for filtering by vendor code.

	Command	Purpose
Step 4	Switch(config)# class-map { <i>traffic-class-name</i> } Switch(config-cmap)# match access-group { <i>access-list-number</i> <i>name</i> { <i>access-list-name</i> }}	Defines the packet classification criteria. Use the match statements to identify the traffic associated with the class.
Step 5	Switch(config-cmap)# exit	Returns to global configuration mode.
Step 6	Switch(config)# policy-map system-cpp-policy Switch(config-pmap)# class < <i>class-map-name</i> > Switch(config-pmap-c)# police [<i>aggregate name</i>] <i>rate burst</i> [conform-action { <i>drop</i> <i>transmit</i> }] [exceed-action { <i>drop</i> <i>transmit</i> }]	Adds the traffic classes to the CoPP policy-map. Uses the police statement to associate actions to the traffic class.
Step 7	Switch(config)# end	Returns to privileged EXEC mode.
Step 8	Switch# show policy-map system-cpp-policy	Verifies your entries.

The following example shows how to configure trusted hosts with source addresses 10.1.1.1 and 10.1.1.2 to forward Telnet packets to the control plane without constraint, while allowing all remaining Telnet packets to be policed at the specific rate (this example assumes the global qos is enabled and the system-cpp-policy policy-map has been created):

```
Switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# qos
Switch(config)# macro global apply system-cpp

! Allow 10.1.1.1 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.1 any eq telnet

! Allow 10.1.1.2 trusted host traffic.
Switch(config)# access-list 140 deny tcp host 10.1.1.2 any eq telnet

! Rate limit all other Telnet traffic.
Switch(config)# access-list 140 permit tcp any any eq telnet

! Define class-map "telnet-class."
Switch(config)# class-map telnet-class
Switch(config-cmap)# match access-group 140
Switch(config-cmap)# exit

! Add the class-map "telnet-class" to "system-cpp-policy" and define ! the proper action
Switch(config)# policy-map system-cpp-policy
Switch(config-pmap)# class telnet-class
Switch(config-pmap-c)# police 80000 1000 conform transmit exceed drop
Switch(config-pmap-c)# exit
Switch(config-pmap)# exit

! Verify the above configuration steps
Switch# show policy-map system-cpp-policy
Policy Map system-cpp-policy
  Class system-cpp-dot1x
  Class system-cpp-bpdu-range
  Class system-cpp-cdp
    police 32000 bps 1000 byte conform-action transmit exceed-action drop
  Class system-cpp-sstp
```

```

Class system-cpp-cgmp

Class system-cpp-hsrpv2
Class system-cpp-igmp
Class system-cpp-pim
Class system-cpp-all-systems-on-subnet
Class system-cpp-all-routers-on-subnet
Class system-cpp-ripv2
Class system-cpp-ip-mcast-linklocal
Class system-cpp-dhcp-cs
Class system-cpp-dhcp-sc
Class system-cpp-dhcp-ss
*   Class telnet-class
    police 8000 bps 1000 byte conform-action drop exceed-action drop

```

CoPP Configuration Guidelines and Restrictions

When configuring CoPP, follow these guidelines and restrictions:

- Only ingress CoPP is supported. So only **input** keyword is supported in control-plane related CLIs.
- Use the system defined class maps for policing control plane traffic.
- Control plane traffic can be policed only using CoPP. Traffic cannot be policed at the input interface or VLAN even though a policy-map containing the control-plane traffic is accepted when the policy-map is attached to an interface or VLAN.
- System-defined class maps cannot be used in policy-maps for regular QoS.
- Use ACLs and class-maps to identify data plane and management plane traffic that are handled by CPU. User-defined class maps should be added to the **system-cpp-policy** policy-map for CoPP.
- The policy-map named **system-cpp-policy** is dedicated for CoPP.
- The default **system-cpp-policy** map does not define actions for the system-defined class maps, which means **no policing**.
- The only action supported in **system-cpp-policy** policy-map is **police**.
- Do not use the **log** keyword in the CoPP policy ACLs.
- Both MAC and IP ACLs can be used to define data plane and management plane traffic classes. But if a packet also matches a pre-defined ACL for the control plane traffic, the **police** action (or no police action) of the control plane class will be taken as the control plane classes appear above user-defined classes in the service policy. This is the same MQC semantic.
- The exceeding action **policed-dscp-transmit** is not supported for CoPP.
- CoPP is not enabled unless the global QoS is enabled and **police** action is specified.

Monitoring CoPP

You can enter the **show policy-map control-plane** command for developing site-specific policies, monitoring statistics for the control plane policy, and troubleshooting CoPP. This command displays dynamic information about the actual policy applied including rate information and the number of bytes (and packets) that conformed or exceeded the configured policies both in hardware and in software.

The output of the **show policy-map control-plane** command is as follows:

```
Switch# show policy-map control-plane
```

Control Plane

Service-policy input: system-cpp-policy

```

Class-map: system-cpp-dot1x (match-all)
  0 packets
  Match: access-group name system-cpp-dot1x

Class-map: system-cpp-bpdu-range (match-all)
  0 packets
  Match: access-group name system-cpp-bpdu-range

```

```

*   Class-map: system-cpp-cdp (match-all)
    160 packets
    Match: access-group name system-cpp-cdp
**  police: Per-interface
    Conform: 22960 bytes Exceed: 0 bytes
*

```

```

Class-map: system-cpp-sstp (match-all)
  0 packets
  Match: access-group name system-cpp-sstp

```

```

Class-map: system-cpp-cgmp (match-all)
  0 packets
  Match: access-group name system-cpp-cgmp

```

```

Class-map: system-cpp-hsrpv2 (match-all)
  0 packets
  Match: access-group name system-cpp-hsrpv2

```

```

Class-map: system-cpp-ospf (match-all)
  0 packets
  Match: access-group name system-cpp-ospf

```

```

Class-map: system-cpp-igmp (match-all)
  0 packets
  Match: access-group name system-cpp-igmp

```

```

Class-map: system-cpp-pim (match-all)
  0 packets
  Match: access-group name system-cpp-pim

```

```

Class-map: system-cpp-all-systems-on-subnet (match-all)
  0 packets
  Match: access-group name system-cpp-all-systems-on-subnet

```

```

Class-map: system-cpp-all-routers-on-subnet (match-all)
  0 packets
  Match: access-group name system-cpp-all-routers-on-subnet

```

```

Class-map: system-cpp-ripv2 (match-all)
  0 packets
  Match: access-group name system-cpp-ripv2

```

```

Class-map: system-cpp-ip-mcast-linklocal (match-all)
  0 packets
  Match: access-group name system-cpp-ip-mcast-linklocal

```

```

Class-map: system-cpp-dhcp-cs (match-all)
  83 packets
  Match: access-group name system-cpp-dhcp-cs

```

```

Class-map: system-cpp-dhcp-sc (match-all)

```

```

    0 packets
    Match: access-group name system-cpp-dhcp-sc

Class-map: system-cpp-dhcp-ss (match-all)
    0 packets
    Match: access-group name system-cpp-dhcp-ss

*   Class-map: telnet-class (match-all)
    0 packets
    Match: access-group 140
**   police: Per-interface
      Conform: 0 bytes Exceed: 0 bytes*

Class-map: class-default (match-any)
    0 packets
    Match: any
    0 packets
Switch#

```

To clear the counters on the control-plane, enter the **clear control-plane *** command:

```

Switch# clear control-plane *
Switch#

```

To display all the CoPP access list information, enter the **show access-lists** command:

```

Switch# show access-lists
Extended IP access list system-cpp-all-routers-on-subnet
10 permit ip any host 224.0.0.2
Extended IP access list system-cpp-all-systems-on-subnet
10 permit ip any host 224.0.0.1
Extended IP access list system-cpp-dhcp-cs
10 permit udp any eq bootpc any eq bootps Extended IP access list
system-cpp-dhcp-sc
10 permit udp any eq bootps any eq bootpc Extended IP access list
system-cpp-dhcp-ss
10 permit udp any eq bootps any eq bootps Extended IP access list
system-cpp-igmp
10 permit igmp any 224.0.0.0 31.255.255.255 Extended IP access list
system-cpp-ip-mcast-linklocal
10 permit ip any 224.0.0.0 0.0.0.255 Extended IP access list
system-cpp-ospf
10 permit ospf any 224.0.0.0 0.0.0.255 Extended IP access list
system-cpp-pim
10 permit pim any 224.0.0.0 0.0.0.255 Extended IP access list
system-cpp-ripv2
10 permit ip any host 224.0.0.9
Extended MAC access list system-cpp-bpdu-range
permit any 0180.c200.0000 0000.0000.000f Extended MAC access list
system-cpp-cdp
permit any host 0100.0ccc.cccc
Extended MAC access list system-cpp-cgmp
permit any host 0100.0cdd.dddd
Extended MAC access list system-cpp-dot1x
permit any host 0180.c200.0003
system-cpp-sstp
permit any host 0100.0ccc.cccd

```

To display one CoPP access list, enter the **show access-lists system-cpp-cdp** command:

```

Switch# show access-list system-cpp-cdp
Extended MAC access list system-cpp-cdp
permit any host 0100.0ccc.cccc
Switch#

```

CHAPTER 45

Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts

This chapter describes how to configure Dynamic Host Configuration Protocol (DHCP) snooping, IP Source Guard, and IPSG for Static Hosts on Catalyst 4500 series switches. It provides guidelines, procedures, and configuration examples.

This chapter consists of the following major sections:

- [Overview of DHCP Snooping, page 45-1](#)
- [Configuring DHCP Snooping, page 45-6](#)
- [Displaying DHCP Snooping Information, page 45-18](#)
- [Overview of IP Source Guard, page 45-19](#)
- [Configuring IP Source Guard, page 45-20](#)
- [Displaying IP Source Binding Information, page 45-23](#)
- [Configuring IP Source Guard for Static Hosts, page 45-24](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of DHCP Snooping

DHCP snooping is a DHCP security feature that provides security by filtering untrusted DHCP messages and by building and maintaining a DHCP snooping binding table. An untrusted message is a message that is received from outside the network or firewall and that can cause traffic attacks within your network.

The DHCP snooping binding table contains the MAC address, IP address, lease time, binding type, VLAN number, and interface information that corresponds to the local untrusted interfaces of a switch; it does not contain information regarding hosts interconnected with a trusted interface. An untrusted interface is an interface that is configured to receive messages from outside the network or firewall. A trusted interface is an interface that is configured to receive only messages from within the network.

DHCP snooping acts like a firewall between untrusted hosts and DHCP servers. It also gives you a way to differentiate between untrusted interfaces connected to the end-user and trusted interfaces connected to the DHCP server or another switch.

**Note**

In order to enable DHCP snooping on a VLAN, you must enable DHCP snooping on the switch.

You can configure DHCP snooping for switches and VLANs. When you enable DHCP snooping on a switch, the interface acts as a Layer 2 bridge, intercepting and safeguarding DHCP messages going to a Layer 2 VLAN. When you enable DHCP snooping on a VLAN, the switch acts as a Layer 2 bridge within a VLAN domain.

Topics include:

- [Trusted and Untrusted Sources, page 45-2](#)
- [Overview of the DHCP Snooping Database Agent, page 45-2](#)
- [Option-82 Data Insertion, page 45-4](#)

Trusted and Untrusted Sources

The DHCP snooping feature determines whether traffic sources are trusted or untrusted. An untrusted source may initiate traffic attacks or other hostile actions. To prevent such attacks, the DHCP snooping feature filters messages and rate-limits traffic from untrusted sources.

In an enterprise network, devices under your administrative control are trusted sources. These devices include the switches, routers and servers in your network. Any device beyond the firewall or outside your network is an untrusted source. Host ports are generally treated as untrusted sources.

In a service provider environment, any device that is not in the service provider network is an untrusted source (such as a customer switch). Host ports are untrusted sources.

In the Catalyst 4500 series switch, you indicate that a source is trusted by configuring the trust state of its connecting interface.

The default trust state of all interfaces is untrusted. You must configure DHCP server interfaces as trusted. You can also configure other interfaces as trusted if they connect to devices (such as switches or routers) inside your network. You usually do not configure host port interfaces as trusted.

**Note**

For DHCP snooping to function properly, all DHCP servers must be connected to the switch through trusted interfaces, as untrusted DHCP messages will be forwarded only to trusted interfaces.

Overview of the DHCP Snooping Database Agent

To retain the bindings across switch reloads, you must use the DHCP snooping database agent. Without this agent, the bindings established by DHCP snooping are lost upon switch reload. Connectivity is lost as well.

The mechanism for the database agent stores the bindings in a file at a configured location. Upon reload, the switch reads the file to build the database for the bindings. The switch keeps the file current by writing to the file as the database changes.

The format of the file that contains the bindings is as follows:

```
<initial-checksum>
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
<entry-1> <checksum-1>
<entry-2> <checksum-1-2>
...
...
<entry-n> <checksum-1-2-...-n>
END
```

Each entry in the file is tagged with a checksum that is used to validate the entries whenever the file is read. The <initial-checksum> entry on the first line helps distinguish entries associated with the latest write from entries that are associated with a previous write.

This is a sample bindings file:

```
3ebe1518
TYPE DHCP-SNOOPING
VERSION 1
BEGIN
1.1.1.1 512 0001.0001.0005 3EBE2881 Gi1/1 e5e1e733
1.1.1.1 512 0001.0001.0002 3EBE2881 Gi1/1 4b3486ec
1.1.1.1 1536 0001.0001.0004 3EBE2881 Gi1/1 f0e02872
1.1.1.1 1024 0001.0001.0003 3EBE2881 Gi1/1 ac41adf9
1.1.1.1 1 0001.0001.0001 3EBE2881 Gi1/1 34b3273e
END
```

Each entry holds an IP address, VLAN, MAC address, lease time (in hex), and the interface associated with a binding. At the end of each entry is a checksum that accounts for all the bytes from the start of the file through all the bytes associated with the entry. Each entry consists of 72 bytes of data, followed by a space, followed by a checksum.

Upon bootup, when the calculated checksum equals the stored checksum, a switch reads entries from the file and adds the bindings to the DHCP snooping database. When the calculated checksum does not equal the stored checksum, the entry read from the file is ignored and so are all the entries following the failed entry. The switch also ignores all those entries from the file whose lease time has expired. (This situation is possible because the lease time might indicate an expired time.) An entry from the file is also ignored if the interface referred to in the entry, no longer exists on the system or if it is a router port or a DHCP snooping-trusted interface.

When a switch learns of new bindings or when it loses some bindings, the switch writes the modified set of entries from the snooping database to the file. The writes are performed with a configurable delay to batch as many changes as possible before the actual write happens. Associated with each transfer is a timeout after which a transfer is aborted if it is not completed. These timers are referred to as the write delay and abort timeout.

Option-82 Data Insertion

In residential, metropolitan Ethernet-access environments, DHCP can centrally manage the IP address assignments for a large number of subscribers. When the DHCP option-82 feature is enabled on the switch, a subscriber device is identified by the switch port through which it connects to the network (in addition to its MAC address). Multiple hosts on the subscriber LAN can be connected to the same port on the access switch and are uniquely identified.

Note

The DHCP option-82 feature is supported only when DHCP snooping is globally enabled and on the VLANs to which subscriber devices using this feature are assigned.

Figure 45-1 is an example of a metropolitan Ethernet network in which a centralized DHCP server assigns IP addresses to subscribers connected to the switch at the access layer. Because the DHCP clients and their associated DHCP server do not reside on the same IP network or subnet, a DHCP relay agent (the Catalyst switch) is configured with a helper address to enable broadcast forwarding and to transfer DHCP messages between the clients and the server.

Figure 45-1 DHCP Relay Agent in a Metropolitan Ethernet Network

When you enable the DHCP snooping information option 82 on the switch, this sequence of events occurs:

- The host (DHCP client) generates a DHCP request and broadcasts it on the network.
- When the switch receives the DHCP request, it adds the option-82 information in the packet. By default, the remote-ID suboption is the switch MAC address, and the circuit-ID suboption is the port identifier, **vlan-mod-port**, from which the packet is received. Beginning with Cisco IOS Release 12.2(40)SG, you can configure the remote ID and circuit ID. For information on configuring these suboptions, see the [“Enabling DHCP Snooping and Option 82” section on page 45-10](#).
- If the IP address of the relay agent is configured, the switch adds this IP address in the DHCP packet.
- The switch forwards the DHCP request that includes the option-82 field to the DHCP server.
- The DHCP server receives the packet. If the server is option-82-capable, it can use the remote ID, the circuit ID, or both to assign IP addresses and implement policies, such as restricting the number of IP addresses that can be assigned to a single remote ID or circuit ID. Then the DHCP server echoes the option-82 field in the DHCP reply.

- The DHCP server unicasts the reply to the switch if the request was relayed to the server by the switch. The switch verifies that it originally inserted the option-82 data by inspecting the remote ID and possibly the circuit ID fields. The switch removes the option-82 field and forwards the packet to the switch port that connects to the DHCP client that sent the DHCP request.

In the default suboption configuration, when the described sequence of events occurs, the values in these fields in [Figure 45-2](#) do not change:

- Circuit-ID suboption fields
 - Suboption type
 - Length of the suboption type
 - Circuit-ID type
 - Length of the circuit-ID type
- Remote-ID suboption fields
 - Suboption type
 - Length of the suboption type
 - Remote-ID type
 - Length of the remote-ID type

[Figure 45-2](#) shows the packet formats for the remote-ID suboption and the circuit-ID suboption when the default suboption configuration is used. For the circuit-ID suboption, the module number corresponds to the switch module number. The switch uses the packet formats when you globally enable DHCP snooping and enter the **ip dhcp snooping information option** global configuration command.

Figure 45-2 Suboption Packet Formats

Circuit ID Suboption Frame Format

Remote ID Suboption Frame Format

116300

Figure 45-3 shows the packet formats for user-configured remote-ID and circuit-ID suboptions. The switch uses these packet formats when DHCP snooping is globally enabled and when the **ip dhcp snooping information option format remote-id** global configuration command and the **ip dhcp snooping vlan information option format-type circuit-id string** interface configuration command are entered.

The values for these fields in the packets change from the default values when you configure the remote-ID and circuit-ID suboptions:

- Circuit-ID suboption fields
 - The circuit-ID type is 1.
 - The length values are variable, depending on the length of the string that you configure.
- Remote-ID suboption fields
 - The remote-ID type is 1.
 - The length values are variable, depending on the length of the string that you configure.

Figure 45-3 User-Configured Suboption Packet Formats

Circuit ID Suboption Frame Format (for user-configured string):

Remote ID Suboption Frame Format (for user-configured string):

Configuring DHCP Snooping

When you configure DHCP snooping on your switch, you are enabling the switch to differentiate untrusted interfaces from trusted interfaces. You must enable DHCP snooping globally before you can use DHCP snooping on a VLAN. You can enable DHCP snooping independently from other DHCP features.

These sections describe how to configure DHCP snooping:

- [Default Configuration for DHCP Snooping, page 45-7](#)
- [Enabling DHCP Snooping, page 45-7](#)

- [Enabling DHCP Snooping on the Aggregation Switch, page 45-9](#)
- [Enabling DHCP Snooping and Option 82, page 45-10](#)
- [Enabling DHCP Snooping on Private VLAN, page 45-11](#)
- [Configuring DHCP Snooping on Private VLAN, page 45-12](#)
- [Configuring DHCP Snooping with an Ethernet Channel Group, page 45-12](#)
- [Enabling the DHCP Snooping Database Agent, page 45-12](#)
- [Limiting the Rate of Incoming DHCP Packets, page 45-13](#)
- [Configuration Examples for the Database Agent, page 45-15](#)

**Note**

For DHCP server configuration information, refer to “Configuring DHCP” in the *Cisco IOS IP and IP Routing Configuration Guide* at:

http://www.cisco.com/en/US/docs/ios/12_2/ip/configuration/guide/1cfdhcp.html

Default Configuration for DHCP Snooping

DHCP snooping is disabled by default. [Table 45-1](#) shows all the default configuration values for each DHCP snooping option.

Table 45-1 Default Configuration Values for DHCP Snooping

Option	Default Value/State
DHCP snooping	Disabled
DHCP snooping information option	Enabled
DHCP snooping information option allow-untrusted	Disabled
DHCP snooping limit rate	Infinite (functions as if rate limiting were disabled)
DHCP snooping trust	Untrusted
DHCP snooping vlan	Disabled

If you want to change the default configuration values, see the “[Enabling DHCP Snooping](#)” section.

Enabling DHCP Snooping

**Note**

When DHCP snooping is enabled globally, DHCP requests are dropped until the ports are configured. Consequently, you should probably configure this feature during a maintenance window and not during production.

To enable DHCP snooping, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip dhcp snooping	Enables DHCP snooping globally. You can use the no keyword to disable DHCP snooping.
Step 2	Switch(config)# ip dhcp snooping vlan <i>number</i> [<i>number</i>] vlan { <i>vlan range</i> }	Enables DHCP snooping on your VLAN or VLAN range.
Step 3	Switch(config)# errdisable recovery { cause dhcp-rate-limit interval <i>interval</i> }	(Optional) Configures the amount of time required for recovery from a specified error disable cause.
Step 4	Switch(config)# errdisable detect cause dhcp-rate-limit { action shutdown vlan }	(Optional) Enables per-VLAN error-disable detection. Note By default this command is enabled, and when a violation occurs the interface is shutdown.
Step 5	Switch(config-if)# ip dhcp snooping trust	Configures the interface as trusted or untrusted. You can use the no keyword to configure an interface to receive messages from an untrusted client.
Step 6	Switch(config-if)# ip dhcp snooping limit rate <i>rate</i>	Configures the number of DHCP packets per second (pps) that an interface can receive. ¹
Step 7	Switch(config)# end	Exits configuration mode.
Step 8	Switch# show ip dhcp snooping	Verifies the configuration.

1. Cisco recommends not configuring the untrusted interface rate limit to more than 100 packets per second. The recommended rate limit for each untrusted client is 15 packets per second. Normally, the rate limit applies to untrusted interfaces. If you want to set up rate limiting for trusted interfaces, keep in mind that trusted interfaces aggregate all DHCP traffic in the switch, and you will need to adjust the rate limit to a higher value. You should fine tune this threshold depending on the network configuration. The CPU should not receive DHCP packets at a sustained rate of more than 1,000 packets per second.

You can configure DHCP snooping for a single VLAN or a range of VLANs. To configure a single VLAN, enter a single VLAN number. To configure a range of VLANs, enter a beginning and an ending VLAN number or a dash and range of VLANs.

The number of incoming DHCP packets is rate-limited to prevent a denial-of-service attack. When the rate of incoming DHCP packets exceeds the configured limit, the switch places the port in the error-disabled state. To prevent the port from shutting down, you can use the **errdisable detect cause dhcp-rate-limit action shutdown vlan** global configuration command to shut down just the offending VLAN on the port where the violation occurred.

When a secure port is in the error-disabled state, you can bring it out of this state automatically by configuring the **errdisable recovery cause dhcp-rate-limit** global configuration command or you can manually reenble it by entering the **shutdown** and **no shut down** interface configuration commands. If a port is in per-VLAN errdisable mode, you can also use **clear errdisable interface name vlan range** command to re-enable the VLAN on the port.

This example shows how to enable DHCP Snooping on Vlan 500 through 555:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 500 555
Switch(config)# ip dhcp snooping information option format remote-id string switch123
Switch(config)# interface GigabitEthernet 5/1
Switch(config-if)# ip dhcp snooping trust
Switch(config-if)# ip dhcp snooping limit rate 100
```

```

Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id
string customer-555
Switch(config-if)# interface FastEthernet 2/1
Switch(config-if)# ip dhcp snooping vlan 555 information option format-type circuit-id
string customer-500
Switch(config)# end
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled
DHCP snooping is configured on following VLANs:
500,555
DHCP snooping is operational on following VLANs:
500,555
DHCP snooping is configured on the following L3 Interfaces:

Insertion of option 82 is enabled
    circuit-id default format: vlan-mod-port
    remote-id: switch123 (string)
Option 82 on untrusted port is not allowed Verification of hwaddr field is enabled DHCP
snooping trust/rate is configured on the following Interfaces:

Interface                Trusted      Rate limit (pps)
-----
FastEthernet5/1          yes         100
    Custom circuit-ids:
        VLAN 555: customer-555
FastEthernet2/1          no          unlimited
    Custom circuit-ids:
        VLAN 500: customer-500

Switch#

```

The following configuration describes the DHCP snooping configuration steps if routing is defined on another Catalyst switch (for example, a Catalyst 6500 series switch):

```

// Trust the uplink gigabit Ethernet trunk port

interface range GigabitEthernet 1/1 - 2
switchport mode trunk
switchport trunk encapsulation dot1q
ip dhcp snooping trust

!

interface VLAN 14
ip address 10.33.234.1 255.255.254.0
ip helper-address 10.5.1.2

```

Note

If you are enabling trunking on uplink gigabit interfaces, and the above routing configuration is defined on a Catalyst 6500 series switch, you must configure the “trust” relationship with downstream DHCP Snooping (on a Catalyst 4500 series switch) which adds Option 82. On a Catalyst 6500 series switch, this task is accomplished with **ip dhcp relay information trusted** VLAN configuration command.

Enabling DHCP Snooping on the Aggregation Switch

To enable DHCP Snooping on an aggregation switch, configure the interface connecting to a downstream switch as a snooping untrusted port. If the downstream switch (or a device such as a DSLAM in the path between the aggregation switch and the DHCP clients) adds DHCP information option 82 to the DHCP packets, the DHCP packets would be dropped on arriving on a snooping untrusted

port. Configuring the **ip dhcp snooping information option allow-untrusted** global configuration command on the aggregation switch would allow the aggregation switch to accept DHCP requests with option 82 information from any snooping untrusted port.

Enabling DHCP Snooping and Option 82

To enable DHCP snooping and Option 82 on the switch, perform the following steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip dhcp snooping	Enables DHCP snooping globally.
Step 3	Switch(config)# ip dhcp snooping vlan <i>vlan-range</i>	Enables DHCP snooping on a VLAN or range of VLANs. The range is 1 to 4094. You can enter a single VLAN ID identified by VLAN ID number, a series of VLAN IDs separated by commas, a range of VLAN IDs separated by hyphens, or a range of VLAN IDs separated by entering the starting and ending VLAN IDs separated by a space.
Step 4	Switch(config)# ip dhcp snooping information option	Enables the switch to insert and remove DHCP relay information (option-82 field) in forwarded DHCP request messages to the DHCP server. This is the default setting.
Step 5	Switch(config)# ip dhcp snooping information option format remote-id [string ASCII-string hostname]	(Optional) Configures the remote-ID suboption. You can configure the remote ID to be: <ul style="list-style-type: none"> String of up to 63 ASCII characters (no spaces) Configured hostname for the switch <ul style="list-style-type: none"> If the hostname is longer than 63 characters, it is truncated to 63 characters in the remote-ID configuration. <p>The default remote ID is the switch MAC address.</p>
Step 6	Switch(config)# ip dhcp snooping information option allow-untrusted	(Optional) If the switch is an aggregation switch connected to an edge switch, enables the switch to accept incoming DHCP snooping packets with option-82 information from the edge switch. The default setting is disabled. Note Enter this command only on aggregation switches that are connected to trusted devices.
Step 7	Switch(config)# interface <i>interface-id</i>	Specifies the interface to be configured, and enter interface configuration mode.
Step 8	Switch(config-if)# ip dhcp snooping vlan <i>vlan</i> information option format-type circuit-id <i>string</i> <i>ASCII-string</i>	(Optional) Configures the circuit-ID suboption for the specified interface. Specify the VLAN and port identifier, using a VLAN ID in the range of 1 to 4094. The default circuit ID is the port identifier, in the format vlan-mod-port . You can configure the circuit ID to be a string of 3 to 63 ASCII characters (no spaces).

	Command	Purpose
Step 9	Switch(config-if)# ip dhcp snooping trust	(Optional) Configures the interface as trusted or untrusted. You can use the no keyword to configure an interface to receive messages from an untrusted client. The default setting is untrusted.
Step 10	Switch(config-if)# ip dhcp snooping limit rate rate	(Optional) Configures the number of DHCP packets per second that an interface can receive. The range is 1 to 2048. By default, no rate limit is configured. Note We recommend an untrusted rate limit of not more than 100 packets per second. If you configure rate limiting for trusted interfaces, you might need to increase the rate limit if the port is a trunk port assigned to more than one VLAN on which DHCP snooping is enabled.
Step 11	Switch(config-if)# exit	Returns to global configuration mode.
Step 12	Switch(config)# ip dhcp snooping verify mac-address	(Optional) Configures the switch to verify that the source MAC address in a DHCP packet that is received on untrusted ports matches the client hardware address in the packet. The default is to verify that the source MAC address matches the client hardware address in the packet.
Step 13	Switch(config)# end	Returns to privileged EXEC mode.
Step 14	Switch# show running-config	Verifies your entries.
Step 15	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable DHCP snooping, use the **no ip dhcp snooping** global configuration command. To disable DHCP snooping on a VLAN or range of VLANs, use the **no ip dhcp snooping vlan vlan-range** global configuration command. To disable the insertion and removal of the option-82 field, use the **no ip dhcp snooping information option** global configuration command. To configure an aggregation switch to drop incoming DHCP snooping packets with option-82 information from an edge switch, use the **no ip dhcp snooping information option allow-untrusted** global configuration command.

This example shows how to enable DHCP snooping globally and on VLAN 10 and to configure a rate limit of 100 packets per second on a port:

```
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10
Switch(config)# ip dhcp snooping information option
Switch(config)# interface gigabitethernet2/0/1
Switch(config-if)# ip dhcp snooping limit rate 100
```

Enabling DHCP Snooping on Private VLAN

DHCP snooping can be enabled on private VLANs, which provide isolation between Layer 2 ports within the same VLAN. If DHCP snooping is enabled (or disabled), the configuration is propagated to both the primary VLAN and its associated secondary VLANs. You cannot enable (or disable) DHCP snooping on a primary VLAN without reflecting this configuration change on the secondary VLANs.

Configuring DHCP snooping on a secondary VLAN is still allowed, but it does not take effect if the associated primary VLAN is already configured. If the associated primary VLAN is configured, the effective DHCP snooping mode on the secondary VLAN is derived from the corresponding primary VLAN. Manually configuring DHCP snooping on a secondary VLAN causes the switch to issue this warning message:

```
DHCP Snooping configuration may not take effect on secondary vlan XXX
```

The **show ip dhcp snooping** command displays all VLANs (both primary and secondary) that have DHCP snooping enabled.

Configuring DHCP Snooping on Private VLAN

DHCP snooping, IPSG, and DAI are Layer 2 based security features that can be enabled and disabled on an individual VLAN, including auxiliary or voice VLAN. This means that you need to enable DHCP snooping on a voice VLAN for a Cisco IP phone to function properly.

Configuring DHCP Snooping with an Ethernet Channel Group

When you configure DHCP snooping, you need to configure trunk interfaces that transmit DHCP packets as trusted interfaces by adding **ip dhcp snooping trust** to the physical interface configuration. However, if DHCP packets will be transmitted over an ethernet channel group, you must configure **ip dhcp snooping trust** on the logical port-channel interface, for example:

```
Switch# show run int port-channel150
Building configuration...

Current configuration : 150 bytes
!
interface Port-channel150
 switchport
 switchport trunk native vlan 4092
 switchport mode trunk
 switchport nonegotiate
 ip dhcp snooping trust
end

Switch#
```

Enabling the DHCP Snooping Database Agent

To configure the database agent, perform one or more of the following tasks:

Command	Purpose
Switch(config)# ip dhcp snooping database {url write-delay seconds timeout seconds}	(Required) Configures a URL for the database agent (or file) and the related timeout values.
Switch(config)# no ip dhcp snooping database [write-delay timeout]	
Switch# show ip dhcp snooping database [detail]	(Optional) Displays the current operating state of the database agent and statistics associated with the transfers.

Command	Purpose
Switch# clear ip dhcp snooping database statistics	(Optional) Clears the statistics associated with the database agent.
Switch# renew ip dhcp snooping database [validation none] [url]	(Optional) Requests the read entries from a file at the given URL.
Switch# ip dhcp snooping binding mac-addr vlan vlan ipaddr interface ifname expiry lease-in-seconds	(Optional) Adds/deletes bindings to the snooping database.
Switch# no ip dhcp snooping binding mac-addr vlan vlan ipaddr interface ifname	

**Note**

Because both NVRAM and bootflash have limited storage capacity, you should use TFTP or network-based files. If you use flash to store the database file, new updates (by the agent) result in the creation of new files (flash fills quickly). Moreover, because of the filesystem used on the flash, a large number of files can cause slow access. When a file is stored in a remote location accessible through TFTP, an RPR/SSO standby supervisor engine can take over the binding list when a switchover occurs.

**Note**

Network-based URLs (such as TFTP and FTP) require that you create an empty file at the configured URL before the switch can write the set of bindings for the first time.

Limiting the Rate of Incoming DHCP Packets

The switch CPU performs DHCP validation checks; therefore, the number of incoming DHCP packets is rate-limited to prevent a denial-of-service attack.

When the rate of incoming DHCP packets exceeds the configured limit, the switch places the port in the error-disabled state. The port remains in that state until you intervene or you enable error-disable recovery so that ports automatically emerge from this state after a specified timeout period.

**Note**

Unless you explicitly configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the **no ip dhcp snooping limit rate** interface configuration command, the interface reverts to its default rate limit.

To prevent the port from shutting down, you can use the **errdisable detect cause dhcp-rate-limit action shutdown vlan** global configuration command to shut down just the offending VLAN on the port where the violation occurred.

To limit the rate of incoming DHCP packets, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# errdisable detect cause dhcp-rate-limit [action shutdown vlan]	Enables per-VLAN error-disable detection.

	Command	Purpose
Step 3	Switch(config)# interface <i>interface-id</i>	Specifies the interface to be rate-limited, and enter interface configuration mode.
Step 4	Switch(config-if)# [no] ip dhcp snooping limit rate	Limits the rate of incoming DHCP requests and responses on the interface. The default rate is disabled.
Step 5	Switch(config-if)# exit	Returns to global configuration mode.
Step 6	Switch(config)# errdisable recovery { cause dhcp-rate-limit interval interval }	(Optional) Enables error recovery from the DHCP error-disable state. By default, recovery is disabled, and the recovery interval is 300 seconds. For interval interval , specify the time in seconds to recover from the error-disable state. The range is 30 to 86400.
Step 7	Switch(config)# exit	Returns to privileged EXEC mode.
Step 8	Switch# show interfaces status	Verifies your settings.
Step 9	Switch# show errdisable recovery	Verifies your settings.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To return to the default rate-limit configuration, use the **no ip dhcp-rate-limit** interface configuration command. To disable error recovery for DHCP inspection, use the **no errdisable recovery cause dhcp-rate-limit** global configuration command.

This example shows how to set an upper limit for the number of incoming packets (100 pps) and to specify a burst interval (1 second):

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface g3/31
Switch(config-if)# ip dhcp-rate-limit rate 100 burst interval 1
Switch(config-if)# exit
Switch(config)# errdisable recovery cause dhcp-rate-limit
Switch(config)# exit
Switch# show interfaces status
```

Port	Name	Status	Vlan	Duplex	Speed	Type
Tel1/1		connected	1	full	10G	10GBase-LR
Tel1/2		connected	vl-err-dis	full	10G	10GBase-LR

```
Switch# show errdisable recovery
ErrDisable Reason    Timer Status
-----
udld                  Disabled

Configuration Examples for the Database Agent

The following examples show how to use the above commands.

Example 1: Enabling the Database Agent

The following example shows how to configure the DHCP snooping database agent to store the bindings at a given location and to view the configuration and operating state:

```

Switch# configure terminal
Switch(config)# ip dhcp snooping database tftp://10.1.1.1/directory/file
Switch(config)# end
Switch# show ip dhcp snooping database detail
Agent URL : tftp://10.1.1.1/directory/file
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : No
Delay Timer Expiry : 7 (00:00:07)
Abort Timer Expiry : Not Running

Last Succeeded Time : None
Last Failed Time : 17:14:25 UTC Sat Jul 7 2001
Last Failed Reason : Unable to access URL.

Total Attempts      :      21   Startup Failures :      0
Successful Transfers :      0   Failed Transfers :     21
Successful Reads     :      0   Failed Reads    :      0
Successful Writes    :      0   Failed Writes   :     21
Media Failures       :      0

```

```

First successful access: Read

Last ignored bindings counters :
Binding Collisions      :      0   Expired leases      :      0
Invalid interfaces      :      0   Unsupported vlans  :      0
Parse failures          :      0
Last Ignored Time : None

Total ignored bindings counters:
Binding Collisions      :      0   Expired leases      :      0
Invalid interfaces      :      0   Unsupported vlans  :      0
Parse failures          :      0

Switch#

```

The first three lines of output show the configured URL and related timer configuration values. The next three lines show the operating state and the amount of time left for expiry of write delay and abort timers.

Among the statistics shown in the output, startup failures indicate the number of attempts the read or create of the file has failed upon bootup.

Note

Because the location is based off in the network, you must create a temporary file on the TFTP server. You can create a temporary file on a typical UNIX workstation by creating a 0 byte file “file” in the directory “directory” that can be referenced by the TFTP server daemon. With some server implementations on UNIX workstations, the file should be provided with full (777) permissions for write access to the file.

DHCP snooping bindings are keyed on the MAC address and VLAN combination. Therefore, if an entry in the remote file has an entry for a given MAC address and VLAN set, for which the switch already has a binding, the entry from the remote file is ignored when the file is read. This condition is referred to as the binding collision.

An entry in a file may no longer be valid because the lease indicated by the entry may have expired by the time it is read. The expired leases counter indicates the number of bindings ignored because of this condition. The Invalid interfaces counter refers to the number of bindings that have been ignored when the interface referred by the entry either does not exist on the system or is a router or DHCP snooping trusted interface if it exists, when the read happened. Unsupported VLANs refers to the number of entries that have been ignored because the indicated VLAN is not supported on the system. The Parse failures counter provides the number of entries that have been ignored when the switch is unable to interpret the meaning of the entries from the file.

The switch maintains two sets of counters for these ignored bindings. One provides the counters for a read that has at least one binding ignored by at least one of these conditions. These counters are shown as the “Last ignored bindings counters.” The total ignored bindings counters provides a sum of the number of bindings that have been ignored because of all the reads since the switch bootup. These two set of counters are cleared by the **clear** command. Therefore, the total counter set may indicate the number of bindings that have been ignored since the last clear.

Example 2: Reading Binding Entries from a TFTP File

To manually read the entries from a TFTP file, perform this task:

	Command	Purpose
Step 1	Switch# show ip dhcp snooping database	Displays the DHCP snooping database agent statistics.
Step 2	Switch# renew ip dhcp snoop data url	Directs the switch to read the file from given URL.
Step 3	Switch# show ip dhcp snoop data	Displays the read status.
Step 4	Switch# show ip dhcp snoop bind	Verifies whether the bindings were read successfully.

This is an example of how to manually read entries from the tftp://10.1.1.1/directory/file:

```
Switch# show ip dhcp snooping database
Agent URL :
Write delay Timer : 300 seconds
Abort Timer : 300 seconds

Agent Running : No
Delay Timer Expiry : Not Running
Abort Timer Expiry : Not Running

Last Succeeded Time : None
Last Failed Time : None
Last Failed Reason : No failure recorded.

Total Attempts      :          0   Startup Failures :          0
Successful Transfers :          0   Failed Transfers :          0
Successful Reads     :          0   Failed Reads    :          0
Successful Writes    :          0   Failed Writes   :          0
Media Failures       :          0

Switch#
Switch# renew ip dhcp snoop data tftp://10.1.1.1/directory/file
Loading directory/file from 10.1.1.1 (via GigabitEthernet1/1): !
[OK - 457 bytes]
Database downloaded successfully.

Switch#
00:01:29: %DHCP_SNOOPING-6-AGENT_OPERATION_SUCCEEDED: DHCP snooping database Read
succeeded.

Switch#
Switch# show ip dhcp snoop bind
MacAddress      IpAddress      Lease(sec)  Type           VLAN  Interface
-----
00:01:00:01:00:05  1.1.1.1        49810      dhcp-snooping  512   GigabitEthernet1/1
```

```

00:01:00:01:00:02 1.1.1.1 49810 dhcp-snooping 512 GigabitEthernet1/1
00:01:00:01:00:04 1.1.1.1 49810 dhcp-snooping 1536 GigabitEthernet1/1
00:01:00:01:00:03 1.1.1.1 49810 dhcp-snooping 1024 GigabitEthernet1/1
00:01:00:01:00:01 1.1.1.1 49810 dhcp-snooping 1 GigabitEthernet1/1
Switch#
Switch# clear ip dhcp snoop bind
Switch# show ip dhcp snoop bind

```

MacAddress	IpAddress	Lease(sec)	Type	VLAN	Interface
-----	-----	-----	-----	----	-----

```

Switch#

```

Example 3: Adding Information to the DHCP Snooping Database

To manually add a binding to the DHCP snooping database, perform this task:

	Command	Purpose
Step 1	Switch# show ip dhcp snooping binding	Views the DHCP snooping database
Step 2	Switch# ip dhcp snooping binding <i>binding-id</i> vlan <i>vlan-id</i> interface <i>interface</i> expiry <i>lease-time</i>	Adds the binding using the 'ip dhcp snooping' exec command
Step 3	Switch# show ip dhcp snooping binding	Checks the DHCP snooping database

This example shows how to manually add a binding to the DHCP snooping database:

```

Switch# show ip dhcp snooping binding
MacAddress      IpAddress      Lease(sec)    Type           VLAN    Interface
-----
Switch#
Switch# ip dhcp snooping binding 1.1.1 vlan 1 1.1.1.1 interface g11/1 expiry 1000

Switch# show ip dhcp snooping binding
MacAddress      IpAddress      Lease(sec)    Type           VLAN    Interface
-----
00:01:00:01:00:01 1.1.1.1      992           dhcp-snooping  1       GigabitEthernet1/1
Switch#

```

Displaying DHCP Snooping Information

You can display a DHCP snooping binding table and configuration information for all interfaces on a switch.

Displaying a Binding Table

The DHCP snooping binding table for each switch contains binding entries that correspond to untrusted ports. The table does not contain information about hosts interconnected with a trusted port because each interconnected switch has its own DHCP snooping binding table.

This example shows how to display the DHCP snooping binding information for a switch:

```

Switch# show ip dhcp snooping binding
MacAddress      IpAddress      Lease(sec)    Type           VLAN    Interface
-----
00:02:B3:3F:3B:99 55.5.5.2      6943          dhcp-snooping  10      FastEthernet6/10
Switch#

```

Table 45-2 describes the fields in the **show ip dhcp snooping binding** command output.

Table 45-2 *show ip dhcp snooping binding Command Output*

Field	Description
MAC Address	Client hardware MAC address
IP Address	Client IP address assigned from the DHCP server
Lease (seconds)	IP address lease time
Type	Binding type; dynamic binding learned by dhcp-snooping or statically-configured binding.
VLAN	VLAN number of the client interface
Interface	Interface that connects to the DHCP client host

Displaying the DHCP Snooping Configuration

This example shows how to display the DHCP snooping configuration for a switch.

```
Switch# show ip dhcp snooping
Switch DHCP snooping is enabled.
DHCP Snooping is configured on the following VLANs:
    10 30-40 100 200-220
Insertion of option 82 is enabled
Option82 on untrusted port is not allowed
Verification of hwaddr field is enabled
Interface          Trusted          Rate limit (pps)
-----
FastEthernet2/1    yes             10
FastEthernet3/1    yes             none
GigabitEthernet1/1 no              20
Switch#
```

Overview of IP Source Guard

Similar to DHCP snooping, this feature is enabled on a DHCP snooping untrusted Layer 2 port. Initially, all IP traffic on the port is blocked except for DHCP packets that are captured by the DHCP snooping process. When a client receives a valid IP address from the DHCP server, or when a static IP source binding is configured by the user, a per-port and VLAN Access Control List (PVACL) is installed on the port. This process restricts the client IP traffic to those source IP addresses configured in the binding; any IP traffic with a source IP address other than that in the IP source binding is filtered out. This filtering limits a host's ability to attack the network by claiming a neighbor host's IP address.

Note

If IP Source Guard is enabled on a trunk port with a large number of VLANs that have DHCP snooping enabled, you might run out of ACL hardware resources, and some packets might be switched in software instead.

**Note**

When IP Source Guard is enabled, you might want to designate an alternative scheme for ACL hardware programming. For more information, see the “TCAM Programming and ACLs” section in the “Configuring Network Security with ACLs” chapter.

**Note**

When an interface is in down state, TCAMs are not consumed for RACLs, but are for PACLs.

IP Source Guard supports the Layer 2 port only, including both access and trunk. For each untrusted Layer 2 port, there are two levels of IP traffic security filtering:

- Source IP address filter

IP traffic is filtered based on its source IP address. Only IP traffic with a source IP address that matches the IP source binding entry is permitted.

An IP source address filter is changed when a new IP source entry binding is created or deleted on the port. The port PVACL is recalculated and reapplied in the hardware to reflect the IP source binding change. By default, if the IP filter is enabled without any IP source binding on the port, a default PVACL that denies all IP traffic is installed on the port. Similarly, when the IP filter is disabled, any IP source filter PVACL is removed from the interface.

- Source IP and MAC address filter

IP traffic is filtered based on its source IP address as well as its MAC address; only IP traffic with source IP and MAC addresses matching the IP source binding entry are permitted.

**Note**

When IP source guard is enabled in IP and MAC filtering mode, the DHCP snooping option 82 must be enabled to ensure that the DHCP protocol works properly. Without option 82 data, the switch cannot locate the client host port to forward the DHCP server reply. Instead, the DHCP server reply is dropped, and the client cannot obtain an IP address.

Configuring IP Source Guard

To enable IP Source Guard, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip dhcp snooping	Enables DHCP snooping globally. You can use the no keyword to disable DHCP snooping.
Step 2	Switch(config)# ip dhcp snooping vlan <i>number</i> [<i>number</i>]	Enables DHCP snooping on your VLANs.
Step 3	Switch(config-if)# no ip dhcp snooping trust	Configures the interface as trusted or untrusted. You can use the no keyword of to configure an interface to receive only messages from within the network.
Step 4	Switch(config-if)# ip verify source vlan dhcp-snooping port-security	Enables IP source guard, source IP, and source MAC address filtering on the port.

	Command	Purpose
Step 5	Switch(config-if)# switchport port-security limit rate invalid-source-mac N	Enables security rate limiting for learned source MAC addresses on the port. Note This limit only applies to the port where IP Source Guard is enabled as filtering both IP and MAC addresses.
Step 6	Switch(config)# ip source binding mac-address vlan vlan-id ip-address interface interface-name	Configures a static IP binding on the port.
Step 7	Switch(config)# end	Exits configuration mode.
Step 8	Switch# show ip verify source interface interface-name	Verifies the configuration.

If you want to stop IP Source Guard with Static Hosts on an interface, use the following commands in interface configuration submode:

```
Switch(config-if)# no ip verify source
Switch(config-if)# no ip device tracking max
```

If the **ip device tracking** command is used in the interface configuration submode, it will be interpreted and run in the global configuration mode, disabling IP device tracking globally. For all interfaces configured with the **ip verify source tracking [port-security]** command, disabling IP device tracking globally causes the IP Source Guard with Static Hosts feature to deny all IP traffic from those interfaces.

Note

The static IP source binding can only be configured on switch port. If you issue the **ip source binding vlan interface** command on a Layer 3 port, you receive this error message: *Static IP source binding can only be configured on switch port.*

This example shows how to enable per-Layer 2-port IP source guard on VLANs 10 through 20:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip dhcp snooping
Switch(config)# ip dhcp snooping vlan 10 20
Switch(config)# interface fa6/1
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# switchport trunk native vlan 10
Switch(config-if)# switchport trunk allowed vlan 11-20
Switch(config-if)# no ip dhcp snooping trust
Switch(config-if)# ip verify source vlan dhcp-snooping
Switch(config)# end
Switch# show ip verify source interface f6/1
```

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
Fa6/1	ip-mac	active	10.0.0.1		10
Fa6/1	ip-mac	active	deny-all		11-20

```
Switch#
```

The output shows that there is one valid DHCP binding to VLAN 10.

Configuring IP Source Guard on Private VLANs

For private VLAN ports, you must enable DHCP snooping on primary VLANs in order for IP source guard to be effective. IP source guard on a primary VLAN is automatically propagate to a secondary VLAN. Configuring a static IP source binding on a secondary VLAN is allowed, but it does not take effect. When manually configuring a static IP source binding on a secondary VLAN, you receive the following warning:

Warning

IP source filter may not take effect on secondary vlan where IP source binding is configured. If private vlan feature is enabled, IP source filter on primary vlan will automatically propagate to all secondary vlans.

Displaying IP Source Guard Information

You can display IP Source Guard PVACL information for all interfaces on a switch using the **show ip verify source** command.

- This example shows displayed PVACLs if DHCP snooping is enabled on VLAN 10 through 20, if interface fa6/1 is configured for IP filtering, and if there is an existing IP address binding 10.0.0.1 on VLAN 10:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/1	ip	active	10.0.0.1		10
fa6/1	ip	active	deny-all		11-20

Note

The second entry shows that a default PVACL (deny all IP traffic) is installed on the port for those snooping-enabled VLANs that do not have a valid IP source binding.

- This example shows displayed PVACL for a trusted port:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/2	ip	inactive-trust-port			

- This example shows displayed PVACL for a port in a VLAN not configured for DHCP snooping:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/3	ip	inactive-no-snooping-vlan			

- This example shows displayed PVACLs for a port with multiple bindings configured for an IP/MAC filtering:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/4	ip-mac	active	10.0.0.2	aaaa.bbbb.cccc	10
fa6/4	ip-mac	active	11.0.0.1	aaaa.bbbb.cccd	11
fa6/4	ip-mac	active	deny-all	deny-all	12-20

- This example shows displayed PVACLs for a port configured for IP/MAC filtering but not for port security:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan

fa6/5	ip-mac	active	10.0.0.3	permit-all	10
fa6/5	ip-mac	active	deny-all	permit-all	11-20

Note The MAC filter shows permit-all because port security is not enabled, so the MAC filter cannot apply to the port/VLAN and is effectively disabled. Always enable port security first.

- This example shows displayed error message when issuing the **show ip verify source** command on a port that does not have an IP source filter mode configured:

IP Source Guard is not configured on the interface fa6/6.

You can also use the **show ip verify source** command to display all interfaces on the switch that have IP source guard enabled:

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
fa6/1	ip	active	10.0.0.1		10
fa6/1	ip	active	deny-all		11-20
fa6/2	ip	inactive-trust-port			
fa6/3	ip	inactive-no-snooping-vlan			
fa6/4	ip-mac	active	10.0.0.2	aaaa.bbbb.cccc	10
fa6/4	ip-mac	active	11.0.0.1	aaaa.bbbb.cccd	11
fa6/4	ip-mac	active	deny-all	deny-all	12-20
fa6/5	ip-mac	active	10.0.0.3	permit-all	10
fa6/5	ip-mac	active	deny-all	permit-all	11-20

Displaying IP Source Binding Information

You can display all IP source bindings configured on all interfaces on a switch using the **show ip source binding** command.

```
Switch# show ip source binding
```

MacAddress	IpAddress	Lease(sec)	Type	VLAN	Interface
00:02:B3:3F:3B:99	55.5.5.2	6522	dhcp-snooping	10	FastEthernet6/10
00:00:00:0A:00:0B	11.0.0.1	infinite	static	10	FastEthernet6/10

Switch#

Table 45-3 describes the fields in the **show ip source binding** command output.

Table 45-3 *show ip source binding Command Output*

Field	Description
MAC Address	Client hardware MAC address
IP Address	Client IP address assigned from the DHCP server
Lease (seconds)	IP address lease time
Type	Binding type; static bindings configured from CLI to dynamic binding learned from DHCP Snooping
VLAN	VLAN number of the client interface
Interface	Interface that connects to the DHCP client host

Configuring IP Source Guard for Static Hosts

Note

Supervisor Engine 6-E does *not* support this feature.

Note

IPSG for Static Hosts should not be used on uplink ports.

IP Source Guard (IPSG) for static hosts extends the IPSG capability to non-DHCP and static environments. The existing IP Source Guard (IPSG) feature uses the entries created by the DHCP snooping feature to validate the hosts connected to a switch. Any traffic received from a host without a valid DHCP binding entry is dropped. In essence, a DHCP environment is a prerequisite for IPSG to work. The IPSG for static hosts feature removes IPSG's dependency on DHCP. The switch creates static entries based on ARP requests or other IP packets and uses them to maintain the list of valid hosts for a given port. In addition, the user can specify the number of hosts that would be allowed to send traffic to a given port. This is equivalent to port-security at Layer 3.

Note

Some IP hosts with multiple network interfaces may inject some invalid packets into a network interface. Those invalid packets contain the IP/MAC address for another network interface of that host as the source address. It may cause IPSG for static hosts in the switch, which connects to the host, to learn the invalid IP/MAC address bindings and reject the valid bindings. You should consult the vendor of the corresponding OS and/or the network device of that host to prevent it from injecting invalid packets.

IPSG for Static Hosts initially learns IP/MAC bindings dynamically through an ACL-based snooping mechanism. IP/MAC bindings are learned from static hosts via ARP and IP packets and are stored using the device tracking database. Once the number of IP addresses that have been dynamically learned or statically configured on a given port reaches a maximum limit, any packet with a new IP address is dropped in hardware. To handle hosts that have moved or gone away for any reason, the IPSG for Static Hosts feature leverages IP device tracking functionality to age out dynamically learned IP address bindings. This feature can be used in conjunction with DHCP snooping. Multiple bindings will be established on a port that is connected to both DHCP and static hosts (i.e. bindings will be stored in both the device tracking database as well as the DHCP snooping binding database).

Topics include:

- [IPSG for Static Hosts on a Layer 2 Access Port, page 45-24](#)
- [IPSG for Static Hosts on a PVLAN Host Port, page 45-28](#)

IPSG for Static Hosts on a Layer 2 Access Port

You can configure IPSG for Static Hosts on a Layer 2 Access Port.

To enable IPSG for Static Hosts with IP filters on a Layer 2 access port, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip device tracking	Turns on the IP host table.
Step 2	Switch(config)# ip device tracking [probe { <i>delay interval</i> }]	(Optional) Configures the optional probe delay parameter for the IP device tracking table: <ul style="list-style-type: none"> interval—Number of seconds that the switch delays sending an ARP probe, triggered by link-up and ARP probe generation by the tracked device. The range is 1 to 120 seconds. The default is 0 seconds.
Step 3	Switch(config)# interface fastEthernet <a/b>	Enters IP configuration mode.
Step 4	Switch(config-if)# switchport mode access	Configures a port as access.
Step 5	Switch(config-if)# switchport access vlan <n>	Configures the VLAN for this port.
Step 6	Switch(config-if)# ip device tracking maximum <n>	Establishes a maximum limit for the bindings on this port. Upper bound for the maximum is 10.
Step 7	Switch(config-if)# switchport port-security	(Optional) Activates Port Security for this port.
Step 8	Switch(config-if)# switchport port-security maximum <n>	(Optional) Establishes a maximum number of MAC addresses for this port.
Step 9	Switch(config-if)# ip verify source tracking [port-security]	Activates IPSG for Static Hosts on this port.
Step 10	Switch(config-if)# end	Exits configuration interface mode.
Step 11	Switch# show ip verify source <i>interface-name</i>	Verifies the configuration.
Step 12	Switch# show ip device track all [active inactive] count	Verifies the configuration by displaying the IP-to-MAC binding for a given host on the switch interface. <ul style="list-style-type: none"> all active - displays only the active IP/MAC binding entries all inactive - displays only the inactive IP/MAC binding entries all - displays the active and inactive IP/MAC binding entries

To stop IPSG with Static Hosts on an interface, use the following commands in interface configuration submode:

```
Switch(config-if)# no ip verify source
Switch(config-if)# no ip device tracking max"
```

To enable IPSG with Static Hosts on a port, issue the following commands:

```
Switch(config)# ip device tracking *****enable IP device tracking globally
Switch(config)# ip device tracking max <n> *****set an IP device tracking maximum on int
Switch(config-if)# ip verify source tracking [port-security] *****activate IPSG on the port
```

Caution

If you only configure the **ip verify source tracking [port-security]** interface configuration command on a port without enabling IP device tracking globally or setting an IP device tracking maximum on that interface, IPSG with Static Hosts will reject all the IP traffic from that interface.

**Note**

The issue above also applies to IPSG with Static Hosts on a PVLAN Host port.

This example shows how to enable IPSG for Static Hosts with IP filters on a Layer 2 access port and to verify the three valid IP bindings on the interface Fa4/3:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastEthernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 10
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# ip verify source tracking
Switch(config-if)# end
```

```
Switch# show ip verify source
```

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
Fa4/3	ip trk	active	40.1.1.24		10
Fa4/3	ip trk	active	40.1.1.20		10
Fa4/3	ip trk	active	40.1.1.21		10

The following example shows how to enable IPSG for Static Hosts with IP-Mac filters on a Layer 2 access port, to verify the five valid IP-MAC bindings on the interface Fa4/3, and to verify that the number of bindings on this interface has reached the maximum limit:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip device tracking
Switch(config)# interface fastEthernet 4/3
Switch(config-if)# switchport mode access
Switch(config-if)# switchport access vlan 1
Switch(config-if)# ip device tracking maximum 5
Switch(config-if)# switchport port-security
Switch(config-if)# switchport port-security maximum 5
Switch(config-if)# ip verify source tracking port-security
Switch(config-if)# end
```

```
Switch# show ip verify source
```

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
Fa4/3	ip-mac trk	active	40.1.1.24	00:00:00:00:03:04	1
Fa4/3	ip-mac trk	active	40.1.1.20	00:00:00:00:03:05	1
Fa4/3	ip-mac trk	active	40.1.1.21	00:00:00:00:03:06	1
Fa4/3	ip-mac trk	active	40.1.1.22	00:00:00:00:03:07	1
Fa4/3	ip-mac trk	active	40.1.1.23	00:00:00:00:03:08	1

The following example displays all IP/MAC binding entries for all interfaces. Observe that the CLI displays all active as well as inactive entries. When a host is learned on a interface, the new entry is marked as active. When the same host is disconnected from the current interface and connected to a different interface, a new IP/MAC binding entry is displayed as active as soon as the host is detected. The old entry for this host on the previous interface is now marked as inactive.

```
Switch# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30
```

IP Address	MAC Address	Vlan	Interface	STATE
200.1.1.8	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE

```

200.1.1.9      0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.10    0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.1     0001.0600.0000  9  GigabitEthernet4/1  ACTIVE
200.1.1.1     0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.2     0001.0600.0000  9  GigabitEthernet4/1  ACTIVE
200.1.1.2     0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.3     0001.0600.0000  9  GigabitEthernet4/1  ACTIVE
200.1.1.3     0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.4     0001.0600.0000  9  GigabitEthernet4/1  ACTIVE
200.1.1.4     0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.5     0001.0600.0000  9  GigabitEthernet4/1  ACTIVE
200.1.1.5     0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.6     0001.0600.0000  8  GigabitEthernet3/1  INACTIVE
200.1.1.7     0001.0600.0000  8  GigabitEthernet3/1  INACTIVE

```

The following example displays all active IP/MAC binding entries for all interfaces:

```

Switch# show ip device tracking all active
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30

```

IP Address	MAC Address	Vlan	Interface	STATE
200.1.1.1	0001.0600.0000	9	GigabitEthernet4/1	ACTIVE
200.1.1.2	0001.0600.0000	9	GigabitEthernet4/1	ACTIVE
200.1.1.3	0001.0600.0000	9	GigabitEthernet4/1	ACTIVE
200.1.1.4	0001.0600.0000	9	GigabitEthernet4/1	ACTIVE
200.1.1.5	0001.0600.0000	9	GigabitEthernet4/1	ACTIVE

The following example displays all inactive IP/MAC binding entries for all interfaces. The host was first learned on GigabitEthernet 3/1 then moved to GigabitEthernet 4/1. So the IP/MAC binding entries learned on GigabitEthernet 3/1 are marked as inactive.

```

Switch# show ip device tracking all inactive
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30

```

IP Address	MAC Address	Vlan	Interface	STATE
200.1.1.8	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.9	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.10	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.1	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.2	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.3	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.4	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.5	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.6	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE
200.1.1.7	0001.0600.0000	8	GigabitEthernet3/1	INACTIVE

The following example display the count of all IP device tracking host entries for all interfaces:

```

Switch# show ip device tracking all count
Total IP Device Tracking Host entries: 5

```

Interface	Maximum Limit	Number of Entries
Fa4/3	5	

IPSG for Static Hosts on a PVLAN Host Port

You can configure IPSG for Static Hosts on a PVLAN host port.

To enable IPSG for Static Hosts with IP filters on a PVLAN host port, perform this task:

	Command	Purpose
Step 1	Switch(config)# vlan <n1>	Enters configuration VLAN mode.
Step 2	Switch(config-vlan)# private-vlan primary	Establishes a primary VLAN on a PVLAN port.
Step 3	Switch(config-vlan)# exit	Exits VLAN configuration mode.
Step 4	Switch(config)# vlan <n2>	Enters configuration VLAN mode.
Step 5	Switch(config-vlan)# private-vlan isolated	Establishes an isolated VLAN on a PVLAN port.
Step 6	Switch(config-vlan)# exit	Exits VLAN configuration mode.
Step 7	Switch(config)# vlan <n1>	Enters configuration VLAN mode.
Step 8	Switch(config-vlan)# private-vlan association 201	Associates the VLAN on an isolated PVLAN port.
Step 9	Switch(config-vlan)# exit	Exits VLAN configuration mode.
Step 10	Switch(config)# interface fastEthernet <a/b>	Enters interface configuration mode.
Step 11	Switch(config-if)# switchport mode private-vlan host	(Optional) Establishes a port as a PVLAN host.
Step 12	Switch(config-if)# switchport private-vlan host-association <a> 	(Optional) Associates this port with the corresponding PVLAN.
Step 13	Switch(config-if)# ip device tracking maximum <n>	Establishes a maximum limit for the bindings on this port.
Step 14	Switch(config-if)# ip verify source tracking [port-security]	Activates IPSG for Static Hosts on this port.
Step 15	Switch(config-if)# end	Exits configuration interface mode.
Step 16	Switch# show ip device tracking all	Verifies the configuration.
Step 17	Switch# show ip verify source interface-name	Verifies the configuration.

This example shows how to enable IPSG for Static Hosts with IP filters on a PVLAN host port:

```
Switch(config)# vlan 200
Switch(config-vlan)# private-vlan primary
Switch(config-vlan)# exit
Switch(config)# vlan 201
Switch(config-vlan)# private-vlan isolated
Switch(config-vlan)# exit
Switch(config)# vlan 200
Switch(config-vlan)# private-vlan association 201
Switch(config-vlan)# exit
Switch(config)# int fastEthernet 4/3
Switch(config-if)# switchport mode private-vlan host
Switch(config-if)# switchport private-vlan host-association 200 201
Switch(config-if)# ip device tracking maximum 8
Switch(config-if)# ip verify source tracking

Switch# show ip device tracking all
IP Device Tracking = Enabled
IP Device Tracking Probe Count = 3
IP Device Tracking Probe Interval = 30
```

IP Address	MAC Address	Vlan	Interface	STATE
40.1.1.24	0000.0000.0304	200	FastEthernet4/3	ACTIVE
40.1.1.20	0000.0000.0305	200	FastEthernet4/3	ACTIVE
40.1.1.21	0000.0000.0306	200	FastEthernet4/3	ACTIVE
40.1.1.22	0000.0000.0307	200	FastEthernet4/3	ACTIVE
40.1.1.23	0000.0000.0308	200	FastEthernet4/3	ACTIVE

The output shows the five valid IP-MAC bindings that have been learned on the interface Fa4/3. For the PVLAN cases, the bindings are associated with primary VLAN ID. So, in this example, the primary VLAN ID, 200, is shown in the table.

```
Switch# show ip verify source
```

Interface	Filter-type	Filter-mode	IP-address	Mac-address	Vlan
Fa4/3	ip trk	active	40.1.1.23		200
Fa4/3	ip trk	active	40.1.1.24		200
Fa4/3	ip trk	active	40.1.1.20		200
Fa4/3	ip trk	active	40.1.1.21		200
Fa4/3	ip trk	active	40.1.1.22		200
Fa4/3	ip trk	active	40.1.1.23		201
Fa4/3	ip trk	active	40.1.1.24		201
Fa4/3	ip trk	active	40.1.1.20		201
Fa4/3	ip trk	active	40.1.1.21		201
Fa4/3	ip trk	active	40.1.1.22		201

The output shows that the five valid IP-MAC bindings are on both the primary and secondary VLAN.

CHAPTER 46

Configuring Dynamic ARP Inspection

This chapter describes how to configure Dynamic ARP Inspection (DAI) on the Catalyst 4500 series switch.

This chapter includes the following major sections:

- [Overview of Dynamic ARP Inspection, page 46-1](#)
- [Configuring Dynamic ARP Inspection, page 46-5](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Dynamic ARP Inspection

Dynamic ARP Inspection (DAI) is a security feature that validates Address Resolution Protocol (ARP) packets in a network. DAI allows a network administrator to intercept, log, and discard ARP packets with invalid MAC-IP pairs. This capability protects the network from certain “man-in-the-middle” attacks.

This section contains the following subsections:

- [ARP Cache Poisoning, page 46-2](#)
- [Purpose of Dynamic ARP Inspection, page 46-2](#)
- [Interface Trust State, Security Coverage and Network Configuration, page 46-3](#)
- [Relative Priority of Static Bindings and DHCP Snooping Entries, page 46-4](#)
- [Logging of Dropped Packets, page 46-4](#)
- [Rate Limiting of ARP Packets, page 46-4](#)
- [Port Channels and Their Behavior, page 46-5](#)

ARP Cache Poisoning

You can attack hosts, switches, and routers connected to your Layer 2 network by “poisoning” their ARP caches. For example, a malicious user might intercept traffic intended for other hosts on the subnet by poisoning the ARP caches of systems connected to the subnet.

Consider the following configuration:

Figure 46-1 ARP Cache Poisoning

Hosts HA, HB, and HC are connected to the switch on interfaces A, B and C, all of which are on the same subnet. Their IP and MAC addresses are shown in parentheses; for example, Host HA uses IP address IA and MAC address MA. When HA needs to communicate to HB at the IP Layer, HA broadcasts an ARP request for the MAC address associated with IB. As soon as HB receives the ARP request, the ARP cache on HB is populated with an ARP binding for a host with the IP address IA and a MAC address MA. When HB responds to HA, the ARP cache on HA is populated with a binding for a host with the IP address IB and a MAC address MB.

Host HC can “poison” the ARP caches of HA and HB by broadcasting forged ARP responses with bindings for a host with an IP address of IA (or IB) and a MAC address of MC. Hosts with poisoned ARP caches use the MAC address MC as the destination MAC address for traffic intended for IA or IB. This means that HC intercepts that traffic. Because HC knows the true MAC addresses associated with IA and IB, HC can forward the intercepted traffic to those hosts using the correct MAC address as the destination. HC has inserted itself into the traffic stream from HA to HB, the classic “man in the middle” attack.

Purpose of Dynamic ARP Inspection

To prevent ARP poisoning attacks, a switch must ensure that only valid ARP requests and responses are relayed. DAI prevents these attacks by intercepting all ARP requests and responses. Each of these intercepted packets is verified for valid MAC address to IP address bindings before the local ARP cache is updated or the packet is forwarded to the appropriate destination. Invalid ARP packets are dropped.

DAI determines the validity of an ARP packet based on valid MAC address to IP address bindings stored in a trusted database. This database is built at runtime by DHCP snooping, provided this feature is enabled on VLANs and on the switch. In addition, in order to handle hosts that use statically configured IP addresses, DAI can also validate ARP packets against user-configured ARP ACLs.

DAI can also be configured to drop ARP packets when the IP addresses in the packet are invalid or when the MAC addresses in the body of the ARP packet do not match the addresses specified in the Ethernet header.

Interface Trust State, Security Coverage and Network Configuration

DAI associates a trust state with each interface on the system. Packets arriving on trusted interfaces bypass all DAI validation checks, while those arriving on untrusted interfaces go through the DAI validation process. In a typical network configuration for DAI, all ports connected to host ports are configured as untrusted, while all ports connected to switches are configured as trusted. With this configuration, all ARP packets entering the network from a given switch pass the security check.

Figure 46-2 Validation of ARP Packets on a DAI-Enabled VLAN

Use the trust state configuration carefully. Configuring interfaces as untrusted when they should be trusted can result in a loss of connectivity. If we assume that both S1 and S2 (in Figure 46-2) run DAI on the VLAN ports that contains H1 and H2, and if H1 and H2 were to acquire their IP addresses from the DHCP server connected to S1, then only S1 binds the IP to MAC address of H1. Therefore, if the interface between S1 and S2 is untrusted, the ARP packets from H1 get dropped on S2. This condition would result in a loss of connectivity between H1 and H2.

Configuring interfaces to be trusted when they are actually untrusted leaves a security hole in the network. If S1 were not running DAI, then H1 can easily poison the ARP of S2 (and H2, if the inter-switch link is configured as trusted). This condition can occur even though S2 is running DAI.

DAI ensures that hosts (on untrusted interfaces) connected to a switch running DAI do not poison the ARP caches of other hosts in the network. It does not, however, ensure that hosts from other portions of the network do not poison the caches of the hosts connected to it.

To handle cases in which some switches in a VLAN run DAI and other switches do not, the interfaces connecting such switches should be configured as untrusted. To validate the bindings of packets from non-DAI switches, however, the switch running DAI should be configured with ARP ACLs. When it is not feasible to determine such bindings, switches running DAI should be isolated from non-DAI switches at Layer 3.

Note

Depending on the setup of the DHCP server and the network, it may not be possible to perform validation of a given ARP packet on all switches in the VLAN.

Relative Priority of Static Bindings and DHCP Snooping Entries

As mentioned previously, DAI populates its database of valid MAC address to IP address bindings through DHCP snooping. It also validates ARP packets against statically configured ARP ACLs. It is important to note that ARP ACLs have precedence over entries in the DHCP snooping database. ARP packets are first compared to user-configured ARP ACLs. If the ARP ACL denies the ARP packet, then the packet is denied even if a valid binding exists in the database populated by DHCP snooping.

Logging of Dropped Packets

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

You use the **ip arp inspection log-buffer** global configuration command to configure the number of entries in the buffer and the number of entries needed in the specified interval to generate system messages. You specify the type of packets that are logged by using the **ip arp inspection vlan logging** global configuration command. For configuration information, see the [“Configuring the Log Buffer” section on page 46-14](#).

Rate Limiting of ARP Packets

DAI performs validation checks in the CPU, so the number of incoming ARP packets is rate-limited to prevent a denial of service attack. By default, the rate for untrusted interfaces is set to 15 pps second, whereas trusted interfaces have no rate limit. When the rate of incoming ARP packets exceeds the configured limit, the port is placed in the errdisable state. The port remains in that state until an administrator intervenes. With the **errdisable recovery** global configuration command, you can enable errdisable recovery so that ports emerge from this state automatically after a specified timeout period.

You use the **ip arp inspection limit** global configuration command to limit the rate of incoming ARP requests and responses on the interface. Unless a rate limit is explicitly configured on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state; that is, 15 packets per second for untrusted interfaces and unlimited for trusted interfaces. Once a rate limit is configured explicitly, the interface retains the rate limit even when its trust state is changed. At any time, the interface reverts to its default rate limit if the *no* form of the **rate limit** command is applied. For configuration information, see the [“Limiting the Rate of Incoming ARP Packets” section on page 46-16](#).

Note

When you enable DAI, all ARP packets are forwarded by CPU (software forwarding, the slow path). With this mechanism, whenever a packet exits through multiple ports, the CPU must create as many copies of the packet as there are egress ports. So, the number of egress ports is a multiplying factor for the CPU. Furthermore, when QoS policing is applied on egress packets that were forwarded by CPU, QoS must be applied in the CPU as well. (You cannot apply QoS in hardware on CPU generated packets because the hardware forwarding path is turned off for CPU generated packets.) Both factors can drive the CPU to a very high utilization level.

Port Channels and Their Behavior

A given physical port can join a channel only when the trust state of the physical port and of the channel match. Otherwise, the physical port remains suspended in the channel. A channel inherits its trust state from the first physical port that joined the channel. Consequently, the trust state of the first physical port need not match the trust state of the channel.

Conversely, when the trust state is changed on the channel, the new trust state is configured on all the physical ports that comprise the channel.

The rate limit check on port channels is unique. The rate of incoming packets on a physical port is checked against the port channel configuration rather than the physical ports' configuration.

The rate limit configuration on a port channel is independent of the configuration on its physical ports.

The rate limit is cumulative across all physical ports; that is, the rate of incoming packets on a port channel equals the sum of rates across all physical ports.

When you configure rate limits for ARP packets on trunks, you must account for VLAN aggregation because a high rate limit on one VLAN can cause a “denial of service” attack to other VLANs when the port is errdisabled by software. Similarly, when a port channel is errdisabled, a high rate limit on one physical port can cause other ports in the channel to go down.

Configuring Dynamic ARP Inspection

These sections describe how to configure dynamic ARP inspection on your switch:

- [Configuring Dynamic ARP Inspection in DHCP Environments, page 46-5](#) (required)
- [Configuring ARP ACLs for Non-DHCP Environments, page 46-11](#) (optional)
- [Configuring the Log Buffer, page 46-14](#) (optional)
- [Limiting the Rate of Incoming ARP Packets, page 46-16](#) (optional)
- [Performing Validation Checks, page 46-19](#) (optional)

Configuring Dynamic ARP Inspection in DHCP Environments

This procedure shows how to configure dynamic ARP inspection when two switches support this feature. Host 1 is connected to Switch A, and Host 2 is connected to Switch B as shown in Figure 46-3. Both switches are running dynamic ARP inspection on VLAN 100 where the hosts are located. A DHCP server is connected to Switch A. Both hosts acquire their IP addresses from the same DHCP server. Therefore, Switch A has the bindings for Host 1, and Switch B has the bindings for Host 2.

Figure 46-3 ARP Packet Validation on a VLAN Enabled for Dynamic ARP Inspection**Note**

Dynamic ARP inspection depends on the entries in the DHCP snooping binding database to verify IP-to-MAC address bindings in incoming ARP requests and ARP responses. Make sure to enable DHCP snooping to permit ARP packets that have dynamically assigned IP addresses. For configuration information, see [Chapter 45, “Configuring DHCP Snooping, IP Source Guard, and IPSG for Static Hosts.”](#)

For information on how to configure dynamic ARP inspection when only one switch supports the feature, see the [“Configuring ARP ACLs for Non-DHCP Environments”](#) section on page 46-11.

To configure dynamic ARP inspection, perform this task on both switches:

	Command	Purpose
Step 1	Switch# show cdp neighbors	Verifies the connection between the switches.
Step 2	Switch# configure terminal	Enters global configuration mode.
Step 3	Switch(config)# [no] ip arp inspection vlan <i>vlan-range</i>	<p>Enables dynamic ARP inspection on a per-VLAN basis. By default, dynamic ARP inspection is disabled on all VLANs.</p> <p>To disable dynamic ARP inspection, use the no ip arp inspection vlan <i>vlan-range</i> global configuration command.</p> <p>For <i>vlan-range</i>, specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094.</p> <p>Specify the same VLAN ID for both switches.</p>
Step 4	Switch(config)# interface <i>interface-id</i>	Specifies the interface connected to the other switch, and enter interface configuration mode.

	Command	Purpose
Step 5	Switch(config-if)# ip arp inspection trust	Configures the connection between the switches as trusted. To return the interfaces to an untrusted state, use the no ip arp inspection trust interface configuration command. By default, all interfaces are untrusted. The switch does not check ARP packets that it receives from the other switch on the trusted interface. It simply forwards the packets. For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the ip arp inspection vlan logging global configuration command. For more information, see the “Configuring the Log Buffer” section on page 46-14 .
Step 6	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 7	Switch# show ip arp inspection interfaces Switch# show ip arp inspection vlan <i>vlan-range</i>	Verifies the dynamic ARP inspection configuration.
Step 8	Switch# show ip dhcp snooping binding	Verifies the DHCP bindings.
Step 9	Switch# show ip arp inspection statistics vlan <i>vlan-range</i>	Checks the dynamic ARP inspection statistics.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure dynamic ARP inspection on Switch A in VLAN 100. You would perform a similar procedure on Switch B.

SwitchB#

Configuring ARP ACLs for Non-DHCP Environments

This procedure shows how to configure dynamic ARP inspection when Switch B shown in [Figure 46-3 on page 46-6](#) does not support dynamic ARP inspection or DHCP snooping.

If you configure port 1 on Switch A as trusted, a security hole is created because both Switch A and Host 1 could be attacked by either Switch B or Host 2. To prevent this possibility, you must configure port 1 on Switch A as untrusted. To permit ARP packets from Host 2, you must set up an ARP ACL and apply it to VLAN 100. If the IP address of Host 2 is not static, such that it is impossible to apply the ACL configuration on Switch A, you must separate Switch A from Switch B at Layer 3 and use a router to route packets between them.

To configure an ARP ACL (on switch A in a non-DHCP environment), perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# arp access-list <i>acl-name</i>	Defines an ARP ACL, and enter ARP access-list configuration mode. By default, no ARP access lists are defined. Note At the end of the ARP access list, there is an implicit deny ip any mac any command.
Step 3	Switch(config-arp-nac)# permit ip host <i>sender-ip</i> mac <i>host sender-mac</i> [log]	Permits ARP packets from the specified host (Host 2). <ul style="list-style-type: none"> For <i>sender-ip</i>, enter the IP address of Host 2. For <i>sender-mac</i>, enter the MAC address of Host 2. (Optional) Specify log to log a packet in the log buffer when it matches the access control entry (ACE). Matches are logged if you also configure the matchlog keyword in the ip arp inspection vlan logging global configuration command. For more information, see the “Configuring the Log Buffer” section on page 46-14.
Step 4	Switch(config-arp-nac)# exit	Returns to global configuration mode.

	Command	Purpose
Step 5	Switch(config)# ip arp inspection filter <i>arp-acl-name</i> vlan <i>vlan-range</i> [static]	<p>Applies the ARP ACL to the VLAN. By default, no defined ARP ACLs are applied to any VLAN.</p> <ul style="list-style-type: none"> For <i>arp-acl-name</i>, specify the name of the ACL created in Step 2. For <i>vlan-range</i>, specify the VLAN that the switches and hosts are in. You can specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. (Optional) Specify static to treat implicit denies in the ARP ACL as explicit denies and to drop packets that do not match any previous clauses in the ACL. DHCP bindings are not used. <p>If you do not specify this keyword, it means that there is no explicit deny in the ACL that denies the packet, and DHCP bindings determine whether a packet is permitted or denied if the packet does not match any clauses in the ACL.</p> <p>ARP packets containing only IP-to-MAC address bindings are compared against the ACL. Packets are permitted only if the access list permits them.</p>
Step 6	Switch(config)# interface <i>interface-id</i>	Specifies the Switch A interface that is connected to Switch B, and enter interface configuration mode.
Step 7	Switch(config-if)# no ip arp inspection trust	<p>Configures the Switch A interface that is connected to Switch B as untrusted.</p> <p>By default, all interfaces are untrusted.</p> <p>For untrusted interfaces, the switch intercepts all ARP requests and responses. It verifies that the intercepted packets have valid IP-to-MAC address bindings before updating the local cache and before forwarding the packet to the appropriate destination. The switch drops invalid packets and logs them in the log buffer according to the logging configuration specified with the ip arp inspection vlan logging global configuration command. For more information, see the “Configuring the Log Buffer” section on page 46-14.</p>
Step 8	Switch(config-if)# end	Returns to privileged EXEC mode.
Step 9	Switch# show arp access-list [<i>acl-name</i>] Switch# show ip arp inspection vlan <i>vlan-range</i> Switch# show ip arp inspection interfaces	Verifies the dynamic ARP inspection configuration.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To remove the ARP ACL, use the **no arp access-list** global configuration command. To remove the ARP ACL attached to a VLAN, use the **no ip arp inspection filter arp-acl-name vlan vlan-range** global configuration command.

This example shows how to configure an ARP ACL called *host2* on Switch A, to permit ARP packets from HostB (IP address 170.1.1.2 and MAC address 2.2.2), to apply the ACL to VLAN 100, and to configure port 1 on Switch A as untrusted:

```
SwitchA# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchA(config)# arp access-list hostB
SwitchA(config-arp-nacl)# permit ip host 170.1.1.2 mac host 2.2.2 log
SwitchA(config-arp-nacl)# exit
SwitchA(config)# ip arp inspection filter hostB vlan 100 static
SwitchA(config)# interface g3/48
SwitchA(config-if)# no ip arp inspection trust
SwitchA(config-if)# end
SwitchA# show arp access-list hostB
ARP access list hostB
    permit ip host 170.1.1.2 mac host 0002.0002.0002 log
```

```
SwitchA# show ip arp inspection interfaces
```

SwitchA#

Configuring the Log Buffer

When the switch drops a packet, it places an entry in the log buffer and then generates system messages on a rate-controlled basis. After the message is generated, the switch clears the entry from the log buffer. Each log entry contains flow information, such as the receiving VLAN, the port number, the source and destination IP addresses, and the source and destination MAC addresses.

A log-buffer entry can represent more than one packet. For example, if an interface receives many packets on the same VLAN with the same ARP parameters, the switch combines the packets as one entry in the log buffer and generates a single system message for the entry.

If the log buffer overflows, it means that a log event does not fit into the log buffer, and the display for the **show ip arp inspection log** privileged EXEC command is affected. No other statistics are provided for the entry.

To configure the log buffer, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip arp inspection log-buffer {entries number logs number interval seconds}	<p>Configures the dynamic ARP inspection logging buffer.</p> <p>By default, when dynamic ARP inspection is enabled, denied or dropped ARP packets are logged. The number of log entries is 32. The number of system messages is limited to 5 per second. The logging-rate interval is 1 second.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> For entries number, specify the number of entries to be logged in the buffer. The range is 0 to 1024. For logs number interval seconds, specify the number of entries to generate system messages in the specified interval. <p>For logs number, the range is 0 to 1024. A 0 value means that the entry is placed in the log buffer, but a system message is not generated.</p> <p>For interval seconds, the range is 0 to 86400 seconds (1 day). A 0 value means that a system message is immediately generated (and the log buffer is always empty).</p> <p>An interval setting of 0 overrides a log setting of 0.</p> <p>The logs and interval settings interact. If the logs number X is greater than interval seconds Y, X divided by Y (X/Y) system messages are sent every second. Otherwise, one system message is sent every Y divided by X (Y/X) seconds.</p>
Step 3	Switch(config)# [no] ip arp inspection vlan vlan-range logging {acl-match {matchlog none} dhcp-bindings {all none permit}}	<p>Controls the type of packets that are logged per VLAN. By default, all denied or all dropped packets are logged. The term <i>logged</i> means the entry is placed in the log buffer and a system message is generated.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> For vlan-range, specify a single VLAN identified by VLAN ID number, a range of VLANs separated by a hyphen, or a series of VLANs separated by a comma. The range is 1 to 4094. For acl-match matchlog, log packets based on the ACE logging configuration. If you specify the matchlog keyword in this command and the log keyword in the permit or deny ARP access-list configuration command, ARP packets permitted or denied by ACEs with log keyword are logged. For acl-match none, do not log packets that match ACLs. For dhcp-bindings all, log all packets that match DHCP bindings. For dhcp-bindings none, do not log packets that match DHCP bindings. For dhcp-bindings permit, log DHCP-binding permitted packets.
Step 4	Switch(config)# exit	Returns to privileged EXEC mode.
Step 5	Switch# show ip arp inspection log	Verifies your settings.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To return to the default log buffer settings, use the **no ip arp inspection log-buffer** global configuration command. To return to the default VLAN log settings, use the **no ip arp inspection vlan *vlan-range* logging {acl-match | dhcp-bindings}** global configuration command. To clear the log buffer, use the **clear ip arp inspection log** privileged EXEC command.

This example shows how to configure the number of entries for the log buffer to 1024. It also shows how to configure your Catalyst 4500 series switch so that the logs must be generated from the buffer at the rate of 100 per 10 seconds.

```
SwitchB# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchB(config)# ip arp inspection log-buffer entries 1024
SwitchB(config)# ip arp inspection log-buffer logs 100 interval 10
SwitchB(config)# end
SwitchB# show ip arp inspection log
Total Log Buffer Size : 1024
Syslog rate : 100 entries per 10 seconds.
```

SwitchB#

Limiting the Rate of Incoming ARP Packets

The switch CPU performs dynamic ARP inspection validation checks; therefore, the number of incoming ARP packets is rate-limited to prevent a denial-of-service attack.

Note

Unless you explicitly configure a rate limit on an interface, changing the trust state of the interface also changes its rate limit to the default value for that trust state. After you configure the rate limit, the interface retains the rate limit even when its trust state is changed. If you enter the **no ip arp-inspection limit** interface configuration command, the interface reverts to its default rate limit.

By default, the switch places the port in the error-disabled state when the rate of incoming ARP packets exceeds the configured limit. To prevent the port from shutting down, you can use the **errdisable detect cause arp-inspection action shutdown vlan** global configuration command to shut down just the offending VLAN on the port where the violation occurred.

When a port is in the error-disabled state, you can bring it out of this state automatically by configuring the **errdisable recovery cause arp-inspection** global configuration command or you can manually reenale it by entering the **shutdown** and **no shut down** interface configuration commands. If a port is in per-VLAN errdisable mode, you can also use **clear errdisable interface *name* vlan *range*** command to re-enable the VLAN on the port.

To limit the rate of incoming ARP packets, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# errdisable detect cause arp-inspection [action shutdown vlan]	Enables per-VLAN error-disable detection. Note By default this command is enabled, and when a violation occurs the interface is shutdown.
Step 3	Switch(config)# interface interface-id	Specifies the interface to be rate-limited, and enters interface configuration mode.
Step 4	Switch(config-if)# [no] ip arp inspection limit {rate pps [burst interval seconds] none}	Limits the rate of incoming ARP requests and responses on the interface. The default rate is 15 pps on untrusted interfaces and unlimited on trusted interfaces. The burst interval is 1 second. The keywords have these meanings: <ul style="list-style-type: none"> For rate pps, specify an upper limit for the number of incoming packets processed per second. The range is 0 to 2048 pps. (Optional) For burst interval seconds, specify the consecutive interval in seconds, over which the interface is monitored for a high rate of ARP packets. The range is 1 to 15. For rate none, specify no upper limit for the rate of incoming ARP packets that can be processed.
Step 5	Switch(config-if)# exit	Returns to global configuration mode.
Step 6	Switch(config)# errdisable recovery {cause arp-inspection interval interval}	(Optional) Enables error recovery from the dynamic ARP inspection error-disable state. By default, recovery is disabled, and the recovery interval is 300 seconds. For interval interval , specify the time in seconds to recover from the error-disable state. The range is 30 to 86400.
Step 7	Switch(config)# exit	Returns to privileged EXEC mode.
Step 8	Switch# show ip arp inspection interfaces	Verifies your settings.
Step 9	Switch# show errdisable recovery	Verifies your settings.
Step 10	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To return to the default rate-limit configuration, use the **no ip arp inspection limit** interface configuration command. To disable error recovery for dynamic ARP inspection, use the **no errdisable recovery cause arp-inspection** global configuration command.

This example shows how to set an upper limit for the number of incoming packets (100 pps) and to specify a burst interval (1 second):

```
SwitchB# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchB(config)# interface g3/31
SwitchB(config-if)# ip arp inspection limit rate 100 burst interval 1
SwitchB(config-if)# exit
SwitchB(config)# errdisable recovery cause arp-inspection
SwitchB(config)# exit
```

SwitchB# **show ip arp inspection interfaces**

Performing Validation Checks

Dynamic ARP inspection intercepts, logs, and discards ARP packets with invalid IP-to-MAC address bindings. You can configure the switch to perform additional checks on the destination MAC address, the sender and target IP addresses, and the source MAC address.

To perform specific checks on incoming ARP packets, perform this task.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ip arp inspection validate {[src-mac] [dst-mac] [ip]}	<p>Performs a specific check on incoming ARP packets. By default, no additional checks are performed.</p> <p>The keywords have these meanings:</p> <ul style="list-style-type: none"> For src-mac, check the source MAC address in the Ethernet header against the sender MAC address in the ARP body. This check is performed on both ARP requests and responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped. For dst-mac, check the destination MAC address in the Ethernet header against the target MAC address in ARP body. This check is performed for ARP responses. When enabled, packets with different MAC addresses are classified as invalid and are dropped. For ip, check the ARP body for invalid and unexpected IP addresses. Addresses include 0.0.0.0, 255.255.255.255, and all IP multicast addresses. Sender IP addresses are checked in all ARP requests and responses, and target IP addresses are checked only in ARP responses. <p>You must specify at least one of the keywords. Each command overrides the configuration of the previous command; that is, if a command enables src and dst mac validations, and a second command enables IP validation only, the src and dst mac validations are disabled as a result of the second command.</p>
Step 3	Switch(config)# exit	Returns to privileged EXEC mode.
Step 4	Switch# show ip arp inspection vlan vlan-range	Verifies your settings.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable checking, use the **no ip arp inspection validate [src-mac] [dst-mac] [ip]** global configuration command. To display statistics for forwarded, dropped, MAC validation failure, and IP validation failure packets, use the **show ip arp inspection statistics** privileged EXEC command.

This example shows how to configure source mac validation. Packets are dropped and an error message may be generated when the source address in the Ethernet header does not match the sender hardware address in the ARP body.

```
SwitchB# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
SwitchB(config)# ip arp inspection validate src-mac
SwitchB(config)# exit
SwitchB# show ip arp inspection vlan 100
```

```
Source Mac Validation      : Enabled
Destination Mac Validation : Disabled
IP Address Validation      : Disabled
```

CHAPTER 47

Configuring Network Security with ACLs

This chapter describes how to use access control lists (ACLs) to configure network security on the Catalyst 4500 series switches.

Note

The Catalyst 4500 series switch supports “time-based ACLs”.

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

This chapter consists of the following major sections:

- [Understanding ACLs, page 47-2](#)
- [Hardware and Software ACL Support, page 47-5](#)
- [TCAM Programming and ACLs for Supervisor Engine II-Plus, Supervisor Engine IV, Supervisor Engine V, and Supervisor Engine V-10GE, page 47-6](#)
- [TCAM Programming and ACLs for Supervisor Engine 6-E, page 47-15](#)
- [Layer 4 Operators in ACLs, page 47-15](#)
- [Configuring Unicast MAC Address Filtering, page 47-19](#)
- [Configuring Named MAC Extended ACLs, page 47-19](#)
- [Configuring EtherType Matching, page 47-21](#)
- [Configuring Named IPv6 ACLs, page 47-22](#)
- [Applying IPv6 ACLs to a Layer 3 Interface, page 47-23](#)
- [Configuring VLAN Maps, page 47-23](#)
- [Displaying VLAN Access Map Information, page 47-30](#)

- [Using VLAN Maps with Router ACLs, page 47-31](#)
- [Configuring PACLs, page 47-33](#)
- [Using PACL with VLAN Maps and Router ACLs, page 47-37](#)

**Note**

The following discussions applies to both Supervisor Engine 6-E and non-Supervisor Engine 6-E configurations unless noted otherwise.

Understanding ACLs

This section contains the following subsections:

- [ACL Overview, page 47-2](#)
- [Supported Features That Use ACLs, page 47-3](#)
- [Router ACLs, page 47-3](#)
- [Port ACLs, page 47-4](#)
- [VLAN Maps, page 47-5](#)

ACL Overview

An ACL is a collection of sequential permit and deny conditions that applies to packets. When a packet is received on an interface, the switch compares the fields in the packet against any applied ACLs to verify that the packet has the permissions required to be forwarded, based on the conditions specified in the access lists. It tests the packets against the conditions in an access list one-by-one. The first match determines whether the switch accepts or rejects the packets. Because the switch stops testing conditions after the first match, the order of conditions in the list is critical. If no conditions match, the switch drops the packet. If there are no restrictions, the switch forwards the packet; otherwise, the switch drops the packet.

Switches traditionally operate at Layer 2, switching traffic within a VLAN, whereas routers route traffic between VLANs at Layer 3. The Catalyst 4500 series switch can accelerate packet routing between VLANs by using Layer 3 switching. The Layer 3 switch bridges the packet, and then routes the packet internally without going to an external router. The packet is then bridged again and sent to its destination. During this process, the switch can control all packets, including packets bridged within a VLAN.

You configure access lists on a router or switch to filter traffic and provide basic security for your network. If you do not configure ACLs, all packets passing through the switch could be allowed on all parts of the network. You can use ACLs to control which hosts can access different parts of a network or to decide which types of traffic are forwarded or blocked at router interfaces. For example, you can allow e-mail traffic to be forwarded but not Telnet traffic. ACLs can be configured to block inbound traffic, outbound traffic, or both. However, on Layer 2 interfaces, you can apply ACLs only in the inbound direction.

An ACL contains an ordered list of access control entries (ACEs). Each ACE specifies permit or deny and a set of conditions the packet must satisfy in order to match the ACE. The meaning of permit or deny depends on the context in which the ACL is used.

The Catalyst 4500 series switch supports three types of ACLs:

- IP ACLs, which filter IP traffic, including TCP, the User Datagram Protocol (UDP), Internet Group Management Protocol (IGMP), and Internet Control Message Protocol (ICMP).
- IPv6 ACLs (applies only to Supervisor Engine 6E).

Supported Features That Use ACLs

The switch supports two applications of ACLs to filter traffic:

- Router ACLs are applied to Layer 3 interfaces. They control the access of routed traffic between VLANs. All Catalyst 4500 series switches can create router ACLs, but you must have a Cisco IOS software image on your switch to apply an ACL to a Layer 3 interface and filter packets routed between VLANs.
- Port ACLs perform access control on traffic entering a Layer 2 interface. If there are not enough hardware CAM entries, the output port ACL is not applied to the port and a warning message is given to user. (This restriction applies to all access group modes for output port ACLs.) When there are enough CAM entries, the output port ACL might be reapplied.

If there is any output port ACL configured on a Layer 2 port, then no VACL or router ACL can be configured on the VLANs that the Layer 2 port belongs to. Also, the reverse is true: port ACLs and VLAN-based ACLs (VACLs and router ACLs) are mutually exclusive on a Layer 2 port. This restriction applies to all access group modes. On the input direction, port ACLs, VLAN-based ACLs, and router ACLs can co-exist.

You can apply only one IP access list, one MAC access list for a Layer 2 interface.

- VLAN ACLs or VLAN maps control the access of all packets (bridged and routed). You can use VLAN maps to filter traffic between devices in the same VLAN. You do not need the enhanced image to create or apply VLAN maps. VLAN maps are configured to control access based on Layer 3 addresses for IP. MAC addresses using Ethernet ACEs control the access of unsupported protocols. After you apply a VLAN map to a VLAN, all packets (routed or bridged) entering the VLAN are checked against that map. Packets can either enter the VLAN through a switch port or through a routed port after being routed.

You can use both router ACLs and VLAN maps on the same switch.

Router ACLs

You can apply one access-list of each supported type to an interface.

Note

Catalyst 4500 series switches running Cisco IOS Release 12.2(40)SG do *not* support IPv6 Port ACLs (PACLs).

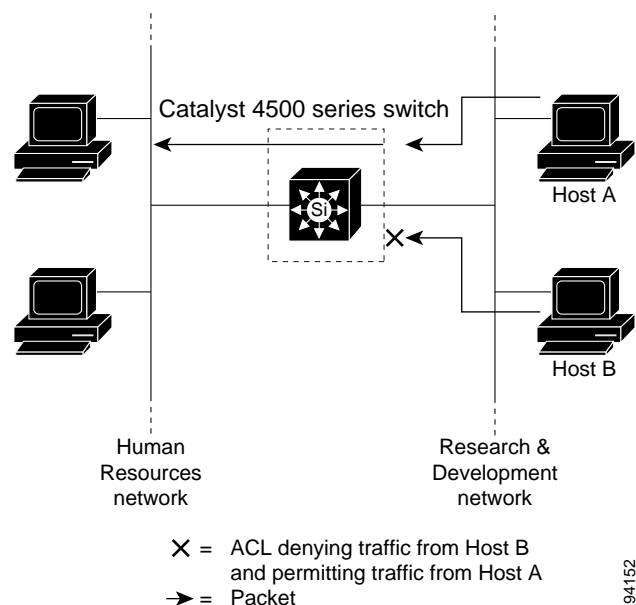

Multiple features can use one ACL for a given interface, and one feature can use multiple ACLs. When a single router ACL is used by multiple features, it is examined multiple times. The access list type determines the input to the matching operation:

- Standard IP access lists use source addresses for matching operations.
- Extended IP access lists use source and destination addresses and optional protocol type information for matching operations.

The switch examines ACLs associated with features configured on a given interface and a direction. As packets enter the switch on an interface, ACLs associated with all inbound features configured on that interface are examined. After packets are routed and before they are forwarded to the next hop, all ACLs associated with outbound features configured on the egress interface are examined.

ACLs permit or deny packet forwarding based on how the packet matches the entries in the ACL. For example, you can use access lists to allow one host to access a part of a network, but prevent another host from accessing the same part. In [Figure 47-1](#), ACLs applied at the router input allow Host A to access the Human Resources network, but prevent Host B from accessing the same network.

Figure 47-1 Using ACLs to Control Traffic to a Network

Port ACLs

You can also apply ACLs to Layer 2 interfaces on a switch. Port ACLs are supported on physical interfaces and EtherChannel interfaces.

The following access lists are supported on Layer 2 interfaces:

- Standard IP access lists using source addresses
- Extended IP access lists using source and destination addresses and optional protocol type information
- MAC extended access lists using source and destination MAC addresses and optional protocol type information

As with router ACLs, the switch examines ACLs associated with features configured on a given interface and permits or denies packet forwarding based on how the packet matches the entries in the ACL. In the example in [Figure 47-1](#), if all workstations were in the same VLAN, ACLs applied at the Layer 2 input would allow Host A to access the Human Resources network, but prevent Host B from accessing the same network.

When you apply a port ACL to a trunk port, the ACL filters traffic on all VLANs present on the trunk port. When you apply a port ACL to a port with voice VLAN, the ACL filters traffic on both data and voice VLANs.

With port ACLs, you can filter IP traffic by using IP access lists and non-IP traffic by using MAC addresses. You can filter both IP and non-IP traffic on the same Layer 2 interface by applying both an IP access list and a MAC access list to the interface.

**Note**

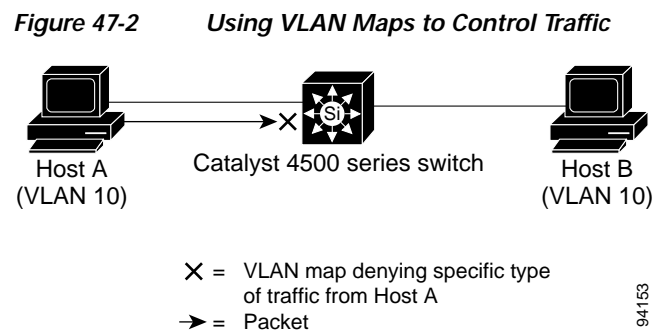

You cannot apply more than one IP access list and one MAC access list to a Layer 2 interface. If an IP access list or MAC access list is already configured on a Layer 2 interface and you apply a new IP access list or MAC access list to the interface, the new ACL replaces the previously configured one.

VLAN Maps

VLAN maps can control the access of all traffic in a VLAN. You can apply VLAN maps on the switch to all packets that are routed into or out of a VLAN or are bridged within a VLAN. Unlike router ACLs, VLAN maps are not defined by direction (input or output).

You can configure VLAN maps to match Layer 3 addresses for IP traffic. Access of all non-IP protocols is controlled with a MAC address and an Ethertype using MAC ACLs in VLAN maps. (IP traffic is not controlled by MAC ACLs in VLAN maps.) You can enforce VLAN maps only on packets going through the switch; you cannot enforce VLAN maps on traffic between hosts on a hub or on another switch connected to this switch.

With VLAN maps, forwarding packets is permitted or denied, based on the action specified in the map. [Figure 47-2](#) illustrates how a VLAN map is applied to deny a specific type of traffic from Host A in VLAN 10 from being forwarded.

Hardware and Software ACL Support

This section describes how to determine whether ACLs are processed in hardware or in software:

- Flows that match a *deny* statement in standard and extended ACLs are dropped in hardware if ICMP unreachable messages are disabled.
- Flows that match a *permit* statement in standard ACLs are processed in hardware.

- The following ACL types are not supported in software:
 - Standard Xerox Network Systems (XNS) Protocol access list
 - Extended XNS access list
 - DECnet access list
 - Protocol type-code access list
 - Standard Internet Packet Exchange (IPX) access list
 - Extended IPX access list

**Note**

Packets that require logging are processed in software. A copy of the packets is sent to the CPU for logging while the actual packets are forwarded in hardware so that non-logged packet processing is not impacted.

By default, the Catalyst 4500 series switch sends ICMP unreachable messages when a packet is denied by an access list; these packets are not dropped in hardware but are forwarded to the switch so that it can generate the ICMP unreachable message.

To drop access-list denied packets in hardware on the input interface, you must disable ICMP unreachable messages using the **no ip unreachable** interface configuration command. The **ip unreachable** command is enabled by default.

**Note**

Cisco IOS Release 12.2(40)SG does not support disabling ip unreachable on interfaces routing IPv6 traffic.

**Note**

If you set the **no ip unreachable** command on all Layer 3 interfaces, output ACL denied packets do not come to the CPU.

TCAM Programming and ACLs for Supervisor Engine II-Plus, Supervisor Engine IV, Supervisor Engine V, and Supervisor Engine V-10GE

TCAM entry and mask utilization on the Catalyst 4500 series switch is based on the following elements:

- ACL configuration
- Supervisor model
- IOS software version

For Supervisor Engine II-Plus-10GE, Supervisor Engine V-10GE, and the Catalyst 4948-10GE switch, the entry and mask utilization equals the number of ACEs in the ACL configuration divided by the number of entries in the TCAM region, regardless of IOS software version. Optimized TCAM utilization is not required.

For Supervisor Engine II-Plus-TS, Supervisor Engines IV, Supervisor Engines V, and the Catalyst 4948 switch, up to eight entries share a single mask in the TCAM regardless of the IOS software release. So, TCAM utilization depends on the ACL configuration. It also depends on the order of configuring each ACL; TCAM utilization may differ if one ACL is configured before another and vice versa. Copying the same ACL configuration to the running-config may also cause TCAM utilization to change.

**Note**

When an interface is in down state, TCAMs are not consumed for RACLs, but are for PACLs.

TCAM utilization on Supervisors II-Plus-TS, IV, V, and the Catalyst 4948 switch may be optimized depending on the ACL configuration and IOS software version. For instance, Cisco IOS Release 12.2(31)SGA and later releases automatically reorder order-independent ACL entries to preserve masks. Two ACEs are order-independent if a single packet can match only one of them. For example, the following two ACEs are order-independent:

```
permit ip host 10.1.1.10 any
permit ip host 10.1.1.20 any
```

Any packet that would match the first ACE would not match the second, and vice versa. In contrast, the following two ACEs are not order-independent:

```
permit ip host 10.1.1.10 any
permit ip any host 10.1.1.20
```

A packet with source IP address 10.1.1.10 and destination IP address 10.1.1.20 would be able to match both ACEs, so their order matters.

When estimating TCAM utilization for Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 switch prior to deployment, start with the default configuration. Because of the dynamic nature of programming ACEs that share masks, estimating TCAM utilization is unpredictable when ACLs are already programmed.

For Cisco IOS Release 12.2(31)SGA and later, you can estimate TCAM utilization for IP ACL provided the TCAM is empty. For each IP ACL, four ACEs are automatically added to the ACL: two static ACEs, an appended IP deny-all ACE, and an appended permit-all ACE. So, the minimum number of masks for an IP ACL is five. To find the number of masks utilized by the remaining ACEs, count the number of different masks, adding one for every different mask with more than eight ACEs.

For Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 switch running IOS software prior to release 12.2(31)SGA, ACLs are not automatically optimized before the TCAM is programmed. Grouping ACEs with similar masks prior to configuring the ACL may improve mask utilization.

**Note**

After upgrading to Cisco IOS Release 12.2(31)SGA or later on Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 switch, TCAM ACL utilization may decrease because of independent ACE reordering. Conversely, downgrading to Cisco IOS Release 12.2(31)SG or earlier may cause TCAM utilization to increase.

TCAM Programming Algorithms

**Note**

The TCAM programming algorithm is *NOT* available on Supervisor Engine 6-E.

Beginning with Cisco IOS Release 12.2(25)EWA, two TCAM programming algorithms are supported on Catalyst 4500 and 4900 series switches: packed and scattered. The *packed* mode algorithm programs the entries in the same 8-entry TCAM block provided the entries' masks match. If the current entry's mask differs from previous entries', the switch software programs the entry in a new 8-entry block. If the mask does not change, or if the mask changes every eight entries across ACLs from the beginning to the end of the configuration, the TCAM may be fully utilized in packed mode for Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 series switch.

In *scattered* mode, a single ACL's entries are distributed across different 8-entry blocks until the ACL is fully programmed. If successive ACLs have the same mask pattern as the first ACL, the TCAM on Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 series switch may be fully utilized.

Scattered mode is recommended for IP Source Guard configurations on Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 switch. This is because the mask pattern for per-VLAN ACLs is the same for all ports configured for IP Source Guard: permit ARP packets, permit Layer 2 traffic if port security is not configured, permit IP traffic from a particular source IP address with a 32-bit mask, deny unknown, and permit all.

**Note**

The TCAM programming algorithm can be configured on Supervisor Engine V-10GE and the Catalyst 4948-10GE switch running Cisco IOS Release 12.2(25)EWA or its subsequent maintenance releases. On Supervisor Engine V-10GE and the Catalyst 4948-10GE switch, however, because ACL masks are not shared among ACEs, TCAM utilization will be the same regardless of the programming algorithm is configured.

**Note**

The TCAM programming algorithm cannot be configured on Supervisor Engines II-Plus-10GE or V-10GE or the Catalyst 4948-10GE switch running Cisco IOS Release 12.2(25)SG and later.

**Note**

The TCAM utilization should not change after you successively configure the same TCAM programming algorithm. For example, configuring access-list hardware entries packed twice should not affect TCAM utilization. However, TCAM utilization may change if one or more commands are issued between successive configurations of the same TCAM programming algorithm.

Below is a summary of scenarios that cause TCAM utilization to change:

- Addition or deletion of ACLs or ACEs in the running-config
- Copying or recopying the ACL configuration from bootflash, a TFTP server, or compact flash memory to the running-config
- Changing the TCAM programming algorithm
- Saving the running-config to NVRAM and reloading the switch
- Resizing the feature ACL or QoS regions of the TCAM with the **access-list hardware region <feature | qos> <input | output> balance <percent>** command on Cisco IOS Release 12.2(31)SGA and beyond.
- Upgrading from images based on Cisco IOS Release 12.2(25)EWA to images based on Cisco IOS Release 12.2(31)SGA

As discussed earlier, two types of hardware resources are consumed when you program ACLs: entries and masks. If either one of these resources is exhausted, no additional ACLs can be programmed into hardware.

If you run out of resources, you refer to the following sections:

- [Change the Programming Algorithm, page 47-9](#)
- [Resize the TCAM Regions, page 47-10](#)
- [Selecting Mode of Capturing Control Packets, page 47-12](#)

Change the Programming Algorithm

If the masks on a system are exhausted, but entries are available, changing the programming scheme from packed to scattered might free up masks, allowing additional ACLs to be programmed into hardware.

Note

Changing the ACL programming algorithm or resizing the TCAM regions causes all ACLs to be temporarily unloaded from the hardware and then reloaded in accordance with the new TCAM parameters. ACLs are inoperative until the reloading process is complete.

The goal is to use TCAM resources more efficiently by minimizing the number of masks per ACL entry.

To...	Use the Command...
Compare TCAM utilization when employing the scattered or packed algorithms.	Switch# show platform hardware acl statistics utilization brief
Change the algorithm from packed to scattered.	Switch(config)# access-list hardware entries scattered
Change the algorithm from scattered to packed.	Switch(config)# access-list hardware entries packed

Note

access-list hardware entries packed is the default, which do *not* appear in the output of the **show running-config** command. If you configure scattered mode, the line “access-list hardware entries scattered” will appear in the output. Instead, if you configure packed mode, *nothing* will appear in the output.

Note

The default TCAM programming algorithm is packed.

The following output was collected from a switch running in packed mode. Observe that 89 percent of the masks are required to program only 49 percent of the ACL entries.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries packed
Switch(config)# end
Switch#
01:15:34: %SYS-5-CONFIG_I: Configured from console by console
Switch#
```

```
Switch# show platform hardware acl statistics utilization brief
```

		Entries/Total (%)	Masks/Total (%)
Input	Acl(PortAndVlan)	2016 / 4096 (49)	460 / 512 (89)
Input	Acl(PortOrVlan)	6 / 4096 (0)	4 / 512 (0)
Input	Qos(PortAndVlan)	0 / 4096 (0)	0 / 512 (0)
Input	Qos(PortOrVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Acl(PortAndVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Acl(PortOrVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Qos(PortAndVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Qos(PortOrVlan)	0 / 4096 (0)	0 / 512 (0)

L4Ops: used 2 out of 64

The following output was collected after the algorithm was switched to scattered. Observe that the number of masks required to program 49 percent of the entries has decreased to 49 percent.

Note

When you enable DHCP snooping and IP Source Guard on all ports on a chassis, you must use the scattered keyword.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware entries scattered
Switch(config)# end
Switch#
01:39:37: %SYS-5-CONFIG_I: Configured from console by console
Switch#
Switch# show platform hardware acl statistics utilization brief
```

		Entries/Total (%)	Masks/Total (%)
Input	Acl(PortAndVlan)	2016 / 4096 (49)	252 / 512 (49)
Input	Acl(PortOrVlan)	6 / 4096 (0)	5 / 512 (0)
Input	Qos(PortAndVlan)	0 / 4096 (0)	0 / 512 (0)
Input	Qos(PortOrVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Acl(PortAndVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Acl(PortOrVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Qos(PortAndVlan)	0 / 4096 (0)	0 / 512 (0)
Output	Qos(PortOrVlan)	0 / 4096 (0)	0 / 512 (0)

Switch#

Resize the TCAM Regions

The TCAM is divided into regions, each of which holds different kinds of entries. There are four main TCAM types: Input ACL, Output ACL, Input QoS, and Output QoS. Each is divided into a PortAndVlan region and a PortOrVlan region. By default the PortAndVlan region and PortOrVlan region are of equal size.

The following table lists the entries and mask counts for each of the supported supervisor engines. The entry/mask counts for the various supervisor engines are for each TCAM type; for example, the input feature TCAM has 16,000 entries, and the output feature TCAM has 16,000 entries.

Supervisor Engine	Entries	Masks
Supervisor Engine III	16,000	2,000
Supervisor Engine IV	16,000	2,000
Supervisor Engine V	16,000	2,000
Supervisor Engine II-Plus	8,000	1,000
Supervisor Engine II-Plus-TS	8,000	1,000
Supervisor Engine V-10GE	16,000	16,000
Supervisor Engine II-Plus-10GE	TBP	TBP

**Note**

Because of the ratio of entries to masks on Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 switch is 8:1, TCAM space for masks may be exhausted before space for entries is exhausted.

**Note**

One region in a TCAM type might be filled while the other region still has free space. When this happens, the regions can be resized to move the free entries from the region where they are not needed to the region where they are needed. Regions are resized using the **access-list hardware region {feature | qos} {input | output} balance** command. Each TCAM type has its own independent region balance.

**Note**

Higher balance values indicate more entries to the PortAndVlan region and less entries to the PortOrVlan region. Lower balance values indicate less entries to the PortAndVlan region and more entries to the PortOrVlan region. A balance of 50 indicates equal allocation to both PortAndVlan and PortOrVlan regions.

**Note**

You can only shift entries between the PortAndVlan region and the PortOrVlan region for a specific TCAM type (for example, from the Input ACL TCAM PortOrVlan region to the Input ACL TCAM PortAndVlan region). You cannot shift entries between TCAM types.

To determine whether region resizing would be beneficial, do the following:

```
Switch# show platform hardware acl statistics utilization brief
```

```
Input  Acl(PortAndVlan)      2346 / 8112 ( 29)      1014 / 1014 (100)
Input  Acl(PortOrVlan)       0 / 8112 (  0)         0 / 1014 (  0)
Input  Qos(PortOrVlan)       0 / 8128 (  0)         0 / 1016 (  0)
Input  Qos(PortOrVlan)       0 / 8128 (  0)         0 / 1016 (  0)
Output Acl(PortOrVlan)       0 / 8112 (  0)         0 / 1014 (  0)
Output Acl(PortOrVlan)       0 / 8112 (  0)         0 / 1014 (  0)
Output Qos(PortOrVlan)       0 / 8128 (  0)         0 / 1016 (  0)
Output Qos(PortOrVlan)       0 / 8128 (  0)         0 / 1016 (  0)
```

```
L4Ops: used 2 out of 64
```

The above output indicates that the Input ACL PortAndVlan region is out of masks, but there is free space in the Input ACL PortOrVlan region that could be repurposed.

The following example shows how to change the region balance of the Input ACL TCAM so that 75 per cent of the entries are allocated to the PortAndVlan region and only 25 per cent to the PortOrVlan region.

```
Switch# configure terminal
Switch(config)# access-list hardware region feature input balance 75
```

After adjusting the region balance, the PortAndVlan region has more resources allocated to it, and the PortOrVlan region has fewer resources.

```
Switch# show platform hardware acl statistics utilization brief
```

Input	Acl(PortAndVlan)	2346 / 12160 (19)	1014 / 1520 (67)
Input	Acl(PortOrVlan)	0 / 4064 (0)	0 / 508 (0)
Input	Qos(PortOrVlan)	0 / 8128 (0)	0 / 1016 (0)
Input	Qos(PortOrVlan)	0 / 8128 (0)	0 / 1016 (0)
Output	Acl(PortOrVlan)	0 / 8112 (0)	0 / 1014 (0)
Output	Acl(PortOrVlan)	0 / 8112 (0)	0 / 1014 (0)
Output	Qos(PortOrVlan)	0 / 8128 (0)	0 / 1016 (0)
Output	Qos(PortOrVlan)	0 / 8128 (0)	0 / 1016 (0)

```
L4Ops: used 2 out of 64
Switch#
```

Note

Both the **no access-list hardware region {feature | qos} {input | output} balance** command and a balance of 50, forces the configuration to the default values. A similar configuration can also be performed for QoS.

Troubleshooting High CPU Due to ACLs

Packets that match entries in fully programmed ACLs are processed in hardware. However, large ACL and IPSG configurations may exhaust TCAM masks on Supervisor Engines II-Plus-TS, IV, V, and the Catalyst 4948 switch before the ACLs are fully programmed.

Packets that match entries in partially programmed ACLs are processed in software using the CPU. This may cause high CPU utilization and packets to be dropped. To determine whether packets are being dropped due to high CPU utilization, reference the following:

http://www.cisco.com/en/US/products/hw/switches/ps663/products_tech_note09186a00804cef15.shtml

If the ACL and/or IPSG configuration is partially programmed in hardware, upgrading to Cisco IOS Release 12.2(31)SGA or later and resizing the TCAM regions may enable the ACLs to be fully programmed.

Note

Removal of obsolete TCAM entries may take several CPU process review cycles to complete. This may cause some packets to be switched in software if the TCAM entry or mask utilization is at or near 100%.

Selecting Mode of Capturing Control Packets

In some deployments, you might want to bridge control packets in hardware rather than globally capture and forward them in software (at the expense of the CPU). The per-VLAN capture mode feature allows a Catalyst 4500 series switch to capture control packets only on selected VLANs and bridge traffic in hardware on all other VLANs.

When you employ per-VLAN capture mode on your switch, it partially disables the global TCAM capture entries internally and attaches feature-specific capture ACLs on those VLANs that are enabled for snooping or routing features. (All IP capture entries, CGMP, and other non-IP entries are still captured through global TCAM.) Because this feature controls specific control packets, they are captured only on the VLANs on which the internal ACLs are installed. On all other VLANs, the control traffic is bridged in hardware rather than forwarded to CPU.

The per-VLAN capture mode allows you to apply user-defined ACLs and QoS policers (in hardware) on control packets. Furthermore, you can subject the aggregate control traffic ingressing the CPU to Control Plane Policing.

When you use per-VLAN capture mode, the following four protocol groups are selectable per VLAN. Observe the breakdown of protocols intercepted by each group.

- IGMP Snooping - Cgmp, Ospf, Igmp, RipV2, Pim, 224.0.0.1, 224.0.0.2, 224.0.0.*
- DHCP Snooping - Client to Server, Server to Client, Server to Server
- Unicast Routing - Ospf, Rip v2, 224.0.0.1, 224.0.0.2, 224.0.0.*
- Multicast Routing - Ospf, Rip v2, Igmp, Pim, 224.0.0.1, 224.0.0.2, 224.0.0.*

Because some of the groups have multiple overlapping ACEs (for example, 224.0.0.* is present in all the groups except for DHCP Snooping), turning on a certain group will also trigger the interception of some protocols from other groups.

Following are the programming triggers for the four protocol groups per VLAN:

- IGMP Snooping should be enabled globally on a given VLAN.
- DHCP Snooping should be enabled globally on a given VLAN.
- Unicast Routing should be enabled and SVI (or a Layer 3 physical) interface should be up and configured with an IP protocol address. This is because interfaces immediately become part of the routing process once the SVI interface comes up and the protocol family address is configured.
- Multicast Routing should be enabled and one of the multicast routing protocols should be configured on the interface (IGMP, PIMv1, PIMv2, MBGP, MOSPF, DVMRP, and IGMP snooping).

Caveats and Restriction

Note

Before configuring per-VLAN capture mode, you should examine your configuration to ensure that only the necessary features are enabled on the desired VLANs.

The following caveats and restrictions apply to per-VLAN capture mode:

- Enabling per-VLAN capture mode consumes additional entries in the ACL/feature TCAM.
The number of available TCAM entries depends on the type of supervisor engine. The entry/mask count further limits the utilization of the ACL/feature TCAM.
- Certain configurations can exhaust TCAM resource earlier in per-VLAN capture mode than in global capture mode (such as, IP Source Guard is enabled on several interfaces, or on a user configured PACL).
You can re-size TCAM regions to make more entries available to the PortAndVlan or PortOrVlan region based on the configuration. This allows more entries to be programmed in hardware before reaching the limit. When TCAM resources are exhausted, the packets are forwarded in software.
- In per-VLAN capture mode, you can configure ACLs to permit or deny control traffic on a VLAN or port.

Because security ACLs are terminated by an *implicit deny*, you must ensure that the ACLs are configured to permit the control packets necessary for the feature (protocol) to operate. However, this rule does not differ from the default behavior.

Configuration

To select the mode of capturing control packets, perform this task:

	Command	Purpose
Step 1	Switch# conf terminal	Enters configuration mode.
Step 2	Switch(config)# [no] access-list hardware capture mode [vlan global]	Selects mode of capturing control packets. The no form of the access-list hardware capture mode command restores the capture mode to the default, global.
Step 3	Switch(config)# end	Returns to enable mode.

This example shows how to configure a Catalyst 4500 series switch to capture control packets only on VLANs where features are enabled:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode vlan
Switch(config)# end
Switch#
```

This example shows how to configure a Catalyst 4500 series switch to capture control packets globally across all VLANs (using *static ACL*, the default mode):

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# access-list hardware capture mode global
Switch(config)# end
Switch#
```

When the capture mode changes from global to VLAN, the static CAM entries are invalidated. This creates a window during which control packets may pass through a Catalyst 4500 series switch without being intercepted to the CPU. This temporary situation is restored when the new per-VLAN capture entries are programmed in the hardware.

When you configure per-VLAN capture mode, you should examine the show commands for individual features to verify the appropriate behavior. In per-VLAN capture mode, the invalidated static CAM entries will appear as inactive in the output of the **show platform hardware acl input entries static** command. For example, the hit count for inactive entries will remain frozen because those entries are invalidated and applied per VLAN where the feature is enabled:

CamIndex Entry Type	Active	Hit Count	CamRegion
50 PermitSharedStp	Y	3344	ControlPktsTwo
51 PermitLoopbackTest	Y	0	ControlPktsTwo
52 PermitProtTunnel	Y	0	ControlPktsTwo
53 CaptureCgmp	N	440	ControlPktsTwo

CamIndex Entry Type	Active	Hit Count	CamRegion
54 CaptureOspf	N	4321	ControlPktsTwo
55 CaptureIcmp	N	0	ControlPktsTwo

TCAM Programming and ACLs for Supervisor Engine 6-E

You apply three types of hardware resources when you program ACLs and ACL-based features on the Supervisor Engine 6-E: mapping table entries (MTEs), profiles, and TCAM value/mask entries. If any of these resources are exhausted, packets are sent to the CPU for software-based processing.

**Note**

Unlike Supervisor Engine II+ through V-10GE, Supervisor Engine 6-E automatically manages the available resources. Because masks are not shared on the Supervisor Engine 6-E, only one programming algorithm exists. Because there are no regions, region resizing is not needed.

If you exhaust resources on the Supervisor Engine 6-E, you should try reducing the complexity of your configuration.

**Note**

When an interface is in down state, TCAMs are not consumed for RACLs, but are for PACLs.

Layer 4 Operators in ACLs

The following sections describe guidelines and restrictions for configuring ACLs that include Layer 4 port operations:

- [Restrictions for Layer 4 Operations, page 47-15](#)
- [Configuration Guidelines for Layer 4 Operations, page 47-16](#)
- [How ACL Processing Impacts CPU, page 47-17](#)

Restrictions for Layer 4 Operations

You can specify these operator types, each of which uses one Layer 4 operation in the hardware:

- gt (greater than)
- lt (less than)
- neq (not equal)
- range (inclusive range)

For Supervisor Engine II+ through V-10GE, you should not specify more than six different operations on the same ACL. If you exceed this number, each new operation might cause the affected ACE (access control entry) to be translated into multiple ACEs in hardware. If you exceed this number, the affected ACE might be processed in software.

For Supervisor Engine 6-E, the limits on the number of Layer 4 operations differ for each type of ACL, and can also vary based on other factors: whether an ACL is applied to incoming or outgoing traffic, whether the ACL is a security ACL or is used as a match condition for a QoS policy, and whether IPv6 ACLs are being programmed using the compressed flowlabel format.

**Note**

The IPv6 compressed flowlabel format uses the Layer 2 Address Table to compress a portion of the IPv6 source address of each ACE in the ACL. The extra space freed in the flowlabel can then be used to support more Layer 4 operations. For this compression to be used, the IPv6 ACL cannot contain any ACEs which mask in only a portion of the bottom 48 bits of the source IPv6 address.

Generally, you will receive at most the following number of Layer 4 operations on the same ACL:

Direction	Protocol	Type	Operations
Input	IPv4	Security	16
Input	IPv6 Compressed	Security	16
Input	IPv6 Uncompressed	Security	7
Input	IPv4	QoS	5
Input	IPv6 Compressed	QoS	12
Input	IPv6 Uncompressed	QoS	8
Output	IPv4	Security	17
Output	IPv6 Compressed	Security	17
Output	IPv6 Uncompressed	Security	8
Output	IPv4	QoS	5
Output	IPv6 Compressed	QoS	12
Output	IPv6 Uncompressed	QoS	8

**Note**

Cases where up to 16 Operations are supported; the 17th will trigger an expansion.

If you exceed the number of available Layer 4 operations, each new operation might cause the affected ACE to be translated into multiple ACEs in the hardware. If this translation fails, packets are sent to the CPU for software processing.

Configuration Guidelines for Layer 4 Operations

Observe the following guidelines when using Layer 4 operators:

- Layer 4 operations are considered different if the operator or operand differ. For example, the following ACL contains three different Layer 4 operations because *gt 10* and *gt 11* are considered two different Layer 4 operations:

```
... gt 10 permit
... lt 9 deny
... gt 11 deny
```

**Note**

The *eq* operator can be used an unlimited number of times because *eq* does not use a Layer 4 operation in hardware.

- Layer 4 operations are considered different if the same operator/operand couple applies once to a source port and once to a destination port, as in the following example:

```
... Src gt 10....
... Dst gt 10
```

A more detailed example follows:

```
access-list 101
... (dst port) gt 10 permit
... (dst port) lt 9 deny
... (dst port) gt 11 deny
... (dst port) neq 6 permit
... (src port) neq 6 deny
... (dst port) gt 10 deny

access-list 102
... (dst port) gt 20 deny
... (src port) lt 9 deny
... (src port) range 11 13 deny
... (dst port) neq 6 permit
```

Access lists 101 and 102 use the following Layer 4 operations:

- Access list 101 Layer 4 operations: 5
 - *gt 10 permit* and *gt 10 deny* both use the same operation because they are identical and both operate on the destination port.
- Access list 102 Layer 4 operations: 4
- Total Layer 4 operations: 8 (due to sharing between the two access lists)
 - *neq 6 permit* is shared between the two ACLs because they are identical and both operate on the same destination port.
- A description of the Layer 4 operations usage is as follows:
 - Layer 4 operation 1 stores *gt 10 permit* and *gt 10 deny* from ACL 101
 - Layer 4 operation 2 stores *lt 9 deny* from ACL 101
 - Layer 4 operation 3 stores *gt 11 deny* from ACL 101
 - Layer 4 operation 4 stores *neq 6 permit* from ACL 101 and 102
 - Layer 4 operation 5 stores *neq 6 deny* from ACL 101
 - Layer 4 operation 6 stores *gt 20 deny* from ACL 102
 - Layer 4 operation 7 stores *lt 9 deny* from ACL 102
 - Layer 4 operation 8 stores *range 11 13 deny* from ACL 102

How ACL Processing Impacts CPU

ACL processing can impact the CPU in two ways:

- For some packets, when the hardware runs out of resources, the software must perform the ACL matches:
 - For Supervisor Engine 2-Plus to V-10GE, the TCP flag combinations "rst ack" and "syn fin rst" are processed in hardware. "rst ack" is equivalent to the keyword **established**. Other TCP flag combinations are supported in software.
 - For Supervisor Engine 6-E, the TCP flag combinations "rst ack", "syn fin rst", "urg" and "psh" are processed in hardware. "rst ack" is equivalent to the keyword **established**. Other TCP flag combinations are supported in software.

- For Supervisor Engine 2-Plus to V-10GE, you can specify up to six Layer 4 operations (lt, gt, neq, and range) in an ACL in order for all operations to be guaranteed to be processed in hardware. More than six Layer 4 operations trigger an attempt to translate the excess operations into multiple ACEs in hardware. If this attempt fails, packets are processed in software. The translation process is less likely to succeed on large ACLs with a great number of Layer 4 operations, and on switches with large numbers of ACLs configured. The precise limit depends on how many other ACLs are configured and which specific Layer 4 operations are used by the ACLs being translated. The eq operator does not require any Layer 4 operations and can be used any number of times.
- For Supervisor Engine 6-E, refer to the [“Restrictions for Layer 4 Operations” section on page 47-15](#).
- If the total number of Layer 4 operations in an ACL is less than six, you can distribute the operations in any way you choose.

Examples:

The following access lists are processed completely in hardware:

```
access-list 104 permit tcp any any established
access-list 105 permit tcp any any rst ack
access-list 107 permit tcp any synfin rst
```

Access lists 104 and 105 are identical; established is shorthand for *rst* and *ack*.

Access list 101, below, is processed completely in software:

```
access-list 101 permit tcp any any syn
```

Because four source and two destination operations exist, access list 106, below, is processed in hardware:

```
access-list 106 permit tcp any range 100 120 any range 120 140
access-list 106 permit tcp any range 140 160 any range 180 200
access-list 106 permit tcp any range 200 220
access-list 106 deny tcp any range 220 240
```

In the following code, the Layer 4 operations for the third ACE trigger an attempt to translate *dst lt 1023* into multiple ACEs in hardware, because three source and three destination operations exist. If the translation attempt fails, the third ACE is processed in software.

```
access-list 102 permit tcp any lt 80 any gt 100
access-list 102 permit tcp any range 100 120 any range 120 1024
access-list 102 permit tcp any gt 1024 any lt 1023
```

Similarly, for access list 103, below, the third ACE triggers an attempt to translate *dst gt 1023* into multiple ACEs in hardware. If the attempt fails, the third ACE is processed in software. Although the operations for source and destination ports look similar, they are considered different Layer 4 operations.)

```
access-list 103 permit tcp any lt 80 any lt 80
access-list 103 permit tcp any range 100 120 any range 100 120
access-list 103 permit tcp any gt 1024 any gt 1023
```

Note

Remember that source port *lt 80* and destination port *lt 80* are considered different operations.

- Some packets must be sent to the CPU for accounting purposes, but the action is still performed by the hardware. For example, if a packet must be logged, a copy is sent to the CPU for logging, but the forwarding (or dropping) is performed in the hardware. Although logging slows the CPU, it does not affect the forwarding rate. This sequence of events would happen under the following conditions:
 - When a log keyword is used
 - When an output ACL denies a packet
 - When an input ACL denies a packet, and on the interface where the ACL is applied, **ip unreachable** is enabled (**ip unreachable** is enabled by default on all the interfaces)

Configuring Unicast MAC Address Filtering

To block all unicast traffic to or from a MAC address in a specified VLAN, perform this task:

Command	Purpose
Switch(config)# mac-address-table static <i>mac_address</i> vlan <i>vlan_ID</i> drop	Blocks all traffic to or from the configured unicast MAC address in the specified VLAN. To clear MAC address-based blocking, use the no form of this command without the drop keyword.

This example shows how to block all unicast traffic to or from MAC address 0050.3e8d.6400 in VLAN 12:

```
Router# configure terminal
Router(config)# mac-address-table static 0050.3e8d.6400 vlan 12 drop
```

Configuring Named MAC Extended ACLs

Note

This section applies to Supervisor Engines II-Plus to 6-E.

You can filter non-IP traffic on a VLAN and on a physical Layer 2 port by using MAC addresses and named MAC extended ACLs. The procedure is similar to that of configuring other extended named ACLs. You can use a number to name the access list, but MAC access list numbers from 700 to 799 are not supported.

Note

Named MAC extended ACLs cannot be applied to Layer 3 interfaces.

For more information about the supported non-IP protocols in the **mac access-list extended** command, refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

To create a named MAC extended ACL, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] mac access-list extended name	Defines an extended MAC access list using a name. Use the no mac access-list extended name global configuration command to delete the entire ACL. You can also delete individual ACEs from named MAC extended ACLs.
Step 3	Switch(config-ext-macl)# {deny permit} {any host source MAC address source MAC address mask} {any host destination MAC address destination MAC address mask} [protocol-family {appletalk arp-non-ipv4 decnet ipx ipv6 rarp-ipv4 rarp-non-ipv4 vines xns}]	In extended MAC access-list configuration mode, specify to permit or deny any source MAC address, a source MAC address with a mask, or a specific host source MAC address and any destination MAC address, destination MAC address with a mask, or a specific destination MAC address. (Optional) <ul style="list-style-type: none"> [protocol-family {appletalk arp-non-ipv4 decnet ipx ipv6 rarp-ipv4 rarp-non-ipv4 vines xns}] <p>Note On Supervisor Engine 6-E, IPv6 packets do <i>not</i> generate Layer 2 ACL lookup keys. So, they do not match on MAC ACLs in the same way that IPv4 packets would not match against MAC ACLs in Supervisor Engines II-Plus to V-10GE. Therefore, the ipv6 keyword is applicable to MAC ACLs on Supervisor Engines II-Plus to V-10GE, but not on Supervisor Engine 6-E.</p>
Step 4	Switch(config-ext-macl)# end	Returns to privileged EXEC mode.
Step 5	Switch# show access-lists [number name]	Shows the access list configuration.
Step 6	Switch(config)# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to create and display an access list named *mac1*, denying only EtherType DECnet Phase IV traffic, but permitting all other types of traffic:

```
Switch(config)# mac access-list extended mac1
Switch(config-ext-macl)# deny any any decnet-iv (old) protocol-family decnet (new)
Switch(config-ext-macl)# permit any any
Switch(config-ext-macl)# end
Switch # show access-lists
Extended MAC access list mac1
    deny any any decnet-iv (old) protocol-family decnet (new)
    permit any any
```

The following example shows how to enable or disable hardware statistics while configuring ACEs in the access list:

```
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# mac access-list extended mac1
Switch(config-ext-nacl)# hardware statistics
Switch(config-ext-nacl)# end
```

Configuring EtherType Matching

Note

This section applies to Supervisor Engine 6-E and the Catalyst 4900M chassis.

You can classify non-IP traffic based on the EtherType value using the existing MAC access list commands. When you classify non-IP traffic by EtherType, you can apply security ACLs and QoS policies to traffic that carry the same EtherType.

EtherType matching allows you to classify tagged and untagged IP packets based on the EtherType value. Tagged packets present a potential operation problem:

- While single-tagged packets are supported on the access and trunk ports, double-tagged packets are not.
- Single and double-tagged packets are not supported if the port mode is dot1qtunnel.

For more information about the **mac access-list extended** command, refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference*.

To create a named MAC extended ACL, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] mac access-list extended <i>name</i>	Defines an extended MAC access list using a name. Use the no mac access-list extended name global configuration command to delete the entire ACL. You can also delete individual ACEs from named MAC extended ACLs.
Step 3	Switch(config-ext-macl)# { deny permit } { any host <i>source MAC address</i> <i>source MAC address mask</i> } { any host <i>destination MAC address</i> <i>destination MAC address mask</i> } [protocol-family { appletalk arp-non-ipv4 decnet ipx ipv6 rarp-ipv4 rarp-non-ipv4 vines xns } <i>ethertype</i>]	In extended MAC access-list configuration mode, specify to permit or deny any based upon the EtherTypes value, valid values are 15636-65535. Note You can specify matching by either EtherType or protocol family but not both.
Step 4	Switch(config-ext-macl)# end	Returns to privileged EXEC mode.
Step 5	Switch# show access-lists [<i>number</i> <i>name</i>]	Shows the access list configuration.
Step 6	Switch(config)# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to create and display an access list named matching, permitting the 0x8863 and 0x8040 EtherType values:

```
Switch(config)# mac access-list extended matching
Switch(config-ext-macl)# permit any any 0x8863
Switch(config-ext-macl)# permit any any 0x8040
Switch(config-ext-macl)# end
Switch# show access-lists matching
Extended MAC access list matching
  permit any any 0x8863
  permit any any netbios
Switch#
```

Configuring Named IPv6 ACLs

Note

This section applies only to Supervisor Engine 6-E.

Supervisor 6-E also support hardware based IPv6 ACLs to filter unicast, multicast, and broadcast IPv6 traffic on a Layer 3 interface. You can only configure such access lists on Layer 3 interfaces that are configured with an IPv6 address.

To create a named IPv6 ACLs, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ipv6 access-list name	Defines an IPv6 access list using a name. Use the no form of the command to delete the IPv6 ACL. You can also delete individual ACEs from IPv6 access-list.
Step 3	Switch(config-ipv6-acl)# {deny permit} {any proto} {host ipv6-addr ipv6-prefix} host ipv6-addr ipv6-prefix	Specifies each IPv6 ACE Note This step may be repeated to define multiple ACEs in the ACL.
Step 4	Switch(config-ipv6-acl)# hardware statistics	(Optional) Enables hardware statistics for the IPv6 ACL.
Step 5	Switch(config-ipv6-acl)# end	Returns to privileged EXEC mode.
Step 6	Switch# show ipv6 access-list	Display the IPv6 access list configuration.

The following example shows how to create and display an IPv6 access list named *v6test*, denying only one ipv6 traffic with one particular source/destination address, but permitting all other types of IPv6 traffic:

```
Switch(config)# ipv6 access-list v6test
Switch(config-ipv6-acl)# deny ipv6 host 2020::10 host 2040::10
Switch(config-ipv6-acl)# permit any any
Switch(config-ipv6-acl)# end
Switch# show ipv6 access-list
IPv6 access list v6test
    deny ipv6 host 2020::10 host 2040::10 sequence 10
    permit ipv6 any any sequence 20
```

To enable hardware statistics, enter the following commands while configuring ACEs in the access list:

```
Switch(config)# ipv6 access-list v6test
Switch(config-ipv6-acl)# hardware statistics
Switch(config-ipv6-acl)# end
```

Note

Hardware statistics is disabled by default.

Applying IPv6 ACLs to a Layer 3 Interface

To apply an IPv6 ACL to a Layer 3 interface, perform the following task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface interface-type slot/interface	Specifies the interface to be configured. Note <i>interface-type</i> must be a Layer 3 interface.
Step 3	Switch(config-if)# ipv6 traffic-filter ipv6-acl {in out}	Apply the ipv6 ACL to a Layer 3 interface.

Note IPv6 ACLs are supported in hardware only on Supervisor 6-E.

Note IPv6 ACLs are supported on Layer 3 interfaces and on Layer 2 ports using the **ipv6 traffic-filter** command.

The following example applies the extended-named IPv6 ACL *simple-ipv6-acl* to SVI 300 routed ingress traffic:

```
Switch# configure terminal
Switch(config)# interface vlan 300
Switch(config-if)# ipv6 traffic-filter simple-ipv6-acl in
```

Note Output IPv6 ACLs with Ace to match on the ICMP option fail on a switch.

The following conditions may cause a RACL to malfunction (There is no workaround.):

- ACL are applied on the output direction of the interface.
- IPv6 ACL contain Ace to match on the ICMP option fields (ICMP Type or ICMP Code).

Here are two examples of such non-functioning RACL:

```
IPv6 access list a1
  permit icmp any any nd-ns sequence 10
  deny ipv6 any any sequence 20

IPv6 access list a2
  permit icmp 2020::/96 any nd-ns sequence 10
  deny ipv6 any any sequence 20
```

Configuring VLAN Maps

This section contains the following subsections:

- [VLAN Map Configuration Guidelines, page 47-24](#)
- [Creating and Deleting VLAN Maps, page 47-25](#)
- [Applying a VLAN Map to a VLAN, page 47-27](#)

- [Using VLAN Maps in Your Network, page 47-28](#)

This section describes how to configure VLAN maps, which is the only way to control filtering within a VLAN. VLAN maps have no direction. To filter traffic in a specific direction by using a VLAN map, you need to include an ACL with specific source or destination addresses. If there is a match clause for that type of packet (IP or MAC) in the VLAN map, the default action is to drop the packet if the packet does not match any of the entries within the map. If there is no match clause for that type of packet, the default is to forward the packet.

To create a VLAN map and apply it to one or more VLANs, perform this task:

-
- Step 1** Create the standard or extended IP ACLs or named MAC extended ACLs that you want to apply to the VLAN.
- Step 2** Enter the **vlan access-map** global configuration command to create a VLAN ACL map entry.
- Step 3** In access map configuration mode, you have the optional to enter an **action** (**forward** [the default] or **drop**) and enter the **match** command to specify an IP packet or a non-IP packet and to match the packet against one or more ACLs (standard or extended). If a match clause is not specified, the action is applied to all packets. The match clause can be used to match against multiple ACLs. If a packet matches any of the specified ACLs, the action is applied.

Note If the VLAN map has a match clause for the type of packet (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map for that type of packet, and no action specified, the packet is forwarded.

- Step 4** Use the **vlan filter** global configuration command to apply a VLAN map to one or more VLANs.
-

Note You cannot apply a VLAN map to a VLAN on a switch that has ACLs applied to Layer 2 interfaces (port ACLs).

VLAN Map Configuration Guidelines

Keep the following guidelines in mind when configuring VLAN maps:

- VLAN maps do not filter IPv4 ARP packets.
- If there is no router ACL configured to deny traffic on a routed VLAN interface (input or output), and no VLAN map configured, all traffic is permitted.
- Each VLAN map consists of a series of entries. The order of entries in a VLAN map is important. A packet that comes into the switch is tested against the first entry in the VLAN map. If it matches, the action specified for that part of the VLAN map is taken. If there is no match, the packet is tested against the next entry in the map.
- If the VLAN map has at least one match clause for the type of packet (IP or MAC) and the packet does not match any of these match clauses, the default is to drop the packet. If there is no match clause for that type of packet in the VLAN map, the default is to forward the packet.
- The system might take longer to boot if you have configured a very large number of ACLs.

Creating and Deleting VLAN Maps

Each VLAN map consists of an ordered series of entries. To create, add to, or delete a VLAN map entry, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# vlan access-map <i>name</i> [<i>number</i>]	Creates a VLAN map, and give it a name and (optionally) a number. The number is the sequence number of the entry within the map. When you create VLAN maps with the same name, numbers are assigned sequentially in increments of 10. When modifying or deleting maps, you can enter the number of the map entry that you want to modify or delete. This command enables access-map configuration mode.
Step 3	Switch(config-access-map)# action { drop forward }	(Optional) Sets the action for the map entry. The default is to forward.
Step 4	Switch(config-access-map)# match { ip mac } address { <i>name</i> <i>number</i> } [<i>name</i> <i>number</i>]	Matches the packet (using either the IP or MAC address) against one or more standard or extended access lists. Note that packets are matched only against access lists of the correct protocol type. IP packets are compared with standard or extended IP access lists. Non-IP packets are only compared with named MAC extended access lists. If a match clause is not specified, the action is taken on all packets.
Step 5	Switch(config-access-map)# end	Returns to global configuration mode.
Step 6	Switch(config)# show running-config	Displays the access list configuration.
Step 7	Switch(config)# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

You can use the **no vlan access-map** *name* global configuration command to delete a map. You can use the **no vlan access-map** *name number* global configuration command to delete a single sequence entry from within the map. You can use the **no action** access-map configuration command to enforce the default action, which is to forward.

VLAN maps do not use the specific **permit** or **deny** keywords. To deny a packet by using VLAN maps, create an ACL that would match the packet, and then set the action to drop. A permit in the ACL is the same as a match. A deny in the ACL means no match.

Examples of ACLs and VLAN Maps

These examples show how to create ACLs and VLAN maps that for specific purposes.

Example 1

This example shows how to create an ACL and a VLAN map to deny a packet. In the first map, any packets that match the ip1 ACL (TCP packets) would be dropped. You first create the ip1 ACL to permit any TCP packet and no other packets. Because there is a match clause for IP packets in the VLAN map, the default action is to drop any IP packet that does not match any of the match clauses.

```
Switch(config)# ip access-list extended ip1
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit

Switch(config)# vlan access-map map_1 10
Switch(config-access-map)# match ip address ip1
Switch(config-access-map)# action drop
```

This example shows how to create a VLAN map to permit a packet. ACL ip2 permits UDP packets; and any packets that match the ip2 ACL are forwarded.

```
Switch(config)# ip access-list extended ip2
Switch(config-ext-nacl)# permit udp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map_1 20
Switch(config-access-map)# match ip address ip2
Switch(config-access-map)# action forward
```

In this map, any IP packets that did not match any of the previous ACLs (that is, packets that are not TCP packets or UDP packets) would get dropped.

Example 2

In this example, the VLAN map is configured to drop IP packets and to forward MAC packets by default. By applying standard ACL 101 and the extended named access lists **igmp-match** and **tcp-match**, the VLAN map is configured to do the following:

- Forward all UDP packets
- Drop all IGMP packets
- Forward all TCP packets
- Drop all other IP packets
- Forward all non-IP packets

```
Switch(config)# access-list 101 permit udp any any
Switch(config)# ip access-list extended igmp-match
Switch(config-ext-nacl)# permit igmp any any
Switch(config)# ip access-list extended tcp-match
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map drop-ip-default 10
Switch(config-access-map)# match ip address 101
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 20
Switch(config-access-map)# match ip address igmp-match
Switch(config-access-map)# action drop
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-ip-default 30
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward
```

Example 3

In this example, the VLAN map is configured to drop MAC packets and forward IP packets by default. By applying MAC extended access lists, **good-hosts** and **good-protocols**, the VLAN map is configured to do the following:

- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Forward MAC packets of DECnet or VINES (Virtual Integrated Network Service) protocol-family

- Drop all other non-IP packets
- Forward all IP packets

```
Switch(config)# mac access-list extended good-hosts
Switch(config-ext-macl)# permit host 000.0c00.0111 any
Switch(config-ext-macl)# permit host 000.0c00.0211 any
Switch(config-ext-nacl)# exit
Switch(config)# mac access-list extended good-protocols
Switch(config-ext-macl)# permit any any protocol-family decnet
Switch(config-ext-macl)# permit any any protocol-family vines
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map drop-mac-default 10
Switch(config-access-map)# match mac address good-hosts
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-mac-default 20
Switch(config-access-map)# match mac address good-protocols
Switch(config-access-map)# action forward
```

Example 4

In this example, the VLAN map is configured to drop all packets (IP and non-IP). By applying access lists **tcp-match** and **good-hosts**, the VLAN map is configured to do the following:

- Forward all TCP packets
- Forward MAC packets from hosts 0000.0c00.0111 and 0000.0c00.0211
- Drop all other IP packets
- Drop all other MAC packets

```
Switch(config)# vlan access-map drop-all-default 10
Switch(config-access-map)# match ip address tcp-match
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
Switch(config)# vlan access-map drop-all-default 20
Switch(config-access-map)# match mac address good-hosts
Switch(config-access-map)# action forward
```

Applying a VLAN Map to a VLAN

To apply a VLAN map to one or more VLANs, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# vlan filter <i>mapname</i> vlan-list <i>list</i>	Applies the VLAN map to one or more VLAN IDs. The list can be a single VLAN ID (22), a consecutive list (10-22), or a string of VLAN IDs (12, 22, 30). Spaces around comma, and dash, are optional.
Step 3	Switch(config)# show running-config	Displays the access list configuration.
Step 4	cSwitch(config)# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

**Note**

You cannot apply a VLAN map to a VLAN on a switch that has ACLs applied to Layer 2 interfaces (port ACLs).

This example shows how to apply VLAN map 1 to VLANs 20 through 22:

```
Switch(config)# vlan filter map 1 vlan-list 20-22
```

Using VLAN Maps in Your Network

Figure 47-3 shows a typical wiring closet configuration. Host X and Host Y are in different VLANs, connected to wiring closet switches A and C. Traffic moving from Host X to Host Y is routed by Switch B. Access to traffic moving from Host X to Host Y can be controlled at the entry point of Switch A. In the following configuration, the switch can support a VLAN map and a QoS classification ACL.

Figure 47-3 Wiring Closet Configuration

For example, if you do not want HTTP traffic to be switched from Host X to Host Y, you could apply a VLAN map on Switch A to drop all HTTP traffic moving from Host X (IP address 10.1.1.32) to Host Y (IP address 10.1.1.34) at Switch A and not bridge the traffic to Switch B. To configure this scenario, you would do the following:

First, define an IP access list http to permit (match) any TCP traffic on the HTTP port, as follows:

```
Switch(config)# ip access-list extended http
Switch(config-ext-nacl)# permit tcp host 10.1.1.32 host 10.1.1.34 eq www
Switch(config-ext-nacl)# exit
```

Next, create a VLAN access map named map2 so that traffic that matches the http access list is dropped and all other IP traffic is forwarded, as follows:

```
Switch(config)# vlan access-map map2 10
Switch(config-access-map)# match ip address http
Switch(config-access-map)# action drop
Switch(config-access-map)# exit

Switch(config)# ip access-list extended match_all
Switch(config-ext-nacl)# permit ip any any
Switch(config-ext-nacl)# exit
Switch(config)# vlan access-map map2 20
Switch(config-access-map)# match ip address match_all
Switch(config-access-map)# action forward
```

Then, apply the VLAN access map named map2 to VLAN 1, as follows:

```
Switch(config)# vlan filter map2 vlan 1
```

Denying Access to a Server on Another VLAN

Figure 47-4 shows how to restrict access to a server on another VLAN. In this example, server 10.1.1.100 in VLAN 10 has the following access restrictions:

- Hosts in subnet 10.1.2.0/8 in VLAN 20 should not have access.
- Hosts 10.1.1.4 and 10.1.1.8 in VLAN 10 should not have access.

Figure 47-4 Deny Access to a Server on Another VLAN

This procedure configures ACLs with VLAN maps to deny access to a server on another VLAN. The VLAN map SERVER_1_ACL denies access to hosts in subnet 10.1.2.0/8, host 10.1.1.4, and host 10.1.1.8. Then it permits all other IP traffic. In Step 3, VLAN map SERVER1 is applied to VLAN 10.

To configure this scenario, you could perform the following steps:

Step 1 Define the IP ACL to match and permit the correct packets.

```
Switch(config)# ip access-list extended SERVER1_ACL
Switch(config-ext-nacl)# permit ip 10.1.2.0 0.0.0.255 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.4 host 10.1.1.100
Switch(config-ext-nacl)# permit ip host 10.1.1.8 host 10.1.1.100
Switch(config-ext-nacl)# exit
```

- Step 2** Define a VLAN map using the ACL to drop IP packets that match SERVER1_ACL and forward IP packets that do not match the ACL.

```
Switch(config)# vlan access-map SERVER1_MAP
Switch(config-access-map)# match ip address SERVER1_ACL
Switch(config-access-map)# action drop
Switch(config)# vlan access-map SERVER1_MAP 20
Switch(config-access-map)# action forward
Switch(config-access-map)# exit
```

- Step 3** Apply the VLAN map to VLAN 10.

```
Switch(config)# vlan filter SERVER1_MAP vlan-list 10.
```

Displaying VLAN Access Map Information

To display information about VLAN access maps or VLAN filters, perform one of these commands:

Command	Purpose
Switch# show vlan access-map [mapname]	Shows information about all VLAN access-maps or the specified access map.
Switch# show vlan filter [access-map name / vlan vlan-id]	Shows information about all VLAN filters or about a specified VLAN or VLAN access map.

This is a sample output of the **show vlan access-map** command:

```
Switch# show vlan access-map
Vlan access-map "map_1" 10
  Match clauses:
    ip address: ip1
  Action:
    drop
Vlan access-map "map_1" 20
  Match clauses:
    mac address: mac1
  Action:
    forward
Vlan access-map "map_1" 30
  Match clauses:
  Action:
    drop
```

Note

Sequence 30 does not have a match clause. All packets (IP as well as non-IP) are matched against it and dropped.

This is a sample output of the **show vlan filter** command:

```
Switch# show vlan filter
VLAN Map map_1 is filtering VLANs:
  20-22
```

Using VLAN Maps with Router ACLs

If the VLAN map has a match clause for a packet type (IP or MAC) and the packet does not match the type, the default is to drop the packet. If there is no match clause in the VLAN map, and no action is specified, the packet is forwarded if it does not match any VLAN map entry.

**Note**

You cannot combine VLAN maps or input router ACLs with port ACLs on a switch.

Guidelines for Using Router ACLs and VLAN Maps on the Same VLAN

Because the switch hardware performs one lookup for each direction (input and output), you must merge a router ACL and a VLAN map when they are configured on the same VLAN. Merging the router ACL with the VLAN map can significantly increase the number of ACEs.

When possible, try to write the ACL so that all entries have a single action except for the final, default action. You should write the ACL using one of these two forms:

```
permit...  
permit...  
permit...  
deny ip any any
```

or

```
deny...  
deny...  
deny...  
permit ip any any
```

To define multiple permit or deny actions in an ACL, group each action type together to reduce the number of entries.

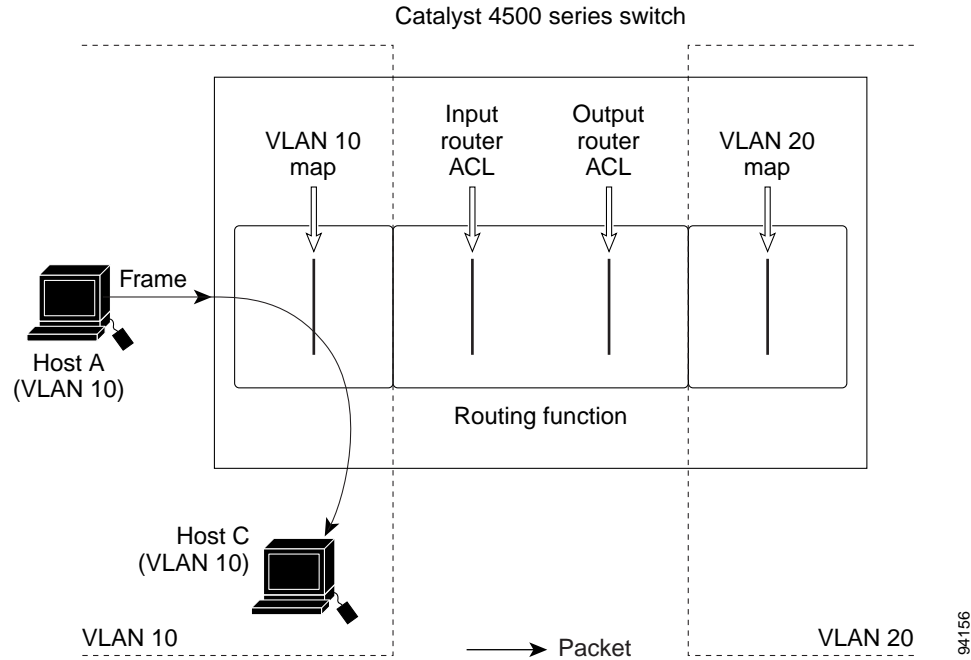

If you need to specify the full-flow mode and the ACL contains both IP ACEs and TCP/UDP/ICMP ACEs with Layer 4 information, put the Layer 4 ACEs at the end of the list. Doing this gives priority to the filtering of traffic based on IP addresses.

Examples of Router ACLs and VLAN Maps Applied to VLANs

These examples show how router ACLs and VLAN maps are applied on a VLAN to control the access of switched, bridged, routed, and multicast packets. Although the following illustrations show packets being forwarded to their destination, each time a packet crosses a line indicating a VLAN map or an ACL, the packet could be dropped rather than forwarded.

ACLs and Switched Packets

Figure 47-5 shows how an ACL processes packets that are switched within a VLAN. Packets switched within the VLAN are not processed by router ACLs.

Figure 47-5 Applying ACLs on Switched Packets

ACLs and Routed Packets

Figure 47-6 shows how ACLs are applied on routed packets. For routed packets, the ACLs are applied in this order:

1. VLAN map for input VLAN
2. Input router ACL
3. Output router ACL
4. VLAN map for output VLAN

Figure 47-6 Applying ACLs on Routed Packets

Configuring PACLS

This section describes how to configure PACLS, which are used to control filtering on Layer 2 interfaces. PACLS can filter traffic to or from Layer 2 interfaces based on Layer 3 information, Layer 4 head information or non-IP Layer 2 information.

This section contains the following topics:

- [Creating a PACL, page 47-33](#)
- [PACL Configuration Guidelines, page 47-34](#)
- [Configuring IP and MAC ACLs on a Layer 2 Interface, page 47-34](#)
- [Using PACL with Access-Group Mode, page 47-35](#)
- [Configuring Access-group Mode on Layer 2 Interface, page 47-35](#)
- [Applying ACLs to a Layer 2 Interface, page 47-36](#)
- [Displaying an ACL Configuration on a Layer 2 Interface, page 47-36](#)

Creating a PACL

To create a PACL and apply it to one or more interfaces, perform this task:

-
- Step 1** Create the standard or extended IP ACLs or named MAC extended ACLs that you want to apply to the interface.
- Step 2** Use the **ip access-group** or **mac access-group interface** command to apply a IP ACL or MAC ACL to one or more Layer 2 interfaces.
-

PACL Configuration Guidelines

Consider the following guidelines when configuring PACLS:

- There can be at most one IP access list and MAC access list applied to the same Layer 2 interface per direction.
- The IP access list filters only IP packets, whereas the MAC access list filters only non-IP packets.
- The number of ACLs and ACEs that can be configured as part of a PACL are bounded by the hardware resources on the switch. Those hardware resources are shared by various ACL features (for example, RACL, VACL) that are configured on the system. If there are insufficient hardware resources to program PACL in hardware, the actions for input and output PACLS differ:
 - For input PACLS, some packets are sent to CPU for software forwarding.
 - For output PACLS, the PACL is disabled on the port.
- These restrictions pertain to output PACLS only:
 - If there are insufficient hardware resources to program the PACL, the output PACL is not applied to the port, and you receive a warning message.
 - If an output PACL is configured on a Layer 2 port, then neither a VACL nor a Router ACL can be configured on the VLANs to which the Layer 2 port belongs.
 If any VACL or Router ACL is configured on the VLANs to which the Layer 2 port belongs, the output PACL cannot be configured on the Layer 2 port. That is, PACLS and VLAN-based ACLs (VACL and Router ACL) are mutually exclusive on Layer 2 ports.
- The input IP ACL logging option is supported, although logging is not supported for output IP ACLs, and MAC ACLs.
- The access group mode can change the way PACLS interact with other ACLs. To maintain consistent behavior across Cisco platforms, use the default access group mode.

Configuring IP and MAC ACLs on a Layer 2 Interface

Only IP or MAC ACLs can be applied to Layer 2 physical interfaces. Standard (numbered, named) and Extended (numbered, named) IP ACLs, and Extended Named MAC ACLs are also supported.

To apply IP or MAC ACLs on a Layer 2 interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface interface	Enters interface config mode.
Step 3	Switch(config-if)# [no] {ip mac} access-group {name number in out}	Applies numbered or named ACL to the Layer 2 interface. The NO prefix deletes the IP or MAC ACL from the Layer 2 interface.
Step 4	Switch(config)# show running-config	Displays the access list configuration.

The following example shows how to configure the Extended Named IP ACL simple-ip-acl to permit all TCP traffic and implicitly deny all other IP traffic:

```
Switch(config)# ip access-list extended simple-ip-acl
Switch(config-ext-nacl)# permit tcp any any
Switch(config-ext-nacl)# end
```

The following example shows how to configure the Extended Named MACL `simple-mac-acl` to permit source host 000.000.011 to any destination host:

```
Switch(config)# mac access-list extended simple-mac-acl
Switch(config-ext-macl)# permit host 000.000.011 any
Switch(config-ext-macl)# end
```

Using PACL with Access-Group Mode

You can use the access group mode to change the way PACLs interact with other ACLs. For example, if a Layer 2 interface belongs to VLAN100, VACL (VLAN filter) V1 is applied on VLAN100, and PACL P1 is applied on the Layer 2 interface. In this situation, you must specify how P1 and V1 impact the traffic with the Layer 2 interface on VLAN100. In a per-interface fashion, the **access-group mode** command can be used to specify one of the desired behaviors that are defined below.

The following modes are defined:

- **prefer port mode**—If PACL is configured on a Layer 2 interface, then PACL takes effect and overwrites the effect of other ACLs (Router ACL and VACL). If no PACL feature is configured on the Layer 2 interface, other features applicable to the interface are merged and applied on the interface. This is the default access group mode.
- **prefer vlan mode**—VLAN-based ACL features take effect on the port provided they have been applied on the port and no PACLs are in effect. If no VLAN-based ACL features are applicable to the Layer 2 interface, then the PACL feature already on the interface is applied.
- **merge mode**—Merges applicable ACL features before they are programmed into the hardware.

Note

Because output PACLs are mutually exclusive with VACL and Router ACLs, the access group mode does not change the behavior of output traffic filtering.

Configuring Access-group Mode on Layer 2 Interface

To configure an access mode on a Layer 2 interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface interface	Enters interface config mode.
Step 3	Switch(config-if)# [no] access-group mode {prefer {port vlan} merge}	Applies numbered or named ACL to the Layer 2 interface. The no prefix deletes the IP or MAC ACL from the Layer 2 interface.
Step 4	Switch(config)# show running-config	Displays the access list configuration.

This example shows how to merge and apply features other than PACL on the interface:

```
Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# access-group mode prefer port
```

This example shows how to merge applicable ACL features before they are programmed into hardware:

```
Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# access-group mode merge
```

Applying ACLs to a Layer 2 Interface

To apply IP and MAC ACLs to a Layer 2 interface, perform one of these tasks:

Command	Purpose
Switch(config-if)# ip access-group <i>ip-acl</i> {in out}	Applies an IP ACL to the Layer 2 interface
Switch(config-if)# mac access-group <i>mac-acl</i> {in out}	Applies a MAC ACL to the Layer 2 interface.

Note

Supervisor Engines III and Supervisor Engine IV running on a Catalyst 4500 series switch support both input and output PACLS on an interface.

This example applies the extended named IP ACL simple-ip-acl to interface FastEthernet 6/1 ingress traffic:

```
Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# ip access-group simple-ip-acl in
```

This example applies the extended named MAC ACL simple-mac-acl to interface FastEthernet 6/1 egress traffic:

```
Switch# configure terminal
Switch(config)# interface fast 6/1
Switch(config-if)# mac access-group simple-mac-acl out
```

Displaying an ACL Configuration on a Layer 2 Interface

To display information about an ACL configuration on Layer 2 interfaces, perform one of these tasks:

Command	Purpose
Switch# show ip interface [<i>interface-name</i>]	Shows the IP access group configuration on the interface.
Switch# show mac access-group interface [<i>interface-name</i>]	Shows the MAC access group configuration on the interface.
Switch# show access-group mode interface [<i>interface-name</i>]	Shows the access group mode configuration on the interface.

This example shows that the IP access group simple-ip-acl is configured on the inbound direction of interface fa6/1:

```
Switch# show ip interface fast 6/1
FastEthernet6/1 is up, line protocol is up
  Inbound  access list is simple-ip-acl
  Outgoing access list is not set
```

This example shows that MAC access group `simple-mac-acl` is configured on the inbound direction of interface `fa6/1`:

```
Switch# show mac access-group interface fast 6/1
Interface FastEthernet6/1:
  Inbound access-list is simple-mac-acl
  Outbound access-list is not set
```

This example shows that access group `merge` is configured on interface `fa6/1`:

```
Switch# show access-group mode interface fast 6/1
Interface FastEthernet6/1:
  Access group mode is: merge
```

Using PACL with VLAN Maps and Router ACLs

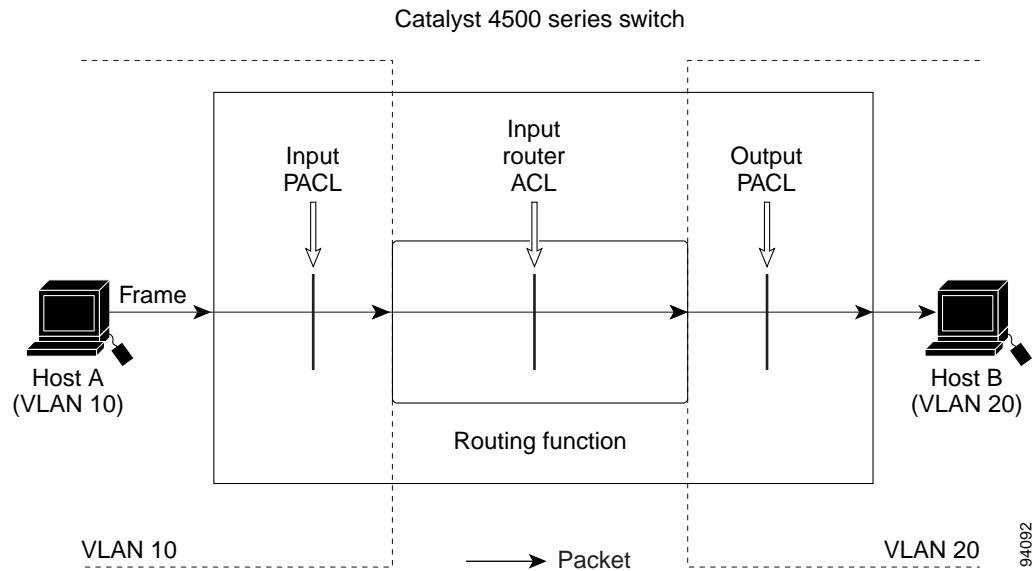

For output PACLs, there is no interaction with VACL or output Router ACLs. (See the restrictions listed in the [“PACL Configuration Guidelines”](#) section on page 47-34.) For input PACLs, however, the interaction with Router ACLs and VACLs depends on the interface access group mode as shown in [Table 47-1](#).

Table 47-1 Interaction Between PACLs, VACLs and Router ACLs

ACL Type(s)	Input PACL		
	prefer port mode	prefer vlan mode	merge mode
1. Input Router ACL	PACL applied	Input Router ACL applied	PACL, Input Router ACL (merged) applied in order (ingress)
2. VACL	PACL applied	VACL applied	PACL, VACL (merged) applied in order (ingress)
3. VACL + Input Router ACL	PACL applied	VACL + Input Router ACL applied	PACL, VACL, Input Router ACL (merged) applied in order (ingress)

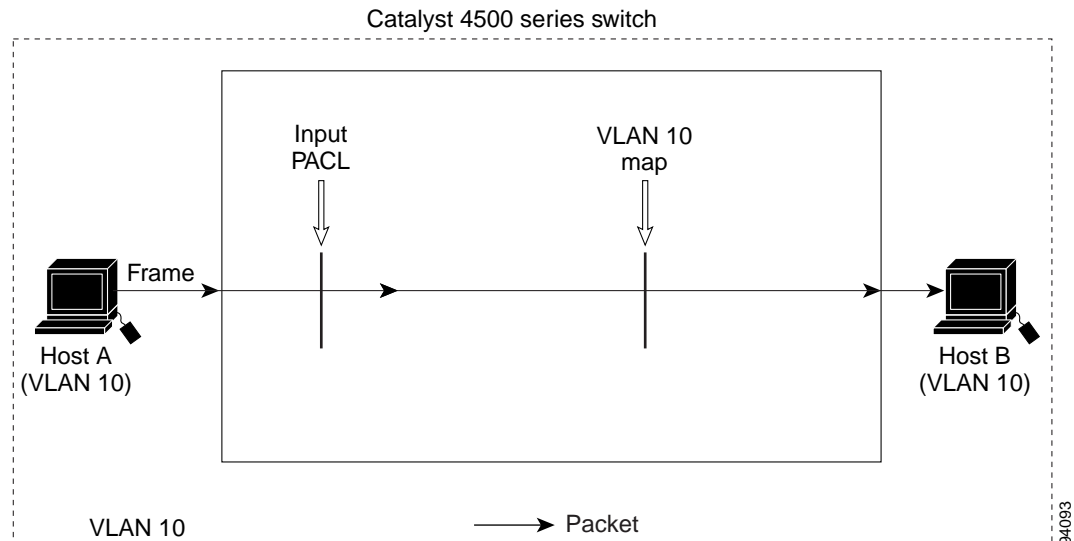

Each ACL Type listed in [Table 47-1](#) is synonymous with a different scenario, as explained in the following discussion.

Scenario 1: Host A is connected to an interface in VLAN 20, which has an SVI configured. The interface has input PACL configured, and the SVI has input Router ACL configured as shown in [Figure 47-7](#):

Figure 47-7 Scenario 1: PACL Interaction with an Input Router ACL

If the interface access group mode is prefer port, then only the input PACL is applied on the ingress traffic from Host A. If the mode is prefer vlan, then only the input Router ACL is applied to ingress traffic from Host A that requires routing. If the mode is merge, then the input PACL is first applied to the ingress traffic from Host A, and the input Router ACL is applied on the traffic that requires routing.

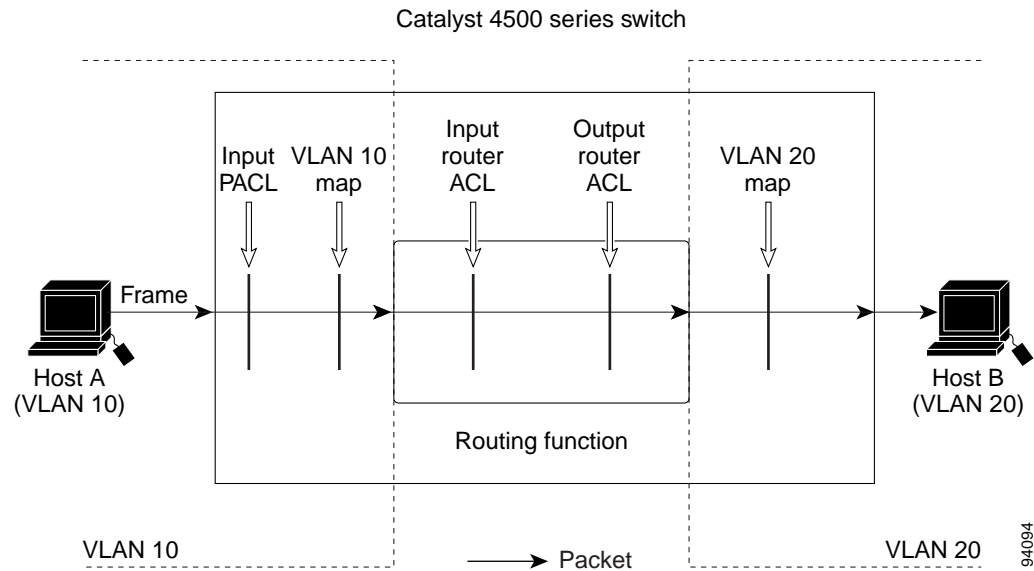

Scenario 2: Host A is connected to an interface in VLAN 10, which has a VACL (VLAN Map) configured and an input PACL configured as shown in [Figure 47-8](#):

Figure 47-8 Scenario 2: PACL Interaction with a VACL

If the interface access group mode is prefer port, then only the input PACL is applied on the ingress traffic from Host A. If the mode is prefer vlan, then only the VACL is applied to the ingress traffic from Host A. If the mode is merge, the input PACL is first applied to the ingress traffic from Host A, and the VACL is applied on the traffic.

Scenario 3: Host A is connected to an interface in VLAN 10, which has a VACL and an SVI configured. The SVI has an input Router ACL configured and the interface has an input PACL configured, as shown in Figure 47-9:

Figure 47-9 Scenario 3: VACL and Input Router ACL

If the interface access group mode is prefer port, then only the input PACL is applied on the ingress traffic from Host A. If the mode is prefer vlan, then the merged results of the VACL and the input Router ACL are applied to the ingress traffic from Host A. If the mode is merge, the input PACL is first applied to the ingress traffic from Host A, the VACL is applied on the traffic and finally, and the input Router ACL is applied to the traffic that needs routing. (that is, the merged results of the input PACL, VACL, and input Router ACL are applied to the traffic).

CHAPTER 48

Port Unicast and Multicast Flood Blocking

This chapter describes how to configure multicast and unicast flood blocking on the Catalyst 4000 family switch. This chapter contains these topics:

- [Overview of Flood Blocking, page 48-1](#)
- [Configuring Port Blocking, page 48-1](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Flood Blocking

Occasionally, unknown unicast or multicast traffic is flooded to a switch port because a MAC address has timed out or has not been learned by the switch. (This condition is especially undesirable for a private VLAN isolated port.) To guarantee that no unicast and multicast traffic is flooded to the port, use the **switchport block unicast** and **switchport block multicast** commands to enable flood blocking on the switch.

Note

The flood blocking feature is supported on all switched ports (including PVLAN ports) and is applied to all VLANs on which the port is forwarding.

Configuring Port Blocking

By default, a switch floods packets with unknown destination MAC addresses to all ports. If unknown unicast and multicast traffic is forwarded to a switch port, there might be security issues. To prevent forwarding such traffic, you can configure a port to block unknown unicast or multicast packets.

Note

Blocking of unicast or multicast traffic is not automatically enabled on a switch port; you must explicitly configure it.

Blocking Flooded Traffic on an Interface

Note

The interface can be a physical interface (for example, GigabitEthernet 1/1) or an EtherChannel group (such as port-channel 5). When you block multicast or unicast traffic for a port channel, it is blocked on all ports in the port channel group.

Note

Starting with Cisco IOS Release 12.2(52)SG, only IPV4 and IPv6 unknown multicast traffic flooding is blocked; Layer 2 unknown multicast flooding is not. This behavior stems from a fix for the following problem: when you configure blocking of unknown multicast flooding on a port, broadcast traffic to the port is also blocked.

To disable the flooding of multicast and unicast packets to an interface, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and enter the type and number of the switchport interface (for example, GigabitEthernet 1/1).
Step 3	Switch(config-if)# switchport block multicast	Blocks unknown multicast forwarding to the port.
Step 4	Switch(config-if)# switchport block unicast	Blocks unknown unicast forwarding to the port.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show interface <i>interface-id</i> switchport	Verifies your entry.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to block unicast and multicast flooding on a GigabitEthernet interface1/1 and how to verify the configuration:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# interface gigabitethernet1/1
Switch(config-if)# switchport block multicast
Switch(config-if)# switchport block unicast
Switch(config-if)# end
Switch# show interface gigabitethernet1/1 switchport
Name: Gi1/3
Switchport: Enabled

<output truncated>

Port Protected: On
Unknown Unicast Traffic: Not Allowed
Unknown Multicast Traffic: Not Allowed
```

```
Broadcast Suppression Level: 100
Multicast Suppression Level: 100
Unicast Suppression Level: 100
```

Resuming Normal Forwarding on a Port

To resume normal forwarding on a port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and enter the type and number of the switchport interface (GigabitEthernet1/1).
Step 3	Switch(config-if)# no switchport block multicast	Enables unknown multicast flooding to the port.
Step 4	Switch(config-if)# no switchport block unicast	Enables unknown unicast flooding to the port.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show interface <i>interface-id</i> switchport	Verifies your entry.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

CHAPTER 49

Configuring Storm Control

This chapter describes how to configure port-based traffic control on the Catalyst 4500 series switch.

This chapter consists of these sections:

- [Overview of Storm Control, page 49-1](#)
- [Enabling Broadcast Storm Control, page 49-3](#)
- [Enabling Multicast Storm Control, page 49-4](#)
- [Disabling Broadcast Storm Control, page 49-6](#)
- [Disabling Multicast Storm Control, page 49-7](#)
- [Displaying Storm Control, page 49-8](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of Storm Control

This section contains the following subsections:

- [Hardware-based Storm Control Implementation, page 49-2](#)
- [Software-based Storm Control Implementation, page 49-3](#)

Storm control prevents LAN interfaces from being disrupted by a broadcast storm. A broadcast storm occurs when broadcast packets flood the subnet, creating excessive traffic and degrading network performance. Errors in the protocol-stack implementation or in the network configuration can cause a broadcast storm.

**Note**

Storm control and Multicast storm control are supported in hardware on all ports on the WS-X4516, WS-X4013+10GE, WS-X4516-10GE, WS-C4948, WS-C4948-10GE, and Supervisor Engine 6-E. In contrast, the supervisor engines WS-X4515, WS-X4014, and WS-X4013+ support storm control in hardware on non-blocking gigabit ports and in software on all other ports, implying that the counters for these interfaces are approximate and computed.

Hardware-based Storm Control Implementation

Broadcast suppression uses filtering that measures broadcast activity in a subnet over a one-second interval and compares the measurement with a predefined threshold. If the threshold is reached, further broadcast activity is suppressed for the duration of the interval. Broadcast suppression is disabled by default.

Figure 49-1 shows the broadcast traffic patterns on a LAN interface over a given interval. In this example, broadcast suppression occurs between times T1 and T2 and between T4 and T5. During those intervals, the amount of broadcast traffic exceeded the configured threshold.

Figure 49-1 Storm Control Example - Hardware-based Implementation

The broadcast suppression threshold numbers and the time interval combination make the broadcast suppression algorithm work with different levels of granularity. A higher threshold allows more broadcast packets to pass through.

Broadcast suppression on the Catalyst 4500 series switches (including Supervisor Engine 6-E) is implemented in hardware. The suppression circuitry monitors packets passing from a LAN interface to the switching bus. If the packet destination address is broadcast, then the broadcast suppression circuitry tracks the current count of broadcasts within the one-second interval, and when a threshold is reached, it filters out subsequent broadcast packets.

Because hardware broadcast suppression uses a bandwidth-based method to measure broadcast activity, the most significant implementation factor is setting the percentage of total available bandwidth that can be used by broadcast traffic. Because packets do not arrive at uniform intervals, the one-second interval during which broadcast activity is measured can affect the behavior of broadcast suppression.

Software-based Storm Control Implementation

When storm control is enabled on an interface, the switch monitors packets received on the interface and determines whether the packets are broadcast. The switch monitors the number of broadcast packets received within a one-second time interval. When the interface threshold is met, all incoming data traffic on the interface is dropped. This threshold is specified as a percentage of total available bandwidth that can be used by broadcast traffic. If the lower threshold is specified, all data traffic is forwarded as soon as the incoming traffic falls below that threshold.

Enabling Broadcast Storm Control

To enable storm control, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and enter the port to configure.
Step 3	Switch(config-if)# storm-control broadcast level [<i>high level</i>] [<i>lower level</i>]	Configures broadcast storm control. Specifies the upper threshold levels for broadcast traffic. The storm control action occurs when traffic utilization reaches this level. (Optional) Specifies the falling threshold level. The normal transmission restarts (if the action is filtering) when traffic drops below this level for interfaces that support software-based suppression. Note The lower level keyword does not apply to Supervisor Engine 6E implementations. Note For ports that perform hardware-based suppression, the lower threshold is ignored.
Step 4	Switch(config-if)# storm-control action { shutdown trap }	Specifies the action to be taken when a storm is detected. The default is to filter out the broadcast traffic and not to send out traps. The shutdown keyword sets the port to error-disable state during a storm. If the recover interval is not set, the port remains in shutdown state. Note The trap keyword generates an SNMP trap when a storm is detected. This keyword is available but not supported in Cisco IOS Release 12.1(19)EW.
Step 5	Switch(config-if)# exit	Returns to configuration mode.
Step 6	Switch(config)# end	Returns to privileged EXEC mode.
Step 7	Switch# show storm-control [<i>interface</i>] broadcast	Displays the number of packets suppressed.
Step 8	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The following example shows how to enable storm control on interface.

```

Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# interface fa3/1
Switch(config-if)# storm-control broadcast level 50
Switch(config-if)# end

Switch# show storm-control //Supervisor Engine 6-E
Interface  Filter State   Broadcast Multicast Level
-----  -
Fi3/1      Forwarding      Enabled   Disabled  50.00%

Switch# show int fa2/1 capabilities //Supervisor Engine 6-E
FastEthernet2/1
  Model:                WS-X4148-RJ45V-RJ-45
  Type:                 10/100BaseTX
  Speed:                10,100,auto
  Duplex:               half,full,auto
  Auto-MDIX:            no
  Trunk encap. type:    802.1Q
  Trunk mode:           on,off,desirable,nonegotiate
  Channel:              yes
  Broadcast suppression: percentage(0-100), hw
  Multicast suppression: percentage(0-100), hw <===== unique to Sup Engine 6-E systems
  Flowcontrol:          rx-(none),tx-(none)
  VLAN Membership:      static, dynamic

```

EEnabling Multicast Storm Control

Topics include:

- [Multicast Suppression on the Supervisor Engine 6-E, page 49-4](#)
- [Multicast Suppression on the WS-X4515, WS-X4014, and WS-X4013+ Supervisor Engines, page 49-5](#)
- [Multicast Suppression on all the other Supervisor Engines, page 49-5](#)

Note

Beginning with Cisco IOS Release 12.2(18)EW, the counters displayed with the **show interface counters storm-control** command includes any multicast packets that were dropped.

Multicast Suppression on the Supervisor Engine 6-E

Supervisor Engine 6-E supports per-interface multicast suppression. This allows the user to subject incoming multicast and broadcast traffic on an interface to suppression.

**Note**

Multicast and broadcast suppression share a common threshold per interface. Multicast suppression takes effect *only* if broadcast suppression is enabled. Disabling broadcast suppression on an interface also disables multicast suppression.

To enable multicast suppression on a Supervisor Engine 6-E, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and enter the port to configure.
Step 3	Switch(config-if)# storm-control broadcast include multicast	Enables multicast suppression.
Step 4	Switch(config-if)# exit	Returns to configuration mode.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show storm-control	Verifies the configuration.

The following example shows how to enable multicast suppression on ports that have broadcast suppression already enabled:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int fa3/1
Switch(config-if)# storm-control broadcast include multicast
Switch(config-if)# end
Switch#
Switch# show storm-control
Interface  Filter State   Broadcast Multicast Level
-----
Fi3/1     Forwarding     Enabled   Enabled   50.00%
```

Multicast Suppression on the WS-X4515, WS-X4014, and WS-X4013+ Supervisor Engines

Hardware does not provide support for multicast suppression on the WS-X4515, WS-X4014, and WS-X4013+ supervisor engines. One consequence of using software-based broadcast suppression on these modules is that all incoming data packets are dropped. Irrespective of your selecting to configure broadcast suppression only, multicast packets are filtered as well on stub and blocking gigabit ports. The non blocking gigabit ports that do provide broadcast suppression in hardware also do not filter multicast packets.

Multicast Suppression on all the other Supervisor Engines

Multicast suppression can be enabled on a WS-X4516, WS-X4013+10GE, WS-X4516-10GE, WS-C4948, and WS-C4948-10GE supervisor engines for all ports that have storm control enabled. Multicast suppression applies to all ports that have broadcast suppression configured on them. It also applies to ports that are configured for broadcast storm-control in the future; you cannot suppress multicast traffic only.

Separate thresholds cannot be provided for broadcast and/or multicast traffic. The threshold you configure for broadcast suppression applies to both the incoming multicast traffic and broadcast traffic.

To enable multicast suppression on WS-X4516, WS-X4013+10GE, WS-X4516-10GE, and WS-C4948 supervisor engines, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and enter the port to configure.
Step 3	Switch(config-if)# storm-control broadcast include multicast	Enable multicast suppression.
Step 4	Switch(config-if)# exit	Returns to configuration mode.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.

The following example shows how to enable multicast suppression on ports that have broadcast suppression already enabled:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# storm-control broadcast include multicast
Switch(config)# end
Switch#
```

Disabling Broadcast Storm Control

To disable storm control, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and enter the port to configure.
Step 3	Switch(config-if)# no storm-control broadcast level	Disables port storm control.
Step 4	Switch(config-if)# no storm-control action {shutdown trap}	Disables the specified storm control action and returns to default filter action.
Step 5	Switch(config-if)# exit	Returns to configuration mode.
Step 6	Switch(config)# end	Returns to privileged EXEC mode.
Step 7	Switch# show storm-control broadcast	Verifies your entries.
Step 8	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The following example shows how to disable storm control on interface.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int fa3/1
Switch(config-if)# no storm-control broadcast level
Switch(config-if)# end
```

```
Switch# show storm-control //Supervisor Engine 2+ to V-10GE
Interface  Filter State   Upper   Lower   Current
-----
Switch#

Switch# show storm-control //Supervisor Engine 6-E
Interface Filter State Broadcast Multicast Level
-----
Switch#
```

Disabling Multicast Storm Control

To disable multicast suppression on WS-X4516, WS-X4515, WS-X4014, and WS-X4013+ supervisor engines, perform the following task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Enters interface configuration mode and enter the port to configure.
Step 3	Switch(config-if)# [no] storm-control broadcast include multicast	Enables multicast suppression.
Step 4	Switch(config-if)# end	Returns to configuration mode.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.

To disable multicast suppression on the Supervisor Engine 6-E, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] storm-control broadcast include multicast	Enables/disables multicast suppression.
Step 3	Switch(config-if)# no storm-control broadcast level	Disables port storm control (broadcast and multicast).
Step 4	Switch(config-if)# end	Returns to configuration mode.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.

Displaying Storm Control

Note

Use the **show interface capabilities** command to determine the mode in which storm control is supported on an interface.

The following example shows an interface that supports broadcast suppression in software (sw).

```
Switch# show int fa2/1 capabilities
FastEthernet2/1
  Model: WS-X4148-RJ45V-RJ-45
  Type: 10/100BaseTX
  Speed: 10,100,auto
  Duplex: half,full,auto
  Auto-MDIX: no
  Trunk encap. type: 802.1Q
  Trunk mode: on,off,desirable,nonegotiate
  Channel: yes
  Broadcast suppression: percentage(0-100), hw
  Multicast suppression: percentage(0-100), hw <=====unique to Sup Engine 6-E
  Flowcontrol: rx-(none),tx-(none)
  VLAN Membership: static, dynamic
  Fast Start: yes
  CoS rewrite: yes
  ToS rewrite: yes
  Inline power: yes (Cisco Voice Protocol)
  SPAN: source/destination
  UDLD: yes
  Link Debounce: no
  Link Debounce Time: no
  Port Security: yes
  Dot1x: yes
  Maximum MTU: 1552 bytes (Baby Giants)
  Multiple Media Types: no
  Diagnostic Monitoring: N/A
```

Note

Use the **show interfaces counters storm-control** command to display a count of discarded packets.

```
Switch# show interfaces counters storm-control
Port      Broadcast  Multicast  Level  TotalSuppressedPackets
Fa2/1     Enabled    Disabled    10.00%  46516510
Gi3/1     Enabled    Enabled     50.00%  0
```

The following example shows the output of the **show storm-control** command:

```
Switch# show storm-control //Supervisor Engine 2+ to V-10GE
Interface  Filter State  Upper  Lower  Current
-----
Gi4/4     Forwarding    2.00%  2.00%  N/A
Switch
```

Note

In the previous example, “current” represents the percentage of traffic suppressed at a given instant, and the value is N/A for ports that perform suppression in hardware.

```
Switch# show storm-control //Supervisor Engine 6-E
Interface  Filter State  Broadcast Multicast Level
-----
Fa2/1     Blocking     Enabled   Disabled  10.00%
Gi3/1     Link Down    Enabled   Enabled   50.00%
```

CHAPTER 50

Configuring SPAN and RSPAN

This chapter describes how to configure the Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) on the Catalyst 4500 series switches. SPAN selects network traffic for analysis by a network analyzer, such as a SwitchProbe device or other Remote Monitoring (RMON) probe.

This chapter consists of the following sections:

- [Overview of SPAN and RSPAN, page 50-1](#)
- [Configuring SPAN, page 50-7](#)
- [CPU Port Sniffing, page 50-10](#)
- [Encapsulation Configuration, page 50-12](#)
- [Ingress Packets, page 50-12](#)
- [Access List Filtering, page 50-13](#)
- [Packet Type Filtering, page 50-15](#)
- [Configuration Example, page 50-16](#)
- [Configuring RSPAN, page 50-16](#)
- [Displaying SPAN and RSPAN Status, page 50-25](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Overview of SPAN and RSPAN

This sections includes the following subsections:

- [SPAN and RSPAN Concepts and Terminology, page 50-3](#)
- [SPAN and RSPAN Session Limits, page 50-6](#)

- [Default SPAN and RSPAN Configuration, page 50-6](#)

SPAN mirrors traffic from one or more source interfaces on any VLAN or from one or more VLANs to a destination interface for analysis. In [Figure 50-1](#), all traffic on Ethernet interface 5 (the source interface) is mirrored to Ethernet interface 10. A network analyzer on Ethernet interface 10 receives all network traffic from Ethernet interface 5 without being physically attached to it.

For SPAN configuration, the source interfaces and the destination interface must be on the same switch.

SPAN does not affect the switching of network traffic on source interfaces; copies of the packets received or transmitted by the source interfaces are sent to the destination interface.

Figure 50-1 Example SPAN Configuration

RSPAN extends SPAN by enabling remote monitoring of multiple switches across your network. The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches. The SPAN traffic from the sources is copied onto the RSPAN VLAN and then forwarded over trunk ports that are carrying the RSPAN VLAN to any RSPAN destination sessions monitoring the RSPAN VLAN, as shown in [Figure 50-2](#).

Figure 50-2 Example of RSPAN Configuration

SPAN and RSPAN do not affect the switching of network traffic on source ports or source VLANs; a copy of the packets received or sent by the sources is sent to the destination. Except for traffic that is required for the SPAN or RSPAN session, by default, destination ports do not receive or forward traffic.

You can use the SPAN or RSPAN destination port to forward transmitted traffic from a network security device. For example, if you connect a Cisco Intrusion Detection System (IDS) sensor appliance to a destination port, the IDS device can send TCP reset packets to close down the TCP session of a suspected attacker.

SPAN and RSPAN Concepts and Terminology

This section describes concepts and terminology associated with SPAN and RSPAN configuration and includes the following subsections:

- [SPAN Session, page 50-3](#)
- [Traffic Types, page 50-3](#)
- [Source Port, page 50-4](#)
- [Destination Port, page 50-5](#)
- [VLAN-Based SPAN, page 50-5](#)
- [SPAN Traffic, page 50-6](#)

SPAN Session

A local SPAN session associates a destination port with source ports. You can monitor incoming or outgoing traffic on a series or range of ports and source VLANs. An RSPAN session associates source ports and source VLANs across your network with an RSPAN VLAN. The destination source is the RSPAN VLAN.

You configure SPAN sessions by using parameters that specify the source of network traffic to monitor.

You can configure multiple SPAN or RSPAN sessions with separate or overlapping sets of SPAN sources. Both switched and routed ports can be configured as SPAN sources or destination ports.

An RSPAN source session associates SPAN source ports or VLANs with a destination RSPAN VLAN. An RSPAN destination session associates an RSPAN VLAN with a destination port.

SPAN sessions do not interfere with the normal operation of the switch; however, an oversubscribed SPAN destination (for example, a 10-Mbps port monitoring a 100-Mbps port) results in dropped or lost packets.

You can configure SPAN sessions on disabled ports; however, a SPAN session does not become active unless you enable the destination port and at least one source port or VLAN for that session.

A SPAN session remains inactive after system startup until the destination port is operational.

Traffic Types

SPAN sessions include these traffic types:

- **Receive (Rx) SPAN**—The goal of receive (or ingress) SPAN is to monitor as much as possible all packets received by the source interface or VLAN before any modification or processing is performed by the switch. A copy of each packet received by the source is sent to the destination port for that SPAN session. You can monitor a series or range of ingress ports or VLANs in a SPAN session.

On tagged packets (Inter-Switch Link [ISL] or IEEE 802.1Q), the tagging is removed at the ingress port. At the destination port, if tagging is enabled, the packets appear with the ISL or 802.1Q headers. If no tagging is specified, packets appear in the native format.

Packets that are modified because of routing are copied without modification for Rx SPAN; that is, the original packet is copied. Packets that are modified because of quality of service (QoS)—for example, modified Differentiated Services Code Point (DSCP)—are copied without modification for Rx SPAN.

Some features that can cause a packet to be dropped during receive processing have no effect on SPAN; the destination port receives a copy of the packet even if the actual incoming packet is dropped. These features include IP standard and extended input access control lists (ACLs), IP standard and extended output ACLs for unicast and ingress QoS policing, VLAN maps, ingress QoS policing, and policy-based routing. Switch congestion that causes packets to be dropped also has no effect on SPAN.

- **Transmit (Tx) SPAN**—The goal of transmit (or egress) SPAN is to monitor as much as possible all packets sent by the source interface after the switch performs all modification and processing. After the packet is modified, the source sends a copy of each packet to the destination port for that SPAN session. You can monitor a range of egress ports in a SPAN session.

Packets that are modified because of routing—for example, with a time-to-live (TTL) or MAC-address modification—are duplicated at the destination port. On packets that are modified because of QoS, the modified packet might not have the same DSCP (IP packet) or CoS (non-IP packet) as the SPAN source.

Some features that can cause a packet to be dropped during transmit processing might also affect the duplicated copy for SPAN. These features include VLAN maps, IP standard and extended output ACLs on multicast packets, and egress QoS policing. In the case of output ACLs, if the SPAN source drops the packet, the SPAN destination would also drop the packet. In the case of egress QoS policing, if the SPAN source drops the packet, the SPAN destination might not drop it. If the source port is oversubscribed, the destination ports have different dropping behavior.

- **Both**—In a SPAN session, you can monitor a single port series or a range of ports for both received and sent packets.

Source Port

A source port (also called a *monitored port*) is a switched or routed port that you monitor for network traffic analysis. In a single local SPAN session or RSPAN source session, you can monitor source port traffic, such as received (Rx), transmitted (Tx), or bidirectional (both). The switch supports any number of source ports (up to the maximum number of available ports on the switch) and any number of source VLANs.

A source port has these characteristics:

- It can be any port type (for example, EtherChannel, Fast Ethernet, Gigabit Ethernet, and so forth).
- It can be monitored in multiple SPAN sessions.
- It cannot be a destination port.
- Each source port can be configured with a direction (ingress, egress, or both) to monitor. For EtherChannel sources, the monitored direction would apply to all physical ports in the group.
- Source ports can be in the same or different VLANs.
- For VLAN SPAN sources, all active ports in the source VLAN are included as source ports.

You can configure a trunk port as a source port. By default, all VLANs active on the trunk are monitored. You can limit SPAN traffic monitoring on trunk source ports to specific VLANs by using VLAN filtering. Only switched traffic in the selected VLANs is sent to the destination port. This feature affects only traffic forwarded to the destination SPAN port and does not affect the switching of normal traffic. This feature is not allowed in sessions with VLAN sources.

Destination Port

Each local SPAN session or RSPAN destination session must have a destination port (also called a *monitoring port*) that receives a copy of traffic from the source ports and VLANs.

A destination port has these characteristics:

- A destination port must reside on the same switch as the source port (for a local SPAN session).
- A destination port can be any Ethernet physical port.
- A destination port can participate in only one SPAN session at a time. (A destination port in one SPAN session cannot be a destination port for a second SPAN session.)
- A destination port cannot be a source port.
- A destination port cannot be an EtherChannel group.
- A destination port can be a physical port that is assigned to an EtherChannel group, even if the EtherChannel group has been specified as a SPAN source. The port is removed from the group while it is configured as a SPAN destination port.
- The port does not transmit any traffic except that traffic required for the SPAN session unless learning is enabled. If learning is enabled, the port also transmits traffic directed to hosts that have been learned on the destination port.
- If ingress traffic forwarding is enabled for a network security device, the destination port forwards traffic at Layer 2.
- A destination port does not participate in spanning tree while the SPAN session is active.
- When it is a destination port, it does not participate in any of the Layer 2 protocols (STP, VTP, CDP, DTP, PagP).
- A destination port that belongs to a source VLAN of any SPAN session is excluded from the source list and is not monitored.
- A destination port receives copies of sent and received traffic for all monitored source ports. If a destination port is oversubscribed, it could become congested and result in packet drops at the destination port. This congestion does not affect traffic forwarding on the source ports.

VLAN-Based SPAN

VLAN-based SPAN (VSPAN) is the monitoring of the network traffic in one or more VLANs.

Use these guidelines for VSPAN sessions:

- Traffic on RSPAN VLANs is not monitored by VLAN-based SPAN sessions.
- Only traffic on the monitored VLAN is sent to the destination port.
- If a destination port belongs to a source VLAN, it is excluded from the source list and is not monitored.
- If ports are added to or removed from the source VLANs, the traffic on the source VLAN received by those ports is added to or removed from the sources being monitored.
- VLAN pruning and the VLAN allowed list have no effect on SPAN monitoring.

- VSPAN monitors only traffic that enters the switch, not traffic that is routed between VLANs. For example, if a VLAN is being Rx-monitored, and the multilayer switch routes traffic from another VLAN to the monitored VLAN, that traffic is not monitored and is not received on the SPAN destination port.
- You cannot use filter VLANs in the same session with VLAN sources.
- You can monitor only Ethernet VLANs.

SPAN Traffic

You can use local SPAN to monitor all network traffic, including multicast and bridge protocol data unit (BPDU) packets, Cisco Discovery Protocol (CDP), VLAN Trunk Protocol (VTP), Dynamic Trunking Protocol (DTP), Spanning Tree Protocol (STP), and Port Aggregation Protocol (PAgP) packets. You cannot use RSPAN to monitor Layer 2 protocols. (See the [“RSPAN Configuration Guidelines”](#) section on page 50-16 for more information.)

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both Rx and Tx) SPAN session is configured for the sources a1 Rx monitor and the a2 Rx and Tx monitor to destination port d1. If a packet enters the switch through a1 and is switched to a2, both incoming and outgoing packets are sent to destination port d1. Both packets are the same (unless a Layer-3 rewrite occurs, in which case the packets are different because of the added Layer 3 information).

SPAN and RSPAN Session Limits

You can configure up to eight simultaneous SPAN sessions containing ingress sources and up to eight simultaneous SPAN sessions containing egress sources. Bidirectional sources count as both ingress and egress. RSPAN destination sessions count as a session containing an ingress source.

Note

Supervisor Engine 6-E allows a maximum of 16 SPAN/RSPAN sessions (8 concurrent sessions with Rx sources and 8 concurrent sessions with Tx sources). Bidirectional sources count as both Rx and Tx. All other supervisor engines allow a maximum of 6 sessions (2 concurrent sessions with RX sources and 4 concurrent sessions with TX sources).

Default SPAN and RSPAN Configuration

Table 50-1 shows the default SPAN and RSPAN configuration.

Table 50-1 *Default SPAN and RSPAN Configuration*

Feature	Default Setting
SPAN state	Disabled.
Source port traffic to monitor	Both received and sent traffic (both).
Filters	All VLANs, all packet types, all address types.
Encapsulation type (destination port)	Native form (no encapsulation type header).
Ingress forwarding (destination port)	Disabled.
Host learning (destination port)	Disabled.

Configuring SPAN

The following sections describe how to configure SPAN:

- [SPAN Configuration Guidelines and Restrictions, page 50-7](#)
- [Configuring SPAN Sources, page 50-8](#)
- [Configuring SPAN Destinations, page 50-9](#)
- [Monitoring Source VLANs on a Trunk Interface, page 50-9](#)
- [Configuration Scenario, page 50-10](#)
- [Verifying a SPAN Configuration, page 50-10](#)

Note

Entering SPAN configuration commands does not clear previously configured SPAN parameters. You must enter the **no monitor session** command to clear configured SPAN parameters.

SPAN Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when configuring SPAN:

- You must use a network analyzer to monitor interfaces.
- You cannot mix source VLANs and filter VLANs within a SPAN session. You can have source VLANs or filter VLANs, but not both at the same time.
- EtherChannel interfaces can be SPAN source interfaces; they cannot be SPAN destination interfaces.
- When you specify source interfaces and do not specify a traffic type (Tx, Rx, or both), “both” is used by default. To change from both to either “tx” or “rx,” unconfigure the corresponding other type “rx” or “tx” with the **no monitor session {session_number} {source {interface interface_list | {vlan vlan_ids | cpu [queue queue_ids] } {rx | tx}}** command.
- If you specify multiple SPAN source interfaces, the interfaces can belong to different VLANs.
- You must enter the **no monitor session number** command with no other parameters to clear the SPAN session *number*.
- The **no monitor** command clears all SPAN sessions.
- SPAN destinations never participate in any spanning tree instance. SPAN includes BPDUs in the monitored traffic, so any BPDUs seen on the SPAN destination are from the SPAN source.
- SPAN is limited to one destination port per session.
- When you create a SPAN session, it sets the packet filter to good automatically and hence you will see another configuration line:

monitor session 1 filter packet-type good rx

Re-enter the **monitor session 1 filter packet-type good rx** command.

Configuring SPAN Sources

To configure the source for a SPAN session, perform this task:

Command	Purpose
<pre>Switch(config)# [no] monitor session {session_number} {source {interface <interface_list> {vlan vlan_ids cpu [queue queue_ids] } [rx tx both]}</pre>	<p>Specifies the SPAN session number (1 through 6), the source interfaces (FastEthernet or GigabitEthernet), VLANs (1 through 4094), whether traffic received or sent from the CPU is copied to the session destination, and the traffic direction to be monitored.</p> <p>For <i>session_number</i>, specifies the session number identified with this RSPAN session (1 through 6).</p> <p>For <i>interface-list</i>, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel <i>port-channel-number</i>).</p> <p>For <i>vlan_ids</i>, specifies the source VLAN.</p> <p>For <i>queue_ids</i>, specifies the queue(s) involved.</p> <p>(Optional) [, -] Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen.</p> <p>(Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both transmitted (Tx) and received (Rx) traffic. Only received traffic can be monitored on additional source ports.</p> <ul style="list-style-type: none"> • Rx—Monitor received traffic. • Tx—Monitor transmitted traffic. • both—Monitor both received and transmitted traffic (bidirectional). <p>Queues may be identified either by number or by name. Queue names may subsume multiple numbered queues for convenience.</p> <p>Use the no keyword to restore the defaults.</p>

This example shows how to configure SPAN session 1 to monitor bidirectional traffic from source interface Fast Ethernet 5/1:

```
Switch(config)# monitor session 1 source interface fastethernet 5/1
```

This example shows how to configure sources with differing directions within a SPAN session:

```
Switch(config)# monitor session 1 source interface fa2/3 rx
Switch(config)# monitor session 1 source interface fa2/2 tx
Switch(config)#
```

Configuring SPAN Destinations

To configure the destination for a SPAN session, perform this task:

Command	Purpose
Switch(config)# [no] monitor session <session_number> destination interface <interface> [encapsulation {isl dot1q}] [ingress [vlan vlan_IDs] [learning]]	Specifies the SPAN session number (1 through 6) and the destination interfaces or VLANs. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>interface</i> , specifies the destination interface. For <i>vlan_IDs</i> , specifies the destination VLAN. Use the no keyword to restore the defaults.

Note

SPAN is limited to one destination port per session.

This example shows how to configure interface Fast Ethernet 5/48 as the destination for SPAN session 1:

```
Switch(config)# monitor session 1 destination interface fastethernet 5/48
```

Monitoring Source VLANs on a Trunk Interface

To monitor specific VLANs when the SPAN source is a trunk interface, perform this task:

Command	Purpose
Switch(config)# [no] monitor session {session_number} filter {vlan vlan_IDs [, -]} {packet-type {good bad}} {address-type {unicast multicast broadcast} [rx tx both]}	Monitors specific VLANs when the SPAN source is a trunk interface. The filter keyword restricts monitoring to traffic that is on the specified VLANs; it is typically used when monitoring a trunk interface. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>vlan_IDs</i> , specifies the VLAN. Monitoring is established through all the ports in the specified VLANs Use the no keyword to restore the defaults.

This example shows how to monitor VLANs 1 through 5 and VLAN 9 when the SPAN source is a trunk interface:

```
Switch(config)# monitor session 2 filter vlan 1 - 5 , 9
```

Configuration Scenario

This example shows how to use the commands described in this chapter to completely configure and unconfigure a span session. Assume that you want to monitor bidirectional traffic from source interfaces Fast Ethernet 4/10, 4/11 and 4/12, Interface 4/10 is configured as a trunk interface carrying VLANs 1 through 4094. Interface Fast Ethernet 4/11 is configured as an access port in VLAN 57 and interface Fast Ethernet 4/12 is configured as an access port in VLAN 58. You want to monitor only traffic in VLAN 57 in that session. Using Fast Ethernet 4/15 as your destination interface, you would enter the following commands:

```
Switch(config)# monitor session 1 source interface fastethernet 4/10 - 12
Switch(config)# monitor session 1 filter vlan 57
Switch(config)# monitor session 1 destination interface fastethernet 4/15
```

You are now monitoring traffic from interface Fast Ethernet 4/10 that is on VLAN 57 out of interface FastEthernet 4/15. To disable the span session enter the following command:

```
Switch(config)# no monitor session 1
```

Verifying a SPAN Configuration

This example shows how to verify the configuration of SPAN session 2:

```
Switch# show monitor session 2
Session 2
-----
Source Ports:
    RX Only:      Fa5/12
    TX Only:      None
    Both:         None
Source VLANs:
    RX Only:      None
    TX Only:      None
    Both:         None
Destination Ports: Fa5/45
Filter VLANs:     1-5,9
Switch#
```

CPU Port Sniffing

When configuring a SPAN session, you can specify the CPU (or a subset of CPU queues) as a SPAN source. Queues may be specified either by number or by name. When such a source is specified, traffic going to the CPU through one of the specified queues is mirrored and sent out of the SPAN destination port in the session. This traffic includes both control packets and regular data packets that are sent to or from the CPU (due to software forwarding).

You can mix the CPU source with either regular port sources or VLAN sources.

To configure CPU source sniffing, perform this task:

Command	Purpose
<pre>Switch(config)# [no] monitor session {session_number} {source {interface interface_list {vlan vlan_IDs cpu [queue queue_ids] } [rx tx both]}</pre>	<p>Specifies that the CPU causes traffic received by or sent from the CPU to be copied to the destination of the session. The queue identifier optionally allows sniffing-only traffic (received) on the specified CPU queue(s).</p> <p>For <i>session_number</i>, specifies the session number identified with this SPAN session (1 through 6).</p> <p>For <i>interface-list</i>, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel <i>port-channel-number</i>).</p> <p>For <i>vlan_IDs</i>, specifies the source VLAN.</p> <p>For <i>queue_ids</i>, specifies the queue(s) involved.</p> <p>(Optional) [, -] Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen.</p> <p>(Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both transmitted (Tx) and received (Rx) traffic. Only received traffic can be monitored on additional source ports.</p> <ul style="list-style-type: none"> • Rx—Monitor received traffic. • Tx—Monitor transmitted traffic. • both—Monitor both received and transmitted traffic (bidirectional). <p>Queues may be identified either by number or by name. Queue names may subsume multiple numbered queues for convenience.</p> <p>Use the no keyword to restore the defaults.</p>

This example shows how to configure a CPU source to sniff all packets received by the CPU:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# monitor session 1 source cpu rx
```

This example shows how to use queue names and queue number ranges for the CPU as a SPAN source on Supervisor Engines 2+ to V 10-GE:

```
Switch(config)# monitor session 2 source cpu queue control-packet rx
Switch(config)# monitor session 3 source cpu queue 21 -23 rx
```

This example shows how to use queue names and queue number ranges for the CPU as a SPAN source on Supervisor Engine 6-E:

```
Switch(config)# monitor session 2 source cpu queue control-packet rx  
Switch(config)# monitor session 3 source cpu queue 10 rx
```

**Note**

For Supervisor Engine 6-E, *control-packet* is mapped to queue 10.

Encapsulation Configuration

When configuring a SPAN destination port, you can explicitly specify the encapsulation type used by the port. Packets sent out the port are tagged in accordance with the specified mode. (The encapsulation mode also controls how tagged packets are handled when the ingress packet option is enabled.) The Catalyst 4500 series switch supervisor engines support ISL encapsulation and 802.1q encapsulation, as well as untagged packets.

**Note**

Supervisor Engine 6-E supports *only* 802.1q encapsulation.

The “replicate” encapsulation type (in which packets are transmitted from the destination port using whatever encapsulation applied to the original packet) is not supported. If no encapsulation mode is specified, the port default is untagged. To view the task of configuring encapsulation, see the command table below.

Ingress Packets

When ingress is enabled, the SPAN destination port accepts incoming packets (potentially tagged depending on the specified encapsulation mode) and switches them normally. When configuring a SPAN destination port, you can specify whether the ingress feature is enabled and what VLAN to use to switch untagged ingress packets. (Specifying an ingress VLAN is not required when ISL encapsulation is configured, as all ISL encapsulated packets have VLAN tags.) Although the port is STP forwarding, it does not participate in the STP, so use caution when configuring this feature lest a spanning-tree loop be introduced in the network. When both ingress and a trunk encapsulation are specified on a SPAN destination port, the port goes forwarding in all active VLANs. Configuring a non-existent VLAN as an ingress VLAN is not allowed.

By default, host learning is disabled on SPAN destination ports with ingress enabled. The port is also removed from VLAN floodsets, so regular traffic is not switched out of the destination port. If learning is enabled, however, then traffic for hosts learned on the destination port is switched out the destination port. Host connected to SPAN destination port will not receive broadcast ARP request thus will not respond. It is also possible to configure static host entries (including a static ARP entry and a static entry in the MAC-address table) on SPAN destination ports.

**Note**

This configuration does not work if the SPAN session does not have a source configured; the session is half configured with only the SPAN destination port.

To configure ingress packets and encapsulation, perform this task:

Command	Purpose
<pre>Switch(config)# [no] monitor session <session_number> destination interface <interface> [encapsulation {isl dot1q}] [ingress [vlan vlan_IDs] [learning]]</pre>	<p>Specifies the configuration of the ingress packet and the encapsulation type of the destination port.</p> <p>Note The isl keyword is <i>not</i> supported on the Supervisor Engine 6-E.</p> <p>For <i>session_number</i>, specifies the session number identified with this SPAN session (1 through 6).</p> <p>For <i>interface</i>, specifies the destination interface.</p> <p>For <i>vlan_IDs</i>, specifies the destination VLAN.</p> <p>Use the no keyword to restore the defaults.</p>

This example shows how to configure a destination port with 802.1q encapsulation and ingress packets using native VLAN 7:

```
Switch(config)# monitor session 1 destination interface fastethernet 5/48
encapsulation dot1q ingress vlan 7
```

With this configuration, traffic from SPAN sources associated with session 1 would be copied out of interface Fast Ethernet 5/48, with 802.1q encapsulation. Incoming traffic would be accepted and switched, with untagged packets being classified into VLAN 7.

Access List Filtering

When configuring a SPAN session, you can apply access list filtering. Access list filtering applies to all packets passing through a SPAN destination port that might be sniffed in the egress or ingress direction. Access list filters are allowed on local SPAN sessions only. If the SPAN destination is an RSPAN VLAN, the access list filter is rejected.

Note

Access list filtering is available in Cisco IOS Release 12.2(20)EW and later releases.

ACL Configuration Guidelines

You can configure ACLs on a SPAN session. Use these guidelines for ACL/SPAN sessions:

- If an ACL is associated with a SPAN session, the rules associated with that ACL are applied against all packets exiting the SPAN destination interface. Rules pertaining to other VACLs or RACLs previously associated with the SPAN destination interface are not applied.
- Only one ACL can be associated with a SPAN session.

- When no ACLs are applied to packets exiting a SPAN destination interface, all traffic is permitted regardless of the PACLS, VACLs, or RACLs that have been previously applied to the destination interface or VLAN to which the SPAN destination interface belongs.
- If an ACL is removed from a SPAN session, all traffic is permitted once again.
- If SPAN configuration is removed from the SPAN session, all rules associated with the SPAN destination interface are applied once again.
- If a SPAN destination port is configured as a trunk port and the VLANs to which it belongs have ACLs associated with them, the traffic is not subjected to the VACLs.
- ACL configuration applies normally to the RSPAN VLAN and to trunk ports carrying the RSPAN VLAN. This configuration enables the user to apply VACLs on RSPAN VLANs. If a user attempts to configure an ACL on a SPAN session with the destination port as an RSPAN VLAN, the configuration is rejected.
- If CAM resources are exhausted and packets are passed to the CPU for lookup, any output port ACLs associated with a SPAN session are not applied.
- If a named IP ACL is configured on a SPAN session before an ACL is created, the configuration is accepted, and the software creates an empty ACL with no ACEs. (An empty ACL permits all packets.) Subsequently, the rules can be added to the ACL.
- The ACLs associated with a SPAN session are applied on the destination interface on output.
- No policing is allowed on traffic exiting SPAN ports.
- Only IP ACLs are supported on SPAN sessions.

Configuring Access List Filtering

To configure access list filtering, perform this task:

Command	Purpose
Switch(config)# [no] monitor session { <i>session_number</i> } filter { ip access-group [<i>name</i> <i>id</i>] } { vlan <i>vlan_IDs</i> [, -] } { packet-type { good bad } } { address-type { unicast multicast broadcast } [rx tx both] }	Specifies filter sniffing based on the access list. For <i>session_number</i> , specify the session number identified with this SPAN session (1 through 6). You can specify either a name or a numeric ID for the access list. For <i>name</i> , specify the IP access list name. For <i>id</i> , specify a standard <1 to 199> or extended <1300-2699> IP access list.

Note

IP access lists must be created in configuration mode as described in the chapter “Configuring Network Security with ACLs.”

This example shows how to configure IP access group 10 on a SPAN session and verify that an access list has been configured:

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# monitor session 1 source interface fa6/1 both
Switch(config)# monitor session 1 destination interface fa6/2
Switch(config)# monitor session 1 filter vlan 1
Switch(config)# monitor session 1 filter ip access-group 10
Switch(config)# exit
Switch# show monitor

Session 1
-----
Type                : Local Session
Source Ports        :
    Both            : Fa6/1
Destination Ports   : Fa6/2
    Encapsulation   : Native
        Ingress     : Disabled
        Learning    : Disabled
Filter VLANs        : 1
IP Access-group     : 10
```

Packet Type Filtering

When configuring a SPAN session, you can specify packet filter parameters similar to VLAN filters. When specified, the packet filters indicate types of packets that may be sniffed. If no packet filters are specified, packets of all types may be sniffed. Different types of packet filters may be specified for ingress and egress traffic.

There are two categories of packet filtering: packet-based (good, error) or address-based (unicast/multicast/broadcast). Packet-based filters can only be applied in the ingress direction. Packets are classified as broadcast, multicast, or unicast by the hardware based on the destination address.

Note

When filters of both types are configured, only packets that pass both filters are spanned. For example, if you set both “error” and “multicast,” only multicast packets with errors are spanned.

To configure packet type filtering, perform this task:

Command	Purpose
Switch(config)# [no] monitor session { <i>session_number</i> } filter { vlan <i>vlan_IDs</i> [, -] } { packet-type { good bad }} { address-type { unicast multicast broadcast } [rx tx both] }	<p>Specifies filter sniffing of the specified packet types in the specified directions.</p> <p>For <i>session_number</i>, specifies the session number identified with this SPAN session (1 through 6).</p> <p>For <i>vlan_IDs</i>, specifies the VLAN.</p> <p>You can specify both Rx and Tx type filters, as well as specify multiple type filters at the same time (such as good and unicast to only sniff non-error unicast frames). As with VLAN filters, if no type or filter is specified, then the session sniffs all packet types.</p> <p>Use the no keyword to restore the defaults.</p>

This example shows how to configure a session to accept only unicast packets in the ingress direction:

```
Switch(config)# monitor session 1 filter address-type unicast rx
```

Configuration Example

The following is an example of SPAN configuration using some of the SPAN enhancements.

In the example below, you configure a session to sniff unicast traffic arriving on interface Gi1/1. The traffic is mirrored out of interface Gi1/2 with ISL encapsulation. Ingress traffic is permitted.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# monitor session 1 source interface gi1/1 rx
Switch(config)# monitor session 1 destination interface gi1/2 encapsulation isl ingress
Switch(config)# monitor session 1 filter address-type unicast rx
Switch(config)# exit
Switch# show monitor
```

```
Session 1
-----
Type                : Local Session
Source Ports        :
    RX Only         : Gi1/1
Destination Ports   : Gi1/2
    Encapsulation   : ISL
    Ingress         : Enabled
    Learning        : Disabled
Filter Addr Type    :
    RX Only         : Unicast
```

Configuring RSPAN

This section describes how to configure RSPAN on your switch and it contains this configuration information:

- [RSPAN Configuration Guidelines, page 50-16](#)
- [Creating an RSPAN Session, page 50-17](#)
- [Creating an RSPAN Destination Session, page 50-19](#)
- [Creating an RSPAN Destination Session and Enabling Ingress Traffic, page 50-20](#)
- [Removing Ports from an RSPAN Session, page 50-21](#)
- [Specifying VLANs to Monitor, page 50-22](#)
- [Specifying VLANs to Filter, page 50-23](#)

RSPAN Configuration Guidelines

Follow these guidelines when configuring RSPAN:

Note

Since RSPAN VLANs have special properties, you should reserve a few VLANs across your network for use as RSPAN VLANs; do not assign access ports to these VLANs.

**Note**

You can apply an output access control list (ACL) to RSPAN traffic to selectively filter or monitor specific packets. Specify these ACLs on the RSPAN VLAN in the RSPAN source switches.

- RSPAN sessions can coexist with SPAN sessions within the limits described in the “[SPAN and RSPAN Session Limits](#)” section on page 50-6.
- For RSPAN configuration, you can distribute the source ports and the destination ports across multiple switches in your network.
- RSPAN does not support BPDU packet monitoring or other Layer 2 switch protocols.
- The RSPAN VLAN is configured only on trunk ports and not on access ports. To avoid unwanted traffic in RSPAN VLANs, make sure that all participating switches support the VLAN remote-span feature. Access ports on the RSPAN VLAN are silently disabled.
- You should create an RSPAN VLAN before configuring an RSPAN source or destination session.
- If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network for VLAN-IDs that are lower than 1005.
- Because RSPAN traffic is carried across a network on an RSPAN VLAN, the original VLAN association of the mirrored packets is lost. Therefore, RSPAN can only support forwarding of traffic from an IDS device onto a single user-specified VLAN.

Creating an RSPAN Session

First create an RSPAN VLAN that *does not* exist for the RSPAN session in any of the switches that participate in RSPAN. With VTP enabled in the network, you can create the RSPAN VLAN in one switch, and then VTP propagates it to the other switches in the VTP domain for VLAN-IDs that are lower than 1005.

Use VTP pruning to get efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

To start an RSPAN source session and to specify the source (monitored) ports and the destination RSPAN VLAN, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# no monitor session { <i>session_number</i> all local remote }	Clears any existing RSPAN configuration for the session. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). Specifies all to remove all RSPAN sessions, local to remove all local sessions, or remote to remove all remote SPAN sessions.
Step 3	Switch(config)# vlan { <i>remote_vlan_ID</i> }	Specifies a remote VLAN ID. Ensure that the VLAN ID is not being used for any user traffic.
Step 4	Switch(config-vlan)# remote-span	Converts the VLAN ID to a remote VLAN ID.
Step 5	Switch(config-vlan)# exit	Returns to global configuration mode.

Command	Purpose
Step 6 Switch(config)# [no] monitor session { <i>session_number</i> } {source {interface <interface_list> {vlan vlan_ids cpu [queue queue_ids]} [rx tx both]	<p>Specifies the RSPAN session and the source port (monitored port).</p> <p>For <i>session_number</i>, specifies the session number identified with this RSPAN session (1 through 6).</p> <p>For <i>interface-list</i>, specifies the source port to monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel <i>port-channel-number</i>).</p> <p>For <i>vlan-ids</i>, specifies the source VLAN or VLANs to monitor. Valid VLANs are in the range from 1 to 4094.</p> <p>For <i>queue_ids</i>, specifies either a set of CPU queue numerical identifiers from 1 to 32, or a named queue.</p> <p>(Optional) [, -] Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen.</p> <p>(Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both transmitted (Tx) and received (Rx) traffic. Only received traffic can be monitored on additional source ports.</p> <ul style="list-style-type: none"> • Rx—Monitor received traffic. • Tx—Monitor transmitted traffic. • both—Monitor both received and transmitted traffic (bidirectional).
Step 7 Switch(config)# monitor session <i>session_number</i> destination remote vlan <i>vlan-ID</i>	<p>Specifies the RSPAN session and the destination remote VLAN.</p> <p>For <i>session_number</i>, specifies the session number identified with this RSPAN session (1 through 6).</p> <p>For <i>vlan-ID</i>, specifies the RSPAN VLAN to carry the monitored traffic to the destination port.</p>
Step 8 Switch(config)# end	Returns to privileged EXEC mode.
Step 9 Switch# show monitor [session <i>session_number</i>]	Verifies your entries.
Step 10 Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to clear any existing RSPAN configuration for session 1, configure RSPAN session 1 to monitor multiple source interfaces, and configure the destination RSPAN VLAN.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no monitor session 1
Switch(config)# monitor session 1 source interface fastEthernet3/10 tx
Switch(config)# monitor session 1 source interface fastEthernet3/2 rx
Switch(config)# monitor session 1 source interface fastEthernet3/3 rx
Switch(config)# monitor session 1 source interface port-channel 102 rx
Switch(config)# monitor session 1 destination remote vlan 901
Switch(config)# end
```

Creating an RSPAN Destination Session

To create an RSPAN destination session and to specify the source RSPAN VLAN and the destination port, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# monitor session <i>session_number</i> source remote vlan <i>vlan-ID</i>	Specifies the RSPAN session and the source RSPAN VLAN. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>vlan-ID</i> , specifies the source RSPAN VLAN to monitor.
Step 3	Switch(config)# [no] monitor session < <i>session_number</i> > destination interface < <i>interface</i> > [encapsulation { isl dot1q }] [ingress [vlan <i>vlan_IDs</i>] [learning]]	Specifies the RSPAN session and the destination interface. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>interface</i> , specifies the destination interface. For <i>vlan_IDs</i> , specifies the ingress VLAN, if necessary. (Optional) [, -] Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen. (Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both sent and received traffic. Only received (rx) traffic can be monitored on additional source ports. <ul style="list-style-type: none"> isl—Use ISL encapsulation. dot1q—Use 802.1Q encapsulation.
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show monitor [session <i>session_number</i>]	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure VLAN 901 as the source remote VLAN and port 5 as the destination interface:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface gigabitEthernet1/2
Switch(config)# end
```

Creating an RSPAN Destination Session and Enabling Ingress Traffic

To create an RSPAN destination session, to specify the source RSPAN VLAN, and to enable ingress traffic on the destination port for a network security device (such as a Cisco IDS [Intrusion Detection System] sensor appliance), perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# monitor session { <i>session_number</i> } source vlan <i>vlan_IDs</i>	Specifies the RSPAN session and the source RSPAN VLAN. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>vlan_IDs</i> , specifies the source VLAN or VLANs to monitor. Valid VLANs are in the range from 1 to 4094.
Step 3	Switch(config)# [monitor session <i>session_number</i> destination interface <i>interface-id</i> [encapsulation { dot1q ingress vlan <i>vlan id</i> } ISL [ingress]} ingress vlan <i>vlan id</i>] [learning]	Specifies the RSPAN session, the destination port, the packet encapsulation, and the ingress VLAN. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>interface-id</i> , specifies the destination port. Valid interfaces include physical interfaces. (Optional) Specifies the encapsulation of the packets transmitted on the RSPAN destination port. If no encapsulation is specified, all transmitted packets are sent in native format (untagged). <ul style="list-style-type: none"> Enter encapsulation dot1q to send native VLAN packets untagged, and all other VLAN tx packets tagged dot1q. Enter encapsulation isl to send all tx packets encapsulated using ISL. (Optional) Specifies whether forwarding is enabled for ingress traffic on the RSPAN destination port. <ul style="list-style-type: none"> For native (untagged) and dot1q encapsulation, specify ingress vlan <i>vlan id</i> to enable ingress forwarding with <i>vlan id</i> as the native VLAN; <i>vlan id</i> is also used as the native VLAN for transmitted packets. Specify ingress to enable ingress forwarding when using ISL encapsulation. Specify learning to enable learning when ingress is enabled.
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show monitor [session <i>session_number</i>]	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure VLAN 901 as the source remote VLAN and how to configure the destination port for ingress traffic on VLAN 5 by using a security device that supports 802.1Q encapsulation:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# monitor session 1 source remote vlan 901
Switch(config)# monitor session 1 destination interface gigabitEthernet1/2 ingress vlan 5
Switch(config)# end
```

Removing Ports from an RSPAN Session

To remove a port as an RSPAN source for a session, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] monitor session {session_number} {source {interface interface_list {vlan vlan_IDs cpu [queue queue_ids]} [rx tx both]}	<p>Specifies the characteristics of the RSPAN source port (monitored port) to remove.</p> <p>For <i>session_number</i>, specifies the session number identified with this RSPAN session (1 through 6).</p> <p>For <i>interface-list</i>, specifies the source port to no longer monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel <i>port-channel-number</i>).</p> <p>For <i>vlan_IDs</i>, specifies the source vlan or vlans to monitor. Valid VLANs are in the range from 1 to 4094.</p> <p>For <i>queue_ids</i>, specifies either a set of CPU queue numerical identifiers from 1 to 32, or a named queue.</p> <p>(Optional) [, -] Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen.</p> <p>(Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both transmitted (Tx) and received (Rx) traffic. Only received traffic can be monitored on additional source ports.</p> <ul style="list-style-type: none"> • Rx—Monitor received traffic. • Tx—Monitor transmitted traffic. • both—Monitor both received and transmitted traffic (bidirectional).
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show monitor [session session_number]	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to remove port 1 as an RSPAN source for RSPAN session 1:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no monitor session 1 source interface gigabitEthernet1/1
Switch(config)# end
```

This example shows how to disable received traffic monitoring on port 1, which was configured for bidirectional monitoring:

```
Switch(config)# no monitor session 1 source interface gigabitEthernet1/1 rx
```

The monitoring of traffic received on port 1 is disabled, but traffic transmitted from this port continues to be monitored.

Specifying VLANs to Monitor

VLAN monitoring is similar to port monitoring. To specify VLANs to monitor, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# no monitor session { <i>session_number</i> all local remote }	Clears any existing SPAN configuration for the session. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). Specify all to remove all SPAN sessions, local to remove all local sessions, or remote to remove all remote SPAN sessions.
Step 3	Switch(config)# [no] monitor session { <i>session_number</i> } { source { interface <i>interface_list</i> { vlan <i>vlan_IDs</i> cpu [<i>queue queue_ids</i>]} [rx tx both]	Specifies the RSPAN session and the source VLANs (monitored VLANs). You can monitor only received (rx) traffic on VLANs. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>interface-list</i> , specifies the source port to no longer monitor. Valid interfaces include physical interfaces and port-channel logical interfaces (port-channel <i>port-channel-number</i>). For <i>vlan-IDs</i> , the range is 1 to 4094; do not enter leading zeros. For <i>queue_ids</i> , specifies the source queue. (Optional) [, -] Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen. (Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both transmitted (Tx) and received (Rx) traffic. Only received traffic can be monitored on additional source ports. <ul style="list-style-type: none"> • Rx—Monitor received traffic. • Tx—Monitor transmitted traffic. • both—Monitor both received and transmitted traffic (bidirectional).

	Command	Purpose
Step 4	Switch(config)# monitor session <i>session_number</i> destination remote vlan <i>vlan-id</i>	Specifies the RSPAN session, the destination remote VLAN. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). For <i>vlan-id</i> , specifies the RSPAN VLAN to carry the monitored traffic to the destination port.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show monitor [session <i>session_number</i>]	Verifies your entries.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To remove one or more source VLANs from the RSPAN session, use the **no monitor session** *session_number* **source vlan** *vlan-id* **rx** global configuration command.

This example shows how to clear any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor received traffic on all ports belonging to VLANs 1 through 3, and send it to destination remote VLAN 902. The configuration is then modified to also monitor received traffic on all ports belonging to VLAN 10.

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source vlan 1 - 3 rx
Switch(config)# monitor session 2 destination remote vlan 902
Switch(config)# monitor session 2 source vlan 10 rx
Switch(config)# end
```

Specifying VLANs to Filter

To limit RSPAN source traffic to specific VLANs, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# no monitor session { <i>session_number</i> all local remote }	Clears any existing SPAN configuration for the session. For <i>session_number</i> , specifies the session number identified with this RSPAN session (1 through 6). Specify all to remove all SPAN sessions, local to remove all local sessions, or remote to remove all remote SPAN sessions.

	Command	Purpose
Step 3	Switch(config)# [no] monitor session { <i>session_number</i> } { source { interface <i>interface_list</i> { vlan <i>vlan_IDs</i> cpu [queue <i>queue_ids</i>]} [rx tx both]	<p>Specifies the characteristics of the source port (monitored port) and RSPAN session.</p> <p>For <i>session_number</i>, specifies the session number identified with this RSPAN session (1 through 6).</p> <p>For <i>interface-list</i>, specifies the source port to monitor. The interface specified must already be configured as a trunk port.</p> <p>For <i>vlan-IDs</i>, the range is 1 to 4094; do not enter leading zeros.</p> <p>For <i>queue_ids</i>, specifies the source queue.</p> <p>(Optional) [, -] Specifies a series or range of interfaces. Enter a space after the comma; enter a space before and after the hyphen.</p> <p>(Optional) Specifies the direction of traffic to monitor. If you do not specify a traffic direction, the source interface sends both transmitted (Tx) and received (Rx) traffic. Only received traffic can be monitored on additional source ports.</p> <ul style="list-style-type: none"> • Rx—Monitor received traffic. • Tx—Monitor transmitted traffic. • both—Monitor both received and transmitted traffic (bidirectional).
Step 4	Switch(config)# monitor session <i>session_number</i> filter vlan <i>vlan-id</i> [, -]	<p>Limits the RSPAN source traffic to specific VLANs.</p> <p>For <i>session_number</i>, specifies the session number identified with this RSPAN session (1 through 6).</p> <p>For <i>vlan-id</i>, the range is 1 to 4094; do not enter leading zeros.</p> <p>(Optional) Use a comma (,) to specify a series of VLANs or use a hyphen (-) to specify a range of VLANs. Enter a space after the comma; enter a space before and after the hyphen.</p>
Step 5	Switch(config)# monitor session <i>session_number</i> destination remote vlan <i>vlan-id</i>	<p>Specifies the RSPAN session, the destination remote VLAN.</p> <p>For <i>session_number</i>, specifies the session number identified with this RSPAN session (1 through 6).</p> <p>For <i>vlan-id</i>, specifies the RSPAN VLAN to carry the monitored traffic to the destination port.</p>
Step 6	Switch(config)# end	Returns to privileged EXEC mode.
Step 7	Switch# show monitor [session <i>session_number</i>]	Verifies your entries.
Step 8	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To monitor all VLANs on the trunk port, use the **no monitor session** *session_number* **filter vlan** global configuration command.

This example shows how to clear any existing configuration on RSPAN session 2, configure RSPAN session 2 to monitor traffic received on trunk port 4, and send traffic for only VLANs 1 through 5 and 9 to destination remote VLAN 902.

```
Switch# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)# no monitor session 2
Switch(config)# monitor session 2 source interface gigabitethernet1/1 rx
Switch(config)# monitor session 2 filter vlan 1 - 5 , 9
Switch(config)# monitor session 2 destination remote vlan 902
Switch(config)# end
```

Displaying SPAN and RSPAN Status

To display the status of the current SPAN or RSPAN configuration, use the **show monitor** privileged EXEC command.

This example displays the output for the **show monitor** command for SPAN source session 1:

```
Switch# show monitor session 1
Session 1
-----
Type: Local Source Session
Source Ports:
    RX Only: Fa3/13
    TX Only:  None
    Both:    None

Source VLANs:
    RX Only:  None
    TX Only:  None
    Both:    None
Source RSPAN VLAN: None
Destination Ports: None
Encapsulation: DOT1Q
Ingress:Enabled, default VLAN=5
Filter VLANs:  None
Dest RSPAN VLAN: None
Ingress : Enabled, default VLAN=2
Learning : Disabled
```

CHAPTER 51

Configuring System Message Logging

This chapter describes how to configure system message logging on the Catalyst 4500 series switch.

This chapter consists of these sections:

- [Understanding System Message Logging, page 51-1](#)
- [Configuring System Message Logging, page 51-2](#)
- [Displaying the Logging Configuration, page 51-12](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding System Message Logging

By default, a switch sends the output from system messages and **debug** privileged EXEC commands to a logging process. The logging process controls the distribution of logging messages to various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console.

Note

The syslog format is compatible with 4.3 BSD UNIX.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so message and debug output are interspersed with prompts or output from other commands. Messages are displayed on the console after the process that generated them has finished.

You can set the severity level of the messages to control the type of messages displayed on the consoles and each of the destinations. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management. For information on possible messages, see the system message guide for this release.

You can access logged system messages by using the switch command-line interface (CLI) or by saving them to a properly configured syslog server. The switch software saves syslog messages in an internal buffer on the switch. If the switch fails, the log is lost unless you had saved it to flash memory.

You can remotely monitor system messages by viewing the logs on a syslog server or by accessing the switch through Telnet or through the console port.

Configuring System Message Logging

These sections describe how to configure system message logging:

- [System Log Message Format, page 51-2](#)
- [Default System Message Logging Configuration, page 51-3](#)
- [Disabling Message Logging, page 51-4](#) (optional)
- [Setting the Message Display Destination Device, page 51-5](#) (optional)
- [Synchronizing Log Messages, page 51-6](#) (optional)
- [Enabling and Disabling Timestamps on Log Messages, page 51-7](#) (optional)
- [Enabling and Disabling Sequence Numbers in Log Messages \(Optional\), page 51-7](#) (optional)
- [Defining the Message Severity Level \(Optional\), page 51-8](#) (optional)
- [Limiting Syslog Messages Sent to the History Table and to SNMP \(Optional\), page 51-9](#) (optional)
- [Configuring UNIX Syslog Servers, page 51-10](#) (optional)

System Log Message Format

System log messages can contain up to 80 characters and a percent sign (%), which follows the optional sequence number or time-stamp information, if configured. Messages are displayed in this format:

seq no:timestamp: %facility-severity-MNEMONIC:description

The part of the message preceding the percent sign depends on the setting of the **service sequence-numbers**, **service timestamps log datetime**, **service timestamps log datetime [localtime] [msec] [show-timezone]**, or **service timestamps log uptime** global configuration command.

[Table 51-1](#) describes the elements of syslog messages.

Table 51-1 **System Log Message Elements**

Element	Description
<i>seq no:</i>	Stamps log messages with a sequence number only if the service sequence-numbers global configuration command is configured. For more information, see the “ Enabling and Disabling Sequence Numbers in Log Messages (Optional) ” section on page 51-7.
<i>timestamp</i> formats: <i>mm/dd hh:mm:ss</i> or <i>hh:mm:ss</i> (short uptime) or <i>d h</i> (long uptime)	Date and time of the message or event. This information appears only if the service timestamps log [datetime log] global configuration command is configured. For more information, see the “ Enabling and Disabling Timestamps on Log Messages ” section on page 51-7.
<i>facility</i>	The facility to which the message refers (for example, SNMP, SYS, and so forth). For a list of supported facilities, see Table 51-4 on page 51-12 .
<i>severity</i>	Single-digit code from 0 to 7 that is the severity of the message. For a description of the severity levels, see Table 51-3 on page 51-9 .
<i>MNEMONIC</i>	Text string that uniquely describes the message.
<i>description</i>	Text string containing detailed information about the event being reported.

This example shows a partial switch system message:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/1, changed state to up
00:00:47: %LINK-3-UPDOWN: Interface GigabitEthernet1/0/2, changed state to up
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface Vlan1, changed state to down
00:00:48: %LINEPROTO-5-UPDOWN: Line protocol on Interface GigabitEthernet1/0/1, changed
state to down 2
*Mar  1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
18:47:02: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
*Mar  1 18:48:50.483 UTC: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

Default System Message Logging Configuration

[Table 51-2](#) shows the default system message logging configuration.

Table 51-2 **Default System Message Logging Configuration**

Feature	Default Setting
System message logging to the console	Enabled.
Console severity	Debugging (and numerically lower levels; see Table 51-3 on page 51-9).
Logging file configuration	No filename specified.
Logging buffer size	4096 bytes.
Logging history size	1 message.
Timestamps	Disabled.

Table 51-2 *Default System Message Logging Configuration (continued)*

Feature	Default Setting
Synchronous logging	Disabled.
Logging server	Disabled.
Syslog server IP address	None configured.
Server facility	Local7 (see Table 51-4 on page 51-12).
Server severity	Informational (and numerically lower levels; see Table 51-3 on page 51-9).

Disabling Message Logging

Message logging is enabled by default. It must be enabled to send messages to any destination other than the console. When enabled, log messages are sent to a logging process, which logs messages to designated locations asynchronously to the processes that generated the messages.

To disable message logging, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# no logging on	Disables message logging.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show running-config or show logging	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Disabling the logging process can slow down the switch because a process must wait until the messages are written to the console before continuing. When the logging process is disabled, messages are displayed on the console as soon as they are produced, often appearing in the middle of command output.

The **logging synchronous** global configuration command also affects the display of messages to the console. When this command is enabled, messages appear only after you press Return. For more information, see the [Synchronizing Log Messages, page 51-6](#).

To re-enable message logging after it has been disabled, use the **logging on** global configuration command.

Setting the Message Display Destination Device

If message logging is enabled, you can send messages to specific locations in addition to the console.

To specify the locations that receive messages, perform this task, beginning in privileged EXEC mode:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# logging buffered [size]	<p>Logs messages to an internal buffer on the switch. The default buffer size is 4096. The range is 4096 to 2147483647 bytes.</p> <p>If the switch, the log file is lost unless you previously saved it to flash memory. See Step 4.</p> <p>Note Do not make the buffer size too large because the switch could run out of memory for other tasks. Use the show memory privileged EXEC command to view the free processor memory on the switch. However, this value is the maximum available, and the buffer size should <i>not</i> be set to this amount.</p>
Step 3	Switch(config)# logging host	<p>Logs messages to a UNIX syslog server host.</p> <p>For <i>host</i>, specify the name or IP address of the host to be used as the syslog server.</p> <p>To build a list of syslog servers that receive logging messages, enter this command more than once.</p> <p>For complete syslog server configuration steps, see the “Configuring UNIX Syslog Servers” section on page 51-10.</p>
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# terminal monitor	<p>Logs messages to a nonconsole terminal during the current session.</p> <p>Terminal parameter-setting commands are set locally and do not remain in effect after the session has ended. You must perform this step for each session to see the debugging messages.</p>
Step 6	Switch# show running-config	Verifies your entries.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The **logging buffered** global configuration command copies logging messages to an internal buffer. The buffer is circular, so newer messages overwrite older messages after the buffer is full. To display the messages that are logged in the buffer, use the **show logging** privileged EXEC command. The first message displayed is the oldest message in the buffer. To clear the contents of the buffer, use the **clear logging** privileged EXEC command.

To disable logging to the console, use the **no logging console** global configuration command. To disable logging to a file, use the **no logging file** [severity-level-number | type] global configuration command.

Synchronizing Log Messages

You can synchronize unsolicited messages and **debug** privileged EXEC command output with solicited device output and prompts for a specific console port line or virtual terminal line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also configure the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is enabled, unsolicited device output appears on the console or printed after solicited device output appears or printed.

Unsolicited messages and **debug** command output appears on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages are displayed, the console again displays the user prompt.

To configure synchronous logging, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# line [console vty] <i>line-number</i> [<i>ending-line-number</i>]	Specifies the line to be configured for synchronous logging of messages. <ul style="list-style-type: none"> Use the console keyword for configurations that occur through the switch console port. Use the line vty line-number command to specify which vty lines are to have synchronous logging enabled. You use a vty connection for configurations that occur through a Telnet session. The range of line numbers is from 0 to 15. <p>You can change the setting of all 16 vty lines at once by entering: line vty 0 15</p> <p>Or you can change the setting of the single vty line being used for your current connection. For example, to change the setting for vty line 2, enter: line vty 2</p> <p>When you enter this command, the mode changes to line configuration.</p>
Step 3	Switch(config)# logging synchronous [level [<i>severity-level</i> all] limit <i>number-of-buffers</i>]	Enables synchronous logging of messages. <ul style="list-style-type: none"> (Optional) For level severity-level, specify the message severity level. Messages with a severity level equal to or higher than this value are printed asynchronously. Low numbers mean greater severity and high numbers mean lesser severity. The default is 2. (Optional) Specifying level all means that all messages are printed asynchronously regardless of the severity level. (Optional) For limit number-of-buffers, specify the number of buffers to be queued for the terminal after which new messages are dropped. The range is 0 to 2147483647. The default is 20.
Step 4	Switch(config)# end	Returns to privileged EXEC mode.

	Command	Purpose
Step 5	Switch# show running-config	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable synchronization of unsolicited messages and debug output, use the **no logging synchronous** [*level severity-level* | **all**] [*limit number-of-buffers*] line configuration command.

Enabling and Disabling Timestamps on Log Messages

Note By default, log messages are not time-stamped.

To enable time-stamping of log messages, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# service timestamps log uptime or Switch(config)# service timestamps log datetime [msec] [localtime] [show-timezone]	Enables log time-stamps. The first command enables time-stamps on log messages, showing the time since the system was rebooted. The second command enables time-stamps on log messages. Depending on the options selected, the timestamp can include the date, time in milliseconds relative to the local time zone, and the time zone name.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show running-config	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable time-stamps for both debug and log messages, use the **no service timestamps** global configuration command.

This example shows part of a logging display with the **service timestamps log datetime** global configuration command enabled:

```
*Mar 1 18:46:11: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

This example shows part of a logging display with the **service timestamps log uptime** global configuration command enabled:

```
00:00:46: %LINK-3-UPDOWN: Interface Port-channel1, changed state to up
```

Enabling and Disabling Sequence Numbers in Log Messages (Optional)

Because more than one log message can have the same timestamp, you can display messages with sequence numbers so that you can unambiguously refer to a single message. By default, sequence numbers in log messages are not displayed.

To enable sequence numbers in log messages, perform this task, which is optional.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# service sequence-numbers	Enables sequence numbers.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show running-config	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable sequence numbers, use the **no service sequence-numbers** global configuration command.

This example shows part of a logging display with sequence numbers enabled:

```
000019: %SYS-5-CONFIG_I: Configured from console by vty2 (10.34.195.36)
```

Defining the Message Severity Level (Optional)

You can limit messages displayed to the selected device by specifying the severity level of the message, which are described in [Table 51-3](#).

To define the message severity level, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# logging console level	Limits messages logged to the console. By default, the console receives debugging messages and numerically lower levels (see Table 51-3 on page 51-9).
Step 3	Switch(config)# logging monitor level	Limits messages logged to the terminal lines. By default, the terminal receives debugging messages and numerically lower levels (see Table 51-3 on page 51-9).
Step 4	Switch(config)# logging trap level	Limits messages logged to the syslog servers. By default, syslog servers receive informational messages and numerically lower levels (see Table 51-3 on page 51-9). For complete syslog server configuration steps, see the “Configuring UNIX Syslog Servers” section on page 51-10 .
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show running-config or Switch# show logging	Verifies your entries.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Note

Specifying a *level* causes messages at that level and numerically lower levels to be displayed at the destination.

To disable logging to the console, use the **no logging console** global configuration command. To disable logging to a terminal other than the console, use the **no logging monitor** global configuration command. To disable logging to syslog servers, use the **no logging trap** global configuration command.

[Table 51-3](#) describes the *level* keywords. It also lists the corresponding UNIX syslog definitions from the most severe level to the least severe level.

Table 51-3 Message Logging Level Keywords

Level Keyword	Level	Description	Syslog Definition
emergencies	0	System unstable	LOG_EMERG
alerts	1	Immediate action needed	LOG_ALERT
critical	2	Critical conditions	LOG_CRIT
errors	3	Error conditions	LOG_ERR
warnings	4	Warning conditions	LOG_WARNING
notifications	5	Normal but significant condition	LOG_NOTICE
informational	6	Informational messages only	LOG_INFO
debugging	7	Debugging messages	LOG_DEBUG

The software generates four other categories of messages:

- Error messages about software or hardware malfunctions, displayed at levels **warnings** through **emergencies**. These types of messages mean that the functionality of the switch is affected. For information on how to recover from these malfunctions, see the system message guide for this release.
- Output from the **debug** commands, displayed at the **debugging** level. Debug commands are typically used only by the Technical Assistance Center.
- Interface up or down transitions and system restart messages, displayed at the **notifications** level. This message is only for information; switch functionality is not affected.
- Reload requests and low-process stack messages, displayed at the **informational** level. This message is only for information; switch functionality is not affected.

Limiting Syslog Messages Sent to the History Table and to SNMP (Optional)

If you enabled syslog message traps to be sent to an SNMP network management station by using the **snmp-server enable trap** global configuration command, you can change the level of messages sent and stored in the switch history table. You also can change the number of messages that are stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level **warning** and numerically lower levels (see [Table 51-3 on page 51-9](#)) are stored in the history table even if syslog traps are not enabled.

To change the level and history table size defaults, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# logging history level ¹	Changes the default level of syslog messages stored in the history file and sent to the SNMP server. See Table 51-3 on page 51-9 for a list of <i>level</i> keywords. By default, warnings, errors, critical, alerts, and emergencies messages are sent.
Step 3	Switch(config)# logging history size number	Specifies the number of syslog messages that can be stored in the history table. The default is to store one message. The range is 0 to 500 messages.
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show running-config	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

1. [Table 51-3](#) lists the level keywords and severity level. For SNMP usage, the severity level values increase by 1. For example, emergencies equal 1, not 0, and critical equals 3, not 2.

When the history table is full (it contains the maximum number of message entries specified with the **logging history size** global configuration command), the oldest message entry is deleted from the table to allow the new message entry to be stored.

To return the logging of syslog messages to the default level, use the **no logging history** global configuration command. To return the number of messages in the history table to the default value, use the **no logging history size** global configuration command.

Configuring UNIX Syslog Servers

The next sections describe how to configure the UNIX server syslog daemon and how to define the UNIX system logging facility.

Logging Messages to a UNIX Syslog Daemon

Before you can send system log messages to a UNIX syslog server, you must configure the syslog daemon on a UNIX server. This procedure is optional.

Note

Some recent versions of UNIX syslog daemons no longer accept by default syslog packets from the network. If this is the case with your system, use the UNIX **man syslogd** command to decide what options must be added to or removed from the syslog command line to enable logging of remote syslog messages.

Log in as root, and perform these steps:

Step 1 Add a line such as the following to the file `/etc/syslog.conf`:

```
local7.debug /usr/adm/logs/cisco.log
```

The **local7** keyword specifies the logging facility to be used; see [Table 51-4 on page 51-12](#) for information on the facilities. The **debug** keyword specifies the syslog level; see [Table 51-3 on page 51-9](#) for information on the severity levels. The syslog daemon sends messages at this level or at a more severe level to the file specified in the next field. The file must already exist, and the syslog daemon must have permission to write to it.

Step 2 Create the log file by entering these commands at the UNIX shell prompt:

```
$ touch /var/log/cisco.log
$ chmod 666 /var/log/cisco.log
```

Step 3 Ensure that the syslog daemon reads the new changes:

```
$ kill -HUP `cat /etc/syslog.pid`
```

For more information, see the **man syslog.conf** and **man syslogd** commands on your UNIX system.

Configuring the UNIX System Logging Facility

When sending system log messages to an external device, you can cause the switch to identify its messages as originating from any of the UNIX syslog facilities.

To configure UNIX system facility message logging, perform this task, which is optional.

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# logging host	Logs messages to a UNIX syslog server host by entering its IP address. To build a list of syslog servers that receive logging messages, enter this command more than once.
Step 3	Switch(config)# logging trap level	Limits messages logged to the syslog servers. Be default, syslog servers receive informational messages and lower. See Table 51-3 on page 51-9 for <i>level</i> keywords.
Step 4	Switch(config)# logging facility facility-type	Configures the syslog facility. See Table 51-4 on page 51-12 for <i>facility-type</i> keywords. The default is local7 .
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show running-config	Verifies your entries.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To remove a syslog server, use the **no logging host** global configuration command, and specify the syslog server IP address. To disable logging to syslog servers, enter the **no logging trap** global configuration command.

Table 51-4 lists the UNIX system facilities supported by the software. For more information about these facilities, consult the operator's manual for your UNIX operating system.

Table 51-4 *Logging Facility-Type Keywords*

Facility Type Keyword	Description
auth	Authorization system
cron	Cron facility
daemon	System daemon
kern	Kernel
local0-7	Locally defined messages
lpr	Line printer system
mail	Mail system
news	USENET news
sys9-14	System use
syslog	System log
user	User process
uucp	UNIX-to-UNIX copy system

Displaying the Logging Configuration

To display the logging configuration and the contents of the log buffer, use the **show logging** privileged EXEC command. For information about the fields in this display, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.3*.

CHAPTER 52

Onboard Failure Logging (OBFL)

- [Prerequisites for OBFL, page 52-1](#)
- [Restrictions for OBFL, page 52-2](#)
- [Information About OBFL, page 52-2](#)
- [Default Settings for OBFL, page 52-9](#)
- [Enabling OBFL, page 52-9](#)
- [Configuration Examples for OBFL, page 52-10](#)

Note

For complete syntax and usage information for the commands used in this chapter, see these publications:

http://www.cisco.com/en/US/partner/docs/routers/xr12000/software/xr12k_r4.0/system_monitoring/command/reference/b_or40gsrbook_chapter_0101.html

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Prerequisites for OBFL

None.

Restrictions for OBFL

They include:

- **Software Restrictions**—If a device (router or switch) intends to use *linear* flash memory as its OBFL storage media, Cisco IOS software must reserve a minimum of two physical sectors (or physical blocks) for the OBFL feature. Because an erase operation for a linear flash device is done on per-sector (or per-block) basis, one extra physical sector is needed. Otherwise, the minimum amount of space reserved for the OBFL feature on any device must be at least 8 KB.
- **Firmware Restrictions**—If a line card or port adapter runs an operating system or firmware that is different from the Cisco IOS operating system, the line card or port adapter must provide device driver level support or an interprocess communications (IPC) layer that allows the OBFL file system to communicate to the line card or port adapter. This requirement is enforced to allow OBFL data to be recorded on a storage device attached to the line card or port adapter.
- **Hardware Restrictions**—To support the OBFL feature, a device must have at least 8 KB of nonvolatile memory space reserved for OBFL data logging.

Information About OBFL

- [Overview of OBFL, page 52-2](#)
- [Information about Data Collected by OBFL, page 52-2](#)

Overview of OBFL

The Onboard Failure Logging (OBFL) feature collects data such as operating temperatures, hardware uptime, interrupts, and other important events and messages from system hardware installed in a Cisco router or switch. The data is stored in nonvolatile memory and helps technical personnel diagnose hardware problems.

Information about Data Collected by OBFL

- [OBFL Data Overview, page 52-2](#)
- [Temperature, page 52-3](#)
- [Operational Uptime, page 52-4](#)
- [Interrupts, page 52-7](#)
- [Message Logging, page 52-8](#)

OBFL Data Overview

The OBFL feature records operating temperatures, hardware uptime, interrupts, and other important events and messages that can assist with diagnosing problems with hardware cards (or *modules*) installed in a Cisco router or switch. Data is logged to files stored in nonvolatile memory. When the onboard hardware is started up, a first record is made for each area monitored and becomes a base value for subsequent records. The OBFL feature provides a circular updating scheme for collecting continuous records and archiving older (historical) records, ensuring accurate data about the system. Data is

recorded in one of two formats: continuous information that displays a snapshot of measurements and samples in a continuous file, and summary information that provides details about the data being collected. The data is displayed using the **show logging onboard** command. The message “No historical data to display” is seen when historical data is not available.

Temperature

Temperatures surrounding hardware modules can exceed recommended safe operating ranges and cause system problems such as packet drops. Higher than recommended operating temperatures can also accelerate component degradation and affect device reliability. Monitoring temperatures is important for maintaining environmental control and system reliability. Once a temperature sample is logged, the sample becomes the base value for the next record. From that point on, temperatures are recorded either when there are changes from the previous record or if the maximum storage time is exceeded. Temperatures are measured and recorded in degrees Celsius.

Temperature Example

```
Switch# sh logging onboard temperature
```

```
-----
TEMPERATURE SUMMARY INFORMATION
-----
```

```
Number of sensors      : 7
Sampling frequency    : 1 minutes
Maximum time of storage : 10 minutes
-----
```

Sensor	ID	Maximum Temperature 0C

Switch#

To interpret this data:

- Number of sensors is the total number of temperature sensors that will be recorded. A column for each sensor is displayed with temperatures listed under the number of each sensor, as available.
- Sampling frequency is the time between measurements.
- Maximum time of storage determines the maximum amount of time, in minutes, that can pass when the temperature remains unchanged and the data is not saved to storage media. After this time, a temperature record will be saved even if the temperature has not changed.
- The Sensor column lists the name of the sensor.
- The ID column lists an assigned identifier for the sensor.
- Maximum Temperature 0C shows the highest recorded temperature per sensor.
- Temp indicates a recorded temperature in degrees Celsius in the historical record. Columns following show the total time each sensor has recorded that temperature.
- Sensor ID is an assigned number, so that temperatures for the same sensor can be stored together.

Operational Uptime

The operational uptime tracking begins when the module is powered on, and information is retained for the life of the module.

Operational Uptime Example

Switch# **sh logging onboard uptime detail**-----
UPTIME SUMMARY INFORMATION

First customer power on : 04/13/2010 19:45:08

Switch#

The operational uptime application tracks the following events:

- Date and time the customer first powered on a component.
- Total uptime and downtime for the component in years, weeks, days, hours, and minutes.
- Total number of component resets.
- Total number of slot (module) changes.
- Current reset timestamp to include the date and time.
- Current slot (module) number of the component.
- Current uptime in years, weeks, days, hours, and minutes.

Interrupts

Interrupts are generated by system components that require attention from the CPU such as ASICs and NMIs. Interrupts are generally related to hardware limit conditions or errors that need to be corrected.

The continuous format records each time a component is interrupted, and this record is stored and used as base information for subsequent records. Each time the list is saved, a timestamp is added. Time differences from the previous interrupt are counted, so that technical personnel can gain a complete record of the component's operational history when an error occurs.

Interrupts Example

```
Switch# sh logging onboard interrupt detail
```

----- INTERRUPT SUMMARY INFORMATION

Name	ID	Offset	Bit	Count
dropped	2	0x0004	0	27323
ipp	6	0x5A00	0	983763
ipp high	10	0x700A	0	34105
ipp low	11	0x9000	0	30211

----- CONTINUOUS INTERRUPT INFORMATION

12/12/2011 16:06:49 0	ipp high	10	0x7AEC	1

```
Switch#
```

To interpret this data:

- Name is a description of the component including its position in the device.
- ID is an assigned field for data storage.
- Offset is the register offset from a component register's base address.
- Bit is the interrupt bit number recorded from the component's internal register.
- The timestamp shows the date and time that an interrupt occurred down to the millisecond.

Message Logging

The OBFL feature logs standard system messages. Instead of displaying the message to a terminal, the message is written to and stored in a file, so the message can be accessed and read at a later time. System messages range from level 1 alerts to level 7 debug messages, and these levels can be specified in the **hw module logging onboard** command.

Error Message Log Example

```
Switch# sh logging onboard message det
-----
ERROR MESSAGE SUMMARY INFORMATION

-----

Switch#
```

To interpret this data:

- A timestamp shows the date and time the message was logged.
- Facility-Sev-Name is a coded naming scheme for a system message, as follows:
 - The Facility code consists of two or more uppercase letters that indicate the hardware device (facility) to which the message refers.
 - Sev is a single-digit code from 1 to 7 that reflects the severity of the message.
 - Name is one or two code names separated by a hyphen that describe the part of the system from where the message is coming.
- The error message follows the Facility-Sev-Name codes. For more information about system messages, see the [Cisco IOS System and Error Messages](#) guide.
- Count indicates the number of instances of this message that is allowed in the history file. Once that number of instances has been recorded, the oldest instance will be removed from the history file to make room for new ones.

- The Persistence Flag gives a message priority over others that do not have the flag set.

Default Settings for OBFL

The OBFL feature is enabled by default. Because of the valuable information this feature offers technical personnel, it should not be disabled.

Enabling OBFL

To enable OBFL, perform this task:

	Command or Action	Purpose
Step 1	Router> enable	Enables privileged EXEC mode (enter your password if prompted).
Step 2	Router# configure terminal	Enters global configuration mode.
Step 3	Router(config)# hw-module module <i>module-number</i> logging onboard [message level {1-7}]	Enables OBFL on the specified hardware module. Note By default, all system messages sent to a device are logged by the OBFL feature. You can define a specific message level (only level 1 messages, as an example) to be logged using the message level keywords.
Step 4	Router(config)# end	Ends global configuration mode.

Configuration Examples for OBFL

The important OBFL feature is the information that is displayed by the **show logging onboard module** privileged EXEC command. This section provides the following examples of how to enable and display OBFL records.

- [Enabling OBFL Message Logging: Example](#)
- [OBFL Message Log: Example](#)
- [OBFL Component Uptime Report: Example](#)
- [OBFL Report for a Specific Time: Example](#)

Enabling OBFL Message Logging: Example

The following example shows how to configure OBFL message logging at level 3:

```
Router(config)# hw-module module 1 logging onboard message level 3
```

OBFL Message Log: Example

The following example shows how to display the system messages that are being logged for module 2:

```
Switch# show logging onboard module 2 message continuous

Switch#

CHAPTER 53

Configuring SNMP

This chapter describes how to configure the Simple Network Management Protocol (SNMP) on the Catalyst 4500 series switch.

This chapter consists of these sections:

- [Understanding SNMP, page 53-1](#)
- [Configuring SNMP, page 53-5](#)
- [Displaying SNMP Status, page 53-17](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Understanding SNMP

SNMP is an application-layer protocol that provides a message format for communication between managers and agents. The SNMP system consists of an SNMP manager, an SNMP agent, and a MIB. The SNMP manager can be part of a network management system (NMS) such as CiscoWorks. The agent and MIB reside on the switch. To configure SNMP on the switch, you define the relationship between the manager and the agent.

The SNMP agent contains MIB variables whose values the SNMP manager can request or change. A manager can get a value from an agent or store a value into the agent. The agent gathers data from the MIB, the repository for information about device parameters and network data. The agent can also respond to a manager's requests to get or set data.

An agent can send unsolicited traps to the manager. Traps are messages alerting the SNMP manager to a condition on the network. Traps can mean improper user authentication, restarts, link status (up or down), MAC address tracking, closing of a Transmission Control Protocol (TCP) connection, loss of connection to a neighbor, or other significant events.

This section includes information about these topics:

- [SNMP Versions, page 53-2](#)
- [SNMP Manager Functions, page 53-3](#)
- [SNMP Agent Functions, page 53-4](#)
- [SNMP Community Strings, page 53-4](#)
- [Using SNMP to Access MIB Variables, page 53-4](#)
- [SNMP Notifications, page 53-5](#)

SNMP Versions

The Catalyst 4500 series switch supports these SNMP versions:

- **SNMPv1**—The Simple Network Management Protocol, a Full Internet Standard, defined in RFC 1157.
- **SNMPv2C** replaces the Party-based Administrative and Security Framework of SNMPv2Classic with the community-string-based Administrative Framework of SNMPv2C while retaining the bulk retrieval and improved error handling of SNMPv2Classic. It has these features:
 - **SNMPv2**—Version 2 of the Simple Network Management Protocol, a Draft Internet Standard, defined in RFCs 1902 through 1907.
 - **SNMPv2C**—The community-string-based Administrative Framework for SNMPv2, an Experimental Internet Protocol defined in RFC 1901.
- **SNMPv3**—Version 3 of the SNMP is an interoperable standards-based protocol defined in RFCs 2273 to 2275. SNMPv3 provides secure access to devices by authenticating and encrypting packets over the network and includes these security features:
 - **Message integrity**—ensuring that a packet was not tampered with in transit
 - **Authentication**—determining that the message is from a valid source
 - **Encryption**—mixing the contents of a package to prevent it from being read by an unauthorized source.

Note To select encryption, enter the **priv** keyword. This keyword is available only when the crypto (encrypted) software image is installed.

Both SNMPv1 and SNMPv2C use a community-based form of security. The community of managers able to access the agent's MIB is defined by an IP address access control list and password.

SNMPv2C includes a bulk retrieval mechanism and more detailed error message reporting to management stations. The bulk retrieval mechanism retrieves tables and large quantities of information, minimizing the number of round-trips required. The SNMPv2C improved error-handling includes expanded error codes that distinguish different kinds of error conditions; these conditions are reported through a single error code in SNMPv1. Error return codes in SNMPv2C report the error type.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy set up for a user and the group within which the user resides. A security level is the permitted level of security within a security model. A combination of the security level and the security model determine which security mechanism is used when handling an SNMP packet. Available security models are SNMPv1, SNMPv2C, and SNMPv3.

The following table identifies the characteristics of the different combinations of security models and levels.

Model	Level	Authentication	Encryption	Result
SNMPv1	noAuthNoPriv	Community string	No	Uses a community string match for authentication.
SNMPv2C	noAuthNoPriv	Community string	No	Uses a community string match for authentication.
SNMPv3	noAuthNoPriv	Username	No	Uses a username match for authentication.
SNMPv3	authNoPriv	MD5 or SHA	No	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms.
SNMPv3	authPriv (requires the cryptographic software image)	MD5 or SHA	DES	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Provides DES 56-bit encryption in addition to authentication based on the CBC-DES (DES-56) standard.

You must configure the SNMP agent to use the SNMP version supported by the management station. Because an agent can communicate with multiple managers, you can configure the software to support communications using SNMPv1, and SNMPv2C, and SNMPv3 protocols.

SNMP Manager Functions

The SNMP manager uses information in the MIB to perform the operations described in [Table 53-1](#).

Table 53-1 *SNMP Operations*

Operation	Description
get-request	Retrieves a value from a specific variable.
get-next-request	Retrieves a value from a variable within a table. ¹
get-bulk-request ²	Retrieves large blocks of data, such as multiple rows in a table, that would otherwise require the transmission of many small blocks of data.
get-response	Replies to a get-request, get-next-request, and set-request sent by an NMS.
set-request	Stores a value in a specific variable.
trap	An unsolicited message sent by an SNMP agent to an SNMP manager when some event has occurred.

1. With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within a table.
2. The **get-bulk** command only works with SNMPv2 or later.

SNMP Agent Functions

The SNMP agent responds to SNMP manager requests as follows:

- **Get a MIB variable**—The SNMP agent begins this function in response to a request from the NMS. The agent retrieves the value of the requested MIB variable and responds to the NMS with that value.
- **Set a MIB variable**—The SNMP agent begins this function in response to a message from the NMS. The SNMP agent changes the value of the MIB variable to the value requested by the NMS.

The SNMP agent also sends unsolicited trap messages to notify an NMS that a significant event has occurred on the agent. Examples of trap conditions include, but are not limited to, when a port or module goes up or down, when spanning-tree topology changes occur, and when authentication failures occur.

SNMP Community Strings

SNMP community strings authenticate access to MIB objects and function as embedded passwords. In order for the NMS to access the switch, the community string definitions on the NMS must match at least one of the three community string definitions on the switch.

A community string can have one of these attributes:

- **Read-only (RO)**—Gives read access to authorized management stations to all objects in the MIB except the community strings, but does not allow write access
- **Read-write (RW)**—Gives read and write access to authorized management stations to all objects in the MIB, but does not allow access to the community strings
- **Read-write-all**—Gives read and write access to authorized management stations to all objects in the MIB, including the community strings

Using SNMP to Access MIB Variables

An example of an NMS is the CiscoWorks network management software. CiscoWorks 2000 software uses the switch MIB variables to set device variables and to poll devices on the network for specific information. The results of a poll can be displayed as a graph and analyzed to troubleshoot internetworking problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

As shown in [Figure 53-1](#), the SNMP agent gathers data from the MIB. The agent can send traps, or notification of certain events, to the SNMP manager, which receives and processes the traps. Traps alert the SNMP manager to a condition on the network such as improper user authentication, restarts, link status (up or down), MAC address tracking, and so forth. The SNMP agent also responds to MIB-related queries sent by the SNMP manager in *get-request*, *get-next-request*, and *set-request* format.

Figure 53-1 SNMP Network

SNMP Notifications

SNMP allows the switch to send notifications to SNMP managers when particular events occur. SNMP notifications can be sent as traps or inform requests. In command syntax, unless there is an option in the command to select either traps or informs, the keyword *traps* refers to either traps or informs, or both. Use the **snmp-server host** command to specify whether to send SNMP notifications as traps or informs.

**Note**

SNMPv1 does not support informs.

Traps are unreliable because the receiver does not send an acknowledgment when it receives a trap, and the sender cannot determine if the trap was received. When an SNMP manager receives an inform request, it acknowledges the message with an SNMP response protocol data unit (PDU). If the sender does not receive a response, the inform request can be sent again. Because they can be re-sent, informs are more likely than traps to reach their intended destination.

The characteristics that make informs more reliable than traps also consume more resources in the switch and in the network. Unlike a trap, which is discarded as soon as it is sent, an inform request is held in memory until a response is received or the request times out. Traps are sent only once, but an inform might be re-sent or retried several times. The retries increase traffic and contribute to a higher overhead on the network. Therefore, traps and informs require a trade-off between reliability and resources. If it is important that the SNMP manager receive every notification, use inform requests. If traffic on the network or memory in the switch is a concern and notification is not required, use traps.

Configuring SNMP

This section describes how to configure SNMP on your switch. It contains this configuration information:

- [Default SNMP Configuration, page 53-5](#)
- [SNMP Configuration Guidelines, page 53-6](#)
- [Disabling the SNMP Agent, page 53-7](#)
- [Configuring Community Strings, page 53-7](#)
- [Configuring SNMP Groups and Users, page 53-9](#)
- [Configuring SNMP Notifications, page 53-11](#)
- [Setting the Agent Contact and Location Information, page 53-15](#)
- [Limiting TFTP Servers Used Through SNMP, page 53-15](#)
- [SNMP Examples, page 53-16](#)

Default SNMP Configuration

[Table 53-2](#) shows the default SNMP configuration.

Table 53-2 **Default SNMP Configuration**

Feature	Default Setting
SNMP agent	Enabled
SNMP trap receiver	None configured
SNMP traps	None enabled except the trap for TCP connections (tty)
SNMP version	If no version keyword is present, the default is Version 1.
SNMPv3 authentication	If no keyword is entered, the default is the noauth (noAuthNoPriv) security level.
SNMP notification type	If no type is specified, all notifications are sent.

SNMP Configuration Guidelines

An SNMP *group* is a table that maps SNMP users to SNMP views. An SNMP *user* is a member of an SNMP group. An SNMP *host* is the recipient of an SNMP trap operation. An SNMP *engine ID* is a name for the local or remote SNMP engine.

When configuring SNMP, follow these guidelines:

- When configuring an SNMP group, do not specify a notify view. The **snmp-server host** global configuration command autogenerates a notify view for the user and then adds it to the group associated with that user. Modifying the group's notify view affects all users associated with that group. For information about when you should configure notify views, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.2*.
- To configure a remote user, specify the IP address or port number for the remote SNMP agent of the device where the user resides.
- Before you configure remote users for a particular agent, configure the SNMP engine ID, using the **snmp-server engineID** global configuration with the **remote** option. The remote agent's SNMP engine ID and user password are used to compute the authentication and privacy digests. If you do not configure the remote engine ID first, the configuration command fails.
- When configuring SNMP informs, you need to configure the SNMP engine ID for the remote agent in the SNMP database before you can send proxy requests or informs to it.
- If a local user is not associated with a remote host, the switch does not send informs for the **auth** (authNoPriv) and the **priv** (authPriv) authentication levels.
- Changing the value of the SNMP engine ID has important side effects. A user's password (entered on the command line) is converted to an MD5 or SHA security digest based on the password and the local engine ID. The command-line password is then destroyed, as required by RFC 2274. Because of this deletion, if the value of the engine ID changes, the security digests of SNMPv3 users become invalid, and you need to reconfigure SNMP users by using the **snmp-server user username** global configuration command. Similar restrictions require the reconfiguration of community strings when the engine ID changes.

Disabling the SNMP Agent

To disable the SNMP agent, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# no snmp-server	Disables the SNMP agent operation.
Step 3	Switch(config)# end	Returns to privileged EXEC mode.
Step 4	Switch# show running-config	Verifies your entries.
Step 5	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The **no snmp-server** global configuration command disables all running versions (Version 1, Version 2C, and Version 3) on the device. No specific IOS command exists to enable SNMP. The first **snmp-server** global configuration command that you enter enables all versions of SNMP.

Configuring Community Strings

You use the SNMP community string to define the relationship between the SNMP manager and the agent. The community string acts like a password to permit access to the agent on the switch. Optionally, you can specify one or more of these characteristics associated with the string:

- An access list of IP addresses of the SNMP managers that are permitted to use the community string to gain access to the agent
- A MIB view, which defines the subset of all MIB objects accessible to the given community
- Read and write or read-only permission for the MIB objects accessible to the community

To configure a community string on the switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# [no] snmp-server community string [view view-name] [ro rw] [access-list-number]	<p>Configures the community string.</p> <ul style="list-style-type: none"> For <i>string</i>, specify a string that acts like a password and permits access to the SNMP protocol. You can configure one or more community strings up to 117 characters. (Optional) For view, specify the view record accessible to the community. (Optional) Specify either read-only (ro) if you want authorized management stations to retrieve MIB objects, or specify read-write (rw) if you want authorized management stations to retrieve and modify MIB objects. By default, the community string permits read-only access to all objects. (Optional) For <i>access-list-number</i>, enter an IP standard access list numbered from 1 to 99 and 1300 to 1999. <p>To remove a specific community string, use the no snmp-server community string global configuration command.</p>
Step 3	Switch(config)# access-list access-list-number {deny permit} source [source-wildcard]	<p>(Optional) If you specified an IP standard access list number in Step 2, create the list, repeating the command as many times as necessary.</p> <ul style="list-style-type: none"> For <i>access-list-number</i>, enter the access list number specified in Step 2. The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched. For <i>source</i>, enter the IP address of the SNMP managers that are permitted to use the community string to gain access to the agent. (Optional) For <i>source-wildcard</i>, enter the wildcard bits in dotted decimal notation to be applied to the source. Place ones in the bit positions that you want to ignore. <p>Recall that the access list is always terminated by an implicit deny statement for everything.</p>
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show running-config	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Note

To disable access for an SNMP community, set the community string for that community to the null string (do not enter a value for the community string).

**Note**

The **snmp-server enable informs** command is not supported. To enable the sending of SNMP inform notifications, use the **snmp-server enable traps** command combined with the **snmp-server host host-addr informs** command.

This example shows how to assign the string *comaccess* to SNMP, to allow read-only access, and to specify that IP access list 4 can use the community string to gain access to the switch SNMP agent:

```
Switch(config)# snmp-server community comaccess ro 4
```

Configuring SNMP Groups and Users

You can specify an identification name (engine ID) for the local or remote SNMP server engine on the switch. You can configure an SNMP server group that maps SNMP users to SNMP views, and you can add new users to the SNMP group.

To configure SNMP on the switch, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# snmp-server engineID { local <i>engineid-string</i> remote <i>ip-address</i> [udp-port <i>port-number</i>] <i>engineid-string</i> }	Configures a name for either the local or remote copy of SNMP. <ul style="list-style-type: none"> The <i>engineid-string</i> is a 24-character ID string with the name of the copy of SNMP. You need not specify the entire 24-character engine ID if it has trailing zeros. Specify only the portion of the engine ID up to the point where only zeros remain in the value. For example, to configure an engine ID of 123400000000000000000000, you can enter this: snmp-server engineID local 1234 If you select remote, specify the <i>ip-address</i> of the device that contains the remote copy of SNMP and the optional UDP port on the remote device. The default is 162.

Step 3

Command	Purpose
<pre>Switch(config)# snmp-server group groupname {v1 v2c v3 [auth noauth priv]} [read readview] [write writeview] [notify notifyview] [access access-list]</pre>	<p>Configures a new SNMP group on the remote device.</p> <ul style="list-style-type: none"> For <i>groupname</i>, specify the name of the group. Specify a security model: <ul style="list-style-type: none"> v1 is the least secure of the possible security models. v2c is the second least secure model. It allows transmission of informs and integers twice the normal width. v3, the most secure, requires you to select an authentication level: <ul style="list-style-type: none"> auth—Enables the Message Digest 5 (MD5) and the Secure Hash Algorithm (SHA) packet authentication. noauth—The noAuthNoPriv security level. This is the default if no keyword is specified. priv—Enables Data Encryption Standard (DES) packet encryption (also called <i>privacy</i>). <p>Note The priv keyword is available only when the crypto software image is installed.</p> <ul style="list-style-type: none"> (Optional) Enter read <i>readview</i> with a string (not to exceed 64 characters) that is the name of the view in which you can only view the contents of the agent. (Optional) Enter write <i>writeview</i> with a string (not to exceed 64 characters) that is the name of the view in which you enter data and configure the contents of the agent. (Optional) Enter notify <i>notifyview</i> with a string (not to exceed 64 characters) that is the name of the view in which you specify a notify, inform, or trap. (Optional) Enter access <i>access-list</i> with a string (not to exceed 64 characters) that is the name of the access list.

	Command	Purpose
Step 4	Switch(config)# snmp-server user <i>username groupname</i> [remote <i>host</i> [udp-port <i>port</i>]] { v1 / v2c v3 [auth { md5 sha } <i>auth-password</i>]} [encrypted] [access <i>access-list</i>]	Configures a new user to an SNMP group. <ul style="list-style-type: none"> • The <i>username</i> is the name of the user on the host that connects to the agent. • The <i>groupname</i> is the name of the group to which the user is associated. • (Optional) Enter remote to specify a remote SNMP entity to which the user belongs and the hostname or IP address of that entity with the optional UDP port number. The default is 162. • Enter the SNMP version number (v1, or v2c, or v3). If you enter v3, you have these additional options: <ul style="list-style-type: none"> – auth is an authentication level setting session, which can be either the HMAC-MD5-96 or the HMAC-SHA-96 authentication level, and requires a password string (not to exceed 64 characters). – encrypted specifies that the password appears in encrypted format. • (Optional) Enter access <i>access-list</i> with a string (not to exceed 64 characters) that is the name of the access list.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# show running-config	Verifies your entries.
Step 7	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Configuring SNMP Notifications

A trap manager is a management station that receives and processes traps. Traps are system alerts that the switch generates when certain events occur. By default, no trap manager is defined, and no traps are sent. Switches running IOS Cisco IOS Release 12.2(31)SG and later releases can have an unlimited number of trap managers.

Note

Many commands use the word *traps* in the command syntax. Unless there is an option in the command to select either traps or informs, the keyword *traps* refers to either traps, informs, or both. Use the **snmp-server host** command to specify whether to send SNMP notifications as traps or informs.

Table 53-3 describes the supported switch traps (notification types). You can enable any or all of these traps and configure a trap manager to receive them.

Table 53-3 Switch Notification Types

Notification Type Keyword	Description
bgp	Generates BGP state change traps. Note This option is only available when the enhanced multilayer image is installed.
bridge	Generates STP bridge MIB traps.
config	Generates a trap for SNMP configuration changes.
config-copy	Generates a trap for SNMP copy configuration changes.
cpu	Allows cpu-related traps.
eigrp	Enable BGP traps. Note This option is only available when the enhanced multilayer image is installed.
entity	Generates a trap for SNMP entity changes.
envmon	Generates environmental monitor traps. You can enable any or all of these environmental traps: fan, shutdown, supply, temperature.
flash	Generates SNMP FLASH notifications.
fru-ctrl	Enable SNMP entity FRU control traps.
hsrp	Generates a trap for Hot Standby Router Protocol (HSRP) changes.
ipmulticast	Generates a trap for IP multicast routing changes.
isis	Enable IS-IS traps. Note This option is only available when the enhanced multilayer image is installed.
mac-notification	Generates a trap for MAC address notifications.
msdp	Generates a trap for Multicast Source Discovery Protocol (MSDP) changes. Note This option is only available when the enhanced multilayer image is installed.
ospf	Generates a trap for Open Shortest Path First (OSPF) changes. You can enable any or all of these traps: Cisco specific, errors, link-state advertisement, rate limit, retransmit, and state changes. Note This option is only available when the enhanced multilayer image is installed.
pim	Generates a trap for Protocol-Independent Multicast (PIM) changes. You can enable any or all of these traps: invalid PIM messages, neighbor changes, and rendezvous point (RP)-mapping changes.
port-security	Generates SNMP port security traps. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0, which means that there is no rate limit.
rf	Enable all SNMP traps defined in Cisco-RF-MIB.
snmp	Generates a trap for SNMP-type notifications for authentication, cold start, warm start, link up or link down.

Table 53-3 Switch Notification Types (continued)

Notification Type Keyword	Description
storm-control	Generates a trap for SNMP storm-control. You can also set a maximum trap rate per second. The range is from 0 to 1000; the default is 0 (no limit is imposed; a trap is sent at every occurrence).
stp	Generates SNMP STP Extended MIB traps.
syslog	Generates SNMP syslog traps.
ttt	Generates a trap for TCP connections. This trap is enabled by default.
vlan-membership	Generates a trap for SNMP VLAN membership changes.
vlancreate	Generates SNMP VLAN created traps.
vlandelete	Generates SNMP VLAN deleted traps.
vtp	Generates a trap for VLAN Trunking Protocol (VTP) changes.

You can use the **snmp-server host** global configuration command to a specific host to receive the notification types listed in [Table 53-3](#).

To configure the switch to send traps or informs to a host, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# snmp-server engineID remote ip-address engineid-string	Specifies the engine ID for the remote host.
Step 3	Switch(config)# snmp-server user username groupname remote host [udp-port port] {v1 v2c v3} [auth {md5 sha} auth-password] [encrypted] [access access-list]	Configures an SNMP user to be associated with the remote host created in Step 2. Note You cannot configure a remote user for an address without first configuring the engine ID for the remote host. If you try to configure the user before configuring the remote engine ID, you receive an error message, and the command is not executed.

	Command	Purpose
Step 4	Switch(config)# snmp-server host <i>host-addr</i> [traps informs] [version { 1 / 2c 3 [auth noauth priv]}] <i>community-string</i> [udp-port <i>port</i>] [<i>notification-type</i>]	<p>Specifies the recipient of an SNMP trap operation.</p> <ul style="list-style-type: none"> For <i>host-addr</i>, specify the name or Internet address of the host (the targeted recipient). (Optional) Enter traps (the default) to send SNMP traps to the host. (Optional) Enter informs to send SNMP informs to the host. (Optional) Specify the SNMP version (1, 2c, or 3). SNMPv1 does not support informs. (Optional) For Version 3, select authentication level auth, noauth, or priv. <p>Note The priv keyword is available only when the crypto software image is installed.</p> <ul style="list-style-type: none"> For <i>community-string</i>, enter the password-like community string sent with the notification operation. (Optional) For udp-port <i>port</i>, enter the remote device UDP port. (Optional) For <i>notification-type</i>, use the keywords listed in Table 53-3 on page 53-12. If no type is specified, all notifications are sent.
Step 5	Switch(config)# snmp-server enable traps <i>notification-types</i>	<p>Enables the switch to send traps or informs and specify the type of notifications to be sent. For a list of notification types, see Table 53-3 on page 53-12, or enter this: snmp-server enable traps ?</p> <p>To enable multiple types of traps, you must enter a separate snmp-server enable traps command for each trap type.</p>
Step 6	Switch(config)# snmp-server trap-source <i>interface-id</i>	(Optional) Specifies the source interface, which provides the IP address for the trap message. This command also sets the source IP address for informs.
Step 7	Switch(config)# snmp-server queue-length <i>length</i>	(Optional) Establishes the message queue length for each trap host. The range is 1 to 1000; the default is 10.
Step 8	Switch(config)# snmp-server trap-timeout <i>seconds</i>	(Optional) Defines how often to resend trap messages. The range is 1 to 1000; the default is 30 seconds.
Step 9	Switch(config)# end	Returns to privileged EXEC mode.
Step 10	Switch# show running-config	Verifies your entries.
Step 11	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The **snmp-server host** command specifies which hosts receive the notifications. The **snmp-server enable trap** command globally enables the mechanism for the specified notification (for traps and informs). To enable a host to receive an inform, you must configure an **snmp-server host informs** command for the host and globally enable informs by using the **snmp-server enable traps** command.

To remove the specified host from receiving traps, use the **no snmp-server host** *host* global configuration command. The **no snmp-server host** command with no keywords disables traps, but not informs, to the host. To disable informs, use the **no snmp-server host informs** global configuration command. To disable a specific trap type, use the **no snmp-server enable traps** *notification-types* global configuration command.

Setting the Agent Contact and Location Information

To set the system contact and location of the SNMP agent so that these descriptions can be accessed through the configuration file, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# snmp-server contact <i>text</i>	Sets the system contact string. For example: snmp-server contact Dial System Operator at beeper 21555.
Step 3	Switch(config)# snmp-server location <i>text</i>	Sets the system location string. For example: snmp-server location Building 3/Room 222
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show running-config	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Limiting TFTP Servers Used Through SNMP

To limit the TFTP servers used for saving and loading configuration files through SNMP to the servers specified in an access list, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# snmp-server tftp-server-list <i>access-list-number</i>	Limits TFTP servers used for configuration file copies through SNMP to the servers in the access list. For <i>access-list-number</i> , enter an IP standard access list numbered from 1 to 99 and 1300 to 1999.
Step 3	Switch(config)# access-list <i>access-list-number</i> { deny / permit } <i>source</i> [<i>source-wildcard</i>]	Creates a standard access list, repeating the command as many times as necessary. <ul style="list-style-type: none"> For <i>access-list-number</i>, enter the access list number specified in Step 2. The deny keyword denies access if the conditions are matched. The permit keyword permits access if the conditions are matched. For <i>source</i>, enter the IP address of the TFTP servers that can access the switch. (Optional) For <i>source-wildcard</i>, enter the wildcard bits, in dotted decimal notation, to be applied to the source. Place ones in the bit positions that you want to ignore. Recall that the access list is always terminated by an implicit deny statement for everything.

	Command	Purpose
Step 4	Switch(config)# end	Returns to privileged EXEC mode.
Step 5	Switch# show running-config	Verifies your entries.
Step 6	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

SNMP Examples

This example shows how to enable all versions of SNMP. The configuration permits any SNMP manager to access all objects with read-only permissions using the community string *public*. This configuration does not cause the switch to send any traps.

```
Switch(config)# snmp-server community public
```

This example shows how to permit any SNMP manager to access all objects with read-only permission using the community string *public*. The switch also sends VTP traps to the hosts 192.180.1.111 and 192.180.1.33 using SNMPv1 and to the host 192.180.1.27 using SNMPv2C. The community string *public* is sent with the traps.

```
Switch(config)# snmp-server community public
Switch(config)# snmp-server enable traps vtp
Switch(config)# snmp-server host 192.180.1.27 version 2c public
Switch(config)# snmp-server host 192.180.1.111 version 1 public
Switch(config)# snmp-server host 192.180.1.33 public
```

This example shows how to allow read-only access for all objects to members of access list 4 that use the *comaccess* community string. No other SNMP managers have access to any objects. SNMP Authentication Failure traps are sent by SNMPv2C to the host *cisco.com* using the community string *public*.

```
Switch(config)# snmp-server community comaccess ro 4
Switch(config)# snmp-server enable traps snmp authentication
Switch(config)# snmp-server host cisco.com version 2c public
```

This example shows how to send Entity MIB traps to the host *cisco.com*. The community string is restricted. The first line enables the switch to send Entity MIB traps in addition to any traps previously enabled. The second line specifies the destination of these traps and overwrites any previous **snmp-server host** commands for the host *cisco.com*.

```
Switch(config)# snmp-server enable traps entity
Switch(config)# snmp-server host cisco.com restricted entity
```

This example shows how to enable the switch to send all traps to the host *myhost.cisco.com* using the community string *public*:

```
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server host myhost.cisco.com public
```

This example shows how to associate a user with a remote host and to send **auth** (authNoPriv) authentication-level informs when the user enters global configuration mode:

```
Switch(config)# snmp-server engineID remote 192.180.1.27 00000063000100a1c0b4011b
Switch(config)# snmp-server group authgroup v3 auth
Switch(config)# snmp-server user authuser authgroup remote 192.180.1.27 v3 auth md5
mypassword
Switch(config)# snmp-server user authuser authgroup v3 auth md5 mypassword
Switch(config)# snmp-server host 192.180.1.27 informs version 3 auth authuser config
Switch(config)# snmp-server enable traps
Switch(config)# snmp-server inform retries 0
```

Displaying SNMP Status

To display SNMP input and output statistics, including the number of illegal community string entries, errors, and requested variables, use the **show snmp** privileged EXEC command. You can also use the other privileged EXEC commands in [Table 53-4](#) to display SNMP information. For information about the fields in the output displays, see the *Cisco IOS Configuration Fundamentals Command Reference, Release 12.4*.

Table 53-4 Commands for Displaying SNMP Information

Feature	Default Setting
show snmp	Displays SNMP statistics.
show snmp engineID	Displays information on the local SNMP engine and all remote engines that have been configured on the device.
show snmp group	Displays information on each SNMP group on the network.
show snmp pending	Displays information on pending SNMP requests.
show snmp sessions	Displays information on the current SNMP sessions.
show snmp user	Displays information on each SNMP user name in the SNMP users table.

Note

The **snmp-server enable informs** command is not supported. To enable the sending of SNMP inform notifications, use the **snmp-server enable traps** command combined with the **snmp-server host** *host-addr* **informs** command.

CHAPTER 54

Configuring NetFlow

Note

Supervisor Engine 6-E and Catalyst 4900M chassis does not support Netflow.

This chapter describes how to configure NetFlow Statistics on the Catalyst 4500 series switches. It also provides guidelines, procedures, and configuration examples.

Note

To use the NetFlow feature, you must have the Supervisor Engine V-10GE (the functionality is embedded in the supervisor engine), or the NetFlow Services Card (WS-F4531) and either a Supervisor Engine IV or a Supervisor Engine V.

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Note

Refer to the *NetFlow Solutions Guide* for more detailed information on NetFlow usage and management.

The following topics are included:

- [Overview of NetFlow Statistics Collection, page 54-2](#)
- [Configuring NetFlow Statistics Collection, page 54-6](#)
- [NetFlow Statistics Collection Configuration Example, page 54-13](#)
- [NetFlow Configuration Examples, page 54-14](#)

Overview of NetFlow Statistics Collection

A network flow is defined as a unidirectional stream of packets between a given source and destination—both defined by a network-layer IP address and transport-layer port number. Specifically, a flow is identified as the combination of the following fields: source IP address, destination IP address, source port number, destination port number, protocol type, type of service, and input interface.

NetFlow Statistics is a global traffic monitoring feature that allows flow-level monitoring of all IPv4-routed traffic through the switch using NetFlow Data Export (NDE). Collected statistics can be exported to an external device (NetFlow Collector/Analyzer) for further processing. Network planners can selectively enable NetFlow Statistics (and NDE) on a per-device basis to gain traffic performance, control, or accounting benefits in specific network locations.

NetFlow exports flow information in UDP datagrams in one of two formats. The version 1 format was the initial released version, and version 5 is a later enhancement to add Border Gateway Protocol (BGP) autonomous system (AS) information and flow sequence numbers. In version 1 and version 5 format, the datagram consists of a header and one or more flow records. The first field of the header contains the version number of the export datagram.

This section contains the following subsections:

- [Information Derived from Hardware, page 54-3](#)
- [Information Derived from Software, page 54-4](#)
- [Assigning the Input and Output Interface and AS Numbers, page 54-4](#)
- [Feature Interaction of Netflow Statistics with UBRL and Microflow Policing, page 54-5](#)
- [VLAN Statistics, page 54-5](#)

NDE Versions

The Catalyst 4500 series switch supports NDE versions 1 and 5 for the captured statistics. NetFlow aggregation requires NDE version 8.

Depending on the current flow mask, some fields in the flow records might not have values. Unsupported fields contain a zero (0).

The following tables describe the supported fields for NDE version 5:

- [Table 54-1](#)—Version 5 header format
- [Table 54-2](#)—Version 5 flow record format

Table 54-1 NDE Version 5 Header Format

Bytes	Content	Description
0–1	version	NetFlow export format version number
2–3	count	Number of flows exported in this packet (1–30)
4–7	SysUptime	Current time in milliseconds since the switch booted
8–11	unix_secs	Current seconds since 0000 UTC 1970
12–15	unix_nsecs	Residual nanoseconds since 0000 UTC 1970
16–19	flow_sequence	Sequence counter of total flows seen
20–21	engine_type	Type of flow switching engine
21–23	engine_id	Slot number of the flow switching engine

Table 54-2 NDE Version 5 Flow Record Format

Bytes	Content	Description	Flow masks: • X=Populated • A=Additional field					
			Source	Destination	Destination Source	Destination Source Interface	Full	Full Interface
0–3	srcaddr	Source IP address	X		X	X	X	X
4–7	dstaddr	Destination IP address		X	X	X	X	X
8–11	nexthop	Next hop switch's IP address		A ¹	A	A	A	A
12–13	input	Ingress interface SNMP ifIndex				X		X
14–15	output	Egress interface SNMP ifIndex		A ¹	A	A	A	A
16–19	dPkts	Packets in the flow	X	X	X	X	X	X
20–23	dOctets	Octets (bytes) in the flow	X	X	X	X	X	X
24–27	first	SysUptime at start of the flow	X	X	X	X	X	X
28–31	last	SysUptime at the time the last packet of the flow was received	X	X	X	X	X	X
32–33	srcport	Layer 4 source port number or equivalent					X ²	X ²
34–35	dstport	Layer 4 destination port number or equivalent					X	X
36	pad1	Unused (zero) byte						
37	tcp_flags	Cumulative OR of TCP flags						
38	prot	Layer 4 protocol (for example, 6=TCP, 17=UDP)					X	X
39	tos	IP type-of-service byte						
40–41	src_as	Autonomous system number of the source, either origin or peer	X		X	X	X	X
42–43	dst_as	Autonomous system number of the destination, either origin or peer		X	X	X	X	X
44–45	src_mask	Source address prefix mask bits	X		X	X	X	X
46–47	dst_mask	Destination address prefix mask bits		X	X	X	X	X
48	pad2	Pad 2 is unused (zero) bytes						

1. With the destination flow mask, the “Next hop switch's IP address” field and the “Output interface's SNMP ifIndex” field might not contain information that is accurate for all flows.
2. In PFC3BXL or PFC3B mode, ICMP traffic contains the ICMP code and type values.

Information Derived from Hardware

Information available in a typical NetFlow record from hardware includes the following:

- the packet and byte counts
- start and end timestamps

- source and destination IP addresses
- IP protocol
- source and destination port numbers

Information Derived from Software

Information available in a typical NetFlow record from software includes the following:

- Input and output identifiers
- Routing information, including next-hop address, origin and peer AS, source and destination prefix mask

Assigning the Input and Output Interface and AS Numbers

The following topics are discussed:

- [Assigning the Inferred Fields, page 54-4](#)
- [Assigning the Output Interface and Output Related Inferred Fields, page 54-4](#)
- [Assigning the Input Interface and Input Related Inferred Fields, page 54-5](#)

Assigning the Inferred Fields

The Catalyst 4500 series switch collects netflow flows in hardware. The hardware collects a sub-set of all the netflow flow fields. The rest of the fields are then filled in by the software when the software examines the routing state.

The Netflow Services Card does not provide enough information to accurately and consistently determine the input interface, output interface and other routing information associated with NetFlow Flows. The Catalyst 4500 series switch has a software mechanism to compensate for this. The mechanism is described in the next paragraph.

Assigning the Output Interface and Output Related Inferred Fields

Software determines the output interface information by looking up the Forwarding Information Base (FIB) entry in the default FIB table (based on the destination IP address). From this FIB entry, the software gains access to the destination AS number for this destination IP address, as well as the appropriate adjacency that stores the interface information. Therefore, the output interface is based solely on the destination IP address. If load balancing is enabled on the switch, the load balancing hash, instead of looking at the adjacency in the FIB entry, is applied to access the appropriate FIB path and access the appropriate adjacency. Although this process typically yields correct results, an inaccuracy can occur when using a PBR that shares IP addresses with the default FIB table. Under these circumstances, there would then be multiple FIB table entries and associated adjacencies for the same destination IP address.

Assigning the Input Interface and Input Related Inferred Fields

Similarly, the input interface and the source AS number for the source IP address are determined by looking up the FIB entry in the default FIB table based on the source IP address. Therefore, the input interface is based solely on the source IP address and a reverse lookup is done to determine to which interface a packet with this IP destination address needs to be routed. This process assumes that the forwarding paths are symmetrical. However, if this process yields multiple input interfaces, a deterministic algorithm is applied to pick one of them the one with the lowest IP address. Although this process typically yields correct values, there are scenarios where the values are inaccurate:

- If load balancing is being applied by an upstream adjacent switch, one input interface must be chosen arbitrarily out of the multiple input interfaces available. This action is necessary because the input interface that would be used depends on the type of load balancing algorithm being deployed by the adjacent upstream switch. It is not always feasible to know the algorithm. Therefore, all flow statistics are attributed to one input interface. Software selects the interface with the lowest IP subnet number.
- In an asymmetric routing scheme in which the traffic for an IP subnet might be received on one interface and sent on another, the inferences noted previously for selecting an input interface, based on a reverse lookup, would be incorrect and cannot be verified.
- If PBR or VRF is enabled on the switch and the flow is destined to an address that resides in the PBR or VRF range or is sourced from an address that resides in the PBR or VRF range, the information is incorrect. In this case, the input and output interface most likely points to the default route (if configured) or have no value at all (NULL)
- If VRF is enabled on the switch on some interfaces and the flow comes from a VRF interface, the information is incorrect. In this case, the input and output interface most likely points to the default route (if configured) or have no value (NULL).

**Note**

The Supervisor Engine V-10GE provides the input interface information via hardware, improving the accuracy of NetFlow information.

Feature Interaction of Netflow Statistics with UBRL and Microflow Policing

On systems with Supervisor Engine V-10GE, there is a feature interaction between Netflow Statistics and UBRL (User Based Rate Limiting). As part of correctly configuring UBRL on a given interface, the class-map must specify a flow-mask. In turn, this flow mask is used to create hardware-based netflow statistics for the flow. By default, for traditional full-flow netflow statistics, the full-flow mask is used. With UBRL, however, the masks can differ. If UBRL is configured on a given interface, the statistics are collected based on the mask configured for UBRL. Consequently, the system does not collect full-flow statistics for traffic transiting an interface configured with UBRL. For more details, refer to the [“Configuring User Based Rate Limiting” section on page 37-38](#).

VLAN Statistics

With NetFlow support, you can report Layer 2 output VLAN statistics, as well as VLAN statistics for routed traffic in and out of a VLAN.

The following example shows the CLI output for a specific VLAN:

```
Switch# show vlan counters or show vlan id 22 count
* Multicast counters include broadcast packets
Vlan Id                                     :22
L2 Unicast Packets                         :38
L2 Unicast Octets                         :2432
L3 Input Unicast Packets                   :14344621
L3 Input Unicast Octets                    :659852566
L3 Output Unicast Packets                  :8983050
L3 Output Unicast Octets                   :413220300
L3 Output Multicast Packets                :0
L3 Output Multicast Octets                :0
L3 Input Multicast Packets                 :0
L3 Input Multicast Octets                  :0
L2 Multicast Packets                      :340
L2 Multicast Octets                       :21760
```

Note

NetFlow support has hardware limitations that restrict the platform support to a subset of all NetFlow fields. Specifically, TCP Flags and the ToS byte (DSCP) are not supported.

Configuring NetFlow Statistics Collection

To configure NetFlow switching, complete the tasks in these sections:

- [Checking for Required Hardware, page 54-6](#)
- [Enabling NetFlow Statistics Collection, page 54-7](#)
- [Configuring Switched/Bridged IP Flows, page 54-8](#)
- [Exporting NetFlow Statistics, page 54-9](#)
- [Managing NetFlow Statistics Collection, page 54-9](#)
- [Configuring an Aggregation Cache, page 54-10](#)
- [Configuring a NetFlow Minimum Prefix Mask for Router-Based Aggregation, page 54-11](#)
- [Configuring NetFlow Aging Parameters, page 54-12](#)

Checking for Required Hardware

To ensure that the necessary hardware is enabled, enter the **show module** command, as follows:

```
Switch# show module all
Chassis Type : WS-C4507R

Power consumed by backplane : 40 Watts

Mod Ports Card Type                               Model
Serial No.
-----+-----+-----+-----+-----+-----+-----+-----+-----+
1      2  1000BaseX (GBIC) Supervisor(active)    WS-X4515

Switch#

```

**Note**

Enabling this feature does not impact the hardware-forwarding performance of the switch.

The effective size of the hardware flow cache table is 65,000 flows. (The hardware flow cache for the Supervisor Engine V-10GE is 85,000 flows.) If more than 85,000 flows are active simultaneously, statistics may be lost for some of the flows.

The effective size of the software flow table is 256, 000 flows. The NetFlow software manages the consistency between the hardware and software tables, keeping the hardware table open by purging inactive hardware flows to the software table.

User-configured timeout settings dictate when the flows are purged and exported through NDE from the software cache. Hardware flow management ensures consistency between hardware flow purging and the user-configured timeout settings.

Software-forwarded flows are also monitored. Moreover, statistics overflow if any flow receives traffic at a sustained rate exceeding 2 gigabits per second. Generally, this situation should not occur because a port cannot transmit at a rate higher than 1 gigabit per second.

**Note**

By design, even if the timeout settings are high, flows automatically “age out” as they approach their statistics limit.

**Note**

First and last-seen (start and end times) flow timestamp accuracy is within 3 seconds.

Enabling NetFlow Statistics Collection

**Note**

NetFlow Flow Statistics are disabled by default.

To enable NetFlow switching, first configure the switch for IP routing as described in the IP configuration chapters in the *Cisco IOS IP and IP Routing Configuration Guide*. After you configure IP routing, perform one of these tasks:

Command	Purpose
Switch(config)# ip flow ingress	Enables NetFlow for IP routing.
Switch(config)# ip flow ingress infer-fields	Enables NetFlow with inferred input/output interfaces and source/destination BGP as information. The inter-fields option must be configured for AS information to be determined.

Configuring Switched/Bridged IP Flows

Netflow is defined as a collection of routed IP flows created and tracked for all routed IP traffic. In switching environments, considerable IP traffic is switched within a VLAN and hence is not routed. This traffic is termed *switched/bridged IP traffic*; the associated flow is termed *switched/bridged IP flows*. NetFlow hardware is capable of creating and tracking this type of flow. The NetFlow Switched IP Flows feature enables you to create, track, and export switched IP flows (that is, it creates and tracks flows for IP traffic that is being switched and not routed).

Be aware of the following:

- Switched IP flow collection cannot be enabled in isolation on Catalyst 4500 series switches. You need to enable both routed flow and switched flow collection to start collecting switched IP flows.
- Generally, the input and output interface information are NULL. If the traffic is being switched on a VLAN that is associated with an SVI, the input and output interface information points to the same Layer 3 interface.
- Switched flows are exported according to regular export configurations; a separate export CLI does not exist.
- In the main cache, switched IP flows and routed IP flows are indistinguishable; this is due to a hardware limitation.

Note

To enable switched IP flow collection on all interfaces, you need to enter both the **ip flow ingress** and **ip flow ingress layer2-switched** commands.

Note

To enable a user-based rate limiting policy on the switched IP flow traffic, you need to enter the **ip flow ingress layer2-switched** command, but not the **ip flow ingress** command. (See “Configuring User Based Rate Limiting” on page 38.)

To configure the NetFlow cache and enable switched IP flow collection, perform this task:

	Command	Purpose
Step 1	Switch# conf terminal	Enters configuration mode.
Step 2	Switch(config)# ip flow ingress	Enables routed flow collection.
Step 3	Switch(config)# ip flow ingress layer2-switched	Enables switched flow collection.

This example shows how to display the contents of an IP flow cache that contains switch IP flows:

```
Switch# show ip cache flow
IP Flow Switching Cache, 17826816 bytes
  2 active, 262142 inactive, 2 added
  6 aged polls, 0 flow alloc failures
  Active flows timeout in 30 minutes
  Inactive flows timeout in 15 seconds
IP Sub Flow Cache, 1081480 bytes
  2 active, 65534 inactive, 2 added, 2 added to flow
  0 alloc failures, 0 force free
  1 chunk, 1 chunk added
  last clearing of statistics never
Protocol      Total      Flows      Packets Bytes      Packets Active(Sec) Idle(Sec)
-----      -
              Flows      /Sec      /Flow  /Pkt      /Sec      /Flow      /Flow

SrcIf          SrcIPAddress  DstIf          DstIPAddress    Pr SrcP DstP  Pkts
Fal            150.1.1.1     Fal            13.1.1.1         11 003F 003F 425K
Fal            13.1.1.1     Fal            150.1.1.1        11 003F 003F 425K
Switch#
```

Exporting NetFlow Statistics

To configure the switch to export NetFlow Statistics to a workstation when a flow expires, perform one of these tasks:

Command	Purpose
Switch(config)# ip flow-export destination {hostname ip-address} udp-port	(Required) Configures the switch to export NetFlow cache entries to a specific destination (for example, a workstation). Note You can specify multiple destinations.
Switch(config)# ip flow-export version {1 {5 [origin-as peer-as]}}	(Optional) Configures the switch to export NetFlow cache entries to a workstation if you are using receiving software that requires version 1 or 5. Version 1 is the default. origin-as causes NetFlow to determine the origin BGP autonomous system of both the source and the destination hosts of the flow. peer-as causes NetFlow to determine the peer BGP autonomous system of both the input and output interfaces of the flow.
Switch(config)# ip flow-export source <interface>	(Optional) Specifies an interface whose IP address is used as the source IP address in the IP header of the NetFlow Data Export (NDE) packet. Default is the NDE output interface.

Managing NetFlow Statistics Collection

You can display and clear NetFlow Statistics, including IP flow switching cache information and flow information, such as the protocol, total flow, flows per second, and so forth. You can also use the resulting information to obtain information about your switch traffic.

To manage NetFlow switching statistics, perform one or both of following tasks:

Command	Purpose
Switch# show ip cache flow	Displays the NetFlow switching statistics.
Switch# clear ip flow stats	Clears the NetFlow switching statistics.

Configuring an Aggregation Cache

Aggregation of NetFlow Statistics is typically performed by NetFlow collection tools on management workstations. By extending this support to the Catalyst 4500 series switch, you can do the following:

- Reduce the required bandwidth between the switch and workstations, because fewer NDE packets are exported.
- Reduce the number of collection workstations required.
- Provide visibility to aggregated flow statistics at the CLI.

To configure an aggregation cache, you must enter the aggregation cache configuration mode, and you must decide which type of aggregation scheme you would like to configure: autonomous system, destination prefix, protocol prefix, or source prefix aggregation cache. Once you define the aggregation scheme, define the operational parameters for that scheme. More than one aggregation cache can be configured concurrently.

To configure an aggregation cache, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip flow-aggregation cache as	Enters aggregation cache configuration mode and enables an aggregation cache scheme (autonomous system, destination-prefix, prefix, protocol-port, or source-prefix).
Step 2	Switch(config-flow-cache)# cache timeout inactive 199	Specifies the number of seconds (in this example, 199) in which an inactive entry is allowed to remain in the aggregation cache before it is deleted.
Step 3	Switch(config-flow-cache)# cache timeout active 45	Specifies the number of minutes (in this example, 45) in which an active entry is active.
Step 4	Switch(config-flow-cache)# export destination 10.42.41.1 9991	Enables the data export.
Step 5	Switch(config-flow-cache)# enabled	Enables aggregation cache creation.

Verifying Aggregation Cache Configuration and Data Export

To verify the aggregation cache information, perform this task:

Command	Purpose
Switch# show ip cache flow aggregation destination-prefix	Displays the specified aggregation cache information.

To confirm data export, perform the following task:

Command	Purpose
Switch# show ip flow export	Displays the statistics for the data export including the main cache and all other enabled caches.

Configuring a NetFlow Minimum Prefix Mask for Router-Based Aggregation

The minimum prefix mask specifies the shortest subnet mask that is used for aggregating flows within one of the IP-address based aggregation caches (e.g. source-prefix, destination-prefix, prefix). In these caches, flows are aggregated based upon the IP address (source, destination, or both, respectively) and masked by the longer of the Minimum Prefix mask and the subnet mask of the route to the source/destination host of the flow (as found in the switch routing table).

Note

The default value of the minimum mask is zero. The configurable range for the minimum mask is from 1 to 32. You should choose an appropriate value depending on the traffic. A higher value for the minimum mask provides more detailed network addresses, but it may also result in increased number of flows in the aggregation cache.

To configure a minimum prefix mask for the Router-Based Aggregation feature, perform the tasks described in the following sections. Each task is optional.

- [Configuring the Minimum Mask of a Prefix Aggregation Scheme](#)
- [Configuring the Minimum Mask of a Destination-Prefix Aggregation Scheme](#)
- [Configuring the Minimum Mask of a Source-Prefix Aggregation Scheme](#)
- [Monitoring and Maintaining Minimum Masks for Aggregation Schemes](#)

Configuring the Minimum Mask of a Prefix Aggregation Scheme

To configure the minimum mask of a prefix aggregation scheme, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip flow-aggregation cache prefix	Configures the prefix aggregation cache.
Step 2	Switch(config-flow-cache)# mask source minimum value	Specifies the minimum value for the source mask.
Step 3	Switch(config-flow-cache)# mask destination minimum value	Specifies minimum value for the destination mask.

Configuring the Minimum Mask of a Destination-Prefix Aggregation Scheme

To configure the minimum mask of a destination-prefix aggregation scheme, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip flow-aggregation cache destination-prefix	Configures the destination aggregation cache.
Step 2	Switch(config-flow-cache)# mask destination minimum value	Specifies the minimum value for the destination mask.

Configuring the Minimum Mask of a Source-Prefix Aggregation Scheme

To configure the minimum mask of a source-prefix aggregation scheme, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip flow-aggregation cache source-prefix	Configures the source-prefix aggregation cache.
Step 2	Switch(config-flow-cache)# mask source minimum value	Specifies the minimum value for the source mask.

Monitoring and Maintaining Minimum Masks for Aggregation Schemes

To view the configured value of the minimum mask, use the following commands for each aggregation scheme, as needed:

Command	Purpose
Switch# show ip cache flow aggregation prefix	Displays the configured value of the minimum mask in the prefix aggregation scheme.
Switch# show ip cache flow aggregation destination-prefix	Displays the configured value of the minimum mask in the destination-prefix aggregation scheme.
Switch# show ip cache flow aggregation source-prefix	Displays the configured value of the minimum mask in the source-prefix aggregation scheme.

Configuring NetFlow Aging Parameters

You can control when flows are purged from the software flow cache (and, if configured, reported through NDE) with the configuration aging parameters, **Active** and **Inactive**, of the **ip flow-cache timeout** command.

Active Aging specifies the period of time in which a flow should be removed from the software flow cache after the flow is created. Generally, this parameter is used to periodically notify external collection devices about active flows. This parameter operates independently of existing traffic on the flow. Active timeout settings tend to be on the order of minutes (default is 30min).

Inactive Aging specifies how long to wait before removing a flow after the last packet is seen. The Inactive parameter clears the flow cache of “stale” flows thereby preventing new flows from starving (due to lack of resources). Inactive timeout settings tend to be on the order of seconds (default is 15sec).

NetFlow Statistics Collection Configuration Example

The following example shows how to modify the configuration to enable NetFlow switching. It also shows how to export the flow statistics for further processing to UDP port 9991 on a workstation with the IP address of 40.0.0.2. In this example, existing NetFlow Statistics are cleared, thereby ensuring that the **show ip cache flow** command displays an accurate summary of the NetFlow switching statistics:

```
Switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# ip route-cache flow
Switch(config)# ip flow-export destination 40.0.0.2 9991
Switch(config)# ip flow-export version 5
Switch(config)# end
Switch# show ip flow export
Flow export is enabled
  Exporting flows to 40.0.0.2 (9991)
  Exporting using source IP address 40.0.0.1
  Version 5 flow records
  2 flows exported in 1 udp datagrams
  0 flows failed due to lack of export packet
  0 export packets were sent up to process level
  0 export packets were dropped due to no fib
  0 export packets were dropped due to adjacency issues
  0 export packets were dropped due to fragmentation failures
  0 export packets were dropped due to encapsulation fixup failures
Switch#

Switch# show ip cache flow

IP Flow Switching Cache, 17826816 bytes

NetFlow Configuration Examples

This section provides the following basic configuration examples:

- [Sample NetFlow Enabling Schemes, page 54-14](#)
- [Sample NetFlow Aggregation Configurations, page 54-14](#)
- [Sample NetFlow Minimum Prefix Mask Router-Based Aggregation Schemes, page 54-16](#)

Sample NetFlow Enabling Schemes

Note

Enabling NetFlow on a per interface basis is not supported on a Catalyst 4500 switch.

This example shows how to enable NetFlow globally:

```

Switch# configure terminal
Switch(config)# ip flow ingress

```

This example shows how to enable NetFlow with support for inferred fields:

```

Switch# configure terminal
Switch(config)# ip flow ingress infer-fields

```

Sample NetFlow Aggregation Configurations

This section provides the following aggregation cache configuration examples:

- [Autonomous System Configuration, page 54-15](#)
- [Destination Prefix Configuration, page 54-15](#)
- [Prefix Configuration, page 54-15](#)
- [Protocol Port Configuration, page 54-15](#)
- [Source Prefix Configuration, page 54-16](#)

Autonomous System Configuration

This example shows how to configure an autonomous system aggregation cache with an inactive timeout of 200 seconds, a cache active timeout of 45 minutes, an export destination IP address of 10.42.42.1, and a destination port of 9992:

```
Switch(config)# ip flow-aggregation cache as
Switch(config-flow-cache)# cache timeout inactive 200
Switch(config-flow-cache)# cache timeout active 45
Switch(config-flow-cache)# export destination 10.42.42.1 9992
Switch(config-flow-cache)# enabled
```

Destination Prefix Configuration

This example shows how to configure a destination prefix aggregation cache with an inactive timeout of 200 seconds, a cache active timeout of 45 minutes, an export destination IP address of 10.42.42.1, and a destination port of 9992:

```
Switch(config)# ip flow-aggregation cache destination-prefix
Switch(config-flow-cache)# cache timeout inactive 200
Switch(config-flow-cache)# cache timeout active 45
Switch(config-flow-cache)# export destination 10.42.42.1 9992
Switch(config-flow-cache)# enabled
```

Prefix Configuration

This example shows how to configure a prefix aggregation cache with an inactive timeout of 200 seconds, a cache active timeout of 45 minutes, an export destination IP address of 10.42.42.1, and a destination port of 9992:

```
Switch(config)# ip flow-aggregation cache prefix
Switch(config-flow-cache)# cache timeout inactive 200
Switch(config-flow-cache)# cache timeout active 45
Switch(config-flow-cache)# export destination 10.42.42.1 9992
Switch(config-flow-cache)# enabled
```

Protocol Port Configuration

This example shows how to configure a protocol port aggregation cache with an inactive timeout of 200 seconds, a cache active timeout of 45 minutes, an export destination IP address of 10.42.42.1, and a destination port of 9992:

```
Switch(config)# ip flow-aggregation cache protocol-port
Switch(config-flow-cache)# cache timeout inactive 200
Switch(config-flow-cache)# cache timeout active 45
Switch(config-flow-cache)# export destination 10.42.42.1 9992
Switch(config-flow-cache)# enabled
```

Source Prefix Configuration

This example shows how to configure a source prefix aggregation cache with an inactive timeout of 200 seconds, a cache active timeout of 45 minutes, an export destination IP address of 10.42.42.1, and a destination port of 9992:

```
Switch(config)# ip flow-aggregation cache source-prefix
Switch(config-flow-cache)# cache timeout inactive 200
Switch(config-flow-cache)# cache timeout active 45
Switch(config-flow-cache)# export destination 10.42.42.1 9992
Switch(config-flow-cache)# enabled
```

Sample NetFlow Minimum Prefix Mask Router-Based Aggregation Schemes

This section provides examples for the NetFlow minimum prefix mask aggregation cache configuration:

- [Prefix Aggregation Scheme](#)
- [Destination-Prefix Aggregation Scheme](#)
- [Source-Prefix Aggregation Scheme](#)

Prefix Aggregation Scheme

This is an example of a prefix aggregation cache configuration:

```
!
ip flow-aggregation cache prefix
mask source minimum 24
mask destination minimum 28
```

In this example, assume the following configuration:

```
ip route 118.42.20.160 255.255.255.224 110.42.13.2
ip route 122.16.93.160 255.255.255.224 111.22.21.2
```

Both routes have a 27-bit subnet mask in the routing table on the switch.

Flows travelling from the 118.42.20.160 subnet to the 122.16.93.160 subnet whose source IP addresses match with a mask of 27 bits and whose destination IP addresses match with a mask of 28 bits are aggregated together in the cache statistics.

Destination-Prefix Aggregation Scheme

This is an example of a destination-prefix aggregation cache configuration:

```
!
ip flow-aggregation cache destination-prefix
mask destination minimum 32
!
```

Source-Prefix Aggregation Scheme

This is an example of a source-prefix aggregation cache configuration:

```
ip flow-aggregation cache source-prefix
mask source minimum 30
```

CHAPTER 55

Configuring Ethernet CFM and OAM

Ethernet Operations, Administration, and Maintenance (OAM) is a protocol for installing, monitoring, and troubleshooting Ethernet networks to enhance management within the Ethernet infrastructure. The Catalyst 4500 series switch supports IEEE 802.1ag Connectivity Fault Management (CFM) and IEEE 802.3ah Ethernet OAM discovery, link monitoring, remote fault detection, and remote loopback. The Ethernet OAM manager controls the interaction between CFM and OAM.

Note

For complete command and configuration information for CFM, see the Cisco IOS feature module at this URL:

http://www.cisco.com/en/US/docs/ios/cether/configuration/guide/ce_cfm.html

This chapter contains these sections:

- [Command List, page 55-1](#)
- [Ethernet CFM Overview, page 55-2](#)
- [Configuring Ethernet CFM, page 55-8](#)
- [Displaying Ethernet CFM Information, page 55-19](#)
- [Ethernet OAM Protocol Overview, page 55-20](#)
- [Setting Up and Configuring Ethernet OAM, page 55-21](#)
- [Displaying Ethernet OAM Protocol Information, page 55-34](#)
- [Ethernet CFM and Ethernet OAM Interaction, page 55-36](#)

Command List

This table lists the commands most commonly used with Ethernet CFM and OAM.

Command	Purpose	Location
Switch(config-if) # no ethernet cfm enable	Disables CFM globally.	Disabling CFM on a Port, page 55-9
Switch(config) # ethernet cfm traceroute cache [size entries / hold-time minutes]	(Optional) Configures the CFM traceroute cache.	Configuring the Ethernet CFM Service over VLANs, page 55-10

Command	Purpose	Location
Switch(config)# ethernet cfm domain <i>domain-name level level-id</i> <i>{direction outward}</i>	Defines a CFM domain, sets the domain level, and enters ethernet-cfm configuration mode for the domain.	Configuring the Ethernet CFM Service over VLANs, page 55-10
Switch(config-ether-cfm)# [no] service <i>csi-id vlan vlan-id</i>	Sets a universally unique ID for the customer within a maintenance domain for an EVC.	Configuring the Ethernet CFM Service over VLANs, page 55-10
Switch(config-ether-cfm)# mep archive-hold-time <i>minutes</i>	(Optional) Sets the number of minutes that data from a missing maintenance end point (mep) is kept before it is purged.	Configuring the Ethernet CFM Service over VLANs, page 55-10
Switch(config-if)# ethernet cfm mip level <i>level-id</i>	Configures an operator-level maintenance intermediate point (MIP) for a domain level-ID	Configuring the Ethernet CFM Service over VLANs, page 55-10
Switch(config-if)# ethernet cfm mep level <i>level-id</i> <i>{[inward] outward}</i> mpid id vlan <i>{vlan-id any vlan-id-vlan-id ,vlan-id-vlan-id}</i>	(Optional) Configures maintenance end points (MEPs). for different maintenance levels.	Configuring the Ethernet CFM Service over VLANs, page 55-10
Switch(config)# ethernet cfm cc <i>{[enable] level {level-id any} vlan {vlan-id any}}</i>	Configures per domain continuity check (cc) parameters. The level ID identifies the domain to which configuration applies.	Configuring the Ethernet CFM Service over VLANs, page 55-10
Switch(config)# snmp-server enable traps ethernet cfm cc <i>[mep-up] [mep-down] [config] [loop] [cross-connect]</i>	(Optional) Enables Ethernet CFM continuity check traps.	Configuring the Ethernet CFM Service over VLANs, page 55-10
Switch(config)# snmp-server enable traps ethernet cfm crosscheck <i>[mep-unknown] [mep-missing] [service-up]</i>	(Optional) Enables Ethernet CFM crosscheck traps.	Configuring the Ethernet CFM Service over VLANs, page 55-10

Ethernet CFM Overview

Ethernet CFM is an end-to-end per-service-instance (per VLAN) Ethernet layer OAM protocol. It includes proactive connectivity monitoring, fault verification, and fault isolation. End-to-end can be provider-edge-to-provider-edge (PE-to-PE) device or customer-edge-to-customer-edge (CE-to-CE) device. Ethernet CFM, as specified by IEEE 802.1ag, is the standard for Layer 2 ping, Layer 2 traceroute, and end-to-end connectivity verification of the Ethernet network.

Unlike CFM, other metro-Ethernet OAM protocols are not end-to-end technologies. For example, IEEE 802.3ah OAM is a single-hop and per-physical-wire protocol and is not end-to-end or service aware.

These sections contain conceptual information about Ethernet CFM:

- [Definition List, page 55-3](#)
- [CFM Domain, page 55-3](#)
- [CFM Maintenance Points, page 55-4](#)
- [General Packet Forwarding Rules, page 55-5](#)

- [CFM Messages, page 55-7](#)
- [Crosscheck Function, page 55-7](#)
- [SNMP Traps, page 55-7](#)
- [IP SLAs Support for CFM, page 55-8](#)

Definition List

Term	Definition
CC	Ethernet OAM Continuity Check
CFM	Ethernet Connectivity Fault Management
EI	Ethernet Infrastructure or EVC Infrastructure
EVC	Ethernet Virtual Circuit
MEP	Maintenance Endpoint
MIP	Maintenance Intermediate Point
OAM	Operations Administration and Maintenance
UNI	User to Network Interface

CFM Domain

A CFM maintenance domain is a management space on a network that is owned and operated by a single entity and defined by a set of internal boundary ports. You assign a unique maintenance level (from 0 to 7) to define the domain hierarchy. The larger the domain, the higher the level. For example, as shown in [Figure 55-1](#), a service-provider domain would be larger than an operator domain and might have a maintenance level of 6, while the operator domain maintenance level would be 3 or 4.

As shown in [Figure 55-2](#), domains cannot intersect or overlap because that would require management by more than one entity, which is not allowed. Domains can touch or nest (if the outer domain has a higher maintenance level than the nested domain). Nesting domains can be useful when a service provider contracts with one or more operators to provide Ethernet service. Each operator has its own maintenance domain and the service provider domain is a superset of the operator domains. Maintenance levels of nesting domains should be communicated among the administering organizations. CFM exchanges messages and performs operations on domains individually.

Figure 55-1 CFM Maintenance Domains

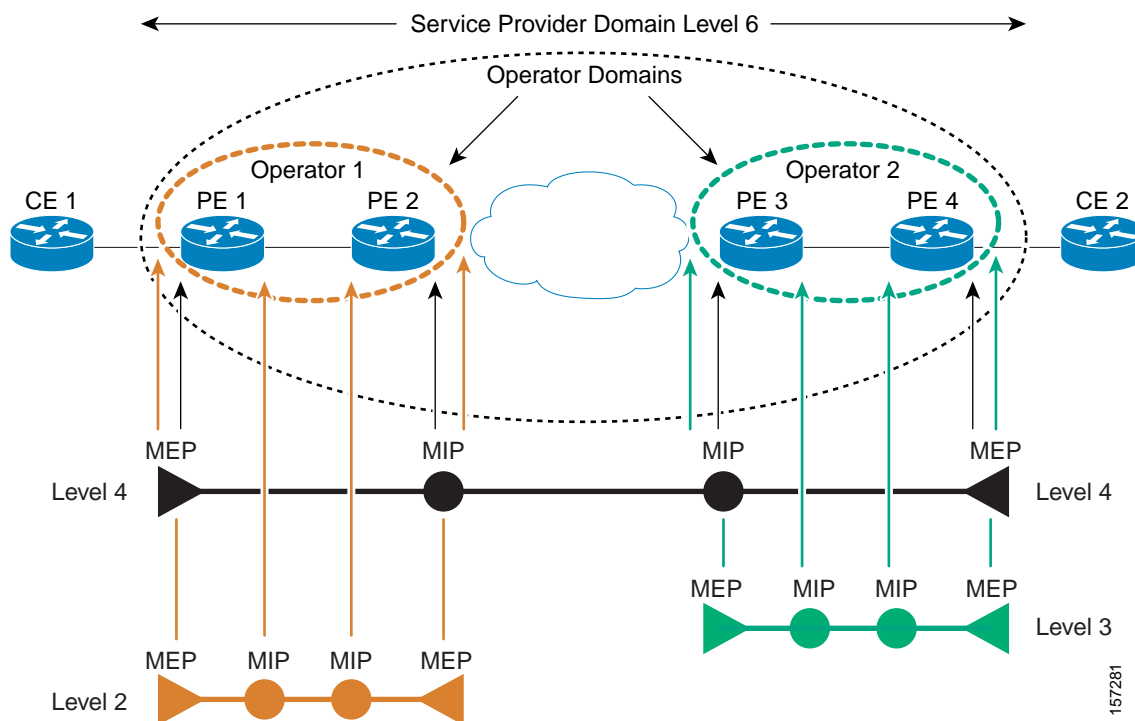

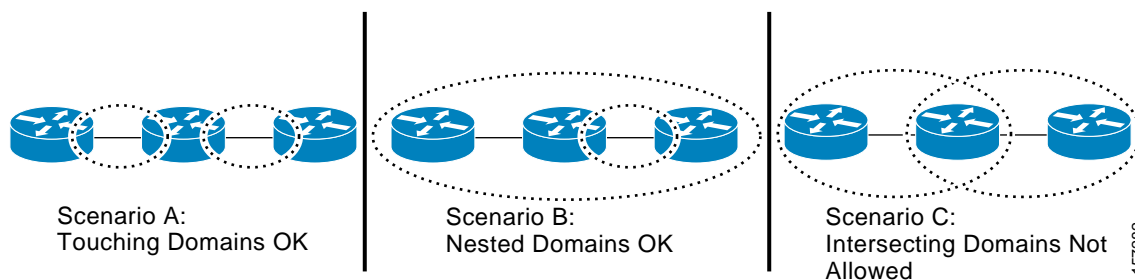

Figure 55-2 Allowed Domain Relationships

CFM Maintenance Points

Operating with a maintenance domain, a maintenance point demarcates an interface that participates in an CFM. Maintenance points drop all lower-level frames and forward all higher-level frames. There are two types of maintenance points:

- Maintenance end points (MEPs) are points at the edge of the domain that define the boundary and confine CFM messages within the boundary. *MEPs are inward facing by default. Inward facing* means that they communicate through the relay function side, not the wire side (connected to the port), whereas MEPs that can be configured as outward facing communicate through the wire side, and not through the relay function side.

An *inward-facing* MEP sends and receives CFM frames through the relay function. It drops all CFM frames at its level or lower that come from the wire side. For CFM frames from the relay side, it processes the frames at its level and drops frames at a lower level. The MEP

transparently forwards all CFM frames at a higher level, whether they are received from the relay or wire side. CFM runs at the provider maintenance level (UPE-to-UPE), specifically with inward-facing MEPs at the user network interface (UNI).

An *outward facing* MEP (OFM) sends and receives CFM frames on the wire side. It drops all CFM frames at its level or lower that come from the relay function side. For CFM frames from the wire side, it processes the frames at its level and drops frames at a lower level. OFM transparently forwards all CFM frames at a higher level, whether they are received from the relay or wire side.

- Maintenance intermediate points (MIPs) are inside a domain, not at the boundary, and respond to CFM only when triggered by traceroute and loopback messages. They forward CFM frames received from MEPs and other MIPs, drop all CFM frames at a lower level, and forward all CFM frames at a higher level, whether they are received from the relay or wire side.

If a port on which the inward facing MEP is configured is blocked by Spanning-Tree Protocol (STP), the MEP cannot receive or transmit CFM messages. If a port on which the outward facing MEP is configured is blocked by STP, the OFM can only receive CFM messages from and transmit them towards the wire. If a port on which a MIP is configured is blocked by STP, the port cannot receive or respond to messages from the relay function side, but can receive CFM messages and respond to them from the wire side.

General Packet Forwarding Rules

Ethernet CFM frames should be forwarded or dropped based on the strict rules of hierarchical maintenance domains. MEPs and MIPs configured on bridge ports act as filters that confine CFM frames within the bounds of the correct domain(s) by dropping frames that do not belong to the correct Level.

Topics include:

- [Inward-Facing MEPs, page 55-5](#)
- [Outward-Facing MEPs, page 55-6](#)
- [Transparent Ports, page 55-6](#)

Inward-Facing MEPs

An inward-facing MEP does the following:

- Sends and receives CFM frames at its level through the relay function, not through the wire connected to the port on which the MEP is configured.
- Drops all CFM frames at its level (or lower level) that come from the wire side.
- Processes all CFM frames at its level that come from the direction of the relay function.

A packet arriving on a wire at a port is coming from the wire side.

A packet arriving internally from the CPU or by the bridging action in hardware (or software) is coming from the relay function side.

- Drops all CFM frames at a lower level that come from the direction of the relay function.
- Transparently forwards all CFM frames at a higher level, whether they come from the relay function or the wire side.

**Note**

A MEP of level L (where $L \neq 7$) requires a MIP of level $M > L$ on the same port. So, CFM frames at a higher level than the MEP are cataloged by this MIP.

- If the port on which the MEP is configured is blocked by STP, the MEP can no longer transmit or receive CFM messages.

**Note**

On Catalyst 4500 Supervisor Engine 6-ME, outward MEPs are only supported on the supervisor uplink ports.

Outward-Facing MEPs

An outward-facing MEP does the following:

- Sends and receives CFM frames at its level through the wire connected to the port through which the MEP is configured.
- Drops all CFM frames at its level (or lower level) that come from the relay function side.
- Processes all CFM frames at its level coming from the direction of the wire.
- Drops all CFM frames at a lower level coming from the direction of the wire.
- Transparently forwards all CFM frames at a higher level, whether they come in from the relay function side or the wire side.

A MEP of level L (where $L \neq 7$) requires a MIP of level $M > L$ on the same port. So, CFM frames at a higher level than the MEP are cataloged by this MIP.

- If the port on which the MEP is configured is blocked by STP, the MEP can still transmit and receive CFM messages through the wire.
- A MIP catalogues and forwards CFM frames at its level both through the wire and through the relay function.
- A MIP stops and drops all CFM frames at a lower level whether they come from the wire or relay function side.
- A MIP transparently forwards CFM frames at a higher level whether they come from the wire or relay function side.
- If the port on which the MIP is configured is blocked by STP, the MIP can no longer receive or relay CFM messages towards the relay function side; however, it can still receive and respond to CFM messages from the wire.

Transparent Ports

A transparent port has neither a MEP nor MIP configured, and forwards CFM frames like regular data traffic.

STP blocking applies to CFM frames on transparent ports just as it applies to ports with inward-facing MEPs; if the port is blocked by STP, CFM frames are dropped as they attempt to ingress or egress that port.

CFM Messages

CFM uses standard Ethernet frames distinguished by EtherType or (for multicast messages) by MAC address. All CFM messages are confined to a maintenance domain and to a service-provider VLAN (S-VLAN). Four CFM messages are supported:

- **Continuity Check (CC) messages**—multicast heartbeat messages exchanged periodically between MEPs that allow MEPs to discover other MEPs within a domain and allow MIPs to discover MEPs. CC messages are confined to a domain or VLAN.
- **Loopback messages**—unicast frames transmitted by a MEP at administrator request to verify connectivity to a particular maintenance point, indicating whether a destination is reachable. A loopback message is similar to an Internet Control Message Protocol (ICMP) ping message.
- **Traceroute messages**—multicast frames transmitted by a MEP at administrator request to track the path (hop-by-hop) to a destination MEP. Traceroute messages are similar in concept to UDP traceroute messages.
- **AIS messages**—described in [Chapter 55, “Configuring Ethernet CFM and OAM.”](#)

Crosscheck Function

The crosscheck function verifies a post-provisioning timer-driven service between dynamically configured MEPs (using crosscheck messages) and expected MEPs (by configuration) for a service. It verifies that all endpoints of a multipoint service are operational. The crosscheck function is performed only one time and is initiated from the command-line interface (CLI).

SNMP Traps

The MEPs generate two types of SMNP traps: CC traps and crosscheck traps.

Supported CC traps include:

- MEP up
- MEP down
- cross-connect (a service ID does not match the VLAN)
- loop
- configuration error

Supported crosscheck traps include:

- service up
- MEP missing (an expected MEP is down)
- unknown MEP

IP SLAs Support for CFM

The Metro switch supports CFM with IP Service Level Agreements (SLAs), which gathers Ethernet layer network performance metrics. Available statistical measurements for the IP SLAs CFM operation include round-trip time, jitter (interpacket delay variance), and packet loss. You can schedule multiple IP SLA operations and use Simple Network Management Protocol (SNMP) trap notifications and syslog messages to monitor threshold violations proactively.

IP SLA integration with CFM gathers Ethernet layer statistical measurements by sending and receiving Ethernet data frames between CFM MEPs. Performance is measured between the source MEP and the destination MEP. Unlike other IP SLA operations that provide performance metrics for only the IP layer, IP SLAs with CFM provide performance metrics for Layer 2.

You can manually configure individual Ethernet ping or jitter operations. You can also configure an IP SLA automatic Ethernet operation that queries the CFM database for all MEPs in a given maintenance domain and VLAN. The operation then automatically creates individual Ethernet ping or jitter operations based on the discovered MEPs.

For more information about IP SLA operation with CFM, see the *IP SLAs for Metro-Ethernet* feature module at this URL:

http://www.cisco.com/en/US/docs/ios/12_2sr/12_2srb/feature/guide/sr_meth.html

Configuring Ethernet CFM

To configure Ethernet CFM you must prepare the network and configuring services. You can optionally configure and enable crosschecking. These sections are included:

- [Default Ethernet CFM Configuration, page 55-8](#)
- [Ethernet CFM Configuration Guidelines, page 55-9](#)
- [Disabling CFM on a Port, page 55-9](#)
- [Configuring the Ethernet CFM Service over VLANs, page 55-10](#)
- [Configuring Ethernet CFM Crosscheck for VLANs, page 55-12](#)
- [Configuring IP SLAs CFM Operation, page 55-13](#)
- [Example: Switchport/VLAN CFM with an Inward-Facing MEP, page 55-17](#)

Default Ethernet CFM Configuration

CFM is globally disabled.

CFM is enabled on all interfaces. A port can be configured as a flow point (MIP/MEP), a transparent port, or disabled (CFM disabled). By default, ports are transparent until configured as MEP, MIP, or disabled.

There are no MEPs or MIPs configured.

Ethernet CFM Configuration Guidelines

Here are some configuration guidelines and restrictions for CFM:

- A MIP should be configured on a port before a MEP, unless the MEP is at level 7 or the MEP is an outward-facing MEP (OFM). Similarly, all the MEPs have to be removed before a MIP on a port.
- CFM Unicast packets (Loopback Messages and Traceroute Reply), are not allowed on an OFM on STP blocked ports. So, the blocked port cannot respond to ping and traceroute.
- CFM is not supported and cannot be configured on routed ports.
- CFM is not supported and cannot be configured on dot1q-tunnel ports.
- CFM is supported on EtherChannel port channels. You can configure an EtherChannel port channel as MEP or MIP. However, CFM is not supported on individual ports that belong to an EtherChannel and you cannot add a CFM port to an EtherChannel group.
- You cannot configure CFM on VLAN interfaces.
- You cannot configure CFM on an EoMPLS port.
- CFM is not supported and cannot be configured on a PVLAN isolated host port, community host port or promiscuous access port.
- CFM is supported only on regular VLANs for inward-facing MEP on PVLAN trunks. Whereas OFM is supported on regular VLANs and isolated VLANs on PVLAN secondary trunk, similarly OFM is supported on regular VLANs and primary VLANs on promiscuous trunk ports.

The CFM service on a PVLAN ends at the PVLAN trunk. The translation of CFM service from one PVLAN to another PVLAN is not supported between the PVLAN trunks.

Disabling CFM on a Port

When CFM is globally enabled, you might want to disable CFM selectively on a port (or port channel).

Note

By default, CFM is globally disabled and enabled at every port.

To configure the network for Ethernet CFM over VLANs, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# interface <i>interface-id</i>	Specify a physical interface or a port channel to configure, and enter interface configuration mode.
Step 3	Switch(config-if)# no ethernet cfm enable	Disables CFM globally. When CFM is disabled on an interface, all CFM frames that arrive at that interface are forwarded as normal data traffic, and are not processed by the CPU.
Step 4	Switch(config-if)# exit	Returns to global configuration mode.
Step 5	Switch(config)# end	Return to privileged EXEC mode.

Configuring the Ethernet CFM Service over VLANs

To configure the network for Ethernet CFM over VLANs, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ethernet cfm enable	Enables CFM globally.
Step 3	Switch(config)# vlan <i>vlan-id</i>	Specifies the VLAN.
Step 4	Switch(config)# ethernet cfm traceroute cache [size <i>entries</i> / hold-time <i>minutes</i>]	(Optional) Configures the CFM traceroute cache. You can set a maximum cache size or hold time. <ul style="list-style-type: none"> (Optional) For size, enter the cache size in number of entry lines. The range is from 1 to 4095; the default is 100 lines. (Optional) For hold-time, enter the maximum cache hold time in minutes. The range is from 1 to 65535; the default is 100 minutes.
Step 5	Switch(config)# ethernet cfm domain <i>domain-name level1 level-id {direction outward}</i>	Defines a CFM domain, sets the domain level, and enters ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7. Configures direction as outward, which is required to configure OFM.
Step 6	Switch(config-ether-cfm)# [no] service csi-id vlan <i>vlan-id</i>	Sets a universally unique ID for the customer within a maintenance domain for an EVC.
Step 7	Switch(config-ether-cfm)# mep archive-hold-time <i>minutes</i>	(Optional) Sets the number of minutes that data from a missing maintenance end point (mep) is kept before it is purged. The range is 1 to 65535; the default is 100 minutes.
Step 8	Switch(config-ether-cfm)# exit	Returns to global configuration mode.
Step 9	Switch(config)# interface <i>interface-id</i>	Specifies a physical interface or a port channel to configure, and enter interface configuration mode.
Step 10	Switch(config-if)# ethernet cfm mip level <i>level-id</i>	Configures an operator-level maintenance intermediate point (MIP) for the domain level-ID defined in Step 3. Note If you plan to configure a MEP at level 7 on this interface, do not use this command to configure a MIP on the interface.

	Command	Purpose
Step 11	Switch(config-if)# ethernet cfm mep level <i>level-id</i> {[inward] outward } mpid id vlan { <i>vlan-id</i> any <i>vlan-id-vlan-id</i> [, <i>vlan-id-vlan-id</i>]}	(Optional) Configures maintenance end points (MEPs). for different maintenance levels. The MEP level range is 0 to 7. <ul style="list-style-type: none">Specify the direction for the end point (Required for Outward, Optional for inward direction).For mpid identifier, enter a maintenance end point identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191.For vlan vlan-id, enter the service provider VLAN ID or IDs as a VLAN-ID (1 to 4095), a range of VLAN-IDs separated by a hyphen, or a series of VLAN IDs separated by comma. Note Repeat the command for different level IDs.
Step 12	Switch(config-ether-cfm)# exit	Returns to global configuration mode.
Step 13	Switch(config)# ethernet cfm cc {[enable] level { <i>level-id</i> any } vlan { <i>vlan-id</i> any }}	Configures per domain continuity check (cc) parameters. The level ID identifies the domain to which configuration applies. <ul style="list-style-type: none">Enter enable to enable CFM cc for the domain level.Enter a maintenance level as a level number (0 to 7) or as any for all maintenance levels.Enter the VLANs to apply the check to, as a VLAN-ID (1 to 4095), a range of VLAN-IDs separated by a hyphen, a series of VLAN IDs separated by commas, or any for any VLANs.
Step 14	Switch(config)# snmp-server enable traps ethernet cfm cc [mep-up] [mep-down] [config] [loop] [cross-connect]	(Optional) Enables Ethernet CFM continuity check traps.
Step 15	Switch(config)# snmp-server enable traps ethernet cfm crosscheck [mep-unknown] [mep-missing] [service-up]	(Optional) Enables Ethernet CFM crosscheck traps.
Step 16	Switch(config)# end	Returns to privileged EXEC mode.
Step 17	Switch# show ethernet cfm domain brief Switch# show ethernet cfm maintenance-points local Switch# show ethernet cfm traceroute-cache	Verifies the configuration.
Step 18	Switch# show running-config	Verifies your entries.
Step 19	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no** versions of the commands to remove the configuration or return to the default configurations.

Configuring Ethernet CFM Crosscheck for VLANs

To configure Ethernet CFM crosscheck for VLANs, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch(config)# ethernet cfm mep crosscheck start-delay <i>delay</i>	Configures the number of seconds that the device waits for remote MEPs to come up before the crosscheck is started. The range is 1 to 65535; the default is 30 seconds.
Step 3	Switch(config)# ethernet cfm domain <i>domain-name level level-id {direction outward}</i>	Defines a CFM domain, set the domain level, and enter ethernet-cfm configuration mode for the domain. The maintenance level number range is 0 to 7. Configure direction as outward, which is required to configure OFM.
Step 4	Switch(config-ether-cfm)# mep crosscheck mpid identifier <i>vlan vlan-id [mac remote MAC address]</i>	Defines a remote maintenance end point (MEP) within a maintenance domain. <ul style="list-style-type: none"> For mpid identifier, enter the remote MEP's maintenance end point identifier. The range is 1 to 8191. For vlan vlan-id, the VLAN range is from 1 to 3581. (Optional) Specify the MAC address of the remote MEP.
Step 5	Switch(config)# end	Returns to privileged EXEC mode.
Step 6	Switch# ethernet cfm mep crosscheck {enable disable} <i>level level-id vlan {vlan-id any}</i>	Enables or disables CFM crosscheck for one or more maintenance levels and VLANs. <ul style="list-style-type: none"> For level level-id, enter a single level ID (0 to 7), a range of level IDs separated by a hyphen, or a series of level IDs separated by commas. For vlan vlan-id, enter the provider VLAN ID or IDs as a VLAN-ID (1 to 3581), a range of VLAN-IDs separated by a hyphen, or a series of VLAN IDs separated by commas, or enter any for any VLAN.
Step 7	Switch# show ethernet cfm maintenance-points remote crosscheck	Verifies the configuration.
Step 8	Switch# show ethernet cfm errors	Displays the results of the crosscheck operation.
Step 9	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no** form of each command to remove a configuration or to return to the default settings.

Configuring IP SLAs CFM Operation

You can manually configure an IP SLA's Ethernet ping or jitter echo operation, or you can configure IP SLAs Ethernet operation with endpoint discovery. You can also configure multiple operation scheduling. For accurate one-way delay statistics, the clocks on the endpoint switches must be synchronized. You can configure the endpoint switches with Network Time Protocol (NTP) so that the switches are synchronized to the same clock source.

**Note**

When you configure the Catalyst 4500 series switch for a class of service (CoS) probe, you must first globally enable QoS by entering the **mls qos** global configuration command.

For detailed information about configuring IP SLAs operations, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4T* at this URL:

http://www.cisco.com/en/US/products/ps6441/products_installation_and_configuration_guides_list.html

For detailed information about IP SLAs commands, see the command reference at this URL:

http://www.cisco.com/en/US/docs/ios/ipsla/command/reference/sla_book.html

This section includes these procedures:

- [Manually Configuring an IP SLAs CFM Probe or Jitter Operation, page 55-13](#)
- [Configuring an IP SLAs Operation with Endpoint Discovery, page 55-15](#)

Manually Configuring an IP SLAs CFM Probe or Jitter Operation

To manually configure an IP SLAs Ethernet echo (ping) or jitter operation, follow these steps:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>ip sla operation-number</code>	Creates an IP SLAs operation, and enters IP SLAs configuration mode.

	Command	Purpose
Step 3	<pre> ethernet echo mpid <i>identifier</i> domain <i>domain-name</i> vlan <i>vlan-id</i> or ethernet jitter mpid <i>identifier</i> domain <i>domain-name</i> vlan <i>vlan-id</i> [interval <i>interpacket-interval</i>] [num-frames <i>number-of</i> <i>frames transmitted</i>] </pre>	<p>Configures the IP SLAs operation as an echo (ping) or jitter operation, and enter IP SLAs Ethernet echo configuration mode.</p> <ul style="list-style-type: none"> Enter echo for a ping operation or jitter for a jitter operation. For mpid <i>identifier</i>, enter a maintenance endpoint identifier. The identifier must be unique for each VLAN (service instance). The range is 1 to 8191. For domain <i>domain-name</i>, enter the CFM domain name. For vlan <i>vlan-id</i>, the VLAN range is from 1 to 4095. (Optional—for jitter only) Enter the interval between sending of jitter packets. (Optional—for jitter only) Enter the num-frames and the number of frames to be sent.
Step 4	cos <i>cos-value</i>	(Optional) Sets a class of service value for the operation. Before configuring the cos parameter on the Catalyst 3750 Metro switch, you must globally enable QoS by entering the mls qos global configuration command.
Step 5	frequency <i>seconds</i>	(Optional) Sets the rate at which the IP SLAs operation repeats. The range is from 1 to 604800 seconds; the default is 60 seconds.
Step 6	history <i>history-parameter</i>	(Optional) Specifies parameters for gathering statistical history information for the IP SLAs operation.
Step 7	owner <i>owner-id</i>	(Optional) Configures the SNMP owner of the IP SLAs operation.
Step 8	request-data-size <i>bytes</i>	(Optional) Specifies the protocol data size for an IP SLAs request packet. The range is from 0 to the maximum size allowed by the protocol being used; the default is 66 bytes.
Step 9	tag <i>text</i>	(Optional) Creates user-specified identifier for an IP SLAs operation.
Step 10	threshold <i>milliseconds</i>	(Optional) Specifies the upper threshold value in milliseconds (ms) for calculating network monitoring statistics. The range is 0 to 2147483647; the default is 5000.
Step 11	timeout <i>milliseconds</i>	(Optional) Specifies the amount of time in ms that the IP SLAs operation waits for a response from its request packet. The range is 0 to 604800000; the default value is 5000.
Step 12	exit	Returns to global configuration mode.

	Command	Purpose
Step 13	<code>ip sla schedule operation-number [ageout seconds] [life {forever seconds}] [recurring] [start-time {hh:mm {ss} [month day day month] pending now after hh:mm:ss}]</code>	<p>Schedules the time parameters for the IP SLAs operation.</p> <ul style="list-style-type: none"> <i>operation-number</i>—Enter the IP SLAs operation number. (Optional) ageout <i>seconds</i>—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds. The default is 0 seconds. (Optional) life—Set the operation to run indefinitely (forever) or for a specific number of <i>seconds</i>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour) (Optional) recurring—Set the probe to be automatically scheduled every day. (Optional) start-time—Enter the time for the operation to begin collecting information: <ul style="list-style-type: none"> To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. Enter pending to select no information collection until a start time is selected. Enter now to start the operation immediately. Enter after <i>hh:mm:ss</i> to show that the operation should start after the entered time has elapsed.
Step 14	<code>end</code>	Returns to privileged EXEC mode.
Step 15	<code>show ip sla configuration [operation-number]</code>	Shows the configured IP SLAs operation.
Step 16	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

To remove an IP SLAs operation, enter the **no ip sla operation-number** global configuration command.

Configuring an IP SLAs Operation with Endpoint Discovery

To use IP SLAs to automatically discover the CFM endpoints for a domain and VLAN ID, follow these steps. You can configure ping or jitter operations to the discovered endpoints.

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>ip sla ethernet-monitor operation-number</code>	Begins configuration of an IP SLAs automatic Ethernet operation, and enter IP SLAs Ethernet monitor configuration mode.

	Command	Purpose
Step 3	<pre> type echo domain <i>domain-name</i> vlan <i>vlan-id</i> [exclude-mpids <i>mp-ids</i>] or type jitter domain <i>domain-name</i> vlan <i>vlan-id</i> [exclude-mpids <i>mp-ids</i>] [interval <i>interpacket-interval</i>] [num-frames <i>number-of</i> <i>frames transmitted</i>] </pre>	<p>Configures the automatic Ethernet operation to create echo (ping) or jitter operation and enters IP SLAs Ethernet echo configuration mode.</p> <ul style="list-style-type: none"> Enter type echo for a ping operation or type jitter for a jitter operation. For mpid identifier, enter a maintenance endpoint identifier. The range is 1 to 8191. For domain domain-name, enter the CFM domain name. For vlan vlan-id, the VLAN range is from 1 to 4095. (Optional) Enter exclude-mpids mp-ids to exclude the specified maintenance endpoint identifiers. (Optional—for jitter only) Enter the interval between sending of jitter packets. (Optional—for jitter only) Enter the num-frames and the number of frames to be sent.
Step 4	cos <i>cos-value</i>	(Optional) Sets a class of service value for the operation.
Step 5	owner <i>owner-id</i>	(Optional) Configures the SNMP owner of the IP SLAs operation.
Step 6	request-data-size <i>bytes</i>	(Optional) Specifies the protocol data size for an IP SLAs request packet. The range is from 0 to the maximum size allowed by the protocol being used; the default is 66 bytes.
Step 7	tag <i>text</i>	(Optional) Creates a user-specified identifier for an IP SLAs operation.
Step 8	threshold <i>milliseconds</i>	(Optional) Specifies the upper threshold value in milliseconds for calculating network monitoring statistics. The range is 0 to 2147483647; the default is 5000.
Step 9	timeout <i>milliseconds</i>	(Optional) Specifies the amount of time in milliseconds that the IP SLAs operation waits for a response from its request packet. The range is 0 to 604800000; the default value is 5000.
Step 10	exit	Returns to global configuration mode.

	Command	Purpose
Step 11	<code>ip sla schedule operation-number [ageout seconds] [life {forever seconds}] [recurring] [start-time {hh:mm {ss} [month day day month] pending now after hh:mm:ss}]</code>	<p>Schedules the time parameters for the IP SLAs operation.</p> <ul style="list-style-type: none"> • <i>operation-number</i>—Enter the IP SLAs operation number. • (Optional) ageout <i>seconds</i>—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds. The default is 0 seconds. • (Optional) life—Set the operation to run indefinitely (forever) or for a specific number of <i>seconds</i>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour) • (Optional) recurring—Set the probe to be automatically scheduled every day. • (Optional) start-time—Enter the time for the operation to begin collecting information: <ul style="list-style-type: none"> – To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. – Enter pending to select no information collection until a start time is selected. – Enter now to start the operation immediately. – Enter after <i>hh:mm:ss</i> to show that the operation should start after the entered time has elapsed.
Step 12	<code>end</code>	Returns to privileged EXEC mode.
Step 13	<code>show ip sla configuration [operation-number]</code>	Shows the configured IP SLAs operation.
Step 14	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

To remove an IP SLAs operation, enter the **no ip sla operation-number** global configuration command.

Example: Switchport/VLAN CFM with an Inward-Facing MEP

The following is an example of a VLAN-based CFM configuration between two switches. In this example, a Supervisor Engine II+10GE switch called *g6-1* is connected to a Metro Ethernet Supervisor Engine 6-E switch called *Switch*. Gi 6/5 of *g6-1* is connected to the gi 3/5 of the *Switch* through an ethernet cable.

Configuration on the Supervisor Engine II+10GE (“g6-1”)

```

-----
!
ethernet cfm domain customer2 level 6
ethernet cfm domain PROVIDER2 level 5

Displaying Ethernet CFM Information

To display Ethernet CFM information, you can use the privileged EXEC commands in [Table 55-1](#).

Table 55-1 *Displaying CFM Information*

Command	Purpose
<code>show ethernet cfm domain brief</code>	Displays brief details about CFM maintenance domains.
<code>show ethernet cfm errors</code>	Displays CFM continuity check error conditions logged on a device since it was last reset or since the log was last cleared. When CFM crosscheck is enabled, displays the results of the CFM crosscheck operation.
<code>show ethernet cfm maintenance-points local</code>	Displays maintenance points configured on a device.
<code>show ethernet cfm maintenance-points remote [detail domain level]</code>	Displays information about a remote maintenance point domains or levels or details in the CFM database.
<code>show ethernet cfm maintenance-points remote crosscheck</code>	Displays information about remote maintenance points configured statically in a crosscheck list.
<code>show ethernet cfm traceroute-cache</code>	Displays the contents of the traceroute cache.

To display IP SLAs Ethernet CFM information, you can use the privileged EXEC commands in [Table 55-2](#).

Table 55-2 *Displaying IP SLAs CFM Information*

Command	Purpose
<code>show ip sla configuration [entry-number]</code>	Displays configuration values including all defaults for all IP SLAs operations or a specific operation.

Table 55-2 Displaying IP SLAs CFM Information

Command	Purpose
<code>show ip sla ethernet-monitor configuration [entry-number]</code>	Displays the configuration of the IP SLAs automatic Ethernet operation.
<code>show ip sla statistics [entry-number / aggregated / details]</code>	Display current or aggregated operational status and statistics.

Ethernet OAM Protocol Overview

The Ethernet OAM protocol for installing, monitoring, and troubleshooting Metro Ethernet networks and Ethernet WANs relies on an optional sublayer in the data link layer of the OSI model. Normal link operation does not require Ethernet OAM. You can implement Ethernet OAM on any full-duplex point-to-point or emulated point-to-point Ethernet link for a network or part of a network (specified interfaces).

OAM frames, called OAM protocol data units (OAM PDUs) use the slow protocol destination MAC address 0180.c200.0002. They are intercepted by the MAC sublayer and cannot propagate beyond a single hop within an Ethernet network. Ethernet OAM is a relatively slow protocol, with a maximum transmission rate of 10 frames per second, resulting in minor impact to normal operations. However, because the CPU must poll error counters frequently, when you enable link monitoring, the number of required CPU cycles is proportional to the number of interfaces that must be polled.

Ethernet OAM has two major components:

- The *OAM client* establishes and manages Ethernet OAM on a link and enables and configures the OAM sublayer. During the OAM discovery phase, the OAM client monitors OAM PDUs received from the remote peer and enables OAM functionality. After the discovery phase, it manages the rules of response to OAM PDUs and the OAM remote loopback mode.
- The *OAM sublayer* presents two standard IEEE 802.3 MAC service interfaces facing the superior and inferior MAC sublayers. It provides a dedicated interface for the OAM client to pass OAM control information and PDUs to and from the client. The sublayer includes these components:
 - The *control block* provides the interface between the OAM client and other OAM sublayer internal blocks.
 - The *multiplexer* manages frames from the MAC client, the control block, and the parser and passes OAM PDUs from the control block and loopback frames from the parser to the subordinate layer.
 - The *parser* classifies frames as OAM PDUs, MAC client frames, or loopback frames and sends them to the appropriate entity: OAM PDUs to the control block, MAC client frames to the superior sublayer, and loopback frames to the multiplexer.

OAM Features

These OAM features are defined by IEEE 802.3ah:

- *Discovery* identifies devices in the network and their OAM capabilities. It uses periodic OAM PDUs to advertise OAM mode, configuration, and capabilities; PDU configuration; and platform identity. An optional phase allows the local station to accept or reject the configuration of the peer OAM entity.

- *Link monitoring* detects and indicates link faults under a variety of conditions and uses the event notification OAM PDU to notify the remote OAM device when it detects problems on the link. Error events include when the number of symbol errors, the number of frame errors, the number of frame errors within a specified number of frames, or the number of error seconds within a specified period exceeding a configured threshold.
- *Remote failure indication* conveys a slowly deteriorating quality of an OAM entity to its peers by communicating these conditions: Link Fault means a loss of signal, Dying Gasp means an unrecoverable condition, and Critical Event means an unspecified vendor-specific critical event. The switch can receive and process but not generate Link Fault or Critical Event OAM PDUs. It can generate Dying Gasp OAM PDUs to show that Ethernet OAM is disabled, the interface is shut down, the interface enters the error-disabled state, or the switch is reloading. It can respond to, but not generate, Dying Gasp PDUs based on loss of power.
- *Remote loopback mode* ensures link quality with a remote peer during installation or troubleshooting. In this mode, when the switch receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same port. The link appears to the user to be functioning. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

OAM Messages

Ethernet OAM messages or PDUs are standard length, untagged Ethernet frames between 64 and 1518 bytes. They do not go beyond a single hop and have a maximum transmission rate of 10 OAM PDUs per second. Message types are information, event notification, loopback control, or vendor-specific OAM PDUs.

Setting Up and Configuring Ethernet OAM

This section includes this information:

- [Default Ethernet OAM Configuration, page 55-21](#)
- [Ethernet OAM Configuration Guidelines, page 55-22](#)
- [Enabling Ethernet OAM on an Interface, page 55-22](#)
- [Enabling Ethernet OAM Remote Loopback, page 55-24](#)
- [Configuring Ethernet OAM Link Monitoring, page 55-25](#)
- [Configuring Ethernet OAM Remote Failure Indications, page 55-27](#)
- [Configuring Ethernet OAM Templates, page 55-30](#)

Default Ethernet OAM Configuration

The default configuration is as follows:

- Ethernet OAM is disabled on all interfaces.
- When Ethernet OAM is enabled on an interface, link monitoring is automatically turned on.
- Remote loopback is disabled.
- No Ethernet OAM templates are configured.

Ethernet OAM Configuration Guidelines

Follow these guidelines when configuring Ethernet OAM:

- The switch does not support monitoring of egress frames sent with cyclic redundancy code (CDC) errors. The **ethernet oam link-monitor transmit crc** interface-configuration or template-configuration commands are visible but are not supported on the switch. The commands are accepted but are not applied to an interface.
- For a remote failure indication, the switch does not generate Link Fault or Critical Event OAM PDUs. However, if these PDUs are received from a link partner, they are processed. The switch generates and receives Dying Gasp OAM PDUs when Ethernet OAM is disabled, the interface is shut down, the interface enters the error-disabled state, or the switch is reloading. It can respond to, but not generate, Dying Gasp PDUs based on loss of power.
- The switch does not support Ethernet OAM loopback on ports that belong to an EtherChannel, ISL trunk, and promiscuous trunk.

Enabling Ethernet OAM on an Interface

To enable Ethernet OAM on an interface, follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Defines an interface to configure as an EOM interface, and enters interface configuration mode.
Step 3	ethernet oam	Enables Ethernet OAM on the interface.
Step 4	ethernet oam [max-rate <i>oampdus</i> min-rate <i>seconds</i> mode { active passive } timeout <i>seconds</i>]	<p>Configures these optional OAM parameters:</p> <ul style="list-style-type: none"> • (Optional) Enter max-rate <i>oampdus</i> to configure the maximum number of OAM PDUs sent per second. The range is from 1 to 10. • (Optional) Enter min-rate <i>seconds</i> to configure the minimum transmission rate in seconds when one OAM PDU is sent per second. The range is from 1 to 10. • (Optional) Enter mode active to set OAM client mode to active. active is the default. • (Optional) Enter mode passive to set OAM client mode to passive. <p>Note When Ethernet OAM mode is enabled on two interfaces passing traffic, at least one must be in the active mode.</p> <ul style="list-style-type: none"> • (Optional) Enter timeout <i>seconds</i> to set a time for OAM client timeout. The range is from 2 to 30.
Step 5	end	Returns to privileged EXEC mode.
Step 6	show ethernet oam status [interface <i>interface-id</i>]	Verifies the configuration.
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Enter the **no ethernet oam** interface configuration command to disable Ethernet OAM on the interface.

This example shows how to set basic OAM parameters on the switch:

```
Switch(config)# int g11/3
Switch(config-if)# ethernet oam
Switch(config-if)# ethernet oam max-rate 9
Switch(config-if)# ethernet oam mode passive
Switch(config-if)# end
Switch# show ethernet oam status int g11/2
GigabitEthernet1/2
```

General

```
Admin state:          enabled
Mode:                 passive
PDU max rate:         9 packets per second
PDU min rate:         1 packet per 1 second
Link timeout:         5 seconds
High threshold action: no action
Link fault action:    no action
Dying gasp action:    no action
Critical event action: no action
```

Link Monitoring

```

Receive-Frame CRC Error

```
Window:              10 x 100 milliseconds
Low threshold:        10 error frame(s)
High threshold:       none
```

```
Transmit-Frame CRC Error: Not Supported
```

Enabling Ethernet OAM Remote Loopback

You must enable Ethernet OAM remote loopback on an interface for the local OAM client to initiate OAM remote loopback operations. Changing this setting causes the local OAM client to exchange configuration information with its remote peer. Remote loopback is disabled by default.

Remote loopback has these limitations:

- Only data packets are looped back.
- You cannot configure Ethernet OAM remote loopback on ISL ports or ports that belong to an EtherChannel.
- Remote loopback can be supported on a max of 16 ports.

To enable Ethernet OAM remote loopback on an interface, follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Defines an interface to configure as an EOM interface, and enters interface configuration mode.
Step 3	ethernet oam remote-loopback { supported timeout <i>seconds</i> }	Enables Ethernet remote loopback on the interface or set a loopback timeout period. <ul style="list-style-type: none"> • Enter supported to enable remote loopback. • Enter timeout <i>seconds</i> to set a remote loopback timeout period. The range is from 1 to 10 seconds.
Step 4	end	Returns to privileged EXEC mode.
Step 5	ethernet oam remote-loopback { start stop } { interface <i>interface-id</i> }	Turns on or turn off Ethernet OAM remote loopback on an interface.
Step 6	show ethernet oam status [interface <i>interface-id</i>]	Verifies the configuration.
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no ethernet oam remote-loopback** {**supported** | **timeout**} interface configuration command to disable remote loopback support or remove the timeout setting.

This example shows how to enable OAM Remote Loopback:

```
Switch(config)# int gi1/3
Switch(config-if)# ethernet oam
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# end
Switch# show running int gi1/1
Building configuration...
```

```
Current configuration : 209 bytes
!
interface GigabitEthernet1/1
 switchport trunk encapsulation dot1q
 switchport trunk allowed vlan 1,19
 switchport mode trunk
 ethernet oam remote-loopback supported
 ethernet oam
end
```

```

Switch# ethernet oam remote-loopback start int gil1/1
This is a intrusive loopback.
Therefore, while you test Ethernet OAM MAC connectivity,
you will be unable to pass traffic across that link.
Proceed with Remote Loopback? [confirm]

Switch# ethernet oam remote-loopback stop int gil1/1
Switch#
*Apr  9 12:52:39.793: %ETHERNET_OAM-6-LOOPBACK: Interface Gil1/1 has exited the master
loopback mode.

```

Configuring Ethernet OAM Link Monitoring

You can configure high and low thresholds for link-monitoring features. If no high threshold is configured, the default is **none**—no high threshold is set. If you do not set a low threshold, the default is a value lower than the high threshold.

Cisco does not generate link event PDUs for rxcrc and trxcrc errors because these are nonstandard.

To configure Ethernet OAM link monitoring on an interface, follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Defines an interface, and enters interface configuration mode.
Step 3	ethernet oam link-monitor supported	Enables the interface to support link monitoring. This is the default. You need to enter this command only if it has been disabled by previously entering the no ethernet oam link-monitor supported command.
Step 4	ethernet oam link-monitor symbol-period {threshold {high {high symbols none} low {low-symbols}} window symbols} Repeat this step to configure both high and low thresholds.	(Optional) Configures high and low thresholds for an error-symbol period that trigger an error-symbol period link event. <ul style="list-style-type: none"> Enter threshold high high-symbols to set a high threshold in number of symbols. The range is 1 to 65535. The default is none. Enter threshold high none to disable the high threshold if it was set. This is the default. Enter threshold low low-symbols to set a low threshold in number of symbols. The range is 0 to 65535. It must be lower than the high threshold. Enter window symbols to set the window size (in number of symbols) of the polling period. The range is 1 to 65535 symbols.

Command	Purpose
<p>Step 5</p> <pre>ethernet oam link-monitor frame {threshold {high {high-frames none} low {low-frames}} window milliseconds}</pre> <p>Repeat this step to configure both high and low thresholds.</p>	<p>(Optional) Configures high and low thresholds for error frames that trigger an error-frame link event.</p> <ul style="list-style-type: none"> • Enter threshold high <i>high-frames</i> to set a high threshold in number of frames. The range is 1 to 65535. The default is none. • Enter threshold high none to disable the high threshold if it was set. This is the default. • Enter threshold low <i>low-frames</i> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1. • Enter window milliseconds to set the a window and period of time during which error frames are counted. The range is 10 to 600 and represents the number of milliseconds in multiples of 100. The default is 100.
<p>Step 6</p> <pre>ethernet oam link-monitor frame-period {threshold {high {high-frames none} low {low-frames}} window frames}</pre> <p>Repeat this step to configure both high and low thresholds.</p>	<p>(Optional) Configures high and low thresholds for the error-frame period that triggers an error-frame-period link event.</p> <ul style="list-style-type: none"> • Enter threshold high <i>high-frames</i> to set a high threshold in number of frames. The range is 1 to 65535. The default is none. • Enter threshold high none to disable the high threshold if it was set. This is the default. • Enter threshold low <i>low-frames</i> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1. • Enter window frames to set the a polling window size in number of frames. The range is 1 to 65535; each value is a multiple of 10000 frames. The default is 1000.
<p>Step 7</p> <pre>ethernet oam link-monitor frame-seconds {threshold {high {high-frames none} low {low-frames}} window milliseconds}</pre> <p>Repeat this step to configure both high and low thresholds.</p>	<p>(Optional) Configures high and low thresholds for the frame-seconds error that triggers an error-frame-seconds link event.</p> <ul style="list-style-type: none"> • Enter threshold high <i>high-frames</i> to set a high error frame-seconds threshold in number of seconds. The range is 1 to 900. The default is none. • Enter threshold high none to disable the high threshold if it was set. This is the default. • Enter threshold low <i>low-frames</i> to set a low threshold in number of frames. The range is 1 to 900. The default is 1. • Enter window frames to set the a polling window size in number of milliseconds. The range is 100 to 9000; each value is a multiple of 100 milliseconds. The default is 1000.

	Command	Purpose
Step 8	ethernet oam link-monitor receive-crc {threshold {high {high-frames none} low {low-frames}} window milliseconds} Repeat this step to configure both high and low thresholds.	(Optional) Configures thresholds for monitoring ingress frames received with cyclic redundancy code (CRC) errors for a period of time. <ul style="list-style-type: none"> Enter threshold high high-frames to set a high threshold for the number of frames received with CRC errors. The range is 1 to 65535 frames. Enter threshold high none to disable the high threshold. Enter threshold low low-frames to set a low threshold in number of frames. The range is 0 to 65535. The default is 1. Enter window milliseconds to set the a window and period of time during which frames with CRC errors are counted. The range is 10 to 1800 and represents the number of milliseconds in multiples of 100. The default is 100.
Step 9	[no] ethernet link-monitor on	(Optional) Starts or stop (when the no keyword is entered) link-monitoring operations on the interface. Link monitoring operations start automatically when support is enabled.
Step 10	end	Returns to privileged EXEC mode.
Step 11	show ethernet oam status [interface interface-id]	Verifies the configuration.
Step 12	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The **ethernet oam link-monitor transmit-crc {threshold {high {high-frames | none} | low {low-frames}} | window milliseconds}** command is visible on the switch and you can enter it, but it is not supported. Enter the **no** form of the command to disable the configuration. Use the **no** form of each command to disable the threshold setting.

Symbol error counters are supported on the following line cards and supervisor cards:

- Supervisor cards: WS-X4515, WS-X4516, WS-X4013+, WS-X4013+TS, WS-X4516-10GE, WS-X4013+10GE
- Line cards: WS-X4148-RJ, WS-X4124-RJ, WS-X4232, WS-X4232-RJ-XX, WS-X4148-RJ21, WS-X4504-FX-MT, WS-X4224-RJ21-XX, WS-X4124-FX-MT, WS-X4232-L3

The rest of the cards do not support symbol error counters.

Configuring Ethernet OAM Remote Failure Indications

You can configure an error-disable action to occur on an interface when the following occur:

- crossing the high thresholds configured on the interface for link monitoring
- on reception of Dying Gasp, executing **shut** on the interface
- on reception of Dying Gasp, **executing reload** command
- on reception of Dying Gasp, **executing no ethernet oam** command on the interface

To enable Ethernet OAM remote-failure indication actions on an interface, follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Defines an interface and enters interface configuration mode.
Step 3	ethernet oam remote-failure [dying-gasp] action error-disable-interface	Configures the Ethernet OAM remote-failure action on the interface. You can configure disabling the interface by selecting dying-gasp to shut down the interface when Ethernet OAM is disabled or the interface enters the error-disabled state.
Step 4	end	Returns to privileged EXEC mode.
Step 5	show ethernet oam status [interface <i>interface-id</i>]	Verifies the configuration.
Step 6	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

This example shows how to configure Ethernet OAM remote-failure action on the switch interface:

```
Switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# int gi1/1
Switch(config-if)# ethernet oam remote-failure dying-gasp action error
Switch(config-if)# ethernet oam link-monitor high-threshold action error
Switch(config-if)# end
Switch# show running-config int gi1/1

  Critical event action: no action
```

Link Monitoring

Status: supported (on)

Symbol Period Error

Window: 100 x 1048576 symbols
 Low threshold: 1 error symbol(s)
 High threshold: none

Frame Error

Window: 10 x 100 milliseconds
 Low threshold: 1 error frame(s)
 High threshold: none

Frame Period Error

Window: 1000 x 10000 frames
 Low threshold: 1 error frame(s)
 High threshold: none

Frame Seconds Error

Window: 100 x 100 milliseconds
 Low threshold: 1 error second(s)
 High threshold: none

Receive-Frame CRC Error

Window: 10 x 100 milliseconds
 Low threshold: 10 error frame(s)
 High threshold: none

Transmit-Frame CRC Error: Not Supported

To enable Ethernet OAM failover action on an EtherChannel interface, follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface port-channel <i>interface-id</i>	Defines an interface and enters interface configuration mode.
Step 3	switchport mode <i>mode</i>	Configures the mode of the EtherChannel interface.
Step 4	ethernet oam link-monitor high-threshold action failover	Configures the Ethernet OAM remote-failure action on the port channel interface to failover. This action is configurable only for link monitoring RFI. If failover is configured on the EtherChannel interface, the interface is not error-disabled if it is the last member port of the EtherChannel.
Step 5	end	Returns to privileged EXEC mode.
Step 6	show ethernet oam status [interface <i>interface-id</i>]	Verifies the configuration.
Step 7	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The switch does not generate Link Fault or Critical Event OAM PDUs. However, if these PDUs are received from a link partner, they are processed. The switch supports sending and receiving Dying Gasp OAM PDUs when Ethernet OAM is disabled, the interface is shut down, the interface enters the

error-disabled state, or the switch is reloading. It can respond to but not generate Dying Gasp PDUs based on loss of power. Enter the **no ethernet remote-failure {critical-event | dying-gasp | link-fault} action** command to disable the remote failure indication action.

Configuring Ethernet OAM Templates

You can create a template for configuring a common set of options on multiple Ethernet OAM interfaces. The template can be configured to monitor frame errors, frame-period errors, frame-second errors, received CRS errors, and symbol-period errors and thresholds. You can also set the template to put the interface in error-disabled state if any high thresholds are exceeded. These steps are optional and can be performed in any sequence or repeated to configure different options.

To configure an Ethernet OAM template and to associate it with an interface, follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	template <i>template-name</i>	Creates a template and enters template configuration mode.
Step 3	ethernet oam link-monitor receive-crc {threshold {high {<i>high-frames</i> none} low {<i>low-frames</i>} window <i>milliseconds</i>}	(Optional) Configures thresholds for monitoring ingress frames received with cyclic redundancy code (CRC) errors for a period of time. <ul style="list-style-type: none"> Enter threshold high <i>high-frames</i> to set a high threshold for the number of frames received with CRC errors. The range is 1 to 65535 frames. Enter threshold high none to disable the high threshold. Enter threshold low <i>low-frames</i> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1. Enter window <i>milliseconds</i> to set the a window and period of time during which frames with CRC errors are counted. The range is 10 to 1800 and represents the number of milliseconds in multiples of 100. The default is 100.

	Command	Purpose
Step 4	<code>ethernet oam link-monitor symbol-period {threshold {high {high-symbols none} low {low-symbols}} window symbols}</code>	<p>(Optional) Configures high and low thresholds for an error-symbol period that triggers an error-symbol period link event.</p> <ul style="list-style-type: none"> Enter threshold high <i>high-symbols</i> to set a high threshold in number of symbols. The range is 1 to 65535. Enter threshold high none to disable the high threshold. Enter threshold low <i>low-symbols</i> to set a low threshold in number of symbols. The range is 0 to 65535. It must be lower than the high threshold. Enter window <i>symbols</i> to set the window size (in number of symbols) of the polling period. The range is 1 to 65535 symbols.
Step 5	<code>ethernet oam link-monitor frame {threshold {high {high-frames none} low {low-frames}} window milliseconds}</code>	<p>(Optional) Configures high and low thresholds for error frames that trigger an error-frame link event.</p> <ul style="list-style-type: none"> Enter threshold high <i>high-frames</i> to set a high threshold in number of frames. The range is 1 to 65535. You must enter a high threshold. Enter threshold high none to disable the high threshold. Enter threshold low <i>low-frames</i> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1. Enter window <i>milliseconds</i> to set the a window and period of time during which error frames are counted. The range is 10 to 600 and represents the number of milliseconds in a multiple of 100. The default is 100.
Step 6	<code>ethernet oam link-monitor frame-period {threshold {high {high-frames none} low {low-frames}} window frames}</code>	<p>(Optional) Configures high and low thresholds for the error-frame period that triggers an error-frame-period link event.</p> <ul style="list-style-type: none"> Enter threshold high <i>high-frames</i> to set a high threshold in number of frames. The range is 1 to 65535. You must enter a high threshold. Enter threshold high none to disable the high threshold. Enter threshold low <i>low-frames</i> to set a low threshold in number of frames. The range is 0 to 65535. The default is 1. Enter window <i>frames</i> to set the a polling window size in number of frames. The range is 1 to 65535; each value is a multiple of 10000 frames. The default is 1000.

	Command	Purpose
Step 7	ethernet oam link-monitor frame-seconds {threshold {high {high-seconds none} low {low-seconds}} window milliseconds}	(Optional) Configures frame-seconds high and low thresholds for triggering an error-frame-seconds link event. <ul style="list-style-type: none"> Enter threshold high high-seconds to set a high threshold in number of seconds. The range is 1 to 900. You must enter a high threshold. Enter threshold high none to disable the high threshold. Enter threshold low low-frames to set a low threshold in number of frames. The range is 1 to 900. The default is 1. Enter window frames to set the a polling window size in number of frames. The range is 100 to 9000; each value is a multiple of 100 milliseconds. The default is 1000.
Step 8	ethernet oam link-monitor high threshold action error-disable-interface	(Optional) Configures the switch to put an interface in an error disabled state when a high threshold for an error is exceeded.
Step 9	exit	Returns to global configuration mode.
Step 10	interface interface-id	Defines an Ethernet OAM interface and enters interface configuration mode.
Step 11	source-template template-name	Associates the template to apply the configured options to the interface.
Step 12	end	Returns to privileged EXEC mode.
Step 13	show ethernet oam status [interface interface-id]	Verifies the configuration.
Step 14	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

The switch does not support monitoring egress frames with CRC errors. The **ethernet oam link-monitor transmit-crc {threshold {high {high-frames | none} | low {low-frames}} | window milliseconds}** command is visible on the switch and you can enter it, but it is not supported. Use the **no** form of each command to remove the option from the template. Use the **no source-template template-name** command to remove the source template association.

The following example illustrates how to configure an Ethernet OAM template and to associate it with an interface:

```
Switch# conf t
Switch(config)# template oam
Switch(config-template)# ethernet oam link-monitor receive-crc threshold high 1000
Switch(config-template)# ethernet oam link-monitor receive-crc threshold low 10
Switch(config-template)# ethernet oam link-monitor symbol-period threshold high 5000
Switch(config-template)# ethernet oam link-monitor symbol-period threshold low 5
Switch(config-template)# ethernet oam link-monitor frame threshold high 8000
Switch(config-template)# ethernet oam link-monitor frame threshold low 8
Switch(config-template)# ethernet oam link-monitor frame-period threshold high 9000
Switch(config-template)# ethernet oam link-monitor frame-period threshold low 9
Switch(config-template)# ethernet oam link-monitor high action error-disable-interface
```

```

Switch(config-template)# exit
Switch(config)# int gi1/2
Switch(config-if)# source template oam
Switch(config-if)# end
Switch# show ethernet oam status int gi1/2
GigabitEthernet1/2

Displaying Ethernet OAM Protocol Information

To display Ethernet OAM protocol information, you can use the privileged EXEC commands in [Table 55-3](#).

Table 55-3 *Displaying Ethernet OAM Protocol Information*

Command	Purpose
<code>show ethernet oam discovery [interface <i>interface-id</i>]</code>	Displays discovery information for all Ethernet OAM interfaces or the specified interface.
<code>show ethernet oam statistics [interface <i>interface-id</i>]</code>	Displays detailed information about Ethernet OAM packets.
<code>show ethernet oam status [interface <i>interface-id</i>]</code>	Displays Ethernet OAM configuration for all interfaces or the specified interface.
<code>show ethernet oam summary</code>	Displays active Ethernet OAM sessions on the switch.

These examples show how to apply these commands:

```
Switch# show ethernet oam discovery

Ethernet CFM and Ethernet OAM Interaction

You can also configure the OAM Manager infrastructure to interact between CFM and Ethernet OAM. When the Ethernet OAM protocol is running on an interface that has CFM MEPs configured, Ethernet OAM informs CFM of the state of the interface. Interaction is unidirectional from the Ethernet OAM to the CFM protocol, and the only information exchanged is the user network interface port status.

The Ethernet OAM protocol notifies CFM when these conditions occur:

- Error thresholds are crossed at the local interface.

CFM responds to the notification by sending a port status of *Local_Excessive_Errors* in the Port StatusType Length Value (TLV).

- Ethernet OAM receives an OAM PDU from the remote side showing that an error threshold is exceeded on the remote endpoint.

CFM responds to the notification by sending a port status of *Remote_Excessive_Errors* in the Port Status TLV.

- The local port is set into loopback mode.

CFM responds by sending a port status of Test in the Port Status TLV.

- The remote port is set into loopback mode.

CFM responds by sending a port status of Test in the Port Status TLV.

For more information about CFM and interaction with Ethernet OAM, see the Ethernet Connectivity Fault Management feature module at this URL:

http://www.cisco.com/en/US/docs/ios/12_2sr/12_2sra/feature/guide/srethcfm.html

Ethernet OAM and CFM Configuration Example

These are configuration example of the interworking between Ethernet OAM and CFM in a sample service provider network. Such a hypothetical network would contain a provider-edge switch connected to a customer edge switch at each endpoint. You must configure CFM, E-LMI, and Ethernet OAM between the customer edge and the provider edge switch.

Customer-edge switch 1 (CE1) configuration:

```
Switch# config t
Switch(config)# interface GigabitEthernet1/1
Switch(config-if)# switchport trunk allowed vlan 10
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# exit
```

Provider-edge switch 1 (PE1) configuration:

```
Switch# config t
Switch(config)# interface FastEthernet1/20
Switch(config-if)# switchport trunk encapsulation dot1q
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet cfm mip level 7
Switch(config-if)# ethernet cfm mep level 4 mpid 100 vlan 100
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oamt
```

Provider-edge switch 2 (PE2) configuration:

```
Switch# config t
Switch(config)# interface GigabitEthernet1/20
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet cfm mip level 7
Switch(config-if)# ethernet cfm mep level 4 mpid 101 vlan 10
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
```

Customer-edge switch 2 (CE2) configuration:

```
Switch# config t
Switch(config)# interface GigabitEthernet1/1
Switch(config-if)# switchport trunk allowed vlan 10
Switch(config-if)# switchport mode trunk
Switch(config-if)# ethernet oam remote-loopback supported
Switch(config-if)# ethernet oam
Switch(config-if)# exit
```

These output examples show provider-edge switch port status of the configuration. Port status shows as *UP* at both switches.

Switch PE1:

```
Switch# show ethernet cfm maintenance points remote
MPID Level Mac Address      Vlan PortState InGressPort      Age(sec) Service ID
101 * 4      0015.633f.6900 10   UP           Gi1/1            27      blue
```

Switch PE2:

```
Switch# show ethernet cfm maintenance points remote
MPID Level Mac Address      Vlan PortState InGressPort      Age(sec) Service ID
100 * 4      0012.00a3.3780 10   UP           Gi1/1            8       blue
Total Remote MEPs: 1
```

This example shows the output when you start remote loopback on CE1 (or PE1). The port state on the remote PE switch shows as *Test* and the remote CE switch enters into error-disable mode.

```
Switch# ethernet oam remote-loopback start interface gigabitethernet 1/1
This is a intrusive loopback.
Therefore, while you test Ethernet OAM MAC connectivity,
you will be unable to pass traffic across that link.
Proceed with Remote Loopback? [confirm]
```

Switch PE1:

```
Switch# show ethernet cfm maintenance points remote
MPID Level Mac Address      Vlan PortState InGressPort      Age(sec) Service ID
101 * 4      0015.633f.6900 10   UP           Gi1/1            27      blue
```

Switch PE2:

```
Switch# show ethernet cfm maintenance points remote
MPID Level Mac Address      Vlan PortState InGressPort      Age(sec) Service ID
100 * 4      0012.00a3.3780 10   TEST        Gi1/1            8       blue
Total Remote MEPs: 1
```

In addition, if you shut down the CE1 interface that connects to PE1, the remote PE2 port shows a PortState of *Down*.

CHAPTER 56

Configuring Y.1731 (AIS and RDI)

The Catalyst 4500 series switch supports Y.1731 Ethernet Alarm Indication Signal function (ETH-AIS) and Ethernet Remote Defect Indication function (ETH-RDI) to provide fault and performance management for service providers in large networks. This chapter describes how to configure Y.1731 ETH-AIS and ETH-RDI.

Note

For complete command and configuration information for Y.1731, see the Cisco IOS feature module at this URL:

<http://www.cisco.com/en/US/docs/ios-xml/ios/cether/configuration/12-2sr/ce-cfm-y1731.html>

This chapter contains these sections:

- [Definition List, page 56-1](#)
- [Y.1731 Overview, page 56-2](#)
- [Configuring Y.1731, page 56-4](#)
- [Displaying Y.1731 Information, page 56-6](#)

Definition List

Term	Definition
CC	Ethernet OAM Continuity Check
CCM	Ethernet OAM Continuity Check Message
CCDB	Ethernet OAM Continuity Check Database
CFM	Ethernet Connectivity Fault Management
EI	Ethernet Infrastructure or EVC Infrastructure
EVC	Ethernet Virtual Circuit
LMEP	Local Mep
MEP	Maintenance Endpoint
MIP	Maintenance Intermediate Point
OAM	Operations Administration and Maintenance

Term	Definition
Service VLAN	The VLAN tag that uniquely identifies a Customer Service Instance within the Provider network
SMEP	Server Mep
SNMP	Simple Network Management Protocol
SP	Service Provider
UNI	User to Network Interface
VLAN	Virtual LAN

Y.1731 Overview

These sections contain conceptual information about Y.1731:

- [Background, page 56-2](#)
- [Alarm Indication Signal, page 56-2](#)
- [Ethernet Remote Defect Indication, page 56-3](#)

Background

The advent of Ethernet as a metropolitan and WAN technology imposes a new set of Operations, Administration, and Maintenance (OAM) requirements on Ethernet's traditionally Enterprise-oriented functions. The expansion of this technology into the larger and more complex wider user base makes operational management of link uptime crucial. Isolating and responding to failures quickly directly affects the competitiveness of the Service Provider.

Server MEP

A Server MEP is a compound function of the Server layer termination function and the Server/ETH adaptation function. It issues frames with ETH-AIS information upon detecting a defect at the Server layer by the Server layer termination function or the adaptation function.

A Virtual MEP represents the logical termination point of CFM MAs defined at the link or transport layer. Imagine a server MEP as one running or defined at Maintenance Level -1. For example, you could associate an outward facing Server MEP with each termination point of IEEE 802.3ah OAM, or with each termination point of MPLS PW OAM.

Alarm Indication Signal

ETH-AIS enables you to suppress alarms when defects are detected at the server (sub) layer. Because of STP's ability to restore, you would not expect to apply ETH-AIS in the STP environments. For the Catalyst 4500 Metro switch, an administrator can enable and disable AIS in the STP environment.

You can enable or disable transmission of frames with ETH-AIS information on a MEP (or on a Server MEP).

Moreover, you can issue frames with ETH-AIS information at the client Maintenance Level by a MEP, including a Server MEP upon detecting defect conditions.

The defect conditions may include:

- Signal fail conditions with ETH-CC enabled
- AIS condition with ETH-CC disabled

For multipoint ETH connectivity, a MEP cannot determine the specific server (sub) layer entity that has encountered defect conditions upon receiving a frame with ETH-AIS information. More importantly, it cannot determine the associated subset of its peer MEPs for which it should suppress alarms because the received ETH-AIS information does not contain that information. Therefore, when a MEP receives a frame with ETH-AIS information, it suppresses alarms for all peer MEPs whether there is still connectivity or not.

For a point-to-point ETH connection, however, a MEP has only one peer MEP. Therefore, there is no ambiguity regarding the peer MEP for which it should suppress alarms when it receives the ETH-AIS information.

Only a MEP, including a Server MEP, is configured to issue frames with ETH-AIS information. Once the MEP detects a defect condition, it immediately starts transmitting periodic frames with ETH-AIS information at a configured client maintenance level. We send the AIS frames at a configured MIP level for an interface. A MEP continues to transmit periodic frames with ETH-AIS information until the defect condition is removed. Upon receiving a frame with ETH-AIS information a MEP detects AIS condition and suppresses loss of continuity alarms associated with all its peer MEPs. A MEP resumes loss of continuity alarm generation upon detecting loss of continuity defect conditions in the absence of AIS condition.

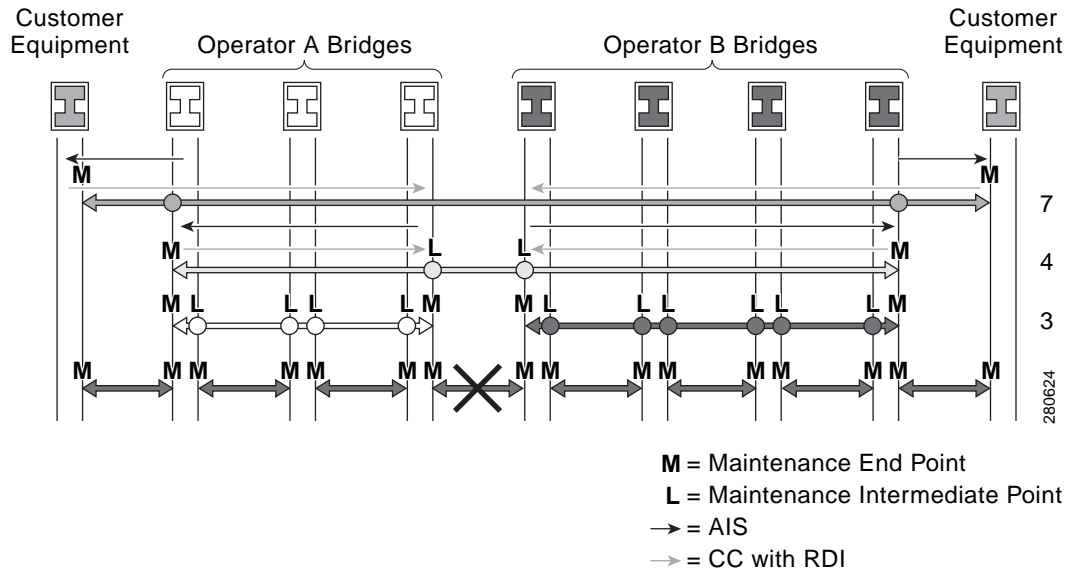

Ethernet Remote Defect Indication

A MEP can use ETH-RDI to notify its peer MEPs that it detects a defect condition. ETH-RDI is used only when ETH-CC transmission is enabled.

ETH-RDI has the following two applications:

- Single-ended fault management: The receiving MEP detects an RDI defect condition, which is correlated with other defect conditions in this MEP and may cause a fault. The absence of received ETH-RDI information in a single MEP indicates the absence of defects in the entire maintenance.
- Contribution to far-end performance monitoring: It reflects a defect condition in the far-end which serves as input to the performance monitoring process.

A MEP that is in a defect condition transmits frames with ETH-RDI information. A MEP, upon receiving frames with ETH-RDI information, determines that its peer MEP has encountered a defect condition. For multipoint ETH connectivity, however, a MEP, upon receiving frames with ETH-RDI information, cannot determine the associated subset of its peer MEPs with which the MEP transmitting RDI information encounters defect conditions. This is because the transmitting MEP itself does not always have that information.

Figure 56-1 Generating and Propagating AIS Messages Upon a Defect (Link Fail)

Configuring Y.1731

Note

Y.1731 is enabled by default.

These sections are included:

- [Y.1731 Configuration Guidelines, page 56-4](#)
- [Configuring AIS Parameters, page 56-5](#)
- [Clearing MEP from the AIS Defect Condition, page 56-6](#)
- [Clearing SMEP from the AIS Defect Condition, page 56-6](#)

Y.1731 Configuration Guidelines

Configuration guidelines and restrictions for Y.1731 include the following:

- Because of STP's restoration capability, do not expect ETH-AIS to be applied in the STP environments.
- AIS is enabled by default on a CFM maintenance domain. The following section illustrates the commands you can use to disable AIS on a maintenance domain. Likewise, RDI is a flag bit in the CC message. Provided CC transmission is enabled, the present RDI flag of the CC message is set to true or false.

Configuring AIS Parameters

To set the parameters for AIS, follow these steps:

	Command	Purpose
Step 1	Switch# configure terminal	Enters global configuration mode.
Step 2	Switch (config)# ethernet cfm ais domain name vlan range	Enters <i>config-ais-mep-cfm</i> submode to configure parameters for all local Meps belonging to that per Maintenance Association (MA). <i>name</i> refers to the domain name <i>range</i> represents VLAN IDs 100, 200-300, 400, 500, or 1-4095 For the domain name vlan range command only configurations that are VLAN disjoint or congruent are accepted.
Step 3	Switch(config-ais-mep-cfm)# disable	Disables AIS transmission.
Step 4	Switch(config-ais-mep-cfm)# period period	Sets the AIS transmission period.
Step 5	Switch(config-ais-mep-cfm)# level level	Establishes a maintenance level to send AIS frames for MEPs belonging to MA. Valid levels are 0 to 7.
Step 6	Switch(config-ais-mep-cfm)# expiry-threshold threshold	Sets the AIS expiry threshold. By default, expiry threshold is 3.5. With this CLI we can change the expiry threshold parameter for MA.
Step 7	Switch(config-ais-mep-cfm)# express alarm	Configures alarm suppression when an AIS message causes the MEP enters an AIS defect condition.
Step 8	Switch(config-ais-mep-cfm)# exit	Returns to global configuration.
Step 9	Switch(config)# [no] ethernet cfm ais link-status global	Enters <i>config-ais-link-cfm</i> submode, enabling you to configure parameters required to follow when link status goes down.
Step 10	Switch(config-if)# [no] ethernet cfm ais link-status period period	Configures ETH-AIS transmission period generated by the link-status on the interface.
Step 11	Switch(config-if)# [no] ethernet cfm ais link-status level level	Configures maintenance level to send AIS frames transmitted by the link-status on the interface.
Step 12	end	Returns to privileged EXEC mode.
Step 13	Switch# show ethernet cfm smep interface name Switch# show ethernet cfm maintenance-points local detail Switch# show ethernet cfm maintenance-points remote detail Switch# show ethernet cfm error	Verifies the configuration.
Step 14	Switch# show running-config	Verifies your entries.
Step 15	Switch# copy running-config startup-config	(Optional) Saves your entries in the configuration file.

Use the **no** versions of the commands to remove the configuration or return to the default configurations.

Clearing MEP from the AIS Defect Condition

To clear the MEP, enter one of the following commands:

```
Switch# clear ethernet cfm ais domain domain_name mpid local mpid vlan vlan#
Switch# clear ethernet cfm ais domain domain_name mpid local mpid evc evc_name
```

Clearing SMEP from the AIS Defect Condition

To clear the CSMP, enter one of the following commands:

```
Switch# clear ethernet cfm ais link-status interface interface_name
Switch# clear ethernet cfm error
```

Note

This operation also clears all error conditions including AIS.

Displaying Y.1731 Information

This example shows how to track the RDI defect and to verify the configuration parameters:

```
Switch# show ethernet cfm main local detail

To display Y.1731 information, you can use the following commands ([Table 56-1](#)).

Table 56-1 Displaying Y.1731 Information

Command	Purpose
<code>show ethernet cfm maintenance-point local detail</code>	Displays AIS status and defect condition on local maintenance points
<code>show ethernet cfm smep [interface <name>]</code>	Displays AIS status and defect condition on SMEP
<code>show ethernet cfm error</code>	Displays errors due to AIS defect condition
<code>show ethernet cfm maintenance-points remote [detail</code>	Displays AIS status and defect Condition on remote maintenance points

CHAPTER 57

Configuring Call Home

This chapter describes how to configure the Call Home feature in Catalyst 4500 Series Switch.

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

This chapter includes the following sections:

- [Understanding Call Home, page 57-2](#)
- [Obtaining Smart Call Home, page 57-2](#)
- [Configuring Call Home, page 57-3](#)
- [Configuring Contact Information, page 57-4](#)
- [Configuring Destination Profiles, page 57-5](#)
- [Subscribing to Alert Groups, page 57-6](#)
- [Configuring General E-Mail Options, page 57-9](#)
- [Enabling Call Home, page 57-10](#)
- [Testing Call Home Communications, page 57-10](#)
- [Configuring and Enabling Smart Call Home, page 57-13](#)

- [Default Settings, page 57-18](#)
- [Alert Group Trigger Events and Commands, page 57-18](#)
- [Message Contents, page 57-21](#)

Understanding Call Home

Call Home provides e-mail-based and web-based notification of critical system events. A versatile range of message formats are available for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications. Common uses of this feature may include direct paging of a network support engineer, e-mail notification to a Network Operations Center, XML delivery to a support website, and utilization of Cisco Smart Call Home services for direct case generation with the Cisco Systems Technical Assistance Center (TAC).

The Call Home feature can deliver alert messages containing information on configuration, diagnostics, environmental conditions, inventory, and syslog events.

The Call Home feature can deliver alerts to multiple recipients, referred to as *Call Home destination profiles*, each with configurable message formats and content categories. A predefined destination profile is provided for sending alerts to the Cisco TAC (callhome@cisco.com), and you also can define your own destination profiles.

Flexible message delivery and format options make it easy to integrate specific support requirements.

The Call Home feature offers the following advantages:

- Multiple message-format options:
 - Short Text—Suitable for pagers or printed reports.
 - Plain Text—Full formatted message information suitable for human reading.
 - XML—Matching readable format using Extensible Markup Language (XML) and Adaptive Markup Language (AML) document type definitions (DTDs). The XML format enables communication with the Cisco TAC.
- Multiple concurrent message destinations.
- Multiple message categories including configuration, diagnostics, environmental conditions, inventory, and syslog events.
- Filtering of messages by severity and pattern matching.
- Scheduling of periodic message sending.

Obtaining Smart Call Home

If you have a service contract directly with Cisco Systems, you can register your devices for the Smart Call Home service. Smart Call Home provides fast resolution of system problems by analyzing Call Home messages sent from your devices and providing background information and recommendations. For issues that can be identified as known, particularly GOLD diagnostics failures, Automatic Service Requests will be generated with the Cisco TAC.

Smart Call Home offers the following features:

- Boot-up diagnostics alerts for linecards & supervisor in the chassis.
- Analysis of Call Home messages from your device, and where appropriate Automatic Service Request generation, routed to the appropriate TAC team, including detailed diagnostic information to speed problem resolution.
- Secure message transport directly from your device or through a downloadable Transport Gateway (TG) aggregation point. You can use a TG aggregation point in cases requiring support for multiple devices or in cases where security requirements mandate that your devices may not be connected directly to the Internet.

- Web-based access to Call Home messages and recommendations, inventory and configuration information for all Call Home devices. Provides access to associated field notices, Security Advisories, and End-of-Life information.

You need to register the following items:

- The SMARTnet contract number for your switch
- Your e-mail address
- Your Cisco.com ID

For detailed information on Smart Call Home, refer to the Smart Call Home page at this URL:

http://www.cisco.com/en/US/products/ps7334/serv_home.html

Configuring Call Home

How you configure Call Home depends on how you intend to use the feature. Consider the following information before you configure Call Home:

- At least one destination profile (predefined or user-defined) must be configured. The destination profile(s) used depends on whether the receiving entity is a pager, e-mail, or automated service such as Cisco Smart Call Home.
 - If the destination profile uses e-mail message delivery, you must specify a Simple Mail Transfer Protocol (SMTP) server.
 - If the destination profile uses secure HTTP (HTTPS) message transport, you must configure a trustpoint certificate authority (CA).
- The contact e-mail, phone, and street address information should be configured so that the receiver can determine the origin of messages received.
- The switch must have IP connectivity to an e-mail server or the destination HTTP server using the **ip domain name** command.
- If Cisco Smart Call Home is used, an active service contract must cover the device being configured.

To configure Call Home, follow these steps:

-
- | | |
|---------------|------------------------------------------------------------------------------------------------------------|
| Step 1 | Configure your site's contact information. |
| Step 2 | Configure destination profiles for each of your intended recipients. |
| Step 3 | Subscribe each destination profile to one or more alert groups, and set alert options. |
| Step 4 | Configure e-mail settings or HTTPS settings (including CA certificate), depending on the transport method. |
| Step 5 | Enable the Call Home feature. |
| Step 6 | Test Call Home messages. |
-

Tip

From the Smart Call Home web application, you can download a basic configuration script to assist you in the configuration of the Call Home feature for use with Smart Call Home and the Cisco TAC. The script will also assist in configuring the trustpoint CA for secure communications with the Smart Call

Home service. The script, provided on an as-is basis, can be downloaded from this URL:

http://www.cisco.com/en/US/products/ps7334/serv_home.html

Configuring Contact Information

Each switch must include a contact e-mail address. You can optionally include a phone number, street address, contract ID, customer ID, and site ID.

To assign the contact information, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# call-home	Enters the Call Home configuration submode.
Step 3	Switch(cfg-call-home)# contact-email-addr <i>email-address</i>	Assigns the customer's e-mail address. Enter up to 200 characters in e-mail address format with no spaces.
Step 4	Switch(cfg-call-home)# phone-number <i>+phone-number</i>	(Optional) Assigns the customer's phone number. Note The number must begin with a plus (+) prefix, and may contain only dashes (-) and numbers. Enter up to 16 characters. If you include spaces, you must enclose your entry in quotes ("").
Step 5	Switch(cfg-call-home)# street-address <i>street-address</i>	(Optional) Assigns the customer's street address where RMA equipment can be shipped. Enter up to 200 characters. If you include spaces, you must enclose your entry in quotes ("").
Step 6	Switch(cfg-call-home)# customer-id <i>text</i>	(Optional) Identifies the customer ID. Enter up to 64 characters. If you include spaces, you must enclose your entry in quotes ("").
Step 7	Switch(cfg-call-home)# site-id <i>text</i>	(Optional) Identifies the customer site ID. Enter up to 200 characters. If you include spaces, you must enclose your entry in quotes ("").
Step 8	Switch(cfg-call-home)# contract-id <i>text</i>	(Optional) Identifies the customer's contract ID for the switch. Enter up to 64 characters. If you include spaces, you must enclose your entry in quotes ("").

This example shows the configuration of contact information:

```
Switch# configure terminal
```

```

Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# call-home
Switch(cfg-call-home)# contact-email-addr username@example.com
Switch(cfg-call-home)# phone-number +1-800-555-4567
Switch(cfg-call-home)# street-address "1234 Picaboo Street, Any city, Any state, 12345"
Switch(cfg-call-home)# customer-id Customer1234
Switch(cfg-call-home)# site-id Site1ManhattanNY
Switch(cfg-call-home)# contract-id Company1234
Switch(cfg-call-home)# exit
Switch(config)#

```

Configuring Destination Profiles

A destination profile contains the required delivery information for an alert notification. At least one destination profile is required. You can configure multiple destination profiles of one or more types.

You can use the predefined destination profile or define a desired profile. If you define a new destination profile, you must assign a profile name.

Note

If you use the Cisco Smart Call Home service, the destination profile must use the XML message format.

You can configure the following attributes for a destination profile:

- **Profile name**—A string that uniquely identifies each user-defined destination profile. The profile name is limited to 31 characters and is not case-sensitive. You cannot use **all** as a profile name.
- **Transport method**—The transport mechanism, either e-mail or HTTP (including HTTPS), for delivery of alerts.
 - For user-defined destination profiles, e-mail is the default, and you can enable either or both transport mechanisms. If you disable both methods, e-mail will be enabled.
 - For the predefined Cisco TAC profile, you can enable either transport mechanism, but not both.
- **Destination address**—The actual address related to the transport method to which the alert should be sent.
- **Message formatting**—The message format used for sending the alert.
 - For user-defined destination profiles, the format options are long-text, short-text, or XML. The default is XML.
 - For the predefined Cisco TAC profile, only XML is allowed.
- **Message size**—The maximum destination message size. The valid range is 50 to 3,145,728 bytes and the default is 3,145,728 bytes.

To create and configure a destination profile, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# call-home	Enters the Call Home configuration submode.
Step 3	Switch(cfg-call-home)# profile <i>name</i>	Enters the Call Home destination profile configuration submode for the specified destination profile. If the specified destination profile does not exist, it is created.
Step 4	Switch(cfg-call-home-profile)# [no] destination transport-method {email http}	(Optional) Enables the message transport method. The no option disables the method.

	Command	Purpose
Step 5	Switch(cfg-call-home-profile)# destination address {email email-address http url}	Configures the destination e-mail address or URL to which Call Home messages will be sent. Note When entering a destination URL, include either http:// or https:// , depending on whether the server is a secure server. If the destination is a secure server, you must also configure a trustpoint CA.
Step 6	Switch(cfg-call-home-profile)# destination preferred-msg-format {long-text short-text xml}	(Optional) Configures a preferred message format. The default is XML.
Step 7	Switch(cfg-call-home-profile)# destination message-size-limit bytes	(Optional) Configures a maximum destination message size for the destination profile.
Step 8	Switch(cfg-call-home-profile)# active	Enables the destination profile. By default, the profile is enabled when it is created.
Step 9	Switch(cfg-call-home-profile)# exit	Exits the Call Home destination profile configuration submode and returns to the Call Home configuration submode.
Step 10	Switch(cfg-call-home)# end	Returns to privileged EXEC mode.
Step 11	Switch# show call-home profile {name all}	Displays the destination profile configuration for a specified profile or all configured profiles.

Copying a Destination Profile

To create a new destination profile by copying an existing profile, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# call-home	Enters the Call Home configuration submode.
Step 3	Switch(cfg-call-home)# copy profile source-profile target-profile	Creates a new destination profile with the same configuration settings as the existing destination profile.

Subscribing to Alert Groups

An alert group is a predefined subset of Call Home alerts supported on the switch. Different types of Call Home alerts are grouped into different alert groups depending on their type. These alert groups are available:

- Configuration
- Diagnostic
- Environment
- Inventory
- Syslog

The triggering events for each alert group are listed in the [“Alert Group Trigger Events and Commands” section on page 57-18](#), and the contents of the alert group messages are listed in the [“Message Contents” section on page 57-21](#).

You can select one or more alert groups to be received by a destination profile.

Note

A Call Home alert is only sent to destination profiles that have subscribed to the alert group containing that Call Home alert. In addition, the alert group must be enabled.

To subscribe a destination profile to an alert group, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# call-home	Enters Call Home configuration submode.
Step 3	Switch(cfg-call-home)# alert-group { all configuration diagnostic environment inventory syslog }	Enables the specified alert group. Use the keyword all to enable all alert groups. By default, all alert groups are enabled.
Step 4	Switch(cfg-call-home)# profile <i>name</i>	Enters the Call Home destination profile configuration submode for the specified destination profile.
Step 5	Switch(cfg-call-home-profile)# subscribe-to-alert-group configuration [periodic { daily <i>hh:mm</i> monthly <i>date hh:mm</i> weekly <i>day hh:mm</i> }]	Subscribes this destination profile to the Configuration alert group. The Configuration alert group can be configured for periodic notification, as described in the “Configuring Periodic Notification” section on page 57-8.
	Switch(cfg-call-home-profile)# subscribe-to-alert-group all	Subscribes to all available alert groups.
Step 6	Switch(cfg-call-home-profile)# subscribe-to-alert-group diagnostic [severity catastrophic disaster fatal critical major minor warning notification normal debugging]	Subscribes this destination profile to the Diagnostic alert group. The Diagnostic alert group can be configured to filter messages based on severity, as described in the “Configuring Message Severity Threshold” section on page 57-8.
Step 7	Switch(cfg-call-home-profile)# subscribe-to-alert-group environment [severity catastrophic disaster fatal critical major minor warning notification normal debugging]	Subscribes this destination profile to the Environment alert group. The Environment alert group can be configured to filter messages based on severity, as described in the “Configuring Message Severity Threshold” section on page 57-8.
Step 8	Switch(cfg-call-home-profile)# subscribe-to-alert-group inventory [periodic { daily <i>hh:mm</i> monthly <i>date hh:mm</i> weekly <i>day hh:mm</i> }]	Subscribes this destination profile to the Inventory alert group. The Inventory alert group can be configured for periodic notification, as described in the “Configuring Periodic Notification” section on page 57-8.

	Command	Purpose
Step 9	<pre>Switch(cfg-call-home-profile)# subscribe-to-alert-group syslog [severity catastrophic disaster fatal critical major minor warning notification normal debugging] [pattern <i>string</i>]</pre>	Subscribes this destination profile to the Syslog alert group. The Syslog alert group can be configured to filter messages based on severity, as described in the “Configuring Message Severity Threshold” section on page 57-8. You can specify a pattern to be matched in the syslog message. If the pattern contains spaces, you must enclose it in quotes (“”).
Step 10	<pre>Switch(cfg-call-home-profile)# exit</pre>	Exits the Call Home destination profile configuration submode.

Configuring Periodic Notification

When you subscribe a destination profile to either the Configuration or the Inventory alert group, you can choose to receive the alert group messages asynchronously or periodically at a specified time. The sending period can be one of the following:

- Daily—Specify the time of day to send, using an hour:minute format *hh:mm*, with a 24-hour clock (for example, 14:30).
- Weekly—Specify the day of the week and time of day in the format *day hh:mm*, where the day of the week is spelled out (for example, monday).
- Monthly—Specify the numeric date, from 1 to 31, and the time of day, in the format *date hh:mm*.

Configuring Message Severity Threshold

When you subscribe a destination profile to the Diagnostic, Environment, or Syslog alert group, you can set a threshold for sending alert group messages based on the message’s level of severity. Any message with a value lower than the threshold is not sent to the destination.

The severity threshold is configured using the keywords in [Table 57-1](#), and ranges from catastrophic (level 9, highest level of urgency) to debugging (level 0, lowest level of urgency). If no severity threshold is configured, the default is normal (level 1).

Note

Call Home severity levels differ from the system message logging severity levels.

Table 57-1 *Severity and Syslog Level Mapping*

Level	Keyword	Syslog Level	Description
9	catastrophic	N/A	Network-wide catastrophic failure
8	disaster	N/A	Significant network impact
7	fatal	Emergency (0)	System unusable
6	critical	Alert (1)	Critical conditions, immediate attention needed
5	major	Critical (2)	Major conditions
4	minor	Error (3)	Minor conditions
3	warning	Warning (4)	Warning conditions

Table 57-1 Severity and Syslog Level Mapping (continued)

Level	Keyword	Syslog Level	Description
2	notification	Notice (5)	Basic notification and informational messages; possibly independently insignificant
1	normal	Information (6)	Normal event signifying return to normal state
0	debugging	Debug (7)	Debugging messages

Configuring Syslog Pattern Matching

When you subscribe a destination profile to the Syslog alert group, you can optionally specify a text pattern to be matched within each syslog message. If you configure a pattern, a Syslog alert group message will be sent only if it contains the specified pattern and meets the severity threshold. If the pattern contains spaces, you must enclose it in quotes (“”) when configuring it. You can specify up to five patterns for each destination profile.

Configuring General E-Mail Options

To use the e-mail message transport, you must configure at least one Simple Mail Transfer Protocol (SMTP) e-mail server address. You can configure the from and reply-to e-mail addresses, and you can specify up to four backup e-mail servers. You can also set a rate limit on e-mail or HTTP messages.

To configure general e-mail options, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# call-home	Enters Call Home configuration submode.
Step 3	Switch(cfg-call-home)# mail-server {ipv4-address name} priority number	Assigns an e-mail server address and its relative priority among configured e-mail servers. Provide either of these: <ul style="list-style-type: none"> The e-mail server's IP address The e-mail server's fully qualified domain <i>name</i> (FQDN) of 64 characters or less. Assign a priority <i>number</i> between 1 (highest priority) and 100 (lowest priority).
Step 4	Switch(cfg-call-home)# sender from email-address	(Optional) Assigns the e-mail address that will appear in the from field in Call Home e-mail messages. If no address is specified, the contact e-mail address is used.
Step 5	Switch(cfg-call-home)# sender reply-to email-address	(Optional) Assigns the e-mail address that will appear in the reply-to field in Call Home e-mail messages.
Step 6	Switch(cfg-call-home)# rate-limit number	(Optional) Specifies a limit on the number of messages sent per minute, from 1 to 60. The default is 20.
Step 7	Switch(cfg-call-home)# vrf vrf-name	(Optional) Specifies the VRF instance to send Call Home e-mail messages. If no VRF is specified, the global routing table is used.

The following notes apply when configuring general e-mail options:

- Backup e-mail servers can be defined by repeating the **mail-server** command using different priority numbers.
- The **mail-server priority number** parameter can be configured from 1 to 100. The server with the highest priority (lowest priority number) will be tried first.

This example shows the configuration of general e-mail parameters, including a primary and secondary e-mail server:

```
Switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)# call-home
Switch(cfg-call-home)# mail-server smtp.example.com priority 1
Switch(cfg-call-home)# mail-server 192.168.0.1 priority 2
Switch(cfg-call-home)# sender from username@example.com
Switch(cfg-call-home)# sender reply-to username@example.com
Switch(cfg-call-home)# exit
Switch(config)#
```

Enabling Call Home

To enable or disable the Call Home feature, perform this task:

	Command	Purpose
Step 1	Switch# configure terminal	Enters configuration mode.
Step 2	Switch(config)# service call-home	Enables the Call Home feature.

Testing Call Home Communications

You can test Call Home communications by sending messages manually using two command types.

- To send a user-defined Call Home test message, use the **call-home test** command.
- To send a specific alert group message, use the **call-home send** command.

Sending a Call Home Test Message Manually

To manually send a Call Home test message, perform this task:

	Command	Purpose
Step 1	Switch# call-home test ["test-message"] profile name	Sends a test message to the specified destination profile. The user-defined test message text is optional, but must be enclosed in quotes (""") if it contains spaces. If no user-defined message is configured, a default message will be sent.

This example shows how to manually send a Call Home test message:

```
Switch# call-home test "test of the day" profile Ciscotac1
```

Sending a Call Home Alert Group Message Manually

To manually trigger a Call Home alert group message, perform this task:

	Command	Purpose
Step 1	Switch# call-home send alert-group configuration [profile name]	Sends a configuration alert group message to one destination profile if specified, or to all subscribed destination profiles.
	Switch# call-home send alert-group diagnostic { module number slot/subslot slot/bay } [profile name]	Sends a diagnostic alert group message to the configured destination profile if specified, or to all subscribed destination profiles. You must specify the module or port whose diagnostic information should be sent.
	Switch# call-home send alert-group inventory [profile name]	Sends an inventory alert group message to one destination profile if specified, or to all subscribed destination profiles.

When manually sending Call Home alert group messages, note the following guidelines:

- You can only manually send the configuration, diagnostic, and inventory alert groups.
- When you manually trigger a configuration, diagnostic, or inventory alert group message and you specify a destination profile name, a message is sent to the destination profile regardless of the profile's active status, subscription status, or severity setting.
- When you manually trigger a configuration or inventory alert group message and do not specify a destination profile name, a message is sent to all active profiles that have either a normal or periodic subscription to the specified alert group.
- When you manually trigger a diagnostic alert group message and do not specify a destination profile name, the command will cause the following actions:
 - For any active profile that subscribes to diagnostic events with a severity level of less than minor, a message is sent regardless of whether the module or interface has observed a diagnostic event.
 - For any active profile that subscribes to diagnostic events with a severity level of minor or higher, a message is sent only if the specified module or interface has observed a diagnostic event of at least the subscribed severity level; otherwise, no diagnostic message is sent to the destination profile.

This example shows how to send the configuration alert-group message to the destination profile:

```
Switch# call-home send alert-group configuration
```

This example shows how to send the diagnostic alert-group message to the destination profile for a specific module, slot/subslot, or slot/bay number.

```
Switch# call-home send alert-group diagnostic module 3 5/2
```

This example shows how to send the diagnostic alert-group message to all destination profiles for a specific module, slot/subslot, or slot/bay number.

```
Switch# call-home send alert-group diagnostic module 3 5/2 profile Ciscotac1
```

This example shows how to send the inventory call-home message:

```
Switch# call-home send alert-group inventory
```

Sending a Request for an Analysis and Report

You can use the **call-home request** command to submit information about your system to Cisco in order to receive helpful information specific to your system. You can request a variety of reports, including security alerts, known bugs, best practices, and command references.

To submit a request for report and analysis information from the Cisco Output Interpreter tool, perform this task:

Step 1	Command	Purpose
	Switch# call-home request output-analysis "show-command" [profile name] [ccoid user-id]	Sends the output of the specified show command for analysis. The show command must be contained in quotes ("").
	Switch# call-home request {config-sanity bugs-list command-reference product-advisory} [profile name] [ccoid user-id]	Sends the output of a predetermined set of commands for analysis such as show running-config all , show version , or show module commands. In addition, the call-home request product-advisory command includes all inventory alert group commands. The keyword specified after the call home request command specifies the type of report required.

When manually sending a Call Home report and analysis request, note the following guidelines:

- If you specify a **profile name** value, the request is sent to the profile. If you do not specify a profile name, the request is sent to the Cisco TAC profile. The recipient profile does not need to be enabled for the Call Home request. The profile should specify the e-mail address where the transport gateway is configured so that the request message can be forwarded to the Cisco TAC and the user can receive the reply from the Smart Call Home service.
- The **ccoid user-id** value is the registered identifier of the Smart Call Home user. If you specify a user-id, the response is sent to the e-mail address of the registered user. If do not specify a user-id, the response is sent to the contact e-mail address of the device.
- Based on the keyword specifying the type of report requested, the following information is returned:
 - **config-sanity**—Information on best practices as related to the current running configuration
 - **bugs-list**—Known bugs in the running version and in the currently applied features
 - **command-reference**—Reference links to all commands in the running configuration
 - **product-advisory**—Product Security Incident Response Team (PSIRT) notices, End of Life (EOL) or End of Sales (EOS) notices, or field notices (FN) that may affect devices in your network

This example shows a request for analysis of a user-specified **show** command:

```
Switch# call-home request output-analysis "show diagnostic result module all" profile TG
```

Sending the Output of a Command

You can use the **call-home send** command to execute a CLI command and e-mail the command output to Cisco or to an e-mail address that you specify.

To execute a CLI command and e-mail the command output, perform this task:

	Command	Purpose
Step 1	Switch# call-home send "command" [email email-addr] [service-number SR]	Executes the specified CLI command and e-mails the output.

When sending the output of a command, note the following guidelines:

- The specified CLI command can be any run command, including commands for all modules. The command must be contained in quotes ("").
- If an e-mail address is specified, the command output will be sent to that address. If no e-mail address is specified, the output will be sent to the Cisco TAC (attach@cisco.com). The e-mail will be sent in long text format with the service number, if specified, in the subject line.
- The service number is required only if no e-mail address is specified, or if a Cisco TAC e-mail address is specified.

This example shows how to send the output of a CLI command to a user-specified e-mail address:

```
Switch# call-home send "show diagnostic result module all" email support@example.com
```

Configuring and Enabling Smart Call Home

For application and configuration information of the Cisco Smart Call Home service, see the “FastStart” section of the *Smart Call Home User Guide* at this location:

<http://www.cisco.com/go/smartcall/>

The user guide includes configuration examples for sending Smart Call Home messages directly from your device or through a transport gateway (TG) aggregation point. You can use a TG aggregation point in cases requiring support for multiple devices or in cases where security requirements mandate that your devices may not be connected directly to the Internet.

Because the Smart Call Home service uses HTTPS as the transport method, you must also configure its CA as a trustpoint, as described in the *Smart Call Home User Guide*.

Displaying Call Home Configuration Information

To display the configured Call Home information, perform these tasks:

Command	Purpose
Switch# show call-home	Displays the Call Home configuration in summary.
Switch# show call-home detail	Displays the Call Home configuration in detail.
Switch# show call-home alert-group	Displays the available alert groups and their status.

Command	Purpose
Switch# show call-home mail-server status	Checks and displays the availability of the configured e-mail server(s).
Switch# show call-home profile {all name}	Displays the configuration of the specified destination profile. Use the keyword all to display the configuration of all destination profiles.
Switch# show call-home statistics	Displays the statistics of Call Home events.

Examples 57-1 to 57-7 show the results when using different options of the **show call-home** command.

Example 57-1 Configured Call Home Information

```
Switch# show call-home
Current call home settings:
  call home feature : disable
  call home message's from address: switch@example.com
  call home message's reply-to address: support@example.com

  vrf for call-home messages: Not yet set up

  contact person's email address: technical@example.com

  contact person's phone number: +1-408-555-1234
  street address: 1234 Picaboo Street, Any city, Any state, 12345
  customer ID: ExampleCorp
  contract ID: X123456789
  site ID: SantaClara
  Mail-server[1]: Address: smtp.example.com Priority: 1
  Mail-server[2]: Address: 192.168.0.1 Priority: 2
  Rate-limit: 20 message(s) per minute

Available alert groups:
  Keyword                State  Description
  -----
  configuration           Disable configuration info
  diagnostic              Disable diagnostic info
  environment            Disable environmental info
  inventory              Enable  inventory info
  syslog                 Disable syslog info

Profiles:
  Profile Name: campus-noc
  Profile Name: CiscoTAC-1

Switch#
```

Example 57-2 Configured Call Home Information in Detail

```
Switch# show call-home detail
Current call home settings:
  call home feature : disable
  call home message's from address: switch@example.com
  call home message's reply-to address: support@example.com

  vrf for call-home messages: Not yet set up

  contact person's email address: technical@example.com

  contact person's phone number: +1-408-555-1234
```

```

street address: 1234 Picaboo Street, Any city, Any state, 12345

Last call-home message sent time: n/a

Default Settings

Table 57-2 lists the default Call Home settings.

Table 57-2 Default Call Home Settings

Parameters	Default
Call Home feature status	Disabled
User-defined profile status	Active
Predefined Cisco TAC profile status	Inactive
Transport method	E-mail
Message format type	XML
Destination message size for a message sent in long text, short text, or XML format	3,145,728
Alert group status	Enabled
Call Home message severity threshold	1 (normal)
Message rate limit for messages per minute	20

Alert Group Trigger Events and Commands

Call Home trigger events are grouped into alert groups, with each alert group assigned CLI commands to execute when an event occurs. The CLI command output is included in the transmitted message.

Table 57-3 lists the trigger events included in each alert group, including the severity level of each event and the executed CLI commands for the alert group.

Table 57-3 Call Home Alert Groups, Events, and Actions

Alert Group	Call Home Trigger Event	Syslog Event	Severity	Description and CLI Commands Executed
Syslog				Event logged to syslog. (Only sent to TAC if syslog level 0, 1, or 2) CLI commands executed: show logging show inventory
	SYSLOG	LOG_EMERG	7	System is unusable.

Table 57-3 Call Home Alert Groups, Events, and Actions (continued)

Alert Group	Call Home Trigger Event	Syslog Event	Severity	Description and CLI Commands Executed
	SYSLOG	LOG_ALERT	6	Action must be taken immediately.
	SYSLOG	LOG_CRIT	5	Critical conditions.
	SYSLOG	LOG_ERR	4	Error conditions.
	SYSLOG	LOG_WARNING	3	Warning conditions.
	SYSLOG	LOG_NOTICE	2	Normal but signification condition.
	SYSLOG	LOG_INFO	1	Informational.
	SYSLOG	LOG_DEBUG	0	Debug-level messages.
Environmental				<p>Events related to power, fan, and environment sensing elements, such as temperature alarms. (Sent to TAC.)</p> <p>CLI commands executed:</p> <p>show module show environment show logging show power show inventory</p>
	TEMP_FAILURE	TempHigh	5	The temperature of the chassis is above the normal threshold.
	TEMP_FAILURE	Critical Temp	5	The temperature of the chassis has risen above the critical threshold.
	TEMP_FAILURE	Shutdown Temp	5	The temperature of the chassis is very high and the system will be shut down.
	TEMP_FAILURE	Some Temp Sensors Failed	3	Some of the temperature sensors have failed.
	TEMP_FAILURE	All Temp Sensors Failed	5	All temperature sensors have failed.
	TEMP_RECOVER	TempOk	5	The temperature of the chassis is normal.
	POWER_FAILURE	PowerSupplyBad	5	A power supply has failed or has been turned off.
	POWER_RECOVERY	PowerSupplyGood	5	A failed power supply has been fixed.
	POWER_FAILURE	PowerSupplyFanBad	3	A power supply fan has failed.
	POWER_RECOVERY	PowerSupplyFanGood	3	A failed power supply fan has been fixed.
	POWER_RECOVERY	PowerSupplyOutputIncreased	3	A power supply output has increased.
	POWER_FAILURE	PowerSupplyOutputDecreased	3	A power supply output has decreased.

Table 57-3 Call Home Alert Groups, Events, and Actions (continued)

Alert Group	Call Home Trigger Event	Syslog Event	Severity	Description and CLI Commands Executed
	POWER_FAIL URE	InlinePowerSupplyBad	3	Inline power source from a power supply has failed or turned off.
	POWER_FAIL URE	MixedPowerSupplyInC hassis	3	Mixed power supplies have been detected in the chassis.
	POWER_FAIL URE	NotEnoughPowerChass is	6	There is insufficient power to support the system. The system might shut down.
	POWER_ RECOVERY	InlinePowerSupplyGoo d	3	A failed source for inline power has been fixed.
	FANTRAY_FA ILURE	FanTrayPartialFailure	3	Either a fan or thermistors in system fan tray has failed.
	FANTRAY_FA ILURE	FanTrayMismatch	3	The fantray, supervisor, chassis combination is disallowed.
	FANTRAY_FA ILURE	FanTrayBad	5	Fan tray has failed.
	FANTRAY_ RECOVERY	FanTrayGood	3/5	Failed fan tray has been fixed. The severity of the notification depends on the failure which has been recovered from.
	FANTRAY_ FAILURE	InsufficientFantray	6	There are not enough FanTray to support the system. This may be followed by a system shut down.
	CLOCK_ALA RM	ClockSwitchover	2	Clock module has switched over to another clock.
	CLOCK_ALA RM	Clock Faulty	3	The clock module has been found to be faulty.
Inventory				Inventory status should be provided whenever a unit is cold-booted, or when FRUs are inserted or removed. it is considered a noncritical event, and the information is used for status and entitlement. CLI commands executed: show module show version show inventory oid show idprom all show power
	INSERTION	Module	1	A linecard or supervisor engine has been inserted into a slot.
	REMOVAL	Module	1	A linecard or supervisor engine has been removed from a slot.

Table 57-3 *Call Home Alert Groups, Events, and Actions (continued)*

Alert Group	Call Home Trigger Event	Syslog Event	Severity	Description and CLI Commands Executed
Diagnostic Failure			1/3/4/5	Events related to standard or intelligent line cards. CLI commands executed: show module show version show inventory show buffers show logging show diagnostic result module x detail show diagnostic result module all
Test	TEST		1	User-generated test message. CLI commands executed: show module show version show inventory
Configuration			1	User-generated request for configuration. CLI commands executed: show module show inventory show version show running-config all show startup-config

Message Contents

The following tables display the content formats of alert group messages:

- [Table 57-4](#) describes the content fields of a short text message.
- [Table 57-5](#) describes the content fields that are common to all long text and XML messages. The fields specific to a particular alert group message are inserted at a point between the common fields. The insertion point is identified in the table.
- [Table 57-6](#) describes the inserted content fields for reactive messages (system failures that require a TAC case) and proactive messages (issues that might result in degraded system performance).
- [Table 57-7](#) describes the inserted content fields for an inventory message.

Table 57-4 *Format for a Short Text Message*

Data Item	Description
Device identification	Configured device name
Date/time stamp	Time stamp of the triggering event
Error isolation message	Plain English description of triggering event
Alarm urgency level	Error level such as that applied to a system message

Table 57-5 Common Fields for All Long Text and XML Messages

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Time stamp	Date/timestamp of event in ISO time notation: YYYY-MM-DDTHH:MM:SS Note the T in between date and time, and note that the timezone/dst offset from UTC has already been added or subtracted.	CallHome/EventTime
Message name	Name of message.	For short text message only
Message type	Specifically "Call Home".	CallHome/Event/Type
Message group	Specifically "reactive". Optional in this case because default is "reactive".	CallHome/Event/SubType
Severity level	Severity level of message.	Body/Block/Severity
Source ID	This field is used to identify the product type for routing through the workflow engine. This is typically the product family name.	For long test mmessage only
Device ID	Unique Device Identifier (UDI) for end device generating message. This field should empty if the message is nonspecific to a fabric switch. Format: type@Sid@serial Where @:Separator character <ul style="list-style-type: none"> Type: If WS-C4503-E, product model number from backplane SEEPROM. Sid: "C" identifying serial ID as a chassis serial number. Serial: The serial number as identified by the Sid field. Example: "WS-C4503-E@C@SPE4465329F"	CallHome/Customer Data/ ContractData/ DeviceId
Customer ID	Optional user-configurable field used for contract information or other ID by any support service.	CallHome/Customer Data/ ContractData/ CustomerId
Contract ID	Optional user-configurable field used for contract information or other ID by any support service.	/CallHome/ Customer Data/ ContractData/ ContractId
Site ID	Optional user-configurable field used for Cisco-supplied site ID or other data meaningful to alternate support service.	CallHome/ CustomerData/ ContractData/ SiteId

Table 57-5 Common Fields for All Long Text and XML Messages (continued)

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Server ID	<p>If message is generated from fabric switch, UDI of switch. If message is proxied or originated by MA, the MA should overwrite this field with the MA UDI.</p> <p>Format is type@Sid@serial</p> <p>Where</p> <p>@: Separator character</p> <ul style="list-style-type: none"> Type: If WS-C4510R, product model number from backplane SEEPROM. Sid: "C" identifying serial ID as a chassis serial number Serial: The serial number as identified by the Sid field. <p>Example: " WS-C4510R@C@CAT234765XR"</p>	For long text message only
Message description	Short text describing the error.	CallHome/ MessageDescription
Device name	Node that experienced the event. This is the host name of the device.	CallHome/ CustomerData/ SystemInfo/ Name
Contact name	Name of person to contact for issues associated with the node experiencing the event.	CallHome/CustomerData/Syst emInfo/Contact
Contact e-mail	E-mail address of person identified as contact for this unit.	CallHome/CustomerData/Syst emInfo/ContactEmail
Contact phone number	Phone number of the person identified as the contact for this unit.	CallHome/CustomerData/Syst emInfo/ContactPhoneNumber
Street address	Optional field containing street address for RMA part shipments associated with this unit.	CallHome/CustomerData/Syst emInfo/StreetAddress
Model name	Model name of the unit (such as WS-C4503). This is the specific model as part of a product family name.	CallHome/ Device/ Cisco_Chassis/Model
Serial number	Chassis serial number of the unit.	CallHome/ Device/ Cisco_Chassis/ SerialNumber
Chassis part number	Top assembly number of the chassis as read from SEEPROM (such as WS-C4503 = 73-10558).	CallHome/Device/Cisco_Chas sis/AdditionalInformation/ AD@name="PartNumber"

Fields specific to a particular alert group message are inserted here.

The following fields may be repeated if multiple CLI commands are executed for this alert group.

Command output name	The exact command that was run (such as the show running-config command).	/aml/attachments/attachment/ name
---------------------	----------------------------------------------------------------------------------	--------------------------------------

Table 57-5 Common Fields for All Long Text and XML Messages (continued)

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Attachment type	Specifically command output.	/aml/Attachments/attachment@type
MIME type	Normally text/plain or encoding type.	/aml/Attachments/Attachment/Data@encoding

Table 57-6 Inserted Fields for a Reactive or Proactive Event Message

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Chassis hardware version	Hardware version of chassis	CallHome/Device/Cisco_Chassis/HardwareVersion
Supervisor module software version	Top-level software version	CallHome/Device/Cisco_Chassis/AdditionalInformation/AD@name="SoftwareVersion"
Affected FRU name	Name of the affected FRU generating the event message	CallHome/Device/Cisco_Chassis/Cisco_Card/Model
Affected FRU serial number	Serial number of affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/SerialNumber
Affected FRU part number	Part number of affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/PartNumber
FRU slot	Slot number of FRU generating the event message	CallHome/Device/Cisco_Chassis/Cisco_Card/LocationWithinContainer
FRU hardware version	Hardware version of affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/HardwareVersion
FRU software version	Software version(s) running on affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/SoftwareIdentity/VersionString

Table 57-7 Inserted Fields for an Inventory Event Message

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Chassis hardware version	Hardware version of chassis	CallHome/Device/Cisco_Chassis/HardwareVersion
Supervisor module software version	Top-level software version	CallHome/Device/Cisco_Chassis/AdditionalInformation/AD@name="SoftwareVersion"
Affected FRU name	Name of the affected FRU generating the event message	CallHome/Device/Cisco_Chassis/Cisco_Card/Model

Table 57-7 *Inserted Fields for an Inventory Event Message (continued)*

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Affected FRU s/n	Serial number of affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/SerialNumber
Affected FRU part number	Part number of affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/PartNumber
FRU slot	Slot number of FRU generating the event message	CallHome/Device/Cisco_Chassis/Cisco_Card/LocationWithinContainer
FRU hardware version	Hardware version of affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/HardwareVersion
FRU software version	Software version(s) running on affected FRU	CallHome/Device/Cisco_Chassis/Cisco_Card/SoftwareIdentity/VersionString

Sample Syslog Alert Notification in Long-Text Format

```

TimeStamp : 2009-02-06 12:57 GMT+00:00
Message Name : syslog
Message Type : Call Home
Message Group : reactive
Severity Level : 2
Source ID : Cat4500/4900
Device ID : WS-C4510R@C@1234567
Customer ID :
Contract ID :
Site ID :
Server ID : WS-C4510R@C@1234567
Event Description : *Feb 6 12:57:54.121: %CLEAR-5-COUNTERS: Clear counter on all
interfaces by console
System Name : Router
Contact Email : abc@example.com
Contact Phone :
Street Address :
Affected Chassis : WS-C4510R
Affected Chassis Serial Number : 1234567
Affected Chassis Part No : 12-3456-78
Affected Chassis Hardware Version : 1.1
Supervisor Software Version : 12.2(20090204:112419)
Command Output Name : show logging
Attachment Type : command output
MIME Type : text/plain
Command Output Text :
Syslog logging: enabled (0 messages dropped, 1 messages rate-limited, 0 flushes, 0
overruns, xml disabled, filtering disabled)

No Active Message Discriminator.

No Inactive Message Discriminator.

CHAPTER 58

Configuring Cisco IOS IP SLAs Operations

This chapter describes how to use Cisco IOS IP Service Level Agreements (SLAs) on the switch. Cisco IP SLAs is a part of Cisco IOS software that allows Cisco customers to analyze IP service levels for IP applications and services by using active traffic monitoring—the generation of traffic in a continuous, reliable, and predictable manner—for measuring network performance. With Cisco IOS IP SLAs, service provider customers can measure and provide service level agreements, and enterprise customers can verify service levels, verify outsourced service level agreements, and understand network performance. Cisco IOS IP SLAs can perform network assessments, verify quality of service (QoS), ease the deployment of new services, and assist with network troubleshooting. Unless otherwise noted, the term *switch* refers to a standalone switch and to a switch stack.

Note

Switches running the IP base image support only IP SLAs responder functionality and must be configured with another device that supports full IP SLAs functionality, for example, a switch.

For more information about IP SLAs, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4T*: http://www.cisco.com/en/US/products/ps6441/products_installation_and_configuration_guides_list.html

This chapter consists of these sections:

- [Command Table, page 58-1](#)
- [Understanding Cisco IOS IP SLAs, page 58-2](#)
- [Configuring IP SLAs Operations, page 58-7](#)
- [Monitoring IP SLAs Operations, page 58-13](#)

Command Table

This table lists the commands most commonly used with Cisco IP SLAs.

Command	Purpose	Location
<code>ip sla responder {tcp-connect udp-echo} ipaddress ip-address port port-number</code>	Configures the switch as an IP SLAs responder.	Configuring the IP SLAs Responder, page 58-8
<code>ip sla operation-number</code>	Creates an IP SLAs operation, and enter IP SLAs configuration mode.	Analyzing IP Service Levels by Using the UDP Jitter Operation, page 58-9

Command	Purpose	Location
udp-jitter { <i>destination-ip-address</i> <i>destination-hostname</i> } <i>destination-port</i> [source-ip { <i>ip-address</i> <i>hostname</i> }] [source-port <i>port-number</i>] [control { enable disable }] [num-packets <i>number-of-packets</i>] [interval <i>interpacket-interval</i>]	Configures the IP SLAs operation as a UDP jitter operation, and enter UDP jitter configuration mode.	Analyzing IP Service Levels by Using the UDP Jitter Operation, page 58-9
frequency <i>seconds</i>	(Optional) Sets the rate at which a specified IP SLAs operation repeats.	Analyzing IP Service Levels by Using the UDP Jitter Operation, page 58-9
ip sla monitor schedule <i>operation-number</i> [life { forever <i>seconds</i> }] [start-time { <i>hh:mm[:ss]</i> <i>month day</i> <i>day month</i> } pending now after <i>hh:mm:ss</i>] [ageout <i>seconds</i>] [recurring]	Configures the scheduling parameters for an individual IP SLAs operation.	Analyzing IP Service Levels by Using the UDP Jitter Operation, page 58-9 Analyzing IP Service Levels by Using the ICMP Echo Operation, page 58-11
icmp-echo { <i>destination-ip-address</i> <i>destination-hostname</i> } [source-ip { <i>ip-address</i> <i>hostname</i> } source-interface <i>interface-id</i>]	Configures the IP SLAs operation as an ICMP Echo operation and enter ICMP echo configuration mode.	Analyzing IP Service Levels by Using the ICMP Echo Operation, page 58-11
frequency <i>seconds</i>	(Optional) Sets the rate at which a specified IP SLAs operation repeats.	Analyzing IP Service Levels by Using the ICMP Echo Operation, page 58-11

Understanding Cisco IOS IP SLAs

Cisco IOS IP SLAs sends data across the network to measure performance between multiple network locations or across multiple network paths. It simulates network data and IP services and collects network performance information in real time. Cisco IOS IP SLAs generates and analyzes traffic either between Cisco IOS devices or from a Cisco IOS device to a remote IP device such as a network application server. Measurements provided by the various Cisco IOS IP SLAs operations can be used for troubleshooting, for problem analysis, and for designing network topologies.

Depending on the specific Cisco IOS IP SLAs operation, various network performance statistics are monitored within the Cisco device and stored in both command-line interface (CLI) and Simple Network Management Protocol (SNMP) MIBs. IP SLAs packets have configurable IP and application layer options such as source and destination IP address, User Datagram Protocol (UDP)/TCP port numbers, a type of service (ToS) byte (including Differentiated Services Code Point [DSCP] and IP Prefix bits), Virtual Private Network (VPN) routing/forwarding instance (VRF), and URL web address.

Because Cisco IP SLAs is Layer 2 transport independent, you can configure end-to-end operations over disparate networks to best reflect the metrics that an end user is likely to experience. IP SLAs collects a unique subset of these performance metrics:

- Delay (both round-trip and one-way)
- Jitter (directional)
- Packet loss (directional)
- Packet sequencing (packet ordering)

- Path (per hop)
- Connectivity (directional)
- Server or website download time

Because Cisco IOS IP SLAs is SNMP-accessible, it can also be used by performance-monitoring applications like CiscoWorks Internetwork Performance Monitor (IPM) and other third-party Cisco partner performance management products. You can find more details about network management products that use Cisco IOS IP SLAs:

<http://www.cisco.com/go/ipsla>

Using IP SLAs can provide these benefits:

- Service-level agreement monitoring, measurement, and verification.
- Network performance monitoring
 - Measures the jitter, latency, or packet loss in the network.
 - Provides continuous, reliable, and predictable measurements.
- IP service network health assessment to verify that the existing QoS is sufficient for new IP services.
- Edge-to-edge network availability monitoring for proactive verification and connectivity testing of network resources (for example, shows the network availability of an NFS server used to store business critical data from a remote site).
- Troubleshooting of network operation by providing consistent, reliable measurement that immediately identifies problems and saves troubleshooting time.

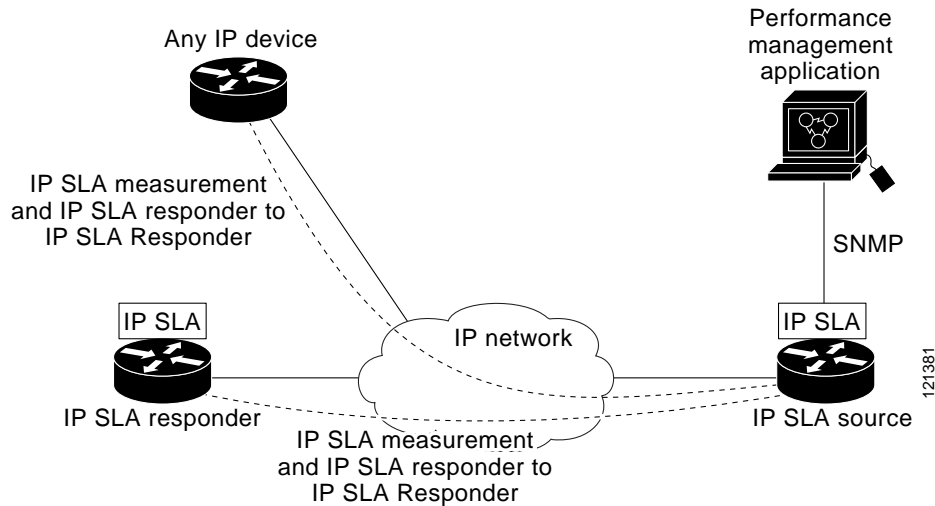

This section includes this information about IP SLAs functionality:

- [Using Cisco IOS IP SLAs to Measure Network Performance, page 58-3](#)
- [IP SLAs Responder and IP SLAs Control Protocol, page 58-4](#)
- [Response Time Computation for IP SLAs, page 58-5](#)
- [IP SLAs Operation Scheduling, page 58-6](#)
- [IP SLAs Operation Threshold Monitoring, page 58-6](#)

Using Cisco IOS IP SLAs to Measure Network Performance

You can use IP SLAs to monitor the performance between any area in the network—core, distribution, and edge—without deploying a physical probe. It uses generated traffic to measure network performance between two networking devices. [Figure 58-1](#) shows how IP SLAs begins when the source device sends a generated packet to the destination device. After the destination device receives the packet, depending on the type of IP SLAs operation, it responds with time-stamp information for the source to make the calculation on performance metrics. An IP SLAs operation performs a network measurement from the source device to a destination in the network using a specific protocol such as UDP.

Figure 58-1 Cisco IOS IP SLAs Operation

To implement IP SLAs network performance measurement, you need to perform these tasks:

1. Enable the IP SLAs responder, if required.
2. Configure the required IP SLAs operation type.
3. Configure any options available for the specified operation type.
4. Configure threshold conditions, if required.
5. Schedule the operation to run, then let the operation run for a period of time to gather statistics.
6. Display and interpret the results of the operation using the Cisco IOS CLI or a network management system (NMS) system with SNMP.

For more information about IP SLAs operations, see the operation-specific chapters in the *Cisco IOS IP SLAs Configuration Guide, Release 12.4T* at this URL:

http://www.cisco.com/en/US/docs/ios/ipsla/configuration/guide/12_4t/sla_12_4t_book.html

The switch does not support Voice over IP (VoIP) service levels using the gatekeeper registration delay operations measurements. Before configuring any IP SLAs application, you can use the **show ip sla application** privileged EXEC command to verify that the operation type is supported on your software image.

IP SLAs Responder and IP SLAs Control Protocol

The IP SLAs responder is a component embedded in the destination Cisco device that allows the system to anticipate and respond to IP SLAs request packets. The responder provides accurate measurements without the need for dedicated probes. The responder uses the Cisco IOS IP SLAs Control Protocol to provide a mechanism through which it can be notified on which port it should listen and respond. Only a Cisco IOS device can be a source for a destination IP SLAs Responder.

Note

The IP SLAs responder can be a Cisco IOS Layer 2, responder-configurable switch, such as a Catalyst 4500 running the IP base image. The responder does not need to support full IP SLAs functionality.

Figure 58-1 shows where the Cisco IOS IP SLAs responder fits in the IP network. The responder listens on a specific port for control protocol messages sent by an IP SLAs operation. Upon receipt of the control message, it enables the specified UDP or TCP port for the specified duration. During this time, the responder accepts the requests and responds to them. It disables the port after it responds to the IP SLAs packet, or when the specified time expires. MD5 authentication for control messages is available for added security.

You do not need to enable the responder on the destination device for all IP SLAs operations. For example, a responder is not required for services that are already provided by the destination router (such as Telnet or HTTP). You cannot configure the IP SLAs responder on non-Cisco devices and Cisco IOS IP SLAs can send operational packets only to services native to those devices.

Response Time Computation for IP SLAs

Switches and routers can take tens of milliseconds to process incoming packets due to other high priority processes. This delay affects the response times because the test-packet reply might be in a queue while waiting to be processed. In this situation, the response times would not accurately represent true network delays. IP SLAs minimizes these processing delays on the source device as well as on the target device (if the responder is being used) to determine true round-trip times. IP SLAs test packets use time stamping to minimize the processing delays.

When the IP SLAs responder is enabled, it allows the target device to take time stamps when the packet arrives on the interface at interrupt level and again just as it is leaving, eliminating the processing time. This time stamping is made with a granularity of sub-milliseconds (ms).

Figure 58-2 demonstrates how the responder works. Four time stamps are taken to make the calculation for round-trip time. At the target router, with the responder functionality enabled, time stamp 2 (TS2) is subtracted from time stamp 3 (TS3) to produce the time spent processing the test packet as represented by delta. This delta value is then subtracted from the overall round-trip time. Notice that the same principle is applied by IP SLAs on the source router where the incoming time stamp 4 (TS4) is also taken at the interrupt level to allow for greater accuracy.

Figure 58-2 Cisco IOS IP SLAs Responder Time Stamping

An additional benefit of the two time stamps at the target device is the ability to track one-way delay, jitter, and directional packet loss. Because much network behavior is asynchronous, it is critical to have these statistics. However, to capture one-way delay measurements, you must configure both the source router and target router with Network Time Protocol (NTP) so that the source and target are synchronized to the same clock source. One-way jitter measurements do not require clock synchronization.

IP SLAs Operation Scheduling

For more details about the IP SLAs multioperations scheduling functionality, see the “IP SLAs—Multiple Operation Scheduling” chapter of the *Cisco IOS IP SLAs Configuration Guide* at this URL:

http://www.cisco.com/en/US/docs/ios/ipsla/configuration/guide/12_4t/sla_12_4t_book.html

When you configure an IP SLAs operation, you must schedule the operation to begin capturing statistics and collecting error information. You can schedule an operation to start immediately or to start at a certain month, day, and hour. You can use the *pending* option to set the operation to start at a later time. The pending option is an internal state of the operation that is visible through SNMP. The pending state is also used when an operation is a reaction (threshold) operation waiting to be triggered. You can schedule a single IP SLAs operation or a group of operations at one time.

You can schedule several IP SLAs operations by using a single command through the Cisco IOS CLI or the CISCO RTTMON-MIB. Scheduling the operations to run at evenly distributed times allows you to control the amount of IP SLAs monitoring traffic. This distribution of IP SLAs operations helps minimize the CPU utilization and thus improves network scalability.

IP SLAs Operation Threshold Monitoring

For details on using thresholds with Cisco IOS IP SLAs operations, see the “IP SLAs—Proactive Threshold Monitoring” chapter of the Cisco IOS IP SLAs Configuration Guide at this URL:

http://www.cisco.com/en/US/docs/ios/ipsla/configuration/guide/12_4t/sla_12_4t_book.html

To support successful service level agreement monitoring, you must have mechanisms that notify you immediately of any possible violation. IP SLAs can send SNMP traps that are triggered by events such as these:

- Connection loss
- Timeout
- Round-trip time threshold
- Average jitter threshold
- One-way packet loss
- One-way jitter
- One-way mean opinion score (MOS)
- One-way latency

An IP SLAs threshold violation can also trigger another IP SLAs operation for further analysis. For example, the frequency could be increased or an ICMP path echo or ICMP path jitter operation could be initiated for troubleshooting.

Determining the type of threshold and the level to set can be complex, and depends on the type of IP service being used in the network.

Configuring IP SLAs Operations

**Note**

This section does not include configuration information for all available operations as the configuration information details are included in the *Cisco IOS IP SLAs Configuration Guide*. It does include several operations as examples, including configuring the responder, configuring UDP jitter operation, which requires a responder, and configuring ICMP echo operation, which does not require a responder. A switch running the IP base image supports only IP SLAs responder functionality. The switch must be running the IP services image for full IP SLAs functionality.

For details about configuring other operations, see the *Cisco IOS IP SLAs Configuration Guide* at this URL

http://www.cisco.com/en/US/docs/ios/ipsla/configuration/guide/12_4t/sla_12_4t_book.html

This section includes this information:

- [Default Configuration, page 58-7](#)
- [Configuration Guidelines, page 58-7](#)
- [Configuring the IP SLAs Responder, page 58-8](#)
- [Analyzing IP Service Levels by Using the UDP Jitter Operation, page 58-9](#)
- [Analyzing IP Service Levels by Using the ICMP Echo Operation, page 58-11](#)

Default Configuration

No IP SLAs operations are configured.

Configuration Guidelines

For detailed descriptions and configuration procedures, see the *Cisco IOS IP SLAs Configuration Guide, Release 12.4T* at this URL:

http://www.cisco.com/en/US/docs/ios/ipsla/configuration/guide/12_4t/sla_12_4t_book.html

Note that not all of the IP SLAs commands or operations described in this guide are supported on the switch. The switch supports IP service level analysis by using UDP jitter, UDP echo, HTTP, TCP connect, ICMP echo, ICMP path echo, ICMP path jitter, FTP, DNS, and DHCP, as well as multiple operation scheduling and proactive threshold monitoring. It does not support VoIP service levels using the gatekeeper registration delay operations measurements.

Before configuring any IP SLAs application, you can use the **show ip sla application** privileged EXEC command to verify that the operation type is supported on your software image. This is an example of the output from the command:

```
Switch# show ip sla application
      IP SLAs
Version: 2.2.0 Round Trip Time MIB, Infrastructure Engine-II
Time of last change in whole IP SLAs: 22:17:39.117 UTC Fri Jun
Estimated system max number of entries: 15801

Estimated number of configurable operations: 15801
Number of Entries configured      : 0
Number of active Entries         : 0
Number of pending Entries        : 0
```

```

Number of inactive Entries      : 0

Supported Operation Types
Type of Operation to Perform: 802.lagEcho
Type of Operation to Perform: 802.lagJitter
Type of Operation to Perform: dhcp
Type of Operation to Perform: dns
Type of Operation to Perform: echo
Type of Operation to Perform: ftp
Type of Operation to Perform: http
Type of Operation to Perform: jitter
Type of Operation to Perform: pathEcho
Type of Operation to Perform: pathJitter
Type of Operation to Perform: tcpConnect
Type of Operation to Perform: udpEcho

IP SLAs low memory water mark: 21741224

```

Configuring the IP SLAs Responder

The IP SLAs responder is available only on Cisco IOS software-based devices, including some Layer 2 switches that do not support full IP SLAs functionality, such as the Cisco ME 2400 switch.

To configure the IP SLAs responder on the target device (the operational target), follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	ip sla responder {tcp-connect udp-echo} ipaddress ip-address port port-number	Configures the switch as an IP SLAs responder. The optional keywords have these meanings: <ul style="list-style-type: none"> • tcp-connect—Enable the responder for TCP connect operations. • udp-echo—Enable the responder for User Datagram Protocol (UDP) echo or jitter operations. • ipaddress ip-address—Enter the destination IP address. • port port-number—Enter the destination port number. <p>Note The IP address and port number must match those configured on the source device for the IP SLAs operation.</p>
Step 3	end	Returns to privileged EXEC mode.
Step 4	show ip sla responder	Verifies the IP SLAs responder configuration on the device.
Step 5	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable the IP SLAs responder, enter the **no ip sla responder** global configuration command. This example shows how to configure the device as a responder for the UDP jitter IP SLAs operation in the next procedure:

```
Switch(config)# ip sla responder udp-echo 172.29.139.134 5000
```

Analyzing IP Service Levels by Using the UDP Jitter Operation

Jitter means interpacket delay variance. When multiple packets are sent consecutively 10 ms apart from source to destination, if the network is behaving correctly, the destination should receive them 10 ms apart. But if there are delays in the network (like queuing, arriving through alternate routes, and so on) the arrival delay between packets might be more than or less than 10 ms with a positive jitter value meaning that the packets arrived more than 10 ms apart. If the packets arrive 12 ms apart, positive jitter is 2 ms; if the packets arrive 8 ms apart, negative jitter is 2 ms. For delay-sensitive networks, positive jitter values are undesirable, and a jitter value of 0 is ideal.

In addition to monitoring jitter, the IP SLAs UDP jitter operation can be used as a multipurpose data gathering operation. The packets IP SLAs generates carry packet sending and receiving sequence information and sending and receiving time stamps from the source and the operational target. Based on these, UDP jitter operations measure this data:

- Per-direction jitter (source to destination and destination to source)
- Per-direction packet-loss
- Per-direction delay (one-way delay)
- Round-trip delay (average round-trip time)

Because the paths for the sending and receiving of data can be different (asymmetric), you can use the per-direction data to more readily identify where congestion or other problems are occurring in the network.

The UDP jitter operation generates synthetic (simulated) UDP traffic and sends a number of UDP packets, each of a specified size, sent a specified number of milliseconds apart, from a source router to a target router, at a given frequency. By default, ten packet-frames, each with a payload size of 10 bytes are generated every 10 ms, and the operation is repeated every 60 seconds. You can configure each of these parameters to best simulate the IP service you want to provide.

Note

The IP SLA precision microsecond feature does not provide microsecond accuracy; it provides only microsecond granularity of the timestamps.

To provide accurate one-way delay (latency) measurements, time synchronization, such as that provided by NTP, is required between the source and the target device. Time synchronization is not required for the one-way jitter and packet loss measurements. If the time is not synchronized between the source and target devices, one-way jitter and packet loss data is returned, but values of 0 are returned for the one-way delay measurements provided by the UDP jitter operation.

Note

Before you configure a UDP jitter operation on the source device, you must enable the IP SLAs responder on the target device (the operational target).

To configure UDP jitter operation on the source device, follow these steps:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>ip sla operation-number</code>	Creates an IP SLAs operation, and enter IP SLAs configuration mode.

Command	Purpose
Step 3 udp-jitter <code>{destination-ip-address destination-hostname}</code> <code>destination-port [source-ip {ip-address hostname}]</code> <code>[source-port port-number]</code> <code>[control {enable disable}]</code> <code>[num-packets number-of-packets] [interval interpacket-interval]</code>	<p>Configures the IP SLAs operation as a UDP jitter operation, and enter UDP jitter configuration mode.</p> <ul style="list-style-type: none"> <i>destination-ip-address</i> <i>destination-hostname</i>—Specify the destination IP address or hostname. <i>destination-port</i>—Specify the destination port number in the range from 1 to 65535. (Optional) source-ip <i>{ip-address hostname}</i>—Specify the source IP address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination. (Optional) source-port <i>port-number</i>—Specify the source port number in the range from 1 to 65535. When a port number is not specified, IP SLAs chooses an available port. (Optional) control—Enable or disable sending of IP SLAs control messages to the IP SLAs responder. By default, IP SLAs control messages are sent to the destination device to establish a connection with the IP SLAs responder. (Optional) num-packets <i>number-of-packets</i>—Enter the number of packets to be generated. The range is 1 to 6000; the default is 10. (Optional) interval <i>inter-packet-interval</i>—Enter the interval between sending packets in milliseconds. The range is 1 to 6000; the default value is 20 ms.
Step 4 frequency <i>seconds</i>	<p>(Optional) Sets the rate at which a specified IP SLAs operation repeats. The range is from 1 to 604800 seconds; the default is 60 seconds.</p>
Step 5 exit	<p>Exits UDP jitter configuration mode, and return to global configuration mode.</p>
Step 6 ip sla monitor schedule <code>operation-number [life {forever seconds}]</code> <code>[start-time {hh:mm [:ss] [month day day month] pending now after hh:mm:ss} [ageout seconds] [recurring]</code>	<p>Configures the scheduling parameters for an individual IP SLAs operation.</p> <ul style="list-style-type: none"> <i>operation-number</i>—Enter the RTR entry number. (Optional) life—Set the operation to run indefinitely (forever) or for a specific number of <i>seconds</i>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour). (Optional) start-time—Enter the time for the operation to begin collecting information: <ul style="list-style-type: none"> To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. If no month is entered, the default is the current month. Enter pending to select no information collection until a start time is selected. Enter now to start the operation immediately. Enter after <i>hh:mm:ss</i> to show that the operation should start after the entered time has elapsed. (Optional) ageout <i>seconds</i>—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds, the default is 0 seconds (never ages out). (Optional) recurring—Set the operation to automatically run every day.

	Command	Purpose
Step 7	end	Returns to privileged EXEC mode.
Step 8	show ip sla configuration [<i>operation-number</i>]	(Optional) Displays configuration values, including all defaults for all IP SLAs operations or a specified operation.
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable the IP SLAs operation, enter the no **ip sla operation-number** global configuration command. This example shows how to configure a UDP jitter IP SLAs operation:

```
Switch(config)# ip sla 10
Switch(config-ip-sla)# udp-jitter 172.29.139.134 5000
Switch(config-ip-sla-jitter)# frequency 30
Switch(config-ip-sla-jitter)# exit
Switch(config)# ip sla schedule 5 start-time now life forever
Switch(config)# end
Switch# show ip sla configuration 10
IP SLAs, Infrastructure Engine-II.
```

```

```

Analyzing IP Service Levels by Using the ICMP Echo Operation

The ICMP echo operation measures end-to-end response time between a Cisco device and any devices using IP. Response time is computed by measuring the time taken between sending an ICMP echo request message to the destination and receiving an ICMP echo reply. Many customers use IP SLAs ICMP-based operations, in-house ping testing, or ping-based dedicated probes for response time measurements between the source IP SLAs device and the destination IP device. The IP SLAs ICMP echo operation conforms to the same specifications as ICMP ping testing, and the two methods result in the same response times.

**Note**

This operation does not require the IP SLAs responder to be enabled.

To configure an ICMP echo operation on the source device, follow these steps:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	ip sla operation-number	Creates an IP SLAs operation and enter IP SLAs configuration mode.
Step 3	icmp-echo { <i>destination-ip-address</i> <i>destination-hostname</i> } [source-ip { <i>ip-address</i> <i>hostname</i> } source-interface <i>interface-id</i>]	Configures the IP SLAs operation as an ICMP Echo operation and enter ICMP echo configuration mode. <ul style="list-style-type: none"> • <i>destination-ip-address</i> <i>destination-hostname</i>—Specify the destination IP address or hostname. • (Optional) source-ip {<i>ip-address</i> <i>hostname</i>}—Specify the source IP address or hostname. When a source IP address or hostname is not specified, IP SLAs chooses the IP address nearest to the destination • (Optional) source-interface <i>interface-id</i>—Specify the source interface for the operation.
Step 4	frequency seconds	(Optional) Sets the rate at which a specified IP SLAs operation repeats. The range is from 1 to 604800 seconds; the default is 60 seconds.
Step 5	exit	Exits UDP jitter configuration mode, and return to global configuration mode.
Step 6	ip sla schedule <i>operation-number</i> [life { forever <i>seconds</i> }] [start-time { <i>hh:mm</i> [: <i>ss</i>] [<i>month</i> <i>day</i> <i>day</i> <i>month</i>] pending now after <i>hh:mm:ss</i>] [ageout <i>seconds</i>] [recurring]	Configures the scheduling parameters for an individual IP SLAs operation. <ul style="list-style-type: none"> • <i>operation-number</i>—Enter the RTR entry number. • (Optional) life—Set the operation to run indefinitely (forever) or for a specific number of <i>seconds</i>. The range is from 0 to 2147483647. The default is 3600 seconds (1 hour) • (Optional) start-time—Enter the time for the operation to begin collecting information: <ul style="list-style-type: none"> – To start at a specific time, enter the hour, minute, second (in 24-hour notation), and day of the month. If no month is entered, the default is the current month. – Enter pending to select no information collection until a start time is selected. – Enter now to start the operation immediately. – Enter after <i>hh:mm:ss</i> to indicate that the operation should start after the entered time has elapsed. • (Optional) ageout <i>seconds</i>—Enter the number of seconds to keep the operation in memory when it is not actively collecting information. The range is 0 to 2073600 seconds; the default is 0 seconds (never ages out). • (Optional) recurring—Set the operation to automatically run every day.
Step 7	end	Returns to privileged EXEC mode.

	Command	Purpose
Step 8	show ip sla configuration [<i>operation-number</i>]	(Optional) Displays configuration values including all defaults for all IP SLAs operations or a specified operation.
Step 9	copy running-config startup-config	(Optional) Saves your entries in the configuration file.

To disable the IP SLAs operation, enter the **no ip sla operation-number** global configuration command. This example shows how to configure an ICMP echo IP SLAs operation:

```
Switch(config)# ip sla 12
Switch(config-ip-sla)# icmp-echo 172.29.139.134
Switch(config-ip-sla-echo)# frequency 30
Switch(config-ip-sla-echo)# exit
Switch(config)# ip sla schedule 5 start-time now life forever
Switch(config)# end
Switch# show ip sla configuration 22
IP SLAs, Infrastructure Engine-II.

Monitoring IP SLAs Operations

To display IP SLAs operations configuration and results, use the commands listed in [Table 58-1](#).

Table 58-1 Monitoring IP SLAs Operations

Command	Purpose
show ip sla application	Displays global information about Cisco IOS IP SLAs.
show ip sla authentication	Displays IP SLAs authentication information.
show ip sla configuration [entry-number]	Displays configuration values including all defaults for all IP SLAs operations or a specific operation.
show ip sla enhanced-history {collection-statistics distribution statistics} [entry-number]	Displays enhanced history statistics for collected history buckets or distribution statistics for all IP SLAs operations or a specific operation.
show ip sla ethernet-monitor configuration [entry-number]	Displays IP SLAs automatic Ethernet configuration.
show ip sla group schedule [schedule-entry-number]	Displays IP SLAs group scheduling configuration and details.
show ip sla history [entry-number / full / tabular]	Displays history collected for all IP SLAs operations
show ip sla mpls-lsp-monitor {collection-statistics configuration ldp operational-state scan-queue summary [entry-number] neighbors}	Displays MPLS label switched path (LSP) Health Monitor operations,
show ip sla reaction-configuration [entry-number]	Displays the configured proactive threshold monitoring settings for all IP SLAs operations or a specific operation.
show ip sla reaction-trigger [entry-number]	Displays the reaction trigger information for all IP SLAs operations or a specific operation.
show ip sla responder	Displays information about the IP SLAs responder.
show ip sla statistics [entry-number aggregated details]	Displays current or aggregated operational status and statistics.

CHAPTER 59

Configuring RMON

This chapter describes how to configure Remote Network Monitoring (RMON) on your Catalyst 4500 series switch. RMON is a standard monitoring specification that defines a set of statistics and functions that can be exchanged between RMON-compliant console systems and network probes. RMON provides you with comprehensive network-fault diagnosis, planning, and performance-tuning information.

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

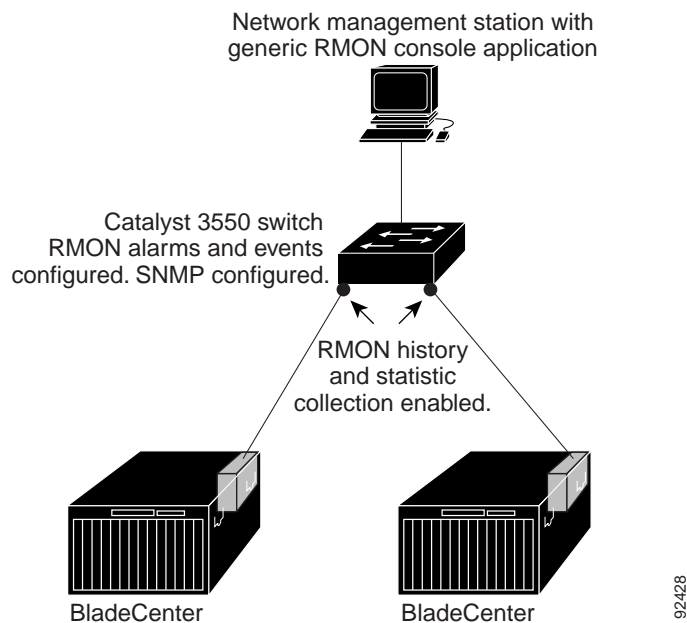

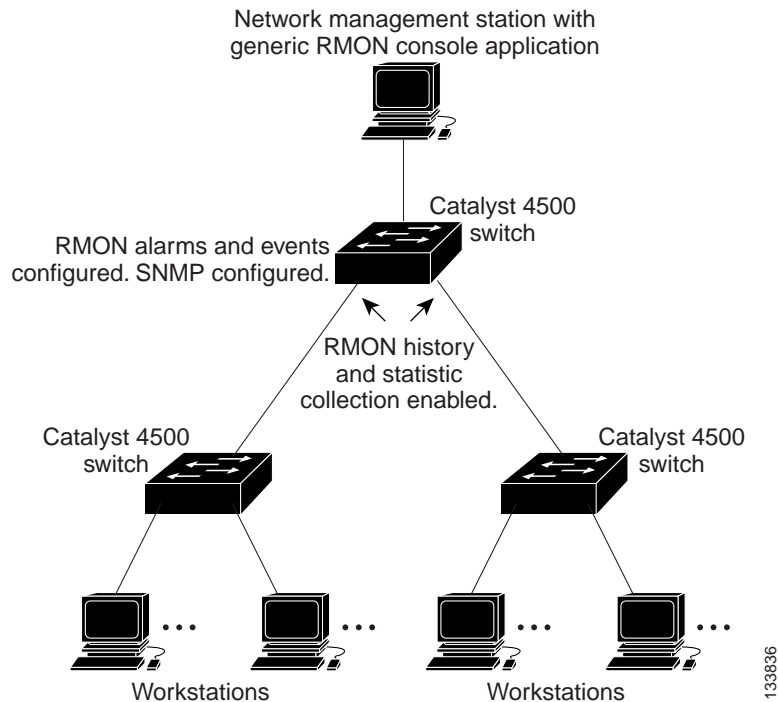

<http://www.cisco.com/en/US/products/ps6350/index.html>

This chapter consists of these sections:

- [Understanding RMON, page 59-1](#)
- [Configuring RMON, page 59-3](#)
- [Displaying RMON Status, page 59-6](#)

Understanding RMON

RMON is an Internet Engineering Task Force (IETF) standard monitoring specification that allows various network agents and console systems to exchange network monitoring data. You can use the RMON feature with the Simple Network Management Protocol (SNMP) agent in the switch to monitor all the traffic flowing among switches on all connected LAN segments.

Figure 59-1 Remote Monitoring Example

The switch supports these RMON groups (defined in RFC 1757):

- Statistics (RMON group 1)—Collects Ethernet, Fast Ethernet, and Gigabit Ethernet statistics on an interface.
- History (RMON group 2)—Collects a history group of statistics on Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces for a specified polling interval.

- Alarm (RMON group 3)—Monitors a specific MIB object for a specified interval, triggers an alarm at a specified value (rising threshold), and resets the alarm at another value (falling threshold). Alarms can be used with events; the alarm triggers an event, which can generate a log entry or an SNMP trap.
- Event (RMON group 9)—Determines the action to take when an event is triggered by an alarm. The action can be to generate a log entry or an SNMP trap.

Because switches supported by Cisco IOS Release 12.2(31)SG use hardware counters for RMON data processing, the monitoring is more efficient, and little processing power is required.

Configuring RMON

This section describes how to configure RMON on your switch. It contains this configuration information:

- [Default RMON Configuration, page 59-3](#)
- [Configuring RMON Alarms and Events, page 59-3](#)
- [Configuring RMON Collection on an Interface, page 59-5](#)

Default RMON Configuration

RMON is disabled by default; no alarms or events are configured.

Only RMON 1 is supported on the switch.

Configuring RMON Alarms and Events

You can configure your switch for RMON by using the command-line interface (CLI) or an SNMP-compatible network management station. We recommend that you use a generic RMON console application on the network management station (NMS) to take advantage of RMON's network management capabilities. You must also configure SNMP on the switch to access RMON MIB objects. For more information, see [Chapter 53, "Configuring SNMP."](#)

To enable RMON alarms and events, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>rmon alarm number variable interval {absolute delta} rising-threshold value [event-number] falling-threshold value [event-number] [owner string]</code>	<p>Sets an alarm on a MIB object.</p> <ul style="list-style-type: none"> For <i>number</i>, specify the alarm number. The range is 1 to 65535. For <i>variable</i>, specify the MIB object to monitor. For <i>interval</i>, specify the time in seconds the alarm monitors the MIB variable. The range is 1 to 4294967295 seconds. Specify the absolute keyword to test each MIB variable directly; specify the delta keyword to test the change between samples of a MIB variable. For <i>value</i>, specify a number at which the alarm is triggered and one for when the alarm is reset. The range for the rising threshold and falling threshold <i>values</i> is -2147483648 to 2147483647. (Optional) For <i>event-number</i>, specify the event number to trigger when the rising or falling threshold exceeds its limit. (Optional) For owner string, specify the owner of the alarm.
Step 3	<code>rmon event number [description string] [log] [owner string] [trap community]</code>	<p>Adds an event in the RMON event table that is associated with an RMON event number.</p> <ul style="list-style-type: none"> For <i>number</i>, assign an event number. The range is 1 to 65535. (Optional) For description string, specify a description of the event. (Optional) Use the log keyword to generate an RMON log entry when the event is triggered. (Optional) For owner string, specify the owner of this event. (Optional) For <i>community</i>, enter the SNMP community string used for this trap.
Step 4	<code>end</code>	Returns to privileged EXEC mode.
Step 5	<code>show running-config</code>	Verifies your entries.
Step 6	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

To disable an alarm, use the **no rmon alarm number** global configuration command on each alarm you configured. You cannot disable at once all the alarms that you configured. To disable an event, use the **no rmon event number** global configuration command. To learn more about alarms and events and how they interact with each other, see RFC 1757.

You can set an alarm on any MIB object. The following example configures RMON alarm number 10 by using the **rmon alarm** command. The alarm monitors the MIB variable *ifEntry.20.1* once every 20 seconds until the alarm is disabled and checks the change in the variable's rise or fall. If the *ifEntry.20.1* value shows a MIB counter increase of 15 or more, such as from 100000 to 100015, the alarm is triggered. The alarm in turn triggers event number 1, which is configured with the **rmon event** command. Possible events can include a log entry or an SNMP trap. If the *ifEntry.20.1* value changes by 0, the alarm is reset and can be triggered again.

```
Switch(config)# rmon alarm 10 ifEntry.20.1 20 delta rising-threshold 15 1
falling-threshold 0 owner jjohnson
```

The following example creates RMON event number 1 by using the **rmon event** command. The event is defined as *High ifOutErrors* and generates a log entry when the event is triggered by the alarm. The user *jjones* owns the row that is created in the event table by this command. This example also generates an SNMP trap when the event is triggered.

```
Switch(config)# rmon event 1 log trap eventtrap description "High ifOutErrors" owner
jjones
```

Configuring RMON Collection on an Interface

You must first configure RMON alarms and events to display collection information.

To collect group history statistics on an interface, perform this task:

	Command	Purpose
Step 1	configure terminal	Enters global configuration mode.
Step 2	interface <i>interface-id</i>	Specifies the interface on which to collect history, and enter interface configuration mode.
Step 3	rmon collection history <i>index</i> [buckets <i>bucket-number</i>] [interval <i>seconds</i>] [owner <i>ownername</i>]	Enables history collection for the specified number of buckets and time period. <ul style="list-style-type: none"> For <i>index</i>, identify the RMON group of statistics. The range is 1 to 65535. (Optional) For buckets <i>bucket-number</i>, specify the maximum number of buckets desired for the RMON collection history group of statistics. The range is 1 to 65535. The default is 50 buckets. (Optional) For interval <i>seconds</i>, specify the number of seconds in each polling cycle. (Optional) For owner <i>ownername</i>, enter the name of the owner of the RMON group of statistics. <p>To disable history collection, use the no rmon collection history index interface configuration command.</p>
Step 4	end	Returns to privileged EXEC mode.
Step 5	show running-config	Verifies your entries.

	Command	Purpose
Step 6	<code>show rmon history</code>	Displays the contents of the switch history table.
Step 7	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

To collect group Ethernet statistics on an interface, perform this task:

	Command	Purpose
Step 1	<code>configure terminal</code>	Enters global configuration mode.
Step 2	<code>interface interface-id</code>	Specifies the interface on which to collect statistics, and enter interface configuration mode.
Step 3	<code>rmon collection stats index [owner ownername]</code>	Enables RMON statistic collection on the interface. <ul style="list-style-type: none"> For <i>index</i>, specify the RMON group of statistics. The range is from 1 to 65535. (Optional) For owner <i>ownername</i>, enter the name of the owner of the RMON group of statistics. To disable the collection of group Ethernet statistics, use the no rmon collection stats index interface configuration command.
Step 4	<code>end</code>	Returns to privileged EXEC mode.
Step 5	<code>show running-config</code>	Verifies your entries.
Step 6	<code>show rmon statistics</code>	Displays the contents of the switch statistics table.
Step 7	<code>copy running-config startup-config</code>	(Optional) Saves your entries in the configuration file.

Displaying RMON Status

To display the RMON status, use one or more of the privileged EXEC commands in [Table 59-1](#):

Table 59-1 Commands for Displaying RMON Status

Command	Purpose
<code>show rmon</code>	Displays general RMON statistics.
<code>show rmon alarms</code>	Displays the RMON alarm table.
<code>show rmon events</code>	Displays the RMON event table.
<code>show rmon history</code>	Displays the RMON history table.
<code>show rmon statistics</code>	Displays the RMON statistics table.

CHAPTER 60

Performing Diagnostics

You can use diagnostics to test and verify the functionality of the hardware components of your system (chassis, supervisor engines, modules, and ASICs) while your Catalyst 4500 series switch is connected to a live network. Diagnostics consists of packet-switching tests that test hardware components and verify the data path and control signals.

Online diagnostics are categorized as bootup, on-demand, schedule, or health-monitoring diagnostics. Bootup diagnostics run during bootup; on-demand diagnostics run from the CLI; scheduled diagnostics run at user-designated intervals or specified times when the switch is connected to a live network; and health-monitoring runs in the background.

This chapter consists of these sections:

- [Configuring Online Diagnostics, page 60-1](#)
- [Performing Diagnostics, page 60-3](#)
- [Power-On Self-Test Diagnostics, page 60-8](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Configuring Online Diagnostics

These sections describe how to configure online diagnostics:

- [Configuring On-Demand Online Diagnostics, page 60-2](#)
- [Scheduling Online Diagnostics, page 60-2](#)

Configuring On-Demand Online Diagnostics

You can run on-demand online diagnostic tests from the CLI. You can set the execution action to either stop or continue the test when a failure is detected, or to stop the test after a specific number of failures occur with the failure count setting. The iteration setting allows you to configure a test to run multiple times.

To schedule online diagnostics, perform this task:

Command	Purpose
Switch# diagnostic ondemand { iteration <i>iteration_count</i> } { action-on-error { continue stop } [<i>error_count</i>]}	Configures on-demand diagnostic tests to run, how many times to run (iterations), and what action to take when errors are found.

This example shows how to set the on-demand testing iteration count:

```
Switch# diagnostic ondemand iterations 3
Switch#
```

This example shows how to set the execution action when an error is detected:

```
Switch# diagnostic ondemand action-on-error continue 2
Switch#
```

Scheduling Online Diagnostics

You can schedule online diagnostics to run at a designated time of day or on a daily, weekly, or monthly basis. You can schedule tests to run only once or to repeat at an interval. Use the **no** form of this command to remove the scheduling.

To configure online diagnostics, perform this task:

Command	Purpose
Switch(config)# diagnostic schedule module <i>number</i> test { <i>test_id</i> <i>test_id_range</i> all } [port { <i>num</i> <i>num_range</i> all } { on <i>mm dd yyyy hh:mm</i> } { daily <i>hh:mm</i> } { weekly <i>day_of_week hh:mm</i> }]	Schedules on-demand diagnostic tests on the specified module for a specific date and time, how many times to run (iterations), and what action to take when errors are found.

This example shows how to schedule diagnostic testing on a specific date and time for a specific port on module 6:

```
Switch(config)# diagnostic schedule module 6 test 2 port 3 on may 23 2009 23:32
Switch(config)#
```

This example shows how to schedule diagnostic testing to occur daily:

```
Switch(config)# diagnostic schedule module 6 test 2 port 3 daily 12:34
Switch(config)#
```

This example shows how to schedule diagnostic testing to occur weekly:

```
Switch(config)# diagnostic schedule module 6 test 2 port 3 weekly friday 09:23
Switch(config)#
```

Performing Diagnostics

After you configure online diagnostics, you can start or stop diagnostic tests or display the test results. You can also see which tests are configured and what diagnostic tests have already run.

These sections describe how to run online diagnostic tests after they have been configured:

- [Starting and Stopping Online Diagnostic Tests, page 60-3](#)
- [Displaying Online Diagnostic Tests and Test Results, page 60-4](#)
- [Line card Online Diagnostics, page 60-6](#)
- [Troubleshooting with Online Diagnostics, page 60-7](#)

Note

Before you enable any online diagnostics tests, enable the logging console or monitor to observe all warning messages.

Note

When running disruptive tests, only run them when you are connected through the console. When disruptive tests complete, a warning message on the console will recommend that you reload the system to return to normal operation. Strictly follow this warning.

Starting and Stopping Online Diagnostic Tests

After you configure diagnostic tests, you can use the **start** and **stop** keywords to begin or end a test.

To start or stop an online diagnostic command, perform one of these tasks:

Command	Purpose
Switch# diagnostic start module <i>number</i> test { <i>test_id</i> <i>test_id_range</i> minimal complete basic per-port non-disruptive all } [port { <i>num</i> <i>port#_range</i> all }]	Starts a diagnostic test on a port or range of ports on the specified module.
Switch# diagnostic stop module <i>number</i>	Stops a diagnostic test on the specified module.

This example shows how to start a diagnostic test on module 6:

```
Switch# diagnostic start module 6 test 2
Diagnostic[module 6]: Running test(s) 2 Run interface level cable diags
Diagnostic[module 6]: Running test(s) 2 may disrupt normal system operation
Do you want to continue? [no]: yes
Switch#
*May 14 21:11:46.631: %DIAG-6-TEST_RUNNING: module 6: Running online-diag-tdr{ID=2} ...
*May 14 21:11:46.631: %DIAG-6-TEST_OK: module 6: online-diag-tdr{ID=2} has completed
successfully
Switch#
```

This example shows how to stop a diagnostic test on module 6:

```
Switch# diagnostic stop module 6
Diagnostic[module 6]: Diagnostic is not active.
```

The message indicates no active diagnostic on module 6

Displaying Online Diagnostic Tests and Test Results

You can display the configured online diagnostic tests and check the results of the tests with the **show diagnostic** command.

To display the configured diagnostic tests, perform this task:

Command	Purpose
Switch# show diagnostic { bootup cns content [module num] description [module num] events [module num] event-type event-type] ondemand result [module num] detail schedule [module num] simulation status }	Displays the test results of online diagnostics and lists supported test suites.

This example shows how to display the online diagnostics configured on module 1:

```
Switch# show diagnostic content module 6
module 6:
Diagnostics test suite attributes:
  M/C/* - Minimal bootup level test / Complete bootup level test / NA
  B/* - Basic ondemand test / NA
  P/V/* - Per port test / Per device test / NA
  D/N/* - Disruptive test / Non-disruptive test / NA
  S/* - Only applicable to standby unit / NA
  X/* - Not a health monitoring test / NA
  F/* - Fixed monitoring interval test / NA
  E/* - Always enabled monitoring test / NA
  A/I - Monitoring is active / Monitoring is inactive
  cable-tdr/* - Interface cable diags / NA
  o/* - Ongoing test, always active / NA
Test Interval   Thre-
ID   Test Name                               Attributes      day hh:mm:ss.ms shold
=====
1) linecard-online-diag -----> M**D***I**      not configured  n/a
2) online-diag-tdr -----> **PD***Icable- not configured  n/a
```

This example shows how to display the test description for a given test on a module:

```
Switch# show diagnostic description module 6 test 1

linecard-online-diag :
  Linecard online-diagnostics run after the system boots up but
  before it starts passing traffic. Each linecard port is placed in
  loopback, and a few packets are injected into the switching fabric
  from the cpu to the port. If the packets are successfully
  received by the cpu, the port passes the test. Sometimes one port
  or a group of ports sharing common components fail. The linecard
  is then placed in partial faulty mode. If no ports can loop back
  traffic, the board is placed in faulty state.
```

Switch#

This example shows how to display the online diagnostic results for module 6:

```
Switch# show diagnostic result module 6
```

```

Current bootup diagnostic level: minimal

module 6:   SerialNo : JAB0815059L

Overall Diagnostic Result for module 6 : PASS
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

Line card Online Diagnostics

A line card online diagnostic test verifies that all ports on a line card are working correctly. The test can detect whether the path to the front panel port on the line card is broken. The test cannot indicate where along the path that the problem occurred.

Note

This test is run only for line cards that have stub chips.

Line card online diagnostics runs only once, when the line cards boot. This situation can happen when you insert a linecard or power up a chassis.

Line card online diagnostics are performed by sending a packet from the CPU to every port on the line card. Because this packet is marked loopback, the CPU expects to see this packet return from the port. The packet first traverses the ASICs on the supervisor engine card, then travels via the chassis backplane and the stub chip on the line cards to the PHYs. The PHY sends it back down the same path.

Note

The packet does not reach or exit the front panel port.

Troubleshooting with Online Diagnostics

A faulty line card occurs if any of the following conditions occurs.

- All ports fail
- All ports on a stub chip fail
- Only one port fails

For all of these situations, the output of the **show module** command would display the status of the line card as faulty:

```
Switch# show mod
Chassis Type : WS-C4507R
Power consumed by backplane : 40 Watts
```

Mod	Ports	Card Type	Model	Serial No.
1	6	Sup II+10GE 10GE (X2), 1000BaseX (SFP)	WS-X4013+10GE	JAB091502G0

Mod	Redundancy role	Operating mode	Redundancy status
1	Active Supervisor	SSO	Active
2	Standby Supervisor	SSO	Standby hot

To troubleshoot a faulty line card, do the following:

Step 1 Enter the command **show diagnostic result module 3**.

If a faulty line card was inserted in the chassis, it will fail the diagnostics and the output will be similar to the following:

```
Current bootup diagnostic level: minimal

module 3: SerialNo : JAB093305RP

Overall Diagnostic Result for module 3 : MAJOR ERROR
Diagnostic level at card bootup: minimal

Test results: (. = Pass, F = Fail, U = Untested)

1) linecard-online-diag -----> F

Switch#
```

Issue an RMA for the line card, contact TAC, and skip steps 2 and 3.

The output may display the following:

```
module 3:

    Overall diagnostic result: PASS

    Test results: (. = Pass, F = Fail, U = Untested)

    1) linecard-online-diag -----> .
```

The message indicates that the line card passed online diagnostics either when it was inserted into the chassis the last time or when the switch was powered up (as reported by the “.”). You need to obtain additional information to determine the cause.

Step 2 Insert a different supervisor engine card and reinsert the line card.

If the linecard passes the test, it suggests that the supervisor engine card is defective.

Issue an RMA for the supervisor engine, contact TAC, and skip step 3.

Because online diagnostics does not run on the supervisor engine card, you cannot use the **#show diagnostic module 1** command to test whether the supervisor engine card is faulty.

Step 3 Reinsert the linecard in a different chassis.

If the linecard passes the test, the problem is associated with the chassis.

Issue an RMA for the chassis and contact TAC.

Power-On Self-Test Diagnostics

The following topics are discussed:

- [Overview, page 60-8](#)
- [Sample POST Results, page 60-9](#)
- [Power-On Self-Test Results for Supervisor Engine V-10GE, page 60-13](#)
- [Troubleshooting the Test Failures, page 60-19](#)

Overview

All Catalyst 4500 series switches have power-on self-test (POST) diagnostics that run whenever a supervisor engine boots. POST tests the basic hardware functionality for the supervisor switching engine, its associated packet memory and other on-board hardware components. The results of the POST impacts how the switch boots, because the health of the supervisor engine is critical to the operation of the switch. The switch might boot in a marginal or faulty state.

POST is currently supported on the following supervisor engines:

- WS-X4014
- WS-X4515
- WS-X4516
- WS-X4516-10GE
- WS-X4013+

- WS-X4013+TS
- WS-X4013+10GE
- WS-C4948G
- WS-C4948G-10GE
- ME-4924-10GE
- WS-X45-SUP6-E
- WS-X45-SUP6L-E

The POST results are indicated with a period (.) or a Pass for Pass, an F for a Fail and a U for Untested.

Sample POST Results

For all the supervisor engines, POST performs CPU, traffic, system, system memory, and feature tests.

For CPU tests, POST verifies appropriate activity of the supervisor SEEPROM, temperature sensor, and Ethernet end-of-band channel (EOBC), when used.

The following example illustrates the output of a CPU subsystem test on all supervisor engines except the WS-X4013+TS:

```
[...]  
Cpu Subsystem Tests ...  
seeprom: . temperature_sensor: . eobc: .  
[...]
```

The following example illustrates the output of a CPU subsystem test on a WS-X4013+TS supervisor engine.

```
[...]  
Cpu Subsystem Tests ...  
seeprom: . temperature_sensor: .  
[...]
```

For traffic tests, POST sends packets from the CPU to the switch. These packets loop several times within the switch core and validate the switching, the Layer 2 and the Layer 3 functionality. To isolate the hardware failures accurately, the loop back is done both inside and outside the switch ports.

The following example illustrates the output of a Layer 2 traffic test at the switch ports on the supervisor engines WS-X4516, WS-X4516-10GE, WS-X4013+10GE, WS-C4948G-10GE:

```
Port Traffic: L2 Serdes Loopback ...  
0: . 1: . 2: . 3: . 4: . 5: . 6: . 7: . 8: . 9: . 10: . 11: .  
12: . 13: . 14: . 15: . 16: . 17: . 18: . 19: . 20: . 21: . 22: . 23: .  
24: . 25: . 26: . 27: . 28: . 29: . 30: . 31: . 32: . 33: . 34: . 35: .  
36: . 37: . 38: . 39: . 40: . 41: . 42: . 43: . 44: . 45: . 46: . 47: .
```

The following example illustrates the output of a Layer 2 traffic test at the switch ports on the supervisor engines WS-X4013+TS, WS-X4515, WS-X4013+, WS-X4014, WS-C4948G:

```
Port Traffic: L2 Serdes Loopback ...  
0: . 1: . 2: . 3: . 4: . 5: . 6: . 7: . 8: . 9: . 10: . 11: .  
12: . 13: . 14: . 15: . 16: . 17: . 18: . 19: . 20: . 21: . 22: . 23: .  
24: . 25: . 26: . 27: . 28: . 29: . 30: . 31:
```

POST also performs tests on the packet and system memory of the switch. These are numbered dynamically in ascending order starting with 1 and represent different memories.

The following example illustrates the output from a system memory test:

```
Switch Subsystem Memory ...
 1: . 2: . 3: . 4: . 5: . 6: . 7: . 8: . 9: . 10: . 11: . 12: .
13: . 14: . 15: . 16: . 17: . 18: . 19: . 20: . 21: . 22: . 23: . 24: .
25: . 26: . 27: . 28: . 29: . 30: . 31: . 32: . 33: . 34: . 35: . 36: .
37: . 38: . 39: . 40: . 41: . 42: . 43: . 44: . 45: . 46: . 47: . 48: .
49: . 50: . 51: . 52: . 53: . 54: . 55: .
```

POST also tests the NetFlow services card (Supervisor Engine IV and Supervisor Engine V) and the NetFlow services feature (Supervisor Engine V -10GE). Failures from these tests are treated as marginal, as they do not impact functionality of the switch (except for the unavailability of the NetFlow features):

```
Netflow Services Feature ...
se: . cf: . 52: . 53: . 54: . 55: . 56: . 57: . 58: . 59: . 60: . 61: .
62: . 63: . 64: . 65: .
```

Note

Supervisor Engine VI-E retains most of the previous supervisor engines' POST features including the CPU subsystem tests, Layer 3 and Layer 2 traffic tests, and memory tests. Redundant ports on redundant systems are not tested. All POST diagnostics are local to the supervisor engine running the tests.

The following example shows the output for a WS-X4516 supervisor engine:

```
Switch# show diagnostic result module 2 detail

module 2:

  Overall diagnostic result: PASS

  Test results: (. = Pass, F = Fail, U = Untested)

Power-On Self-Test Results for Supervisor Engine V-10GE

For the Supervisor Engine V-10GE (WS-X4516-10GE), POST tests extra redundancy features on the 10-Gigabit ports.

The following topics are discussed:

- [POST on the Active Supervisor Engine, page 60-14](#)
- [Sample POST Results on an Active Supervisor Engine, page 60-14](#)
- [POST on a Standby Supervisor Engine, page 60-16](#)
- [Sample Display of the POST on a Standby Supervisor Engine, page 60-17](#)

POST on the Active Supervisor Engine

The active supervisor engine tests the remote redundant 10-Gigabit ports on the standby supervisor engine if it is present when the active supervisor engine is booting. The status of the port is displayed as “Remote TenGigabit Port Status.” If no standby supervisor engine is present, the remote port status is always displayed as Untested. This situation persists even after a new standby supervisor engine is inserted. The remaining tests are conducted using only the Gigabit ports’ configuration.

After the active supervisor engine has completed the startup diagnostics, if the standby supervisor engine is now removed, the remote port status is changed to Untested in the overall diagnostic results.

Sample POST Results on an Active Supervisor Engine

```

POST on a Standby Supervisor Engine

Ports 62 and 63 of the supervisor engine always remain Untested (U). Because the standby supervisor engine never tests the remote 10-Gigabit port on the active supervisor engine, the remote 10-Gigabit port status on the standby supervisor engine is always Untested. The supervisor engine performs the remaining tests using the Gigabit ports' configuration.

Note

On a redundant chassis, concurrent POST is supported on supervisor engines that are already inserted. However, if a second supervisor engine is inserted while the first one is loading, you might boot the first supervisor engine in a faulty IOS state (POST will abort and some of the POST's tests will be bypassed).

This situation only happens during concurrent bootup of the supervisor engines. You should not insert any additional supervisor engines in the empty supervisor engine slot while an already seated supervisor engine is running POST. The POST sequence is completed when the “Exiting to ios...” message is displayed.

Sample Display of the POST on a Standby Supervisor Engine

Switch#

**Note**

To ensure that the maximum number of ports are tested, ensure that both supervisor engines are present on power-up.

Troubleshooting the Test Failures

A failure of any of the POST tests reflects a problem with the hardware on the supervisor engine. Cisco IOS boots the supervisor engine with limited functionality, allowing the user to evaluate and display the diagnostic test results. To determine the failure cause, do one of the following:

- Evaluate whether the hardware failure is persistent by power cycling the supervisor engine to rerun the POST tests.
- Remove and reinsert the supervisor engine into the chassis to ensure that the seating is correct.

Please call the Cisco Systems customer support team for more information.

**Note**

On a redundant chassis, concurrent POST is supported on supervisor engines that are already inserted. However, if a second supervisor engine is inserted while the first one is loading, you might boot the first supervisor engine in a faulty Cisco IOS state (POST will abort, and some of the POST's tests will be bypassed). This situation only happens during concurrent bootup of the supervisor engines. You should not insert any additional supervisor engines in the empty supervisor engine slot while an already seated supervisor engine is running POST. The POST sequence is completed when the "Exiting to ios..." message is displayed.

CHAPTER 61

Configuring WCCP Version 2 Services

Note

Supervisor Engine 6-E and Catalyst 4900M chassis do not support WCCP Version 2.

This chapter describes how to configure the Catalyst 4500 series switches to redirect traffic to content engines (web caches) using the Web Cache Communication Protocol (WCCP) version 2

Note

Throughout this chapter, WCCP refers to WCCP version 2. Version 1 is *not* supported.

This chapter consists of these sections:

- [Understanding WCCP, page 61-2](#)
- [Restrictions for WCCP, page 61-5](#)
- [Configuring WCCP, page 61-6](#)
- [Verifying and Monitoring WCCP Configuration Settings, page 61-8](#)
- [WCCP Configuration Examples, page 61-9](#)

Note

The tasks in this chapter assume that you have already configured content engines on your network. For specific information on hardware and network planning associated with Cisco Content Engines and WCCP, see the Product Literature and Documentation links available on the Cisco.com at these locations:

http://www.cisco.com/en/US/docs/ios/12_2/configfun/configuration/guide/fcf018_ps1835_TSD_Products_Configuration_Guide_Chapter.html.

and

http://www.cisco.com/en/US/tech/tk122/tk717/tsd_technology_support_protocol_home.html

Understanding WCCP

These sections describe WCCP:

- [WCCP Overview, page 61-2](#)
- [Hardware Acceleration, page 61-2](#)
- [Understanding WCCP Configuration, page 61-3](#)
- [WCCP Features, page 61-4](#)

WCCP Overview

WCCP is a Cisco-developed content-routing technology that enables you to integrate content engines into your network infrastructure.

The Cisco IOS WCCP feature enables use of Cisco Content Engines (or other content engines running WCCP) to localize web traffic patterns in the network, enabling content requests to be fulfilled locally. Traffic localization reduces transmission costs and download time.

WCCP enables Cisco IOS routing platforms to transparently redirect content requests. The main benefit of transparent redirection of HTTP requests is that users need not configure their browsers to use a web proxy. Instead, they can use the target URL to request content, and have their requests automatically redirected to a content engine. The word “transparent” in this case means that the end user does not know that a requested file (such as a web page) came from the content engine instead of from the originally specified server.

When a content engine receives a request, it attempts to service it from its own local content. If the requested information is not present, the content engine issues its own request to the originally targeted server to get the required information. When the content engine retrieves the requested information, it forwards it to the requesting client and caches it to fulfill future requests, thus maximizing download performance and substantially reducing transmission costs.

WCCP enables a series of content engines, called a *content engine cluster*, to provide content to a router or multiple routers. Network administrators can easily scale their content engines to handle heavy traffic loads through these clustering capabilities. Cisco clustering technology enables each content member to work in parallel, resulting in linear scalability. Clustering content engines greatly improves the scalability, redundancy, and availability of your caching solution. You can cluster up to 32 content engines to scale to your desired capacity.

Hardware Acceleration

Catalyst 4500 series switches provide hardware acceleration for directly connected Cisco Content Engines, which is more efficient than Layer 3 redirection in the software.

You must configure a directly connected Content Engine to negotiate use of the WCCP Layer 2 Redirection feature with load balancing based on the mask assignment table. The **show ip wccp web-cache detail** command displays which redirection method is in use for each cache.

Note

You can configure the Cisco Content Engine software release 2.2 or later releases to use the WCCP Layer 2 redirection feature along with the mask assignment table.

Understanding WCCP Configuration

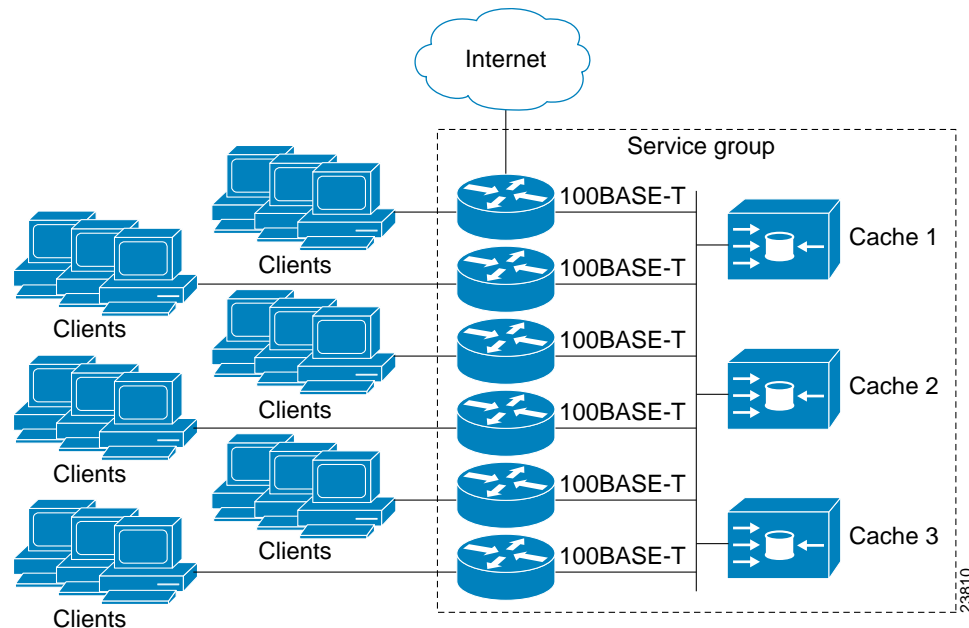

Note

WCCPv1 is not supported.

Multiple routers can use WCCP to service a cache cluster. [Figure 61-1](#) illustrates a sample configuration using multiple routers.

Figure 61-1 Cisco Content Engine Network Configuration Using WCCP

The subset of content engines within a cluster and routers connected to the cluster that are running the same service is known as a *service group*. Available services include TCP and User Datagram Protocol (UDP) redirection.

WCCP requires that each content engine be aware of all the routers in the service group. To specify the addresses of all the routers in a service group, you must choose one of the following methods:

- **Unicast**—A list of router addresses for each of the routers in the group is configured on each content engine. In this case the address of each router in the group must be explicitly specified for each content engine during configuration.
- **Multicast**—A single multicast address is configured on each content engine. In the multicast address method, the content engine sends a single-address notification that provides coverage for all routers in the service group. For example, a content engine could indicate that packets should be sent to a multicast address of 224.0.0.100, which would send a multicast packet to all routers in the service group configured for group listening using WCCP (see the **ip wccp group-listen** interface configuration command for details).

The multicast option is easier to configure because you need only specify a single address on each content engine. This option also enables you to add and remove routers from a service group dynamically without needing to reconfigure the content engines with a different list of addresses each time.

The following sequence of events shows how WCCP configuration works:

1. Each content engine is configured with a list of routers.
2. Each content engine announces its presence and a list of all routers with which it has established communications. The routers reply with their view (list) of content engines in the group.
3. Once the view is consistent across all content engines in the cluster, one content engine is designated as the lead and sets the policy that the routers need to deploy in redirecting packets.

The following sections describe how to configure WCCP on routers so they may participate in a service group.

WCCP Features

These sections describe WCCP features:

- [Support for HTTP and Non-HTTP Services](#)
- [Support for Multiple Routers](#)
- [MD5 Security](#)
- [Web Content Packet Return](#)

Support for HTTP and Non-HTTP Services

WCCP enables redirection of HTTP traffic (TCP port 80 traffic), as well as non-HTTP traffic (TCP and UDP). WCCP supports the redirection of packets intended for other ports, including those used for proxy-web cache handling, File Transfer Protocol (FTP) caching, FTP proxy handling, web caching for ports other than 80, and real audio, video, and telephony applications.

To accommodate the various types of services available, WCCP introduces the concept of multiple *service groups*. Service information is specified in the WCCP configuration commands using dynamic services identification numbers (such as “98”) or a predefined service keywords (such as “web-cache”). This information is used to validate that service group members are all using or providing the same service.

Note

The Catalyst 4500 series switch supports up to eight service groups.

For information on supported WCCP version 2 services with ACNS version 5.2 software, refer to the *Release Notes for Cisco ACNS Software, Release 5.2.3*.

The content engines in service group specify traffic to be redirected by protocol (TCP or UDP) and port (source or destination). Each service group has a priority level assigned to it. Packets are matched against service groups in priority order and redirected by the highest priority service group that matches traffic characteristics.

Support for Multiple Routers

WCCP enables you to attach multiple routers to a cluster of cache engines. The use of multiple routers in a service group enables redundancy, interface aggregation, and distribution of the redirection load.

MD5 Security

WCCP provides optional authentication that enables you to control which routers and content engines become part of the service group using passwords and the HMAC MD5 standard. Shared-secret MD5 one-time authentication (set using the **ip wccp [password [0-7] password]** global configuration command) enables messages to be protected against interception, inspection, and replay.

Web Content Packet Return

If a content engine is unable to provide a requested object it has cached due to error or overload, the content engine returns the request to the router for onward transmission to the originally specified destination server. WCCP verifies which requests have been returned from the content engine unserved. Using this information, the router can then forward the request to the originally targeted server (rather than attempting to resend the request to the content cluster). This provides error handling transparency to clients.

Typical reasons why a content engine would reject packets and initiate the packet return feature include the following:

- Instances when the content engine is overloaded and has no room to service the packets.
- Instances when the content engine is filtering for certain conditions that make caching packets counterproductive (such as, when IP authentication has been turned on).

Restrictions for WCCP

The following limitations apply to WCCP:

- WCCP works only with IP networks.
- For routers servicing a multicast cluster, the time to live (TTL) value must be set at 15 or fewer.
- Because the messages may now be IP multicast, members may receive messages that are not relevant or duplicates. Appropriate filtering needs to be performed.
- A service group can comprise up to 32 content engines and 32 routers.
- All content engines in a cluster must be configured to communicate with all routers servicing the cluster.
- Up to 8 service groups are supported at the same time on the same client interface.
- The L2 rewrite forwarding method is supported, but GRE encapsulation is not.
- Direct L3 connectivity to content engines is required; L3 connectivity of one or more hops away is not supported.
- Layer 2 redirection requires that content engines and clients I/Fs be directly connected to a router and should be on separate IP subnetworks
- The TCAM friendly mask-based assignment is supported, but the hash bucket-based method is not.
- Redirect ACL for WCCP on a client interface is not supported.
- Incoming traffic redirection on an interface is supported, but outgoing traffic re-direction is not.
- When TCAM space is exhausted, traffic is not redirected; it is forwarded normally.
- WCCP version 2 standard allows for support of up to 256 distinct masks. However, a Catalyst 4500 series switch only supports mask assignment table with a single mask.

Configuring WCCP

The following configuration tasks assume that you have already installed and configured the content engines you want to include in your network. You must configure the content engines in the cluster before configuring WCCP functionality on your routers. Refer to the [Cisco Content Engine User Guide](#) for content engine configuration and set up tasks.

IP must be configured on the router interface connected to the cache engines. Examples of router configuration tasks follow this section. For complete descriptions of the command syntax, refer to the *Cisco IOS Configuration Fundamentals Command Reference, Cisco IOS Release 12.3*.

These sections describe how to configure WCCP:

- [Configuring a Service Group Using WCCP, page 61-6](#) (Required)
- [Using Access Lists for a WCCP Service Group, page 61-7](#) (Optional)
- [Setting a Password for a Router and Cache Engines, page 61-8](#) (Optional)

Configuring a Service Group Using WCCP

WCCP uses service groups based on logical redirection services, deployed for intercepting and redirecting traffic. The standard service is the content engine, which intercepts TCP port 80 (HTTP) traffic and redirects that traffic to the content engines. This service is referred to as a *well-known service*, because the characteristics of the web cache service are known by both the router and content engines. A description of a well-known service is not required beyond a service identification (in this case, the command line interface (CLI) provides a **web-cache** keyword in the command syntax).

For information on supported WCCP services with ACNS version 5.2 software, refer to the *Release Notes for Cisco ACNS Software, Release 5.2.3*.

In addition to the web cache service, there can be up to seven dynamic services running concurrently on the switch.

Note

More than one service can run on a switch at the same time, and routers and content engines can be part of multiple service groups at the same time.

The dynamic services are defined by the content engines; the content engine instructs the router which protocol or ports to intercept, and how to distribute the traffic. The router itself does not have information on the characteristics of the dynamic service group's traffic, because this information is provided by the first content engine to join the group. In a dynamic service, up to eight ports can be specified within a single protocol TCP or UDP).

Cisco Content Engines, for example, use dynamic service 99 to specify a reverse-proxy service. However, other content engines may use this service number for some other service. The following configuration information deals with enabling general services on Cisco routers. Refer to the content engine documentation for information on configuring services on content engines.

To enable a service on a Catalyst 4500 series switch, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip wccp { web-cache <i>service-number</i> } [group-address <i>groupaddress</i>] [group-list <i>access-list</i>] [password <i>password</i>]	Specifies a dynamic service to enable on the switch, specifies the IP multicast address used by the service group (optional), group list to use for content engine membership (optional), specifies whether to use MD5 authentication (optional), and enables the WCCP service.
Step 2	Switch(config)# interface <i>type number</i>	Specifies a client interface to configure and enters interface configuration mode.
Step 3	Switch(config-if)# ip wccp { web-cache <i>service-number</i> } redirect in	Enables WCCP redirection for ingress traffic on the specified client interface.
Step 4	Switch(config)# interface <i>type number</i>	(Only needed to run the multicast feature) Specifies the content engine interface to be configured for multicast reception.
Step 5	Switch(config-if)# ip wccp { web-cache <i>service-number</i> } group-listen	(Only needed to run the multicast feature) Enables the reception of IP multicast packets (WCCP protocol packets originating from the content engines) on the interface specified in Step 4.

Specifying a Web Cache Service

To configure a web-cache service, perform this task:

	Command	Purpose
Step 1	Switch(config)# ip wccp web-cache	Enables the web cache service on the switch.
Step 2	Switch(config)# interface <i>type number</i>	Targets a client interface number for which the web cache service runs, and enters interface configuration mode.
Step 3	Switch(config-if)# ip wccp web-cache redirect in	Enables the check on packets to determine if they qualify to be redirected to a content engine, using the client interface specified in Step 2.

Using Access Lists for a WCCP Service Group

A Catalyst 4500 series switch can use an access list to restrict the content engines that can join a service group.

To restrict a content engine, perform this task:

	Command	Purpose
Step 1	Switch(config)# access-list <i>access-list</i> permit ip host <i>host-address</i> [<i>destination-address</i> <i>destination-host</i> any]	Creates an access list based on the unicast address of the content engines.
Step 2	Switch(config)# ip wccp web-cache group-list <i>access-list</i>	Indicates to the switch which content engines are allowed or disallowed to form a service group.

Setting a Password for a Router and Cache Engines

MD5 password security requires that each content engine and Catalyst 4500 series switch that wants to join a service group be configured with the service group password. The password can consist of up to seven characters. Each content engine or Catalyst 4500 series switch in the service group authenticates the security component in a received WCCP packet immediately after validating the WCCP message header. Packets failing authentication are discarded.

To configure an MD5 password for use by the Catalyst 4500 series switch in WCCP communications, perform this task:

Command	Purpose
Switch(config)# ip wccp web-cache password <i>password</i>	Sets an MD5 password on the Catalyst 4500 series switch.

Verifying and Monitoring WCCP Configuration Settings

To verify and monitor the configuration settings for WCCP, use the following commands in EXEC mode:

Command	Purpose
Switch# show ip wccp [web-cache <i>service-number</i>]	Displays global information related to WCCP, including the protocol version currently running, the number of content engines in the routers service group, which content engine group is allowed to connect to the router, and which access list is being used.
Switch# show ip wccp { web-cache <i>service-number</i> } detail	Queries the router for information on which content engines of a specific service group the router has detected. The information can be displayed for either the web cache service or the specified dynamic service.
Switch# show ip interface	Displays status about whether any ip wccp redirection commands are configured on a client interface. For example, “Web Cache Redirect is enabled / disabled.”
Switch# show ip wccp { web-cache <i>service-number</i> } view	<p>Displays which devices in a particular service group have been detected and which content engines are having trouble becoming visible to all other switches to which the current switch is connected.</p> <p>The view keyword indicates a list of addresses of the service group. The information can be displayed for either the web cache service or the specified dynamic service.</p> <p>For further troubleshooting information, use the show ip wccp {web-cache service number} service command.</p>

WCCP Configuration Examples

This section provides the following configuration examples:

- [Performing a General WCCP Configuration Example, page 61-9](#)
- [Running a Web Cache Service Example, page 61-9](#)
- [Running a Reverse Proxy Service Example, page 61-9](#)
- [Using Access Lists Example, page 61-10](#)
- [Setting a Password for a Switch and Content Engines Example, page 61-10](#)
- [Verifying WCCP Settings Example, page 61-10](#)

Performing a General WCCP Configuration Example

The following example shows a general WCCP configuration session. VLAN 20 is for the client interface. VLAN 50 is for the content engine interface.

```
Switch# configure terminal
Switch(config)# ip wccp web-cache group-address 224.1.1.100 password alaska1
Switch(config)# interface vlan 20
Switch(config-if)# ip wccp web-cache redirect in
Switch(config)# interface vlan 50
Switch(config-if)# ip wccp web cache group-listen
```

Running a Web Cache Service Example

The following example shows a web cache service configuration session:

```
Switch# configure terminal
Switch(config)# ip wccp web-cache
Switch(config)# interface vlan 20
Switch(config-if)# ip wccp web-cache redirect in
Switch(config-if)# ^Z
Switch# copy running-config startup-config
Switch# show ip interface vlan 20 | include WCCP Redirect
WCCP Redirect inbound is enabled
WCCP Redirect exclude is disabled
```

Running a Reverse Proxy Service Example

The following example assumes you are configuring a service group using Cisco Content Engines, which use dynamic service 99 to run a reverse proxy service:

```
Switch# configure terminal
router(config)# ip wccp 99
router(config)# interface vlan 40
router(config-if)# ip wccp 99 redirect in
```

Using Access Lists Example

To achieve better security, you can use a standard access list to notify the Catalyst 4500 series switch to which IP addresses are valid addresses for a content engine attempting to register with the current switch. The following example shows a standard access list configuration session where the access list number is 10 for some sample hosts:

```
router(config)# access-list 10 permit host 11.1.1.1
router(config)# access-list 10 permit host 11.1.1.2
router(config)# access-list 10 permit host 11.1.1.3
router(config)# ip wccp web-cache group-list 10
```

Setting a Password for a Switch and Content Engines Example

The following example shows a WCCP password configuration session where the password is *alaska1*:

```
Switch# configure terminal
router(config)# ip wccp web-cache password alaska1
```

Verifying WCCP Settings Example

To verify your configuration changes, use the **more system:running-config** EXEC command. The following example shows that the both the web cache service and dynamic service 99 are enabled on the Catalyst 4500 series switch:

```
Switch# more system:running-config

CHAPTER 62

ROM Monitor

This appendix describes the Cisco 806 router ROM monitor (also called the bootstrap program). The ROM monitor firmware runs when the router is powered up or reset. The firmware helps to initialize the processor hardware and boot the operating system software. You can use the ROM monitor to perform certain configuration tasks, such as recovering a lost password or downloading software over the console port. If there is no Cisco IOS software image loaded on the router, the ROM monitor runs the router.

This appendix contains the following sections:

- [Entering the ROM Monitor](#)
- [ROM Monitor Commands](#)
- [Command Descriptions](#)
- [Configuration Register](#)
- [Console Download](#)
- [Debug Commands](#)
- [Exiting the ROM Monitor](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Entering the ROM Monitor

To use the ROM monitor, you must be using a terminal or PC that is connected to the router over the console port. Refer to the installation chapter in the *Cisco 806 Router Hardware Installation Guide* that came with the router to connect the router to a PC or terminal.

Perform these steps to configure the router to boot up in ROM monitor mode the next time it is rebooted.

	Command	Task
Step 1	enable	Enters privileged EXEC mode.
Step 2	configure terminal	Enters global configuration mode.
Step 3	config-reg 0x0	Resets the configuration register.
Step 4	exit	Exits global configuration mode.
Step 5	reload	<p>Reboots the router with the new configuration register value. The router remains in ROM monitor and does not boot the Cisco IOS software.</p> <p>As long as the configuration value is 0x0, you must manually boot the operating system from the console. See the boot command in the “Command Descriptions” section in this appendix.</p> <p>After the router reboots, it is in ROM monitor mode. The number in the prompt increments with each new line.</p>

ROM Monitor Commands

Enter **?** or **help** at the ROM monitor prompt to display a list of available commands and options, as follows:

```
rommon 1 > ?
alias          set and display aliases command
boot           boot up an external process
confreg        configuration register utility
dev            list the device table
dir            list files in file system
help           monitor builtin command help
history        monitor command history
meminfo        main memory information
repeat         repeat a monitor command
reset          system reset
set            display the monitor variables
sysret         print out info from last system return
unalias        unset an alias
unset          unset a monitor variable
```

Commands are case sensitive. You can halt any command by pressing the Break key on a terminal. If you are using a PC, most terminal emulation programs halt a command when you press the Ctrl and the Break keys at the same time. If you are using another type of terminal emulator or terminal emulation software, refer to the documentation for that product for information on how to send a Break command.

Command Descriptions

[Table 62-1](#) describes the most commonly used ROM monitor commands.

Table 62-1 Most Commonly Used ROM Monitor Commands

Command	Description
reset or i	Resets and initializes the router, similar to a power up.
dev	Lists boot device identifications on the router; for example: <pre>rommon 10> dev Devices in device table: id name flash: flash</pre>
dir device:	Lists the files on the named device; flash, for example: <pre>rommon 4 > dir flash: File size Checksum File name 2835276 bytes (0x2b434c) 0x2073 c806-oy6-mz</pre>
boot commands	For more information about the ROM monitor boot commands, refer to the <i>Cisco IOS Configuration Guide</i> and the <i>Cisco IOS Command Reference</i> .
b	Boots the first image in Flash memory.
b flash: [filename]	Attempts to boot the image directly from the first partition of Flash memory. If you do not enter a filename, this command will boot this first image in Flash.

Configuration Register

The virtual configuration register is in nonvolatile RAM (NVRAM) and has the same functionality as other Cisco routers. You can view or modify the virtual configuration register from either the ROM monitor or the operating system software. Within ROM monitor, you can change the configuration register by entering the register value in hexadecimal format, or by allowing the ROM monitor to prompt you for the setting of each bit.

Changing the Configuration Register Manually

To change the virtual configuration register from the ROM monitor manually, enter the command **confreg** followed by the new value of the register in hexadecimal, as shown in the following example:

```
rommon 1 > confreg 0x2101
```

You must reset or power cycle for new config to take effect

```
rommon 2 >
```

The value is always interpreted as hexadecimal. The new virtual configuration register value is written into NVRAM but does not take effect until you reset or reboot the router.

Changing the Configuration Register Using Prompts

Entering **confreg** without an argument displays the contents of the virtual configuration register and a prompt to alter the contents by describing the meaning of each bit.

In either case, the new virtual configuration register value is written into NVRAM but does not take effect until you reset or reboot the router.

The following display shows an example of entering the **confreg** command:

```
rommon 7> confreg

Configuration Summary
enabled are:
console baud: 9600
boot: the ROM Monitor

do you wish to change the configuration? y/n [n]: y
enable "diagnostic mode"? y/n [n]: y
enable "use net in IP bcast address"? y/n [n]:
enable "load rom after netboot fails"? y/n [n]:
enable "use all zero broadcast"? y/n [n]:
enable "break/abort has effect"? y/n [n]:
enable "ignore system config info"? y/n [n]:
change console baud rate? y/n [n]: y
enter rate: 0 = 9600, 1 = 4800, 2 = 1200, 3 = 2400 [0]: 0
change the boot characteristics? y/n [n]: y
enter to boot:
0 = ROM Monitor
1 = the boot helper image
2-15 = boot system
[0]: 0

Configuration Summary
enabled are:
diagnostic mode
console baud: 9600
boot: the ROM Monitor

do you wish to change the configuration? y/n [n]:

You must reset or power cycle for new config to take effect
```

Console Download

You can use console download, a ROM monitor function, to download over the router console port either a software image or a configuration file. After download, the file is either saved to the mini-Flash memory module or to main memory for execution (image files only).

Use console download when you do not have access to a Trivial File Transfer Protocol (TFTP) server.

Note

If you want to download a software image or a configuration file to the router over the console port, you must use the **ROM monitor** command.

Note

If you are using a PC to download a Cisco IOS image over the router console port at 115,200 bps, ensure that the PC serial port is using a 16550 universal asynchronous transmitter/receiver (UART). If the PC serial port is not using a 16550 UART, we recommend using a speed of 38,400 or less when downloading a Cisco IOS image over the console port.

Error Reporting

Because the ROM monitor console download uses the console to perform the data transfer, error messages are only displayed on the console when the data transfer is terminated.

If an error does occur during a data transfer, the transfer is terminated, and an error message is displayed. If you have changed the baud rate from the default rate, the error message is followed by a message telling you to restore the terminal to the baud rate specified in the configuration register.

Debug Commands

Most ROM monitor debugging commands are functional only when Cisco IOS software has crashed or is halted.

The following are ROM monitor debugging commands:

- **frame**—displays an individual stack frame.
- **sysret**—displays return information from the last booted system image. This information includes the reason for terminating the image, a stack dump of up to eight frames, and, if an exception is involved, the address where the exception occurred; for example:

```
rommon 8> sysret
System Return Info:
count: 19,  reason: user break
pc:0x801111b0,  error address: 0x801111b0
Stack Trace:
FP: 0x80005ea8, PC: 0x801111b0
FP: 0x80005eb4, PC: 0x80113694
FP: 0x80005f74, PC: 0x8010eb44
FP: 0x80005f9c, PC: 0x80008118
FP: 0x80005fac, PC: 0x80008064
FP: 0x80005fc4, PC: 0xffff03d70
FP: 0x80005ffc, PC: 0x00000000
FP: 0x00000000, PC: 0x00000000
```

- **meminfo**—displays size in bytes, starting address, available range of main memory, the starting point and size of packet memory, and size of NVRAM; for example:

```
rommon 9> meminfo

Main memory size: 40 MB.
Available main memory starts at 0x10000, size 40896KB
IO (packet) memory size: 5 percent of main memory.
NVRAM size: 32KB
```

Exiting the ROM Monitor

You must set the configuration register to a value from 0x2 to 0xF for the router to boot a Cisco IOS image from Flash memory upon startup or reloading.

The following example shows how to reset the configuration register and cause the router to boot a Cisco IOS image stored in Flash memory:

```
rommon 1 > confreg 0x2101
```

You must reset or power cycle for new config to take effect

```
rommon 2 >boot
```

The router will boot the Cisco IOS image in Flash memory. The configuration register will change to 0x2101 the next time the router is reset or power cycled.

CHAPTER 63

Configuring MIB Support

This chapter describes how to configure SNMP and MIB support for the Cisco 4500 series switch. It includes the following sections:

- [Determining MIB Support for Cisco IOS Releases, page 63-1](#)
- [Using Cisco IOS MIB Tools, page 63-2](#)
- [Downloading and Compiling MIBs, page 63-2](#)
- [Enabling SNMP Support, page 63-4](#)

Note

For complete syntax and usage information for the switch commands used in this chapter, first look at the *Cisco Catalyst 4500 Series Switch Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/hw/switches/ps4324/index.html>

If the command is not found in the Catalyst 4500 Series Switch Command Reference, it will be found in the larger Cisco IOS library. Refer to the *Catalyst 4500 Series Switch Cisco IOS Command Reference* and related publications at this location:

<http://www.cisco.com/en/US/products/ps6350/index.html>

Determining MIB Support for Cisco IOS Releases

Follow these steps to determine which MIBs are included in the Cisco IOS release running on the Cisco 4500 series switch:

-
- | | |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Step 1 | Go to the Cisco MIBs Support page:
http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml |
| Step 2 | Under Cisco Access Products, select a Cisco 4500 switch to display a list of MIBs supported on the Cisco 4500 switches. |
| Step 3 | Scroll through the list to find the release you are interested in. |
-

Using Cisco IOS MIB Tools

This section describes how to access the Cisco MIB tools page. The MIB Locator finds MIBs in Cisco IOS software releases. You can find general MIB information, instructions about how to use the SNMP Object Navigator which translates SNMP object identifiers (OIDs) into SNMP names, and how to load Cisco MIBs.

Follow these steps to access the Cisco IOS MIB tools site:

-
- Step 1** Go to the Cisco Products and Services page:
<http://tools.cisco.com/ITDIT/MIBS/servlet/index>
- Step 2** Click **MIB Locator** to launch the application. The MIB Locator application allows you to find a MIB in the following three ways.
- From the MIB Locator page, you can:
- Click the drop-down menu and select the desired Cisco IOS software release.
 - From the Platform Family menu, select the appropriate feature set: **CAT4500-SUP2-PLUS**, **CAT4500-SUP2-PLUS-TS**, **CAT4500-SUP3**, **CAT4500-SUP4**, **CAT4500-SUP5**, **CAT4500-SUP5-10gGE2**, and **CAT4948**. If you select the platform first, the system displays only those releases and feature sets that apply to the Cisco 4500 series switch.
 - From the Feature Set menu, select **Service Provider W/VIP**.
- Step 3** From the MIB Locator page, you can search by image name. For example, enter the following and click the **Submit** button:
- c7200-js56i-mz.12.0-1
- Step 4** From the MIB Locator page, you can search for the MIB from the list of MIBs in the menu. You can select one, or for multiple selections, hold down the **CTRL** key, then click the **Submit** button.

Note After you make a selection, follow the links and instructions.

Downloading and Compiling MIBs

The following sections provide information about how to download and compile MIBs for the Cisco 4500 series switch:

- [Considerations for Working with MIBs](#)
- [Downloading MIBs](#)
- [Compiling MIBs](#)

Considerations for Working with MIBs

While working with MIBs, consider the following:

Mismatches on Datatype Definitions

- Mismatches on datatype definitions might cause compiler errors or warning messages. Although Cisco MIB datatype definitions are not mismatched, some standard RFC MIBs do mismatch. For example:

```
MIB A defines: SomeDatatype ::= INTEGER(0..100)
MIB B defines: SomeDatatype ::= INTEGER(1..50)
```

This example is considered to be a trivial error and the MIB loads successfully with a warning message.

The next example is considered as a nontrivial error (even though the two definitions are essentially equivalent), and the MIB is not successfully parsed.

```
MIB A defines: SomeDatatype ::= DisplayString
MIB B defines: SomeDatatype ::= OCTET STRING (SIZE(0..255))
```

If your MIB compiler treats these as errors, or you want to delete the warning messages, edit one of the MIBs that define this same datatype so that the definitions match.

- Many MIBs import definitions from other MIBs. If your management application requires MIBs to be loaded, and you experience problems with undefined objects, you might want to load the following MIBs in this order:

```
SNMPv2-SMI.my
SNMPv2-TC.my
SNMPv2-MIB.my
RFC1213-MIB.my
IF-MIB.my
CISCO-SMI.my
CISCO-PRODUCTS-MIB.my
CISCO-TC.my
```

- For additional information and SNMP technical tips, go to the following URL:
<http://www.cisco.com/cisco/web/support/index.html>
- For a list of SNMP OIDs assigned to MIB objects, go to the following URL and click on **SNMP Object Navigator** and follow the links:
<http://tools.cisco.com/ITDIT/MIBS/servlet/index>

Note You must have a Cisco CCO name and password to access the MIB Locator.

- For information about how to download and compile Cisco MIBs, go to the following URL:
http://www.cisco.com/en/US/tech/tk648/tk362/technologies_tech_note09186a00800b4cee.shtml

Downloading MIBs

Follow these steps to download the MIBs onto your system if they are not already there:

-
- Step 1** Review the considerations in the previous section.
- Step 2** Go to one of the following Cisco URLs. If the MIB you want to download is not there, try the other URL; otherwise, go to one of the URLs in Step 5.
- <ftp://ftp.cisco.com/pub/mibs/v2>
- <ftp://ftp.cisco.com/pub/mibs/v1>

- Step 3** Click the link for a MIB to download that MIB to your system.
- Step 4** Select **File > Save** or **File > Save As** to save the MIB on your system.
- Step 5** You can download industry-standard MIBs from the following URLs:
- <http://www.oidview.com/mibs/0/md-0-1.html>
-

Compiling MIBs

If you plan to integrate the Cisco 4500 series switch with an SNMP-based management application, then you must also compile the MIBs for that platform. For example, if you are running HP OpenView on a UNIX operating system, you must compile Cisco 4500 series switch MIBs with the HP OpenView Network Management System (NMS). For instructions, see the NMS documentation.

Enabling SNMP Support

The following procedure summarizes how to configure the Cisco 4500 series switch for SNMP support.

For detailed information about SNMP commands, see the following Cisco documents:

- *Cisco IOS Release 12.3 Configuration Fundamentals and Network Management Configuration Guide*, available at the following URL:
http://www.cisco.com/en/US/products/ps6350/products_installation_and_configuration_guides_list.html
- *Cisco IOS Release 12.3 Configuration Fundamentals and Network Management Command Reference*, Part 3: System Management Commands, “Router and Network Configuration Commands” section, available at the following URL:
http://www.cisco.com/en/US/docs/ios/12_3/configfun/command/reference/fun_r.html

To configure the Cisco 4500 series switch for SNMP support, follow these steps:

-
- Step 1** Set up your basic SNMP configuration through the command line interface (CLI) on the router. Note that these basic configuration commands are issued for SNMP version 2c. For SNMP version 3, you must also set up SNMP users and groups. (See the preceding list of documents for command and setup information.)
- Define SNMP read-only and read-write communities:

```
Router (config)# snmp-server community Read_Only_Community_Name ro
Router (config)# snmp-server community Read_Write_Community_Name rw
```
 - Configure SNMP views (to limit the range of objects accessible to different SNMP user groups):

```
Router (config)# snmp-server view view_name oid-tree {included | excluded}
```
- Step 2** Identify (by IP address) the host to receive SNMP notifications from the router:

```
Router (config)# snmp-server host host
```
- Step 3** Configure the router to generate notifications. You can use keywords to limit the number and types of messages generated.

```
Router (config)# snmp-server enable traps [notification-type] [notification-option]
```

Step 4 Optional. Configure the router to generate SNMP notifications released to field replaceable units (FRUs):

```
Router (config)# snmp-server enable traps fru-ctrl
```

Step 5 Optional. Configure the router to generate SNMP notifications related to environmental monitoring:

```
Router (config)# snmp-server enable traps envmon
```

Acronyms and Abbreviations

Table A-1 defines the acronyms and abbreviations used in this publication.

Table A-1 Acronyms

Acronym	Expansion
ACE	access control entry
ACL	access control list
AFI	authority and format identifier
Agport	aggregation port
ALPS	Airline Protocol Support
AMP	Active Monitor Present
APaRT	Automated Packet Recognition and Translation
ARP	Address Resolution Protocol
AV	attribute value
AVVID	Architecture for Voice, Video and Integrated Data
BDD	binary decision diagrams
BECN	backward explicit congestion notification
BGP	Border Gateway Protocol
BPDU	bridge protocol data unit
BRF	bridge relay function
BSC	Bisync
BSTUN	Block Serial Tunnel
BUS	broadcast and unknown server
BVI	bridge-group virtual interface
CAM	content-addressable memory
CAR	committed access rate
CCA	circuit card assembly
CDP	Cisco Discovery Protocol
CEF	Cisco Express Forwarding
CGMP	Cisco Group Management Protocol

Table A-1 *Acronyms (continued)*

Acronym	Expansion
CHAP	Challenge Handshake Authentication Protocol
CIR	committed information rate
CIST	Common and Internal Spanning Tree
CLI	command-line interface
CLNS	Connection-Less Network Service
CMNS	Connection-Mode Network Service
COPS	Common Open Policy Server
COPS-DS	Common Open Policy Server Differentiated Services
CoS	class of service
CPLD	Complex Programmable Logic Device
CRC	cyclic redundancy check
CRF	concentrator relay function
CST	Common Spanning Tree
CUDD	University of Colorado Decision Diagram
DBL	Dynamic Buffer Limiting
DCC	Data Country Code
dCEF	distributed Cisco Express Forwarding
DDR	dial-on-demand routing
DE	discard eligibility
DEC	Digital Equipment Corporation
DFI	Domain-Specific Part Format Identifier
DFP	Dynamic Feedback Protocol
DISL	Dynamic Inter-Switch Link
DLC	Data Link Control
DLSw	Data Link Switching
DMP	data movement processor
DNS	Domain Name System
DoD	Department of Defense
DOS	denial of service
DRAM	dynamic RAM
DSAP	destination service access point
DSCP	differentiated services code point
DSPU	downstream SNA Physical Units
DTP	Dynamic Trunking Protocol
DTR	data terminal ready
DXI	data exchange interface

Table A-1 *Acronyms (continued)*

Acronym	Expansion
EAP	Extensible Authentication Protocol
EARL	Enhanced Address Recognition Logic
EEPROM	electrically erasable programmable read-only memory
EHSA	enhanced high system availability
EHT	Explicit Host Tracking
EIA	Electronic Industries Association
ELAN	Emulated Local Area Network
EOBC	Ethernet out-of-band channel
ESI	end-system identifier
FECN	forward explicit congestion notification
FM	feature manager
FRU	field replaceable unit
FSM	feasible successor metrics
GARP	General Attribute Registration Protocol
GMRP	GARP Multicast Registration Protocol
GVRP	GARP VLAN Registration Protocol
HSRP	Hot Standby Routing Protocol
ICC	Inter-card Communication
ICD	International Code Designator
ICMP	Internet Control Message Protocol
IDB	interface descriptor block
IDP	initial domain part or Internet Datagram Protocol
IFS	IOS File System
IGMP	Internet Group Management Protocol
IGRP	Interior Gateway Routing Protocol
ILMI	Integrated Local Management Interface
IP	Internet Protocol
IPC	interprocessor communication
IPX	Internetwork Packet Exchange
IS-IS	Intermediate System-to-Intermediate System Intradomain Routing Protocol
ISL	Inter-Switch Link
ISO	International Organization of Standardization
LAN	local area network
LANE	LAN Emulation
LAPB	Link Access Procedure, Balanced

Table A-1 *Acronyms (continued)*

Acronym	Expansion
LDA	Local Director Acceleration
LCP	Link Control Protocol
LEC	LAN Emulation Client
LECS	LAN Emulation Configuration Server
LEM	link error monitor
LER	link error rate
LES	LAN Emulation Server
LLC	Logical Link Control
LTL	Local Target Logic
MAC	Media Access Control
MACL	MAC Access Control
MD5	Message Digest 5
MFD	multicast fast drop
MIB	Management Information Base
MII	media-independent interface
MLS	Multilayer Switching
MLSE	maintenance loop signaling entity
MOP	Maintenance Operation Protocol
MOTD	message-of-the-day
MLSE	maintenance loops signaling entity
MRM	multicast routing monitor
MSDP	Multicast Source Discovery Protocol
MST	Multiple Spanning Tree
MSTI	MST instance
MTU	maximum transmission unit
MVAP	multiple VLAN access port
NBP	Name Binding Protocol
NCIA	Native Client Interface Architecture
NDE	NetFlow Data Export
NET	network entity title
NetBIOS	Network Basic Input/Output System
NFFC	NetFlow Feature Card
NMP	Network Management Processor
NSAP	network service access point
NTP	Network Time Protocol
NVRAM	nonvolatile RAM

Table A-1 *Acronyms (continued)*

Acronym	Expansion
OAM	Operation, Administration, and Maintenance
ODM	order dependent merge
OSI	Open System Interconnection
OSPF	open shortest path first
PACL	Port Access Control List
PAE	port access entity
PAGP	Port Aggregation Protocol
PBD	packet buffer daughterboard
PBR	Policy Based Routing
PC	Personal Computer
PCM	pulse code modulation
PCR	peak cell rate
PDP	policy decision point
PDU	protocol data unit
PEP	policy enforcement point
PGM	Pragmatic General Multicast
PHY	physical sublayer
PIB	policy information base
PIM	Protocol Independent Multicast
PoE	Power over Internet
PPP	Point-to-Point Protocol
PRID	Policy Rule Identifiers
PVST+	Per VLAN Spanning Tree+
QM	QoS manager
QoS	quality of service
RADIUS	Remote Access Dial-In User Service
RAM	random-access memory
RCP	Remote Copy Protocol
RGMP	Router-Ports Group Management Protocol
RIB	routing information base
RIF	Routing Information Field
RMON	remote network monitor
ROM	read-only memory
ROMMON	ROM monitor
RP	route processor or rendezvous point
RPC	remote procedure call

Table A-1 *Acronyms (continued)*

Acronym	Expansion
RPF	reverse path forwarding
RPR	Route Processor Redundancy
RSPAN	remote SPAN
RST	reset
RSVP	ReSerVation Protocol
SAID	Security Association Identifier
SAP	service access point
SCM	service connection manager
SCP	Switch-Module Configuration Protocol
SDLC	Synchronous Data Link Control
SGBP	Stack Group Bidding Protocol
SIMM	single in-line memory module
SLB	server load balancing
SLCP	Supervisor Line-Card Processor
SLIP	Serial Line Internet Protocol
SMDS	Software Management and Delivery Systems
SMF	software MAC filter
SMP	Standby Monitor Present
SMRP	Simple Multicast Routing Protocol
SMT	Station Management
SNAP	Subnetwork Access Protocol
SNMP	Simple Network Management Protocol
SPAN	Switched Port Analyzer
SSTP	Cisco Shared Spanning Tree
STP	Spanning Tree Protocol
SVC	switched virtual circuit
SVI	switched virtual interface
TACACS+	Terminal Access Controller Access Control System Plus
TARP	Target Identifier Address Resolution Protocol
TCAM	Ternary Content Addressable Memory
TCL	table contention level
TCP/IP	Transmission Control Protocol/Internet Protocol
TFTP	Trivial File Transfer Protocol
TIA	Telecommunications Industry Association
TopN	Utility that allows the user to analyze port traffic by reports
TOS	type of service

Table A-1 *Acronyms (continued)*

Acronym	Expansion
TLV	type-length-value
TTL	Time To Live
TVX	valid transmission
UDLD	UniDirectional Link Detection Protocol
UDP	User Datagram Protocol
UNI	User-Network Interface
UTC	Coordinated Universal Time
VACL	VLAN access control list
VCC	virtual channel circuit
VCI	virtual circuit identifier
VCR	Virtual Configuration Register
VINES	Virtual Network System
VLAN	virtual LAN
VMPS	VLAN Membership Policy Server
VPN	virtual private network
VRF	VPN routing and forwarding
VTP	VLAN Trunking Protocol
VVID	voice VLAN ID
WFQ	weighted fair queueing
WRED	weighted random early detection
